Intellectual Property Rights

Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The declarations pertaining to these essential IPRs, if any, are publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<https://ipr.etsi.org/>).

Pursuant to the ETSI Directives including the ETSI IPR Policy, no investigation regarding the essentiality of IPRs, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

DECT™, PLUGTESTS™, UMTS™ and the ETSI logo are trademarks of ETSI registered for the benefit of its Members. **3GPP™** and **LTE™** are trademarks of ETSI registered for the benefit of its Members and of the 3GPP Organizational Partners. **oneM2M™** logo is a trademark of ETSI registered for the benefit of its Members and of the oneM2M Partners. **GSM®** and the GSM logo are trademarks registered and owned by the GSM Association.

Foreword

This Group Report (GR) has been produced by ETSI Industry Specification Group (ISG) cross-cutting Context Information Management (CIM).

Modal verbs terminology

In the present document "**should**", "**should not**", "**may**", "**need not**", "**will**", "**will not**", "**can**" and "**cannot**" are to be interpreted as described in clause 3.2 of the [ETSI Drafting Rules](#) (Verbal forms for the expression of provisions).

"**must**" and "**must not**" are **NOT** allowed in ETSI deliverables except when used in direct citation.

Introduction

The DCAT Application Profile (DCAT-AP) is a specification based on World Wide Web Consortium's Data Catalog vocabulary (DCAT) for describing public sector and other open datasets in Europe. Its basic use case is to enable a cross-data portal search for datasets and make public sector data better searchable across borders and sectors. The present document proposes a mapping to enrich NGSI-LD datasets with metadata aligned with DCAT/DCAT-AP definitions.

1 Scope

The present document aims at recommending an approach to encode dataset and data services metadata within an NGSI-LD format using Data Catalog Vocabulary (DCAT) and its Application Profile (DCAT-AP) representation.

4 DCAT-AP model for describing datasets and data services

4.0 Introduction

The exponential number of published datasets creates an ever-increasing and more complex data environment for a user to navigate. Data on its own, without contextual information or links to other similar sources, often proves difficult to analyse or interpret.

In Europe, a developing open government data ecosystem is employing various technologies and platforms to foster both data publication and data usability. A common metadata standard, the DCAT-AP specification, serves as the universal language amidst this otherwise fragmented environment. This standard-based approach fosters the subsidiarity principle, empowering open data portal owners to select platforms and internal structures tailored to their needs. Nevertheless, these owners are required to furnish DCAT-AP compliant metadata exports for their stored datasets.

"Data Catalog Vocabulary (DCAT) is a Resource Description Framework (RDF) vocabulary designed to facilitate interoperability between data catalogs published on the Web" [i.1]. DCAT is meant for the description of datasets and data services using a standard model and vocabulary. DCAT provides RDF classes and properties to allow datasets and data services to be described and included in a catalogue. This can increase the discoverability of datasets and data services. It also enables having a decentralized approach to publishing and discovering data catalogues.

Furthermore, the DCAT vocabulary can be extended by adding classes and properties for metadata fields not covered in the DCAT specification. Each of these new specifications constitutes a DCAT profile, i.e. a named set of constraints based on DCAT. In fact, there are already a number of profiles that have been created to extend it for application in data catalogues in different domains.

"DCAT-AP is a DCAT profile for sharing information about catalogues containing datasets and data services descriptions in Europe" [i.2]. This Application Profile provides a minimal common basis within Europe to share datasets and data services cross-border and cross-domain.

In this respect, an important clarification that has to be done to correctly understand the scope of DCAT-AP is that data described in a catalogue can come in many formats, ranging from spreadsheets, through XML and RDF to various specialized formats. DCAT does not make any assumptions about these serialization formats of the datasets but it does distinguish between the abstract dataset and its different manifestations or distributions. Thus, it is important to differentiate between the dataset (i.e. the entities containing the context information, for example, temperature, humidity, etc.) and the dataset description (i.e. the entities containing the metadata that describes which entities compose the dataset, for example, Catalogue, Dataset, DataService, Distribution, etc.). DCAT-AP's scope is on the dataset description (i.e. the metadata associated to the actual data).

Thus, the main classes in DCAT-AP are thus the classes Catalogue, Dataset, Distribution and Data Service, which can be combined for the description of each catalogue as necessary, usually as a mixture of datasets and data services. In the most recent version of the DCAT-AP specification, dataset series are introduced to further organise the datasets within a catalogue. DCAT-AP provides a plethora of properties, vocabularies and guidelines to extensively express information about Open Data.

In this sense, it is important to highlight that within the DCAT-AP specification the term Entities is actually employed to define the classes that can be leveraged to describe a catalogue and the datasets and/or data services contained in it. However, the present document is referring to them using the term Classes in order to not conflict with the concept of Entity that is used in the ETSI ISG CIM NGSI-LD standard [i.3] when specifying the mapping between DCAT-AP Entities (also known as DCAT-AP Classes) and the respective NGSI-LD Entities.

5 DCAT-AP concepts to NGSI-LD mapping

5.0 Foreword

This clause introduces the rules for describing DCAT-AP classes using NGSI-LD.

The objective is to be able to describe the metadata related to NGSI-LD datasets (i.e. context information available through an NGSI-LD Context Broker) using the conceptual classes defined in the DCAT-AP model.

5.1 DCAT-AP main classes

5.1.0 Foreword

First the key classes from the DCAT-AP model are mapped into an NGSI-LD data model.

5.1.1 Catalogue

Figure 1 shows the attributes and class hierarchy for the main DCAT-AP class, the Catalogue class.

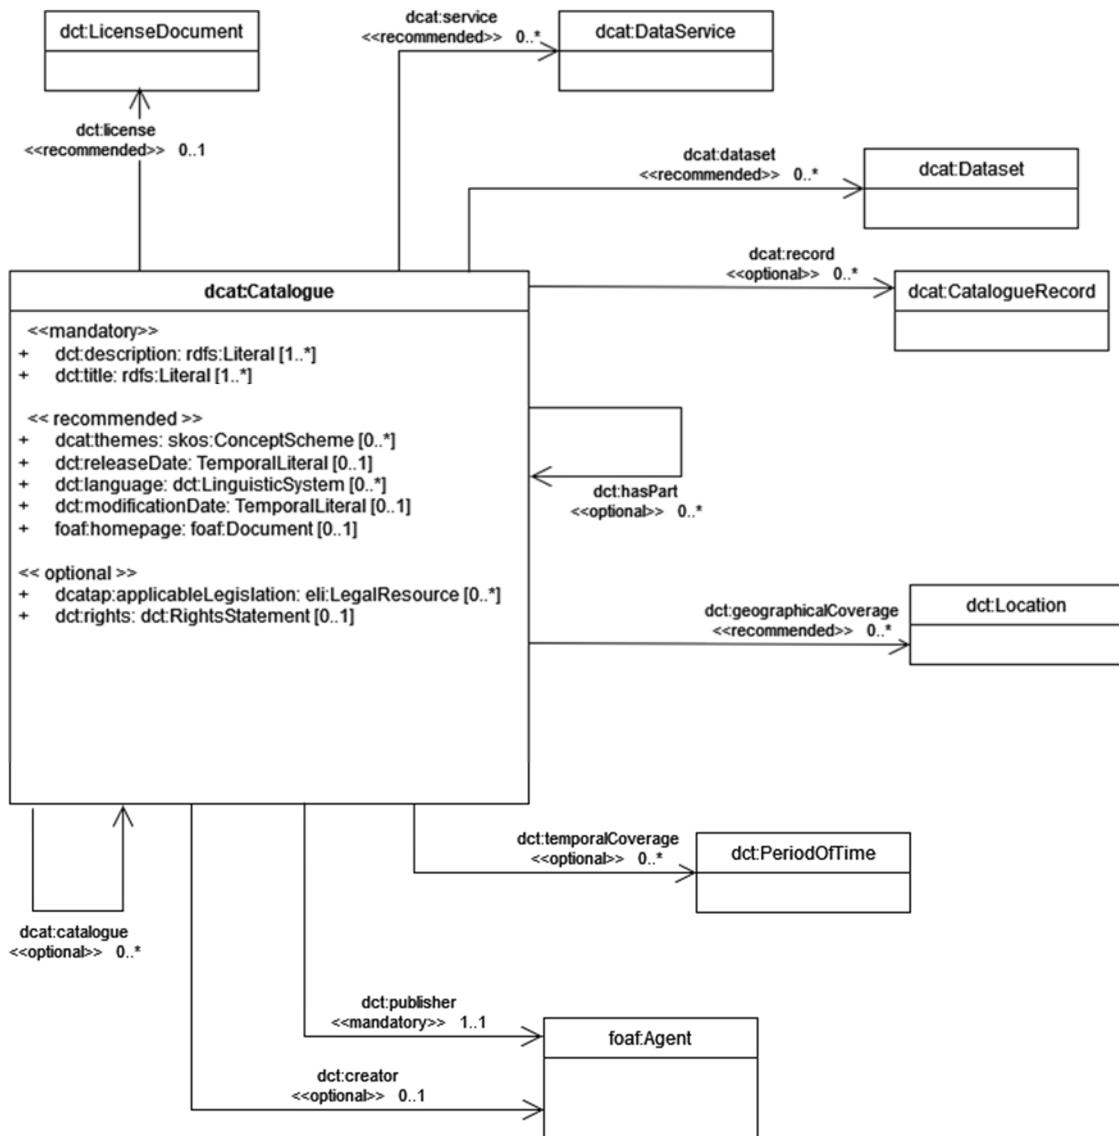

Figure 1: Attributes and class hierarchy for the Catalogue class

This class is meant for describing a catalogue or repository that hosts the Datasets or Data Services being described. It has the following properties: applicableLegislation, catalogue, creator, dataset, description, geographicalCoverage, hasPart, homepage, language, licence, modificationDate, publisher, record, releaseDate, rights, service, temporalCoverage, themes, and title.

