Introduction

The present document is part of a set of standards developed by ETSI that are designed to fit in a modular structure to cover radio equipment within the scope of the Radio Equipment Directive [i.1]. The present document is produced following the guidance in ETSI EG 203 336 [i.2] as applicable.

1 Scope

The present document specifies technical characteristics and methods of measurements for the following equipment:

- Multi-Standard Radio capable Base stations (NR, E-UTRA, UTRA, GSM/EDGE, NB-IoT).

NOTE: UTRA TDD is not included in Release 17 of ETSI EN 301 908.

These radio equipment types are capable of operating in all or any part of the frequency bands given in table 1-1.

The technical requirements of the present document apply under the environmental profile for operation of the equipment, which shall be in accordance with its intended use. The equipment shall comply with all the technical requirements of the present document at all times when operating within the boundary limits of the operational environmental profile defined by its intended use.

4.2 Conformance requirements

4.2.1 Introduction

The requirements in the present document are based on the assumption that the operating band (see table 1-1) is shared between systems of the IMT family (for band 3 and 8 also GSM) or systems having compatible characteristics.

To meet the essential requirement under article 3.2 of Directive 2014/53/EU [i.1] for IMT Base Stations (BSs), a set of essential parameters in addition to those in ETSI EN 301 908-1 [i.4] have been identified. Table 4.2.1-1 provides a cross reference between these essential parameters and the corresponding technical requirements for equipment within the scope of the present document.

The manufacturer shall declare the following:

- The supported capability set(s) according to clause 4.7.1 of ETSI TS 137 141 [1].
- The supported RF configurations according to clause 4.7.2 of ETSI TS 137 141 [1].
- The intended class of the BS under test.
- The NB-IoT parameters according to clauses 4.6.6 and 4.6.7 of ETSI TS 137 141 [1].

The technical requirements in the present document apply for the declared Base Station class and operating band(s) as outlined for each requirement. For a Base Station supporting more than one operating band, conformance testing for each technical requirement in clause 5 shall be performed for each operating band.

NOTE 1: For NB-IoT guard band operation, the NB-IoT edge should be placed at least 200 kHz away from the E-UTRA channel edge, in absence of an agreement between operators using adjacent blocks. NB-IoT guard band operation is only foreseen within E-UTRA channel bandwidths of 10 MHz and higher. This statement is provided for information and does not have any impact on the conformance requirements or essential radio test suites in the present document.

For GSM/EDGE operation of a BS, the requirements according to the applicable multicarrier BTS class apply. The Wide Area BS, Medium Range BS and Local Area BS in the present document correspond to the Wide Area multicarrier BTS, Medium Range multicarrier BTS and Local Area multicarrier BTS respectively in the GSM/EDGE specifications [14].

All technical requirements shall apply with a frequency offset from the lowest and highest carrier frequencies transmitted or received in the specified operating band to the Base Station RF bandwidth edges ($F_{\text{offset, RAT}}$) that is specific for each RAT in each Band Category as defined in clause 4.4 of ETSI TS 137 141 [1].

The technical requirements apply for MSR BS including the MSR BS configurations described in annex B.

For BS capable of multi-band operation (for NR this refers to BS type 1-C with a multi-band connector), the technical requirements in the present document shall apply for each supported operating band unless otherwise stated. For some requirements it is explicitly stated that specific additions or exclusions to the requirement apply for BS capable of multi-band operation. In the case of multiband operation of a BS, single-RAT operation and the corresponding applicability of the requirements for each operating band is determined based on the RAT configuration within only that operating band, unless otherwise stated.

For BS capable of multi-band operation, various structures in terms of combinations of different transmitter and receiver implementations (multi-band or single band) with mapping of transceivers to one or more antenna port(s) in different ways are possible. In the case where multiple bands are mapped on an antenna connector, the exclusions or provisions for multi-band capable BS are applicable to this antenna connector. In the case where a single band is mapped on an antenna connector, the following shall apply:

- Single-band transmitter spurious emissions, operating band unwanted emissions, ACLR, transmitter intermodulation and receiver spurious emissions requirements shall apply to this antenna connector that is mapped to single-band.
- If the BS is configured for single-band operation, single-band requirements shall apply to this antenna connector configured for single-band operation and no exclusions or provisions for multi-band capable BS are applicable. Single-band requirements are tested separately at the antenna connector configured for single-band operation, with all other antenna connectors terminated.

For a band supported by a Base Station where the transmitted carriers are not processed in active RF components together with carriers in any other band, single-band transmitter requirements shall apply. For a band supported by a Base Station where the received carriers are not processed in active RF components together with carriers in any other band, single-band receiver requirements shall apply.

For a BS capable of multi-band operation supporting BC3 bands for TDD, the RF requirements in the present document assume synchronized operation, where no simultaneous uplink and downlink occur between the bands.

For a BS declared to be capable of E-UTRA (and where applicable NR) with NB-IoT in-band operations, the limits for subPRB allocation do not apply.

NOTE 2: For a BS operating in band 20, additional limits for protection of DTT are described in clause 6.6.2.5.4.3 of ETSI TS 137 141 [1]. This statement is provided for information and does not have any impact on the conformance requirements or essential radio test suites in the present document.

NOTE 3: For a BS operating in band 32, 50, 51, 75 and 76, additional limits for protection are described in clause 6.6.2.5.4.6 of ETSI TS 137 141 [1]. This statement is provided for information and does not have any impact on the conformance requirements or essential radio test suites in the present document.

NOTE 4: Additional requirements arising from EC/CEPT spectrum regulatory framework that apply to specific equipment applicable to specific cases in certain countries and/or in certain geographical areas are addressed in ETSI TS 103 807 [i.8].

4.2.2 Operating band unwanted emissions

4.2.2.1 Definition and applicability

Unwanted emissions consist of out-of-band emissions and spurious emissions (Recommendation ITU-R SM.329-12 [i.5]). Out-of-band emissions are emissions immediately outside the channel bandwidth resulting from the modulation process and non-linearity in the transmitter but excluding spurious emissions. Spurious emissions are emissions which are caused by unwanted transmitter effects such as harmonics emission, parasitic emission, intermodulation products and frequency conversion products, but exclude out-of-band emissions. Operating band unwanted emissions cover both out-of-band and spurious domain frequencies.

