

# ETSI TS 151 010-1 V5.0.0 (2002-09)

---

*Technical Specification*

**Digital cellular telecommunications system (Phase 2+);  
Mobile Station (MS) conformance specification;  
Part 1: Conformance specification  
(3GPP TS 51.010-1 version 5.0.0 Release 5)**

---

## Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "*Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards*", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<http://www.etsi.org/legal/home.htm>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

---

## Foreword

This Technical Specification (TS) has been produced by the ETSI 3<sup>rd</sup> Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under [www.etsi.org/key](http://www.etsi.org/key).

| Intellectual Property Rights .....                                           | 2  |
| Foreword.....                                                                | 2  |
| Foreword.....                                                                | 48 |
| 1 Scope .....                                                                | 49 |
| 2 References .....                                                           | 49 |
| 3 Definitions, conventions and applicability .....                           | 57 |
| 3.1 Mobile station definition and configurations.....                        | 57 |
| 3.2 Applicability.....                                                       | 58 |
| 3.2.1 Applicability of this specification.....                               | 58 |
| 3.2.1.1 MS equipped with a connector.....                                    | 58 |
| 3.2.1.2 GPRS.....                                                            | 58 |
| 3.2.2 Applicability of the individual tests .....                            | 58 |
| 3.2.3 Applicability to terminal equipment .....                              | 58 |
| 3.3 Definitions.....                                                         | 59 |
| 3.4 Conventions for mathematical notations .....                             | 59 |
| 3.4.1 Mathematical signs .....                                               | 59 |
| 3.4.2 Powers to the base 10.....                                             | 59 |
| 3.5 Conventions on electrical terms .....                                    | 60 |
| 3.5.1 Radio Frequency (RF) input signal level .....                          | 60 |
| 3.5.2 Reference sensitivity level.....                                       | 60 |
| 3.5.3 Power level of fading signal .....                                     | 60 |
| 3.6 Terms on test conditions.....                                            | 61 |
| 3.6.1 Radio test conditions.....                                             | 61 |
| 4 Test Equipment .....                                                       | 62 |
| 4.1 Terms used to describe test equipment in the present document.....       | 62 |
| 4.2 Functional requirements of test equipment .....                          | 62 |
| 5 Testing methodology in general (layers 1, 2, and 3) .....                  | 62 |
| 5.1 Testing of optional functions and procedures.....                        | 62 |
| 5.2 Test interfaces and facilities .....                                     | 62 |
| 5.3 Different protocol layers .....                                          | 63 |
| 5.4 Information to be provided by the apparatus supplier .....               | 63 |
| 5.5 Definitions of transmit and receive times.....                           | 63 |
| 6 Reference test methods.....                                                | 64 |
| 6.1 General .....                                                            | 64 |
| 6.2 Choice of frequencies in the frequency hopping mode .....                | 64 |
| 6.3 "Ideal" radio conditions .....                                           | 65 |
| 6.4 Standard test signals .....                                              | 65 |
| 6.5 Power (control) levels .....                                             | 65 |
| 7 Implicit testing.....                                                      | 65 |
| 8 Measurement uncertainty .....                                              | 66 |
| 9 Format of tests.....                                                       | 66 |
| 10 Generic call set up procedures.....                                       | 67 |
| 10.1 Generic call set-up procedure for mobile terminating speech calls ..... | 67 |
| 10.1.1 Initial conditions .....                                              | 67 |
| 10.1.2 Definition of system information messages.....                        | 67 |
| 10.1.3 Procedure .....                                                       | 69 |
| 10.1.4 Specific message contents .....                                       | 70 |
| 10.2 Generic call set-up procedure for mobile originating speech calls.....  | 71 |
| 10.2.1 Initial conditions .....                                              | 72 |
| 10.2.2 Definition of system information messages.....                        | 72 |

|            |                                                                                                                           |    |
|------------|---------------------------------------------------------------------------------------------------------------------------|----|
| 10.2.3     | Procedure .....                                                                                                           | 72 |
| 10.2.4     | Specific message contents .....                                                                                           | 73 |
| 10.3       | Generic call set-up procedure for mobile terminating data calls .....                                                     | 74 |
| 10.3.1     | Initial conditions .....                                                                                                  | 74 |
| 10.3.2     | Definition of system information messages .....                                                                           | 75 |
| 10.3.3     | Procedure .....                                                                                                           | 75 |
| 10.3.4     | Specific message contents .....                                                                                           | 75 |
| 10.4       | Generic call set-up procedure for mobile originating data calls .....                                                     | 77 |
| 10.4.1     | Initial conditions .....                                                                                                  | 77 |
| 10.4.2     | Definition of system information messages .....                                                                           | 77 |
| 10.4.3     | Procedure .....                                                                                                           | 78 |
| 10.4.4     | Specific message contents .....                                                                                           | 78 |
| 10.5       | Generic call set-up procedure for mobile terminating multislot configuration, minimum number of timeslots allocated ..... | 80 |
| 10.5.1     | Initial conditions .....                                                                                                  | 80 |
| 10.5.2     | Definition of system information messages .....                                                                           | 81 |
| 10.5.3     | Procedure .....                                                                                                           | 81 |
| 10.5.4     | Specific message contents .....                                                                                           | 82 |
| 10.6       | Generic call set-up procedure for mobile originating multislot configuration, minimum number of timeslots allocated ..... | 83 |
| 10.6.1     | Initial conditions .....                                                                                                  | 83 |
| 10.6.2     | Definition of system information messages .....                                                                           | 84 |
| 10.6.3     | Procedure .....                                                                                                           | 84 |
| 10.6.4     | Specific message contents .....                                                                                           | 84 |
| 10.7       | Generic procedure for GPRS downlink data transfer .....                                                                   | 86 |
| 10.7.1     | Initial conditions .....                                                                                                  | 86 |
| 10.7.2     | Definition of system information messages .....                                                                           | 86 |
| 10.7.3     | Procedure .....                                                                                                           | 87 |
| 10.7.4     | Specific message contents .....                                                                                           | 87 |
| 10.8       | Generic procedure for GPRS uplink data transfer .....                                                                     | 87 |
| 10.8.1     | Initial conditions .....                                                                                                  | 87 |
| 10.8.2     | Definition of system information messages .....                                                                           | 87 |
| 10.8.3     | Procedure .....                                                                                                           | 88 |
| 10.8.4     | Specific message contents .....                                                                                           | 88 |
| 11         | General tests .....                                                                                                       | 90 |
| 11.1       | Verification of support and non-support of services (multiple numbering scheme or ISDN) .....                             | 90 |
| 11.1.1     | Mobile Terminated (MT) calls .....                                                                                        | 90 |
| 11.1.1.1   | Definition and applicability .....                                                                                        | 90 |
| 11.1.1.2   | Conformance requirement .....                                                                                             | 90 |
| 11.1.1.3   | Test purpose .....                                                                                                        | 90 |

| 20.22.2   | Cell reselection in Packet Idle mode.....                                                                 | 455 |
| 20.22.3   | Priority of cells .....                                                                                   | 456 |
| 20.22.4   | Cell re-selection with cells in different routing area .....                                              | 458 |
| 20.22.5   | Network controlled Cell re-selection in Transfer Mode .....                                               | 460 |
| 20.22.6   | Cell reselection timings .....                                                                            | 461 |
| 20.22.7   | Downlink signalling failure .....                                                                         | 462 |
| 20.22.8   | Cell selection when the best cell does not support GPRS.....                                              | 463 |
| 20.22.9   | Cell reselection when the best cell does not support GPRS.....                                            | 465 |
| 20.22.10  | Cell Selection-Search for Suitable Cell/ cell priority.....                                               | 468 |
| 20.22.11  | Cell Selection/No normal priority cell.....                                                               | 469 |
| 20.22.12  | Cell Selection on "LA Not Allowed" .....                                                                  | 470 |
| 20.22.13  | Cell Reselection based on C32 quality .....                                                               | 471 |
| 20.22.14  | Cell Reselection in case Cell reselection occurred in the previous 15 s .....                             | 472 |
| 20.22.15  | Cell Reselection/ ready state / no reselection.....                                                       | 474 |
| 20.22.16  | Cell Reselection/ ready state/ Reselection and Cell update procedure .....                                | 475 |
| 20.22.17  | C2 reselection in another RA - no cell reselection.....                                                   | 477 |
| 20.22.18  | C2 reselection in another Routing Area - Routing Area Update.....                                         | 478 |
| 20.22.19  | Borders between routing areas - reselection of a GPRS cell in a homogenous network .....                  | 479 |
| 20.22.20  | Cell Reselection based on C32 - Cell Reselection on CCCH - PBCCH not present .....                        | 480 |
| 20.22.21  | Cell Reselection based on C32/GCRH value - Cell Reselection on CCCH - PBCCH not present.....              | 482 |
| 20.22.22  | Cell Reselection with cells in different Routing area - Cell Reselection on CCCH - PBCCH not present..... | 485 |
| 20.22.23  | Cell Reselection based on C32 - Cell Reselection on CCCH - PBCCH not supported .....                      | 486 |
| 20.22.24  | Cell Reselection based on C32/cell of same priority/ Cell Reselection on CCCH - PBCCH not supported ..... | 488 |
| 20.22.25  | Cell Reselection based on C32/C31<0/ Cell Reselection on CCCH - PBCCH not supported .....                 | 490 |
| 20.22.26  | Cell Reselection based on C32 quality / Cell Reselection on CCCH - PBCCH not supported .....              | 491 |
| 20.22.27  | Void .....                                                                                                | 494 |
| 20.22.28  | Cell Reselection/no suitable cell found/cell selection.....                                               | 494 |
| 20.23     | COMPACT Cell Selection and Reselection.....                                                               | 496 |
| 20.23.1   | Cell selection .....                                                                                      | 497 |
| 20.23.2   | Cell reselection in Packet Idle mode.....                                                                 | 499 |
| 20.23.3   | Priority of cells .....                                                                                   | 500 |
| 20.23.4   | Cell re-selection with cells in different routing area .....                                              | 502 |
| 20.23.5   | Network controlled Cell re-selection in Transfer Mode .....                                               | 503 |
| 20.23.6   | Cell reselection timings .....                                                                            | 504 |
| 20.23.7   | Downlink signalling failure .....                                                                         | 505 |
| 20.23.8   | COMPACT Cell re-selection when target cell is BCCH supporting EGPRS and different routing area.....       | 507 |
| 20.23.9   | Cell re-selection when target cell is COMPACT CPBCCH in different routing area .....                      | 508 |
| 20.24     | SoLSA Cell Selection and Reselection .....                                                                | 510 |
| 20.24.1   | SoLSA Cell Selection suitable cell.....                                                                   | 516 |
| 20.24.2   | SoLSA Cell (Re)Selection Emergency Call .....                                                             | 522 |
| 20.24.3   | SoLSA Cell Reselection / idle mode support enabled .....                                                  | 524 |
| 20.24.3.1 | General conformance requirement.....                                                                      | 524 |
| 20.24.3.2 | SoLSA Cell Reselection / idle mode support enabled / LSA Priority.....                                    | 526 |
| 20.24.3.3 | SoLSA Cell Reselection / idle mode support enabled / LSA Priority / different location area.....          | 528 |
| 20.24.3.4 | SoLSA Cell Reselection / idle mode support enabled / Priority Threshold .....                             | 531 |
| 20.24.3.5 | SoLSA Cell Reselection / idle mode support enabled / LSA Priority / LSA_OFFSET .....                      | 534 |
| 20.24.3.6 | SoLSA Cell Reselection / idle mode support enabled / LSA Priority / cell combinations.....                | 536 |
| 20.24.3.7 | SoLSA Cell Reselection / roaming .....                                                                    | 539 |

| A3.1.2.1 IMSI detach initiation by the MS - 3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.3.4.1 .....                  | 4222        |
| A3.1.2.2 IMSI detach completion by the MS - 3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.3.4.3.....                   | 4222        |
| A3.1.2.3 MM specific procedures - 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.4 and 4.5.1.1.....                    | 4222        |
| A3.1.2.4 Receiving an MM STATUS message - 3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.6 .....                        | 4223        |
| A3.1.3 Call control.....                                                                                            | 4223        |
| A3.1.3.1 Status enquiry procedures - 3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.5.3.1.....                          | 4223        |
| A3.1.3.2 Receiving a STATUS message by a CC entity - 3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.5.3.2.....          | 4223        |
| A3.1.3.3 Called side compatibility checking - 3GPP TS 04.08 / 3GPP TS 24.008 clause B.3 .....                       | 4223        |
| A3.1.3.4 Disconnect on incoming call.....                                                                           | 4223        |
| A3.1.4 Layer 1 .....                                                                                                | 4223        |
| A3.1.4.1 Optional storage of BCCH carrier information - 3GPP TS 05.08 subclause 6.3 .....                           | 4223        |
| A3.1.5 Autocalling - (ref.: 3GPP TS 02.07, annex 1) .....                                                           | 4223        |
| A3.1.6 Transient states .....                                                                                       | 4224        |
| A3.2 Protocol Implementation Extra Information for Testing (PIXIT).....                                             | 4225        |
| A3.2.0 Introduction .....                                                                                           | 4225        |
| A3.2.1 Basic characteristics .....                                                                                  | 4225        |
| A3.2.1.1 Type of antenna .....                                                                                      | 4225        |
| A3.2.1.2 Power supply .....                                                                                         | 4225        |
| A3.2.1.3 Power class of the MS .....                                                                                | 4225        |
| A3.2.1.4 Channel modes supported.....                                                                               | 4225        |
| A3.2.1.5 Teleservices supported.....                                                                                | 4226        |
| A3.2.1.6 Supplementary services supported.....                                                                      | 4226        |
| A3.2.1.7 Bearer services supported .....                                                                            | 4226        |
| A3.2.1.8 SIM removal .....                                                                                          | 4227        |
| A3.2.1.9 Classmark .....                                                                                            | 4227        |
| A3.2.1.10 Type of SIM/ME interface (ref. 3GPP TS 11.11 and 3GPP TS 11.12) .....                                     | 4227        |
| A3.2.1.11 Multislot class .....                                                                                     | 4227        |
| A3.2.2 Man machine interface .....                                                                                  | 4227        |
| A3.2.2.1 Mobile station features.....                                                                               | 4227        |
| A3.2.2.2 Short message service .....                                                                                | 4228        |
| A3.2.2.3 Supplementary services .....                                                                               | 4229        |
| A3.2.2.3.1 Call forwarding .....                                                                                    | 4229        |
| A3.2.2.3.2 Call restriction.....                                                                                    | 4229        |
| A3.2.2.3.3 Handling of (undefined) GSM supplementary services .....                                                 | 4229        |
| A3.2.3 Electrical Man Machine Interface (EMMI).....                                                                 | 4229        |

|           |                                                                                         |      |
|-----------|-----------------------------------------------------------------------------------------|------|
| A3.2.3.1  | Methods supported for activation/deactivation of EMMI.....                              | 4229 |
| A3.2.3.2  | Transmission rate supported by the ME on the EMMI.....                                  | 4230 |
| A3.2.3.3  | Layer 3 messages supported on the EMMI.....                                             | 4230 |
| A3.2.3.4  | Keystroke sequence messages .....                                                       | 4230 |
| A3.2.3.5  | Internal malfunction detected messages .....                                            | 4230 |
| A3.2.4    | Digital Audio Interface (DAI).....                                                      | 4230 |
| A3.2.5    | Characteristics related to bearer services or teleservices.....                         | 4230 |
| A3.2.5.1  | Access interface .....                                                                  | 4230 |
| A3.2.5.2  | Configuration of the MT.....                                                            | 4231 |
| A3.2.5.3  | Capability information.....                                                             | 4231 |
| A3.2.5.4  | Subaddress or DDI number.....                                                           | 4231 |
| A3.2.5.5  | User to user signalling .....                                                           | 4231 |
| A3.2.5.6  | Data call set-up and data call clearing .....                                           | 4231 |
| A3.2.5.7  | Characteristics of non-transparent data services .....                                  | 4232 |
| A3.2.5.8  | Possible ways of setting-up a call from either an external interface or internally..... | 4232 |
| A3.2.5.9  | Application layer causing automatic call termination.....                               | 4232 |
| A3.2.5.10 | Call re-establishment for MS not supporting speech .....                                | 4232 |
| A3.2.6    | International mobile station equipment identity .....                                   | 4232 |
| A3.2.7    | Receiver intermediate frequencies .....                                                 | 4232 |
| A3.2.8    | Artificial ear .....                                                                    | 4232 |

#### **Annex 4: Test SIM Parameters .....4236**

|         |                                                                           |      |
|---------|---------------------------------------------------------------------------|------|
| A4.1    | Introduction .....                                                        | 4236 |
| A4.1.1  | Definitions.....                                                          | 4236 |
| A4.1.2  | Definition of the test algorithm for authentication .....                 | 4236 |
| A4.2    | Default Parameters for the test SIM .....                                 | 4236 |
| A4.3    | Default settings for the Elementary Files (EFs).....                      | 4237 |
| A4.3.1  | EF <sub>ICCID</sub> (ICC Identification) .....                            | 4237 |
| A4.3.2  | EF <sub>LP</sub> (Language preference) .....                              | 4237 |
| A4.3.3  | EF <sub>IMSI</sub> (IMSI).....                                            | 4237 |
| A4.3.4  | EF <sub>Kc</sub> (Ciphering key Kc) .....                                 | 4237 |
| A4.3.5  | EF <sub>PLMNsel</sub> (PLMN selector).....                                | 4237 |
| A4.3.6  | EF <sub>HPLMN</sub> (HPLMN search period) .....                           | 4238 |
| A4.3.7  | EF <sub>ACMmax</sub> (ACM maximum value) .....                            | 4238 |
| A4.3.8  | EF <sub>SST</sub> (SIM service table).....                                | 4238 |
| A4.3.9  | EF <sub>ACM</sub> (Accumulated call meter).....                           | 4239 |
| A4.3.10 | EF <sub>PUCT</sub> (Price per unit and currency table) .....              | 4239 |
| A4.3.11 | EF <sub>CBMI</sub> (Cell broadcast Message Identifier Selection).....     | 4239 |
| A4.3.12 | EF <sub>BCCH</sub> (Broadcast control channels) .....                     | 4239 |
| A4.3.13 | EF <sub>ACC</sub> (Access control class) .....                            | 4240 |
| A4.3.14 | EF <sub>FPLMN</sub> (Forbidden PLMNs) .....                               | 4240 |
| A4.3.15 | EF <sub>LOCI</sub> (Location information).....                            | 4240 |
| A4.3.16 | EF <sub>AD</sub> (Administrative data) .....                              | 4241 |
| A4.3.17 | EF <sub>Phase</sub> (Phase identification) .....                          | 4241 |
| A4.3.18 | EF <sub>ADN</sub> (Abbreviated dialling numbers) .....                    | 4241 |
| A4.3.19 | EF <sub>FDN</sub> (Fixed dialling numbers) .....                          | 4241 |
| A4.3.20 | EF <sub>SMS</sub> (Short messages).....                                   | 4241 |
| A4.3.21 | EF <sub>CCP</sub> (Capability configuration parameters) .....             | 4241 |
| A4.3.22 | EF <sub>MSISDN</sub> (MSISDN).....                                        | 4241 |
| A4.3.23 | EF <sub>SMSp</sub> (Short message service parameters) .....               | 4242 |
| A4.3.24 | EF <sub>SMSs</sub> (SMS status).....                                      | 4242 |
| A4.3.25 | EF <sub>EXT1</sub> (Extension 1) .....                                    | 4242 |
| A4.3.26 | EF <sub>EXT2</sub> (Extension 2) .....                                    | 4242 |
| A4.3.27 | EF <sub>VGCS</sub> (Voice Group Call Service) .....                       | 4242 |
| A4.3.28 | EF <sub>VGCSs</sub> (Voice Group Call Service Status) .....               | 4243 |
| A4.3.29 | EF <sub>VBS</sub> (Voice Broadcast Service) .....                         | 4243 |
| A4.3.30 | EF <sub>VBSs</sub> (Voice Broadcast Service Status).....                  | 4244 |
| A4.3.31 | EF <sub>eMLPP</sub> (enhanced Multi Level Pre-emption and Priority) ..... | 4244 |

|                                                                           |                                                                            |             |
|---------------------------------------------------------------------------|----------------------------------------------------------------------------|-------------|
| A4.3.32                                                                   | EF <sup>AAeM</sup> (Automatic Answer for eMLPP Service)                    | 4245        |
| A4.3.33                                                                   | EF <sup>KcGPRS</sup> (GPRS Ciphering key KcGPRS)                           | 4245        |
| A4.3.34                                                                   | EF <sup>LOCIGPRS</sup> (GPRS location information)                         | 4245        |
| <b>Annex 5: Test equipment</b>                                            |                                                                            | <b>4246</b> |
| A5.1                                                                      | Introduction                                                               | 4246        |
| A5.1.1                                                                    | General                                                                    | 4246        |
| A5.1.2                                                                    | Test equipment terms                                                       | 4246        |
| A5.1.3                                                                    | Confidence level                                                           | 4246        |
| A5.2                                                                      | Standard test signals                                                      | 4247        |
| A5.3                                                                      | SS functional requirements                                                 | 4247        |
| A5.3.1                                                                    | Level setting range                                                        | 4247        |
| A5.3.2                                                                    | Level Measurement / operation range                                        | 4247        |
| A5.3.3                                                                    | MS power supply interface                                                  | 4247        |
| A5.3.4                                                                    | MS antenna interface                                                       | 4248        |
| A5.3.4.1                                                                  | Uplink receiver error                                                      | 4248        |
| A5.3.4.2                                                                  | Power and Power versus time measurements                                   | 4248        |
| A5.3.4.3                                                                  | Wideband selective power measurement                                       | 4251        |
| A5.3.4.4                                                                  | Inband selective power measurements                                        | 4251        |
| A5.3.4.5                                                                  | Modulation accuracy and frequency error measurements                       | 4252        |
| A5.3.4.6                                                                  | RF delay measurements relative to nominal times                            | 4252        |
| A5.3.4.7                                                                  | The wanted signal or traffic channel of serving cell                       | 4252        |
| A5.3.4.8                                                                  | The first interfering signal or traffic channel of the first adjacent cell | 4254        |
| A5.3.4.9                                                                  | The second interfering signal                                              | 4255        |
| A5.3.4.10                                                                 | BCCH carriers of serving and adjacent cells                                | 4255        |
| A5.3.4.11                                                                 | The wide frequency range signal                                            | 4256        |
| A5.3.4.12                                                                 | The multipath fading function                                              | 4257        |
| A5.3.5                                                                    | MS audio interface and DAI                                                 | 4257        |
| A5.3.5.1                                                                  | General uncertainties                                                      | 4257        |
| A5.3.5.2                                                                  | Analogue single test tone                                                  | 4257        |
| A5.3.5.3                                                                  | Delay measurement between Um and DAI                                       | 4257        |
| A5.4                                                                      | SIM simulator functional requirements                                      | 4258        |
| A5.4.1                                                                    | General                                                                    | 4258        |
| A5.4.2                                                                    | Contacts C1, C2, C6, C7                                                    | 4258        |
| A5.4.2.1                                                                  | Default measurement / setting uncertainties                                | 4258        |
| A5.4.2.2                                                                  | Contact C1                                                                 | 4258        |

# Foreword

This Technical Specification has been produced by the 3<sup>rd</sup> Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

The present document describes the technical characteristics and methods of test for Mobile Stations (MSs), operating in the 400 MHz, 700 MHz, 850 MHz, 900 MHz, 1 800 MHz and/or 1900 MHz frequency band (GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and/or PCS 1 900) within the digital cellular telecommunications system. Definition 'all types of mobiles' includes all systems listed above (GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900).

The present document is part 1 of a multi-part deliverable covering the Digital cellular telecommunications system (GSM Phase2 and Phase 2+ Releases 1996, 1997, 1998, 1999, 3GPP Release 4 and 3GPP Release 5); Mobile Station (MS) conformance specification, as identified below:

- Part 1: Conformance specification**  
**Reference: 3GPP TS 51.010-1.**
- Part 2: Protocol Implementation Conformance Statement (PICS) proforma specification.  
Reference: 3GPP TS 51.010-2.
- Part 3: Layer 3 (L3) Abstract Test Suite (ATS).  
Reference: 3GPP TS 51.010-3.
- Part 4: SIM Application Toolkit conformance specification.  
Reference: 3GPP TS 11.10-4.

---

# 1 Scope

The present document describes the technical characteristics and methods of test for Mobile Stations (MS), for the Pan European digital cellular communications system and Personal Communication Systems (PCS) operating in the 400 MHz, 700 MHz, 850 MHz, 900 MHz, 1 800 MHz and 1 900 MHz band (GSM 400, GSM 900, DCS 1 800 and PCS 1 900), standardized by ETSI Special Mobile Group (SMG).

The present document is valid for MS implemented according to GSM Phase2 or Phase2+ R96, or R97, or R98, or R99 or 3GPP Release 4 or 3GPP Release 5.

A subset of the tests is referenced in the GSM Common Technical Regulations (CTRs) and is used for regulatory conformance testing according to the EEC procedures for Telecommunications Terminal Equipment (TTE) type approval (EC Directive 91/263/EEC; also known as the "Terminal Directive" or "Second Phase Directive"). The remaining tests can be used to verify conformance with the GSM core technical specifications for those requirements that are not considered "essential" in the sense of the EC Directive 91/263/EEC (Article 4).

The present document covers the minimum characteristics considered necessary in order to provide sufficient performance for mobile equipment and to prevent interference to other services or to other users, and to the PLMNs.

It does not necessarily include all the characteristics which may be required by a user or subscriber, nor does it necessarily represent the optimum performance achievable.

It applies to the public land mobile radio service in the GSM 400, 700 MHz, 850 MHz, GSM 900, DCS 1 800 and PCS 1 900 systems, using constant envelope modulation and operating on radio frequencies in the 400 MHz, 700 MHz, 850 MHz, 900, MHz 1 800 MHz and 1 900 MHz bands respectively with a channel separation of 200 kHz and carrying 8 full rate channels or 16 half rate channels per carrier according to the TDMA principle.

The present document is part of the GSM-series of technical specifications. The present document neither replaces any of the other GSM technical specifications or GSM related ETSs or ENs, nor is it created to provide full understanding of (or parts of) the GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 systems. The present document lists the requirements, and provides the methods of test for testing a MS for conformance to the GSM standard.

For a full description of the system, reference should be made to all the GSM technical specifications or GSM related ETSs or ENs. Clause 2 provides a complete list of the GSM technical specifications, GSM related ETSs, ENs, and ETRs, on which this conformance test specifications is based.

The present document applies to the unit which includes the hardware to establish a connection across the radio interface.

If there is a difference between this conformance document, and any other GSM technical specification or GSM related ETS or EN, or 3GPP TS, then the other GSM technical specification or GSM related ETS or EN or 3GPP TS shall prevail.

---

# 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication and/or edition number or version number) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the relevant Release*.
  - For a GSM Phase 2+ Release 5 MS, references to GSM documents are to version 5.x.y, when available.
  - For a GSM Phase 2+ Release 4 MS, references to GSM documents are to version 4.x.y, when available.

- For a GSM Phase 2+ Release 1999 MS, references to GSM documents are to version 8.x.y (for 01.-series to 12.-series) or (3.x.y for 21.-series to 35.-series), when available.
- For a GSM Phase 2+ Release 1998 MS, references to GSM documents are to version 7.x.y, when available.
- For a GSM Phase 2+ Release 1997 MS, references to GSM documents are to version 6.x.y, when available.
- For a GSM Phase 2+ Release 1996 MS, references to GSM documents are to version 5.x.y, when available.
- For a GSM Phase 2 MS, references to GSM documents are to version 4.x.y.

NOTE: References to 3GPP Technical Specifications and Technical Reports throughout the present document shall be interpreted according to the Release shown in the formal reference in this clause, based upon the Release of the implementation under test.

EXAMPLE 1: References for a Ph2 MS shall be interpreted as:

[1] 3GPP TS 01.04 Ph2

[2] 3GPP TS 02.02 Ph2

etc.

EXAMPLE 2: References for a Rel-4 MS shall be interpreted as:

[1] 3GPP TS 21.905 Rel-4

[2] 3GPP TS 22.002 Rel-4

etc.

---

## 3 Definitions, conventions and applicability

For the purposes of the present document, the abbreviations and acronyms given in 3GPP TS 01.04 apply.

### 3.1 Mobile station definition and configurations

In the present document, a MS can be:

- a vehicle mounted station;
- a portable station;
- a handheld station;
- a vehicle mounted/portable station;
- a vehicle mounted/handheld station.

A MS is the complete equipment configuration which may take part in a communication. However, this may not be the MS as it is offered to a test house for conformance testing.

In general, the MS, as it will be presented to a test house for conformance testing, is the station without all the additional Terminal Equipment (TE). Such a piece of hardware is also called a Mobile Termination (MT), but in the present document, the expression MS is used for any form of MS hardware as it is offered to the test house.

**Figure 3-1**

During the tests, the interfaces of the MT shall be connected to a System Simulator (SS), which will also emulate the TE. For some tests, it may be necessary to establish a pre-configured setup of the MS.

**EXAMPLE:** For reception of automatic fax group 3 to a fax machine on the R-interface, the MS needs configuration information about the presence of such a machine on that interface.

As an alternative, the TE may be physically integrated.

For a more detailed description of MS-configurations, see 3GPP TS 02.06.

## 3.2 Applicability

### 3.2.1 Applicability of this specification

#### 3.2.1.1 MS equipped with a connector

If a MS is equipped with a connector, to connect terminal equipment on an S or R reference point as defined in 3GPP TS 04.02, then testing of the MS may include testing of appropriate functioning to and from this connector.

The present document does not apply to TE which is to be connected to that connector, even if it is delivered with the MS.

#### 3.2.1.2 GPRS

Several important tests are missing in the present document for the following types of GPRS MS:

- Type 2 MS [3GPP TS 05.02].
- MS with 3 or more TX-slots (included in the test cases are multislot classes 1, 2, 3, 4, 5, 6, 8, 9, 10, 19 and 24) [3GPP TS 05.02].
- GPRS only MS.
- Mobiles that can operate in class A [3GPP TS 03.60].
- Mobiles that can operate in class B in Network mode III [3GPP TS 03.60].
- Optional GPRS features.

### 3.2.2 Applicability of the individual tests

This information has been moved to 3GPP TS 51.010-2, annex B.

### 3.2.3 Applicability to terminal equipment

If a MS is delivered for conformance testing, and it contains physically integrated TE, then the present document applies to the complete MS including that TE.

The present document also applies to separate TE that is delivered for conformance testing with the MS. The MS is then tested as an MT0. In that case, the specific TE with which the MS is tested is documented in the test report.

### 3.3 Definitions

For the purposes of the present document, the following terms and definitions apply:

**idle updated:** MS is defined to be "idle updated" if the following three conditions are fulfilled:

- its update status is U1 UPDATED (see 3GPP TS 04.08 / 3GPP TS 24.008);
- it is in the MM state MM-IDLE (see 3GPP TS 04.08 / 3GPP TS 24.008);
- it is in the RR idle mode (see 3GPP TS 04.08 / 3GPP TS 44.018).

**idle not updated:** MS is defined to be "idle not updated" if the following three conditions are fulfilled:

- its update status is U2 NOT UPDATED (see 3GPP TS 04.08 / 3GPP TS 24.008);
- it is in the MM state MM-IDLE (see 3GPP TS 04.08 / 3GPP TS 24.008);
- it is in the RR idle mode (see 3GPP TS 04.08 / 3GPP TS 44.018).

**arbitrary:** if for a test, a test purpose, a test group, or a test suite, which uses a certain parameter the value of that parameter has to be chosen arbitrarily in a certain set of values, this means that:

- for each value in the set the MS is required to fulfil the requirements of the test, test purpose, test group, or test suite, but that
- the test, test purpose, test group, or test suite is only performed for one value in the set, the selection of which is made by the test operator.

### 3.4 Conventions for mathematical notations

For the purpose of the present document mathematical terms used throughout the present document are given in this subclause.

#### 3.4.1 Mathematical signs

The "plus or minus" sign is expressed by "±".

The sign "multiplied by" is expressed by "\*".

The sign "divided by" is expressed by "/", or the common division bar.

The sign "greater than or equal to" is expressed by "≥".

The sign "less than or equal to" is expressed by "≤".

#### 3.4.2 Powers to the base 10

Powers to the base 10 are expressed by "10Ex", where x is the exponent, e.g. 10E-5, 10E6.

## 3.5 Conventions on electrical terms

### 3.5.1 Radio Frequency (RF) input signal level

In general, the RF input signal level to the MS is expressed in terms of the received field strength  $E$  in dB $\mu$ V/m (assuming a 0 dBi gain antenna). This is related to the power level  $P$  in dBm by the following formula (see 3GPP TS 05.05):

GSM 400:  $E$  (dB $\mu$ V/m) =  $P$  (dBm) + 130.5 (calculated for a frequency of 460 MHz).

GSM 700:  $E$  (dB $\mu$ V/m) =  $P$  (dBm) + 134.9 (calculated for a frequency of 770 MHz).

GSM 850:  $E$  (dB $\mu$ V/m) =  $P$  (dBm) + 135.9 (calculated for a frequency of 859 MHz).

GSM 900:  $E$  (dB $\mu$ V/m) =  $P$  (dBm) + 136,5 (calculated for a frequency of 925 MHz).

DCS 1 800:  $E$  (dB $\mu$ V/m) =  $P$  (dBm) + 142,3 (calculated for a frequency of 1 795 MHz).

PCS 1 900:  $E$  (dB $\mu$ V/m) =  $P$  (dBm) + 142,9 (calculated for a frequency of 1 920 MHz).

According to annex 1 subclause A.1.1.5.3, in all tests in which a handheld MS normally only equipped with integral antenna is the unit under test, the equivalent input signal level into a temporary test connector is determined from:

$$E_{in} = E_{req} + F;$$

where:

$E_{in}$  = input signal level to a temporary antenna connector (dB $\mu$ Vemf);

$E_{req}$  = signal level required by the test (dB $\mu$ Vemf);

$F$  = coupling factor (dB) at the respective ARFCN.

Since  $F$  has to be determined by each test house individually,  $E_{in}$  cannot be given as a figure in test procedures.

If the case of integral antenna is applicable, the input signal level is then expressed in the test procedures as:

$$E_{req} \text{ dB}\mu\text{Vemf} ( );$$

where the empty parenthesis is to be read as  $E_{in}$ .

Alternatively, the input signal level to the MS at the antenna connector can be expressed in dB $\mu$ Vemf( ). This is related to the power level  $P$  in dBm by the following formula, assuming a 50  $\Omega$  antenna connector:

$$\text{Input signal level (dB}\mu\text{Vemf( ))} = P(\text{dBm}) + 113.$$

### 3.5.2 Reference sensitivity level

In the present document the term:

Reference Sensitivity level ( )

is used to indicate that the SS establishes reference sensitivity level taking account of any losses associated with the RF connection to the MS.

### 3.5.3 Power level of fading signal

The power level of a fading signal is defined as the total signal level averaged over time.

## 3.6 Terms on test conditions

### 3.6.1 Radio test conditions

The radio propagation conditions refer to multipath propagation models of 3GPP TS 05.05.

They are expressed by typical profiles:

- static;
- rural area (RA);
- hilly terrain (HT);
- urban area (TU); or for
- equalization test (EQ).

The non-static profiles are also related to typical speeds of movement of the MS expressed in km/h, e.g. TU1,5, TU3, TU50, HT100, EQ50.

In the present document the following conventions are used.

**Table 3.2**

| Term   | for GSM 400 represents | for GSM 700 represents | For GSM 850 and GSM 900 represents | for DCS 1800 and PCS 1 900 represents |
|--------|------------------------|------------------------|------------------------------------|---------------------------------------|
| RA     | RA500                  | RA300                  | RA250                              | RA130                                 |
| HT     | HT200                  | HT120                  | HT100                              | HT100                                 |
| TUhigh | TU100                  | TU60                   | TU50                               | TU50                                  |
| TUlow  | TU6                    | TU3.6                  | TU3                                | TU1,5                                 |
| EQ     | EQ100                  | EQ60                   | EQ50                               | EQ50                                  |

For tests using ARFCN ranges the following tables 3.3 and 3.4 shall be used.

**Table 3.3**

| Term             | P-GSM 900  | DCS 1 800  | E-GSM 900  | R-GSM 900                                       |
|------------------|------------|------------|------------|-------------------------------------------------|
| Low ARFCN range  | 1 to 5     | 513 to 523 | 975 to 980 | 955 to 960 (R-GSM)<br>and<br>975 to 980 (E-GSM) |
| Mid ARFCN range  | 60 to 65   | 690 to 710 | 60 to 65   | 60 to 65                                        |
| High ARFCN range | 120 to 124 | 874 to 884 | 120 to 124 | 120 to 124                                      |

**Table 3.4**

| Term             | GSM 450    | GSM 480    | PCS 1 900  | GSM 750    | GSM 850    |
|------------------|------------|------------|------------|------------|------------|
| Low ARFCN range  | 259 to 261 | 306 to 308 | 513 to 523 | 438 to 452 | 128 to 132 |
| Mid ARFCN range  | 275 to 277 | 322 to 324 | 650 to 670 | 472 to 474 | 188 to 192 |
| High ARFCN range | 291 to 293 | 338 to 340 | 799 to 809 | 507 to 511 | 247 to 251 |

NOTE 1: For definitions of GSM 450, GSM 480, GSM 750, GSM 850, P-GSM 900, DCS 1 800, PCS 1 900, E-GSM 900 and R-GSM 900 refer to 3GPP TS 05.05.

NOTE 2: In the present document the term "GSM 900" is used to cover the primary GSM band, the extended GSM band and the railway-GSM band.

NOTE3: For R-GSM two low ARFCN ranges are defined. Unless specified otherwise for a specific test the ARFCN range defined for E-GSM900 MS is used for the testing of MS supporting the R-GSM 900 frequency range.

---

## 4 Test Equipment

### 4.1 Terms used to describe test equipment in the present document

In order to perform MS conformity testing, the use of test equipment is necessary to provide the MS with stimulus signals and to analyse and record the resulting responses.

Throughout the present document the term "System Simulator" is used to describe the suite of test equipment required to interact with the following MS interfaces:

- antenna;
- acoustic;
- data port;
- power supply;
- DAI.

The term "SIM simulator" is used to describe the test equipment required to interact with the SIM/ME interface.

A "test SIM" has the physical characteristics of a standard SIM card, (see subclause 11.11) with specific parameters defined in annex 4.

### 4.2 Functional requirements of test equipment

The present document does not include a functional description of the test equipment required to perform the tests. These requirements should be deduced from the test descriptions and the information in annex 5.

Annex 5 describes the requirements for the test equipment which cannot be derived from, and which are assumed in, the conformance test descriptions described in the present document. Specifically, stimulus setting and measurement uncertainty requirements are defined in annex 5.

---

## 5 Testing methodology in general (layers 1, 2, and 3)

### 5.1 Testing of optional functions and procedures

Any function or procedure which is optional, as indicated in the present document, may be subject to a conformance test if it is implemented in the MS.

A declaration by the apparatus supplier (PICS/PIXIT) is used to determine whether an optional function/procedure has been implemented.

### 5.2 Test interfaces and facilities

The air interface (Um reference point) provides the main test interface for the purpose of performing conformance tests.

The SS layer 2 and layer 3 shall react with the MS on the air interface in accordance with the BSS requirements in the 3GPP TS 04.xx and 05.xx series recommendations, except where the description defines otherwise.

The provision of the following special conformance test facilities is mandatory where applicable:

- support of special conformance test functions, which are enabled by the insertion of a dedicated SIM for testing (test-SIM);
- provision of a Digital Audio Interface (only for MS which support speech services, or alternate speech/data services);
- for equipment which does not have a permanent external 50  $\Omega$  connector, a temporary 50  $\Omega$  antenna connector shall be provided in accordance with the requirements of annex 1 GC7;
- for MS supporting diversity, or for any other reason having more than one RF connector (or temporary connector in the case of integral antenna MS) the manufacturer shall supply coupling and / or terminating devices so that the tests can be performed via a single transmit / receive RF connection.

Furthermore, an optional Electrical Man Machine Interface (EMMI), is specified.

These special conformance test facilities, with the exception of the temporary antenna connector, are described in subclause 36.1.

Actions at the user side of the equipment under test (i.e. at the man-machine Interface, at the S- or R- interface, at the SIM-interface, execution of higher layer processes in the case of data services) are used to invoke actions at layers 1, 2 and 3 of the Dm-channel protocol within the equipment under test.

## 5.3 Different protocol layers

The conformance tests for each layer of the Dm-channel protocol are specified separately and the test configuration(s) to be used in testing each layer is specified in the subclause of the present document relating to the conformance tests for that layer.

## 5.4 Information to be provided by the apparatus supplier

The apparatus supplier shall provide two kinds of information:

- information with respect to the protocol: Protocol Implementation Conformance Statement (PICS);
- information with respect to the man machine interface: Protocol Implementation Extra Information required for Testing (PIXIT).

The complete list of the information to be provided by the apparatus supplier is a matter between the apparatus supplier and the test house but an example of the information to be supplied is given in informative annex 3 of the present document.

## 5.5 Definitions of transmit and receive times

The time a burst is received or transmitted is defined to be in the middle of the burst, i.e. transition from Bit Number BN74 to BN75 for all bursts except random access bursts, the middle of which is the transition from BN48 to BN49.

The reception/transmission time of speech or data blocks or a signalling frame (layer 2 and layer 3) is defined to be the reception/transmission time of the last burst containing part of the block or frame.

The start of a layer 2 or 3 frame is defined to be the time of the first burst containing part of the layer 2 or 3 frame. (The time of a burst is defined to be in the middle of the burst.)

The end of a layer 2 or 3 frame is defined to be the time of the last burst containing part of the layer 2 or 3 frame.

## 6 Reference test methods

### 6.1 General

Annex 1 gives reference test conditions to be used throughout the present document, unless otherwise specified. It consists of a part on general conditions, and a part on normal and extreme test conditions.

Unless otherwise specified, tests are run using the normal test conditions.

If a test is to be run using the extreme test conditions then this is identified in the test description.

For all tests, the MS is connected to the SS. This connection, unless otherwise specified, is to the permanent antenna connector for a MS which is equipped with one, or via the temporary antenna connector defined in annex 1, GC7, for a MS with an integral antenna, and not normally having a means of connecting an external antenna.

### 6.2 Choice of frequencies in the frequency hopping mode

For the tests using frequency hopping, 38 frequencies are used over:

- GSM 850: a 21 MHz band;
- P-GSM 900: a 21 MHz band;
- E-GSM 900: a [21] MHz band;
- R-GSM 900: a 23 MHz band;
- DCS 1 800: a 75 MHz band;
- PCS 1 900: a 60 MHz band.

For the tests using frequency hopping, 14 frequencies are used over:

- GSM 450: a 6.4 MHz band;
- GSM 480: a 6.4 MHz band.

For the tests using frequency hopping, 24 frequencies are used over:

- GSM 750: a 12.4 MHz band.

**Table 6.1: Hopping frequencies**

|           | ARFCN                                                                                                                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GSM 450   | 260, 262, 265, 267, 269, 272, 274, 278, 280, 282, 285, 287, 290, 292                                                                                                                         |
| GSM 480   | 307, 309, 312, 314, 316, 319, 321, 325, 327, 329, 332, 334, 337, 339                                                                                                                         |
| GSM 750   | 444, 447, 450, 451, 455, 457, 459, 463, 464, 467, 471, 475, 479, 482, 483, 486, 489, 494, 496, 498, 502, 503, 505                                                                            |
| GSM 850   | 137, 141, 144, 145, 149, 151, 153, 157, 158, 161, 165, 169, 172, 173, 177, 179, 181, 185, 186, 189, 193, 197, 200, 201, 205, 207, 209, 213, 214, 217, 221, 225, 228, 229, 233, 235, 237, 241 |
| P-GSM900  | 10, 14, 17, 18, 22, 24, 26, 30, 31, 34, 38, 42, 45, 46, 50, 52, 54, 58, 59, 62, 66, 70, 73, 74, 78, 80, 82, 86, 87, 90, 94, 98, 101, 102, 106, 108, 110, 114                                 |
| E-GSM900  | 984, 988, 991, 992, 996, 998, 1 000, 1 004, 1 005, 1 008, 1 012, 1 016, 1 019, 1 020, 1 022, 2, 6, 10, 14, 17, 18, 22, 24, 26, 30, 31, 34, 38, 42, 45, 46, 50, 52, 54, 58, 59, 62, 64        |
| R-GSM 900 | 955, 963, 966, 967, 971, 974, 984, 988, 991, 992, 996, 998, 1 000, 1 004, 1 005, 1 008, 1 012, 1016, 1019, 1020, 1022, 2, 6, 10, 14, 17, 18, 22, 24, 26, 30, 31, 34, 36, 38, 42, 43, 45      |
| DCS 1 800 | 522, 539, 543, 556, 564, 573, 585, 590, 606, 607, 624, 627, 641, 648, 658, 669, 675, 690, 692, 709, 711, 726, 732, 743, 753, 760, 774, 777, 794, 795, 811, 816, 828, 837, 845, 858, 862, 879 |
| PCS 1 900 | 522, 539, 543, 547, 556, 564, 573, 585, 590, 596, 606, 607, 615, 624, 627, 633, 641, 648, 658, 669, 675, 684, 690, 692, 703, 709, 711, 726, 732, 743, 753, 760, 774, 777, 789, 794, 795, 803 |

NOTE: The range of frequencies available during tests under simulated fading conditions is restricted by the fading simulator bandwidth.

For the tests using frequency hopping on packet data channels a reduced number of frequencies shall be used for certain bands.

**Table 6.2: Packet Data Channel Hopping frequencies**

|           | ARFCN                                                                                    |
|-----------|------------------------------------------------------------------------------------------|
| E-GSM900  | 2, 14, 22, 30, 38, 46, 54, 62, 988, 996, 998, 1004, 1012, 1016, 1020, 1022               |
| DCS 1 800 | 522, 564, 585, 606, 625, 648, 669, 690, 709, 726, 743, 760, 777, 795, 816, 837, 858, 879 |
| PCS 1 900 | 522, 547, 573, 596, 606, 624, 641, 669, 675, 692, 711, 743, 753, 777, 789, 794, 795, 803 |

## 6.3 "Ideal" radio conditions

In the present document the following conditions are referenced by the term "ideal" radio conditions:

- No multipath conditions.

MS power control level:

|                 |                                             |                                                |
|-----------------|---------------------------------------------|------------------------------------------------|
| GSM 400:        |                                             | 7                                              |
| GSM 700:        |                                             | 7                                              |
| GSM 850:        |                                             | 7                                              |
| GSM 900:        |                                             | 7                                              |
| DCS 1 800:      |                                             | 3                                              |
| PCS 1 900       |                                             | 3                                              |
| RF level to MS: | 63 dB $\mu$ Vemf ( )                        | (not tests in subclauses 14.4, 14.5 or 18.1.4) |
| RF level to MS: | 20 dB above reference sensitivity level ( ) | (subclauses 14.4 and 14.5)                     |
| RF level to MS: | 28 dB $\mu$ Vemf ( )                        | (tests in subclause 18.1.4)                    |

## 6.4 Standard test signals

The standard test signals C0, C1, I0, I1 and I2 as used in the present document, are defined in annex 5.

## 6.5 Power (control) levels

In the present document, except where explicitly stated otherwise, if the MS is commanded to its minimum power (control) level, the SS is allowed to signal power control level 19 for GSM 400, GSM 700, GSM 850, GSM 900, and 15 for DCS 1 800 and PCS 1 900. Furthermore, except where explicitly stated otherwise, if the MS is commanded to its maximum power (control) level, and if MS\_TXPWR\_MAX\_CCH is set to the maximum output power of the MS, the SS is allowed to signal the power control level corresponding to the maximum output power for the power class of the MS. For a GSM 400 or GSM 900 power class 2 MS, the SS is allowed to signal power control level 2.

---

## 7 Implicit testing

For some GSM features conformance is not verified explicitly in the present document. This does not imply that correct functioning of these features is not essential, but that these are implicitly tested to a sufficient degree in other tests. Examples for implicitly tested features are frequency hopping and encryption.

It should be noted that for these features some aspects have to be and are explicitly tested, e.g. the ability to switch to frequency hopping or non-hopping, and the ability to change the encryption mode setting.

---

## 8 Measurement uncertainty

The measured value relating to the corresponding limit shall be used to determine whether or not a terminal equipment meets the requirement. (ETR 028 annex B).

This process is often referred to as "shared risk".

---

## 9 Format of tests

In general the following basic format for tests is used:

\*.\*.\* Title

\*.\*.\*.1 Definition and applicability

These subclauses provides, if necessary, a definition of the feature/function being tested and the applicability of the test to different MS (e.g. speech only, data only etc.).

\*.\*.\*.2 Conformance requirement

This subclause details the core specification requirements being tested and includes any necessary core specification references.

\*.\*.\*.3 Test purpose

This subclause details the purpose of the test.

\*.\*.\*.4 Method of test

\*.\*.\*.4.1 Initial conditions

If present this subclause defines the initial conditions to be established before running the test.

\*.\*.\*.4.2 Procedure

This subclause details the test procedure.

\*.\*.\*.5 Test requirements

This subclause details the conditions to be met for successful completion of the test.

[However for the Layer 3 tests, in general, a slightly modified format, as described below, is used:

\*.\*.\* Title

\*.\*.\*.1 Conformance requirement

References

\*.\*.\*.2 Test purpose

\*.\*.\*.3 Method of test

Initial conditions

Related PICS/PIXIT statement

Foreseen final state of the MS

Test Procedure

Maximum duration of the test

Expected sequence]

## 10 Generic call set up procedures

### 10.1 Generic call set-up procedure for mobile terminating speech calls

In the test procedures described in the present document, unless otherwise stated in the test description, the Mobile Terminating Speech call set-up procedure shall be as described in this subclause.

**NOTE:** In test cases where a fading profile is required, a different and appropriate ARFCN may be selected, for instance if the fading simulator bandwidth does not allow use of the default ARFCN.

#### 10.1.1 Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

- the MS shall be operated under normal test conditions (see annex 1 TC.2.1);
- the special Test-SIM (see annex 4) shall be inserted;
- the MS is "idle, updated", with a TMSI assigned and listening to the BCCH/CCCH of the active cell.

#### 10.1.2 Definition of system information messages

The following parameters shall be coded into the system information messages. Parameters shall be coded according to 3GPP TS 04.08 / 3GPP TS 44.018.

The RACH Control Parameters IE shall be the same in SYSTEM INFORMATION TYPE 1, TYPE 2, TYPE 3 and TYPE 4 messages.

The Location Area Identification IE, Cell Selection Parameters IE, and P1 bit shall be the same in SYSTEM INFORMATION TYPE 3 and TYPE 4 messages.

##### SYSTEM INFORMATION TYPE 1

| Information Element                      | Value/remark                                             |
|------------------------------------------|----------------------------------------------------------|
| Cell channel description                 | Includes the hopping sequence ARFCNs, if hopping is used |
| RACH control parameters                  |                                                          |
| MAX RETRANS                              | Any Value                                                |
| TX-INTEGER                               | Any Value                                                |
| CELL BAR ACCESS                          | Not barred                                               |
| CALL RE-ESTABLISHMENT                    | Not Allowed                                              |
| EMERGENCY CALL                           | Allowed                                                  |
| ACCESS CONTROL CLASS<br>(0...9, 11...15) | None Barred                                              |
| S11 rest octets                          | Spare Octets                                             |

## SYSTEM INFORMATION TYPE 2

| Information Element                      | Value/remark                                                                                                                                          |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| BCCH Frequency list                      | Indicates seven surrounding cells on any ARFCN of the supported band, excluding ARFCNs in or immediately adjacent to those specified in subclause 6.2 |
| NCC permitted<br>NCC PERMITTED           | e.g. all NCCs permitted                                                                                                                               |
| RACH control parameters                  |                                                                                                                                                       |
| MAX RETRANS                              | Any Value                                                                                                                                             |
| TX-INTEGER                               | Any Value                                                                                                                                             |
| CELL BAR ACCESS                          | Not barred                                                                                                                                            |
| CALL RE-ESTABLISHMENT                    | Not Allowed                                                                                                                                           |
| EMERGENCY CALL                           | Allowed                                                                                                                                               |
| ACCESS CONTROL CLASS<br>(0...9, 11...15) | None Barred                                                                                                                                           |

## SYSTEM INFORMATION TYPE 3

| Information Element                      | Value/remark                                                        |
|------------------------------------------|---------------------------------------------------------------------|
| Cell identity                            |                                                                     |
| CI VALUE                                 | 0001 hex (not relevant)                                             |

## 10.1.3 Procedure

An MS terminating call on a TCH/FS shall be established under ideal radio conditions and with Timing advance set to 0, as follows:

| Step | Direction | Message                 | Comments                                                                                                                                                                                                                                                                                                                                                   |

#### 10.1.4 Specific message contents

PAGING REQUEST TYPE 1 (3GPP TS 04.08 / 3GPP TS 44.018, subclause 9.1.22) to the MS

| Information Element    | Value/remark           |
|------------------------|------------------------|
| Protocol Discriminator | RR                     |
| Skip Indicator         | 0000                   |
| Message Type           |                        |
| Page Mode              | Normal Paging          |
| Channel Needed         | spare, any channel     |
| Mobile Identity 1      |                        |
| Odd/even no of digits  | As applicable for TMSI |
| Type of Identity       | TMSI                   |
| Identity digits        | As applicable          |
| Mobile Identity 2      | Omitted                |
| P1 rest octets         | Spare octets           |

IMMEDIATE ASSIGNMENT (3GPP TS 04.08 / 3GPP TS 44.018, subclause 9.1.18) to the MS

| Information Element    | Value/remark            |
|------------------------|-------------------------|
| Protocol Discriminator | RR                      |
| Skip Indicator         | 0000                    |
| Message Type           |                         |
| Page Mode              | Normal                  |
| Channel Description    |                         |
| Channel Type           | SDCCH/SACCH 1(4)        |
| Time slot number       | zero                    |
| Training seq. code     | same as BCCH            |
| Hopping                | No                      |
| ARFCN                  | ARFCN of the BCCH       |
| Random Reference       |                         |
| Random access info     | As in CHAN REQ          |
| N51, N32, N26          | As applicable           |
| Timing Advance         | 0                       |
| Mobile allocation      | length 0 due to hopping |
| IA rest octets         | Spare octets            |

AUTHENTICATION REQUEST (3GPP TS 04.08 / 3GPP TS 24.008, subclause 9.2.2) to the MS

| Information Element       | Value/remark |
|---------------------------|--------------|
| Protocol Discriminator    | MM           |
| Skip Indicator            | 0000         |
| Message Type              |              |
| Ciphering key seq. number | Arbitrary    |
| Authent. parameter RAND   | Arbitrary    |

CIPHERING MODE COMMAND (3GPP TS 04.08 / 3GPP TS 44.018, subclause 9.1.9) to the MS

| Information Element    | Value/remark                 |
|------------------------|------------------------------|
| Protocol Discriminator | RR                           |
| Skip Indicator         | 0000                         |
| Message Type           |                              |
| Ciphering mode setting | Start ciphering              |
| Algorithm Identifier   | Supported by the MS          |
| Cipher Response        | IMEISV shall not be included |

SETUP (3GPP TS 04.08 / 3GPP TS 24.008, subclause 9.3.23) to the MS

| Information Element    | Value/remark                                                       |
|------------------------|--------------------------------------------------------------------|
| Protocol Discriminator | CC                                                                 |
| Transaction Identifier | SS orig.                                                           |
| Message Type           |                                                                    |
| Signal                 | any non-reserved value                                             |
| Bearer capability 1    | Appropriate for the basic service selected for the test or omitted |

ASSIGNMENT COMMAND (3GPP TS 04.08 / 3GPP TS 44.018, subclause 9.1.2) to the MS

| Information Element    | Value/remark          |
|------------------------|-----------------------|
| Protocol Discriminator | RR                    |
| Skip Indicator         | 0000                  |
| Message Type           |                       |
| Channel Description    |                       |
| Channel type           | Bm + ACCHs            |
| Time slot number       | Arbitrary             |
| Training seq. code     | Default               |
| Hopping                | No                    |
| ARFCN                  | Default               |
| Power level            | Power control level 7 |
| Channel mode           | Speech full rate      |

CONNECT ACKNOWLEDGE (3GPP TS 04.08 / 3GPP TS 24.008, subclause 9.3.6) to the MS

| Information Element    | Value/remark |
|------------------------|--------------|

## 10.2 Generic call set-up procedure for mobile originating speech calls

In the test procedures described in the present document, unless otherwise stated in the test description, the Mobile Originating Speech (MOC) call set-up procedure shall be as described in this subclause.

NOTE: In test cases where a fading profile is required, a different and appropriate ARFCN may be selected, for instance if the fading simulator bandwidth does not allow use of the default ARFCN.

## 10.2.1 Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

- the MS shall be operated under normal test conditions (see annex 1 TC.2.1);
- the special Test-SIM (see annex 4) shall be inserted;
- the MS is "idle, updated", with a TMSI assigned and listening to the BCCH/CCCH of the active cell.

## 10.2.2 Definition of system information messages

See subclause 10.1.2.

## 10.2.3 Procedure

An MS originating call on a TCH/FS shall be established under ideal radio conditions and with Timing advance set to 0, as follows:

| Step | Direction | Message                 | Comments                                                                        |
|------|-----------|-------------------------|---------------------------------------------------------------------------------|
| 1    | MS        |                         | "called number" entered                                                         |
| 2    | MS -> SS  | CHANNEL REQUEST         | Establishment cause indicates "originating call, NECI <> 1"                     |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT    |                                                                                 |
| 4    | MS -> SS  | CM SERVICE REQUEST      | Message is contained in SABM                                                    |
| 5    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                 |
| 6    | MS -> SS  | AUTHENTICATION RESPONSE | SRES specifies correct value                                                    |
| 7    | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message                                 |
| 8    | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered       |
| 9    | SS        |                         | SS starts ciphering                                                             |
| 10   | MS -> SS  | SETUP                   |                                                                                 |
| 11   | SS -> MS  | CALL PROCEEDING         |                                                                                 |
| 12   | SS -> MS  | ALERTING                |                                                                                 |
| 13   | MS        |                         | An alerting indication as defined in an PICS/PIXIT statement is given by the MS |
| 14   | SS -> MS  | ASSIGNMENT COMMAND      |                                                                                 |
| 15   | MS -> SS  | ASSIGNMENT COMPLETE     |                                                                                 |
| 16   | SS -> MS  | CONNECT                 |                                                                                 |
| 17   | MS -> SS  | CONNECT ACKNOWLEDGE     |                                                                                 |
| 18   | MS        |                         | The TCH is through connected in both directions                                 |

## 10.2.4 Specific message contents

IMMEDIATE ASSIGNMENT (3GPP TS 04.08 / 3GPP TS 44.018, subclause 9.1.18) to the MS

| Information Element    | Value/remark            |
|------------------------|-------------------------|
| Protocol Discriminator | RR                      |
| Skip Indicator         | 0000                    |
| Message Type           |                         |
| Page Mode              | Normal                  |
| Channel Description    |                         |
| Channel Type           | SDCCH/SACCH 1(4)        |
| Time slot number       | zero                    |
| Training seq. code     | same as BCCH            |
| Hopping                | No                      |
| ARFCN                  | ARFCN of the BCCH       |
| Random Reference       |                         |
| Random access info     | As in CHAN REQ          |
| N51, N32, N26          | As applicable           |
| Timing Advance         | 0                       |
| Mobile allocation      | length 0 due to hopping |
| IA rest octets         | Spare octets            |

AUTHENTICATION REQUEST (3GPP TS 04.08 / 3GPP TS 24.008, subclause 9.2.2) to the MS

| Information Element       | Value/remark |
|---------------------------|--------------|
| Protocol Discriminator    | MM           |
| Skip Indicator            | 0000         |
| Message Type              |              |
| Ciphering key seq. number | Arbitrary    |
| Authent. parameter RAND   | Arbitrary    |

CIPHERING MODE COMMAND (3GPP TS 04.08 / 3GPP TS 44.018, subclause 9.1.9) to the MS

| Information Element    | Value/remark                 |
|------------------------|------------------------------|
| Protocol Discriminator | RR                           |
| Skip Indicator         | 0000                         |
| Message Type           |                              |
| Ciphering mode setting | Start ciphering              |
| Algorithm Identifier   | Supported by the MS          |
| Cipher Response        | IMEISV shall not be included |

CALL PROCEEDING (3GPP TS 04.08 / 3GPP TS 24.008, subclause 9.3.3) to the MS

| Information Element    | Value/remark          |
|------------------------|-----------------------|
| Protocol Discriminator | CC                    |
| Transaction Identifier | As derived from SETUP |
| Message Type           |                       |
| Repeat Indicator       | Omitted               |
| Bearer Capability 1    | Omitted               |
| Bearer Capability 2    | Omitted               |
| Facility               | Omitted               |
| Progress Indicator     | Omitted               |

ALERTING (3GPP TS 04.08 / 3GPP TS 24.008, subclause 9.3.1) to the MS

| Information Element    | Value/remark          |
|------------------------|-----------------------|
| Protocol Discriminator | CC                    |
| Transaction Identifier | As derived from SETUP |
| Message Type           |                       |
| Facility               | Omitted               |
| Progress Indicator     | Omitted               |
| User-user              | Omitted               |

ASSIGNMENT COMMAND (3GPP TS 04.08 / 3GPP TS 44.018, subclause 9.1.2) to the MS

| Information Element    | Value/remark          |
|------------------------|-----------------------|
| Protocol Discriminator | RR                    |
| Skip Indicator         | 0000                  |
| Message Type           |                       |
| Channel Description    |                       |
| Channel type           | Bm + ACCHs            |
| Time slot number       | Arbitrary             |
| Training seq. code     | Default               |
| Hopping                | No                    |
| ARFCN                  | Default               |
| Power level            | Power control level 7 |
| Channel mode           | Speech full rate      |

CONNECT (3GPP TS 04.08 / 3GPP TS 24.008, subclause 9.3.5) to the MS

| Information Element    | Value/remark          |
|------------------------|-----------------------|
| Protocol Discriminator | CC                    |
| Transaction Identifier | As derived from SETUP |

| Connected Subaddress   | Omitted               |
| User-user              | Omitted               |

## 10.3 Generic call set-up procedure for mobile terminating data calls

In the test procedures described in the present document, unless otherwise stated in the test description, the Mobile Terminating Data call set-up procedure shall be as described in this subclause.

NOTE: In test cases where a fading profile is required, a different and appropriate ARFCN may be selected, for instance if the fading simulator bandwidth does not allow use of the default ARFCN.

### 10.3.1 Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

- the MS shall be operated under normal test conditions (see annex 1 TC.2.1).
- the special Test-SIM (see annex 4) shall be inserted;
- the MS is "idle, updated", with a TMSI assigned and listening to the BCCH/CCCH of the active cell.

## 10.3.2 Definition of system information messages

See subclause 10.1.2.

## 10.3.3 Procedure

An MS terminating call on a TCH shall be established under ideal radio conditions and with Timing advance set to 0, as follows:

| Step | Direction | Message                 | Comments                                                                                                                          |
|------|-----------|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1   | Sent on the correct paging subchannel                                                                                             |
| 2    | MS -> SS  | CHANNEL REQUEST         | Establishment cause indicates "answer to paging"                                                                                  |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT    |                                                                                                                                   |
| 4    | MS -> SS  | PAGING RESPONSE         | Message is contained in SABM                                                                                                      |
| 5    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                                                                   |
| 6    | MS -> SS  | AUTHENTICATION RESPONSE | SRES specifies correct value                                                                                                      |
| 7    | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message                                                                                   |
| 8    | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered                                                         |
| 9    | SS        |                         | SS starts ciphering                                                                                                               |
| 10   | SS -> MS  | SETUP                   | A call is set up according to the required characteristics of the test procedure. Bearer Capability and Signal IEs included       |
| 11   | MS -> SS  | CALL CONFIRMED          | Bearer Capability shall or shall not be included according to the rules given in 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 07.01 |
| A12  | MS -> SS  | CONNECT                 |                                                                                                                                   |
| B12  | MS -> SS  | ALERTING                |                                                                                                                                   |
| B13  | MS        |                         | An alerting indication as defined in a PICS/PIXIT statement given by the MS                                                       |
| B14  | MS        |                         | The MS is made to accept the call in a way described in a PICS/PIXIT statement                                                    |
| B15  | MS -> SS  | CONNECT                 |                                                                                                                                   |
| 16   | SS -> MS  | ASSIGNMENT COMMAND      |                                                                                                                                   |
| 17   | MS -> SS  | ASSIGNMENT COMPLETE     |                                                                                                                                   |
| 18   | MS        |                         | The TCH is through connected in both directions                                                                                   |
| 19   | SS -> MS  | CONNECT ACKNOWLEDGE     |                                                                                                                                   |

## 10.3.4 Specific message contents

PAGING REQUEST TYPE 1 (3GPP TS 04.08 / 3GPP TS 44.018, subclause 9.1.22) to the MS

## 10.4 Generic call set-up procedure for mobile originating data calls

In the test procedures described in the present document, unless otherwise stated in the test description, the Mobile Originating Data call set-up procedure shall be as described in this subclause.

NOTE: In test cases where a fading profile is required, a different and appropriate ARFCN may be selected, for instance if the fading simulator bandwidth does not allow use of the default ARFCN.

### 10.4.1 Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

- the MS shall be operated under normal test conditions (see annex 1 TC.2.1);
- the special Test-SIM (see annex 4) shall be inserted;
- the MS is "idle, updated", with a TMSI assigned and listening to the BCCH/CCCH of the active cell.

### 10.4.2 Definition of system information messages

See subclause 10.1.2.

### 10.4.3 Procedure

An MS originating call on a TCH shall be established under ideal radio conditions and with Timing advance set to 0, as follows:

| Step | Direction | Message                 | Comments                                                                        |
|------|-----------|-------------------------|---------------------------------------------------------------------------------|
| 1    | MS        |                         | "called number" entered                                                         |
| 2    | MS -> SS  | CHANNEL REQUEST         | Establishment cause indicates "originating call, NECI <> 1"                     |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT    |                                                                                 |
| 4    | MS -> SS  | CM SERVICE REQUEST      | Message is contained in SABM                                                    |
| 5    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                 |
| 6    | MS -> SS  | AUTHENTICATION RESPONSE | SRES specifies correct value                                                    |
| 7    | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message                                 |
| 8    | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered       |
| 9    | SS        |                         | SS starts ciphering                                                             |
| 10   | MS -> SS  | SETUP                   |                                                                                 |
| 11   | SS -> MS  | CALL PROCEEDING         |                                                                                 |
| 12   | SS -> MS  | ALERTING                |                                                                                 |
| 13   | MS        |                         | An alerting indication as defined in an PICS/PIXIT statement is given by the MS |
| 14   | SS -> MS  | ASSIGNMENT COMMAND      |                                                                                 |
| 15   | MS -> SS  | ASSIGNMENT COMPLETE     |                                                                                 |
| 16   | SS -> MS  | CONNECT                 |                                                                                 |
| 17   | MS -> SS  | CONNECT ACKNOWLEDGE     |                                                                                 |
| 18   | MS        |                         | The TCH is through connected in both directions                                 |

| User-user              | Omitted               |

## 10.5 Generic call set-up procedure for mobile terminating multislot configuration, minimum number of timeslots allocated

In the test procedures described in the present document, unless otherwise stated in the test description, the Mobile Terminating multislot connection set-up procedure shall be as described in this subclause.

NOTE: In test cases where a fading profile is required, a different and appropriate ARFCN may be selected, for instance if the fading simulator bandwidth does not allow use of the default ARFCN.

### 10.5.1 Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

- the MS shall be operated under normal test conditions (see annex 1 TC.2.1);
- the special Test-SIM (see annex 4) shall be inserted;
- the MS is "idle, updated", with a TMSI assigned and listening to the BCCH/CCCH of the active cell.

## 10.5.2 Definition of system information messages

See subclause 10.1.2.

## 10.5.3 Procedure

An MS terminating multislot connection shall be established under ideal radio conditions and with Timing advance set to 0, as follows:

| Step | Direction | Message                 | Comments                                                                                                                                    |
|------|-----------|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | SS -> MS  | PAGING REQUEST TYPE 1   | Sent on the correct paging subchannel                                                                                                       |
| 2    | MS -> SS  | CHANNEL REQUEST         | Establishment cause indicates "answer to paging"                                                                                            |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT    |                                                                                                                                             |
| 4    | MS -> SS  | PAGING RESPONSE         | Message is contained in SABM                                                                                                                |
| 5    | MS -> SS  | CLASSMARK CHANGE        | Multislot class                                                                                                                             |
| 6    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                                                                             |
| 7    | MS -> SS  | AUTHENTICATION RESPONSE | SRES specifies correct value                                                                                                                |
| 8    | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message                                                                                             |
| 9    | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered                                                                   |
| 10   | SS        |                         | SS starts ciphering                                                                                                                         |
| 11   | SS -> MS  | SETUP                   | A multislot connection is set up according to the required characteristics of the test procedure. Bearer Capability and Signal IEs included |
| 12   | MS -> SS  | CALL CONFIRMED          | Bearer Capability shall or shall not be included according to the rules given in 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 07.01           |
| A12  | MS -> SS  | CONNECT                 |                                                                                                                                             |
| B13  | MS -> SS  | ALERTING                |                                                                                                                                             |
| B14  | MS        |                         | An alerting indication as defined in a PICS/PIXIT statement given by the MS                                                                 |
| B15  | MS        |                         | The MS is made to accept the call in a way described in a PICS/PIXIT statement                                                              |
| B16  | MS -> SS  | CONNECT                 |                                                                                                                                             |
| 17   | SS -> MS  | ASSIGNMENT COMMAND      | In multislot allocation only one timeslot is allocated.                                                                                     |
| 18   | MS -> SS  | ASSIGNMENT COMPLETE     | Sent on the TCH/Sm channel                                                                                                                  |
| 19   | MS        |                         | The TCH(s) is through connected in both directions                                                                                          |
| 20   | SS -> MS  | CONNECT ACKNOWLEDGE     |                                                                                                                                             |

## 10.6 Generic call set-up procedure for mobile originating multislot configuration, minimum number of timeslots allocated

In the test procedures described in the present document, unless otherwise stated in the test description, the Mobile Originating multislot connection set-up procedure shall be as described in this subclause.

NOTE: In test cases where a fading profile is required, a different and appropriate ARFCN may be selected, for instance if the fading simulator bandwidth does not allow use of the default ARFCN.

### 10.6.1 Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

- the MS shall be operated under normal test conditions (see annex 1 TC.2.1);
- the special Test-SIM (see annex 4) shall be inserted;
- the MS is "idle, updated", with a TMSI assigned and listening to the BCCH/CCCH of the active cell.

## 10.6.2 Definition of system information messages

See subclause 10.1.2.

## 10.6.3 Procedure

An MS originating multislot connection shall be established under ideal radio conditions and with Timing advance set to 0, as follows:

| Step | Direction | Message                 | Comments                                                                                          |
|------|-----------|-------------------------|---------------------------------------------------------------------------------------------------|
| 1    | MS        |                         | "called number" entered                                                                           |
| 2    | MS -> SS  | CHANNEL REQUEST         | Establishment cause indicates "originating call, NECI <> 1"                                       |
| 3    | SS -> MS  | IMMEDIATE ASSIGNMENT    |                                                                                                   |
| 4    | MS -> SS  | CM SERVICE REQUEST      | Message is contained in SABM                                                                      |
| 5    | MS -> SS  | CLASSMARK CHANGE        | Multislot class                                                                                   |
| 6    | SS -> MS  | AUTHENTICATION REQUEST  |                                                                                                   |
| 7    | MS -> SS  | AUTHENTICATION RESPONSE | SRES specifies correct value                                                                      |
| 8    | SS -> MS  | CIPHERING MODE COMMAND  | SS starts deciphering after sending the message                                                   |
| 9    | MS -> SS  | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered                         |
| 10   | SS        |                         | SS starts ciphering                                                                               |
| 11   | MS -> SS  | SETUP                   | A multislot connection is set up according to the required characteristics of the test procedure. |
| 12   | SS -> MS  | CALL PROCEEDING         |                                                                                                   |
| 13   | SS -> MS  | ALERTING                |                                                                                                   |
| 14   | MS        |                         | An alerting indication as defined in an PICS/PIXIT statement is given by the MS                   |
| 15   | SS -> MS  | ASSIGNMENT COMMAND      | In multislot allocation only one timeslot is allocated.                                           |
| 16   | MS -> SS  | ASSIGNMENT COMPLETE     | Sent on TCH/Sm channel.                                                                           |
| 17   | SS -> MS  | CONNECT                 |                                                                                                   |
| 18   | MS -> SS  | CONNECT ACKNOWLEDGE     |                                                                                                   |
| 19   | MS        |                         | The TCH(s) is through connected in both directions                                                |

## 10.7 Generic procedure for GPRS downlink data transfer

In the test procedures described in the present document, unless otherwise stated in the test description, the Mobile Terminating Data transfer procedure shall be as described in this subclause.

NOTE: In test cases where a fading profile is required, a different and appropriate ARFCN may be selected, for instance if the fading simulator bandwidth does not allow use of the default ARFCN.

### 10.7.1 Initial conditions

System Simulator:

- 1 cell, default parameters as specified in clause 40;
- ideal radio conditions and Timing advance set to 0.

Mobile Station:

- the MS shall be operated under normal test conditions (see annex 1 TC.2.1);
- the special Test-SIM (see annex 4) shall be inserted;
- the MS is GPRS attached with a P-TMSI allocated and the test PDP context2 activated.

### 10.7.2 Definition of system information messages

See clause 40.

### 10.7.3 Procedure

| Step | Direction | Message                        | Comments                                                                                                                                                                                                                      |
|------|-----------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    |           |                                | Start an application in the MS that continually reads all received data                                                                                                                                                       |
| 2    | SS -> MS  | PACKET PAGING REQUEST          | Contains P-TMSI of the MS. Sent on PPCH.                                                                                                                                                                                      |
| 3    | MS -> SS  | PACKET CHANNEL REQUEST         | ACCESS TYPE = " Page Response ". Received on PRACH.                                                                                                                                                                           |
| 4    | SS -> MS  | PACKET UPLINK ASSIGNMENT       | Random Reference = pertaining to the message received in step 3. Sent on PAGCH. Single block assignment.                                                                                                                      |
| 5    | MS -> SS  | UPLINK RLC DATA BLOCK          | LLC PDU implicitly indicating paging response, containing TLLI in the RLC/MAC header. .                                                                                                                                       |
| 6    | SS -> MS  | PACKET UPLINK ACK/NACK         | Acknowledge the received RLC data block. Sent on PACCH. Poll bit in the MAC header is set to indicate a valid RRBP.                                                                                                           |
| 7    | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT | As RLC/MAC control block. Received on PACCH.                                                                                                                                                                                  |
| 8    | SS -> MS  | PACKET DOWNLINK ASSIGNMENT     | Poll bit in the MAC header is set to indicate a valid RRBP. Sent on PCCCH. TIMESLOT_ALLOCATION arbitrarily chosen but shall not exceed the multislot capabilities of the MS. Other parameters as specified in each test case. |
| 9    | MS -> SS  | PACKET CONTROL ACKNOWLEDGEMENT | Received on PACCH.                                                                                                                                                                                                            |

NOTE: The MS is always granted a USF whenever the MS is expected to send.

### 10.7.4 Specific message contents

See clause 40.

## 10.8 Generic procedure for GPRS uplink data transfer

In the test procedures described in the present document, unless otherwise stated in the test description, the Mobile Originated Data transfer procedure shall be as described in this subclause.

NOTE: In test cases where a fading profile is required, a different and appropriate ARFCN may be selected, for instance if the fading simulator bandwidth does not allow use of the default ARFCN.

### 10.8.1 Initial conditions

System Simulator:

- 1 cell, default parameters as specified in clause 40;
- ideal radio conditions and Timing advance set to 0.

Mobile Station:

- the MS shall be operated under normal test conditions (see annex 1 TC.2.1);
- the special Test-SIM (see annex 4) shall be inserted;
- the MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

### 10.8.2 Definition of system information messages

See clause 40.

### 10.8.3 Procedure

| Step | Direction | Message                             | Comments                                                                                                                                                                    |
|------|-----------|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    |           |                                     | Start an application in the MS that continually sends data                                                                                                                  |
| 2    | MS -> SS  | PACKET CHANNEL REQUEST              | Received on PRACH.                                                                                                                                                          |
| 3    | SS -> MS  | PACKET UPLINK ASSIGNMENT            | Single block assignment, to order the MS to follow the two phase access procedure. Sent on PAGCH.                                                                           |
| 4    | MS -> SS  | PACKET RESOURCE REQUEST             | Two phase access procedure. Received on the single block assigned in step 3.                                                                                                |
| 5    | SS -> MS  | PACKET UPLINK ASSIGNMENT            | Sent on PACCH of the same PDCH assigned in step 2. TIMESLOT_ALLOCATION arbitrarily chosen but shall not exceed the multislot capabilities of the MS. Open ended assignment. |
| 6    | SS -> MS  | PACKET DOWNLINK DUMMY CONTROL BLOCK | Sent on PACCH containing USF assigned to the MS.                                                                                                                            |

NOTE: The MS is always granted a USF whenever the MS is expected to send.

| Dynamic allocation                 | 01                                                                                                                                           |
| - Extended Dynamic Allocation      | 0 ( Dynamic allocation)                                                                                                                      |
| - {0 1<P0><PR_MODE>}               | 0                                                                                                                                            |
| - USF_GRANULARITY                  | 0, one block                                                                                                                                 |
| - {0 1<UPLINK_TFI_ASSIGNMENT>}     | 1 ( uplink TFI assignment)                                                                                                                   |
| - UPLINK_TFI_ASSIGNMENT            | Arbitrarily chosen (default 00101)                                                                                                           |
| - {0 1<RLC_DATA_BLOCKS_GRANTED>}   | 0 (no RLC_DATA_BLOCKS_GRANTED, open-ended TBF)                                                                                               |
| - {0 1<TBF_STARTING_TIME>}         | 0 (no starting time)                                                                                                                         |
| -                                  | 1 (Timeslot Allocation with Power Control Parameters)                                                                                        |
|                                    | one slot arbitrarily chosen and the following USF_TNx and GAMMA_TNx shall be corresponding to the chosen value, default timeslot 2 assigned) |
|                                    | 0.5                                                                                                                                          |
| - ALPHA                            | 0 (timeslot 0 not assigned)                                                                                                                  |
| - {0 1<USF_TN0><GAMMA_TN0>}        | 0 (timeslot 1 not assigned)                                                                                                                  |
| - {0 1<USF_TN1><GAMMA_TN1>}        | 1 (timeslot 2 assigned)                                                                                                                      |
| - {0 1<USF_TN2><GAMMA_TN2>}        | Arbitrarily chosen (default 101)                                                                                                             |
| - USF_TN2                          | For GSM 900, +9 dBm                                                                                                                          |
| - GAMMA_TN2                        | For DCS 1800, +6 dBm                                                                                                                         |
|                                    | For PCS 1 900, +6 dBm                                                                                                                        |
| - {0 1<USF_TN3><GAMMA_TN3>}        | 0 (timeslot 3 not assigned)                                                                                                                  |
| - {0 1<USF_TN4><GAMMA_TN4>}        | 0 (timeslot 4 not assigned)                                                                                                                  |
| - {0 1<USF_TN5><GAMMA_TN5>}        | 0 (timeslot 5 not assigned)                                                                                                                  |
| - {0 1<USF_TN6><GAMMA_TN6>}        | 0 (timeslot 6 not assigned)                                                                                                                  |
| - {0 1<USF_TN7><GAMMA_TN7>}        | 0 (timeslot 7 not assigned)                                                                                                                  |
| spare padding                      | Spare Padding                                                                                                                                |

See also clause 40.

## 11 General tests

### 11.1 Verification of support and non-support of services (multiple numbering scheme or ISDN)

#### 11.1.1 Mobile Terminated (MT) calls

##### 11.1.1.1 Definition and applicability

This test applies to all MS. It is repeated for all Mobile Terminated Bearer Services / Teleservices according to 3GPP TS 02.02 and 3GPP TS 02.03 except Teleservices 21, 22 and 23.

##### 11.1.1.2 Conformance requirement

1. The MS shall check the Information Elements for Bearer Capability in a received SETUP message, and if it agrees to the proposed set, it shall respond with a CALL CONFIRMED message.

3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.2.2.2; 3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.2.2.3.

2. The MS in the "Null" state, U0, ready to receive a SETUP shall reject a SETUP with Information Elements for Bearer Capability which are incompatible with the Bearer Services / Teleservices supported by the MS, and shall send a RELEASE COMPLETE message.

3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.2.2.2; 3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.2.2.3.1; 3GPP TS 07.01, subclause 8.3.1; 3GPP TS 04.08 / 3GPP TS 24.008, subclause B.3.2.

##### 11.1.1.3 Test purpose

1. To verify that the MS, for the case of the Multinumbering scheme or ISDN, accepts a SETUP message, where the Information Elements for Bearer Capability are compatible with the Bearer Services / Teleservices declared as supported by the MS, by sending a CALL CONFIRMED message.

This is verified for all Mobile Terminated Bearer Services / Teleservices declared as supported by the MS.

2. To verify that the MS in the "Null" state, U0, when receiving a SETUP message containing incompatible Information Elements for Bearer Capability will respond with a RELEASE COMPLETE message.

This is verified for all Mobile Terminated Bearer Services / Teleservices not declared as supported by the MS.

##### 11.1.1.4 Method of test

###### 11.1.1.4.1 Initial conditions

For an MS with an external interface the interface shall be setup in such a way that the MS is able to successfully receive the call for the service in question. The manufacturer shall state how this is done in a PIXIT statement. The same applies to features which must be activated by MMI before an incoming call can be accepted.

The PIXIT statement for the service in question shall be consistent with the PICS statement made by the manufacturer and will result for this tests in one or several valid BC codings as presented in subclause 11.8.

The generic call set-up procedure shall be followed up to and including the reception of the CIPHERING MODE COMPLETE message from the MS.

#### 11.1.1.4.2 Procedure

- a) For a Mobile Terminated Bearer Service / Teleservice declared as supported by the MS. The SS transmits a SETUP message.

The SETUP shall contain a single or dual BC-IE where the parameter values are arbitrarily selected among those declared as supported by the MS in PIXIT statements and corresponding to the Bearer Service / Teleservice being tested.

- b) If more than one BC-IE (or pair of) correspond to the Bearer Service / Teleservice being tested, step a) is repeated once (and only once) with another single or dual BC-IE. The BC-IE shall be chosen in such a way that as many parameters as possible are different from the previous BC-IE. In particular, if more than one value for the "Connection Element" parameter is possible, the new BC-IE shall contain a different value from the previous one for this parameter.

- c) Step a) and b) are repeated for all Bearer Services / Teleservices declared as supported by the MS.

- d) For an Mobile Terminated Bearer Service / Teleservice not declared as supported by the MS. The SS transmits SETUP. If the MS supports TS62 but not TS61, then TS61 is not tested.

The SETUP shall contain a single or dual BC-IE where the parameter values are arbitrarily selected among those defined in 3GPP TS 07.01 Annex II and corresponding to the Bearer Service / Teleservice being tested. The complete coding of the corresponding BC-IE(s) can be found in subclause 11.8.

- e) Step d) is repeated for all Bearer Services / Teleservices not declared as supported by the MS.

#### 11.1.1.5 Test requirement

- 1) After steps a), b) and c), the MS shall send a CALL CONFIRMED message. The MS may contain a single or dual BC-IE. If present these IEs are not checked.
- 2) After steps d) and e), the MS shall send a RELEASE COMPLETE message with cause value 88 - incompatible destination.

### 11.1.2 Mobile Originated (MO) calls

#### 11.1.2.1 Definition and applicability

This test applies to all MS able to initiate an MO call. It is repeated for all Mobile Originated Bearer Services / Teleservices according to 3GPP TS 02.02 and 3GPP TS 02.03 except Teleservices 21, 22 and 23, which are supported by the MS.

#### 11.1.2.2 Conformance requirement

1. The MS shall set up a call with a SETUP message containing a single or multiple BC-IE and if required by the service, a single or multiple LLC according to the actual configuration of the MS. Two bearer capabilities can be present only in the cases described in 3GPP TS 07.01.

3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.2.2.2; 3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.2.2.3.1; 3GPP TS 04.08 / 3GPP TS 24.008, subclause 9.3.2; 3GPP TS 07.01, subclause 8.3.3.

2. The Repeat Indicator Information Element shall be included in the SETUP message, when the in-call modification procedure is used.

3GPP TS 04.08 / 3GPP TS 24.008, subclause 9.3.2.

### 11.1.2.3 Test purpose

1. To verify that the MS generates a SETUP message which includes a single or multiple Bearer Capability and if required by the service, a single or multiple LLC, according to the actual configuration on the MS.

This is verified for all Mobile Originated Bearer Services / Teleservices described in 3GPP TS 07.01 and declared as supported by the MS.

2. To verify that the MS includes a correctly encoded Repeat Indicator if it includes multiple Bearer Capabilities in the SETUP message.

### 11.1.2.4 Method of test

#### 11.1.2.4.1 Initial conditions

If possible, the MS shall be configured to initiate an outgoing call with a specified BC and with the corresponding LLC when the ITC value is "unrestricted digital" in the SETUP message. The manufacturer must state how this is done in a PIXIT statement. The same applies to features which must be activated by MMI before an outgoing call can be initiated.

The PIXIT statement for the service in question shall be consistent with the PICS statement made by the manufacturer and will result for this test in one valid BC coding as presented in subclause 11.8.

#### 11.1.2.4.2 Procedure

- a) The MS shall be made to initiate a call.
- b) If the MS can be configured to send a specific BC, the test is repeated with the MS configured for all possible preferred Bearer Services and Teleservices declared as supported by the MS. The complete coding of the corresponding BC-IE(s) can be found in subclause 11.8.

### 11.1.2.5 Test requirement

The MS shall send a SETUP message, which shall contain the BC among those declared as supported by the MS. If the MS is configured to send a specific BC, the SETUP message shall contain this particular BC. The BC-IE(s) shall be set according to 3GPP TS 07.01. When an ITC value is set to "unrestricted digital" the MS shall include the corresponding LLC information element.

Where two BCs are contained in the SETUP message, it shall be checked that the combination is allowed, according to 3GPP TS 07.01 and that a Repeat Indicator is also included.

## 11.2 Verification of support of the single numbering scheme

### 11.2.1 Definition and applicability

This test applies to all MS.

### 11.2.2 Conformance requirement

1. The MS shall respond to a SETUP message containing no BC-IE with a CALL CONFIRMED message including the single or multiple Bearer Capability, according to the actual configuration of the MS. Two bearer capabilities can be present only in the cases described in 3GPP TS 07.01.

3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.2.2.2; 3GPP TS 04.08 / 3GPP TS 24.008, subclause 5.2.2.3.1; 3GPP TS 04.08 / 3GPP TS 24.008, subclause 9.3.2; 3GPP TS 07.01, subclause 8.3.3.

2. The Repeat Indicator Information Element shall be included in the CALL CONFIRMED message, when the in-call modification procedure is used, and no Bearer Capability Information Element is included in the received SETUP message.

3GPP TS 04.08 / 3GPP TS 24.008, subclause 9.3.2.

### 11.2.3 Test purpose

1. To verify that the MS, for the case of the Single Numbering Scheme, accepts a SETUP message, where the Information Elements for Bearer Capability and Lower and Higher Layer Compatibility are not present by sending a CALL CONFIRMED message, which includes the single or multiple Bearer Capabilities, according to the actual configuration on the MS.

This is verified for one Mobile Terminated Bearer Service / Teleservice described in 3GPP TS 07.01 and declared as supported by the MS.

2. To verify that the MS includes a correctly encoded Repeat Indicator if it includes multiple Bearer Capabilities in the CALL CONFIRMED message.

### 11.2.4 Method of test

#### 11.2.4.1 Initial conditions

The MS is setup to receive a call. If possible, the MS shall be configured to respond to an incoming call with a specified BC selected arbitrarily from those declared as supported by the MS, in the CALL CONFIRMED message, in reply to a SETUP message with no BC, LLC or HLC elements. The manufacturer must state how this is done in a PIXIT statement. The same applies to features which must be activated by MMI before an incoming call can be accepted.

The generic call set-up procedure shall be followed up to and including the reception of the CIPHERING MODE COMPLETE message from the MS.

The PIXIT statement for the service in question shall be consistent with the PICS statement made by the manufacturer and will result for this tests in one or several valid BC codings as presented in subclause 11.8.

#### 11.2.4.2 Procedure

The SS transmits a SETUP message with no BC, LLC or HLC elements.

### 11.2.5 Test requirement

The MS shall send a CALL CONFIRMED message, which shall contain the BC among those declared as supported by the MS. If the MS is configured to respond with a specific BC, the CALL CONFIRMED message shall contain this particular BC. The BC-IE shall be coded according to 3GPP TS 07.01.

Where two BCs are contained in the CALL CONFIRMED message, it shall be checked that the combination is allowed, according to 3GPP TS 07.01 and that a Repeat Indicator is also included.

## 11.3 Verification of non-support of services (Advice of Charge Charging (AoCC))

### 11.3.1 Definition and applicability

This test applies to MS which do **not** support AoCC.

Test procedures (a) and (b) apply to MS which support MT calls.

Test procedure (c) applies to MS which support MO calls.

Test procedure (d) applies to MS which support at least one circuit switched basic service.

## 11.3.2 Conformance requirement

1. An MS claiming to **not** support AoCC and in the outgoing call / U4 call delivered state, on receipt of a CONNECT message containing AoCC information shall acknowledge the CONNECT message but ignore and not acknowledge the AoCC information sent within the CONNECT.
2. An MS claiming to **not** support AoCC and in the outgoing call / U4 call delivered state, on receipt of a FACILITY message containing AoCC information shall ignore and not acknowledge the AoCC information contained within the FACILITY.
3. An MS claiming to **not** support AoCC and in the incoming call / U9 call confirmed state, on receipt of a FACILITY message containing AoCC information shall ignore and not acknowledge the AoCC information contained within the FACILITY.
4. An MS claiming to **not** support AoCC and in the U10 call active state, on receipt of a FACILITY message containing AoCC information shall ignore and not acknowledge the AoCC information contained within the FACILITY.

3GPP TS 03.86 subclauses 1.2, 1.3, 2.2 and 2.3; 3GPP TS 04.86 clause 2.

## 11.3.3 Test purpose

1. To verify that an MS claiming to **not** support AoCC and in the outgoing call / U4 call delivered state, on receipt of a CONNECT message containing AoCC information acknowledges the CONNECT message but ignores and does not acknowledge the AoCC information sent within the CONNECT.
2. To verify that an MS claiming to **not** support AoCC and in the outgoing call / U4 call delivered state, on receipt of a FACILITY message containing AoCC information ignores and does not acknowledge the AoCC information contained within the FACILITY.
3. To verify that an MS claiming to not support AoCC and in the incoming call / U9 call confirmed state, on receipt of a FACILITY message containing AoCC information ignores and does not acknowledge the AoCC information contained within the FACILITY.
4. To verify that an MS claiming to **not** support AoCC and in the U10 call active state, on receipt of a FACILITY message containing AoCC information ignores and does not acknowledge the AoCC information contained within the FACILITY.

## 11.3.4 Method of test

### 11.3.4.1 Initial conditions

The generic call set up procedures are followed up to and including the reception, or transmission, of the ALERTING message by the MS.

### 11.3.4.2 Procedure

- a) For an Mobile Originated call in the U4 state the SS transmits CONNECT containing AoCC information.
- b) For an Mobile Originated call in the U4 state the SS transmits FACILITY containing AoCC information.
- c) For an Mobile Terminated call in the U9 state the SS transmits a FACILITY containing AoCC information.
- d) For a call in the U10 state the SS transmits a FACILITY containing AoCC information

## 11.3.5 Test requirement

The MS shall ignore the AoCC information sent to it in the Facility information elements as part of the CONNECT/FACILITY messages and not send any AoCC information acknowledgement. It shall be checked for 15 s that the MS does not transmit any AoCC information acknowledgement after the receipt of AoCC information.

## 11.4 Verification of non-support of services (call hold)

### 11.4.1 Definition and applicability

Applicable to MS which do **not** support the Call-Hold supplementary service. This test applies only to MSs that claim to support AoCC. This test applies only to MS which support MO calls.

### 11.4.2 Conformance requirement

An MS claiming to **not** support the Call Hold supplementary service and in the U10 call active state shall, when the appropriate Call Hold MMI command is entered:

- Fail to put the first call on hold.
- Fail to place the second call.
- Optionally provide some indication to the user of an error.

3GPP TS 02.83; 3GPP TS 04.83.

### 11.4.3 Test purpose

To verify that an MS claiming to **not** support the Call Hold supplementary service and in the U10 call active state, reacts in the following manner when the appropriate call hold MMI command is entered:

- MS fails to put the first call on hold.
- MS fails to place the second call.
- Optionally provides some indication to the user of an error.

### 11.4.4 Method of test

#### 11.4.4.1 Initial conditions

The mobile originating generic call set up procedures shall be followed up to and including the transmission by the MS of the CONNECT ACKNOWLEDGE to place the call in the U10 call active state.

#### 11.4.4.2 Procedure

A second directory number is entered followed by "SEND" via the MMI.

### 11.4.5 Test requirement

The MS shall not send any HOLD messages on the dedicated channel. This is checked for 3 s.

The MS may however send other messages.

The MS may also give the user an indication of the error that has occurred.

## 11.5 Verification of non-support of services (multiparty)

### 11.5.1 Definition and applicability

Applicable for MSs that support the Call-Hold supplementary service but **not** the MultiParty supplementary service. This test applies only to MSs that support AoCC. This test applies only to MS which support MO calls.

## 11.5.2 Conformance requirement

An MS claiming to not support the MultiParty supplementary service and in the U10 call active state with one call and in the held state with another call shall, when the appropriate MultiParty MMI command is entered:

- Fail to combine the three parties in a MultiParty call.
- Optionally provide some indication to the user of an error.

3GPP TS 02.83, 3GPP TS 02.84, 3GPP TS 04.83, 3GPP TS 04.84.

## 11.5.3 Test purpose

To verify that an MS claiming to not support the MultiParty supplementary service and in the U10 call active state with one call and another call on hold, reacts in the following manner when the appropriate MultiParty MMI command is entered:

- Fails to combine the three parties in a MultiParty call.
- Optionally provides some indication to the user of an error.

## 11.5.4 Method of test

### 11.5.4.1 Initial conditions

The mobile originating generic call set up procedures shall be followed up to and including the transmission by the MS of the CONNECT ACKNOWLEDGE to place the call in the U10 call active state. A second directory number is then entered followed by send to put the first call on hold and place a second call.

### 11.5.4.2 Procedure

"3" followed by "SEND" is entered via the MMI.

## 11.5.5 Test requirement

The MS shall not send a FACILITY message, containing the build multiparty request, on the dedicated channel. This is checked for 3 s.

The MS may however send other messages.

The MS may also give the user an indication of the error that has occurred.

## 11.6 Verification of non-support of feature (Fixed Dialling Number (FDN))

### 11.6.1 Definition and applicability

This test applies to MS which do **not** support FDN. This test applies only to MS which support MO calls.

### 11.6.2 Conformance requirement

1. An MS claiming to **not** support FDN that has a SIM with FDN allocated and activated in its SIM Service Table (Service Number 3) and has FDN "enabled" shall refuse a request from the user to attempt an outgoing call.
2. An MS claiming to **not** support FDN that has a SIM with FDN allocated and activated in its SIM Service Table (Service Number 3) and has FDN "enabled" shall not respond to paging.

3. An MS claiming **not** to support FDN that has a SIM with FDN allocated and activated shall not attempt to rehabilitate the IMSI and Location Information Elementary Files of the SIM.

3GPP TS 02.07 subclause B3.2, 3GPP TS 11.11 subclause 11.2.1.

### 11.6.3 Test purpose

1. To verify that an MS claiming to **not** support FDN and that has a SIM with FDN allocated and activated in its SIM Service Table and has FDN "enabled". i.e. AND, IMSI and Location Information Elementary Files are Invalidated inserted, it refuses an attempt to make an outgoing call made by the user.
2. To verify that an MS claiming to **not** support FDN and that has a SIM with FDN allocated and activated in its SIM Service Table and has FDN "enabled". i.e. AND, IMSI and Location Information Elementary Files are Invalidated inserted, it does not answer to paging.
3. To verify that an MS claiming **not** to support FDN and that has a SIM with FDN allocated and activated in its SIM Service Table and has FDN "enabled". i.e. AND, IMSI and Location Information Elementary Files are Invalidated inserted, does not attempt to rehabilitate IMSI and Location Information.

### 11.6.4 Method of test

#### 11.6.4.1 Initial conditions

The ME is powered off. No SIM is inserted in the ME.

#### 11.6.4.2 Procedure

- a) A SIM with FDN allocated and activated in its SIM Service Table and has FDN "enabled" is inserted in the ME and the MS is powered on.
- b) An outgoing CM connection is attempted by the user.
- c) The MS paged with its IMSI.
- d) The MS is powered off and the SIM is examined using a suitable tool to determine if the IMSI and Location Information Elementary Files have been Rehabilitated.

### 11.6.5 Test requirement

- 1) in step b), the MS shall not send a CHANNEL REQUEST message.
- 2) in step c), the MS shall not send a CHANNEL REQUEST message.
- 3) in step d), the IMSI and Location Information Elementary Files shall be Invalidated.

## 11.7 IMEI Security

### 11.7.1 Conformance requirements

The IMEI shall not be changed after the ME's final production process. It shall resist tampering, i.e. manipulation and change, by any means (e.g. physical, electrical and software).

NOTE: This requirement is valid for new GSM Phase 2 and Release 96, 97, 98 and 99 MEs type approved after 1<sup>st</sup> June 2002.

3GPP TS 02.09, 3GPP TS 02.16, 3GPP TS 03.03.

## 11.7.2 Test purpose

To verify the conformance requirement.

## 11.7.3 Method of test

Not available.

## 11.7.4 Declaration

The manufacturer shall declare that:

- he has taken necessary and sufficient steps to ensure that any individual or organisation cannot economically change the IMEI after the ME's final production process; and
- that the IMEI resists tampering, i.e. manipulation and change, by any means (e.g. physical, electrical and software).

# 11.8 Coding of the Bearer Capability information element

This subclause describes the coding of the bearer capability IE in a SETUP and in a CALL CONFIRMED message according to 3GPP TS 07.01 and 3GPP TS 04.08 / 3GPP TS 24.008.

More precisely, the matter of subclause 11.8.1 is the coding of the bearer capability IE in a mobile terminating SETUP and subclause 11.8.2 deals with the coding of the bearer capability IE in a mobile originating SETUP and in a CALL CONFIRMED message.

In the whole section "x", "y" and "X" have the following meanings:

- when a field is coded with values of "x", it means that several bit combinations are authorized and the allowable ones are described in the relevant paragraph or section;
- "y" means that the value of the spare bit can be set to either 0 or 1 at the sending side and that the receiving side shall accept either of these values;
- "X" in the hexadecimal coding of the Bearer Capability IE reflects all the possible values taken by an octet taking account of the number of bits coded as "x" or "y" and their place in the octet.

### 11.8.1 Network to MS Direction

#### 11.8.1.1 BS 21 to 26 - Asynchronous Service

##### 11.8.1.1.1 BS 21

##### 11.8.1.1.1.1 3,1 kHz Audio, Transparent

Depending of the type of flow control supported by the TE, octet 7 is present or not. If not present, it means "outband flow control". If octet 7 is present, the value ISO 6429 (0 1000) means "Inband flow control" and the value COPnoFLCT (0 1100) means "No flow control".

The following configuration is also authorized:

Connection element in Octet 6c:            -    1    x    -    -    -    -    -    -    Both T or NT preferred

## 11.8.1.1.2 BS 22

Same as BS 21 except:

|                           |                        |   |   |   |   |   |   |   |   |            |
|---------------------------|------------------------|---|---|---|---|---|---|---|---|------------|
|                           | User Rate in Octet 6a: | - | - | - | - | 0 | 0 | 1 | 0 | 1,2 kbit/s |
| If different from "none", | Modem Type Octet 6c:   | - | - | - | 0 | 0 | 0 | 1 | 0 | Modem V.22 |

In case of 3,1 kHz Audio non transparent service, depending of the type of flow control supported by the TE, octet 7 is present or not. If not present, it means "outband flow control".

## 11.8.1.1.3 BS 24

Same as BS 21 except:

|                           |                        |   |   |   |   |   |   |   |   |               |
|---------------------------|------------------------|---|---|---|---|---|---|---|---|---------------|
|                           | User Rate in Octet 6a: | - | - | - | - | 0 | 0 | 1 | 1 | 2,4 kbit/s    |
| If different from "none", | Modem Type Octet 6c:   | - | - | - | 0 | 0 | 0 | 1 | 1 | Modem V.22bis |

In case of 3,1 kHz Audio non transparent service, depending of the type of flow control supported by the TE, octet 7 is present or not. If not present, it means "outband flow control".

## 11.8.1.1.4 BS 25

Same as BS 21 except:

|                           |                        |   |   |   |   |   |   |   |   |            |
|---------------------------|------------------------|---|---|---|---|---|---|---|---|------------|
|                           | User Rate in Octet 6a: | - | - | - | - | 0 | 1 | 0 | 0 | 4,8 kbit/s |
| If different from "none", | Modem Type Octet 6c:   | - | - | - | 0 | 0 | 1 | 1 | 0 | Modem V.32 |

In case of 3,1 kHz Audio non transparent service, depending of the type of flow control supported by the TE, octet 7 is present or not. If not present, it means "outband flow control".

## 11.8.1.1.5 BS 26

Same as BS 21 except:

|                           |                           |   |   |   |   |   |   |   |   |            |
|---------------------------|---------------------------|---|---|---|---|---|---|---|---|------------|
|                           | NIRR in Octet 4           | - | - | - | - | - | - | 0 | - | no meaning |
|                           | User Rate in Octet 6a:    | - | - | - | - | 0 | 1 | 0 | 1 | 9,6 kbit/s |
|                           | Interm. Rate in Octet 6b: | - | 1 | 1 | - | - | - | - | - | 16 kbit/s  |
| If different from "none", | Modem Type Octet 6c:      | - | - | - | 0 | 0 | 1 | 1 | 0 | Modem V.32 |

In case of 3,1kHz Audio non transparent service, depending of the type of flow control supported by the TE, octet 7 is present or not. If not present, it means "outband flow control".

Depending of the type of flow control supported by the TE, the coding of octet 7 is different. The value ISO 6429 (0 1000) means "Inband flow control" and the value COPnoFLCT (0 1100) means "No flow control". The "Outband Flow control is not allowed with V.21 modem).

Depending of the user rate supported by the MS, the user rate and the modem type change:

### 11.8.1.6 TS 62 - Automatic Facsimile group 3

The repeat Indicator in the Setup message is not available.

The BC GSM is coded as described in subclause 11.8.1.5.

### 11.8.2 MS to SS direction

In the whole subclause 11.8.2, "1)" and "2)" stand for:

- 1) Not applicable in a CALL CONFIRMED message.
- 2) Not applicable in a CALL CONFIRMED message responding to a SETUP message with no BC-IE (PSTN-originated call with single numbering scheme).

If the MS supports only Full Rate:

Radio Channel Requirement in Octet 3:      -    0    1    -    -    -    -    -    Full rate support only mobile station

Else

Radio Channel Requirement in Octet 3:      -    1    x    -    -    -    -    -    Dual rate mobile station

#### 11.8.2.1 BS 21 to 26 - Asynchronous Service

If the MS supports only SAP I.440/I.450:

SAP in Octet 5:                                      -    -    -    -    -    0    0    1    I.440/I.450

If the MS supports only SAP X.28 non dedicated PAD:

SAP in Octet 5:                                      -    -    -    -    -    1    0    1    X.28 nond

Else:

SAP in Octet 5:                                      -    -    -    -    -    x    0    1    I.440/I.450 or X.28 nond

The use of the alternative configuration "Autobauding modem type 1" in BS 22 to BS 26 is the same as indicated for BS 21 in subclauses 11.8.2.1.1.1 and 11.8.2.1.1.2.

11.8.2.1.1 BS 21

11.8.2.1.1.1 3,1 kHz Audio, Transparent

Depending of the type of flow control supported by the TE, octet 7 is present or not. If not present, it means "outband flow control". If octet 7 is present, the value ISO 6429 (0 1000) means "Inband flow control" and the value COPnoFLCT (0 1100) means "No flow control".

## 11.8.2.1.2 BS 22

Same as BS 21 except:

|                           |                        |   |   |   |   |   |   |   |   |            |
|---------------------------|------------------------|---|---|---|---|---|---|---|---|------------|
|                           | User Rate in Octet 6a: | - | - | - | - | 0 | 0 | 1 | 0 | 1,2 kbit/s |
| If different from "none", | Modem Type Octet 6c:   | - | - | - | 0 | 0 | 0 | 1 | 0 | Modem V.22 |

In case of 3,1 kHz Audio non transparent service, depending of the type of flow control supported by the TE, octet 7 is present or not. If not present, it means "outband flow control".

## 11.8.2.1.3 BS 24

Same as BS 21 except:

|                           |                        |   |   |   |   |   |   |   |   |               |
|---------------------------|------------------------|---|---|---|---|---|---|---|---|---------------|
|                           | User Rate in Octet 6a: | - | - | - | - | 0 | 0 | 1 | 1 | 2,4 kbit/s    |
| If different from "none", | Modem Type Octet 6c:   | - | - | - | 0 | 0 | 0 | 1 | 1 | Modem V.22bis |
|                           |                        |   |   |   |   |   | 1 | 0 | 1 | Modem V.26ter |

In case of 3,1kHz Audio non transparent service, depending of the type of flow control supported by the TE, octet 7 is present or not. If not present, it means "outband flow control".

## 11.8.2.1.4 BS 25

Same as BS 21 except:

|                           |                        |   |   |   |   |   |   |   |   |            |
|---------------------------|------------------------|---|---|---|---|---|---|---|---|------------|
|                           | User Rate in Octet 6a: | - | - | - | - | 0 | 1 | 0 | 0 | 4,8 kbit/s |
| If different from "none", | Modem Type Octet 6c:   | - | - | - | 0 | 0 | 1 | 1 | 0 | Modem V.32 |

In case of 3,1 kHz Audio non transparent service, depending of the type of flow control supported by the TE, octet 7 is present or not. If not present, it means "outband flow control".

## 11.8.2.1.5 BS 26

Same as BS 21 except:

|                           |                           |   |   |   |   |   |   |   |   |            |
|---------------------------|---------------------------|---|---|---|---|---|---|---|---|------------|
|                           | NIRR in Octet 4:          | - | - | - | - | - | - | 0 | - | no meaning |
|                           | User Rate in Octet 6a:    | - | - | - | - | 0 | 1 | 0 | 1 | 9,6 kbit/s |
|                           | Interm. Rate in Octet 6b: | - | 1 | 1 | - | - | - | - | - | 16 kbit/s  |
| If different from "none", | Modem Type Octet 6c:      | - | - | - | 0 | 0 | 1 | 1 | 0 | Modem V.32 |

In case of 3,1kHz Audio non transparent service, depending of the type of flow control supported by the TE, octet 7 is present or not. If not present, it means "outband flow control".

## 11.8.2.1.6 BS 23

Same as BS 21 except:

|                           |                        |   |   |   |   |   |   |   |   |                     |
|---------------------------|------------------------|---|---|---|---|---|---|---|---|---------------------|
|                           | User Rate in Octet 6a: | - | - | - | - | 0 | 1 | 1 | 1 | 1,2 kbit/s/75 bit/s |
| If different from "none", | Modem Type Octet 6c:   | - | - | - | 0 | 0 | 1 | 0 | 0 | Modem V.23          |

In case of 3,1kHz Audio non transparent service, depending of the type of flow control supported by the TE, octet 7 is present or not. If not present, it means "outband flow control".

### 11.8.2.5 BS 61 - Alternate Speech / Data

The first BC is coded as follows:

- IF: speech full rate version 2 is supported by the mobile, see subclause 11.8.2.9.2;
- ELSE: see subclause 11.8.2.9.1.

The repeat Indicator in the Setup message is coded "Circular for successive selection (alternate)": D1.

The second BC in the Setup message is coded as described below.

#### 11.8.2.5.1 Speech/Asynchronous Data, Transparent

## 12 Transceiver

### 12.1 Conducted spurious emissions

#### 12.1.1 MS allocated a channel

##### 12.1.1.1 Definition and applicability

Conducted spurious emissions, when the MS has been allocated a channel, are emissions from the antenna connector at frequencies other than those of the carrier and sidebands associated with normal modulation.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS with a permanent antenna connector.

##### 12.1.1.2 Conformance requirement

1. The conducted spurious power emitted by the MS, when allocated a channel, shall be no more than the levels in table 12.1.
  - 1.1 Under normal voltage conditions; 3GPP TS 05.05, subclauses 4.3 and 4.3.3.
  - 1.2 Under extreme voltage conditions; 3GPP TS 05.05, subclauses 4.3 and 4.3.3, and clause D.2.

**Table 12.1**

| Frequency range        | Power level in dBm                          |           |           |
|------------------------|---------------------------------------------|-----------|-----------|
|                        | GSM 400,<br>GSM 700,<br>GSM 850,<br>GSM 900 | DCS 1 800 | PCS 1 900 |
| 9 kHz to 1 GHz         | -36                                         | -36       | -36       |
| 1 GHz to 12,75 GHz     | -30                                         |           | -30       |
| 1 GHz to 1 710 MHz     |                                             | -30       |           |
| 1 710 MHz to 1 785 MHz |                                             | -36       |           |
| 1 785 MHz to 12,75 GHz |                                             | -30       |           |

##### 12.1.1.3 Test purpose

1. To verify that conducted spurious emissions from the MS when allocated a channel do not exceed the conformance requirements. These conducted spurious emissions will be measured in the frequency band 100 kHz to 12,75 GHz excluding the following received bands:

For GSM 400, GSM 900 and DCS 1 800:

- the band 925 MHz to 960 MHz;
- the band 1 805 MHz to 1 880 MHz;
- in addition for GSM 400 MS:
  - the band 460,4 MHz to 467,6 MHz;
  - the band 488,8 MHz to 496 MHz.

For GSM 700, GSM 850 and PCS 1 900:

- the band 747 MHz to 762 MHz;
- the band 869 MHz to 894 MHz;

- the band 1 930 MHz to 1 990 MHz.

1.1 Under normal voltage conditions.

1.2 Under extreme voltage conditions.

NOTE: The band 9 MHz to 100 kHz is not tested, because of test implementation problems.

#### 12.1.1.4 Method of test

##### 12.1.1.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a channel in the Mid ARFCN range.

The SS commands the MS to loop back its channel decoder output to channel encoder input.

The SS sends Standard Test Signal C1.

The SS sets the MS to operate at its maximum output power.

##### 12.1.1.4.2 Procedure

- a) Measurements are made in the frequency range 100 kHz to 12,75 GHz. Spurious emissions are measured at the connector of the transceiver, as the power level of any discrete signal, higher than the requirement in table 12.1 minus 6 dB, delivered into a 50  $\Omega$  load.

The measurement bandwidth based on a 5 pole synchronously tuned filter is according to table 12.2. The power indication is the peak power detected by the measuring system.

The measurement on any frequency shall be performed for at least one TDMA frame period with the exception of the idle frame.

NOTE: This ensures that both the active times (MS transmitting) and the quiet times are measured.

- b) The test is repeated under extreme voltage test conditions ([annex 1, TC2.2 and TC3]).

Table 12.2

| Frequency range                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Frequency offset                                                                                 | Filter bandwidth                     | Approx video bandwidth             |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|--------------------------------------|------------------------------------|
| 100 kHz to 50 MHz                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | -                                                                                                | 10 kHz                               | 30 kHz                             |

| NOTE 1: The excluded RX bands are tested in subclause 13.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                  |                                      |                                    |
| NOTE 2: The filter and video bandwidths, and frequency offsets are only correct for measurements on an MS transmitting on a channel in the Mid ARFCN range.                                                                                                                                                                                                                                                                                                                                                        |                                                                                                  |                                      |                                    |
| NOTE 3: Due to practical implementation, the video bandwidth is restricted to a maximum of 3 MHz.                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                  |                                      |                                    |

## 12.1.1.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.3.

Table 12.3

| Frequency range        | Power level in dBm                          |           |           |

|                        | GSM 400,<br>GSM 700,<br>GSM 850,<br>GSM 900 | DCS 1 800 | PCS 1 900 |
| 100 kHz to 1 GHz       | -36                                         | -36       | -36       |
| 1 GHz to 12,75 GHz     | -30                                         |           | -30       |
| 1 GHz to 1710 MHz      |                                             | -30       |           |
| 1 710 MHz to 1 785 MHz |                                             | -36       |           |
| 1 785 MHz to 12,75 GHz |                                             | -30       |           |

## 12.1.2 MS in idle mode

### 12.1.2.1 Definition and applicability

Conducted spurious emissions are any emissions from the antenna connector, when the MS is in idle mode.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 MS and PCS 1 900 with a permanent antenna connector.

### 12.1.2.2 Conformance requirement

1. The conducted spurious power emitted by the MS, when in idle mode, shall be no more than the levels in table 12.4.

1.1 Under normal voltage conditions; 3GPP TS 05.05, subclauses 4.3 and 4.3.3.

1.2 Under extreme voltage conditions; 3GPP TS 05.05, subclauses 4.3 and 4.3.3, and clause D.2.

**Table 12.4**

| Frequency range |           | Power level in dBm                |                                   |
|-----------------|-----------|-----------------------------------|-----------------------------------|
|                 |           | GSM 400,<br>GSM 900,<br>DCS 1 800 | GSM 700,<br>GSM 850,<br>PCS 1 900 |
| 9 kHz to        | 880 MHz   | -57                               | -57                               |
| 880 MHz to      | 915 MHz   | -59                               | -57                               |
| 915 MHz to      | 1000 MHz  | -57                               | -57                               |
| 1 GHz to        | 1 710 MHz | -47                               |                                   |
| 1 710 MHz to    | 1 785 MHz | -53                               |                                   |
| 1 785 MHz to    | 12,75 GHz | -47                               |                                   |
| 1 GHz to        | 1 850 MHz |                                   | -47                               |
| 1 850 MHz to    | 1 910 MHz |                                   | -53                               |
| 1 910 MHz to    | 12,75 GHz |                                   | -47                               |

### 12.1.2.3 Test purpose

1. To verify that conducted spurious emissions, in the frequency band 100 kHz to 12,75 GHz from the MS when in idle mode do not exceed the conformance requirements.

1.1 Under normal voltage conditions.

1.2 Under extreme voltage conditions.

NOTE: The band 9 KhZ to 100 kHz is not tested, because of test implementation problems.

### 12.1.2.4 Method of test

#### 12.1.2.4.1 Initial conditions

The BCCH message content from the serving cell shall ensure that Periodic Location Updating is not used and that page mode is continuously set to Paging Reorganization and BS\_AG\_BLKs\_RES is set to 0 so that the MS receiver will operate continually.

The CCCH\_CONF shall be set to 000. 1 basic physical channel used for CCCH not combined with SDCCHs.

The BCCH allocation shall either be empty or contain only the serving cell BCCH.

NOTE: This is to ensure that the receiver does not scan other ARFCN. Scanning other ARFCN could lead to a moving in frequency of the spurious and therefore to the possibility of either not measuring a spurious emission or measuring it more than once.