Table 1 summarizes these properties as on which type of NGSI-LD property they are mapped into, its description and usage recommendation, its cardinality and the range for each of them.

Table 1: Details on the Catalogue entities' properties

Property	NGSI-LD type	Description and Usage	Card	Range
applicableLegislation	Property	The legislation that mandates the creation or management of the Catalogue.	0..*	eli:LegalResource
catalogue	Relationship	A catalogue whose contents are of interest in the context of this catalogue.	0..*	dcat:Catalogue
creator	Relationship	An entity responsible for the creation of the catalogue.	0..1	foaf:Agent
dataset	Relationship	A Dataset that is part of the Catalogue. As empty Catalogues are usually indications of problems, this property should be combined with the property service to implement an empty Catalogue check.	0..*	dcat:Dataset
description	Property	A free-text account of the Catalogue. This property can be repeated for parallel language versions of the description.	1..*	rdfs:Literal
geographicalCoverage	Relationship	A geographical area covered by the Catalogue. It can be represented using a controlled vocabulary or with geographic coordinates. The EU Vocabularies Name Authority Lists have to be used for continents, countries and places that are in those lists; if a particular location is not in one of the mentioned Named Authority Lists, Geonames URIs have to be used.	0..*	dct:Location
hasPart	Relationship	A related Catalogue that is part of the described Catalogue.	0..*	dcat:Catalogue
homepage	Property	A web page that acts as the main page for the Catalogue.	0..1	foaf:Document
language	Property	A language used in the textual metadata describing titles, descriptions, etc. of the Datasets in the Catalogue. This property can be repeated if the metadata is provided in multiple languages. EU Vocabularies Languages Named Authority List (http://publications.europa.eu/resource/auth/ority/language).	0..*	dct:LinguisticSystem
license	Property	A licence under which the Catalogue can be used or reused.	0..1	dct:LicenseDocument
modificationDate	Property	The most recent date on which the Catalogue was modified.	0..1	rdfs:Literal
publisher	Relationship	An entity (organisation) responsible for making the Catalogue available.	1	foaf:Agent
record	Relationship	A Catalogue Record that is part of the Catalogue.	0..*	dcat:CatalogueRecord
releaseDate	Property	The date of formal issuance (e.g. publication) of the Catalogue.	0..1	rdfs:Literal
rights	Property	A statement that specifies rights associated with the Catalogue.	0..1	dct:RightsStatement
service	Relationship	A site or end-point (Data Service) that is listed in the Catalogue. As empty Catalogues are usually indications of problems, this property should be combined with the property dataset to implement an empty Catalogue check.	0..*	dcat:DataService
temporalCoverage	Property	A temporal period that the Catalogue covers.	0..*	dct:PeriodOfTime

Property	NGSI-LD type	Description and Usage	Card	Range
themes	Property	A knowledge organization system used to classify the Resources that are in the Catalogue. This property refers to a knowledge organization system used to classify the Catalogue's Datasets. It needs to have at least the value NAL:data-theme as this is the mandatory controlled vocabulary for dcat:theme. The values to be used for this property are the URLs of the concepts in the Dataset Theme Vocabulary (http://publications.europa.eu/resource/authority/data-theme).	0..*	skos:ConceptScheme
title	Property	A name given to the Catalogue. This property can be repeated for parallel language versions of the name.	1..*	rdfs:Literal

Listing 1 shows an excerpt of the schema for the NGSI-LD mapping for the DCAT-AP Catalogue class. The complete JSON Schema can be found in Annex B.

Listing 1: Snippet of the JSON Schema for the NGSI-LD Catalogue entity

Some examples of the usage of the NGSI-LD entity of type Catalogue can be found in Annex A.

5.1.2 Dataset

Figure 2 shows the attributes and class hierarchy for the DCAT-AP Dataset class.

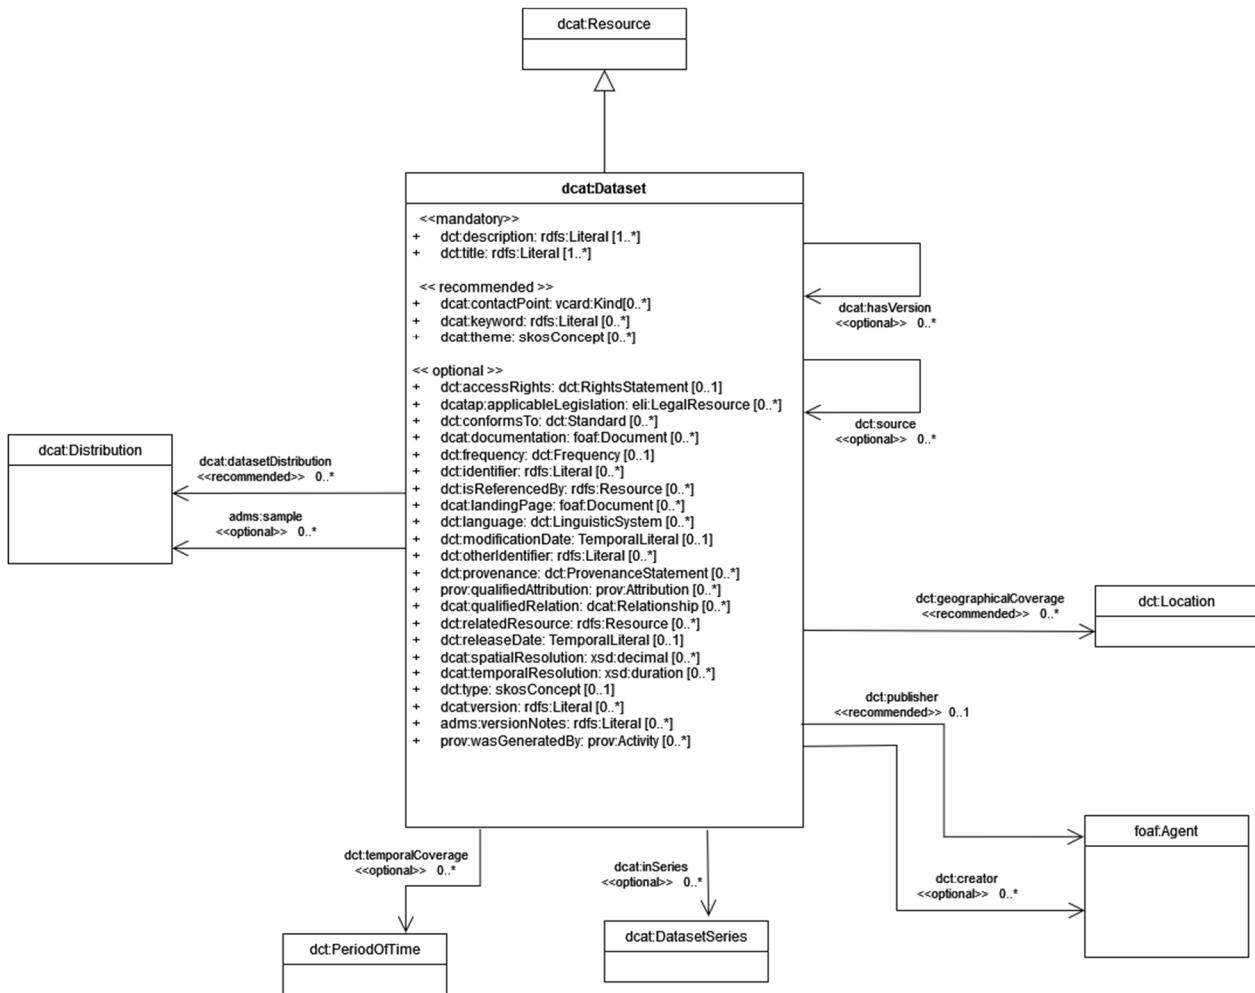

Figure 2: Attributes and class hierarchy for the Dataset class

This class is meant for describing a conceptual entity that represents the information published. It has the following properties: accessRights, applicableLegislation, conformsTo, contactPoint, creator, datasetDistribution, description, documentation, frequency, geographicalcoverage, hasVersion, identifier, inSeries, isReferencedBy, keyword, landingPage, language, modificationDate, otherIdentifier, provenance, publisher, qualifiedAttribution, qualifiedRelation, relatedResource, releaseDate, sample, source, spatialResolution, temporalCoverage, temporalResolution, theme, title, type, version, versionNotes, and wasGeneratedBy.