The Operating band unwanted emission limits are defined from Δf_{OBUE} below the lowest frequency of each supported downlink operating band to the lower Base Station RF bandwidth edge located at $F_{\text{BW RF,low}}$ and from the upper Base Station RF bandwidth edge located at $F_{\text{BW RF,high}}$ up to Δf_{OBUE} above the highest frequency of each supported downlink operating band. In addition, for a BS operating in non-contiguous spectrum, it shall apply inside any sub-block gap. In addition, for a BS operating in multiple bands, it applies inside any Inter RF bandwidth gap. The values of Δf_{OBUE} are defined in table 4.2.2.1-1. For a BS with multi-RAT operation where the individual RATs are in different RAT specific bands that partially or fully overlap; Δf_{OBUE} is according to the combined frequency range occupied by the overlapping bands.

The additional limits in clauses 4.2.2.2.7 and 4.2.2.2.8 also apply further than Δf_{OBUE} from the edges of downlink operating band.

Table 4.2.2.1-1: Maximum offset of OBUE outside the downlink operating band

Operating band characteristics	Δf_{OBUE} [MHz]
$F_{\text{DL,high}} - F_{\text{DL,low}} \leq 200$ MHz	10
$200 \text{ MHz} < F_{\text{DL,high}} - F_{\text{DL,low}} \leq 900$ MHz	40

The requirements shall apply whatever the type of transmitter considered and for all transmission modes foreseen by the manufacturer's specification, except for any operating band with GSM/EDGE single RAT operation. The requirements in ETSI TS 145 005 [5] as defined in clause 4.2.2.2.3 shall apply to an MSR Base Station for any operating band with GSM/EDGE single RAT operation in Band Category 2.

For BS capable of multi-band operation where multiple bands are mapped on separate antenna connectors, the single-band requirements shall apply and the cumulative evaluation of the emission limit in the inter-RF bandwidth gap are not applicable.

4.2.2.2 Limits

4.2.2.2.1 Limits for Band Categories 1 and 3

For a Wide Area BS operating in Band Category 1 or Band Category 3 the requirement shall apply outside the Base Station RF bandwidth edges. In addition, for a Wide Area BS operating in non-contiguous spectrum, it shall apply inside any sub-block gap. In addition, for a Wide Area BS operating in multiple bands, it applies inside any Inter RF bandwidth gap.

For a Medium Range BS operating in Band Category 1 the requirement shall apply outside the Base Station RF bandwidth edges. In addition, for a Medium Range BS operating in non-contiguous spectrum, it shall apply inside any sub-block gap. In addition, for a Medium Range BS operating in multiple bands, it applies inside any Inter RF bandwidth gap.

For a Local Area BS operating in Band Category 1 the requirement shall apply outside the Base Station RF bandwidth edges. In addition, for a Local Area BS operating in non-contiguous spectrum, it shall apply inside any sub-block gap. In addition, for a Local Area BS operating in multiple bands, it applies inside any Inter RF bandwidth gap.

Outside the Base Station RF bandwidth edges, emissions shall not exceed the maximum levels specified in tables 4.2.2.2.1-1 to 4.2.2.2.1-9, where:

- Δf is the separation between the Base Station RF bandwidth edge frequency and the nominal -3 dB point of the measuring filter closest to the carrier frequency.
- f_{offset} is the separation between the Base Station RF bandwidth edge frequency and the centre of the measuring filter.
- $f_{\text{offset}_{\text{max}}}$ is the offset to the frequency Δf_{OBUE} outside the downlink operating band.
- Δf_{max} is equal to $f_{\text{offset}_{\text{max}}}$ minus half of the bandwidth of the measuring filter.

For a BS operating in multiple bands, inside any inter-RF bandwidth gaps with $W_{\text{gap}} < 2 \times \Delta f_{\text{OBUE}}$, emissions shall not exceed the cumulative sum of the test requirements specified at the Base Station RF bandwidth edges on each side of the inter-RF bandwidth gap. The test requirement for Base Station RF bandwidth edge is specified in tables 4.2.2.2.1-1 to 4.2.2.2.1-8, where in this case:

- Δf is the separation between the Base Station RF bandwidth edge frequency and the nominal -3 dB point of the measuring filter closest to the carrier frequency.
- f_{offset} is the separation between the Base Station RF bandwidth edge frequency and the centre of the measuring filter.
- $f_{\text{offset}_{\text{max}}}$ is equal to the Inter RF bandwidth gap minus half of the bandwidth of the measuring filter.
- Δf_{max} is equal to $f_{\text{offset}_{\text{max}}}$ minus half of the bandwidth of the measuring filter.

For BS capable of multi-band operation where multiple bands are mapped on the same antenna connector, the operating band unwanted emission limits also apply in a supported operating band without any carriers transmitted, in the case where there are carriers transmitted in other supported operating band(s). In this case where there is no carrier transmitted in an operating band the operating band unwanted emission limit, as defined in the tables of the present clause for the largest frequency offset (Δf_{max}), of a band where there are no carriers transmitted shall apply from Δf_{OBUE} below the lowest frequency, up to Δf_{OBUE} above the highest frequency of the supported downlink operating band without any carrier transmitted; and no cumulative limits are applied in the inter-band gap between a supported downlink band with carrier(s) transmitted and a downlink band without carrier transmitted.

Inside any sub-block gap for a BS operating in non-contiguous spectrum, emissions shall not exceed the cumulative sum of the test requirements specified for the adjacent sub-blocks on each side of the sub-block gap. The test requirement for each sub-block is specified in tables 4.2.2.2.1-1 to 4.2.2.2.1-9, where in this case:

- Δf is the separation between the sub-block edge frequency and the nominal -3 dB point of the measuring filter closest to the sub-block edge frequency.
- f_{offset} is the separation between the sub-block edge frequency and the centre of the measuring filter.
- $f_{\text{offset}_{\text{max}}}$ is equal to the sub-block gap bandwidth minus half of the bandwidth of the measuring filter.
- Δf_{max} is equal to $f_{\text{offset}_{\text{max}}}$ minus half of the bandwidth of the measuring filter.

Applicability of Wide Area operating band unwanted emission requirements in tables 4.2.2.2.1-1, 4.2.2.2.1-2, 4.2.2.2.1-2B, 4.2.2.2.1-2C and 4.2.2.2.1-2D is specified in table 4.2.2.2.1-0.