The MS is in MM state "idle, updated".

## 12.1.2.4.2 Procedure

- a) Measurements are made in the frequency range 100 kHz to 12,75 GHz. Spurious emissions are measured as the power level of any discrete signal, higher than the requirement in table 12.4 minus 6 dB, delivered into a 50  $\Omega$  load.

The measurement bandwidth based on a 5 pole synchronously tuned filter is set according to table 12.5. The power indication is the peak power detected by the measuring system.

The measurement time on any frequency shall be such that it includes the time during which the MS receives a TDMA frame containing the paging channel.

Table 12.5

| Frequency range     | Filter bandwidth | Video bandwidth |
|---------------------|------------------|-----------------|
| 100 kHz to 50 MHz   | 10 kHz           | 30 kHz          |
| 50 MHz to 12,75 GHz | 100 kHz          | 300 kHz         |

- b) The test is repeated under extreme voltage test conditions ([annex 1, TC2.2 and TC3]).

## 12.1.2.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.6.

Table 12.6

| Frequency range |           | Power level in dBm                |                                   |
|-----------------|-----------|-----------------------------------|-----------------------------------|
|                 |           | GSM 400,<br>GSM 900,<br>DCS 1 800 | GSM 700,<br>GSM 850, PCS<br>1 900 |
| 100 kHz to      | 880 MHz   | -57                               | -57                               |
| 880 MHz to      | 915 MHz   | -59                               | -57                               |
| 915 MHz to      | 1 000 MHz | -57                               | -57                               |
| 1 GHz to        | 1 710 MHz | -47                               |                                   |
| 1 710 MHz to    | 1 785 MHz | -53                               |                                   |
| 1 785 MHz to    | 12,75 GHz | -47                               |                                   |
| 1 GHz to        | 1 850 MHz |                                   | -47                               |
| 1 850 MHz to    | 1 910 MHz |                                   | -53                               |
| 1 910 MHz to    | 12,75 GHz |                                   | -47                               |

## 12.2 Radiated spurious emissions

This test is performed either on an outdoor test site, fulfilling the requirements of [GC4 of annex 1], or in an anechoic shielded chamber, fulfilling the requirements of ([GC5 of annex 1]). Performing the measurement in the anechoic shielded chamber is preferred. The sample shall be placed at the specified height on the support.

NOTE: The test method described has been written for measurement in an anechoic shielded chamber. If an outdoor test site is used then additional precautions are necessary to ensure correct measurement. These measures are familiar to test houses which perform spurious emissions tests and are:

- Raise/lower the test antenna through the specified height range during both the emission detection and substitution parts of the test.
- Perform a qualitative pre-search in a shielded environment for test sites where the ambient RF environment can prevent the detection of spurious emissions which exceed the limit.
- Detect emissions at a more sensitive threshold to that specified in subclause 12.2.1.4 to allow for destructive interference due to ground plane reflections at the test antenna search height.

## 12.2.1 MS allocated a channel

### 12.2.1.1 Definition and applicability

Radiated spurious emissions, when the MS has been allocated a channel, are any emissions radiated by the cabinet and structure of the mobile station, including all interconnecting cables.

This is also known as "cabinet radiation".

The requirements apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS. The test applies to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS with the exception of the test at extreme voltages for an MS where a practical connection, to an external power supply, is not possible.

**NOTE:** A "practical connection" shall be interpreted to mean it is possible to connect extreme voltages to the MS without interfering with the configuration of the MS in a way which could invalidate the test.

### 12.2.1.2 Conformance requirement

1. The radiated spurious power emitted by the MS, when allocated a channel, shall be no more than the levels in table 12.7 under normal voltage conditions; 3GPP TS 05.05, subclauses 4.3 and 4.3.3.
2. The radiated spurious power emitted by the MS, when allocated a channel, shall be no more than the levels in table 12.7 under extreme voltage conditions; 3GPP TS 05.05, subclauses 4.3 and 4.3.3, and clause D.2.

**Table 12.7**

| Frequency range |           | Power level in dBm                          |           |           |
|-----------------|-----------|---------------------------------------------|-----------|-----------|
|                 |           | GSM 400,<br>GSM 700,<br>GSM 850,<br>GSM 900 | DCS 1 800 | PCS 1 900 |
| 30 MHz to       | 1 GHz     | -36                                         | -36       | -36       |
| 1 GHz to        | 4 GHz     | -30                                         |           | -30       |
| 1 GHz to        | 1 710 MHz |                                             | -30       |           |
| 1 710 MHz to    | 1 785 MHz |                                             | -36       |           |
| 1 785 MHz to    | 4 GHz     |                                             | -30       |           |

### 12.2.1.3 Test purpose

1. To verify that radiated spurious emissions from the MS when allocated a channel do not exceed the conformance requirements under normal voltage conditions.
2. To verify that radiated spurious emissions from the MS when allocated a channel do not exceed the conformance requirements under extreme voltage conditions.

### 12.2.1.4 Method of test

#### 12.2.1.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a channel in the Mid ARFCN range.

**NOTE:** The power supply shall be connected to the MS such that the physical configuration does not change in a way that could have an effect on the measurement. In particular, the battery pack of the MS should not normally be removed. In cases where no practical connection can be made to the power supply, the MS's intended battery source shall be used.

The SS commands the MS to loop back its channel decoder output to its channel encoder input.

The SS sends Standard Test Signal C1.

The SS sets the MS to operate at its maximum output power.

## 12.2.1.4.2 Procedure

- a) Initially the test antenna is closely coupled to the MS and any spurious emission radiated by the MS is detected by the test antenna and receiver in the range 30 MHz to 4 GHz.

NOTE 1: This is a qualitative step to identify the frequency and presence of spurious emissions which are to be measured in subsequent steps.

- b) The test antenna separation is set to the appropriate measurement distance and at each frequency at which an emission has been detected, the MS shall be rotated to obtain maximum response and the effective radiated power of the emission determined by a substitution measurement. In case of an anechoic shielded chamber pre-calibration may be used instead of a substitution measurement.
- c) The measurement bandwidth, based on a 5 pole synchronously tuned filter, is set according to table 12.8. The power indication is the peak power detected by the measuring system.

The measurement on any frequency shall be performed for at least one TDMA frame period, with the exception of the idle frame.

NOTE 2: This ensures that both the active times (MS transmitting) and the quiet times are measured.

NOTE 3: For these filter bandwidths some difficulties may be experienced with noise floor above required measurement limit. This will depend on the gain of the test antenna, and adjustment of the measuring system bandwidth is permissible. Alternatively, for test frequencies above 900 MHz, the test antenna separation from the MS may be reduced to 1 metre.

- d) The measurements are repeated with the test antenna in the orthogonal polarization plane.
- e) The test is repeated under extreme voltage test conditions (see [annex 1, TC2.2]).

Table 12.8

| Frequency range                                                                                                                                                                                                                                                                   | Frequency offset                       | Filter bandwidth | Approx video bandwidth |

|                                                                                                                                                                                                                                                                                   | > 6,0 MHz                              | 100 kHz          | 300 kHz                |
|                                                                                                                                                                                                                                                                                   | (offset from carrier)                  |                  |                        |
| NOTE 1: The filter and video bandwidths, and frequency offsets are only correct for measurements on an MS transmitting on a channel in the Mid ARFCN range.                                                                                                                       |                                        |                  |                        |
| NOTE 2: Due to practical implementation of a SS, the video bandwidth is restricted to a maximum of 3 MHz.                                                                                                                                                                         |                                        |                  |                        |

## 12.2.1.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.7.

## 12.2.2 MS in idle mode

### 12.2.2.1 Definition and applicability

Radiated spurious emissions, when the MS is in idle mode, are any emissions radiated by the cabinet and structure of the mobile station, including all interconnecting cables.

This is also known as "cabinet radiation".

The requirements apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS. The test applies to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS with the exception of the test at extreme voltages for an MS where a practical connection, to an external power supply, is not possible.

**NOTE:** A "practical connection" shall be interpreted to mean it is possible to connect extreme voltages to the MS without interfering with the configuration of the MS in a way which could invalidate the test.

### 12.2.2.2 Conformance requirement

1. The radiated spurious power emitted by the MS, when in idle mode, shall be no more than the levels in table 12.9. under normal voltage conditions; 3GPP TS 05.05, subclauses 4.3 and 4.3.3.
2. The radiated spurious power emitted by the MS, when in idle mode, shall be no more than the levels in table 12.9. under extreme voltage conditions; 3GPP TS 05.05, subclauses 4.3 and 4.3.3, and clause D.2.

**Table 12.9**

| Frequency range |           | Power level in dBm                |                                   |
|-----------------|-----------|-----------------------------------|-----------------------------------|
|                 |           | GSM 400,<br>GSM 900,<br>DCS 1 800 | GSM 700,<br>GSM 850,<br>PCS 1 900 |
| 30 MHz to       | 880 MHz   | -57                               | -57                               |
| 880 MHz to      | 915 MHz   | -59                               | -57                               |
| 915 MHz to      | 1 000 MHz | -57                               | -57                               |
| 1 GHz to        | 1 710 MHz | -47                               |                                   |
| 1 710 MHz to    | 1 785 MHz | -53                               |                                   |
| 1 785 MHz to    | 4 GHz     | -47                               |                                   |
| 1 GHz to        | 1 850 MHz |                                   | -47                               |
| 1 850 MHz to    | 1 910 MHz |                                   | -53                               |
| 1 910 MHz to    | 4GHz      |                                   | -47                               |

### 12.2.2.3 Test purpose

1. To verify that radiated spurious emissions from the MS when in idle mode do not exceed the requirements under normal voltage conditions.
2. To verify that radiated spurious emissions from the MS when in idle mode do not exceed the requirements under extreme voltage conditions.

### 12.2.2.4 Method of test

#### 12.2.2.4.1 Initial conditions

**NOTE 1:** The power supply shall be connected to the MS such that the physical configuration does not change in a way that could have an effect on the measurement. In particular, the battery pack of the MS should not normally be removed. In cases where no practical connection can be made to the power supply, the MS's intended battery source shall be used.

The BCCH message content from the serving cell shall ensure that Periodic Location Updating is not used and that page mode is continuously set to Paging Reorganization and BS\_AG\_BLK\_RES is set to 0 so that the MS receiver will operate continually.

The CCCH\_CONF shall be set to 000. 1 basic physical channel used for CCCH not combined with SDCCHs.

The BCCH allocation shall either be empty or contain only the serving cell BCCH.

NOTE 2: This is to ensure that the receiver does not scan other ARFCN. Scanning other ARFCN could lead to a moving in frequency of the spurious and therefore to the possibility of either not measuring a spurious emission or measuring it more than once.

The MS is in MM state "idle, updated".

#### 12.2.2.4.2 Procedure

- a) Initially the test antenna is closely coupled to the MS and any spurious emission radiated by the MS are detected by the test antenna and receiver in the range 30 MHz to 4 GHz.

NOTE 1: This is a qualitative step to identify the frequency and presence of spurious emissions which are to be measured in subsequent steps.

- b) The test antenna separation is set to the appropriate measurement distance and at each frequency at which a spurious emission has been detected the MS is rotated to obtain a maximum response. The effective radiated power of the emission is determined by a substitution measurement. In case of an anechoic shielded chamber pre-calibration may be used instead of a substitution measurement.
- c) The measurement bandwidth based on a 5 pole synchronously tuned filter shall be according to table 12.10. The power indication is the peak power detected by the measuring system.

The measurement time on any frequency shall be such that it includes the time during which the MS receives a TDMA frame containing the paging channel.

NOTE 2: For these filter bandwidths some difficulties may be experienced with noise floor above required measurement limit. This will depend on the gain of the test antenna, and adjustment of the measuring system bandwidth is permissible. Alternatively, for test frequencies above 900 MHz, the test antenna separation from the MS may be reduced to 1 metre.

**Table 12.10**

| Frequency range  | Filter bandwidth | Video bandwidth |
|------------------|------------------|-----------------|
| 30 MHz to 50 MHz | 10 kHz           | 30 kHz          |
| 50 MHz to 4 GHz  | 100 kHz          | 300 kHz         |

- d) The measurements are repeated with the test antenna in the orthogonal polarization plane.
- e) The test is repeated under extreme voltage test conditions (see [Annex 1, TC2.2]).

#### 12.2.2.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.9.

## 12.3 Conducted spurious emissions for MS supporting the R-GSM frequency band

This subclause applies only to MS supporting the R-GSM frequency band.

### 12.3.1 MS allocated a channel

#### 12.3.1.1 Definition and applicability

Conducted spurious emissions, when the MS has been allocated a channel, are emissions from the antenna connector at frequencies other than those of the carrier and sidebands associated with normal modulation.

The requirements and this test apply to all types of R-GSM 900 MS with a permanent antenna connector.

### 12.3.1.2 Conformance requirement

1. The conducted spurious power emitted by the MS, when allocated a channel, shall be no more than the levels in table 12.11.
  - 1.1 Under normal voltage conditions; 3GPP TS 05.05, subclauses 4.3 and 4.3.3.
  - 1.2 Under extreme voltage conditions; 3GPP TS 05.05, subclause 4.3 and 4.3.3, and clause D.2.

**Table 12.11**

| Frequency range    | Power level in dBm    |                       |
|--------------------|-----------------------|-----------------------|
|                    | R-GSM 900<br>small MS | R-GSM 900<br>other MS |
| 9 kHz to 1 GHz     | -36                   |                       |
| 9 kHz to 876 MHz   |                       | -36                   |
| 876 MHz to 915 MHz |                       | -42                   |
| 915 MHz to 1 GHz   |                       | -36                   |
| 1 GHz to 12,75 GHz | -30                   | -30                   |

### 12.3.1.3 Test purpose

1. To verify that conducted spurious emissions, in the frequency band 100 kHz to 12,75 GHz excluding the R-GSM 900 and DCS 1 800 receive bands, from the MS when allocated a channel do not exceed the conformance requirements.
  - 1.1 Under normal voltage conditions.
  - 1.2 Under extreme voltage conditions.

NOTE: The band 9 kHz to 100 kHz is not tested, because of test implementation problems.

### 12.3.1.4 Method of test

#### 12.3.1.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a channel in the Mid ARFCN range.

The SS commands the MS to loop back its channel decoder output to channel encoder input.

The SS sends Standard Test Signal C1.

The SS sets the MS to operate at its maximum output power.

#### 12.3.1.4.2 Procedure

- a) Measurements are made in the frequency range 100 kHz to 12,75 GHz. Spurious emissions are measured at the connector of the transceiver, as the power level of any discrete signal, higher than the requirement in table 12.11 minus 6 dB, delivered into a 50  $\Omega$  load.

The measurement bandwidth based on a 5 pole synchronously tuned filter is according to table 12.12. The power indication is the peak power detected by the measuring system.

The measurement on any frequency shall be performed for at least one TDMA frame period with the exception of the idle frame.

NOTE: This ensures that both the active times (MS transmitting) and the quiet times are measured.

- b) The test is repeated under extreme voltage test conditions ([annex 1, TC2.2 and TC3]).

Table 12.12

| Frequency range                                                                                                                                                 | Frequency offset                                                                                    | Filter bandwidth                     | Approx video bandwidth             |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|--------------------------------------|------------------------------------|
| 100 kHz to 50 MHz                                                                                                                                               | -                                                                                                   | 10 kHz                               | 30 kHz                             |
| 50 MHz to 500 MHz                                                                                                                                               | -                                                                                                   | 100 kHz                              | 300 kHz                            |
| 500 MHz to 12,75 GHz,<br>excl. relevant TX band:<br>R-GSM: 876 MHz to 915 MHz;<br>;<br>,<br>and the RX bands:<br>921 MHz to 960 MHz;<br>1 805 MHz to 1 880 MHz. | 0 to 10 MHz<br>>= 10 MHz<br>>= 20 MHz<br>>= 30 MHz<br><br>(offset from edge<br>of relevant TX band) | 100 kHz<br>300 kHz<br>1 MHz<br>3 MHz | 300 kHz<br>1 MHz<br>3 MHz<br>3 MHz |

| NOTE 1: The frequency ranges 921 MHz to 960 MHz and 1 805 MHz to 1 880 MHz are excluded as these ranges are tested in subclause 13.9.                           |                                                                                                     |                                      |                                    |
| NOTE 2: The filter and video bandwidths, and frequency offsets are only correct for measurements on an MS transmitting on a channel in the Mid ARFCN range.     |                                                                                                     |                                      |                                    |
| NOTE 3: Due to practical implementation, the video bandwidth is restricted to a maximum of 3 MHz.                                                               |                                                                                                     |                                      |                                    |

### 12.3.1.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.13.

Table 12.13

| Frequency range    | Power level in dBm    |                       |
|--------------------|-----------------------|-----------------------|
|                    | R-GSM 900<br>small MS | R-GSM 900<br>other MS |
| 100 kHz to 1 GHz   | -36                   |                       |
| 100 kHz to 876 MHz |                       | -36                   |
| 876 MHz to 915 MHz |                       | -42                   |
| 915 MHz to 1 GHz   |                       | -36                   |
| 1 GHz to 12,75 GHz | -30                   | -30                   |

## 12.3.2 MS in idle mode

### 12.3.2.1 Definition and applicability

Conducted spurious emissions are any emissions from the antenna connector, when the MS is in idle mode.

The requirements and this test apply to all types of R-GSM 900 MS with a permanent antenna connector.

### 12.3.2.2 Conformance requirement

- The conducted spurious power emitted by the MS, when in idle mode, shall be no more than the levels in table 12.14.

1.1 Under normal voltage conditions; 3GPP TS 05.05, subclauses 4.3 and 4.3.3.

1.2 Under extreme voltage conditions; 3GPP TS 05.05, subclauses 4.3 and 4.3.3, and clause D.2.

**Table 12.14**

| Frequency range |           | Power level in dBm |
|-----------------|-----------|--------------------|
| 9 kHz to        | 880 MHz   | -57                |
| 880 MHz to      | 915 MHz   | -59                |
| 915 MHz to      | 1 000 MHz | -57                |
| 1 GHz to        | 1 710 MHz | -47                |
| 1 710 MHz to    | 1 785 MHz | -53                |
| 1 785 MHz to    | 12,75 GHz | -47                |

### 12.3.2.3 Test purpose

1. To verify that conducted spurious emissions, in the frequency band 100 kHz to 12,75 GHz from the MS when in idle mode do not exceed the conformance requirements.

1.1 Under normal voltage conditions.

1.2 Under extreme voltage conditions.

NOTE: The band 9 kHz to 100 kHz is not tested, because of test implementation problems.

### 12.3.2.4 Method of test

#### 12.3.2.4.1 Initial conditions

The BCCH message content from the serving cell shall ensure that Periodic Location Updating is not used and that page mode is continuously set to Paging Reorganization and BS\_AG\_BLK\_RES is set to 0 so that the MS receiver will operate continually.

The CCCH\_CONF shall be set to 000. 1 basic physical channel used for CCCH not combined with SDCCHs.

The BCCH allocation shall either be empty or contain only the serving cell BCCH.

NOTE: This is to ensure that the receiver does not scan other ARFCN. Scanning other ARFCN could lead to a moving in frequency of the spurious and therefore to the possibility of either not measuring a spurious emission or measuring it more than once.

The MS is in MM state "idle, updated".

#### 12.3.2.4.2 Procedure

- a) Measurements are made in the frequency range 100 kHz to 12,75 GHz. Spurious emissions are measured as the power level of any discrete signal, higher than the requirement in table 12.14 minus 6 dB, delivered into a 50  $\Omega$  load.

The measurement bandwidth based on a 5 pole synchronously tuned filter is set according to table 12.15. The power indication is the peak power detected by the measuring system.

The measurement time on any frequency shall be such that it includes the time during which the MS receives a TDMA frame containing the paging channel.

**Table 12.15**

| Frequency range     | Filter bandwidth | Video bandwidth |
|---------------------|------------------|-----------------|
| 100 kHz to 50 MHz   | 10 kHz           | 30 kHz          |
| 50 MHz to 12,75 GHz | 100 kHz          | 300 kHz         |

- b) The test is repeated under extreme voltage test conditions ([annex 1, TC2.2 and TC3]).

### 12.3.2.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.16.

**Table 12.16**

| Frequency range |           | Power level in dBm |
|-----------------|-----------|--------------------|
| 100 kHz to      | 880 MHz   | -57                |
| 880 MHz to      | 915 MHz   | -59                |
| 915 MHz to      | 1 000 MHz | -57                |
| 1 GHz to        | 1 710 MHz | -47                |
| 1 710 MHz to    | 1 785 MHz | -53                |
| 1 785 MHz to    | 12,75 GHz | -47                |

## 12.4 Radiated spurious emissions for MS supporting the R-GSM frequency band

This subclause applies only to MS supporting the R-GSM frequency band.

This test is performed either on an outdoor test site, fulfilling the requirements of [GC4 of annex 1], or in an anechoic shielded chamber, fulfilling the requirements of ([GC5 of annex 1]). Performing the measurement in the anechoic shielded chamber is preferred. The sample shall be placed at the specified height on the support.

**NOTE:** The test method described has been written for measurement in an anechoic shielded chamber. If an outdoor test site is used then additional precautions are necessary to ensure correct measurement. These measures are familiar to test houses which perform spurious emissions tests and are:

- Raise/lower the test antenna through the specified height range during both the emission detection and substitution parts of the test.
- Perform a qualitative pre-search in a shielded environment for test sites where the ambient RF environment can prevent the detection of spurious emissions which exceed the limit.
- Detect emissions at a more sensitive threshold to that specified in subclause 12.4.1.4 to allow for destructive interference due to ground plane reflections at the test antenna search height.

### 12.4.1 MS allocated a channel

#### 12.4.1.1 Definition and applicability

Radiated spurious emissions, when the MS has been allocated a channel, are any emissions radiated by the cabinet and structure of the mobile station, including all interconnecting cables.

This is also known as "cabinet radiation".

The requirements apply to all types of R-GSM 900 MS. The test applies to all types of R-GSM with the exception of the test at extreme voltages for an MS where a practical connection, to an external power supply, is not possible.

**NOTE:** A "practical connection" shall be interpreted to mean it is possible to connect extreme voltages to the MS without interfering with the configuration of the MS in a way which could invalidate the test.

#### 12.4.1.2 Conformance requirement

- The radiated spurious power emitted by the MS, when allocated a channel, shall be no more than the levels in table 12.17 under normal voltage conditions; 3GPP TS 05.05, subclauses 4.3 and 4.3.3.
- The radiated spurious power emitted by the MS, when allocated a channel, shall be no more than the levels in table 12.17 under extreme voltage conditions; 3GPP TS 05.05, subclauses 4.3 and 4.3.3, and clause D.2.

Table 12.17

| Frequency range |         | Power level in dBm    |                          |
|-----------------|---------|-----------------------|--------------------------|
|                 |         | R-GSM 900<br>small MS | R-GSM<br>900<br>other MS |
| 30 MHz to       | 1 GHz   | -36                   |                          |
| 30 MHz to       | 876 MHz |                       | -36                      |
| 876 MHz to      | 915 MHz |                       | -42                      |
| 915 MHz to      | 1 GHz   |                       | -36                      |
| 1 GHz to        | 4 GHz   | -30                   | -30                      |

#### 12.4.1.3 Test purpose

1. To verify that radiated spurious emissions from the MS when allocated a channel do not exceed the conformance requirements under normal voltage conditions.
2. To verify that radiated spurious emissions from the MS when allocated a channel do not exceed the conformance requirements under extreme voltage conditions.

#### 12.4.1.4 Method of test

##### 12.4.1.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a channel in the Mid ARFCN range.

**NOTE:** The power supply shall be connected to the MS such that the physical configuration does not change in a way that could have an effect on the measurement. In particular, the battery pack of the MS should not normally be removed. In cases where no practical connection can be made to the power supply, the MS's intended battery source shall be used.

The SS commands the MS to loop back its channel decoder output to its channel encoder input.

The SS sends Standard Test Signal C1.

The SS sets the MS to operate at its maximum output power.

##### 12.4.1.4.2 Procedure

- a) Initially the test antenna is closely coupled to the MS and any spurious emission radiated by the MS is detected by the test antenna and receiver in the range 30 MHz to 4 GHz.

**NOTE 0:** This is a qualitative step to identify the frequency and presence of spurious emissions which are to be measured in subsequent steps.

- b) The test antenna separation is set to the appropriate measurement distance and at each frequency at which an emission has been detected, the MS shall be rotated to obtain maximum response and the effective radiated power of the emission determined by a substitution measurement. In case of an anechoic shielded chamber pre-calibration may be used instead of a substitution measurement.
- c) The measurement bandwidth, based on a 5 pole synchronously tuned filter, is set according to table 12.18. The power indication is the peak power detected by the measuring system.

The measurement on any frequency shall be performed for at least one TDMA frame period, with the exception of the idle frame.

**NOTE 1:** This ensures that both the active times (MS transmitting) and the quiet times are measured.

**NOTE 2:** For these filter bandwidths some difficulties may be experienced with noise floor above required measurement limit. This will depend on the gain of the test antenna, and adjustment of the measuring system bandwidth is permissible. Alternatively, for test frequencies above 900 MHz, the test antenna separation from the MS may be reduced to 1 metre.

- d) The measurements are repeated with the test antenna in the orthogonal polarization plane.

e) The test is repeated under extreme voltage test conditions (see [annex 1, TC2.2]).

**Table 12.18**

| Frequency range                                                                                                                                             | Frequency offset                       | Filter bandwidth | Approx video bandwidth |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------|------------------|------------------------|
| 30 MHz to 50 MHz                                                                                                                                            | -                                      | 10 kHz           | 30 kHz                 |
| 50 MHz to 500 MHz                                                                                                                                           | -                                      | 100 kHz          | 300 kHz                |
| 500 MHz to 4 GHz,                                                                                                                                           | 0 to 10 MHz                            | 100 kHz          | 300 kHz                |
| excl. relevant TX band:                                                                                                                                     | >= 10 MHz                              | 300 kHz          | 1 MHz                  |
| R-GSM: 876 MHz to 915 MHz;                                                                                                                                  | >= 20 MHz                              | 1 MHz            | 3 MHz                  |
|                                                                                                                                                             | >= 30 MHz                              | 3 MHz            | 3 MHz                  |
|                                                                                                                                                             | (offset from edge of relevant TX band) |                  |                        |
| relevant TX band:                                                                                                                                           |                                        |                  |                        |
| R-GSM: 876 MHz to 915 MHz                                                                                                                                   | 1,8 MHz to 6,0 MHz                     | 30 kHz           | 100 kHz                |
|                                                                                                                                                             | > 6,0 MHz                              | 100 kHz          | 300 kHz                |
|                                                                                                                                                             | (offset from carrier)                  |                  |                        |
| NOTE 1: The filter and video bandwidths, and frequency offsets are only correct for measurements on an MS transmitting on a channel in the Mid ARFCN range. |                                        |                  |                        |
| NOTE 2: Due to practical implementation of a SS, the video bandwidth is restricted to a maximum of 3 MHz.                                                   |                                        |                  |                        |

#### 12.4.1.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.17.

### 12.4.2 MS in idle mode

#### 12.4.2.1 Definition and applicability

Radiated spurious emissions, when the MS is in idle mode, are any emissions radiated by the cabinet and structure of the mobile station, including all interconnecting cables.

This is also known as "cabinet radiation".

The requirements apply to all types of R-GSM 900 MS. The test applies to all types of R-GSM 900 with the exception of the test at extreme voltages for an MS where a practical connection, to an external power supply, is not possible.

NOTE: A "practical connection" shall be interpreted to mean it is possible to connect extreme voltages to the MS without interfering with the configuration of the MS in a way which could invalidate the test.

#### 12.4.2.2 Conformance requirement

1. The radiated spurious power emitted by the MS, when in idle mode, shall be no more than the levels in table 12.19. under normal voltage conditions; 3GPP TS 05.05, subclauses 4.3 and 4.3.3.
2. The radiated spurious power emitted by the MS, when in idle mode, shall be no more than the levels in table 12.19. under extreme voltage conditions; 3GPP TS 05.05, subclauses 4.3 and 4.3.3, and clause D.2.

**Table 12.19**

| Frequency range        | Power level in dBm |
|------------------------|--------------------|
| 30 MHz to 880 MHz      | -57                |
| 880 MHz to 915 MHz     | -59                |
| 915 MHz to 1 000 MHz   | -57                |
| 1 GHz to 1 710 MHz     | -47                |
| 1 710 MHz to 1 785 MHz | -53                |
| 1 785 MHz to 4 GHz     | -47                |

### 12.4.2.3 Test purpose

1. To verify that radiated spurious emissions from the MS when in idle mode do not exceed the requirements under normal voltage conditions.
2. To verify that radiated spurious emissions from the MS when in idle mode do not exceed the requirements under extreme voltage conditions.

### 12.4.2.4 Method of test

#### 12.4.2.4.1 Initial conditions

NOTE 1: The power supply shall be connected to the MS such that the physical configuration does not change in a way that could have an effect on the measurement. In particular, the battery pack of the MS should not normally be removed. In cases where no practical connection can be made to the power supply, the MS's intended battery source shall be used.

The BCCH message content from the serving cell shall ensure that Periodic Location Updating is not used and that page mode is continuously set to Paging Reorganization and BS\_AG\_BLK\_RES is set to 0 so that the MS receiver will operate continually.

The CCCH\_CONF shall be set to 000. 1 basic physical channel used for CCCH not combined with SDCCHs.

The BCCH allocation shall either be empty or contain only the serving cell BCCH.

NOTE 2: This is to ensure that the receiver does not scan other ARFCN. Scanning other ARFCN could lead to a moving in frequency of the spurious and therefore to the possibility of either not measuring a spurious emission or measuring it more than once.

The MS is in MM state "idle, updated".

#### 12.4.2.4.2 Procedure

- a) Initially the test antenna is closely coupled to the MS and any spurious emission radiated by the MS are detected by the test antenna and receiver in the range 30 MHz to 4 GHz.

NOTE 1: This is a qualitative step to identify the frequency and presence of spurious emissions which are to be measured in subsequent steps.

- b) The test antenna separation is set to the appropriate measurement distance and at each frequency at which a spurious emission has been detected the MS is rotated to obtain a maximum response. The effective radiated power of the emission is determined by a substitution measurement. In case of an anechoic shielded chamber pre-calibration may be used instead of a substitution measurement.
- c) The measurement bandwidth based on a 5 pole synchronously tuned filter shall be according to table 12.20. The power indication is the peak power detected by the measuring system.

The measurement time on any frequency shall be such that it includes the time during which the MS receives a TDMA frame containing the paging channel.

NOTE 2: For these filter bandwidths some difficulties may be experienced with noise floor above required measurement limit. This will depend on the gain of the test antenna, and adjustment of the measuring system bandwidth is permissible. Alternatively, for test frequencies above 900 MHz, the test antenna separation from the MS may be reduced to 1 metre.

**Table 12.20**

| Frequency range  | Filter bandwidth | Video bandwidth |
|------------------|------------------|-----------------|
| 30 MHz to 50 MHz | 10 kHz           | 30 kHz          |
| 50 MHz to 4 GHz  | 100 kHz          | 300 kHz         |

- d) The measurements are repeated with the test antenna in the orthogonal polarization plane.

- e) The test is repeated under extreme voltage test conditions (see [annex 1, TC2.2]).

#### 12.4.2.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.19.

---

## 13 Transmitter

### 13.1 Frequency error and phase error

#### 13.1.1 Definition and applicability

The frequency error is the difference in frequency, after adjustment for the effect of the modulation and phase error, between the RF transmission from the MS and either:

- the RF transmission from the BS; or
- the nominal frequency for the ARFCN used.

The phase error is the difference in phase, after adjustment for the effect of the frequency error, between the RF transmission from the MS and the theoretical transmission according to the intended modulation.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS.

#### 13.1.2 Conformance requirement

1. The MS carrier frequency shall be accurate to within 0,1 ppm, or accurate to within 0,1 ppm compared to signals received from the BS. For GSM 400 MS a value of 0,2 ppm shall be used in both cases.
  - 1.1 Under normal conditions; 3GPP TS 05.10, subclause 6.1.
  - 1.2 Under vibration conditions; 3GPP TS 05.10, subclause 6.1; 3GPP TS 05.05, annex D in subclause D.2.3.
  - 1.3 Under extreme conditions; 3GPP TS 05.10, subclause 6.1; 3GPP TS 05.05, subclause 4.4; 3GPP TS 05.05, annex D in subclauses D.2.1 and D.2.2.
2. The RMS phase error (difference between the phase error trajectory and its linear regression on the active part of the time slot) for each burst shall not be greater than 5 degrees.
  - 2.1 Under normal conditions; 3GPP TS 05.05, subclause 4.6.
  - 2.2 Under vibration conditions; 3GPP TS 05.05, subclause 4.6; 3GPP TS 05.05, annex D in subclause D.2.3.
  - 2.3 Under extreme conditions; 3GPP TS 05.05, subclause 4.6; 3GPP TS 05.05, annex D in subclauses D.2.1 and D.2.2.
3. The maximum peak deviation during the useful part of each burst shall not be greater than 20 degrees.
  - 3.1 Under normal conditions; 3GPP TS 05.05, subclause 4.6.
  - 3.2 Under vibration conditions; 3GPP TS 05.05, subclause 4.6; 3GPP TS 05.05, annex D in subclause D.2.3.
  - 3.3 Under extreme conditions; 3GPP TS 05.05, subclause 4.6; 3GPP TS 05.05, annex D in subclauses D.2.1 and D.2.2.

#### 13.1.3 Test purpose

1. To verify that the MS carrier frequency error does not exceed 0,1 ppm (0,2 ppm for GSM 400):

- 1.1 Under normal conditions.
- 1.2 When the MS is being vibrated.
- 1.3 Under extreme conditions.

NOTE: The transmit frequency accuracy of the SS is expected to be sufficient to ensure that the difference between 0,1 ppm (0,2 ppm for GSM 400) absolute and 0,1 ppm (0,2 ppm for GSM 400) compared to signals received from the BS would be small enough to be considered insignificant.

2. To verify that the RMS phase error on the useful part of the bursts transmitted by the MS does not exceed conformance requirement 2:
  - 2.1 Under normal conditions.
  - 2.2 When the MS is being vibrated.
  - 2.3 Under extreme conditions.
3. To verify that the maximum phase error on the useful part of the bursts transmitted by the MS does not exceed conformance requirement 3:
  - 3.1 Under normal conditions.
  - 3.2 When the MS is being vibrated.
  - 3.3 Under extreme conditions.

#### 13.1.4 Method of test

NOTE: In order to measure the accuracy of the frequency and phase error a sampled measurement of the transmitted phase trajectory is obtained. This is compared with the theoretically expected phase trajectory. The regression line of the difference between the expected trajectory and the measured trajectory is an indication of the frequency error (assumed constant through the burst), whilst the departure of the phase differences from this trajectory is a measure of the phase error. The peak phase error is the value furthest from the regression line and the RMS phase error is the root mean square average of the phase error of all samples.

##### 13.1.4.1 Initial conditions

A call is set up according to the Generic call setup procedure.

The SS commands the MS to hopping mode (table 6.1).

NOTE 1: It is not necessary to test in hopping mode but is done here as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to make sure bursts are taken from a few different channels.

The SS activates ciphering mode.

NOTE 2: Ciphering mode is active during this test to give a pseudo-random bit stream to the modulator.

The SS commands the MS to complete the traffic channel loop back without signalling of erased frames (see subclause 36.2.1.1).

The SS generates Standard Test Signal C1 of annex 5.

##### 13.1.4.2 Procedure

- a) For one transmitted burst, the SS captures the signal as a series of phase samples over the period of the burst. These samples are evenly distributed over the duration of the burst with a minimum sampling rate of  $2/T$ , where  $T$  is the modulation symbol period. The received phase trajectory is then represented by this array of at least 294 samples.

- b) The SS then calculates, from the known bit pattern and the formal definition of the modulator contained in 3GPP TS 05.04, the expected phase trajectory.
- c) From a) and b) the phase trajectory error is calculated, and a linear regression line computed through this phase trajectory error. The slope of this regression line is the frequency error of the mobile transmitter relative to the simulator reference. The difference between the regression line and the individual sample points is the phase error of that point.

- c.1) The sampled array of at least 294 phase measurements is represented by the vector:

$$\varnothing_m = \varnothing_m(0) \dots \varnothing_m(n)$$

where the number of samples in the array  $n+1 \geq 294$ .

- c.2) The calculated array, at the corresponding sampling instants, is represented by the vector:

$$\varnothing_c = \varnothing_c(0) \dots \varnothing_c(n).$$

- c.3) The error array is represented by the vector:

$$\varnothing_e = \{\varnothing_m(0) - \varnothing_c(0)\} \dots \dots \dots \{\varnothing_m(n) - \varnothing_c(n)\} = \varnothing_e(0) \dots \varnothing_e(n).$$

- c.4) The corresponding sample numbers form a vector  $t = t(0) \dots t(n)$ .

- c.5) By regression theory the slope of the samples with respect to  $t$  is  $k$  where:

$$k = \frac{\sum_{j=0}^{j=n} t(j) * \varnothing_e(j)}{\sum_{j=0}^{j=n} t(j)^2}$$

- c.6) The frequency error is given by  $k/(360 * \gamma)$ , where  $\gamma$  is the sampling interval in s and all phase samples are measured in degrees.

- c.7) The individual phase errors from the regression line are given by:

$$\varnothing_e(j) - k * t(j).$$

- c.8) The RMS value  $\varnothing_e$  of the phase errors is given by:

$$\varnothing_e(\text{RMS}) = \left[ \frac{\sum_{j=0}^{j=n} \{\varnothing_e(j) - k * t(j)\}^2}{n+1} \right]^{1/2}$$

- d) Steps a) to c) are repeated for 20 bursts, not necessarily contiguous.
- e) The SS instructs the MS to its maximum power control level, all other conditions remaining constant. Steps a) to d) are repeated.
- f) The SS instructs the MS to the minimum power control level, all other conditions remaining constant. Steps a) to d) are repeated.
- g) The MS is hard mounted on a vibration table and vibrated at the frequency/amplitudes specified in annex 1, TC4. During the vibration steps a) to f) are repeated.

NOTE 1: If the call is terminated when mounting the MS to the vibration table, it will be necessary to establish the initial conditions again before repeating steps a) to f).

- h) The MS is re-positioned on the vibration table in the two orthogonal planes to the plane used in step g). For each of the orthogonal planes step g) is repeated.
- i) Steps a) to f) are repeated under extreme test conditions (see annex 1, TC2.2).

NOTE 2: The series of samples taken to determine the phase trajectory could also be used, with different post-processing, to determine the transmitter burst characteristics of subclause 13.3. Although described independently, it is valid to combine the tests of subclauses 13.1 and 13.3, giving both answers from single sets of captured data.

## 13.1.5 Test requirements

### 13.1.5.1 Frequency error

For all measured bursts, the frequency error, derived in step c.6), shall be less than 0,1 ppm, except for GSM 400 MS where a value of 0,2 ppm shall be used.

### 13.1.5.2 Phase error

For all measured bursts, the RMS phase error, derived in step c.8), shall not exceed 5 degrees.

For all measured bursts, each individual phase error, derived in step c.7), shall not exceed 20 degrees.

## 13.2 Frequency error under multipath and interference conditions

### 13.2.1 Definition and applicability

The frequency error under multipath and interference conditions is a measure of the ability of the MS to maintain frequency synchronization with the received signal under conditions of Doppler shift, multipath reception and interference.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS.

### 13.2.2 Conformance requirement

1. The MS carrier frequency error for each burst shall be accurate to within 0,1 ppm (0,2 ppm for GSM 400), or 0,1 ppm (0,2 ppm for GSM 400) compared to signals received from the BS for signal levels down to 3 dB below the reference sensitivity level.
  - 1.1 Under normal conditions; 3GPP TS 05.10, subclauses 6 and 6.1.
  - 1.2 Under extreme conditions; 3GPP TS 05.10, subclauses 6 and 6.1; 3GPP TS 05.05 annex D in subclauses D.2.1 and D.2.2.
2. The MS carrier frequency error for each burst shall be accurate to within 0,1 ppm (0,2 ppm for GSM 400), or 0,1 ppm (0,2 ppm for GSM 400) compared to signals received from the BS for 3 dB less carrier to interference ratio than the reference interference ratios (3GPP TS 05.10, subclauses 6 and 6.1).

### 13.2.3 Test purpose

1. To verify that the MS carrier frequency error at reference sensitivity, under conditions of multipath and Doppler shift does not exceed 0,1 ppm (0,2 ppm for GSM 400) + the frequency error due to the Doppler shift of the received signal and the assessment error in the MS.
  - 1.1 Under normal conditions.

1.2 Under extreme conditions.

NOTE 1: Although the conformance requirement states that frequency synchronization should be maintained for input signals 3 dB below reference sensitivity. Due to the Radio Link Failure counter this test condition cannot be established. Hence all tests in this subclause are conducted at reference sensitivity level.

2. To verify that the MS carrier frequency error, under interference conditions and TU low fading profile, does not exceed 0,1 ppm (0,2 ppm for GSM 400) + the frequency error due to the Doppler shift of the received signal and the assessment error in the MS.

NOTE 2: The test adds the effect of Doppler shift to the requirements as the conformance requirement refers to signals input to the MS receiver whereas the frequency reference for measurement will not take account of the Doppler shift.

### 13.2.4 Method of test

This test uses the same measurement process as test 13.1 for the MS operating under various RF conditions.

NOTE: The BA list sent on the BCCH and the SACCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCH but if they are provided none will be within 5 channels of the ARFCN used for the serving BCCH or TCH.

#### 13.2.4.1 Initial conditions

The MS is brought into the idle updated state on a serving cell with BCCH in the mid ARFCN range.

#### 13.2.4.2 Procedure

- a) The level of the serving cell BCCH is set to 10 dB above the reference sensitivity level( ) and the fading function set to RA. The SS waits 30 s for the MS to stabilize to these conditions. The SS is set up to capture the first burst transmitted by the MS during call establishment. A call is initiated by the SS on a channel in the mid ARFCN range as described for the generic call set up procedure but to a TCH at level 10 dB above the reference sensitivity level( ) and fading function set to RA.
- b) The SS calculates the frequency accuracy of the captured burst as described in test 13.1.
- c) The SS sets the serving cell BCCH and TCH to the reference sensitivity level( ) applicable to the type of MS, still with the fading function set to RA and then waits 30 s for the MS to stabilize to these conditions.
- d) The SS shall capture subsequent bursts from the traffic channel in the manner described in test 13.1.

NOTE: Due to the very low signal level at the MS receiver input the MS receiver is liable to error. The "looped back" bits are therefore also liable to error, and hence the SS does not know the expected bit sequence. The SS will have to demodulate the received signal to derive (error free) the transmitter burst bit pattern. Using this bit pattern the SS can calculate the expected phase trajectory according to the definition within 3GPP TS 05.04.

- e) The SS calculates the frequency accuracy of the captured burst as described in test 13.1.
- f) Steps d) and e) are repeated for 5 traffic channel bursts spaced over a period of not less than 20 s.
- g) The initial conditions are established again and steps a) to f) are repeated but with the fading function set to HT100 (HT200 for GSM 400, HT120 for GSM 700).
- h) The initial conditions are established again and steps a) to f) are repeated but with the fading function set to TU50 (TU100 for GSM 400, TU 60 for GSM 700).
- i) The initial conditions are established again and steps a) and b) are repeated but with the following differences:
  - the levels of the BCCH and TCH are set to 18 dB above reference sensitivity level( ).
  - two further independent interfering signals are sent on the same nominal carrier frequency as the BCCH and TCH and at a level 10 dB below the level of the TCH and modulated with random data, including the midamble.

- the fading function for all channels is set to TUlow.
- j) The SS waits 100 s for the MS to stabilize to these conditions.
- k) Repeat steps d) to f), except that at step f) the measurement period must be extended to 200 s and the number of measurements increased to 20.
- l) The initial conditions are established again and steps a) to k) are repeated for ARFCN in the Low ARFCN range.
- m) The initial conditions are established again and steps a) to k) are repeated for ARFCN in the High ARFCN range.
- n) Repeat step h) under extreme test conditions (see annex 1, TC2.2).

### 13.2.5 Test requirements

The frequency error, with reference to the SS carrier frequency as measured in repeats of step e), for each measured burst shall be less than the values shown in tables 13-1a and 13-1b.

**Table 13-1a: Requirements for frequency error under multipath, Doppler shift and interference conditions**

| GSM 850 and GSM 900   |                           | DCS 1 800             |                           | PCS 1 900             |                           |
|-----------------------|---------------------------|-----------------------|---------------------------|-----------------------|---------------------------|
| Propagation condition | Permitted frequency error | Propagation condition | Permitted frequency error | Propagation condition | Permitted frequency error |
| RA250                 | ±300 Hz                   | RA130                 | ±400 Hz                   | RA130                 | ±420 Hz                   |
| HT100                 | ±180 Hz                   | HT100                 | ±350 Hz                   | HT100                 | ±370 Hz                   |
| TU50                  | ±160 Hz                   | TU50                  | ±260 Hz                   | TU50                  | ±280 Hz                   |
| TU3                   | ±230 Hz                   | TU1,5                 | ±320 Hz                   | TU1,5                 | ±330 Hz                   |

**Table 13-1b: Requirements for frequency error under multipath, Doppler shift and interference conditions**

| GSM 450               |                           | GSM 480               |                           | GSM 700               |                           |
|-----------------------|---------------------------|-----------------------|---------------------------|-----------------------|---------------------------|
| Propagation condition | Permitted frequency error | Propagation condition | Permitted frequency error | Propagation condition | Permitted frequency error |
| RA500                 | ±300 Hz                   | RA500                 | ±300 Hz                   | RA 300                | ±300 Hz                   |
| HT200                 | ±180 Hz                   | HT200                 | ±180 Hz                   | HT 120                | ±180 Hz                   |
| TU100                 | ±160 Hz                   | TU100                 | ±160 Hz                   | TU 60                 | ±160 Hz                   |
| TU6                   | ±230 Hz                   | TU6                   | ±230 Hz                   | TU 3.6                | ±230 Hz                   |

## 13.3 Transmitter output power and burst timing

### 13.3.1 Definition and applicability

The transmitter output power is the average value of the power delivered to an artificial antenna or radiated by the MS and its integral antenna, over the time that the useful information bits of one burst are transmitted.

The transmit burst timing is the envelope of the RF power transmitted with respect to time. The timings are referenced to the transition from bit 13 to bit 14 of the Training Sequence ("midamble") before differential decoding. The timing of the modulation is referenced to the timing of the received signal from the SS.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS.

### 13.3.2 Conformance requirement

1. The MS maximum output power shall be as defined in 3GPP TS 05.05, subclause 4.1.1, table for GMSK modulation, according to its power class, with a tolerance of ±2 dB under normal conditions; 3GPP TS 05.05, subclause 4.1.1, table for GMSK modulation.

2. The MS maximum output power shall be as defined in 3GPP TS 05.05, subclause 4.1.1, table for GMSK modulation, according to its power class, with a tolerance of  $\pm 2,5$  dB under extreme conditions; 3GPP TS 05.05, subclause 4.1.1, table for GMSK modulation; 3GPP TS 05.05 annex D in subclauses D.2.1 and D.2.2.
3. The power control levels shall have the nominal output power levels as defined in 3GPP TS 05.05, subclause 4.1.1, from the lowest power control level up to the maximum output power corresponding to the class of the MS (for tolerance on maximum output power see conformance requirements 1), with a tolerance of  $\pm 3$  dB,  $\pm 4$  dB or  $\pm 5$  dB under normal conditions; 3GPP TS 05.05, subclause 4.1.1.
4. The power control levels shall have the nominal output power levels as defined in 3GPP TS 05.05, 4.1.1, from the lowest power control level up to the maximum output power corresponding to the class of the MS (for tolerance on maximum output power see conformance requirements 2), with a tolerance of  $\pm 4$  dB,  $\pm 5$  dB or  $\pm 6$  dB under extreme conditions; 3GPP TS 05.05, subclause 4.1.1; 3GPP TS 05.05 annex D subclauses D.2.1 and D.2.2.
5. The output power actually transmitted by the MS at consecutive power control levels shall form a monotonic sequence and the interval between power control levels shall be  $2 \pm 1,5$  dB ( $1 \pm 1$  dB between power control level 30 and 31 for PCS 1 900); 3GPP TS 05.05, subclause 4.1.1.
6. The transmitted power level relative to time for a normal burst shall be within the power/time template given in 3GPP TS 05.05, annex B in figure B.1:
  - 6.1 Under normal conditions; 3GPP TS 05.05, subclause 4.5.2.
  - 6.2 Under extreme conditions; 3GPP TS 05.05, subclause 4.5.2, 3GPP TS 05.05 annex D in subclauses D.2.1 and D.2.2.
7. When accessing a cell on the RACH and before receiving the first power command during a communication on a DCCH or TCH (after an IMMEDIATE ASSIGNMENT), all GSM, class 1 and class 2 DCS 1 800 and PCS 1 900 MS shall use the power control level defined by the MS\_TXPWR\_MAX\_CCH parameter broadcast on the BCCH of the cell, or if MS\_TXPWR\_MAX\_CCH corresponds to a power control level not supported by the MS as defined by its power class, the MS shall act as though the closest supported power control level had been broadcast. A Class 3 DCS 1 800 MS shall use the POWER\_OFFSET parameter.
8. The transmissions from the MS to the BS, measured at the MS antenna, shall be  $468,75 - TA$  bit periods behind the transmissions received from the BS, where TA is the last timing advance received from the current serving BS. The tolerance on these timings shall be  $\pm 1$  bit period:
  - 8.1 Under normal conditions; 3GPP TS 05.10, subclause 6.4.
  - 8.2 Under extreme conditions; 3GPP TS 05.10, subclause 6.4, 3GPP TS 05.05 annex D in subclauses D.2.1 and D.2.2.
9. The transmitted power level relative to time for a random access burst shall be within the power/time template given in 3GPP TS 05.05, annex B in figure B.3:
  - 9.1 Under normal conditions; 3GPP TS 05.05, subclause 4.5.2.
  - 9.2 Under extreme conditions; 3GPP TS 05.05, subclause 4.5.2, 3GPP TS 05.05 annex D in subclauses D.2.1 and D.2.2.
- 10 The MS shall use a TA value of 0 for the Random Access burst sent:
  - 10.1 Under normal conditions; 3GPP TS 05.10, subclause 6.6.
  - 10.2 Under extreme conditions; 3GPP TS 05.10, subclause 6.6, 3GPP TS 05.05 annex D in subclauses D.2.1 and D.2.2.

### 13.3.3 Test purpose

1. To verify that the maximum output power of the MS, under normal conditions, is within conformance requirement 1.
2. To verify that the maximum output power of the MS, under extreme conditions, is within conformance requirement 2.

3. To verify that all power control levels, relevant to the class of MS, are implemented in the MS and have output power levels, under normal conditions, within conformance requirement 3.
4. To verify that all power control levels have output power levels, under extreme conditions, within conformance requirement 4.
5. To verify that the step in the output power transmitted by the MS at consecutive power control levels is within conformance requirement 5 under normal conditions.
6. To verify that the output power relative to time, when sending a normal burst is within conformance requirement 6:
  - 6.1 Under normal conditions.
  - 6.2 Under extreme conditions.
7. To verify that the MS uses the maximum power control level according to its power class if commanded to a power control level exceeding its power class.
8. To verify that, for normal bursts, the MS transmissions to the BS are timed within conformance requirement 8:
  - 8.1 Under normal conditions.
  - 8.2 Under extreme conditions.
9. To verify that the output power relative to time, when sending an access burst is within conformance requirement 9:
  - 9.1 Under normal conditions.
  - 9.2 Under extreme conditions.
10. To verify that, for an access burst, the MS transmission to the BS is timed within conformance requirement 10:
  - 10.1 Under normal conditions.
  - 10.2 Under extreme conditions.

### 13.3.4 Methods of test

Two methods of test are described, separately for:

- 1) equipment fitted with a permanent antenna connector and for
- 2) equipment fitted with an integral antenna, and which cannot be connected to an external antenna except by the fitting of a temporary test connector as a test fixture.

NOTE: The behaviour of the MS in the system is determined to a high degree by the antenna, and this is the only transmitter test in this EN using the integral antenna. Further studies are ongoing on improved testing on the integral antenna, taking practical conditions of MS use into account.

#### 13.3.4.1 Method of test for equipment with a permanent antenna connector

##### 13.3.4.1.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a channel with ARFCN in the Mid ARFCN range, power control level set to Max power. MS TXPWR\_MAX\_CCH is set to the maximum value supported by the Power Class of the Mobile under test. For DCS 1 800 mobile stations the POWER\_OFFSET parameter is set to 6 dB.

## 13.3.4.1.2 Procedure

- a) Measurement of normal burst transmitter output power.
  - The SS takes power measurement samples evenly distributed over the duration of one burst with a sampling rate of at least  $2/T$ , where  $T$  is the bit duration. The samples are identified in time with respect to the modulation on the burst. The SS identifies the centre of the useful 147 transmitted bits, i.e. the transition from bit 13 to bit 14 of the midamble, as the timing reference.
  - The transmitter output power is calculated as the average of the samples over the 147 useful bits. This is also used as the 0 dB reference for the power/time template.
- b) Measurement of normal burst timing delay.
  - The burst timing delay is the difference in time between the timing reference identified in a) and the corresponding transition in the burst received by the MS immediately prior to the MS transmit burst sampled.
- c) Measurement of normal burst power/time relationship.
  - The array of power samples measured in a) are referenced in time to the centre of the useful transmitted bits and in power to the 0 dB reference, both identified in a).
- d) Steps a) to c) are repeated with the MS commanded to operate on each of the power control levels defined, even those not supported by the MS.
- e) The SS commands the MS to the maximum power control level supported by the MS and steps a) to c) are repeated for ARFCN in the Low and High ranges.
- f) Measurement of access burst transmitter output power.
  - The SS causes the MS to generate an Access Burst on an ARFCN in the Mid ARFCN range, this could be either by a handover procedure or a new request for radio resource. In the case of a handover procedure the Power Level indicated in the HANDOVER COMMAND message is the maximum power control level supported by the MS. In the case of an Access Burst the MS shall use the Power Level indicated in the MS\_TXPWR\_MAX\_CCH parameter. If the power class of the MS is DCS 1 800 Class 3, the MS shall also use the POWER\_OFFSET parameter.
  - The SS takes power measurement samples evenly distributed over the duration of the access burst as described in a). However, in this case the SS identifies the centre of the useful bits of the burst by identifying the transition from the last bit of the synch sequence. The centre of the burst is then five data bits prior to this point and is used as the timing reference.
  - The transmitter output power is calculated as the average of the samples over the 87 useful bits of the burst. This is also used as the 0 dB reference for the power/time template.
- g) Measurement of access burst timing delay.
  - The burst timing delay is the difference in time between the timing reference identified in f) and the MS received data on the common control channel.
- h) Measurement of access burst power/time relationship.
  - The array of power samples measured in f) are referenced in time to the centre of the useful transmitted bits and in power to the 0 dB reference, both identified in f).
- i) Depending on the method used in step f) to cause the MS to send an Access Burst, the SS sends either a HANDOVER COMMAND with power control level set to 10 or it changes the System Information elements MS\_TXPWR\_MAX\_CCH and for DCS 1 800 the POWER\_OFFSET on the serving cell BCCH in order to limit the MS transmit power on the Access Burst to power control level 10 (+23 dBm for GSM 400, GSM 700, GSM 850, and GSM 900 or +10 dBm for DCS 1 800 and PCS 1 900) and then steps f) to h) are repeated.
- j) Steps a) to i) are repeated under extreme test conditions (annex 1, TC2.2) except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

### 13.3.4.2 Method of test for equipment with an integral antenna

NOTE: If the MS is equipped with a permanent connector, such that the antenna can be disconnected and the SS be connected directly, then the method of subclause 13.3.4.1 will be applied.

The tests in this subclause are performed on an unmodified test sample.

#### 13.3.4.2.1 Initial conditions

The MS is placed in the anechoic shielded chamber (annex 1, GC5) or on the outdoor test site, on an isolated support, in the position for normal use, at a distance of at least 3 metres from a test antenna, connected to the SS.

NOTE: The test method described has been written for measurement in an anechoic shielded chamber. If an outdoor test site is used then, in addition, it is necessary to raise/lower the test antenna through the specified height range to maximize the received power levels from both the test sample and the substitution antenna.

A call is set up by the SS according to the generic call set up procedure on a channel with ARFCN in the Mid ARFCN range, power control level set to Max power. MS\_TXPWR\_MAX\_CCH is set to the maximum value supported by the Power Class of the Mobile under test. For DCS 1 800 mobile stations the POWER\_OFFSET parameter is set to 6 dB.

#### 13.3.4.2.2 Procedure

- a) With the initial conditions set according to subclause 13.3.4.2.1 the test procedure in subclause 13.3.4.1.2 is followed up to and including step i), except that in step a), when measurements are done at maximum power for ARFCN in the Low, Mid and High range, the measurement is made eight times with the MS rotated by  $n \cdot 45$  degrees for all values of  $n$  in the range 0 to 7.

The measurements taken are received transmitter output power measurements rather than transmitter output power measurements, the output power measurement values can be derived as follows.

- b) Assessment of test site loss for scaling of received output power measurements.

The MS is replaced by a half-wave dipole, resonating at the centre frequency of the transmit band, connected to an RF generator.

The frequency of the RF signal generator is set to the frequency of the ARFCN used for the 24 measurements in step a), the output power is adjusted to reproduce the received transmitter output power averages recorded in step a).

For each indication the power, delivered by the generator (in Watts) to the half-wave dipole, is recorded. These values are recorded in the form  $P_{nc}$ , where  $n$  = MS rotation and  $c$  = channel number.

For each channel number used compute:

$$P_{ac}(\text{Watts into dipole}) = \frac{1}{8} * \sum_{n=0}^{n=7} P_{nc}$$

from which:  $P_{ac}(\text{Tx dBm}) = 10 \log_{10}(P_{ac}) + 30 + 2,15$

The difference, for each of the three channels, between the actual transmitter output power averaged over the 8 measurement orientations and the received transmitter output power at orientation  $n = 0$  is used to scale the received measurement results to actual transmitter output powers for all measured power control levels and ARFCN, which can then be checked against the requirements.

- c) Temporary antenna connector calibration factors (transmit).

A modified test sample equipped with a temporary antenna connector is placed in a climatic test chamber and is linked to the SS by means of the temporary antenna connector.

Under normal test conditions, the power measurement and calculation parts of steps a) to i) of 13.3.4.1.2 are repeated except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

NOTE 1: The values noted here are related to the output transmitter carrier power levels under normal test conditions, which are known after step b). Therefore frequency dependent calibration factors that account for the effects of the temporary antenna connector can be determined.

d) Measurements at extreme test conditions.

NOTE 2: Basically the procedure for extreme conditions is:

- the power/time template is tested in the "normal" way;
- the radiated power is measured by measuring the difference with respect to the radiated power under normal test conditions.

Under extreme test conditions steps a) to i) of subclause 13.3.4.1.2 are repeated except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

The transmitter output power under extreme test conditions is calculated for each burst type, power control level and for every frequency used by adding the frequency dependent calibration factor, determined in c), to the values obtained at extreme conditions in this step.

### 13.3.5 Test requirements

- a) The transmitter output power, under every combination of normal and extreme test conditions, for normal bursts and access bursts, at each frequency and for each power control level applicable to the MS power class, shall be at the relevant level shown in table 13-2, table 13-3 or table 13-4 within the tolerances also shown in table 13-2, table 13-3 or table 13-4.

NOTE: When the power control level corresponds to the power class of the MS, then the tolerances shall be 2,0 dB under normal test conditions and 2,5 dB under extreme test conditions.

PCS 1 900 only - end

- b) The difference between the transmitter output power at two adjacent power control levels, measured at the same frequency, shall not be less than 0,5 dB and not be more than 3,5 dB. For PCS 1 900 Class 3 the difference between the transmitter output power at power controls level 30 and 31, measured at the same frequency, shall not be less than 0 dB and not be more than 2 dB.
- c) The power/time relationship of the measured samples for normal bursts shall be within the limits of the power time template of figure 13-1 at each frequency, under every combination of normal and extreme test conditions and at each power control level measured.

**Figure 13-1: Power / time template for normal bursts**

\* For GSM 400, GSM 700, GSM 850 and GSM 900 MS:

- 4 dBc for power control level 16;
- 2 dBc for power control level 17;
- 1 dBc for power control levels 18 and 19.

For DCS 1 800 and PCS 1 900 MS:

- 4 dBc for power control level 11;
- 2 dBc for power control level 12;
- 1 dBc for power control levels 13, 14 and 15.

\*\* For GSM 400, GSM 700, GSM 850 and GSM 900 MS:

- 30 dBc or -17 dBm, whichever is the higher.

For DCS 1 800 and PCS 1 900 MS:

- 30 dBc or -20 dBm, whichever is the higher.

**Table 13-5: Lowest measurement limit for power / time template**

|                                    | lowest limit                                                                                                                                                                         |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GSM 400, GSM 700, GSM 850, GSM 900 | -59 dBc or -54 dBm whichever is the highest, except for the timeslot preceding the active slot, for which the allowed level is equal to -59 dBc or -36 dBm, whichever is the highest |
| DCS 1 800, PCS 1 900               | -48 dBc or -48 dBm whichever is the highest                                                                                                                                          |

- d) All the power control levels, for the type and power class of the MS as stated by the manufacturer, shall be implemented in the MS.
- e) When the transmitter is commanded to a power control level outside of the capability corresponding to the type and power class of the MS as stated by the manufacturer, then the transmitter output power shall be within the tolerances for the closest power control level corresponding to the type and power class as stated by the manufacturer.

- f) The centre of the transmitted normal burst as defined by the transition of bits 13/14 of the midamble shall be 3 timeslot periods (1 731  $\mu$ s)  $\pm$ 1 bit period ( $\pm$ 3,69  $\mu$ s) after the centre of the corresponding received burst.
- g) The power/time relationship of the measured samples for access bursts shall be within the limits of the power time template of figure 13-2 at each frequency, under every combination of normal and extreme test conditions and at each power control level measured.

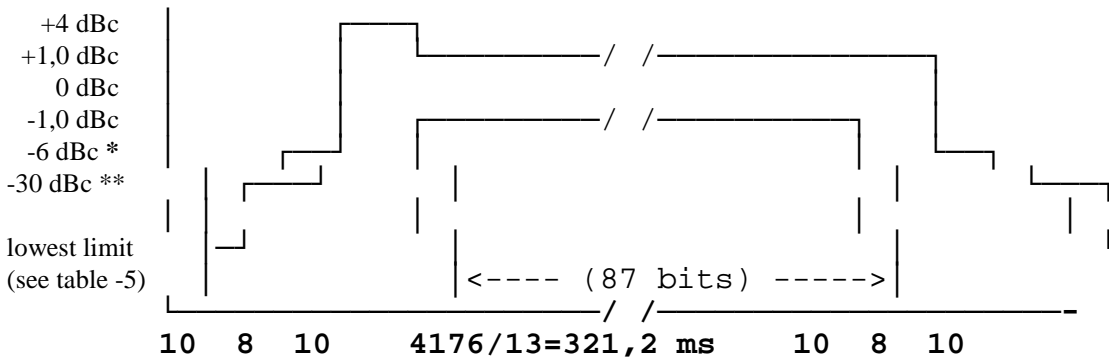

Figure 13-2: Power / time template for access burst

- \* For GSM 400, GSM 700, GSM 850 and GSM 900 MS:

- 4 dBc for power control level 16;
- 2 dBc for power control level 17;
- 1 dBc for power control levels 18 and 19.

For DCS 1 800 and PCS 1 900 MS:

- 4 dBc for power control level 11;
- 2 dBc for power control level 12;
- 1 dBc for power control levels 13, 14 and 15.

- \*\* For GSM 400, GSM 700, GSM 850 and GS M900 MS:

- 30 dBc or -17 dBm, whichever is the higher.

For DCS 1 800 and PCS 1 900 MS:

- 30 dBc or -20 dBm, whichever is the higher.

- h) The centre of the transmitted access burst shall be an integer number of timeslot periods less 30 bit periods relative to any CCCH midamble centre with a tolerance of  $\pm$ 1 bit period ( $\pm$ 3,69  $\mu$ s).

## 13.4 Output RF spectrum

### 13.4.1 Definition and applicability

The output RF spectrum is the relationship between the frequency offset from the carrier and the power, measured in a specified bandwidth and time, produced by the MS due to the effects of modulation and power ramping.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS.

## 13.4.2 Conformance requirement

1. The level of the output RF spectrum due to modulation shall be no more than that given in 3GPP TS 05.05, subclause 4.2.1, table a1) for GSM 400, GSM 700, GSM 850 and GSM 900, table B.1) for DCS 1 800 or table C.1) for PCS 1 900, with the following lowest measurement limits:
  - -36 dBm below 600 kHz offset from the carrier;
  - -51 dBm for GSM 400, GSM 700, GSM 850 and GSM 900 or -56 dBm for DCS 1 800 and PCS 1 900 from 600 kHz out to less than 1 800 kHz offset from the carrier;
  - -46 dBm for GSM 400, GSM 700, GSM 850 and GSM 900 or -51 dBm for DCS 1 800 and PCS 1 900 at and beyond 1 800 kHz offset from the carrier;
 but with the following exceptions at up to -36 dBm:
  - up to three bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz in the combined range 600 kHz to 6000 kHz above and below the carrier;
  - up to 12 bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz at more than 6 000 kHz offset from the carrier.
  - 1.1 Under normal conditions; 3GPP TS 05.05, subclause 4.2.1.
  - 1.2 Under extreme conditions; 3GPP TS 05.05, subclause 4.2.1; 3GPP TS 05.05, annex D in subclauses D.2.1 and D.2.2.
2. The level of the output RF spectrum due to switching transients shall be no more than given in 3GPP TS 05.05, subclause 4.2.2, table "a) Mobile Station".
  - 2.1 Under normal conditions; 3GPP TS 05.05, subclause 4.2.2.
  - 2.2 Under extreme conditions; 3GPP TS 05.05, subclause 4.2.2; 3GPP TS 05.05 annex D in subclauses D.2.1 and D.2.2.
3. When allocated a channel, the power emitted by a GSM 400, GSM 900 and DCS 1 800 MS, in the band 935 MHz to 960 MHz shall be no more than -79 dBm, in the band 925 MHz to 935 MHz shall be no more than -67 dBm and in the band 1 805 MHz to 1 880 MHz shall be no more than -71 dBm except in five measurements in each of the bands 925 MHz to 960 MHz and 1 805 MHz to 1 880 MHz where exceptions at up to -36 dBm are permitted. For GSM 400 MS, in addition, the power emitted by MS, in the bands of 460,4 MHz to 467,6 MHz and 488,8 MHz to 496 MHz shall be no more than -67 dBm except in three measurements in each of the bands 460,4 MHz to 467,6 MHz and 488,8 MHz to 496 MHz where exceptions at up to -36 dBm are permitted. For GSM 700, GSM 850 and PCS 1 900 MS, the power emitted by MS, in the band of 747 MHz to 757 MHz shall be no more than -79 dBm, in the band of 757 MHz to 762 MHz shall be no more than -73 dBm, in the band 869 MHz to 894 MHz shall be no more than -79 dBm, in the band 1 930 MHz to 1 990 MHz shall be no more than -71 dBm except in five measurements in each of the bands 747 MHz to 762 MHz, 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz where exceptions at up to -36 dBm are permitted. Under normal conditions; 3GPP TS 05.05, subclause 4.3.3.

## 13.4.3 Test purpose

1. To verify that the output RF spectrum due to modulation does not exceed conformance requirement 1.
  - 1.1 Under normal conditions.
  - 1.2 Under extreme conditions.
2. To verify that the output RF spectrum due to switching transients does not exceed conformance requirement 2 when a reasonable margin is allowed for the effect of spectrum due to modulation.
  - 2.1 Under normal conditions.
  - 2.2 Under extreme conditions.
3. To verify that the MS spurious emissions in the MS receive band do not exceed conformance requirement 3.

## 13.4.4 Method of test

### 13.4.4.1 Initial conditions

A call is set up according to the generic call set up procedure.

The SS commands the MS to hopping mode. The hopping pattern includes only three channels, namely one with an ARFCN in the Low ARFCN range, a second one with an ARFCN in the Mid ARFCN range and the third one with an ARFCN in the High ARFCN range.

NOTE 1: Although the measurement is made whilst the MS is in hopping mode, each measurement is on one single channel.

NOTE 2: This test is specified in hopping mode as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to handover the MS between the three channels tested at the appropriate time.

The SS commands the MS to complete the traffic channel loop back without signalling of erased frames (see subclause 36.2.1.1). This is to set a defined random pattern for the transmitter.

The SS sends Standard Test Signal C1 (annex 5) to the MS at a level of 23 dB $\mu$ Vemf( ).

### 13.4.4.2 Procedure

NOTE: When averaging is in use during frequency hopping mode, the averaging only includes bursts transmitted when the hopping carrier corresponds to the nominal carrier of the measurement.

a) In steps b) to h) the FT is equal to the hop pattern ARFCN in the Mid ARFCN range.

b) The other settings of the spectrum analyser are set as follows:

- Zero frequency scan;
- Resolution bandwidth: 30 kHz;
- Video bandwidth: 30 kHz;
- Video averaging: may be used, depending on the implementation of the test.

The video signal of the spectrum analyser is "gated" such that the spectrum generated by at least 40 of the bits 87 to 132 of the burst is the only spectrum measured. This gating may be analogue or numerical, dependent upon the design of the spectrum analyser. Only measurements during transmitted bursts on the nominal carrier of the measurement are included. The spectrum analyser averages over the gated period and over 200 or 50 such bursts, using numerical and/or video averaging.

The MS is commanded to its maximum power control level.

c) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 50 bursts at all multiples of 30 kHz offset from FT to < 1 800 kHz.

d) The resolution and video bandwidth on the spectrum analyser are adjusted to 100 kHz and the measurements are made at the following frequencies:

- on every ARFCN from 1 800 kHz offset from the carrier to the edge of the relevant transmit band for each measurement over 50 bursts;
- at 200 kHz intervals over the 2 MHz either side of the relevant transmit band for each measurement over 50 bursts.

For GSM 400, GSM 900 and DCS 1 800:

- at 200 kHz intervals over the band 925 MHz to 960 MHz for each measurement over 50 bursts;
- at 200 kHz intervals over the band 1 805 MHz to 1 880 MHz for each measurement over 50 bursts.

In addition for GSM 400 MS:

- at 200 kHz intervals over the band 460,4 MHz to 467,6 MHz for each measurement over 50 bursts;
- at 200 kHz intervals over the band 488,8 MHz to 496 MHz for each measurement over 50 bursts.

For GSM 700, GSM 850 and PCS 1 900:

- at 200 kHz intervals over the band 747 MHz to 762 MHz for each measurement over 50 bursts;
- at 200 kHz intervals over the band 869 MHz to 894 MHz for each measurement over 50 bursts;
- at 200 kHz intervals over the band 1 930 MHz to 1 990 MHz for each measurement over 50 bursts.

- e) The MS is commanded to its minimum power control level. The spectrum analyser is set again as in b).
- f) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 200 bursts at the following frequencies:

FT;

FT + 100 kHz            FT - 100 kHz;

FT + 200 kHz            FT - 200 kHz;

FT + 250 kHz            FT - 250 kHz;

FT + 200 kHz \* N        FT - 200 kHz \* N;

where N = 2, 3, 4, 5, 6, 7, and 8;

and FT = RF channel nominal centre frequency.

- g) The spectrum analyser settings are adjusted to:

- Zero frequency scan;
- Resolution bandwidth:        30 kHz;
- Video bandwidth:                100 kHz;
- Peak hold.

The spectrum analyser gating of the signal is switched off.

The MS is commanded to its maximum power control level.

- h) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured at the following frequencies:

FT + 400 kHz            FT - 400 kHz;

FT + 600 kHz            FT - 600 kHz;

FT + 1,2 MHz            FT - 1,2 MHz;

FT + 1,8 MHz            FT - 1,8 MHz;

where FT = RF channel nominal centre frequency.

The duration of each measurement (at each frequency) will be such as to cover at least 10 burst transmissions at FT.

- i) Step h) is repeated for power control levels 7 and 11.
- j) Steps b), f), g) and h) are repeated with FT equal to the hop pattern ARFCN in the Low ARFCN range except that in step g) the MS is commanded to power control level 11 rather than maximum power.
- k) Steps b), f), g) and h) are repeated with FT equal to the hop pattern ARFCN in the High ARFCN range except that in step g) the MS is commanded to power control level 11 rather than maximum power.

- l) Steps a) b) f) g) and h) are repeated under extreme test conditions (annex 1, TC2.2). except that at step g) the MS is commanded to power control level 11.

### 13.4.5 Test requirements

For absolute measurements, performed on a temporary antenna connector, in the frequency band 450,4 MHz to 457,6 MHz, 478,8 MHz to 486 MHz, 777 MHz to 792 MHz, 824 MHz to 849 MHz, 880 MHz to 915 MHz, 1 710 MHz to 1 785 MHz, or 1 850 MHz to 1 910 MHz, the temporary antenna connector coupling factor, determined according to subclause 13.3.4.2.2 and annex 1 GC7, for the nearest relevant frequency, will be used.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 925 MHz to 960 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 900 MS. For a GSM 400, GSM 700, GSM 850, DCS 1 800 or PCS 1 900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 1 805 MHz to 1 880 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for DCS 1 800 MS. For GSM 400, GSM 700, GSM 850, GSM 900 or PCS 1 900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 460,4 MHz to 467,6 MHz or 488,8 MHz to 496 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 400 MS. For a GSM 700, GSM 850, GSM 900, DCS 1800 or PCS 1 900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 1 930 MHz to 1 990 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for PCS 1 900 MS. For GSM 400, GSM 700, GSM 850, GSM 900 or DCS 1 800 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 747 MHz to 762 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 700 MS. For a GSM 400, GSM 850, GSM 900, DCS 1800 or PCS 1 900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 869 MHz to 894 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 850 MS. For a GSM 400, GSM 700, GSM 900, DCS 1800 or PCS 1 900 MS 0 dB will be assumed.

The figures in the tables below, at the listed frequencies from the carrier (kHz), are the maximum level (dB) relative to a measurement in 30 kHz bandwidth on the carrier (reference 3GPP TS 05.05 subclause 4.2.1).

- a) For the modulation sidebands out to less than 1 800 kHz offset from the carrier frequency (FT) measured in step c), f), h), j), k) and l) the measured power level in dB relative to the power level measured at FT, for all types of MS, shall not exceed the limits derived from the values shown in table 13-6 for GSM 400, GSM 700, GSM 850 and GSM 900, table 13-7 for DCS 1 800 or table 13-8 for PCS 1 900 according to the actual transmit power and frequency offset from FT. However any failures in the combined range 600 kHz to less than 1 800 kHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below.

**Table 13-6: GSM 400, GSM 700, GSM 850 and GSM 900 Spectrum due to modulation out to less than 1 800 kHz offset**

|                                                                          | power levels in dB relative to the measurement at FT |     |     |     |              |
|--------------------------------------------------------------------------|------------------------------------------------------|-----|-----|-----|--------------|
| Power level                                                              | Frequency offset (kHz)                               |     |     |     |              |
| (dBm)                                                                    | 0-100                                                | 200 | 250 | 400 | 600 to <1800 |
| 39                                                                       | +0,5                                                 | -30 | -33 | -60 | -66          |
| 37                                                                       | +0,5                                                 | -30 | -33 | -60 | -64          |
| 35                                                                       | +0,5                                                 | -30 | -33 | -60 | -62          |
| <= 33                                                                    | +0,5                                                 | -30 | -33 | -60 | -60          |
| The values above are subject to the minimum absolute levels (dBm) below. |                                                      |     |     |     |              |
|                                                                          | -36                                                  | -36 | -36 | -36 | -51          |

**Table 13-7: DCS 1 800 Spectrum due to modulation out to less than 1 800 kHz offset**

| power levels in dB relative to the measurement at FT                     |                        |     |     |     |              |
|--------------------------------------------------------------------------|------------------------|-----|-----|-----|--------------|
| Power level                                                              | Frequency offset (kHz) |     |     |     |              |
| (dBm)                                                                    | 0-100                  | 200 | 250 | 400 | 600 to <1800 |
| <= 36                                                                    | +0,5                   | -30 | -33 | -60 | -60          |
| The values above are subject to the minimum absolute levels (dBm) below. |                        |     |     |     |              |
|                                                                          | -36                    | -36 | -36 | -36 | -56          |

**Table 13-8: PCS 1 900 Spectrum due to modulation out to less than 1 800 kHz offset**

| power levels in dB relative to the measurement at FT                     |                        |     |     |     |              |               |
|--------------------------------------------------------------------------|------------------------|-----|-----|-----|--------------|---------------|
| Power level                                                              | Frequency offset (kHz) |     |     |     |              |               |
| (dBm)                                                                    | 0-100                  | 200 | 250 | 400 | 600 to <1200 | 1200 to <1800 |
| <= 33                                                                    | +0,5                   | -30 | -33 | -60 | -60          | -60           |
| The values above are subject to the minimum absolute levels (dBm) below. |                        |     |     |     |              |               |
|                                                                          | -36                    | -36 | -36 | -36 | -56          | -56           |

NOTE 1: For frequency offsets between 100 kHz and 600 kHz the requirement is derived by a linear interpolation between the points identified in the table with linear frequency and power in dB relative.

- b) For the modulation sidebands from 1 800 kHz offset from the carrier frequency (FT) and out to 2 MHz beyond the edge of the relevant transmit band, measured in step d), the measured power level in dB relative to the power level measured at FT, shall not exceed the values shown in table 13-7 according to the actual transmit power, frequency offset from FT and system on which the MS is designed to operate. However any failures in the combined range 1 800 kHz to 6 MHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below, and any other failures may be counted towards the exceptions allowed in test requirements d) below.

**Table 13-9: Spectrum due to modulation from 1 800 kHz offset to the edge of the transmit band (wideband noise)**

| power levels in dB relative to the measurement at FT                     |                      |                  |          |             |                      |          |             |                      |          |
|--------------------------------------------------------------------------|----------------------|------------------|----------|-------------|----------------------|----------|-------------|----------------------|----------|

| The values above are subject to the minimum absolute levels (dBm) below. |                      |                  |          |             |                      |          |             |                      |          |
|                                                                          | -46                  | -46              | -46      |             | -51                  | -51      |             | -51                  | -51      |

- c) Any failures (from a) and b) above) in the combined range 600 kHz to 6 MHz above and below the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, spurious emissions are allowed in up to three 200 kHz bands centred on an integer multiple of 200 kHz so long as no spurious emission exceeds -36 dBm. Any spurious emissions measured in a 30 kHz bandwidth which spans two 200 kHz bands can be counted towards either 200 kHz band, whichever minimizes the number of 200 kHz bands containing spurious exceptions.

- d) Any failures (from b) above) beyond 6 MHz offset from the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, up to twelve spurious emissions are allowed so long as no spurious emission exceeds -36 dBm.
- e) For GSM 400, GSM 900 and DCS 1 800 MS the spurious emissions in the bands 925 MHz to 935 MHz, 935 MHz to 960 MHz and 1 805 MHz to 1 880 MHz, measured in step d), shall not exceed the values shown in table 13-10 except in up to five measurements in the band 925 MHz to 960 MHz and five measurements in the band 1 805 MHz to 1 880 MHz where a level up to -36 dBm is permitted. For GSM 400 MS, in addition, the MS spurious emissions in the bands 460,4 MHz to 467,6 MHz and 488,8 MHz to 496 MHz shall not exceed the value of -67 dBm, except in up to three measurements in each of the bands 460,4 MHz to 467,6 MHz and 488,8 MHz to 496 MHz where a level up to -36 dBm is permitted. For GSM 700, GSM 850 and PCS 1 900 MS the spurious emissions in the bands 747 MHz to 757 MHz, 757 MHz to 762 MHz, 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz shall not exceed the values shown in table 13-10 except in up to five measurements in each of the bands 747 MHz to 762 MHz, 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz where a level up to -36 dBm is permitted.

**Table 13-10: Spurious emissions in the MS receive bands**

| Band (MHz)     | Spurious emissions level (dBm) |                                |
|----------------|--------------------------------|--------------------------------|
|                | GSM 400, GSM 900 and DCS 1 800 | GSM 700, GSM 850 and PCS 1 900 |
| 925 to 935     | -67                            |                                |
| 935 to 960     | -79                            |                                |
| 1 805 to 1 880 | -71                            |                                |
| 747 to 757     |                                | -79                            |
| 757 to 762     |                                | -73                            |
| 869 to 894     |                                | -79                            |
| 1 930 to 1 990 |                                | -71                            |

- f) For the power ramp sidebands of steps h) and i) the power levels must not exceed the values shown in table 13-11 for GSM 400, GSM 700, GSM 850 and GSM 900, table 13-12 for DCS 1 800 or table 13-13 for PCS 1 900.

**Table 13-11: GSM Spectrum due to switching transients**

| Power level | Maximum level for various offsets from carrier frequency |         |           |           |
|-------------|----------------------------------------------------------|---------|-----------|-----------|
|             | 400 kHz                                                  | 600 kHz | 1 200 kHz | 1 800 kHz |
| 39 dBm      | -13 dBm                                                  | -21 dBm | -21 dBm   | -24 dBm   |
| 37 dBm      | -15 dBm                                                  | -21 dBm | -21 dBm   | -24 dBm   |
| 35 dBm      | -17 dBm                                                  | -21 dBm | -21 dBm   | -24 dBm   |
| 33 dBm      | -19 dBm                                                  | -21 dBm | -21 dBm   | -24 dBm   |

|             | 400 kHz                                                  | 600 kHz | 1200 kHz | 1 800 kHz |
| 36 dBm      | -16 dBm                                                  | -21 dBm | -21 dBm  | -24 dBm   |
| 34 dBm      | -18 dBm                                                  | -21 dBm | -21 dBm  | -24 dBm   |
| 32 dBm      | -20 dBm                                                  | -22 dBm | -22 dBm  | -25 dBm   |
| 30 dBm      | -22 dBm                                                  | -24 dBm | -24 dBm  | -27 dBm   |
| 28 dBm      | -23 dBm                                                  | -25 dBm | -26 dBm  | -29 dBm   |
| 26 dBm      | -23 dBm                                                  | -26 dBm | -28 dBm  | -31 dBm   |
| 24 dBm      | -23 dBm                                                  | -26 dBm | -30 dBm  | -33 dBm   |
| 22 dBm      | -23 dBm                                                  | -26 dBm | -31 dBm  | -35 dBm   |
| <= +20 dBm  | -23 dBm                                                  | -26 dBm | -32 dBm  | -36 dBm   |

**Table 13-13: PCS 1 900 Spectrum due to switching transients**

| Power level | Maximum level for various offsets from carrier frequency |         |           |           |
|-------------|----------------------------------------------------------|---------|-----------|-----------|
|             | 400 kHz                                                  | 600 kHz | 1 200 kHz | 1 800 kHz |
| 33 dBm      | -19 dBm                                                  | -22 dBm | -22 dBm   | -25 dBm   |
| 32 dBm      | -20 dBm                                                  | -22 dBm | -22 dBm   | -25 dBm   |
| 30 dBm      | -22 dBm                                                  | -24 dBm | -24 dBm   | -27 dBm   |
| 28 dBm      | -23 dBm                                                  | -25 dBm | -26 dBm   | -29 dBm   |
| 26 dBm      | -23 dBm                                                  | -26 dBm | -28 dBm   | -31 dBm   |
| 24 dBm      | -23 dBm                                                  | -26 dBm | -30 dBm   | -33 dBm   |
| 22 dBm      | -23 dBm                                                  | -26 dBm | -31 dBm   | -35 dBm   |
| <= +20 dBm  | -23 dBm                                                  | -26 dBm | -32 dBm   | -36 dBm   |

NOTE 2: These figures are different from the requirements in 3GPP TS 05.05 because at higher power levels it is the modulation spectrum which is being measured using a peak hold measurement. This allowance is given in the table.

NOTE 3: The figures for table 13-11, table 13-12 and table 13-13 assume that, using the peak hold measurement, the lowest level measurable is 8 dB above the level of the modulation specification using the 30 kHz bandwidth gated average technique for 400 kHz offset from the carrier. At 600 and 1200 kHz offset the level is 6 dB above and at 1 800 kHz offset the level is 3 dB above. The figures for 1 800 kHz have assumed the 30 kHz bandwidth spectrum due to modulation specification at <1 800 kHz.

## 13.5 Void

## 13.6 Frequency error and phase error in HSCSD multislots configurations

### 13.6.1 Definition and applicability

The frequency error is the difference in frequency, after adjustment for the effect of the modulation and phase error, between the RF transmission from the MS and either:

- the RF transmission from the BS; or
- the nominal frequency for the ARFCN used.

The phase error is the difference in phase, after adjustment for the effect of the frequency error, between the RF transmission from the MS and the theoretical transmission according to the intended modulation.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS and any multiband MS which are capable of HSCSD multislots operation.

### 13.6.2 Conformance requirement

1. The MS carrier frequency shall be accurate to within 0,1 ppm, or accurate to within 0,1 ppm compared to signals received from the BS:
  - 1.1 Under normal conditions; 3GPP TS 05.10, subclause 6.1.
  - 1.2 Under vibration conditions; 3GPP TS 05.10, subclause 6.1; 3GPP TS 05.05, annex D D.2.3.
  - 1.3 Under extreme conditions; 3GPP TS 05.10, subclause 6.1; 3GPP TS 05.05, subclause 4.4; 3GPP TS 05.05, annex D in subclauses D.2.1 and D.2.2.

2. The RMS phase error (difference between the phase error trajectory and its linear regression on the active part of the time slot) for each burst shall not be greater than 5 degrees:
  - 2.1 Under normal conditions; 3GPP TS 05.05, subclause 4.6.
  - 2.2 Under vibration conditions; 3GPP TS 05.05, subclause 4.6; 3GPP TS 05.05, annex D in subclause D.2.3.
  - 2.3 Under extreme conditions; 3GPP TS 05.05, subclause 4.6; 3GPP TS 05.05, annex D in subclauses D.2.1 and D.2.2.
3. The maximum peak deviation during the useful part of each burst shall not be greater than 20 degrees.
  - 3.1 Under normal conditions; 3GPP TS 05.05, subclause 4.6.
  - 3.2 Under vibration conditions; 3GPP TS 05.05, subclause 4.6; 3GPP TS 05.05, annex D in subclause D.2.3.
  - 3.3 Under extreme conditions; 3GPP TS 05.05, subclause 4.6; 3GPP TS 05.05, annex D in subclauses D.2.1 and D.2.2.

### 13.6.3 Test purpose

1. To verify that in a multislot configuration the MS carrier frequency error does not exceed 0,1 ppm:
  - 1.1 Under normal conditions.
  - 1.2 When the MS is being vibrated.
  - 1.3 Under extreme conditions.

NOTE: The transmit frequency accuracy of the SS is expected to be sufficient to ensure that the difference between 0,1 ppm absolute and 0,1 ppm compared to signals received from the BS would be small enough to be considered insignificant.

2. To verify that the RMS phase error on the useful part of the bursts transmitted by the MS in a multislot configuration does not exceed conformance requirement 2:
  - 2.1 Under normal conditions.
  - 2.2 When the MS is being vibrated.
  - 2.3 Under extreme conditions.
3. To verify that the maximum phase error on the useful part of the bursts transmitted by the MS in a multislot configuration does not exceed conformance requirement 3.
  - 3.1 Under normal conditions.
  - 3.2 When the MS is being vibrated.
  - 3.3 Under extreme conditions.

### 13.6.4 Method of test

NOTE: In order to measure the accuracy of the frequency and phase error a sampled measurement of the transmitted phase trajectory is obtained. This is compared with the theoretically expected phase trajectory. The regression line of the difference between the expected trajectory and the measured trajectory is an indication of the frequency error (assumed constant through the burst), whilst the departure of the phase differences from this trajectory is a measure of the phase error. The peak phase error is the value furthest from the regression line and the RMS phase error is the root mean square average of the phase error of all samples.

### 13.6.4.1 Initial conditions

A call is set up according to the generic call setup procedure for multislot HSCSD.

The SS commands the MS to hopping mode (table 13.6.1).

NOTE 1: It is not necessary to test in hopping mode but is done here as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to make sure bursts are taken from a few different channels.

The SS activates ciphering mode.

NOTE 2: Ciphering mode is active during this test to give a pseudo-random bit stream to the modulator.

The SS sets the MS to operate in a multislot configuration with maximum number of transmitted time slots.

The SS commands the MS to complete the traffic channel multislot loop back including signalling of erased frames.

The SS generates Standard Test Signal C1 of annex 5.

### 13.6.4.2 Procedure

- a) For one transmitted burst on the last multislot subchannel, the SS captures the signal as a series of phase samples over the period of the burst. These samples are evenly distributed over the duration of the burst with a minimum sampling rate of  $2/T$ , where  $T$  is the modulation symbol period. The received phase trajectory is then represented by this array of at least 294 samples.
- b) The SS then calculates, from the known bit pattern and the formal definition of the modulator contained in 3GPP TS 05.04, the expected phase trajectory.
- c) From a) and b) the phase trajectory error is calculated, and a linear regression line computed through this phase trajectory error. The slope of this regression line is the frequency error of the mobile transmitter relative to the simulator reference. The difference between the regression line and the individual sample points is the phase error of that point.

- c.1) The sampled array of at least 294 phase measurements is represented by the vector:

$$\varnothing_m = \varnothing_m(0) \dots \varnothing_m(n)$$

where the number of samples in the array  $n+1 \geq 294$ .

- c.2) The calculated array, at the corresponding sampling instants, is represented by the vector:

$$\varnothing_c = \varnothing_c(0) \dots \varnothing_c(n).$$

- c.3) The error array is represented by the vector:

$$\varnothing_e = \{\varnothing_m(0) - \varnothing_c(0)\} \dots \dots \dots \{\varnothing_m(n) - \varnothing_c(n)\} = \varnothing_e(0) \dots \varnothing_e(n).$$

- c.4) The corresponding sample numbers form a vector  $t = t(0) \dots t(n)$ .

- c.5) By regression theory the slope of the samples with respect to  $t$  is  $k$  where:

$$k = \frac{\sum_{j=0}^{j=n} t(j) * \varnothing_e(j)}{\sum_{j=0}^{j=n} t(j)^2}$$

- c.6) The frequency error is given by  $k/(360 \times \gamma)$ , where  $\gamma$  is the sampling interval in s and all phase samples are measured in degrees.

- c.7) The individual phase errors from the regression line are given by:

$$\varnothing_e(j) - k \times t(j).$$

- c.8) The RMS value  $\varnothing_e$  of the phase errors is given by:

$$\varnothing_e(\text{RMS}) = \left[ \frac{\sum_{j=0}^{j=n} \{\varnothing_e(j) - k * t(j)\}^2}{n+1} \right]^{1/2}$$

- d) Steps a) to c) are repeated for 20 bursts, not necessarily contiguous.
- e) The SS instructs the MS to its maximum power control level on each multislot subchannel, all other conditions remaining constant. Steps a) to d) are repeated.
- f) The SS instructs the MS to the minimum power control level on each multislot subchannel, all other conditions remaining constant. Steps a) to d) are repeated.
- g) The MS is hard mounted on a vibration table and vibrated at the frequency/amplitudes specified in annex 1, TC4.

During the vibration steps a) to f) are repeated.

NOTE 1: If the call is terminated when mounting the MS to the vibration table, it will be necessary to establish the initial conditions again before repeating steps a) to f).

- h) The MS is re-positioned on the vibration table in the two orthogonal planes to the plane used in step g). For each of the orthogonal planes step g) is repeated.
- i) Steps a) to f) are repeated under extreme test conditions (see annex 1, TC2.2).

NOTE 2: The series of samples taken to determine the phase trajectory could also be used, with different post-processing, to determine the transmitter burst characteristics of 'Transmitter output power and burst timing in multislot configuration'. Although described independently, it is valid to combine these two tests, giving both answers from single sets of captured data.

## 13.6.5 Test requirements

### 13.6.5.1 Frequency error

For all measured bursts, the frequency error, derived in step c.6), shall be less than 10E-7.

### 13.6.5.2 Phase error

For all measured bursts, the RMS phase error, derived in step c.8), shall not exceed 5 degrees.

For all measured bursts, each individual phase error, derived in step c.7), shall not exceed 20 degrees.

## 13.7 Transmitter output power and burst timing in HSCSD configurations

### 13.7.1 Definition and applicability

The transmitter output power is the average value of the power delivered to an artificial antenna or radiated by the MS and its integral antenna, over the time that the useful information bits of one burst are transmitted.

The transmit burst timing is the envelope of the RF power transmitted with respect to time. The timings are referenced to the transition from bit 13 to bit 14 of the Training Sequence ("midamble") before differential decoding. The timing of the modulation is referenced to the timing of the received signal from the SS.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS and multiband any MS which are capable of HSCSD multislot operation.

## 13.7.2 Conformance requirement

1. The MS maximum output power shall be as defined in 3GPP TS 05.05, subclause 4.1.1, first table, according to its power class, with a tolerance of  $\pm 2$  dB under normal conditions; 3GPP TS 05.05, subclause 4.1.1, first table.
2. The MS maximum output power shall be as defined in 3GPP TS 05.05, subclause 4.1.1, first table, according to its power class, with a tolerance of  $\pm 2,5$  dB under extreme conditions; 3GPP TS 05.05, subclause 4.1.1, first table; 3GPP TS 05.05 annex D in subclauses D.2.1 and D.2.2.
3. The power control levels shall have the nominal output power levels as defined in 3GPP TS 05.05, subclause 4.1.1, third table (for GSM 400, GSM 700, GSM 850 and GSM 900), fourth table (for DCS 1 800) or fifth table (for PCS 1 900), from the lowest power control level up to the maximum output power corresponding to the class of the MS (for tolerance on maximum output power see conformance requirements 1), with a tolerance of  $\pm 3$  dB,  $\pm 4$  dB or  $\pm 5$  dB under normal conditions; 3GPP TS 05.05, subclause 4.1.1, third, fourth or fifth table.
4. The power control levels shall have the nominal output power levels as defined in 3GPP TS 05.05, subclause 4.1.1, third table (for GSM 400, GSM 700, GSM 850 and GSM 900), fourth table (for DCS 1 800) or fifth table (for PCS 1 900), from the lowest power control level up to the maximum output power corresponding to the class of the MS (for tolerance on maximum output power see conformance requirements 2), with a tolerance of  $\pm 4$  dB,  $\pm 5$  dB or  $\pm 6$  dB under extreme conditions; 3GPP TS 05.05, subclause 4.1.1, third, fourth or fifth table; 3GPP TS 05.05 annex D in subclauses D.2.1 and D.2.2.
5. The output power actually transmitted by the MS at consecutive power control levels shall form a monotonic sequence and the interval between power control levels shall be  $2 \pm 1,5$  dB ( $1 \pm 1$  dB between power control level 30 and 31 for PCS 1 900); 3GPP TS 05.05, subclause 4.1.1.
6. The transmitted power level relative to time for a normal burst shall be within the power/time template given in 3GPP TS 05.05, annex B figure B1. In multislot configurations where the bursts in two or more consecutive time slots are actually transmitted at the same frequency, the template of annex B shall be respected at the beginning and the end of the series of consecutive bursts. The output power during the guard period between every two consecutive active timeslots shall not exceed the level allowed for the useful part of the first timeslot or the level allowed for the useful part of the second timeslot plus 3 dB, whichever is the highest:
  - 6.1 Under normal conditions; 3GPP TS 05.05, subclause 4.5.2.
  - 6.2 Under extreme conditions; 3GPP TS 05.05, subclause 4.5.2, 3GPP TS 05.05 annex D in subclauses D.2.1 and D.2.2.
7. In multislot configurations, bidirectional subchannels shall be individually power controlled; 3GPP TS 05.08, subclause 4.2.
8. When accessing a cell on the RACH and before receiving the first power command during a communication on a DCCH or TCH (after an IMMEDIATE ASSIGNMENT), all GSM and class 1 and class 2 DCS 1 800 and PCS 1 900 MS shall use the power control level defined by the MS\_TXPWR\_MAX\_CCH parameter broadcast on the BCCH of the cell, or if MS\_TXPWR\_MAX\_CCH corresponds to a power control level not supported by the MS as defined by its power class, the MS shall act as though the closest supported power control level had been broadcast. A Class 3 DCS 1 800 MS shall use the POWER\_OFFSET parameter.
9. The transmissions from the MS to the BS, measured at the MS antenna, shall be  $468,75 - TA$  bit periods behind the transmissions received from the BS, where TA is the last timing advance received from the current serving BS. The tolerance on these timings shall be  $\pm 1$  bit period:
  - 9.1 Under normal conditions; 3GPP TS 05.10, subclause 6.4.
  - 9.2 Under extreme conditions; 3GPP TS 05.10, subclause 6.4, 3GPP TS 05.05 annex D in subclauses D.2.1 and D.2.2.
10. The transmitted power level relative to time for a random access burst shall be within the power/time template given in 3GPP TS 05.05, annex B figure B.3:
  - 10.1 Under normal conditions; 3GPP TS 05.05, subclause 4.5.2.
  - 10.2 Under extreme conditions; 3GPP TS 05.05, subclause 4.5.2, 3GPP TS 05.05 annex D in subclauses D.2.1 and D.2.2.

11 The MS shall use a TA value of 0 for the Random Access burst sent:

11.1 Under normal conditions; 3GPP TS 05.10, subclause 6.6.

11.2 Under extreme conditions; 3GPP TS 05.10, subclause 6.6, 3GPP TS 05.05 annex D in subclauses D.2.1 and D.2.2.

### 13.7.3 Test purpose

1. To verify that the maximum output power of the MS in HSCSD multislot configuration, under normal conditions, is within conformance requirement 1.
2. To verify that the maximum output power of the MS in HSCSD multislot configuration, under extreme conditions, is within conformance requirement 2.
3. To verify that all power control levels, relevant to the class of MS, are implemented in the MS in HSCSD multislot configuration and have output power levels, under normal conditions, within conformance requirement 3.
4. To verify that all power control levels have output power levels, under extreme conditions, within conformance requirement 4.
5. To verify that the step in the output power transmitted by the MS in HSCSD multislot configuration at consecutive power control levels is within conformance requirement 5 under normal conditions.
6. To verify that the output power relative to time, when sending a normal burst is within conformance requirement 6 in HSCSD multislot configuration:
  - 6.1 Under normal conditions.
  - 6.2 Under extreme conditions.
7. To verify that the MS in HSCSD multislot configuration uses the maximum power control level according to its power class if commanded to a power control level exceeding its power class.
8. To verify that, for normal bursts, the MS transmissions to the BS are timed within conformance requirement 8 in HSCSD multislot configuration:
  - 8.1 Under normal conditions.
  - 8.2 Under extreme conditions.
9. To verify that the output power relative to time, when sending an access burst is within conformance requirement 9 in HSCSD multislot configuration:
  - 9.1 Under normal conditions.
  - 9.2 Under extreme conditions.
10. To verify that, for an access burst, the MS transmission to the BS is timed within conformance requirement 10 in HSCSD multislot configuration:
  - 10.1 Under normal conditions.
  - 10.2 Under extreme conditions.
11. To verify that, power is individually controlled on bidirectional HSCSD subchannels.

## 13.7.4 Methods of test

Two methods of test are described, separately for:

- 1) equipment fitted with a permanent antenna connector; and for
- 2) equipment fitted with an integral antenna, and which cannot be connected to an external antenna except by the fitting of a temporary test connector as a test fixture.

NOTE: The behaviour of the MS in the system is determined to a high degree by the antenna, and this is the only transmitter test in this EN using the integral antenna. Further studies are ongoing on improved testing on the integral antenna, taking practical conditions of MS use into account.

### 13.7.4.1 Method of test for equipment with a permanent antenna connector

#### 13.7.4.1.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure for HSCSD multislot configuration on a channel with ARFCN in the Mid ARFCN range, power control level set to Max power and MS to operate in its highest number of uplink slots. MS TXPWR\_MAX\_CCH is set to the maximum value supported by the Power Class of the Mobile under test. For DCS 1 800 mobile stations the POWER\_OFFSET parameter is set to 6 dB.

#### 13.7.4.1.2 Procedure

- a) Measurement of normal burst transmitter output power.

The SS takes power measurement samples evenly distributed over the duration of one burst with a sampling rate of at least  $2/T$ , where  $T$  is the bit duration. The samples are identified in time with respect to the modulation on the burst. The SS identifies the centre of the useful 147 transmitted bits, i.e. the transition from bit 13 to bit 14 of the midamble, as the timing reference.

The transmitter output power is calculated as the average of the samples over the 147 useful bits. This is also used as the 0 dB reference for the power/time template.

- b) Measurement of normal burst timing delay.

The burst timing delay is the difference in time between the timing reference identified in a) and the corresponding transition in the burst received by the MS immediately prior to the MS transmit burst sampled.

- c) Measurement of normal burst power/time relationship.

The array of power samples measured in a) are referenced in time to the centre of the useful transmitted bits and in power to the 0 dB reference, both identified in a).

- d) Steps a) to c) are repeated on each multislot subchannel with the MS commanded to operate on each of the power control levels defined, even those not supported by the MS.

- e) The SS commands the MS to the maximum power control level supported by the MS and steps a) to c) are repeated on each multislot subchannel for ARFCN in the Low and High ranges.

- f) The SS commands the MS to the maximum power control level in the first multislot subchannel allocated and to the minimum power control level in the second multislot subchannel allocated. Any further timeslots allocated are to be set to the maximum power control level. Steps a) to c) and corresponding measurements on each subchannel are repeated.

- g) Measurement of access burst transmitter output power.

The SS causes the MS to generate an Access Burst on an ARFCN in the Mid ARFCN range, this could be either by a handover procedure or a new request for radio resource. In the case of a handover procedure the Power Level indicated in the HANDOVER COMMAND message is the maximum power control level supported by the MS. In the case of an Access Burst the MS shall use the Power Level indicated in the MS\_TXPWR\_MAX\_CCH parameter. If the power class of the MS is DCS 1 800 Class 3, the MS shall also use the POWER\_OFFSET parameter.

The SS takes power measurement samples evenly distributed over the duration of the access burst as described in a). However, in this case the SS identifies the centre of the useful bits of the burst by identifying the transition from the last bit of the synch sequence. The centre of the burst is then five data bits prior to this point and is used as the timing reference.

The transmitter output power is calculated as the average of the samples over the 87 useful bits of the burst. This is also used as the 0 dB reference for the power/time template.

h) Measurement of access burst timing delay.

The burst timing delay is the difference in time between the timing reference identified in g) and the MS received data on the common control channel.

i) Measurement of access burst power/time relationship.

The array of power samples measured in g) are referenced in time to the centre of the useful transmitted bits and in power to the 0 dB reference, both identified in g).

j) Depending on the method used in step g) to cause the MS to send an Access Burst, the SS sends either a HANDOVER COMMAND with power control level set to 10 or it changes the System Information elements MS\_TXPWR\_MAX\_CCH and for DCS 1 800 the POWER\_OFFSET on the serving cell BCCH in order to limit the MS transmit power on the Access Burst to power control level 10 (+23 dBm for GSM 400, GSM 700, GSM 850 and GSM 900 or +10 dBm for DCS 1 800 and PCS 1 900) and then steps g) to i) are repeated.

k) Steps a) to j) are repeated under extreme test conditions (annex 1, TC2.2) except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

#### 13.7.4.2 Method of test for equipment with an integral antenna

NOTE: If the MS is equipped with a permanent connector, such that the antenna can be disconnected and the SS be connected directly, then the method of subclause 13.7.4.1 will be applied.

The tests in this subclause are performed on an unmodified test sample.

##### 13.7.4.2.1 Initial conditions

The MS is placed in the anechoic shielded chamber (annex 1, GC5) or on the outdoor test site, on an isolated support, in the position for normal use, at a distance of at least 3 metres from a test antenna, connected to the SS.

NOTE: The test method described has been written for measurement in an anechoic shielded chamber. If an outdoor test site is used then, in addition, it is necessary to raise/lower the test antenna through the specified height range to maximize the received power levels from both the test sample and the substitution antenna.

A call is set up by the SS according to the generic call set up procedure on a channel with ARFCN in the Mid ARFCN range, power control level set to Max power. MS\_TXPWR\_MAX\_CCH is set to the maximum value supported by the Power Class of the Mobile under test. For DCS 1 800 mobile stations the POWER\_OFFSET parameter is set to 6 dB.

##### 13.7.4.2.2 Procedure

a) With the initial conditions set according to subclause 13.7.4.2.1 the test procedure in subclause 13.7.4.1.2 is followed up to and including step j), except that in step a), when measurements are done at maximum power for ARFCN in the Low, Mid and High range, the measurement is made eight times with the MS rotated by  $n \times 45$  degrees for all values of  $n$  in the range 0 to 7.

The measurements taken are received transmitter output power measurements rather than transmitter output power measurements, the output power measurement values can be derived as follows.

b) Assessment of test site loss for scaling of received output power measurements.

The MS is replaced by a half-wave dipole, resonating at the centre frequency of the transmit band, connected to an RF generator.

The frequency of the RF signal generator is set to the frequency of the ARFCN used for the 24 measurements in step a), the output power is adjusted to reproduce the received transmitter output power averages recorded in step a).

For each indication the power, delivered by the generator (in Watts) to the half-wave dipole, is recorded. These values are recorded in the form  $P_{nc}$ , where  $n$  = MS rotation and  $c$  = channel number.

For each channel number used compute:

$$P_{ac}(\text{Watts into dipole}) = \frac{1}{8} * \sum_{n=0}^{n=7} P_{nc}$$

from which:  $P_{ac}(\text{Tx dBm}) = 10\log_{10}(P_{ac}) + 30 + 2,15$

The difference, for each of the three channels, between the actual transmitter output power averaged over the 8 measurement orientations and the received transmitter output power at orientation  $n = 0$  is used to scale the received measurement results to actual transmitter output powers for all measured power control levels and ARFCN, which can then be checked against the requirements.

c) Temporary antenna connector calibration factors (transmit).

A modified test sample equipped with a temporary antenna connector is placed in a climatic test chamber and is linked to the SS by means of the temporary antenna connector.

Under normal test conditions, the power measurement and calculation parts of steps a) to j) of subclause 13.7.4.1.2 are repeated except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

NOTE 1: The values noted here are related to the output transmitter carrier power levels under normal test conditions, which are known after step b). Therefore frequency dependent calibration factors that account for the effects of the temporary antenna connector can be determined.

d) Measurements at extreme test conditions.

NOTE 2: Basically the procedure for extreme conditions is:

- the power/time template is tested in the "normal" way;
- the radiated power is measured by measuring the difference with respect to the radiated power under normal test conditions.

Under extreme test conditions steps a) to j) of subclause 13.7.4.1.2 are repeated except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

The transmitter output power under extreme test conditions is calculated for each burst type, power control level and for every frequency used by adding the frequency dependent calibration factor, determined in c), to the values obtained at extreme conditions in this step.

## 13.7.5 Test requirements

- a) The transmitter output power on each subchannel, under every combination of normal and extreme test conditions, for normal bursts and access bursts, at each frequency and for each power control level applicable to the MS power class, shall be at the relevant level shown in table 13.7-1, table 13.7-2 or table 13.7-3 within the tolerances also shown in table 13.7-1, table 13.7-2 or table 13.7-3.

GSM 400, GSM 700, GSM 850 and GSM 900 only - begin

**Table 13.7-1: GSM 400, GSM 700, GSM 850 and GSM 900 transmitter output power for different power classes**

| Power class |   |   |   |        | Power control level | Transmitter output power<br>dBm | Tolerances   |  |
|-------------|---|---|---|--------|---------------------|---------------------------------|--------------|--|
| 2           | 3 | 4 | 5 | normal |                     |                                 | extreme      |  |
| .           | . | . | . | 2      | 39                  | ±2 dB                           | ±2,5 dB      |  |

NOTE: When the power control level corresponds to the power class of the MS, then the tolerances shall be 2,0 dB under normal test conditions and 2,5 dB under extreme test conditions.

PCS 1 900 only - end

- b) The difference between the transmitter output power at two adjacent power control levels, measured at the same frequency, shall not be less than 0,5 dB and not be more than 3,5 dB. For PCS 1 900 Class 3 the difference between the transmitter output power at power controls level 30 and 31, measured at the same frequency, shall not be less than 0 dB and not be more than 2 dB.
- c) The power/time relationship of the measured samples for normal bursts shall be within the limits of the power time template of figure 13.7-2 at each frequency, under every combination of normal and extreme test conditions and at each power control level measured.

**Figure 13.7-2: Power / time template for normal bursts**

\* For GSM 400, GSM 700, GSM 850 and GSM 900 MS:

- 4 dBc for power control level 16;
- 2 dBc for power control level 17;
- 1 dBc for power control levels 18 and 19.

For DCS 1 800 and PCS 1 900 MS:

- 4 dBc for power control level 11;
- 2 dBc for power control level 12;
- 1 dBc for power control levels 13, 14 and 15.

\*\* For GSM 400, GSM 700, GSM 850 and GSM 900 MS:

- 30 dBc or -17 dBm, whichever is the higher.

For DCS 1 800 and PCS 1 900 MS:

- 30 dBc or -20 dBm, whichever is the higher.

**Table 13.7-4: Lowest measurement limit for power / time template**

|                                             | lowest limit                                                                                                                                                                |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GSM 400,<br>GSM 700,<br>GSM 850,<br>GSM 900 | -59 dBc or -54 dBm whichever is the highest, except for the timeslot preceding the active slot, for which the allowed level is -59 dBc or -36 dBm, whichever is the highest |
| DCS 1 800,<br>PCS 1 900                     | -48 dBc or -48 dBm whichever is the highest                                                                                                                                 |

- d) All the power control levels, for the type and power class of the MS as stated by the manufacturer, shall be implemented in the MS.
- e) When the transmitter is commanded to a power control level outside of the capability corresponding to the type and power class of the MS as stated by the manufacturer, then the transmitter output power shall be within the tolerances for the closest power control level corresponding to the type and power class as stated by the manufacturer.
- f) The centre of the transmitted normal burst as defined by the transition of bits 13/14 of the midamble shall be 3 timeslot periods (1 731 μs) ±1 bit period (±3,69 μs) after the centre of the corresponding received burst.
- g) The power/time relationship of the measured samples for access bursts shall be within the limits of the power time template of figure 13.7-3 at each frequency, under every combination of normal and extreme test conditions and at each power control level measured.

**Figure 13.7-3: Power / time template for access burst**

\* For GSM 400, GSM 700, GSM 850 and GSM 900 MS:

- 4 dBc for power control level 16;
- 2 dBc for power control level 17;
- 1 dBc for power control levels 18 and 19.

For DCS 1 800 and PCS 1 900 MS:

- 4 dBc for power control level 11;

- 2 dBc for power control level 12;
- 1 dBc for power control levels 13, 14 and 15.

\*\* For GSM 400, GSM 700, GSM 850 and GSM 900 MS:

- 30 dBc or -17 dBm, whichever is the higher.

For DCS 1 800 and PCS 1 900 MS:

- 30 dBc or -20 dBm, whichever is the higher.

- h) The centre of the transmitted access burst shall be an integer number of timeslot periods less 30 bit periods relative to any CCCH midamble centre with a tolerance of  $\pm 1$  bit period ( $\pm 3,69 \mu\text{s}$ ).

## 13.8 Output RF spectrum in HSCSD multislot configuration

### 13.8.1 Definition and applicability

The output RF spectrum is the relationship between the frequency offset from the carrier and the power, measured in a specified bandwidth and time, produced by the MS due to the effects of modulation and power ramping.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS and any multiband MS, which are capable of HSCSD multislot operation.

### 13.8.2 Conformance requirement

1. The level of the output RF spectrum due to modulation shall be no more than that given in 3GPP TS 05.05, 4.2.1, table a) for GSM 400, GSM 700, GSM 850 and GSM 900, table b) for DCS 1 800 or table c) for PCS 1 900, with the following lowest measurement limits:

- -36 dBm below 600 kHz offset from the carrier;
- -51 dBm for GSM 400 and GSM 900 or -56 dBm for DCS 1 800 and PCS 1 900 from 600 kHz out to less than 1 800 kHz offset from the carrier;
- -46 dBm for GSM 400 and GSM 900 or -51 dBm for DCS 1 800 and PCS 1 900 at and beyond 1 800 kHz offset from the carrier;

but with the following exceptions at up to -36 dBm:

- up to three bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz in the combined range 600 kHz to 6000 kHz above and below the carrier;
- up to 12 bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz at more than 6 000 kHz offset from the carrier.

1.1 Under normal conditions; 3GPP TS 05.05, subclause 4.2.1.

1.2 Under extreme conditions; 3GPP TS 05.05, subclause 4.2.1; 3GPP TS 05.05, annex D in subclauses D.2.1 and D.2.2.

2. The level of the output RF spectrum due to switching transients shall be no more than given in 3GPP TS 05.05, subclause 4.2.2, table "a) Mobile Station".

2.1 Under normal conditions; 3GPP TS 05.05, subclause 4.2.2.

2.2 Under extreme conditions; 3GPP TS 05.05, subclause 4.2.2; 3GPP TS 05.05 annex D in subclauses D.2.1 and D.2.2.

3. When allocated a channel, the power emitted by a GSM 400, GSM 900 and DCS 1 800 MS, in the band 935 MHz to 960 MHz shall be no more than -79 dBm, in the band 925 MHz to 935 MHz shall be no more than -67 dBm and in the band 1 805 MHz to 1 880 MHz shall be no more than -71 dBm except in five measurements in each of the bands 925 MHz to 960 MHz and 1 805 MHz to 1 880 MHz where exceptions at up to -36 dBm are

permitted. For GSM 400 MS, in addition, the power emitted by MS, in the bands of 460,4 MHz to 467,6 MHz and 488,8 MHz to 496 MHz shall be no more than -67 dBm except in three measurements in each of the bands 460,4 MHz to 467,6 MHz and 488,8 MHz to 496 MHz where exceptions at up to -36 dBm are permitted. For PCS 1 900 MS, the power emitted by MS, in the band 869 MHz to 894 MHz shall be no more than -79 dBm, in the band 1 930 MHz to 1 990 MHz shall be no more than -71 dBm except in five measurements in each of the bands 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz where exceptions at up to -36 dBm are permitted. For GSM 700 and GSM 850, the power emitted by MS, in the band 747 MHz to 757 MHz shall be no more than -79 dBm, in the band of 757 MHz to 762 MHz shall be no more than -73 dBm, in the band 869 MHz to 894 MHz shall be no more than -79 dBm, in the band 1 930 MHz to 1 990 MHz shall be no more than -71 dBm except in five measurements in each of the bands 747 MHz to 762 MHz, 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz where exceptions at up to -36 dBm are permitted. Under normal conditions; 3GPP TS 05.05, subclause 4.3.3.

### 13.8.3 Test purpose

1. To verify that the output RF spectrum due to modulation does not exceed conformance requirement 1 in the multislot configurations.
  - 1.1 Under normal conditions.
  - 1.2 Under extreme conditions.
2. To verify that the output RF spectrum due to switching transients does not exceed conformance requirement 2 in the multislot configurations when a reasonable margin is allowed for the effect of spectrum due to modulation.
  - 2.1 Under normal conditions.
  - 2.2 Under extreme conditions.
3. To verify that the MS spurious emissions in the MS receive band do not exceed conformance requirement 3 in the multislot configurations.