Table 2 summarizes these properties as on which type of NGSI-LD property they are mapped into, its description and usage recommendation, its cardinality and the range for each of them.

Table 2: Details on the Dataset entities' properties

Property	NGSI-LD type	Description and Usage	Card.	Range
accessRights	Property	Information that indicates whether the Dataset is publicly accessible, has access restrictions or is not public.	0..1	dct:RightsStatement
applicableLegislation	Property	The legislation that mandates the creation or management of the Dataset.	0..*	eli:LegalResource
conformsTo	Property	An implementing rule or other specification.	0..*	dct:Standard
contactPoint	Relationship	Contact information that can be used for sending comments about the Dataset.	0..*	vcard:Kind
creator	Relationship	An entity responsible for producing the dataset.	0..*	foaf:Agent
datasetDistribution	Relationship	An available Distribution for the Dataset.	0..*	dcat:Distribution
description	Property	A free-text account of the Dataset. This property can be repeated for parallel language versions of the description.	1..*	rdfs:Literal
documentation	Property	A page or document about this Dataset.	0..*	foaf:Document
frequency	Property	The frequency at which the Dataset is updated. EU Vocabulary Frequency Named Authority List (http://publications.europa.eu/resource/authority/frequency).	0..1	dct:Frequency
geographicalCoverage	Relationship	A geographic region that is covered by the Dataset. It can be represented using a controlled vocabulary or with geographic coordinates. The EU Vocabulary Name Authority Lists have to be used for continents, countries and places that are in those lists; if a particular location is not in one of the mentioned Named Authority Lists, Geonames URIs have to be used.	0..*	dct:Location
hasVersion	Relationship	A related Dataset that is a version, edition, or adaptation of the described Dataset.	0..*	dcat:Dataset
inSeries	Relationship	A dataset series of which the dataset is part.	0..*	dcat:DatasetSeries
isReferencedBy	Relationship	A related resource, such as a publication, that references, cites, or otherwise points to the dataset.	0..*	rdfs:Resource
keyword	Property	A keyword or tag describing the Dataset.	0..*	rdfs:Literal
landingPage	Property	A web page that acts as the main page for the Catalogue. It is intended to point to a landing page at the original data provider, not to a page on a site of a third party, such as an aggregator.	0..*	foaf:Document
language	Property	A language of the Dataset. This property can be repeated if there are multiple languages in the Dataset. EU Vocabulary Languages Named Authority List (http://publications.europa.eu/resource/authority/language).	0..*	dct:LinguisticSystem
modificationDate	Property	The most recent date on which the Dataset was changed or modified.	0..1	rdfs:Literal
otherIdentifier	Property	A secondary identifier of the Dataset. Examples are DataCite, DOI, EZID or W3ID.	0..*	rdfs:Literal
provenance	Property	A statement about the lineage of a Dataset.	0..*	dct:ProvenanceStatement

Property	NGSI-LD type	Description and Usage	Card.	Range
publisher	Relationship	An entity (organisation) responsible for making the Dataset available.	0..1	foaf:Agent
qualifiedAttribution	Relationship	An Agent having some form of responsibility for the resource.	0..*	dcat:Attribution
qualifiedRelation	Relationship	A description of a relationship with another resource.	0..*	dcat:Relationship
relatedResource	Relationship	A related resource.	0..*	rdfs:Resource
releaseDate	Property	The date of formal issuance (e.g. publication) of the Dataset.	0..1	rdfs:Literal
sample	Relationship	A sample distribution of the dataset.	0..*	dcat:Distribution
source	Relationship	A related Dataset from which the described Dataset is derived.	0..*	dcat:Dataset
spatialResolution	Property	The minimum spatial separation resolvable in a dataset, measured in meters.	0..*	xsd:decimal
temporalCoverage	Property	A temporal period that the Dataset covers.	0..*	dcat:PeriodOfTime
temporalResolution	Property	The minimum time period resolvable in the dataset.	0..*	xsd:duration
theme	Property	A category of the Dataset. A Dataset may be associated with multiple themes. The values to be used for this property are the URIs of the concepts in the Dataset Theme Vocabulary (http://publications.europa.eu/resource/authority/data-theme).	0..*	skos:Concept
title	Property	A name given to the Dataset. This property can be repeated for parallel language versions of the name.	1..*	rdfs:Literal
datasetType	Property	A type of the Dataset. A recommended controlled vocabulary data-type is foreseen.	0..1	skos:Concept
version	Property	The version indicator (name or identifier) of a resource.	0..*	rdfs:Literal
versionNotes	Property	A description of the differences between this version and a previous version of the Dataset. This property can be repeated for parallel language versions of the version notes.	0..*	rdfs:Literal
wasGeneratedBy	Relationship	An activity that generated, or provides the business context for, the creation of the dataset.	0..*	prov:Activity

Listing 2 shows an excerpt of the schema for the NGSI-LD mapping for the DCAT-AP Dataset class. The complete JSON Schema can be found in Annex B.

Listing 2: Snippet of the JSON Schema for the NGSI-LD Dataset entity

Some examples of the usage of the NGSI-LD entity of type Dataset can be found in Annex A.

5.1.3 Dataset Series

Figure 3 shows the attributes and class hierarchy for the DCAT-AP DatasetSeries class.

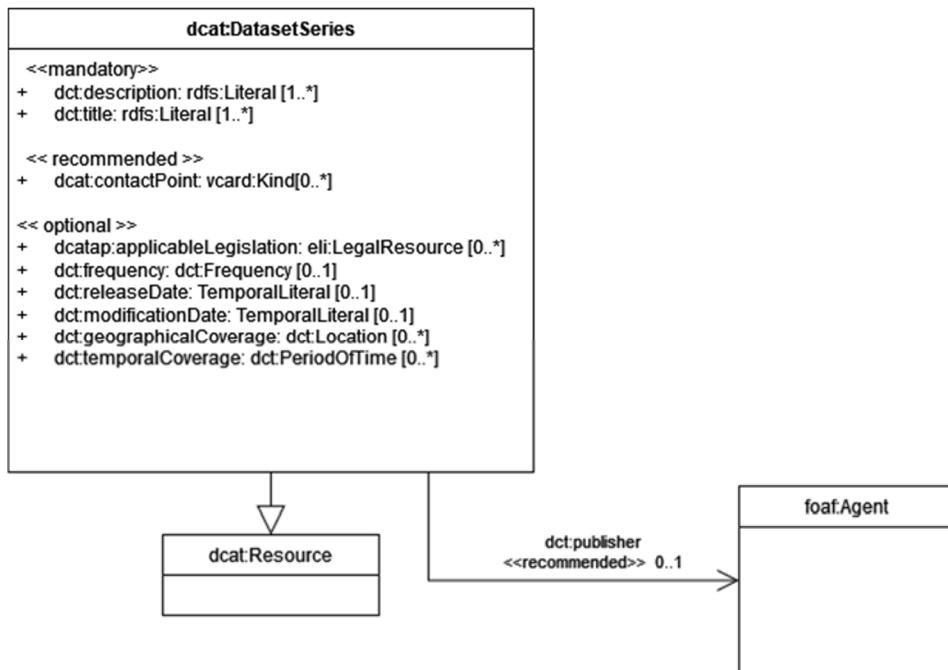

Figure 3: Attributes and class hierarchy for the DatasetSeries class

This class is meant for representing a collection of datasets that are published separately, but share some characteristics that group them. It has the following properties: applicable legislation, contact point, description, frequency, geographical coverage, modification date, publisher, release date, temporal coverage, and title.

Table 3 summarizes these properties as on which type of NGSI-LD property they are mapped into, its description and usage recommendation, its cardinality and the range for each of them.

Table 3: Details on the DatasetSeries entities' properties

Property	NGSI-LD type	Description and Usage	Card.	Range
applicableLegislation	Property	The legislation that mandates the creation or management of the Dataset Series.	0..*	eli:LegalResource
contactPoint	Relationship	Contact information that can be used for sending comments about the Dataset Series.	0..*	vcard:Kind
description	Property	A free-text account of the Dataset Series. This property can be repeated for parallel language versions. It is recommended to provide an indication about the dimensions the Dataset Series evolves.	1..*	rdfs:Literal
frequency	Property	The frequency at which the Dataset Series is updated. EU Vocabulary Frequency Named Authority List (http://publications.europa.eu/resource/authority/frequency).	0..1	dct:Frequency
geographicalCoverage	Relationship	A geographic region that is covered by the Dataset Series. It can be represented using a controlled vocabulary or with geographic coordinates. The EU Vocabulary Name Authority Lists have to be used for continents, countries and places that are in those lists; if a particular location is not in one of the mentioned Named Authority Lists, Geonames URLs have to be used.	0..*	dct:Location

Property	NGSI-LD type	Description and Usage	Card.	Range
modificationDate	Property	The most recent date on which the Dataset Series was changed or modified. This is not equal to the most recent modified dataset in the collection of the dataset series.	0..1	rdfs:Literal
publisher	Relationship	An entity (organisation) responsible for ensuring the coherency of the Dataset Series. The publisher of the dataset series may not be the publisher of all datasets. E.g. a digital archive could take over the publishing of older datasets in the series.	0..1	foaf:Agent
releaseDate	Property	The date of formal issuance (e.g. publication) of the Dataset Series. The moment when the dataset series was established as a managed resource. This is not equal to the release date of the oldest dataset in the collection of the dataset series.	0..1	rdfs:Literal
temporalCoverage	Property	A temporal period that the Dataset Series covers. When temporal coverage is a dimension in the dataset series then the temporal coverage of each dataset in the collection should be part of the temporal coverage. In that case, an open-ended value is recommended, e.g. after 2012.	0..*	dcat:PeriodOfTime
title	Property	A name given to the Dataset Series. This property can be repeated for parallel language versions of the name.	1..*	rdfs:Literal

Listing 3 shows an excerpt of the schema for the NGSI-LD mapping for the DCAT-AP Dataset Series class. The complete JSON Schema can be found in Annex B.