NOTE 2: For MSR BS supporting non-contiguous spectrum operation within any operating band, the minimum requirement within sub-block gaps is calculated as a cumulative sum of contributions from adjacent sub-blocks on each side of the sub-block gap.			
NOTE 3: For MSR BS supporting multi-band operation with Inter RF Bandwidth gap $< 2 \times \Delta f_{\text{OBUE}}$ the minimum requirement within the Inter RF Bandwidth gaps is calculated as a cumulative sum of contributions from adjacent sub-blocks or RF Bandwidth on each side of the Inter RF Bandwidth gap.			
NOTE 4: In case the carrier adjacent to the RF bandwidth edge is a standalone NB-IoT carrier, the value of $X = P_{\text{NB-IoTcarrier}} - 24$, where $P_{\text{NB-IoTcarrier}}$ is the power level of the standalone NB-IoT carrier adjacent to the RF bandwidth edge. In other cases, $X = 0$.			

4.2.2.2.2 Limits for Band Category 2

For a BS operating in Band Category 2 the requirement shall apply outside the Base Station RF bandwidth edges. In addition, for a BS operating in non-contiguous spectrum, it shall apply inside any sub-block gap.

Outside the Base Station RF bandwidth edges, emissions shall not exceed the maximum levels specified in tables 4.2.2.2.2-1 to 4.2.2.2.2-8, where:

- Δf is the separation between the Base Station RF bandwidth edge frequency and the nominal -3 dB point of the measuring filter closest to the carrier frequency.
- f_{offset} is the separation between the Base Station RF bandwidth edge frequency and the centre of the measuring filter.
- $f_{\text{offset}_{\text{max}}}$ is the offset to the frequency Δf_{OBUE} outside the downlink operating band.
- Δf_{max} is equal to $f_{\text{offset}_{\text{max}}}$ minus half of the bandwidth of the measuring filter.

For a BS operating in multiple bands, inside any inter-RF bandwidth gaps with $W_{\text{gap}} < 2 \times \Delta f_{\text{OBUE}}$, emissions shall not exceed the cumulative sum of the test requirements specified at the Base Station RF bandwidth edges on each side of the inter-RF bandwidth gap. The test requirement for Base Station RF bandwidth edge is specified in tables 4.2.2.2.2-1 to 4.2.2.2.2-8, where in this case:

- Δf is the separation between the Base Station RF bandwidth edge frequency and the nominal -3 dB point of the measuring filter closest to the carrier frequency.
- f_{offset} is the separation between the Base Station RF bandwidth edge frequency and the centre of the measuring filter.
- $f_{\text{offset}_{\text{max}}}$ is equal to the Inter RF bandwidth gap minus half of the bandwidth of the measuring filter.
- Δf_{max} is equal to $f_{\text{offset}_{\text{max}}}$ minus half of the bandwidth of the measuring filter.

For a BS capable of multi-band operation where multiple bands are mapped on the same antenna connector and where there is no carrier transmitted in an operating band, the operating band unwanted emission limit, as defined in the tables of the present clause for the largest frequency offset (Δf_{\max}), of a band where there are no carriers transmitted shall apply from Δf_{OBUE} below the lowest frequency, up to Δf_{OBUE} above the highest frequency of the supported downlink operating band without any carrier transmitted; and no cumulative limits are applied in the inter-band gap between a supported downlink band with carrier(s) transmitted and a supported downlink band without any carrier transmitted.

Inside any sub-block gap for a BS operating in non-contiguous spectrum, emissions shall not exceed the cumulative sum of the test requirement specified for the adjacent sub-blocks on each side of the sub-block gap. The test requirement for each sub-block is specified in tables 4.2.2.2.2-1 to 4.2.2.2.2-8, where in this case:

- Δf is the separation between the sub-block edge frequency and the nominal -3 dB point of the measuring filter closest to the sub-block edge.
- f_{offset} is the separation between the sub-block edge frequency and the centre of the measuring filter.
- $f_{\text{offset}_{\max}}$ is equal to the sub-block gap bandwidth minus half of the bandwidth of the measuring filter.
- Δf_{\max} is equal to $f_{\text{offset}_{\max}}$ minus half of the bandwidth of the measuring filter.

Applicability of Wide Area operating band unwanted emission requirements in tables 4.2.2.2.2-1, 4.2.2.2.2-2A and 4.2.2.2.2-2B is specified in table 4.2.2.2.2-0.

4.2.2.3 Conformance

Conformance tests described in clause 5.3.1 shall be carried out.

4.2.3 Adjacent Channel Leakage power Ratio (ACLR)

4.2.3.1 Definition and applicability

Unwanted emissions consist of out-of-band emissions and spurious emissions (Recommendation ITU-R SM.329-12 [i.5]). Out-of-band emissions are emissions immediately outside the channel bandwidth resulting from the modulation process and non-linearity in the transmitter but excluding spurious emissions. The out-of-band emissions requirement for the BS transmitter is specified both in terms of Adjacent Channel Leakage power Ratio (ACLR) and Operating band unwanted emissions.

Adjacent Channel Leakage power Ratio (ACLR) is the ratio of the filtered mean power centred on the assigned channel frequency to the filtered mean power centred on an adjacent channel frequency.

4.2.3.2 Limits

4.2.3.2.1 E-UTRA limits

For E-UTRA, the limits are specified in tables 4.2.3.2.1-1 and 4.2.3.2.1-2, and shall apply outside the Base Station RF bandwidth or Maximum Radio Bandwidth.

In addition, inside any frequency gap with a gap size $W_{\text{gap}} \geq 15$ MHz and $W_{\text{gap}} \geq 20$ MHz for a BS operating in non-contiguous spectrum, the ACLR test requirement for the first and second adjacent channels, respectively, in tables 4.2.3.2.1-3 and 4.2.3.2.1-4 shall apply.

For a BS operating in non-contiguous spectrum the CACLR test requirement in clause 4.2.3.2.4 applies in sub-block gaps for the frequency ranges defined in table 4.2.3.2.4-1.

For a BS operating in multiple bands, where multiple bands are mapped on the same antenna connector, the CACLR requirement in clause 4.2.3.2.4 applies in inter-RF bandwidth gaps for the frequency ranges defined in table 4.2.3.2.4-1.

The requirement applies during the transmitter on period.

The ACLR is defined with a square filter of bandwidth equal to the transmission bandwidth configuration of the transmitted signal (BW_{Config}) centred on the assigned channel frequency and a filter centred on the adjacent channel frequency according to tables 4.2.3.2.1-1 to 4.2.3.2.1-4.

For Wide Area BS, either the ACLR limits in tables 4.2.3.2.1-1 to 4.2.3.2.1-4 or the absolute limit of -15 dBm/MHz shall apply, whichever is less stringent.

For Medium Range BS, either the ACLR limits in tables 4.2.3.2.1-1 to 4.2.3.2.1-4 or the absolute limit of -25 dBm/MHz shall apply, whichever is less stringent.