### 13.8.4 Method of test

#### 13.8.4.1 Initial conditions

A call is set up according to the generic call set up procedure for multislot HSCSD.

The SS commands the MS to hopping mode. The hopping pattern includes only three channels, namely one with an ARFCN in the Low ARFCN range, a second one with an ARFCN in the Mid ARFCN range and the third one with an ARFCN in the High ARFCN range.

NOTE 1: Although the measurement is made whilst the MS is in hopping mode, each measurement is on one single channel.

NOTE 2: This test is specified in hopping mode as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to handover the MS between the three channels tested at the appropriate time.

The SS sends Standard Test Signal C1 (annex 5) to the MS at a level of 23 dB $\mu$ V<sub>emf</sub>( ).

The SS sets the MS to operate in a multislot configuration where is maximum number of transmitting timeslots. Maximum power level is set in all channels.

#### 13.8.4.2 Procedure

NOTE: When averaging is in use during frequency hopping mode, the averaging only includes bursts transmitted when the hopping carrier corresponds to the nominal carrier of the measurement.

- a) In steps b) to h) the FT is equal to the hop pattern ARFCN in the Mid ARFCN range.
- b) The other settings of the spectrum analyser are set as follows:

- Zero frequency scan;
- Resolution bandwidth: 30 kHz;
- Video bandwidth: 30 kHz;
- Video averaging: may be used, depending on the implementation of the test.

The video signal of the spectrum analyser is "gated" such that the spectrum generated by at least 40 of the bits 87 to 132 of the burst in one of the active time slots is the only spectrum measured. This gating may be analogue or numerical, dependent upon the design of the spectrum analyser. Only measurements during transmitted bursts on the nominal carrier of the measurement are included. The spectrum analyser averages over the gated period and over 200 or 50 such bursts, using numerical and/or video averaging.

- c) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 50 bursts at all multiples of 30 kHz offset from FT to < 1 800 kHz.
- d) The resolution and video bandwidth on the spectrum analyser are adjusted to 100 kHz and the measurements are made at the following frequencies:
- on every ARFCN from 1 800 kHz offset from the carrier to the edge of the relevant transmit band for each measurement over 50 bursts.
  - at 200 kHz intervals over the 2 MHz either side of the relevant transmit band for each measurement over 50 bursts.

For GSM 400, GSM 900 and DCS 1 800:

- at 200 kHz intervals over the band 925 MHz to 960 MHz for each measurement over 50 bursts.
- at 200 kHz intervals over the band 1 805 MHz to 1 880 MHz for each measurement over 50 bursts.
- in addition for GSM 400 MS:
  - at 200 kHz intervals over the band 460,4 MHz to 467,6 MHz for each measurement over 50 bursts.
  - at 200 kHz intervals over the band 488,8 MHz to 496 MHz for each measurement over 50 bursts.

For GSM 700 and GSM 850:

- at 200 kHz intervals over the band 747 MHz to 762 MHz for each measurement over 50 bursts.
- at 200 kHz intervals over the band 869 MHz to 894 MHz for each measurement over 50 bursts.
- at 200 kHz intervals over the band 1 930 MHz to 1 990 MHz for each measurement over 50 bursts.

For PCS 1 900:

- at 200 kHz intervals over the band 869 MHz to 894 MHz for each measurement over 50 bursts.
- at 200 kHz intervals over the band 1 930 MHz to 1 990 MHz for each measurement over 50 bursts.

- e) The MS is commanded to its minimum power control level. The spectrum analyser is set again as in b).

- f) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 200 bursts at the following frequencies:

FT;

FT + 100 kHz                      FT - 100 kHz;

FT + 200 kHz                      FT - 200 kHz;

FT + 250 kHz                      FT - 250 kHz;

FT + 200 kHz \* N                  FT - 200 kHz × N;

where N = 2, 3, 4, 5, 6, 7, and 8;

and  $FT = RF$  channel nominal centre frequency.

- g) Steps a) to f) is repeated except that in step a) the spectrum analyzer is gated so that the burst of the next active time slot is measured.
- h) The spectrum analyser settings are adjusted to:
- Zero frequency scan;
  - Resolution bandwidth: 30 kHz;
  - Video bandwidth: 100 kHz;
  - Peak hold.

The spectrum analyser gating of the signal is switched off.

The MS is commanded to its maximum power control level in every transmitted time slot.

- i) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured at the following frequencies:

|                |                 |
|----------------|-----------------|
| $FT + 400$ kHz | $FT - 400$ kHz; |
| $FT + 600$ kHz | $FT - 600$ kHz; |
| $FT + 1,2$ MHz | $FT - 1,2$ MHz; |
| $FT + 1,8$ MHz | $FT - 1,8$ MHz; |

where  $FT = RF$  channel nominal centre frequency.

The duration of each measurement (at each frequency) will be such as to cover at least 10 burst transmissions at  $FT$ .

- j) Step i) is repeated for power control levels 7 and 11.
- k) Steps b), f), h) and i) are repeated with  $FT$  equal to the hop pattern ARFCN in the Low ARFCN range except that in step h) the MS is commanded to power control level 11 rather than maximum power.
- l) Steps b), f), h) and i) are repeated with  $FT$  equal to the hop pattern ARFCN in the High ARFCN range except that in step h) the MS is commanded to power control level 11 rather than maximum power.
- m) Steps a) b) f) h), and i) are repeated under extreme test conditions (annex 1, TC2.2). except that at step h) the MS is commanded to power control level 11.

### 13.8.5 Test requirements

For absolute measurements, performed on a temporary antenna connector, in the frequency band 450,4 MHz to 457,6 MHz, 478,8 MHz to 486 MHz, 777 MHz to 792 MHz, 824 MHz to 849 MHz, 880 MHz to 915 MHz, 1 710 MHz to 1 785 MHz or 1 850 MHz to 1 910 MHz, the temporary antenna connector coupling factor, determined according to subclause 13.3.4.2.2 and annex 1 GC7, for the nearest relevant frequency, will be used.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 925 MHz to 960 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 900 MS. For a GSM 400, GSM 700, GSM 850 or DCS 1 800 or PCS 1 900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 1 805 MHz to 1 880 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for DCS 1 800 MS. For GSM 400, GSM 700, GSM 850, GSM 900 or PCS 1 900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 460,4 MHz to 467,6 MHz or 488,8 MHz to 496 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 400 MS. For a GSM 700, GSM 850, GSM 900, DCS 1 800 or PCS 1 900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 747 MHz to 762 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 700 MS. For a GSM 400, GSM 850, GSM 900 or DCS 1 800 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 869 MHz to 894 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 850 MS. For a GSM 400, GSM 700, GSM 900 or DCS 1 800 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 1 930 MHz to 1 990 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for PCS 1 900 MS. For GSM 400, GSM 900 or DCS 1 800 MS 0 dB will be assumed.

The figures in the tables below, at the listed frequencies from the carrier (kHz), are the maximum level (dB) relative to a measurement in 30 kHz bandwidth on the carrier (reference 3GPP TS 05.05 subclause 4.2.1).

- a) For the modulation sidebands out to less than 1 800 kHz offset from the carrier frequency (FT) measured in step c), f), i), k), l) and m) the measured power level in dB relative to the power level measured at FT, for all types of MS, shall not exceed the limits derived from the values shown in table 1 for GSM 400, GSM 700, GSM 850 and GSM 900, table 2 for DCS 1 800 or table 3 for PCS 1 900 according to the actual transmit power and frequency offset from FT. However any failures in the combined range 600 kHz to less than 1 800 kHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below.

**Table 1: GSM 400, GSM 700, GSM 850 and GSM 900 Spectrum due to modulation out to less than 1 800 kHz offset**

|                                                                          | power levels in dB relative to the measurement at FT |     |     |     |               |
|--------------------------------------------------------------------------|------------------------------------------------------|-----|-----|-----|---------------|
| Power level                                                              | Frequency offset (kHz)                               |     |     |     |               |
| (dBm)                                                                    | 0-100                                                | 200 | 250 | 400 | 600 to <1 800 |
| 39                                                                       | +0,5                                                 | -30 | -33 | -60 | -66           |
| 37                                                                       | +0,5                                                 | -30 | -33 | -60 | -64           |
| 35                                                                       | +0,5                                                 | -30 | -33 | -60 | -62           |
| <= 33                                                                    | +0,5                                                 | -30 | -33 | -60 | -60           |
| The values above are subject to the minimum absolute levels (dBm) below. |                                                      |     |     |     |               |
|                                                                          | -36                                                  | -36 | -36 | -36 | -51           |

**Table 2: DCS 1 800 Spectrum due to modulation out to less than 1 800 kHz offset**

|                                                                          | power levels in dB relative to the measurement at FT |     |     |     |               |
|--------------------------------------------------------------------------|------------------------------------------------------|-----|-----|-----|---------------|
| Power level                                                              | Frequency offset (kHz)                               |     |     |     |               |
| (dBm)                                                                    | 0-100                                                | 200 | 250 | 400 | 600 to <1 800 |
| <= 36                                                                    | +0,5                                                 | -30 | -33 | -60 | -60           |
| The values above are subject to the minimum absolute levels (dBm) below. |                                                      |     |     |     |               |
|                                                                          | -36                                                  | -36 | -36 | -36 | -56           |

**Table 3: PCS 1 900 Spectrum due to modulation out to less than 1 800 kHz offset**

|                                                                          | power levels in dB relative to the measurement at FT |     |     |     |               |                 |
|--------------------------------------------------------------------------|------------------------------------------------------|-----|-----|-----|---------------|-----------------|
| Power level                                                              | Frequency offset (kHz)                               |     |     |     |               |                 |
| (dBm)                                                                    | 0-100                                                | 200 | 250 | 400 | 600 to <1 200 | 1 200 to <1 800 |
| <= 33                                                                    | +0,5                                                 | -30 | -33 | -60 | -60           | -60             |
| The values above are subject to the minimum absolute levels (dBm) below. |                                                      |     |     |     |               |                 |
|                                                                          | -36                                                  | -36 | -36 | -36 | -56           | -56             |

NOTE 1: For frequency offsets between 100 kHz and 600 kHz the requirement is derived by a linear interpolation between the points identified in the table with linear frequency and power in dB relative.

- b) For the modulation sidebands from 1 800 kHz offset from the carrier frequency (FT) and out to 2 MHz beyond the edge of the relevant transmit band, measured in step d), the measured power level in dB relative to the power level measured at FT, shall not exceed the values shown in table 4 according to the actual transmit power, frequency offset from FT and system on which the MS is designed to operate. However any failures in the combined range 1 800 kHz to 6 MHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below, and any other failures may be counted towards the exceptions allowed in test requirements d) below.

**Table 4: Spectrum due to modulation from 1 800 kHz offset to the edge of the transmit band (wideband noise)**

| power levels in dB relative to the measurement at FT                     |                  |          |          |           |                  |          |           |                  |          |

|                                                                          |                  |          |          | 28        | -63              | -71      | 26        | -61              | -69      |
|                                                                          |                  |          |          | 26        | -61              | -69      | <= 24     | -59              | -67      |
|                                                                          |                  |          |          | <= 24     | -59              | -67      |           |                  |          |
| The values above are subject to the minimum absolute levels (dBm) below. |                  |          |          |           |                  |          |           |                  |          |
|                                                                          | -46              | -46      | -46      |           | -51              | -51      |           | -51              | -51      |

- c) Any failures (from a) and b) above) in the combined range 600 kHz to 6 MHz above and below the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, spurious emissions are allowed in up to three 200 kHz bands centred on an integer multiple of 200 kHz so long as no spurious emission exceeds -36 dBm. Any spurious emissions measured in a 30 kHz bandwidth which spans two 200 kHz bands can be counted towards either 200 kHz band, whichever minimizes the number of 200 kHz bands containing spurious exceptions.
- d) Any failures (from b) above) beyond 6 MHz offset from the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, up to twelve spurious emissions are allowed so long as no spurious emission exceeds -36 dBm.
- e) For GSM 400, GSM 900 and DCS 1 800 MS spurious emissions in the bands 925 MHz to 935 MHz, 935 MHz to 960 MHz and 1 805 MHz to 1 880 MHz, measured in step d), shall not exceed the values shown in table 5 except in up to five measurements in the band 925 MHz to 960 MHz and five measurements in the band 1 805 MHz to 1 880 MHz where a level up to -36 dBm is permitted. For GSM 400 MS, in addition, the MS spurious emissions in the bands 460,4 MHz to 467,6 MHz and 488,8 MHz to 496 MHz shall not exceed the value of -67 dBm, except in up to three measurements in each of the bands 460,4 MHz to 467,6 MHz and 488,8 MHz to 496 MHz where a level up to -36 dBm is permitted. For GSM 700 and GSM 850 the spurious emissions in the bands 747 MHz to 757 MHz, 757 MHz to 762 MHz and 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz shall not exceed the values shown in table 4 except in up to five measurements in each of the bands 747 MHz to 762 MHz and 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz where a level up to -36 dBm is permitted. For PCS 1 900 MS the spurious emissions in the bands 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz shall not exceed the values shown in table 5 except in up to five measurements in each of the bands 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz where a level up to -36 dBm is permitted.

Table 5: Spurious emissions in the MS receive bands

| Band (MHz)     | Spurious emissions level (dBm) |                                |
|----------------|--------------------------------|--------------------------------|
|                | GSM 400, GSM 900 and DCS 1 800 | GSM 700, GSM 850 and PCS 1 900 |
| 925 to 935     | -67                            |                                |
| 935 to 960     | -79                            |                                |
| 1 805 to 1 880 | -71                            |                                |
| 747 to 757     |                                | -79                            |
| 757 to 762     |                                | -73                            |
| 869 to 894     |                                | -79                            |
| 1 930 to 1 990 |                                | -71                            |

- f) For the power ramp sidebands of steps h), i) and k) the power levels must not exceed the values shown in table 6 for GSM 400, GSM 700, GSM 850 and GSM 900, table 7 for DCS 1 800 or table 8 for PCS 1 900.

Table 6: GSM Spectrum due to switching transients

| Power level | Maximum level for various offsets from carrier frequency |         |           |           |
|-------------|----------------------------------------------------------|---------|-----------|-----------|
|             | 400 kHz                                                  | 600 kHz | 1 200 kHz | 1 800 kHz |
| 39 dBm      | -13 dBm                                                  | -21 dBm | -21 dBm   | -24 dBm   |
| 37 dBm      | -15 dBm                                                  | -21 dBm | -21 dBm   | -24 dBm   |
| 35 dBm      | -17 dBm                                                  | -21 dBm | -21 dBm   | -24 dBm   |
| 33 dBm      | -19 dBm                                                  | -21 dBm | -21 dBm   | -24 dBm   |
| 31 dBm      | -21 dBm                                                  | -23 dBm | -23 dBm   | -26 dBm   |
| 29 dBm      | -23 dBm                                                  | -25 dBm | -25 dBm   | -28 dBm   |
| 27 dBm      | -23 dBm                                                  | -26 dBm | -27 dBm   | -30 dBm   |
| 25 dBm      | -23 dBm                                                  | -26 dBm | -29 dBm   | -32 dBm   |
| 23 dBm      | -23 dBm                                                  | -26 dBm | -31 dBm   | -34 dBm   |
| <= +21 dBm  | -23 dBm                                                  | -26 dBm | -32 dBm   | -36 dBm   |

Table 7: DCS 1 800 Spectrum due to switching transients

| Power level | Maximum level for various offsets from carrier frequency |         |           |           |
|-------------|----------------------------------------------------------|---------|-----------|-----------|
|             | 400 kHz                                                  | 600 kHz | 1 200 kHz | 1 800 kHz |
| 36 dBm      | -16 dBm                                                  | -21 dBm | -21 dBm   | -24 dBm   |
| 34 dBm      | -18 dBm                                                  | -21 dBm | -21 dBm   | -24 dBm   |
| 32 dBm      | -20 dBm                                                  | -22 dBm | -22 dBm   | -25 dBm   |
| 30 dBm      | -22 dBm                                                  | -24 dBm | -24 dBm   | -27 dBm   |
| 28 dBm      | -23 dBm                                                  | -25 dBm | -26 dBm   | -29 dBm   |
| 26 dBm      | -23 dBm                                                  | -26 dBm | -28 dBm   | -31 dBm   |
| 24 dBm      | -23 dBm                                                  | -26 dBm | -30 dBm   | -33 dBm   |
| 22 dBm      | -23 dBm                                                  | -26 dBm | -31 dBm   | -35 dBm   |
| <= +20 dBm  | -23 dBm                                                  | -26 dBm | -32 dBm   | -36 dBm   |

Table 8: PCS 1 900 Spectrum due to switching transients

| Power level | Maximum level for various offsets from carrier frequency |         |           |           |
|-------------|----------------------------------------------------------|---------|-----------|-----------|
|             | 400 kHz                                                  | 600 kHz | 1 200 kHz | 1 800 kHz |
| 33 dBm      | -19 dBm                                                  | -22 dBm | -22 dBm   | -25 dBm   |
| 32 dBm      | -20 dBm                                                  | -22 dBm | -22 dBm   | -25 dBm   |
| 30 dBm      | -22 dBm                                                  | -24 dBm | -24 dBm   | -27 dBm   |
| 28 dBm      | -23 dBm                                                  | -25 dBm | -26 dBm   | -29 dBm   |
| 26 dBm      | -23 dBm                                                  | -26 dBm | -28 dBm   | -31 dBm   |
| 24 dBm      | -23 dBm                                                  | -26 dBm | -30 dBm   | -33 dBm   |
| 22 dBm      | -23 dBm                                                  | -26 dBm | -31 dBm   | -35 dBm   |
| <= +20 dBm  | -23 dBm                                                  | -26 dBm | -32 dBm   | -36 dBm   |

NOTE 2: These figures are different from the requirements in 3GPP TS 05.05 because at higher power levels it is the modulation spectrum which is being measured using a peak hold measurement. This allowance is given in the table.

NOTE 3: The figures for table 6, table 7 and table 8 assume that, using the peak hold measurement, the lowest level measurable is 8 dB above the level of the modulation specification using the 30 kHz bandwidth gated average technique for 400 kHz offset from the carrier. At 600 kHz and 1 200 kHz offset the level is 6 dB above and at 1 800 kHz offset the level is 3 dB above. The figures for 1 800 kHz have assumed the 30 kHz bandwidth spectrum due to modulation specification at < 1 800 kHz.

## 13.9 Output RF spectrum for MS supporting the R-GSM band

### 13.9.1 Definition and applicability

The output RF spectrum is the relationship between the frequency offset from the carrier and the power, measured in a specified bandwidth and time, produced by the MS due to the effects of modulation and power ramping.

The requirements and this test apply to all types of R-GSM 900.

### 13.9.2 Conformance requirement

1. The level of the output RF spectrum due to modulation shall be no more than that given in 3GPP TS 05.05, subclause 4.2.1, table a) for R-GSM 900 with the following lowest measurement limits:

- -36 dBm below 600 kHz offset from the carrier;
- -51 dBm for R-GSM 900 from 600 kHz out to less than 1 800 kHz offset from the carrier;
- -46 dBm for R-GSM 900 at and beyond 1 800 kHz offset from the carrier;

but with the following exceptions at up to -36 dBm:

- up to three bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz in the combined range 600 kHz to 6000 kHz above and below the carrier;
- up to 12 bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz at more than 6 000 kHz offset from the carrier.

1.1 Under normal conditions; 3GPP TS 05.05, subclause 4.2.1.

1.2 Under extreme conditions; 3GPP TS 05.05, subclause 4.2.1; 3GPP TS 05.05, annex D in subclauses D.2.1 and D.2.2.

2. The level of the output RF spectrum due to switching transients shall be no more than given in 3GPP TS 05.05, subclause 4.2.2, table "a) Mobile Station:".

2.1 Under normal conditions; 3GPP TS 05.05, subclause 4.2.2.

2.2 Under extreme conditions; 3GPP TS 05.05, subclause 4.2.2; 3GPP TS 05.05 annex D in subclauses D.2.1 and D.2.2.

3. When allocated a channel, the power emitted by the MS, in the band 935 MHz to 960 MHz shall be no more than -79 dBm, in the band 925 MHz to 935 MHz shall be no more than -67 dBm, in the band 921 MHz to 925 MHz shall be no more than -60 dBm and in the band 1 805 MHz to 1 880 MHz shall be no more than -71 dBm except in five measurements in each of the bands 925 MHz to 960 MHz and 1 805 MHz to 1 880 MHz where exceptions at up to -36 dBm are permitted. Under normal conditions; 3GPP TS 05.05, subclause 4.3.3.

### 13.9.3 Test purpose

1. To verify that the output RF spectrum due to modulation does not exceed conformance requirement 1.

1.1 Under normal conditions.

- 1.2 Under extreme conditions.
2. To verify that the output RF spectrum due to switching transients does not exceed conformance requirement 2 when a reasonable margin is allowed for the effect of spectrum due to modulation.
  - 2.1 Under normal conditions.
  - 2.2 Under extreme conditions.
3. To verify that the MS spurious emissions in the MS receive band do not exceed conformance requirement 3.

## 13.9.4 Method of test

### 13.9.4.1 Initial conditions

A call is set up according to the generic call set up procedure.

The SS commands the MS to hopping mode. The hopping pattern includes only three channels, namely one with an ARFCN in the Low R-GSM ARFCN range, a second one with an ARFCN in the Mid ARFCN range and the third one with an ARFCN in the High ARFCN range.

NOTE 1: Although the measurement is made whilst the MS is in hopping mode, each measurement is on one single channel.

NOTE 2: This test is specified in hopping mode as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to handover the MS between the three channels tested at the appropriate time.

The SS commands the MS to complete the traffic channel loop back without signalling of erased frames (see subclause 36.2.1.1). This is to set a defined random pattern for the transmitter.

The SS sends Standard Test Signal C1 (annex 5) to the MS at a level of 23 dB $\mu$ Vemf( ).

### 13.9.4.2 Procedure

NOTE: When averaging is in use during frequency hopping mode, the averaging only includes bursts transmitted when the hopping carrier corresponds to the nominal carrier of the measurement.

- a) In steps b) to h) the FT is equal to the hop pattern ARFCN in the Mid ARFCN range.
- b) The other settings of the spectrum analyser are set as follows:
  - Zero frequency scan;
  - Resolution bandwidth: 30 kHz;
  - Video bandwidth: 30 kHz;
  - Video averaging: may be used, depending on the implementation of the test.

The video signal of the spectrum analyser is "gated" such that the spectrum generated by at least 40 of the bits 87 to 132 of the burst is the only spectrum measured. This gating may be analogue or numerical, dependent upon the design of the spectrum analyser. Only measurements during transmitted bursts on the nominal carrier of the measurement are included. The spectrum analyser averages over the gated period and over 200 or 50 such bursts, using numerical and/or video averaging.

The MS is commanded to its maximum power control level.

- c) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 50 bursts at all multiples of 30 kHz offset from FT to < 1 800 kHz.
- d) The resolution and video bandwidth on the spectrum analyser are adjusted to 100 kHz and the measurements are made at the following frequencies:

- on every ARFCN from 1 800 kHz offset from the carrier to the edge of the relevant transmit band for each measurement over 50 bursts.
  - at 200 kHz intervals over the 2 MHz either side of the relevant transmit band for each measurement over 50 bursts.
  - at 200 kHz intervals over the band 921 MHz to 960 MHz for each measurement over 50 bursts.
  - at 200 kHz intervals over the band 1 805 MHz to 1 880 MHz for each measurement over 50 bursts.
- e) The MS is commanded to its minimum power control level. The spectrum analyser is set again as in b).
- f) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 200 bursts at the following frequencies:

FT;

FT + 100 kHz                      FT - 100 kHz;

FT + 200 kHz                      FT - 200 kHz;

FT + 250 kHz                      FT - 250 kHz;

FT + 200 kHz × N                  FT - 200 kHz × N;

where N = 2, 3, 4, 5, 6, 7, and 8;

and FT = RF channel nominal centre frequency.

- g) The spectrum analyser settings are adjusted to:

- Zero frequency scan;
- Resolution bandwidth:      30 kHz;
- Video bandwidth:              100 kHz;
- Peak hold.

The spectrum analyser gating of the signal is switched off.

The MS is commanded to its maximum power control level.

- h) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured at the following frequencies:

FT + 400 kHz                      FT - 400 kHz;

FT + 600 kHz                      FT - 600 kHz;

FT + 1,2 MHz                      FT - 1,2 MHz;

FT + 1,8 MHz                      FT - 1,8 MHz;

where FT = RF channel nominal centre frequency.

The duration of each measurement (at each frequency) will be such as to cover at least 10 burst transmissions at FT.

- i) Step h) is repeated for power control levels 7 and 11.
- j) Steps b), f), g) and h) are repeated with FT equal to the hop pattern ARFCN in the Low R-GSM ARFCN range except that in step g) the MS is commanded to power control level 11 rather than maximum power.
- k) Steps b), f), g) and h) are repeated with FT equal to the hop pattern ARFCN in the High ARFCN range except that in step g) the MS is commanded to power control level 11 rather than maximum power.

- l) Steps a), b), f), g) and h) are repeated under extreme test conditions (annex 1, TC2.2). except that at step g) the MS is commanded to power control level 11.

### 13.9.5 Test requirements

For absolute measurements, performed on a temporary antenna connector, in the frequency band 876 MHz to 915 MHz or 1 710 MHz to 1 785 MHz, the temporary antenna connector coupling factor, determined according to subclause 13.3.4.2.2 and annex 1 GC7, for the nearest relevant frequency, will be used.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 921 MHz to 960 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 900 MS

For absolute measurements, performed on a temporary antenna connector, in the frequency band 1 805 MHz to 1 880 MHz for R-GSM 900 MS 0 dB will be assumed.

The figures in the tables below, at the listed frequencies from the carrier (kHz), are the maximum level (dB) relative to a measurement in 30 kHz bandwidth on the carrier (reference 3GPP TS 05.05 subclause 4.2.1).

- a) For the modulation sidebands out to less than 1 800 kHz offset from the carrier frequency (FT) measured in step c), f), h), j), k) and l) the measured power level in dB relative to the power level measured at FT, for all types of MS, shall not exceed the limits derived from the values shown in table 13.9-1 for R-GSM 900 according to the actual transmit power and frequency offset from FT. However any failures in the combined range 600 kHz to less than 1 800 kHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below.

**Table 13.9-1a: R-GSM 900 Spectrum due to modulation out to less than 1 800 kHz offset**

| Power level<br>(dBm)                                                     | power levels in dB relative to the measurement at FT |     |     |     |               |
|--------------------------------------------------------------------------|------------------------------------------------------|-----|-----|-----|---------------|
|                                                                          | Frequency offset (kHz)                               |     |     |     |               |
|                                                                          | 0-100                                                | 200 | 250 | 400 | 600 to <1 800 |
| 39                                                                       | +0,5                                                 | -30 | -33 | -60 | -66           |
| 37                                                                       | +0,5                                                 | -30 | -33 | -60 | -64           |
| 35                                                                       | +0,5                                                 | -30 | -33 | -60 | -62           |
| <= 33                                                                    | +0,5                                                 | -30 | -33 | -60 | -60           |
| The values above are subject to the minimum absolute levels (dBm) below. |                                                      |     |     |     |               |
|                                                                          | -36                                                  | -36 | -36 | -36 | -51           |

NOTE 1: For frequency offsets between 100 kHz and 600 kHz the requirement is derived by a linear interpolation between the points identified in the table with linear frequency and power in dB relative.

- b) For the modulation sidebands from 1 800 kHz offset from the carrier frequency (FT) and out to 2 MHz beyond the edge of the relevant transmit band, measured in step d), the measured power level in dB relative to the power level measured at FT, shall not exceed the values shown in table 13.9-2 according to the actual transmit power, frequency offset from FT and system on which the MS is designed to operate. However any failures in the combined range 1 800 kHz to 6 MHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below, and any other failures may be counted towards the exceptions allowed in test requirements d) below.

**Table 13.9-2: Spectrum due to modulation from 1 800 kHz offset to the edge of the transmit band (wideband noise)**

| Power levels in<br>dB relative to the measurement at FT                        |                      |                     |          |
|--------------------------------------------------------------------------------|----------------------|---------------------|----------|
| R-GSM 900                                                                      |                      |                     |          |
| Power level<br>(dBm)                                                           | Frequency offset kHz |                     |          |
|                                                                                | 1 800 to<br>< 3 000  | 3 000 to<br>< 6 000 | >= 6 000 |
| 39                                                                             | -69                  | -71                 | -77      |
| 37                                                                             | -67                  | -69                 | -75      |
| 35                                                                             | -65                  | -67                 | -73      |
| <= 33                                                                          | -63                  | -65                 | -71      |
| <b>The values above are subject to the minimum absolute levels (dBm) below</b> |                      |                     |          |
|                                                                                | -46                  | -46                 | -46      |

- c) Any failures (from a) and b) above) in the combined range 600 kHz to 6 MHz above and below the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, spurious emissions are allowed in up to three 200 kHz bands centred on an integer multiple of 200 kHz so long as no spurious emission exceeds -36 dBm. Any spurious emissions measured in a 30 kHz bandwidth which spans two 200 kHz bands can be counted towards either 200 kHz band, whichever minimizes the number of 200 kHz bands containing spurious exceptions.
- d) Any failures (from b) above) beyond 6 MHz offset from the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, up to twelve spurious emissions are allowed so long as no spurious emission exceeds -36 dBm.
- e) The MS spurious emissions in the bands 921 MHz to 925, 925 MHz to 935 MHz, 935 MHz to 960 MHz and 1 805 MHz to 1 880 MHz, measured in step d), for all types of MS, shall not exceed the values shown in table 13.9-3 except in up to five measurements in the band 925 to 960 MHz and five measurements in the band 1 805 MHz to 1 880 MHz where a level up to -36 dBm is permitted.

**Table 13.9-3: Spurious emissions in the R-GSM MS receive bands**

| Band<br>(MHz)  | Spurious emissions level<br>(dBm) |
|----------------|-----------------------------------|
| 921 to 925     | -60                               |
| 925 to 935     | -67                               |
| 935 to 960     | -79                               |
| 1 805 to 1 880 | -71                               |

- f) For the power ramp sidebands of steps h) and i) the power levels must not exceed the values shown in table 13.9-4 for GSM 900.

**Table 13.9-4: R-GSM Spectrum due to switching transients**

| Power level | Maximum level for various offsets from carrier<br>frequency |         |           |           |
|-------------|-------------------------------------------------------------|---------|-----------|-----------|
|             | 400 kHz                                                     | 600 kHz | 1 200 kHz | 1 800 kHz |
| 39 dBm      | -13 dBm                                                     | -21 dBm | -21 dBm   | -24 dBm   |
| 37 dBm      | -15 dBm                                                     | -21 dBm | -21 dBm   | -24 dBm   |
| 35 dBm      | -17 dBm                                                     | -21 dBm | -21 dBm   | -24 dBm   |
| 33 dBm      | -19 dBm                                                     | -21 dBm | -21 dBm   | -24 dBm   |
| 31 dBm      | -21 dBm                                                     | -23 dBm | -23 dBm   | -26 dBm   |
| 29 dBm      | -23 dBm                                                     | -25 dBm | -25 dBm   | -28 dBm   |
| 27 dBm      | -23 dBm                                                     | -26 dBm | -27 dBm   | -30 dBm   |
| 25 dBm      | -23 dBm                                                     | -26 dBm | -29 dBm   | -32 dBm   |
| 23 dBm      | -23 dBm                                                     | -26 dBm | -31 dBm   | -34 dBm   |
| <= +21 dBm  | -23 dBm                                                     | -26 dBm | -32 dBm   | -36 dBm   |

NOTE 2: These figures are different from the requirements in 3GPP TS 05.05 because at higher power levels it is the modulation spectrum which is being measured using a peak hold measurement. This allowance is given in the table.

NOTE 3: The figures for table 13.9-4 assume that, using the peak hold measurement, the lowest level measurable is 8 dB above the level of the modulation specification using the 30 kHz bandwidth gated average technique for 400 kHz offset from the carrier. At 600 and 1200 kHz offset the level is 6 dB above and at 1 800 kHz offset the level is 3 dB above. The figures for 1 800 kHz have assumed the 30 kHz bandwidth spectrum due to modulation specification at < 1 800 kHz.

## 13.16 GPRS transmitter tests

### 13.16.1 Frequency error and phase error in GPRS multislots configuration

#### 13.16.1.1 Definition and applicability

The frequency error is the difference in frequency, after adjustment for the effect of the modulation and phase error, between the RF transmission from the MS and either:

- the RF transmission from the BS; or
- the nominal frequency for the ARFCN used.

The phase error is the difference in phase, after adjustment for the effect of the frequency error, between the RF transmission from the MS and the theoretical transmission according to the intended modulation.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS which are capable of GPRS multislots operation on the uplink.

#### 13.16.1.2 Conformance requirement

1. The MS carrier frequency shall be accurate to within 0,1 ppm compared to signals received from the BS.
  - 1.1 Under normal conditions; 3GPP TS 05.10, subclause 6.1.
  - 1.2 Under vibration conditions; 3GPP TS 05.10, subclause 6.1; 3GPP TS 05.05, annex D subclause D.2.3.
  - 1.3 Under extreme conditions; 3GPP TS 05.10, subclause 6.1; 3GPP TS 05.05, subclause 4.4; 3GPP TS 05.05, annex D subclauses D.2.1 and D.2.2.
2. The RMS phase error (difference between the phase error trajectory and its linear regression on the active part of the time slot) for each burst shall not be greater than 5 degrees.

- 2.1 Under normal conditions; 3GPP TS 05.05, subclause 4.6.
- 2.2 Under vibration conditions; 3GPP TS 05.05, subclause 4.6; 3GPP TS 05.05, annex D D.2.3.
- 2.3 Under extreme conditions; 3GPP TS 05.05, subclause 4.6; 3GPP TS 05.05, annex D D.2.1, D.2.2.
- 3. The maximum peak deviation during the useful part of each burst shall not be greater than 20 degrees.
  - 3.1 Under normal conditions; 3GPP TS 05.05, subclause 4.6.
  - 3.2 Under vibration conditions; 3GPP TS 05.05, subclause 4.6; 3GPP TS 05.05, annex D subclause D.2.3.
  - 3.3 Under extreme conditions; 3GPP TS 05.05, subclause 4.6; 3GPP TS 05.05, annex D subclauses D.2.1 and D.2.2.

#### 13.16.1.3 Test purpose

1. To verify that in a multislot configuration the MS carrier frequency error does not exceed 0.1 ppm:
  - 1.1 Under normal conditions.
  - 1.2 When the MS is being vibrated.
  - 1.3 Under extreme conditions.
2. To verify that the RMS phase error on the useful parts of the bursts transmitted by the MS in a multislot configuration does not exceed conformance requirement 2:
  - 2.1 Under normal conditions.
  - 2.2 When the MS is being vibrated.
  - 2.3 Under extreme conditions.
3. To verify that the maximum phase error on the useful parts of the bursts transmitted by the MS in a multislot configuration does not exceed conformance requirement 3:
  - 3.1 Under normal conditions.
  - 3.2 When the MS is being vibrated.
  - 3.3 Under extreme conditions.

#### 13.16.1.4 Method of the test

NOTE: In order to measure the accuracy of the frequency and phase error a sampled measurement of the transmitted phase trajectory is obtained. This is compared with the theoretically expected phase trajectory. The regression line of the difference between the expected trajectory and the measured trajectory is an indication of the frequency error (assumed constant through the burst), whilst the departure of the phase differences from this trajectory is a measure of the phase error. The peak phase error is the value furthest from the regression line and the RMS phase error is the root mean square average of the phase error of all samples.

##### 13.16.1.4.1 Initial conditions

The test shall be run under the default GPRS conditions defined in clause 40.

The SS commands the MS to hopping mode (table 13.6.1, 3GPP TS 11.10).

NOTE: It is not necessary to test in hopping mode but is done here as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to make sure bursts are taken from a few different channels.

The MS shall be operated with it's highest number of uplink slots.

The Test Mode defined in 3GPP TS 04.14 (subclause 5.4) will be utilised. If the MS is capable of both:

Mode (a) transmitting pseudo-random data sequence in RLC data blocks;

Mode (b) transmitting looped-back RLC data blocks;

then Mode (a) will be used.

If Mode (b) is used then the SS sends the pseudo-random data sequence specified for Mode (a) on the downlink for loopback on the uplink.

#### 13.16.1.4.2 Procedure

- a) For one transmitted burst on the last slot of the multislot configuration, the SS captures the signal as a series of phase samples over the period of the burst. These samples are evenly distributed over the duration of the burst with a minimum sampling rate of  $2/T$ , where  $T$  is the modulation symbol period. The received phase trajectory is then represented by this array of at least 294 samples.
- b) The SS then calculates, from the known bit pattern and the formal definition of the modulator contained in 3GPP TS 05.04, the expected phase trajectory.
- c) From a) and b) the phase trajectory error is calculated, and a linear regression line computed through this phase trajectory error. The slope of this regression line is the frequency error of the mobile transmitter relative to the simulator reference. The difference between the regression line and the individual sample points is the phase error of that point.

- c.1) The sampled array of at least 294 phase measurements is represented by the vector:

$$\varnothing_m = \varnothing_m(0) \dots \varnothing_m(n)$$

where the number of samples in the array  $n+1 \geq 294$ .

- c.2) The calculated array, at the corresponding sampling instants, is represented by the vector:

$$\varnothing_c = \varnothing_c(0) \dots \varnothing_c(n).$$

- c.3) The error array is represented by the vector:

$$\varnothing_e = \{\varnothing_m(0) - \varnothing_c(0)\} \dots \dots \dots \{\varnothing_m(n) - \varnothing_c(n)\} = \varnothing_e(0) \dots \varnothing_e(n).$$

- c.4) The corresponding sample numbers form a vector  $t = t(0) \dots t(n)$ .

- c.5) By regression theory the slope of the samples with respect to  $t$  is  $k$  where:

$$k = \frac{\sum_{j=0}^{j=n} t(j) * \varnothing_e(j)}{\sum_{j=0}^{j=n} t(j)^2}$$

- c.6) The frequency error is given by  $k/(360 * g)$ , where  $g$  is the sampling interval in s and all phase samples are measured in degrees.

- c.7) The individual phase errors from the regression line are given by:

$$\varnothing_e(j) - k * t(j).$$

- c.8) The RMS value  $\varnothing_e$  of the phase errors is given by:

$$\varnothing_e(\text{RMS}) = \left[ \frac{\sum_{j=0}^{j=n} \{\varnothing_e(j) - k * t(j)\}^2}{n+1} \right]^{1/2}$$

- d) Steps a) to c) are repeated for 20 bursts, not necessarily contiguous.
- e) The SS instructs the MS to its maximum power control level by setting the power control parameter ALPHA ( $\alpha$ ) to 0 and GAMMA\_TN ( $\Gamma_{CH}$ ) for each timeslot to the desired power level in the Packet Uplink Assignment message (Closed Loop Control, see 3GPP TS 05.08, clause B.2), all other conditions remaining constant. Steps a) to d) are repeated.
- f) The SS instructs the MS to the minimum power control level, all other conditions remaining constant. Steps a) to d) are repeated.
- g) The MS is hard mounted on a vibration table and vibrated at the frequency/amplitudes specified in annex 1, TC4. During the vibration steps a) to f) are repeated.

NOTE: If the call is terminated when mounting the MS to the vibration table, it will be necessary to establish the initial conditions again before repeating steps a) to f).

- h) The MS is re-positioned on the vibration table in the two orthogonal planes to the plane used in step g). For each of the orthogonal planes step g) is repeated.
- i) Steps a) to f) are repeated under extreme test conditions (see annex 1, TC2.2).

#### 13.16.1.5.1 Frequency error

For all measured bursts, the frequency error, derived in step c.6), shall be less than  $10E-7$ .

#### 13.16.1.5.2 Phase error

For all measured bursts, the RMS phase error, derived in step c.8), shall not exceed 5 degrees.

For all measured bursts, each individual phase error, derived in step c.7), shall not exceed 20 degrees.

### 13.16.2 Transmitter output power in GPRS multislot configuration

#### 13.16.2.1 Definition and applicability

The transmitter output power is the average value of the power delivered to an artificial antenna or radiated by the MS and its integral antenna, over the time that the useful information bits of one burst are transmitted.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS and any multiband MS, which are capable of GPRS multislot operation on the uplink.

#### 13.16.2.2 Conformance requirement

1. The MS maximum output power shall be as defined in 3GPP TS 05.05, subclause 4.1.1, first table, according to its power class, with a tolerance of  $\pm 2$  dB under normal conditions; 3GPP TS 05.05, subclause 4.1.1, first table.
2. The MS maximum output power shall be as defined in 3GPP TS 05.05, subclause 4.1.1, first table, according to its power class, with a tolerance of  $\pm 2,5$  dB under extreme conditions; 3GPP TS 05.05, subclause 4.1.1, first table; 3GPP TS 05.05 annex D subclauses D.2.1 and D.2.2.
3. The power control levels shall have the nominal output power levels as defined in 3GPP TS 05.05, subclause 4.1.1, third table (for GSM 400, GSM 700, GSM 850 and GSM 900), fourth table (for DCS 1 800) or fifth table (for PCS 1 900), from the lowest power control level up to the maximum output power corresponding to the class of the MS (for tolerance on maximum output power see conformance requirements 1), with a tolerance of  $\pm 3$  dB,  $\pm 4$  dB or  $\pm 5$  dB under normal conditions; 3GPP TS 05.05, subclause 4.1.1, third, fourth or fifth table.
4. The power control levels shall have the nominal output power levels as defined in 3GPP TS 05.05, subclause 4.1.1, third table (for GSM 400, GSM 700, GSM 850 and GSM 900), fourth table (for DCS 1 800) or fifth table (for PCS 1 900), from the lowest power control level up to the maximum output power corresponding to the class of the MS (for tolerance on maximum output power see conformance requirements 2), with a tolerance of  $\pm 4$  dB,  $\pm 5$  dB or  $\pm 6$  dB under extreme conditions; 3GPP TS 05.05, subclause 4.1.1, third, fourth or fifth table; 3GPP TS 05.05 annex D subclauses D.2.1 and D.2.2.

5. The output power actually transmitted by the MS at consecutive power control levels shall form a monotonic sequence and the interval between power control levels shall be  $2 \pm 1,5$  dB ( $1 \pm 1$ dB between power control level 30 and 31 for PCS 1 900); 3GPP TS 05.05, subclause 4.1.1.
6. The transmitted power level relative to time for a normal burst shall be within the power/time template given in 3GPP TS 05.05, annex B figure B1. In multislot configurations where the bursts in two or more consecutive time slots are actually transmitted at the same frequency the template of annex B shall respected during the useful part of each burst and at the beginning and the end of the series of consecutive bursts. The output power during the guard period between every two consecutive active timeslots shall not exceed the level allowed for the useful part of the first timeslot or the level allowed for the useful part of the second timeslot plus 3 dB, whichever is the highest:
  - 6.1 Under normal conditions; 3GPP TS 05.05, subclause 4.5.2.
  - 6.2 Under extreme conditions; 3GPP TS 05.05, subclause 4.5.2, 3GPP TS 05.05 annex D subclauses D.2.1 and D.2.2.
7. When accessing a cell on the PRACH or RACH and before receiving the first power control parameters during packet transfer on PDCH, all GSM and class 1 and class 2 DCS 1 800 and PCS 1 900 MS shall use the power control level defined by the GPRS\_MS\_TXPWR\_MAX\_CCH parameter broadcast on the PBCCH or MS\_TXPWR\_MAX\_CCH parameter broadcast on the BCCH of the cell. When MS\_TXPWR\_MAX\_CCH is received on the BCCH, a class 3 DCS 1800 MS shall add to it the value POWER\_OFFSET broadcast on the BCCH. If MS\_TXPWR\_MAX\_CCH or the sum defined by: MS\_TXPWR\_MAX\_CCH plus POWER\_OFFSET corresponds to a power control level not supported by the MS as defined by its power class, the MS shall act as though the closest supported power control level had been broadcast.
8. The transmitted power level relative to time for a Random Access burst shall be within the power/time template given in 3GPP TS 05.05, annex B figure B.3:
  - 8.1 Under normal conditions; 3GPP TS 05.05, subclause 4.5.2.
  - 8.2 Under extreme conditions; 3GPP TS 05.05, subclause 4.5.2, 3GPP TS 05.05 annex D subclauses D.2.1 and D.2.2.

### 13.16.2.3 Test purpose

1. To verify that the maximum output power of the MS in GPRS multislot configuration, under normal conditions, is within conformance requirement 1.
2. To verify that the maximum output power of the MS in GPRS multislot configuration, under extreme conditions, is within conformance requirement 2.
3. To verify that all power control levels, relevant to the class of MS, are implemented in the MS in GPRS multislot configuration and have output power levels, under normal conditions, within conformance requirement 3.
4. To verify that all power control levels have output power levels, under extreme conditions, within conformance requirement 4.
5. To verify that the step in the output power transmitted by the MS in GPRS multislot configuration at consecutive power control levels is within conformance requirement 5 under normal conditions.
6. To verify that the output power relative to time, when sending a normal burst is within conformance requirement 6 in GPRS multislot configuration:
  - 6.1 Under normal conditions.
  - 6.2 Under extreme conditions.
7. To verify that the MS in GPRS multislot configuration uses the maximum power control level according to its power class if commanded to a power control level exceeding its power class.
8. To verify that the output power relative to time, when sending an access burst is within conformance requirement 8 in GPRS multislot configuration:
  - 8.1 Under normal conditions.

8.2 Under extreme conditions.

#### 13.16.2.4 Methods of test

Two methods of test are described, separately for:

- 1) equipment fitted with a permanent antenna connector; and for
- 2) equipment fitted with an integral antenna, and which cannot be connected to an external antenna except by the fitting of a temporary test connector as a test fixture.

NOTE: The behaviour of the MS in the system is determined to a high degree by the antenna, and this is the only transmitter test in this ETS using the integral antenna. Further studies are ongoing on improved testing on the integral antenna, taking practical conditions of MS use into account.

##### 13.16.2.4.1 Method of test for equipment with a permanent antenna connector

###### 13.16.2.4.1.1 Initial conditions

The test shall be run under the default GPRS conditions defined in clause 40.

The MS shall be operated with its highest number of uplink slots.

The Test Mode defined in 3GPP TS 04.14 (subclause 5.4) will be utilised. If the MS is capable of both:

- Mode (a) transmitting pseudo-random data sequence in RLC data blocks;
- Mode (b) transmitting looped-back RLC data blocks;

then Mode (a) will be used.

If Mode (b) is used then the SS sends the psuedo-random data sequence specified for Mode (a) on the downlink for loopback on the uplink.

The SS controls the power level by setting the concerned time slot's power control parameter ALPHA ( $\alpha$ ) to 0 and GAMMA\_TN ( $\Gamma_{CH}$ ) to the desired power level in the Packet Uplink Assignment message (Closed Loop Control, see 3GPP TS 05.08, clause B.2) GPRS\_MS\_TXPWR\_MAX\_CCH / MS\_TXPWR\_MAX\_CCH is set to the maximum value supported by the Power Class of the Mobile under test. For DCS 1 800 mobile stations the POWER\_OFFSET parameter is set to 6 dB.

###### 13.16.2.4.1.2 Procedure

- a) Measurement of normal burst transmitter output power.

The SS takes power measurement samples evenly distributed over the duration of one burst with a sampling rate of at least  $2/T$ , where  $T$  is the bit duration. The samples are identified in time with respect to the modulation on the burst. The SS identifies the centre of the useful 147 transmitted bits, i.e. the transition from bit 13 to bit 14 of the midamble, as the timing reference.

The transmitter output power is calculated as the average of the samples over the 147 useful bits. This is also used as the 0 dB reference for the power/time template.

- b) Measurement of normal burst power/time relationship

The array of power samples measured in a) are referenced in time to the centre of the useful transmitted bits and in power to the 0 dB reference, both identified in a).

- c) Steps a) to b) are repeated on each timeslot within the multislot configuration with the MS commanded to operate on each of the power control levels defined, even those not supported by the MS.
- d) The SS commands the MS to the maximum power control level supported by the MS and steps a) to b) are repeated on each timeslot within the multislot configuration for ARFCN in the Low and High ranges.
- e) The SS commands the MS to the maximum power control level in the first timeslot allocated within the multislot configuration and to the minimum power control level in the second timeslot allocated. Any further timeslots

allocated are to be set to the maximum power control level. Steps a) to b) and corresponding measurements on each timeslot within the multislot configuration are repeated.

f) Measurement of access burst transmitter output power

The SS causes the MS to generate an Access Burst on an ARFCN in the Mid ARFCN range, this could be either by a cell re-selection or a new request for radio resource. In the case of a cell re-selection procedure the Power Level indicated in the PSI3 message is the maximum power control level supported by the MS. In the case of an Access Burst the MS shall use the Power Level indicated in the GPRS\_MS\_TXPWR\_MAX\_CCH parameter. If the power class of the MS is DCS 1 800 Class 3 and the Power Level is indicated by the MS\_TXPWR\_MAX\_CCH parameter, the MS shall also use the POWER\_OFFSET parameter.

The SS takes power measurement samples evenly distributed over the duration of the access burst as described in a). However, in this case the SS identifies the centre of the useful bits of the burst by identifying the transition from the last bit of the synch sequence. The centre of the burst is then five data bits prior to this point and is used as the timing reference.

The transmitter output power is calculated as the average of the samples over the 87 useful bits of the burst. This is also used as the 0 dB reference for the power/time template.

g) Measurement of access burst power/time relationship

The array of power samples measured in f) are referenced in time to the centre of the useful transmitted bits and in power to the 0 dB reference, both identified in f).

h) Depending on the method used in step f) to cause the MS to send an Access Burst, the SS sends either a PACKET CELL CHANGE ORDER along with power control level set to 10 in PSI3 parameter GPRS\_MS\_TXPWR\_MAX\_CCH or it changes the (Packet) System Information elements (GPRS\_)MS\_TXPWR\_MAX\_CCH and for DCS 1 800 the POWER\_OFFSET on the serving cell PBCCH/BCCH in order to limit the MS transmit power on the Access Burst to power control level 10 (+23 dBm for GSM 400, GSM 700, GSM 850 and GSM 900 or +10 dBm for DCS 1 800 and PCS 1 900) and then steps f) to g) are repeated.

i) Steps a) to h) are repeated under extreme test conditions (annex 1, TC2.2) except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

#### 13.16.2.4.2 Method of test for equipment with an integral antenna

NOTE: If the MS is equipped with a permanent connector, such that the antenna can be disconnected and the SS be connected directly, then the method of subclause 13.16.2.4.1 will be applied.

The tests in this subclause are performed on an unmodified test sample.

##### 13.16.2.4.2.1 Initial conditions

The MS is placed in the anechoic shielded chamber (annex 1, GC5) or on the outdoor test site, on an isolated support, in the position for normal use, at a distance of at least 3 metres from a test antenna, connected to the SS.

NOTE: The test method described has been written for measurement in an anechoic shielded chamber. If an outdoor test site is used then, in addition, it is necessary to raise/lower the test antenna through the specified height range to maximize the received power levels from both the test sample and the substitution antenna.

The Initial Conditions for the test are defined in subclause 13.16.2.4.1.1.

##### 13.16.2.4.2.2 Procedure

a) With the initial conditions set according to subclause 13.16.2.4.2.1 the test procedure in subclause 13.16.2.4.1.2 is followed up to and including step h), except that in step a), when measurements are done at maximum power for ARFCN in the Low, Mid and High range, the measurement is made eight times with the MS rotated by  $n \times 45$  degrees for all values of  $n$  in the range 0 to 7.

The measurements taken are received transmitter output power measurements rather than transmitter output power measurements, the output power measurement values can be derived as follows.

b) Assessment of test site loss for scaling of received output power measurements.

The MS is replaced by a half-wave dipole, resonating at the centre frequency of the transmit band, connected to an RF generator.

The frequency of the RF signal generator is set to the frequency of the ARFCN used for the 24 measurements in step a), the output power is adjusted to reproduce the received transmitter output power averages recorded in step a).

For each indication the power, delivered by the generator (in Watts) to the half-wave dipole, is recorded. These values are recorded in the form  $P_{nc}$ , where  $n$  = MS rotation and  $c$  = channel number.

For each channel number used compute:

$$P_{ac}(\text{Watts into dipole}) = \frac{1}{8} * \sum_{n=0}^{n=7} P_{nc}$$

from which:  $P_{ac} (\text{Tx dBm}) = 10\log_{10}(P_{ac}) + 30 + 2,15$

The difference, for each of the three channels, between the actual transmitter output power averaged over the 8 measurement orientations and the received transmitter output power at orientation  $n = 0$  is used to scale the received measurement results to actual transmitter output powers for all measured power control levels and ARFCN, which can then be checked against the requirements.

c) Temporary antenna connector calibration factors (transmit)

A modified test sample equipped with a temporary antenna connector is placed in a climatic test chamber and is linked to the SS by means of the temporary antenna connector.

Under normal test conditions, the power measurement and calculation parts of steps a) to j) of 13.16.2.4.1.2 are repeated except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

NOTE 1: The values noted here are related to the output transmitter carrier power levels under normal test conditions, which are known after step b). Therefore frequency dependent calibration factors that account for the effects of the temporary antenna connector can be determined.

d) Measurements at extreme test conditions.

NOTE 2: Basically the procedure for extreme conditions is:

- the power/time template is tested in the "normal" way;
- the radiated power is measured by measuring the difference with respect to the radiated power under normal test conditions.

Under extreme test conditions steps a) to h) of subclause 13.16.2.4.1.2 are repeated except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

The transmitter output power under extreme test conditions is calculated for each burst type, power control level and for every frequency used by adding the frequency dependent calibration factor, determined in c), to the values obtained at extreme conditions in this step.

### 13.16.2.5 Test requirements

- a) The transmitter output power, under every combination of normal and extreme test conditions, for normal bursts and access bursts, at each frequency and for each power control level applicable to the MS power class, shall be at the relevant level shown in table 13.16.2-1, table 13.16.2-2 or table 13.16.2-3 within the tolerances also shown in table 13.16.2-1, table 13.16.2-2 or table 13.16.2-3.

GSM 400, GSM 700, GSM 850 and GSM 900 only - begin

**Table 13.16.2-1: GSM 400, GSM 700, GSM 850 and GSM 900 transmitter output power for different power classes**

| Power class |   |   |   | Power control level | Transmitter output power | Tolerances   |              |
|-------------|---|---|---|---------------------|--------------------------|--------------|--------------|
| 2           | 3 | 4 | 5 |                     |                          | dBm          | normal       |

- 30 dBc or -20 dBm, whichever is the higher.

### 13.16.3 Output RF spectrum in GPRS multislot configuration

#### 13.16.3.1 Definition and applicability

The output RF spectrum is the relationship between the frequency offset from the carrier and the power, measured in a specified bandwidth and time, produced by the MS due to the effects of modulation and power ramping.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS and any multiband MS, which are capable of GPRS multislot operation on the uplink.

#### 13.16.3.2 Conformance requirement

1. The level of the output RF spectrum due to modulation shall be no more than that given in 3GPP TS 05.05, subclause 4.2.1, table a) for GSM 400, GSM 700, GSM 850 and GSM 900, table b) for DCS 1 800 or table c) for PCS 1 900, with the following lowest measurement limits:

- -36 dBm below 600 kHz offset from the carrier;
- -51 dBm for GSM 400, GSM 700, GSM 850 and GSM 900 or -56 dBm for DCS 1 800 and PCS 1 900 from 600 kHz out to less than 1 800 kHz offset from the carrier;
- -46 dBm for GSM 400, GSM 700, GSM 850 and GSM 900 or -51 dBm for DCS 1 800 and PCS 1 900 at and beyond 1 800 kHz offset from the carrier;

but with the following exceptions at up to -36 dBm:

- up to three bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz in the combined range 600 kHz to 6 000 kHz above and below the carrier;
- up to 12 bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz at more than 6 000 kHz offset from the carrier.

1.1 Under normal conditions; 3GPP TS 05.05, subclause 4.2.1.

1.2 Under extreme conditions; 3GPP TS 05.05, subclause 4.2.1; 3GPP TS 05.05, annex D subclauses D.2.1 and D.2.2.

2. The level of the output RF spectrum due to switching transients shall be no more than given in 3GPP TS 05.05, subclause 4.2.2, table "a) Mobile Station".
  - 2.1 Under normal conditions; 3GPP TS 05.05, subclause 4.2.2.
  - 2.2 Under extreme conditions; 3GPP TS 05.05, subclause 4.2.2; 3GPP TS 05.05 annex D subclause D.2.1 and D.2.2.
3. When allocated a channel, the power emitted by a GSM 400, GSM 900 and DCS 1 800 MS, in the band 935 MHz to 960 MHz shall be no more than -79 dBm, in the band 925 MHz to 935 MHz shall be no more than -67 dBm and in the band 1 805 MHz to 1 880 MHz shall be no more than -71 dBm except in five measurements in each of the bands 925 MHz to 960 MHz and 1 805 MHz to 1 880 MHz where exceptions at up to -36 dBm are permitted. For GSM 400 MS, in addition, the power emitted by MS, in the bands of 460,4 MHz to 467,6 MHz and 488,8 MHz to 496 MHz shall be no more than -67 dBm except in three measurements in each of the bands 460,4 MHz to 467,6 MHz and 488,8 MHz to 496 MHz where exceptions at up to -36 dBm are permitted. For GSM 700 and GSM 850, the power emitted by MS, in the band of 747 MHz to 757 MHz shall be no more than -79 dBm, in the band of 757 MHz to 762 MHz shall be no more than -73 dBm, in the band 869 MHz to 894 MHz shall be no more than -79 dBm, in the band 1 930 MHz to 1 990 MHz shall be no more than -71 dBm except in five measurements in each of the bands 747 MHz to 762 MHz, 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz where exceptions at up to -36 dBm are permitted. For PCS 1 900 MS, the power emitted by MS, in the band 869 MHz to 894 MHz shall be no more than -79 dBm, in the band 1 930 MHz to 1 990 MHz shall be no more than -71 dBm except in five measurements in each of the bands 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz where exceptions at up to -36 dBm are permitted. Under normal conditions; 3GPP TS 05.05, subclause 4.3.3.

#### 13.16.3.3 Test purpose

1. To verify that the output RF spectrum due to modulation does not exceed conformance requirement 1 in the GPRS multislot configurations.
  - 1.1 Under normal conditions.
  - 1.2 Under extreme conditions.
2. To verify that the output RF spectrum due to switching transients does not exceed conformance requirement 2 in the GPRS multislot configurations when a reasonable margin is allowed for the effect of spectrum due to modulation.
  - 2.1 Under normal conditions.
  - 2.2 Under extreme conditions.
3. To verify that the MS spurious emissions in the MS receive band do not exceed conformance requirement 3 in the GPRS multislot configurations.

#### 13.16.3.4 Method of test

##### 13.16.3.4.1 Initial conditions

The test shall be run under the default GPRS conditions defined in clause 40.

The MS shall be operated with its highest number of uplink slots.

The Test Mode defined in 3GPP TS 04.14 (subclause 5.4) will be utilised. If the MS is capable of both:

- Mode (a) transmitting pseudo-random data sequence in RLC data blocks;
- Mode (b) transmitting looped-back RLC data blocks;

then Mode (a) will be used.

If Mode (b) is used then the SS sends the psuedo-random data sequence specified for Mode (a) on the downlink for loopback on the uplink. The SS shall use a level of  $23 \text{ dB}\mu\text{Vemf}(\ )$ .

The SS commands the MS to hopping mode. The hopping pattern includes only three channels, namely one with an ARFCN in the Low ARFCN range, a second one with an ARFCN in the Mid ARFCN range and the third one with an ARFCN in the High ARFCN range.

NOTE 1: Although the measurement is made whilst the MS is in hopping mode, each measurement is on one single channel.

NOTE 2: This test is specified in hopping mode as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to cell re-select the MS between the three channels tested at the appropriate time.

#### 13.16.3.4.2 Procedure

NOTE: When averaging is in use during frequency hopping mode, the averaging only includes bursts transmitted when the hopping carrier corresponds to the nominal carrier of the measurement.

a) In steps b) to h) the FT is equal to the hop pattern ARFCN in the Mid ARFCN range.

b) The other settings of the spectrum analyser are set as follows:

- Zero frequency scan;
- Resolution bandwidth: 30 kHz;
- Video bandwidth: 30 kHz;
- Video averaging: may be used, depending on the implementation of the test.

The video signal of the spectrum analyser is "gated" such that the spectrum generated by at least 40 of the bits 87 to 132 of the burst in one of the active time slots is the only spectrum measured. This gating may be analogue or numerical, dependent upon the design of the spectrum analyser. Only measurements during transmitted bursts on the nominal carrier of the measurement are included. The spectrum analyser averages over the gated period and over 200 or 50 such bursts, using numerical and/or video averaging.

c) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 50 bursts at all multiples of 30 kHz offset from FT to < 1 800 kHz.

d) The resolution and video bandwidth on the spectrum analyser are adjusted to 100 kHz and the measurements are made at the following frequencies:

on every ARFCN from 1 800 kHz offset from the carrier to the edge of the relevant transmit band for each measurement over 50 bursts.

at 200 kHz intervals over the 2 MHz either side of the relevant transmit band for each measurement over 50 bursts.

For GSM 400, GSM 900 and DCS 1 800:

at 200 kHz intervals over the band 925 MHz to 960 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 1 805 MHz to 1 880 MHz for each measurement over 50 bursts.

In addition for GSM 400 MS:

at 200 kHz intervals over the band 460,4 MHz to 467,6 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 488,8 MHz to 496 MHz for each measurement over 50 bursts.

For GSM 700 and GSM 850:

at 200 kHz intervals over the band 747MHz to 762 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 869 MHz to 894 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 1 930 MHz to 1 990 MHz for each measurement over 50 bursts.

For PCS 1 900:

at 200 kHz intervals over the band 869 MHz to 894 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 1 930 MHz to 1 990 MHz for each measurement over 50 bursts.

- e) The MS is commanded to its minimum power control level. The spectrum analyser is set again as in b).
- f) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 200 bursts at the following frequencies:

FT;

FT + 100 kHz                      FT - 100 kHz;

FT + 200 kHz                      FT - 200 kHz;

FT + 250 kHz                      FT - 250 kHz;

FT + 200 kHz \* N                  FT - 200 kHz \* N;

where N = 2, 3, 4, 5, 6, 7, and 8;

and FT = RF channel nominal centre frequency.

- g) Steps a) to f) is repeated except that in step a) the spectrum analyzer is gated so that the burst of the next active time slot is measured.

- h) The spectrum analyser settings are adjusted to:

- Zero frequency scan;
- Resolution bandwidth:      30 kHz;
- Video bandwidth:              100 kHz;
- Peak hold.

The spectrum analyser gating of the signal is switched off.

The MS is commanded to its maximum power control level in every transmitted time slot.

- i) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured at the following frequencies:

FT + 400 kHz                      FT - 400 kHz;

FT + 600 kHz                      FT - 600 kHz;

FT + 1,2 MHz                      FT - 1,2 MHz;

FT + 1,8 MHz                      FT - 1,8 MHz;

where FT = RF channel nominal centre frequency.

The duration of each measurement (at each frequency) will be such as to cover at least 10 burst transmissions at FT.

- j) Step i) is repeated for power control levels 7 and 11.
- k) Steps b), f), h) and i) are repeated with FT equal to the hop pattern ARFCN in the Low ARFCN range except that in step h) the MS is commanded to power control level 11 rather than maximum power.
- l) Steps b), f), h) and i) are repeated with FT equal to the hop pattern ARFCN in the High ARFCN range except that in step h) the MS is commanded to power control level 11 rather than maximum power.
- m) Steps a) b) f) h), and i) are repeated under extreme test conditions (annex 1, TC2.2). except that at step h) the MS is commanded to power control level 11.

## 13.16.3.5 Test requirements

For absolute measurements, performed on a temporary antenna connector, in the frequency band 450,4 MHz to 457,6 MHz, 478,8 MHz to 486 MHz, 777 MHz to 792 MHz, 824 MHz to 849 MHz, 880 MHz to 915 MHz, 1 710 MHz to 1 785 MHz, or 1 850 MHz to 1 910 MHz, the temporary antenna connector coupling factor, determined according to subclause 13.3.4.2.2 and annex 1 GC7, for the nearest relevant frequency, will be used.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 925 MHz to 960 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 900 MS. For a GSM 400, GSM 700, GSM 850, DCS 1 800 or PCS 1 900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 1 805 MHz to 1 880 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for DCS 1 800 MS. For a GSM 400, GSM 700, GSM 850, GSM 900 or PCS 1 900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 460,4 MHz to 467,6 MHz or 488.8 to 496 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 400 MS. For a GSM 700, GSM 850, GSM 900, DCS 1800 or PCS 1 900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 747 MHz to 762 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 700 MS. For a GSM 400, GSM 850, GSM 900 or DCS 1800 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 869 MHz to 894 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 850 MS. For a GSM 400, GSM 700, GSM 900 or DCS 1800 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 1 930 MHz to 1 990 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for PCS 1 900 MS. For GSM 400, GSM 900 or DCS 1 800 MS 0 dB will be assumed.

The figures in the tables below, at the listed frequencies from the carrier (kHz), are the maximum level (dB) relative to a measurement in 30 kHz bandwidth on the carrier (reference 3GPP TS 05.05 subclause 4.2.1).

- a) For the modulation sidebands out to less than 1 800 kHz offset from the carrier frequency (FT) measured in step c), f), i), k), l) and m) the measured power level in dB relative to the power level measured at FT, for all types of MS, shall not exceed the limits derived from the values shown in table 13.16.3-1 for GSM 400, GSM 700, GSM 850 and GSM 900, table 13.16.3-2 for DCS 1 800 or table 13.16.3-3 for PCS 1 900 according to the actual transmit power and frequency offset from FT. However any failures in the combined range 600 kHz to less than 1 800 kHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below.

**Table 13.16.3-1: GSM 400, GSM 700, GSM 850 and GSM 900 Spectrum due to modulation out to less than 1 800 kHz offset**

| Power level<br>(dBm)                                                     | power levels in dB relative to the measurement at FT |     |     |     |                |
|--------------------------------------------------------------------------|------------------------------------------------------|-----|-----|-----|----------------|
|                                                                          | Frequency offset (kHz)                               |     |     |     |                |
|                                                                          | 0-100                                                | 200 | 250 | 400 | 600 to < 1 800 |
| 39                                                                       | +0,5                                                 | -30 | -33 | -60 | -66            |
| 37                                                                       | +0,5                                                 | -30 | -33 | -60 | -64            |
| 35                                                                       | +0,5                                                 | -30 | -33 | -60 | -62            |
| <= 33                                                                    | +0,5                                                 | -30 | -33 | -60 | -60            |
| The values above are subject to the minimum absolute levels (dBm) below. |                                                      |     |     |     |                |
|                                                                          | -36                                                  | -36 | -36 | -36 | -51            |

|--------------------------------------------------------------------------|------------------------------------------------------|-----|-----|-----|----------------|
|                                                                          | Frequency offset (kHz)                               |     |     |     |                |
|                                                                          | 0-100                                                | 200 | 250 | 400 | 600 to < 1 800 |
| <= 36                                                                    | +0,5                                                 | -30 | -33 | -60 | -60            |
| The values above are subject to the minimum absolute levels (dBm) below. |                                                      |     |     |     |                |
|                                                                          | -36                                                  | -36 | -36 | -36 | -56            |

**Table 13.16.3-3: PCS 1 900 Spectrum due to modulation out to less than 1 800 kHz offset**

| Power level<br>(dBm)                                                     | power levels in dB relative to the measurement at FT |     |     |     |                |                  |
|--------------------------------------------------------------------------|------------------------------------------------------|-----|-----|-----|----------------|------------------|
|                                                                          | Frequency offset (kHz)                               |     |     |     |                |                  |
|                                                                          | 0-100                                                | 200 | 250 | 400 | 600 to < 1 200 | 1 200 to < 1 800 |
| <= 33                                                                    | +0,5                                                 | -30 | -33 | -60 | -60            | -60              |
| The values above are subject to the minimum absolute levels (dBm) below. |                                                      |     |     |     |                |                  |
|                                                                          | -36                                                  | -36 | -36 | -36 | -56            | -56              |

NOTE 1: For frequency offsets between 100 kHz and 600 kHz the requirement is derived by a linear interpolation between the points identified in the table with linear frequency and power in dB relative.

- b) For the modulation sidebands from 1 800 kHz offset from the carrier frequency (FT) and out to 2 MHz beyond the edge of the relevant transmit band, measured in step d), the measured power level in dB relative to the power level measured at FT, shall not exceed the values shown in table 13.16.3-4 according to the actual transmit power, frequency offset from FT and system on which the MS is designed to operate. However any failures in the combined range 1 800 kHz to 6 MHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below, and any other failures may be counted towards the exceptions allowed in test requirements d) below.

**Table 13.16.3-4: Spectrum due to modulation from 1 800 kHz offset to the edge of the transmit band (wideband noise)**

| power levels in dB relative to the measurement at FT                     |                      |                  |          |             |                      |          |             |                      |          |

|                                                                          | -46                  | -46              | -46      |             | -51                  | -51      |             | -51                  | -51      |

- c) Any failures (from a) and b) above) in the combined range 600 kHz to 6 MHz above and below the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, spurious emissions are allowed in up to three 200 kHz bands centred on an integer multiple of 200 kHz so long as no spurious emission exceeds -36 dBm. Any spurious emissions measured in a 30 kHz bandwidth which spans two 200 kHz bands can be counted towards either 200 kHz band, whichever minimizes the number of 200 kHz bands containing spurious exceptions.
- d) Any failures (from b) above) beyond 6 MHz offset from the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, up to twelve spurious emissions are allowed so long as no spurious emission exceeds -36 dBm.

- e) For GSM 400, GSM 900 and DCS 1 800 MS the MS spurious emissions in the bands 925 MHz to 935 MHz, 935 MHz to 960 MHz and 1 805 MHz to 1 880 MHz, measured in step d), shall not exceed the values shown in table 13.16.3-5 except in up to five measurements in the band 925 MHz to 960 MHz and five measurements in the band 1 805 MHz to 1 880 MHz where a level up to -36 dBm is permitted. For GSM 400 MS, in addition, the MS spurious emissions in the bands 460,4 MHz to 467,6 MHz and 488,8 MHz to 496 MHz shall not exceed the value of -67 dBm, except in up to three measurements in each of the bands 460,4 MHz to 467,6 MHz and 488,8 MHz to 496 MHz where a level up to -36 dBm is permitted. For GSM 700 and GSM 850 the spurious emissions in the bands 747 MHz to 757 MHz, 757 MHz to 762 MHz, 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz shall not exceed the values shown in table 13.16.3-4 except in up to five measurements in each of the bands 747 MHz to 762 MHz, 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz where a level up to -36 dBm is permitted. For PCS 1 900 MS the spurious emissions in the bands 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz shall not exceed the values shown in table 13.16.3-5 except in up to five measurements in each of the bands 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz where a level up to -36 dBm is permitted.

**Table 13.16.3-5: Spurious emissions in the MS receive bands**

| Band (MHz)   | Spurious emissions level (dBm) |           |
|--------------|--------------------------------|-----------|
|              | GSM 400, GSM 900 and DCS 1 800 | PCS 1 900 |
| 925 to 935   | -67                            |           |
| 935 to 960   | -79                            |           |
| 1805 to 1880 | -71                            |           |
| 747 to 757   |                                | -79       |
| 757 to 762   |                                | -73       |
| 869 to 894   |                                | -79       |
| 1930 to 1990 |                                | -71       |

- f) For the power ramp sidebands of steps h), i) and k) the power levels must not exceed the values shown in table 13.16.3-6 for GSM 400, GSM 700, GSM 850 and GSM 900, table 13.16.3-7 for DCS 1 800 or table 13.16.3-8 for PCS 1 900.

**Table 13.16.3-6: GSM Spectrum due to switching transients**

| Power level | Maximum level for various offsets from carrier frequency |         |          |           |
|-------------|----------------------------------------------------------|---------|----------|-----------|
|             | 400 kHz                                                  | 600 kHz | 1200 kHz | 1 800 kHz |
| 39 dBm      | -13 dBm                                                  | -21 dBm | -21 dBm  | -24 dBm   |
| 37 dBm      | -15 dBm                                                  | -21 dBm | -21 dBm  | -24 dBm   |
| 35 dBm      | -17 dBm                                                  | -21 dBm | -21 dBm  | -24 dBm   |
| 33 dBm      | -19 dBm                                                  | -21 dBm | -21 dBm  | -24 dBm   |
| 31 dBm      | -21 dBm                                                  | -23 dBm | -23 dBm  | -26 dBm   |
| 29 dBm      | -23 dBm                                                  | -25 dBm | -25 dBm  | -28 dBm   |

| 36 dBm      | -16 dBm                                                  | -21 dBm | -21 dBm   | -24 dBm   |
| 34 dBm      | -18 dBm                                                  | -21 dBm | -21 dBm   | -24 dBm   |
| 32 dBm      | -20 dBm                                                  | -22 dBm | -22 dBm   | -25 dBm   |
| 30 dBm      | -22 dBm                                                  | -24 dBm | -24 dBm   | -27 dBm   |
| 28 dBm      | -23 dBm                                                  | -25 dBm | -26 dBm   | -29 dBm   |
| 26 dBm      | -23 dBm                                                  | -26 dBm | -28 dBm   | -31 dBm   |
| 24 dBm      | -23 dBm                                                  | -26 dBm | -30 dBm   | -33 dBm   |
| 22 dBm      | -23 dBm                                                  | -26 dBm | -31 dBm   | -35 dBm   |
| <= +20 dBm  | -23 dBm                                                  | -26 dBm | -32 dBm   | -36 dBm   |

**Table 13.16.3-8: PCS 1 900 Spectrum due to switching transients**

| Power level | Maximum level for various offsets from carrier frequency |         |           |           |
|-------------|----------------------------------------------------------|---------|-----------|-----------|
|             | 400 kHz                                                  | 600 kHz | 1 200 kHz | 1 800 kHz |
| 33 dBm      | -19 dBm                                                  | -22 dBm | -22 dBm   | -25 dBm   |
| 32 dBm      | -20 dBm                                                  | -22 dBm | -22 dBm   | -25 dBm   |
| 30 dBm      | -22 dBm                                                  | -24 dBm | -24 dBm   | -27 dBm   |
| 28 dBm      | -23 dBm                                                  | -25 dBm | -26 dBm   | -29 dBm   |
| 26 dBm      | -23 dBm                                                  | -26 dBm | -28 dBm   | -31 dBm   |
| 24 dBm      | -23 dBm                                                  | -26 dBm | -30 dBm   | -33 dBm   |
| 22 dBm      | -23 dBm                                                  | -26 dBm | -31 dBm   | -35 dBm   |
| <= +20 dBm  | -23 dBm                                                  | -26 dBm | -32 dBm   | -36 dBm   |

NOTE 2: These figures are different from the requirements in 3GPP TS 05.05 because at higher power levels it is the modulation spectrum which is being measured using a peak hold measurement. This allowance is given in the table.

NOTE 3: The figures for table 13.16.3-6, table 13.16.3-7 and table 13.16.3-8 assume that, using the peak hold measurement, the lowest level measurable is 8 dB above the level of the modulation specification using the 30 kHz bandwidth gated average technique for 400 kHz offset from the carrier. At 600 and 1 200 kHz offset the level is 6 dB above and at 1 800 kHz offset the level is 3 dB above. The figures for 1 800 kHz have assumed the 30 kHz bandwidth spectrum due to modulation specification at < 1 800 kHz.

## 13.17 EGPRS transmitter tests

### 13.17.1 Frequency error and Modulation accuracy in EGPRS Configuration

#### 13.17.1.1 Definition and applicability

The frequency error is the difference in frequency, after adjustment for the effect of the modulation accuracy between the RF transmission from the MS and either:

- the RF transmission from the BS; or
- the nominal frequency for the ARFCN used.

Modulation Accuracy.

For GMSK, the modulation accuracy of the transmitted signal is described as the phase accuracy (phase error) of the GMSK modulated signal. The phase error for GSMK modulation is the difference in phase, after adjustment for the effect of the frequency error, between the RF transmission from the MS and the theoretical transmission according to the intended modulation.

Since the conformance requirement, test procedure and test requirement for GMSK modulation accuracy (RMS Phase error and maximum peak deviation) are defined in subclause 13.16.1 for GPRS MS, being thereby defined also for all EGPRS MS in that section, only 8PSK modulation accuracy conformance requirement, test procedure and test requirement are defined in this subclause.

For 8-PSK, the error vector between the vector representing the transmitted signal and the vector representing the error-free modulated signal defines modulation accuracy. The magnitude of the error vector is called Error Vector Magnitude (EVM). Origin suppression is defined to be the ratio of the carrier leakage to the modulated signal.

The requirements and this test apply to EGPRS MS which are capable of 8PSK modulated transmission in the uplink. For multiband MS, requirements and this test apply to all applicable bands.

#### 13.17.1.2 Conformance requirement

1. The carrier frequency under 8PSK modulation shall be accurate to within 0,2 ppm for GSM 400 and 0,1 ppm for all other bands compared to signals received from the BS.

1.1 Under normal conditions; 3GPP TS 05.10, subclause 6.1.

- 1.2 Under vibration conditions; 3GPP TS 05.10, subclause 6.1; 3GPP TS 05.05, annex D subclause D.2.3.
- 1.3 Under extreme conditions; 3GPP TS 05.10, subclause 6.1; 3GPP TS 05.05, subclause 4.4; 3GPP TS 05.05, annex D subclauses D.2.1 and D.2.2.
2. The RMS EVM over the useful part of any burst of the 8-PSK modulated signal shall not exceed.
- 2.1 9,0% Under normal conditions; 3GPP TS 05.05, subclause 4.6.2.1
- 2.2 10,0% Under extreme conditions; 3GPP TS 05.05, subclause 4.6; 3GPP TS 05.05, annex D subclauses D.2.1 and D.2.2.
3. The peak EVM values of any burst of the 8PSK modulated signal shall be  $\leq 30$  %.
- 3.1 Under normal conditions; 3GPP TS 05.05, subclause 4.6.2.3.
- 3.2 Under extreme conditions; 3GPP TS 05.05, subclause 4.6.2.3; 3GPP TS 05.05, annex D subclauses D.2.1 and D.2.2.
4. The 95:th-percentile value of any burst of the 8-PSK modulated signal shall be  $\leq 15$  %.
- 4.1 Under normal conditions; 3GPP TS 05.05, subclause 4.6.2.4.
- 4.2 Under extreme conditions; 3GPP TS 05.05, subclause 4.6.2.4; 3GPP TS 05.05, annex D subclauses D.2.1 and D.2.2.
5. The Origin Offset Suppression for any 8PSK modulated signal shall exceed 30 dB.
- 5.1 Under normal conditions; 3GPP TS 05.05, subclause 4.6.2.2.
- 5.2 Under extreme conditions; 3GPP TS 05.05, subclause 4.6.2.2; 3GPP TS 05.05, annex D subclauses D.2.1 and D.2.2.

#### 13.17.1.3 Test purpose

To verify that the carrier frequency error does not exceed conformance requirement 1:

- 1.1 Under normal conditions.
- 1.2 When the MS is being vibrated.
- 1.3 Under extreme conditions.

To verify that the RMS EVM over the useful part of the burst, excluding tail bits, transmitted by the MS does not exceed conformance requirement 2:

- 2.1 Under normal conditions.
- 2.2 When the MS is being vibrated.
- 2.3 Under extreme conditions.

To verify that the peak EVM values over the useful part of the burst, excluding tail bits, transmitted by the MS does not exceed conformance requirement 3:

- 3.1 Under normal conditions.
- 3.2 When the MS is being vibrated.
- 3.3 Under extreme conditions.

To verify that the 95:th percentile EVM over the useful part of any burst, excluding tail bits, does not exceed conformance requirement 4:

- 4.1 Under normal conditions.
- 4.2 When the MS is being vibrated.

4.3 Under extreme conditions.

To verify that the origin offset suppression does exceed conformance requirement 5:

5.1 Under normal conditions.

5.2 When the MS is being vibrated.

5.3 Under extreme conditions.

#### 13.17.1.4 Method of the test

##### Initial conditions

The test shall be run under the default EGPRS conditions defined in clause 50.

The SS shall command the MS to hopping mode (for the choice of frequencies in the frequency hopping mode, see subclause 6.2 and tables 6-1 and 6-2).

NOTE: It is not necessary to test in hopping mode but is done here as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to make sure bursts are taken from a few different channels.

The MS shall be operated with its highest number of uplink slots.

The Test Mode defined in 3GPP TS 04.14 subclause 5.4 shall be utilised. If the MS is capable of both:

Mode (a) transmitting pseudo-random data sequence in RLC data blocks;

Mode (b) transmitting looped-back RLC data blocks;

then Mode (a) will be used.

For the 8PSK procedure described below, the initial power value of each active timeslot shall be set to a mid-range power value.

#### 13.17.1.4.2 Test procedure

##### Procedure for 8PSK Frequency error and modulation accuracy measurements

- a) For one transmitted burst on the last slot of the multislot configuration, the SS captures the transmitted signal by taking at least four samples per symbol. The transmitted signal is modeled by:

$$Y(t) = C1 \{R(t) + D(t) + C0\} W^t$$

R(t) is defined to be an ideal transmitter signal.

D(t) is the residual complex error on signal R(t).

C0 is a constant origin offset representing carrier feedthrough.

C1 is a complex constant representing the arbitrary phase and output power of the transmitter.

$W = e^{\alpha + j 2\pi f}$  accounts for both a frequency offset of " $2\pi f$ " radians per second phase rotation and an amplitude change of " $\alpha$ " nepers per second.

The symbol timing phase of Y(t) is aligned with R(t).

- b) The SS shall generate the ideal transmitter signal as a reference. The ideal transmitter signal can be constructed from a priori knowledge of the transmitted symbols or from the demodulated symbols of the transmitted burst. In the latter case, unknown symbols shall be detected with an error rate sufficiently small to ensure the accuracy of the measurement equipment (see annex 5).

c)

- c.1) The transmitted signal  $Y(t)$  is compensated in amplitude, frequency and phase by multiplying with the factor:

$$W^{-1}/C1$$

The values for  $W$  and  $C1$  are determined using an iterative procedure.  $W(\alpha, f)$ ,  $C1$  and  $C0$  are chosen to minimise the RMS value of EVM on a burst-by-burst basis.

- c.2) After compensation,  $Y(t)$  is passed through the specified measurement filter (3GPP TS 05.05, subclause 4.6.2) to produce the signal:

$$Z(k) = S(k) + E(k) + C0$$

where:

$S(k)$  is the ideal transmitter signal observed through the measurement filter;

$k = \text{floor}(t/T_s)$ , where  $T_s = 1/270.833$  kHz corresponding to the symbol times.

- c.3) The error vector is defined to be:

$$E(k) = Z(k) - C0 - S(k)$$

It is measured and calculated for each instant  $k$  over the useful part of the burst excluding tail bits. The RMS vector error is defined as:

$$\text{RMS EVM} = \sqrt{\frac{\sum_{k \in K} |E(k)|^2}{\sum_{k \in K} |S(k)|^2}}$$

- c.4) Steps c.1) to c.3) are repeated with successive approximations of  $W(\alpha, f)$ ,  $C1$  and  $C0$  until the minimum value of RMS EVM is found. The minimised value of RMS EVM and the final values for  $C1$ ,  $C0$  and  $f$  are noted. ( $f$  represents the frequency error of the burst).
- d) For each symbol in the useful part of the burst excluding tail bits, the SS shall calculate the error vector magnitude as:

$$\text{EVM}(k) = \frac{|E(k)|}{\sqrt{\frac{\sum_{k \in K} |S(k)|^2}{N}}}$$

The peak value of symbol EVM in the useful part of the burst, excluding tail bits, is noted.

- e) The SS shall calculate the value for Origin Offset Suppression for the burst as:

$$\text{OOS} = \left( \frac{|C_o|^2}{\frac{1}{N} \sum_{k \in K} |S(k)|^2} \right)$$

- f) Steps a) to e) are repeated for a total of 200 bursts.
- g) The peak values of symbol EVM noted in step d) are averaged for the 200 measured bursts.
- h) The origin offset suppression values derived in step e) are averaged for the 200 measured bursts. The resulting average is converted to log format.

$$\text{OOS}(dB) = -10 \log(\text{OOS})$$

- i) From the distribution of symbol EVM values calculated in step d) for the 200 measured bursts, the SS shall determine the 95: th percentile value.
- j) The SS instructs the MS to its maximum power control level by setting the power control parameter ALPHA ( $\alpha$ ) to 0 and GAMMA\_TN ( $\Gamma_{CH}$ ) for each timeslot to the desired power level in the Packet Uplink Assignment or Packet Timeslot Reconfigure message (Closed Loop Control, see 3GPP TS 05.08, clause B.2), all other conditions remaining constant. Steps a) to i) are repeated.
- k) The SS instructs the MS to the minimum power control level, all other conditions remaining constant. Steps a) to i) are repeated.
- l) The MS is hard mounted on a vibration table and vibrated at the frequency/amplitudes specified in annex 1, TC4. During the vibration steps a) to i) are repeated.

NOTE: If the call is terminated when mounting the MS to the vibration table, it will be necessary to establish the initial conditions again before repeating steps a) to i).

- m) The MS is re-positioned on the vibration table in the two orthogonal planes to the plane used in step k). For each of the orthogonal planes step l) is repeated.
- n) Steps a) to i) are repeated under extreme test conditions (see annex 1, TC2.2).

#### 13.17.1.5 Test Requirements

1. For all measured bursts, the frequency error, derived in step c.4), shall be less than  $10E-7$ .
2. For all measured bursts, the RMS EVM, derived in step c.3) shall not exceed 9.0 % under normal conditions and 10.0% under extreme conditions.
3. The (averaged) value of peak EVM derived in step g) shall not exceed 30 %.
4. The 95:th percentile value derived in step i) shall not exceed 15 %.
5. The origin offset suppression derived in subclause 13.17.1.4.2 step h) shall exceed 30 dB for MS.

### 13.17.2 Frequency error under multipath and interference conditions

#### 13.17.2.1 Definition and applicability

The frequency error under multipath and interference conditions is a measure of the ability of the MS to maintain frequency synchronization with the received signal under conditions of Doppler shift, multipath reception and interference.

The requirements and this test apply to all EGPRS MSs. For multiband MS, requirements and this test apply to all applicable bands.

#### 13.17.2.2 Conformance requirement

1. The MS carrier frequency error for each burst shall be accurate to within 0,1 ppm for GSM 700, GSM 850, GSM 900, DCS 1800, PCS 1 900 and 0,2 ppm for GSM 400 compared to signals received from the BS for signal levels down to 3 dB below the reference sensitivity level.
  - 1.1 Under normal conditions; 3GPP TS 05.10, subclauses 6 and 6.1.
  - 1.2 Under extreme conditions; 3GPP TS 05.10, subclauses 6 and 6.1; 3GPP TS 05.05 annex D subclauses D.2.1 and D.2.2.
2. The MS carrier frequency error for each burst shall be accurate to within 0,1 ppm, for GSM 700, GSM 850, GSM 900, DCS 1800 and PCS 1 900 and 0,2 ppm for GSM 400 compared to signals received from the BS for 3 dB less carrier to interference ratio than the reference interference ratios; 3GPP TS 05.10, subclauses 6 and 6.1.

### 13.17.2.3 Test purpose

1. To verify that the MS carrier frequency error at reference sensitivity, under conditions of multipath and Doppler shift does not exceed 0,1 ppm for GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 and 0,2 ppm for GSM 400 + the frequency error due to the Doppler shift of the received signal and the assessment error in the MS.

1.1 Under normal conditions.

1.2 Under extreme conditions.

NOTE 1: Although the conformance requirement states that frequency synchronization should be maintained for input signals 3 dB below reference sensitivity. Due to the Radio Link Failure counter this test condition cannot be established. Hence all tests in this subclause are conducted at reference sensitivity level.

2. To verify that the MS carrier frequency error, under interference conditions and TUlow fading profile, does not exceed 0,1 ppm for GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 and 0,2 ppm for GSM 400 + the frequency error due to the Doppler shift of the received signal and the assessment error in the MS.

NOTE 2: The test adds the effect of Doppler shift to the requirements as the conformance requirement refers to signals input to the MS receiver whereas the frequency reference for measurement will not take account of the Doppler shift.

### 13.17.2.4 Method of test

This test uses the same measurement process as test 13.16.1 for GMSK modulated uplink transmission and 13.17.1 for 8PSK modulated uplink transmission for the MS operating under various RF conditions.

NOTE: The BA list sent on the BCCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCH but if they are provided none will be within 5 channels of the ARFCN used for the serving BCCH or PDTCH.

EGPRS Switched Radio Loopback Mode (3GPP TS 04.14, subclause 5.5) shall be utilised. This is since 8PSK modulated transmission is applied in the downlink during the test and EGPRS Switched Radio Loopback Mode is the only mandatory test mode for EGPRS MS that implements different modulations between concurrent downlink and uplink transmission. This test requires such test mode capability since an EGPRS MS is also allowed to support only GMSK modulated uplink transmission.

#### 13.17.2.4.1 Initial conditions

The MS is brought into the packet idle GPRS attached state on a serving cell with BCCH in the mid ARFCN range. The level of the serving cell BCCH is set to 10 dB above the reference sensitivity level( ) and the fading function set to RA. The SS waits 30 s for the MS to stabilize to these conditions.

#### 13.17.2.4.2 Procedure

- a) The SS is set up to capture the first burst transmitted by the MS during the uplink TBF. EGPRS Switched Radio Block Loop Back Mode is initiated by the SS according to the procedure defined in 3GPP TS 04.14; 5.5.1 on a channel in the mid ARFCN range. The PDTCH level is set to 10 dB above the reference sensitivity level( ) and the fading function is set to RA. 8PSK modulated downlink transmission shall be utilised.
- b) The SS calculates the frequency accuracy of the captured burst as described in test 13.16.1 for MS capable of only GMSK modulated transmission in the uplink. For MS capable of both GMSK and 8PSK modulated transmission in the uplink the frequency accuracy of the captured burst shall be calculated as described in the test 13.17.1.
- c) The SS sets the serving cell BCCH and PDTCH to the reference sensitivity level( ) applicable to the type of MS, still with the fading function set to RA and then waits 30 s for the MS to stabilize to these conditions.
- d) The SS shall capture subsequent bursts from the traffic channel in the manner described in test 13.16.1 or test 13.17.1.

NOTE: Due to the very low signal level at the MS receiver input the MS receiver is liable to error. The "looped back" bits are therefore also liable to error, and hence the SS does not know the expected bit sequence. The SS will have to demodulate the received signal to derive (error free) the transmitter burst bit pattern. Using this bit pattern the SS can calculate the expected phase trajectory according to the definition within 3GPP TS 05.04.

- e) The SS calculates the frequency accuracy of the captured burst as described in test 13.16.1 or test 13.17.1.
- f) Steps d) and e) are repeated for 5 traffic channel bursts spaced over a period of not less than 20 s.
- g) Both downlink and uplink TBFs are terminated. The initial conditions are established again and steps a) to f) are repeated but with the fading function set to HT200 for GSM 400, HT120 for GSM700 and HT100 for all other bands.
- h) The initial conditions are established again and steps a) to f) are repeated but with the fading function set to TU100 for GSM 400, TU60 for GSM700 and TU50 for all other bands.
- i) The initial conditions are established again and steps a) and b) are repeated but with the following differences:
- the levels of the BCCH and PDTCH are set to 18 dB above reference sensitivity level( ).
  - two further independent 8-PSK modulated interfering signals are sent on the same nominal carrier frequency as the BCCH and PDTCH and at a level 10 dB below the level of the PDTCH and modulated with random data, including the midamble.
  - the fading function for all channels is set to TUlow.
- j) The SS waits 100 s for the MS to stabilize to these conditions.
- k) Repeat steps d) to f), except that at step f) the measurement period must be extended to 200 s and the number of measurements increased to 20.
- l) The initial conditions are established again and steps a) to k) are repeated for ARFCN in the Low ARFCN range.
- m) The initial conditions are established again and steps a) to k) are repeated for ARFCN in the High ARFCN range.
- n) Repeat step h) under extreme test conditions (see annex 1, TC2.2).

### 13.17.2.5 Test requirements

The frequency error, with reference to the SS carrier frequency as measured in repeats of step e), for each measured burst shall be less than the values shown in table 13-17-1.

**Table 13-17-1: Requirements for frequency error under multipath, Doppler shift and interference conditions**

| GSM 400               |                           | GSM 850 and GSM 900   |                           | DCS 1 800 and PCS 1 900 |                           |
|-----------------------|---------------------------|-----------------------|---------------------------|-------------------------|---------------------------|
| Propagation condition | Permitted frequency error | Propagation condition | Permitted frequency error | Propagation condition   | Permitted frequency error |
| RA500                 | ±300 Hz                   | RA250                 | ±300 Hz                   | RA130                   | ±400 Hz                   |
| HT200                 | ±180 Hz                   | HT100                 | ±180 Hz                   | HT100                   | ±350 Hz                   |
| TU100                 | ±160 Hz                   | TU50                  | ±160 Hz                   | TU50                    | ±260 Hz                   |
| TU6                   | ±230 Hz                   | TU3                   | ±230 Hz                   | TU1,5                   | ±320 Hz                   |

| GSM 700               |                           |
|-----------------------|---------------------------|
| Propagation condition | Permitted frequency error |
| RA 300                | ±300 Hz                   |
| HT 120                | ±180 Hz                   |
| TU 60                 | ±160 Hz                   |
| TU 3.6                | ±230 Hz                   |

## 13.17.3 EGPRS Transmitter output power

### 13.17.3.1 Definition and applicability

The transmitter output power is the average value of the power delivered to an artificial antenna or radiated by the MS and its integral antenna, over the time that the useful information bits of one burst are transmitted.

Since the conformance requirement, test procedure and test requirement of GSMK modulated signal's output power are defined in subclause 13.16.2 for GPRS MS, being thereby defined also for all EGPRS MS in that section, only 8PSK modulated signal's output power conformance requirement, test procedure and test requirements are defined in this subclause.

The requirements and this test apply to all EGPRS MS capable of 8PSK modulated uplink transmission.

### 13.17.3.2 Conformance requirement

1. The MS maximum output power for 8-PSK modulated signal shall be as defined in 3GPP TS 05.05, subclause 4.1.1, second table, according to its power class, with a tolerances of  $\pm 2$  dB,  $\pm 3$  dB,  $+3/-4$  dB defined under normal conditions in the 3GPP TS 05.05, subclause 4.1.1, second table.
2. The MS maximum output power for 8-PSK modulated signal shall be as defined in 3GPP TS 05.05, subclause 4.1.1, second table, according to its power class, with a tolerances of  $\pm 2,5$  dB,  $\pm 4$  dB,  $+4/-4,5$  dB defined under extreme conditions in the 3GPP TS 05.05, subclause 4.1.1, second table.
3. The power control levels for 8-PSK shall have the nominal output power levels as defined in 3GPP TS 05.05, subclause 4.1.1, third table (for GSM 400, GSM 700, GSM 850 and GSM 900), fourth table (for DCS 1 800) or fifth table (for PCS 1 900), from the lowest power control level up to the maximum output power corresponding to the class of the MS (for tolerance on maximum output power see conformance requirement 1), with a tolerance of  $\pm 2$  dB,  $\pm 3$  dB, 4 dB or 5 dB under normal conditions; 3GPP TS 05.05, subclause 4.1.1, third, fourth or fifth table.
4. The power control levels for 8-PSK shall have the nominal output power levels as defined in 3GPP TS 05.05, subclause 4.1.1, third table (for GSM 400, GSM 700, GSM 850 and GSM 900), fourth table (for DCS 1 800) or fifth table (for PCS 1 900), from the lowest power control level up to the maximum output power corresponding to the class of the MS (for tolerance on maximum output power see conformance requirements 2), with a tolerance of  $\pm 2,5$  dB,  $\pm 4$  dB, 5 dB or 6 dB under extreme conditions; 3GPP TS 05.05, subclause 4.1.1, third, fourth or fifth table; 3GPP TS 05.05 annex D subclauses D.2.1 and D.2.2.
5. For 8-PSK, the output power actually transmitted by the MS at consecutive power control levels shall form a monotonic sequence and the interval between power control levels shall be  $2 \pm 1,5$  dB; 3GPP TS 05.05, subclause 4.1.1.
6. The transmitted power level relative to time for a normal burst shall be within the power/time template given in 3GPP TS 05.05, annex B bottom figure for 8PSK modulated signal. In the case of Multislot Configurations where the bursts in two or more consecutive time slots are actually transmitted at the same frequency, the template of annex B shall be respected during the useful part of each burst and at the beginning and the end of the series of consecutive bursts. The output power during the guard period between every two consecutive active timeslots shall not exceed the level allowed for the useful part of the first timeslot, or the level allowed for the useful part of the second timeslot plus 3 dB, whichever is the highest.
  - 6.1 Under normal conditions; 3GPP TS 05.05, subclause 4.5.2.
  - 6.2 Under extreme conditions; 3GPP TS 05.05, subclause 4.5.2, 3GPP TS 05.05 annex D subclauses D.2.1 and D.2.2.

### 13.17.3.3 Test purpose

1. To verify that the maximum output power of the 8PSK modulated signal of the EGPRS MS, under normal conditions, is within conformance requirement 1.
2. To verify that the maximum output power of the 8PSK modulated signal of the EGPRS MS, under extreme conditions, is within conformance requirement 2.

3. To verify that the maximum output power of the 8-PSK modulated signal of the EGPRS MS capable of 8PSK multislot configuration in the uplink, under normal conditions, is within conformance requirement 1.
4. To verify that the maximum output power of the 8-PSK modulated signal of the EGPRS MS capable of 8PSK multislot configuration in the uplink, under extreme conditions, is within conformance requirement 2.
5. To verify that all power control levels, relevant to the power class of the EGPRS MS for 8PSK modulation, are implemented in the MS and have output power levels, under normal conditions, within conformance requirement 3.
6. To verify that all power control levels, relevant to the power class of the EGPRS MS for 8PSK modulation, are implemented in the MS capable of 8PSK multislot configuration in the uplink and have the output power levels, under normal conditions, within conformance requirement 3.
7. To verify that all power control levels, relevant to the power class of the EGPRS MS for 8PSK modulation, have output power levels, under extreme conditions, within conformance requirement 4.
8. To verify that all power control levels, relevant to the power class of the EGPRS MS for 8PSK modulation, have output power levels in 8PSK multislot configuration in the uplink, under extreme conditions, within conformance requirement 4.
9. To verify that the step in the output power transmitted by the EGPRS MS at consecutive power control levels for 8PSK modulated signals is within conformance requirement 5 under normal conditions.
10. To verify that the step in the output power transmitted by the EGPRS MS capable of multislot 8PSK configuration in the uplink at consecutive power control levels for 8PSK modulated signals is within conformance requirement 5.
11. To verify that the output power relative to time, when sending a normal burst of the 8-PSK modulated signal is within conformance requirement 6:
  - 11.1 Under normal conditions.
  - 11.2 Under extreme conditions.
12. To verify that the output power relative to time, when sending a normal burst of 8PSK modulated signal is within conformance requirement 6 for EGPRS MS capable of 8PSK multislot configuration in the uplink:
  - 12.1 Under normal conditions.
  - 12.2 Under extreme conditions.

NOTE: For EGPRS MS capable of 8PSK multislot configuration in the uplink, the tests are executed only for multislot configuration.

#### 13.17.3.4 Methods of test

Two methods of test are described, separately for:

- 1) equipment fitted with a permanent antenna connector; and for
- 2) equipment fitted with an integral antenna, and which cannot be connected to an external antenna except by the fitting of a temporary test connector as a test fixture.

NOTE: The behaviour of the MS in the system is determined to a high degree by the antenna, and this is the only transmitter test in this ETS using the integral antenna. Further studies are ongoing on improved testing on the integral antenna, taking practical conditions of MS use into account.

##### 13.17.3.4.1 Method of test for equipment with a permanent antenna connector

###### 13.17.3.4.1.1 Initial conditions

The test shall be run under the default EGPRS conditions defined in clause 50.

The Test Mode defined in 3GPP TS 04.14 subclause 5.4 shall be utilised. If the MS is capable of both:

- Mode (a) transmitting pseudo-random data sequence in RLC data blocks;
- Mode (b) transmitting looped-back RLC data blocks.

Then Mode (a) will be used. The SS orders the MS to transmit on the uplink with 8PSK modulation, on a mid range ARFCN, power control level set to Max power and MS to operate in its highest number of uplink slots.

The SS controls the power level by setting the concerned timeslot's power control parameter ALPHA ( $\alpha$ ) to 0 and GAMMA\_TN ( $\Gamma_{CH}$ ) to the desired power level in the Packet Uplink Assignment or Packet Time Slot Reconfigure message (Closed Loop Control, see 3GPP TS 05.08, clause B.2) GPRS\_MS\_TXPWR\_MAX\_CCH / MS\_TXPWR\_MAX\_CCH is set to the maximum value supported by the Power Class of the Mobile under test. For DCS 1 800 mobile stations the POWER\_OFFSET parameter is set to 6 dB.

#### 13.17.3.4.1.2 Test procedure

- a) Measurement of normal burst transmitter output power

For 8PSK, power may be determined by applying the technique described for GMSK in subclause 13.16.2.4.1.2; step a) and then averaging over multiple bursts to achieve sufficient accuracy (see annex 5). Alternatively, an estimation technique based on a single burst which can be demonstrated to yield the same result as the long term average may be used. The long term average or the estimate of long term average is used as the 0dB reference for the power/time template.

- b) Measurement of normal burst power/time relationship. The array of power samples measured in a) are referenced in time to the centre of the useful transmitted symbols and in power to the 0 dB reference, both identified in a).
- c) Steps a) to b) are repeated on each timeslot within the multislot configuration with the MS commanded to operate on each of the power control levels defined, even those not supported by the MS.
- d) The SS commands the MS to the maximum power control level supported by the MS and steps a) to b) are repeated on each timeslot within the multislot configuration for ARFCN in the Low and High ranges.
- e) The SS commands the MS to the maximum power control level in the first timeslot allocated within the multislot configuration and to the minimum power control level in the second timeslot allocated. Any further timeslots allocated are to be set to the maximum power control level. Steps a) to b) and corresponding measurements on each timeslot within the multislot configuration are repeated. This step is only applicable to MS which support more than one uplink time slot.
- f) Steps a) to e) are repeated under extreme test conditions (annex 1, TC2.2) except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

#### 13.17.3.4.2 Method of test for equipment with an integral antenna

NOTE: If the MS is equipped with a permanent connector, such that the antenna can be disconnected and the SS be connected directly, then the method of subclause 13.17.3.4.1 will be applied.

The tests in this subclause are performed on an unmodified test sample.

##### 13.17.3.4.2.1 Initial conditions

The MS is placed in the anechoic shielded chamber (annex 1, GC5) or on the outdoor test site, on an isolated support, in the position for normal use, at a distance of at least 3 metres from a test antenna, connected to the SS.

NOTE: The test method described has been written for measurement in an anechoic shielded chamber. If an outdoor test site is used then, in addition, it is necessary to raise/lower the test antenna through the specified height range to maximize the received power levels from both the test sample and the substitution antenna.

The initial conditions for the MS are defined in subclause 13.17.3.4.1.1

## 13.17.3.4.2.2 Test procedure

- a) With the initial conditions set according to subclause 13.17.3.4.2.1 the test procedure in subclause 13.17.3.4.1.2 is followed up to and including step e), except that in step a), when measurements are done at maximum power for ARFCN in the Low, Mid and High range, the measurement is made eight times with the MS rotated by  $n \cdot 45$  degrees for all values of  $n$  in the range 0 to 7.

The measurements taken are received transmitter output power measurements rather than transmitter output power measurements, the output power measurement values can be derived as follows.

- b) Assessment of test site loss for scaling of received output power measurements.

The MS is replaced by a half-wave dipole, resonating at the centre frequency of the transmit band, connected to an RF generator.

The frequency of the RF signal generator is set to the frequency of the ARFCN used for the 24 measurements in step a), the output power is adjusted to reproduce the received transmitter output power averages recorded in step a).

For each indication the power, delivered by the generator (in Watts) to the half-wave dipole, is recorded. These values are recorded in the form  $P_{nc}$ , where  $n$  = MS rotation and  $c$  = channel number.

For each channel number used compute:

$$P_{ac}(\text{Watts into dipole}) = \frac{1}{8} * \sum_{n=0}^{n=7} P_{nc}$$

from which:  $P_{ac}(\text{Tx dBm}) = 10 \log_{10}(P_{ac}) + 30 + 2,15$

The difference, for each of the three channels, between the actual transmitter output power averaged over the 8 measurement orientations and the received transmitter output power at orientation  $n = 0$  is used to scale the received measurement results to actual transmitter output powers for all measured power control levels and ARFCN, which can then be checked against the requirements.

- c) Temporary antenna connector calibration factors (transmit)

A modified test sample equipped with a temporary antenna connector is placed in a climatic test chamber and is linked to the SS by means of the temporary antenna connector.

Under normal test conditions, the power measurement and calculation parts of steps a) to e) of subclause 13.17.3.4.1.2 are repeated except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

NOTE 1: The values noted here are related to the output transmitter carrier power levels under normal test conditions, which are known after step b). Therefore frequency dependent calibration factors that account for the effects of the temporary antenna connector can be determined.

- d) Measurements at extreme test conditions.

NOTE 2: Basically the procedure for extreme conditions is:

- the power/time template is tested in the "normal" way;
- the radiated power is measured by measuring the difference with respect to the radiated power under normal test conditions.

Under extreme test conditions steps a) to e) of subclause 13.17.3.4.1.2 are repeated except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

The transmitter output power under extreme test conditions is calculated for each burst type, power control level and for every frequency used by adding the frequency dependent calibration factor, determined in c), to the values obtained at extreme conditions in this step.

13.17.3.5 Test requirements

- a) The transmitter output power for the 8-PSK modulated signals, under every combination of normal and extreme test conditions, for normal bursts, at each frequency and for each power control level applicable to the MS power class, shall be at the relevant level shown in table 13.17.3-1 or table 13.17.3-2 within the tolerances also shown in table 13.17.3-1 or table 13.17.3-2.
- b) Void

GSM 400, GSM 700, GSM 850 and GSM 900 beginning

**Table 13.17.3-1: GSM 400, GSM 700, GSM 850 and GSM 900 transmitter output power for different power classes 8PSK Modulated Signals**

## 13.17.4 Output RF spectrum in EGPRS configuration

### 13.17.4.1 Definition and applicability

The output RF spectrum is the relationship between the frequency offset from the carrier and the power, measured in a specified bandwidth and time, produced by the MS due to the effects of modulation and power ramping.

Since the conformance requirement, test procedure and test requirement of GSMK modulated signal's output RF spectrum are defined in subclause 13.16.3 for GPRS MS, being thereby defined also for all EGPRS MS in that section, only 8PSK modulated signal's RF output spectrum conformance requirement, test procedure and test requirements are defined in this subclause.

The requirements and this test apply to all EGPRS MSs which are capable of 8PSK modulated uplink transmission.

#### 13.17.4.2 Conformance requirement

1. The level of the output RF spectrum due to 8PSK modulation shall be no more than that given in 3GPP TS 05.05, subclause 4.2.1, with the following lowest measurement limits:
  - 36 dBm below 600 kHz offset from the carrier;
  - 51 dBm for GSM 400, GSM 700, GSM 850 and GSM 900 or -56 dBm for DCS 1 800 and PCS 1 900 from 600 kHz out to less than 1 800 kHz offset from the carrier;
  - 46 dBm for GSM 400, GSM 700, GSM 850 and GSM 900 or -51 dBm for DCS 1 800 and PCS 1 900 at and beyond 1 800 kHz offset from the carrier;but with the following exceptions at up to -36 dBm:
  - up to three bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz in the combined range 600 kHz to 6 000 kHz above and below the carrier;
  - up to 12 bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz at more than 6 000 kHz offset from the carrier.

1.1 Under normal conditions; 3GPP TS 05.05, subclause 4.2.1.

1.2 Under extreme conditions; 3GPP TS 05.05, subclause 4.2.1; 3GPP TS 05.05, annex D subclauses D.2.1 and D.2.2.

2. The level of the output RF spectrum due to switching transients shall be no more than given in 3GPP TS 05.05, subclause 4.2.2, table "a) Mobile Station".
  - 2.1 Under normal conditions; 3GPP TS 05.05, subclause 4.2.2.
  - 2.2 Under extreme conditions; 3GPP TS 05.05, subclause 4.2.2; 3GPP TS 05.05 annex D subclauses D.2.1 and D.2.2.
3. When allocated a channel, the power emitted by the GSM 400, GSM 900 and DCS 1800 MS, in the band 935 MHz to 960 MHz shall be no more than -79 dBm, in the band 925 MHz to 935 MHz shall be no more than -67 dBm and in the band 1 805 MHz to 1 880 MHz shall be no more than -71 dBm, except in five measurements in each of the bands 925 MHz to 960 MHz and 1 805 MHz to 1 880 MHz, where exceptions at up to -36 dBm are permitted. For GSM 400 mobiles, in addition, a limit of -67 dBm shall apply in the frequency bands 460,4 MHz to 467,6 MHz and 488,8 MHz to 496 MHz.

For GSM 700, GSM 850 and PCS 1 900, the power emitted by MS, in the band of 747 MHz to 757 MHz shall be no more than -79 dBm, in the band of 757 MHz to 762 MHz shall be no more than -73 dBm, in the band 869 MHz to 894 MHz shall be no more than -79 dBm, in the band 1 930 MHz to 1 990 MHz shall be no more than -71 dBm except in five measurements in each of the bands 747 MHz to 762 MHz, 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz where exceptions at up to -36 dBm are permitted; 3GPP TS 05.05, subclause 4.3.3.

#### 13.17.4.3 Test purpose

1. To verify that the output RF spectrum due to 8PSK modulation of an EGPRS MS does not exceed conformance requirement 1.
  - 1.1 Under normal conditions.
  - 1.2 Under extreme conditions.

2. To verify that the output RF spectrum due to 8PSK modulation of an EGPRS MS does not exceed conformance requirement 1 in 8PSK uplink multislot configuration.
  - 2.1 Under normal conditions.
  - 2.2 Under extreme conditions.
3. To verify that the output RF spectrum due to switching transients of 8PSK modulated signals of an EGPRS MS does not exceed conformance requirement 2 when a reasonable margin is allowed for the effect of spectrum due to modulation.
  - 3.1 Under normal conditions.
  - 3.2 Under extreme conditions.
4. To verify that the output RF spectrum due to switching transients of 8PSK modulated signals of an EGPRS MS does not exceed conformance requirement 2 in 8PSK uplink multislot configuration when a reasonable margin is allowed for the effect of spectrum due to modulation.
  - 4.1 Under normal conditions.
  - 4.2 Under extreme conditions.
5. To verify that the MS spurious emissions in the MS receive band for 8PSK modulated signals of an EGPRS MS do not exceed conformance requirement 3.
6. To verify that the MS spurious emissions in the MS receive band for 8PSK modulated signals of an EGPRS MS do not exceed conformance requirement 3 in 8PSK uplink multislot configuration.

NOTE: For EGPRS MS capable of 8PSK multislot configuration in the uplink, the tests are executed only for multislot configuration.

#### 13.17.4.4 Method of test

##### Initial conditions

The test shall be run under the default EGPRS conditions defined in clause 50.

The Test Mode defined in 3GPP TS 04.14 subclause 5.4 shall be utilised. If the MS is capable of both:

- Mode (a) transmitting pseudo-random data sequence in RLC data blocks;
- Mode (b) transmitting looped-back RLC data blocks;

then Mode (a) will be used.

The SS commands the MS to transmit with its maximum number of uplink slots, with 8PSK modulation in hopping mode. The hopping pattern includes only three channels, namely one with an ARFCN in the Low ARFCN range, a second one with an ARFCN in the Mid ARFCN range and the third one with an ARFCN in the High ARFCN range.

The SS shall use a transmission level of  $23 \text{ dB}\mu\text{Vemf}$  ( ).

NOTE 1: Although the measurement is made whilst the MS is in hopping mode, each measurement is on one single channel.

NOTE 2: This test is specified in hopping mode as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to cell re-select the MS between the three channels tested at the appropriate time.

##### 13.17.4.4.2 Test procedure

NOTE: When averaging is in use during frequency hopping mode, the averaging only includes bursts transmitted when the hopping carrier corresponds to the nominal carrier of the measurement.

- a) In steps b) to h) the FT is equal to the hop pattern ARFCN in the Mid ARFCN range.

b) The other settings of the spectrum analyser are set as follows:

- Zero frequency scan;
- Resolution bandwidth: 30 kHz;
- Video bandwidth: 30 kHz;
- Video averaging: may be used, depending on the implementation of the test.

The video signal of the spectrum analyser is "gated" such that the spectrum generated by at least 40 of the symbols 87 to 132 of the burst in one of the active time slots is the only spectrum measured. This gating may be analogue or numerical, dependent upon the design of the spectrum analyser. Only measurements during transmitted bursts on the nominal carrier of the measurement are included. The spectrum analyser averages over the gated period and over 200 or 50 such bursts, using numerical and/or video averaging.

c) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 50 bursts at all multiples of 30 kHz offset from FT to < 1 800 kHz.

d) The resolution and video bandwidth on the spectrum analyser are adjusted to 100 kHz and the measurements are made at the following frequencies:

on every ARFCN from 1 800 kHz offset from the carrier to the edge of the relevant transmit band for each measurement over 50 bursts.

at 200 kHz intervals over the 2 MHz either side of the relevant transmit band for each measurement over 50 bursts.

For GSM 400, GSM 900 and DCS 1 800:

at 200 kHz intervals over the band 450 MHz to 496 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 925 MHz to 960 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 1 805 MHz to 1 880 MHz for each measurement over 50 bursts.

For GSM 700, GSM 850 and DCS 1 900:

at 200 kHz intervals over the band 747 MHz to 762 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 869 MHz to 894 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 1 930 MHz to 1 990 MHz for each measurement over 50 bursts.

e) The MS is commanded to its minimum power control level. The spectrum analyser is set again as in b).

f) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 200 bursts at the following frequencies:

FT;

FT + 100 kHz                      FT - 100 kHz;

FT + 200 kHz                      FT - 200 kHz;

FT + 250 kHz                      FT - 250 kHz;

FT + 200 kHz \* N                      FT - 200 kHz \* N;

where N = 2, 3, 4, 5, 6, 7, and 8;

and FT = RF channel nominal centre frequency.

g) Steps a) to f) is repeated except that in step a) the spectrum analyzer is gated so that the burst of the next active time slot is measured.

h) The spectrum analyser settings are adjusted to:

- Zero frequency scan;
- Resolution bandwidth: 30 kHz;
- Video bandwidth: 100 kHz;
- Peak hold.

The spectrum analyser gating of the signal is switched off.

The MS is commanded to its maximum power control level in every transmitted time slot.

i) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured at the following frequencies:

FT + 400 kHz                      FT - 400 kHz;

FT + 600 kHz                      FT - 600 kHz;

FT + 1,2 MHz                      FT - 1,2 MHz;

FT + 1,8 MHz                      FT - 1,8 MHz;

where FT = RF channel nominal centre frequency.