Listing 3: Snippet of the JSON Schema for the NGSI-LD Dataset Series entity

  ...
},
"@context": {
  "type": "array"
}
},
"required": ["id", "type", "description", "title"],
"additionalProperties": false
}
}

```

Some examples of the usage of the NGSI-LD entity of type DatasetSeries can be found in Annex A.

5.1.4 Distribution

Figure 4 shows the attributes and class hierarchy for the DCAT-AP Distribution class.

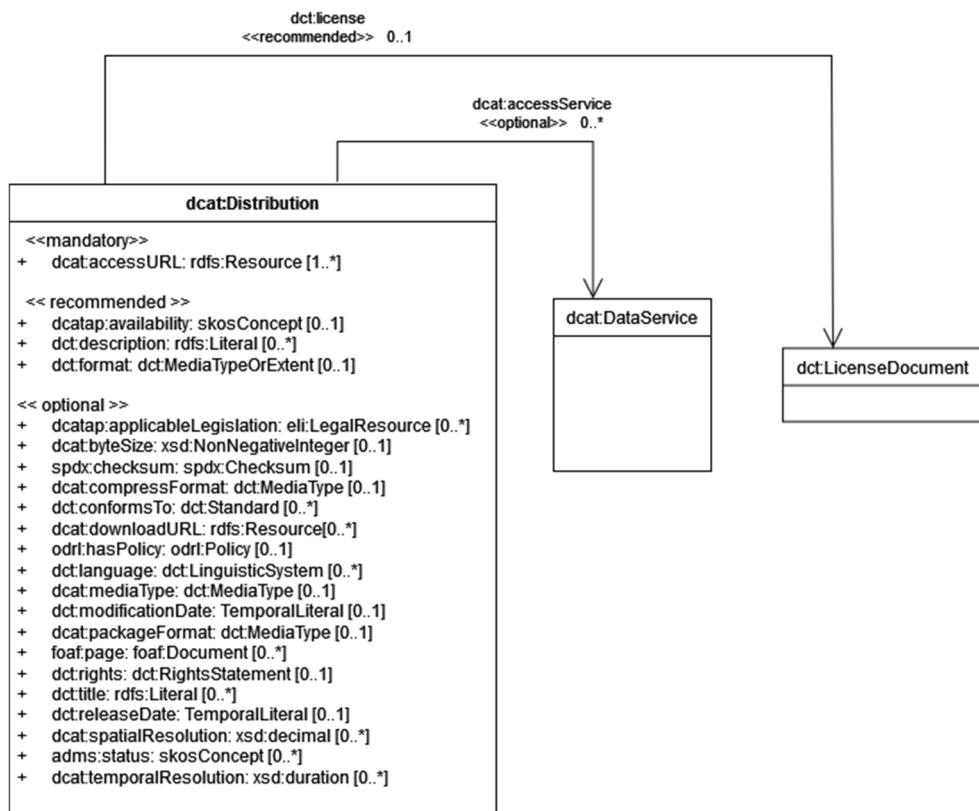

Figure 4: Attributes and class hierarchy for the Distribution class

This class is meant for describing a physical embodiment of the Dataset in a particular format. Distributions are specific representations of a dataset, described with the intent to facilitate the delivery of the data as file to a user. The access URL (preferably download URL) will provide a simple way to obtain (download) the content of the dataset in the representation specified by the distribution. The obtained (downloaded) content is fully determined by the publisher of the distribution. Only after obtaining the data the (re)user can change the data according to its needs.

It has the following properties: `accessService`, `accessURL`, `applicableLegislation`, `availability`, `byteSize`, `checksum`, `compressionFormat`, `description`, `documentation`, `downloadURL`, `format`, `hasPolicy`, `language`, `licence`, `linkedSchemas`, `mediaType`, `modificationDate`, `packagingFormat`, `releaseDate`, `rights`, `spatialResolution`, `status`, `temporalResolution`, and `title`.

Table 4 summarizes these properties as on which type of NGSI-LD property they are mapped into, its description and usage recommendation, its cardinality and the range for each of them.

Table 4: Details on the Distribution entities' properties

Property	NGSI-LD type	Description and Usage	Card.	Range
accessService	Relationship	A data service that gives access to the distribution of the dataset.	0..*	dcat:DataService
accessURL	Property	A URL that gives access to a Distribution of the Dataset. The resource at the access URL may contain information about how to get the Dataset.	1..*	dcat:endpointURL
applicableLegislation	Property	The legislation that mandates the creation or management of the Dataset Series.	0..*	eli:LegalResource
availability	Property	An indication how long it is planned to keep the Distribution of the Dataset available.	0..1	skos:Concept
byteSize	Property	The size of a Distribution in bytes.	0..1	xsd:nonNegativeInteger
checksum	Relationship	A mechanism that can be used to verify that the contents of a distribution have not changed. The checksum is related to the downloadURL.	0..1	dcat:Checksum

Property	NGSI-LD type	Description and Usage	Card.	Range
compressionFormat	Property	The format of the file in which the data is contained in a compressed form, e.g. to reduce the size of the downloadable file. It SHOULD be expressed using a media type as defined in the official register of media types managed by IANA.	0..1	dct:MediaType
description	Property	A free-text account of the Distribution. This property can be repeated for parallel language versions of the description.	0..*	rdfs:Literal
documentation	Property	A page or document about this Distribution.	0..*	foaf:Document
downloadURL	Property	A URL that is a direct link to a downloadable file in a given format.	0..*	dcat:downloadURL
format	Property	The file format of the Distribution.	0..1	dcat:MediaTypeOrExtent
hasPolicy	Relationship	The policy expressing the rights associated with the distribution if using the ODRL vocabulary.	0..1	odrl:Policy
language	Property	A language used in the Distribution. This property can be repeated if the metadata is provided in multiple languages. EU Vocabularies Languages Named Authority List (http://publications.europa.eu/resource/auth/ority/language).	0..*	dct:LinguisticSystem
license	Property	A licence under which the Distribution is made available.	0..1	dct:LicenseDocument
linkedSchemas	Property	An established schema to which the described Distribution conforms.	0..*	dct:Standard
mediaType	Property	The media type of the Distribution as defined in the official register of media types managed by IANA.	0..1	dcat:MediaType
modificationDate	Property	The most recent date on which the Distribution was changed or modified.	0..1	rdfs:Literal
packagingFormat	Property	The format of the file in which one or more data files are grouped together, e.g. to enable a set of related files to be downloaded together. It SHOULD be expressed using a media type as defined in the official register of media types managed by IANA.	0..1	dcat:MediaType
releaseDate	Property	The date of formal issuance (e.g. publication) of the Distribution.	0..1	rdfs:Literal
rights	Property	A statement that specifies rights associated with the Distribution.	0..1	dct:RightsStatement
spatialResolution	Property	The minimum spatial separation resolvable in a dataset distribution, measured in meters.	0..*	xsd:decimal
status	Property	The status of the distribution in the context of maturity lifecycle. It HAS TO take one of the values Completed, Deprecated, Under Development, Withdrawn.	0..1	skos:Concept
temporalResolution	Property	The minimum time period resolvable in the dataset distribution.	0..*	xsd:duration
title	Property	A name given to the Distribution. This property can be repeated for parallel language versions of the description.	1..*	rdfs:Literal

Some examples of the usage of the NGSI-LD entity of type Distribution can be found in Annex A.

5.1.5 Data Service

Figure 5 shows the attributes and class hierarchy for the DCAT-AP DataService class.

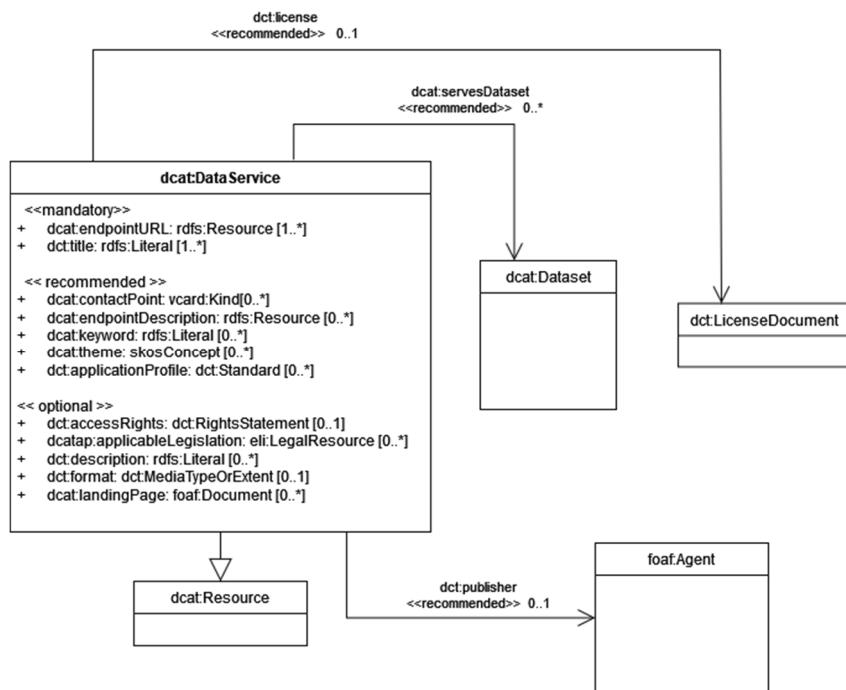

Figure 5: Attributes and class hierarchy for the Distribution class

This class is meant for describing a collection of operations that provides access to one or more datasets or data processing functions.

A first distinction between distributions and data services is their dependency on a dataset for their existence. A distribution cannot exist without its dataset. It is a specific representation of a dataset. Whereas a data service is an entity in its own right. It provides access to datasets or it provides data processing functions. The independence also holds between the distributions of a dataset, and the data service which provides access to that dataset. The distributions are not required to be the result of the data service operations. However, they may.

Many of the properties of distributions are file oriented (downloadURL, format, byte size, checksum, modification date, etc.). The relevance of this information is reduced for data services, related information is present in a very different form and thus under different terminology. For instance, data services do and can provide format transformations, language transformations and schema transformations on request. Also, the handling of trust is different. While tampering of downloadable content is detected by e.g. checksums, data services create often a trusted channel using security measures such as authentication and encryption. This reduces the need for additional trust checks on the data.