For Local Area BS, either the ACLR limits in tables 4.2.3.2.1-1 to 4.2.3.2.1-4 or the absolute limit of -32 dBm/MHz shall apply, whichever is less stringent.

For operation in paired spectrum, the ACLR shall be higher than the value specified in table 4.2.3.2.1-1.

Table 4.2.3.2.1-1: Base Station ACLR in paired spectrum

NOTE 2: The RRC filter shall be equivalent to the transmit pulse shape filter defined in ETSI TS 125 104 [2], with a chip rate as defined in this table.				

For operation in unpaired spectrum, the ACLR shall be higher than the value specified in table 4.2.3.2.1-2.

4.2.3.3 Conformance

Conformance tests described in clause 5.3.2 shall be carried out.

4.2.4 Transmitter spurious emissions

4.2.4.1 Definition and applicability

Unwanted emissions consist of out-of-band emissions and spurious emissions (Recommendation ITU-R SM.329-12 [i.5]). Spurious emissions are emissions that are caused by unwanted transmitter effects such as harmonics emission, parasitic emission, intermodulation products and frequency conversion products, but exclude out-of-band emissions. This is measured at the Base Station antenna connector.

The transmitter spurious emission limits shall apply from 9 kHz to 12,75 GHz, excluding the frequency range from Δf_{OBUE} below the lowest frequency of the downlink operating band up to Δf_{OBUE} above the highest frequency of the downlink operating band. For BS capable of multi-band operation where multiple bands are mapped on the same antenna connector, this exclusion shall apply for each supported operating band. For BS capable of multi-band operation where multiple bands are mapped on separate antenna connectors, the single-band requirements shall apply, and the multi-band exclusions and provisions are not applicable. For some operating bands the upper frequency limit is higher than 12,75 GHz. The values of Δf_{OBUE} are defined in table 4.2.2.1-1.

The requirements shall apply whatever the type of transmitter considered. It shall apply for all transmission modes foreseen by the manufacturer's specification. Unless otherwise stated, all requirements are measured as mean power (RMS).

4.2.4.2 Limits

NOTE 3: This spurious frequency range shall apply only for <i>operating bands</i> for which the 5 th harmonic of the upper frequency edge of the DL operating band is reaching beyond 12,75 GHz.

NOTE 1: Where the table has two entries for the same or overlapping frequency ranges, both limits shall be applied.				
NOTE 2: As set out in the definition in clause 4.2.4.1, except for the cases where the noted requirements apply to a BS operating in band 28, the co-existence requirements in this table shall not apply for the 10 MHz frequency range immediately outside the downlink operating band (see table 1-1). This is also the case when the downlink operating band is adjacent to the band for the protected system in the table.				
NOTE 3: The co-existence requirement is specified for the full frequency range defined for band 32 in ETSI TS 137 141 [1].				

4.2.4.2.4 Protection of the BS receiver of own or different BS

This requirement shall be applied for FDD operation in order to prevent the receivers of the Base Stations being desensitized by emissions from the BS transmitter. It is measured at the transmit antenna port for any type of BS which has common or separate Tx/Rx antenna ports.

The power of any spurious emission shall not exceed the limits in table 4.2.4.2.4-1.

Table 4.2.4.2.4-1: BS Spurious emissions limits for protection of the BS receiver

NOTE 1: F_{UL_low} and F_{UL_high} are the lowest and highest frequency of the BS uplink operating band respectively.				
NOTE 2: This requirement shall only apply in the uplink frequency range where the BS receiver is allowed to operate according to table 1-1.				

4.2.4.3 Conformance

Conformance tests described in clause 5.3.3 shall be carried out.

4.2.5 Base station output power

4.2.5.1 Definition and applicability

Output power of the Base Station is the mean power delivered to a load with resistance equal to the nominal load impedance of the transmitter.

The configured carrier power is the target maximum power for a specific carrier for the operating mode set in the BS within the limits given by the manufacturer's declaration.

This is an output power accuracy requirement defined at the antenna connector during the transmitter ON period for a specific carrier in a specified reference condition.

For BS operating from 2 390 MHz to 2 400 MHz there is an additional requirement on the maximum output power.

4.2.5.2 Limits

In normal conditions, the maximum carrier output power shall for UTRA, E-UTRA and NR remain:

- within +2,7 dB and -2,7 dB of the manufacturer's rated carrier output power for carrier frequency $f \leq 3,0$ GHz;
- within +3,0 dB and -3,0 dB of the manufacturer's rated output power for carrier frequency $3,0 \text{ GHz} < f \leq 4,2 \text{ GHz}$;

and for GSM/EDGE and NB-IoT remain within +3,0 dB and -3,0 dB of the manufacturer's rated carrier output power.

In extreme conditions, maximum carrier output power shall for UTRA, E-UTRA and NR remain:

- within +3,2 dB and -3,2 dB of the manufacturer's rated carrier output power for carrier frequency $f \leq 3,0$ GHz;
- within +3,5 dB and -3,5 dB of the manufacturer's rated output power for carrier frequency $3,0 \text{ GHz} < f \leq 4,2 \text{ GHz}$;

and for GSM/EDGE and NB-IoT remain within +3,5 dB and -3,5 dB of the manufacturer's rated carrier output power.

In addition, for BS operating from 2 390 MHz to 2 400 MHz, the maximum carrier output power ($P_{\text{max, c, AC}}$) shall not exceed:

- 28 dBm/(5 MHz) for Wide Area BS
- 34 dBm/(5 MHz) for Medium Range BS
- 43 dBm/(5 MHz) for Local Area BS
- 45 dBm/(5 MHz) for Home BS

This limit is derived from [i.21] assuming a 17 dBi maximum antenna gain for Wide Area BS, an 11 dBi maximum antenna gain for Medium Range BS, a 2 dBi maximum antenna gain for Local Area BS, a 0 dBi maximum antenna gain for Home BS. All limits are derived assuming one antenna connector.

4.2.5.3 Conformance

Conformance tests described in clause 5.3.4 shall be carried out.

4.2.6 Transmit intermodulation

4.2.6.1 Definition and applicability

The transmitter intermodulation requirement is a measure of the capability of the transmitter to inhibit the generation of signals in its nonlinear elements caused by the presence of the wanted signal and an interfering signal reaching the transmitter via the antenna. The requirement shall apply during the transmitter ON period and the transmitter transient period.

The transmitter intermodulation level is the power of the intermodulation products when an interfering signal is injected into the antenna connector.