The duration of each measurement (at each frequency) will be such as to cover at least 10 burst transmissions at FT.

j) Step i) is repeated for power control levels 7 and 11.

k) Steps b), f), h) and i) are repeated with FT equal to the hop pattern ARFCN in the Low ARFCN range except that in step h) the MS is commanded to power control level 11 rather than maximum power.

l) Steps b), f), h) and i) are repeated with FT equal to the hop pattern ARFCN in the High ARFCN range except that in step h) the MS is commanded to power control level 11 rather than maximum power.

m) Steps a) b) f) h), and i) are repeated under extreme test conditions (annex 1, TC2.2). except that at step h) the MS is commanded to power control level 11.

#### 13.17.4.5 Test requirements

For absolute measurements, performed on a temporary antenna connector, in the frequency band 450 MHz to 486 MHz or 777 MHz to 792 MHz or 824 MHz to 849 MHz or 880 MHz to 915 MHz or 1 710 MHz to 1 785 MHz or 1 850 MHz to 1 910 MHz, the temporary antenna connector coupling factor, determined according to subclause 13.3.4.2.2 and annex 1 GC7, for the nearest relevant frequency, will be used.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 450 MHz to 486 MHz or 925 MHz to 960 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 400 or GSM 900 MS respectively. For a DCS 1 800 MS and PCS 1 900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 1 805 MHz to 1 880 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for DCS 1 800 MS. For GSM 400 MS and GSM 900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 747 MHz to 762 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 700 MS. For a GSM 400, GSM 850, GSM 900, DCS 1800 or PCS 1 900 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 869 to 894 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 850 MS. For a GSM 400, GSM 700, GSM 900, DCS 1800 or PCS 1 900 MS 0 dB will be assumed.

The figures in the tables below, at the listed frequencies from the carrier (kHz), are the maximum level (dB) relative to a measurement in 30 kHz bandwidth on the carrier (reference 3GPP TS 05.05 subclause 4.2.1).

- a) For the modulation sidebands out to less than 1 800 kHz offset from the carrier frequency (FT) measured in step c), f), i), k), l) and m) the measured power level in dB relative to the power level measured at FT, for all types of MS, shall not exceed the limits derived from the values shown in table 13.17.4-1 for GSM 400, GSM 700, GSM 850 and GSM 900 or table 13.17.4-2 for DCS 1 800 and PCS 1 900 MS, according to the actual transmit power and frequency offset from FT. However any failures in the combined range 600 kHz to less than 1 800 kHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below.

**Table 13.17.4-1: GSM 400, GSM 700, GSM 850 and GSM 900 Spectrum due to modulation out to less than 1 800 kHz offset**

| Power level<br>(dBm)                                                                | power levels in dB relative to the measurement at FT |     |     |            |                |
|-------------------------------------------------------------------------------------|------------------------------------------------------|-----|-----|------------|----------------|
|                                                                                     | Frequency offset (kHz)                               |     |     |            |                |
|                                                                                     | 0-100                                                | 200 | 250 | 400        | 600 to < 1 800 |
| 39                                                                                  | +0,5                                                 | -30 | -33 | -60        | -66            |
| 37                                                                                  | +0,5                                                 | -30 | -33 | -60        | -64            |
| 35                                                                                  | +0,5                                                 | -30 | -33 | -60        | -62            |
| <= 33                                                                               | +0,5                                                 | -30 | -33 | -60 (note) | -60            |
| The values above are subject to the minimum absolute levels (dBm) below.            |                                                      |     |     |            |                |
|                                                                                     | -36                                                  | -36 | -36 | -36        | -51            |
| NOTE: For equipment supporting 8PSK, the requirement for 8-PSK modulation is -54dB. |                                                      |     |     |            |                |

**Table 13.17.4-2: DCS 1 800/PCS 1 900 Spectrum due to modulation out to less than 1 800 kHz offset**

| Power level<br>(dBm)                                                                 | power levels in dB relative to the measurement at FT |     |     |               |                |
|--------------------------------------------------------------------------------------|------------------------------------------------------|-----|-----|---------------|----------------|
|                                                                                      | Frequency offset (kHz)                               |     |     |               |                |
|                                                                                      | 0-100                                                | 200 | 250 | 400           | 600 to < 1 800 |
| <= 36                                                                                | +0,5                                                 | -30 | -33 | -60           | -60            |
| 34                                                                                   | +0.5                                                 | -30 | -33 | -60           | -60            |
| 32                                                                                   | +0.5                                                 | -30 | -33 | -60           | -60            |
| 30                                                                                   | +0.5                                                 | -30 | -33 | -60<br>(note) | -60            |
| The values above are subject to the minimum absolute levels (dBm) below.             |                                                      |     |     |               |                |
|                                                                                      | -36                                                  | -36 | -36 | -36           | -56            |
| NOTE: For equipment supporting 8-PSK, the requirement for 8-PSK modulation is -54dB. |                                                      |     |     |               |                |

NOTE 1: For frequency offsets between 100 kHz and 600 kHz the requirement is derived by a linear interpolation between the points identified in the table with linear frequency and power in dB relative.

- b) For the modulation sidebands from 1 800 kHz offset from the carrier frequency (FT) and out to 2 MHz beyond the edge of the relevant transmit band, measured in step d), the measured power level in dB relative to the power level measured at FT, shall not exceed the values shown in table 13.17.4-3 according to the actual transmit power, frequency offset from FT and system on which the MS is designed to operate. However any failures in the combined range 1 800 kHz to 6 MHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below, and any other failures may be counted towards the exceptions allowed in test requirements d) below.

**Table 13.17.4-3: Spectrum due to modulation from 1 800 kHz offset to the edge of the transmit band (wideband noise)**

| power levels in dB relative to the measurement at FT                     |                  |            |            |                         |                  |         |

| 35                                                                       | -65              | -67        | -73        | 32                      | -67              | -75     |
| <b>≤ 33</b>                                                              | <b>-63</b>       | <b>-65</b> | <b>-71</b> | 30                      | -65              | -73     |
|                                                                          |                  |            |            | 28                      | -63              | -71     |
|                                                                          |                  |            |            | 26                      | -61              | -69     |
|                                                                          |                  |            |            | ≤ 24                    | -59              | -67     |
| The values above are subject to the minimum absolute levels (dBm) below. |                  |            |            |                         |                  |         |
|                                                                          | -46              | -46        | -46        |                         | -51              | -51     |

- c) Any failures (from a) and b) above) in the combined range 600 kHz to 6 MHz above and below the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, spurious emissions are allowed in up to three 200 kHz bands centred on an integer multiple of 200 kHz so long as no spurious emission exceeds -36 dBm. Any spurious emissions measured in a 30 kHz bandwidth which spans two 200 kHz bands can be counted towards either 200 kHz band, whichever minimizes the number of 200 kHz bands containing spurious exceptions.
- d) Any failures (from b) above) beyond 6 MHz offset from the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, up to twelve spurious emissions are allowed so long as no spurious emission exceeds -36 dBm.
- e) The MS spurious emissions in the bands 460,4 MHz to 467,6 MHz, 488,8 MHz to 496 MHz, 925 MHz to 935 MHz, 935 MHz to 960 MHz, 1 805 MHz to 1 880 MHz and 1 850 MHz to 1 910 MHz measured in step d), for all types of MS, shall not exceed the values shown in table 13.16.4-4 except in up to 3 measurements in the band 460,4 MHz to 467,6 MHz and 488,8 MHz to 496 MHz, in up to five measurements in the band 925 MHz to 960 MHz and five measurements in the band 1 805 MHz to 1 880 MHz where a level up to -36 dBm is permitted. For GSM 700, GSM 850 and PCS 1 900 the spurious emissions in the bands 747 MHz to 757 MHz, 757 MHz to 762 MHz, 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz shall not exceed the values shown in table 13.17.4-4 except in up to five measurements in each of the bands 747 MHz to 762 MHz, 869 MHz to 894 MHz and 1 930 MHz to 1 990 MHz where a level up to -36 dBm is permitted.

**Table 13.17.4-4: Spurious emissions in the MS receive bands**

| Band (MHz)     | Spurious emissions level for GSM 400, GSM 900 and DCS 1800 (dBm) | Spurious emissions level for GSM 700, GSM 850 and PCS 1 900 (dBm)                                           |
|----------------|------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| 460 to 496     | -67 Applicable only for GSM 400 mobiles                          |                                                                                                             |
| 925 to 935     | -67                                                              |                                                                                                             |

- f) For the power ramp sidebands of steps h), i) and k) the power levels must not exceed the values shown in table 13.17.4-5 for GSM 700, GSM 850 and GSM 900 or table 13.17.4-6 for DCS 1 800.

Table 13.17.4-5: GSM700, GSM 850 and GSM 900 Spectrum due to switching transients

| Power level | Maximum level for various offsets from carrier frequency |         |           |           |
|-------------|----------------------------------------------------------|---------|-----------|-----------|
|             | 400 kHz                                                  | 600 kHz | 1 200 kHz | 1 800 kHz |
| 39 dBm      | -13 dBm                                                  | -21 dBm | -21 dBm   | -24 dBm   |
| 37 dBm      | -15 dBm                                                  | -21 dBm | -21 dBm   | -24 dBm   |
| 35 dBm      | -17 dBm                                                  | -21 dBm | -21 dBm   | -24 dBm   |
| 33 dBm      | -19 dBm                                                  | -21 dBm | -21 dBm   | -24 dBm   |
| 31 dBm      | -21 dBm                                                  | -23 dBm | -23 dBm   | -26 dBm   |
| 29 dBm      | -23 dBm                                                  | -25 dBm | -25 dBm   | -28 dBm   |
| 27 dBm      | -23 dBm                                                  | -26 dBm | -27 dBm   | -30 dBm   |
| 25 dBm      | -23 dBm                                                  | -26 dBm | -29 dBm   | -32 dBm   |
| 23 dBm      | -23 dBm                                                  | -26 dBm | -31 dBm   | -34 dBm   |
| <= +21 dBm  | -23 dBm                                                  | -26 dBm | -32 dBm   | -36 dBm   |

Table 13.17.4-6: DCS 1 800/PCS 1 900 Spectrum due to switching transients

| Power level | Maximum level for various offsets from carrier frequency |         |           |           |
|-------------|----------------------------------------------------------|---------|-----------|-----------|
|             | 400 kHz                                                  | 600 kHz | 1 200 kHz | 1 800 kHz |
| 36 dBm      | -16 dBm                                                  | -21 dBm | -21 dBm   | -24 dBm   |
| 34 dBm      | -18 dBm                                                  | -21 dBm | -21 dBm   | -24 dBm   |
| 32 dBm      | -20 dBm                                                  | -22 dBm | -22 dBm   | -25 dBm   |
| 30 dBm      | -22 dBm                                                  | -24 dBm | -24 dBm   | -27 dBm   |
| 28 dBm      | -23 dBm                                                  | -25 dBm | -26 dBm   | -29 dBm   |
| 26 dBm      | -23 dBm                                                  | -26 dBm | -28 dBm   | -31 dBm   |
| 24 dBm      | -23 dBm                                                  | -26 dBm | -30 dBm   | -33 dBm   |
| 22 dBm      | -23 dBm                                                  | -26 dBm | -31 dBm   | -35 dBm   |
| <= +20 dBm  | -23 dBm                                                  | -26 dBm | -32 dBm   | -36 dBm   |

NOTE 2: These figures are different from the requirements in 3GPP TS 05.05 because at higher power levels it is the modulation spectrum which is being measured using a peak hold measurement. This allowance is given in the table.

NOTE 3: The figures for table 13.17.3-5 and table 13.17.3-6 assume that, using the peak hold measurement, the lowest level measurable is 8 dB above the level of the modulation specification using the 30 kHz bandwidth gated average technique for 400 kHz offset from the carrier. At 600 and 1 200 kHz offset the level is 6 dB above and at 1 800 kHz offset the level is 3 dB above. The figures for 1 800 kHz have assumed the 30 kHz bandwidth spectrum due to modulation specification at <1 800 kHz.

### 13.17.5 Void

---

## 14 Receiver

In this clause on receiver measurements, the procedures to test equipment which is fitted with a permanent antenna connector, and the procedures to test equipment which is designed to only be used with an integral antenna, are in general combined into one single test description.

Tests on Mobile Stations fitted with an integral antenna and having no means of connecting an external antenna are specified in terms of received field strength. In order to perform tests on such Mobile Stations without the need for separated access to a calibrated test site a temporary antenna connector is used as defined in annex 1 subclause 1.1.3 (General Conditions).

In practice the temporary antenna connector may be used for transmitter measurements described in clause 3, but the calibration factors determined in annex 1 will not be directly usable. The detailed calibration, when needed, for transmission tests are described in the relevant subclauses of 3.

Wherever in this subclause, for FACCH tests, the SS is required to send a Layer 3 message not requiring a Layer 3 response from the MS the message can be a TEST INTERFACE message or a STATUS message, possibly with an unknown Protocol Discriminator.

### Testing philosophy

Certain assumptions concerning the functional mechanisms of GSM receivers have been made in order to define tests that will verify the receiver performance without excessive redundancy and excessive test times.

The receiver functions can be divided into:

- Analogue RF and IF stages that are affected by input levels, temperature and power supply levels.
- Demodulator that is affected by input levels and interfering signals.
- Decoders that are affected by the different logical channels and input levels.

The tests are designed to stress each of these blocks with a minimum of redundancy.

### Statistical testing of receiver BER/FER performance

#### Error Definition

##### 1) Frame Erasure Ratio (FER)

A frame is defined as erased if the error detection functions in the receiver, operating in accordance with 3GPP TS 05.03, indicate an error (BFI = 1). For full rate or half rate speech this is the result of the cyclic redundancy check (CRC) as well as other processing functions that cause a Bad Frame Indication (BFI). For signalling channels it is the result of the FIRE code or any other block code used. For data traffic FER is not defined.

##### 2) Residual Bit Error Ratio (RBER).

The Residual Bit Error Ratio is defined as the Bit Error Ratio (BER) in frames which have not been declared as erased.

##### 3) Bit Error Ratio (BER).

The Bit Error Ratio is defined as the ratio of the bits wrongly received to all data bits sent.

##### 4) Unreliable Frame Ratio (UFR).

The Unreliable Frame Ratio is defined as the ratio of frames declared as erased (BFI=1), or unreliable (UFI=1), to the total number of frames transmitted. An unreliable frame is indicated by setting the UFI flag (UFI=1) and an erased frame is indicated by setting the BFI flag (BFI=1) (see 3GPP TS 06.21).

##### 5) Erased SID Frame Ratio (ESIDR).

A SID Frame is erased (SID=0) when the MS does not detect a valid transmitted SID frame as a valid SID frame (SID=2), or an invalid SID frame (SID=1). The Erased SID Frame Ratio is defined as the ratio of erased SID frames (SID=0), to the total number of valid SID frames transmitted (see 3GPP TS 06.41).

##### 6) Erased Valid SID Frame Ratio (EVSIDR).

An Erased Valid SID Frame is declared when the MS does not detect a valid transmitted SID frame as a valid SID frame (SID=2) and (BFI=0 and UFI=0). The Erased Valid SID Frame Ratio is defined as the ratio of erased valid SID frames (SID=0), or (SID=1), or ((BFI or UFI)=1), to the total number of valid SID frames transmitted (see 3GPP TS 06.41).

##### 7) Erased Valid SID\_UPDATE frame Rate associated to an adaptive speech traffic channel (EVSIDUR).

This related to the erasure of a SID\_UPDATE frame related to an AMR channel (full rate or half rate) due to the failure to detect the SID\_UPDATE identifier or to a due to a CRC failure.

##### 8) Erased Valid RATSCCH Frame Rate associated to an adaptive speech traffic channel (EVRFR).

This relates to the erasure of the RATSCCH message due to the failure to detect the RATSCCH identifier or due to a CRC failure.

9) Frame error rate for the In-Band channel (TCH/AFS-INB or TCH/AHS-INB).

This related to the erasure of an AMR speech frame (full rate or half rate) due to the bad decoding of the Mode Indication in-band bits.

#### Test method

Each test is performed in the following manner:

- a) Set up the required test conditions.
- b) Perform the test for at least the minimum number of samples (frames, bits or bits from non erased frames) and record the number of offered samples and the number of occurred events (frame, bit or residual bit errors).
- c) Terminate the test and determine the test result ("pass" or "fail") by comparing the measured error rate against the test limit error rate.

It is permitted to run the test over more samples than the value stated for minimum number of samples. The effect of increasing the number of samples is always to give a higher probability that a good unit will pass and a lower risk that a bad unit will pass, according to the definitions of good and bad unit in this subclause.

#### Test criteria

The limits on number of samples and test limit error rate shall be defined in order to comply with different requirements:

- 1) to keep reasonably low the risk of passing a bad unit for each individual test;
- 2) to have high probability of passing a good unit for each individual test;
- 3) to perform measurements with a high degree of statistical significance;
- 4) to keep the test time as low as possible.

The risk of passing a bad unit (point 1) should be kept lower than 0,2 %. The performance on a full rate channel, or a half rate data channel, is generally considered "bad" if its BER (or FER) performance is 1,5 times worse than that specified in AWGN (Additive White Gaussian Noise) and 1,26 times worse than that specified in multipath environment. These values have been adopted (taking into account the expected shapes of the BER performance) in order not to pass a unit with performance worse than the specifications by more than 1 dB.

The performance on a half rate speech channel, is generally considered "bad" if the BER (or FER, or UFR) is worse than that specified, multiplied by the factors given in table 14-1. These values have been adopted (taking into account the expected shapes of the BER performance) in order not to pass a unit with performance worse than the specifications by more than 1 dB.

**Table 14-1: TCH/HS "bad" unit multiplication factors**

| Propagation Conditions            | GSM 400, GSM 700, GSM 850 and GSM 900 |                   |            |            | DCS 1 800 and PCS 1 900 |                   |            |            |

The probability of passing a good unit operating on the specification limit of performance (point 2) should be at least 99,7 %.

If the error events can be assumed to be random independent variables, outputs of stationary random processes with identical Gaussian distributions, the previous figures suggest a number of events (point 3) not lower than 200 in AWGN channel and not lower than 600 in a multipath environment, and to test a BER (or FER) performance 1,22 times worse than that specified in AWGN and 1,12 times worse than that specified in a multipath environment (this corresponds to testing a performance, at the most, 0,5 dB worse than that specified).

For multipath propagation conditions the hypothesis of stationary random processes does not generally hold. In case of non frequency hopping operation mode, the radio channel may be assumed to change 10 times per wavelength of travelled distance and to be short term stationary in between. So, in this case, the required observation time for having good statistical properties should not be lower (with some rounding) than that reported in table 14-1.

**Table 14-2: Minimum test time according to propagation profile**

| Propagation Conditions | GSM 400, GSM 700, GSM 850 and GSM 900 |        |    |    | DCS 1 800 and PCS 1 900 |        |     |    |
|------------------------|---------------------------------------|--------|----|----|-------------------------|--------|-----|----|
|                        | TUlow                                 | TUhigh | HT | RA | TUlow                   | TUhigh | HT  | RA |
| Min. test time (s)     | 500                                   | 30     | 15 | 6  | 500                     | 15     | 7,5 | 6  |

Tables 14-3 and 14-4 detail, for the different test conditions, the minimum number of samples required in order to meet points 1) to 3): the corresponding test time (point 4) can be consequently computed.

As can be seen in the tables, in some of the cases in which both FER and RBBER have to be tested on the same channel, the length of time for the FER measurement has been adopted for the RBBER measurement. This is longer than that required for the RBBER only according to the discussed criteria, but allows the use of a test limit error rate closer to the specified error rate while maintaining the same statistical significance. When, as is normal, it is desired to perform the FER and RBBER tests, the closer test limit error rate for the RBBER measurement can be achieved without increasing the total test time. It is always possible to extend the length of any test and further improve the statistical significance of that test.

Co-channel rejection tests with a frequency condition noted as "@ndB" are performed with the interfering frequency transmitted with an additional n dB attenuation, see 3GPP TS 45.005.

Table 14-3: Test conditions for GSM 400, GSM 700, GSM 850 and GSM 900

| Type of test          | Type of channel                | Propagation/frequency conditions | Specified FER/BER %  | Test limit FER/BER % | Minimum No of samples | Prob that good unit will pass % | Bad unit BER/ FER %  | Risk that bad unit will pass |
|-----------------------|--------------------------------|----------------------------------|----------------------|----------------------|-----------------------|---------------------------------|----------------------|------------------------------|

| „                                    | FACCH/F                                | TUhigh/No FH                            | 3,900           | 4,368                      | 13736                        | 99,752                                   | 4,914                    | 0,140                                 |

NOTE 1:  $\alpha$  is a parameter which ranges from 1 to 1.6. The value of  $\alpha$  for a RBER test on TCH/FS class Ib bits under particular measurement conditions shall be the same as that determined in the FER test on TCH/FS under the same conditions. For example, the value of  $\alpha$  may be different for a TUhigh sensitivity test and an RA sensitivity test. The value of  $\alpha$  is determined by dividing the measured error rate for the FER test by the value of the test limit error rate listed in the limits section of the test corresponding to  $\alpha=1$ ; if the result of the division is lower than 1, a value of  $\alpha=1$  shall be used, if the value of  $\alpha > 1.6$  the FER test has failed (the normal treatment of stimulus uncertainties applies). The probabilities that a good unit will pass and the risks that a bad unit will pass, listed in the table are valid for  $\alpha=1$ , and would be slightly different for other values of  $\alpha$ .

NOTE 2: In order to save time the sensitivity and co-channel rejection tests for the TCH/F2,4 channel does not comply with the above said constraints.

In fact, a bad unit which performs 2 times (instead of 1,26) worse than that specified is accounted for, so reducing the required number of events to 150, instead of 600. On the other hand, the specified RBER is in this case  $10E-5$  and, on the basis of simulations and hardware validation results, doubling this RBER results in a drop in performance of less than 1 dB.

## 14.1 Bad frame indication

### 14.1.1 Bad frame indication - TCH/FS

#### 14.1.1.1 Bad frame indication - TCH/FS - Random RF input

##### 14.1.1.1.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS under DTX conditions. It includes the effect of the 3 bit Cyclic Redundancy Check (CRC) and all other processing associated with the DTX function. The BFI is measured on a full rate speech TCH (TCH/FS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

The requirements and this test only apply to MS supporting speech.

##### 14.1.1.1.2 Conformance requirement

On a full rate speech TCH (TCH/FS) with a random RF input, the overall reception performance shall be such that, on average, less than one undetected bad speech frame (false bad frame indication) in 60 s will be measured; 3GPP TS 05.05, subclause 6.4 b

##### 14.1.1.1.3 Test purpose

1. To verify that the BFI performance does not exceed the conformance requirement with an allowance for the statistical significance of the test.
2. To verify that on reception of a SID frame the BFI is not set.

##### 14.1.1.1.4 Method of test

###### 14.1.1.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS with an ARFCN in the Mid ARFCN range, power control level set to maximum power.

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

NOTE: DTX is used during the test to prevent the MS dropping the call.

###### 14.1.1.1.4.2 Procedure

- a) The SS simulates a BSS in DTX mode. During the period when no transmission would occur the SS transmits a GSM carrier modulated with random data at a level 11 dB above reference sensitivity level( ). The SACCH is transmitted normally at a level 20 dB above reference sensitivity( ). The SID frame is transmitted in its correct time interval with valid information at a level 20 dB above reference sensitivity level( ). During transmission of SACCH or SID frames the random data is discontinued.
- b) The SS transmits at least the minimum number of samples of frames of TCH/FS information and checks the BFI of the looped back signal from the MS. The SS records the number of frames where the bad frame indication is not set. During transmission by the SS of SID frames the SS checks that the BFI is not set.

NOTE 1: Further explanations on the mechanism of signalling the BFI to the SS will be found in clause 36.

NOTE 2: In some cases the MS decodes half SID frames correctly even if these are not transmitted completely. Therefore, in case that a MS detects a good SID frame, the SS has to consider the received bits in detail.

###### 14.1.1.1.5 Test requirements

The BFI performance is accepted if the measured rate of undetected bad frames does not exceed the test limit error rate:

Test limit error rate: 0,041 %;

Minimum number of samples: 492 000 (excluding SID frames).

During loop back of SID frames no BFI shall be set.

#### 14.1.1.2 Bad frame indication - TCH/FS - Frequency hopping and downlink DTX

##### 14.1.1.2.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS under DTX conditions. It includes the effect of the 3 bit Cyclic Redundancy Check (CRC) and all other processing associated with the DTX function. The BFI is measured on a full rate speech TCH (TCH/FS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

The requirements and this test only apply to MS supporting speech.

##### 14.1.1.2.2 Conformance requirement

On a speech TCH (TCH/FS or TCH/HS), when DTX is activated with frequency hopping through C0 where bursts comprising SID frames, SACCH frames and dummy bursts are received at a level 20 dB above the reference sensitivity level and with no transmissions at the other bursts of the TCH, the overall reception performance shall be such that, on average less than one undetected bad speech frame (false bad frame indication BFI) shall be measured in one minute for MS. 3GPP TS 05.05, subclause 6.4c.

##### 14.1.1.2.3 Test purpose

1. To verify that the BFI performance in case of frequency hopping including the C0 radio frequency does not exceed the conformance requirement with an allowance for the statistical significance of the test.
2. To verify that on reception of a SID frame the BFI is not set.

##### 14.1.1.2.4 Method of test

###### 14.1.1.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

NOTE: DTX is used during the test to prevent the MS dropping the call.

###### 14.1.1.2.4.2 Procedure

- a) The SS sets downlink DTX on.
- b) The SS performs the measurement over at least the minimum number of samples of frames of TCH/FS information and checks the BFI of the looped back signal from the MS. The SS only transmits SID frames, SACCH frames and dummy bursts, with no transmission of TCH bursts. The SS records the number of frames where the bad frame indication is not set. During transmission by the SS of SID frames the SS checks that the BFI is not set.

NOTE 1: Further explanations on the mechanism of signalling the BFI to the SS will be found in clause 36.

NOTE 2: In some cases the MS decodes half SID frames correctly even if these are not transmitted completely. Therefore, in case that a MS detects a good SID frame, the SS has to consider the received bits in detail.

###### 14.1.1.2.5 Test requirements

The BFI performance is accepted if the measured rate of undetected bad frames does not exceed the test limit error rate:

Test limit error rate: 0,041 %;

Minimum number of samples: 492 000 (excluding SID frames).

During loop back of SID frames no BFI shall be set.

## 14.1.2 Bad frame indication - TCH/HS

### 14.1.2.1 Bad frame indication - TCH/HS - Random RF input

#### 14.1.2.1.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS under DTX conditions. It includes the effect of the 3 bit Cyclic Redundancy Check (CRC) and all other processing associated with the DTX function. The BFI is measured on a half rate speech TCH (TCH/HS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

The requirements and this test only apply to MS supporting half rate speech.

#### 14.1.2.1.2 Conformance requirement

On a half rate speech TCH (TCH/HS) with a random RF input, the overall reception performance shall be such that, on average, less than one undetected bad speech frame (false bad frame indication) in 60 seconds will be measured; 3GPP TS 05.05, subclause 6.4b.

#### 14.1.2.1.3 Test purpose

1. To verify that the BFI performance does not exceed the conformance requirement with an allowance for the statistical significance of the test.
2. To verify that on reception of a SID frame the BFI is not set.

#### 14.1.2.1.4 Method of test

##### 14.1.2.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/HS with an ARFCN in the Mid ARFCN range, power control level set to maximum power.

The SS commands the MS to complete traffic channel loop back A and signal frames detected with BFI=1 as erased.

NOTE 1: Test loop A is defined in clause 36. Frames detected with BFI=1 are signalled as erased on the uplink.

NOTE 2: DTX is used during the test to prevent the MS dropping the call.

##### 14.1.2.1.4.2 Procedure

- a) The SS simulates a BSS in DTX mode. During the periods when no transmission would occur, the SS transmits a GSM carrier modulated with random data, at a level 11 dB above reference sensitivity level( ). The SACCH is transmitted normally, at a level 20 dB above reference sensitivity( ). The SID frame is transmitted in its correct time interval, with valid information, at a level 20 dB above reference sensitivity level( ). During transmission of SACCH or SID frames, the random data is discontinued.
- b) The SS transmits at least the minimum number of samples of frames of TCH/HS information and checks the BFI of the looped back signal from the MS. The SS records the number of frames where the bad frame indication is not set. During transmission by the SS of SID frames the SS checks that the BFI is not set.

##### 14.1.2.1.5 Test requirements

The BFI performance is accepted if the measured rate of undetected bad frames does not exceed the test limit error rate:

Test limit error rate: 0,041 %;

Minimum number of samples: 492 000 (excluding SID frames).

During loop back of SID frames no BFI shall be set.

#### 14.1.2.2 Bad frame indication - TCH/HS - Frequency hopping and downlink DTX

##### 14.1.2.2.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS under DTX conditions. It includes the effect of the 3 bit Cyclic Redundancy Check (CRC) and all other processing associated with the DTX function. The BFI is measured on a half rate speech TCH (TCH/HS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

The requirements and this test only apply to MS supporting half rate speech.

##### 14.1.2.2.2 Conformance requirement

On a half rate speech TCH (TCH/HS), when DTX is activated with frequency hopping through C0 where bursts comprising SID frames, SACCH frames and dummy bursts are received at a level 20 dB above the reference sensitivity level and with no transmissions at the other bursts of the TCH, the overall reception performance shall be such that, on average less than one undetected bad speech frame (false bad frame indication BFI) shall be measured in one minute for MS. 3GPP TS 05.05, subclause 6.4c.

##### 14.1.2.2.3 Test purpose

1. To verify that the BFI performance in case of frequency hopping including the C0 radio frequency does not exceed the conformance requirement with an allowance for the statistical significance of the test.
2. To verify that on reception of a SID frame the BFI is not set.

##### 14.1.2.2.4 Method of test

###### 14.1.2.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/HS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

NOTE: DTX is used during the test to prevent the MS dropping the call.

###### 14.1.2.2.4.2 Procedure

- a) The SS sets downlink DTX on.
- b) The SS performs the measurement over at least the minimum number of samples of frames of TCH/HS information and checks the BFI of the looped back signal from the MS. The SS only transmits SID frames, SACCH frames and dummy bursts, with no transmission of TCH bursts. The SS records the number of frames where the bad frame indication is not set. During transmission by the SS of SID frames the SS checks that the BFI is not set.

NOTE 1: Further explanations on the mechanism of signalling the BFI to the SS will be found in clause 36.

NOTE 2: In some cases the MS decodes half SID frames correctly even if these are not transmitted completely. Therefore, in case that a MS detects a good SID frame, the SS has to consider the received bits in detail.

##### 14.1.2.2.5 Test requirements

The BFI performance is accepted if the measured rate of undetected bad frames does not exceed the test limit error rate:

Test limit error rate: 0,041 %;

Minimum number of samples: 492 000 (excluding SID frames).

During loop back of SID frames no BFI shall be set.

### 14.1.3 Bad frame indication - TCH/FS - Frequency hopping and downlink DTX - Phase 2 MS in a phase 1 network

#### 14.1.3.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS under DTX conditions. It includes the effect of the 3 bit Cyclic Redundancy Check (CRC) and all other processing associated with the DTX function. The BFI is measured on a full rate speech TCH (TCH/FS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

Annex A of 3GPP TS 05.02 requires that a phase 2 MS behave properly in a phase 1 network.

The requirements and this test only apply to MS supporting speech.

#### 14.1.3.2 Conformance requirement

On a full rate speech TCH (TCH/FS) in DTX conditions with a transmitted burst 20 dB above reference sensitivity and static conditions, the overall reception performance shall be such that, on average, less than one undetected bad speech frame (false bad frame indication) in 60 seconds will be measured; 3GPP TS 05.05, subclause 6.4b.

#### 14.1.3.3 Test purpose

1. To verify that the BFI performance in case of frequency hopping including the C0 radio frequency does not exceed the conformance requirement with an allowance for the statistical significance of the test.
2. To verify that on reception of a SID frame the BFI is not set.

#### 14.1.3.4 Method of test

##### 14.1.3.4.1 Initial conditions

###### Initial conditions 1

A call is set up according to the generic call set up procedure on a TCH/FS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

When downlink DTX is activated with frequency hopping including the C0 radio frequency, the following configuration applies for filling the bursts on the C0 carrier.

| C0 filling on the TCH                                                                                                 | Half burst filling                                               | Dummy bursts stealing flag | Half burst Filling stealing flag |
|-----------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------|----------------------------|----------------------------------|
| Dummy bursts with (BN61, BN 62,...) mapped from the TSC bits of normal bursts. See subclause A.2.1.3 of 3GPP TS 05.02 | Partial SID information. See subclause A.2.2.1 of 3GPP TS 05.02. | 0                          | 0                                |

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

###### Initial conditions 2

A call is set up according to the generic call set up procedure on a TCH/FS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

When downlink DTX is activated with frequency hopping including the C0 radio frequency, the following configuration applies for filling the bursts on the C0 carrier.

| <b>C0 filling on the TCH</b>                                    | <b>Half burst filling</b>                                        | <b>Dummy bursts stealing flag</b> | <b>Half burst Filling stealing flag</b> |
|-----------------------------------------------------------------|------------------------------------------------------------------|-----------------------------------|-----------------------------------------|
| Partial SID information. See subclause A.2.1.4 of 3GPP TS 05.02 | Partial SID information. See subclause A.2.2.1 of 3GPP TS 05.02. | 1                                 | 1                                       |

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

### Initial conditions 3

A call is set up according to the generic call set up procedure on a TCH/FS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

When downlink DTX is activated with frequency hopping including the C0 radio frequency, the following configuration applies for filling the bursts on the C0 carrier.

| <b>C0 filling on the TCH</b>                                                             | <b>Half burst filling</b>                                        | <b>Dummy bursts stealing flag</b> | <b>Half burst Filling stealing flag</b> |
|------------------------------------------------------------------------------------------|------------------------------------------------------------------|-----------------------------------|-----------------------------------------|
| Dummy bursts with 'C0 filling training sequence'. See subclause A.2.1.4 of 3GPP TS 05.02 | Dummy bursts mixed bits. See subclause A.2.2.2 of 3GPP TS 05.02. | 1                                 | 1                                       |

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

NOTE: DTX is used during the test to prevent the MS dropping the call.

#### 14.1.3.4.2 Procedure

The two following steps are repeated 3 times, once for each initial condition specified in the previous clause.

- a) The SS sets downlink DTX on.
- b) The SS transmits at least the minimum number of samples of frames of TCH/FS information and checks the BFI of the looped back signal from the MS. The SS records the number of frames where the bad frame indication is not set. During transmission by the SS of SID frames the SS checks that the BFI is not set.

NOTE 1: Further explanations on the mechanism of signalling the BFI to the SS will be found in clause 36.

NOTE 2: In some cases the MS decodes half SID frames correctly even if these are not transmitted completely. Therefore, in case that a MS detects a good SID frame, the SS has to consider the received bits in detail.

#### 14.1.3.5 Test requirements

After each repetition of steps a) + b) the following requirements are applied.

The BFI performance is accepted if the measured rate of undetected bad frames does not exceed the test limit error rate:

Test limit error rate: 0,041 %;

Minimum number of samples: 492 000 (excluding SID frames).

During loop back of SID frames no BFI shall be set.

## 14.1.4 Bad frame indication - TCH/HS - Frequency hopping and downlink DTX - Phase 2 MS in a phase 1 network

### 14.1.4.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS under DTX conditions. It includes the effect of the 3 bit Cyclic Redundancy Check (CRC) and all other processing associated with the DTX function. The BFI is measured on a half rate speech TCH (TCH/HS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

Annex A of 3GPP TS 05.02 requires that a phase 2 MS behave properly in a phase 1 network.

The requirements and this test only apply to MS supporting half rate speech.

### 14.1.4.2 Conformance requirement

On a half rate speech TCH (TCH/HS) in DTX conditions with a transmitted burst 20 dB above reference sensitivity and static conditions, the overall reception performance shall be such that, on average, less than one undetected bad speech frame (false bad frame indication) in 60 seconds will be measured; 3GPP TS 05.05, subclause 6.4b.

### 14.1.4.3 Test purpose

1. To verify that the BFI performance in case of frequency hopping including the C0 radio frequency does not exceed the conformance requirement with an allowance for the statistical significance of the test.
2. To verify that on reception of a SID frame the BFI is not set.

### 14.1.4.4 Method of test

#### 14.1.4.4.1 Initial conditions

##### Initial conditions 1

A call is set up according to the generic call set up procedure on a TCH/HS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

When downlink DTX is activated with frequency hopping including the C0 radio frequency, the following configuration applies for filling the bursts on the C0 carrier.

| C0 filling on the TCH                                                                                                 | Half burst filling                                               | Dummy bursts stealing flag | Half burst Filling stealing flag |
|-----------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------|----------------------------|----------------------------------|
| Dummy bursts with (BN61, BN 62,...) mapped from the TSC bits of normal bursts. See subclause A.2.1.3 of 3GPP TS 05.02 | Partial SID information. See subclause A.2.2.1 of 3GPP TS 05.02. | 0                          | 0                                |

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

##### Initial conditions 2

A call is set up according to the generic call set up procedure on a TCH/HS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

When downlink DTX is activated with frequency hopping including the C0 radio frequency, the following configuration applies for filling the bursts on the C0 carrier.

| <b>C0 filling on the TCH</b>                                    | <b>Half burst filling</b>                                        | <b>Dummy bursts stealing flag</b> | <b>Half burst Filling stealing flag</b> |
|-----------------------------------------------------------------|------------------------------------------------------------------|-----------------------------------|-----------------------------------------|
| Partial SID information. See subclause A.2.1.4 of 3GPP TS 05.02 | Partial SID information. See subclause A.2.2.1 of 3GPP TS 05.02. | 1                                 | 1                                       |

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

### Initial conditions 3

A call is set up according to the generic call set up procedure on a TCH/HS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

When downlink DTX is activated with frequency hopping including the C0 radio frequency, the following configuration applies for filling the bursts on the C0 carrier.

| <b>C0 filling on the TCH</b>                                                             | <b>Half burst filling</b>                                        | <b>Dummy bursts stealing flag</b> | <b>Half burst Filling stealing flag</b> |
|------------------------------------------------------------------------------------------|------------------------------------------------------------------|-----------------------------------|-----------------------------------------|
| Dummy bursts with 'C0 filling training sequence'. See subclause A.2.1.4 of 3GPP TS 05.02 | Dummy bursts mixed bits. See subclause A.2.2.2 of 3GPP TS 05.02. | 1                                 | 1                                       |

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

NOTE: DTX is used during the test to prevent the MS dropping the call.

#### 14.1.4.4.2 Procedure

The two following steps are repeated 3 times, once for each initial condition specified in the previous clause.

- a) The SS sets downlink DTX on.
- b) The SS transmits at least the minimum number of samples of frames of TCH/HS information and checks the BFI of the looped back signal from the MS. The SS records the number of frames where the bad frame indication is not set. During transmission by the SS of SID frames the SS checks that the BFI is not set.

NOTE 1: Further explanations on the mechanism of signalling the BFI to the SS will be found in clause 36.

NOTE 2: In some cases the MS decodes half SID frames correctly even if these are not transmitted completely. Therefore, in case that a MS detects a good SID frame, the SS has to consider the received bits in detail.

#### 14.1.4.5 Test requirements

After each repetition of steps a) + b) the following requirements are applied.

The BFI performance is accepted if the measured rate of undetected bad frames does not exceed the test limit error rate:

Test limit error rate: 0,041 %;

Minimum number of samples: 492 000 (excluding SID frames).

During loop back of SID frames no BFI shall be set.

## 14.1.5 Bad frame indication - TCH/AFS (Speech frame)

### 14.1.5.1 Bad frame indication - TCH/AFS - Random RF input

#### 14.1.5.1.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS. It includes the effect of the 6 bits Cyclic Redundancy Check (CRC). The BFI is measured on a full rate speech TCH (TCH/AFS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

The requirements and this test only apply to MS supporting AMR.

#### 14.1.5.1.2 Conformance requirement

On a full rate speech TCH (TCH/AFS) with a random RF input, the overall reception performance shall be such that, on average, less than one undetected bad speech frame (false bad frame indication) in 60 s will be measured; 3GPP TS 05.05, subclause 6.4b.

#### 14.1.5.1.3 Test purpose

1. To verify that the BFI performance does not exceed the conformance requirement with an allowance for the statistical significance of the test.

#### 14.1.5.1.4 Method of test

##### 14.1.5.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AFS with an ARFCN in the Mid ARFCN range, power control level set to maximum power.

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

##### 14.1.5.1.4.2 Procedure

- a) The SS simulates a BSS in AMR mode. During the period when no transmission would occur the SS transmits a GSM carrier modulated with random data at a level 11 dB above reference sensitivity level. The SACCH is transmitted normally at a level 20 dB above reference sensitivity. During transmission of SACCH or frames the random data is discontinued.
- b) The SS transmits at least the minimum number of samples of frames of TCH/AFS information and checks the BFI of the looped back signal from the MS. The SS records the number of frames where the bad frame indication is not set

NOTE 1: Further explanations on the mechanism of signalling the BFI to the SS will be found in clause 36.

#### 14.1.5.1.5 Test requirements

The BFI performance is accepted if the measured rate of undetected bad frames does not exceed the test limit error rate:

Test limit error rate: 0,041 %;

Minimum number of samples: 492 000

## 14.1.6 Bad frame indication - TCH/AHS

### 14.1.6.1 Bad frame indication - TCH/AHS - Random RF input

#### 14.1.6.1.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS. It includes the effect of the 14-bit Cyclic Redundancy Check (CRC). The BFI is measured on a half rate speech TCH (TCH/AHS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

The requirements and this test only apply to MS supporting AMR half rate.

#### 14.1.6.1.2 Conformance requirement

On a half rate speech TCH (TCH/AHS) with a random RF input, the overall reception performance shall be such that, on average, less than one undetected bad speech frame (false bad frame indication) in 60 s will be measured; 3GPP TS 05.05, subclause 6.4b.

#### 14.1.6.1.3 Test purpose

1. To verify that the BFI performance does not exceed the conformance requirement with an allowance for the statistical significance of the test.

#### 14.1.6.1.4 Method of test

##### 14.1.6.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AHS with an ARFCN in the Mid ARFCN range, power control level set to maximum power.

##### 14.1.6.1.4.2 Procedure

- a) The SS simulates a BSS in AMR mode. During the periods when no transmission would occur, the SS transmits a GSM carrier modulated with random data, at a level 11 dB above reference sensitivity level. The SACCH is transmitted normally, at a level 20 dB above reference sensitivity. During transmission of SACCH frames, the random data is discontinued.
- b) The SS transmits at least the minimum number of samples of frames of TCH/AHS information and checks the BFI of the looped back signal from the MS. The SS records the number of frames where the bad frame indication is not set.

#### 14.1.6.1.5 Test requirements

The BFI performance is accepted if the measured rate of undetected bad frames does not exceed the test limit error rate:

Test limit error rate: 0,041 %;

Minimum number of samples: 492 000.

## 14.1.6 Bad frame indication - TCH/AFS (Speech frame)

### 14.1.6.1 Bad frame indication - TCH/AFS - Random RF input

#### 14.1.6.1.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS. It includes the effect of the 6 bits Cyclic Redundancy Check (CRC). The BFI is measured on a full rate speech TCH (TCH/AFS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

The requirements and this test only apply to MS supporting AMR.

#### 14.1.6.1.2 Conformance requirement

On a full rate speech TCH (TCH/AFS) with a random RF input, the overall reception performance shall be such that, on average, less than one undetected bad speech frame (false bad frame indication) in 60 s will be measured; 3GPP TS 05.05, subclause 6.4b.

#### 14.1.6.1.3 Test purpose

1. To verify that the BFI performance does not exceed the conformance requirement with an allowance for the statistical significance of the test.

#### 14.1.6.1.4 Method of test

##### 14.1.6.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AFS with an ARFCN in the Mid ARFCN range, power control level set to maximum power.

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

##### 14.1.6.1.4.2 Procedure

- a) The SS simulates a BSS in AMR mode. During the period when no transmission would occur the SS transmits a GSM carrier modulated with random data at a level 11 dB above reference sensitivity level. The SACCH is transmitted normally at a level 20 dB above reference sensitivity. During transmission of SACCH or frames the random data is discontinued.
- b) The SS transmits at least the minimum number of samples of frames of TCH/AFS information and checks the BFI of the looped back signal from the MS. The SS records the number of frames where the bad frame indication is not set

NOTE: Further explanations on the mechanism of signalling the BFI to the SS will be found in clause 36.

#### 14.1.6.1.5 Test requirements

The BFI performance is accepted if the measured rate of undetected bad speech frames does not exceed the test limit error rate:

Test limit error rate: 0,041 %;

Minimum number of samples: 492 000

### 14.1.7 Bad frame indication - TCH/AHS

#### 14.1.7.1 Bad frame indication - TCH/AHS - Random RF input

##### 14.1.7.1.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS. It includes the effect of the 14-bit Cyclic Redundancy Check (CRC). The BFI is measured on a half rate speech TCH (TCH/AHS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

The requirements and this test only apply to MS supporting AMR half rate.

##### 14.1.7.1.2 Conformance requirement

On a half rate speech TCH (TCH/AHS) with a random RF input, the overall reception performance shall be such that, on average, less than one undetected bad speech frame (false bad frame indication) in 60 s will be measured; 3GPP TS 05.05, subclause 6.4b.

#### 14.1.7.1.3 Test purpose

1. To verify that the BFI performance does not exceed the conformance requirement with an allowance for the statistical significance of the test.

#### 14.1.7.1.4 Method of test

##### 14.1.7.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AHS with an ARFCN in the Mid ARFCN range, power control level set to maximum power.

##### 14.1.7.1.4.2 Procedure

- a) The SS simulates a BSS in AMR mode. During the periods when no transmission would occur, the SS transmits a GSM carrier modulated with random data, at a level 11 dB above reference sensitivity level. The SACCH is transmitted normally, at a level 20 dB above reference sensitivity. During transmission of SACCH frames, the random data is discontinued.
- b) The SS transmits at least the minimum number of samples of frames of TCH/AHS information and checks the BFI of the looped back signal from the MS. The SS records the number of frames where the bad frame indication is not set.

#### 14.1.7.1.5 Test requirements

The BFI performance is accepted if the measured rate of undetected bad speech frames does not exceed the test limit error rate:

Test limit error rate: 0,041 %;

Minimum number of samples: 492 000

## 14.2 Reference sensitivity

### 14.2.1 Reference sensitivity - TCH/FS

#### 14.2.1.1 Definition and applicability

The reference sensitivity is the signal level at the MS receiver input at which a certain BER and FER must be achieved.

The requirements and this test apply to MS supporting speech.

For E-GSM 900 MS this test is only performed in the P-GSM band.

#### 14.2.1.2 Conformance requirement

1. At reference sensitivity level, the TCH/FS FER shall meet the reference sensitivity performance of table 1 in 3GPP TS 05.05 subclause 6.2.
2. At reference sensitivity level, the TCH/FS class I RBER shall meet the reference sensitivity performance of table 1 in 3GPP TS 05.05 subclause 6.2.
3. At reference sensitivity level, the TCH/FS class II RBER shall meet the reference sensitivity, performance of table 1 in 3GPP TS 05.05 subclause 6.2.
4. At reference sensitivity level, the TCH/FS class II RBER shall meet the reference sensitivity, performance of table 1 in GSM under extreme conditions; 3GPP TS 05.05 subclause 6.2 and annex D subclauses D.2.1 and D.2.2.

#### 14.2.1.3 Test purpose

NOTE: This test is performed under STATIC propagation conditions to allow implicit testing of the ability of the MS to hop over the full band. The tests under dynamic propagation conditions are better suited to test the reference sensitivity conformance but cannot test hopping over the full band due to limited bandwidth of available fading simulators.

1. To verify that the MS does not exceed conformance requirement 1 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 3 under STATIC, TUhigh, RA and HT propagation conditions with an allowance for the statistical significance of the test.
4. To verify that the MS does not exceed conformance requirement 4 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.

#### 14.2.1.4 Method of test

NOTE 1: The BA list sent on the BCCH and SACCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCHs but, if provided the signal strengths of BCCHs shall be in the range  $15 \text{ dB}\mu\text{Vemf}(\ )$  to  $35 \text{ dB}\mu\text{Vemf}(\ )$ .

NOTE 2: The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

NOTE 3: When frequency hopping is used, the traffic channel may fall on any of the ARFCNs defined in clause 6.

##### 14.2.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS with an ARFCN in the Mid ARFCN range for GSM 400, GSM 700, GSM 850, DCS 1800 and PCS 1 900 and ARFCN 70 for GSM 900, power control level set to maximum power.

NOTE: For GSM 900 ARFCN 70 is tested since this is the 73rd harmonic of the 13 MHz clock normally used internally in a MS.

The SS transmits Standard Test Signal C1 on the traffic channel.

The SS commands the MS to create traffic channel loop back signalling erased frames.

##### 14.2.1.4.2 Procedure

- a) The fading function is set to TUhigh.
- b) the SS sets the amplitude of the wanted signal to reference sensitivity level ( ).
- c) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- d) The SS determines the number of residual bit error events for the bits of class II, by examining sequences of at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.
- e) The SS determines the number of residual bit error events for the bits of the class Ib, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.
- f) The SS also determines the frame erasure events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully, if it is not signalled as erased.
- g) Steps a) to d) are repeated under extreme test conditions.

- h) Steps a) to g) are repeated for TCH/FS with ARFCNs in the Low ARFCN range for GSM 400, GSM 700, GSM 850, DCS 1800 and PCS 1 900 and ARFCN 5 for GSM 900 and the High ARFCN range.

NOTE: For GSM 900 ARFCN 5 is tested since this is the 72nd harmonic of the 13 MHz clock normally used internally in a MS.

- i) Steps b) to d) are repeated with the SS fading function set in turn to RA and HT.
- j) Steps b) to g) are repeated, with the SS fading function set to static and the MS is commanded by the SS into hopping mode using the hopping sequence defined in clause 6.

The amplitude of the wanted signal is set according to step b). All the other time slots, except the active ones, are set to 20 dB above reference sensitivity level( ). This implicitly tests adjacent time slot rejection.

#### 14.2.1.5 Test requirements

The error rates measured for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the test limit error rate values given in table 14-5 or 14-6.

**Table 14-5: Limits for GSM 400, GSM 700, GSM 850 and GSM 900 sensitivity**

| Channels       | Propagation conditions TUhigh |                        | Propagation conditions RA |                        | Propagation conditions HT |                        | Static conditions       |                        |
|----------------|-------------------------------|------------------------|---------------------------|------------------------|---------------------------|------------------------|-------------------------|------------------------|
|                | Test limit error rate %       | Minimum No. of samples | Test limit error rate %   | Minimum No. of samples | Test limit error rate %   | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
| TCH/FS         |                               |                        |                           |                        |                           |                        |                         |                        |
| FER            | $6,742 \cdot \alpha$          | 8 900                  |                           |                        |                           |                        | $0,122 \cdot \alpha$    | 164 000                |
| class Ib(RBER) | $0,42/\alpha$                 | 1 000 000              |                           |                        |                           |                        | $0,41/\alpha$           | 20 000 000             |
| class II(RBER) | 8,333                         | 120 000                | 7,5                       | 24 000                 | 9,333                     | 60 000                 | 2,439                   | 8 200                  |

**Table 14-6: Limits for DCS 1 800 and PCS 1 900 sensitivity**

| Channels       | Propagation conditions TUhigh |                        | Propagation conditions RA |                        | Propagation conditions HT |                        | Static conditions       |                        |
|----------------|-------------------------------|------------------------|---------------------------|------------------------|---------------------------|------------------------|-------------------------|------------------------|
|                | Test limit error rate %       | Minimum No. of samples | Test limit error rate %   | Minimum No. of samples | Test limit error rate %   | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
| TCH/FS         |                               |                        |                           |                        |                           |                        |                         |                        |
| FER            | $4,478 \cdot \alpha$          | 13 400                 |                           |                        |                           |                        | $0,122 \cdot \alpha$    | 164 000                |
| class Ib(RBER) | $0,32/\alpha$                 | 1 500 000              |                           |                        |                           |                        | $0,41/\alpha$           | 20 000 000             |
| class II(RBER) | 8,333                         | 60 000                 | 7,5                       | 24 000                 | 9,333                     | 30 000                 | 2,439                   | 8 200                  |

Where  $\alpha$  is a parameter which can range from 1 to 1.6. The value of  $\alpha$  for a RBER test on TCH/FS class Ib bits under particular measurement conditions shall be the same as that determined in the FER test on TCH/FS under the same conditions.

## 14.2.2 Reference sensitivity - TCH/HS (Speech frames)

### 14.2.2.1 Definition and applicability

The reference sensitivity level is the signal level at the MS receiver input at which a certain BER and FER and UFR for speech frames must be achieved.

The requirements and this test apply to MS supporting half rate speech.

#### 14.2.2.2 Conformance requirement

1. At reference sensitivity level, the TCH/HS FER shall meet the reference sensitivity performance of table 1 in 3GPP TS 05.05 subclause 6.2.
2. At reference sensitivity level, the TCH/HS class Ib RBER (BFI=0) shall meet the reference sensitivity performance of table 1 in 3GPP TS 05.05 subclause 6.2.
3. At reference sensitivity level, the TCH/HS class II RBER (BFI=0) shall meet the reference sensitivity performance of table 1 in 3GPP TS 05.05 subclause 6.2.
4. At reference sensitivity level, the TCH/HS UFR shall meet the reference sensitivity performance of table 1 in 3GPP TS 05.05 subclause 6.2.
5. At reference sensitivity level, the TCH/HS class Ib RBER ((BFI or UFI)=0) shall meet the reference sensitivity performance of table 1 in 3GPP TS 05.05 subclause 6.2.

#### 14.2.2.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under TUhigh propagation conditions with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under TUhigh propagation conditions with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 3 under TUhigh, RA and HT propagation conditions with an allowance for the statistical significance of the test.
4. To verify that the MS does not exceed conformance requirement 4 under TUhigh propagation conditions with an allowance for the statistical significance of the test.
5. To verify that the MS does not exceed conformance requirement 5 under TUhigh propagation conditions with an allowance for the statistical significance of the test.

#### 14.2.2.4 Method of test

##### 14.2.2.4.1 Initial conditions

The BA list sent on the BCCH and SACCH indicates at least six surrounding cells, with at least one near to each band edge. It is not necessary to generate any of these BCCHs, but if provided, the signal strengths of BCCHs shall be in the range  $15 \text{ dB}\mu\text{Vemf}(\ )$  to  $35 \text{ dB}\mu\text{Vemf}(\ )$ .

The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

A call is set up according to the generic call set up procedure on a TCH/HS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel.

##### 14.2.2.4.2 Procedure

- a) The SS commands the MS to create traffic channel loop back signalling erased frames using test loop A.

NOTE 1: Test loop A is defined in clause 36. Frames detected with BFI=1 are signalled as erased on the uplink.

- b) The fading function is set to TUhigh.
- c) The SS sets the amplitude of the wanted signal to reference sensitivity level ( $\ )$ .
- d) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- e) The SS determines the number of residual bit error events for the bits of class II, by examining sequences of at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.

- f) The SS determines the number of residual bit error events for the bits of the class Ib, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.
- g) The SS also determines the frame erasure events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully, if it is not signalled as erased.
- h) Steps d) and e) are repeated, with the SS fading function set in turn to RA and HT.
- j) The SS increases the amplitude of the wanted signal to 20 dB above reference sensitivity level.
- k) The SS commands the MS to open test loop A and close test loop D.

NOTE 2: Test loop D is defined in clause 36. Frames marked as erased (BFI=1) or unreliable (UFI=1) are signalled to the SS on the uplink.

- l) The fading function is set to TUhigh.
- m) The SS sets the amplitude of the wanted signal to reference sensitivity level ( ).
- n) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the erased/unreliable frame indication.
- p) The SS determines the number of residual bit error events for the bits of the class Ib, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased/unreliable.
- q) The SS also determines the unreliable frame events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased/unreliable.

#### 14.2.2.5 Test requirements

The error rates measured for different channels and under the different propagation conditions, shall not exceed the test limit error rate values given in table 14-7 or 14-8.

**Table 14-7: Limits for GSM 400, GSM 700, GSM 850 and GSM 900 sensitivity**

| Channels                         | Propagation conditions TUhigh |                        | Propagation conditions RA |                        | Propagation conditions HT |                        |
|----------------------------------|-------------------------------|------------------------|---------------------------|------------------------|---------------------------|------------------------|
|                                  | Test limit error rate %       | Minimum No. of samples | Test limit error rate %   | Minimum No. of samples | Test limit error rate %   | Minimum No. of samples |
| TCH/HS (FER)                     | 4,598                         | 13050                  | 8,500                     | 20000                  | 7,600                     | 20000                  |
| TCH/HS Class Ib (BFI=0)          | 0,404                         | 148500                 |                           |                        |                           |                        |
| TCH/HS Class II (BFI=0)          | 7,725                         | 25500                  |                           |                        |                           |                        |
| TCH/HS (UFR)                     | 6,250                         | 9600                   |                           |                        |                           |                        |
| TCH/HS Class Ib ((BFI or UFI)=0) | 0,269                         | 227000                 |                           |                        |                           |                        |

**Table 14-8: Limits for DCS 1800 and PCS 1 900 sensitivity**

| Channels                         | Propagation conditions TUhigh |                        | Propagation conditions RA |                        | Propagation conditions HT |                        |
|----------------------------------|-------------------------------|------------------------|---------------------------|------------------------|---------------------------|------------------------|
|                                  | Test limit error rate %       | Minimum No. of samples | Test limit error rate %   | Minimum No. of samples | Test limit error rate %   | Minimum No. of samples |
| TCH/HS (FER)                     | 4,706                         | 12750                  | 8,735                     | 20000                  | 7,600                     | 20000                  |
| TCH/HS Class Ib (BFI=0)          | 0,426                         | 141000                 |                           |                        |                           |                        |
| TCH/HS Class II (BFI=0)          | 7,725                         | 25500                  |                           |                        |                           |                        |
| TCH/HS (UFR)                     | 6,383                         | 9400                   |                           |                        |                           |                        |
| TCH/HS Class Ib ((BFI or UFI)=0) | 0,291                         | 206000                 |                           |                        |                           |                        |

## 14.2.3 Reference sensitivity - FACCH/F

### 14.2.3.1 Definition and applicability

The reference sensitivity for control channels is the signal level at the MS receiver input at which a certain FER must be achieved.

The requirements and this test apply to all types of MS.

### 14.2.3.2 Conformance requirement.

At reference sensitivity level, the FACCH/F FER shall meet the reference sensitivity performance of table 1 in 3GPP TS 05.05 subclause 6.2.

### 14.2.3.3 Test purpose.

To verify that the MS does not exceed the conformance requirement under TUhigh propagation condition with an allowance for the statistical significance of the test.

### 14.2.3.4 Method of test

#### 14.2.3.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/F with an ARFCN in the Low ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel.

#### 14.2.3.4.2 Procedure

- a) The fading function is set to TUhigh.
- b) The SS sets the amplitude of the wanted signal to reference sensitivity level ( ).
- c) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Due to the low signal level the MS may not be able to acknowledge the Layer 2 frame with an RR frame and the SS will repeat the Layer 2 frame. Each repeated L2 frame will be counted and will indicate a frame erasure event.
- d) The SS determines the frame erasure events during at least the minimum number of samples of FACCH/F frames.

NOTE: These frames will not be consecutive but it is expected that the statistical significance of the tests will not be unduly degraded.

### 14.2.3.5 Test Requirements

The error rates measured shall not exceed the test limit error rate values given in table 14-9.

**Table 14-9: Limits for FACCH/F sensitivity**

| Channels | Type of measurements | Propagation | GSM 400, GSM 700, GSM 850 and GSM 900 |                       | DCS 1 800 and PCS 1 900 |                       |
|----------|----------------------|-------------|---------------------------------------|-----------------------|-------------------------|-----------------------|
|          |                      |             | Test limit error rate %               | Minimum No of samples | Test limit error rate % | Minimum No of samples |
| FACCH/F  | FER                  | TUhigh      | 8,961                                 | 6696                  | 4,368                   | 13736                 |

## 14.2.4 Reference sensitivity - FACCH/H

### 14.2.4.1 Definition and applicability

The reference sensitivity for control channels is the signal level at the MS receiver input at which a certain FER must be achieved.

The requirements and this test apply to MS supporting half rate channels.

### 14.2.4.2 Conformance requirement.

At reference sensitivity level, the FACCH/H FER shall meet the reference sensitivity performance of table 1 in 3GPP TS 05.05 subclause 6.2.

### 14.2.4.3 Test purpose.

To verify that the MS does not exceed the conformance requirement under TUhigh propagation condition with an allowance for the statistical significance of the test.

### 14.2.4.4 Method of test

#### 14.2.4.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/H with an ARFCN in the Mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel.

#### 14.2.4.4.2 Procedure

- a) The fading function is set to TUhigh.
- b) The SS sets the amplitude of the wanted signal to reference sensitivity level ( ).
- c) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Due to the low signal level the MS may not be able to acknowledge the Layer 2 frame with an RR frame and the SS will repeat the Layer 2 frame. Each repeated L2 frame will be counted and will indicate a frame erasure event.
- d) The SS determines the frame erasure events during at least the minimum number of samples of FACCH/H frames.

NOTE: These frames will not be consecutive but it is expected that the statistical significance of the tests will not be unduly degraded.

#### 14.2.4.5 Test requirements

The error rates measured shall not exceed the test limit error rate values given in table 14-10.

**Table 14-10: Limits for FACCH/H sensitivity**

| Channels | Type of measurements | Propagation | GSM 400, GSM 700, GSM 850 and GSM 900 |                       | DCS 1 800 and PCS 1 900 |                       |
|----------|----------------------|-------------|---------------------------------------|-----------------------|-------------------------|-----------------------|
|          |                      |             | Test limit error rate %               | Minimum No of samples | Test limit error rate % | Minimum No of samples |
| FACCH/H  | FER                  | TUhigh      | 7,728                                 |                       | 8,064                   |                       |

## 14.2.5 Reference sensitivity - full rate data channels

### 14.2.5.1 Definition and applicability

The reference sensitivity for data channels is the signal level at the MS receiver input at which a certain BER must be achieved.

The requirements and this test apply to MS supporting data.

### 14.2.5.2 Conformance Requirement.

1. At reference sensitivity level, the TCH/F9,6, TCH/F4,8 and TCH/F2,4 BER shall meet the reference sensitivity performance of table 1 in 3GPP TS 05.05 subclause 6.2.

### 14.2.5.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under HT propagation condition with an allowance for the statistical significance of the test.

### 14.2.5.4 Method of test

#### 14.2.5.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH with an ARFCN in the Mid ARFCN range. One of the supported TCH/(F9,6, F4,8, or F2,4) shall be used. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel.

The SS commands the MS to create the traffic channel loop back signalling erased frames (subclause 36.2.1.1.1).

#### 14.2.5.4.2 Procedure

- a) The fading function is set to HT.
- b) The SS sets the amplitude of the wanted signal level to reference sensitivity level ( ).
- c) The SS compares transmitted data with received data for at least the minimum number of samples of consecutive bits and records every error bit as an error event.
- d) The SS sets the wanted signal level to 28 dB $\mu$ V<sub>emf</sub>.
- e) The SS commands the MS to open the TCH loop.
- f) The SS commands the MS to another of the supported data channels.
- g) Steps b) to f) are repeated for all supported full rate data channels.

### 14.2.5.5 Test requirements

The Max-events measured for different channels shall not exceed the values given in table 14-11.

**Table 14-11: Limits for full rate data channel sensitivity**

| Channels | Type of measurements | Propagation | GSM 400, GSM 700, GSM 850 and GSM 900 |                       | DCS 1 800 and PCS 1 900 |                       |
|----------|----------------------|-------------|---------------------------------------|-----------------------|-------------------------|-----------------------|
|          |                      |             | Test limit error rate %               | Minimum No of samples | Test limit error rate % | Minimum No of samples |
| TCH/F9,6 | BER                  | HT          | 0,778                                 | 180000                | 0,784                   | 76500                 |
| TCH/F4,8 | BER                  | HT          | 0,011                                 | 5350000               | 0,011                   | 5350000               |
| TCH/F2,4 | BER                  | HT          | 0,001                                 | 11900000              | 0,001                   | 11900000              |

## 14.2.6 Reference sensitivity - half rate data channels

### 14.2.6.1 Definition and applicability

The reference sensitivity for data channels is the signal level at the MS receiver input at which a certain BER must be achieved.

The requirements and this test apply to MS supporting half rate data.

### 14.2.6.2 Conformance Requirement.

1. At reference sensitivity level, the TCH/H4,8 and TCH/H2,4 BER shall meet the reference sensitivity performance of table 1 in 3GPP TS 05.05 subclause 6.2.

### 14.2.6.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under HT propagation condition with an allowance for the statistical significance of the test.

### 14.2.6.4 Method of test

#### 14.2.6.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH with an ARFCN in the Mid ARFCN range. One of the supported TCH/(H4,8 or H2,4) shall be used. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel.

The SS commands the MS to create the traffic channel loop back signalling erased frames (subclause 36.2.1.1.1).

#### 14.2.6.4.2 Procedure

- a) The fading function is set to HT.
- b) The SS sets the amplitude of the wanted signal level to reference sensitivity level ( ).
- c) The SS compares transmitted data with received data for at least the minimum number of samples of consecutive bits and records every error bit as an error event.
- d) The SS sets the wanted signal level to 28 dB $\mu$ Vemf.
- e) The SS commands the MS to open the TCH loop.
- f) The SS commands the MS to another of the supported data channels.
- g) Steps b) to f) are repeated for all supported data channels.

### 14.2.6.5 Test requirements

The Max-events measured for different channels shall not exceed the values given in table 14-12.

**Table 14-12: Limits for half rate data channel sensitivity**

|          |                         |                  | GSM 400, GSM 700, GSM 850<br>and GSM 900 |                          | DCS 1 800 and PCS 1 900    |                          |
|----------|-------------------------|------------------|------------------------------------------|--------------------------|----------------------------|--------------------------|
| Channels | Type of<br>measurements | Propag-<br>ation | Test limit error<br>rate %               | Minimum No<br>of samples | Test limit error<br>rate % | Minimum No<br>of samples |
| TCH/H4,8 | BER                     | HT               | 0,778                                    | 180000                   | -                          | -                        |
| TCH/H2,4 | BER                     | HT               | 0,011                                    | 5350000                  | -                          | -                        |

## 14.2.7 Reference sensitivity - TCH/EFS

### 14.2.7.1 Definition and applicability

The reference sensitivity is the signal level at the MS receiver input at which a certain BER and FER must be achieved.

The requirements and this test apply to MS supporting speech.

For E-GSM 900 MS this test is only performed in the P-GSM band.

### 14.2.7.2 Conformance requirement

1. At reference sensitivity level, the TCH/EFS FER shall meet the reference sensitivity performance of table 1 in 3GPP TS 05.05 subclause 6.2.
2. At reference sensitivity level, the TCH/EFS class I RBER shall meet the reference sensitivity performance of table 1 in 3GPP TS 05.05 subclause 6.2.
3. At reference sensitivity level, the TCH/EFS class II RBER shall meet the reference sensitivity, performance of table 1 in 3GPP TS 05.05 subclause 6.2.
4. At reference sensitivity level, the TCH/EFS class II RBER shall meet the reference sensitivity, performance of table 1 in GSM under extreme conditions; 3GPP TS 05.05, subclause 6.2 and annex D subclauses D.2.1 and D.2.2.

### 14.2.7.3 Test purpose

NOTE: This test is performed under STATIC propagation conditions to allow implicit testing of the ability of the MS to hop over the full band. The tests under dynamic propagation conditions are better suited to test the reference sensitivity conformance but cannot test hopping over the full band due to limited bandwidth of available fading simulators.

1. To verify that the MS does not exceed conformance requirement 1 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 3 under STATIC, TUhigh, RA and HT propagation conditions with an allowance for the statistical significance of the test.
4. To verify that the MS does not exceed conformance requirement 4 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.

### 14.2.7.4 Method of test

NOTE 1: The BA list sent on the BCCH and SACCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCHs but, if provided the signal strengths of BCCHs shall be in the range  $15 \text{ dBmVemf}(\ )$  to  $35 \text{ dBmVemf}(\ )$ .

NOTE 2: The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

NOTE 3: When frequency hopping is used, the traffic channel may fall on any of the ARFCNs defined in clause 6.

#### 14.2.7.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/EFS with an ARFCN in the Mid ARFCN range for GSM 400, GSM 700, GSM 850, DCS 1800 and PCS 1 900 and ARFCN 70 for GSM 900, power control level set to maximum power.

NOTE: For GSM 900 ARFCN 70 is tested since this is the 73rd harmonic of the 13 MHz clock normally used internally in a MS.

The SS transmits Standard Test Signal C1 on the traffic channel.

The SS commands the MS to create traffic channel loop back signalling erased frames.

#### 14.2.7.4.2 Procedure

- a) The fading function is set to TUhigh.
- b) the SS sets the amplitude of the wanted signal to reference sensitivity level ( ).
- c) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- d) The SS determines the number of residual bit error events for the bits of class II, by examining sequences of at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.
- e) The SS determines the number of residual bit error events for the bits of the class Ib, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.
- f) The SS also determines the frame erasure events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully, if it is not signalled as erased.
- g) Steps a) to d) are repeated under extreme test conditions.
- h) Steps a) to g) are repeated for TCH/EFS with ARFCNs in the Low ARFCN range for GSM 400, GSM 700, GSM 850, DCS 1800 and PCS 1 900 and ARFCN 5 for GSM 900 and the High ARFCN range.

NOTE: For GSM 900 ARFCN 5 is tested since this is the 72nd harmonic of the 13 MHz clock normally used internally in a MS.

- i) Steps b) to d) are repeated with the SS fading function set in turn to RA and HT.
- j) Steps b) to g) are repeated, with the SS fading function set to static and the MS is commanded by the SS into hopping mode using the hopping sequence defined in clause 6.

The amplitude of the wanted signal is set according to step b). All the other time slots, except the active ones, are set to 20 dB above reference sensitivity level( ). This implicitly tests adjacent time slot rejection.

#### 14.2.7.5 Test requirements

The error rates measured for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the test limit error rate values given in tables 14-4 or 14-13a, 14-13b.

**Table 14-13a: Limits for GSM 400, GSM 700, GSM 850 and GSM 900 sensitivity**

| Channels        | Propagation conditions TUhigh |                        | Propagation conditions RA |                        | Propagation conditions HT |                        | Static conditions       |                        |
|-----------------|-------------------------------|------------------------|---------------------------|------------------------|---------------------------|------------------------|-------------------------|------------------------|
|                 | Test limit error rate %       | Minimum No. of samples | Test limit error rate %   | Minimum No. of samples | Test limit error rate %   | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
| TCH/EFS         |                               |                        |                           |                        |                           |                        |                         |                        |
| FER             | 8,867                         | 8900                   |                           |                        |                           |                        | 0,122                   | 164000                 |

## 14.2.8 Reference sensitivity - full rate data channels in multislot configuration

### 14.2.8.1 Definition and applicability

The reference sensitivity for data channels is the signal level at the MS receiver input at which a certain BER must be achieved.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1800 and PCS 1 900 MS and any multiband MS which are capable of HSCSD multislot operation.

### 14.2.8.2 Conformance Requirement.

- At reference sensitivity level, the TCH/F9,6, TCH/F4,8 and TCH/F2,4 BER shall meet the reference sensitivity performance of table 1 in 3GPP TS 05.05 subclause 6.2.

### 14.2.8.3 Test purpose

- To verify that the MS does not exceed conformance requirement 1 in all multislot classes under HT propagation condition with an allowance for the statistical significance of the test.

### 14.2.8.4 Method of test

#### 14.2.8.4.1 Initial conditions

A call is set up according to the generic call set up procedure for multislot HSCSD on a TCH with an ARFCN in the Mid ARFCN range. One of the supported TCH/(F9,6, F4,8, or F2,4) shall be used.

The SS sets the MS to operate in a worst case configuration where the overlapping of the transmitting and receiving timeslots are maximized. If it needs the use of timing advance, it is set to 63. If overlapping is not possible, transmitting and receiving timeslots should be as close as possible.

The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on all the channels.

The SS commands the MS to create the loop back of the closest channel to the transmitting timeslot.

#### 14.2.8.4.2 Procedure

- The fading function is set to HT.
- The SS commands the MS to close the TCH loop.
- The SS sets the amplitude of the wanted signal level to reference sensitivity level ( ) in all subchannels.
- The SS compares transmitted data with received data in all channels for at least the minimum number of samples of consecutive bits and records every error bit as an error event.
- The SS sets the wanted signal level to 28 dBmVemf.

- f) The SS commands the MS to open the TCH loop.
- g) The SS commands the MS to another of the supported data channels.
- h) Steps b) to g) are repeated for all supported full rate data channels.

#### 14.2.8.5 Test requirements

The Max-events measured for different channels shall not exceed the values given in table 14-15.

**Table 14-15: Limits for full rate data channel sensitivity**

| Channels | Type of measurements | Propagation | GSM 400, GSM 700, GSM 850 and GSM 900 |                       | DCS 1 800 and PCS 1 900 |                       |
|----------|----------------------|-------------|---------------------------------------|-----------------------|-------------------------|-----------------------|
|          |                      |             | Test limit error rate %               | Minimum No of samples | Test limit error rate % | Minimum No of samples |
| TCH/F9,6 | BER                  | HT          | 0,778                                 | 180000                | 0,784                   | 76500                 |
| TCH/F4,8 | BER                  | HT          | 0,011                                 | 5350000               | 0,011                   | 5350000               |
| TCH/F2,4 | BER                  | HT          | 0,001                                 | 11900000              | 0,001                   | 11900000              |

### 14.2.9 Reference sensitivity - TCH/FS for MS supporting the R-GSM band

#### 14.2.9.1 Definition and applicability

The reference sensitivity is the signal level at the MS receiver input at which a certain BER and FER must be achieved.

The requirements and this test apply to R-GSM MS supporting speech.

#### 14.2.9.2 Conformance requirement

1. At reference sensitivity level, the TCH/FS FER shall meet the reference sensitivity performance of table 1 in 3GPP TS 05.05 subclause 6.2.
2. At reference sensitivity level, the TCH/FS class I RBER shall meet the reference sensitivity performance of table 1 in 3GPP TS 05.05 subclause 6.2.
3. At reference sensitivity level, the TCH/FS class II RBER shall meet the reference sensitivity, performance of table 1 in 3GPP TS 05.05 subclause 6.2.
4. At reference sensitivity level, the TCH/FS class II RBER shall meet the reference sensitivity, performance of table 1 in GSM under extreme conditions; 3GPP TS 05.05, subclause 6.2 and annex D subclauses D.2.1 and D.2.2.

#### 14.2.9.3 Test purpose

NOTE: This test is performed under STATIC propagation conditions to allow implicit testing of the ability of the MS to hop over the full band. The tests under dynamic propagation conditions are better suited to test the reference sensitivity conformance but cannot test hopping over the full band due to limited bandwidth of available fading simulators.

1. To verify that the MS does not exceed conformance requirement 1 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 3 under STATIC, TUhigh, RA and HT propagation conditions with an allowance for the statistical significance of the test.
4. To verify that the MS does not exceed conformance requirement 4 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.

#### 14.2.9.4 Method of test

NOTE 1: The BA list sent on the BCCH and SACCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCHs but, if provided the signal strengths of BCCHs shall be in the range  $15 \text{ dB}\mu\text{Vemf}(\ )$  to  $35 \text{ dB}\mu\text{Vemf}(\ )$ .

NOTE 2: The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

NOTE 3: When frequency hopping is used, the traffic channel may fall on any of the ARFCNs defined in clause 6.

##### 14.2.9.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS with ARFCN 70 for R-GSM 900, power control level set to maximum power.

NOTE: For R-GSM 900 ARFCN 70 is tested since this is the 73rd harmonic of the 13 MHz clock normally used internally in a MS.

The SS transmits Standard Test Signal C1 on the traffic channel.

The SS commands the MS to create traffic channel loop back signalling erased frames.

##### 14.2.9.4.2 Procedure

- a) The fading function is set to TUhigh.
- b) the SS sets the amplitude of the wanted signal to reference sensitivity level ( ).
- c) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- d) The SS determines the number of residual bit error events for the bits of class II, by examining sequences of at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.
- e) The SS determines the number of residual bit error events for the bits of the class Ib, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.
- f) The SS also determines the frame erasure events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully, if it is not signalled as erased.
- g) Steps a) to d) are repeated under extreme test conditions.
- h) Steps a) to g) are repeated for TCH/FS with ARFCN 5 and 964 for R-GSM 900 and the High ARFCN range.

NOTE: For R-GSM 900 ARFCN 5 and 964 are tested since they are the 72<sup>nd</sup> and 71<sup>st</sup> harmonic of the 13 MHz clock normally used internally in a MS.i) Steps b) to d) are repeated with the SS fading function set in turn to RA and HT.

- j) Steps b) to g) are repeated, with the SS fading function set to static and the MS is commanded by the SS into hopping mode using the hopping sequence defined in clause 6.

The amplitude of the wanted signal is set according to step b). All the other time slots, except the active ones, are set to 20 dB above reference sensitivity level( ). This implicitly tests adjacent time slot rejection.

##### 14.2.9.5 Test requirements

The error rates measured for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the test limit error rate values given in table 14-5b.

Table 14-5b: Limits for GSM 900 sensitivity

| Channels       | Propagation conditions TUhigh |                        | Propagation conditions RA |                        | Propagation conditions HT |                        | Static conditions       |                        |
|----------------|-------------------------------|------------------------|---------------------------|------------------------|---------------------------|------------------------|-------------------------|------------------------|
|                | Test limit error rate %       | Minimum No. of samples | Test limit error rate %   | Minimum No. of samples | Test limit error rate %   | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
| TCH/FS         |                               |                        |                           |                        |                           |                        |                         |                        |
| FER            | 6,742* $\alpha$               | 8900                   |                           |                        |                           |                        | 0,122* $\alpha$         | 164000                 |
| class Ib(RBER) | 0,42/ $\alpha$                | 1000000                |                           |                        |                           |                        | 0,41/ $\alpha$          | 20000000               |
| class II(RBER) | 8,333                         | 120000                 | 7,5                       | 24000                  | 9,333                     | 60000                  | 2,439                   | 8200                   |

## 14.2.10 Reference sensitivity - TCH/AFS

### 14.2.10.1 Definition and applicability

The reference sensitivity is the signal level at the MS receiver input at which a certain BER and FER must be achieved.

The requirements and this test apply to MS supporting AMR Full Rate speech.

For E-GSM 900 MS this test is only performed in the P-GSM band.

### 14.2.10.2 Conformance requirement

1. At reference sensitivity level, the TCH/AFS FER shall meet the reference sensitivity performance of table 1 in 3GPP TS 05.05 subclause 6.2.
2. At reference sensitivity level, the TCH/AFS class Ib RBER shall meet the reference sensitivity, performance of table 1 in 3GPP TS 05.05 subclause 6.2.

### 14.2.10.3 Test purpose

NOTE: This test is not performed under STATIC propagation conditions because the performance requirements are too small to be accurately measured.

1. To verify that the MS does not exceed conformance requirement 1 under TUhigh propagation conditions with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under TUhigh propagation conditions with an allowance for the statistical significance of the test.

### 14.2.10.4 Method of test

NOTE 1: The BA list sent on the BCCH and SACCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCHs but, if provided the signal strengths of BCCHs shall be in the range 15 dB $\mu$ Vemf( ) to 35 dB $\mu$ Vemf( ).

NOTE 2: The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

NOTE 3: When frequency hopping is used, the traffic channel may fall on any of the ARFCNs defined in clause 6.

#### 14.2.10.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AFS with an ARFCN in the Mid ARFCN range for GSM 400, GSM 700, GSM 850, DCS 1800 and PCS 1900 and ARFCN 70 for GSM 900, power control level set to maximum power.

NOTE: For GSM 900 ARFCN 70 is tested since this is the 73<sup>rd</sup> harmonic of the 13 MHz clock normally used internally in a MS.

The multirate configuration indicates the use of a codec set limited to 12,2 kbit/s.

The SS transmits Standard Test Signal C1 on the traffic channel.

The SS commands the MS to create traffic channel loop back signalling erased frames.

#### 14.2.10.4.2 Procedure

- a) The fading function is set to TUhigh.
- b) the SS sets the amplitude of the wanted signal to reference sensitivity level ( ).
- c) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- d) The SS determines the number of residual bit error events for the bits of class Ib, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib. Bits are taken only from those frames not signalled as erased.
- e) The SS also determines the frame erasure events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully, if it is not signalled as erased.
- f) Steps a) to e) are repeated for TCH/AFS with ARFCNs in the Low ARFCN range for GSM 400, GSM 700, GSM 850, DCS 1800 and PCS 1 900 and ARFCN 5 for GSM 900 and the High ARFCN range.
- g) The SS uses a Channel Mode Modify procedure to change the active codec set to 10,2 kbit/s and steps a) to f) are repeated.
- h) The SS uses a Channel Mode Modify procedure to change the active codec set to 7,95 kbit/s and steps a) to f) are repeated.
- i) The SS uses a Channel Mode Modify procedure to change the active codec set to 7,4 kbit/s and steps a) to f) are repeated.
- j) The SS uses a Channel Mode Modify procedure to change the active codec set to 6,7 kbit/s and steps a) to f) are repeated.
- k) The SS uses a Channel Mode Modify procedure to change the active codec set to 5,9 kbit/s and steps a) to f) are repeated.
- l) The SS uses a Channel Mode Modify procedure to change the active codec set to 5,15 kbit/s and steps a) to f) are repeated.
- m) The SS uses a Channel Mode Modify procedure to change the active codec set to 4,75 kbit/s and steps a) to f) are repeated.

NOTE: For GSM 900 ARFCN 5 is tested since this is the 72<sup>nd</sup> harmonic of the 13 MHz clock normally used internally in a MS.

#### 14.2.10.5 Test requirements

The error rates measured for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the test limit error rate values given in table 14-5 or 14-6.

Table 14-5: Limits for GSM 400, GSM 700, GSM 850 and GSM 900 sensitivity

| Channels                    | Propagation conditions TUhigh |                        |
|-----------------------------|-------------------------------|------------------------|
|                             | Test limit error rate %       | Minimum No. of samples |
| TCH/AFS 12.2 (FER)          | 6.174                         | 12250                  |

## 14.2.18 Reference sensitivity - TCH/AHS

### 14.2.18.1 Definition and applicability

The reference sensitivity level is the signal level at the MS receiver input at which a certain BER and FER for speech frames must be achieved.

The requirements and this test apply to MS supporting AMR Half Rate speech.

#### 14.2.18.2 Conformance requirement

1. At reference sensitivity level, the TCH/AHS FER shall meet the reference sensitivity performance of table 1 in 3GPP TS 05.05 subclause 6.2.
2. At reference sensitivity level, the TCH/AHS class Ib RBER (BFI=0) shall meet the reference sensitivity performance of table 1 in 3GPP TS 05.05 subclause 6.2.
3. At reference sensitivity level, the TCH/AHS class II RBER (BFI=0) shall meet the reference sensitivity performance of table 1 in 3GPP TS 05.05 subclause 6.2.

#### 14.2.18.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under TUhigh propagation conditions with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under TUhigh propagation conditions with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 3 under TUhigh, RA and HT propagation conditions with an allowance for the statistical significance of the test.

#### 14.2.18.4 Method of test

##### 14.2.18.4.1 Initial conditions

The BA list sent on the BCCH and SACCH indicates at least six surrounding cells, with at least one near to each band edge. It is not necessary to generate any of these BCCHs, but if provided, the signal strengths of BCCHs shall be in the range  $15 \text{ dB}\mu\text{Vemf}(\ )$  to  $35 \text{ dB}\mu\text{Vemf}(\ )$ .

The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

A call is set up according to the generic call set up procedure on a TCH/AHS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The multirate configuration indicates the use of a codec set limited to 7,95 kbit/s.

The SS transmits Standard Test Signal C1 on the traffic channel.

##### 14.2.18.4.2 Procedure

- a) The SS commands the MS to create traffic channel loop back signalling erased frames.

NOTE: Frames detected with BFI=1 are signalled as erased on the uplink.

- b) The fading function is set to TUhigh.
- c) The SS sets the amplitude of the wanted signal to reference sensitivity level ( $\ )$ .
- d) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- e) The SS determines the number of residual bit error events for the bits of class II, by examining sequences of at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.
- f) The SS determines the number of residual bit error events for the bits of the class Ib, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.
- g) The SS also determines the frame erasure events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully, if it is not signalled as erased.
- h) Steps d) and e) are repeated, with the SS fading function set in turn to RA and HT.

- i) The SS uses a Channel Mode Modify procedure to change the active codec set to 7,4 kbit/s and steps b) to h) are repeated.
- j) The SS uses a Channel Mode Modify procedure to change the active codec set to 6,7 kbit/s and steps b) to h) are repeated.
- k) The SS uses a Channel Mode Modify procedure to change the active codec set to 5,9 kbit/s and steps b) to h) are repeated.
- l) The SS uses a Channel Mode Modify procedure to change the active codec set to 5,15 kbit/s and steps b) to h) are repeated.
- m) The SS uses a Channel Mode Modify procedure to change the active codec set to 4,75 kbit/s and steps b) to h) are repeated.

#### 14.2.18.5 Test requirements

The error rates measured for different channels and under the different propagation conditions, shall not exceed the test limit error rate values given in table 14-7 or 14-8.

**Table 14-7: Limits for GSM 400, GSM 700, GSM 850 and GSM 900 sensitivity**

| Channels                      | Propagation conditions TUhigh |                        | Propagation conditions RA |                        | Propagation conditions HT |                        |
|-------------------------------|-------------------------------|------------------------|---------------------------|------------------------|---------------------------|------------------------|
|                               | Test limit error rate %       | Minimum No. of samples | Test limit error rate %   | Minimum No. of samples | Test limit error rate %   | Minimum No. of samples |
| TCH/AHS 7.95 (FER)            | 25.20                         | 3000                   |                           |                        |                           |                        |

## 14.3 Usable receiver input level range

### 14.3.1 Definition and applicability

The usable receiver input level range is the range of the radio frequency input level of a specified modulated signal over which bit error ratio or frame erasure ratios stay between specified limits.

The requirements and this test apply to MS supporting speech.

### 14.3.2 Conformance requirement

1. The receiver input level range requirements of 3GPP TS 05.05 subclause 6.1 for TCH/FS class II RBBER under static and EQ propagation conditions shall be met:

- 1.1 Under normal conditions.
- 1.2 Under extreme conditions.

### 14.3.3 Test purpose

1. To verify that the MS does not exceed the conformance requirement with an allowance for the statistical significance of the test:
  - 1.1 Under normal conditions.
  - 1.2 Under extreme conditions.

### 14.3.4 Method of test

#### 14.3.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS with an ARFCN in the Mid ARFCN range, power control level set to maximum.

The SS transmits Standard Test Signal C1 on the TCH/FS.

The SS commands the MS to create traffic channel loop back signalling erased frames (subclause 36.2.1.1.2).

#### 14.3.4.2 Procedure

- a) The SS compares the data that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding.

The SS tests the bit error ratio for the non-protected bits of TCH/FS class II, by examining sequences of at least the minimum number of samples of consecutive bits of class II. The number of error events is recorded.

- b) Step a) is repeated with the amplitude of the wanted signal increased to an input level at the receiver input of  $73 \text{ dB}\mu\text{Vemf}(\ )$ .

- c) Step a) is repeated with the amplitude of the wanted signal increased to an input level at the receiver input of:

GSM 400:  $98 \text{ dB}\mu\text{Vemf}(\ )$ .

GSM 700  $98 \text{ dB}\mu\text{Vemf}(\ )$ .

GSM 850  $98 \text{ dB}\mu\text{Vemf}(\ )$ .

GSM 900:  $98 \text{ dB}\mu\text{Vemf}(\ )$ .

DCS 1 800:  $90 \text{ dB}\mu\text{Vemf}(\ )$ .

PCS 1 900:  $90 \text{ dB}\mu\text{Vemf}(\ )$ .

- d) The SS fading function is set to EQ.

- e) Step a) is repeated with the amplitude of the wanted signal set to respectively 20 dB above reference sensitivity level( ) and  $73 \text{ dB}\mu\text{Vemf}(\ )$  at the receiver input.

- f) The test is repeated under extreme test conditions.

#### 14.3.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-14. This shall apply for any combination of normal and extreme test voltages and ambient temperature, for the different propagation conditions and for any level of input signal to the receiver.

**Table 14-14: Limits for input level range**

| Propagation conditions                        | GSM 400, GSM 700, GSM 850 and GSM 900 |                        | DCS 1 800 and PCS 1 900 |                        |

## 14.4 Co-channel rejection

### 14.4.1 Co-channel rejection - TCH/FS

#### 14.4.1.1 Definition and applicability

The co-channel rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted modulated signal, both signals being at the nominal frequency of the receiver.

The requirements and this test apply to MS supporting speech.

#### 14.4.1.2 Conformance requirement

1. At reference co-channel interference the TCH/FS FER shall meet the reference interference performance of table 2 in 3GPP TS 05.05 subclause 6.3.
2. At reference co-channel interference the TCH/FS class Ib BER shall meet the reference interference performance of table 2 in 3GPP TS 05.05 subclause 6.3.
3. At reference co-channel interference the TCH/FS class II BER shall meet the reference interference performance of table 2 in 3GPP TS 05.05 subclause 6.3.

#### 14.4.1.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under propagation condition TU<sub>high</sub> with frequency hopping and TU<sub>low</sub> with no frequency hopping with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under propagation condition TU<sub>high</sub> with frequency hopping and TU<sub>low</sub> with no frequency hopping, with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 3 under propagation condition TU<sub>high</sub> with frequency hopping and TU<sub>low</sub> with no frequency hopping with an allowance for the statistical significance of the test.

#### 14.4.1.4 Method of test

##### 14.4.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel (wanted signal).

The SS commands the MS to create the traffic channel loop back, signalling erased frames (subclause 36.1.2.1.1.1).

##### 14.4.1.4.2 Procedure

- a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 9 dB below that of the wanted signal.

The fading characteristic of the wanted and the interfering signal is TU<sub>low</sub>.

- b) The SS compares the modulation of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

- c) The SS determines the number of residual bit error events for the bits of class II, by examining at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.
- d) The SS determines the number of residual bit error events for the bits of the class Ib, by examining at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.
- e) The SS also determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased.
- f) Steps a) to e) are repeated except that in step a) both the wanted and interfering signal are TUhigh hopping and the SS commands the MS into hopping mode. A hop pattern covering at least 10 frequencies in a range not exceeding 5 MHz is used.

The hopping band is centred around an ARFCN in the Mid ARFCN range. The hopping frequencies are chosen from those defined in clause 6.

#### 14.4.1.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-15.

**Table 14-15: Limits for co-channel rejection**

| Channel         | Type of measurement | Propagation condition | Test limit error rate % | Minimum No. of samples |
|-----------------|---------------------|-----------------------|-------------------------|------------------------|
| TCH/FS          | FER                 | TUlow/No FH           | $24 \cdot \alpha$       | 25 000                 |
| TCH/FS Class Ib | RBER                | TUlow/No FH           | $2,091/\alpha$          | 3 300 000              |
| TCH/FS Class II | RBER                | TUlow/No FH           | 4,3                     | 2 000 000              |
| TCH/FS          | FER                 | TUhigh/FH             | $3,371 \cdot \alpha$    | 17 800                 |
| TCH/FS class Ib | RBER                | TUhigh/FH             | $0,215/\alpha$          | 2 000 000              |
| TCH/FS class II | RBER                | TUhigh/FH             | 8,333                   | 1 200 000              |

The parameter  $\alpha$  can range from 1 to 1.6. The value of  $\alpha$  for the RBER test on TCH/FS class Ib bits under particular measurement conditions shall be the same as that determined in the FER test on TCH/FS under the same conditions.

### 14.4.2 Co-channel rejection - TCH/HS

#### 14.4.2.1 Definition and applicability

The requirements and this test apply to MS supporting half rate speech.

#### 14.4.2.2 Conformance requirement

1. At reference cochannel interference, the TCH/HS FER (shall meet the reference interference performance of table 2 in 3GPP TS 05.05 subclause 6.3.
2. At reference cochannel interference, the TCH/HS class Ib BER (BFI=0) shall meet the reference interference performance of table 2 in 3GPP TS 05.05 subclause 6.3.
3. At reference cochannel interference, the TCH/HS class II BER (BFI=0) shall meet the reference interference performance of table 2 in 3GPP TS 05.05 subclause 6.3.
4. At reference cochannel interference, the TCH/HS UFR shall meet the reference interference performance of table 2 in 3GPP TS 05.05 subclause 6.3.
5. At reference cochannel interference, the TCH/HS class Ib RBER ((BFI or UFI)=0) shall meet the reference interference performance of table 2 in 3GPP TS 05.05 subclause 6.3.

#### 14.4.2.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1, under propagation conditions TU<sub>high</sub> with frequency hopping, with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 1, under propagation conditions TU<sub>high</sub> with frequency hopping, with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 1, under propagation conditions TU<sub>high</sub> with frequency hopping, with an allowance for the statistical significance of the test.
4. To verify that the MS does not exceed conformance requirement 4, under propagation condition TU<sub>high</sub> with frequency hopping, with an allowance for the statistical significance of the test.
5. To verify that the MS does not exceed conformance requirement 4, under propagation condition TU<sub>high</sub> with frequency hopping, with an allowance for the statistical significance of the test.

#### 14.4.2.4 Method of test

##### 14.4.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/HS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel (wanted signal).

##### 14.4.2.4.2 Procedure

- a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 9 dB below that of the wanted signal.

- b) The fading characteristic of the wanted and the interfering signal is set to TU<sub>high</sub>. The SS commands the MS into hopping mode. A hop pattern covering at least 10 frequencies in a range not exceeding 5 MHz is used.

The hopping pattern is centred around an ARFCN in the Mid ARFCN range. The hopping frequencies are chosen from those defined in clause 6.

- c) The SS commands the MS to create traffic channel loop back signalling erased frames using test loop A.

NOTE 1: Test loop A is defined in clause 36. Frames marked with BFI=1 are signalled as erased on the uplink.

- d) The SS compares the modulation of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

- e) The SS determines the number of residual bit error events for the bits of class II, by examining at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.

- f) The SS determines the number of residual bit error events for the bits of the class Ib, by examining at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.

- g) The SS also determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased.

- h) The SS commands the MS to open test loop A and close test loop D.

NOTE 2: Test loop D is defined in clause 36. Frames marked as erased (BFI=1), or unreliable (UFI=1), are signalled to the SS on the uplink.

- j) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the erased/unreliable frame indication.

- k) The SS determines the number of residual bit error events for the bits of the class Ib, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased/unreliable.
- l) The SS also determines the unreliable frame events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased/unreliable.

#### 14.4.2.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-16 or table 14-17.

**Table 14-16: Limits for GSM 400, GSM 700, GSM 850 and GSM 900 co-channel rejection**

| Channel/Type of measurement           | Propagation condition | Test limit error rate % | Minimum No. of samples |
|---------------------------------------|-----------------------|-------------------------|------------------------|
| TCH/HS FER                            | TUhigh/FH             | 5,607                   | 10 700                 |
| TCH/HS Class Ib RBER (BFI=0)          | TUhigh/FH             | 0,325                   | 184 700                |
| TCH/HS Class II RBER (BFI=0)          | TUhigh/FH             | 7,961                   | 25 500                 |
| TCH/HS UFR                            | TUhigh/FH             | 6,834                   | 8 780                  |
| TCH/HS Class Ib RBER ((BFI or UFI)=0) | TUhigh/FH             | 0,235                   | 255 000                |

**Table 14-17: Limits for DCS 1800 and PCS 1 900 co-channel rejection**

| Channel/Type of measurement           | Propagation condition | Test limit error rate % | Minimum No. of samples |
|---------------------------------------|-----------------------|-------------------------|------------------------|
| TCH/HS FER                            | TUhigh/FH             | 5,607                   | 10 700                 |
| TCH/HS Class Ib RBER (BFI=0)          | TUhigh/FH             | 0,325                   | 184 700                |
| TCH/HS Class II RBER (BFI=0)          | TUhigh/FH             | 7,961                   | 25 500                 |
| TCH/HS UFR                            | TUhigh/FH             | 6,834                   | 8 780                  |
| TCH/HS Class Ib RBER ((BFI or UFI)=0) | TUhigh/FH             | 0,235                   | 255 000                |

### 14.4.3 Co-channel rejection - TCH/HS (SID frames)

#### 14.4.3.1 Definition and applicability

The requirements and this test apply to MS supporting half rate speech.

#### 14.4.3.2 Conformance requirement

1. At reference cochannel interference, the TCH/HS ESIDR, for SID frames indicated as SID=0 shall meet the reference interference performance of table 2 in 3GPP TS 05.05 subclause 6.3.
2. At reference cochannel interference, the TCH/HS RBER for SID frames indicated as SID=1 or SID=2, shall meet the reference interference performance of table 2 in 3GPP TS 05.05 subclause 6.3.
3. At reference cochannel interference, the TCH/HS EVSIDR for SID frames indicated as (SID=0), or (SID=1), or ((BFI or UFI)=1), shall meet the reference interference performance of table 2 in 3GPP TS 05.05 subclause 6.3.
4. At reference cochannel interference, the TCH/HS RBER for SID frames indicated as SID=2 and (BFI or UFI)=0, shall meet the reference interference performance of table 2 in 3GPP TS 05.05 subclause 6.3.

#### 14.4.3.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under propagation condition TUlow, with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under propagation condition TUlow, with an allowance for the statistical significance of the test.

3. To verify that the MS does not exceed conformance requirement 3 under propagation condition TUlow, with an allowance for the statistical significance of the test.
4. To verify that the MS does not exceed conformance requirement 4 under propagation condition TUlow, with an allowance for the statistical significance of the test.

#### 14.4.3.4 Method of test

##### 14.4.3.4.1 Initial conditions

The BCCH data indicates that uplink DTX shall be disabled.

A call is set up according to the generic call set up procedure on a TCH/HS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel.

##### 14.4.3.4.2 Procedure

- a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 9 dB below that of the wanted signal.

- b) The fading function is set to TUlow.
- c) The SS commands the MS to create traffic channel loop back signalling erased frames using test loop E.

NOTE 1: Test loop E is defined in clause 36. Frames marked with (SID=0) shall be signalled as erased on the uplink.

- d) The SS transmits continuously SID frames on the downlink. The SID codeword is transmitted correctly, but the SID information contains random data.
- e) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- f) The SS determines the number of residual bit error events for the class 1 SID bits, which do not belong to the SID codeword, by examining sequences of at least the minimum number of samples of consecutive class 1 SID bits. Bits are taken only from those frames not signalled as erased.
- g) The SS also determines the erased SID events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased. Bits comprising the SID codeword are excluded.
- h) The SS commands the MS to open test loop E and close test loop F.

NOTE 2: Test loop F is defined in clause 36. Frames marked with (SID=0), or (SID=1), or ((BFI or UFI)=1), shall be signalled as erased on the uplink.

- j) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- k) The SS determines the number of residual bit error events for the class 1 SID bits, which do not belong to the SID codeword, by examining sequences of at least the minimum number of samples of consecutive class 1 SID bits. Bits are taken only from those frames not signalled as erased.
- l) The SS also determines the erased valid SID events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased.

#### 14.4.3.5 Test requirements

The error rates measured in this test shall not exceed the test limit error rate values given in table 14-18.

Table 14-18: Limits for co-channel rejection

| Channel/Type of measurement         | Propagation condition | Test limit error rate % | Minimum No. of samples |
|-------------------------------------|-----------------------|-------------------------|------------------------|
| ESIDR                               | TUlow                 | 19,152                  | 25 000                 |
| SID RBER (SID=1 or 2)               | TUlow                 | 0,560                   | 500 000                |
| EVSIDR                              | TUlow                 | 24,000                  | 25 000                 |
| SID RBER (SID=2 and (BFI or UFI)=0) | TUlow                 | 0,022                   | 2 678 000              |

## 14.4.4 Co-channel rejection - FACCH/F

### 14.4.4.1 Definition and applicability

The co-channel rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted modulated signal, both signals being at the nominal frequency of the receiver.

The requirements and this test apply to all types of MS.

### 14.4.4.2 Conformance requirement

At reference cochannel interference the FACCH/F FER shall meet the reference interference performance of table 2 in 3GPP TS 05.05 subclause 6.3).

### 14.4.4.3 Test purpose

To verify that the MS does not exceed the conformance requirement under propagation condition TUlow with an allowance for the statistical significance of the test.

### 14.4.4.4 Method of test

#### 14.4.4.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH with an ARFCN in the mid ARFCN range. For MS supporting speech this shall be a TCH/FS. For MS not supporting speech one of the supported TCH/ (F9,6, F4,8, or F2,4) shall be used. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel (wanted signal).

#### 14.4.4.4.2 Procedure

- a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 9 dB below that of the wanted signal.

The fading characteristic of the wanted and the interfering signal is TUlow.

- d) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Due to the co-channel interference, the MS may not be able to acknowledge the Layer 2 frame. Each repeated L2 frame indicates a frame erasure event. The SS determines the number of frame erasure events during at least the minimum number of samples of FACCH/F frames.

NOTE: These frames will not be consecutive but it is expected that the statistical significance of the tests will not be unduly degraded.

#### 14.4.4.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-19.

**Table 14-19: Limits for co-channel rejection**

| Channel | Type of measurement | Propagation condition | Test limit error rate % | Minimum No. of samples |
|---------|---------------------|-----------------------|-------------------------|------------------------|
| FACCH/F | FER                 | TUlow/No FH           | 24                      | 25 000                 |

## 14.4.5 Co-channel rejection - FACCH/H

### 14.4.5.1 Definition and applicability

The requirements and this test apply to MS supporting half rate channels.

### 14.4.5.2 Conformance requirement

At reference cochannel interference the FACCH/H FER shall meet the reference interference performance of table 2 in 3GPP TS 05.05 subclause 6.3).

### 14.4.5.3 Test purpose

To verify that the MS does not exceed the conformance requirement under propagation condition TUlow with an allowance for the statistical significance of the test.

### 14.4.5.4 Method of test

#### 14.4.5.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH with an ARFCN in the mid ARFCN range. For MS supporting half rate speech this shall be a TCH/HS. For MS not supporting speech one of the supported TCH/(H4,8, or H2,4) shall be used. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel (wanted signal).

#### 14.4.5.4.2 Procedure

- a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 9 dB below that of the wanted signal.

The fading characteristic of the wanted and the interfering signal is TUlow.

- d) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Due to the co-channel interference, the MS may not be able to acknowledge the Layer 2 frame. Each repeated L2 frame indicates a frame erasure event. The SS determines the number of frame erasure events during at least the minimum number of samples of FACCH/H frames.

NOTE: These frames will not be consecutive but it is expected that the statistical significance of the tests will not be unduly degrade.

### 14.4.5.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-20.

Table 14-20: Limits for co-channel rejection

| Channel | Type of measurement | Propagation condition | Test limit error rate % | Minimum No. of samples |
|---------|---------------------|-----------------------|-------------------------|------------------------|
| FACCH/H | FER                 | TUlow/No FH           | 24,000                  | 25 000                 |

## 14.4.6 Co-channel rejection - TCH/EFS

### 14.4.6.1 Definition and applicability

The co-channel rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted modulated signal, both signals being at the nominal frequency of the receiver.

The requirements and this test apply to MS supporting speech.

### 14.4.6.2 Conformance requirement

1. At reference co-channel interference the TCH/EFS FER shall meet the reference interference performance of table 2 in 3GPP TS 05.05 subclause 6.3.
2. At reference co-channel interference the TCH/EFS class Ib BER shall meet the reference interference performance of table 2 in 3GPP TS 05.05 subclause 6.3.
3. At reference co-channel interference the TCH/EFS class II BER shall meet the reference interference performance of table 2 in 3GPP TS 05.05 subclause 6.3.

### 14.4.6.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under propagation condition TUhigh with frequency hopping and TUlow with no frequency hopping with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under propagation condition TUhigh with frequency hopping and TUlow with no frequency hopping, with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 3 under propagation condition TUhigh with frequency hopping and TUlow with no frequency hopping with an allowance for the statistical significance of the test.

### 14.4.6.4 Method of test

#### 14.4.6.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/EFS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel (wanted signal).

The SS commands the MS to create the traffic channel loop back, signalling erased frames (subclause 36.1.2.1.1.1).

#### 14.4.6.4.2 Procedure

- a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 9 dB below that of the wanted signal.

The fading characteristic of the wanted and the interfering signal is TUlow.

- b) The SS compares the modulation of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- c) The SS determines the number of residual bit error events for the bits of class II, by examining at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.
- d) The SS determines the number of residual bit error events for the bits of the class Ib, by examining at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.
- e) The SS also determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased.
- f) Steps a) to e) are repeated except that in step a) both the wanted and interfering signal are TUhigh hopping and the SS commands the MS into hopping mode. A hop pattern covering at least 10 frequencies in a range not exceeding 5 MHz is used.

The hopping band is centred around an ARFCN in the Mid ARFCN range. The hopping frequencies are chosen from those defined in clause 6.

#### 14.4.6.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-21.

**Table 14-21: Limits for co-channel rejection**

| Channel          | Type of measurement | Propagation condition | Test limit error rate % | Minimum No. of samples |
|------------------|---------------------|-----------------------|-------------------------|------------------------|
| TCH/EFS          | FER                 | TUlow/No FH           | 24                      | 25 000                 |
| TCH/EFS Class Ib | RBER                | TUlow/No FH           | 0,209                   | 3 300 000              |
| TCH/EFS Class II | RBER                | TUlow/No FH           | 3,039                   | 2 000 000              |
| TCH/EFS          | FER                 | TUhigh/FH             | 3,357                   | 17 800                 |
| TCH/EFS class Ib | RBER                | TUhigh/FH             | 0,115                   | 2 000 000              |
| TCH/EFS class II | RBER                | TUhigh/FH             | 8,333                   | 1 200 000              |

### 14.4.7 Receiver performance in the case of frequency hopping and co-channel interference on one carrier

#### 14.4.7.1 Definition and applicability

The GSM receiver is specified to be able to handle one out of four carriers being strongly interfered with, if frequency hopping is applied. This is used in networks to increase the capacity.

The requirement and this test apply to all R97 MS (or later) supporting speech.

#### 14.4.7.2 Conformance Requirement

Under the following conditions:

- a useful signal, cyclic frequency hopping over four carriers under static conditions, with equal input levels 20 dB above reference sensitivity level;
- a random, continuous, GMSK-modulated interfering signal on only one of the carriers at a level 10 dB higher than the useful signal,

the FER for TCH/FS shall be less than 5%; 3GPP TS 05.05 subclause 6.6.

#### 14.4.7.3 Test Purpose

To verify that the MS does not exceed the conformance requirement with an allowance for the statistical significance of the test.

#### 14.4.7.4 Method Of Test

##### 14.4.7.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS channel in hopping mode, power control level set to maximum power. A cyclic hop pattern covering four frequencies with a minimum carrier distance of 600 kHz is used.

The SS transmits Standard Test Signal C1 on the traffic channel with a power level 20 dB above reference sensitivity level (wanted signal). No fading is applied.

The SS commands the MS to create the traffic channel loop back, signalling erased frames.

##### 14.4.7.4.2 Test Procedure

- a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal) on one of the hopping frequencies of the wanted signal, and on the timeslot used by the wanted signal. The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 10 dB above that of the wanted signal. No fading characteristics are applied.
- b) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- c) The SS determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased.

##### 14.4.7.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate value given in the following table.

| Channel | Type of measurement | Propagation condition | Test limit error rate (%) | Minimum No. of samples |
|---------|---------------------|-----------------------|---------------------------|------------------------|
| TCH/FS  | FER                 | Static                | 6.1                       | 3 300                  |

## 14.4.8 Co-channel rejection - TCH/AFS

### 14.4.8.1 Definition and applicability

The co-channel rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted modulated signal, both signals being at the nominal frequency of the receiver.

The requirements and this test apply to MS supporting AMR Full Rate speech.

### 14.4.8.2 Conformance requirement

1. At reference co-channel interference the TCH/AFS FER shall meet the reference interference performance of table 2 in 3GPP TS 05.05 subclause 6.3.
2. At reference co-channel interference the TCH/AFS class Ib BER shall meet the reference interference performance of table 2 in 3GPP TS 05.05 subclause 6.3.

### 14.4.8.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under propagation condition TU<sub>high</sub> with frequency hopping and TU<sub>low</sub> with no frequency hopping with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under propagation condition TU<sub>high</sub> with frequency hopping and TU<sub>low</sub> with no frequency hopping, with an allowance for the statistical significance of the test.

#### 14.4.8.4 Method of test

##### 14.4.8.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AFS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The multirate configuration indicates the use of a codec set limited to 12,2 kbit/s.

The SS transmits Standard Test Signal C1 on the traffic channel (wanted signal).

The SS commands the MS to create the traffic channel loop back, signalling erased frames (subclause 36).

##### 14.4.8.4.2 Procedure

- a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 9 dB below that of the wanted signal.

The fading characteristic of the wanted and the interfering signal is TUlow.

- b) The SS compares the modulation of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- c) The SS determines the number of residual bit error events for the bits of the class Ib, by examining at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.
- d) The SS also determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased.
- e) Steps a) to d) are repeated except that in step a) both the wanted and interfering signal are TUhigh hopping and the SS commands the MS into hopping mode. A hop pattern covering at least 10 frequencies in a range not exceeding 5 MHz is used.

The hopping band is centred around an ARFCN in the Mid ARFCN range. The hopping frequencies are chosen from those defined in clause 6.

- f) The SS uses a Channel Mode Modify procedure to change the active codec set to 10,2 kbit/s and steps b) to e) are repeated.
- g) The SS uses a Channel Mode Modify procedure to change the active codec set to 7,95 kbit/s and steps b) to e) are repeated.
- h) The SS uses a Channel Mode Modify procedure to change the active codec set to 7,4 kbit/s and steps b) to e) are repeated.
- i) The SS uses a Channel Mode Modify procedure to change the active codec set to 6,7 kbit/s and steps b) to e) are repeated.
- j) The SS uses a Channel Mode Modify procedure to change the active codec set to 5,9 kbit/s and steps b) to e) are repeated.
- k) The SS uses a Channel Mode Modify procedure to change the active codec set to 5,15 kbit/s and steps b) to e) are repeated.
- l) The SS uses a Channel Mode Modify procedure to change the active codec set to 4,75 kbit/s and steps b) to e) are repeated.

##### 14.4.8.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-16.

Co-channel rejection tests with a frequency condition noted as "@ndB" are performed with the interfering frequency transmitted with an additional n dB attenuation, see 3GPP TS 45.005.

**Table 14-16: Limits for GSM 400, GSM 700, GSM 850 and GSM 900 co-channel rejection**

| Channel                      | Propagation condition | Test limit error rate % | Minimum No. of samples |

#### 14.4.9 to 14.4.15 (void)

### 14.4.16 Co-channel rejection - TCH/AHS

#### 14.4.16.1 Definition and applicability

The requirements and this test apply to MS supporting AMR Half Rate speech.

#### 14.4.16.2 Conformance requirement

1. At reference cochannel interference, the TCH/AHS FER shall meet the reference interference performance of table 2 in 3GPP TS 05.05 subclause 6.3.
2. At reference cochannel interference, the TCH/AHS class Ib BER (BFI=0) shall meet the reference interference performance of table 2 in 3GPP TS 05.05 subclause 6.3.
3. At reference cochannel interference, the TCH/AHS class II BER (BFI=0) shall meet the reference interference performance of table 2 in 3GPP TS 05.05 subclause 6.3.

#### 14.4.16.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1, under propagation conditions TUhigh without frequency hopping, with an allowance for the statistical significance of the test.

2. To verify that the MS does not exceed conformance requirement 2, under propagation conditions TUhigh without frequency hopping, with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 3, under propagation conditions TUhigh without frequency hopping, with an allowance for the statistical significance of the test.

#### 14.4.16.4 Method of test

##### 14.4.16.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AHS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The multirate configuration indicates the use of a codec set limited to 7,95 kbit/s.

The SS transmits Standard Test Signal C1 on the traffic channel (wanted signal).

##### 14.4.16.4.2 Procedure

- a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 9 dB + 3 dB additional offset = 12 dB below that of the wanted signal.

- b) The fading characteristic of the wanted and the interfering signal is set to TUhigh. The SS commands the MS into non hopping mode.
- c) The SS commands the MS to create traffic channel loop back signalling erased frames.

NOTE: Frames marked with BFI=1 are signalled as erased on the uplink.

- d) The SS compares the modulation of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- e) The SS determines the number of residual bit error events for the bits of class II, by examining at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.
- f) The SS determines the number of residual bit error events for the bits of the class Ib, by examining at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.
- g) The SS also determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased.
- h) The SS uses a Channel Mode Modify procedure to change the active codec set to 7,4 kbit/s and steps b) to g) are repeated.
- i) The SS uses a Channel Mode Modify procedure to change the active codec set to 6,7 kbit/s and steps b) to g) are repeated.
- j) The SS uses a Channel Mode Modify procedure to change the active codec set to 5,9 kbit/s and steps b) to g) are repeated.
- k) The SS uses a Channel Mode Modify procedure to change the active codec set to 5,15 kbit/s and steps b) to g) are repeated.
- l) The SS uses a Channel Mode Modify procedure to change the active codec set to 4,75 kbit/s and steps b) to g) are repeated.

##### 14.4.16.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-16 or table 14-17.

**Table 14-16: Limits for GSM 400, GSM 700, GSM 850 and GSM 900 co-channel rejection**

| Channel                      | Propagation condition | Test limit error rate % | Minimum No. of samples |
|------------------------------|-----------------------|-------------------------|------------------------|
| TCH/AHS 7.95 (FER)           | TUhigh/No FH@+3dB     | 8.44                    | 8960                   |
| TCH/AHS 7.95 Class Ib (RBER) | TUhigh/No FH@+3dB     | 1.62                    | 60000                  |

## 14.5 Adjacent channel rejection

### 14.5.1 Adjacent channel rejection - speech channels

#### 14.5.1.1 TCH/FS

##### 14.5.1.1.1 Definition and applicability

The adjacent channel selectivity is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted signal in the adjacent channel.

The adjacent channel can be adjacent in the RF spectrum or in time. There are therefore two types of adjacent channel selectivity:

- 1) Adjacent RF channel selectivity which is specifically tested in this subclause.

- 2) Adjacent Time Slot selectivity, which is implicitly tested in test 14.2.1.

The requirements and this test apply to MS supporting speech.

#### 14.5.1.1.2 Conformance requirement

1. With adjacent channel interference at 200 kHz above and below the wanted signal and signal level 9 dB above the wanted signal level:

1.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the FER for TCH/FS shall be within the requirements of table 2 in 3GPP TS 05.05 subclause 6.3.

1.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the Class Ib RBER shall be within the requirements of table 2 in 3GPP TS 05.05 subclause 6.3.

1.3 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the Class II RBER shall be within the requirements of table 2 in 3GPP TS 05.05 subclause 6.3.

1.4 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the Class II RBER shall be within the requirements of table 2 in 3GPP TS 05.05 under extreme test conditions; 3GPP TS 05.05 subclause 6.3 and annex D subclauses D.2.1 and D.2.2.

2. For adjacent channel interference at 400 kHz above and below the wanted signal frequency and signal level 41 dB above the wanted signal level:

2.1 For a TUhigh faded wanted signal and a static adjacent channel interferer, the FER for TCH/FS shall be better than:

GSM 400, GSM 700, GSM 850 and GSM 900: 10,2\* $\alpha$  %; 3GPP TS 05.05, subclause 6.3;

DCS 1 800 and PCS 1 900: 5,1\* $\alpha$  %; 3GPP TS 05.05, subclause 6.3.