It has the following properties: access rights, applicable legislation, application profile, contact point, description, endpoint description, endpoint URL, format, keyword, landing page, licence, publisher, serves dataset, theme, and title.

Table 5 summarizes these properties as on which type of NGSI-LD property they are mapped into, its description and usage recommendation, its cardinality and the range for each of them.

Table 5: Details on the Distribution entities' properties

Property	NGSI-LD type	Description and Usage	Card.	Range
accessRights	Property	Information regarding access or restrictions based on privacy, security, or other policies.	0..1	dct:RightsStatement
applicableLegislation	Property	The legislation that mandates the creation or management of the Data Service.	0..*	eli:LegalResource
applicationProfile	Property	An established (technical) standard to which the Data Service conforms. The standards referred here SHOULD describe the Data Service and not the data it serves. The latter is provided by the dataset with which this Data Service is connected. For instance the data service adheres to the OGC WFS API standard, while the associated dataset adheres to the INSPIRE Address data model.	0..*	dct:Standard
contactPoint	Relationship	Contact information that can be used for sending comments about the Data Service.	0..*	vcard:Kind
description	Property	A free-text account of the Data Service. This property can be repeated for parallel language versions of the description.	0..*	rdfs:Literal
endpointDescription	Property	A description of the services available via the end-points, including their operations, parameters etc. The property gives specific details of the actual endpoint instances, while the property application profile (dct:conformsTo) is used to indicate the general standard or specification that the endpoints implement.	0..*	rdfs:Resource
endpointURL	Property	The root location or primary endpoint of the service (an IRI).	1..*	dcat:endpointURL
format	Property	The structure that can be returned by querying the endpointURL.	0..*	dcat:MediaTypeOrExtent
keyword	Property	A keyword or tag describing the Data Service.	0..*	rdfs:Literal
landingPage	Property	A web page that provides access to the Data Service and/or additional information. It is intended to point to a landing page at the original data service provider, not to a page on a site of a third party, such as an aggregator.	0..*	foaf:Document
license	Property	A licence under which the Data service is made available.	0..1	dct:LicenseDocument
publisher	Relationship	An entity (organisation) responsible for making the Data Service available.	0..1	foaf:Agent
servesDataset	Relationship	This property refers to a collection of data that this data service can distribute.	0..*	dcat:Dataset
theme	Property	A category of the Data Service. A Data Service may be associated with multiple themes.	0..*	skos:Concept
title	Property	A name given to the Data Service. This property can be repeated for parallel language versions of the name.	1..*	rdfs:Literal

Some examples of the usage of the NGSI-LD entity of type Location can be found in Annex A.

5.1.8 Catalogue Record

Figure 8 shows the attributes and class hierarchy for the DCAT-AP CatalogueRecord class.

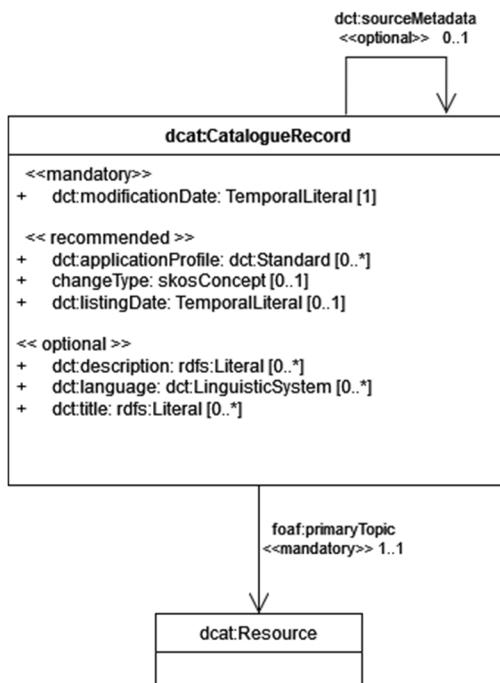

Figure 8: Attributes and class hierarchy for the CatalogueRecord class

This class is meant for providing a description of a Catalogued Resource's entry in the Catalogue. It has the following properties: application profile, change type, description, language, listing date, modification date, primary topic, source metadata, and title.

Table 8 summarizes these properties as on which type of NGSI-LD property they are mapped into, its description and usage recommendation, its cardinality and the range for each of them.

Table 8: Details on the CatalogueRecord entities' properties

Property	NGSI-LD type	Description and Usage	Card.	Range
applicationProfile	Property	An Application Profile that the Catalogued Resource's metadata conforms to.	0..*	dct:Standard
changeType	Property	The status of the catalogue record in the context of editorial flow of the dataset and data service descriptions.	0..1	skos:Concept
description	Property	A free-text account of the record. This property can be repeated for parallel language versions of the description.	0..*	rdfs:Literal

Property	NGSI-LD type	Description and Usage	Card.	Range
language	Property	A language used in the textual metadata describing titles, descriptions, etc. of the Catalogued Resource. This property can be repeated if the metadata is provided in multiple languages. EU Vocabularies Languages Named Authority List (http://publications.europa.eu/resource/authority/language).	0..*	dct:LinguisticSystem
listingDate	Property	The date on which the description of the Resource was included in the Catalogue.	0..1	rdfs:Literal
modificationDate	Property	The most recent date on which the Catalogue entry was changed or modified.	1	rdfs:Literal
primaryTopic	Relationship	A link to the Dataset, Data service or Catalogue described in the record. A catalogue record will refer to one entity in a catalogue. This can be either a Dataset or a Data Service. To ensure an unambiguous reading of the cardinality the range is set to Catalogued Resource. However, it is not the intent with this range to require the explicit use of the class Catalogued Record. As abstract class, an subclass should be used.	1	dcat:Resource
sourceMetadata	Relationship	The original metadata that was used in creating metadata for the Dataset.	0..1	dcat:CatalogueRecord
title	Property	A name given to the Data Service. This property can be repeated for parallel language versions of the name.	0..*	rdfs:Literal

Listing 8 shows an excerpt of the schema for the NGSI-LD mapping for the DCAT-AP Catalogue Record class. The complete JSON Schema can be found in Annex B.

```

Some examples of the usage of the NGSI-LD entity of type CatalogueRecord can be found in Annex A.

5.1.9 Catalogued Resource

This class is meant for describing a resource published or curated by a single agent. DCAT-AP specification does not impose any additional requirements to properties for this entity.

This class Catalogued Record is an abstract class for DCAT-AP. Therefore, only subclasses (i.e. Dataset, Dataset Series and Data Service) should be used in a data exchange.

The present document does not impose any additional requirements to properties for this entity.

5.1.10 Checksum

This class is meant for describing a value that allows the contents of a file to be authenticated.

This class allows the results of a variety of checksum and cryptographic message digest algorithms to be represented. It has the following properties are defined: algorithm, and checksum value.