For BS capable of multi-band operation where multiple bands are mapped on separate antenna connectors, the single-band requirements shall apply regardless of the interfering signals position relative to the Inter RF bandwidth gap.

4.2.6.2 Limits

4.2.6.2.1 General limits

In the frequency range relevant for this test, the transmitter intermodulation level shall not exceed the unwanted emission limits in clauses 4.2.2.2, 4.2.3.2 and 4.2.4.2 in the presence of a wanted signal and an interfering signal according to table 4.2.6.2.1-1 for BS operation in BC1, BC2 and BC3. The measurement are limited to the frequency ranges of all third- and fifth-order intermodulation products, considering the width of these products and excluding the bandwidths of the wanted and interfering signals.

The requirement shall apply outside the Base Station RF bandwidth or Maximum Radio Bandwidth. The interfering signal offset is defined relative to the Base Station RF bandwidth edges or Maximum Radio Bandwidth edges.

For BS operating in non-contiguous spectrum, the requirement is also applicable inside a sub-block gap for interfering signal offsets where the interfering signal falls completely within the sub-block gap. The interfering signal offset is defined relative to the sub-block edges.

For BS capable of multi-band operation, the requirement shall apply relative to the Base Station RF bandwidth edges of each operating band. In case the Inter RF bandwidth gap is less than 15 MHz, the requirement in the gap shall apply only for interfering signal offsets where the interfering signal falls completely within the Inter RF bandwidth gap.

Table 4.2.6.2.1-1: Interfering signals for the Transmitter intermodulation requirement

Parameter	Value
Interfering signal type	E-UTRA signal of channel bandwidth 5 MHz
Interfering signal level	Mean power level 30 dB below the mean power of the wanted signal
Interfering signal centre frequency offset from edge of the Base Station RF bandwidth	2,5 MHz for modulated interferer 7,5 MHz for modulated interferer 12,5 MHz for modulated interferer
NOTE:	Interfering signal positions that are partially or completely outside of the downlink operating band of the Base Station are excluded from the requirement, unless the interfering signal positions fall within the frequency range of adjacent downlink operating bands listed in table 1-1. In case that none of the interfering signal positions fall completely within the frequency range of the downlink operating band, the test suite in clause 5.3.5 provides further guidance.

4.2.6.2.2 Additional limits (BC1 and BC2)

In the frequency range relevant for this test, the transmitter intermodulation level shall not exceed the unwanted emission limits in clauses 4.2.2.2, 4.2.3.2 and 4.2.4.2 in the presence of a wanted signal and an interfering signal according to table 4.2.6.2.2-1 for BS operation in BC2. The measurement are limited to the frequency ranges of all third and fifth order intermodulation products, considering the width of these products and excluding the bandwidths of the wanted and interfering signals.

The requirement shall apply outside of the Base Station RF bandwidth or Maximum Radio Bandwidth for BC2. The interfering signal offset is defined relative to the Base Station RF bandwidth edges or Maximum Radio Bandwidth edges.

For BS operating in non-contiguous spectrum in BC1 or BC2, the requirement is also applicable inside a sub-block gap larger than or equal to two times the interfering signal centre frequency offset. For BS operating in non-contiguous spectrum in BC1, the requirement is not applicable inside a sub-block gap with a gap size equal or larger than 5 MHz. The interfering signal offset is defined relative to the sub-block edges.

For BS capable of multi-band operation, the requirement shall apply relative to the Base Station RF bandwidth edges of a BC2 operating band. The requirement is also applicable for BC1 and BC2 inside an Inter RF bandwidth gap equal to or larger than two times the interfering signal centre frequency offset. For BS capable of multi-band operation, the requirement is not applicable for BC1 band inside an Inter RF bandwidth gap with a gap size equal to or larger than 5 MHz.

Table 4.2.6.2.2-1: Interfering signal for the Transmitter intermodulation requirement (BC2)

Parameter	Value
Interfering signal type	CW
Interfering signal level	Mean power level 30 dB below the mean power of the wanted signal
Interfering signal centre frequency offset from edge of the Base Station RF bandwidth	> 800 kHz for CW interferer
NOTE: Interfering signal positions that are partially or completely outside of the downlink operating band of the Base Station are excluded from the requirement.	

4.2.6.2.3 Void

4.2.6.3 Conformance

Conformance tests described in clause 5.3.5 shall be carried out.

4.2.7 Receiver spurious emissions

4.2.7.1 Definition and applicability

The receiver spurious emissions power is the power of emissions generated or amplified in a receiver that appear at the BS receiver antenna connector. The requirements shall apply to all BS with separate RX and TX antenna ports. In this case for FDD BS the test shall be performed when both TX and RX are on, with the TX port terminated.

For TDD BS with common RX and TX antenna port the requirement shall apply during the Transmitter OFF period. For FDD BS with common RX and TX antenna port the transmitter spurious emission limits as specified in clause 4.2.4 are valid.

For BS capable of multi-band operation where multiple bands are mapped on separate antenna connectors, the single-band requirements shall apply and the excluded frequency range is only applicable for the operating band supported on each antenna connector.

Unless otherwise stated, a BS declared to be capable of E-UTRA with NB-IoT in-band and guard band operations (or any combination with GSM and/or UTRA and/or NR) is only required to pass the receiver spurious emissions tests for E-UTRA with guard band operation (or any combination with GSM and/or UTRA and/or NR). It is not required to perform the receiver spurious emissions tests again for E-UTRA with in-band operation (or any combination with GSM and/or UTRA and/or NR).

4.2.7.2 Limits

4.2.7.2.1 General limits

The power of any spurious emission shall not exceed the levels in table 4.2.7.2.1-1.

In addition to the requirements in table 4.2.7.2.1-1, the power of any spurious emission shall not exceed the limits specified in clauses 4.2.4.2.3 and 4.2.4.2.4.

Table 4.2.7.2.1-1: General spurious emission test requirement

Frequency range	Maximum level	Measurement Bandwidth	Note
30 MHz to 1 GHz	-57 dBm	100 kHz	
1 GHz to 12,75 GHz	-47 dBm	1 MHz	
12,75 GHz to 5 th harmonic of the upper frequency edge of the downlink operating band	-47 dBm	1 MHz	This spurious frequency range shall apply only for <i>operating bands</i> for which the 5 th harmonic of the upper frequency edge of the UL <i>operating band</i> is reaching beyond 12,75 GHz.
NOTE: The frequency range from $F_{\text{BW RF,DL,low}} - \Delta f_{\text{OBUE}}$ to $F_{\text{BW RF,DL,high}} + \Delta f_{\text{OBUE}}$ may be excluded from the requirement. For BS capable of multi-band operation, the exclusion shall apply for all supported operating bands. For BS capable of multi-band operation where multiple bands are mapped on separate antenna connectors, the single-band requirements shall apply and the excluded frequency range is only applicable for the operating band supported on each antenna connector.			