2.2 For a TUhigh faded wanted signal and a static adjacent channel interferer, the Class Ib RBER shall be better than:

GSM 400, GSM 700, GSM 850 and GSM 900: 0,72/ $\alpha$  %; 3GPP TS 05.05, subclause 6.3;

DCS 1 800 and PCS 1 900: 0,45/ $\alpha$  %; 3GPP TS 05.05, subclause 6.3.

2.3 For a TUhigh faded wanted signal and a static adjacent channel interferer, the Class II RBER shall be better than:

GSM 400, GSM 700, GSM 850 and GSM 900: 8,8 %; 3GPP TS 05.05, subclause 6.3;

DCS 1 800 and PCS 1 900: 8,9 %; 3GPP TS 05.05, subclause 6.3.

2.4 For a TUhigh faded wanted signal and a static adjacent channel interferer, the Class II RBER shall be better than:

GSM 400, GSM 700, GSM 850 and GSM 900: 8,8 %;

DCS 1 800 and PCS 1 900: 8,9 %.

under extreme test conditions; 3GPP TS 05.05, subclause 6.3, annex D subclauses D.2.1 and D.2.2.

#### 14.5.1.1.3 Test purpose

- 1 To verify that with a TUhigh adjacent channel interferer at 200 kHz above and below the wanted TUhigh signal frequency and signal level 9 dB above the wanted signal level:

1.1 Conformance requirement 1.1 is met with an allowance for the statistical significance of the test.

1.2 Conformance requirement 1.2 is met with an allowance for the statistical significance of the test.

1.3 Conformance requirement 1.3 is met with an allowance for the statistical significance of the test.

1.4 Conformance requirement 1.4 is met with an allowance for the statistical significance of the test.

2. To verify that with a static adjacent channel interferer at 400 kHz above and below a TUhigh wanted signal frequency and signal level 41 dB above the wanted signal level:

2.1 Conformance requirement 2.1 is met with an allowance for the statistical significance of the test.

2.2 Conformance requirement 2.2 is met with an allowance for the statistical significance of the test.

2.3 Conformance requirement 2.3 is met with an allowance for the statistical significance of the test.

2.4 Conformance requirement 2.4 is met with an allowance for the statistical significance of the test.

#### 14.5.1.1.4 Method of test

##### 14.5.1.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS commands the MS to create the traffic channel loop back signalling erased frames.

The SS transmits Standard Test Signal C1 on the TCH (wanted signal).

##### 14.5.1.1.4.2 Procedure

- a) In addition to the wanted signal, the SS transmits an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal.

The fading characteristic of the wanted and the unwanted signal is set to TUhigh.

The unwanted signal is transmitted at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to 9dB above that of the wanted signal.

- b) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- c) The SS tests the frame erasure compliance for the TCH/FS by examining at least the minimum number of samples of consecutive frames. The number of frame erasure events is recorded.
- d) The SS determines the number of residual bit error events for the bits of the class Ib and class II, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib and class II, Bits are only taken from those frames for which no bad frame indication was given.
- e) The measurement of steps c) and d) is repeated with the unwanted signal on a frequency at the same displacement from, but below, the frequency of the wanted signal.
- f) The measurement of steps c) to e) shall be repeated for a displacement of the unwanted signal of 400 kHz, and with the amplitude of the unwanted signal 41 dB above the level of the wanted input signal, and the unwanted signal static.
- g) Steps c) to f) are repeated under extreme test conditions.

## 14.5.1.1.5 Test requirements

**Table 14-22: Limits for adjacent channel selectivity**

|                 |                                |                     | GSM 400, GSM 700, GSM 850 and GSM 900 |                        | DCS 1 800 and PCS 1 900 |                        |

| 400 kHz         | TCH/FS<br>class Ib<br>class II | FER                 | 11,461* $\alpha$                      | 8 900                  | 5,714* $\alpha$         | 10 500                 |
|                 |                                | RBER                | 0,756/ $\alpha$                       | 1 000 000              | 0,483/ $\alpha$         | 1 200 000              |
|                 |                                | RBER                | 9,167                                 | 600 000                | 9,167                   | 720 000                |

The error rates measured in this test shall not exceed the test limit error rate given in table 14-22. This shall apply for any combination of normal and extreme test voltages and ambient temperature, and with the interfering signals at either side of the wanted frequency.

The parameter  $\alpha$  can range from 1 to 1,6. The value of  $\alpha$  for the RBER test on TCH/FS class Ib bits under particular measurement conditions shall be the same as that determined in the FER test on TCH/FS under the same conditions.

NOTE: A static unwanted signal is used to avoid a potential problem with the implementation of the fading simulator.

## 14.5.1.2 TCH/AFS

## 14.5.1.2.1 Definition and applicability

The adjacent channel selectivity is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted signal in the adjacent channel.

The adjacent channel can be adjacent in the RF spectrum or in time. There are therefore two types of adjacent channel selectivity:

- 1) Adjacent RF channel selectivity, which is specifically tested in this subclause.
- 2) Adjacent Time Slot selectivity, which is not tested in this subclause.

The requirements and this test apply to MS supporting AMR Full Rate speech.

## 14.5.1.2.2 Conformance requirement

1. With adjacent channel interference at 200 kHz above and below the wanted signal and signal level 9 dB above the wanted signal level:
  - 1.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the FER for TCH/AFS shall be within the requirements of table 2 in 3GPP TS 05.05; 3GPP TS 05.05, 6.3.
  - 1.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the Class Ib and Class II RBER shall be within the requirements of table 2 in 3GPP TS 05.05; 3GPP TS 05.05, 6.3.
2. For adjacent channel interference at 400 kHz above and below the wanted signal frequency and signal level 41 dB above the wanted signal level:
  - 2.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the FER for TCH/AFS shall be within the requirements of table 2 in 3GPP TS 05.05; 3GPP TS 05.05, 6.3.
  - 1.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the Class Ib and Class II RBER shall be within the requirements of table 2 in 3GPP TS 05.05; 3GPP TS 05.05, 6.3.

#### 14.5.1.2.3 Test purpose

- 1 To verify that with a TUhigh adjacent channel interferer at 200 kHz above the wanted TUhigh signal frequency and signal level 9 dB above the wanted signal level:
  - 1.1 Conformance requirement 1.1 is met with an allowance for the statistical significance of the test.
  - 1.2 Conformance requirement 1.2 is met with an allowance for the statistical significance of the test.
- 2 To verify that with a static adjacent channel interferer at 400 kHz below a TUhigh wanted signal frequency and signal level 41 dB above the wanted signal level:
  - 2.1 Conformance requirement 2.1 is met with an allowance for the statistical significance of the test.
  - 2.2 Conformance requirement 2.2 is met with an allowance for the statistical significance of the test.

#### 14.5.1.2.4 Method of test

##### 14.5.1.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AFS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The multirate configuration indicates the use of a codec set limited to 12.2 kbit/s.

The SS commands the MS to create the traffic channel loop back signalling erased frames.

The SS transmits Standard Test Signal C1 on the TCH (wanted signal).

##### 14.5.1.2.4.2 Procedure

- a) In addition to the wanted signal, the SS transmits an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal.

The fading characteristic of the wanted and the unwanted signal is set to TUHigh.

The unwanted signal is transmitted at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to 9dB above that of the wanted signal.
- b) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- c) The SS tests the frame erasure compliance for the TCH/AFS by examining at least the minimum number of samples of consecutive frames. The number of frame erasure events is recorded.
- d) The SS determines the number of residual bit error events for the bits of the class Ib, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib, Bits are only taken from those frames for which no bad frame indication was given.
- e) The measurement of steps c) to d) shall be repeated for a displacement of the unwanted signal of 400 kHz below the nominal frequency of the wanted signal. The amplitude of the unwanted signal shall be set to 41 dB above the level of the wanted signal.
- f) The SS uses a Channel Mode Modify procedure to change the active codec set to 10.2 kbit/s and steps a) to e) are repeated.
- g) The SS uses a Channel Mode Modify procedure to change the active codec set to 7.95 kbit/s and steps a) to e) are repeated.
- h) The SS uses a Channel Mode Modify procedure to change the active codec set to 7.4 kbit/s and steps a) to e) are repeated.

- i) The SS uses a Channel Mode Modify procedure to change the active codec set to 6.7 kbit/s and steps a) to e) are repeated
- j) The SS uses a Channel Mode Modify procedure to change the active codec set to 5.9 kbit/s and steps a) to e) are repeated
- k) The SS uses a Channel Mode Modify procedure to change the active codec set to 5.15 kbit/s and steps a) to e) are repeated
- l) The SS uses a Channel Mode Modify procedure to change the active codec set to 4.75 kbit/s and steps a) to e) are repeated

#### Maximum Duration of Test

4 hours for each radio band (GSM 400, GSM 700, GSM 850, GSM 900)

7 hours for each radio band (GSM 1800, GSM1900)

#### 14.5.1.2.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in tables 14-24 and 14-25. Adjacent channel rejection tests with a frequency condition noted as "@ndB" are performed with the interfering frequency transmitted with an additional n dB attenuation, see 3GPP TS 05.05. Where an entry in the table is '-', this combination should not be tested.

**Table 14-24: Limits for GSM 400, GSM 700, GSM 850 and GSM 900 adjacent channel rejection (applicable to R98 only)**

| Channel                      | Interferer level | Propagation condition TUhigh |                        |
|------------------------------|------------------|------------------------------|------------------------|
|                              |                  | Test limit error rate %      | Minimum No. of samples |
| TCH/AFS 12.2 (FER)           |                  | 7.560                        | 10 000                 |
| TCH/AFS 12.2 Class Ib (RBER) |                  | 2.142                        | 36 000                 |
| TCH/AFS 10.2 (FER)           |                  | 3.402                        | 22 500                 |
| TCH/AFS 10.2 Class Ib (RBER) |                  | 0.378                        | 200 000                |

|                              |        |       |         |
|------------------------------|--------|-------|---------|

### 14.5.1.3 TCH/AHS

#### 14.5.1.3.1 Definition and applicability

The adjacent channel selectivity is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted signal in the adjacent channel.

The adjacent channel can be adjacent in the RF spectrum or in time. There are therefore two types of adjacent channel selectivity:

- 1) Adjacent RF channel selectivity which is specifically tested in this subclause.
- 2) Adjacent Time Slot selectivity, which is not tested in this subclause.

The requirements and this test apply to MS supporting AMR Half Rate speech.

#### 14.5.1.3.2 Conformance requirement

1. With adjacent channel interference at 200 kHz above and below the wanted signal and signal level 9 dB above the wanted signal level:
  - 1.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the FER for TCH/AHS shall be within the requirements of table 2 in 3GPP TS 05.05; 3GPP TS 05.05, 6.3.
  - 1.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the Class Ib and Class II RBER shall be within the requirements of table 2 in 3GPP TS 05.05; 3GPP TS 05.05, 6.3.
2. For adjacent channel interference at 400 kHz above and below the wanted signal frequency and signal level 41 dB above the wanted signal level:
  - 2.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the FER for TCH/AHS shall be within the requirements of table 2 in 3GPP TS 05.05; 3GPP TS 05.05, 6.3.
  - 2.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the Class Ib and Class II RBER shall be within the requirements of table 2 in 3GPP TS 05.05; 3GPP TS 05.05, 6.3.

#### 14.5.1.3.3 Test purpose

- 1 To verify that with a TUhigh adjacent channel interferer at 200 kHz below the wanted TUhigh signal frequency and signal level 9 dB above the wanted signal level:
  - 1.1 Conformance requirement 1.1 is met with an allowance for the statistical significance of the test.
  - 1.2 Conformance requirement 1.2 is met with an allowance for the statistical significance of the test.
- 2 To verify that with a static adjacent channel interferer at 400 kHz above a TUhigh wanted signal frequency and signal level 41 dB above the wanted signal level:
  - 2.1 Conformance requirement 2.1 is met with an allowance for the statistical significance of the test.
  - 2.2 Conformance requirement 2.2 is met with an allowance for the statistical significance of the test.

#### 14.5.1.3.4 Method of test

##### 14.5.1.3.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/AHS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The multirate configuration indicates the use of a codec set limited to 7.95 kbit/s.

The SS commands the MS to create the traffic channel loop back signalling erased frames.

The SS transmits Standard Test Signal C1 on the TCH (wanted signal).

#### 14.5.1.3.4.2 Procedure

- a) In addition to the wanted signal, the SS transmits an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).  
  
The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal.  
  
The fading characteristic of the wanted and the unwanted signal is set to TUHigh.  
  
The unwanted signal is transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal. Its amplitude is set to 9dB above that of the wanted signal.
- b) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- c) The SS tests the frame erasure compliance for the TCH/AHS by examining at least the minimum number of samples of consecutive frames. The number of frame erasure events is recorded.
- d) The SS determines the number of residual bit error events for the bits of the class Ib, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib, Bits are only taken from those frames for which no bad frame indication was given.
- e) The measurement of steps c) to d) shall be repeated for a displacement of the unwanted signal of 400 kHz above the nominal frequency of the wanted signal. The amplitude of the unwanted signal shall be set to 41 dB above the level of the wanted signal.
- f) The SS uses a Channel Mode Modify procedure to change the active codec set to 7.4 kbit/s and steps a) to e) are repeated
- g) The SS uses a Channel Mode Modify procedure to change the active codec set to 6.7 kbit/s and steps a) to e) are repeated
- h) The SS uses a Channel Mode Modify procedure to change the active codec set to 5.9 kbit/s and steps a) to e) are repeated
- i) The SS uses a Channel Mode Modify procedure to change the active codec set to 5.15 kbit/s and steps a) to e) are repeated
- j) The SS uses a Channel Mode Modify procedure to change the active codec set to 4.75 kbit/s and steps a) to e) are repeated

#### Maximum Duration of Test

1.5 hours for each radio band.

#### 14.5.1.3.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in tables 14-26 and 14-27. Adjacent channel rejection tests with a frequency condition noted as "@ndB" are performed with the interfering frequency transmitted with an additional n dB attenuation, see 3GPP TS 05.05.

**Table 14-26: Limits for GSM 400, GSM 700, GSM 850 and GSM 900 adjacent channel rejection (applicable to R98 only)**

| Channel                      | Interferer level | Propagation condition TUhigh |                        |
|------------------------------|------------------|------------------------------|------------------------|
|                              |                  | Test limit error rate %      | Minimum No. of samples |
| TCH/AHS 7.95 (FER)           | @+3dB            | 8.44                         | 8 960                  |
| TCH/AHS 7.95 Class Ib (RBER) | @+3dB            | 1.26                         | 60 000                 |
| TCH/AHS 7.95 Class II (RBER) | @+3dB            | 4.032                        | 18 750                 |
| TCH/AHS 7.4 (FER)            | @+3dB            | 6.048                        | 12 500                 |
| TCH/AHS 7.4 Class Ib (RBER)  | @+3dB            | 0.643                        | 117 650                |
| TCH/AHS 7.4 Class II (RBER)  | @+3dB            | 4.158                        | 18 200                 |
| TCH/AHS 6.7 (FER)            | @+3dB            | 2.898                        | 26 000                 |
| TCH/AHS 6.7 Class Ib (RBER)  | @+3dB            | 0.491                        | 153 000                |

| TCH/AHS 4.75 Class II (RBER) |                  | 8.82                         | 8 580                  |

## 14.5.2 Adjacent channel rejection - control channels

### 14.5.2.1 Definition and applicability

The adjacent channel selectivity is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted signal in the adjacent channel.

The adjacent channel can be the adjacent in the RF spectrum or in time. There are therefore two types of adjacent channel selectivity:

- 1) Adjacent RF channel selectivity which is specifically tested in this subclause.
- 2) Adjacent Time Slot selectivity, which is implicitly tested in test 14.2.1.

The requirements and this test apply to MS not supporting speech.

#### 14.5.2.2 Conformance requirement

1. For adjacent channel interference at 200 kHz above and below the wanted signal frequency and signal level 9 dB above the wanted signal level:
  - 1.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the FER for the FACCH/F does not exceed the requirements of table 2 in 3GPP TS 05.05 subclause 6.3.
  - 1.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the FER for the FACCH/F does not exceed the requirements of table 2 in 3GPP TS 05.05 under extreme test conditions; 3GPP TS 05.05 subclause 6.3, annex D subclauses D.2.1 and D.2.2.
2. With adjacent channel interference at 400 kHz above and below the wanted signal frequency and signal level 41 dB above the wanted signal level:
  - 2.1 For a TUhigh faded wanted signal and a static adjacent channel interferer, the FER for the FACCH/F shall be better than:
 

|                                        |                                       |
|----------------------------------------|---------------------------------------|
| GSM 400, GSM 700, GSM 850 and GSM 900: | 17,1 %; 3GPP TS 05.05, subclause 6.3; |
| DCS 1 800 and PCS 1 900:               | 6,1 %; 3GPP TS 05.05, subclause 6.3.  |
  - 2.2 For a TUhigh faded wanted signal and a static adjacent channel interferer, the FACCH/F shall be better than:
 

|                                        |         |
|----------------------------------------|---------|
| GSM 400, GSM 700, GSM 850 and GSM 900: | 17,1 %; |
| DCS 1 800 and PCS 1 900:               | 6,1 %.  |

under extreme test conditions; 3GPP TS 05.05, subclause 6.3, annex D subclauses D.2.1 and D.2.2.

#### 14.5.2.3 Test purpose

1. To verify that with TUhigh adjacent channel interference at 200 kHz above and below a TUhigh wanted signal frequency and signal level 9 dB above the wanted signal level:
  - 1.1 Conformance requirement 1.1 is met with an allowance for the statistical significance of the test.
  - 1.2 Conformance requirement 1.2 is met with an allowance for the statistical significance of the test.
2. To verify that with static adjacent channel interference at 400 kHz above and below a TUhigh wanted signal frequency and signal level 41 dB above the wanted signal level:
  - 2.1 Conformance requirement 2.1 is met with an allowance for the statistical significance of the test.
  - 2.2 Conformance requirement 2.2 is met with an allowance for the statistical significance of the test.

#### 14.5.2.4 Method of test

##### 14.5.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH in the mid ARFCN range. Any one of the supported TCH/(F9,6, F4,8, or F2,4) shall be used.

The SS transmits the Standard Test Signal C1 on the TCH (wanted signal).

##### 14.5.2.4.2 Procedure

- a) In addition to the wanted signal, the SS transmits an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. The fading characteristic of the wanted and the unwanted signal is TUhigh.

The unwanted signal is transmitted at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to 9dB above that of the wanted signal.

- b) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Due to the adjacent channel interference, the MS may not be able to acknowledge the Layer 2 frame. Each repeated L2 frame indicates a frame erasure event. The SS determines the number of frame erasure events during at least the minimum number of samples of FACCH/F frames.

NOTE: These frames will not be consecutive but it is expected that the statistical significance of the tests will not be unduly degraded.

- c) The measurement of step b) is repeated with the unwanted signal on a frequency at the same displacement from, but below, the frequency of the wanted signal.
- d) The measurement of steps a) to c) is repeated for a displacement of the unwanted signal of 400 kHz, and with the amplitude of the unwanted signal 41 dB above the level of the wanted input signal, and the unwanted signal static.
- e) Steps a) to d) are repeated under extreme test conditions.

#### 14.5.2.5 Test requirements

**Table 14-23: Limits for adjacent channel selectivity**

| Interference at | Channel | Type of measurement | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
|-----------------|---------|---------------------|-------------------------|------------------------|-------------------------|------------------------|
| 200 kHz         | FACCH/F | FER                 | 10,640                  | 5 639                  | 3,808                   | 15 756                 |
| 400 kHz         | FACCH/F | FER                 | 19,152                  | 3 133                  | 6,832                   | 8 782                  |

The error rates measured in this test shall not exceed the test limit error rates given in table 14-23. This shall apply for any combination of normal and extreme test voltages and ambient temperature, and with the interfering signals at either side of the wanted frequency.

NOTE: A static unwanted signal is used to avoid a potential problem with the noise floor of the fading simulator.

## 14.6 Intermodulation rejection

### 14.6.1 Intermodulation rejection - speech channels

#### 14.6.1.1 Definition and applicability

The intermodulation rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of two or more unwanted signals with a specific frequency relationship to the wanted signal frequency.

The requirements and this test apply to MS supporting speech.

For E-GSM 900 and R-GSM 900 MS this test is only performed in the P-GSM band.

#### 14.6.1.2 Conformance requirement

In the presence of two unwanted signals with a specific frequency relationship to the wanted signal frequency the Class II RBER for TCH/FS shall meet the reference sensitivity performance of table 1 in 3GPP TS 05.05 subclause 5.3.

#### 14.6.1.3 Test purpose

To verify that the MS does not exceed the conformance requirement with an allowance for the statistical significance of the test.

#### 14.6.1.4 Method of test

NOTE: The measurements address the third order intermodulation, which represents the most serious case.

##### 14.6.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH with an ARFCN in the Mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel.

##### 14.6.1.4.2 Procedure

- a) The amplitude of the wanted signal is set to 4 dB above the reference sensitivity level (see table 14-24).
- b) The SS commands the MS to create the loop back facility signalling erased frames.
- c) The SS produces a static wanted signal, and two static interfering (unwanted) signals at the same time. There is no correlation in the modulation between the signals.

The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above that of the receiver. This signal is static and unmodulated.

The second interfering signal is on an ARFCN eight above that of the receiver. This signal is static, continuous and modulated by random data.

The amplitude of both the interfering signals is set according to table 14-24.

- d) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

The SS tests the RBER compliance of class II bits by examining at least the minimum number of samples of consecutive bits. Bits only taken from those frames which do not signal frame erasure. The number of error events is recorded.

- e) The measurement of step d) is repeated with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.
- f) Steps b) to e), are repeated but with the receiver operating on an ARFCN in the Low ARFCN range.
- g) Steps b) to e), are repeated but with the receiver operating on an ARFCN in the High ARFCN range.
- h) Steps a) to g) are repeated under extreme test conditions.

**Table 14-24: Intermodulation test signal levels**

|                                       | GSM 400, GSM 700,<br>GSM 850 and GSM 900 |          | DCS 1 800        |         | PCS 1 900 |
|---------------------------------------|------------------------------------------|----------|------------------|---------|-----------|
|                                       | Small MS                                 | Other MS | Class 1 and<br>2 | Class 3 |           |
| WANTED SIGNAL<br>dB $\mu$ Vemf( )     | 15                                       | 13       | 17               | 15      | 15        |
| FIRST INTERFERER<br>dB $\mu$ Vemf( )  | 64                                       | 74       | 64               | 68      | 64        |
| SECOND INTERFERER<br>dB $\mu$ Vemf( ) | 63                                       | 63       | 64               | 68      | 64        |

NOTE: Some of the levels in table 14-24 are different to those specified in 3GPP TS 05.05 due to the consideration of the effect of modulation sideband noise from the second interferer.

##### 14.6.1.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-25.

This shall apply under normal condition and under any combination of normal and extreme test voltages and ambient temperature, and with the two interfering signals at either side of the wanted frequency.

**Table 14-25: Limits for intermodulation rejection**

| Channel         | Propagation conditions | Type of measurement | Test limit error rate % | Minimum No. of samples |
|-----------------|------------------------|---------------------|-------------------------|------------------------|
| TCH/FS Class II | Static                 | RBER                | 2,439                   | 8 200                  |

## 14.6.2 Intermodulation rejection - control channels

### 14.6.2.1 Definition and applicability

The intermodulation rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of two or more unwanted signals with a specific frequency relationship to the wanted signal frequency.

The requirements and this test apply to MS not supporting speech.

For E-GSM 900 and R-GSM 900 MS this test is only performed in the P-GSM band.

### 14.6.2.2 Conformance requirement

In the presence of two unwanted signals with a specific frequency relationship to the wanted signal frequency the FER for FACCH/F shall meet the reference sensitivity performance of table 1 in 3GPP TS 05.05 subclause 5.3.

### 14.6.2.3 Test purpose

To verify that the MS does not exceed the conformance requirement with an allowance for the statistical significance of the test.

### 14.6.2.4 Method of test

NOTE: The measurements address the third order intermodulation, which represents the most serious case.

#### 14.6.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH with an ARFCN in the Mid ARFCN range, power control level set to maximum.

The SS transmits Standard Test Signal C1 on the traffic channel. The amplitude of the wanted signal is set to 4 dB above the reference sensitivity level (see table 14-25).

#### 14.6.2.4.2 Procedure

- a) The SS produces a TUhigh wanted signal, and two static interfering (unwanted) signals at the same time. There is no correlation in the modulation between the signals.

The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above that of the receiver. This signal is static and unmodulated.

The second interfering signal is on an ARFCN eight above that of the receiver. This signal is static, continuous and modulated by random data.

The amplitude of both the interfering signals is set according to table 14-26.

- b) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. The SS determines the number of frame erasure events during at least the minimum number of samples of FACCH/F frames.

NOTE: These frames will not be consecutive but it is expected that the statistical significance of the tests will not be unduly degraded.

- c) The measurement of step b) is repeated with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.
- d) Steps a) to c), are repeated but with the receiver operating on an ARFCN in the Low ARFCN range.
- e) Steps a) to c), are repeated but with the receiver operating on an ARFCN in the High ARFCN range.
- f) Steps a) to e) are repeated under extreme test conditions.

**Table 14-26: Intermodulation test signal levels**

|                                       | GSM 400, GSM 700,<br>GSM 850 and GSM 900 |          | DCS 1 800        |         | PCS 1 900 |
|---------------------------------------|------------------------------------------|----------|------------------|---------|-----------|
|                                       | Small MS                                 | Other MS | Class 1 and<br>2 | Class 3 |           |
| WANTED SIGNAL<br>dB $\mu$ Vemf( )     | 15                                       | 13       | 17               | 15      | 15        |
| FIRST INTERFERER<br>dB $\mu$ Vemf( )  | 64                                       | 74       | 64               | 68      | 64        |
| SECOND INTERFERER<br>dB $\mu$ Vemf( ) | 63                                       | 63       | 64               | 68      | 64        |

NOTE: Some of the levels in table 14-26 are different to those specified in 3GPP TS 05.05 due to the consideration of the effect of modulation sideband noise from the second interferer.

#### 14.6.2.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-27.

This shall apply under normal condition and under any combination of normal and extreme test voltages and ambient temperature, and with the two interfering signals at either side of the wanted frequency.

**Table 14-27: Limits for intermodulation rejection**

| Channel | Propagation conditions | Type of measurement | GSM 400, GSM 700,<br>GSM 850 and GSM 900 |                            | DCS 1 800 and PCS 1 900 |                        |
|---------|------------------------|---------------------|------------------------------------------|----------------------------|-------------------------|------------------------|
|         |                        |                     | Test limit error rate %                  | Minimum No. of max-samples | Test limit error rate % | Min No. of max-samples |
| FACCH/F | TUhigh/No FH           | FER                 | 8,961                                    | 6 696                      | 4,368                   | 13 736                 |

## 14.7 Blocking and spurious response

### 14.7.1 Blocking and spurious response - speech channels

#### 14.7.1.1 Definition and applicability

Blocking is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted input signal, on frequencies other than those of the spurious responses or the adjacent channels, without exceeding a given degradation.

The requirements and this test apply to MS supporting speech.

#### 14.7.1.2 Conformance requirement

1. The blocking characteristics of the receiver are specified separately for in-band and out-of-band performance as identified in 3GPP TS 05.05 subclause 5.1.

The reference sensitivity performance as specified in table 1 of 3GPP TS 05.05 shall be met when the following signals are simultaneously input to the receiver:

- a useful signal at frequency  $f_0$ , 3 dB above the reference sensitivity level as specified in 3GPP TS 05.05 subclause 6.2;
- a continuous, static sine wave signal at a level as in the table of 3GPP TS 05.05 subclause 5.1 and at a frequency ( $f$ ) which is an integer multiple of 200 kHz;
- with the following exceptions, called spurious response frequencies:
  - a) GSM 700, GSM 850 and GSM 900: in band, for a maximum of six occurrences (which if grouped shall not exceed three contiguous occurrences per group);
 

DCS 1 800: in band, for a maximum of twelve occurrences (which if grouped shall not exceed three contiguous occurrences per group);

PCS 1 900: in band, for a maximum of twelve occurrences (which if grouped shall not exceed three contiguous occurrences per group);

GSM 400: in band, for a maximum of three occurrences;
  - b) out of band, for a maximum of 24 occurrences (which if below  $f_0$  and grouped shall not exceed three contiguous occurrences per group).

where the above performance shall be met when the continuous sine wave signal ( $f$ ) is set to a level of 70 dB $\mu$ V (emf) (i.e. -43 dBm). 3GPP TS 05.05, subclause 5.1.

#### 14.7.1.3 Test purpose

1. To verify that the in band blocking performance is met without exceeding the total number of allowed in band spurious responses. An allowance is made for the statistical significance of the test.
2. To verify that at selected out of band frequencies, the out of band blocking performance is met without exceeding the total number of allowed out of band spurious responses. An allowance is made for the statistical significance of the test.

NOTE: Not all of the possible out of band frequencies are tested as this results in excessive test time. However, the total number of out of band spurious responses, specified in 3GPP TS 05.05, are allowed to ensure a fair test of the MS.

#### 14.7.1.4 Method of test

##### 14.7.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure, except the BCCH frequency list shall be empty, on a TCH with an arbitrary ARFCN in the range supported by the MS. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel. (TCH frequency FR).

The SS commands the MS to create traffic channel loop back signalling erased frames.

##### 14.7.1.4.2 Procedure

- a) The SS produces a static wanted signal and a static interfering signal at the same time. The amplitude of the wanted signal is set to 4 dB above the reference sensitivity level.
- b) The unwanted signal is a C.W. signal (Standard test signal IO) of frequency FB. It is applied in turn on the subset of frequencies calculated in step c) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range  $FR \pm 600$  kHz are excluded.

NOTE: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies  $nFB$  where  $n = 2, 3, 4, 5$ , etc.

c) The frequencies at which the test is performed (adjusted to an integer multiple of 200 kHz channels most closely approximating the absolute frequency of the calculated blocking signal frequency) are the combined frequencies from i), ii) and iii) below:-

i) The total frequency range formed by:

GSM 400 the frequencies between  $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 3,6 \text{ MHz})$

and  $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 3,6 \text{ MHz})$ .

GSM 700 the frequencies between  $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 7,5 \text{ MHz})$

and  $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 7,5 \text{ MHz})$ .

GSM 850 and P-GSM 900 the frequencies between  $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$

and  $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$ .

E-GSM 900 the frequencies between  $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$

and  $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$ .

DCS 1 800 the frequencies between  $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$

and  $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$ .

PCS 1 900 the frequencies between  $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 30,0 \text{ MHz})$

and  $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 30,0 \text{ MHz})$ .

and

the frequencies +100 MHz and -100 MHz from the edge of the relevant receive band.

Measurements are made at 200 kHz intervals.

ii) The three frequencies  $IF_1$ ,  $IF_1 + 200 \text{ kHz}$ ,  $IF_1 - 200 \text{ kHz}$ .

iii) The frequencies:

$mF_{lo} + IF_1$ ;

$mF_{lo} - IF_1$ ;

$mFR$ ;

where  $m$  is all positive integers greater than or equal to 2 such that either sum lies in the range 100 kHz to 12,75 GHz.

The frequencies in step ii) and iii) lying in the range of frequencies defined by step i) above need not be repeated.

Where:

$F_{lo}$  - local oscillator applied to first receiver mixer

$IF_1 \dots IF_n$  - are the  $n$  intermediate frequencies

$F_{lo}$ ,  $IF_1$ ,  $IF_2 \dots IF_n$  - shall be declared by the manufacturer in the PIXIT statement 3GPP TS 51.010-1 annex 3.

d) The level of the unwanted signal is set according to table 14-28.

Table 14-28a: Level of unwanted signals

| FREQUENCY                            | GSM 900                   |          | DCS 1 800 |
|--------------------------------------|---------------------------|----------|-----------|
|                                      | Small MS                  | Other MS |           |
|                                      | LEVEL IN dB $\mu$ Vemf( ) |          |           |
| FR $\pm$ 600 kHz to FR $\pm$ 800 kHz | 70                        | 75       | 70        |
| FR $\pm$ 800 kHz to FR $\pm$ 1,6 MHz | 70                        | 80       | 70        |
| FR $\pm$ 1,6 MHz to FR $\pm$ 3 MHz   | 80                        | 90       | 80        |
| 915 MHz to FR - 3 MHz                | 90                        | 90       | -         |
| FR + 3 MHz to 980 MHz                | 90                        | 90       | -         |
| 1 785 MHz to FR - 3 MHz              | -                         | -        | 87        |
| FR + 3 MHz to 1 920 MHz              | -                         | -        | 87        |
| 835 MHz to < 915 MHz                 | 113                       | 113      |           |
| > 980 MHz to 1 000 MHz               | 113                       | 113      |           |
| 100 kHz to < 835 MHz                 | 90                        | 90       |           |
| > 1 000 MHz to 12,75 GHz             | 90                        | 90       |           |
| 100 kHz to 1 705 MHz                 | -                         | -        | 113       |
| > 1 705 MHz to < 1 785 MHz           | -                         | -        | 101       |
| > 1 920 MHz to 1 980 MHz             | -                         | -        | 101       |
| > 1 980 MHz to 12,75 GHz             | -                         | -        | 90        |

Table 14-28b: Level of unwanted signals

| FREQUENCY                            | GSM 450                   |          | GSM 480  |          |

| 100 kHz to 1 830 MHz                 | 113                       |
| > 1 830 MHz to < 1 910 MHz           | 101                       |
| > 2 010 MHz to 2 070 MHz             | 101                       |
| > 2 070 MHz to 12,75 GHz             | 90                        |

**Table 14-28d: Level of unwanted signals**

| FREQUENCY                            | GSM 750                   | GSM 850 |
|--------------------------------------|---------------------------|---------|
|                                      | LEVEL IN dB $\mu$ Vemf( ) |         |
| FR $\pm$ 600 kHz to FR $\pm$ 800 kHz | 70                        | 70      |
| FR $\pm$ 800 kHz to FR $\pm$ 1,6 MHz | 70                        | 70      |
| FR $\pm$ 1,6 MHz to FR $\pm$ 3 MHz   | 80                        | 80      |
| 727 MHz to FR - 3 MHz                | 90                        | -       |
| FR + 3 MHz to 782 MHz                | 90                        | -       |
| 849 MHz to FR - 3 MHz                | -                         | 90      |
| FR + 3 MHz to 914 MHz                | -                         | 90      |
| 100 kHz to < 727 MHz                 | 113                       | -       |
| > 782 MHz to 12,75 GHz               | 113                       | -       |
| 100 kHz to < 849 MHz                 | -                         | 113     |
| > 914 MHz to 12,75 GHz               | -                         | 113     |

NOTE 1: These values differ from 3GPP TS 05.05 because of practical generator limits in the SS.

NOTE 2: For an E-GSM 900 MS the level of the unwanted signal in the band 905 MHz to < 915 MHz is relaxed to 108 dB $\mu$ Vemf( ).

NOTE 3: For a GSM 450 small MS the level of the unwanted signal in the band 450,4 MHz to < 457,6 MHz is relaxed to 108 dB $\mu$ Vemf( ). For a GSM 480 small MS the level of the unwanted signal in the band 478,8 MHz to < 486 MHz is relaxed to 108 dB $\mu$ Vemf( ).

e) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

The SS tests the RBER compliance for the bits of class II, by examining sequences of at least the minimum number of samples of consecutive bits of class II, where bits are taken only from those frames for which no bad frame indication was given. The number of error events is recorded.

If a failure is indicated it is noted and counted towards the allowed exemption totals.

In the case of failures discovered at the predicted frequencies at steps f ii), iii) or iv) the test is repeated on the adjacent channels  $\pm$ 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also tested. This process is repeated until all channels constituting the group of failures is known.

#### 14.7.1.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-29.

This shall apply under normal test voltage and ambient temperature, and with the interfering signal at any frequency in the range specified.

**Table 14-29: Limits for blocking**

| Channel         | Type of measurement | Test limit error rate % | Minimum number of samples |
|-----------------|---------------------|-------------------------|---------------------------|
| TCH/FS Class II | RBER                | 2,439                   | 8 200                     |

The following exceptions are allowed:

GSM 450: A maximum of three failures in the frequency band 457,6 MHz to 473,6 MHz.

A maximum of 24 failures in the combined bands 100 kHz to 457,6 MHz and 473,6 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

GSM 480: A maximum of three failures in the frequency band 486 MHz to 502 MHz.

A maximum of 24 failures in the combined bands 100 kHz to 486 MHz and 502 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

|            |                                                                                                                                                                                                                                                                                                                                   |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GSM 750:   | A maximum of six failures in the frequency band 727 MHz to 782 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).<br><br>A maximum of 24 failures in the combined bands 100 kHz to 727 MHz and 782 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group). |
| GSM 850:   | A maximum of six failures in the frequency band 849 MHz to 914 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).<br><br>A maximum of 24 failures in the combined bands 100 kHz to 849 MHz and 914 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group). |
| GSM 900:   | A maximum of six failures in the frequency band 915 MHz to 980 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).<br><br>A maximum of 24 failures in the combined bands 100 kHz to 915 MHz and 980 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group). |
| DCS 1 800: | A maximum of twelve failures in the band 1 785 MHz to 1 920 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).<br><br>A maximum of 24 in the combined bands 100 kHz to 1 785 MHz and 1 920 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).         |
| PCS 1 900: | A maximum of twelve failures in the band 1 910 MHz to 2 010 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).<br><br>A maximum of 24 in the combined bands 100 kHz to 1 910 MHz and 2 010 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).         |

If the number of failures do not exceed the maximum allowed figures stated above, the test of 14.7.1.4 is repeated at the frequencies at which the failures occurred. The level of the unwanted signal is set to  $70 \text{ dB}\mu\text{Vemf}(\ )$  and the performance requirement is once again that that stated in the table above.

The number Error rate measured in this test shall not exceed the test limit error rate values given in table 14-29.

No failures are allowed at this lower unwanted signal level.

## 14.7.2 Blocking and spurious response - control channels

### 14.7.2.1 Definition and applicability

Blocking is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted input signal, on frequencies other than those of the spurious responses or the adjacent channels, without exceeding a given degradation.

The requirements and this test apply to MS not supporting speech.

### 14.7.2.2 Conformance requirement

1. The blocking characteristics of the receiver are specified separately for in-band and out-of-band performance as identified in 3GPP TS 05.05 subclause 5.1.

The reference sensitivity performance as specified in table 1 of 3GPP TS 05.05 shall be met when the following signals are simultaneously input to the receiver:

- a useful signal at frequency  $f_0$ , 3 dB above the reference sensitivity level as specified in 3GPP TS 05.05 subclause 6.2;

- a continuous, static sine wave signal at a level as in the table of 3GPP TS 05.05 subclause 5.1 and at a frequency (f) which is an integer multiple of 200 kHz.

with the following exceptions, called spurious response frequencies:

- a) GSM 700, GSM 850 or GSM 900: in band, for a maximum of six occurrences (which if grouped shall not exceed three contiguous occurrences per group);

DCS 1 800: in band, for a maximum of twelve occurrences (which if grouped shall not exceed three contiguous occurrences per group);

PCS 1 900: in band, for a maximum of twelve occurrences (which if grouped shall not exceed three contiguous occurrences per group);

GSM 400: in band, for a maximum of three occurrences;

- b) out of band, for a maximum of 24 occurrences (which if below  $f_0$  and grouped shall not exceed three contiguous occurrences per group).

where the above performance shall be met when the continuous sine wave signal (f) is set to a level of 70 dB $\mu$ V (emf) (i.e. -43 dBm). 3GPP TS 05.05, subclause 5.1.

#### 14.7.2.3 Test purpose

1. To verify that the in band blocking performance is met without exceeding the total number of allowed in band spurious responses. An allowance is made for the statistical significance of the test.
2. To verify that at selected out of band frequencies, the out of band blocking performance is met without exceeding the total number of allowed out of band spurious responses. An allowance is made for the statistical significance of the test.

NOTE: Not all of the possible out of band frequencies are tested as this results in excessive test time. However, the total number of out of band spurious responses, specified in 3GPP TS 05.05, are allowed to ensure a fair test of the MS.

#### 14.7.2.4 Method of test

##### 14.7.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure, except the BCCH frequency list shall be empty, on a TCH with an arbitrary ARFCN in the range supported by the MS. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel. (TCH frequency FR).

##### 14.7.2.4.2 Procedure

- a) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Due to interfering signals, the MS may not be able to acknowledge the Layer 2 frame. Frame erasures are indicated by repeated L2 frames.
- b) The SS is set to produce a TUhigh wanted signal and a static interfering signal at the same time. The SS sets the amplitude of the wanted signal to 4 dB above the reference sensitivity level.
- c) The unwanted signal is a C.W. signal (Standard test signal IO) of frequency FB. It is applied in turn on the subset of frequencies calculated at step f) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range  $FR \pm 600$  kHz are excluded.

NOTE: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies  $nFB$  where  $n = 2, 3, 4, 5$ , etc.

d) The frequencies at which the test is performed (adjusted to an integer multiple of 200 kHz channels most closely approximating the absolute frequency of the calculated blocking signal frequency) are the combined frequencies from i), ii) and iii) which follow:

i) The total frequency range formed by:-

GSM 400 the frequencies between  $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 3,6 \text{ MHz})$

and  $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 3,6 \text{ MHz})$ .

GSM 700 the frequencies between  $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 7,5 \text{ MHz})$

and  $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 7,5 \text{ MHz})$ .

GSM 850 the frequencies between  $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$

and  $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$ .

P-GSM 900 the frequencies between  $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$

and  $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$ .

E-GSM 900 the frequencies between  $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$

and  $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$ .

DCS 1 800 the frequencies between  $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$

and  $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$ .

PCS 1 900 the frequencies between  $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 30,0 \text{ MHz})$

and  $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 30,0 \text{ MHz})$ .

and

the frequencies +100 MHz and -100 MHz from the edge of the relevant receive band.

Measurement are made at 200 kHz intervals.

ii) The three frequencies  $IF_1$ ,  $IF_1 + 200 \text{ kHz}$ ,  $IF_1 - 200 \text{ kHz}$ .

iii) The frequencies:

$mF_{10} + IF_1$ ;

$mF_{10} - IF_1$ ;

$mFR$ ;

where m is all positive integers greater than or equal to 2 such that either sum lies in the range 100 kHz to 12,75 GHz.

The frequencies in step ii) and iii) lying in the range of frequencies defined by step i) above need not be repeated.

Where:

$F_{10}$  - local oscillator applied to first receiver mixer

$IF_1 \dots IF_n$  - are the n intermediate frequencies

$F_{10}$ ,  $IF_1$ ,  $IF_2 \dots IF_n$  - shall be declared by the manufacturer in the PIXIT statement  
3GPP TS 51.010-1 annex 3.

e) The level of the unwanted signal is set according to table 14-30.

Table 14-30a: Level of unwanted signals

| FREQUENCY                            | GSM 900                   |          | DCS 1 800 |
|--------------------------------------|---------------------------|----------|-----------|
|                                      | Small MS                  | Other MS |           |
|                                      | LEVEL IN dB $\mu$ Vemf( ) |          |           |
| FR $\pm$ 600 kHz to FR $\pm$ 800 kHz | 70                        | 75       | 70        |
| FR $\pm$ 800 kHz to FR $\pm$ 1,6 MHz | 70                        | 80       | 70        |

| FR $\pm$ 1,6 MHz to FR $\pm$ 3 MHz   | 80                                   | 80                                   |
| 727 MHz to FR - 3 MHz                | 90                                   | -                                    |
| FR + 3 MHz to 782 MHz                | 90                                   | -                                    |
| 849 MHz to FR - 3 MHz                | -                                    | 90                                   |
| FR + 3 MHz to 914 MHz                | -                                    | 90                                   |
| 100 kHz to < 727 MHz                 | 113                                  | -                                    |
| > 782 MHz to 12,75 GHz               | 113                                  | -                                    |
| 100 kHz to < 849 MHz                 | -                                    | 113                                  |
| > 914 MHz to 12,75 GHz               | -                                    | 113                                  |

NOTE 1: These values differ from 3GPP TS 05.05 because of practical generator limits in the SS.

NOTE 2: For an E-GSM 900 MS the level of the unwanted signal in the band 905 MHz to < 915 MHz is relaxed to 108 dB $\mu$ Vemf( ).

NOTE 3: For a GSM 450 small MS the level of the unwanted signal in the band 450,4 MHz to <457,6 MHz is relaxed to 108 dB $\mu$ Vemf( ). For a GSM 480 small MS the level of the unwanted signal in the band 478,8 MHz to <486 MHz is relaxed to 108 dB $\mu$ Vemf( ).

f) The SS determines the number of frame erasure events during at least the minimum number of samples. If a failure is indicated, it is noted and counted towards the allowed exemption total.

In the case of failures discovered at the predicted frequencies at steps f ii), iii) or iv) the test is repeated on the adjacent channels  $\pm$ 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

#### 14.7.2.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate given in table 14-31.

This shall apply under normal test voltage and ambient temperature, and with the interfering signal at any frequency in the range specified.

**Table 14-31: Limits for blocking**

| Channel | Type of measurement | GSM 400 and GSM 900   |                        | DCS 1 800 and PCS 1 900 |                        |
|---------|---------------------|-----------------------|------------------------|-------------------------|------------------------|
|         |                     | Test limit error rate | Minimum No. of samples | Test limit error rate   | Minimum No. of samples |
| FACCH/F | FER                 | 8,961                 | 6 696                  | 4,368                   | 13 736                 |

The following exceptions are allowed:

GSM 450: A maximum of three failures in the frequency band 457,6 MHz to 473,6 MHz.

A maximum of 24 failures in the combined bands 100 kHz to 457,6 MHz and 473,6 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

GSM 480: A maximum of three failures in the frequency band 486 MHz to 502 MHz.

A maximum of 24 failures in the combined bands 100 kHz to 486 MHz and 502 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

GSM 750: A maximum of six failures in the frequency band 727 MHz to 782 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 failures in the combined bands 100 kHz to 727 MHz and 782 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

- GSM 850:** A maximum of six failures in the frequency band 849 MHz to 914 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).  
A maximum of 24 failures in the combined bands 100 kHz to 849 MHz and 914 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).
- GSM 900:** A maximum of six failures in the band 915 MHz to 980 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).  
A maximum of 24 in the combined bands 100 kHz to 915 MHz and 980 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).
- DCS 1 800:** A maximum of twelve failures in the band 1785 MHz to 1 920 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).  
A maximum of 24 in the combined bands 100 kHz to 1785 MHz and 1 920 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).
- PCS 1 900:** A maximum of twelve failures in the band 1 910 MHz to 2 010 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).  
A maximum of 24 in the combined bands 100 kHz to 1 910 MHz and 2 010 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

If the number of failures do not exceed the maximum allowed figures stated above, the test of 14.7.2.4 is repeated at the frequencies at which the failures occurred. The level of the unwanted signal is set to 70 dB $\mu$ Vemf( ) and the performance requirement is once again that stated above.

The number of Error Events recorded in this test shall not exceed the test limit error rate values given above, when using the maximum number of samples.

No failures are allowed at this lower unwanted signal level.

### 14.7.3 Blocking and spurious response - speech channels for MS supporting the R-GSM band

#### 14.7.3.1 Definition and applicability

Blocking is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted input signal, on frequencies other than those of the spurious responses or the adjacent channels, without exceeding a given degradation.

The requirements and this test apply to R-GSM MS supporting speech.

#### 14.7.3.2 Conformance requirement

1. The blocking characteristics of the receiver are specified separately for in-band and out-of-band performance as identified in 3GPP TS 05.05 subclause 5.1.

The reference sensitivity performance as specified in table 1 of 3GPP TS 05.05 shall be met when the following signals are simultaneously input to the receiver:

- a useful signal at frequency  $f_0$ , 3 dB above the reference sensitivity level as specified in 3GPP TS 05.05 subclause 6.2;
- a continuous, static sine wave signal at a level as in the table of 3GPP TS 05.05 subclause 5.1 and at a frequency ( $f$ ) which is an integer multiple of 200 kHz.

With the following exceptions, called spurious response frequencies:

- a) R-GSM 900: in band, for a maximum of six occurrences (which if grouped shall not exceed three contiguous occurrences per group);

- b) out of band, for a maximum of 24 occurrences (which if below  $f_0$  and grouped shall not exceed three contiguous occurrences per group).

Where the above performance shall be met when the continuous sine wave signal ( $f$ ) is set to a level of 70 dB $\mu$ V (emf) (i.e. -43 dBm). 3GPP TS 05.05, subclause 5.1.

#### 14.7.3.3 Test purpose

1. To verify that the in band blocking performance is met without exceeding the total number of allowed in band spurious responses. An allowance is made for the statistical significance of the test.
2. To verify that at selected out of band frequencies, the out of band blocking performance is met without exceeding the total number of allowed out of band spurious responses. An allowance is made for the statistical significance of the test.

NOTE: Not all of the possible out of band frequencies are tested as this results in excessive test time. However, the total number of out of band spurious responses, specified in 3GPP TS 05.05, are allowed to ensure a fair test of the MS.

#### 14.7.3.4 Method of test

##### 14.7.3.4.1 Initial conditions

A call is set up according to the generic call set up procedure, except the BCCH frequency list shall be empty, on a TCH with an arbitrary ARFCN in the range supported by the MS. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel. (TCH frequency FR).

The SS commands the MS to create traffic channel loop back signalling erased frames.

##### 14.7.3.4.2 Procedure

- a) The SS produces a static wanted signal and a static interfering signal at the same time. The amplitude of the wanted signal is set to 4 dB above the reference sensitivity level.
- b) The unwanted signal is a C.W. signal (Standard test signal IO) of frequency FB. It is applied in turn on the subset of frequencies calculated in step c) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range  $FR \pm 600$  kHz are excluded.

NOTE: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies  $nFB$  where  $n = 2, 3, 4, 5$ , etc.

- c) The frequencies at which the test is performed (adjusted to an integer multiple of 200 kHz channels most closely approximating the absolute frequency of the calculated blocking signal frequency) are the combined frequencies from i), ii) and iii) below:-

- i) The total frequency range formed by:-

R-GSM 900 the frequencies between  $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 19,5 \text{ MHz})$

and  $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 19,5 \text{ MHz})$ .

And the frequencies +100 MHz and -100 MHz from the edge of the relevant receive band.

Measurements are made at 200 kHz intervals.

- ii) The three frequencies  $IF_1, IF_1 + 200 \text{ kHz}, IF_1 - 200 \text{ kHz}$ .

- iii) The frequencies:

$mF_{10} + IF_1;$

$mF_{10} - IF_1;$

mFR;

where m is all positive integers greater than or equal to 2 such that either sum lies in the range 100 kHz to 12,75 GHz.

The frequencies in step ii) and iii) lying in the range of frequencies defined by step i) above need not be repeated.

Where:

$F_{lo}$  - local oscillator applied to first receiver mixer

$IF_1 \dots IF_n$  - are the n intermediate frequencies

$F_{lo}, IF_1, IF_2 \dots IF_n$  - shall be declared by the manufacturer in the PIXIT statement 3GPP TS 51.010-1 annex 3.

d) The level of the unwanted signal is set according to table 14-28b.

**Table 14-28b: Level of unwanted signals for R-GSM MS**

| FREQUENCY                            | R-GSM 900                 |          |
|--------------------------------------|---------------------------|----------|
|                                      | Small MS                  | Other MS |
|                                      | LEVEL IN dB $\mu$ Vemf( ) |          |
| FR $\pm$ 600 kHz to FR $\pm$ 800 kHz | 70                        | 75       |
| FR $\pm$ 800 kHz to FR $\pm$ 1,6 MHz | 70                        | 80       |
| FR $\pm$ 1,6 MHz to FR $\pm$ 3 MHz   | 80                        | 90       |
| 915 MHz to FR - 3 MHz                | 90                        | 90       |
| FR + 3 MHz to 980 MHz                | 90                        | 90       |
| 1 785 MHz to FR - 3 MHz              | -                         | -        |
| FR + 3 MHz to 1 920 MHz              | -                         | -        |
| 835 MHz to < 876 MHz                 | 113                       | 113      |
| 876 MHz to 880 MHz                   | 106                       | 113      |
| 880 MHz to 915 MHz                   | 106                       | 108      |
| > 980 MHz to 1 000 MHz               | 113                       | 113      |
| 100 kHz to < 835 MHz                 | 90                        | 90       |
| > 1 000 MHz to 12,75 GHz             | 90                        | 90       |

NOTE: These values differ from 3GPP TS 05.05 because of practical generator limits in the SS.

e) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

The SS tests the RBER compliance for the bits of class II, by examining sequences of at least the minimum number of samples of consecutive bits of class II, where bits are taken only from those frames for which no bad frame indication was given. The number of error events is recorded.

If a failure is indicated it is noted and counted towards the allowed exemption totals.

In the case of failures discovered at the predicted frequencies at steps f ii), iii) or iv) the test is repeated on the adjacent channels  $\pm$ 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also tested. This process is repeated until all channels constituting the group of failures is known.

#### 14.7.3.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-29b.

This shall apply under normal test voltage and ambient temperature, and with the interfering signal at any frequency in the range specified.

**Table 14-29b: Limits for blocking**

| Channel         | Type of measurement | Test limit error rate % | Minimum number of samples |
|-----------------|---------------------|-------------------------|---------------------------|
| TCH/FS Class II | RBER                | 2,439                   | 8 200                     |

The following exceptions are allowed:

R-GSM 900: A maximum of six failures in the frequency band 915 MHz to 980 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 failures in the combined bands 100 kHz to 915 MHz and 980 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

If the number of failures do not exceed the maximum allowed figures stated above, the test of 14.7.3.4 is repeated at the frequencies at which the failures occurred. The level of the unwanted signal is set to 70 dB $\mu$ Vemf( ) and the performance requirement is once again that that stated in the table above.

The number Error rate measured in this test shall not exceed the test limit error rate values given in table 14-29b.

No failures are allowed at this lower unwanted signal level.

## 14.7.4 Blocking and spurious response - control channels for MS supporting the R-GSM band

### 14.7.4.1 Definition and applicability

Blocking is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted input signal, on frequencies other than those of the spurious responses or the adjacent channels, without exceeding a given degradation.

The requirements and this test apply to R-GSM MS not supporting speech.

### 14.7.4.2 Conformance requirement

- The blocking characteristics of the receiver are specified separately for in-band and out-of-band performance as identified in 3GPP TS 05.05 subclause 5.1.

The reference sensitivity performance as specified in table 1 of 3GPP TS 05.05 shall be met when the following signals are simultaneously input to the receiver:

- a useful signal at frequency  $f_0$ , 3 dB above the reference sensitivity level as specified in 3GPP TS 05.05 subclause 6.2;
- a continuous, static sine wave signal at a level as in the table of 3GPP TS 05.05 subclause 5.1 and at a frequency ( $f$ ) which is an integer multiple of 200 kHz.

With the following exceptions, called spurious response frequencies:-

- a) R-GSM 900: in band, for a maximum of six occurrences (which if grouped shall not exceed three contiguous occurrences per group);
- b) out of band, for a maximum of 24 occurrences (which if below  $f_0$  and grouped shall not exceed three contiguous occurrences per group).

Where the above performance shall be met when the continuous sine wave signal ( $f$ ) is set to a level of 70 dB $\mu$ V (emf) (i.e. -43 dBm). 3GPP TS 05.05, subclause 5.1.

### 14.7.4.3 Test purpose

- To verify that the in band blocking performance is met without exceeding the total number of allowed in band spurious responses. An allowance is made for the statistical significance of the test.

2. To verify that at selected out of band frequencies, the out of band blocking performance is met without exceeding the total number of allowed out of band spurious responses. An allowance is made for the statistical significance of the test.

NOTE: Not all of the possible out of band frequencies are tested as this results in excessive test time. However, the total number of out of band spurious responses, specified in 3GPP TS 05.05, are allowed to ensure a fair test of the MS.

#### 14.7.4.4 Method of test

##### 14.7.4.4.1 Initial conditions

A call is set up according to the generic call set up procedure, except the BCCH frequency list shall be empty, on a TCH with an arbitrary ARFCN in the range supported by the MS. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel. (TCH frequency FR).

##### 14.7.4.4.2 Procedure

- a) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Due to interfering signals, the MS may not be able to acknowledge the Layer 2 frame. Frame erasures are indicated by repeated L2 frames.
- b) The SS is set to produce a TUhigh wanted signal and a static interfering signal at the same time. The SS sets the amplitude of the wanted signal to 4 dB above the reference sensitivity level.
- c) The unwanted signal is a C.W. signal (Standard test signal IO) of frequency FB. It is applied in turn on the subset of frequencies calculated at step f) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range  $FR \pm 600$  kHz are excluded.

NOTE: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies  $nFB$  where  $n = 2, 3, 4, 5$ , etc.

- d) The frequencies at which the test is performed (adjusted to an integer multiple of 200 kHz channels most closely approximating the absolute frequency of the calculated blocking signal frequency) are the combined frequencies from i), ii) and iii) which follow:

- i) The total frequency range formed by:-

R-GSM 900 the frequencies between  $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 19,5 \text{ MHz})$

and  $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 19,5 \text{ MHz})$ .

and

the frequencies +100 MHz and -100 MHz from the edge of the relevant receive band.

Measurement are made at 200 kHz intervals.

- ii) The three frequencies  $IF_1$ ,  $IF_1 + 200$  kHz,  $IF_1 - 200$  kHz.

- iii) The frequencies:

$mF_{10} + IF_1$ ;

$mF_{10} - IF_1$ ;

$mFR$ ;

where  $m$  is all positive integers greater than or equal to 2 such that either sum lies in the range 100 kHz to 12,75 GHz.

The frequencies in step ii) and iii) lying in the range of frequencies defined by step i) above need not be repeated.

Where:

- $F_{lo}$  - local oscillator applied to first receiver mixer
- $IF_1 \dots IF_n$  - are the n intermediate frequencies
- $F_{lo}, IF_1, IF_2 \dots IF_n$  - shall be declared by the manufacturer in the PIXIT statement 3GPP TS 51.010-1 annex 3.

- e) The level of the unwanted signal is set according to table 14-30b.

**Table 14-30b: Level of unwanted signals**

| FREQUENCY                            | GSM 900                   |          |
|--------------------------------------|---------------------------|----------|
|                                      | Small MS                  | Other MS |
|                                      | LEVEL IN dB $\mu$ Vemf( ) |          |
| FR $\pm$ 600 kHz to FR $\pm$ 800 kHz | 70                        | 75       |
| FR $\pm$ 800 kHz to FR $\pm$ 1,6 MHz | 70                        | 80       |
| FR $\pm$ 1,6 MHz to FR $\pm$ 3 MHz   | 80                        | 90       |
| 915 MHz to FR - 3 MHz                | 90                        | 90       |
| FR + 3 MHz to 980 MHz                | 90                        | 90       |
| 835 MHz to < 876 MHz                 | 113                       | 113      |
| 876 MHz to 880 MHz                   | 106                       | 113      |
| 880 MHz to 915 MHz                   | 106                       | 108      |
| > 980 MHz to 1 000 MHz               | 113                       | 113      |
| 100 kHz to < 835 MHz                 | 90                        | 90       |
| >1000 MHz to 12,75 GHz               | 90                        | 90       |

NOTE: These values differ from 3GPP TS 05.05 because of practical generator limits in the SS.

- f) The SS determines the number of frame erasure events during at least the minimum number of samples. If a failure is indicated, it is noted and counted towards the allowed exemption total.

In the case of failures discovered at the predicted frequencies at steps f ii), iii) or iv) the test is repeated on the adjacent channels  $\pm$ 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

#### 14.7.4.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate given in table 14-31b.

This shall apply under normal test voltage and ambient temperature, and with the interfering signal at any frequency in the range specified.

**Table 14-31b: Limits for blocking**

| Channel | Type of measurement | GSM 900               |                        | DCS 1 800             |                        |
|---------|---------------------|-----------------------|------------------------|-----------------------|------------------------|
|         |                     | Test limit error rate | Minimum No. of samples | Test limit error rate | Minimum No. of samples |
| FACCH/F | FER                 | 8,961                 | 6 696                  | 4,368                 | 13 736                 |

The following exceptions are allowed:

- R-GSM 900: A maximum of six failures in the band 915 MHz to 980 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 in the combined bands 100 kHz to 915 MHz and 980 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

If the number of failures do not exceed the maximum allowed figures stated above, the test of 14.7.4.4 is repeated at the frequencies at which the failures occurred. The level of the unwanted signal is set to  $70 \text{ dB}\mu\text{Vemf}(\ )$  and the performance requirement is once again that stated above.

The number of Error Events recorded in this test shall not exceed the test limit error rate values given above, when using the maximum number of samples.

No failures are allowed at this lower unwanted signal level.

## 14.8 AM suppression

### 14.8.1 AM suppression - speech channels

#### 14.8.1.1 Definition and applicability

AM suppression is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted TDMA modulated interferer.

The requirements and this test apply to MS supporting speech.

#### 14.8.1.2 Conformance requirement

The reference sensitivity performance as specified in table 1 shall be met when the following signals are simultaneously input to the receiver:

- a useful signal at frequency  $f_0$ , 3 dB above the reference sensitivity level as specified in 3GPP TS 05.05 subclause 5.2.
- a single frequency ( $f$ ), in the relevant receive band,  $|f - f_0| \geq 6\text{MHz}$ , which is an integer multiple of 200 kHz, a GSM TDMA signal modulated by any 148-bits subsequence of the 511-bits pseudo random bit sequence, defined in ITU-T Recommendation O.153 fascicle IV.4, at a level as defined in the table below. The interferer shall have one timeslot active and the frequency shall be at least 2 channels separated from any identified spurious responses. The transmitted bursts shall be synchronized to but, delayed in time between 61 and 86 bit periods relative to the bursts of the wanted signal. 3GPP TS 05.05, subclause 5.2.

| MS type                                                                                                                                                                         | Signal level         |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|
| GSM 400                                                                                                                                                                         | -31 dBm              |
| GSM 700                                                                                                                                                                         | -31 dBm              |
| GSM 850                                                                                                                                                                         | -31 dBm              |
| GSM 900                                                                                                                                                                         | -31 dBm              |
| DCS 1 800                                                                                                                                                                       | -29 / -31 dBm (note) |
| PCS 1 900                                                                                                                                                                       | -31 dBm              |
| NOTE: The -31 dBm level shall apply to DCS 1 800 class 1 and class 2 MS meeting the -102 dBm reference sensitivity level requirement according to 3GPP TS 05.05, subclause 6.2. |                      |

#### 14.8.1.3 Test purpose

To verify that the AM suppression performance of the MS meets the conformance requirement with an allowance for the statistical significance of the test.

#### 14.8.1.4 Method of test

##### 14.8.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure, on a TCH/FS with an ARFCN in the mid ARFCN range. The power control level is set to maximum power.

The SS transmits standard Test Signal C1 on the traffic channel (TCH frequency FR).

The SS commands the MS to create traffic channel loop back signalling erased frames.

This test is performed after test 14.7.

#### 14.8.1.4.2 Procedure

- a) The SS produces a static wanted signal with an amplitude 4 dB above reference sensitivity level.
- b) The SS produces an interfering signal as described below:
  - static fading profile;
  - at an in band frequency greater than 6 MHz separated from FR and separated by at least two ARFCNs from any spurious responses.

NOTE: Spurious responses are identified by test cases 14.7.1 and 14.7.2.

- at a level as described in table 14-32.
- GSM TDMA modulated by random data with one timeslot active.
- synchronized to, but delayed between 61 and 86 bit periods to the bursts of the wanted signal.

**Table 14-32: Interferer signal level**

| MS type                                                                                                                                                                                                            | Signal level (dB $\mu$ V <sub>emf</sub> ) |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------|
| GSM 400                                                                                                                                                                                                            | 82                                        |
| GSM 700                                                                                                                                                                                                            | 82                                        |
| GSM 850                                                                                                                                                                                                            | 82                                        |
| GSM 900                                                                                                                                                                                                            | 82                                        |
| DCS 1 800                                                                                                                                                                                                          | 82/84                                     |
| PCS 1 900                                                                                                                                                                                                          | 82                                        |
| NOTE: The 82 dB $\mu$ V <sub>emf</sub> (ie. -31 dBm) level shall apply to DCS 1 800 class 1 and class 2 MS meeting the -102 dBm reference sensitivity level requirement according to 3GPP TS 05.05, subclause 6.2. |                                           |

- c) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- d) The SS tests the RBER compliance of class II bits by examining at least the minimum number of samples of consecutive bits. Bits only taken from those frames which do not signal frame erasure. The number of error events is recorded.

#### 14.8.1.5 Test requirements

The error rates measured in this test shall not exceed the test limit error rate values given in table 14.27.

**Table 14-33: Limits for AM suppression**

| Channel         | Propagation conditions | Type of measurement | Test limit error rate % | Minimum No. of samples |
|-----------------|------------------------|---------------------|-------------------------|------------------------|
| TCH/FS Class II | Static                 | RBER                | 2,439                   | 8 200                  |

## 14.8.2 AM suppression - control channels

### 14.8.2.1 Definition and applicability

AM suppression is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted TDMA modulated interferer.

The requirements and this test apply to MS not supporting speech.

### 14.8.2.2 Conformance requirement

The reference sensitivity performance as specified in table 1 shall be met when the following signals are simultaneously input to the receiver:

- a useful signal at frequency  $f_0$ , 3 dB above the reference sensitivity level as specified in 3GPP TS 05.05 subclause 5.2.
- a single frequency ( $f$ ), in the relevant receive band,  $|f - f_0| \geq 6\text{MHz}$ , which is an integer multiple of 200 kHz, a GSM TDMA signal modulated by any 148-bits subsequence of the 511-bits pseudo random bit sequence, defined in ITU-T Recommendation O.153 fascicle IV.4, at a level as defined in the table below. The interferer shall have one timeslot active and the frequency shall be at least 2 channels separated from any identified spurious responses. The transmitted bursts shall be synchronized to but, delayed in time between 61 and 86 bit periods relative to the bursts of the wanted signal. 3GPP TS 05.05, subclause 5.2.

| MS type   | Signal level                                                                                                                                                              |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GSM 400   | -31 dBm                                                                                                                                                                   |
| GSM 700   | -31 dBm                                                                                                                                                                   |
| GSM 850   | -31 dBm                                                                                                                                                                   |
| GSM 900   | -31 dBm                                                                                                                                                                   |
| DCS 1 800 | -29 / -31 dBm (note)                                                                                                                                                      |
| PCS 1 900 | -31 dBm                                                                                                                                                                   |
| NOTE:     | The -31 dBm level shall apply to DCS 1 800 class 1 and class 2 MS meeting the -102 dBm reference sensitivity level requirement according to 3GPP TS 05.05, subclause 6.2. |

### 14.8.2.3 Test purpose

To verify that the AM suppression performance of the MS meets the conformance requirement with an allowance for the statistical significance of the test.

### 14.8.2.4 Method of test

#### 14.8.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure, on a TCH with an ARFCN in the mid ARFCN range. The power control level is set to maximum power.

The SS transmits standard Test Signal C1 on the traffic channel (TCH frequency FR).

This test is performed after test 14.7.

#### 14.8.2.4.2 Procedure

- a) The SS produces a TUhigh wanted signal with an amplitude 4 dB above reference sensitivity level.
- b) The SS produces an interfering signal as described below:
  - static fading profile;
  - t an in band frequency greater than 6 MHz separated from FR and separated by at least two ARFCNs from any spurious responses.

NOTE: Spurious responses are identified by test cases 14.7.1 and 14.7.2.

- at a level as described in table 14-34.
- GSM TDMA modulated by random data with one timeslot active.
- synchronized to, but delayed between 61 and 86 bit periods to the bursts of the wanted signal.

**Table 14-34: Interferer signal level**

| MS type                                                                                                                                                                                                            | Signal level (dB $\mu$ V <sub>emf</sub> ) |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------|
| GSM 400                                                                                                                                                                                                            | 82                                        |
| GSM 700                                                                                                                                                                                                            | 82                                        |
| GSM 850                                                                                                                                                                                                            | 82                                        |
| GSM 900                                                                                                                                                                                                            | 82                                        |
| DCS 1 800                                                                                                                                                                                                          | 82/84                                     |
| PCS 1 900                                                                                                                                                                                                          | 82                                        |
| NOTE: The 82 dB $\mu$ V <sub>emf</sub> (ie. -31 dBm) level shall apply to DCS 1 800 class 1 and class 2 MS meeting the -102 dBm reference sensitivity level requirement according to 3GPP TS 05.05, subclause 6.2. |                                           |

- c) The SS sends the status message. Due to interfering signals, the MS may not be able acknowledge the Layer 2 frame. Frame erasures are indicated by repeated L2 frames.
- d) The SS determines the number of frame erasure events during at least the minimum number of samples. If a failure is indicated, it is noted and counted towards the allowed exemption total.

#### 14.8.2.5 Test requirements

The error rates measured in this test shall not exceed the test limit error rate values given in table 14.35.

**Table 14-35: Limits for AM suppression**

| Channel | Propagation conditions | Type of measurement | GSM 400, GSM 700, GSM 850 and GSM 900 |                            | DCS 1 800 and PCS 1 900 |                        |
|---------|------------------------|---------------------|---------------------------------------|----------------------------|-------------------------|------------------------|
|         |                        |                     | Test limit error rate %               | Minimum No. of max-samples | Test limit error rate % | Min No. of max-samples |
| FACCH/F | TUhigh/No FH           | FER                 | 8,961                                 | 6 696                      | 4,368                   | 13 736                 |

## 14.9 Paging performance at high input levels

### 14.9.1 Definition and applicability

The paging performance at high input levels is the signal level at the MS receiver input at which a certain FER for the PCH must be achieved.

The requirements and this test apply to all types of MS.

### 14.9.2 Conformance requirement

The paging performance at high input levels requirements of 3GPP TS 05.05 subclause 6.5 a) for PCH under static propagation conditions shall be met from 20 dB above reference sensitivity level up to -15 dBm for GSM 400, GSM 700, GSM 850 and GSM 900 and -23 dBm for DCS 1 800 and PCS 1 900.

### 14.9.3 Test purpose

To verify that the MS does not exceed the conformance requirement with an allowance for the statistical significance of the test.

#### 14.9.4 Method of test

##### 14.9.4.1 Initial conditions

###### System Simulator:

1 cell, Tx-Integer = 3, MAX RETRANS is set to minimum. The CCCH is combined with SDCCH.

BS\_PA\_MFRMS = 9 to achieve worst case sleep mode (DRX). The signal level at the receiver input is set to:

GSM 400: -15 dBm;

GSM 700: -15 dBm;

GSM 850: -15 dBm;

GSM 900: -15 dBm;

DCS 1800: -23 dBm;

PCS 1 900: -23 dBm.

###### Mobile Station:

The MS has a valid TMSI. It is "idle updated". The MS should have been powered up immediately before running the test, i.e. if a Location update is necessary the MS must be switched off and on again.

##### 14.9.4.2 Procedure

The MS is paged and the SS starts timer T3113. If a CHANNEL REQUEST is received before expiry of T3113 the SS sends an IMMEDIATE ASSIGNMENT REJECT. The sequence is performed 4 times.

Between two consecutive executions the SS must wait for an amount of time which is enough to guarantee that the MS is in service (listening to its paging subchannel).

##### 14.9.5 Test requirements

If the MS answers all pagings with a CHANNEL REQUEST the requirements are met.

NOTE: The probability for a good MS to fail this test is less than 1 %.

## 14.16 GPRS receiver tests

Statistical testing of receiver BLER performance

### Error Definition

Block Error Ratio (BLER):

The Block Error Ratio is the ratio of blocks received in error to the total number of received blocks, where a block is defined as received in error if the error detection functions in the receiver, operating in accordance with 3GPP TS 05.03, indicate an error as a result of the Block Check Sequence (BCS).

For USF the Block Error Ratio is the ratio of incorrectly interpreted USF to the total number of received USF.

### Test criteria

In the receiver tests for circuit switched channels, test error rates have been defined in order not to pass MS with a performance worse than the specification by 1 dB, with tests to be performed at the sensitivity and interference levels defined in 3GPP TS 05.05. For circuit switched channels 3GPP TS 05.05 defines the error rates at a fixed sensitivity or interference level.

For packet switched channels 3GPP TS 05.05 defines the receive or interference level at which a fixed Block Error Ratio is met. Therefore, for GPRS the receiver is tested with a 1 dB offset in the receive level and the interference level.

If the error events can be assumed to be random independent variables, outputs of stationary random processes with identical Gaussian distributions, the previous figures suggest a number of events not lower than 200 in AWGN channel and not lower than 600 in a multipath environment.

For multipath propagation conditions the hypothesis of stationary random processes does not generally hold. In case of non frequency hopping operation mode, the radio channel may be assumed to change 10 times per wavelength of travelled distance and to be short term stationary in between. So, in this case, the required observation time for having good statistical properties should not be lower (with some rounding) than that reported in table 14.16-1.

**Table 14.16-1: Minimum test time according to propagation profile**

| Propagation Conditions | GSM 400, GSM 700, GSM 850 and GSM 900 |        |    |    | DCS 1 800 and PCS 1 900 |        |     |    |
|------------------------|---------------------------------------|--------|----|----|-------------------------|--------|-----|----|
|                        | TUlow                                 | TUhigh | HT | RA | TUlow                   | TUhigh | HT  | RA |
| Min. test time (s)     | 500                                   | 30     | 15 | 6  | 500                     | 15     | 7,5 | 6  |

Table 14.16-2 details, for the different test conditions, the minimum number of blocks required in order to meet points 1) to 3): the corresponding test time (point 4) can be consequently computed.

**Table 14.16-2: Test conditions**

| Type of test | Type of channel    | Propagation/<br>frequency<br>conditions | Speci-fied<br>BLER % | Minimum<br>No of<br>blocks      |
|--------------|--------------------|-----------------------------------------|----------------------|---------------------------------|

## 14.16.1 Minimum Input level for Reference Performance

### 14.16.1.1 Definition and applicability

The minimum input level is the signal level at the MS receiver input at which a certain BLER is met.

The requirements and this test apply to MS supporting packet channels.

### 14.16.1.2 Conformance requirement

- The block error rate (BLER) performance shall not exceed 10 % at input levels according to the table below.

| Type of channel                              |     | Propagation conditions |                |                   |            |            |
|----------------------------------------------|-----|------------------------|----------------|-------------------|------------|------------|
|                                              |     | static                 | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
| <b>GSM 400, GSM 700, GSM 850 and GSM 900</b> |     |                        |                |                   |            |            |
| PDTCH/CS-1                                   | dBm | -104                   | -104           | -104              | -104       | -103       |
| PDTCH/CS-2                                   | dBm | -104                   | -100           | -101              | -101       | -99        |
| PDTCH/CS-3                                   | dBm | -104                   | -98            | -99               | -98        | -96        |
| PDTCH/CS-4                                   | dBm | -101                   | -90            | -90               | *          | *          |
| <b>DCS 1 800 and PCS 1 900</b>               |     |                        |                |                   |            |            |
| PDTCH/CS-1                                   | dBm | -104                   | -104           | -104              | -104       | -103       |
| PDTCH/CS-2                                   | dBm | -104                   | -100           | -100              | -101       | -99        |
| PDTCH/CS-3                                   | dBm | -104                   | -98            | -98               | -98        | -94        |
| PDTCH/CS-4                                   | dBm | -101                   | -88            | -88               | *          | *          |

The input levels given in the above Table are referenced to normal GSM 900 MS, and have to be corrected by the following values for other MS:

|                                                |       |
|------------------------------------------------|-------|
| GSM 400, GSM 700, GSM 850 and GSM 900 small MS | +2 dB |
| DCS 1800 class 1 or 2 MS                       | +4 dB |
| DCS 1800 class 3 and PCS 1 900 class 1 or 2 MS | +2 dB |
| PCS 1 900 class 3 MS                           | 0 dB  |

3GPP TS 05.05, table 1a; 3GPP TS 05.05, subclause 6.2.

- The block error rate (BLER) performance shall not exceed 1 % at input levels according to the table below.

| Type of channel                              |     | Propagation conditions |                |                   |            |            |
|----------------------------------------------|-----|------------------------|----------------|-------------------|------------|------------|
|                                              |     | static                 | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
| <b>GSM 400, GSM 700, GSM 850 and GSM 900</b> |     |                        |                |                   |            |            |
| USF/CS-1                                     | dBm | < -104                 | -103           | -104              | -104       | -104       |
| USF/CS-2 to 4                                | dBm | < -104                 | -104           | -104              | -104       | -104       |
| <b>DCS 1 800 and PCS 1 900</b>               |     |                        |                |                   |            |            |
| USF/CS-1                                     | dBm | < -104                 | -104           | -104              | -104       | -104       |
| USF/CS-2 to 4                                | dBm | < -104                 | -104           | -104              | -104       | -104       |

The input levels given in the above Table are referenced to normal GSM 900 MS, and have to be corrected by the following values for other MS:

|                                                |       |
|------------------------------------------------|-------|
| GSM 400, GSM 700, GSM 850 and GSM 900 small MS | +2 dB |
| DCS 1800 class 1 or 2 MS                       | +4 dB |
| DCS 1800 class 3 and PCS 1 900 class 1 or 2 MS | +2 dB |
| PCS 1 900 class 3 MS                           | 0 dB  |

3GPP TS 05.05, table 1a; 3GPP TS 05.05, subclause 6.2.

3. The BLER shall not exceed the the conformance requirements given in 1. - 2. under extreme conditions; 3GPP TS 05.05, subclause 6.2 and annex D subclauses D.2.1 and D.2.2.

4. The reference sensitivity performance specified above need not be met in the following cases:

for MS at the static channel, if the received level on either of the two adjacent timeslots to the wanted exceed the wanted timeslot by more than 20 dB;

for MS on a multislot configuration, if the received level on any of the timeslots belonging to the same multislot configuration as the wanted time slot, exceed the wanted time slot by more than 6 dB;

The interfering adjacent time slots shall be static with valid GSM signals in all cases;

3GPP TS 05.05, subclause 6.2.

- 5) For an MS allocated a USF on a PDCH with a random RF input or a valid PDCH signal with a random USF not equal to the allocated USF, the overall reception shall be such that the MS shall detect the allocated USF in less than 1% of the radio blocks. This requirement shall be met for all input levels up to -40 dBm.

3GPP TS 05.05, subclause 6.4

#### 14.16.1.3 Test purpose

NOTE: This test is performed under STATIC propagation conditions to allow implicit testing of the ability of the MS to hop over the full band. The tests under dynamic propagation conditions are better suited to test the minimum input level for reference BLER performance conformance but cannot test hopping over the full band due to limited bandwidth of available fading simulators.

1. To verify that that the MS sends a Packet Not Acknowledge in the Packet Downlink Ack/Nack in case of a the Block Check Sequence indicating a Block Error.
2. To verify that the MS does not exceed conformance requirement 1 for CS-3 and CS-4 under STATIC, TUhigh, HT and RA propagation conditions with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 2 under HT propagation conditions with an allowance for the statistical significance of the test.
4. To verify that the MS does not exceed conformance requirement 3 under STATIC, TUhigh, HT and RA propagation conditions for the PDTCH, and HT propagation conditions for the USF, with an allowance for the statistical significance of the test.
5. To verify that the MS meets the conformance requirements also 1 and 2 for the conditions allowed by conformance requirement 4, with an allowance for the statistical significance of the test.
6. To verify that the MS meets conformance requirement 5, with an allowance for the statistical significance of the test.

#### 14.16.1.4 Method of test

##### 14.16.1.4.1 Initial conditions

NOTE 1: The BA list sent on the BCCH and SACCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCHs but, if provided the signal strengths of BCCHs shall be in the range  $15 \text{ dB}\mu\text{Vemf}( )$  to  $35 \text{ dB}\mu\text{Vemf}( )$ . Surrounding cell signal levels and cell reselection parameters are set so that the MS will not try a cell reselection.

NOTE 2: The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

NOTE 3: When frequency hopping is used, the traffic channel may fall on any of the ARFCNs defined in clause 6.

NOTE 4: The PSII message is included in the PACCH when the MS is in packet transfer mode. The PBCCH\_CHANGE\_MARK value in PSII is not changed. This, together with preventing cell reselection as per Note 1, ensures that the MS is highly unlikely to suspend the TBF (3GPP TS 04.60 subclause 5.5.1.4.2 Suspension of operation to receive system operation), and thus making the effect of TBF suspension statistically insignificant for the test result.

A call is set up according to the generic call set up procedure for packet switched on an ARFCN in the Mid range, on the maximum number of receive timeslots, with the MS transmitting at maximum power.

For the ACK/NACK BLER and the BCS BLER parts of the test case, a downlink TBF will be established.

For the USF BLER parts of the test case the Test Mode defined in 3GPP TS 04.14 (subclause 5.4) will be used for uplink TBF. If the MS is capable of both:

Mode (a) transmitting pseudo-random data sequence in RLC data blocks;

Mode (b) transmitting looped-back RLC data blocks;

then Mode (a) will be used.

If Mode (b) is used then the SS sends the pseudo-random data sequence specified for Mode (a) on the downlink for loopback on the uplink.

#### 14.16.1.4.2 Procedure

- a) The SS transmits packets under TU50 propagation conditions, using CS-3 coding at a level of 1 dB above the level given in conformance reference 1. Out of the 400 blocks transmitted by the SS, 20 blocks are sent with incorrect BCS, at (pseudo) random positions. The SS checks, for the blocks it transmitted with incorrect BCS, whether or not the MS Packet Downlink Ack/Nack as sent by the MS indicates these blocks as not acknowledged.
- b) The SS transmits packets under static conditions, with the MS commanded to hopping mode using the hopping sequence used in clause 6, and using CS-3 coding to the MS on all allocated timeslots, at a level of 1 dB above the level given in the table in conformance requirement 1. On the time slots not allocated to the MS, the SS transmits at a level of 20 dB above the level given in the table in conformance requirement 1. This implicitly tests adjacent time slot rejection.
- c) The SS counts the number of blocks transmitted with CS-3 and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- d) Once the number of blocks transmitted with CS-3 as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14-16.2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats step b) to d) with the following four fading conditions and hopping modes: TUhigh/noFH, TUhigh/FH, HT/noFH and RA/noFH. For these tests with fading channels, the SS does not transmit on the timeslots not allocated to the MS.
- f) The SS repeats steps b) to e) using CS-4 coding without RA/noFH.
- g) The SS repeats steps b) to f) under extreme test conditions.
- h) This step is only performed for a multislot MS. The SS establishes the normal test conditions with the exceptions in the parameter settings of Packet Downlink Assignment message:
  - $P_0 = 14$  dBm;
  - BTS\_PWR\_CTRL\_MODE = Mode A;
  - PR\_MODE = B.

Furthermore, the SS has to set the PR fields in the MAC headers of each downlink RLC data block to correspond to the applied downlink power level, as defined below. The SS repeats steps b) to d) with only one of the active timeslots at 1 dB above the level at which the reference sensitivity performance shall be met, and all other timeslots belonging to the same multislot configuration at a level of 6 dB above this timeslot.

- i) The SS establishes the normal test conditions, and sets the fading function to HT/noFH.
- j) The SS sets the value of the USF/CS-1 such as to allocate the uplink to the MS, transmitting at a level of 1 dB above the level given in the table in conformance requirement 2.
- k) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- l) Once the number of USF/CS-1 allocating the uplink for the MS as counted in step k) reaches or exceeds the minimum number of blocks as given in table 14-16.2, the SS calculates the Block error ratio. The SS resets both counters.
- m) The SS repeats steps j) to l) using USF/CS2 to 4 coding.
- n) The SS repeats steps i) to m) under extreme test conditions.
- o) The SS establishes normal test condition and a static channel. The SS sets the value of the USF/CS-1 to all values randomly, with the exception of the one allocated to the MS, transmitting at 3 dB below the level at which reference performance shall be met, and counts the number of times the MS transmits on the uplink. This is done for 2 000 blocks.

#### 14.16.1.5 Test requirements

In step a) the Packet Downlink Ack/Nack as sent by the MS shall indicate every block transmitted by the SS with incorrect BCS as not acknowledged.

The block error ratio, as calculated by the SS for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

In step o) the MS shall transmit no more than 25 times.

In the case when downlink power control is not used and the output power used on the transmitted blocks is not equal to (BCCH level –  $P_b$ ) then the MS is not required to fulfil 3GPP TS 05.05 requirements for the first 25 blocks addressed to this MS (3GPP TS 05.08, subclause 10.2.2).

NOTE: This is stated in the Rel 99 version of 3GPP TS 05.08.

### 14.16.2 Co-channel rejection

#### 14.16.2.1 Co-channel rejection for packet channels

##### 14.16.2.1.1 Definition and applicability

The co-channel rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted modulated signal, both signals being at the nominal frequency of the receiver.

The requirements and this test apply to MS supporting packet channels.

## 14.16.2.1.2 Conformance requirement

1. The block error rate (BLER) performance shall not exceed 10 % at co-channel interference ratios ( $C/I_c$ ) exceeding those according to the table below.

| Type of channel                              |    | Propagation conditions |                   |                      |               |
|----------------------------------------------|----|------------------------|-------------------|----------------------|---------------|
|                                              |    | TUlow<br>(no FH)       | TUhigh<br>(no FH) | TUhigh<br>(ideal FH) | RA<br>(no FH) |
| <b>GSM 400, GSM 700, GSM 850 and GSM 900</b> |    |                        |                   |                      |               |
| PDTCH/CS-1                                   | dB | 13                     | 10                | 9                    | 9             |
| PDTCH/CS-2                                   | dB | 15                     | 14                | 13                   | 13            |
| PDTCH/CS-3                                   | dB | 16                     | 16                | 15                   | 16            |
| PDTCH/CS-4                                   | dB | 21                     | 24                | 23                   | -             |
| <b>DCS 1 800 and PCS 1 900</b>               |    |                        |                   |                      |               |
| PDTCH/CS-1                                   | dB | 13                     | 9                 | 9                    | 9             |
| PDTCH/CS-2                                   | dB | 15                     | 13                | 13                   | 13            |
| PDTCH/CS-3                                   | dB | 16                     | 16                | 16                   | 16            |
| PDTCH/CS-4                                   | dB | 21                     | 27                | 25                   | -             |

3GPP TS 05.05, table 2a; 3GPP TS 05.05, subclause 6.2.

2. The block error rate (BLER) performance shall not exceed 1 % at co-channel interference ratios ( $C/I_c$ ) exceeding those according to the table below.

| Type of channel                              |    | Propagation conditions |                   |                      |               |
|----------------------------------------------|----|------------------------|-------------------|----------------------|---------------|
|                                              |    | TUlow<br>(no FH)       | TUhigh<br>(no FH) | TUhigh<br>(ideal FH) | RA<br>(no FH) |
| <b>GSM 400, GSM 700, GSM 850 and GSM 900</b> |    |                        |                   |                      |               |
| USF/CS-1                                     | dB | 19                     | 12                | 10                   | 10            |
| USF/CS-2 to 4                                | dB | 18                     | 10                | 9                    | 8             |
| <b>DCS 1 800 and PCS 1 900</b>               |    |                        |                   |                      |               |
| USF/CS-1                                     | dB | 19                     | 10                | 10                   | 10            |
| USF/CS-2 to 4                                | dB | 18                     | 9                 | 9                    | 7             |

## 14.16.2.1.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under propagation condition TUlow/no FH, TUhigh/noFH, TUhigh/FH and RA/no FH with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under propagation condition TUhigh/noFH, with an allowance for the statistical significance of the test.

## 14.16.2.1.4 Method of test

## 14.16.2.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1.

In addition to this wanted signal (C), the SS produces an independent, uncorrelated interfering signal (I).

This unwanted signal is random, continuous and GSM-modulated, and has no fixed relationship with the bit transitions of the wanted signal.

For the ACK/NACK BLER and the BCS BLER parts of the test case, a downlink TBF will be established.

For the USF BLER parts of the test case the Test Mode defined in GSM Rec. 4.14 (para 5.4) will be used for uplink TBF. If the MS is capable of both:

Mode (a) transmitting pseudo-random data sequence in RLC data blocks;

Mode (b) transmitting looped-back RLC data blocks;

then Mode (a) will be used.

If Mode (b) is used then the SS sends the pseudo-random data sequence specified for Mode (a) on the downlink for loopback on the uplink.

#### 14.16.2.1.4.2 Procedure

- a) The SS transmits packets using CS-1 coding to the MS on all allocated timeslots.
- b) The fading characteristic of the wanted and the interfering signal is TU<sub>low</sub>, no FH applies.
- c) The co-channel interference ratio is set to 1 dB above the ratio given in the table in conformance requirement 1. The interferer shall have the same frequency hopping sequence as the wanted signal, as well as be subject to the same fading profile.
- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in table 14-x, the SS calculates the Block error ratio. The SS resets both counters.
- f) In the case of CS-1 the SS repeats step c) to e) with the following three fading conditions and hopping modes: TU<sub>high</sub>/noFH, TU<sub>high</sub>/FH, and RA/noFH.  
In the case of CS-2 the SS repeats step c) to e) with the fading condition and hopping mode RA/no FH only.  
In the case of CS-3 the SS repeats step c) to e) with the fading condition and hopping mode TU<sub>high</sub>/FH only.  
In the case of CS-4 the SS repeats step c) to e) with the fading condition and hopping modes: TU<sub>high</sub>/noFH.
- g) The SS repeats the steps b) to f) for each of the coding schemes CS-2, CS-3 and CS-4.
- h) The SS establishes the normal test conditions, and sets the fading function to TU<sub>high</sub>/noFH.
- i) The SS sets the value of the USF/CS-1 such as to allocate the uplink to the MS, using a co-channel interference level of 1 dB above the level given in the table in conformance requirement 2.
- j) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- k) Once the number of USF/CS-1 allocating the uplink for the MS as counted in step j) reaches or exceeds the minimum number of blocks as given in table 14-x, the SS calculates the Block error ratio. The SS resets both counters.
- l) The SS repeats steps i) to k) using USF/CS2 coding.

#### 14.16.2.1.5 Test requirements

The block error ratio, as calculated by the SS for different channels and under the different propagation conditions, shall not exceed the conformance requirement.

NOTE: The wanted signal levels derived from calculations using 3GPP TS 45.005 subclause 6.3 together with subclause 14.16.2.1.4.2 c) shall be set according to the table below.

| Type of channel                                                                                                                                                                                             |     | Propagation conditions |                   |                      |               |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|------------------------|-------------------|----------------------|---------------|
|                                                                                                                                                                                                             |     | TUlow<br>(no FH)       | TUhigh<br>(no FH) | TUhigh<br>(ideal FH) | RA<br>(no FH) |

| PDTCH/CS-3                                                                                                                                                                                                  | dBm | -74                    | -74               | -74                  | -74           |
| PDTCH/CS-4                                                                                                                                                                                                  | dBm | -69                    | -63               | -65                  | -             |
| NOTE 1: For other GSM 400, GSM 900, GSM 850 and GSM 700 ms the values in the table above should be decreased by 2 dBm.                                                                                      |     |                        |                   |                      |               |
| NOTE 2: For other classes of PCS 1 900 ms the values in the above table should be decreased by 2 dBm. For DCS 1 800 MS under extreme conditions the values in the above table should be increased by 2 dBm. |     |                        |                   |                      |               |

## 14.18 EGPRS receiver tests

### Statistical testing of receiver BLER performance

#### Error Definition

Block Error Ratio (BLER):

The Block Error Ratio is the ratio of blocks received in error to the total number of received blocks, where a block is defined as received in error if the error detection functions in the receiver, operating in accordance with 3GPP TS 05.03, indicate an error as the result of the Block Check Sequence (BCS).

For USF the Block Error Ratio is the ratio of incorrectly interpreted USF to the total number of received USF.

#### Test criteria

In the receiver tests for circuit switched channels, test error rates have been defined in order not to pass MS with a performance worse than the specification by 1 dB, with tests to be performed at the sensitivity and interference levels defined in 3GPP TS 05.05. For circuit switched channels 3GPP TS 05.05 defines the error rates at a fixed sensitivity or interference level.

For packet switched channels 3GPP TS 05.05 defines the receive or interference level at which a fixed Block Error Ratio is met. Therefore, for EGPRS the receiver is tested with a 1 dB offset in the receive level and the interference level.

If the error events can be assumed to be random independent variables, outputs of stationary random processes with identical Gaussian distributions, the previous figures suggest a number of events not lower than 200 in AWGN channel and not lower than 600 in a multipath environment.

For multipath propagation conditions the hypothesis of stationary random processes does not generally hold. In case of non frequency hopping operation mode, the radio channel may be assumed to change 10 times per wavelength of travelled distance and to be short term stationary in between. So, in this case, the required observation time for having good statistical properties should not be lower (with some rounding) than that reported in table 14.18-1.

**Table 14.18-1: Minimum test time according to propagation profile**

| Propagation Conditions | GSM 400, GSM 700, GSM 850 and GSM 900 |        |    |    | DCS 1 800 and PCS 1 900 |        |     |    |
|------------------------|---------------------------------------|--------|----|----|-------------------------|--------|-----|----|
|                        | TUlow                                 | TUhigh | HT | RA | TUlow                   | TUhigh | HT  | RA |
| Min. test time (s)     | 500                                   | 30     | 15 | 6  | 500                     | 15     | 7,5 | 6  |

Table 14.18-2 details, for the different test conditions, the minimum number of blocks required in order to meet points 1) to 3): the corresponding test time (point 4) can be consequently computed.

**Table 14.18-2: Test conditions**

| Type of test            | Type of channel  | Propagation/frequency conditions | Specified BLER % | Minimum No of RLC blocks             |
|-------------------------|------------------|----------------------------------|------------------|--------------------------------------|

NOTE 1: For MCS-7, 8 and 9 the BLER of 10 % or 30 % is specified in the conformance requirements. For MCS-5 to 6 a BLER of 10 % is always applied.

NOTE 2: Under fading conditions the number of RLC blocks indicated above shall be transmitted on each timeslot of the multislot configuration.

## 14.18.1 Minimum Input level for Reference Performance

### 14.18.1.1 Definition and applicability

The minimum input level is the signal level at the MS receiver input at which a certain BLER is met.

The requirements and this test apply to all types of MS which are capable of EGPRS operation.

### 14.18.1.2 Conformance requirement

1. The block error rate (BLER) performance for PDTCH/MCS1 to 4 shall not exceed 10 % at input levels according to the table 14.18-3a; and for PDTCH/MCS5 to 9 shall not exceed 10 % or 30 % depending on Coding Schemes at input levels according to the table 14.18-3b.

**Table 14.18-3a: PDTCH Sensitivity Input Level for GMSK modulation**

| PDTCH/MCS-1                                  | dBm | -104                   | -102,5            | -103                 | -103          | -101,5        |
| PDTCH/MCS-2                                  | dBm | -104                   | -100,5            | -101                 | -100,5        | -99,5         |
| PDTCH/MCS-3                                  | dBm | -104                   | -96,5             | -96,5                | -92,5         | -94,5         |
| PDTCH/MCS-4                                  | dBm | -101,5                 | -90,5             | -90,5                | (note)        | (note)        |

NOTE: PDTCH/MCS-4 can not meet the reference performance for some propagation conditions.

The input levels given in the above Table are applicable to GSM 400, GSM 700, GSM 850, GSM 900 and PCS 1 900 MS, and have to be corrected by the following values for the following classes of MS:

|                                    |        |
|------------------------------------|--------|
| GSM 400 small MS                   | +2 dB; |
| GSM 700, GSM 850, GSM 900 small MS | +2 dB; |
| DCS 1800 class 1 or 2 MS           | +4 dB; |
| DCS 1800 class 3 MS                | +2 dB; |
| PCS 1 900 class 1 or 2 MS          | +2 dB. |

3GPP TS 05.05, table 1a; 3GPP TS 05.05, subclause 6.2.

| PDTCH/MCS-5                                                                                                                                                                                                                                            | dBm | -98                    | -93,5          | -93,5             | -93        | -89,5        |
| PDTCH/MCS-6                                                                                                                                                                                                                                            | dBm | -96                    | -91            | -91               | -88        | -83,5        |
| PDTCH/MCS-7                                                                                                                                                                                                                                            | dBm | -93                    | -81,5          | -80,5             | (note 2)   | (note 2)     |
| PDTCH/MCS-8                                                                                                                                                                                                                                            | dBm | -90,5                  | -80 (note 3)   | -80 (note 3)      | (note 2)   | (note 2)     |
| PDTCH/MCS-9                                                                                                                                                                                                                                            | dBm | -86                    | (note 2)       | (note 2)          | (note 2)   | (note 2)     |
| NOTE 1: Ideal FH case assumes perfect decorrelation between bursts. This case may only be tested if such a decorrelation is ensured in the test. For TUhigh (ideal FH), sufficient decorrelation may be achieved with 4 frequencies spaced over 5 MHz. |     |                        |                |                   |            |              |
| NOTE 2: PDTCH for MCS-x can not meet the reference performance for some propagation conditions.                                                                                                                                                        |     |                        |                |                   |            |              |
| NOTE 3: Performance is specified at 30% BLER for some cases.                                                                                                                                                                                           |     |                        |                |                   |            |              |

The input levels given in the above Table are applicable to Class 4 or Class 5 MS for GSM 400, GSM 700, GSM 850 and GSM 900 and to Class 1 or Class 2 MS for DCS 1 800 and PCS 1 900. For all other MS the input levels have to be corrected by the value of -2 dB.

3GPP TS 05.05, tables 1c; 3GPP TS 05.05, subclause 6.2

- The block error rate (BLER) performance for USF/MCS1 to 9 shall not exceed 1 % at input levels according to the tables 14.18-4a and 14.18-4b.

**Table 14.18-4a: USF Sensitivity Input Level for GMSK modulation**

| Type of channel                       |     | Propagation conditions |                |                   |            |            |
|---------------------------------------|-----|------------------------|----------------|-------------------|------------|------------|
|                                       |     | static                 | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
| GSM 400, GSM 700, GSM 850 and GSM 900 |     |                        |                |                   |            |            |
| USF/MCS-1 to 4                        | dBm | -104                   | -102,5         | -104              | -104       | -102,5     |
| DCS 1 800 and PCS 1 900               |     |                        |                |                   |            |            |
| USF/MCS-1 to 4                        | dBm | -104                   | -104           | -104              | -104       | -102,5     |

The input levels given in the above Table are applicable to GSM 400, GSM 700, GSM 850, GSM 900 and PCS 1 900 MS, and have to be corrected by the following values for the following classes of MS:

|                                       |        |
|---------------------------------------|--------|
| GSM 400 small MS                      | +2 dB; |
| GSM 700, GSM 850 and GSM 900 small MS | +2 dB; |
| DCS 1800 class 1 or 2 MS              | +4 dB; |
| DCS 1800 class 3 MS                   | +2 dB; |
| PCS 1 900 class 1 or 2 MS             | +2 dB. |

3GPP TS 05.05, table 1a; 3GPP TS 05.05, subclause 6.2.

**Table 14.18-4b: USF Sensitivity Input Level for 8-PSK modulation**

| Type of Channel                              |     | Propagation conditions |                |                   |            |            |
|----------------------------------------------|-----|------------------------|----------------|-------------------|------------|------------|
|                                              |     | static                 | TUhigh (no FH) | TUhigh (ideal FH) | RA (no FH) | HT (no FH) |
| <b>GSM 400, GSM 700, GSM 850 and GSM 900</b> |     |                        |                |                   |            |            |
| USF/MCS-5 to 9                               | dBm | -102                   | -97,5          | -99               | -100       | -99        |
| <b>DCS 1 800 and PCS 1 900</b>               |     |                        |                |                   |            |            |
| USF/MCS-5 to 9                               | dBm | -102                   | -99            | -99               | -100       | -99        |

The input levels given in the above Table are applicable to Class 4 or Class 5 MS for GSM 400, GSM 700, GSM 850 and GSM 900 and to Class 1 or Class 2 MS for DCS 1 800 and PCS 1 900. For all other MS the input levels have to be corrected by the value of -2 dB.

3GPP TS 05.05, table 1c; 3GPP TS 05.05, subclause 6.2

- The BLER shall not exceed the conformance requirements given in 1. and 2. under extreme conditions; 3GPP TS 05.05, subclause 6.2 and annex D subclauses D.2.1 and D.2.2.
- The reference sensitivity performance specified above need not be met in the following cases:

For MS at the static channel, if the received level on either of the two adjacent timeslots to the wanted exceed the wanted timeslot by more than 20 dB.

For MS on a multislot configuration, if the received level on any of the timeslots belonging to the same multislot configuration as the wanted time slot, exceed the wanted time slot by more than 6 dB.

The interfering adjacent time slots shall be static with valid GSM signals in all cases.

3GPP TS 05.05, subclause 6.2.

- For an MS allocated a USF on a PDCH with a random RF input or a valid PDCH signal with a random USF not equal to the allocated USF, the overall reception shall be such that the MS shall detect the allocated USF in less than 1 % of the radio blocks for GMSK modulated signals and 1 % for 8-PSK modulated signals. This requirement shall be met for all input levels up to -40 dBm for GMSK modulated signals and up to -40 dBm for 8-PSK modulated signals.

3GPP TS 05.05, subclause 6.4

#### 14.18.1.3 Test purpose

- To verify that the MS sends a Packet Not Acknowledge in the Packet Downlink Ack/Nack in case of the Block Check Sequence indicating a Block Error.
- To verify that the MS does not exceed conformance requirement 1 for PDTCH with different coding schemes and under different propagation conditions with an allowance for the statistical significance of the test.
- To verify that the MS does not exceed conformance requirement 2 under HT propagation conditions with an allowance for the statistical significance of the test.

4. To verify that the MS does not exceed conformance requirement 3 under STATIC, TUhigh, HT and RA propagation conditions for the PDTCH, and under HT propagation conditions for the USF, with an allowance for the statistical significance of the test.
5. To verify that the MS meets the conformance requirements also 1 and 2 for the conditions allowed by conformance requirement 4, with an allowance for the statistical significance of the test.
6. To verify that the MS meets conformance requirement 5, with an allowance for the statistical significance of the test.

#### 14.18.1.4 Method of test

##### Initial conditions

NOTE 1: The BA list sent on the BCCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCHs but, if provided the signal strengths of BCCHs shall be in the range  $15 \text{ dB}\mu\text{Vemf}(\ )$  to  $35 \text{ dB}\mu\text{Vemf}(\ )$ . Surrounding cell signal levels and cell reselection parameters are set so that the MS will not try a cell reselection.

NOTE 2: The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

NOTE 3: When frequency hopping is used, the traffic channel may fall on any of the ARFCNs defined in clause 6.

NOTE 4: The PSI1 message is included in the PACCH when the MS is in packet transfer mode. The PBCCH\_CHANGE\_MARK value in PSI1 is not changed. This, together with preventing cell reselection as per Note 1, ensures that the MS is highly unlikely to suspend the TBF (3GPP TS 04.60 subclause 5.5.1.4.2 Suspension of operation to receive system operation), and thus making the effect of TBF suspension statistically insignificant for the test result.

For both GMSK and 8-PSK modulations, a downlink TBF is set up according to the generic procedure specified in clause 40 for packet switched on an ARFCN in the Mid range. The SS shall transmit on the maximum number of receive timeslots. The SS commands the MS to transmit at maximum power.

##### Test procedure

For GMSK Modulation:

- a) The SS transmits packets under TUhigh propagation conditions, using MCS-4 coding at a level of 1 dB above the level given in conformance reference 1. Out of the 400 blocks transmitted by the SS, 20 blocks are sent with incorrect BCS, at (pseudo) random positions. The SS checks, for the blocks it transmitted with incorrect BCS, whether or not the MS Packet Downlink Ack/Nack as sent by the MS indicates these blocks as not acknowledged.
- b) The SS transmits packets under static conditions, with the MS commanded to hopping mode using the hopping sequence used in clause 6, and using MCS-4 coding to the MS on all allocated timeslots, at a level of 1 dB above the level given in the table in conformance requirement 1. On the time slots not allocated to the MS, the SS transmits at a level of 20 dB above the level given in the table in conformance requirement 1. This implicitly tests adjacent time slot rejection.
- c) The SS counts the number of blocks transmitted with MCS-4 and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 5: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- d) Once the number of blocks transmitted with MCS-4 as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats step b) to d) with the following two fading conditions and hopping modes: TUhigh/noFH and TUhigh/FH. For these tests with fading channels, the SS does not transmit on the timeslots not allocated to the MS.

- f) The SS repeats steps b) to d) using MCS-3 coding with RA/No FH, MCS-2 coding with HT/No FH and MCS-1 coding with TUhigh/No FH. For these tests, the SS does not transmit on the timeslots not allocated to the MS.
- g) The SS repeats steps b) to e) under extreme test conditions for MCS-4 coding only.
- h) This step is only performed for a multislot MS. The SS establishes the normal test conditions, and repeats steps b) to d) with only one of the active timeslots at 1 dB above the level at which the reference sensitivity performance shall be met, and all other timeslots belonging to the same multislot configuration at a level of 6 dB above this timeslot.
- i) The SS establishes the normal test conditions, and sets the fading function to HT/noFH. An uplink TBF shall be established.
- j) The SS sets the value of the USF/MCS-1 such as to allocate the uplink to the MS, transmitting at a level of 1 dB above the level given in the table in conformance requirement 2.
- k) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- l) Once the number of USF/MCS-1 allocating the uplink for the MS as counted in step k) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters
- m) The SS repeats steps j) to l) using USF/MCS2 to 4 coding.
- n) The SS repeats steps i) to l) under extreme test conditions for MCS-4 coding only.
- o) The SS establishes normal test condition and a static channel. The SS sets the value of the USF/MCS-1 to all values randomly, with the exception of the one allocated to the MS, transmitting at 3 dB below the level at which reference performance shall be met, and counts the number of times the MS transmits on the uplink. This is done for 2 000 blocks.

For 8-PSK Modulation:

- a) The SS transmits packets under TUhigh propagation conditions, using MCS-8 coding at a level of 1 dB above the level given in conformance reference 1. Out of the 400 blocks transmitted by the SS, 20 blocks are sent with incorrect BCS, at (pseudo) random positions. The SS checks, for the blocks it transmitted with incorrect BCS, whether or not the MS Packet Downlink Ack/Nack as sent by the MS indicates these blocks as not acknowledged.
- b) The SS transmits packets under static conditions, with the MS commanded to hopping mode using the hopping sequence used in clause 6, and using MCS-8 coding to the MS on all allocated timeslots, at a level of 1 dB above the level given in the table in conformance requirement 1. On the time slots not allocated to the MS, the SS transmits at a level of 20 dB above the level given in the table in conformance requirement 1. This implicitly tests adjacent time slot rejection.
- c) The SS counts the number of blocks transmitted with MCS-8 and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 6: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can sent this message.

- d) Once the number of blocks transmitted with MCS-8 as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats step b) to d) with the following two fading conditions and hopping modes: TUhigh/noFH and TUhigh/FH. For these tests with fading channels, the SS does not transmit on the timeslots not allocated to the MS.
- f) The SS repeats steps b) to d) using MCS-9 with static condition, MCS-7 with TUhigh/FH, MSC-6 with HT/No FH and MSC-5 with RA/No FH. For these tests, the SS does not transmit on the timeslots not allocated to the MS.
- g) The SS repeats steps b) to e) under extreme test conditions for MCS-8 coding only.

- h) This step is only performed for a multislot MS. The SS establishes the normal test conditions, and repeats steps b) to d) with only one of the active timeslots at 1 dB above the level at which the reference sensitivity performance shall be met, and all other timeslots belonging to the same multislot configuration at a level of 6 dB above this timeslot.
- i) The SS establishes the normal test conditions, and sets the fading function to HT/noFH. An uplink TBF shall be established.
- j) The SS sets the value of the USF/MCS-5 such as to allocate the uplink to the MS, transmitting at a level of 1 dB above the level given in the table in conformance requirement 2.
- k) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- l) Once the number of USF/MCS-5 allocating the uplink for the MS as counted in step k) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- m) The SS repeats steps j) to l) using USF/MCS-6 to 9 coding.
- n) The SS repeats steps j) to l) under extreme test conditions for MCS-9 coding only.
- o) The SS establishes normal test condition and a static channel. The SS sets the value of the USF/MCS-5 to all values randomly, with the exception of the one allocated to the MS, transmitting at 3 dB below the level at which reference performance shall be met, and counts the number of times the MS transmits on the uplink. This is done for 2 000 blocks.

#### 14.18.1.5 Test requirements

In step a) the Packet Downlink Ack/Nack as sent by the MS shall indicate every block transmitted by the SS with incorrect BCS as not acknowledged.

The block error ratio, as calculated by the SS for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

In step o) for both GMSK modulation and 8-PSK modulation the MS shall transmit no more than 25 times.

### 14.18.2 Co-channel rejection

#### 14.18.2.1 Definition and applicability

The co-channel rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted modulated signal, both signals being at the nominal frequency of the receiver. "Wanted signal" in this test is the signal generated by the transmitted RLC data blocks.

The requirements and this test apply to all types of MS which are capable of EGPRS operation.

#### 14.18.2.2 Conformance requirement

1. The block error rate (BLER) performance for PDTCH/MCS1 to 4 shall not exceed 10 % at co-channel interference ratios ( $C/I_c$ ) exceeding those according to the table 14.18-5a; and for PDTCH/MCS5 to 9 shall not exceed 10 % or 30 % depending on Coding Schemes at co-channel interference ratios ( $C/I_c$ ) exceeding those according to the table 14.18-5b.

Table 14.18-5a: PDTCH Co-channel Interference Ratio for GMSK modulation

| Type of channel                                                                          |    | Propagation conditions |                   |                      |               |
|------------------------------------------------------------------------------------------|----|------------------------|-------------------|----------------------|---------------|
|                                                                                          |    | TUlow<br>(no FH)       | TUhigh<br>(no FH) | TUhigh<br>(ideal FH) | RA<br>(no FH) |
| <b>GSM 400, GSM 700, GSM 850 and GSM 900</b>                                             |    |                        |                   |                      |               |
| PDTCH/MCS-1                                                                              | dB | 13                     | 10,5              | 9,5                  | 10            |
| PDTCH/MCS-2                                                                              | dB | 15                     | 12,5              | 12                   | 12            |
| PDTCH/MCS-3                                                                              | dB | 16,5                   | 17                | 17                   | 19            |
| PDTCH/MCS-4                                                                              | dB | 19                     | 22                | 22                   | (note)        |
| <b>DCS 1 800 and PCS 1 900</b>                                                           |    |                        |                   |                      |               |
| PDTCH/MCS-1                                                                              | dB | 13                     | 10                | 9,5                  | 10            |
| PDTCH/MCS-2                                                                              | dB | 15                     | 12                | 12                   | 12            |
| PDTCH/MCS-3                                                                              | dB | 16,5                   | 17                | 18                   | 19            |
| PDTCH/MCS-4                                                                              | dB | 19                     | 23                | 23                   | (note)        |
| NOTE: PDTCH/MCS-4 can not meet the reference performance for some propagation condition. |    |                        |                   |                      |               |

3GPP TS 05.05, Tables 2c.

#### 14.18.2.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 for different coding schemes and under different propagation conditions with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under propagation condition TUhigh/noFH, with an allowance for the statistical significance of the test.

#### 14.18.2.4 Method of test

##### Initial conditions

For both GMSK and 8-PSK modulations, a downlink TBF is set up according to the generic procedure specified in clause 40 for packet switched with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS transmits EGPRS RLC data blocks containing random data. In addition to these data blocks, the SS produces an independent, uncorrelated interfering signal (I1).

##### Test procedure

For GMSK Modulation:

- a) The SS transmits packets on PDTCH using MCS-4 coding to the MS on all allocated timeslots.
- b) The fading characteristic of the wanted signal and the interfering signal is TUlow, no FH applies.
- c) The co-channel interference ratio is set to 1 dB above the ratio given in the table in conformance requirement 1. The interferer shall have the same frequency hopping sequence as the wanted signal, as well as be subject to the same fading profile.
- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 1: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- f) The SS repeats step c) to e) with the TUhigh/noFH fading condition
- g) The SS repeats the steps b) to e) for the coding schemes MCS-3 with TUhigh/noFH, MCS-2 with TUhigh/FH and MCS-1 with RA/noFH.
- h) The SS establishes the normal test conditions, and sets the fading function to TUhigh/noFH. An uplink TBF shall be established.

- i) The SS sets the value of the USF/MCS-4 such as to allocate the uplink to the MS, using a co-channel interference ratio of 1 dB above the ratio given in the table in conformance requirement 2.
- j) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- k) Once the number of USF/MCS-4 allocating the uplink for the MS as counted in step j) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- l) The SS repeats steps i) to k) for each of the coding scheme MCS-1 to 3.

For 8-PSK Modulation:

- a) The SS transmits packets on PDTCH using MCS-8 coding to the MS on all allocated timeslots.
- b) The fading characteristic of the wanted signal and the interfering signal is TU<sub>low</sub>, no FH applies.
- c) The co-channel interference ratio is set to 1 dB above the ratio given in the table in conformance requirement 1. The interferer shall have the same frequency hopping sequence as the wanted signal, as well as be subject to the same fading profile.
- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 2: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- f) The SS repeats step c) to e) with the TU<sub>high</sub>/noFH fading condition.
- g) The SS repeats steps c) to e) for MCS-9 with TU<sub>low</sub>/NoFH, MCS-7 with TU<sub>high</sub>/noFH, MCS-6 with TU<sub>high</sub>/FH and MSC-5 with RA/noFH.
- h) The SS establishes the normal test conditions, and sets the fading function to TU<sub>high</sub>/noFH. An uplink TBF shall be established.
- i) The SS sets the value of the USF/MCS-9 such as to allocate the uplink to the MS, using a co-channel interference ratio of 1 dB above the ratio given in the table in conformance requirement 2.
- j) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- k) Once the number of USF/MCS-9 allocating the uplink for the MS as counted in step j) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- l) The SS repeats steps i) to k) using USF/MCS-5, 6, 7 and 8 coding.

#### 14.18.2.5 Test requirements

The block error ratio, as calculated by the SS for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

## 14.18.3 Adjacent channel rejection

### 14.18.3.1 Definition and applicability

The adjacent channel selectivity is a measure of the capability of the receiver to receive wanted data packets without exceeding a given degradation due to the presence of an interfering signal (I1) in the adjacent channel. "Wanted signal" in this test is the signal generated by the transmitted RLC data blocks.

The adjacent channel can be the adjacent in the RF spectrum or in time. There are therefore two types of adjacent channel selectivity:

- 1) Adjacent RF channel selectivity which is specifically tested in this subclause.
- 2) Adjacent Time Slot selectivity, which is implicitly tested in test 14.18.2.

The requirements and this test apply to all types of MS which are capable of EGPRS operation.

### 14.18.3.2 Conformance requirement

1. For GMSK modulation, under adjacent channel interference at 200 kHz above and below the wanted signal frequency and at the adjacent interference ratio ( $C/I_{a1}$ ) exceeding  $C/I_c - 18\text{dB}$  where  $C/I_c$  is the co-channel interference ratio specified in table 14.18-5a for PDTCH and table 14.18-6a for USF channels.

1.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/MCS-1 to 4 shall not exceed 10 %; 3GPP TS 05.05, subclause 6.2.

1.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for USF/MSC-1 to 4 shall not exceed 1 %; 3GPP TS 05.05, subclause 6.2.