Table 9 summarizes these properties as on which type of NGSI-LD property they are mapped into, its description and usage recommendation, its cardinality and the range for each of them.

Table 9: Details on the Checksum entities' properties

Property	NGSI-LD type	Description and Usage	Card.	Range
algorithm	Property	The algorithm used to produce the subject Checksum.	1	spdx:algorithm
checksumValue	Property	A lower case hexadecimal encoded digest value produced using a specific algorithm.	1	xsd:hexBinary

Listing 9 shows an excerpt of the schema for the NGSI-LD mapping for the DCAT-AP Checksum class. The complete JSON Schema can be found in Annex B.

6 NGSI-LD handling of DCAT-AP Location entities

As it has been introduced in clause 5.1.7, the DCAT-AP specification defines a specific DCAT-AP class for describing the areas covered by Catalogues, Datasets and Dataset Series. This class acts as the Range for the geographicalCoverage attribute for these entities.

While in NGSI-LD the description of locations and/or areas is typically handled making use of GeoProperties (in order to exploit the special geographical queries defined in the API), in the present document, the solution proposed has adopted a different approach in order to make the NGSI-LD mapping as respectful with the DCAT-AP specification as possible.

In this sense, the geographicalCoverage attribute of DCAT-AP Catalogues, Datasets and Dataset Series, have been modelled as a Relationship, connecting any entity of these types with a specific Location entity, which, in turn is described using any of the attributes specified in clause 5.1.7.

This way, the use of controlled vocabularies, as it is recommended in the DCAT-AP specification, as well as detailed geometries (using NGSI-LD GeoProperty associated functionalities), is possible.

7 NGSI-LD handling of DCAT-AP based entities

7.0 Foreword

Clause 7 describes potential additions to the NGSI-LD API to directly generate the datasets' description from the actual context information (i.e. NGSI-LD entities and corresponding knowledge graph) that is available at a NGSI-LD Context Broker.

7.1 Creation of Data Services, Datasets and Dataset Series

7.1.0 Foreword

NGSI-LD is meant for enabling access to context data. DCAT-AP, on contrary, is meant for sharing information about Catalogues containing Datasets and Data Services descriptions in Europe. Basically, while NGSI-LD is focused on providing access to data, DCAT-AP's scope is on the description of metadata mainly about how these data are organised.

Having said this, metadata is, on its own, context information. Thus, it is subject to be expressed following the NGSI-LD information model (which is the main objective of the present document) and to be available through specific resources of the NGSI-LD API.

For this latter aspect, in this clause some options are discussed to be considered for augmenting the NGSI-LD API. Before delving deeper into the details of these options, it is worth highlighting some important considerations on the mutual implications between NGSI-LD and DCAT-AP.

Firstly, DCAT-AP defines a hierarchy of classes on which the Catalogue is at the top; Datasets belong to a Catalogue; and data are accessible whether on a Distribution or through a Data Service. Figure 9 shows this hierarchy and the relationship among the NGSI-LD entities defined to represent these DCAT-AP classes.

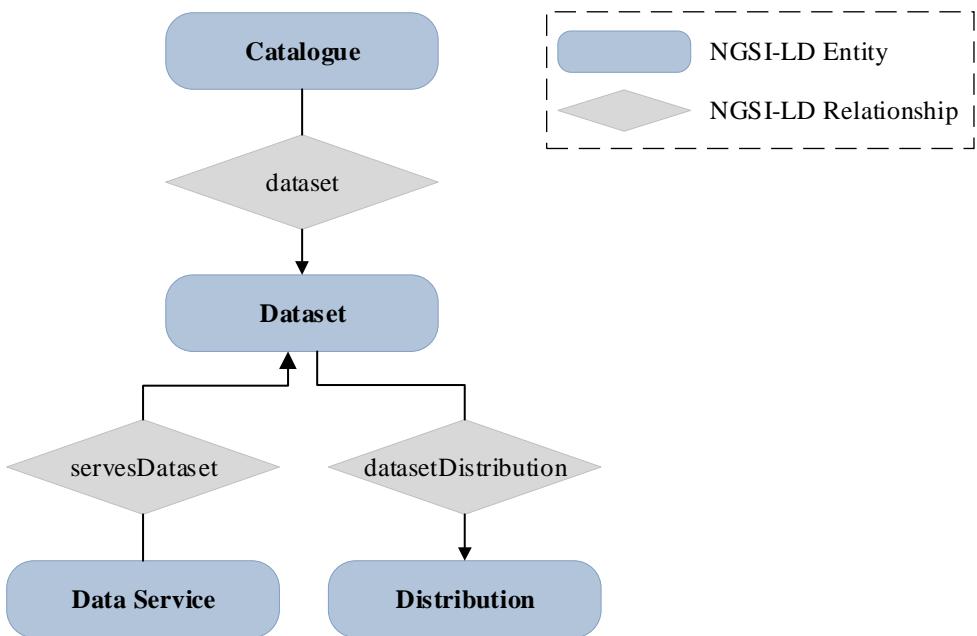

Figure 9: Relationships among Catalogue, Dataset, Data Service and Distribution classes

In this sense, neither Catalogue entities nor Dataset entities provide details on how to actually have access to data, but they are the Distribution and DataService entities the ones that contains the actual endpoints to download or query the data respectively. The reason for having two alternatives is related to the fact that DCAT-AP establishes a distinction between data arranged in a file (the concept behind DCAT-AP Distributions, "A physical embodiment of the Dataset in a particular format.") and data that is available through a service (the concept behind DCAT-AP Data Services, "A collection of operations that provides access to one or more datasets or data processing functions.").

However, it is clear that the DCAT-AP Data Service definition is the one that best fits with the way in which NGSI-LD makes context data available. Thus, in clause 7.1.1, the recommendations will focus on the description of data availability through DataServices entities, for which the corresponding NGSI-LD API resource has to be included as its *endpointURL* property as it is shown in Figure 10.

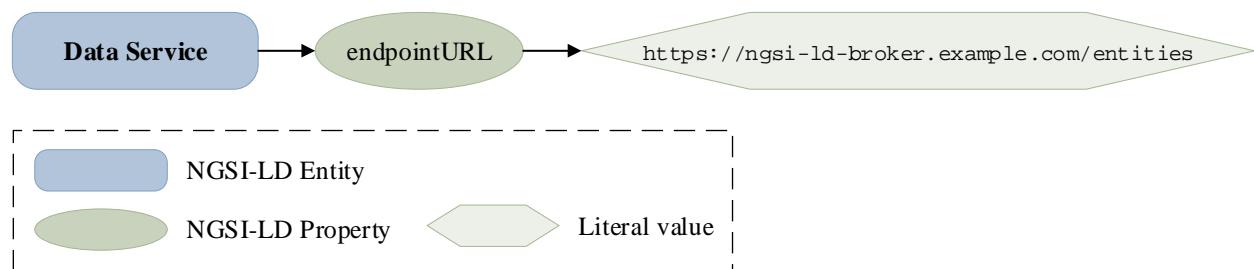

Figure 10: Example of endpointURL property specification within a DataService entity

Finally, the inclusion of the Dataset Series concept is an option that DCAT-AP supports to arrange Datasets that are related to one another beyond the fact that they are all contained in the same Catalogue. Figure 11 shows this hierarchy and the relationship among the NGSI-LD entities defined to represent these DCAT-AP classes.

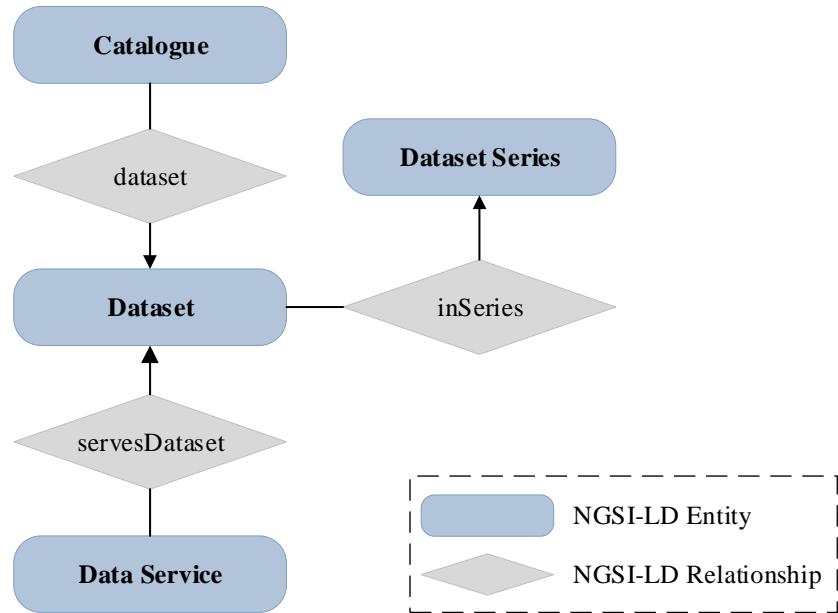

Figure 11: Relationships among Catalogue, Dataset, Data Service and DatasetSeries classes

7.1.1 Data Services

With the purpose of the autonomous creation of Data Services, a new resource would need to be included to the NGSI-LD API, `/dataservices`. By means of this resource the DataService type entities stored in the Context Broker can be accessed. The proposed operations comprise the creation of the entity, retrieve of entity, update of attributes and deletion of the entity.

