## Intellectual Property Rights

### Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "*Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards*", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<https://ipr.etsi.org/>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

### Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

## Legal Notice

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities. These shall be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between 3GPP and ETSI identities can be found under <http://webapp.etsi.org/key/queryform.asp>.

---

## Modal verbs terminology

In the present document "**shall**", "**shall not**", "**should**", "**should not**", "**may**", "**need not**", "**will**", "**will not**", "**can**" and "**cannot**" are to be interpreted as described in clause 3.2 of the [ETSI Drafting Rules](#) (Verbal forms for the expression of provisions).

"**must**" and "**must not**" are **NOT** allowed in ETSI deliverables except when used in direct citation.

# Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

---

# Introduction

This specification has been prepared by the 3GPP Task Force, and gives a detailed specification of the 3GPP confidentiality algorithm GEA5 and the 3GPP integrity algorithm GIA5.

This document is the first of three, which between them form the entire specification of the 3GPP confidentiality algorithm GEA5 and the 3GPP integrity algorithm GIA5:

- **3GPP TS 55.251: "Specification of the GEA5 and GIA5 encryption algorithms for GPRS; GEA5 and GIA4 algorithm specification".**
- 3GPP TS 55.252: "Specification of the GEA5 and GIA5 encryption algorithms for GPRS; Implementers' test data".
- 3GPP TS 55.253: "Specification of the GEA5 and GIA5 encryption algorithms for GPRS; Design conformance test data".

---

# 1 Scope

The present document defines the technical details of the 3GPP confidential algorithm GEA5 and the 3GPP integrity algorithm GIA5.

---

# 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

[1] 3GPP TR 21.905: "Vocabulary for 3GPP Specifications".

[2] 3GPP TS 33.216: "Specification of the 3GPP Confidentiality and Integrity Algorithms UEA2 & UIA2; Document 2: SNOW 3G specification".

---

# 3 Definitions, symbols and abbreviations

## 3.1 Definitions

For the purposes of the present document, the terms and definitions given in 3GPP TR 21.905 [1] and the following apply. A term defined in the present document takes precedence over the definition of the same term, if any, in 3GPP TR 21.905 [1].

(none)

## 3.2 Symbols

For the purposes of the present document, the following symbols apply:

=	The assignment operator.
$\oplus$	The bitwise exclusive-OR operation.
	The concatenation of the two operands.
KASUMI[x] <sub>k</sub>	The output of the KASUMI algorithm applied to input value <b>x</b> using the key <b>k</b> .
X[i]	The <i>i</i> <sup>th</sup> bit of the variable X. (X = X[0]    X[1]    X[2]    .....).
Y <sub>i</sub>	The <i>i</i> <sup>th</sup> block of the variable Y. (Y = Y <sub>0</sub>    Y <sub>1</sub>    Y <sub>2</sub>    ....).
ceiling(x)	The smallest integer greater than or equal to the real number <b>x</b> .
& <sub>n</sub>	The bitwise AND operation in an n-bit register.
<< <sub>n</sub> t	t-bit left shift in an n-bit register.
>> <sub>n</sub> t	t-bit right shift in an n-bit register.

## 3.3 Abbreviations

For the purposes of the present document, the abbreviations given in 3GPP TR 21.905 [1] and the following apply. An abbreviation defined in the present document takes precedence over the definition of the same abbreviation, if any, in 3GPP TR 21.905 [1].

CBC-MAC MAC	Cipher Block Chaining Message Authentication Code Message Authentication Code
----------------	--

---

## 4 Introductory information

### 4.1 Introduction

The confidentiality algorithm GEA5 is a stream cipher that is used to encrypt/decrypt blocks of data under a confidentiality key KC128. The block of data may be between 1 and 65536 octets long. The algorithm uses SNOW 3G [2] as a keystream generator.

The integrity algorithm GIA5 computes a 32-bit MAC (Message Authentication Code) of a given input message using an integrity key KI128. The approach adopted uses SNOW 3G.

### 4.2 Notation

#### 4.2.1 Radix

The prefix "0x" indicates hexadecimal numbers.

#### 4.2.2 Conventions

The assignment operator "=", as used in several programming languages.

$$\langle \text{variable} \rangle = \langle \text{expression} \rangle$$

means that  $\langle \text{variable} \rangle$  assumes the value that  $\langle \text{expression} \rangle$  had before the assignment took place. For instance,

$$x = x + y + 3$$

means

(new value of  $x$ ) becomes (old value of  $x$ ) + (old value of  $y$ ) + 3.

#### 4.2.3 Bit/byte ordering

All data variables in this specification are presented with the most significant bit (or byte) on the left hand side and the least significant bit (or byte) on the right hand side. Where a variable is broken down into a number of sub-strings, the left most (most significant) sub-string is numbered 0, the next most significant is numbered 1 and so on through to the least significant.