For 8-PSK modulation, under adjacent channel interference at 200 kHz above and below the wanted signal frequency and at the adjacent interference ratio ( $C/I_{a1}$ ) specified in table 14.18-7a.

1.3 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/MCS-5 to 9 shall not exceed 10 % or 30 % depending on Coding Scheme; 3GPP TS 05.05, subclause 6.2.

1.4 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for USF/MSC-5 to 9 shall not exceed 1 %; 3GPP TS 05.05, subclause 6.2.

**Table 14.18-7a: Adjacent channel interference ratio for MS  
at reference performance for 8-PSK modulation**

| GSM 400, GSM 700, GSM 850 and GSM 900                                                          |                        |                     |                   |                      |               |          |

| Type of channel                                                                                | Propagation conditions |                     |                   |                      |               |          |
|                                                                                                | TUlow<br>(no FH)       | TUlow<br>(ideal FH) | TUhigh<br>(no FH) | TUhigh<br>(ideal FH) | RA<br>(no FH) |          |
| PDTCH/MCS-5                                                                                    | dB                     | 2,5                 | -2                | -2                   | -1,5          | 1        |
| PDTCH/MCS-6                                                                                    | dB                     | 5,5                 | 0,5               | 1,5                  | 1,5           | 6,5      |
| PDTCH/MCS-7                                                                                    | dB                     | 10,5                | 8                 | 12,5                 | 12            | (note 1) |
| PDTCH/MCS-8                                                                                    | dB                     | 15,5                | 9 (note 2)        | 16 (note 2)          | 15,5 (note 2) | (note 1) |
| PDTCH/MCS-9                                                                                    | dB                     | 10 (note 2)         | 12,5 (note 2)     | (note 1)             | (note 1)      | (note 1) |
| USF/MCS-5 to 9                                                                                 | dB                     | -1                  | -8,5              | -9                   | -9,5          | -9       |
| NOTE1: PDTCH for MCS-x can not meet the reference performance for some propagation conditions. |                        |                     |                   |                      |               |          |
| NOTE 2: Performance is specified at 30% BLER for some cases.                                   |                        |                     |                   |                      |               |          |

3GPP TS 05.05, table 2g and subclause 6.3.

- 2 For both GMSK and 8-PSK modulations, under adjacent channel interference conditions with interfering signals at 400 kHz above and below the wanted signal frequency and at the adjacent interference ratio ( $C/I_{a2}$ ) exceeding  $C/I_c - 50$ dB.

2.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for PDTCH/MCS-1 to 4 shall not exceed 10 % for GMSK modulation; and for PDTCH/MCS-5 to 9 shall not exceed 10 % or 30 % depending on Coding Schemes; 3GPP TS 05.05, subclause 6.2.

2.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, The block error rate (BLER) performance for USF/MSC-1 to 9 shall not exceed 1 %; 3GPP TS 05.05, subclause 6.2.

$C/I_c$  is the co-channel interference ratio. For a PDTCH with GMSK modulation  $C/I_c$  is specified in table 14.18-5a; for a PDTCH with 8-PSK modulation  $C/I_c$  is specified in table 14.18-5b, for a USF with GMSK modulation  $C/I_c$  is specified in tables 14.18-6a; and for USF with 8-PSK modulation  $C/I_c$  is specified in table 14.18-6b. 3GPP TS 05.05, subclause 6.3.

3. The BLER shall not exceed the conformance requirements given in 1. and 2. under extreme conditions; 3GPP TS 05.05, subclause 6.2 and annex D subclauses D.2.1 and D.2.2.

#### 14.18.3.3 Test purpose

- 1 To verify that the conformance requirements 1.1, 1.2, 1.3 and 1.4 are met with an allowance for the statistical significance of the test in the presence of a GMSK modulated adjacent channel interferer under propagation condition TUhigh at 200 kHz above and below the wanted signal frequency.
- 2 To verify that the conformance requirements 2.1 and 2.2 are met with an allowance for the statistical significance of the test in the presence of a GMSK modulated adjacent channel interferer under propagation condition TUhigh at 400 kHz above and below the wanted signal frequency.
3. To verify that Conformance Requirements are met under extreme conditions.

#### 14.18.3.4 Method of test

##### Initial conditions

For both GMSK and 8-PSK modulations, a downlink TBF is set up according to the generic procedure specified in clause 40 for packet switched with an ARFCN in the mid ARFCN range, power control level set to maximum power. The SS transmits EGPRS RLC data blocks containing random data. In addition to the wanted test signal, the SS transmits an independent, uncorrelated interfering signal Standard Test Signal (I1). This unwanted signal is random, continuous and GMSK-modulated, and has no fixed relationship with the bit transitions of the wanted signal.

The fading characteristic of the wanted and the interfering signal is TUhigh.

##### Test procedure

For GMSK Modulation:

- a) The SS transmits packets on PDTCH using MCS-1 coding to the MS on all allocated timeslots.
- b) The SS transmits the unwanted signal at a nominal frequency 200kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.
- c) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 1: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- d) Once the number of blocks transmitted with the current coding scheme as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.
- f) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to to achieve the adjacent interference ratio as specified in the conformance requirements.
- g) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to to achieve the adjacent interference ratio as specified in the conformance requirements.
- h) The SS repeats steps b) to g) for each of the coding schemes MCS-2 to 4.
- i) The SS repeats steps a) to g) under extreme test conditions for MCS-4 coding scheme only.
- j) The SS establishes the normal test conditions. An uplink TBF shall be established.
- k) The SS sets the value of the USF/MCS-1 such as to allocate the uplink to the MS.
- l) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to to achieve the adjacent interference ratio as specified in the conformance requirements.
- m) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- n) Once the number of USF/MCS-1 allocating the uplink for the MS as counted in step m) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.

- o) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.
- p) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.
- q) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.
- r) The SS repeats steps k) to q) for each of the coding schemes USF/MCS-2 to 4.
- s) The SS repeats steps k) to q) under extreme test conditions for coding scheme USF/MCS-4 only.

For 8-PSK Modulation:

- a) The SS transmits packets on PDTCH using MCS-5 coding to the MS on all allocated timeslots.
- b) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.
- c) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 2: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- d) Once the number of blocks transmitted with the current coding scheme as counted in step c) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.
- f) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.
- g) The SS repeats steps c) and d) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.
- h) The SS repeats steps b) to g) for each of the coding schemes MCS-6 to 8 and for the coding scheme MCS-9 with the TU low fading condition for both the wanted and the interfering signal.
- i) The SS repeats steps a) to h) under extreme test conditions for coding scheme MCS-9 only.
- j) The SS establishes the normal test conditions. An uplink TBF shall be established.
- k) The SS sets the value of the USF/MCS-5 such as to allocate the uplink to the MS.
- l) The SS transmits the unwanted signal at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.
- m) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.

- n) Once the number of USF/MCS-5 allocating the uplink for the MS as counted in step m) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- o) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 200 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.
- p) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz above the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.
- q) The SS repeats steps m) and n) with the unwanted signal transmitted at a nominal frequency 400 kHz below the nominal frequency of the wanted signal and its amplitude is set to achieve the adjacent interference ratio as specified in the conformance requirements.
- r) The SS repeats steps k) to q) for each of the coding schemes MCS-6 to 9.
- s) The SS repeats steps k) to r) under extreme test conditions for coding scheme MCS-9 only.

#### 14.18.3.5 Test requirements

The block error ratio, as calculated by the SS for different channels with different coding schemes and under TUhigh propagation condition, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

### 14.18.4 Intermodulation rejection

#### 14.18.4.1 Definition and applicability

The intermodulation rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of two or more unwanted signals with a specific frequency relationship to the wanted signal frequency. "Wanted signal" in this test is the signal generated by the transmitted RLC data blocks.

The requirements and this test apply to all types of MS which are capable of EGPRS operation.

#### 14.18.4.2 Conformance requirement

In the presence of two unwanted signals with a specific frequency relationship to the wanted signal frequency in both GMSK and 8-PSK modulations

1. The block error rate (BLER) performance for PDTCH/MCS1 to 4 shall not exceed 10 % and for PDTCH/MCS5 to 9 shall not exceed 10 % or 30 % depending on Coding Schemes; 3GPP TS 05.05, subclause 6.2.
2. The block error rate (BLER) performance for USF/MSC-1 to 9 shall not exceed 1 %; 3GPP TS 05.05, subclause 6.2.
3. The BLER shall not exceed the conformance requirements given in 1. - 2. under extreme conditions; 3GPP TS 05.05, subclause 6.2 and annex D subclauses D.2.1 and D.2.2.

#### 14.18.4.3 Test purpose

1. To verify that the MS does not exceed the conformance requirements for different channels and coding schemes under the static condition with an allowance for the statistical significance of the test.
2. To verify that Conformance Requirements are met under extreme conditions.

#### 14.18.4.4 Method of test

NOTE: The measurements address the third order intermodulation, which represents the most serious case.

## Initial conditions

For both GMSK and 8-PSK modulations, a downlink TBF is set up according to the generic procedure specified in clause 40 for packet switched with an ARFCN in the Mid ARFCN range, power control level set to maximum.

The SS transmits EGPRS RLC data blocks containing random data. The amplitude of the wanted signal is set to 4 dB above the reference sensitivity level with appropriate correction value as specified in table 14.18-3a for GMSK modulation and table 14.18-3b for 8-PSK modulation for PDTCH channel and in tables 14.18-4a for GMSK modulation and 14.18-4b for 8-PSK modulation for USF channel.

In addition to the static wanted test signal, the SS transmits two static interfering (unwanted) signals at the same time. There is no correlation in the modulation between the signals.

## Test procedure

For GMSK modulation:

- a) The SS transmits packets on PDTCH using MCS-4 coding to the MS on all allocated timeslots.
- b) The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above the ARFCN of the wanted signal. This signal is static, continuous and unmodulated.
- c) The second interfering signal is on an ARFCN eight above the ARFCN of the wanted signal. This signal is static, continuous and GMSK modulated by random data (I1).

The amplitude of both the interfering signals is set according to table 14.18-8.

- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 1: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- f) The SS repeats steps d) and e) with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.
- g) The SS repeats steps a) to f) with the receiver operating on an ARFCN in the Low ARFCN.
- h) The SS repeats steps a) to f) with the receiver operating on an ARFCN in the High ARFCN range.
- i) The SS repeats steps a) to f) for each of the coding schemes MCS-1 to 3.
- j) Steps a) to h) are repeated under extreme test conditions for MCS-4 only.
- k) The SS establishes the normal test conditions. An uplink TBF shall be established.
- l) The SS sets the value of the USF/MCS-4 such as to allocate the uplink to the MS.
- m) The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above the ARFCN of the wanted signal. This signal is static, continuous and unmodulated.
- n) The second interfering signal is on an ARFCN eight above the ARFCN of the wanted signal. This signal is static, continuous and GMSK modulated by random data (I1).

The amplitude of both the interfering signals is set according to table 14.18-8.

- o) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.

- p) Once the number of USF/MCS-4 allocating the uplink for the MS as counted in step o) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.
- q) The SS repeats steps o) and p) with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.
- r) The SS repeats steps l) to q) with the receiver operating on an ARFCN in the Low ARFCN.
- s) The SS repeats steps l) to q) with the receiver operating on an ARFCN in the High ARFCN range.
- t) The SS repeats steps l) to q) for each of the coding schemes MCS-1 to 3 with the receiver operating on an ARFCN in the Middle ARFCN range.
- u) The SS repeats steps l) to s) under extreme test conditions for MCS-4 only.

For 8-PSK Modulation:

- a) The SS transmits packets on PDTCH using MCS-9 coding to the MS on all allocated timeslots.
- b) The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above the ARFCN of the wanted signal. This signal is static, continuous and unmodulated.
- c) The second interfering signal is on an ARFCN eight above the ARFCN of the wanted signal. This signal is static, continuous and GMSK modulated by random data (I1).

The amplitude of both the interfering signals is set according to table 14.18-8.

- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 04.60, 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 2: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.
- f) The SS repeats steps d) and e) with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.
- g) The SS repeats steps a) to f) with the receiver operating on an ARFCN in the Low ARFCN.
- h) The SS repeats steps a) to f) with the receiver operating on an ARFCN in the High ARFCN range.
- i) The SS repeats steps a) to f) for each of the coding schemes MCS-5,6,7 and 8 with the receiver operating on an ARFCN in the Middle ARFCN range.
- j) The SS repeats steps a) to h) under extreme test conditions for MCS-9 only.
- k) The SS establishes the normal test conditions. An uplink TBF shall be established.
- l) The SS sets the value of the USF/MCS-9 such as to allocate the uplink to the MS.
- m) The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above the ARFCN of the wanted signal. This signal is static, continuous and unmodulated.
- n) The second interfering signal is on an ARFCN eight above the ARFCN of the wanted signal. This signal is static, continuous and GMSK modulated by random data (I1).

The amplitude of both the interfering signals is set according to table 14.18-8.

- o) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.

- p) Once the number of USF/MCS-9 allocating the uplink for the MS as counted in step o) reaches or exceeds the minimum number of blocks as given in table 14.18-2, the SS calculates the Block error ratio. The SS resets both counters.
- q) The SS repeats steps o) and p) with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.
- r) The SS repeats steps l) to q) with the receiver operating on an ARFCN in the Low ARFCN
- s) The SS repeats steps l) to q) with the receiver operating on an ARFCN in the High ARFCN range.
- t) The SS repeats steps l) to q) for each of the coding schemes MCS-5, 6, 7 and 8 with the receiver operating on an ARFCN in the Middle ARFCN range.
- u) The SS repeats steps l) to s) under extreme test conditions for MCS-9 only.

**Table 14.18-8: Intermodulation interfering test signal levels**

|                                       | GSM 400, GSM 700, GSM 850, GSM 900, PCS<br>1 900 |          | DCS 1 800     |         |
|---------------------------------------|--------------------------------------------------|----------|---------------|---------|
|                                       | Small MS                                         | Other MS | Class 1 and 2 | Class 3 |
| FIRST INTERFERER<br>dB $\mu$ Vemf( )  | 64                                               | 74       | 64            | 68      |
| SECOND INTERFERER<br>dB $\mu$ Vemf( ) | 63                                               | 63       | 64            | 68      |

NOTE: Some of the levels in table 14.18-8 are different to those specified in 3GPP TS 05.05 due to the consideration of the effect of modulation sideband noise from the second interferer.

#### 14.18.4.5 Test requirements

The block error ratio, as calculated by the SS for different channels with different coding schemes and under static condition, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

### 14.18.5 Blocking and spurious response

#### 14.18.5.1 Definition and applicability

Blocking is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted input signal, on frequencies other than those of the spurious responses or the adjacent channels, without exceeding a given degradation. "Wanted signal" in this test is the signal generated by the transmitted RLC data blocks.

The requirements and this test apply to all types of MS which are capable of EGPRS operation.

#### 14.18.5.2 Conformance requirement

- The blocking characteristics of the receiver are specified separately for in-band and out-of-band performance as identified in 3GPP TS 05.05 subclause 5.1.
- The block error rate (BLER) performance for PDTCH/MCS1 to 4 shall not exceed 10 % and for PDTCH/MCS5 to 9 shall not exceed 10 % or 30 % depending on Coding Schemes and for USF/MCS1 to 9 shall not exceed 1 % when the following signals are simultaneously input to the receiver; 3GPP TS 05.05, subclause 6.2:
  - a useful signal at frequency  $f_0$ , 3 dB above the reference sensitivity level specified in table 14.18-3a for GMSK modulation and table 14.18-3b for 8-PSK modulation for PDTCH channels; and in tables 14.18-4a for GMSK modulation and 14.18-4b for 8-PSK modulation for USF channel with correction values as specified in 3GPP TS 05.05 subclause 6.2;
  - a continuous, static sine wave unwanted signal at a level as in the table 14.18-9 below and at a frequency (f) which is an integer multiple of 200 kHz.

with the following exceptions, called spurious response frequencies:

- a) GSM 400: inband, for a maximum of three occurrences. 3GPP TS 05.05, subclause 5.1.  
     GSM 700, GSM 850 or GSM 900: in band, for a maximum of six occurrences (which if grouped shall not exceed three contiguous occurrences per group). 3GPP TS 05.05, subclause 5.1.  
     DCS 1 800 and PCS 1 900: in band, for a maximum of twelve occurrences (which if grouped shall not exceed three contiguous occurrences per group). 3GPP TS 05.05, subclause 5.1.
- b) out of band, for a maximum of 24 occurrences (which if below  $f_0$  and grouped shall not exceed three contiguous occurrences per group). 3GPP TS 05.05, subclause 5.1.

where the above performance shall be met when the continuous sine wave signal ( $f$ ) is set to a level of 70 dB $\mu$ V (emf) (i.e. -43 dBm). 3GPP TS 05.05, subclause 5.1.

#### 14.18.5.3 Test purpose

1. To verify that the in band blocking performance is met without exceeding the total number of allowed in band spurious responses. An allowance is made for the statistical significance of the test.
2. To verify that at selected out of band frequencies, the out of band blocking performance is met without exceeding the total number of allowed out of band spurious responses. An allowance is made for the statistical significance of the test.

NOTE: Not all of the possible out of band frequencies are tested as this results in excessive test time. However, the total number of out of band spurious responses, specified in 3GPP TS 05.05, are allowed to ensure a fair test of the MS.

#### 14.18.5.4 Method of test

##### Initial conditions

For both GMSK and 8-PSK modulations, a downlink TBF is set up according to the generic procedure specified in clause 40 for packet switched, except the BCCH frequency list shall be empty, on an arbitrary ARFCN in the range supported by the MS. The power control level is set to maximum power.

The SS transmits EGPRS RLC data blocks containing random data.

In addition to the wanted Test Signal, the SS transmit a static unmodulated continuous interfering signal (Standard Test Signal I0).

##### Test procedure

For GMSK Modulation:

- a) The SS is set to produce a TUhigh GMSK wanted signal and a static interfering signal at the same time. The SS sets the amplitude of the wanted signal to 4 dB above the reference sensitivity level specified in table 14.18-3a for PDTCH channel and in table 14.18-4a for USF channel with correction values as specified in 3GPP TS 05.05 subclause 6.2.
- b) The SS transmits packets on PDTCH using MSC-4 coding to MS on all allocated timeslots.
- c) The unwanted signal is of frequency FB. It is applied in turn on the subset of frequencies calculated at step d) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range  $FR \pm 600$  kHz are excluded.

NOTE: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies  $nFB$  where  $n = 2, 3, 4, 5$ , etc.

- d) The frequencies at which the test is performed (adjusted to an integer multiple of 200 kHz channels most closely approximating the absolute frequency of the calculated blocking signal frequency) are the combined frequencies from i), ii) and iii) which follow:

i) The total frequency range formed by:

GSM 400 the frequencies between  $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 3,6 \text{ MHz})$   
and  $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 3,6 \text{ MHz})$ .

GSM 700 the frequencies between  $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 7,5 \text{ MHz})$   
and  $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 7,5 \text{ MHz})$ .

GSM 850 the frequencies between  $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$   
and  $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$ .

P-GSM 900: the frequencies between  $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$   
and  $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$ .

E-GSM 900: the frequencies between  $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$   
and  $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$ .

DCS 1 800: the frequencies between  $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$   
and  $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$ .

PCS 1 900: the frequencies between  $F_{10} + (IF_1 + IF_2 + \dots + IF_n + 30 \text{ MHz})$   
and  $F_{10} - (IF_1 + IF_2 + \dots + IF_n + 30 \text{ MHz})$ .

and

the frequencies +100 MHz and -100 MHz from the edge of the relevant receive band.

Measurement are made at 200 kHz intervals.

ii) The three frequencies  $IF_1$ ,  $IF_1 + 200 \text{ kHz}$ ,  $IF_1 - 200 \text{ kHz}$ .

iii) The frequencies:

$mF_{10} + IF_1$ ;

$mF_{10} - IF_1$ ;

$mFR$ ;

where  $m$  is all positive integers greater than or equal to 2 such that either sum lies in the range 100 kHz to 12,75 GHz.

The frequencies in step ii) and iii) lying in the range of frequencies defined by step i) above need not be repeated.

Where:

$F_{10}$  - local oscillator applied to first receiver mixer

$IF_1 \dots IF_n$  - are the  $n$  intermediate frequencies

$F_{10}$ ,  $IF_1$ ,  $IF_2 \dots IF_n$  - shall be declared by the manufacturer in the PIXIT statement  
3GPP TS 51.010-1 annex 3.

e) The level of the unwanted signal is set according to table 14.18-9.

Table 14.18-9a: Level of unwanted signals

|                                      | GSM450                                    |          | GSM480   |          | GSM 900  |          | DCS 1 800 | PCS 1 900 |
|--------------------------------------|-------------------------------------------|----------|----------|----------|----------|----------|-----------|-----------|
|                                      | Small MS                                  | Other MS | Small MS | Other MS | Small MS | Other MS |           |           |
| <b>FREQUENCY</b>                     | <b>LEVEL IN dB<math>\mu</math>Vemf( )</b> |          |          |          |          |          |           |           |
| FR $\pm$ 600 kHz to FR $\pm$ 800 kHz | 70                                        | 75       | 70       | 75       | 70       | 75       | 70        | 70        |
| FR $\pm$ 800 kHz to FR $\pm$ 1,6 MHz | 70                                        | 80       | 70       | 80       | 70       | 80       | 70        | 70        |
| FR $\pm$ 1,6 MHz to FR $\pm$ 3 MHz   | 80                                        | 90       | 80       | 90       | 80       | 90       | 80        | 80        |
| 457,6 MHz to FR - 3 MHz              | 90                                        | 90       | -        | -        | -        | -        | -         | -         |
| FR + 3 MHz to 473,6 MHz              | 90                                        | 90       | -        | -        | -        | -        | -         | -         |
| 486 MHz to FR - 3MHz                 | -                                         | -        | 90       | 90       | -        | -        | -         | -         |
| FR + 3MHz to 502 MHz                 | -                                         | -        | 90       | 90       | -        | -        | -         | -         |
| 915 MHz to FR - 3 MHz                | -                                         | -        | -        | -        | 90       | 90       | -         | -         |

| 100 kHz to < 457,6 MHz               | 113                                       | 113      | -        | -        | -        | -        | -         | -         |
| > 473,6MHz to 12,750 MHz             | 113                                       | 113      | -        | -        | -        | -        | -         | -         |
| 100 kHz to < 486 MHz                 | -                                         | -        | 113      | 113      | -        | -        | -         | -         |
| > 502 MHz to 12,750 MHz              | -                                         | -        | 113      | 113      | -        | -        | -         | -         |
| 835 MHz to < 915 MHz                 | -                                         | -        | -        | -        | 113      | 113      | -         | -         |
| > 980 MHz to 1 000 MHz               | -                                         | -        | -        | -        | 113      | 113      | -         | -         |
| 100 kHz to < 835 MHz                 | -                                         | -        | -        | -        | 113      | 113      | -         | -         |
| > 1 000 MHz to 12,750 MHz            | -                                         | -        | -        | -        | 113      | 113      | -         | -         |
| 100 kHz to 1 705 MHz                 | -                                         | -        | -        | -        | -        | -        | 113       | -         |
| > 1 705 MHz to < 1 785 MHz           | -                                         | -        | -        | -        | -        | -        | 101       | -         |
| > 1 920 MHz to 1 980 MHz             | -                                         | -        | -        | -        | -        | -        | 101       | -         |
| > 1 980 MHz to 12,750 MHz            | -                                         | -        | -        | -        | -        | -        | 113       | -         |
| 100 kHz to < 1 830 MHz               | -                                         | -        | -        | -        | -        | -        | -         | 113       |
| 1 830 MHz to < 1 910 MHz             | -                                         | -        | -        | -        | -        | -        | -         | 101       |
| > 2 010 MHz to 2 070 MHz             | -                                         | -        | -        | -        | -        | -        | -         | 101       |
| > 2 070 MHz to 12,750 MHz            | -                                         | -        | -        | -        | -        | -        | -         | 113       |

Table 14-18-9b: Level of unwanted signals

| FREQUENCY                            | GSM 750                   | GSM 850 |
|--------------------------------------|---------------------------|---------|
|                                      | LEVEL IN dB $\mu$ Vemf( ) |         |
| FR $\pm$ 600 kHz to FR $\pm$ 800 kHz | 70                        | 70      |
| FR $\pm$ 800 kHz to FR $\pm$ 1,6 MHz | 70                        | 70      |
| FR $\pm$ 1,6 MHz to FR $\pm$ 3 MHz   | 80                        | 80      |
| 727 MHz to FR - 3 MHz                | 90                        | -       |
| FR + 3 MHz to 782 MHz                | 90                        | -       |
| 849 MHz to FR - 3 MHz                | -                         | 90      |
| FR + 3 MHz to 914 MHz                | -                         | 90      |
| 100 kHz to < 727 MHz                 | 113                       | -       |
| > 782 MHz to 12,75 GHz               | 113                       | -       |
| 100 kHz to < 849 MHz                 | -                         | 113     |
| > 914 MHz to 12,75 GHz               | -                         | 113     |

NOTE 1: For E-GSM 900 MS the level of the unwanted signal in the band 905 MHz to 915 MHz is relaxed to 108 dB $\mu$ Vemf( ). 3GPP TS 05.05, subclause 5.1.

NOTE 2: a) For R-GSM 900 MS the level of the unwanted signal in the band 880 MHz to 915 MHz is relaxed to 108 dBuVemf( ). 3GPP TS 05.05, subclause 5.1.

b) For R-GSM 900 small MS the level of the unwanted signal in the band 876 MHz to 915 MHz is relaxed to 106 dBuVemf( ). 3GPP TS 05.05, subclause 5.1.

NOTE 3: a) For GSM 450 small MS the level of the unwanted signal in the band 450,4 MHz to 457,6 MHz is relaxed to 108 dBuVemf( ). 3GPP TS 05.05, subclause 5.1.

b) For GSM 480 small MS the level of the unwanted signal in the band 478,8 MHz to 486 MHz is relaxed to 108 dBuVemf( ). 3GPP TS 05.05, subclause 5.1.

f) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 3GPP TS 04.60, subclause 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 1: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

g) Once the number of blocks transmitted with the current coding scheme as counted in step f) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters.

If a failure is indicated, it is noted and counted towards the allowed exemption total. In the case of failures discovered at the predicted frequencies at steps d i), ii) or iii) the test is repeated on the adjacent channels  $\pm 200$  kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

h) The SS sets the value of the USF/MCS-4 such as to allocate the uplink to the MS.

i) The unwanted signal is of frequency FB. It is applied in turn on the subset of frequencies calculated at step d) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range  $FR \pm 600$  kHz are excluded.

NOTE 2: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies  $nFB$  where  $n = 2, 3, 4, 5$ , etc.

j) The level of the unwanted signal is set according to table 14.18-9.

k) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.

l) Once the number of USF/MCS-4 allocating the uplink for the MS as counted in step k) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters. If a failure is indicated, it is noted and counted towards the allowed exemption total.

In the case of failures discovered at the predicted frequencies at steps d i), ii) or iii) the test is repeated on the adjacent channels  $\pm 200$  kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

For 8-PSK Modulation:

a) The SS is set to produce a static 8-PSK wanted signal and a static interfering signal at the same time. The SS sets the amplitude of the wanted signal to 4 dB above the reference sensitivity level specified in table 14.18-3b for PDTCH channel and in table 14.18-4b for USF channel with correction values as specified in 3GPP TS 05.05 subclause 6.2;

b) The SS transmits packets on PDTCH using MSC-9 coding to MS on all allocated timeslots.

c) The unwanted signal is of frequency FB. It is applied in turn on the subset of frequencies calculated at step d) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range  $FR \pm 600$  kHz are excluded.

NOTE 3: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies  $nFB$  where  $n = 2, 3, 4, 5$ , etc.

d) The frequencies at which the test is performed (adjusted to an integer multiple of 200 kHz channels most closely approximating the absolute frequency of the calculated blocking signal frequency) are the combined frequencies from i), ii) and iii) which follow:

i) The total frequency range formed by:

GSM 400 the frequencies between  $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 3,6 \text{ MHz})$   
and  $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 3,6 \text{ MHz})$ .

GSM 700 the frequencies between  $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 7,5 \text{ MHz})$   
and  $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 7,5 \text{ MHz})$ .

GSM 850 the frequencies between  $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$   
and  $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$ .

P-GSM 900: the frequencies between  $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$   
and  $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$ .

E-GSM 900: the frequencies between  $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$   
and  $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$ .

DCS 1 800: the frequencies between  $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$   
and  $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$ .

PCS 1 900: the frequencies between  $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 30 \text{ MHz})$   
and  $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 30 \text{ MHz})$ .

and

the frequencies +100 MHz and -100 MHz from the edge of the relevant receive band.

Measurement are made at 200 kHz intervals.

ii) The three frequencies  $IF_1$ ,  $IF_1 + 200 \text{ kHz}$ ,  $IF_1 - 200 \text{ kHz}$ .

iii) The frequencies:

$mF_{lo} + IF_1$ ;

$mF_{lo} - IF_1$ ;

$mFR$ ;

where  $m$  is all positive integers greater than or equal to 2 such that either sum lies in the range 100 kHz to 12,75 GHz.

The frequencies in step ii) and iii) lying in the range of frequencies defined by step i) above need not be repeated.

Where:

$F_{lo}$  - local oscillator applied to first receiver mixer

$IF_1 \dots IF_n$  - are the  $n$  intermediate frequencies

$F_{lo}$ ,  $IF_1$ ,  $IF_2 \dots IF_n$  - shall be declared by the manufacturer in the PIXIT statement  
3GPP TS 51.010-1 annex 3.

- e) The level of the unwanted signal is set according to table 14.18-9.
- f) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 04.60, 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

NOTE 4: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- g) Once the number of blocks transmitted with the current coding scheme as counted in step f) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters. If a failure is indicated, it is noted and counted towards the allowed exemption total.

In the case of failures discovered at the predicted frequencies at steps d i), ii) or iii) the test is repeated on the adjacent channels  $\pm 200$  kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

- h) The SS sets the value of the USF/MCS-9 such as to allocate the uplink to the MS.
- j) The unwanted signal is of frequency FB. It is applied in turn on the subset of frequencies calculated at step d) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range  $FR \pm 600$  kHz are excluded.

NOTE 5: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies  $nFB$  where  $n = 2, 3, 4, 5$ , etc.

- k) The level of the unwanted signal is set according to table 14.18-9.
- l) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- m) Once the number of USF/MCS-9 allocating the uplink for the MS as counted in step l) reaches or exceeds the minimum number of blocks as given in table 14-18-2, the SS calculates the Block error ratio. The SS resets both counters. If a failure is indicated, it is noted and counted towards the allowed exemption total.

In the case of failures discovered at the predicted frequencies at steps d i), ii) or iii) the test is repeated on the adjacent channels  $\pm 200$  kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

#### 14.18.5.5 Test requirements

The block error ratio as calculated by the SS for different channels and coding schemes shall not exceed the conformance requirement.

This shall apply under normal test voltage and ambient temperature, and with the interfering signal at any frequency in the range specified.

The following exceptions are allowed:

- GSM 400: A maximum of three failures in the band 457,6 MHz to 473,6 MHz for GSM450 and in the band 486,0 MHz to 502,0 MHz for GSM480  
  - A maximum of 24 in the combined bands 100 kHz to 457,6 MHz and 473,6 MHz to 12,75 GHz for GSM 450 and in the combined bands 100 kHz to 486,0 MHz and 502,0 MHz to 12,75 GHz for GSM 480 (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).
- GSM 750: A maximum of six failures in the frequency band 727 MHz to 782 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).  
  - A maximum of 24 failures in the combined bands 100 kHz to 727 MHz and 782 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

- GSM 850: A maximum of six failures in the frequency band 849 MHz to 914 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).
- A maximum of 24 failures in the combined bands 100 kHz to 849 MHz and 914 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).
- GSM 900: A maximum of six failures in the band 915 MHz to 980 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).
- A maximum of 24 in the combined bands 100 kHz to 915 MHz and 980 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).
- DCS 1 800: A maximum of twelve failures in the band 1 785 MHz to 1 920 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).
- A maximum of 24 in the combined bands 100 kHz to 1 785 MHz and 1 920 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).
- PCS 1 900: A maximum of twelve failures in the band 1 910 MHz to 2 010 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).
- A maximum of 24 in the combined bands 100 kHz to 1 910 MHz and 2 010 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

If the number of failures do not exceed the maximum allowed figures stated above, the test of 14.18.5.4 is repeated at the frequencies at which the failures occurred. The level of the unwanted signal is set to 70 dBuVemf( ) and the performance requirement is once again that stated above.

The number of Error Events recorded in this test shall not exceed the test limit error rate values given above, when using the maximum number of samples.

No failures are allowed at this lower unwanted signal level.

## 14.18.6 EGPRS Usable receiver input level range

### 14.18.6.1 Definition and applicability

The usable receiver input level range is the range of the radio frequency input level of a specified modulated signal over which bit error ratio stay between specified limits.

The requirements and this test apply to all types of MS which are capable of EGPRS operation.

### 14.18.6.2 Conformance requirement

1. The receiver input level range requirements of 3GPP TS 05.05 subclause 6.1 for raw data bits of GMSK modulation under static and EQ propagation conditions shall be met:
  - 1.1 Under normal conditions.
  - 1.2 Under extreme conditions.
2. The receiver input level range requirements of 3GPP TS 05.05 subclause 6.1 for raw data bits of 8PSK modulation under static condition shall be met:
  - 2.1 Under normal conditions.
  - 2.2 Under extreme conditions.
3. The receiver input level range requirements of 3GPP TS 05.05 subclause 6.1 for raw data bits of 8PSK modulation with random frequency offset under static condition shall be met:
  - 3.1 Under normal conditions.
  - 3.2 Under extreme conditions.

### 14.18.6.3 Test purpose

1. To verify that the MS does not exceed the conformance requirement with an allowance for the statistical significance of the test.
  - 1.1 Under normal conditions.
  - 1.2 Under extreme conditions.

### 14.18.6.4 Test Method

#### Initial Conditions

The MS is assumed to be EGPRS attached.

The SS establishes a downlink TBF on one timeslot.

The SS commands the MS to request an establishment of the TBF Uplink and to create a channel loop back after demodulation and before decoding. This is achieved using the EGPRS test mode by transmitting a EGPRS TEST\_CMD (see 3GPP TS 04.14, subclause TBD)

#### Test Procedure

For GMSK Modulation:

- a) The SS shall transmit the pseudo-random data using the standard GMSK-modulated test signal in the Mid ARFCN range and the input level at the receiver input shall be 20 dB above the Reference Sensitivity Level.
- b) The SS compares the data that it sends to the MS with the data which is looped back from the receiver after demodulation and before decoding.

The SS tests the bit error ratio for the data bits, by examining sequences of at least the minimum number of samples specified in the test requirements. The number of error events is recorded.

- c) Step b) is repeated with the input level at the receiver input increased to 73 dB $\mu$ Vemf().
- d) Step b) is repeated with the input level at the receiver input increased to the following values:  
For GSM 400 and GSM 900: 98 dB $\mu$ Vemf().  
For DCS 1 800 and PCS 1 900: 90 dB $\mu$ Vemf().
- e) The SS fading function is set to EQ.
- f) Step b) is repeated with the input level at the receiver input set to 20dB above the reference sensitivity level() and then increased to 73 dB $\mu$ Vemf().
- g) Steps a) to f) are repeated under extreme test conditions.

For 8PSK Modulation:

- a) The SS shall transmit the pseudo-random data using the standard 8PSK-modulated test signal in the Mid ARFCN range and the input level at the receiver input shall be 20dB above the Reference Sensitivity Level. For the EGPRS Class A MS, the standard GMSK-modulated test signal will be used for UL transmission.
- b) The SS compares the data that it sends to the MS with the data which is looped back from the receiver after demodulation and before decoding.  
  
The SS tests the bit error ratio for the data bits, by examining sequences of at least the minimum number of samples specified in the test requirements. The number of error events is recorded.
- c) Step b) is repeated with the input level at the receiver input increased to 73 dB $\mu$ Vemf().
- d) Step b) is repeated with the input level at the receiver input increased to 87 dB $\mu$ Vemf().
- e) Steps a) to d) are repeated under extreme test conditions.

For 8PSK Modulation with random frequency offset:

- a) The SS shall transmit the pseudo-random data using the standard 8PSK-modulated test signal with random frequency offset within 0,1ppm in the Mid ARFCN range and the input level at the receiver input shall be 20 dB above the Reference Sensitivity Level. For the EGPRS Class A MS, the standard GMSK-modulated test signal will be used for UL transmission.
- b) The SS compares the data that it sends to the MS with the data which is looped back from the receiver after demodulation and before decoding.

The SS tests the bit error ratio for the data bits, by examining sequences of at least the minimum number of samples specified in the test requirements. The number of error events is recorded.

- c) Step b) is repeated with the input level at the receiver input increased to 73 dB $\mu$ Vemf().
- d) Step a) to c) are repeated under extreme test conditions.

#### 14.18.6.5 Test Requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14.18-10. This shall apply for any combination of normal and extreme test voltages and ambient temperature, for the different propagation conditions and for any level of input signal to the receiver.

**Table 14.18-10: Limits for input level range**

| Type of test signals                      | Type of measurement | Propaga-tion Conditions        | GSM 400 and 900         |                        | DCS 1 800 and PCS 1 900 |                        |
|-------------------------------------------|---------------------|--------------------------------|-------------------------|------------------------|-------------------------|------------------------|
|                                           |                     |                                | Test limit Error rate % | Minimum No. of samples | Test limit Error rate % | Minimum No. of samples |
| GMSK                                      | BER                 | Static <= 73dB $\mu$ Vemf()    | 0,012                   | 1 640 000              | 0,012                   | 1 640 000              |
|                                           |                     | Static <= 98dB $\mu$ Vemf()    | 0,122                   | 164 000                | 0,122                   | 164 000                |
|                                           |                     | Static <= 90dB $\mu$ Vemf() EQ | 3,25                    | 120 000                | 3,25                    | 120 000                |
| 8PSK                                      | BER                 | Static<= 73dB $\mu$ Vemf()     | 0,012                   | 1 640 000              | 0,012                   | 1 640 000              |
|                                           |                     | Static <= 87dB $\mu$ Vemf()    | 0,122                   | 164 000                | 0,122                   | 164 000                |
| 8PSK with frequency offset within 0,1 ppm | BER                 | Static <= 73dB $\mu$ Vemf()    | 0,012                   | 1 640 000              | 0,122                   | 164 000                |

### 14.18.7 Incremental Redundancy Performance

#### 14.18.7.1 Definition and applicability

In Incremental Redundancy RLC mode, soft information from multiple, differently punctured versions of an RLC data block may be used when decoding the RLC data block. This significantly increases the link performance.

The requirements and this test apply to all EGPRS MS.

#### 14.18.7.2 Conformance requirement

An EGPRS capable MS shall, under the conditions stated in the table below, achieve a long-term throughput of 20 kbps per time slot (see NOTE) measured between LLC and RLC/MAC layer.

|                                 |                                        |
|---------------------------------|----------------------------------------|
| Propagation conditions          | Static, input level -97,0 dBm          |
| Modulation and Coding Scheme    | MCS-9                                  |
| Acknowledgements polling period | 32 RLC data blocks                     |
| Roundtrip time                  | 120 ms                                 |
| Number of timeslots             | Maximum capability of the MS           |
| Transmit window side            | Maximum for the MS timeslot capability |

NOTE: This corresponds to an equivalent block error rate of approximately 0.66 using the prescribed MCS-9.

3GPP TS 05.05, subclause 6.7 (3GPP 45.005, subclause 6.7).

#### 14.18.7.3 Test purpose

To verify that the EGPRS MS operating in Incremental Redundancy RLC mode achieves a long-term throughput of 20 kbps per timeslot, measured between LLC and RLC/MAC layer, under the conditions defined in conformance requirement.

#### 14.18.7.4 Method of test

The SS establishes a downlink TBF in Incremental Redundancy RLC mode, on a Mid ARFCN Range, under the conditions defined in the conformance requirement. The downlink data transfer is proceeded according the Incremental Redundancy RLC mode procedures using MCS-9. The throughput between LLC and RLC/MAC layer is determined by the SS on the basis of the amount of successfully delivered LLC data, i.e. the amount of data bits in acknowledged RLC data blocks representing LLC or higher layer data. The long-term throughput is determined as an average of data throughput measurements performed in Low, Mid and High ARFCN ranges, with three averaged data throughput measurements performed on each frequency range.

##### 14.18.7.4.1 Initial conditions

The SS establishes a downlink EGPRS TBF in Incremental Redundancy RLC mode according to the generic procedures defined in sect. 50, on a Mid ARFCN Range. For the TBF, the SS allocates the maximum number of timeslots according to the multislot capability of the MS under test, applies MCS-9 as the Modulation and Coding Scheme and the maximum transmit window size the number of used time slots allow for the data transfer. The SS commands the MS to use maximum transmit power in the uplink, decreases the transmit power to -96 dBm in the downlink and preserves the fading conditions as static.

##### 14.18.7.4.2 Procedure

- a) Using MSC-9 with Puncturing Scheme 1 (PS1), the SS continues the EGPRS TBF in the downlink by transmitting RLC data blocks with valid Block Sequence Numbers (BSN) within the transmit window of maximum size according to MS's multislot class, and polls the MS for acknowledgements after every polling period of 32 RLC data blocks.
- b) The SS updates its associated acknowledge state array V(B) according to the ack/nack bitmap in the EGPRS Downlink Ack/Nack message transmitted by the MS as a response to polling.
- c) While continuing the transmission of further RLC data blocks with PS1, the SS retransmits, after a delay that corresponds to a round trip time of 120ms, all unacknowledged RLC data blocks with PS2 starting from the oldest unacknowledged RLC blocks.
- d) The SS repeats the steps a) to c). For retransmissions of RLC data blocks that have already been retransmitted with PS2, the SS applies PS3 for such blocks and further again PS1 and PS2 in cyclic manner if necessary.
- e) Steps a) to d) are repeated until either all RLC data block of valid BSNs within the transmit window are transmitted and acknowledged or the LA/IR bit in the EGPRS Packet Ack/Nack message is set by the MS to indicate the memory run out for IR operation.
- f) The SS calculates the data throughput per time slot between RLC/MAC and LLC layers on the basis of successfully transmitted LLC-data during steps a) to e).
- g) Steps a) to f) are repeated three times. The SS calculates the average LLC data throughput over these three test runs.

- h) Steps a) to g) are repeated at Low and High ARFCN ranges. The SS calculates the average throughput of LLC data over the test runs on Low, Mid and High ARFCN ranges.

#### 14.18.7.5 Test requirements

The average long-term throughput per time slot as a result of step h) of the test procedure 14.18.7.4.2 shall equal or exceed 20 kbps.

---

## 15 Timing advance and absolute delay

### 15.1 Definition and applicability

Timing advance (TA) is a time offset in bits as sent to the MS by the BS. The MS shall advance its transmissions to the BS by the timing advance relative to 3 timeslots behind transmissions received from the BS.

The absolute delay is the delay between a common burst reference point within the received and the transmitted RF burst.

NOTE: For normal or dummy bursts, the common burst reference point is defined to be the transition from bit 13 to bit 14 of the midamble. For an access burst it is defined to be the transition from bit 48 to bit 49 of the burst.

Equivalently the delay can be referenced to the modulator input vs. the demodulator output or to the differential encoder input vs. the differential decoder output, provided the measured delay is corrected for the additional delays in the signal path.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS.

### 15.2 Conformance requirement

- 1) The random access burst transmission, measured at the MS antenna, shall use a TA of 0, and therefore be 3 timeslots behind the transmissions received from the BTS, with an absolute tolerance of  $\pm 1$  bit period.

3GPP TS 05.10, subclauses 6.4 and 6.6.

- 2) The normal burst transmission, measured at the MS antenna, shall be 3 timeslots - TA behind the transmissions received from the BTS, with an absolute tolerance of  $\pm 1$  bit period.

3GPP TS 05.10, subclause 6.4.

- 3) When the MS receives a new value of TA on the SACCH, it shall implement the new value of TA at the first TDMA frame belonging to the next reporting period, after the SACCH frame containing the new TA value.

3GPP TS 05.10, subclause 6.5.

- 4) The MS shall signal the used TA to the BS, in the L1 header of the uplink SACCH message.

3GPP TS 05.10, subclause 6.4, 3GPP TS 04.04, subclause 7.2.

### 15.3 Test purpose

- 1) To verify that the MS uses a TA value of 0 for the access burst.
- 2) To verify that the MS meets the absolute receive/transmit delay requirement for the access burst.
- 3) To verify that the MS meets the absolute receive/transmit delay requirement for normal bursts.
- 4) To verify that the MS implements a new timing advance value as signalled on the SACCH as in the requirement.
- 5) To verify that the MS sends the TA used on the uplink SACCH as in the requirement.

### 15.4 Method of test

#### 15.4.1 Initial conditions

The SS sends "MAXRETRANS = 7" and "TX-INTEGGER = 3" on the BCCH.

The MS is brought into MM state "idle, updated".

#### 15.4.2 Procedure

- a) The SS pages the MS after 10 s.
- b) The SS does not respond to the first 7 CHANNEL REQUEST messages from the MS. The SS responds to the 8th CHANNEL REQUEST from the MS on the RACH by sending an IMMEDIATE ASSIGNMENT message, with TA set to 0.
- c) The SS continues to set up a call according to the generic call set up procedure.
- d) The SS signals the TA values 10, 20, 30, 40, 50, 60, 63, and one random value other than these values to the MS in consecutive SACCH blocks.

For GSM 400 MS, the SS signals the TA values 35, 70, 105, 140, 175, 210, 219, and one random value other than these values to the MS in consecutive SACCH blocks.

The SS determines the TA value set in the L1 header on the uplink SACCH for each timing advance.

The SS measures the absolute delay for all bursts.

#### 15.5 Test requirement

The measured receive/transmit delay for each burst shall equal the following nominal values with an absolute tolerance of  $\pm 1$  bit period:

access bursts: 3 timeslots (= 45/26 ms).

normal bursts: 3 timeslots (= 45/26 ms) minus the last TA value received from the SS.

The MS shall use the new timing advance at the first TDMA frame belonging to the next reporting period after the SACCH frame containing the new TA value.

The TA field in the uplink SACCH L1 header shall contain to the most recently ordered TA value.

#### 15.6 GPRS Timing advance and absolute delay

##### 15.6.1 Definition and applicability

Timing advance (TA) is a time offset in bits as sent to the MS by the BS. The MS shall advance its transmissions to the BS by the timing advance relative to 3 timeslots behind transmissions received from the BS.

The absolute delay is the delay between a common burst reference point within the received and the transmitted RF burst.

The timing advance procedure is used to derive the correct value for timing advance that the MS has to use for the uplink transmission of radio blocks.

The timing advance procedure comprises two parts:

- initial timing advance estimation;
- continuous timing advance update.

NOTE: For normal or dummy bursts, the common burst reference point is defined to be the transition from bit 13 to bit 14 of the midamble. For an access burst it is defined to be the transition from bit 48 to bit 49 of the burst.

Equivalently the delay can be referenced to the modulator input vs. the demodulator output or to the differential encoder input vs. the differential decoder output, provided the measured delay is corrected for the additional delays in the signal path.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1900 MS supporting GPRS.

## 15.6.2 Conformance requirement

- 1) The random access burst transmission, measured at the MS antenna, shall use a TA of 0, and therefore be 3 timeslots behind the transmissions received from the BTS, with an absolute tolerance of  $\pm 1$  bit period.

3GPP TS 05.10, subclauses 6.4 and 6.6.

- 2) The normal burst transmission, measured at the MS antenna, shall be 3 timeslots - TA behind the transmissions received from the BTS, with an absolute tolerance of  $\pm 1$  bit period. In case of a multislot configuration, the MS shall use a common timebase for transmission of all channels. In this case, the MS may optionally use a timeslot length of 157 bit periods on timeslots  $TN = 0$  and 4, and 156 bit periods on timeslots with  $TN = 1, 2, 3, 5, 6$  and 7, rather than 156,25 bit periods on all timeslots. In case of a packet switched multislot configuration the common timebase shall be derived from all timeslots monitored by the MS. In this case, the MS may assume that the BTS uses a timeslot length of 156,25 bit periods on all timeslots

3GPP TS 05.10, subclause 6.4.

- 3) For an MS in Packet transfer mode, except MS class A in dedicated mode:

Within the packet resource assignments (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60) for uplink or downlink messages the MS gets the Timing Advance Index (TAI). The MS shall send access bursts on the subchannel defined by the TAI on the PTCCH using  $TA=0$ .

3GPP TS 05.10, subclause 6.5.2.

- 4) For an MS in Packet transfer mode, except MS class A in dedicated mode:

When the MS receives the updated value of TA from the BTS on the downlink PTCCH, it shall always use the last received TA value for the uplink transmission.

3GPP TS 05.10, subclause 6.5.2.

- 5) For an MS in Packet transfer mode, except MS class A in dedicated mode:

Upon initiation of the continuous timing advance procedure the MS shall disregard the TA values on PTCCH until it has sent its first access burst on PTCCH.

3GPP TS 05.10, subclause 6.5.2.

- 6) For an MS in Packet transfer mode, except MS class A in dedicated mode:

The network may request the MS to send 4 access bursts to calculate a new TA value. For this purpose the network sets the system information element `CONTROL_ACK_TYPE` to indicate that the MS is to respond with a `PACKET_CONTROL_ACKNOWLEDGEMENT` consisting of 4 access bursts (see 3GPP TS 04.60), and sends a `PACKET_POLLING_REQUEST` to the MS. In this case, the MS shall transmit 4 consecutive access bursts on the assigned resources.

3GPP TS 05.10, subclause 6.5.2.

- 7) For an MS in Packet transfer mode, except MS class A in dedicated mode:

If the MS receives a resource assignment or power control/timing advance message (see 3GPP TS 04.60), the MS shall use the included TA value until it receives a new value on PTCCH.

3GPP TS 05.10, subclause 6.5.2.

- 8) For an MS in Packet transfer mode, except MS class A in dedicated mode:

If the MS receive a packet resource assignment (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60) indicating to the MS that it can only start the uplink transmission on PTCCH after the timing advance is obtained by the continuous update procedure, the MS shall start the packet transfer after the TA value is received on the PTCCH.

3GPP TS 05.10, subclause 6.5.2.

9) For an MS in Packet transfer mode, except MS class A in dedicated mode:

If the MS receives a packet resource assignment (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60) indicating that a default timing advance shall be used, the MS shall not use the continuous timing advance procedure.

3GPP TS 05.10, subclause 6.5.2.

10) For an MS in Packet transfer mode, except MS class A in dedicated mode:

When the MS receives a new or updated TA value on the downlink PTCCH or downlink PACCH, the MS shall be ready to transmit using the new TA value within 40 ms of the end of the last timeslot of the message block containing the new TA value.

3GPP TS 05.10, subclause 6.9.

NOTE: A MS class A in dedicated mode has to follow the procedures described in 3GPP TS 05.10 subclause 6.5.1.

### 15.6.3 Test purpose

- 1) To verify that the MS uses a TA value of 0 for the access burst.
- 2) To verify that the MS meets the absolute receive/transmit delay requirement for the access burst.
- 3) To verify that the MS meets the absolute receive/transmit delay requirement for normal bursts.
- 4) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, when it receives an updated value of TA from the BTS on the downlink PTCCH, uses the last received TA value for the uplink transmission, respecting conformance requirement 10.
- 5) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, upon initiation of the continuous timing advance procedure shall disregard the TA values on PTCCH until it has sent its first access burst on PTCCH.
- 6) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, if it receives a packet polling message as defined in conformance requirement 6, sends 4 access bursts on a network assigned uplink resource.
- 7) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, if it receives a resource assignment or power control/timing advance message (see 3GPP TS 04.60), uses the included TA value until it receives a new value on PTCCH.
- 8) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, if it receives a packet resource assignment (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60) indicating to the MS that it can only start the uplink transmission on PDTCH after the timing advance is obtained by the continuous update procedure, it starts the packet transfer after the TA value is received on the PTCCH respecting conformance requirement 10.
- 9) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, if it receives a packet resource assignment (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60) indicating that a default timing advance shall be used, does not use the continuous timing advance procedure.

### 15.6.4 Method of test

#### 15.6.4.1 Initial conditions

The test shall be run under the default GPRS conditions defined in clause 40.

The SS sets the Packet System Information 1 parameter CONTROL\_ACK\_TYPE to "0".

The MS is brought into packet idle mode.

The Test Mode defined in 3GPP TS 04.14 (subclause 5.4) may be used for uplink TBF. If the MS is capable of both:

Mode (a) transmitting pseudo-random data sequence in RLC data blocks;

Mode (b) transmitting looped-back RLC data blocks;

then Mode (a) will be used.

If Mode (b) is used then the SS sends the pseudo-random data sequence specified for Mode (a) on the downlink for loopback on the uplink.

If the Test Mode is not used, the MS shall be PDP context activated and triggered for uplink data transfer (up to 2000 octets of data) in order to supply the necessary uplink data.

NOTE: The Test Requirements (15.6.5) are based on a One Phase Packet Access protocol, see 3GPP TS 04.60.

#### 15.6.4.2 Procedure

- a) The SS pages MS on the PPCH. The SS measures the receive/transmit delay for each burst.
- b) The MS is brought into packet transfer mode. The SS transmits a packet resource assignment to the MS with a valid TAI. The SS transmits a TA value on the PTCCH for this TAI which is not 0 nor 1. The SS measures the receive/transmit delay for each burst.
- c) The SS transmits a number of different TA values on the PTCCH for the TAI assigned to the MS. The SS also changes the TA values on the PTCCH for the other TAI in such a way that there is no correlation between TA values. The SS measures the receive/transmit delay for each burst.
- d) The SS transmits a new TA value, different by more than 1 from the previously transmitted one, in such a way that the MS can only correctly receive the last (4th) occurrence of the new TA value. The SS measures the receive/transmit delay for each burst.
- e) The MS is made to send a Packet Channel Request. The SS responds with a Packet Queuing Notification. After 4 s the SS sends a Packet Polling, addressing the MS with its Temporary Queuing Identity. The SS measures the receive/transmit delay for each burst.

NOTE: The wait must be less than 5 seconds, see 3GPP TS 04.60 subclause 7.1.2.2.2., timer T3162.

- f) The SS sends a Packet Uplink Assignment to the MS with valid TIMING\_ADVANCE\_INDEX, TIMING\_ADVANCE\_TIMESLOT\_NUMBER, and TIMING\_ADVANCE\_VALUE. As part of the subsequent continuous timing advance update procedure, the SS sends a timing advance value on the downlink PTCCH for the MS, that is different from the TIMING\_ADVANCE\_VALUE in the Packet Uplink Assignment. The SS measures the receive/transmit delay for each burst.
- g) The SS sends a Packet Uplink Assignment to the MS with valid TIMING\_ADVANCE\_INDEX and TIMING\_ADVANCE\_TIMESLOT\_NUMBER corresponding to the PTCCH, and with the TIMING\_ADVANCE\_VALUE field not present. The SS allocates uplink resources to the MS in such a way that the allocated uplink resources occur before the uplink PTCCH allocated to the MS. The SS measures the receive/transmit delay for each burst.
- h) The SS sends a Packet Uplink Assignment to the MS with TIMING\_ADVANCE\_VALUE set to a value different from the last one ordered on the PTCCH, and the TIMING\_ADVANCE\_INDEX and TIMING\_ADVANCE\_TIMESLOT\_NUMBER fields not present. The SS continues to transmit TA values on the PTCCH. These shall be different from the TA value TIMING\_ADVANCE\_VALUE in the Packet Uplink Assignment. The SS measures the receive/transmit delay for each burst.

#### 15.6.5 Test requirement

The measured receive/transmit delay for each burst shall equal the following nominal values with an absolute tolerance of  $\pm 1$  bit period.

access bursts: 3 timeslots (= 45/26 ms).

normal bursts: 3 timeslots (= 45/26 ms) minus the last TA value received from the SS.

In step a) the MS shall transmit an access burst on the PRACH.

In step b) the MS shall send access bursts on the PTCCH on the subchannel defined by the TAI with TA = 0.

In step c) the MS shall use the updated TA values.

In step d) the MS shall use the updated TA value.

In step e) the MS shall transmit 4 access bursts.

In step f) the MS shall use the TIMING\_ADVANCE\_VALUE in the Packet Uplink Assignment first, and change to the Timing Advance value transmitted on the downlink PTCCH in response to the sending of an access burst on the uplink PTCCH.

In step g) the MS shall not transmit on the allocated resources before it received a Timing Advance value on the downlink PTCCH in response to the sending of an access burst on the uplink PTCCH.

In step h) the last TA value received from the SS is the TIMING\_ADVANCE\_VALUE in the Packet Uplink Assignment.

## 15.7 ECSD Timing advance and absolute delay

### 15.7.1 Definition and applicability

Timing advance (TA) is a time offset in symbols as sent to the MS by the BS. The MS shall advance its transmissions to the BS by the timing advance relative to 3 timeslots behind transmissions received from the BS.

The absolute delay is the delay between a common burst reference point within the received and the transmitted RF burst.

NOTE: For normal bursts for GMSK modulation, the common burst reference point is defined to be the transition from bit 13 to bit 14 of the midamble. For normal bursts for 8-PSK modulation, the common burst reference point is defined to be the transition from symbol 13 to symbol 14 of the midamble. For an access burst it is defined to be the transition from bit 48 to bit 49 of the burst.

Equivalently the delay can be referenced to the modulator input vs. the demodulator output or to the differential encoder input vs. the differential decoder output, provided the measured delay is corrected for the additional delays in the signal path.

The requirement and this test apply to all types of MSs supporting ECSD.

### 15.7.2 Conformance requirement

- 1) The random access burst transmission, measured at the MS antenna, shall use a TA of 0, and therefore be 3 timeslots behind the transmissions received from the BTS, with an absolute tolerance of  $\pm 1$  symbol period.

3GPP TS 05.10, subclauses 6.4 and 6.6.

- 2) The normal burst transmission, measured at the MS antenna, shall be 3 timeslots - TA behind the transmissions received from the BTS, with an absolute tolerance of  $\pm 1$  symbol period. In case of a multislot configuration, the MS shall use a common timebase for transmission of all channels. In this case, the MS may optionally use a timeslot length of 157 symbol periods on timeslots TN = 0 and 4, and 156 symbol periods on timeslots with TN = 1, 2, 3, 5, 6 and 7, rather than 156,25 symbol periods on all timeslots. In case of a circuit switched multislot configuration, the common timebase shall be derived from the main channel and the TA values received on other channels shall be neglected.

3GPP TS 05.10, subclause 6.4.

- 3) When the MS receives a new value of TA on the SACCH, it shall implement the new value of TA at the first TDMA frame belonging to the next reporting period, after the SACCH frame containing the new TA value.

3GPP TS 05.10, subclause 6.5.1

- 4) The MS shall signal the used TA to the BS, in the L1 header of the uplink SACCH message.

3GPP TS 05.10, subclause 6.5.1, 3GPP TS 04.04, subclause 7.2.

### 15.7.3 Test purpose

- 1) To verify that the MS uses a TA value of 0 for the access burst.
- 2) To verify that the MS meets the absolute receive/transmit delay requirement for the access burst.
- 3) To verify that the MS meets the absolute receive/transmit delay requirement for normal bursts.
- 4) To verify that the MS implements a new timing advance value as signalled on the SACCH as in the requirement.
- 5) To verify that the MS sends the TA used on the uplink SACCH as in the requirement.
- 6) To verify that a multislot capable MS operates in accordance with the conformance requirement 2.

### 15.7.4 Method of test

#### Initial conditions

The SS sends "MAXRETRANS = 7" and "TX-INTEGGER = 3" on the BCCH.

The MS is brought into MM state "idle, updated".

#### Procedure

- a) The SS pages the MS after 10 s.
- b) The SS does not respond to the first 7 CHANNEL REQUEST messages from the MS. The SS responds to the 8th CHANNEL REQUEST from the MS on the RACH by sending an IMMEDIATE ASSIGNMENT message, with TA set to 0.
- c) The SS continues to set up a call according to the generic call set up procedure for ECSD. In the case of a multislot capable MS, the call is set up according to the generic call set up procedure for multislot configuration for ECSD and the SS commands the MS to operate with maximum number of both uplink and downlink timeslots according to the multislot class of the MS. In the case of class A ECSD MS, 8-PSK modulated channels shall be used in the downlink. In the case of class B ECSD MS, GMSK modulated channels shall be used in the downlink and 8-PSK modulated channels in the uplink.
- d) The SS signals the TA values 10, 20, 30, 40, 50, 60, 63, and one random value other than these values to the MS in consecutive SACCH blocks.

For GSM 400 MS, the SS signals the TA values 35, 70, 105, 140, 175, 210, 219, and one random value other than these values to the MS in consecutive SACCH blocks.

In the case of a multislot capable MS, the TA values defined above are signalled on the main channel of the multislot configuration, and on the subchannels TA values different from those ones are signalled.

The SS determines the TA value set in the L1 header on the uplink SACCH for each timing advance.

The SS measures the absolute delay for all bursts.

### 15.7.5 Test requirement

The measured receive/transmit delay for each burst shall equal the following nominal values with an absolute tolerance of  $\pm 1$  symbol period:

access bursts: 3 timeslots (= 45/26 ms).

normal bursts: 3 timeslots (= 45/26 ms) minus the last TA value received from the SS.

The MS shall use the new timing advance at the first TDMA frame belonging to the next reporting period after the SACCH frame containing the new TA value.

The TA field in the uplink SACCH L1 header shall contain to the most recently ordered TA value.

The multislot capable MS shall use a common TA value for all uplink channels, derived from the main downlink channel of the multislot configuration. The TA value in the uplink SACCH L1 header shall be that one.

## 15.8 EGPRS timing advance and absolute delay

### 15.8.1 Definition and applicability

Timing advance (TA) is a time offset in symbols as sent to the MS by the BS. The MS shall advance its transmissions to the BS by the timing advance relative to 3 timeslots behind transmissions received from the BS.

The absolute delay is the delay between a common burst reference point within the received and the transmitted RF burst.

The timing advance procedure is used to derive the correct value for timing advance that the MS has to use for the uplink transmission of radio blocks.

The timing advance procedure comprises two parts:

- initial timing advance estimation;
- continuous timing advance update.

NOTE: For normal bursts for GMSK modulation, the common burst reference point is defined to be the transition from bit 13 to bit 14 of the midamble. For normal bursts for 8-PSK modulation, the common burst reference point is defined to be the transition from symbol 13 to symbol 14 of the midamble. For an access burst it is defined to be the transition from bit 48 to bit 49 of the burst.

Equivalently the delay can be referenced to the modulator input vs. the demodulator output or to the differential encoder input vs. the differential decoder output, provided the measured delay is corrected for the additional delays in the signal path.

The requirement and this test apply to all types of MSs supporting EGPRS.

### 15.8.2 Conformance requirement

- 1) The random access burst transmission, measured at the MS antenna, shall use a TA of 0, and therefore be 3 timeslots behind the transmissions received from the BTS, with an absolute tolerance of  $\pm 1$  symbol period.

3GPP TS 05.10, subclauses 6.4 and 6.6.

- 2) The normal burst transmission, measured at the MS antenna, shall be 3 timeslots - TA behind the transmissions received from the BTS, with an absolute tolerance of  $\pm 1$  symbol period. In case of a multislot configuration, the MS shall use a common timebase for transmission of all channels. In this case, the MS may optionally use a timeslot length of 157 symbol periods on timeslots  $TN = 0$  and 4, and 156 symbol periods on timeslots with  $TN = 1, 2, 3, 5, 6$  and 7, rather than 156,25 symbol periods on all timeslots. In case of a packet switched multislot configuration the common timebase shall be derived from all timeslots monitored by the MS. In this case, the MS may assume that the BTS uses a timeslot length of 156,25 symbol periods on all timeslots

3GPP TS 05.10, subclause 6.4.

- 3) For an MS in Packet transfer mode, except MS class A in dedicated mode:

Within the packet resource assignments (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60) for uplink or downlink messages the MS gets the Timing Advance Index (TAI). The MS shall send access bursts on the subchannel defined by the TAI on the PTCCH using  $TA=0$ .

3GPP TS 05.10, subclause 6.5.2.

- 4) For an MS in Packet transfer mode, except MS class A in dedicated mode:

When the MS receives the updated value of TA from the BTS on the downlink PTCCH, it shall always use the last received TA value for the uplink transmission.

3GPP TS 05.10, subclause 6.5.2.

- 5) For an MS in Packet transfer mode, except MS class A in dedicated mode:

Upon initiation of the continuous timing advance procedure the MS shall disregard the TA values on PTCCH until it has sent its first access burst on PTCCH.

3GPP TS 05.10, subclause 6.5.2.

- 6) For an MS in Packet transfer mode, except MS class A in dedicated mode:

The network may request the MS to send 4 access bursts to calculate a new TA value. For this purpose the network sets the system information element CONTROL\_ACK\_TYPE to indicate that the MS is to respond with a PACKET\_CONTROL\_ACKNOWLEDGEMENT consisting of 4 access bursts (see 3GPP TS 04.60), and sends a PACKET\_POLLING\_REQUEST to the MS. In this case, the MS shall transmit 4 consecutive access bursts on the assigned resources.

3GPP TS 05.10, subclause 6.5.2.

- 7) For an MS in Packet transfer mode, except MS class A in dedicated mode:

If the MS receives a resource assignment or power control/timing advance message (see 3GPP TS 04.60), the MS shall use the included TA value until it receives a new value on PTCCH.

3GPP TS 05.10, subclause 6.5.2.

- 8) For an MS in Packet transfer mode, except MS class A in dedicated mode:

If the MS receive a packet resource assignment (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60) indicating to the MS that it can only start the uplink transmission on PDTCH after the timing advance is obtained by the continuous update procedure, the MS shall start the packet transfer after the TA value is received on the PTCCH.

3GPP TS 05.10, subclause 6.5.2.

- 9) For an MS in Packet transfer mode, except MS class A in dedicated mode:

If the MS receives a packet resource assignment (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60) indicating that a default timing advance shall be used, the MS shall not use the continuous timing advance procedure.

3GPP TS 05.10, subclause 6.5.2.

- 10) For an MS in Packet transfer mode, except MS class A in dedicated mode:

When the MS receives a new or updated TA value on the downlink PTCCH or downlink PACCH, the MS shall be ready to transmit using the new TA value within 40 ms of the end of the last timeslot of the message block containing the new TA value.

3GPP TS 05.10, subclause 6.9.

NOTE: A MS class A in dedicated mode has to follow the procedures described in 3GPP TS 05.10 subclause 6.5.1.

### 15.8.3 Test purpose

- 1) To verify that the MS uses a TA value of 0 for the access burst.
- 2) To verify that the MS meets the absolute receive/transmit delay requirement for the access burst.
- 3) To verify that the MS meets the absolute receive/transmit delay requirement for normal bursts in accordance with the conformance requirement 2.
- 4) To verify that an MS in Packet transfer mode, except for aMS Class A in dedicated mode, when it receives an updated value of TA from the BTS on the downlink PTCCH, uses the last received TA value for the uplink transmission, respecting conformance requirement 10.

- 5) To verify that an MS in Packet transfer mode, except for aMS Class A in dedicated mode, upon initiation of the continuous timing advance procedure shall disregard the TA values on PTCCH until it has sent its first access burst on PTCCH.
- 6) To verify that an MS in Packet transfer mode, except for a MS Class A in dedicated mode, if it receives a packet polling message as defined in conformance requirement 6, sends 4 access bursts on a network assigned uplink resource.
- 7) To verify that an MS in Packet transfer mode, except for a MS Class A in dedicated mode, if it receives a resource assignment or power control/timing advance message (see 3GPP TS 04.60), uses the included TA value until it receives a new value on PTCCH.
- 8) To verify that an MS in Packet transfer mode, except for a MS Class A in dedicated mode, if it receives a packet resource assignment (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60) indicating to the MS that it can only start the uplink transmission on PDTCH after the timing advance is obtained by the continuous update procedure, it starts the packet transfer after the TA value is received on the PTCCH respecting conformance requirement 10.
- 9) To verify that an MS in Packet transfer mode, except for a MS Class A in dedicated mode, if it receives a packet resource assignment (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60) indicating that a default timing advance shall be used, does not use the continuous timing advance procedure.

#### 15.8.4 Method of test

##### Initial conditions

The SS sets the Packet System Information 1 parameter CONTROL\_ACK\_TYPE to "0".

The MS is brought into packet idle mode.

##### Procedure

- a) The SS pages MS on the PPCH. The SS measures the receive/transmit delay for each burst.
- b) The SS brings the MS into packet transfer mode and orders the MS to transmit on the uplink for the duration of the test. This is achieved using the EGPRS test mode by transmitting a EGPRS TEST\_CMD (see 3GPP TS 04.14). Maximum number of uplink and downlink PDTCHs is allocated according to the multislot class of the MS. In case of class A EGPRS MS, 8-PSK modulated PDTCHs are used in the downlink. In case of class B EGPRS MS, GMSK modulated PDTCHs are used in the downlink and 8-PSK modulated PDTCHs are used in the uplink. The SS transmits a packet resource assignment to the MS with a valid TAI. The SS transmits a TA value on the PTCCH for this TAI which is not 0 nor 1. The SS measures the receive/transmit delay for each burst.
- c) The SS transmits a number of different TA values on the PTCCH for the TAI assigned to the MS. The SS also changes the TA values on the PTCCH for the other TAI in such a way that there is no correlation between TA values. For multislot capable MS, the TA values are transmitted on arbitrary downlink channels allocated for the MS. The SS measures the receive/transmit delay for each burst.
- d) The SS transmits a new TA value, different by more than 1 from the previously transmitted one, in such a way that the MS can only correctly receive the last (4th) occurrence of the new TA value. The SS measures the receive/transmit delay for each burst. The uplink TBF is terminated.
- e) The MS is made to send a Packet Channel Request by transmitting a EGPRS\_TEST\_CMD. The SS responds with a Packet Queuing Notification. After 10 s the SS sends a Packet Polling, addressing the MS with its Temporary Queuing Identity. The SS measures the receive/transmit delay for each burst.

NOTE: The 10 s is an arbitrary value.

- f) The SS sends a Packet Uplink Assignment to the MS with valid TIMING\_ADVANCE\_INDEX, TIMING\_ADVANCE\_TIMESLOT\_NUMBER, and TIMING\_ADVANCE\_VALUE. As part of the subsequent continuous timing advance update procedure, the SS sends a timing advance value on the downlink PTCCH for the MS, that is different from the TIMING\_ADVANCE\_VALUE in the Packet Uplink Assignment. The SS measures the receive/transmit delay for each burst.

- g) The SS sends a Packet Uplink Assignment to the MS with valid TIMING\_ADVANCE\_INDEX and TIMING\_ADVANCE\_TIMESLOT\_NUMBER corresponding to the PTCCH, and with the TIMING\_ADVANCE\_VALUE field not present. The SS allocates uplink resources to the MS in such a way that the allocated uplink resources occur before the uplink PTCCH allocated to the MS. The SS measures the receive/transmit delay for each burst.
- h) The SS sends a Packet Uplink Assignment to the MS with TIMING\_ADVANCE\_VALUE set to a value different from the last one ordered on the PTCCH, and the TIMING\_ADVANCE\_INDEX and TIMING\_ADVANCE\_TIMESLOT\_NUMBER fields not present. The SS continues to transmit TA values on the PTCCH. These shall be different from the TA value TIMING\_ADVANCE\_VALUE in the Packet Uplink Assignment. The SS measures the receive/transmit delay for each burst.

#### 15.8.4.3 Test requirement

The measured receive/transmit delay for each burst shall equal the following nominal values with an absolute tolerance of  $\pm 1$  symbol period.

access bursts: 3 timeslots (= 45/26 ms).

normal bursts: 3 timeslots (= 45/26 ms) minus the last TA value received from the SS.

In step a) the MS shall transmit an access burst on the PRACH.

In step b) the MS shall send access bursts on the PTCCH on the subchannel defined by the TAI with TA = 0.

In step c) the MS shall use the updated TA values on all of the allocated uplink channels.

In step d) the MS shall use the updated TA value.

In step e) the MS shall transmit 4 access bursts.

In step f) the MS shall use the TIMING\_ADVANCE\_VALUE in the Packet Uplink Assignment first, and change to the Timing Advance value transmitted on the downlink PTCCH in response to the sending of an access burst on the uplink PTCCH.

After step h) the MS shall not transmit on the allocated resources before it received a Timing Advance value on the downlink PTCCH in response to the sending of an access burst on the uplink PTCCH.

In step h) the last TA value received from the SS is the TIMING\_ADVANCE\_VALUE in the Packet Uplink Assignment.

---

## 16 Reception time tracking speed

### 16.1 Definition and applicability

Reception time tracking speed is the speed at which the MS adapts its transmit time to a change in the timing of the received signal.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS.

### 16.2 Conformance requirement

If the MS determines that the timing difference with signals received from the BS exceeds 2  $\mu$ s, the MS shall adjust its timebase in steps of 1/4 bit period, in intervals not less than 1 s and not greater than 2 s until the timing difference is less than 1/2 bit period at 3 dB below reference sensitivity and 3 dB less carrier to interference ratio than the reference interference ratios.

3GPP TS 05.10, subclauses 6 and 6.2.

### 16.3 Test purpose

- 1) To verify that the MS adapts its transmit time to the timing of the received signal as in the conformance requirement under TUHigh propagation conditions at 2 dB above reference sensitivity level( ).
- 2) To verify that the MS adapts its transmit time to the timing of the received signal as in the conformance requirement under RA propagation conditions at 2 dB above reference sensitivity level( ).

NOTE: This test is performed at a level higher than in the conformance requirement because of test implementation problems.

### 16.4 Method of test

#### 16.4.1 Initial conditions

The SS sets up a call according to the generic call set up procedure on a channel in the Mid ARFCN range.

The SS sets TUHigh.

#### 16.4.2 Procedure

- a) After 10 s the SS sets the input signal level to 2 dB above reference sensitivity level( ).
- b) For the last second before step c) the SS takes an average receive/transmit delay of all bursts in that 1 s.
- c) The SS increases the delay of the transmitted signal to the MS by a 2 bit step (about 7,4  $\mu$ s) and keeps this delay for 20 s.
- d) The SS measures the absolute receive/transmit delay for each burst.
- e) The SS increases the input signal level to 5 dB above reference sensitivity level( ) and sets propagation condition RA.
- f) The SS repeats steps a) to d).

## 16.5 Test requirement

The MS shall adjust the timing of its transmit burst back to the correct receive/transmit timing delay. All burst timings shall be within the shaded part of figure 16.1.

bits change  
of transmit  
timing

NOTE:  $t = 0$  is the time at which the SS makes the transmission timing step change in c) of subclause 16.4.2.

Figure 16.1

## 17 Access times during handover

### 17.1 Intra cell channel change

#### 17.1.1 Definition and applicability

The access times are:

- the time between either receipt by the MS of the last timeslot of the message block containing an ASSIGNMENT COMMAND or HANDOVER COMMAND and the time it has to be ready to transmit on the new channel; and
- the time between the end of the last complete speech or data frame or message block sent on the old channel and the time the MS is ready to transmit on the new channel.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS. For E-GSM 900 and R-GSM 900 MS this test is performed in the P-GSM band (see table 3.3 P-GSM 900ARFCN ranges).

#### 17.1.2 Conformance requirement

- 1) When for an intracell channel change, the MS receives an ASSIGNMENT COMMAND command or a HANDOVER COMMAND it shall be ready to transmit on the new channel within 120 ms of the last timeslot of the message block containing the command.

3GPP TS 05.10, subclause 6.8.

- 2) For an intracell channel change, the time between the end of the last complete speech or data frame or message block sent on the old channel and the time the MS is ready to transmit on the new channel shall be less than 20 ms.

3GPP TS 05.10, subclause 6.8.

#### 17.1.3 Test purpose

- 1) To verify that the MS, when commanded to perform an intracell channel change to a new ARFCN and/or a new timeslot number within the same cell, if the starting time is not used in the ASSIGNMENT COMMAND, is ready to transmit on the new channel within 120 ms of the last timeslot containing the ASSIGNMENT COMMAND.
- 2) To verify that the MS, when commanded to perform an intracell channel change to a new ARFCN and/or a new timeslot number within the same cell, if the starting time is not used in the ASSIGNMENT COMMAND, is ready to transmit on the new channel within 20 ms of the last complete speech/data frame or message block sent on the old channel.

#### 17.1.4 Method of test

##### 17.1.4.1 Initial conditions

The SS sets up a call according to the generic call set up procedure on a channel in the Low ARFCN range on timeslot 1.

##### 17.1.4.2 Procedure

- a) The SS sends an ASSIGNMENT COMMAND to the MS allocating a channel in the high ARFCN range on timeslot 2, and with a power command of 7. These old and new carriers have a relative frequency tolerance of 0, and a relative timing tolerance of 1/4 bit.
- b) The SS, after it has sent the ASSIGNMENT COMMAND, measures the reception time of bursts received on the new channel, and the time at which transmission ceases on the old channel.

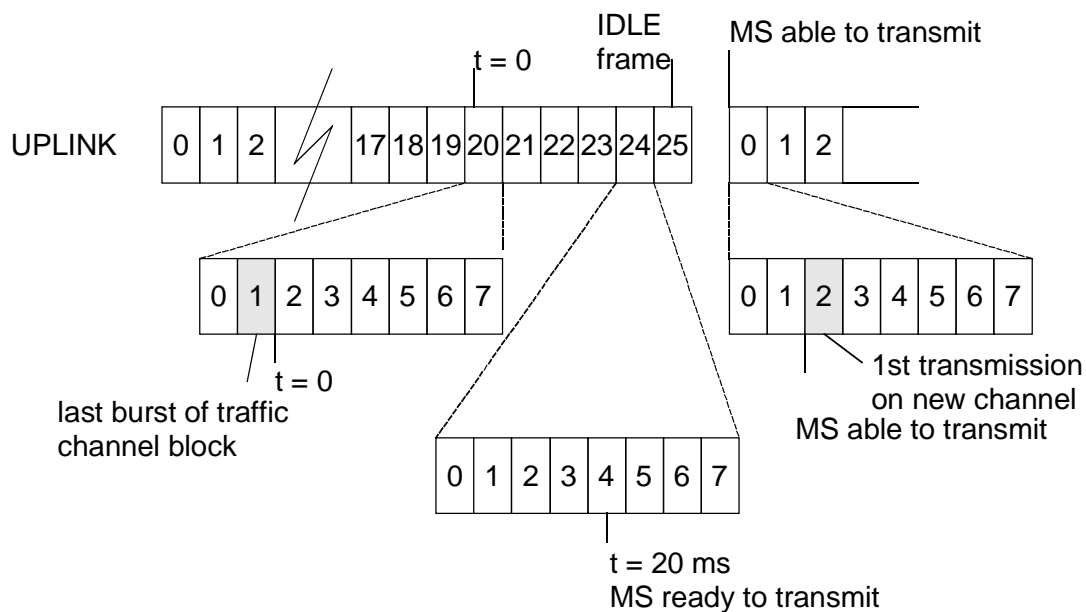

Timing difference between Downlink and Uplink is 3 timeslots.

Relative timing difference between the 2 carriers is a 1/4 bit period.

Maximum time to first transmission on the new channel is 131 ms (120ms + 2 frames + 3 timeslots + 1/4 bit period)

Figure 17-1: Access time - Intra cell channel change (Test Requirement 1)

**Figure 17-2: Access time - Intra cell channel change (Test Requirement 2)**

### 17.1.5 Test requirement

- 1) The MS shall transmit its first burst on the new channel within 131 ms from the last timeslot of the message block containing the ASSIGNMENT COMMAND.

NOTE 1: The requirement time of 120 ms, at which the MS shall be ready to transmit, will expire right at the beginning of a new downlink burst on timeslot 2, which will be the last burst of a traffic channel block. The following frame could be an IDLE frame and the MS would then transmit in the next frame. Taking into account the 3 timeslot shift between up and downlink, and the 1/4 bit relative timing tolerance between the carriers, means that the MS may first transmit on the new channel after 131 ms (120 ms + 2 frames + 3 timeslots + 1/4 bit period). See figure 17-1.

- 2) The MS shall transmit its first burst on the new channel within 27,7 ms from the last complete speech or data frame or message block sent on the old channel.

NOTE 2: The requirement time of 20 ms, at which the MS shall be ready to transmit, will expire at just over 4 frames after the sending of the last bit on the old channel. The next frame could be an IDLE frame and the MS would then transmit in the following frame. This equates to 6 frames so in the worst case, including the 1/4 bit relative timing tolerance between the carriers, the MS may take 27,7 ms before starting transmissions on the new channel.

## 17.2 Inter cell handover

### 17.2.1 Definition and applicability

The access times are:

- the time between receipt by the MS of the last timeslot of the message block containing a HANDOVER COMMAND and the time it has to be ready to transmit on the new channel; and
- the time between the end of the last complete speech or data frame or message block sent on the old channel and the time the MS is ready to transmit on the new channel.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS.

### 17.2.2 Conformance requirement

- 1) When the MS receives a HANOVER COMMAND it shall be ready to transmit on the new channel within 120 ms of the last timeslot of the message block containing the HANOVER COMMAND.

3GPP TS 05.10, subclause 6.8

- 2) The time between the end of the last complete speech or data frame or message block sent on the old channel and the time the MS is ready to transmit on the new channel shall be less than 20 ms.

3GPP TS 05.10, subclause 6.8.

- 3) When the MS receives a new TA value in response to a handover access burst, the MS shall be ready to transmit using the new TA value within 40 ms of the end of the last timeslot of the message block containing the new TA.

3GPP TS 05.10, subclause 6.9.

- 4) The MS shall use a TA value of 0 for the handover access bursts sent.

3GPP TS 05.10, subclause 6.6.

### 17.2.3 Test purpose

- 1) To verify that the MS, when commanded to handover on a new ARFCN and a new timeslot number in a new, not synchronized cell, starting time not used in the HANOVER COMMAND, will be ready to transmit on the new channel within 120 ms of the last timeslot containing the HANOVER COMMAND.
- 2) To verify that the MS, when commanded to handover on a new ARFCN and a new timeslot number in a new, not synchronized cell, starting time not used in the HANOVER COMMAND, will be ready to transmit on the new channel within 20 ms of the last complete speech or data frame or message block sent on the old channel.
- 3) To verify that the MS, when it receives a new TA value in response to a handover access burst, is ready to transmit using the new TA value within 50 ms of the end of the last timeslot of the message block containing the new TA value.
- 4) To verify that the MS uses a TA value of 0 for the handover access burst sent.

### 17.2.4 Method of test

#### 17.2.4.1 Initial conditions

The SS establishes two non-synchronized cells, A and B, under ideal radio conditions. A is the old cell and B is the target for the handover.

The SS uses two traffic channels with the following properties:

|        |        | <b>GSM 900</b> | <b>DCS 1 800</b> | <b>PCS 1 900</b> |
|--------|--------|----------------|------------------|------------------|
| Cell A | TN     | 2              | 2                | 2                |
|        | ARFCN  | 1              | 512              | 512              |
|        | offset | +267 Hz        | +320 Hz          | +366 Hz          |
| Cell B | TN     | 0              | 0                | 0                |
|        | ARFCN  | 124            | 885              | 810              |
|        | offset | -267 Hz        | -320 Hz          | -366 Hz          |

|        |        | <b>GSM 450</b> | <b>GSM 480</b> |
|--------|--------|----------------|----------------|
| Cell A | TN     | 2              | 2              |
|        | ARFCN  | 259            | 306            |
|        | offset | +240 Hz        | +260 Hz        |
| Cell B | TN     | 0              | 0              |
|        | ARFCN  | 293            | 340            |
|        | offset | -240 Hz        | -260 Hz        |

|        |        | GSM 750 | GSM 850 |
|--------|--------|---------|---------|
| Cell A | TN     | 2       | 2       |
|        | ARFCN  | 438     | 128     |
|        | offset | +250 Hz | +252 Hz |
| Cell B | TN     | 0       | 0       |
|        | ARFCN  | 511     | 251     |
|        | offset | -250 Hz | -252 Hz |

NOTE: This offset is representing worst cases for Doppler shift at 500 km/h, 300km/h, 250 km/h, 250 km/h and 130 km/h for GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 respectively, and a frequency inaccuracy of 0,05 ppm.

The BCCH for the two cells have the following differences in timing:

|                |     |
|----------------|-----|
| Timer T1       | 50; |
| Timer T2       | 15; |
| Timer T3       | 40; |
| 1/4 bit number | 17; |
| Timeslots      | 2.  |

The SS sets up a call according to the generic call set up procedure on the channel in cell A.

#### 17.2.4.2 Procedure

- The SS sends a HANOVER COMMAND on the main DCCH on cell A ordering the MS to go to the channel in cell B. The power command is set to 7.
- After the SS has sent HANOVER COMMAND it measures the reception time of bursts received on the new channel and the time at which transmission ceases on the old channel.
- The SS also measures the absolute transmit/receive delay for the access bursts on the new channel.
- The SS sends the PHYSICAL INFORMATION with TA set to 50. The SS then measures the reception time and absolute delay of the bursts transmitted on the new cell.

#### 17.2.5 Test requirement

- The MS shall transmit its first burst on cell B within 142,6 ms from the last timeslot of the message block containing the HANOVER COMMAND.

NOTE 1: The requirement time of 120 ms, at which the MS shall be ready to transmit, will expire right at the end of the last burst of a downlink traffic channel block on the old channel. Due to the two timeslot difference in cell timing, the two timeslots difference in the channel allocation and the 15 frames difference in multiframe timing, this point could occur 2,5 frames before the end of the last burst of a downlink traffic channel block on the new channel. The following frame could be an IDLE frame and the MS would then transmit in the next frame. Taking into account the three timeslot shift between up and downlink, and the 17 1/4 bit periods timing difference between the two carriers, means that the MS may first transmits on the new channel after 142,6 ms (120 ms + 2,5 frames + 2 frames + 3 timeslots + 17 1/4 bit periods).

- The MS shall transmit its first burst on cell B within 39,2 ms from the last complete speech or data frame or message block sent on cell A.

NOTE 2: The requirement time of 20 ms, at which the MS shall be ready to transmit, will expire at just over 4 frames after the sending of the last bit on the old channel. Due to the two timeslot difference in cell timing, the two timeslots difference in the channel allocation and the 15 frames difference in multiframe timing, this point could occur 2 frames before the end of the last burst of an uplink traffic channel block on the new channel. The following frame could be an IDLE frame and the MS would then transmit in the next frame. This equates to 8,5 frames so in the worst case the MS may take 39,2 ms between cessation of transmission on the old channel and transmission beginning on the new channel.

- 3) The MS shall transmit using the TA value in the PHYSICAL INFORMATION within 50 ms from the end of the last timeslot of the message block containing the new TA value.
- 4) The measured absolute delay for the access bursts in steps c) and d) shall equal 3 timeslots (=45/26 ms), with an absolute tolerance of  $\pm 1$  bit.

---

## 18 Temporary reception gaps

### 18.1 Temporary reception gaps, single slot

#### 18.1.1 Definition and applicability

A temporary reception gap is a limited period of time in which the RF reception is interrupted. During this gap the MS shall maintain the frequency and timing of its transmission within specifications.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 MS and PCS 1 900, except where an application layer is always running which would perform a normal release of the call due to loss of traffic (see PICS/PIXIT).

#### 18.1.2 Conformance requirement

- 1) During a temporary total loss of signal, of up to 64 SACCH block periods, the MS shall update its timebase with a clock which is accurate to within 0,2 ppm, or to within 0,2 ppm of the signals previously received from the BTS. The MS shall use the same frequency source for both RF frequency generation and clocking the timebase.

3GPP TS 05.10, subclauses 6.1 and 6.7.

- 2) The MS shall time its transmissions to the BTS according to signals received from the BTS. The MS transmissions to the BTS, measured at the MS antenna, shall be 3 timeslots - TA behind the transmissions received from the BTS, where TA is the last timing advance received from the current serving BTS.

3GPP TS 05.10, subclause 6.4.

- 3) During a temporary total loss of signal, of up to 64 SACCH block periods, the MS shall update its timebase with a clock which is accurate to within 0,2 ppm, or to within 0,2 ppm of the signals previously received from the BTS.

3GPP TS 05.10, subclause 6.7.

#### 18.1.3 Test purpose

- 1) To verify that, during a temporary total loss of signal of up to 63 SACCH block periods, the MS carrier frequency is accurate to within 0,2 ppm of the signals previously received from the BTS.
- 2) To verify that, the MS transmissions to the BTS, measured at the MS antenna, is 3 timeslots behind the transmissions received from the BTS, with a tolerance of  $\pm 1$  bit period.
- 3) To verify that, during a temporary total loss of signal, of up to 63 SACCH block periods, the MS transmission timing may have drifted resulting in an error not greater than  $\pm 6,048 \mu\text{s}$  (0,2 ppm of 63 SACCH blocks).

#### 18.1.4 Method of test

##### 18.1.4.1 Initial conditions

The SS signals RADIO\_LINK\_TIMEOUT = 64 and "DTX OFF" on the BCCH.

The MS is brought into MM state "idle, updated".

After 10 s, the SS continues to set up a call according to the generic call set up procedure.

#### 18.1.4.2 Procedure

- a) The SS, in a TDMA frame immediately following the transmission of a complete SACCH block, removes the downlink signal for 63 SACCH blocks.

NOTE: This gives the maximum temporary reception gap.

- b) The SS measures the frequency and timing of the MS transmissions immediately before, and at least 5 times at approximately equally spaced intervals during the gap, one of these measurements being at the end of the gap.
- c) The SS resumes transmission for a period sufficient to allow the MS reception of 1 SACCH block.
- d) The SS again removes downlink transmission for a period equal to at least 3 SACCH blocks. The SS measures the frequency and timing of the MS transmissions immediately before and during this second reception gap.

#### 18.1.5 Test requirement

- 1) The MS carrier frequency shall be accurate to within 0,2 ppm compared to signals received from the SS.
- 2) The receive/transmit delay timing shall be 3 timeslots  $\pm$  1 bit.
- 3) During the second reception gap the MS shall maintain transmission for a period up to but not exceeding 3 SACCH blocks.
- 4) During the first, maximum, reception gap the MS transmission timing may have drifted resulting in an error of not greater than  $\pm 6,048 \mu\text{s}$ .

NOTE: The SS determines the error at the start of the reception gap from the first measurement of MS transmission frequency and timing.

## 18.2 Temporary reception gaps in HSCSD multislots configurations

### 18.2.1 Definition and applicability

A temporary reception gap is a limited period of time in which the RF reception is interrupted. During this gap the MS shall maintain the frequency and timing of its transmission within specifications.

The requirements and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800, PCS 1 900 MS and any multiband MS which are capable of HSCSD multislots operation, except where an application layer is always running which would perform a normal release of the call due to loss of traffic (see PICS/PIXIT).

### 18.2.2 Conformance requirement

- 1) During a temporary total loss of signal, of up to 64 SACCH block periods, the MS shall update its timebase with a clock which is accurate to within 0,2 ppm, or to within 0,2 ppm of the signals previously received from the BTS. The MS shall use the same frequency source for both RF frequency generation and clocking the timebase.

3GPP TS 05.10, subclauses 6.7 and 6.1.

- 2) The MS shall time its transmissions to the BTS according to signals received from the BTS. The MS transmissions to the BTS, measured at the MS antenna, shall be 3 timeslots - TA behind the transmissions received from the BTS, where TA is the last timing advance received from the current serving BTS.

3GPP TS 05.10, subclause 6.4.

- 3) During a temporary total loss of signal, of up to 64 SACCH block periods, the MS shall update its timebase with a clock which is accurate to within 0,2 ppm, or to within 0,2 ppm of the signals previously received from the BTS.

3GPP TS 05.10, subclause 6.7.

### 18.2.3 Test purpose

- 1) To verify that, during a temporary total loss of signal of up to 63 SACCH block periods on the main multislot channel, the MS carrier frequency is accurate to within 0,2 ppm of the signals previously received from the BTS.
- 2) To verify that, the MS transmissions to the BTS, measured at the MS antenna, is 3 timeslots behind the transmissions received from the BTS, with a tolerance of  $\pm 1$  bit period.
- 3) To verify that, during a temporary total loss of signal, of up to 63 SACCH block periods on the main multislot channel, the MS transmission timing may have drifted resulting in an error not greater than  $\pm 6,048 \mu\text{s}$  (0,2 ppm of 63 SACCH blocks).
- 4) To verify that, during a temporary loss of more than 64 SACCH block periods on other than the main channel in symmetric configuration, the MS meet the requirements 1, 2 and 3.

### 18.2.4 Method of test

#### 18.2.4.1 Initial conditions

The SS signals RADIO\_LINK\_TIMEOUT = 64 and "DTX OFF" on the BCCH.

The MS is brought into MM state "idle, updated".

After 10 s, the SS continues to set up a call according to the generic call set up procedure for multislot HSCSD.

The SS commands the MS to operate in a highest possible asymmetric configuration, with a maximum number of downlink timeslots.

#### 18.2.4.2 Procedure

- a) The SS, in a TDMA frame immediately following the transmission of a complete SACCH block, removes the downlink signal for 63 SACCH blocks of the main channel.  
NOTE: This gives the maximum temporary reception gap.
- b) The SS measures the frequency and timing of the MS transmissions immediately before, and at least 5 times at approximately equally spaced intervals during the gap, one of these measurements being at the end of the gap.
- c) The SS resumes transmission for a period sufficient to allow the MS reception of 1 SACCH block.
- d) The SS again removes downlink transmission for a period equal to at least 3 SACCH blocks of the main channel. The SS measures the frequency and timing of the MS transmissions immediately before and during this second reception gap.
- e) SS signals RADIO\_LINK\_TIMEOUT=64 and commands the MS to operate in a highest possible symmetric multislot configuration, with a maximum number of uplink timeslots.
- f) For a symmetric multislot configuration steps a) and b) are repeated with the exception that a 69 SACCH blocks are removed from a channel other than the main channel.

### 18.2.5 Test requirement

- 1) The MS carrier frequency shall be accurate to within 0,2 ppm compared to signals received from the SS.
- 2) The receive/transmit delay timing shall be 3 timeslots  $\pm 1$  bit.
- 3) During the second reception gap the MS shall maintain transmission for a period up to but not exceeding 3 SACCH blocks.
- 4) During the first, maximum, reception gap the MS transmission timing may have drifted resulting in an error of not greater than  $\pm 6,048 \mu\text{s}$ .
- 5) During the last reception gap, the MS shall maintain transmission.

NOTE: The SS determines the error at the start of the reception gap from the first measurement of MS transmission frequency and timing.

---

## 19 Channel release after unrecoverable errors

NOTE: It is not possible to explicitly verify the correct functioning of all aspects of the radio link failure algorithm in the MS. Therefore 3 tests are used to implicitly verify correct implementation.

### 19.1 Channel release after unrecoverable errors - 1

#### 19.1.1 Definition and applicability

Channel release after unrecoverable errors is a procedure to abort the call if the radio link has been severely corrupted for some time, according to a link failure criterion.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS, except where an application layer is always running which would perform a normal release of the call due to loss of traffic (see PICS/PIXIT).

#### 19.1.2 Conformance requirement

- 1) If the MS is unable to decode a SACCH message, the radio link counter S is decreased by 1. In the case of a successful reception of a SACCH message S is increased by 2. In any case S shall not exceed the value of RADIO\_LINK\_TIMEOUT. If S reaches 0 a radio link failure shall be declared.

3GPP TS 05.08, subclause 5.2.

- 2) The MS shall continue transmitting as normal on the uplink until S reaches 0.

3GPP TS 05.08, subclause 5.2.

- 3) The algorithm shall start after the assignment of a dedicated channel and S shall be initialized to RADIO\_LINK\_TIMEOUT.

3GPP TS 05.08, subclause 5.2.

- 4) (Re-)initialization and start of the algorithm shall be done whenever the MS switches to a new channel (this includes the old channel in assignment and handover failure cases), at the latest when the main signalling link (see 3GPP TS 04.08 / 3GPP TS 44.018) has been established.

3GPP TS 05.08, subclause 5.2.

#### 19.1.3 Test purpose

- 1) To verify correct handling of the radio link counter S.
- 2) To verify that the MS that is transmitting continues to transmit as normal on the uplink until S reaches 0.
- 3) To verify that the algorithm starts after the assignment of a dedicated channel, with S initialized to RADIO\_LINK\_TIMEOUT.
- 4) To verify that the MS declares RADIO\_LINK\_FAILURE, and clears the RR connection when S = 0.

#### 19.1.4 Method of test

##### 19.1.4.1 Initial conditions

The SS sends a randomly chooses value N for the parameter RADIO\_LINK\_TIMEOUT on the BCCH. CALL RE-ESTABLISHMENT is not allowed.

#### 19.1.4.2 Procedure

- a) A MS originated call is set up according to the generic call set up procedure.
- b) The SS sends 32 error free SACCH messages, followed by N SACCH messages that contain unrecoverable errors, and then continuously sends error free SACCH messages.

NOTE: The SS shall continue sending error free SACCH messages for a time that allows the MS to release the RR connection.

- c) The SS sets N to a different but randomly chosen value, and broadcasts this on the BCCH. The SS repeats steps a) to b).

#### 19.1.5 Test requirement

After receiving the N SACCH messages with unrecoverable errors, the MS shall abort the RR-connection, i.e. there is no more MS activity on the SACCH channel.

## 19.2 Channel release after unrecoverable errors - 2

#### 19.2.1 Definition and applicability

Channel release after unrecoverable errors is a procedure to abort the call if the radio link has been severely corrupted for some time, according to a link failure criterion.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS, except where an application layer is always running which would perform a normal release of the call due to loss of traffic (see PICS/PIXIT).

#### 19.2.2 Conformance requirement

- 1) If the MS is unable to decode a SACCH message, the radio link counter S is decreased by 1. In the case of a successful reception of a SACCH message S is increased by 2. In any case S shall not exceed the value of RADIO\_LINK\_TIMEOUT. If S reaches 0 a radio link failure shall be declared.

3GPP TS 05.08, subclause 5.2.

- 2) The MS shall continue transmitting as normal on the uplink until S reaches 0.

3GPP TS 05.08, subclause 5.2.

- 3) The algorithm shall start after the assignment of a dedicated channel and S shall be initialized to RADIO\_LINK\_TIMEOUT.

3GPP TS 05.08, subclause 5.2.

- 4) (Re-)initialization and start of the algorithm shall be done whenever the MS switches to a new channel (this includes the old channel in assignment and handover failure cases), at the latest when the main signalling link (see 3GPP TS 04.08 / 3GPP TS 44.018) has been established.

3GPP TS 05.08, subclause 5.2.

#### 19.2.3 Test purpose

- 1) To verify correct handling of the radio link counter S.
- 2) To verify that the MS that is transmitting continues to transmit as normal on the uplink until S reaches 0.
- 3) To verify that the algorithm starts after the assignment of a dedicated channel, with S initialized to RADIO\_LINK\_TIMEOUT.

#### 19.2.4 Method of test

##### 19.2.4.1 Initial conditions

The SS sends a randomly chooses value N for the parameter RADIO\_LINK\_TIMEOUT on the BCCH. CALL RE-ESTABLISHMENT is not allowed.

##### 19.2.4.2 Procedure

- a) A MS originated call is set up according to the generic call set up procedure.
- b) The SS sends 2 SACCH messages with unrecoverable errors followed by one error free SACCH message. This step is repeated 64 times.
- c) The SS sets N to a different but randomly chosen value, and broadcasts this on the BCCH. The SS repeats steps a) to b).

##### 19.2.5 Test requirement

The MS shall not abort the RR-connection.

## 19.3 Channel release after unrecoverable errors - 3

### 19.3.1 Definition and applicability

Channel release after unrecoverable errors is a procedure to abort the call if the radio link has been severely corrupted for some time, according to a link failure criterion.

The requirement and this test apply to all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MS, except where an application layer is always running which would perform a normal release of the call due to loss of traffic (see PICS/PIXIT).

### 19.3.2 Conformance requirements

- 1) If the MS is unable to decode a SACCH message, the radio link counter S is decreased by 1. In the case of a successful reception of a SACCH message S is increased by 2. In any case S shall not exceed the value of RADIO\_LINK\_TIMEOUT. If S reaches 0 a radio link failure shall be declared.

3GPP TS 05.08, subclause 5.2.

- 2) The MS shall continue transmitting as normal on the uplink until S reaches 0.

3GPP TS 05.08, subclause 5.2.

- 3) The algorithm shall start after the assignment of a dedicated channel and S shall be initialized to RADIO\_LINK\_TIMEOUT.

3GPP TS 05.08, subclause 5.2.

- 4) (Re-)initialization and start of the algorithm shall be done whenever the MS switches to a new channel (this includes the old channel in assignment and handover failure cases), at the latest when the main signalling link (see 3GPP TS 04.08 / 3GPP TS 44.018) has been established.

3GPP TS 05.08, subclause 5.2.

### 19.3.3 Test purpose

- 1) To verify correct handling of the radio link counter S.
- 2) To verify that the MS that is transmitting continues to transmit as normal on the uplink until S reaches 0.
- 3) To verify that the algorithm starts after the assignment of a dedicated channel, with S initialized to RADIO\_LINK\_TIMEOUT.
- 4) To verify that the MS declares RADIO\_LINK\_FAILURE, and clears the RR connection when S = 0.

### 19.3.4 Method of test

#### 19.3.4.1 Initial conditions

The SS sends a randomly chooses value N for the parameter RADIO\_LINK\_TIMEOUT on the BCCH. CALL RE\_ESTABLISHMENT is not allowed.

#### 19.3.4.2 Procedure

- a) A MS originated call is set up according to the generic call set up procedure.
- b) The SS sends 32 error free SACCH messages, followed by 3 SACCH messages with unrecoverable errors, and the sends 1 error free SACCH message. This step is repeated N - 2 times.
- c) The SS shall continuously send error free SACCH messages.

NOTE: The SS shall continue sending error free SACCH messages for a time that allows the MS to release the RR connection.

- d) The SS sets N to a different but randomly chosen value, and broadcasts this on the BCCH. The SS repeats steps a) to c).

### 19.3.5 Test requirement

After receiving the  $3 \times (N - 2)$  erroneous SACCH messages the MS shall abort the RR-connection, i.e. there is no more activity on the SACCH channel.

---

## 20 Cell selection and reselection

In the following paragraphs some explanatory text is given concerning the nature of the tests in this clause and the general behaviour of the SS is described.

Since the conformance requirements of most of the tests in this clause cannot be tested explicitly, testing is done implicitly by testing the MS behaviour from its responses to the SS.

The SS transmits one BCCH carrier per cell as indicated in the initial conditions for each test. These are referred to as carrier 1, carrier 2, etc. Each of these cell control channels are non-combined with SDCCHs. It is assumed that the SS can simultaneously transmit seven BCCH carriers and monitor three random access channels. For multiband tests it is assumed that at least one of the BCCH carriers and one of the monitored random access channels is in a different frequency band from the others. In some cases, a test is performed in multiple stages in order that the requirements can be tested within the above constraints.

For any MS all the carriers are in its supported band(s) of operation. For an E-GSM mobile station at least one of the carriers is in the extension band and one of the carriers is in the primary band.

Unless otherwise stated in the method of test, in all of the tests of this clause:

- The SS is continuously paging the MS on all carriers at the start of the test and does not respond to RACH requests from the MS. Where a test specifies that the MS is not paged on a particular carrier, only idle paging is transmitted according to 3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.2.2.2.

- The default values of the system information data fields given in table 20.1 are used.
- The SIM is in the idle updated state in the default location area with a TMSI assigned at the beginning of each test.
- The ARFCNs used for the carriers in each test are chosen from those in table 20.1 with adjacent carriers separated by a minimum of three channels.

The absolute accuracy of the MS signal level measurements is assumed to be  $\pm 6$  dB. A difference of at least 8 dB is allowed for cases of discrimination between C1 or C2 values and 0.

The relative accuracy of the MS signal level measurements is assumed to be  $\pm 3$  dB for the signal levels used in the tests of this clause, except for subclause 20.20, where the relative accuracy is assumed to be  $\pm 5$  dB if the measurements are on different frequency bands. A difference of at least 5 dB is allowed for cases of discrimination between C1 or C2 values on different carriers, except for subclause 20.20, where a difference of at least 10 dB is allowed if the measurements are on different frequency bands.

NOTE 1: The accuracy of MS signal level measurements is specified in 3GPP TS 05.08. For all of the tests in this clause, the signal levels used are greater than 1 dB above reference sensitivity level.

NOTE 2: The tolerance on timers specified in 3GPP TS 05.08 is  $\pm 10$  % except for PENALTY\_TIME where it is  $\pm 2$  s. In the tests of this clause, the test requirements include these tolerances. Consequently, the times stated in the test requirement sometimes differ from the corresponding timer in the conformance requirement.

Where pulsed signals are specified, the SS tolerance on pulse width is  $\pm 2$  % and the SS tolerance on power level  $\pm 1$  dB.

**Table 20.1: Default values of the system information fields**

| Parameter                | 3GPP TS 04.08 / 3GPP TS 44.018 reference | Abbr. | Normal Setting                                                                                                                                                                                                                                                                                                                        |
|--------------------------|------------------------------------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 20.1 Cell selection

### 20.1.1 Definition and applicability

Cell selection is a process in which a MS, whenever a new PLMN is selected, attempts to find a suitable cell of that PLMN to camp on. Two methods of searching for a suitable cell are possible, normal cell selection and stored list cell selection. The process ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. Once the MS is camped on a cell, access to the network is allowed.

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

### 20.1.2 Conformance requirement

1. The MS shall be able to select the correct (fourth strongest) cell and be able to respond to paging on that cell within 30 s of switch on, when the three strongest cells are not suitable. This assumes a valid SIM, with PIN disabled and ideal radio conditions; 3GPP TS 05.08, subclause 6.1.
2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:
  - 2.1 (i) It should be a cell of the selected PLMN
  - 2.2 (ii) It should not be "barred" (see subclause 3.5.1)
  - 2.3 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. This is estimated as shown in subclause 3.6.  
3GPP TS 03.22, subclause 3.2.1.

NOTE: Criteria (iii) is not applicable for Cell Selection.

3. Initially the MS looks for a cell which satisfies these 4 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a suitable cell is found, the MS camps on it; 3GPP TS 03.22, subclause 3.2.1.
4. The MS shall be able to calculate correctly the path loss criterion parameter C1, used for cell selection and reselection; 3GPP TS 05.08, subclause 6.4.

### 20.1.3 Test purpose

1. To verify that the MS meets conformance requirement 1.
2. To verify that:
  - 2.1 The MS does not select a cell of a PLMN which is not the selected PLMN.
  - 2.2 The MS does not select a cell which is "barred".
  - 2.3 The MS does not select a cell with  $C1 < 0$ .
3. To verify that the MS selects suitable cells in descending order of received signal strength.
4. To verify that the MS does not select a cell with  $C1 < 0$ .

### 20.1.4 Method of test

#### 20.1.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter                                   | Carrier 1 | Carrier 2 | Carrier 3                | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------------|-----------|-----------|--------------------------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm) | 48 / -65  | 38 / -75  | 43 / -70                 | 33 / -80  | 28 / -85  | OFF       |
| CBA                                         | 1         | 0         | 0                        | 0         | 0         |           |
| RXLEV_ACCESS_MIN<br>(dBm)                   | -90       | -67       | -90                      | -88       | -98       |           |
| MNC                                         |           |           | 01 (011 for<br>PCS 1900) |           |           |           |
| MCC                                         |           |           | 002                      |           |           |           |
| C1                                          | 25        | -8        | 20                       | 8         | 13        |           |
| C2                                          | 25        | -8        | 20                       | 8         | 13        |           |

For an E-GSM MS carrier 2 and carrier 4 ARFCNs are chosen in the E-GSM band, carrier 1 and carrier 3 ARFCNs in the P-GSM band.

#### 20.1.4.2 Procedure

- a) The SS activates the carriers and monitors carriers 2, 4 and 5 for RA requests from the MS.
- b) The MS is switched on.
- c) The MS is switched off.
- d) The SS monitors carriers 1 and 3 for RA requests from the MS.
- e) The MS is switched on.

#### 20.1.5 Test requirements

- 1) After step b), the first response from the MS shall be on carrier 4 within 33 s. There shall be no response from the MS on carrier 2.
- 2) After step e), there shall be no response from the MS on either carrier 1 or carrier 3 within 33 s.

## 20.2 Cell selection with varying signal strength values

### 20.2.1 Definition and applicability

For definition see conformance requirement.

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

### 20.2.2 Conformance requirement

1. The MS shall:

The MS shall search all RF channels in the system (35 for GSM 450, 35 for GSM 480, 74 for GSM 750, 124 for GSM 850, 124 for GSM, 174 for E-GSM, 374 for DCS 1 800 and 299 for PCS 1900), take readings of received RF signal strength on each RF channel, and calculate the received level average for each. The averaging is based on at least five measurement samples per RF carrier spread over 3 to 5 s, the measurement samples from the different RF carriers being spread evenly during this period. 3GPP TS 05.08, subclause 6.2.

1.1 The MS shall search all RF channels in the system (35 for GSM 450, 35 for GSM 480, 74 for GSM 750, 124 for GSM 700, 124 for GSM, 174 for E-GSM, 374 for DCS 1 800 and 299 for PCS 1900), take readings of received RF signal strength on each RF channel, and calculate the received level average for each.

1.2 The averaging is based on at least five measurement samples per RF carrier spread over  $T_{av}$  (3 s to 5 s).

1.3 The measurement samples from the different RF carriers being spread evenly during this period.

2. These quantities are termed the "receive level averages", shall be unweighted averages of the received signal strengths measured in dBm. GSM 05.08, subclause 6.1.

### 20.2.3 Test purpose

1. To verify that:
  - 1.1 The MS meets conformance requirement 1.1.
  - 1.2 The MS meets conformance requirement 1.2.
  - 1.3 The MS meets conformance requirement 1.3.
2. To verify that the MS meets conformance requirement 2.

## 20.2.4 Method of test

## 20.2.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter                                    | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|----------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm)  | 23 / -90  | 58 / -55  | OFF       | OFF       | OFF       | OFF       |
| RXLEV_ACCESS_MIN<br>(dB $\mu$ V emf() / dBm) | 13 / -100 | 13 / -100 |           |           |           |           |
| C1                                           | 10        | 53        |           |           |           |           |

For an E-GSM MS carrier 1 ARFCN is chosen in the E-GSM band.

The manufacturer of the equipment shall declare his averaging time  $T_{av}$ . This time is the time between the first and the last measurement sample taken on one carrier during one averaging period.

## 20.2.4.2 Procedure

- a) The SS transmits on carriers 1 and 2. After a period of  $b \times T_{av}$  carrier 2 reduces its transmit level to -85 dBm (28 dB $\mu$ V emf( )). After a further period of  $a \times T_{av}$ , carrier 2 increases its transmit level again to -55 dBm (58 dB $\mu$ V emf( )). Switching of carrier 2 continues with these levels and duty cycle until the end of the test.

$T_{av}$  is the averaging time declared by the manufacturer.

The parameters  $a$  and  $b$  are chosen according to the following rules:

$$(a + b) \times T_{av} > T_{av}$$

$$0 < a \times T_{av} < 2/3 \times T_{av}$$

$$0,5 \times T_{av} < b \times T_{av} < T_{av}$$

In the equations  $<$  and  $>$  means at least one TDMA frame less or greater than the given value.

While satisfying the conditions given above:

$a$  is chosen to be as close as possible to  $2/3$ .

$b$  is chosen to be as close as possible to  $0,5$ .

- b) The MS is switched on.  
c) The SS monitors all RA requests from MS on carriers 1 and 2.

## 20.2.5 Test requirements

In step c), the first response from the MS shall be on carrier 2 within 33 s.

NOTE 1: With the selected duty cycle it can be guaranteed that a "good" MS passes the test even at the worst case situations. The minimum averaged value of carrier 2 is in any case higher or equal to -75 dBm which is still 6 dB above carrier 1's level (for a "good" MS).

NOTE 2: With the selected levels and duty cycle the probability that a "bad" MS (i.e. MS that averages over shorter period than 3 s) fails the test is maximized. However, it can not be guaranteed that all the MSs not fulfilling the conformance requirement of averaging or uniform sampling will fail this test.

## 20.3 Basic cell reselection

### 20.3.1 Definition and applicability

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1900 MSs.

### 20.3.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:

1.1 (iii) The cell camped on (current serving cell) has become barred.

1.2 (iv) There is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).

The MS will then reselect a new cell in order to fulfil the process goal.; 3GPP TS 03.22, subclause 4.5.

NOTE 1: Criterion (i) is tested in subclause 20.8 (Cell reselection when  $C1(\text{serving cell}) < 0$  for 5 s).

NOTE 2: Criterion (ii) is tested subclause 20.16 (Downlink signalling failure).

NOTE 3: Criterion (v) is tested in subclause 20.6 (Cell reselection timings).

2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:

2.1 (ii) It should not be "barred".

2.2 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. 3GPP TS 03.22, subclause 3.2.1.

NOTE 4: Criterion (i) is not relevant for cell reselection and for cell selection it is tested in subclause 20.1.

NOTE 5: Criterion (iv) refers to the C1 parameter.

3. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection; 3GPP TS 05.08, subclause 6.4.

4. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:

i) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 s. This indicates that the path loss to the cell has become too high.

ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 s, except in the case of the new cell being in a different location area in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least `CELL_RESELECT_HYSTERESIS` dB as defined by the BCCH data from the current serving cell, for a period of 5 s. This indicates that it is a better cell. 3GPP TS 05.08, subclause 6.6.2.

5. The MS shall attempt to decode the full BCCH data of the serving cell at least every 30 s; 3GPP TS 05.08, subclause 6.6.1.

### 20.3.3 Test purpose

1. To verify that:

1.1 The MS meets conformance requirement 1.1.

1.2 The MS meets conformance requirement 1.2.

2. To verify that:
  - 2.1 The MS does not reselect a cell which is barred.
  - 2.2 The MS does not reselect a cell which has a  $C1 < 0$ .
3. To verify that the MS calculates the C2 parameter correctly when the CELL\_RESELECT\_OFFSET, TEMPORARY\_OFFSET and PENALTY\_TIME parameters are not used.
4. To verify that the MS takes into account the CELL\_RESELECT\_HYSTERESIS parameter when reselecting a cell in a different location area.
5. To verify that the MS decodes the CELL\_BAR\_ACCESS and CELL\_BAR\_QUALIFY parameters from the BCCH every 30 s.

#### 20.3.4 Method of test

##### 20.3.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter                                  | Carrier 1 | Carrier 2 | Carrier 3                           | Carrier 4 | Carrier 5 | Carrier 6 |
|--------------------------------------------|-----------|-----------|-------------------------------------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf) / dBm) | 43 / -70  | 33 / -80  | 43 / -70                            | 38 / -75  | 38 / -75  |           |
| RXLEV_ACCESS_MIN<br>(dBm)                  | -85       | -90       | -90                                 | -85       | -67       |           |
| CRH                                        | 10 dB     |           |                                     |           |           |           |
| LAC                                        |           |           | different<br>from other<br>carriers |           |           |           |
| CBA                                        |           |           |                                     | 1         |           |           |
| CBQ                                        |           |           |                                     | 0         |           |           |
| C1                                         | 15        | 10        | 20                                  | 10        | -8        |           |
| C2                                         | 15        | 10        | 20                                  | 10        | -8        |           |

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test.