4.2.7.2.2 Additional limits for BC2

For a BS operating in Band Category 2 when GSM/EDGE is configured, the power of any spurious emissions shall not exceed the limits in table 4.2.7.2.2-1.

For BS capable of multi-band operation, the limits in table 4.2.7.2.2-1 are only applicable when all supported operating bands belong to BC2 and GSM/EDGE is configured in all bands.

Table 4.2.7.2.2-1: Additional BS spurious emissions limits for BC2

Frequency range	Frequency offset from transmitter operating band edge (see note)	Maximum level	Measurement Bandwidth

	≥ 30 MHz	-57 dBm	3 MHz
1 GHz to 12,75 GHz	≥ 30 MHz	-47 dBm	3 MHz
NOTE: For BS capable of multi-band operation, the frequency offset is relative to the closest supported operating band.			

4.2.7.3 Conformance

Conformance tests described in clause 5.3.6 shall be carried out.

4.2.8 In-band blocking

4.2.8.1 Definition and applicability

The in-band blocking characteristics is a measure of the receiver ability to receive a wanted signal at its assigned channel in the presence of an unwanted interferer inside the operating band.

The in-band blocking requirement applies from $F_{\text{UL,low}} - \Delta f_{\text{OoB}}$ to $F_{\text{UL,high}} + \Delta f_{\text{OoB}}$, excluding the downlink frequency range of the FDD *operating band*. The values of Δf_{OoB} are defined in table 4.2.8.1-1. For a BS with multi-RAT operation where the individual RATs are in different RAT specific bands that partially or fully overlap; Δf_{OoB} is according to the combined frequency range occupied by the overlapping bands.

Table 4.2.8.1-1: Maximum Δf_{OoB} offset outside the uplink operating band

Operating band characteristics	Δf_{OoB} [MHz]
$200 \text{ MHz} \geq F_{\text{UL,high}} - F_{\text{UL,low}}$	20
$200 \text{ MHz} < F_{\text{UL,high}} - F_{\text{UL,low}} \leq 900 \text{ MHz}$	60

Unless otherwise stated, a BS declared to be capable of E-UTRA with NB-IoT in-band and guard band operations (or any combination with GSM and/or UTRA and/or NR) is only required to pass the in-band blocking tests for E-UTRA with guard band operation (or any combination with GSM and/or UTRA and/or NR). It is not required to perform the in-band selectivity and blocking receiver tests again for E-UTRA with in-band operation (or any combination with GSM and/or UTRA and/or NR).

Conformance tests described in clause 5.3.7 shall be carried out.

4.2.9 Out-of-band blocking

4.2.9.1 Definition and applicability

The Out-of-band blocking characteristic is a measure of the receiver's ability to receive a wanted signal at its assigned channel in the presence of an unwanted interferer outside the uplink operating band.

Table 4.2.9.2-1: Out-of-band blocking performance requirement

Interfering signal mean power [dBm]	Wanted signal mean power [dBm]	Type of interfering signal
-15 (note 2)	$P_{REFSENS} + x\text{dB}$ (note 1)	CW carrier
NOTE 1: $P_{REFSENS}$ depends on the RAT, the BS class and the channel bandwidth, see clause 4.2.12. "x" is equal to 6 in case of NR, E-UTRA, UTRA or NB-IoT wanted signals and equal to 3 in case of GSM/EDGE wanted signal.

In addition, each group of exceptions shall not exceed three contiguous measurements using a 1 MHz step size.		

4.2.9.3 Conformance

Conformance tests described in clause 5.3.8 shall be carried out.

4.2.10 Receiver intermodulation characteristics

4.2.10.1 Definition and applicability

Third and higher order mixing of the two interfering RF signals can produce an interfering signal in the band of the desired channel. Intermodulation response rejection is a measure of the capability of the receiver to receive a wanted signal on its assigned channel frequency in the presence of two interfering signals which have a specific frequency relationship to the wanted signal.

Unless otherwise stated, a BS declared to be capable of E-UTRA with NB-IoT in-band and guard band operations (or any combination with GSM and/or UTRA and/or NR) is only required to pass the receiver intermodulation tests for E-UTRA with guard band operation (or any combination with GSM and/or UTRA and/or NR). It is not required to perform the receiver intermodulation tests again for E-UTRA with in-band operation (or any combination with GSM and/or UTRA and/or NR).

4.2.10.2 Limits

4.2.10.2.1 General intermodulation limits

Interfering signals shall be a CW signal and an E-UTRA or UTRA signal, as specified in annex A of ETSI TS 137 141 [1].

The requirement shall apply outside the Base Station RF bandwidth or Maximum Radio Bandwidth. The interfering signal offset is defined relative to the Base Station RF bandwidth edges or Maximum Radio Bandwidth edges.

For BS capable of multi-band operation, the requirement shall apply in addition inside any Inter RF bandwidth gap, in case the gap size is at least twice as wide as the UTRA/E-UTRA interfering signal centre frequency offset from the Base Station RF bandwidth edge. The interfering signal offset is defined relative to the Base Station RF bandwidth edges inside the Inter RF bandwidth gap.

For the wanted signal at the assigned channel frequency and two interfering signals coupled to the Base Station antenna input, using the parameters in tables 4.2.10.2.1-1 and 4.2.10.2.1-2, the following requirements shall be met:

- For any measured E-UTRA carrier, the throughput shall be ≥ 95 % of the maximum throughput of the reference measurement channel defined in ETSI TS 136 104 [4], clause 7.2.
- For any measured UTRA FDD carrier, the BER shall not exceed 0,001 for the reference measurement channel defined in ETSI TS 125 104 [2], clause 7.2.
- For any measured GSM/EDGE carrier, the conditions in ETSI TS 145 005 [5], clause P.2.2 shall apply.
- For any measured NB-IoT carrier (standalone or operating in E-UTRA in-band/guard band), the throughput shall be ≥ 95 % of the maximum throughput of the reference measurement channel defined in ETSI TS 136 104 [4], clause 7.2.