For example an  $n$ -bit MESSAGE is subdivided into 64-bit substrings  $MB_0, MB_1 \dots MB_i$  so if the message is:

0x0123456789ABCDEFEDCBA987654321086545381AB594FC28786404C50A37...

then:

$MB_0 = 0x0123456789ABCDEF$   
 $MB_1 = 0xFEDCBA9876543210$   
 $MB_2 = 0x86545381AB594FC2$   
 $MB_3 = 0x8786404C50A37\dots$

In binary this is:

```
00000001001000110100010101100111100010011010101111001101111011111111110...
```

with  $MB_0 = 0000000100100011010001010110011110001001101010111100110111101111$   
 $MB_1 = 1111111011011100101110101001100001110110010101000011001000010000$   
 $MB_2 = 1000011001010100010100111000000110101011010110010100111111000010$   
 $MB_3 = 1000011110000110010000000100110001010000101000110111...$

## 4.3 List of variables

CONSTANT-F	a 32-bit parameter which is constant for any given FRAMETYPE input.
DIRECTION	the 1-bit input to both the GEA5 and GIA5 functions indicating the direction of transmission (uplink or downlink).
FRAMETYPE	an 8-bit input to the GEA5 and GIA5 functions indicating the type of frame to be protected.
INPUT	the 32-bit time variant input to the GEA5 function
INPUT-I	the 32-bit time variant input to the GIA5 function
KC128	the 128-bit confidentiality key.
KI128	the 128-bit integrity key.
KS[i]	the <i>i</i> th bit of keystream produced by the keystream generator.
L	the number of 32-bit words of SNOW 3G keystream that are generated by GEA5 (equal to $\text{ceiling}(M/4)$ ).
LENGTH	a 64 bit parameter defined within GIA5 which specifies the number of bits of message to be MAC'd (equal to 8 times M).
M	the input to the GEA5 function which specifies the number of octets of output required (1-65536); also the input to the GIA5 function which specifies the number of octets of message to be MAC'd (1-65536).
MAC	the 32-bit message authentication code (MAC) produced by the integrity function GIA5.
MESSAGE	the input bitstream of LENGTH bits that is to be processed by the GIA5 function.
OUTPUT	the output octets from the GEA5 function.
$S_1, S_2, \dots$	a sequence of 64-bit words derived from MESSAGE and LENGTH which is used within GIA5 to construct the MAC
$z_1, z_2, \dots$	the 32-bit words forming the keystream sequence of SNOW 3G. The word produced first is $z_1$ , the next word $z_2$ and so on.

---

# 5 Confidentiality algorithm GEA5

## 5.1 Introduction

The confidentiality algorithm GEA5 is a stream cipher that encrypts/decrypts blocks of data between 1 and 65536 octets in length.

## 5.2 Inputs and outputs

The inputs to the algorithm are given in Table 5.2.1, the output in Table 5.2.2:

**Table 5.2.1: GEA5 inputs**

Parameter	Size (bits)	Comment
INPUT	32	Frame dependent input INPUT[0]...INPUT[31]
DIRECTION	1	Direction of transmission DIRECTION[0]
FRAMETYPE	8	Input value signifying the type of frame to be protected
KC128	128	Confidentiality key KC128[0]...KC128[127]
M		The number of octets of output required in the range 1 to 65536 inclusive

**Table 5.2.2: GEA5 output**

Parameter	Size (bits)	Comment
OUTPUT	8M	Keystream octets OUTPUT{0}...OUTPUT{M-1}

## 5.3 Components and architecture

# 6 Integrity algorithm GIA5

## 6.1 Introduction

The integrity algorithm GIA5 computes a Message Authentication Code (MAC) on an input message under an integrity key KI128. The message may be between 1 and 65536 octets long.

For ease of implementation the algorithm is based on the same stream cipher (SNOW 3G) [2] as is used by the confidentiality algorithm GEA5.

## 6.2 Inputs and outputs

The inputs to the algorithm are given in table 6.2.1, the output in table 6.2.2:

Table 6.2.1: GIA5 inputs

Parameter	Size (bits)	Comment
INPUT-I	32	Frame dependent input INPUT-I[0]...INPUT-I[31]
M		The length of MESSAGE in octets (1-65536)
MESSAGE	8M	Input octet stream MESSAGE{0}...MESSAGE{M-1}
DIRECTION	1	Direction of transmission DIRECTION[0]
FRAMETYPE	8	Input value signifying the type of frame to be protected
KI128	128	Integrity key KI128[0]...KI128[127]

Table 6.2.2: GIA5 output

Parameter	Size (bits)	Comment
MAC	32	Message authentication code MAC[0]...MAC[31]