##### 20.3.4.2 Procedure

- a) The SS activates carriers 1, 2, 4 and 5. The MS is not paged on carrier 1. The SS monitors carriers 2, 4 and 5 for RA requests from the MS.
- b) The MS is switched on.
- c) The SS stops paging on all carriers except carrier 2. The level of carrier 2 is increased to 43 dB $\mu$ Vemf (C2 becomes 20 dB), and the SS monitors carrier 2 for RA requests from the MS.
- d) When the SS receives a response from the MS on carrier 2, it stops paging the MS on this carrier.
- e) The MS is switched off.
- f) The SS is reconfigured and sets CBA = 1 on carriers 1 and 5.
- g) The MS is switched on.
- h) After 33 s, the SS starts paging continuously on carrier 1 and sets CBA=1 on carrier 2 and CBA=0 on carriers 1, 4 and 5.
- i) When the SS receives a response on carrier 1, it stops paging the MS and waits for 25 s. (The MS should reselect and camp onto carrier 1).
- j) The SS activates carrier 3, pages the MS continuously on this carrier and monitors carrier 3 for RA requests from the MS.

k) The SS increases the level of carrier 3 to 53 dB $\mu$ V<sub>emf</sub> (C2 increases to 30 dB.).

#### 20.3.5 Test requirements

- 1) After step b), there shall be no response from the MS on carriers 2, 4, or 5 within 50 s.
- 2) In step c), the MS shall respond on carrier 2 within 20 s of increasing the level of carrier 2.

NOTE 1: 5 s to perform running average, 10 s to detect C2 differences, 2,4 s to read BCCH of carrier 2, 1 s to perform RA. Total 18,4 s, allow 20 s.

- 3) In step h), the MS shall respond on carrier 1 within 50 s of setting CBA=1 on carrier 2.

NOTE 2: 33 s for the MS to read the BCCH of carrier 2 (30 s + 10 %), 15 s for the MS to reselect cell 1, since the MS already has a running average on carrier 1, allow 50 s.

- 4) After step j), there shall be no response from the MS within 50 s.
- 5) After step k), the MS shall respond on carrier 3 within 20 s.

## 20.4 Cell reselection using TEMPORARY\_OFFSET, CELL\_RESELECT\_OFFSET, POWER\_OFFSET and PENALTY\_TIME parameters

### 20.4.1 Definition and applicability

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs

### 20.4.2 Conformance requirement

1. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection; 3GPP TS 05.08, subclause 6.4.

### 20.4.3 Test purpose

1. To verify that the MS calculates the C2 parameter correctly when the CELL\_RESELECT\_OFFSET, TEMPORARY\_OFFSET and PENALTY\_TIME parameters are used.
2. To verify DCS 1 800 and PCS 1 900 MS correctly calculate the C2 parameter when the POWER\_OFFSET parameter is present.

### 20.4.4 Method of test

#### 20.4.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter                                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm) | 53 / -60  | 43 / -70  | 48 / -65  | 48 / -65  |           |           |
| RXLEV_ACCESS_MIN<br>(dBm)                   | -80       | -100      | -85       | -85       |           |           |
| PT                                          |           | 11111     | 40 s      | 60 s      |           |           |
| CRO                                         |           | 16 dB     | 20 dB     | 20 dB     |           |           |
| TO                                          |           |           | 20 dB     | 20 dB     |           |           |
| K = 1                                       |           |           |           |           |           |           |
| C1                                          | 20        | 30        | 20        | 20        |           |           |
| C2                                          | 20        | 14        | 20 - > 40 | 20 - > 40 |           |           |
| K = 2 (DCS1800 Class 3 MS<br>only)          |           |           |           |           |           |           |
| POWER_OFFSET                                | 0         | 2         | 6         | 6         |           |           |

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test.

#### 20.4.4.2 Procedure

For testing of GSM MS, the test procedure is performed for execution counter K = 1.

For testing of DCS 1 800 MS, the test procedure is performed for execution counter K = 1 and 2:

On execution counter K = 1, the POWER\_OFFSET Parameter is not present.

On execution counter K = 2, the POWER\_OFFSET parameter is present.

- a) The SS activates carriers 1 and 2. The MS is not paged on carrier 1. The SS monitors carrier 2 for RA requests from the MS.
- b) The MS is switched on.
- c) The SS increases the level of carrier 2 to 54 dB $\mu$ Vemf (C2 becomes 25 dB).
- d) When the SS receives a response on carrier 2, the SS stops paging on that carrier and waits for 20 s (The MS should reselect and camp onto carrier 2).
- e) The SS activates carriers 3 and 4 and continuously pages the MS on these carriers. The SS monitors carriers 3 and 4 for RA requests from the MS.

#### 20.4.4.3 Requirements

For execution counter K = 1 and K = 2.

- 1) After step b), there shall be no response from the MS on carrier 2 within 50 s.
- 2) After step c), the MS shall respond on carrier 2 within 20 s of increasing the level of carrier 2.
- 3) After step e), there shall be no response from the MS on carrier 3 within 38 s of activating the carriers but, the MS shall respond on carrier 3 within 90 s. The response on carrier 3 shall be before any response on carrier 4.

NOTE: Minimum time of 38 s set by penalty timer on carrier 3 less 2 s tolerance. Maximum time, total of 33 s to read BCCH of carrier 3, 42 s for expiry of penalty timer on carrier 3, 15 s for reselection, since the MS will already have running averages on carriers 3 and 4, when the penalty timers expire, allow 90 s.

## 20.5 Cell reselection using parameters transmitted in the System Information type 2bis, type 2ter, type 7 and type 8 messages

### 20.5.1 Definition and applicability

System information (SI) type 7 and 8 are transmitted on the BCCH Ext when the system information type 4 message does not contain all information needed for cell selection.

The system information type 2 bis message is used when the system information type 2 message does not contain all neighbour cell ARFCNs.

The system information type 2 ter message is used when system information type 2 messages broadcast by one cell which are system information 2 or both system information 2 and 2bis do not contain all neighbour cell ARFCNs.

Test purposes 1 and 3 are applicable to all types of GSM 400, GSM 700, GSM 850, GSM900, DCS1800 and PCS 1 900 MS.

Test purpose 2 is only applicable for E-GSM, DCS 1 800 and PCS 1 900 MS. This is reflected in initial conditions step d).

Test purpose 4 is only applicable to an E-GSM MS. This is reflected in initial conditions step f), test procedures d) and e) and test requirements clause 3).

### 20.5.2 Conformance requirement

1. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection. 3GPP TS 05.08, subclause 6.4.
2. Whilst in idle mode, an MS shall continue to monitor all BCCH carriers as indicated by the BCCH allocation. 3GPP TS 05.08, subclause 6.6.1.
3. Mobile stations shall treat all ARFCNs in the set {0, 1, 2 ... 1023} as valid ARFCN values even if the mobile station is unable to transmit or receive on that ARFCN. 3GPP TS 04.08 / 3GPP TS 44.018, subclause 10.5.2.1b.
4. An E-GSM MS shall correctly decode parameters transmitted in the system information type 2 ter message. 3GPP TS 04.08 / 3GPP TS 44.018, subclause 9.1.34.

### 20.5.3 Test purpose

1. To verify that the MS correctly calculates the C2 criterion when the parameters affecting cell reselection are transmitted in the system information type 7 and 8 messages.
2. To verify that E-GSM, DCS 1 800 and PCS 1 900 MS decode parameters transmitted in the system information type 2 bis message.
3. To verify that the MS treats ARFCNs as valid ARFCNs even if the MS is unable to transmit or receive on that ARFCN.
4. To verify that an E-GSM mobile correctly decode parameters transmitted in the system information type 2 ter message.

### 20.5.4 Method of test

#### 20.5.4.1 Initial conditions

- a) Parameters changed from the default values in table 20.1.

| Parameter                                                                                             | Carrier 1 | Carrier 2 | Carrier 3<br>(note) | Carrier 4 | Carrier 5 | Carrier 6 |
|-------------------------------------------------------------------------------------------------------|-----------|-----------|---------------------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm)                                                           | 53 / -60  | 32 / -81  | 40 / -73            | OFF       | OFF       | OFF       |
| RXLEV_ACCESS_MI<br>N (dB $\mu$ V emf() / dBm)                                                         | 23 / -90  | 23 / -90  | 30 / -83            |           |           |           |
| BS_AG_BLKS_RES<br>PT                                                                                  | 1         | 1         | 1                   |           |           |           |
| CRO                                                                                                   |           | 0         | 0                   |           |           |           |
| TO                                                                                                    |           | 16 dB     | 10 dB               |           |           |           |
|                                                                                                       |           | 0 dB      | 0 dB                |           |           |           |
| C1                                                                                                    | 30        | 9         | 10                  |           |           |           |
| C2                                                                                                    | 30        | 25        | 20                  |           |           |           |
| NOTE: Carrier 3 is off for P-GSM, DCS 1800 and PCS 1 900 MS. Carrier 3 is only required for E-GSM MS. |           |           |                     |           |           |           |

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test and the ARFCNs specified in d) below.

- b) The ARFCNs of carriers 1, 2 and 3 are chosen from those in table 20.1.
- c) The cell reselection parameters PENALTY\_TIME, CELL\_RESELECT\_OFFSET and TEMPORARY\_OFFSET are transmitted in the SI3, SI7 and SI8 messages on carrier 2. They are not transmitted in SI4 and the ADDITIONAL RESELECT PARAM IND parameter is set to 1.
- d) The SI2bis message is transmitted on carrier 1 and contains the ARFCN of carrier 2 and ARFCNs 43, 70, 500, 550, 990 and 995. For an E-GSM MS, a DCS 1 800 and PCS 1 900 MS, the ARFCN of carrier 2 is not transmitted in the SI2 message.
- e) Carriers 1 and 2 are synchronized, but staggered in frame number so that the transmission of the SI3 message on carrier 2, coincides with the paging block which the MS is listening to on carrier 1.

NOTE: Under these conditions, the MS can only decode the parameters affecting cell reselection from the SI7 or SI8 messages.

To achieve this, the following conditions are used:

- BS\_PA\_MFRMS = 4;
- IMSI mod 1000 = 12;
- FN carrier 1 = FN carrier 2-21, for simultaneously transmitted frames.
- f) For an E-GSM MS, the SI3 message on carrier 2 indicates that SI2ter is used on carrier 2. SI2ter message contains the ARFCN of carrier 3 and ARFCNs 45, 76, 891, 905. The ARFCN of carrier 3 is transmitted neither in the SI2 nor in the SI2bis messages on carriers 1 and 2.

#### 20.5.4.2 Test Procedure

- a) The SS activates the channels. The MS is not paged on carrier 1.
- b) The MS is switched on.
- c) After 50 s, the SS increases the level of carrier 2 to 42 dB $\mu$ Vemf( ).
- d) For an E-GSM MS only, when the SS receives a response on carrier 2, the SS stops paging on that carrier and after 30 s, the SS increases the level of carrier 3 to 60 dB $\mu$ Vemf( ).

#### 20.5.5 Test Requirements

- 1) After step b), there shall be no response from the MS on carrier 2. For an E-GSM MS there shall also be no response on carrier 3.
- 2) After increasing the level of carrier 2 in step c), the MS shall respond on carrier 2 within 20 s.
- 3) After increasing the level of carrier 3 in step d), an E-GSM mobile shall respond on carrier 3 within 20 s.

## 20.6 Cell reselection timings

### 20.6.1 Definition and applicability

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

### 20.6.2 Conformance requirement

1. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:
    - 1.1 ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 s.
    - 1.2 Cell reselection for any other reason (see 3GPP TS 03.22) shall take place immediately, but the cell that the MS was camped on shall not be returned to within 5 s if another suitable cell can be found.
- 3GPP TS 05.08, subclause 6.6.2.

### 20.6.3 Test purpose

1. To verify that:
  - 1.1 The MS does not perform a cell reselection when the C2 value for a non serving cell does not exceed the C2 value of the serving cell for a period of at least 5 s.
  - 1.2 When the MS performs an immediate cell reselection due to an unsuccessful random access attempt, the cell that the MS was camped onto is not returned to within 5 s when another suitable cell exists.

### 20.6.4 Method of test

#### 20.6.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter                                    | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier |
|----------------------------------------------|-----------|-----------|-----------|-----------|-----------|---------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm)  | 56 / -57  | 46 / -67  | OFF       | OFF       | OFF       | OFF     |
| RXLEV_ACCESS_MIN<br>(dB $\mu$ V emf() / dBm) | 29 / -84  | 33 / -80  |           |           |           |         |
| Max. Retrans                                 | 00        | 00        |           |           |           |         |
| C1                                           | 27        | 13        |           |           |           |         |
| C2                                           | 27        | 13        |           |           |           |         |

Below is an alternative table of parameters for use with test equipment that cannot reach the upper RF levels as specified in the table above. These carrier levels are reduced by 5 dB and will not effect the purpose of the test case.

| Parameter                                    | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier |
|----------------------------------------------|-----------|-----------|-----------|-----------|-----------|---------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm)  | 51 / -62  | 41 / -72  | OFF       | OFF       | OFF       | OFF     |
| RXLEV_ACCESS_MIN<br>(dB $\mu$ V emf() / dBm) | 24 / -89  | 28 / -85  |           |           |           |         |
| Max. Retrans                                 | 00        | 00        |           |           |           |         |
| C1                                           | 27        | 13        |           |           |           |         |
| C2                                           | 27        | 13        |           |           |           |         |

The BA(BCCH) list only contains 5 ARFCNs including the ARFCNs of the carriers used during the test.

NOTE: With 5 ARFCNs in the BA(BCCH) list and BS\_PA\_MFRMS=5 (default value) the MS will maintain a running average on surrounding cells over a period of 5 s.

### 20.6.4.2 Procedure

- a) The SS activates the channels. The MS is not paged on any of the carriers.
- b) The MS is switched on.
- c) After 50 s, the SS starts paging continuously on carriers 1 and 2 for 20 s. The SS monitors carriers 1 and 2 for RA requests from the MS.
- d) The SS stops paging on carriers 1 and 2 and waits for 20 s. (The MS should revert to carrier 1 due to cell reselection.)
- e) The SS starts paging continuously on carrier 2.
- f) The SS increases the transmit level of carrier 2 by 20 dB for a period of 4 s and then reduces the level back to the original value.
- g) The SS increases the transmit level of carrier 2 by 20 dB and waits for the MS to access on carrier 2.

### 20.6.5 Test requirements

- 1) In step c), the MS shall transmit 2 RA requests on carrier 1 followed by 2 RA requests on carrier 2. Subsequent RA requests on either carrier shall not occur within 4,5 s of the second RA request on that carrier.
- 2) In step f), there shall be no access on carrier 2 within 34 seconds of increasing the level of carrier 2.
- 3) After step g), the MS shall respond on carrier 2.

## 20.7 Priority of cells

### 20.7.1 Definition and applicability

In general, cell prioritization is a means of encouraging MSs to select some suitable cells in preference to others.

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

### 20.7.2 Conformance requirement

1. During cell selection a cell with low priority indication will only be selected if a suitable cell of normal priority cannot be found; 3GPP TS 03.22, subclause 3.5.2.1.
- 2.

**Table 1a: Parameters affecting cell priority for cell selection**

| CELL_BAR_QUALIFY | CELL_BAR_ACCESS | Cell selection priority | Status for cell reselection |
|------------------|-----------------|-------------------------|-----------------------------|
| 0                | 0               | normal                  | normal                      |
| 0                | 1               | barred                  | barred                      |
| 1                | 0               | low                     | normal (see note 2)         |
| 1                | 1               | low                     | normal (see note 2)         |

3GPP TS 05.08, table 1.a.

3. If all the following conditions are met then the "Cell selection priority" and the "Status for cell reselection" shall be set to normal:
  - the cell belongs to the MS HPLMN;
  - the MS is in cell test operation mode;
  - the CELL\_BAR\_ACCESS is set to "1";
  - the CELL\_BAR\_QUALIFY is set to "0";

- the Access Control class 15 is barred.

3GPP TS 05.08, table 1.a.

### 20.7.3 Test purpose

1. To verify that the MS does not select a cell of low priority when a suitable cell of normal priority exists with a lower received signal strength.
2. To verify that the MS takes into account CELL\_BAR\_ACCESS and CELL BAR \_QUALIFY when performing cell selection and reselection.
3. To verify that the MS meets conformance requirement 3.

### 20.7.4 Method of test

#### 20.7.4.1 Initial conditions

Parameters changed from Default values table 20.1

| Parameter                                    | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|----------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm)  | 33 / -80  | 43 / -70  | 33 / -80  | 23 / -90  | OFF       | OFF       |
| RXLEV_ACCESS_MIN<br>(dB $\mu$ V emf() / dBm) | 3 / -110  | 23 / -90  | 13 / -100 | 13 / -100 |           |           |
| CBA                                          | 0         | 1         | 1         | 0         |           |           |
| CBQ                                          | 1         | 1         | 0         | 0         |           |           |
| Access class 15                              | barred    | barred    | barred    | barred    |           |           |
| C1                                           | 30        | 20        | 20        | 10        |           |           |

#### 20.7.4.2 Procedure

- a) The SS activates the carriers and monitors for RA requests from the MS on carriers 1, 2, and 4.
- b) The MS is switched on.
- c) The MS is switched off. The SS deactivates the carriers.
- d) The MS is placed in cell test operation mode.

NOTE: Cell test mode is a mode of operation defined in SIM administrative data field.

- e) The SS activates the carriers and monitors for RA requests from the MS on carriers 1, 2, and 3.
- f) The MS is switched on.

### 20.7.5 Test requirements

- 1) After step b), the first response from the MS shall be on carrier 4 within 33 s, followed by a response on carrier 1 before a response (if any) on carrier 2 within 50 s.
- 2) After step f), the first response from the MS shall be on carrier 3 within 33 s, followed by a response on carrier 1 before a response (if any) on carrier 2 within 50 s.

## 20.8 Cell reselection when C1 (serving cell) < 0 for 5 s

### 20.8.1 Definition and applicability

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

## 20.8.2 Conformance requirement

1. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:
  - i) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 s. This indicates that the path loss to the cell has become too high. 3GPP TS 05.08, subclause 6.6.2.
2. While camped on a cell of the selected PLMN ("camped normally"), the MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:
  - i) The path loss criterion parameter C1 (see subclause 3.6) indicates that the path loss to the cell has become too high. 3GPP TS 03.22, subclause 4.5.

## 20.8.3 Test purpose

1. To verify that the MS meets conformance requirement 1.
2. To verify that the MS meets conformance requirement 2.

## 20.8.4 Method of test

### 20.8.4.1 Initial conditions

Parameters changed from Default values table 20.1.

| Parameter                                    | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|----------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm)  | 63 / -50  | 33 / -80  | OFF       | OFF       | OFF       | OFF       |
| RXLEV_ACCESS_MIN<br>(dB $\mu$ V emf() / dBm) | 43 / -70  | 23 / -90  |           |           |           |           |
| CRO                                          | 30 dB     |           |           |           |           |           |
| TO                                           | 0         |           |           |           |           |           |
| PT                                           | 0         |           |           |           |           |           |
| C1                                           | 20        | 10        |           |           |           |           |
| C2                                           | 50        | 10        |           |           |           |           |

NOTE: With BS\_PA\_MFRMS = 5 (default value), the averaging time of the MS on the serving cell BCCH is 5,9 s.

### 20.8.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2 for RA requests from the MS.
- b) The MS is switched on.
- c) The SS reduces signal level on carrier 1 to -80 dBm / 33 dB $\mu$ V emf() for 4 s. Then, the SS raises the level back to -50 dBm / 63 dB $\mu$ V emf(). (C1 becomes -10 dB and C2, 20 dB during this period).
- d) The SS reduces signal level on carrier 1 to -80 dBm / 33 dB $\mu$ V emf()

## 20.8.5 Test requirements

- 1) After step b), there shall be no access on carrier 1 or carrier 2, within 50 s.
- 2) After step c), there shall be no access on carrier 2 within 30 s.
- 3) After step d), the MS shall access on carrier 2 within 20 s.

## 20.9 Running average of the surrounding cell BCCH carrier signal levels

### 20.9.1 Definition and applicability

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

### 20.9.2 Conformance requirement

1. Whilst in idle mode an MS shall continue to monitor all BCCH carriers as indicated by the BCCH allocation (BA - See table 1). A running average of received level in the preceding 5 to:
  - Max.  $\{5, ((5 \times N + 6) \text{ DIV } 7) * \text{BS\_PA\_MFRMS} / 4\}$ ;
  - seconds shall be maintained for each carrier in the BCCH allocation. N is the number of non-serving cell BCCH carriers in BA and the parameter BS\_PA\_MFRMS is defined in 3GPP TS 05.02; 3GPP TS 05.08, subclause 6.6.1.
2. The same number of measurement samples shall be taken for all non-serving cell BCCH carriers of the BA list, and the samples allocated to each carrier shall as far as possible be uniformly distributed over each evaluation period. 3GPP TS 05.08, subclause 6.6.1

### 20.9.3 Test purpose

1. To verify that if the MS calculates a received level average (over 5 s) for a non-serving suitable cell which results in the value of C2 exceeding the value of C2 for the serving cell, then cell reselection takes place to the non-serving cell.
2. To verify that by using suitable varying levels of signal strength for non serving cells, the MS samples on non serving cell BCCH carriers are as far as possible distributed uniformly over each evaluation period.

### 20.9.4 Method of test

#### 20.9.4.1 Initial conditions

Parameters changed from Default values table 20.1.

| Parameter                                    | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|----------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm)  | 53 / -60  | 33 / -80  | OFF       | OFF       | OFF       | OFF       |
| RXLEV_ACCESS_MIN<br>(dB $\mu$ V emf() / dBm) | 23 / -90  | 23 / -90  |           |           |           |           |
| C1                                           | 30        | 10        |           |           |           |           |
| C2                                           | 30        | 10        |           |           |           |           |

BS\_PA\_MFRMS is set to 4 for this test.

The BA(BCCH) list only contains 7 ARFCNs including the ARFCNs of the carriers used during the test.

NOTE: With 7 ARFCNs in the BA(BCCH) list and BS\_PA\_MFRMS=4 the MS will maintain a running average on surrounding cells over a period of 5 s.

#### 20.9.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.
- b) The MS is switched on.
- c) The SS starts switching the level of carrier 2 between -80 dBm and -57 dBm every 2,7 s and continues to do so until the end of the test.

d) The SS decreases the level of carrier 1 to -76 dBm.

NOTE: As a result of the switching in levels, the running average on carrier 2 will be between -66 dBm and -71dBm, assuming that samples are distributed over five consecutive paging blocks.

### 20.9.5 Test requirements

1) After step b), there shall be no access from the MS on carrier 1 or carrier 2, within 50 s.

2) After step c), there shall be no access from the MS on carrier 1 or 2 within 25 s.

NOTE: Any potential access on is likely to occur within 20 s.

3) After step d), the MS shall access on carrier 2 within 20 s.

## 20.10 Running average of the serving cell BCCH carrier signal level

### 20.10.1 Definition and applicability

The MS is required to monitor continuously the BCCH carrier signal level of the serving cell (and to compare it to the BCCH carrier signal levels of the non-serving cells) to guarantee that it is camped on the most suitable cell.

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

### 20.10.2 Conformance requirement

1. For the serving cell, receive level measurement samples shall be taken at least for each paging block of the MS. The receive level average shall be a running average determined using samples collected over a period of 5 s or five consecutive paging blocks of that MS, whichever is the greater period. New receiving level average values shall be calculated as often as possible.; 3GPP TS 05.08, subclause 6.6.1.

### 20.10.3 Test purpose

1. To verify that by using suitable varying levels of signal strength for the serving cell, the MS performs a running average over 5 consecutive paging blocks.

### 20.10.4 Method of test

#### 20.10.4.1 Initial conditions

Parameters changed from Default values table 20.1.

| Parameter                              | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|----------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level<br>(dBμV emf() / dBm)  | 63 / -50  | 39 / -74  | OFF       | OFF       | OFF       | OFF       |
| RXLEV_ACCESS_MIN<br>(dBμV emf() / dBm) | 23 / -90  | 23 / -90  |           |           |           |           |
| C1                                     | 40        | 16        |           |           |           |           |
| C2                                     | 40        | 16        |           |           |           |           |

NOTE: With BS\_PA\_MFRMS = 5 (default value), the averaging time of the MS on the serving cell BCCH is 5,9 s.

### 20.10.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2 for RA requests from the MS.
- b) The MS is switched on.
- c) After 50 s the SS starts switching the level of carrier 1 between -80 dBm and -50 dBm every 3 s.

NOTE: As a result of the switching in levels, the running average on carrier 1 will be between -62 dBm and -68 dBm over five consecutive paging blocks.

- d) The SS increases the level of carrier 2 to -56 dBm.

### 20.10.5 Test requirement

- 1) After step c), the MS shall not access on carrier 2, within 25 s.
- 2) After step d), the MS shall access on carrier 2, within 30 s.

NOTE: 13,75 s to perform running average, 10 s to detect C2 differences, 2,4 s to read BCCH of carrier 2, 1 s to perform RA. Total 27,15 s, allow 30 s.

## 20.11 Updating the list of six strongest neighbour carriers and decoding the BCCH information of a new carrier on the list

### 20.11.1 Definition and applicability

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

### 20.11.2 Conformance requirement

1. The list of the 6 strongest non-serving carriers shall be updated at least as often as the duration of the running average defined for measurements on the BCCH allocation and may be updated more frequently; 3GPP TS 05.08, subclause 6.6.1.
2. When the MS recognizes that a new BCCH carrier has become one of the 6 strongest, the BCCH data shall be decoded for the new carrier within 30 s; 3GPP TS 05.08, subclause 6.6.1.

### 20.11.3 Test purpose

1. To verify that MS meets conformance requirement 1.
2. To verify that MS meets conformance requirement 2.

### 20.11.4 Method of test

#### 20.11.4.1 Initial conditions

Six BCCH carriers are established with the system information contents of table 20.1.

Parameters changed from Default values table 20.1.

| Parameter                          | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 | Carrier 7 |
|------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dBμV emf ( )/dBm) | 53 / -60  | 48 / -65  | 43 / -70  | 38 / -75  | 33 / -80  | 33 / -80  | 38 / -75  |
| RXLEV_ACCESS_MIN                   | -90       | -90       | -90       | -90       | -90       | -90       | -110      |
| C1                                 | 30        | 25        | 20        | 15        | 10        | 10        | 35        |
| C2                                 | 30        | 25        | 20        | 15        | 10        | 10        | 35        |

The BA(BCCH) list contains only eight ARFCNs and includes those of carriers 1 to 7.

BS\_PA\_MFRMS is set to 3 during this test.

NOTE: The combination of 8 carriers on the BA list and BS\_PA\_MFRMS = 3 leads to averaging time of 5 s. Hence 5 s is also the updating time of the list of six strongest neighbour carriers.

#### 20.11.4.2 Procedure

- The SS activates carriers 1 to 6. The MS is not paged on any of the carriers.
- The MS is switched on.
- After 60 s, the SS activates carrier 7 and pages the MS continuously on this carrier. The SS monitors carrier 7 for RA requests from the MS.

#### 20.11.5 Test requirements

- The MS shall access on carrier 7 within 55 s of activating carrier 7.

NOTE: 5,5 s to notice new strongest carrier in top 6 (because the updating time for six strongest is 5 s (+10 %)), 33 s to read BCCH, 15 s for reselection, since the MS has already performed the running average on the new strongest carrier, allow 55 s.

## 20.12 Decoding the BCCH information of the neighbour carriers on the list of six strongest neighbour carriers

### 20.12.1 Definition and applicability

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

### 20.12.2 Conformance requirement

- The MS shall attempt to decode the BCCH data block that contains the parameters affecting cell reselection for each of the 6 strongest non-serving cell BCCH carriers at least every 5 minutes; 3GPP TS 05.08, subclause 6.6.1.

NOTE: Verification of cell reselection as implicitly tested here is performed in subclause 20.3.

### 20.12.3 Test purpose

- To verify that the MS decodes the BCCH data block that contains the parameters affecting cell reselection for a non-serving cell BCCH carrier, (which is in the list of six strongest neighbour cells), at least every 5 minutes. This is achieved by changing the BCCH data such that the value of C2 for the non serving cell exceeds the value of C2 for the serving cell, and observing that the MS performs cell reselection within 5 minutes plus the time allowed for cell reselection after the change of the BCCH data.

### 20.12.4 Method of test

#### 20.12.4.1 Initial conditions

Parameters changed from Default values table 20.1.

| Parameter                                  | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level<br>(dB $\mu$ V emf) / dBm) | 38 / -75  | 33 / -80  | OFF       | OFF       | OFF       | OFF       |
| C1                                         | 15        | 10        |           |           |           |           |
| C2                                         | 15        | 10        |           |           |           |           |

#### 20.12.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.
- b) The MS is switched on.
- c) The SS changes the RXLEV\_ACCESS\_MIN in the BCCH data of carrier 2 to be -100 dBm.

NOTE: With the above change the C2 of carrier 2 becomes 20 whereas the C2 of carrier 1 stays at 15.

#### 20.12.5 Test requirements

- 1) After step b), there shall be no access from the MS on carrier 1 or carrier 2 within 50 s.
- 2) After step c), the MS shall access on carrier 2 within 345 s of the change in the BCCH data of carrier 2.

NOTE: 330 s for decode of BCCH of carrier 2 (300 s +10 %), 15 s for reselection of carrier 2, since the MS already has a running average on carrier 2.

## 20.13 Decoding the BSIC of the neighbour carriers on the list of six strongest neighbour carriers

#### 20.13.1 Definition and applicability

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

#### 20.13.2 Conformance requirement

1. The MS shall attempt to check the BSIC for each of the 6 strongest non-serving cell BCCH carriers at least every 30 s, to confirm that it is monitoring the same cell. If a change of BSIC is detected then the carrier shall be treated as a new carrier and the BCCH data redetermined; 3GPP TS 05.08, subclause 6.6.1.

NOTE: Verification of cell reselection as implicitly tested here is performed in subclause 20.3.

#### 20.13.3 Test purpose

1. To verify that the MS will check the BSIC of the non-serving cell, which is in the list of six strongest neighbour cells, by changing the BSIC and the BCCH data of the non-serving cell such that the value of C2 for that cell exceeds the value of C2 of the serving cell, and observing that the MS performs cell reselection within the time allowed to check the BSIC, redetermine the BCCH data and perform cell reselection.

#### 20.13.4 Method of test

##### 20.13.4.1 Initial conditions

Parameters changed from Default values table 20.1.

| Parameter                                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level<br>(dB $\mu$ V emf() / dBm) | 38 / -75  | 33 / -80  | OFF       | OFF       | OFF       | OFF       |
| C1                                          | 15        | 10        |           |           |           |           |
| C2                                          | 15        | 10        |           |           |           |           |

#### 20.13.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.
- b) The MS is switched on.
- c) The SS changes the BSIC of carrier 2 by changing the Base Station Colour Code (BCC) part of the BSIC. The SS also changes the RXLEV\_ACCESS\_MIN in the BCCH data of carrier 2 to be -100 dBm.

NOTE: With the above change to the BCCH data the C2 of carrier 2 becomes 20 whereas the C2 of carrier 1 stays at 15.

#### 20.13.5 Test requirements

- 1) In step b), there shall be no access from the MS on carrier 1 or carrier 2 within 50 s.
- 2) After step c), the MS shall access on carrier 2 within 85 s of the change in the BSIC value (and BCCH data) of carrier 2.

NOTE: 33 s for check of BSIC on carrier 2, 33 s for decode of BCCH of carrier 2, 15 s for reselection of carrier 2, since the MS already has a running average on carrier 2, allow 85 s.

## 20.14 Emergency calls

#### 20.14.1 Definition and applicability

This test is applicable for GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs supporting speech.

#### 20.14.2 Conformance requirement

1. When in a limited service state, the MS shall be able to initiate emergency calls; 3GPP TS 05.08, subclause 6.8.
2. When in a limited service state and if not camped on a cell, the MS shall monitor the signal strength of all 35 (GSM 450), all 35 (GSM 480), all 74 (for GSM 750), all 124 (for GSM 850), all 124 (for GSM), all 174 (for E-GSM), all 374 (for DCS 1 800) or all 299 (for PCS 1 900) RF channels, and search for a BCCH carrier which has  $C1 > 0$  and which is not barred. When such a carrier is found, the MS shall camp on that cell, irrespective of the PLMN identity; 3GPP TS 05.08, subclause 6.8.
3. The MS shall perform cell reselection at least among the cells of the PLMN of the cell on which the MS has camped, according to the algorithm of 3GPP TS 03.22, subclauses 4.5 and 3.7, except that a zero value of CELL\_RESELECT\_HYSTERESIS shall be used; 3GPP TS 05.08, subclause 6.8.

#### 20.14.3 Test purpose

1. To verify that the MS shall be able to initiate emergency calls when no suitable cells of the selected PLMN are available, but at least one acceptable cell is available.
2. To verify that the MS selects a cell with  $C1 > 0$  and  $CBA = 0$  when no suitable cells of the selected PLMN are available.
3. To verify that the MS, when performing cell reselection in the limited service state, uses CELL\_RESELECT\_HYSTERESIS = 0.

## 20.14.4 Method of test

## 20.14.4.1 Initial conditions

Parameters changed from Default values table 20.1.

| Parameter                                 | Carrier 1               | Carrier 2      | Carrier 3      | Carrier 4 | Carrier 5 | Carrier 6 |
|-------------------------------------------|-------------------------|----------------|----------------|-----------|-----------|-----------|
| RF signal level (dB $\mu$ V emf() / dBm)  | 38 / -75                | 33 / -80       | 33 / -80       | OFF       | OFF       | OFF       |
| RXLEV_ACCESS_MIN (dB $\mu$ V emf() / dBm) | 23 / -90                | 43 / -70       | 23 / -90       |           |           |           |
| CELL_BAR_ACCESS<br>MCC,MNC                | 1 (barred)<br>forbidden | 0<br>forbidden | 0<br>forbidden |           |           |           |
| CELL_RESELECT_HYST                        | 0                       | 0              | 14 dB          |           |           |           |
| C1                                        | 15                      | -10            | 10             |           |           |           |

NOTE: All the BCCH carriers belong to the same PLMN, which is not the MS's home PLMN and is in the SIM's forbidden PLMN's list.

## 20.14.4.2 Procedure

- a) The SS activates the carriers. The SS monitors for RA attempts from the MS on carriers 1, 2 and 3 for the duration of the test. In order to prevent the MS from answering to paging only idle-paging is sent on all channels.
- b) The MS is switched on.
- c) 50 s after switch on, an emergency call is initiated on the MS.
- d) The SS changes the CBA of carrier 1 to 0.

NOTE 1: The MS should reselect to carrier 1 because it should not take into account the CELL\_RESELECT\_HYST value of 14 but use 0 instead.

- e) After 345 s an emergency call is initiated on the MS.

NOTE 2: 330 s to detect change of BCCH data, 15 s to perform reselection of carrier 1, since the MS already has a running average on carrier 1.

## 20.14.5 Test requirements

- 1) In step c), the first access by the MS shall be on carrier 3.
- 2) In step e), the first access from the MS shall be on carrier 1.

## 20.15 Cell reselection due to MS rejection "LA not allowed"

## 20.15.1 Definition and applicability

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

This process goes on while camping on a cell which pertains to an LA which is placed in the list of "forbidden LAIs for regional provision of service".

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

## 20.15.2 Conformance requirement

1. In response to a registration attempt, when receiving an LU reject with cause value "LA not allowed", the MS stores this LAI in a list of "forbidden LAIs for regional provision of service", to prevent repeated attempts to access a cell of the forbidden LA, 3GPP TS 03.22, subclause 3.3.
2. If the MS has received the cause 'LA not allowed', it shall ignore this fact when selecting a cell to camp on, i.e. it shall not reject a cell for camping on because that cell is part of a LA where this cause has been received, 3GPP TS 03.22, subclause 3.5.4.
3. In response to a registration attempt, when receiving an LU reject with cause value "LA not allowed", the MS continues to perform normal cell-reselection, 3GPP TS 03.22, subclause 4.4.2
4. A new LU attempt shall only be performed when a new LA (or new PLMN) is entered according to the cell reselection procedure, 3GPP TS 03.22, subclause 3.3 and figure 4.

NOTE: LA stands for "Location Area" and LU stands for "Location Update".

## 20.15.3 Test purpose

1. To verify that if an LU is rejected with cause "LA not allowed" that the LAI of that cell is written into a forbidden list which prevents the MS from performing LU onto another cell in that LA. This is verified indirectly in test purposes 2,3 and 4.
2. To verify that the MS will not reject a cell for camping on because that cell is part of a LA in the list of "forbidden LAIs for regional provision of service". This is verified indirectly by making the MS attempt an emergency call and checking that the channel request message is transmitted on the correct cell.
3. To verify that the MS when receiving an LU reject with cause value "LA not allowed", the MS continues to perform normal cell-reselection:

Cell reselection is triggered if there is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter). 3GPP TS 03.22, subclauses 3.4 and 4.5.

4. To verify that a new LU attempt will be performed when a new LA (or new PLMN) is entered, 3GPP TS 03.22, subclause 3.3 and figure 4.

## 20.15.4 Method of test

## 20.15.4.1 Initial conditions

Parameters changed from Default values table 20.1.

| Parameter                                    | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|----------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm)  | 63 / -50  | 54 / -59  | 44 / -69  | OFF       | OFF       | OFF       |
| RXLEV_ACCESS_MIN (dB $\mu$ V<br>emf() / dBm) | 53 / -60  | 35 / -78  | 29 / -84  |           |           |           |
| CRH                                          | 14        | 0         | 10        |           |           |           |
| LAC                                          | H1111     | H2222     | H1111     |           |           |           |
| ATT                                          | 1         | 1         | 1         |           |           |           |
| C1                                           | 10        | 19        | 15        |           |           |           |
| C2                                           | 10        | 19        | 15        |           |           |           |

#### 20.15.4.2 Procedure

- a) The SS activates the carriers. The SS monitors all RA requests from MS on carriers 1, 2 and 3 until step e) has been completed. Only idle-paging is sent on all channels.
- b) The MS is switched on.
- c) When the MS performs an IMSI attach onto carrier 1, the SS shall reject it with cause "LA not allowed".
- d) 30 s after the MS has returned to idle mode (channel release after LU reject), the MS is manually commanded to set up an emergency call.

NOTE 1:  $C2$  of carrier 3 >  $C2$  of carrier 1. Carriers 1 and 3 belong to the same LA.

- e) The SS rejects the CM service request from the MS, with a CM service reject message with cause value #17 (Network Failure).

NOTE 2: Cause values #4 (IMSI unknown in VLR) or #6 (Illegal ME) lead to unwanted behaviour of the mobile.

- f) 10 s after the MS has returned to idle mode (channel release after CM service reject), the SS increases the level of carrier 2 to 65 dB $\mu$ V emf().

NOTE 3:  $C2$  of carrier 2 = 30, now larger than  $C2$  of carrier 3 + CRH.

- g) The SS shall accept any LU on carrier 2.

#### 20.15.5 Test requirements

- 1) After step b), the MS shall respond on carrier 1 within 33 s.
- 2) In step d), the MS shall access on carrier 3 with a channel request message, within 15 s of being commanded to set up the emergency call.
- 3) After increasing the level of carrier 2 in step f), the MS shall reselect and access onto carrier 2 requesting an LU within 30 s.

NOTE: 13,75 s to perform running average, 10 s to detect  $C2$  differences, 2,4 s to read BCCH of carrier 2, 1 s to perform RA. Total 27,15 s, allow 30 s.

## 20.16 Downlink signalling failure

#### 20.16.1 Definition and applicability

See conformance requirement.

#### 20.16.2 Conformance requirement

The downlink signalling failure criterion is based on the downlink signalling failure counter DSC.

1. When the MS camps on a cell, DSC shall be initialized to a value equal to the nearest integer to  $90/N$  where  $N$  is the BS\_PA\_MFRMS parameter for that cell (see 3GPP TS 05.02).
2. Thereafter, whenever the MS attempts to decode a message in its paging subchannel; if a message is successfully decoded DSC is increased by 1,(however never beyond the nearest integer to  $90/N$ ).
3. Whenever the MS can not successfully decode a message in its paging subchannel the DSC is decreased by 4.
4. When DSC reaches 0, a downlink signalling failure shall be declared. A downlink signalling failure shall result in cell reselection, 3GPP TS 03.22, subclause 4.5 (ii) and 3GPP TS 05.08, subclause 6.5.

NOTE: The network sends the paging subchannel for a given MS every BS\_PA\_MFRMS multiframes. The requirement for network transmission on the paging subchannel is specified in 3GPP TS 04.08 / 3GPP TS 44.018. The MS is required to attempt to decode a message every time its paging subchannel is sent.

### 20.16.3 Test purpose

1. To verify that the MS initializes the DSC counter in accordance with the conformance requirement. This is verified indirectly.
2. To verify that whenever the MS successfully decodes a message on paging subchannel, the DSC is increased by 1, (however never beyond the nearest integer to  $90/N$ ). This is verified indirectly.
3. To verify that whenever the MS can not successfully decode a message on paging subchannel, the DSC decreased by 4. This is verified indirectly.
4. To verify that when the DSC reaches 0, a downlink signalling failure shall be declared and the MS will perform cell reselection.

### 20.16.4 Method of test

#### 20.16.4.1 Initial conditions

Two BCCH carriers are established with the system information contents of table 20.1.

Parameters changed from Default values table 20.1.

| Parameter                                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level<br>(dB $\mu$ V emf() / dBm) | 43 / -70  | 33 / -80  | OFF       | OFF       | OFF       | OFF       |
| C1 = C2                                     | 20        | 10        |           |           |           |           |

NOTE: The DSC counter will have a value 18 ( $90/5$ ).

#### 20.16.4.2 Procedure

- a) The MS is switched on. On carrier 1 valid layer 3 messages shall be sent in the paging blocks, but not paging the MS (idle paging). On carrier 2 the MS is paged continuously in all paging blocks.
- b) After 40 s the SS sends corrupted data (using random data, wrong parity bits see 3GPP TS 05.03, subclauses 4.3 and 4.1.2 or other lower layer error) in four successive paging blocks to carrier 1 and then reverts to sending normal data.

NOTE 1: Sending corrupted, i.e. non-decodable data on four successive paging blocks should decrease the DSC to 2.

- c) The SS monitors all accesses on both carriers for 30 s.
- d) The SS sends corrupted data in five successive paging blocks to carrier 1 and then reverts to sending normal data.

NOTE 2: Sending random, data on five successive paging blocks should decrease the DSC to  $< 0$  and cause a cell reselection.

- e) The SS monitors all accesses on both carriers for 30 s.

### 20.16.5 Test requirements

- 1) There shall be no access to carrier 2 in test steps a) and c).
- 2) The MS shall access on carrier 2 at test step e) within 15 s.

## 20.17 Cell selection if no suitable cell found in 10 s

### 20.17.1 Definition and applicability

See conformance requirement.

### 20.17.2 Conformance requirement

If no suitable cell is found in cell reselection process within 10 s, the cell selection algorithm of 3GPP TS 03.22 shall be performed, 3GPP TS 05.08, subclause 6.6.2.

### 20.17.3 Test purpose

To verify that the MS fulfils the conformance requirement.

### 20.17.4 Method of test

#### 20.17.4.1 Initial conditions

One BCCH carrier is established with the system information contents of table 20.1.

Parameters changed from Default values table 20.1.

| Parameter                                              | Carrier 1      | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--------------------------------------------------------|----------------|-----------|-----------|-----------|-----------|-----------|
| RF signal level<br>(dB $\mu$ V emf() / dBm)<br>C1 = C2 | 43 / -70<br>20 | OFF       | OFF       | OFF       | OFF       | OFF       |

#### 20.17.4.2 Procedure

- a) The MS is switched on. Idle paging is sent on carrier 1.
- b) After the MS indicates service the SS reduces the transmit level of carrier 1 to 13 dB $\mu$ V emf() (so that C1 of carrier 1 becomes -10) and turns on a new carrier (carrier 2) at a level of 33 dB $\mu$ V emf(). Carrier 2 shall not be in the MS BA list (i.e. it shall not be one of the carriers that MS has been monitoring after camped on carrier 1).
- c) The SS shall monitor all accesses on carriers 1 and 2 for 60 s.

NOTE: The access on carrier 2 should not take longer than 50 s. (5 s to rxlev averages, 5 s for C1 < 0 duration, 10 s for searching another suitable cell, 30 s for cell selection), 60 s is a safe time to wait.

### 20.17.5 Test requirements

The MS shall access on carrier 2 at test step c) within 60 s.

## 20.18 Cell reselection due to MS rejection "Roaming not allowed in this LA"

### 20.18.1 Definition and applicability

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

The MS looks for suitable neighbour cells which satisfies 4 constraints including that It should not be in an LA which is in the list of "forbidden LAs for roaming".

This test is applicable for all types of GSM 400, GSM 700, GSM 850, GSM 900, DCS 1 800 and PCS 1 900 MSs.

## 20.18.2 Conformance requirement

1. To prevent repeated attempts to have roaming service on a not allowed LA, when the MS is informed that an LA is forbidden, the LA is added to a list of "forbidden LAs for roaming" which is stored in the MS, 3GPP TS 03.22; subclause 3.1.
2. If the MS has received the cause "Roaming not allowed in this LA", in response to a LU attempt, the Network Selection Procedure shall be started, 3GPP TS 03.22; subclause 4.3.3 L3, 3GPP TS 04.08 / 3GPP TS 24.008, subclause 4.4.4.7.
3. The MS can only perform camping on a suitable cell, which:
  - should not be in an LA which is in the list of "forbidden LAs for roaming" 3GPP TS 03.22, subclause 3.2.1.

NOTE: LA stands for "Location Area" and LU stands for "Location Update".

## 20.18.3 Test purpose

1. To verify that if an LU is rejected with cause "Roaming not allowed in this LA", that the LAI of that cell is written into a forbidden list which prevents the MS from camping onto any cell in that LA.
2. To verify that if the MS has received the cause "Roaming not allowed in this LA", in response to a LU attempt, the Network Selection Procedure is initiated. This is verified indirectly by test purpose 3, in that the new LA is accessed as part of cell selection, hence CRH is disregarded.
3. To verify that if an LU is rejected, when attempting LU in a LA with LAI = LAI1, with cause "Roaming not allowed in this LA" and only cells of the selected PLMN are available, the MS will only camp and attempt LU in any LA with LAI <> LAI1.

## 20.18.4 Method of test

## 20.18.4.1 Initial conditions

Parameters changed from Default values table 20.1.

| Parameter                           | Carrier 1    | Carrier 2    | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|-------------------------------------|--------------|--------------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm)  | 63 / -50     | 53 / -60     | OFF       | OFF       | OFF       | OFF       |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 23 / -90     | 23 / -90     |           |           |           |           |
| MNC                                 | MNC <> HPLMN | MNC <> HPLMN |           |           |           |           |
| MCC                                 | MCC of HPLMN | MCC of HPLMN |           |           |           |           |
| CRH                                 | 0            | 0            |           |           |           |           |
| LAC                                 | H1111        | H2222        |           |           |           |           |
| ATT                                 | 1            | 1            |           |           |           |           |
| C1                                  | 40           | 30           |           |           |           |           |
| C2                                  | 40           | 30           |           |           |           |           |

## 20.18.4.2 Procedure

- a) The MS is switched on. Idle paging is sent on all carriers.
- b) The SS monitors all RA requests from MS on carriers 1 and 2.
- c) When the MS performs an IMSI attach onto carrier 1, the SS shall reject it with cause "Roaming not allowed in this LA".
- d) The SS shall accept any LU on carrier 2.
- e) The SS monitors all RA requests from MS on carriers 1 to 2.

### 20.18.5 Test requirements

- 1) The MS should respond on carrier 1 within 33 s of switch on.
- 2) After LU reject, the MS shall initiate the Network Selection Procedure and access onto Carrier 2 as part of cell selection within 33 s from returning to idle mode after the LU reject.

NOTE: The timing requirement in b) is given only for testing purposes only. No timing requirements are defined for the Network Selection Procedure, but the time allowed for cell selection (see 20.1) should be adequate.

- 3) After the LU reject on carrier 1, there shall be no more access attempts on this carrier.

## 20.19 Cell selection on release of SDCCH and TCH

### 20.19.1 Definition and applicability

Void.

### 20.19.2 Conformance requirement

1. When the SS releases a TCH or SDCCH and returns to idle mode, it shall, as quickly as possible camp on the BCCH carrier of the cell whose channel has just been released. If the full BCCH data for that cell was not decoded in the preceding 30 s, the MS shall then attempt to decode the full BCCH data. Until the MS has decoded the BCCH data required for determining the paging group, it shall also monitor all paging blocks on timeslot 0 of the BCCH carrier for possible paging messages that might address it. If the MS receives a page before having decoded the full BCCH data for the cell, the MS shall store the page and respond once the full BCCH data has been decoded, provided that the cell is not barred and the MS's access class is allowed.  
3GPP TS 05.08, subclause 6.7.

### 20.19.3 Test purpose

1. To verify that on release of a TCH or an SDCCH, the MS camps as quickly as possible on the BCCH carrier of the cell whose channel has just been released.

NOTE: This is implicitly tested by the MS responding to a paging request. The decoding of BCCH data cannot be explicitly tested. However, the MS shall monitor for paging messages which may address it if it decodes the BCCH.

### 20.19.4 Method of test

#### 20.19.4.1 Initial conditions

- a) Parameters changed from default values in table 20.1.

| Parameter                              | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|----------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dBmV emf() / dBm)  | 53 / -60  | 33 / -80  | OFF       | OFF       | OFF       | OFF       |
| RXLEV_ACCESS_MIN<br>(dBmV emf() / dBm) | 23 / -90  | 23 / -90  |           |           |           |           |
| BS_PA_MFRMS                            | 2         | 2         |           |           |           |           |
| ATT                                    | 1         |           |           |           |           |           |
| C1                                     | 30        | 10        |           |           |           |           |
| C2                                     | 30        | 10        |           |           |           |           |

- b) Carrier 1 is configured to have a combined control channel.
- c) Carrier 2 is configured to have a non combined control channel.

#### 20.19.4.2 Test procedure

- a) The SS activates the carriers. No paging messages are transmitted on carrier 1 or carrier 2.
- b) The MS is switched on.
- c) In response to the MS access for IMSI attach, the SS allocates a combined SDDCH/4, accepts the IMSI attach procedure and then releases the link. After 0,5 s but within 1 second of transmitting the UA frame on completion of the IMSI attach procedure, the SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 1.
- d) When the MS responds to paging, the SS establishes a call on a traffic channel.
- e) The SS increases the level of carrier 2 to 63 dBmV emf().
- f) After 10 s the SS performs a handover to another TCH, with the parameters of carrier 2 indicated in the CELL DESCRIPTION information element of the HANDOVER COMMAND message.
- g) After a further 10 s, the SS clears down the call. After 0,5 s but within 1 second of transmitting the UA frame, the SS transmits a single PAGING REQUEST on carrier 2 in the appropriate paging block of the MS.

#### 20.19.5 Test requirements

- 1) After step b) the MS shall access in order to commence an IMSI attach procedure on carrier 1 within 33 s.
- 2) In step c), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.
- 3) In step g), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

## 20.20 Multiband cell selection and reselection

### 20.20.1 Multiband cell selection and reselection / Cell Selection

#### 20.20.1.1 Definition and applicability

Multiband cell selection is a process in which a multiband MS, whenever a new PLMN is selected, attempts to find a suitable cell of that PLMN to camp on, irrespective of frequency band. Two methods of searching for a suitable cell are possible, normal cell selection and stored list cell selection. The process ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. Once the MS is camped on a cell, access to the network is allowed.

This test is applicable for any multiband MSs supporting simultaneous multiband operation.

#### 20.20.1.2 Conformance requirement

1. A multiband MS shall search all channels within its bands of operation (35 for GSM 450, 35 for GSM 480, 74 for GSM 750, 124 for GSM 850, 124 for P-GSM, 174 for E-GSM and 374 for DCS). The number of channels searched will be the sum of channels on each band of operation; 3GPP TS 05.08, subclause 6.2.
2. The MS shall be able to select the correct (fourth strongest) cell and be able to respond to paging on that cell within 30 s of switch on, when the three strongest cells are not suitable. This assumes a valid SIM, with PIN disabled and ideal radio conditions; 3GPP TS 05.08, subclause 6.1.
3. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:
  - 3.1 (i) It should be a cell of the selected PLMN
  - 3.2 (ii) It should not be "barred" (see subclause 3.5.1)
  - 3.3 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. This is estimated as shown in subclause 3.6.

3GPP TS 03.22, subclause 3.2.1.

NOTE: Criteria (iii) is not applicable for Cell Selection

4. Initially the MS looks for a cell which satisfies these 4 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a suitable cell is found, the MS camps on it; 3GPP TS 03.22, subclause 3.2.1.
5. The MS shall be able to calculate correctly the path loss criterion parameter C1, used for cell selection and reselection; 3GPP TS 05.08, subclause 6.4.

#### 20.20.1.3 Test purpose

1. To verify that the MS meets conformance requirement 1.
2. To verify that the MS meets conformance requirement 2 in a multiband environment.
3. To verify that:
  - 3.1 The MS does not select a cell of a PLMN which is not the selected PLMN.
  - 3.2 The MS does not select a cell which is "barred".
  - 3.3 The MS does not select a cell with  $C1 < 0$ .
4. To verify that the MS selects suitable cells in descending order of received signal strength, irrespective of frequency band.
5. To verify that the MS does not select a cell with  $C1 < 0$ .

#### 20.20.1.4 Method of test

##### 20.20.1.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter                          | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBmV emf() / dBm) | 48 / -65  | 36 / -77  | 43 / -70  | 33 / -80  | 23 / -90  | OFF       |
| CBA                                | 1         | 0         | 0         | 0         | 0         |           |
| RXLEV_ACCESS_MIN (dBm)             | -90       | -69       | -90       | -88       | -98       |           |
| MNC                                |           |           | 01        |           |           |           |
| MCC                                |           |           | 002       |           |           |           |
| MS_TXPWR_MAX_CCH                   | 7         | 7         |           | 7         |           |           |
| C1                                 | 25        | -8        | 20        | 8         | 8         |           |
| C2                                 | 25        | -8        | 20        | 8         | 8         |           |

Carrier 1, carrier 2 and carrier 4 ARFCNs are chosen in the lower band, carrier 3 and carrier 5 ARFCNs in the higher band.

##### 20.20.1.4.2 Procedure

- a) The SS activates the carriers and monitors carriers 2, 4 and 5 for RA requests from the MS.
- b) The MS is switched on.
- c) The MS is switched off.
- d) The SS monitors carriers 1 and 3 for RA requests from the MS.
- e) The MS is switched on.
- f) The MS is switched off.
- g) The SS is reconfigured and sets MCC of carrier 3 to 001 (same as the other carriers).

- h) The SS activates the carriers and monitors carriers 3, 4 and 5 for RA requests from the MS.
- i) The MS is switched on.
- j) The MS is switched off.
- k) For multiband MS supporting three or more bands all combinations of two bands shall be tested using the steps from a) to j).

#### 20.20.1.4.3 Related PICS/PIXIT statement(s)

Support for stored list cell selection Yes/No.

#### 20.20.1.5 Test requirements

- 1) After step b), the first response from the MS shall be on carrier 4 within 33 s. If the MS supports stored list cell selection MS may be also on carrier 5. There shall be no response from the MS on carrier 2.
- 2) After step e), there shall be no response from the MS on either carrier 1 or carrier 3 within 33 s.
- 3) After step i), the first response from the MS shall be on carrier 3 within 33 s. If the MS supports stored list cell selection the first response may be also on carrier 4 or carrier 5.

### 20.20.2 Multiband cell selection and reselection / Cell reselection

#### 20.20.2.1 Definition and applicability

While camped on a cell of the selected PLMN the multiband MS may need to select a different cell (irrespective of frequency band used) in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

This test is applicable for any multiband MS supporting simultaneous multiband operation.

#### 20.20.2.2 Conformance requirement

1. The list of the 6 strongest non-serving carriers shall be updated at least as often as the duration of the running average defined for measurements on the BCCH allocation and may be updated more frequently; 3GPP TS 05.08, subclause 6.6.1.
2. When the MS recognizes that a new BCCH carrier has become one of the 6 strongest, the BCCH data shall be decoded for the new carrier within 30 s; 3GPP TS 05.08, subclause 6.6.1.
3. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection; 3GPP TS 05.08, subclause 6.4.

#### 20.20.2.3 Test purpose

1. To verify that MS meets conformance requirement 1.
2. To verify that MS meets conformance requirement 2.
3. To verify that the MS calculates the C2 parameter correctly when the CELL\_RESELECT\_OFFSET, and PENALTY\_TIME parameters are used to give different priorities to different frequency bands.

## 20.20.2.4 Method of test

## 20.20.2.4.1 Initial conditions

Six BCCH carriers are established with the system information contents of table 20.1.

Parameters changed from Default values table 20.1.

| Parameter                             | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 | Carrier 7 |
|---------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level<br>(dBmV emf ( )/dBm) | 53 / -60  | 48 / -65  | 43 / -70  | 38 / -75  | 33 / -80  | 33 / -80  | 43 / -70  |
| RXLEV_ACCESS_MIN<br>(dBm)             | -90       | -90       | -90       | -90       | -90       | -90       | -110      |
| PT                                    |           |           |           |           |           |           | 11111     |
| CRO                                   |           |           |           |           |           |           | 20 dB     |
| MS_TXPWR_MAX_CCH                      | 7         | 7         | 7         |           |           |           |           |
| C1                                    | 30        | 25        | 20        | 15        | 10        | 10        | 40        |
| C2                                    | 30        | 25        | 20        | 15        | 10        | 10        | 20        |

Carrier 1, 2 and 3 ARFCNs are chosen in the lower band, carrier 4, 5, 6 and 7 ARFCNs in the higher band.

The BA(BCCH) list contains only eight ARFCNs and includes those of carriers 1 to 7.

BS\_PA\_MFRMS is set to 3 during this test.

NOTE: The combination of 8 carriers on the BA list and BS\_PA\_MFRMS = 3 leads to averaging time of 5 s. Hence 5 s is also the updating time of the list of six strongest neighbour carriers.

## 20.20.2.4.2 Procedure

- a) The SS activates carriers 1 to 6. The MS is not paged on any of the carriers.
- b) The MS is switched on.
- c) After 60 s, the SS deactivates carrier 4 and activates carrier 7 and pages the MS continuously on carrier 7. The SS monitors carrier 7 for RA requests from the MS.
- d) The MS is switched off.
- e) The SS is reconfigured and sets PT = 0 and CRO = 0 on carrier 7 (thus increasing C2 to 40 dB).
- f) The SS activates carriers 1 to 6. The MS is not paged on any of the carriers.
- g) The MS is switched on.
- h) After 60 s, the SS deactivates carrier 4 and activates carrier 7 and pages the MS continuously on carrier 7. The SS monitors carrier 7 for RA requests from the MS.
- i) 20 s after receiving an RA request on carrier 7 the SS sets PT = 11111 and CRO = 20 dB on carrier 7 (thus decreasing C2 to 20dB), stops paging on carrier 7, and pages the MS continuously on carrier 1. The SS monitors carrier 1 for RA requests from the MS.
- j) The MS is switched off.
- k) For multiband MS supporting three or more bands all combinations of two bands shall be tested using the steps from a) to j).

### 20.20.2.5 Test requirements

- 1) After step c) there shall be no response from the MS on carrier 7 within 55 s of activating carrier 7.
- 2) After step h) the MS shall access on carrier 7 within 55 s of activating carrier 7.

NOTE: 5,5 s to notice new strongest carrier in top 6 (because the updating time for six strongest is 5 s (+10 %)), 33 s to read BCCH, 15 s for reselection, since the MS has already performed the running average on the new strongest carrier, allow 55 s.

- 3) After step i) the MS shall access on carrier 1 within 55 s of setting PT and CRO on carrier 7.

## 20.21 R-GSM cell selection and reselection

This subclause is applicable for the MS supporting R-GSM band except when otherwise stated.

In the following paragraphs some explanatory text is given concerning the nature of the tests in this subclause and the general behaviour of the SS is described.

Since the conformance requirements of most of the tests in this subclause cannot be tested explicitly, testing is done implicitly by testing the MS behaviour from its responses to the SS.

The SS transmits one BCCH carrier per cell as indicated in the initial conditions for each test. These are referred to as carrier 1, carrier 2, etc. It is assumed that the SS can simultaneously transmit seven BCCH carriers and monitor three random access channels. For multiband tests it is assumed that at least one of the BCCH carriers and one of the monitored random access channels is in a different frequency band from the others. In some cases, a test is performed in multiple stages in order that the requirements can be tested within the above constraints.

For any MS all the carriers are in its supported band(s) of operation. For an R-GSM mobile station at least one of the carriers is chosen between ARFCN 955-974 and one of the carriers is in the primary band.

Unless otherwise stated in the method of test, in all of the tests of this subclause:

- The SS is continuously paging the MS on all carriers at the start of the test and does not respond to RACH requests from the MS. Where a test specifies that the MS is not paged on a particular carrier, only idle paging is transmitted according to 3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.2.2.2.
- The default values of the system information data fields given in table 20.21.1 are used.
- The SIM is in the idle updated state in the default location area with a TMSI assigned at the beginning of each test.
- The ARFCNs used for the carriers in each test are chosen from those in table 20.21.1 with adjacent carriers separated by a minimum of three channels.

The absolute accuracy of the MS signal level measurements is assumed to be  $\pm 6$  dB. A difference of at least 8 dB is allowed for cases of discrimination between C1 or C2 values and 0.

The relative accuracy of the MS signal level measurements is assumed to be  $\pm 3$  dB for the signal levels used in the tests of this subclause, except for subclause 20.20, where the relative accuracy is assumed to be  $\pm 5$  dB if the measurements are on different frequency bands. A difference of at least 5 dB is allowed for cases of discrimination between C1 or C2 values on different carriers, except for subclause 20.20, where a difference of at least 10 dB is allowed if the measurements are on different frequency bands.

NOTE 1: The accuracy of MS signal level measurements is specified in 3GPP TS 05.08. For all of the tests in this subclause, the signal levels used are greater than 1 dB above reference sensitivity level.

NOTE 2: The tolerance on timers specified in 3GPP TS 05.08 is  $\pm 10$  % except for PENALTY\_TIME where it is  $\pm 2$  s. In the tests of this subclause, the test requirements include these tolerances. Consequently, the times stated in the test requirement sometimes differ from the corresponding timer in the conformance requirement.

Where pulsed signals are specified, the SS tolerance on pulse width is  $\pm 2$  % and the SS tolerance on power level  $\pm 1$  dB.

Table 20.21.1: Default values of the system information fields

| Parameter                | 3GPP TS 04.08 /<br>3GPP TS 44.018<br>reference | Abbr. | Normal Setting                                                                                                                                                                                                                                                                |

## 20.21.1 R-GSM cell selection

### 20.21.1.1 Definition and applicability

Cell selection is a process in which a MS, whenever a new PLMN is selected, attempts to find a suitable cell of that PLMN to camp on. Two methods of searching for a suitable cell are possible, normal cell selection and stored list cell selection. The process ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. Once the MS is camped on a cell, access to the network is allowed.

## 20.21.1.2 Conformance requirement

1. The MS shall be able to select the correct (fourth strongest) cell and be able to respond to paging on that cell within 30 s of switch on, when the three strongest cells are not suitable. This assumes a valid SIM, with PIN disabled and ideal radio conditions; 3GPP TS 05.08, subclause 6.1.
2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:
  - 2.1 (i) It should be a cell of the selected PLMN.
  - 2.2 (ii) It should not be "barred" (see subclause 3.5.1).
  - 2.3 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. This is estimated as shown in subclause 3.6.  
3GPP TS 03.22, subclause 3.2.1.

NOTE: Criteria (iii) is not applicable for Cell Selection.

3. Initially the MS looks for a cell which satisfies these 4 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a suitable cell is found, the MS camps on it; 3GPP TS 03.22, subclause 3.2.1.
4. The MS shall be able to calculate correctly the path loss criterion parameter C1, used for cell selection and reselection; 3GPP TS 05.08, subclause 6.4.

## 20.21.1.3 Test purpose

1. To verify that the MS meets conformance requirement 1.
2. To verify that:
  - 2.1 The MS does not select a cell of a PLMN which is not the selected PLMN.
  - 2.2 The MS does not select a cell which is "barred".
  - 2.3 The MS does not select a cell with  $C1 < 0$ .
3. To verify that the MS selects suitable cells in descending order of received signal strength.
4. To verify that the MS does not select a cell with  $C1 < 0$ .

## 20.21.1.4 Method of test

## 20.21.1.4.1 Initial conditions

Parameters changed from the default values in table 20.21.1.

| Parameter                                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm) | 48 / -65  | 38 / -75  | 43 / -70  | 33 / -80  | 28 / -85  | OFF       |
| CBA                                         | 1         | 0         | 0         | 0         | 0         |           |
| RXLEV_ACCESS_MIN<br>(dBm)                   | -90       | -67       | -90       | -88       | -98       |           |
| MNC                                         |           |           | 01        |           |           |           |
| MCC                                         |           |           | 002       |           |           |           |
| C1                                          | 25        | -8        | 20        | 8         | 13        |           |
| C2                                          | 25        | -8        | 20        | 8         | 13        |           |

Carrier 2 and carrier 4 are chosen between ARFCN 955 - 974. Carrier 1 is chosen between 975 - 1 023, 0; and carrier 3 remains in the P-GSM band.

#### 20.21.1.4.2 Procedure

- a) The SS activates the carriers and monitors carriers 2, 4 and 5 for RA requests from the MS.
- b) The MS is switched on.
- c) The MS is switched off.
- d) The SS monitors carriers 1 and 3 for RA requests from the MS.
- e) The MS is switched on.

#### 20.21.1.5 Test requirements

- 1) After step b), the first response from the MS shall be on carrier 4 within 33 s. There shall be no response from the MS on carrier 2.
- 2) After step e), there shall be no response from the MS on either carrier 1 or carrier 3 within 33 s.

### 20.21.2 R-GSM cell selection with varying signal strength values

#### 20.21.2.1 Definition and applicability

For definition see conformance requirement.

#### 20.21.2.2 Conformance requirement

1. The MS shall:

The MS shall search all RF channels in the system (194 ARFCNs for R-GSM), take readings of received RF signal strength on each RF channel, and calculate the received level average for each. The averaging is based on at least five measurement samples per RF carrier spread over 3 s to 5 s, the measurement samples from the different RF carriers being spread evenly during this period. 3GPP TS 05.08, subclause 6.2.

1.1 The MS shall search all RF channels in the system (194 ARFCNs for R-GSM), take readings of received RF signal strength on each RF channel, and calculate the received level average for each.

1.2 The averaging is based on at least five measurement samples per RF carrier spread over  $T_{av}$  (3 s to 5 s).

1.3 The measurement samples from the different RF carriers being spread evenly during this period.

2. These quantities are termed the "receive level averages", shall be unweighted averages of the received signal strengths measured in dBm. 3GPP TS 05.08, subclause 6.1.

#### 20.21.2.3 Test purpose

1. To verify that:
  - 1.1 The MS meets conformance requirement 1.1.
  - 1.2 The MS meets conformance requirement 1.2.
  - 1.3 The MS meets conformance requirement 1.3.
- 2 To verify that the MS meets conformance requirement 2.

## 20.21.2.4 Method of test

## 20.21.2.4.1 Initial conditions

Parameters changed from the default values in table 20.21.1.

| Parameter                                    | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|----------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm)  | 23 / -90  | 58 / -55  | OFF       | OFF       | OFF       | OFF       |
| RXLEV_ACCESS_MIN<br>(dB $\mu$ V emf() / dBm) | 13 / -100 | 13 / -100 |           |           |           |           |
| C1                                           | 10        | 53        |           |           |           |           |

Carrier 1 is chosen between ARFCN 955 - 974.

The manufacturer of the equipment shall declare his averaging time  $T_{av}$ . This time is the time between the first and the last measurement sample taken on one carrier during one averaging period.

## 20.21.2.4.2 Procedure

- a) The SS transmits on carriers 1 and 2. After a period of  $b \times T_{av}$  carrier 2 reduces its transmit level to -85 dBm (28 dB $\mu$ V emf( )). After a further period of  $a \times T_{av}$ , carrier 2 increases its transmit level again to -55 dBm (58 dB $\mu$ V emf( )). Switching of carrier 2 continues with these levels and duty cycle until the end of the test.

$T_{av}$  is the averaging time declared by the manufacturer.

The parameters  $a$  and  $b$  are chosen according to the following rules:

$$(a + b) \times T_{av} > T_{av}$$

$$0 < a \times T_{av} < 2/3 \times T_{av}$$

$$0,5 \times T_{av} < b \times T_{av} < T_{av}$$

In the equations  $<$  and  $>$  means at least one TDMA frame less or greater than the given value.

While satisfying the conditions given above:

$a$  is chosen to be as close as possible to  $2/3$ .

$b$  is chosen to be as close as possible to  $0,5$ .

- b) The MS is switched on.  
c) The SS monitors all RA requests from MS on carriers 1 and 2.

## 20.21.2.5 Test requirements

In step c), the first response from the MS shall be on carrier 2 within 33 s.

NOTE 1: With the selected duty cycle it can be guaranteed that a "good" MS passes the test even at the worst case situations. The minimum averaged value of carrier 2 is in any case higher or equal to -75 dBm which is still 6 dB above carrier 1's level (for a "good" MS).

NOTE 2: With the selected levels and duty cycle the probability that a "bad" MS (i.e. MS that averages over shorter period than 3 s) fails the test is maximized. However, it can not be guaranteed that all the MSs not fulfilling the conformance requirement of averaging or uniform sampling will fail this test.

## 20.21.3 R-GSM basic cell reselection

### 20.21.3.1 Definition and applicability

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

### 20.21.3.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:

1.1 (iii) The cell camped on (current serving cell) has become barred.

1.2 (iv) There is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).

The MS will then reselect a new cell in order to fulfil the process goal.; 3GPP TS 03.22, subclause 4.5.

NOTE 1: Criterion (i) is tested in subclause 20.21.8 (Cell reselection when  $C1(\text{serving cell}) < 0$  for 5 s).

NOTE 2: Criterion (ii) is tested subclause 20.21.16 (Downlink signalling failure).

NOTE 3: Criterion (v) is tested in subclause 20.21.6 (Cell reselection timings).

2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:

2.1 (ii) It should not be "barred".

2.2 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. 3GPP TS 03.22, subclause 3.2.1.

NOTE 4: Criterion (i) is not relevant for cell reselection and for cell selection it is tested in subclause 20.21.1.

NOTE 5: Criterion (iv) refers to the C1 parameter.

3. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection; 3GPP TS 05.08, subclause 6.4.

4. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:

i) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 s. This indicates that the path loss to the cell has become too high.

ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 s, except in the case of the new cell being in a different location area in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least `CELL_RESELECT_HYSTERESIS` dB as defined by the BCCH data from the current serving cell, for a period of 5 s. This indicates that it is a better cell. 3GPP TS 05.08, subclause 6.6.2.

5. The MS shall attempt to decode the full BCCH data of the serving cell at least every 30 s; 3GPP TS 05.08, subclause 6.6.1.

### 20.21.3.3 Test purpose

1. To verify that:

1.1 The MS meets conformance requirement 1.1.

1.2 The MS meets conformance requirement 1.2.

2. To verify that:
  - 2.1 The MS does not reselect a cell which is barred.
  - 2.2 The MS does not reselect a cell which has a  $C1 < 0$ .
3. To verify that the MS calculates the C2 parameter correctly when the CELL\_RESELECT\_OFFSET, TEMPORARY\_OFFSET and PENALTY\_TIME parameters are not used.
4. To verify that the MS takes into account the CELL\_RESELECT\_HYSTERESIS parameter when reselecting a cell in a different location area.
5. To verify that the MS decodes the CELL\_BAR\_ACCESS and CELL\_BAR\_QUALIFY parameters from the BCCH every 30 s.

#### 20.21.3.4 Method of test

##### 20.21.3.4.1 Initial conditions

Parameters changed from the default values in table 20.21.1.

| Parameter                                   | Carrier 1 | Carrier 2 | Carrier 3                           | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------------|-----------|-----------|-------------------------------------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm) | 43 / -70  | 33 / -80  | 43 / -70                            | 38 / -75  | 38 / -75  |           |
| RXLEV_ACCESS_MIN (dBm)                      | -85       | -90       | -90                                 | -85       | -67       |           |
| CRH                                         | 10 dB     |           |                                     |           |           |           |
| LAC                                         |           |           | different<br>from other<br>carriers |           |           |           |
| CBA                                         |           |           |                                     | 1         |           |           |
| CBQ                                         |           |           |                                     | 0         |           |           |
| C1                                          | 15        | 10        | 20                                  | 10        | -8        |           |
| C2                                          | 15        | 10        | 20                                  | 10        | -8        |           |

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test.

##### 20.21.3.4.2 Procedure

- a) The SS activates carriers 1, 2, 4 and 5. The MS is not paged on carrier 1. The SS monitors carriers 2, 4 and 5 for RA requests from the MS.
- b) The MS is switched on.
- c) The SS stops paging on all carriers except carrier 2. The level of carrier 2 is increased to 43 dB $\mu$ Vemf (C2 becomes 20 dB), and the SS monitors carrier 2 for RA requests from the MS.
- d) When the SS receives a response from the MS on carrier 2, it stops paging the MS on this carrier.
- e) The MS is switched off.
- f) The SS is reconfigured and sets CBA = 1 on carriers 1 and 5.
- g) The MS is switched on.
- h) After 33 s, the SS starts paging continuously on carrier 1 and sets CBA=1 on carrier 2 and CBA=0 on carriers 1, 4 and 5.
- i) When the SS receives a response on carrier 1, it stops paging the MS and waits for 25 s. (The MS should reselect and camp onto carrier 1).
- j) The SS activates carrier 3, pages the MS continuously on this carrier and monitors carrier 3 for RA requests from the MS.
- k) The SS increases the level of carrier 3 to 53 dB $\mu$ Vemf (C2 increases to 30 dB).

## 20.21.3.5 Test requirements

- 1) After step b), there shall be no response from the MS on carriers 2, 4, or 5 within 50 s.
- 2) In step c), the MS shall respond on carrier 2 within 20 s of increasing the level of carrier 2.

NOTE 1: 5 s to perform running average, 10 s to detect C2 differences, 2,4 s to read BCCH of carrier 2, 1 s to perform RA. Total 18,4 s, allow 20 s.

- 3) In step h), the MS shall respond on carrier 1 within 50 s of setting CBA=1 on carrier 2.

NOTE 2: 33 s for the MS to read the BCCH of carrier 2 (30 s + 10 %), 15 s for the MS to reselect cell 1, since the MS already has a running average on carrier 1, allow 50 s.

- 4) After step j), there shall be no response from the MS within 50 s.
- 5) After step k), the MS shall respond on carrier 3 within 20 s.

## 20.21.4 R-GSM cell reselection using TEMPORARY\_OFFSET, CELL\_RESELECT\_OFFSET, POWER\_OFFSET and PENALTY\_TIME parameters

## 20.21.4.1 Definition and applicability

Void.

## 20.21.4.2 Conformance requirement

1. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection; 3GPP TS 05.08, subclause 6.4.

## 20.21.4.3 Test purpose

1. To verify that the MS calculates the C2 parameter correctly when the CELL\_RESELECT\_OFFSET, TEMPORARY\_OFFSET and PENALTY\_TIME parameters are used.
2. To verify DCS 1 800 MS correctly calculate the C2 parameter when the POWER\_OFFSET parameter is present.

## 20.21.4.4 Method of test

## 20.21.4.4.1 Initial conditions

Parameters changed from the default values in table 20.21.1.

| Parameter                             | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dBμV emf() / dBm) | 53 / -60  | 43 / -70  | 48 / -65  | 48 / -65  |           |           |
| RXLEV_ACCESS_MIN<br>(dBm)             | -80       | -100      | -85       | -85       |           |           |
| PT                                    |           | 11111     | 40 s      | 60 s      |           |           |
| CRO                                   |           | 16 dB     | 20 dB     | 20 dB     |           |           |
| TO                                    |           |           | 20 dB     | 20 dB     |           |           |
| K = 1                                 |           |           |           |           |           |           |
| C1                                    | 20        | 30        | 20        | 20        |           |           |
| C2                                    | 20        | 14        | 20 -> 40  | 20 -> 40  |           |           |
| K = 2 (DCS1800 Class 3 MS<br>only)    |           |           |           |           |           |           |
| POWER_OFFSET                          | 0         | 2         | 6         | 6         |           |           |

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test.

#### 20.21.4.4.2 Procedure

For testing of GSM MS, the test procedure is performed for execution counter  $K = 1$ .

For testing of DCS 1 800 MS, the test procedure is performed for execution counter  $K = 1$  and 2:

On execution counter  $K = 1$ , the POWER\_OFFSET Parameter is not present.

On execution counter  $K = 2$ , the POWER\_OFFSET parameter is present.

- a) The SS activates carriers 1 and 2. The MS is not paged on carrier 1. The SS monitors carrier 2 for RA requests from the MS.
- b) The MS is switched on.
- c) The SS increases the level of carrier 2 to 54 dB $\mu$ V<sub>emf</sub> (C2 becomes 25 dB).
- d) When the SS receives a response on carrier 2, the SS stops paging on that carrier and waits for 20 s (The MS should reselect and camp onto carrier 2).
- e) The SS activates carriers 3 and 4 and continuously pages the MS on these carriers. The SS monitors carriers 3 and 4 for RA requests from the MS.

#### 20.21.4.4.3 Requirements

For execution counter  $K = 1$  and  $K = 2$ .

- 1) After step b), there shall be no response from the MS on carrier 2 within 50 s.
- 2) After step c), the MS shall respond on carrier 2 within 20 s of increasing the level of carrier 2.
- 3) After step e), there shall be no response from the MS on carrier 3 within 38 s of activating the carriers but, the MS shall respond on carrier 3 within 90 s. The response on carrier 3 shall be before any response on carrier 4.

NOTE: Minimum time of 38 s set by penalty timer on carrier 3 less 2 s tolerance. Maximum time, total of 33 s to read BCCH of carrier 3, 42 s for expiry of penalty timer on carrier 3, 15 s for reselection, since the MS will already have running averages on carriers 3 and 4, when the penalty timers expire, allow 90 s.

### 20.21.5 R-GSM cell reselection using parameters transmitted in the System Information type 2bis, type 2ter, type 7 and type 8 messages

#### 20.21.5.1 Definition and applicability

System information (SI) type 7 and 8 are transmitted on the BCCH Ext when the system information type 4 message does not contain all information needed for cell selection.

The system information type 2 bis message is used when the system information type 2 message does not contain all neighbour cell ARFCNs.

The system information type 2 ter message is used when system information type 2 messages broadcast by one cell which are system information 2 or both system information 2 and 2bis do not contain all neighbour cell ARFCNs.

#### 20.21.5.2 Conformance requirement

1. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection. 3GPP TS 05.08, subclause 6.4.
2. Whilst in idle mode, an MS shall continue to monitor all BCCH carriers as indicated by the BCCH allocation. 3GPP TS 05.08, subclause 6.6.1.
3. Mobile stations shall treat all ARFCNs in the set {0, 1, 2 ... 1 023} as valid ARFCN values even if the mobile station is unable to transmit or receive on that ARFCN. 3GPP TS 04.08 / 3GPP TS 44.018, subclause 10.5.2.1b.

- 4 The MS shall correctly decodes parameters transmitted in the system information type 2 ter message.  
3GPP TS 04.08 / 3GPP TS 44.018, subclause 9.1.34.

#### 20.21.5.3 Test purpose

1. To verify that the MS correctly calculates the C2 criterion when the parameters affecting cell reselection are transmitted in the system information type 7 and 8 messages.
2. To verify that the MS decodes parameters transmitted in the system information type 2 bis message.
3. To verify that the MS treats ARFCNs as valid ARFCNs even if the MS is unable to transmit or receive on that ARFCN.
4. To verify that the MS correctly decodes parameters transmitted in the system information type 2 ter message.

#### 20.21.5.4 Method of test

##### 20.21.5.4.1 Initial conditions

- a) Parameters changed from the default values in table 20.21.1.

| Parameter                                    | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|----------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm)  | 53 / -60  | 32 / -81  | 40 / -73  | OFF       | OFF       | OFF       |
| RXLEV_ACCESS_MIN<br>(dB $\mu$ V emf() / dBm) | 23 / -90  | 23 / -90  | 30 / -83  |           |           |           |
| BS_AG_BLK_RES                                | 1         | 1         | 1         |           |           |           |
| PT                                           |           | 0         | 0         |           |           |           |
| CRO                                          |           | 16 dB     | 10 dB     |           |           |           |
| TO                                           |           | 0 dB      | 0 dB      |           |           |           |
| C1                                           | 30        | 9         | 10        |           |           |           |
| C2                                           | 30        | 25        | 20        |           |           |           |

- b) The ARFCNs of carriers 1, 2 and 3 are chosen from those in table 20.21.1 with carrier 3 chosen between ARFCN 955 - 974.
- c) The cell reselection parameters PENALTY\_TIME, CELL\_RESELECT\_OFFSET and TEMPORARY\_OFFSET are transmitted in the SI3, SI7 and SI8 messages on carrier 2. They are not transmitted in SI4 and the ADDITIONAL RESELECT PARAM IND parameter is set to 1.
- d) The SI2bis message is transmitted on carrier 1 and contains the ARFCN of carrier 2 and ARFCNs 43, 70, 500, 550, 958, 963, 990 and 995. The ARFCN of carrier 2 is not transmitted in the SI2 message.
- e) Carriers 1 and 2 are synchronized, but staggered in frame number so that the transmission of the SI3 message on carrier 2, coincides with the paging block which the MS is listening to on carrier 1.

NOTE: Under these conditions, the MS can only decode the parameters affecting cell reselection from the SI7 or SI8 messages.

To achieve this, the following conditions are used:

- BS\_PA\_MFRMS = 4;
  - IMSI mod 1000 = 12;
  - FN carrier 1 = FN carrier 2-21, for simultaneously transmitted frames.
- f) The SI3 message on carrier 2 indicates that SI2ter is used on carrier 2. SI2ter message contains the ARFCN of carrier 3 and ARFCNs 45, 76, 891, 905. The ARFCN of carrier 3 is transmitted neither in the SI2 nor in the SI2bis messages on carriers 1 and 2.

#### 20.21.5.4.2 Test Procedure

- a) The SS activates the channels. The MS is not paged on carrier 1.
- b) The MS is switched on.
- c) After 50 s, the SS increases the level of carrier 2 to 42 dB $\mu$ V<sub>emf</sub>( ).
- d) When the SS receives a response on carrier 2, the SS stops paging on that carrier and after 30 s, the SS increases the level of carrier 3 to 60 dB $\mu$ V<sub>emf</sub>( ).

#### 20.21.5.5 Test Requirements

- 1) After step b), there shall be no response from the MS on carrier 2. There shall also be no response on carrier 3.
- 2) After increasing the level of carrier 2 in step c), the MS shall respond on carrier 2 within 33 s.
- 3) After increasing the level of carrier 3 in step d), the mobile shall respond on carrier 3 within 35 s.

### 20.21.6 R-GSM cell reselection timings

#### 20.21.6.1 Definition and applicability

Void.

#### 20.21.6.2 Conformance requirement

1. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:
    - 1.1 ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 s.
    - 1.2 In case ii) above, cell reselection shall not take place if there was a cell reselection within the previous 15 s.
    - 1.3 Cell reselection for any other reason (see 3GPP TS 03.22) shall take place immediately, but the cell that the MS was camped on shall not be returned to within 5 s if another suitable cell can be found.
- 3GPP TS 05.08, subclause 6.6.2.

#### 20.21.6.3 Test purpose

1. To verify that:
  - 1.1 The MS does not perform a cell reselection when the C2 value for a non serving cell does not exceed the C2 value of the serving cell for a period of at least 5 s.
  - 1.2 The MS meets conformance requirement 1.2 with an allowance for the uncertainty of the test.
  - 1.3 When the MS performs an immediate cell reselection due to an unsuccessful random access attempt, the cell that the MS was camped onto is not returned to within 5 s when another suitable cell exists.

#### 20.21.6.4 Method of test

##### 20.21.6.4.1 Initial conditions

Parameters changed from the default values in table 20.21.1.

| Parameter                                    | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier |
|----------------------------------------------|-----------|-----------|-----------|-----------|-----------|---------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm)  | 56 / -57  | 46 / -67  | OFF       | OFF       | OFF       | OFF     |
| RXLEV_ACCESS_MIN<br>(dB $\mu$ V emf() / dBm) | 29 / -84  | 33 / -80  |           |           |           |         |
| Max. Retrans                                 | 00        | 00        |           |           |           |         |
| C1                                           | 27        | 13        |           |           |           |         |
| C2                                           | 27        | 13        |           |           |           |         |

Below is an alternative table of parameters for use with test equipment that cannot reach the upper RF levels as specified in the table above. These carrier levels are reduced by 5 dB and will not effect the purpose of the test case:

| Parameter                                    | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|----------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm)  | 51 / -62  | 41 / -72  | OFF       | OFF       | OFF       | OFF       |
| RXLEV_ACCESS_MIN<br>(dB $\mu$ V emf() / dBm) | 24 / -89  | 28 / -85  |           |           |           |           |
| Max. Retrans                                 | 00        | 00        |           |           |           |           |
| C1                                           | 27        | 13        |           |           |           |           |
| C2                                           | 27        | 13        |           |           |           |           |

The BA(BCCH) list only contains 5 ARFCNs including the ARFCNs of the carriers used during the test.

NOTE: With 5 ARFCNs in the BA(BCCH) list and BS\_PA\_MFRMS=5 (default value) the MS will maintain a running average on surrounding cells over a period of 5 s.

#### 20.21.6.4.2 Procedure

- a) The SS activates the channels. The MS is not paged on any of the carriers.
- b) The MS is switched on.
- c) After 50 s, the SS starts paging continuously on carriers 1 and 2 for 20 s. The SS monitors carriers 1 and 2 for RA requests from the MS.
- d) The SS stops paging on carriers 1 and 2 and waits for 20 s. (The MS should revert to carrier 1 due to cell reselection.)
- e) The SS starts paging continuously on carrier 2.
- f) The SS increases the transmit level of carrier 2 by 20 dB for a period of 4 s and then reduces the level back to the original value.
- g) The SS increases the transmit level of carrier 2 by 20dB and waits for the MS to access on carrier 2. The SS records the time t from the increase in the level of carrier 2 to the first response from the MS.
- h) The SS stops paging on carrier 2 and decreases the transmit level of carrier 2 back to the original value.
- j) The SS waits 20 s. (The MS should revert to carrier 1 due to cell reselection.)
- k) The SS increases the transmit level of carrier 2 by 20 dB. After t+2 s, the SS starts paging continuously on carrier 1 and reduces the level of carrier 2 back to the original level.

#### 20.21.6.5 Test requirements

- 1) In step c), the MS shall transmit 2 RA requests on carrier 1 followed by 2 RA requests on carrier 2. Subsequent RA requests on carrier 1 shall not occur within 4,5 s of the second RA request on carrier 1.
- 2) In step f), there shall be no access on carrier 2 within 34 seconds of increasing the level of carrier 2.
- 3) After step g), the MS shall respond on carrier 2.

- 4) In step k), there shall be no response on carrier 1 within 11 s after the level of carrier 2 is reduced back to the original level.

NOTE: The 11 s is derived from (t+15) seconds minimum cell reselection timer minus (t+2) seconds from the start of step k) up to the reduction of the level of carrier 2. A further 2 s are subtracted to cover for any uncertainty introduced by the RA process occurring after step g).

## 20.21.7 R-GSM priority of cells

### 20.21.7.1 Definition and applicability

In general, cell prioritization is a means of encouraging MSs to select some suitable cells in preference to others.

### 20.21.7.2 Conformance requirement

1. During cell selection a cell with low priority indication will only be selected if a suitable cell of normal priority cannot be found; 3GPP TS 03.22, subclause 3.5.2.1.
- 2.

**Table 1a: Parameters affecting cell priority for cell selection**

| CELL_BAR_QUALIFY | CELL_BAR_ACCESS | Cell selection priority | Status for cell reselection |
|------------------|-----------------|-------------------------|-----------------------------|
| 0                | 0               | normal                  | normal                      |
| 0                | 1               | barred                  | barred                      |
| 1                | 0               | low                     | normal (see note 2)         |
| 1                | 1               | low                     | normal (see note 2)         |

3GPP TS 05.08, table 1.a.

3. If all the following conditions are met then the "Cell selection priority" and the "Status for cell reselection" shall be set to normal:
  - the cell belongs to the MS HPLMN;
  - the MS is in cell test operation mode;
  - the CELL\_BAR\_ACCESS is set to "1";
  - the CELL\_BAR\_QUALIFY is set to "0";
  - the Access Control class 15 is barred.

3GPP TS 05.08, table 1.a.

### 20.21.7.3 Test purpose

1. To verify that the MS does not select a cell of low priority when a suitable cell of normal priority exists with a lower received signal strength.
2. To verify that the MS takes into account CELL\_BAR\_ACCESS and CELL BAR \_QUALIFY when performing cell selection and reselection.
3. To verify that the MS meets conformance requirement 3.

### 20.21.7.4 Method of test

#### 20.21.7.4.1 Initial conditions

Parameters changed from Default values table 20.21.1.

| Parameter                             | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dBμV emf) / dBm)  | 33 / -80  | 43 / -70  | 33 / -80  | 23 / -90  | OFF       | OFF       |
| RXLEV_ACCESS_MIN<br>(dBμV emf) / dBm) | 3 / -110  | 23 / -90  | 13 / -100 | 13 / -100 |           |           |
| CBA                                   | 0         | 1         | 1         | 0         |           |           |
| CBQ                                   | 1         | 1         | 0         | 0         |           |           |
| Access class 15                       | barred    | barred    | barred    | barred    |           |           |
| C1                                    | 30        | 20        | 20        | 10        |           |           |

#### 20.21.7.4.2 Procedure

- The SS activates the carriers and monitors for RA requests from the MS on carriers 1, 2, and 4.
- The MS is switched on.
- The MS is switched off. The SS deactivates the carriers.
- The MS is placed in cell test operation mode.

NOTE: Cell test mode is a mode of operation defined in SIM administrative data field.

- The SS activates the carriers and monitors for RA requests from the MS on carriers 1, 2, and 3.
- The MS is switched on.

#### 20.21.7.5 Test requirements

- After step b), the first response from the MS shall be on carrier 4 within 33 s, followed by a response on carrier 1 before a response (if any) on carrier 2 within 50 s.
- After step f), the first response from the MS shall be on carrier 3 within 33 s, followed by a response on carrier 1 before a response (if any) on carrier 2 within 50 s.

### 20.21.8 R-GSM cell reselection when C1 (serving cell) < 0 for 5 s

#### 20.21.8.1 Definition and applicability

Void.

#### 20.21.8.2 Conformance requirement

- At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:
  - The path loss criterion (C1) for current serving cell falls below zero for a period of 5 s. This indicates that the path loss to the cell has become too high. 3GPP TS 05.08, subclause 6.6.2.
- While camped on a cell of the selected PLMN ("camped normally"), the MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:
  - The path loss criterion parameter C1 (see subclause 3.6) indicates that the path loss to the cell has become too high.; 3GPP TS 03.22, subclause 4.5.

#### 20.21.8.3 Test purpose

- To verify that the MS meets conformance requirement 1.
- To verify that the MS meets conformance requirement 2.

## 20.21.8.4 Method of test

## 20.21.8.4.1 Initial conditions

Parameters changed from Default values table 20.21.1.

| Parameter                                    | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|----------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm)  | 63 / -50  | 33 / -80  | OFF       | OFF       | OFF       | OFF       |
| RXLEV_ACCESS_MIN<br>(dB $\mu$ V emf() / dBm) | 43 / -70  | 23 / -90  |           |           |           |           |
| CRO                                          | 30 dB     |           |           |           |           |           |
| TO                                           | 0         |           |           |           |           |           |
| PT                                           | 0         |           |           |           |           |           |
| C1                                           | 20        | 10        |           |           |           |           |
| C2                                           | 50        | 10        |           |           |           |           |

NOTE: With BS\_PA\_MFRMS = 5 (default value), the averaging time of the MS on the serving cell BCCH is 5,9 s.

## 20.21.8.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2 for RA requests from the MS.
- b) The MS is switched on.
- c) The SS reduces signal level on carrier 1 to -80 dBm / 33 dB $\mu$ V emf() for 4 s. Then, the SS raises the level back to -50 dBm / 63 dB $\mu$ V emf(). (C1 becomes -10 dB and C2, 20 dB during this period).
- d) The SS reduces signal level on carrier 1 to -80 dBm / 33 dB $\mu$ V emf().

## 20.21.8.5 Test requirements

- 1) After step b), there shall be no access on carrier 1 or carrier 2, within 50 s.
- 2) After step c), there shall be no access on carrier 2 within 30 s.
- 3) After step d), the MS shall access on carrier 2 within 20 s.

## 20.21.9 R-GSM running average of the surrounding cell BCCH carrier signal levels

## 20.21.9.1 Definition and applicability

Void.

## 20.21.9.2 Conformance requirement

1. Whilst in idle mode an MS shall continue to monitor all BCCH carriers as indicated by the BCCH allocation (BA - See table 1). A running average of received level in the preceding 5 to:
  - Max.  $\{5, ((5 \times N + 6) \text{ DIV } 7) \times \text{BS\_PA\_MFRMS} / 4\}$
  - seconds shall be maintained for each carrier in the BCCH allocation. N is the number of non-serving cell BCCH carriers in BA and the parameter BS\_PA\_MFRMS is defined in 3GPP TS 05.02; 3GPP TS 05.08, subclause 6.6.1.

2. The same number of measurement samples shall be taken for all non-serving cell BCCH carriers of the BA list, and the samples allocated to each carrier shall as far as possible be uniformly distributed over each evaluation period.; 3GPP TS 05.08, subclause 6.6.1

### 20.21.9.3 Test purpose

1. To verify that if the MS calculates a received level average (over 5 s) for a non-serving suitable cell which results in the value of C2 exceeding the value of C2 for the serving cell, then cell reselection takes place to the non-serving cell.
2. To verify that by using suitable varying levels of signal strength for non serving cells, the MS samples on non serving cell BCCH carriers are as far as possible distributed uniformly over each evaluation period.

### 20.21.9.4 Method of test

#### 20.21.9.4.1 Initial conditions

Parameters changed from Default values table 20.21.1.

| Parameter                                    | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|----------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm)  | 53 / -60  | 33 / -80  | OFF       | OFF       | OFF       | OFF       |
| RXLEV_ACCESS_MIN<br>(dB $\mu$ V emf() / dBm) | 23 / -90  | 23 / -90  |           |           |           |           |
| C1                                           | 30        | 10        |           |           |           |           |
| C2                                           | 30        | 10        |           |           |           |           |

BS\_PA\_MFRMS is set to 4 for this test.

The BA(BCCH) list only contains 7 ARFCNs including the ARFCNs of the carriers used during the test.

NOTE: With 7 ARFCNs in the BA(BCCH) list and BS\_PA\_MFRMS=4 the MS will maintain a running average on surrounding cells over a period of 5 s.

#### 20.21.9.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.
- b) The MS is switched on.
- c) The SS starts switching the level of carrier 2 between -80 dBm and -57 dBm every 2,7 s and continues to do so until the end of the test.
- d) The SS decreases the level of carrier 1 to -76 dBm.

NOTE: As a result of the switching in levels, the running average on carrier 2 will be between -66dBm and -71dBm, assuming that samples are distributed over five consecutive paging blocks.

#### 20.21.9.5 Test requirements

- 1) After step b), there shall be no access from the MS on carrier 1 or carrier 2, within 50 s.
- 2) After step c), there shall be no access from the MS on carrier 1 or 2 within 25 s.

NOTE: Any potential access on is likely to occur within 20 s.

- 3) After step d), the MS shall access on carrier 2 within 20 s.

## 20.21.10 R-GSM running average of the serving cell BCCH carrier signal level

### 20.21.10.1 Definition and applicability

The MS is required to monitor continuously the BCCH carrier signal level of the serving cell (and to compare it to the BCCH carrier signal levels of the non-serving cells) to guarantee that it is camped on the most suitable cell.

### 20.21.10.2 Conformance requirement

1. For the serving cell, receive level measurement samples shall be taken at least for each paging block of the MS. The receive level average shall be a running average determined using samples collected over a period of 5 s or five consecutive paging blocks of that MS, whichever is the greater period. New receiving level average values shall be calculated as often as possible. 3GPP TS 05.08, subclause 6.6.1.

### 20.21.10.3 Test purpose

1. To verify that by using suitable varying levels of signal strength for the serving cell, the MS performs a running average over 5 consecutive paging blocks.

### 20.21.10.4 Method of test

#### 20.21.10.4.1 Initial conditions

Parameters changed from Default values table 20.21.1.

| Parameter                                    | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|----------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level<br>(dB $\mu$ V emf() / dBm)  | 63 / -50  | 39 / -74  | OFF       | OFF       | OFF       | OFF       |
| RXLEV_ACCESS_MIN<br>(dB $\mu$ V emf() / dBm) | 23 / -90  | 23 / -90  |           |           |           |           |
| C1                                           | 40        | 16        |           |           |           |           |
| C2                                           | 40        | 16        |           |           |           |           |

NOTE: With BS\_PA\_MFRMS = 5 (default value), the averaging time of the MS on the serving cell BCCH is 5,9 s.

#### 20.21.10.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2 for RA requests from the MS.
- b) The MS is switched on.
- c) After 50 s the SS starts switching the level of carrier 1 between -80 dBm and -50 dBm every 3 s.

NOTE: As a result of the switching in levels, the running average on carrier 1 will be between -62 dBm and -68 dBm over five consecutive paging blocks.

- d) The SS increases the level of carrier 2 to -56 dBm.

### 20.21.10.5 Test requirement

- 1) After step c), the MS shall not access on carrier 2, within 25 s.
- 2) After step d), the MS shall access on carrier 2, within 30 s.

NOTE: 13,75 s to perform running average, 10 s to detect C2 differences, 2,4 s to read BCCH of carrier 2, 1 s to perform RA. Total 27,15 s, allow 30 s.

## 20.21.11 Updating the list of six strongest neighbour carriers and decoding the BCCH information of a new carrier on the list

### 20.21.11.1 Definition and applicability

Void.

### 20.21.11.2 Conformance requirement

1. The list of the 6 strongest non-serving carriers shall be updated at least as often as the duration of the running average defined for measurements on the BCCH allocation and may be updated more frequently; 3GPP TS 05.08, subclause 6.6.1.
2. When the MS recognizes that a new BCCH carrier has become one of the 6 strongest, the BCCH data shall be decoded for the new carrier within 30 s; 3GPP TS 05.08, subclause 6.6.1.

### 20.21.11.3 Test purpose

1. To verify that MS meets conformance requirement 1.
2. To verify that MS meets conformance requirement 2.

### 20.21.11.4 Method of test

#### 20.21.11.4.1 Initial conditions

Six BCCH carriers are established with the system information contents of table 20.21.1.

Parameters changed from Default values table 20.21.1.

| Parameter                          | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 | Carrier 7 |
|------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dBμV emf ( )/dBm) | 53 / -60  | 48 / -65  | 43 / -70  | 38 / -75  | 33 / -80  | 33 / -80  | 38 / -75  |
| RXLEV_ACCESS_MIN                   | -90       | -90       | -90       | -90       | -90       | -90       | -110      |
| C1                                 | 30        | 25        | 20        | 15        | 10        | 10        | 35        |
| C2                                 | 30        | 25        | 20        | 15        | 10        | 10        | 35        |

The BA(BCCH) list contains only eight ARFCNs and includes those of carriers 1 to 7.

BS\_PA\_MFRMS is set to 3 during this test.

NOTE: The combination of 8 carriers on the BA list and BS\_PA\_MFRMS = 3 leads to averaging time of 5 s. Hence 5 s is also the updating time of the list of six strongest neighbour carriers.

#### 20.21.11.4.2 Procedure

- a) The SS activates carriers 1 to 6. The MS is not paged on any of the carriers.
- b) The MS is switched on.
- c) After 60 s, the SS activates carrier 7 and pages the MS continuously on this carrier. The SS monitors carrier 7 for RA requests from the MS.

#### 20.21.11.5 Test requirements

- 1) The MS shall access on carrier 7 within 55 s of activating carrier 7.

NOTE: 5,5 s to notice new strongest carrier in top 6 (because the updating time for six strongest is 5 s (+10 %)), 33 s to read BCCH, 15 s for reselection, since the MS has already performed the running average on the new strongest carrier, allow 55 s.

## 20.21.12 R-GSM decoding the BCCH information of the neighbour carriers on the list of six strongest neighbour carriers

### 20.21.12.1 Definition and applicability

Void.

### 20.21.12.2 Conformance requirement

1. The MS shall attempt to decode the BCCH data block that contains the parameters affecting cell reselection for each of the 6 strongest non-serving cell BCCH carriers at least every 5 minutes; 3GPP TS 05.08, subclause 6.6.1.

NOTE: Verification of cell reselection as implicitly tested here is performed in subclause 20.21.3.

### 20.21.12.3 Test purpose

1. To verify that the MS decodes the BCCH data block that contains the parameters affecting cell reselection for a non-serving cell BCCH carrier, (which is in the list of six strongest neighbour cells), at least every 5 minutes. This is achieved by changing the BCCH data such that the value of C2 for the non serving cell exceeds the value of C2 for the serving cell, and observing that the MS performs cell reselection within 5 minutes plus the time allowed for cell reselection after the change of the BCCH data.

### 20.21.12.4 Method of test

#### 20.21.12.4.1 Initial conditions

Parameters changed from Default values table 20.21.1.

| Parameter                                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level<br>(dB $\mu$ V emf() / dBm) | 38 / -75  | 33 / -80  | OFF       | OFF       | OFF       | OFF       |
| C1                                          | 15        | 10        |           |           |           |           |
| C2                                          | 15        | 10        |           |           |           |           |

#### 20.21.12.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.
- b) The MS is switched on.
- c) The SS changes the RXLEV\_ACCESS\_MIN in the BCCH data of carrier 2 to be -100 dBm.

NOTE: With the above change the C2 of carrier 2 becomes 20 whereas the C2 of carrier 1 stays at 15.

#### 20.21.12.5 Test requirements

- 1) After step b), there shall be no access from the MS on carrier 1 or carrier 2 within 50 s.
- 2) After step c), the MS shall access on carrier 2 within 345 s of the change in the BCCH data of carrier 2.

NOTE: 330 s for decode of BCCH of carrier 2 (300 s +10 %), 15 s for reselection of carrier 2, since the MS already has a running average on carrier 2.

## 20.21.13 R-GSM decoding the BSIC of the neighbour carriers on the list of six strongest neighbour carriers

### 20.21.13.1 Definition and applicability

Void.

### 20.21.13.2 Conformance requirement

1. The MS shall attempt to check the BSIC for each of the 6 strongest non-serving cell BCCH carriers at least every 30 s, to confirm that it is monitoring the same cell. If a change of BSIC is detected then the carrier shall be treated as a new carrier and the BCCH data redetermined; 3GPP TS 05.08, subclause 6.6.1.

NOTE: Verification of cell reselection as implicitly tested here is performed in subclause 20.21.3.

### 20.21.13.3 Test purpose

1. To verify that the MS will check the BSIC of the non-serving cell, which is in the list of six strongest neighbour cells, by changing the BSIC and the BCCH data of the non-serving cell such that the value of C2 for that cell exceeds the value of C2 of the serving cell, and observing that the MS performs cell reselection within the time allowed to check the BSIC, redetermine the BCCH data and perform cell reselection.

### 20.21.13.4 Method of test

#### 20.21.13.4.1 Initial conditions

Parameters changed from Default values table 20.21.1.

| Parameter                                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level<br>(dB $\mu$ V emf() / dBm) | 38 / -75  | 33 / -80  | OFF       | OFF       | OFF       | OFF       |
| C1                                          | 15        | 10        |           |           |           |           |
| C2                                          | 15        | 10        |           |           |           |           |

#### 20.21.13.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.
- b) The MS is switched on.
- c) The SS changes the BSIC of carrier 2 by changing the Base Station Colour Code (BCC) part of the BSIC. The SS also changes the RXLEV\_ACCESS\_MIN in the BCCH data of carrier 2 to be -100 dBm.

NOTE: With the above change to the BCCH data the C2 of carrier 2 becomes 20 whereas the C2 of carrier 1 stays at 15.

#### 20.21.13.5 Test requirements

- 1) In step b), there shall be no access from the MS on carrier 1 or carrier 2 within 50 s.
- 2) After step c), the MS shall access on carrier 2 within 85 s of the change in the BSIC value (and BCCH data) of carrier 2.

NOTE: 33 s for check of BSIC on carrier 2, 33 s for decode of BCCH of carrier 2, 15 s for reselection of carrier 2, since the MS already has a running average on carrier 2, allow 85 s.

## 20.21.14 R-GSM emergency calls

### 20.21.14.1 Definition and applicability

This test is applicable for R-GSM MSs supporting speech.

### 20.21.14.2 Conformance requirement

1. When in a limited service state, the MS shall be able to initiate emergency calls; 3GPP TS 05.08, subclause 6.8.

2. When in a limited service state and if not camped on a cell, the MS shall monitor the signal strength of all 194 RF channels, and search for a BCCH carrier which has  $C1 > 0$  and which is not barred. When such a carrier is found, the MS shall camp on that cell, irrespective of the PLMN identity; 3GPP TS 05.08, subclause 6.8.
3. The MS shall perform cell reselection at least among the cells of the PLMN of the cell on which the MS has camped, according to the algorithm of 3GPP TS 03.22, subclauses 4.5 and 3.7, except that a zero value of CELL\_RESELECT\_HYSTERESIS shall be used; 3GPP TS 05.08, subclause 6.8.

#### 20.21.14.3 Test purpose

1. To verify that the MS shall be able to initiate emergency calls when no suitable cells of the selected PLMN are available, but at least one acceptable cell is available.
2. To verify that the MS selects a cell with  $C1 > 0$  and  $CBA = 0$  when no suitable cells of the selected PLMN are available.
3. To verify that the MS, when performing cell reselection in the limited service state, uses  $CELL\_RESELECT\_HYSTERESIS = 0$ .

#### 20.21.14.4 Method of test

##### 20.21.14.4.1 Initial conditions

Parameters changed from Default values table 20.21.1.

| Parameter                                    | Carrier 1               | Carrier 2      | Carrier 3      | Carrier 4 | Carrier 5 | Carrier 6 |
|----------------------------------------------|-------------------------|----------------|----------------|-----------|-----------|-----------|
| RF signal level<br>(dB $\mu$ V emf() / dBm)  | 38 / -75                | 33 / -80       | 33 / -80       | OFF       | OFF       | OFF       |
| RXLEV_ACCESS_MIN<br>(dB $\mu$ V emf() / dBm) | 23 / -90                | 43 / -70       | 23 / -90       |           |           |           |
| CELL_BAR_ACCESS<br>MCC,MNC                   | 1 (barred)<br>forbidden | 0<br>forbidden | 0<br>forbidden |           |           |           |
| CELL_RESELECT_HYST                           | 0                       | 0              | 14 dB          |           |           |           |
| C1                                           | 15                      | -10            | 10             |           |           |           |

NOTE: All the BCCH carriers belong to the same PLMN, which is not the MS's home PLMN and is in the SIM's forbidden PLMN's list.

##### 20.21.14.4.2 Procedure

- a) The SS activates the carriers. The SS monitors for RA attempts from the MS on carriers 1, 2 and 3 for the duration of the test.
- b) The MS is switched on.
- c) 50 s after switch on, an emergency call is initiated on the MS.
- d) The SS changes the CBA of carrier 1 to 0.

NOTE 1: The MS should reselect to carrier 1 because it should not take into account the CELL\_RESELECT\_HYST value of 14 but use 0 instead.

- e) After 345 s an emergency call is initiated on the MS.

NOTE 2: 330 s to detect change of BCCH data, 15 s to perform reselection of carrier 1, since the MS already has a running average on carrier 1.

##### 20.21.14.5 Test requirements

- 1) In step c), the first access by the MS shall be on carrier 3.
- 2) In step e), the first access from the MS shall be on carrier 1.

## 20.21.15 R-GSM cell reselection due to MS rejection "LA not allowed"

### 20.21.15.1 Definition and applicability

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

This process goes on while camping on a cell which pertains to an LA which is placed in the list of "forbidden LAIs for regional provision of service".

### 20.21.15.2 Conformance requirement

1. In response to a registration attempt, when receiving an LU reject with cause value "LA not allowed", the MS stores this LAI in a list of "forbidden LAIs for regional provision of service", to prevent repeated attempts to access a cell of the forbidden LA, 3GPP TS 03.22, subclause 3.3.
2. If the MS has received the cause 'LA not allowed', it shall ignore this fact when selecting a cell to camp on, i.e. it shall not reject a cell for camping on because that cell is part of a LA where this cause has been received, 3GPP TS 03.22, subclause 3.5.4.
3. In response to a registration attempt, when receiving an LU reject with cause value "LA not allowed", the MS continues to perform normal cell-reselection, 3GPP TS 03.22, subclause 4.4.2
4. A new LU attempt shall only be performed when a new LA (or new PLMN) is entered according to the cell reselection procedure, 3GPP TS 03.22, subclause 3.3 and figure 4.

NOTE: LA stands for "Location Area" and LU stands for "Location Update".

### 20.21.15.3 Test purpose

1. To verify that if an LU is rejected with cause "LA not allowed" that the LAI of that cell is written into a forbidden list which prevents the MS from performing LU onto another cell in that LA. This is verified indirectly in test purposes 2, 3 and 4.
2. To verify that the MS will not reject a cell for camping on because that cell is part of a LA in the list of "forbidden LAIs for regional provision of service". This is verified indirectly by making the MS attempt an emergency call and checking that the channel request message is transmitted on the correct cell.
3. To verify that the MS when receiving an LU reject with cause value "LA not allowed", the MS continues to perform normal cell-reselection:

Cell reselection is triggered if there is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter). 3GPP TS 03.22, subclauses 3.4 and 4.5.

4. To verify that a new LU attempt will be performed when a new LA (or new PLMN) is entered, 3GPP TS 03.22, subclause 3.3 and figure 4.

### 20.21.15.4 Method of test

#### 20.21.15.4.1 Initial conditions

Parameters changed from Default values table 20.21.1.

| Parameter                                    | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|----------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm)  | 63 / -50  | 54 / -59  | 44 / -69  | OFF       | OFF       | OFF       |
| RXLEV_ACCESS_MIN<br>(dB $\mu$ V emf() / dBm) | 53 / -60  | 35 / -78  | 29 / -84  |           |           |           |
| CRH                                          | 14        | 0         | 10        |           |           |           |
| LAC                                          | H1111     | H2222     | H1111     |           |           |           |
| ATT                                          | 1         | 1         | 1         |           |           |           |
| C1                                           | 10        | 19        | 15        |           |           |           |
| C2                                           | 10        | 19        | 15        |           |           |           |

#### 20.21.15.4.2 Procedure

- The SS activates the carriers. The SS monitors all RA requests from MS on carriers 1, 2 and 3 until step e) has been completed. Only idle-paging is sent on all channels.
- The MS is switched on.
- When the MS performs an IMSI attach onto carrier 1, the SS shall reject it with cause "LA not allowed".
- 30 s after the MS has returned to idle mode (channel release after LU reject), the MS is manually commanded to set up an emergency call.

NOTE 1: C2 of carrier 3 > C2 of carrier 1. Carriers 1 and 3 belong to the same LA.

- The SS rejects the CM service request from the MS, with a CM service reject message with cause value #17 (Network Failure).

NOTE 2: Cause values #4 (IMSI unknown in VLR) or #6 (Illegal ME) lead to unwanted behaviour of the mobile.

- 10 s after the MS has returned to idle mode (channel release after CM service reject), the SS increases the level of carrier 2 to 65 dB $\mu$ V emf().

NOTE 3: C2 of carrier 2 = 30, now larger than C2 of carrier 3 + CRH.

- The SS shall accept any LU on carrier 2.

#### 20.21.15.5 Test requirements

- After step b), the MS shall respond on carrier 1 within 33 s.
- In step d), the MS shall access on carrier 3 with a channel request message, within 15 s of being commanded to set up the emergency call.
- After increasing the level of carrier 2 in step f), the MS shall reselect and access onto carrier 2 requesting an LU within 30 s.

NOTE: 13,75 s to perform running average, 10 s to detect C2 differences, 2,4 s to read BCCH of carrier 2, 1 s to perform RA. Total 27,15 s, allow 30 s.

### 20.21.16 R-GSM downlink signalling failure

#### 20.21.16.1 Definition and applicability

See conformance requirement.

#### 20.16.2 Conformance requirement

The downlink signalling failure criterion is based on the downlink signalling failure counter DSC.

- When the MS camps on a cell, DSC shall be initialized to a value equal to the nearest integer to  $90/N$  where N is the BS\_PA\_MFRMS parameter for that cell (see 3GPP TS 05.02).

2. Thereafter, whenever the MS attempts to decode a message in its paging subchannel; if a message is successfully decoded DSC is increased by 1,(however never beyond the nearest integer to 90/N).
3. Whenever the MS can not successfully decode a message in its paging subchannel the DSC is decreased by 4.
4. When DSC reaches 0, a downlink signalling failure shall be declared. A downlink signalling failure shall result in cell reselection, 3GPP TS 03.22, subclause 4.5 (ii) and 3GPP TS 05.08, subclause 6.5.

NOTE: The network sends the paging subchannel for a given MS every BS\_PA\_MFRMS multiframes. The requirement for network transmission on the paging subchannel is specified in 3GPP TS 04.08 / 3GPP TS 44.018. The MS is required to attempt to decode a message every time its paging subchannel is sent.

#### 20.21.16.3 Test purpose

1. To verify that the MS initializes the DSC counter in accordance with the conformance requirement. This is verified indirectly.
2. To verify that whenever the MS successfully decodes a message on paging subchannel, the DSC is increased by 1, (however never beyond the nearest integer to 90/N). This is verified indirectly.
3. To verify that whenever the MS can not successfully decode a message on paging subchannel, the DSC decreased by 4. This is verified indirectly.
4. To verify that when the DSC reaches 0, a downlink signalling failure shall be declared and the MS will perform cell reselection.

#### 20.21.16.4 Method of test

##### 20.21.16.4.1 Initial conditions

Two BCCH carriers are established with the system information contents of table 20.21.1.

Parameters changed from Default values table 20.21.1.

| Parameter                             | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level<br>(dBμV emf() / dBm) | 43 / -70  | 33 / -80  | OFF       | OFF       | OFF       | OFF       |
| C1 = C2                               | 20        | 10        |           |           |           |           |

NOTE: The DSC counter will have a value 18 (90/5).

##### 20.21.16.4.2 Procedure

- a) The MS is switched on. On carrier 1 valid layer 3 messages shall be sent in the paging blocks, but not paging the MS (idle paging). On carrier 2 the MS is paged continuously in all paging blocks.
- b) After 40 s the SS sends corrupted data (using random data, wrong parity bits see 3GPP TS 05.03, subclauses 4.3 and 4.1.2 or other lower layer error) in four successive paging blocks to carrier 1 and then reverts to sending normal data.

NOTE 1: Sending corrupted, i.e. non-decodable data on four successive paging blocks should decrease the DSC to 2.

- c) The SS monitors all accesses on both carriers for 30 s.
- d) The SS sends corrupted data in five successive paging blocks to carrier 1 and then reverts to sending normal data.