NOTE 1: P_{REFSENS} depends on the RAT, the BS class and on the channel bandwidth, see clause 7.2 in ETSI TS 137 141 [1]. For E-UTRA channel bandwidths 10, 15 and 20 MHz this requirement shall apply only for a FRC A1-3 mapped to the frequency range at the channel edge adjacent to the interfering signals.			
NOTE 2: For WA BS supporting GSM and/or UTRA, "x" is equal to 6 in case of NR, E-UTRA, UTRA or NB-IoT wanted signals and equal to 3 in case of GSM/EDGE wanted signal.			
NOTE 3: For MR supporting GSM and/or UTRA, "x" is equal to 6 in case of UTRA wanted signals, 9 in case of NR, E-UTRA or NB-IoT wanted signal and equal to 3 in case of GSM/EDGE wanted signal.			
NOTE 4: For LA supporting GSM and/or UTRA, "x" is equal to 12 in case of NR, E-UTRA or NB-IoT wanted signals, 6 in case of UTRA wanted signal and equal to 3 in case of GSM/EDGE wanted signal.			
NOTE 5: For a BS neither supporting GSM nor UTRA, "x" is equal to 6 for all BS classes if NR is supported, otherwise "x" is equal to 6 for WA BS or, 9 for MR BS and 12 for LA BS if NR is not supported.			
NOTE 6: For a BS supporting NR but neither UTRA nor GSM; "y" is equal to -4 for the WA BS class, -3 for the MR BS class and -6 for the LA BS class. For all other cases, "y" is equal to zero for all BS classes.

For BS capable of multi-band operation, the requirement shall apply in addition inside any Inter RF bandwidth gap in case the gap size is at least as wide as the E-UTRA interfering signal in table 4.2.10.2.2-2. The interfering signal offset is defined relative to the Base Station RF bandwidth edges inside the Inter RF bandwidth gap.

For the wanted signal at the assigned channel frequency and two interfering signals coupled to the Base Station antenna input, using the parameters in tables 4.2.10.2.2-1 and 4.2.10.2.2-2, the following requirements shall be met:

4.2.11 Narrowband blocking

4.2.11.1 Definition and applicability

The narrowband blocking characteristics is a measure of the receiver ability to receive a wanted signal at its assigned channel in the presence of an unwanted interferer inside the operating band in the adjacent channel.

Unless otherwise stated, a BS declared to be capable of E-UTRA with NB-IoT in-band and guard band operations (or any combination with GSM and/or UTRA and/or NR) is only required to pass the narrowband blocking tests for E-UTRA with guard band operation (or any combination with GSM and/or UTRA and/or NR). It is not required to perform the in-band selectivity and blocking receiver tests again for E-UTRA with in-band operation (or any combination with GSM and/or UTRA and/or NR).

4.2.11.2 Limits

4.2.11.2.1 General limits

For the narrowband blocking requirement, the interfering signal shall be an E-UTRA 1RB signal as specified in clause A.3 of ETSI TS 137 141 [1].

For BS operating in non-contiguous spectrum, the requirement shall apply in addition inside any sub-block gap, in case the sub-block gap size is at least 3 MHz. The interfering signal offset is defined relative to the sub-block edges inside the sub-block gap.

For BS capable of multi-band operation, the requirement shall apply in addition inside any Inter RF bandwidth gap in case the gap size is at least 3 MHz. The interfering signal offset is defined relative to the Base Station RF bandwidth edges inside the Inter RF bandwidth gap.

For the wanted and interfering signal coupled to the Base Station antenna input, using the parameters in table 4.2.11.2.1-1 the following requirements shall be met:

- For any measured E-UTRA carrier, the throughput shall be ≥ 95 % of the maximum throughput of the reference measurement channel defined in ETSI TS 136 104 [4], clause 7.2.

- For any measured NB-IoT carrier (operating in NR in-band), the throughput shall be ≥ 95 % of the maximum throughput of the reference measurement channel defined in ETSI TS 138 104 [16], clause 7.2.
- For any measured NR carrier, the throughput shall be ≥ 95 % of the maximum throughput of the reference measurement channel defined in ETSI TS 138 104 [16], clause 7.2.

5.3 Essential radio test suites

5.3.0 Introduction

This clause describes the test suites for MSR Base Stations.

The test configurations that shall be used for demonstrating conformance are specified in clause 5 of ETSI TS 137 141 [1]. Test configurations shall apply according to the declared RAT Capability Set (CS) of the Base Station and the Band Category of the declared operating band (BC1, BC2 or BC3). Transmitter test signals and test models, as defined in clause 4.9.2 of ETSI TS 137 141 [1], shall be used.

Many tests in the present document are performed with the maximum Base Station RF bandwidth located at the bottom, middle and top of the supported frequency range in the operating band. These are denoted as B_{RFBW} (bottom), M_{RFBW} (middle) and T_{RFBW} (top) for single band testing and $B_{\text{RFBW}}-T'_{\text{RFBW}}$ and $B'_{\text{RFBW}}-T_{\text{RFBW}}$ for multi-band testing, and are defined in clause 4.9.1 of ETSI TS 137 141 [1].

The measurement system required for each test is presented for information in ETSI TS 137 141 [1], annex D.

Unless otherwise stated, a BS declared to be capable of E-UTRA with NB-IoT in-band or guard band operations (or any combination with GSM and/or UTRA) is only required to pass the transmitter and receiver tests for E-UTRA with NB-IoT in-band or guard band (or any combination with GSM and/or UTRA); it is not required to perform the transmitter tests again for E-UTRA only (or any combination with GSM and/or UTRA).

Unless otherwise stated, a BS declared to be capable of E-UTRA with NB-IoT in-band and guard band operations (or any combination with GSM and/or UTRA) needs only to pass the transmitter tests for E-UTRA with guard band operation (or any combination with GSM and/or UTRA).

Unless otherwise stated, a BS declared to be capable of NB-IoT operation in NR in-band (or any combination with GSM and/or UTRA or E-UTRA) is only required to pass the transmitter tests for NB-IoT operation in NR in-band (or any combination with GSM and/or UTRA or E-UTRA); it is not required to perform the transmitter tests again for NR only (or any combination with GSM and/or UTRA or E-UTRA).

NB-IoT testing shall be performed with the NB-IoT signal located as described in clause 4.7.3 of ETSI TS 136 141 [11].

- 2) Step the centre frequency of the measurement filter in contiguous steps and measure the emission within the specified frequency ranges with the specified measurement bandwidth. For BS operating in multiple bands or non-contiguous spectrum, the emission within the Inter RF Bandwidth or sub-block gap shall be measured using the specified measurement bandwidth from the closest RF Bandwidth or sub-block edge.
- 3) Repeat the test for the remaining test cases with channel set-up according to clauses 5 and 4.9.2 of ETSI TS 137 141 [1].