As for the retrieve (GET), update (PUT and/or PATCH) and delete (DELETE) operations, the system behaviour remains the same as for the `/entities` resource. Both three actions make use of the id of the entity at the URI of the Context Broker such that:

- Retrieve: GET `/dataservices/<entityId>`
- Update (Replace entity): PUT `/dataservices/<entityId>`, Body: Entity[]
- Update (Merge entity): PATCH `/dataservices/<entityId>`, Body: Entity Fragment[]
- Delete: DELETE `/dataservices/<entityId>`

Nonetheless, the entity creation operation is proposed with an autonomous behaviour. Given that a Data Service describes the access to a set of data, its NGSI-LD property `endpointURL` is one of the most critical attributes, setting the access point to this data. The approach proposed enables the embedding of a query in the URI, subsequently being used as part of the URI to filter the data that conforms this Data Service. The general formulation is as follows:

- Autonomous creation: POST `/dataservices?q=<query>`

Considering that the creation of entities derived from DCAT-AP needs from the data provider involvement in order to fill most of the entities' attributes, this autonomous POST operation within the NGSI-LD system has to generate the minimum entity required by the DCAT-AP specification. Thus, the autonomously generated entity has to include only its mandatory properties: `id`, `type`, `title`, and `endpointURL`. In the case that the rest of the available attributes presented in the clause 5.1.5 are to be added, PUT (Replace entity) and PATCH (Merge entity) operations described above have to be used.

EXAMPLE:

Autonomous creation

```
Request:
POST /dataservices?q==type="AirQualityObserved"
```

```
Response:
{
  "id": "urn:ngsi-ld DataService:AirQualityObserved",
  "type": "DataService",
  "title": {
    "type": "Property",
    "value": ["Data Service on Air Quality Observed data."]
  },
  "endpointURL": {
    "type": "Property",
    "@id": "https://ngsi-ld-broker.example.com/entities?type=AirQualityObserved"
  },
  "@context": [
    "https://uri.etsi.org/ngsi-ld/v1/ngsi-ld-core-context-v1.7.jsonld",
    "https://semiceu.github.io/DCAT-AP/releases/3.0.0/context/dcat-ap.jsonld",
    {
      "title": "DataService.title",
      "endpointURL": "DataService.endpointURL"
    }
  ]
}
```

Update (Merge entity):

```
Request:
PATCH /dataservices/urn:ngsi-ld DataService:AirQualityObserved
Body:
{
  "title": {
    "type": "Property",
    "value": [
      "Data Service on air quality data on the city of Santander.",
      {
        "@language": "http://publications.europa.eu/resource/authority/language/SPA",
        "@value": "Data Service con datos sobre la calidad del aire en Santander."
      }
    ]
  },
  "description": {

      "endpointURL": "DatasetSeries.endpointURL"
    }
  ]
}
```

7.1.2 Datasets

With the purpose of the autonomous creation of Datasets, a new resource should be included to the NGSI-LD API, `/datasets`. By means of this resource the Dataset type entities stored in the Context Broker can be accessed. The proposed operations comprise the creation of the entity, retrieve of entity, update of attributes and deletion of the entity.

As for the retrieve (GET), update (PUT and/or PATCH) and delete (DELETE) operations, the system behaviour remains the same as for the `/entities` resource. Both three actions make use of the id of the entity at the URI of the Context Broker such that:

- Retrieve: GET `/datasets/<entityId>`
- Update (Replace entity): PUT `/datasets/<entityId>`, Body: Entity[]
- Update (Merge entity): PATCH `/datasets/<entityId>`, Body: Entity Fragment[]
- Delete: DELETE `/datasets/<entityId>`

Nonetheless, the entity creation operation is proposed with an autonomous behaviour. The approach proposed enables the embedding of a query in the URI, subsequently being used to establish the aggregation of the data contained in the dataset. The general formulation is as follows:

- Autonomous creation: POST `/datasets?q=<query>`

Considering that the creation of entities derived from DCAT-AP needs from the data provider involvement in order to fill most of the entities' attributes, this autonomous POST operation within the NGSI-LD system has to generate the minimum entity required by the DCAT-AP specification. Thus, the generated entity has to include only its mandatory properties: `id`, `type`, `title`, and `description`.

However, within the DCAT-AP specification, Datasets are not, as such, the direct containers of the actual data, but the Distributions and Data Services are the DCAT-AP classes that actually provides access to data. Moreover, as it has been mentioned above, access to context information leveraging the NGSI-LD API fits completely on the DCAT-AP definition of a Data Service (i.e. "A collection of operations that provides access to one or more datasets or data processing functions."). Thus, the most natural and complete way of representing the actual data availability should not be limited to the creation of a Dataset entity, but rather create the underlying DataService entity.

Data Services are related to their parent Dataset through the `servesDataset` attribute on the DataService specification. Hence, when creating the Dataset entity, it is recommended to create or update the corresponding DataService entity establishing the Relationship among them.

In the case that the rest of the available attributes presented in clause 5.1.2 are to be added, PUT (Replace entity) and PATCH (Merge entity) operations described above have to be used.

EXAMPLE:

Autonomous creation

```
Request:
POST /datasets?q==type="AirQualityObserved"
```

```
Response:
[
  {
    "id": "urn:ngsi-ld:Dataset:AirQualityObserved",
    "type": "Dataset",
    "title": {
      "type": "Property",
      "value": ["Dataset on Air Quality Observed data."]
    },
    "description": {
      "type": "Property",
      "value": ["This is the Dataset on Air Quality Observed data."]
    },
    "@context": [
      "https://uri.etsi.org/ngsi-ld/v1/ngsi-ld-core-context-v1.7.jsonld",
      "https://semiceu.github.io/DCAT-AP/releases/3.0.0/context/dcat-ap.jsonld",
      {
        "title": "Dataset.title",
        "type": "Property"
      }
    ]
  }
]
```

```

        "description": "Dataset.descripcion"
    }
]
},
{
    "id": "urn:ngsi-ld DataService:AirQualityObserved",
    "type": "DataService",
    "title": {
        "type": "Property",
        "value": [ "Data Service on Air Quality Observed data." ]
    },
    "endpointURL": {
        "type": "Property",
        "@id": "https://ngsi-ld-broker.example.com/entities?type=AirQualityObserved"
    },
    "servesDataset": {
        "type": "Relationship",
        "@id": "urn:ngsi-ld Dataset:AirQualityObserved"
    },
    "@context": [
        "https://uri.etsi.org/ngsi-ld/v1/ngsi-ld-core-context-v1.7.jsonld",
        "https://semiceu.github.io/DCAT-AP/releases/3.0.0/context/dcat-ap.jsonld",
        {
            "title": "DataService.title",
            "servesDataset": "DataService.servesDataset",
            "endpointURL": "DataService.endpointURL"
        }
    ]
}
]

```

Update (Merge entity):

```

Request:

```

7.1.3 Dataset Series

With the purpose of the autonomous creation of Dataset Series, a new resource should be included to the NGSI-LD API, `/datasetseries`. By means of this resource the DatasetSeries type entities stored in the Context Broker can be accessed. The proposed operations comprise the creation of the entity, retrieve of entity, update of attributes and deletion of the entity.

As for the retrieve (GET), update (PUT and/or PATCH) and delete (DELETE) operations, the system behaviour remains the same as for the `/entities` resource. Both three actions make use of the id of the entity at the URI of the Context Broker such that:

- Retrieve: GET `/datasetseries/<entityId>`
- Update (Replace entity): PUT `/datasetseries/<entityId>`, Body: Entity[]
- Update (Merge entity): PATCH `/datasetseries/<entityId>`, Body: Entity Fragment[]
- Delete: DELETE `/datasetseries/<entityId>`

Nonetheless, the entity creation operation is proposed with an autonomous behaviour. The approach proposed enables the embedding of a query in the URI, subsequently being used to establish the aggregation of the data contained in the dataset. The general formulation is as follows:

- Autonomous creation: POST `/datasetseries?q=<query>`

Considering that the creation of entities derived from DCAT-AP needs from the data provider involvement in order to fill most of the entities' attributes, this autonomous POST operation within the NGSI-LD system has to generate the minimum entity required by the DCAT-AP specification. Thus, the generated entity has to include only its mandatory properties: `id`, `type`, and `title`.

However, within the DCAT-AP specification, Dataset Series does not have much sense if the actual Datasets being part of such series do not exist. Thus, the most complete way of representing the actual existence of a Dataset Series should not be limited to the creation of a DatasetSeries entity on isolation, but rather create the initial Dataset entity on the series.

Datasets are related to their parent Dataset Series through the *inSeries* attribute on the Dataset specification. Hence, when creating the DatasetSeries entity it is recommended to create or update the corresponding Dataset entity establishing the Relationship among them. In case the underlying Dataset does not exist and it has to be created during the Dataset Series creation, then, the corresponding DataService entity has to be created as described in clause 7.1.2.