NOTE 2: Sending random, data on five successive paging blocks should decrease the DSC to < 0 and cause a cell reselection.

- e) The SS monitors all accesses on both carriers for 30 s.

## 20.21.16.5 Test requirements

- 1) There shall be no access to carrier 2 in test steps a) and c).
- 2) The MS shall access on carrier 2 at test step e) within 15 s.

## 20.21.17 R-GSM cell selection if no suitable cell found in 10 s

## 20.21.17.1 Definition and applicability

See conformance requirement.

## 20.21.17.2 Conformance requirement

If no suitable cell is found in cell reselection process within 10 s, the cell selection algorithm of 3GPP TS 03.22 shall be performed, 3GPP TS 05.08; subclause 6.6.2.

## 20.21.17.3 Test purpose

To verify that the MS fulfils the conformance requirement.

## 20.21.17.4 Method of test

## 20.21.17.4.1 Initial conditions

One BCCH carrier is established with the system information contents of table 20.21.1.

Parameters changed from Default values table 20.21.1.

| Parameter                                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level<br>(dB $\mu$ V emf() / dBm) | 43 / -70  | OFF       | OFF       | OFF       | OFF       | OFF       |
| C1 = C2                                     | 20        |           |           |           |           |           |

## 20.21.17.4.2 Procedure

- a) The MS is switched on. Idle paging is sent on carrier 1.
- b) After the MS indicates service the SS reduces the transmit level of carrier 1 to 13 dB $\mu$ V emf() (so that C1 of carrier 1 becomes -10) and turns on a new carrier (carrier 2) at a level of 33 dB $\mu$ V emf(). Carrier 2 shall not be in the MS BA list (i.e. it shall not be one of the carriers that MS has been monitoring after camped on carrier 1).
- c) The SS shall monitor all accesses on carriers 1 and 2 for 60 s.

NOTE: The access on carrier 2 should not take longer than 50 s. (5 s to rxlev averages, 5 s for C1 < 0 duration, 10 s for searching another suitable cell, 30 s for cell selection), 60 s is a safe time to wait.

## 20.21.17.5 Test requirements

The MS shall access on carrier 2 at test step c) within 60 s.

## 20.21.18 R-GSM cell reselection due to MS rejection "Roaming not allowed in this LA"

## 20.21.18.1 Definition and applicability

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

The MS looks for suitable neighbour cells which satisfies 4 constraints including that It should not be in an LA which is in the list of "forbidden LAs for roaming".

#### 20.21.18.2 Conformance requirement

1. To prevent repeated attempts to have roaming service on a not allowed LA, when the MS is informed that an LA is forbidden, the LA is added to a list of "forbidden LAs for roaming" which is stored in the MS, 3GPP TS 03.22, subclause 3.1.
2. If the MS has received the cause "Roaming not allowed in this LA", in response to a LU attempt, the Network Selection Procedure shall be started, 3GPP TS 03.22; subclause 4.3.3 L3, 3GPP TS 04.08 / 3GPP TS 24.008; subclause 4.4.4.7.
3. The MS can only perform camping on a suitable cell, which:
  - should not be in an LA which is in the list of "forbidden LAs for roaming" 3GPP TS 03.22, subclause 3.2.1.

NOTE: LA stands for "Location Area" and LU stands for "Location Update".

#### 20.21.18.3 Test purpose

1. To verify that if an LU is rejected with cause "Roaming not allowed in this LA", that the LAI of that cell is written into a forbidden list which prevents the MS from camping onto any cell in that LA.
2. To verify that if the MS has received the cause "Roaming not allowed in this LA", in response to a LU attempt, the Network Selection Procedure is initiated. This is verified indirectly by test purpose 3, in that the new LA is accessed as part of cell selection, hence CRH is disregarded.
3. To verify that if an LU is rejected, when attempting LU in a LA with LAI = LAI1, with cause "Roaming not allowed in this LA" and only cells of the selected PLMN are available, the MS will only camp and attempt LU in any LA with LAI > LAI1.

#### 20.21.18.4 Method of test

##### 20.21.18.4.1 Initial conditions

Parameters changed from Default values table 20.21.1.

| Parameter                              | Carrier 1    | Carrier 2    | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|----------------------------------------|--------------|--------------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dBμV emf() / dBm)  | 63 / -50     | 53 / -60     | OFF       | OFF       | OFF       | OFF       |
| RXLEV_ACCESS_MIN<br>(dBμV emf() / dBm) | 23 / -90     | 23 / -90     |           |           |           |           |
| MNC                                    | MNC <> HPLMN | MNC <> HPLMN |           |           |           |           |

##### 20.21.18.4.2 Procedure

- a) The MS is switched on. Idle paging is sent on all carriers.
- b) The SS monitors all RA requests from MS on carriers 1 and 2.
- c) When the MS performs an IMSI attach onto carrier 1, the SS shall reject it with cause "Roaming not allowed in this LA".
- d) The SS shall accept any LU on carrier 2.

- e) The SS monitors all RA requests from MS on carriers 1 to 2.

#### 20.21.18.5 Test requirements

- 1) The MS should respond on carrier 1 within 33 s of switch on.
- 2) After LU reject, the MS shall initiate the Network Selection Procedure and access onto Carrier 2 as part of cell selection within 33 s from returning to idle mode after the LU reject.

NOTE: The timing requirement in b) is given only for testing purposes only. No timing requirements are defined for the Network Selection Procedure, but the time allowed for cell selection (see 20.21.1) should be adequate.

- 3) After the LU reject on carrier 1, there shall be no more access attempts on this carrier.

### 20.21.19 R-GSM cell selection on release of SDCCH and TCH

#### 20.21.19.1 Definition and applicability

#### 20.21.19.2 Conformance requirement

1. When the SS releases a TCH or SDCCH and returns to idle mode, it shall, as quickly as possible camp on the BCCH carrier of the cell whose channel has just been released. If the full BCCH data for that cell was not decoded in the preceding 30 s, the MS shall then attempt to decode the full BCCH data. Until the MS has decoded the BCCH data required for determining the paging group, it shall also monitor all paging blocks on timeslot 0 of the BCCH carrier for possible paging messages that might address it. If the MS receives a page before having decoded the full BCCH data for the cell, the MS shall store the page and respond once the full BCCH data has been decoded, provided that the cell is not barred and the MSs access class is allowed. 3GPP TS 05.08, subclause 6.7.

#### 20.21.19.3 Test purpose

1. To verify that on release of a TCH or an SDCCH, the MS camps as quickly as possible on the BCCH carrier of the cell whose channel has just been released.

NOTE: This is implicitly tested by the MS responding to a paging request. The decoding of BCCH data cannot be explicitly tested. However, the MS shall monitor for paging messages which may address it if it decodes the BCCH.

#### 20.21.19.4 Method of test

##### 20.21.19.4.1 Initial conditions

- a) Parameters changed from default values in table 20.21.1.

| Parameter                              | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|----------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dBmV emf() / dBm)  | 53 / -60  | 33 / -80  | OFF       | OFF       | OFF       | OFF       |
| RXLEV_ACCESS_MIN<br>(dBmV emf() / dBm) | 23 / -90  | 23 / -90  |           |           |           |           |
| BS_PA_MFRMS                            | 2         | 2         |           |           |           |           |
| ATT                                    | 1         |           |           |           |           |           |
| C1                                     | 30        | 10        |           |           |           |           |
| C2                                     | 30        | 10        |           |           |           |           |

- b) Carrier 1 is configured to have a combined control channel.
- c) Carrier 2 is configured to have a non combined control channel.

#### 20.21.19.4.2 Test procedure

- a) The SS activates the carriers. No paging messages are transmitted on carrier 1 or carrier 2.
- b) The MS is switched on.
- c) In response to the MS access for IMSI attach, the SS allocates a combined SDDCH/4, accepts the IMSI attach procedure and then releases the link. After 0,5 s but within 1 s of transmitting the UA frame on completion of the IMSI attach procedure, the SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 1.
- d) When the MS responds to paging, the SS establishes a call on a traffic channel.
- e) The SS increases the level of carrier 2 to 63 dBmV emf().
- f) After 10 s the SS performs a handover to another TCH, with the parameters of carrier 2 indicated in the CELL DESCRIPTION information element of the HANDOVER COMMAND message.
- g) After a further 10 s, the SS clears down the call. After 0,5 s but within 1 second of transmitting the UA frame, the SS transmits a single PAGING REQUEST on carrier 2 in the appropriate paging block of the MS.

#### 20.21.19.5 Test requirements

- 1) After step b) the MS shall access in order to commence an IMSI attach procedure on carrier 1 within 33 s.
- 2) In step c), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.
- 3) In step g), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

## 20.22 GPRS Cell Selection and Reselection

The absolute accuracy of the MS signal level measurements is assumed to be  $\pm 6$  dB. A difference of at least 8 dB is allowed for cases of discrimination between C1, C31, C32 values and 0.

The relative accuracy of the MS signal level measurements is assumed to be  $\pm 3$  dB for the signal levels used in the tests of this subclause. A difference of at least 5 dB is allowed for cases of discrimination between C1 and C31 and C32 values on different carriers.

NOTE 1: The accuracy of MS signal level measurements is specified in 3GPP TS 05.08. For all of the tests in this subclause, the signal levels used are greater than 1 dB above reference sensitivity level.

NOTE 2: The tolerance on timers specified in 3GPP TS 05.08 is  $\pm 10$  % except for PENALTY\_TIME where it is  $\pm 2$  s. In the tests of this subclause, the test requirements include these tolerances. Consequently, the times stated in the test requirement sometimes differ from the corresponding timer in the conformance requirement.

Where pulsed signals are specified, the SS tolerance on pulse width is  $\pm 2$  % and the SS tolerance on power level  $\pm 1$  dB.

The cell re-selection tests defined in the subclauses 20.22.2 to 20.22.7 apply to the MSs attached to GPRS if a PBCCH exists in the serving cell. The cell re-selection test defined in the subclause 20.22.9 applies to the MSs attached to GPRS when no PBCCH exists in the serving cell. Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 of 3GPP TS 05.08 and therefore tests defined in clause 20 of TS 51.010 apply.

The support of GPRS shall be indicated in SYSTEM INFORMATION TYPE 3 message. In addition, the support of GPRS shall be indicated in either SYSTEM INFORMATION TYPE 4 or SYSTEM INFORMATION TYPE 7 and 8 messages. If GPRS is supported, SYSTEM INFORMATION TYPE 13 message shall be sent. SI 13 message shall not be sent if GPRS is not supported (3GPP TS 04.08 / 3GPP TS 44.018, subclause 3.2.2.1. Additional requirements for the broadcast of system information in a cell supporting GPRS are specified in 3GPP TS 04.60. The GPRS support is indicated by the presence of the field GPRS Indicator in the SI Rest Octets (3GPP TS 04.08 / 3GPP TS 44.018, subclauses 10.5.2.34; 10.5.2.35, 10.5.2.36 and 10.5.2.37).

The following definitions are applicable to tests 20.22.1 to 20.22.28:

- Carrier X supports GPRS : the SS includes the field GPRS Indicator in SI 3 Rest Octets and in SI 4 Rest Octets.

- The SS enables GPRS on carrier X : the SS starts including the field GPRS Indicator in SI 3 Rest Octets and in SI 4 Rest Octets.
- The SS disables GPRS on carrier X : the SS stops including the field GPRS Indicator in SI 3 Rest Octets and in SI 4 Rest Octets.

Unless otherwise stated in the method of test, in all of the tests of this subclause:

- The SIM is in the idle updated state in the default registration area with a TMSI and PTMSI assigned at the beginning of each test.
- Where MS paging is specified within a test, TMSI is to be used on CCCH and PTMSI on PCCCH
- All carriers support GPRS on BCCH without a separate PBCCH channel.
- The Scheduling of Packet System information should be such that a complete set of consistent PSI messages can be decoded within 8 multiframe (8 × 52 frames).
- The Scheduling of System Information should be such that a complete set of consistent SI messages, including SI13 were applicable, can be decoded within 8 multiframe (8 × 51 frames).
- The MS is configured to automatically attach to GPRS at switch on by using the PICS/PIXIT Statement "Automatic GPRS attach procedure at switch on or power on Yes/No" as in GPRS Attach procedure tests (see subclause 44.2.1). For MS that does attach at power on, the SS shall accept access request with cause 'MM procedure' in the case of PRACH and 'one phase access' in the case of RACH in determining test verdict where applicable.

Table 20.22.1: Default values of the system information fields

| Parameter               | 3GPP TS 04.60 reference | Abbr. | Normal Setting                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------|-------------------------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PRIORITY_CLASS          | 11.2.20                 | PC    | 1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## 20.22.1 Cell selection

### 20.22.1.1 Definition and applicability

Cell selection is a process in which an MS, whenever a new PLMN is selected, attempts to find a suitable cell of that PLMN to camp on. Two methods of searching for a suitable cell are possible, normal cell selection and stored list cell selection. The process ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. Once the MS is camped on a cell, access to the network is allowed.

## 20.22.1.2 Conformance requirement

1. The MS shall be able to select the strongest cell within 30 s of switch on. This assumes a valid SIM, with PIN disabled and ideal radio conditions, 3GPP TS 05.08, subclause 6.1.
2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:
  - 2.1 (i) It should be a cell of the selected PLMN
  - 2.2 (ii) It should not be "barred" (see subclause 3.5.1)
  - 2.3 (iii) It should not be in an LA which is in the list of "forbidden LAs for roaming";
  - 2.4 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. This is estimated as shown in subclause 3.6. 3GPP TS 03.22, subclause 3.2.1.

NOTE: Criteria 2.3 (iii) is not applicable for Cell Selection.

3. Initially the MS looks for a cell which satisfies these 4 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a suitable cell is found, the MS camps on it, 3GPP TS 03.22, subclause 3.2.1.
4. The MS shall be able to calculate correctly the path loss criterion parameter C1, used for cell selection and reselection, 3GPP TS 05.08, subclause 6.4.

## 20.22.1.3 Test purpose

1. To verify that the MS meets conformance requirement 1. even when one of the other cells supports GPRS.
2. To verify that:
  - 2.1 The MS does not select a cell of a PLMN, which is not the selected PLMN.
  - 2.2 The MS does not select a cell which is "barred".
  - 2.4 The MS does not select a cell with  $C1 < 0$ .
3. To verify that the MS selects suitable cells in descending order of received signal strength.
4. To verify that the MS does not select a cell with  $C1 < 0$ .

## 20.22.1.4 Method of test

## 20.22.1.4.1 Initial conditions

Parameters changed from the default values in table 20.22.1.

| Parameter              | Carrier 1 | Carrier 2 | Carrier 3             | Carrier 4 | Carrier 5 | Carrier 6 |
|------------------------|-----------|-----------|-----------------------|-----------|-----------|-----------|
| RF Signal Level (dBm)  | -75       | -80       | -70                   | -60       | -70       | -80       |
| CBA                    | 0         | 0         | 0                     | 1         | 0         |           |
| RXLEV_ACCESS_MIN (dBm) | -90       |           | -90                   | -90       | -60       |           |
| GPRS_RXLEV_ACCESS_MIN  |           | -90       |                       |           |           | -90       |
| MNC                    |           |           | 01 (011 for PCS 1900) |           |           |           |
| MCC                    |           |           | 002                   |           |           |           |
| C1                     | 15        | 10        | 20                    | 30        | -10       |           |

NOTE 1: For an E-GSM MS carrier 1 and carrier 5 ARFCNs are chosen in the E-GSM band, carrier 3 and carrier 4 ARFCNs in the P-GSM band.

NOTE 2: Carrier 2 is the BCCH carrier which broadcasts the position of the PBCCH channel in the cell (carrier 6).

NOTE 3: Carriers 1, 3, 4 and 5 do not support GPRS.

#### 20.22.1.4.2 Procedure

- a) The SS activates and pages on the MS on all carriers. All Carriers are monitored for RA requests from the MS.
- b) The MS is switched on.

#### 20.22.1.5 Test requirements

- 1) After step b), the first response from the MS shall be on carrier 1 within 33 s. There shall be no response from the MS on any other carrier.

### 20.22.2 Cell reselection in Packet Idle mode

#### 20.22.2.1 Definition and applicability

This test is applicable for all types of GPRS mobiles.

#### 20.22.2.2 Conformance requirement

1. At least for every new sample or every second, whichever is the greatest, the MS shall update RLA\_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; 3GPP TS 05.08, subclause 10.1.2 The MS shall make a cell re-selection if:

- (i) The path loss criterion parameter (C1) for the serving cell falls below zero.
- (ii) A non-serving suitable cell (see 3GPP TS 03.22) is evaluated to be better than the serving cell. The best cell is the cell with the highest value of C32 among:
  - those cells that have the highest PRIORITY\_CLASS among those that fulfil the criterion  $C31 \geq 0$ ; or
  - all cells, if no cells fulfil the criterion  $C31 \geq 0$ .

If the parameter C32\_QUAL is set, positive GPRS\_RESELECT\_OFFSET values shall only be applied to the neighbour cell with the highest RLA\_P value of those cells for which C32 is compared above.

PRIORITY\_CLASS and C32\_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area:
  - GPRS\_CELL\_RESELECT\_HYSTERESIS. If the parameter C31\_HYST is set,;
  - GPRS\_CELL\_RESELECT\_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area:
  - RA\_RESELECT\_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 s: 5 dB.
  - GPRS\_CELL\_RESELECT\_HYSTERESIS, C31\_HYST and RA\_RESELECT\_HYSTERESIS are broadcast on PBCCH of the serving cell.

#### 20.22.2.3 Test purpose

To verify that the MS reselects the correct cell based on the C32 parameter when GPRS\_RESELECT\_OFFSET, TEMPORARY\_OFFSET and PENALTY\_TIME parameters are transmitted in the System information messages.

1. To verify MS does not reselect on the basis of C31 as there are no HCS threshold values transmitted in the System information messages.

#### 20.22.2.4 Method of test

##### 20.22.2.4.1 Initial conditions

Parameters changed from the default values in table 20.22.1.

| Parameter                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|-----------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBm)       | -65       | -60       | -70       | -65       | -60       | -70       |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -85       | -90       | -100      | -85       | -90       | -100      |
| GPT                         |           |           |           | 40 s      |           |           |
| GRO                         |           | -20 dB    |           | 20 dB     |           | -20 dB    |
| GTO                         |           |           |           | 20 dB     |           |           |
| C1                          | 20        |           | 30        | 20        | 30        | 30        |
| C32                         | 20        |           | 10        | 20-40     | 30        | 10        |

NOTE 1: The BA(GPRS) list only contains the ARFCNs of the carriers used during the test.

NOTE 2: The HCS structure is omitted from the packet system information messages.

NOTE 3: Carrier 5 is the BCCH carrier which broadcasts the position of the PBCCH channel in the cell (Carrier 2).  
Carrier 3 is the BCCH carrier which broadcasts the position of the PBCCH channel in the cell (Carrier 6).  
Carrier 1 is the BCCH carrier which broadcasts the position of the PBCCH channel in the cell (Carrier 4).

#### 20.22.2.4.2 Procedure

- a) The SS activates carriers 2 and 5. The MS is paged on carriers 2 and 5.
- b) The MS is switched on.
- c) The SS activates carriers 1, 4, 3 and 6. The MS is paged on carriers 1, 4, 3 and 6. The SS monitors carriers 4 and 6 for RA requests from the MS.

#### 20.22.2.5 Test Requirements

- 1) After step b) the SS should ensure that the MS final state is in Packet Idle mode on carrier 2.
- 2) After step c) there should be no response on carrier 4 within 38 s of activating the carrier but MS should respond on carrier 4 within 50 s plus Max{5 s, 5 consecutive paging blocks of that MS } of activating the carrier.

NOTE: Minimum time of 38 s set by penalty timer on carrier 4 less 2 s tolerance. Maximum time includes 40 s + 2 s tolerance for expiry of penalty timer on carrier 4, 2 s to decode BCCH on carrier 1 (taking into account the Scheduling of System Information requirement from setion 20.22), 2 s to decode PBCCH on carrier 4 (taking into account the Scheduling of Packet System Information requirement from setion 20.22), 1 s for reselection, since the MS will already have running averages on carrier 1, when the penalty timers expire, additional time for update of NB-list in the mobile, allow at least 50 s plus Max{5 s, 5 consecutive paging blocks of that MS }.

### 20.22.3 Priority of cells

#### 20.22.3.1 Definition and applicability

This test is applicable for all types of GPRS mobiles.

### 20.22.3.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update  $RLA\_P$  and calculate the value of  $C1$ ,  $C31$  and  $C32$  for the serving cell and the non-serving cells; 3GPP TS 05.08, subclause 10.1.2. The MS shall make a cell re-selection if:

- (i) The path loss criterion parameter ( $C1$ ) for the serving cell falls below zero.
- (ii) A non-serving suitable cell (see 3GPP TS 03.22) is evaluated to be better than the serving cell. The best cell is the cell with the highest value of  $C32$  among:
  - those cells that have the highest  $PRIORITY\_CLASS$  among those that fulfil the criterion  $C31 \geq 0$ ; or
  - all cells, if no cells fulfil the criterion  $C31 \geq 0$ .

If the parameter  $C32\_QUAL$  is set, positive  $GPRS\_RESELECT\_OFFSET$  values shall only be applied to the neighbour cell with the highest  $RLA\_P$  value of those cells for which  $C32$  is compared above.

$PRIORITY\_CLASS$  and  $C32\_QUAL$  are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the  $C32$  value for the neighbour cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area:
  - $GPRS\_CELL\_RESELECT\_HYSTERESIS$ . If the parameter  $C31\_HYST$  is set;
  - $GPRS\_CELL\_RESELECT\_HYSTERESIS$  shall also be subtracted from the  $C31$  value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area:
  - $RA\_RESELECT\_HYSTERESIS$ .
- in case of a cell re-selection occurred within the previous 15 s: 5 dB.
  - $GPRS\_CELL\_RESELECT\_HYSTERESIS$ ,  $C31\_HYST$  and  $RA\_RESELECT\_HYSTERESIS$  are broadcast on PBCCH of the serving cell.

### 20.22.3.3 Test purpose

1. To verify that the MS reselects to the correct cell by calculating  $C31$  correctly when  $C31\_HYST$  is set on the network.

### 20.22.3.4 Method of Test

#### 20.22.3.4.1 Initial Conditions

Parameters changed from the default values in table 20.22.1.

| Parameter                                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBm)                       | -60       | -60       | -80       | -64       | -70       | -70       |
| GPRS_RXLEV_ACCESS_MIN (dBm)<br>C31_HYST = 1 | -100      |           | -100      | -92       | -100      | -102      |
| Priority Class                              | 3         |           | 3         | 3         | 3         | 1         |
| GRO                                         |           |           | 10        | 4         | 10        | 16        |
| HCS_THR                                     | -90       |           | -70       | -80       | -86       | -86       |
| GCRH                                        | 6         |           |           |           |           |           |
| C1                                          | 40 to 15  |           | 20        | 28        | 30        | 32        |
| C31                                         | 30 to 5   |           | -16       | 10        | 10        | 10        |
| C32                                         | 40 to 15  |           | 24        | 26        | 34        | 42        |

NOTE 1: GRO = GPRS\_RESELECT\_OFFSET, GCRH = GPRS\_CELL\_RESELECT\_HYSTERESIS, RARH = RA\_RESELECT\_HYSTERESIS.

NOTE 2: The BA(GPRS) list only contains the ARFCNs of the carriers used during the test. The HCS structure is transmitted in the Packet system information messages.

NOTE 3: Carrier 1 is the BCCH carrier which broadcasts the position of the PBCCH channel in the cell (carrier 2.)

NOTE 4: Carrier 2 (PBCCH) broadcasts settings for carriers 3 to 6. Calculations of C31 and C32 are based on the MS attached to carrier 2.

#### 20.22.3.4.2 Procedure

- The MS is switched on and completes GPRS Attach procedure (ready timer deactivated) on carrier 2.
- The SS waits 10 s.
- The RF level of carriers 1 and 2 are reduced to -85 dBm (C1 = decreases to 15).

#### 20.22.3.5 Test Requirements

After step c) the MS should respond on carrier 5. (Carrier 3 should be rejected as  $C31 < 0$ , carrier 6 has a lower priority class than carrier 4 and carrier 5 so is rejected, even though  $C32 = 40$ , out of carrier 4 and 5, carrier 5 has highest C32 value.

NOTE: Time allowed includes Max{5s, 5 consecutive paging blocks of the MS} for MS to determine C32 on neighbour cell is higher, 2 seconds to decode BCCH, 2 sec to decode PSII and 1 sec for re-selection.

### 20.22.4 Cell re-selection with cells in different routing area

#### 20.22.4.1 Definition and applicability

This test is applicable for all types of GPRS mobiles.

#### 20.22.4.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA\_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; 3GPP TS 05.08, subclause 10.1.2. The MS shall make a cell re-selection if:

- The path loss criterion parameter (C1) for the serving cell falls below zero.
- A non-serving suitable cell (see 3GPP TS 03.22) is evaluated to be better than the serving cell. The best cell is the cell with the highest value of C32 among;
  - those cells that have the highest PRIORITY\_CLASS among those that fulfil the criterion  $C31 \geq 0$ ; or
  - all cells, if no cells fulfil the criterion  $C31 \geq 0$ .

If the parameter C32\_QUAL is set, positive GPRS\_RESELECT\_OFFSET values shall only be applied to the neighbour cell with the highest RLA\_P value of those cells for which C32 is compared above.

PRIORITY\_CLASS and C32\_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area:
  - GPRS\_CELL\_RESELECT\_HYSTERESIS. If the parameter C31\_HYST is set;
  - GPRS\_CELL\_RESELECT\_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area:
  - RA\_RESELECT\_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 s: 5 dB.
- GPRS\_CELL\_RESELECT\_HYSTERESIS, C31\_HYST and RA\_RESELECT\_HYSTERESIS are broadcast on PBCCH of the serving cell.

#### 20.22.4.3 Test purpose

To verify that the MS reselects to the correct cell by calculating C32 correctly when one of the cells is in a different routing area.

#### 20.22.4.4 Method of Test

##### 20.22.4.4.1 Initial Conditions

Parameters changed from the default values in table 20.22.1.

| Parameter                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|-----------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBm)       | -60       | -60       | -70       | -70       | -70       | -70       |
| RA COLOUR                   | 1         |           | 1         |           |           | 2         |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -100      |           | -100      |           |           | -100      |
| GRO                         |           |           | 4         |           |           | 6         |
| GCRH                        | 4         |           |           |           |           |           |
| RARH                        | 14        |           |           |           |           |           |
| C1                          | 40        |           | 30        |           |           | 30        |
| C32                         | 40        |           | 34        |           |           | 22        |

NOTE 1: GRO = GPRS\_RESELECT\_OFFSET, GCRH = GPRS\_CELL\_RESELECT\_HYSTERESIS, RARH = RA\_RESELECT\_HYSTERESIS.

NOTE 2: The BA(GPRS) list only contains the ARFCNs of the carriers used during the test. The HCS structure is omitted from the packet system information messages on all the cells. Therefore C31 is not used.

NOTE 3: Carrier 1 is the BCCH carrier which broadcasts the position of the PBCCH channel in the cell (carrier 2)  
Carrier 3 is the BCCH carrier which broadcasts the position of the PBCCH channel in the cell (carrier 4)  
Carrier 6 is the BCCH carrier which broadcasts the position of the PBCCH channel in the cell (carrier 5).

NOTE 4: The calculated values of C32 are based on the MS attached to Carrier 2

#### 20.22.4.4.2 Procedure

- a) The MS is switched on and completes GPRS Attach procedure (ready timer deactivated) on carrier 2.
- b) The SS waits 10 s.
- c) The RF level of carriers 1 and 2 are reduced to -85 dBm (C1 = decreases to 15).

#### 20.22.4.5 Test Requirements

After step c) the MS should respond on carrier 4. (Carrier 5 C32=22 if RA\_RESELECT\_HYSTERESIS is used correctly by MS otherwise it will be 36 and MS will select carrier 5 incorrectly)

Note: Time allowed includes Max{5s, 5 consecutive paging blocks of the MS} for MS to determine C32 on neighbour cell is higher, 2 seconds to decode BCCH, 2 sec to decode PSII, 2 sec to decode PBCCH and 1 sec for re-selection.

### 20.22.5 Network controlled Cell re-selection in Transfer Mode

#### 20.22.5.1 Definition and applicability

This test is applicable for all types of GPRS mobiles.

#### 20.22.5.2 Conformance requirement

1. A cell re-selection command may be sent from the network to an MS. When the MS receives the command, it shall immediately re-select the cell according to the included cell description and change the network control mode according to the command (3GPP TS 04. 60, GSM05.08, subclause 10.1.4).

#### 20.22.5.3 Test purpose

To verify the MS can correctly interpret the network control commands and reselect to the correct cell.

#### 20.22.5.4 Method of Test

##### 20.22.5.4.1 Initial Conditions

Parameters changed from the default values in table 20.22.1.

| Parameter                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 |
|-----------------------------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBm)       | -60       | -60       | -80       | -70       | -70       |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -100      | -100      | -100      | -100      | -100      |
| NETWORK_CONTROL_ORDER       | NC2       | NC2       | NC0       | NC2       | NC2       |
| NC_REPORTING PERIOD_T (s)   | 0,96      | 0,96      |           | 0,96      | 0,96      |
| C1                          | 40-20     |           | 20-40     | 30        |           |
| C32                         | 40-20     |           | 20-40     | 30        |           |

NOTE 1: The HCS structure is omitted from the packet system information messages on all the cells. Therefore C31 is not used.

NOTE 2: Carrier 1 is a BCCH carrier which broadcasts the position of the PBCCH channel in the cell (carrier 2) and Carrier 4 is a BCCH carrier which broadcasts the position of the PBCCH channel in the cell (carrier 5).

#### 20.22.5.4.2 Procedure

- a) The MS is switched on and completes GPRS Attach procedure (ready timer deactivated) on carrier 2.
- b) The RF level of carriers 1 and 2 are reduced to -80 dBm. (C32 becomes 20).

- c) The SS waits 15 s after the RF level of carriers 1 and 2 are reduced before sending Packet Cell Change Order, with the IMMEDIATE\_REL bit set to FALSE, to the MS to select carrier 4. The MS shall complete Cell Update procedure on carrier 4.
- d) The RF level of carrier 3 is increased to -60 dBm. (C32 becomes 40).
- e) The SS waits 15 s after increasing the RF level of carrier 3 before the Network Control Order is changed to NC0 on carriers 4 and 5 by sending Packet Measurement Order.

#### 20.22.5.5 Test Requirements

- 1) After step b) there should be no response on carriers 3, 4 or 5.
- 2) After step c) there should be a response on carrier 4  
 Note: Time allowed includes Max{5s, 5 consecutive paging blocks of the MS} for MS to determine C32 on neighbour cell, 2 seconds to decode BCCH, 2 sec to decode PSI1, 2 sec to decode PBCCH and 5 sec for re-selection.
- 3) After step d) there should be no response on carriers 1, 2, 3.
- 4) After step e) there should be a response on carrier 3 within 3 s of the SS sending the Packet Measurement Order. (The 3 s = 2 s for BCCH decoding + 1s for re-selection + tolerance.)

### 20.22.6 Cell reselection timings

#### 20.22.6.1 Definition and applicability

This test is applicable for all types of GPRS mobiles.

#### 20.22.6.2 Conformance requirement

At least for every sample or every second, whichever is greatest, the MS shall calculate the value of C1, C31 and C32 for the serving cell and recalculate C1, C31 and C32 values for non serving cells (if necessary). The MS shall make a cell re-selection if:

- i) The path loss criterion parameter (C1) for the serving cells falls below zero.

#### 20.22.6.3 Test purpose

- 1. To verify that the MS meets conformance requirement 6.2 (i) within time allowed.

#### 20.22.6.4 Method of Test

##### 20.22.6.4.1 Initial Conditions

Parameters changed from the default values in table 20.22.1.

| Parameter                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|-----------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBm)       | -60       | -60       | -70       | -70       |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -90       | -90       | -100      | -100      |
| GRO                         |           |           | -28       |           |
| C1                          | 30        |           | 30        |           |
| C32                         | 30        |           | 2         |           |

NOTE 1: The HCS structure is omitted from the system information messages on all the cells. Therefore C31 is not used.

NOTE 2: Carriers 1 and 3 are the BCCH carriers which broadcast the position of the PBCCH channel in the cell (carriers 2 and 4).

#### 20.22.6.4.2 Procedure

- a) The SS activates carriers 1 and 2. The MS is switched on and brought into Packet Idle Mode on carrier 2.
- b) The SS activates all remaining carriers and pages the MS on carrier 4. The SS starts to monitor carriers 3 and 4 for responses from the MS.
- c) The SS waits 30 s before the RF level of carriers 1 and 2 are reduced to -100 dBm for X seconds, where  $X = \text{repetition of paging blocks in seconds} \times 2$ . (During this period C1 becomes -10). Then the SS raises the level back to -60 dBm. The SS waits 20 s.
- d) The SS reduces the RF level on carriers 1 and 2 to -100dBm.

#### 20.22.6.5 Test Requirements

- 1) After step c) there shall be no access on carrier 3 or carrier 4.
- 2) After step d) there shall be access on carrier 4 within 25 s (allow 20 s for c1 average to reach -10 + 2 s to decode BCCH + 2 s to decode PBCCH).

### 20.22.7 Downlink signalling failure

#### 20.22.7.1 Definition and applicability

This test is applicable for all types of GPRS MSs.

#### 20.22.7.2 Conformance requirement

The downlink signalling failure criterion is based on the downlink signalling failure counter DSC.

1. If DRX period split is supported, DSC shall be initialised to a value equal to the nearest integer to  $\max(10, 90/64 \times \text{SPLIT\_PG\_CYCLE})$  where SPLIT\_PG\_CYCLE is a parameter given by the MS at GPRS attach (see 3GPP TS 05.02).
2. Thereafter, whenever the MS attempts to decode a message in its paging subchannel; if a message is successfully decoded DSC is increased by 1, however never beyond the max value defined in 1.
3. Whenever the MS can not successfully decode a message in its paging subchannel the DSC is decreased by 4.
4. When DSC reaches 0, a downlink signalling failure shall be declared. A downlink signalling failure shall result in cell reselection, 3GPP TS 03.22, subclause 4.5 (ii) and 3GPP TS 05.08, subclause 6.5

NOTE: The network sends the paging subchannel for a given MS every  $64/\text{SPLIT\_PG\_CYCLE}$  multiframes. The requirement for network transmission on the paging subchannel is specified in 3GPP TS 04.08 / 3GPP TS 44.018. The MS is required to attempt to decode a message every time its paging subchannel is sent.

#### 20.22.7.3 Test purpose

1. To verify that the MS initialises the DSC counter in accordance with the conformance requirement. This is verified indirectly.
2. To verify that whenever the MS successfully decodes a message on paging subchannel, the DSC is increased by 1, (however never beyond the nearest integer to max defined in subclause 16.2.1). This is verified indirectly.
3. To verify that whenever the MS can not successfully decode a message on paging subchannel, the DSC decreased by 4. This is verified indirectly.
4. To verify that when the DSC reaches 0, a downlink signalling failure shall be declared and the MS will perform cell reselection.

## 20.22.7.4 Method of Test

## 20.22.7.4.1 Initial Conditions

Parameters changed from the default values in table 20.22.1.

| Parameter                                   | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|---------------------------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm) | -65       | -65       | -60       | -60       |
| GPRS_RXLEV_ACCESS_MIN (dBm)                 | -95       | -95       | -100      | -100      |
| C1                                          | 30        |           | 40        |           |
| C32                                         | 30        |           | 40        |           |

NOTE 1: The HCS structure is omitted from the system information messages on all the cells. Therefore C31 is not used.

NOTE 2: The SS shall use the SPLIT\_PG\_CYCLE which the MS defines in the Attach Request. The SS shall calculate the DSC, which the MS uses, based upon the received SPLIT\_PG\_CYCLE. I.e. if the MS uses SPLIT\_PG\_CYCLE = 4, the SS shall use DSC = 10 and paging blocks shall occur every 832 frames or 3,84 s.

NOTE 3: Carriers 1 and 3 are BCCH carriers which broadcast the position of the PBCCH channel in the cell (carriers 2 and 4).

## 20.22.7.4.2 Procedure

- The SS activates carriers 3 and 4. On carrier 4 valid layer 3 messages shall be sent in the paging blocks, but not paging the MS. The MS is switched on and brought into Packet Idle Mode on carrier 4. The SS activates all remaining carriers and on carrier 2 the MS is paged continuously in all paging blocks.
- After 40 s the SS sends corrupted data (using random data, wrong parity bits see 3GPP TS 05.03, subclauses 4.3 and 4.1.2 or other lower layer error) in 2 successive paging blocks on carrier 4 and then reverts to sending normal data.

NOTE 1: Sending corrupted, i.e. non-decodable data on 2 successive paging blocks should decrease the DSC to 2.

- The SS monitors all accesses on both carriers for X s, where  $X = DSC \times \text{repetition of paging blocks in seconds}$  (Allows the DSC counter to go back to maximum).
- The SS sends corrupted data in successive paging blocks on carrier 4 until DCS < 0 and then reverts to sending normal data..

NOTE 2: Sending corrupted, data in successive paging blocks should decrease the DSC to < 0 (or below 0) and cause a cell reselection.

- The SS monitors all accesses on both carriers for 30 s.

## 20.22.7.5 Test requirements

- There shall be no access on carriers 1 or 2 after step b).
- The MS shall access on carrier 2 at test step e) within 5 s. (The time should be measured from the transmission of the last complete successive paging block with errors and allows 4 secs for decoding BCCH and PBCCH).

## 20.22.8 Cell selection when the best cell does not support GPRS

## 20.22.8.1 Definition and applicability

Cell selection is a process in which an MS, whenever a new PLMN is selected, attempts to find a suitable cell of that PLMN to camp on. Two methods of searching for a suitable cell are possible, normal cell selection and stored list cell selection. The process ensures that the MS is camped on a cell from which it can reliably decode downlink data and

with which it has a high probability of communications on the uplink. The support of GPRS is not a condition to select a cell. Once the MS is camped on a cell, access to the network is allowed.

This test is applicable for all types of GPRS MSs.

#### 20.22.8.2 Conformance requirement

1. The MS shall be able to select the strongest cell within 30 s of switch on. This assumes a valid SIM, with PIN disabled and ideal radio conditions, 3GPP TS 05.08, subclause 6.1.
2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:
  - 2.1 (i) It should be a cell of the selected PLMN;
  - 2.2 (ii) It should not be "barred" (see subclause 3.5.1);
  - 2.3 (iii) It should not be in an LA which is in the list of "forbidden LAs for roaming";
  - 2.4 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. This is estimated as shown in subclause 3.6. 3GPP TS 03.22, subclause 3.2.1.

NOTE: Criteria 2.3 (iii) is not applicable for Cell Selection.

3. Initially the MS looks for a cell which satisfies these 4 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a suitable cell is found, the MS camps on it, 3GPP TS 03.22, subclause 3.2.1.
4. The MS shall be able to calculate correctly the path loss criterion parameter C1, used for cell selection and reselection, 3GPP TS 05.08, subclause 6.4.

#### 20.22.8.3 Test purpose

1. To verify that the MS meets conformance requirement 1. even when one of the other cells supports GPRS.
2. To verify that:
  - 2.1 The MS does not select a cell of a PLMN, which is not the selected PLMN.
  - 2.2 The MS does not select a cell which is "barred".
  - 2.4 The MS does not select a cell with  $C1 < 0$ .
3. To verify that the MS selects suitable cells in descending order of received signal strength.
4. To verify that the MS does not select a cell with  $C1 < 0$ .

#### 20.22.8.4 Method of test

##### 20.22.8.4.1 Initial conditions

Parameters changed from the default values in table 20.22.1.

| Parameter              | Carrier 1 | Carrier 2 | Carrier 3             | Carrier 4 | Carrier 5 |
|------------------------|-----------|-----------|-----------------------|-----------|-----------|
| RF Signal Level (dBm)  | -75       | -80       | -70                   | -60       | -70       |
| CBA                    | 0         | 0         | 0                     | 1         | 0         |
| RXLEV_ACCESS_MIN (dBm) | -90       | -90       | -90                   | -90       | -60       |
| GPRS_RXLEV_ACCESS_MIN  |           |           |                       |           |           |
| MNC                    |           |           | 01 (011 for PCS 1900) |           |           |
| MCC                    |           |           | 002                   |           |           |
| C1                     | 15        | 10        | 20                    | 30        | -10       |

NOTE 1: For an E-GSM MS carrier 1 and carrier 5 ARFCNs are chosen in the E-GSM band, carrier 3 and carrier 4 ARFCNs in the P-GSM band.

NOTE 2: Carrier 2 supports GPRS without PBCCH channel in the cell.

NOTE 3: Carriers 1, 3, 4 and 5 do not support GPRS.

#### 20.22.8.4.2 Procedure

- a) The SS activates and pages on the MS on all carriers. All Carriers are monitored for RA requests from the MS.
- b) The MS is switched on.

#### 20.22.8.5 Test requirements

- 1) After step b), the first response from the MS shall be on carrier 1 within 33 s. There shall be no response from the MS on any other carrier.

## 20.22.9 Cell reselection when the best cell does not support GPRS

### 20.22.9.1 Definition and applicability

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. The target cell should be reselected despite it does not support GPRS.

This test is applicable for all types of GPRS MSs.

### 20.22.9.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:
  - 1.1 (iii) The cell camped on (current serving cell) has become barred.
  - 1.2 (iv) There is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).

The MS will then reselect a new cell in order to fulfil the process goal.; 3GPP TS 03.22, subclause 4.5.

NOTE 1: Criterion (i) is tested in subclause 20.8 (Cell reselection when  $C1(\text{serving cell}) < 0$  for 5 s).

NOTE 2: Criterion (ii) is tested subclause 20.16 (Downlink signalling failure).

NOTE 3: Criterion (v) is tested in subclause 20.6 (Cell reselection timings).

2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:

- 2.1 (ii) It should not be "barred".
- 2.2 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. 3GPP TS 03.22, subclause 3.2.1.

NOTE 4: Criterion (i) is not relevant for cell reselection and for cell selection it is tested in subclause 20.1.

NOTE 5: Criterion (iv) refers to the C1 parameter.

3. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection; 3GPP TS 05.08, subclause 6.4.
4. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:
  - i) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 s. This indicates that the path loss to the cell has become too high.

- ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 s, except in the case of the new cell being in a different location area in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL\_RESELECT\_HYSTERESIS dB as defined by the BCCH data from the current serving cell, for a period of 5 s. This indicates that it is a better cell. 3GPP TS 05.08, subclause 6.6.2.
5. The MS shall attempt to decode the full BCCH data of the serving cell at least every 30 s; 3GPP TS 05.08, subclause 6.6.1.

### 20.22.9.3 Test purpose

1. To verify that:
  - 1.1 The MS meets conformance requirement 1.1.
  - 1.2 The MS meets conformance requirement 1.2.
  - 1.3 The MS meets conformance requirement 1.3.
2. To verify that:
  - 2.1 The MS does not reselect a cell which is barred.
  - 2.2 The MS does not reselect a cell which has a  $C1 < 0$ .
  - 2.3 The MS does reselect a cell even if does not support GPRS.
  - 2.4 The MS keeps camping on the serving cell despite it does not support GPRS and there is a non-serving suitable cell with a lower C2 that supports GPRS.
  - 2.5 The MS does not attempt to attach to GPRS when camping on a cell that does not support GPRS despite there is a non-serving suitable cell with a lower C2 that supports GPRS.
3. To verify that the MS calculates the C2 parameter correctly when the CELL\_RESELECT\_OFFSET, TEMPORARY\_OFFSET and PENALTY\_TIME parameters are not used.
4. To verify that the MS takes into account the CELL\_RESELECT\_HYSTERESIS parameter when reselecting a cell in a different location area, whether the this cell supports GPRS or not.
5. To verify that the MS decodes the CELL\_BAR\_ACCESS and CELL\_BAR\_QUALIFY parameters from the BCCH every 30 s.

### 20.22.9.4 Method of test

#### 20.22.9.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter                                   | Carrier 1 | Carrier 2 | Carrier 3                        | Carrier 4 | Carrier 5 |
|---------------------------------------------|-----------|-----------|----------------------------------|-----------|-----------|
| RF Signal Level<br>(dB $\mu$ V emf() / dBm) | 43 / -70  | 33 / -80  | 43 / -70                         | 38 / -75  | 38 / -75  |
| RXLEV_ACCESS_MIN (dBm)                      | -85       | -90       | -90                              | -85       | -67       |
| CRH                                         | 10 dB     |           |                                  |           |           |
| LAC                                         |           |           | different from<br>other carriers |           |           |
| CBA                                         |           |           |                                  | 1         |           |
| CBQ                                         |           |           |                                  | 0         |           |
| C1                                          | 15        | 10        | 20                               | 10        | -8        |
| C2                                          | 15        | 10        | 20                               | 10        | -8        |

NOTE 1: Carrier 1 and 3 support GPRS without PBCCH channel in the cell.

NOTE 2: Carriers 2, 4 and 5 do not support GPRS.

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test.

#### 20.22.9.4.2 Procedure

- a) The SS activates carriers 1, 2, 4 and 5. The MS is paged on carriers 1, 2, 4 and 5. The SS monitors carriers 2, 4 and 5 for RA requests from the MS.
- b) The MS is switched on.
- c) When the SS receives a response on carrier 1, it stops paging the MS on this carrier and waits for 25 s. (The MS should reselect and camp onto carrier 1.)
- d) The SS disables GPRS on carrier 1 and enables GPRS on carrier 2.
- e) The SS enables GPRS on carrier 1 and disables GPRS on carrier 2.
- f) The SS stops paging on all carriers except carrier 2. The level of carrier 2 is increased to 43 dB $\mu$ Vemf (C2 becomes 20 dB), and the SS monitors carrier 2 for RA requests from the MS.
- g) When the SS receives a response from the MS on carrier 2, it stops paging the MS on this carrier.
- h) The MS is switched off then on and the MS is paged on carriers 1, 4 and 5. The SS monitors carrier 1, 4 and 5 for RA requests from the MS.
- i) The MS is switched off.
- j) The SS is reconfigured and sets CBA = 1 on carriers 1 and 5, enables GPRS on carrier 2 and disables GPRS on carrier 1.
- k) The MS is switched on.
- l) After 33 s, the SS starts paging continuously on carrier 1 and sets CBA = 1 on carrier 2 and CBA=0 on carriers 1, 4 and 5.
- m) When the SS receives a response on carrier 1, it stops paging the MS and waits for 25 s. (The MS should reselect and camp onto carrier 1.)
- n) The SS activates carrier 3, pages the MS continuously on this carrier and monitors carrier 3 for RA requests from the MS.
- o) The SS increases the level of carrier 3 to 53 dB $\mu$ Vemf (C2 increases to 30 dB).
- p) The MS is switched off. The SS is reconfigured and sets CBA = 1 on carriers 1 and 5, disables GPRS on carrier 3 and enables GPRS on carrier 1.
- q) The SS deactivates carrier 3. The MS is switched on.
- r) After 33 s, the SS starts paging continuously on carrier 1 and sets CBA = 1 on carrier 2 and CBA = 0 on carriers 1, 4 and 5.
- s) When the SS receives a response on carrier 1, it stops paging the MS and waits for 25 s. (The MS should reselect and camp onto carrier 1).
- t) The SS activates carrier 3 at 43 dB $\mu$ Vemf, pages the MS continuously on this carrier and monitors carrier 3 for RA requests from the MS.
- u) The SS increases the level of carrier 3 to 53 dB $\mu$ Vemf (C2 increases to 30 dB).

#### 20.22.9.5 Test requirements

- 1) After step c), there shall be no response from the MS on carriers 2, 4, or 5 within 50 s.

NOTE 1: 33 s for the MS to read the BCCH of carrier 2 (30 s + 10 %), 15 s for the MS to reselect cell 1, since the MS already has a running average on carrier 1, allow 50 s.

- 2) After step d), there shall be no response from the MS on carriers 2, 4, or 5 within 50 s.

- 3) After step e), there shall be no response from the MS on carriers 2, 4, or 5 within 50 s.
- 4) In step f), the MS shall respond on carrier 2 within 20 s of increasing the level of carrier 2.

NOTE 2: 5 s to perform running average, 10 s to detect C2 differences, 2,4 s to read BCCH of carrier 2, 1 s to perform RA. Total 18,4 s, allow 20 s.

- 5) After step h), there shall be no response from the MS on carriers 1, 4, or 5 within 50 s.
- 6) In step l), the MS shall respond on carrier 1 within 50 s of setting CBA=1 on carrier 2.
- 7) After step n), there shall be no response from the MS within 50 s.
- 8) After step o), the MS shall respond on carrier 3 within 20 s.
- 9) In step r), the MS shall respond on carrier 1 within 50 s of setting CBA=1 on carrier 2.

NOTE 2: 33 s for the MS to read the BCCH of carrier 2 (30 s + 10 %), 15 s for the MS to reselect cell 1, since the MS already has a running average on carrier 1, allow 50 s.

- 10) After step t), there shall be no response from the MS within 50 s.
- 11) After step u), the MS shall respond on carrier 3 within 20 s.

## 20.22.10 Cell Selection-Search for Suitable Cell/ cell priority

### 20.22.10.1 Definition and applicability

This test is applicable for all types of GPRS mobiles.

### 20.22.10.2 Conformance requirement

For normal service, the MS has to camp on suitable cell. The choice of such a suitable cell for the purpose of receiving normal service is referred to as "normal camping". If a suitable cell is found, the MS camps on it and performs any registration necessary. Cells can have two levels of priority, suitable cells which are of low priority are only camped on if there are no other suitable cells of normal priority (3GPP TS 03.22, subclause 3.5.2).

### 20.22.10.3 Test purpose

To verify that the MS selects cells of Normal priority even though there is a stronger suitable cell of low priority. Thus it verifies that PBCCH presence does not degrade the MS functionality.

### 20.22.10.4 Method of test

Initial conditions

| Parameter             | Carrier1 | Carrier2 | Carrier3 | Carrier4 |
|-----------------------|----------|----------|----------|----------|
| RF Signal Level       | -70      | -70      | -80      | -80      |
| RXLEV_ACCESS_MIN      | -90      |          | -90      |          |
| GPRS_RXLEV_ACCESS_MIN |          | -90      |          | -90      |
| CELL_BAR_QUALIFY      | 1        |          | 0        |          |
| C1                    | 20       | 20       | 10       | 10       |

NOTE 1: Carrier 1 and carrier 3 are the BCCH Carriers which broadcasts the position of the PBCCH channel in the cell (carrier 2 and carrier 4).

NOTE 2: Carrier 1 and carrier 2 are for Cell 1, carrier 3 and carrier 4 are for Cell 2.

NOTE 3: Cell Bar Qualify is transmitted on BCCH. CBQ = 1, low priority and CBQ = 0 is normal priority.

## Procedure

- a) The SS activates all Carriers.
- b) MS is Switched on.

### 20.22.10.5 Test Requirements

- 1) After Step b) the response from the MS shall be on Carrier 4.

NOTE: Cell 1 BCCH carrier is stronger, but has low priority, So MS should camp on Cell 2.

## 20.22.11 Cell Selection/No normal priority cell

### 20.22.11.1 Definition and applicability

This test is applicable for all types of GPRS mobiles.

### 20.22.11.2 Conformance requirement

Cells can have two levels of priority, suitable cells which are of low priority are only camped on if there are no other suitable cells of normal priority (3GPP TS 03.22 subclause 3.2.1).

### 20.22.11.3 Test purpose

To verify that the MS camps on a cell of low priority when no suitable cells of normal priority are available. Thus it verifies that PBCCH presence does not degrade the MS functionality.

### 20.22.11.4 Method of test

#### Initial conditions

| Parameter           | Carrier1 | Carrier2 | Carrier3 | Carrier4 |
|---------------------|----------|----------|----------|----------|
| RF Signal Level     | -80      | -80      | -100     | -100     |
| RXLEV_ACCESS_MIN    | -90      |          | -90      |          |
| GPRS_LEV_ACCESS_MIN |          | -90      |          | -90      |
| CELL_BAR_QUALIFY    | 1        |          | 0        |          |
| C1                  | 10       | 10       | -10      | -10      |

NOTE 1: Carrier 1 and Carrier 3 are the BCCH Carriers which broadcasts the position of the PBCCH channels in the cell (carrier 2 and carrier 4).

NOTE 2: Carrier 1 and carrier 2 are for Cell 1, carrier 3 and carrier 4 are for Cell 2.

NOTE 3: Cell Bar Qualify is transmitted on BCCH. CBQ = 1, low priority and CBQ = 0 is normal priority.

## Procedure

- a) The SS activates all the Carriers.
- b) MS is switched on.

### 20.22.11.5 Test Requirements

- 1) After Step b) the first response from the MS shall be on Carrier 2 within 33 s.

NOTE: Cell 1 BCCH carrier is stronger, but has low priority, So MS should camp on Carrier 2 (PBCCH carrier on Cell 1).

## 20.22.12 Cell Selection on "LA Not Allowed"

### 20.22.12.1 Definition and applicability

This test is applicable for all types of GPRS mobiles.

### 20.22.12.2 Conformance requirement

If the MS has received the cause "LA Not Allowed" it shall ignore this fact when selecting a cell to camp on (3GPP TS 03.22, subclause 3.2.1).

### 20.22.12.3 Test purpose

To verify that the MS does not reject a cell because the cell is a part of the LA for which it has received the cause "LA Not Allowed".

NOTE: During GPRS Attach, the MS receives an ATTACH REJECT message with cause 'LA not allowed'. The MS shall then camp on any acceptable cell and shall be able to make emergency calls.

### 20.22.12.4 Method of test

Initial conditions

| Parameter           | Carrier1 | Carrier2 | Carrier3 | Carrier4 |
|---------------------|----------|----------|----------|----------|
| RF Signal Level     | -60      | -60      | -75      | -75      |
| RXLEV_ACCESS_MIN    | -90      |          | -90      |          |
| GPRS_LEV_ACCESS_MIN |          | -90      |          | -90      |
| CELL_BAR_ACCESS     | 0        |          | 1        |          |
| LAC                 | Default  |          | Default  |          |
| C1                  | 30       | 30       | 15       | 15       |

NOTE 1: Carrier 1 and carrier 3 are the BCCH Carriers which broadcasts the position of the PBCCH channel in the cell (carrier 2 and carrier 4).

NOTE 2: Carrier 1 and carrier 2 are for Cell 1, carrier 3 and carrier 4 are for Cell 2.

#### 20.22.12.4.2 Procedure

- a) The SS activates all the Carriers.
- b) MS is Switched on.
- c) The SS sends an Attach Reject Message on Cell 1 with cause as "LA not allowed".
- d) MS is switched off and then switched on.
- e) The MS is manually commanded to set up an emergency call.

#### 20.22.12.5 Test Requirements

- 1) After Step b) the response shall be on Carrier 2.
- 2) In step e), the MS shall access on carrier 1 with a channel request message, within 15 s of being commanded to set up the emergency call.

NOTE: Cell 2 is barred and hence it is not suitable for Camping.

## 20.22.13 Cell Reselection based on C32 quality

### 20.22.13.1 Definition and applicability

This test is applicable for all types of GPRS mobiles.

### 20.22.13.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA\_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; (3GPP TS 05.08, subclause 10.1.2). The MS shall make a cell re-selection if:

- a. The path loss criterion parameter (C1) for the serving cell falls below zero.
- b. A non-serving suitable cell (see 3GPP TS 03.22) is evaluated to be better than the serving cell. The best cell is the cell with highest value of C32 among:
  - those cells that have the highest PRIORITY\_CLASS among those that fulfill the criterion  $C31 \geq 0$ ; or
  - all cells, if no cells fulfill the criterion  $C31 \geq 0$ ;
  - if the parameter C32\_QUAL is set, positive GPRS\_RESELECT\_OFFSET values shall only be applied to the neighbour cell with the highest RLA\_P value of those cells for which C32 is compared above.

PRIORITY\_CLASS and C32\_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area:
  - GPRS\_CELL\_RESELECT\_HYSTERESIS. If the parameter C31\_HYST is set;
  - GPRS\_CELL\_RESELECT\_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area:
  - RA\_RESELECT\_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 s: 5 dB.

GPRS\_CELL\_RESELECT\_HYSTERESIS, C31\_HYST and RA\_RESELECT\_HYSTERESIS are broadcast on PBCCH of the serving cell (3GPP TS 05.08 subclauses 10.1, 3GPP TS 05.08 10.1.2 and 10.1.3).

### 20.22.13.3 Test purpose

To verify that if C32\_QUAL is set, positive GPRS\_RESELECT\_OFFSET values shall only be applied for the neighbour cells with the highest RLA value of those cells for which C32 is compared, Otherwise positive GRO shall be applied for all the neighbour cells.

## 20.22.13.4 Method of test

## Initial conditions

| Parameter             | Carrier1   | Carrier2   | Carrier3 | Carrier4 | Carrier5 | Carrier6 |
|-----------------------|------------|------------|----------|----------|----------|----------|
| RF Signal Level       | -50 to -75 | -50 to -75 | -60      | -60      | -65      | -65      |
| RXLEV_ACCESS_MIN      | -90        |            | -90      |          | -90      |          |
| GPRS_RXLEV_ACCESS_MIN |            | -90        |          | -90      |          | -90      |
| GPRS_PRIORITY_CLASS   |            | 1          |          | 1        |          | 1        |
| GPRS_RESELECT_OFFSET  |            |            |          | 2        |          | 10       |
| GPRS_HCS_THR          |            | -90        |          | -80      |          | -80      |
| C1                    | 40 to 15   | 40 to 15   | 30       | 30       | 25       | 25       |
| C31                   |            | 30 to 5    |          | 20       |          | 10       |
| C32                   |            | 40 to 15   |          | 32       |          | 25       |

NOTE 1: All cells shall be in the same routing area.

NOTE 2: Carrier 1, carrier 3 and carrier 5 are the BCCH Carriers which broadcasts the position of the PBCCH channels in the cell (carrier 2, carrier 4 and carrier 6).

NOTE 3: Carrier 1 and carrier 2 are for Cell 1, carrier 3 and carrier 4 are for Cell 2, carrier 5 and carrier 6 are for Cell 3.

## 20.22.13.4.2 Procedure

- a) The SS activates all carriers.
- b) MS is switched on.
- c) GPRS attach procedure is completed by SS.
- d) The RF level of Carrier 1 and 2 is decreased to -75 so that C32 (Cell 1) is lesser than that of the other cells.
- e) the SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 4.

## 20.22.13.5 Test Requirements

- 1) The MS shall camp on Cell 1 within 33 s after step b).
- 2) The MS is GPRS Attached after step c).
- 3) After step d), the MS camps on carrier 4.
- 4) In step e), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

NOTE 1:  $C32(n) = C1(n) + GRO$  {n is the neighboring cells}.

NOTE 2: If C32\_QUAL is set on PBCCH then this positive GRO is added to only highest RLA\_P, i.e. to Carrier4. So Cell 2 is selected. If C32\_QUAL was not set, then GRO is added to all the carriers. So Carrier 6 would have been more suitable.

## 20.22.14 Cell Reselection in case Cell reselection occurred in the previous 15 s

## 20.22.14.1 Definition and applicability

This test is applicable for all types of GPRS mobiles.

## 20.22.14.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA\_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; (3GPP TS 05.08, subclause 10.1.2.) The MS shall make a cell re-selection if:

- a. The path loss criterion parameter (C1) for the serving cell falls below zero.
- b. A non-serving suitable cell (see 3GPP TS 03.22) is evaluated to be better than the serving cell. The best cell is the cell with highest value of C32 among:
  - those cells that have the highest PRIORITY\_CLASS among those that fulfill the criterion  $C31 \geq 0$ ; or
  - all cells, if no cells fulfill the criterion  $C31 \geq 0$ ;
  - if the parameter C32\_QUAL is set, positive GRPS\_RESELECT\_OFFSET values shall be only be applied to the neighbour cell with the highest RLA\_P value of those cells for which C32 is compared above.

PRIORITY\_CLASS and C32\_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area:
  - GPRS\_CELL\_RESELECT\_HYSTERESIS. If the parameter C31\_HYST is set;
  - GPRS\_CELL\_RESELECT\_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area:
  - RA\_RESELECT\_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 s: 5 dB.
  - GPRS\_CELL\_RESELECT\_HYSTERESIS, C31\_HYST and RA\_RESELECT\_HYSTERESIS are broadcast on PBCCH of the serving cell. (3GPP TS 05.08 subclauses 10.1, 10.1.2 and 10.1.3).

## 20.22.14.3 Test purpose

To verify that while reselecting a cell, in case cell reselection occurred within the previous 15 s, the Hysteresis value subtracted from the C32 value of the neighbour cells is 5 dB.

## 20.22.14.4 Method of test

Initial conditions

| Parameter             | Carrier1 | Carrier2 | Carrier3 | Carrier4 | Carrier5 | Carrier6 |
|-----------------------|----------|----------|----------|----------|----------|----------|
| RF Signal Level       | -70      | -70      | -70      | -70      | -66      | -66      |
| RXLEV_ACCESS_MIN      | -90      |          | -90      |          | -90      |          |
| GPRS_RXLEV_ACCESS_MIN |          | -90      |          | -90      |          | -90      |
| GPRS_CRH              |          |          |          | +2 dB    |          |          |
| Network Control Order |          | NC2      |          | NC0      |          | NC0      |
| C1                    | 20       | 20       | 20       | 20       | 24       | 24       |
| C2                    | 20       | 20       |          |          |          |          |
| C32                   |          |          |          | 20       |          | 24       |

NOTE 1: MS is GRPS attached on Cell 1 (carriers 1 and 2) and in ready state. Ready timer set to default value.

NOTE 2: Carrier 1, carrier 3 and carrier 5 are the BCCH Carriers which broadcasts the position of the PBCCH channel in the cell (carrier 2, carrier 4 and carrier 6).

NOTE 3: Cell 1 (carriers 1 and 2), Cell 2 (carriers 3 and 4), Cell 3 (carriers 5 and 6).

NOTE 4: MS\_TXPWR\_MAX\_CCH may be set to a value such that B is negative and  $C1 = A - RF$  Signal level - GPRS\_RXLEV\_ACCESS\_MIN.

NOTE 5: Carriers should have a relative accuracy of  $\pm 2$  dB.

#### 20.22.14.4.2 Procedure

- a) The SS activates carriers 3 and 4.
- b) Send PCCO message on PCCCH to Order the MS to change to Cell 2.
- c) The SS waits for 5 s and switches off carriers 1 and 2.
- d) The SS waits for 5 s before activating carrier 5 and carrier 6 such that:
  - $C32$  (Cell 2) >  $C32$  (Cell 3) - 5dB.(to check that the MS does not reselect based on CRH in ready state when cell reselection has taken place in the previous 15 s.)
- e) The SS waits for 5 s.
- f) the SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 4.

#### 20.22.14.5 Test Requirements

- 1) MS shall reselect to Cell 2 after step b).
- 2) The MS shall remain camped on Cell 2 after step d).
- 3) In step f), the MS shall respond to paging within 3 s of transmitting the PAGING REQUEST.

## 20.22.15 Cell Reselection/ ready state / no reselection

### 20.22.15.1 Definition and applicability

This test is applicable for all classes of GPRS Mobiles.

### 20.22.15.2 Conformance requirement

At least every 5 s, the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non-serving cells (if necessary). 3GPP TS 05.08 subclause 6.6.2.

The MS shall then check whether:

- i) the path loss criterion (C1) for the current serving cell falls below zero for a period of 5 s. This indicates that the path loss to the cell has become too high.
- ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 s except:
  - a) in the case of a new cell being in a different Location Area or, for a GPRS MS, in a different routing area or always for a GPRS MS in ready state in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL\_RESELECT\_HYSTERESIS dB as defined by the BCCH data from the current serving cell, for a period of 5 s.

### 20.22.15.3 Test purpose

To verify that the MS does not reselect because of a C2 criteria when GMM is in ready state (MS GPRS attached) and when the C2 value for adjacent cell exceeds the C2 value of the serving cell by at least CELL\_RESELECT\_HYSTERESIS dB for a period of less than 5 s.

NOTE: The serving cell C2 decreases before mobile is out of ready state with the following conditions.

- a)  $C2(\text{Serving}) + \text{CELL\_RESELECT\_HYSTERESIS} > C2(\text{Adjacent})$ .
- b)  $C2(\text{Serving}) + \text{CELL\_RESELECT\_HYSTERESIS} < C2(\text{Adjacent})$  for  $< 5$  s.

#### 20.22.15.4 Method of Test

##### Initial Conditions

Parameters changed from the default values in table 20.22.1.

| Parameter        | Carrier1   | Carrier2 |
|------------------|------------|----------|
| RF Signal Level  | -55 to -75 | -60      |
| RXLEV_ACCESS_MIN | -90        | -90      |
| CRH              | 10         |          |
| C2               | 35 to 15   | 30       |

NOTE 1: MS must be configured to Initiate GPRS Attach on Power On.

NOTE 2: Cell reselection criteria from the above parameters:

$$[C2(s) = 15] < [C2(n) = 30]$$

$$[C2(s) + \text{CRH} = 25] > [C2(n) = 30]$$

for a period of less than 5 s, where 's' denotes the serving cell and 'n' denotes the non-serving cell. After 5 s, C2 of serving cell goes back to the original higher value.

#### 20.22.15.4.2 Procedure

- a) The SS activates both carriers.
- b) MS is switched on.
- c) The SS completes the GPRS Attach procedure (Ready Timer set to default value).
- d) The C2 value for carrier 1 is decreased by 20 dB for  $< 5$  s.
- e) the SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 1.

#### 20.22.15.5 Test requirements

- 1) The MS shall camp on carrier 1 within 33 s after step b), and initiate the GPRS Attach procedure.
- 2) The MS is in GMM Ready State after step c).
- 3) The MS continues to be in ready state and does not initiate cell-reselection after step d).
- 4) In step e), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

## 20.22.16 Cell Reselection/ ready state/ Reselection and Cell update procedure

### 20.22.16.1 Definition and applicability

This test is applicable to all classes of GPRS Mobiles.

### 20.22.16.2 Conformance requirement

The MS is required to perform the following measurements to ensure that the path loss criterion to the serving cell is acceptable.(3GPP TS 05.08 subclause 6.6.2).

At least every 5s the MS shall calculate the value of C1 and C2 for the serving cell and re-calculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:

- 1) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 s. This indicates that the path loss to the cell has become too high.
- 2) The calculated value of C2 for non -serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 s, except:
  - a) in the case of new cell being in a different location area, for a GPRS MS, in a different routing area or always for a GPRS Ms in ready state in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL\_RESELECT\_HYSTERESIS dB as defined by the BCCH data from the current serving cell, for a period of 5 s; or
  - b) in case of a cell reselection occurring within the previous 15 s in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least 5dB for a period of 5 s.

This indicates that it is a better cell.

A cell update takes place when the MS enters a new cell inside the current RA and the MS is in READY state. If the RA has changed, a routing area update is executed instead of a cell update (3GPP TS 03.60 subclause 6.9.11).

#### 20.22.16.3 Test purpose

1. To verify that the MS reselects an adjacent cell because of a C2 criteria when GMM is in ready state (MS GPRS attached) and when the C2 value for adjacent cell exceeds the C2 value of the serving cell by at least CELL\_RESELECT\_HYSTERESIS dB for a period of 5 s.
2. To verify that the MS performs the cell update procedure (when the cell is in the same Routing Area) and  $C2(\text{Serving}) + \text{CELL\_RESELECT\_HYSTERESIS} < C2(\text{Adjacent})$  for at least 5 s.

#### 20.22.16.4 Method of Test

##### Initial Conditions

Parameters changed from the default values in table 20.22.1.

| Parameter        | Carrier1   | Carrier2 |
|------------------|------------|----------|
| RF Signal Level  | -60 to -75 | -65      |
| RXLEV_ACCESS_MIN | -90        | -90      |
| CRH              | 6          |          |
| C2               | 30 to 15   | 25       |

NOTE: Cell reselection criteria from the above parameters:

$$[C2(s) = 15] < [C2(n) = 25] \text{ for a period } > 5 \text{ s.}$$

$$[C2(s) + \text{CRH} = 21] < [C2(n) = 25] \text{ for a period } > 5 \text{ s.}$$

##### Procedure

- a) The SS activates both carriers.
- b) MS is switched on.
- c) The SS completes the GPRS Attach procedure (Ready Timer set to default value).
- d) The C2 value for carrier 1 is decreased by 15 dB.

#### 20.22.16.5 Test requirements

- 1) The MS shall camp on carrier 1 within 33 s after step b) and initiate a GPRS Attach procedure.
- 2) The MS is in GMM ready state after step c).
- 3) Verify that the MS reselects carrier 2 and initiates the Cell Update procedure after step d).

## 20.22.17 C2 reselection in another RA - no cell reselection

### 20.22.17.1 Definition and applicability

This test is applicable for all classes of GPRS Mobiles.

### 20.22.17.2 Conformance requirement

The MS is required to perform the following measurements to ensure that the path loss criterion to the serving cell is acceptable.(3GPP TS 05.08 subclause 6.6.2)

At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and re-calculate C1 and C2 values for non serving cells(if necessary).The MS shall then check whether:

- 1) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 s. This indicates that the path loss to the cell has become too high.
- 2) The calculated value of C2 for non -serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 s, except:
  - a) in the case of new cell being in a different location area, for a GPRS MS, in a different routing area or always for a GPRS Ms in ready state in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL\_RESELECT\_HYSTERISIS dB as defined by the BCCH data from the current serving cell, for a period of 5 s; or
  - b) in case of a cell reselection occurring within the previous 15 s in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least 5dB for a period of 5 s.

This indicates that it is a better cell.

A cell update takes place when the MS enters a new cell inside the current RA and the MS is in READY state. If the RA has changed, a routing area update is executed instead of a cell update (3GPP TS 03.60 subclause 6.9.11).

### 20.22.17.3 Test purpose

To verify that the MS does not reselecting an adjacent cell when the cell is in a routing area different from the serving cell's one and when the C2 value for the adjacent cell does not exceed the C2 value of the serving cell for a period of 5 s by at least CRH dB.

### 20.22.17.4 Method of Test

#### Initial Conditions

| Parameter        | Carrier1   | Carrier2 | Carrier3 | Carrier4 |
|------------------|------------|----------|----------|----------|
| RF Signal        | -60 to -80 | -65      | -75      | -75      |
| CBA              | 0          | 0        | 0        | 0        |
| RXLEV_ACCESS_MIN | -100       | -100     | -100     | -100     |
| CRH              | +10        |          |          |          |
| C1               | 40 to 20   | 35       | 25       | 25       |
| C2               | 40 to 20   | 35       | 25       | 25       |
| GPRS Supported   | Yes        | Yes      | Yes      | Yes      |

NOTE: Carrier 1 and carrier 3 are in same routing area, carrier 2 and carrier 4 are in different routing area from carriers 1 and 3.

#### 20.22.17.4.2 Procedure

- a) The SS activates all carriers.
- b) MS is switched ON.
- c) The SS shall complete the GPRS attach procedure (Ready timer set to default).

- d) Decrease the RF level of Carrier 1 such that the following conditions are met for a period of less than 5 s.
- $C2(\text{adjacent}) > C2(\text{Serving});$
  - $C2 + CRH(\text{serving cell}) < C2(\text{adjacent cell}).$
- e) the SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 1.

#### 20.22.17.5 Test requirements

- 1) MS shall camp on Carrier 1 after step b) and initiate a GPRS attach procedure.
- 2) The MS is in GMM ready state after step c).
- 3) After completion of step d) the MS shall not initiate reselection.
- 4) In step e), the MS shall respond to paging within 3 s of transmitting the PAGING REQUEST.

### 20.22.18 C2 reselection in another Routing Area - Routing Area Update

#### 20.22.18.1 Definition and applicability

This test is applicable for all classes of GPRS Mobiles.

#### 20.22.18.2 Conformance requirement

The MS is required to perform the following measurements to ensure that the path loss criterion to the serving cell is acceptable. (3GPP TS 05.08 subclause 6.6.2)

At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and re-calculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:

- 1) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 s. This indicates that the path loss to the cell has become too high.
- 2) The calculated value of C2 for non -serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 s, except:
  - a) in the case of new cell being in a different location area, for a GPRS MS, in a different routing area or always for a GPRS Ms in ready state in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL\_RESELECT\_HYSTERSIS dB as defined by the BCCH data from the current serving cell, for a period of 5 s; or
  - b) in case of a cell reselection occurring within the previous 15 s in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least 5 dB for a period of 5 s.

This indicates that it is a better cell.

A cell update takes place when the MS enters a new cell inside the current RA and the MS is in READY state. If the RA has changed, a routing area update is executed instead of a cell update (3GPP TS 03.60 subclause 6.9.11).

#### 20.22.18.3 Test purpose

1. To Verify that when the MS is in ready state, the MS reselects an adjacent cell when the cell is in a routing area different from the serving cell's one and when the C2 value for the adjacent cell exceed the C2 value of the serving cell for a period of 5 s by at least CRH dB.
2. To verify that the MS performs the Normal Routing Area Update procedure.

## 20.22.18.4 Method of Test

Initial Conditions:

| Parameter        | Carrier1   | Carrier2 | Carrier3 | Carrier4 |
|------------------|------------|----------|----------|----------|
| RF Signal        | -60 to -80 | -65      | -75      | -75      |
| CBA              | 0          | 0        | 0        | 0        |
| RXLEV_ACCESS_MIN | -100       | -100     | -100     | -100     |
| CRH              | +10        |          |          |          |
| C1               | 40 to 20   | 35       | 25       | 25       |
| C2               | 40 to 20   | 35       | 25       | 25       |

NOTE 1: Carrier 1 and carrier 3 are in same routing area.

NOTE 2: Carrier 2 and carrier 4 are in different routing area from carrier 1 and carrier 3.

## 20.22.18.4.2 Procedure

- a) The SS activates all carriers.
- b) MS is switched ON.
- c) SS Completes the GPRS attach procedure (Ready timer set to default).
- d) The RF level of Carrier 1 is decreased to -80 dBm such that the following condition is met:
  - $C2(\text{serving}) + CRH < C2(\text{adjacent cell})$ .

## 20.22.18.5 Test requirements

- 1) MS shall camp on Carrier 1 after step b) and initiate a GPRS attach procedure.
- 2) The MS is in GMM ready state after step c).
- 3) After step d) the MS shall reselect to carrier 2. The MS shall initiate the Routing Area Update procedure.

## 20.22.19 Borders between routing areas - reselection of a GPRS cell in a homogenous network

## 20.22.19.1 Definition and applicability

This test is applicable for all classes of GPRS Mobiles.

## 20.22.19.2 Conformance requirement

The MS is required to perform the following measurements to ensure that the path loss criterion to the serving cell is acceptable.(3GPP TS 05.08 subclause 6.6.2, 3GPP TS 03.22 subclause 3.4). A cell in a different registration area is only selected if it is better in terms of path loss criterion than all the cells in the current registration area by at least the value of CELL\_RESELECT\_HYSTERESIS (CRH). A GPRS MS uses a GPRS\_CELL\_RESELECT\_HYSTERESIS (GCRH) if provided.

At least every 5s the MS shall calculate the value of C1 and C2 for the serving cell and re-calculate C1 and C2 values for non serving cells(if necessary).The MS shall then check whether:

- 1) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 s. This indicates that the path loss to the cell has become too high.
- 2) The calculated value of C2 for non -serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 s, except:
  - a) in the case of new cell being in a different location area, for a GPRS MS, in a different routing area or always for a GPRS Ms in ready state in which case the C2 value for the new cell shall exceed the C2 value of the

servicing cell by at least CELL\_RESELECT\_HYSTERESIS (CRH) dB as defined by the BCCH data from the current servicing cell, for a period of 5 s; or

- b) in case of a cell reselection occurring within the previous 15 s in which case the C2 value for the new cell shall exceed the C2 value of the servicing cell by at least 5dB for a period of 5 s.

This indicates that it is a better cell.

A cell update takes place when the MS enters a new cell inside the current RA and the MS is in READY state the RA has changed, a routing area update is executed instead of a cell update (3GPP TS 03.60 subclause 6.9.11).

### 20.22.19.3 Test purpose

To Verify that the MS does not reselect a cell in a different routing area when another one is suitable in the same routing area even if C2 is lower. The MS performs Cell Update procedure.

### 20.22.19.4 Method of Test

#### Initial Conditions

| Parameter        | Carrier1    | Carrier2 | Carrier3 | Carrier4 |
|------------------|-------------|----------|----------|----------|
| RF Signal        | -60 to -105 | -65      | -70      | -75      |
| CBA              | 0           | 0        | 0        | 0        |
| RXLEV_ACCESS_MIN | -100        | -100     | -100     | -100     |
| CRH              | +10         |          | +10      |          |
| C1               | 40 to -5    | 35       | 30       | 25       |
| C2               | 40 to -5    | 35       | 30       | 25       |

NOTE 1: Carrier 1 and carrier 3 are in same routing area.

NOTE 2: Carrier 2 and carrier 4 are in different routing area then carrier 1 and carrier 3.

#### 20.22.19.4.2 Procedure

- a) The SS activates all carriers.
- b) MS is switched ON.
- c) The SS completes the GPRS attach procedure.
- d) The RF level of Carrier 1 is decreased such that C1 is < 0 for 5 s.

#### 20.22.19.5 Test requirements

- 1) The MS shall camp on carrier 1 after step b) and initiate the GPRS attach procedure.
- 2) The MS is in Ready State after Step c).
- 3) After step d) the MS shall reselect to carrier 3 as:
  - $C2(\text{Carrier 2}) > C2(\text{Carrier 3})$ ;
  - $C2(\text{Carrier 3}) + CRH(\text{Carrier 1}) > C2(\text{Carrier 2})$ .

After reselection, cell update procedure shall be initiated.

## 20.22.20 Cell Reselection based on C32 - Cell Reselection on CCCH - PBCCH not present

### 20.22.20.1 Definition and applicability

This test is applicable for all types of GPRS mobiles.

### 20.22.20.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA\_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; 3GPP TS 05.08, subclause 10.1.2. The MS shall make a cell re-selection if:

- a. The path loss criterion parameter (C1) for the serving cell falls below zero.
- b. A non-serving suitable cell (see 3GPP TS 03.22) is evaluated to be better than the serving cell. The best cell is the cell with highest value of C32 among:
  - Those cells that have the highest PRIORITY\_CLASS among those that fulfill the criterion  $C31 \geq 0$ ; or
  - All cells, if no cells fulfill the criterion  $C31 \geq 0$ ;
  - If the parameter C32\_QUAL is set, positive GRPS\_RESELECT\_OFFSET values shall be only be applied to the neighbour cell with the highest RLA\_P value of those cells for which C32 is compared above.

PRIORITY\_CLASS and C32\_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbor cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area:
  - GPRS\_CELL\_RESELECT\_HYSTERESIS. If the parameter C31\_HYST is set;
  - GPRS\_CELL\_RESELECT\_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area:
  - RA\_RESELECT\_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 s: 5 dB.
  - GPRS\_CELL\_RESELECT\_HYSTERESIS, C31\_HYST and RA\_RESELECT\_HYSTERESIS are broadcast on PBCCH of the serving cell.

The cell re-selection procedures defined in subclauses 10.1.1 to 10.1.3 (of 3GPP TS 05.08) apply to the MS attached to GPRS if a PBCCH exists in the serving cell. These procedures shall also apply for cells for which GPRS cell re-selection parameters are provided to the MS in a Packet Cell Change Order or Packet Measurement Order message. Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 of 3GPP TS 05.08.

### 20.22.20.3 Test purpose

1. To verify that the MS reselects the correct cell based on the C32 parameter when GPRS\_RESELECT\_OFFSET, TEMPORARY\_OFFSET and PENALTY\_TIME parameters are transmitted in the Packet Measurement Order Message on PACCH.
2. To verify MS does not reselect on the basis of C31 as there are no HCS threshold values transmitted in the System Information Messages.

NOTE 1: No PBCCH exists in any of the cells.

NOTE 2 : GPRS reselection parameters are transmitted on the Packet Measurement Order Message on PACCH.

## 20.22.20.4 Method of test

## Initial conditions

| Parameter             | Carrier1 | Carrier2                                                                         |
|-----------------------|----------|----------------------------------------------------------------------------------|
| RF Signal Level       | -60      | -50                                                                              |
| RXLEV_ACCESS_MIN      | -100     | -100                                                                             |
| GPRS_RXLEV_ACCESS_MIN | -100     | -100                                                                             |
| GPRS_RESELECT_OFFSET  |          | 10                                                                               |
| GPRS_PENALTY_TIME     |          | 120sec                                                                           |
| GPRS_TEMPORARY_OFFSET |          | 30dB                                                                             |
| C1                    | 40       | 50                                                                               |
| C32                   | 40       | 30 (within the duration of penalty time)<br>to 60 (after expiry of penalty time) |

NOTE: This test needs two GPRS cells with default settings specified in clause 40 (channel combination without PBCCH).

## 20.22.20.4.2 Procedure

- a) The SS activates carrier1.
- b) MS is switched on.
- c) GPRS attach procedure is completed by SS.
- d) Send GPRS reselection parameters through Packet Measurement Order message.
- e) SS activates Carrier2.

NOTE 1: Due to GPRS Cell Selection parameters sent in the Packet Measurement Order the following conditions should be met:

- $C32(\text{Carrier2}) < C32(\text{Carrier1})$  {with in the duration of penalty time sec};
  - $C32(\text{Carrier2}) > C32(\text{Carrier1})$  {after expiry of penalty time sec}.
- f) The SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 2 after (Penalty time + Max{5 s, 5 consecutive paging blocks of that MS}) after switching on Carrier 2.

NOTE 2: GPRS\_TEMPORARY\_OFFSET applies a negative offset to C32 for the duration of GPRS\_PENALTY\_TIME.

## 20.22.20.5 Test Requirements

- 1) The MS shall camp on carrier 1 within 33 s after step b) and initiates the attach procedure.
- 2) After step e), the MS shall not initiate reselection until penalty time expires and MS reselects to carrier 2 after expiry of penalty time.
- 3) In step f), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

## 20.22.21 Cell Reselection based on C32/GCRH value - Cell Reselection on CCCH - PBCCH not present

## 20.22.21.1 Definition and applicability

This test is applicable for all types of GPRS mobiles.

### 20.22.21.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA\_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; 3GPP TS 05.08, subclause 10.1.2. The MS shall make a cell re-selection if:

- a. The path loss criterion parameter (C1) for the serving cell falls below zero.
  - b. A non-serving suitable cell (see 3GPP TS 03.22) is evaluated to be better than the serving cell. The best cell is the cell with highest value of C32 among:
    - Those cells that have the highest PRIORITY\_CLASS among those that fulfill the criterion  $C31 \geq 0$ ; or
    - All cells, if no cells fulfill the criterion  $C31 \geq 0$ ;
- If the parameter C32\_QUAL is set, positive GRPS\_RESELECT\_OFFSET values shall be only be applied to the neighbour cell with the highest RLA\_P value of those cells for which C32 is compared above.

PRIORITY\_CLASS and C32\_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbor cells:

- in standby state, if the new cell is in the same routing area: 0.
  - in ready state, if the new cell is in the same routing area:
    - GPRS\_CELL\_RESELECT\_HYSTERESIS. If the parameter C31\_HYST is set;
    - GPRS\_CELL\_RESELECT\_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
  - in standby or ready state, if the new cell is in a different routing area:
    - RA\_RESELECT\_HYSTERESIS.
  - in case of a cell re-selection occurred within the previous 15 s: 5 dB.
- GPRS\_CELL\_RESELECT\_HYSTERESIS, C31\_HYST and RA\_RESELECT\_HYSTERESIS are broadcast on PBCCH of the serving cell.

The cell re-selection procedures defined in subclauses 10.1.1 to 10.1.3 (of 3GPP TS 05.08) apply to the MS attached to GPRS if a PBCCH exists in the serving cell. These procedures shall also apply for cells for which GPRS cell re-selection parameters are provided to the MS in a Packet Cell Change Order or Packet Measurement Order message. Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 of 3GPP TS 05.08.

### 20.22.21.3 Test purpose

To verify that the MS reselects the correct cell based on the C32 parameter when GPRS\_CELL\_RESELECT\_HYSTERESIS value is available.

This GPRS\_CELL\_RESELECT\_HYSTERESIS value shall be deducted from C31 also for neighbour cells if C31\_HYST is set. GPRS Reselection Parameters are transmitted on the Packet Measurement Order message on PACCH.

NOTE: No PBCCH exists in any of the cells.

## 20.22.21.4 Method of test

## Initial conditions

| Parameter                | Carrier1   | Carrier2 | Carrier3 |
|--------------------------|------------|----------|----------|
| RF SIGNAL LEVEL          | -60 to -85 | -75      | -70      |
| RXLEV_ACCESS_MIN         | -100       | -100     | -100     |
| GPRS_PRIORITY_CLASS      | 1          | 1        | 1        |
| GPRS_HCS_THR             | -80        | -84      | -90      |
| GPRS_RESELECT_OFFSET     |            | 16       | 4        |
| CELL_RESELECT_HYSTERISIS | 12         | 0        | 0        |
| NETWORK_CONTROL_ORDER    | NC2        | NC2      | NC2      |
| C1                       | 40 to 15   | 25       | 30       |
| C31                      | 20 to -5   | 9        | 20       |
| C32                      | 40 to 15   | 29       | 22       |

NOTE 1: All cells shall be in the same routing area.

NOTE 2: As PBCCH is not supported, GCRH value maps onto CRH value as per table 4 of 3GPP TS 05.08.

NOTE 3: CELL\_RESELECT\_HYSTERISIS is broadcast in System Information messages on BCCH.

NOTE 4: This test needs three GPRS cells with default settings specified in clause 40 (channel combination without PBCCH).

## Procedure

- a) The SS activates all carriers.
- b) MS is switched on.
- c) GPRS attach procedure is completed by SS.
- d) Send GPRS reselection parameters through Packet Measurement Order message.
- e) The RF level of Carrier 1 is decreased such that C32 (carrier1) is less than that of the other carriers.
- f) the SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 2.

## 20.22.21.5 Test Requirements

- 1) The MS shall camp on carrier 1 within 33 s after step b) and initiates the attach procedure.
- 2) After step e), the MS reselects to carrier2.
- 3) In step f), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

NOTE 1:  $C32(n) = C1(n) + GRO - GCRH$  {If MS is in ready state, n is for neighbor cells}

NOTE 2: IF C31\_HYST is set, GCRH value shall also to be subtracted from C31 value for the neighbor cells.

NOTE 3: IF C31\_HYST is set, then C31 of carrier 2 becomes negative. Then among carrier 2 and carrier 3 (having same priority), the MS neglects carrier 2 because C31 value is negative for carrier 2 though possessing higher C32 value. So, the MS selects Carrier 3 as it meets the criteria  $C31 \geq 0$  among highest PRIORITY\_CLASS.

- $C31(n) = RLA\_P - HCS\_THR - GCRH$  <as C31\_HYST is set >.
- $C31(n) = RLA\_P - HCS\_THR$  { if C31\_HYST is ZERO }.

## 20.22.22 Cell Reselection with cells in different Routing area - Cell Reselection on CCCH - PBCCH not present

### 20.22.22.1 Definition and applicability

This test is applicable for all types of GPRS mobiles.

### 20.22.22.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA\_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; 3GPP TS 05.08, subclause 10.1.2. The MS shall make a cell re-selection if:

- a. The path loss criterion parameter (C1) for the serving cell falls below zero.
- b. A non-serving suitable cell (see 3GPP TS 03.22) is evaluated to be better than the serving cell. The best cell is the cell with highest value of C32 among:
  - Those cells that have the highest PRIORITY\_CLASS among those that fulfill the criterion  $C31 \geq 0$ ; or
  - All cells, if no cells fulfill the criterion  $C31 \geq 0$ ;
  - If the parameter C32\_QUAL is set, positive GRPS\_RESELECT\_OFFSET values shall be only be applied to the neighbor cell with the highest RLA\_P value of those cells for which C32 is compared above.

PRIORITY\_CLASS and C32\_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbor cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area:
  - GPRS\_CELL\_RESELECT\_HYSTERESIS. If the parameter C31\_HYST is set;
  - GPRS\_CELL\_RESELECT\_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area:
  - RA\_RESELECT\_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 s: 5 dB.
  - GPRS\_CELL\_RESELECT\_HYSTERESIS, C31\_HYST and RA\_RESELECT\_HYSTERESIS are broadcast on PBCCH of the serving cell.

The cell re-selection procedures defined in subclauses 10.1.1 to 10.1.3 (of 3GPP TS 05.08) apply to the MS attached to GPRS if a PBCCH exists in the serving cell. These procedures shall also apply for cells for which GPRS cell re-selection parameters are provided to the MS in a Packet Cell Change Order or Packet Measurement Order message. Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 of 3GPP TS 05.08.

### 20.22.22.3 Test purpose

To verify that the MS reselects to the correct cell by calculating C32 correctly when one of the cells is in a different routing area. When the MS is in the Standby or ready state, on triggering of a reselection, when it considers a suitable cell which happens to be in a different Routing Area, the C32 value of the new cell must be reduced by RARH for comparison.

## 20.22.22.4 Method of test

## Initial conditions

| Parameter             | Carrier1   | Carrier2 | Carrier3 |
|-----------------------|------------|----------|----------|
| RF Signal             | -60 to -80 | -65      | -70      |
| GPRS_RXLEV_ACCESS_MIN | -90        | -90      | -90      |
| RA COLOUR             | 001        | 010      | 001      |
| RARH                  | 10         |          |          |
| C1                    | 30 to 10   | 25       | 20       |
| C32                   | 30 to 10   | 15       | 20       |

NOTE 1: The BA(BCCH) list only contains the ARFCNs of the carriers used during the test.

NOTE 2: The value of RXLEV\_ACCESS\_MIN is obtained from the SI messages for reselection. If required the GPRS cell-reselection parameters are sent to the MS, so that it updates the cell-reselection parameters.

NOTE 3: When a neighbouring cell belongs to a different RA, RARH value is deduced from its C32 value during reselection, if the MS is in Standby or Ready state. In absence of PBCCH, when RARH is not available, CRH (from SI messages on BCCH) is used instead (3GPP TS 05.08 subclause 10.1.1).

NOTE 4: This test needs three GPRS cells with default settings specified in clause 40 (channel combination without PBCCH).

## 20.22.22.4.2 Procedure

- a) All the carriers are activated and MS is switched ON.
- b) SS completes the GPRS Attach procedure. (Ready Timer is set to default.)
- c) Send GPRS reselection parameters through Packet Measurement Order message.
- d) SS waits until MS goes into Standby Mode (expiry of Ready Timer). The RF level of carrier 1 is reduced to -80dBm, hence Reselection is triggered.
- e) The SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 3.

## 20.22.22.5 Test Requirements

- 1) After step a) the MS camps on Carrier 1 and initiates the GPRS Attach procedure.
- 2) MS reselects to carrier 3 after step d).
- 3) In step e), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

## 20.22.23 Cell Reselection based on C32 - Cell Reselection on CCCH - PBCCH not supported

## 20.22.23.1 Definition and applicability

This test is applicable for all types of GPRS mobiles.

## 20.22.23.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA\_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; 3GPP TS 05.08, subclause 10.1.2. The MS shall make a cell re-selection if:

- a. The path loss criterion parameter (C1) for the serving cell falls below zero.
- b. A non-serving suitable cell (see 3GPP TS 03.22) is evaluated to be better than the serving cell. The best cell is the cell with highest value of C32 among:

- Those cells that have the highest PRIORITY\_CLASS among those that fulfill the criterion  $C31 \geq 0$ ; or
- All cells, if no cells fulfill the criterion  $C31 \geq 0$ ;
- If the parameter C32\_QUAL is set, positive GRPS\_RESELECT\_OFFSET values shall be only be applied to the neighbour cell with the highest RLA\_P value of those cells for which C32 is compared above.

PRIORITY\_CLASS and C32\_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area:
  - GPRS\_CELL\_RESELECT\_HYSTERESIS.If the parameter C31\_HYST is set;
  - GPRS\_CELL\_RESELECT\_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area:
  - RA\_RESELECT\_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 s: 5 dB.
  - GPRS\_CELL\_RESELECT\_HYSTERESIS, C31\_HYST and RA\_RESELECT\_HYSTERESIS are broadcast on PBCCH of the serving cell.

The cell re-selection procedures defined in subclauses 10.1.1 to 10.1.3 (of 3GPP TS 05.08) apply to the MS attached to GPRS if a PBCCH exists in the serving cell. These procedures shall also apply for cells for which GPRS cell re-selection parameters are provided to the MS in a Packet Cell Change Order or Packet Measurement Order message. Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 of 3GPP TS 05.08.

### 20.22.23.3 Test purpose

To verify that when all cells fulfill the criteria  $C31 \geq 0$ , the MS selects the cell with the highest value of C32 among the cells with the highest PRIORITY\_CLASS.

NOTE: GPRS reselection parameters are transmitted on the Packet Measurement Order Message on PACCH.

### 20.22.23.4 Method of test

Initial conditions

| Parameter             | Carrier1   | Carrier2 | Carrier3 |
|-----------------------|------------|----------|----------|
| RF Signal Level       | -60 to -85 | -65      | -60      |
| RXLEV_ACCESS_MIN      | -100       | -100     | -100     |
| CELL_RESELECT_OFF SET | 0          | 10       | 0        |
| GPRS_RESELECT_OFF SET | 0          | 10       | 10       |
| GPRS_PRIORITY_CLASS   | 0          | 3        | 0        |
| GPRS_HCS_THR          | -90        | -90      | -90      |
| C1                    | 40 to 15   | 35       | 40       |
| C31                   | 30 to 5    | 25       | 30       |
| C32                   | 40 to 15   | 45       | 50       |

NOTE 1: All cells shall be in the same routing area.

NOTE 2: This test needs three GPRS cells with default settings specified in clause 40 (channel combination without PBCCH).

## Procedure

- a) The SS activates carrier1.
- b) MS is switched on.
- c) GPRS attach procedure is completed by SS.
- d) Send GPRS reselection parameters through Packet Measurement Order message.
- e) SS activates carrier2 and carrier3.
- f) The RF level of carrier 1 is decreased such that C32 (Carrier1) is less than that of the other Carriers.
- g) The SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 2.

### 20.22.23.5 Test Requirements

- 1) The MS shall camp on carrier 1 within 33 s after step b) and initiate the attach procedure.
- 2) After step f), the MS reselects to carrier 2.
- 3) In step g), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

NOTE 1: All cells fulfil the criteria  $C31 \geq 0$ . After checking C31 condition, MS Checks for highest PRIORITY\_CLASS.

NOTE 2: Though C32 value of carrier 3 is greater than that of carrier 2, carrier 2 has higher PRIORITY\_CLASS. So MS reselects to carrier 2.

## 20.22.24 Cell Reselection based on C32/cell of same priority/ Cell Reselection on CCCH - PBCCH not supported

### 20.22.24.1 Definition and applicability

This test is applicable for all types of GPRS mobiles.

### 20.22.24.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA\_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; 3GPP TS 05.08, subclause 10.1.2. The MS shall make a cell re-selection if:

- a. The path loss criterion parameter (C1) for the serving cell falls below zero.
- b. A non-serving suitable cell (see 3GPP TS 03.22) is evaluated to be better than the serving cell. The best cell is the cell with highest value of C32 among:
  - Those cells that have the highest PRIORITY\_CLASS among those that fulfill the criterion  $C31 \geq 0$ ; or
  - All cells, if no cells fulfill the criterion  $C31 \geq 0$ ;
  - If the parameter C32\_QUAL is set, positive GRPS\_RESELECT\_OFFSET values shall be only be applied to the neighbour cell with the highest RLA\_P value of those cells for which C32 is compared above.

PRIORITY\_CLASS and C32\_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbor cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area:
  - GPRS\_CELL\_RESELECT\_HYSTERESIS. If the parameter C31\_HYST is set;

- GPRS\_CELL\_RESELECT\_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area:
  - RA\_RESELECT\_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 s: 5 dB.
- GPRS\_CELL\_RESELECT\_HYSTERESIS, C31\_HYST and RA\_RESELECT\_HYSTERESIS are broadcast on PBCCH of the serving cell.

The cell re-selection procedures defined in subclauses 10.1.1 to 10.1.3 (of 3GPP TS 05.08) apply to the MS attached to GPRS if a PBCCH exists in the serving cell. These procedures shall also apply for cells for which GPRS cell re-selection parameters are provided to the MS in a Packet Cell Change Order or Packet Measurement Order message. Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 of 3GPP TS 05.08.

#### 20.22.24.3 Test purpose

To verify that the MS selects the cell with the highest value of C32 when no cells fulfilling the criteria  $C31 \geq 0$  and all cells are of same priority.

NOTE: GPRS reselection parameters are transmitted on the Packet Measurement Order Message on CCCH.

#### 20.22.24.4 Method of test

Initial conditions

| Parameter             | Carrier1   | Carrier2 | Carrier3 |
|-----------------------|------------|----------|----------|
| RF Signal Level       | -60 to -85 | -70      | -64      |
| RXLEV_ACCESS_MIN      | -100       | -100     | -90      |
| GPRS_RXLEV_ACCESS_MIN | -100       | -100     | -90      |
| GPRS_PRIORITY_CLASS   | 1          | 1        | 1        |
| GPRS_HCS_THR          | -80        | -60      | -60      |
| C1                    | 40 to 15   | 30       | 26       |
| C31                   | 20 to -5   | -10      | -4       |
| C32                   | 40 to 15   | 30       | 26       |

NOTE 1: All cells shall be in the same routing area.

NOTE 2: This test needs three GPRS cells with default settings specified in clause 40 (channel combination without PBCCH).

#### Procedure

- a) The SS activates carrier1.
- b) MS is switched on.
- c) GPRS attach procedure is completed by SS.
- d) Send GPRS reselection parameters through Packet Measurement Order message.
- e) SS activates carrier2 and carrier3.
- e) The RF level of carrier 1 is decreased such that C32 (Carrier1) is less than that of the other carriers.
- f) The SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 2.

#### 20.22.24.5 Test Requirements

- 1) The MS shall camp on carrier 1 within 33 s after step b).

2) After step e), the MS reselects carrier 2.

3) In step e), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

NOTE 1: As C31 value of all other Carriers is less than zero, MS checks for highest C32 value only. Here all cells are of same priority.

NOTE 2: RF signal level of carrier 3 is greater than that of carrier 2, because C32 value is less than that of carrier 2, MS reselects carrier 2, as C31 value is less than zero for all carriers.

## 20.22.25 Cell Reselection based on $C32/C31 < 0$ / Cell Reselection on CCCH - PBCCH not supported

### 20.22.25.1 Definition and applicability

This test is applicable for all types of GPRS mobiles.

### 20.22.25.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA\_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; 3GPP TS 05.08, subclause 10.1.2. The MS shall make a cell re-selection if:

- a. The path loss criterion parameter (C1) for the serving cell falls below zero.
- b. A non-serving suitable cell (see 3GPP TS 03.22) is evaluated to be better than the serving cell. The best cell is the cell with highest value of C32 among:
  - Those cells that have the highest PRIORITY\_CLASS among those that fulfill the criterion  $C31 \geq 0$ ; or
  - All cells, if no cells fulfill the criterion  $C31 \geq 0$ ;
  - If the parameter C32\_QUAL is set, positive GRPS\_RESELECT\_OFFSET values shall be only be applied to the neighbour cell with the highest RLA\_P value of those cells for which C32 is compared above.

PRIORITY\_CLASS and C32\_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbor cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area:
  - GPRS\_CELL\_RESELECT\_HYSTERESIS. If the parameter C31\_HYST is set;
  - GPRS\_CELL\_RESELECT\_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area:
  - RA\_RESELECT\_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 s: 5 dB.
  - GPRS\_CELL\_RESELECT\_HYSTERESIS, C31\_HYST and RA\_RESELECT\_HYSTERESIS are broadcast on PBCCH of the serving cell.

The cell re-selection procedures defined in subclauses 10.1.1 to 10.1.3 (of 3GPP TS 05.08) apply to the MS attached to GPRS if a PBCCH exists in the serving cell. These procedures shall also apply for cells for which GPRS cell re-selection parameters are provided to the MS in a Packet Cell Change Order or Packet Measurement Order message. Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 of 3GPP TS 05.08.

## 20.22.25.3 Test purpose

To verify that the MS selects the cell with the highest value of C32 when no cells fulfil the criteria  $C31 \geq 0$  and cells are of different priority.

NOTE: GPRS reselection parameters are transmitted on the Packet Measurement Order Message on PACCH.

## 20.22.25.4 Method of test

Initial conditions

| Parameter           | Carrier1   | Carrier2 | Carrier3 |
|---------------------|------------|----------|----------|
| RF Signal Level     | -60 to -85 | -65      | -70      |
| RXLEV_ACCESS_MIN    | -100       | -90      | -100     |
| GPRS_PRIORITY_CLASS | 1          | 3        | 1        |
| GPRS_HCS_THR        | -60        | -60      | -60      |
| C1                  | 40 to 15   | 25       | 30       |
| C31                 | 0 to -25   | -5       | -10      |
| C32                 | 40 to 15   | 25       | 30       |

NOTE 1: All cells shall be in the same routing area.

NOTE 2: This test needs three GPRS cells with default settings specified in clause 40 (channel combination without PBCCH).

## Procedure

- a) The SS activate first carrier1.
- b) MS is switched on.
- c) GPRS attach procedure is completed by SS.
- d) Send GPRS reselection parameters through Packet Measurement Order message.
- e) SS activates carrier2 and carrier3.
- f) The RF level of carrier 1 is decreased such that  $C32(\text{Carrier1})$  is lesser than that of the other carriers.
- g) The SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 3.

## 20.22.25.5 Test Requirements

- 1) The MS shall camp on carrier 1 within 33 s after step b).
- 2) After step f), the MS camps on Carrier 3.
- 3) In step g), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

NOTE 1: As  $C31$  value of all other Carriers is less than zero, it simply checks for highest  $C32$  value. Here non-serving cells are not of same priority.

NOTE 2: Though the PRIORITY\_CLASS of Carrier3 is lesser than that of Carrier2, as Carrier 3 has highest  $C32$  value, MS reselects Carrier 3 only as all Carriers 's  $C31$  value is negative.

## 20.22.26 Cell Reselection based on C32 quality / Cell Reselection on CCCH - PBCCH not supported

## 20.22.26.1 Definition and applicability

This test is applicable for all types of GPRS mobiles.

### 20.22.26.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA\_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; 3GPP TS 05.08, subclause 10.1.2. The MS shall make a cell re-selection if:

- a. The path loss criterion parameter (C1) for the serving cell falls below zero.
- b. A non-serving suitable cell (see 3GPP TS 03.22) is evaluated to be better than the serving cell. The best cell is the cell with highest value of C32 among:
  - Those cells that have the highest PRIORITY\_CLASS among those that fulfill the criterion  $C31 \geq 0$ ; or
  - All cells, if no cells fulfill the criterion  $C31 \geq 0$ .
  - If the parameter C32\_QUAL is set, positive GRPS\_RESELECT\_OFFSET values shall be only be applied to the neighbour cell with the highest RLA\_P value of those cells for which C32 is compared above.

PRIORITY\_CLASS and C32\_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbor cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area:
  - GPRS\_CELL\_RESELECT\_HYSTERESIS. If the parameter C31\_HYST is set;
  - GPRS\_CELL\_RESELECT\_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area:
  - RA\_RESELECT\_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 s: 5 dB.
  - GPRS\_CELL\_RESELECT\_HYSTERESIS, C31\_HYST and RA\_RESELECT\_HYSTERESIS are broadcast on PBCCH of the serving cell.

The cell re-selection procedures defined in subclauses 10.1.1 to 10.1.3 (of 3GPP TS 05.08) apply to the MS attached to GPRS if a PBCCH exists in the serving cell. These procedures shall also apply for cells for which GPRS cell re-selection parameters are provided to the MS in a Packet Cell Change Order or Packet Measurement Order message. Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 of 3GPP TS 05.08.

### 20.22.26.3 Test purpose

To verify that if C32\_QUAL is set, positive GRPS\_RESELECT\_OFFSET values shall only be applied for the neighbour cells with the highest RLA value of those cells for which C32 is compared, Otherwise positive GRO shall be applied for all the neighbour cells.

NOTE: GPRS reselection parameters are transmitted on the Packet Measurement Order Message on PACCH.

## 20.22.26.4 Method of test

## Initial conditions

| Parameter            | Carrier1   | Carrier2 | Carrier3 |
|----------------------|------------|----------|----------|
| RF Signal Level      | -60 to -90 | -60      | -70      |
| RXLEV_ACCESS_MIN     | -100       | -90      | -100     |
| GPRS_PRIORITY_CLASS  | 1          | 1        | 1        |
| GPRS_RESELECT_OFFSET |            | 4        | 10       |
| GPRS_HCS_THR         | -90        | -80      | -80      |
| C1                   | 40 to 10   | 30       | 30       |
| C31                  | 30 to 0    | 20       | 10       |
| C32                  | 40 to 10   | 34       | 40       |

NOTE 1: All cells shall be in the same routing area.

NOTE 2: As PBCCH is not supported, C32\_QUAL value is always ZERO, as per table 4 of 3GPP TS 05.08. Table 4 gives info regarding Conversion from idle mode to GPRS cell re-selection parameters.

NOTE 3: Since C32\_QUAL is ZERO, GPRS\_RESELECT\_OFFSET is added to all cells, irrespective of the values of RLA\_P.

NOTE 4: This test needs three GPRS cells with default settings specified in clause 40 (channel combination without PBCCH).

## Procedure

- a) The SS activates carrier1.
- b) MS is switched on.
- c) GPRS attach procedure is completed by SS.
- d) Send GPRS reselection parameters through Packet Measurement Order message.
- e) SS activates carrier2 and carrier3.
- f) The RF level of Carrier 1 is decreased such that C32(Carrier1) is lesser than that of the other Carriers.
- g) The SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 3.

## 20.22.26.5 Test Requirements

- 1) The MS shall camp on carrier 1 within 33 s after step b) and initiates the attach procedure.
- 2) After step f), the MS reselects to Carrier 3.
- 3) In step g), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

NOTE 1: While calculating C32 value positive GPRS\_RESELECT\_OFFSET is added to C1 value.  
 $C32(n) = C1(n) + GPRS\_RESELECT\_OFFSET$  {n is for neighbouring cell}.

NOTE 2: GRO is added to all neighbouring cells as C32\_QUAL value is ZERO.

NOTE 3: If C32\_QUAL is set {if PBCCH exists}, then this positive GRO is added to only highest RLA\_P, i.e to Carrier2 and then MS reselects Carrier2 (C32 value 34) instead of Carrier3 (C32 value 30) as highest C32 value is of Carrier2.

## 20.22.27 Void

## 20.22.28 Cell Reselection/no suitable cell found/cell selection

### 20.22.28.1 Definition and applicability

This test is applicable for all types of GPRS mobiles.

### 20.22.28.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update  $RLA\_P$  and calculate the value of  $C1$ ,  $C31$  and  $C32$  for the serving cell and the non-serving cells; 3GPP TS 05.08, subclause 10.1.2. The MS shall make a cell re-selection if:

- a. The path loss criterion parameter ( $C1$ ) for the serving cell falls below zero.
- b. A non-serving suitable cell (see 3GPP TS 03.22) is evaluated to be better than the serving cell. The best cell is the cell with highest value of  $C32$  among:
  - Those cells that have the highest  $PRIORITY\_CLASS$  among those that fulfill the criterion  $C31 \geq 0$ ; or
  - All cells, if no cells fulfill the criterion  $C31 \geq 0$ .
  - If the parameter  $C32\_QUAL$  is set, positive  $GRPS\_RESELECT\_OFFSET$  values shall be only be applied to the neighbour cell with the highest  $RLA\_P$  value of those cells for which  $C32$  is compared above.

$PRIORITY\_CLASS$  and  $C32\_QUAL$  are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the  $C32$  value for the neighbor cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area:
  - $GRPS\_CELL\_RESELECT\_HYSTERESIS$ . If the parameter  $C31\_HYST$  is set;
  - $GRPS\_CELL\_RESELECT\_HYSTERESIS$  shall also be subtracted from the  $C31$  value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area:
  - $RA\_RESELECT\_HYSTERESIS$ .
- in case of a cell re-selection occurred within the previous 15 s: 5 dB.
  - $GRPS\_CELL\_RESELECT\_HYSTERESIS$ ,  $C31\_HYST$  and  $RA\_RESELECT\_HYSTERESIS$  are broadcast on PBCCH of the serving cell.

Cell re-selection for any other reason (see 3GPP TS 03.22) shall take place immediately, but the cell that the MS was camped on shall not be returned to within 5 s if another suitable cell can be found. If valid  $RLA\_P$  values are not available, the MS shall wait until these values are available and then perform the cell re-selection if it is still required. The MS may accelerate the measurement procedure within the requirements in subclause 10.1.1 to minimise the cell re-selection delay.

If no suitable cell is found within 10 s, the cell selection algorithm of 3GPP TS 03.22 shall be performed. Since information concerning a number of channels is already known to the MS, it may assign high priority to measurements on the strongest carriers from which it has not previously made attempts to obtain BCCH information, and omit repeated measurements on the known ones (3GPP TS 05.08, subclause 10.1.3).

The cell re-selection procedures defined in subclauses 10.1.1 to 10.1.3 (of 3GPP TS 05.08) apply to the MS attached to GPRS if a PBCCH exists in the serving cell. These procedures shall also apply for cells for which GPRS cell re-selection parameters are provided to the MS in a Packet Cell Change Order or Packet Measurement Order message.

Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 of 3GPP TS 05.08.

### 20.22.28.3 Test purpose

To verify that if cell re-selection is triggered and no suitable cell is found within 10 s, the cell selection procedures of 3GPP TS 03.22 are performed.

NOTE: If cell reselection occurs due to reasons other than Path loss criteria or more suitable neighbour cell, and no suitable cell is found within 10 s, the MS performs the cell selection procedures of 3GPP TS 03.22.

### 20.22.28.4 Method of test

Initial conditions

| Parameter        | Carrier1 | Carrier2 | Carrier3 |
|------------------|----------|----------|----------|
| RF Signal Level  | -70      | -60      | -65      |
| RXLEV_ACCESS_MIN | -100     | -100     | -100     |
| Cell_Bar_Access  | 0 to 1   | 1        | 0        |
| C1               | 30       | 40       | 35       |
| C2               | 30       | 40       | 35       |

NOTE 1: PBCCH is not supported in any of the cells.

NOTE 2: All cells support GPRS.

NOTE 3: MS is GPRS attached and in ready state. Ready timer value should be set to a large enough value to allow the test to be carried out (say 32 s).

NOTE 4: This test needs three GPRS cells with default settings specified in clause 40 (channel combination without PBCCH).

### Procedure

- a) The SS activates Carrier 1.
- b) MS is switched ON.
- c) The SS shall complete the GPRS attach procedure.
- d) Send GPRS reselection parameters through Packet Measurement Order message.
- e) The SS activates Carrier 2 and Carrier 3.
- f) The SS then bars Carrier 1.
- g) The SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 3.

### 20.22.28.5 Test Requirements

- 1) MS shall camp on Carrier 1 after step b) and initiate the attach procedure.
- 2) The MS shall camp on Carrier 3 after step f).
- 3) In step g), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

(Since Carrier 2 is a better cell in terms of RF signal level, the MS should reselect to Carrier 2. However, Carrier 2 is not suitable as it is barred. Hence the Mobile initiates the Cell selection algorithm of 3GPP TS 03.22 and camps on Carrier 3 though it does not belong to the neighbour list.)

## 20.23 COMPACT Cell Selection and Reselection

The absolute accuracy of the MS signal level measurements is assumed to be  $\pm 6$  dB. A difference of at least 8 dB is allowed for cases of discrimination between C1, C31, C32 values and 0.

The relative accuracy of the MS signal level measurements is assumed to be  $\pm 3$  dB for the signal levels used in the tests of this subclause. A difference of at least 5 dB is allowed for cases of discrimination between C1 and C31 and C32 values on different carriers.

NOTE 1: The accuracy of MS signal level measurements is specified in 3GPP TS 05.08. For all of the tests in this subclause, the signal levels used are greater than 1 dB above reference sensitivity level.

NOTE 2: The tolerance on timers specified in 3GPP TS 05.08 is  $\pm 10$  % except for PENALTY\_TIME where it is  $\pm 2$  s. In the tests of this subclause, the test requirements include these tolerances. Consequently, the times stated in the test requirement sometimes differ from the corresponding timer in the conformance requirement.

Where pulsed signals are specified, the SS tolerance on pulse width is  $\pm 2$  % and the SS tolerance on power level  $\pm 1$  dB.

The cell re-selection tests defined in the following subclauses applies to the MSs attached to EGPRS if a CPBCCH exists in the serving cell. Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 or clause 10 of 3GPP TS 05.08 and therefore tests defined in clause 20 or subclause 20.22 of 3GPP TS 11.10 apply respectively.

Unless otherwise stated in the method of test, in all of the tests of this subclause:

- The SIM is in the idle updated state in the default registration area with a PTMSI assigned at the beginning of each test.
- All carriers support COMPACT.
- The Scheduling of Packet System information should be such that a complete set of consistent PSI messages can be decoded within 8 multiframe.
- The mobile station supports COMPACT.
- The mobile station is either packet data only capable or it does not support GSM CS services.
- Time Group 0 is used to send CPBCCH / CPCCCH blocks for all ARFCN values (one active timegroup/carrier).
- 1 CPBCCH block and 3 CPPCH blocks are allocated in all timegroups ( $N_{CCCH\_NH} = 4$ ).
- All cells must be timeslot and frame synchronized to each other.

Table 20.23.1: Default values of the system information fields

| Parameter                     | 3GPP TS 04.6<br>0 reference | Abbr. | Normal Setting                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## 20.23.1 Cell selection

### 20.23.1.1 Definition and applicability

Cell selection is a process in which an MS, whenever a new PLMN is selected, attempts to find a suitable cell of that PLMN to camp on. Two methods of searching for a suitable cell are possible, normal cell selection and stored list cell selection. The process ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. Once the MS is camped on a cell, access to the network is allowed.

## 20.23.1.2 Conformance requirement

1. The MS shall be able to select the strongest COMPACT cell within 120 s of switch on. This assumes a valid SIM, with PIN disabled and ideal radio conditions.
2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:
  - 2.1 (i) It should be a cell of the selected PLMN.
  - 2.2 (ii) It should not be "barred" (see 3GPP TS 03.22 subclause 3.5.1).
  - 2.3 (iii) It should not be in an LA which is in the list of "forbidden LAs for roaming".
  - 2.4 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. This is estimated as shown in subclause 3.6. (3GPP TS 03.22, subclause 3.2.1)

NOTE: Criteria 2.3 (iii) is not applicable for Cell Selection.

3. Initially the MS looks for a cell which satisfies these 4 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a suitable cell is found, the MS camps on it, 3GPP TS 03.22, subclause 3.2.1.
4. The MS shall be able to calculate correctly the path loss criterion parameter C1, used for cell selection and reselection, 3GPP TS 05.08, subclause 12.3.4.

## 20.23.1.3 Test purpose

1. To verify that the MS meets conformance requirement 1. when all cells support COMPACT.
2. To verify that:
  - 2.1 The MS does not select a cell of a PLMN, which is not the selected PLMN.
  - 2.2 The MS does not select a cell which is "barred".
  - 2.3 The MS does not select a cell with  $C1 < 0$ .