Annex B (normative): Base Station configurations

B.1 Reception with multiple receiver antenna connectors and receiver diversity

For the tests in clause 5, the requirement shall apply at each receiver antenna connector for receivers with antenna diversity or in the case of multi-carrier reception with multiple receiver antenna connectors.

Receiver requirements are tested at the antenna connector, with the remaining receiver(s) disabled or their antenna connector(s) being terminated. If the manufacturer has declared the receiver paths to be equivalent, it is sufficient to apply the specified test signal at any one of the receiver antenna connectors.

For a multi-band BS, multi-band tests for blocking and intermodulation are performed with the interferer(s) applied to each antenna connector mapped to the receiver for the wanted signal(s), however only to one antenna at a time. Antenna connectors to which no signals are applied are terminated.

B.2 Duplexers

The requirements of the present document shall be met with a duplexer fitted, if a duplexer is supplied as part of the BS.

B.3 Power supply options

If the BS is supplied with a number of different power supply configurations, it may not be necessary to test RF parameters for each of the power supply options, provided that it can be demonstrated that the range of conditions over which the equipment is tested is at least as great as the range of conditions due to any of the power supply configurations.

This shall apply particularly if a BS contains a DC rail which can be supplied either externally or from an internal mains power supply. In this case, the conditions of extreme power supply for the mains power supply options can be tested by testing only the external DC supply option. The range of DC input voltages for the test should be sufficient to verify the performance with any of the power supplies, over its range of operating conditions within the BS, including variation of mains input voltage, temperature and output current.

B.4 Ancillary RF amplifiers

The requirements of the present document shall be met with the ancillary RF amplifier fitted, if an ancillary amplifier is part of the base station. At tests according to clause 5, the ancillary amplifier is connected to the BS by a connecting network (including any cable(s), attenuator(s), etc.) with applicable loss to make sure the appropriate operating conditions of the ancillary amplifier and the BS. The applicable connecting network loss range is declared by the manufacturer. Other characteristics and the temperature dependence of the attenuation of the connecting network are neglected. The actual attenuation value of the connecting network is chosen for each test as one of the applicable extreme values. The lowest value is used unless otherwise stated.

Sufficient tests should be repeated with the ancillary amplifier fitted and, if it is optional, without the ancillary RF amplifier to verify that the BS meets the requirements of the present document in both cases.

When testing, the following tests shall be repeated with the optional ancillary amplifier fitted according to table B.4-1, where X denotes that the test shall apply.

Table B.4-1: Tests applicable to Ancillary RF Amplifiers

	Clause	TX amplifier only	RX amplifier only	TX/RX amplifiers combined (see note)
Receiver Tests	5.3.6		X	X
	5.3.7		X	X
	5.3.8		X	X
	5.3.9		X	
	5.3.11		X	X
Transmitter Tests	5.3.1	X		X
	5.3.2	X		X
	5.3.3	X		X
	5.3.4	X		X
	5.3.5	X		X
NOTE: Combining can be by duplex filters or any other network. The amplifiers can either be in RX or TX branch or in both. Either one of these amplifiers could be a passive network.				

In the test, according to clause 5.3.4, the highest applicable attenuation value is applied.

B.5 BS using antenna arrays

B.5.0 General

A BS may be configured with a multiple antenna port connection for some or all of its transceivers or with an antenna array related to one cell (not one array per transceiver). This clause shall apply to a BS which meets at least one of the following conditions:

- the transmitter output signals from one or more transceiver appear at more than one antenna port; or
- there is more than one receiver antenna port for a transceiver or per cell and an input signal is required at more than one port for the correct operation of the receiver thus the outputs from the transmitters as well as the inputs to the receivers are directly connected to several antennas (known as "air combining"); or
- transmitters and receivers are connected via duplexers to more than one antenna.

In case of diversity or spatial multiplexing, multiple antennas are not considered as an antenna array.

If a BS is used, in normal operation, in conjunction with an antenna system which contains filters or active elements which are necessary to meet the E-UTRA requirements, the conformance tests may be performed on a system comprising the BS together with these elements, supplied separately for the purposes of testing. In this case, it shall be demonstrated that the performance of the configuration under test is representative of the system in normal operation, and the conformance assessment is only applicable when the BS is used with the antenna system.

For conformance testing of such a BS, the following procedure may be used.

B.5.1 Receiver tests

For each test, the test signals applied to the receiver antenna connectors shall be such that the sum of the powers of the signals applied equals the power of the test signal(s) specified in the test.

An example of a suitable test configuration is shown in figure B.5.1-1.

Figure B.5.1-1: Receiver test set-up

For spurious emissions from the receiver antenna connector, the test may be performed separately for each receiver antenna connector.

B.5.2 Transmitter tests

For each test, the test signals applied to the transmitter antenna connectors (P_i) shall be such that the sum of the powers of the signals applied equals the power of the test signal(s) (P_s) specified in the test. This may be assessed by separately measuring the signals emitted by each antenna connector and summing the results, or by combining the signals and performing a single measurement. The characteristics (e.g. amplitude and phase) of the combining network should be such that the power of the combined signal is maximized.

An example of a suitable test configuration is shown in figure B.5.2-1.

Figure B.5.2-1: Transmitter test set-up

For Intermodulation attenuation, the test may be performed separately for each transmitter antenna connector.

B.6 Transmission with multiple transmitter antenna connectors

Unless otherwise stated, for the tests in clause 5, the requirement shall apply for each transmitter antenna connector in case of transmission with multiple transmitter antenna connectors.

Transmitter requirements are tested at the antenna connector, with the remaining antenna connector(s) being terminated. If the manufacturer has declared the transmitter paths to be equivalent, it is sufficient to measure the signal at any one of the transmitter antenna connectors.

B.7 BS with integrated Iuant BS modem

Unless otherwise stated, for the tests in the present document, the integrated Iuant BS modem shall be switched off. Spurious emissions according to clauses 5.3.3 and 5.3.6 shall be measured only for frequencies above 20 MHz with the integrated Iuant BS modem switched on.

Annex C (informative): Maximum measurement uncertainty

The measurements described in the present document are based on the following assumptions:

- the measured value related to the corresponding limit is used to decide whether an equipment meets the requirements of the present document;
- the value of the measurement uncertainty for the measurement of each parameter is included in the test report.