In the case that the rest of the available attributes presented in clause 5.1.3 are to be added, PUT (Replace entity) and PATCH (Merge entity) operations described above have to be used.

EXAMPLE:

Autonomous creation

```
Request:  
POST /datasetseries?q==type="AirQualityObserved"
```

```
Response:  
[  
  {  
    "id": "urn:ngsi-ld:DatasetSeries:AirQualityObserved",  
    "type": "DatasetSeries",  
    "title": {  
      "type": "Property",  
      "value": [ "Dataset Series on Air Quality Observed data." ]  
    },  
    "@context": [

7.2 Data Services creation upon Context Source registration

A Context Source represents a source of context data within an NGSI-LD architecture. Its registration within the NGSI-LD architecture provides the system with knowledge about what data is available and to which access point it should be requested. This registration is done through the ContextSourceRegistration entity type.

A Data Service is a class defined in DCAT-AP for the description of a collection of operations that provides access to one or more datasets or data processing functions. Therefore, within the NGSI-LD domain, its relationship with Context Sources is straightforward: a DataService entity is used for the description of Context Sources, providing the information and metadata necessary for its full understanding, through the properties and relationships described in clause 5.1.5.

The approach proposed is based on the creation of Data Services upon Context Source registration in an autonomous way, making use of the endpoint and its HTTP binding described in clause 7.1.1. There are several alternatives to consider:

- Creation of a Data Service per type of registered data.
- Creation of a Data Service per registered data type and specified pattern identifier (*idPattern*).
- Creation of a Data Service per Context Source.

Supporting these or other options should be considered for augmenting the NGSI-LD API, but it should be up to the infrastructure manager to decide which approach to implement. Nevertheless, the most straightforward choice would appear to be the first option, where a Data Service is created for each type of data registered.

EXAMPLE:

Autonomous creation

```
Request:
POST /csourceRegistrations?q==type="AirQualityObserved"
{
  "id": "urn:ngsi-ld:ContextSourceRegistration:AirQualityObserved",
  "type": "ContextSourceRegistration",
  "information": [
    {
      "entities": [
        {
          "type": "AirQualityObserved"
        }
      ],
    },
  ],
  "endpoint": " https://ngsi-ld-broker.example.com/entities?type=AirQualityObserved ",
  "@context": [
    "https://uri.etsi.org/ngsi-ld/v1/ngsi-ld-core-context-v1.7.jsonld"
  ]
}
```

```
Response:
<Location Header>
```

Retrieve:

```
Request:
GET /dataservices/urn:ngsi-ld DataService:AirQualityObserved
```

```
Response:
{
  "id": "urn:ngsi-ld DataService:AirQualityObserved",
  "type": "DataService",
  "title": {
    "type": "Property",
    "value": ["Data Service on Air Quality Observed data."]
  },
  "endpointURL": {
    "type": "Property",
    "value": [
      "https://ngsi-ld-broker.example.com/entities?type=AirQualityObserved"
    ]
  }
}
```

```

    "@id": "https://ngsi-ld-broker.example.com/entities?type=AirQualityObserved"
},
"@context": [
  "https://uri.etsi.org/ngsi-ld/v1/ngsi-ld-core-context-v1.7.jsonld",
]
}
}
```

Update (Merge entity):

```

Request:
PATCH /dataservices/urn:ngsi-ld DataService:AirQualityObserved

```

7.3 Handling temporal data

Nowadays, temporal data and historical records are a matter of paramount importance for performing analysis and extracting valuable insights. Within the current NGSI-LD infrastructure, there exists a dedicated endpoint for the management of these temporal values, `/temporal/entities`. Nevertheless, this approach combined with the presented DCAT-AP structures can be further exploited.

The suggested approach is based on the generation of the hierarchy shown in Figure 12 for handling temporal data, where the entities of type DatasetSeries, Dataset and DataServices are linked through relationships.

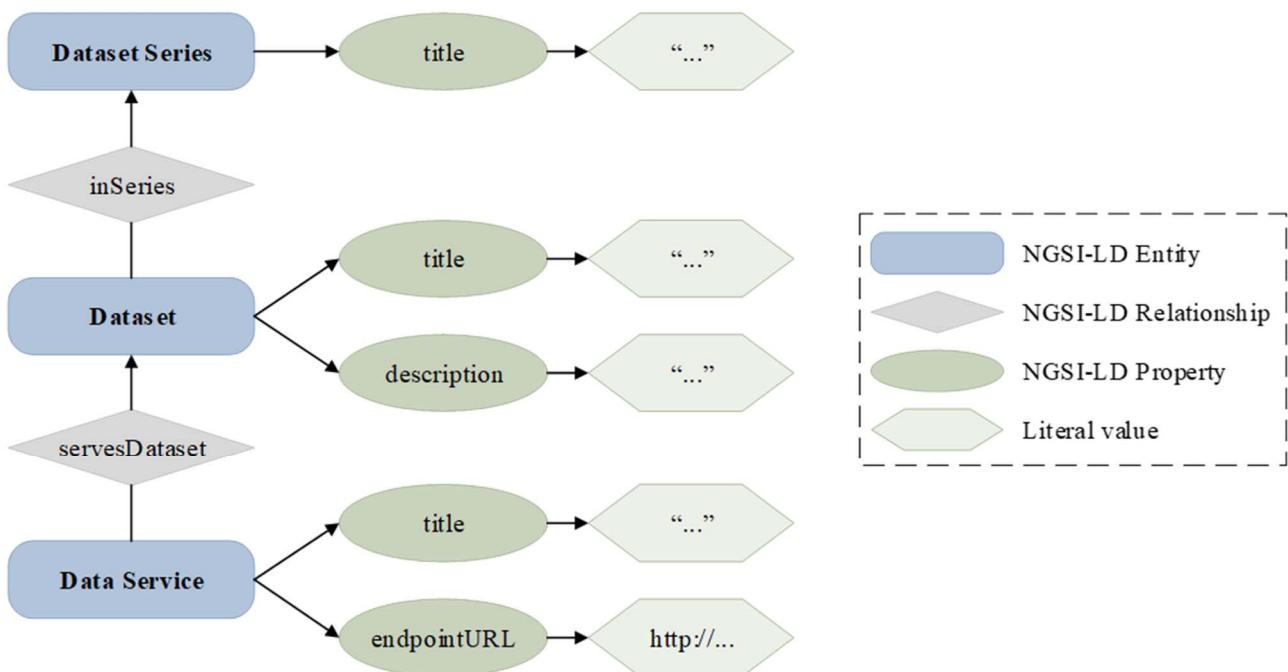

Figure 12: Example of properties specification within a DataService entity for handling temporal data

According to this structure, the parent entity has to be of type DatasetSeries, which defines a set of datasets forming a series that are, basically, structured according to a certain time periodicity. Each entity of type Dataset would describe a set of data with a temporal start and end date, whose data source is defined by a Data Service. This hierarchical structure, which target is based on handling temporal data, has to make use of the endpoints and HTTP requests described in clause 7.1.

The autonomous component of this strategy relies on an extension of the API presented in clause 7.1.3 in order to enable the possibility of specifying certain parameters that trigger the creation of all three entity structures. Its general formulation is:

- Autonomous creation: POST /datasetseries?q=<query>

where:

```
<query>=type==<type>;frequency=<frequency>;startsAt=<start_date>;endsAt=<end_date>
```

Given these parameters, the NGSI-LD infrastructure is able to create the Dataset Series entity as well as the required Datasets and Data Services. For example, if *frequency* is "MONTHLY" and *startsAt* and *endsAt* comprise a year of data, then the NGSI-LD infrastructure has to create a Dataset Series containing a Dataset per month (12 Datasets), each of them related with a Data Service (12 Data Services, 1 per month).

EXAMPLE:

(monthly frequency):

```
Data Service - April 2024
{
  "id": "urn:ngsi-ld DataService:AirQualityObserved:April2024",

Annex A: Mapping examples

A.0 Foreword

Annex A presents usage examples of DCAT-AP classes mapped into NGSI-LD entities. Furthermore, the @context file that has to be used for any DCAT-AP entity is also provided.

A.1 Catalogue entity

Listing A-1: Basic example of Catalogue

```
{
  "id": "urn:ngsi-ld:Catalogue:id:SALTED-project",
  "type": "Catalogue",
  "title": {
    "type": "Property",
    "value": [
      {
        "@language": "http://publications.europa.eu/resource/authority/language/ENG",
        "@value": "SALTED Project"
      },
      {
        "@language": "http://publications.europa.eu/resource/authority/language/SPA",
        "@value": "Proyecto SALTED"
      }
    ]
  },
  "description": {
    "type": "Property",
    "value": [
      "This is the SALTED Project Catalogue. Data is available in JSON and JSON-LD format.",
      {
        "@language": "http://publications.europa.eu/resource/authority/language/SPA",
        "@value": "Este es el catalogo del proyecto SALTED. La informacion esta disponible en formato JSON y JSON-LD."
      }
    ]
  },
  "publisher": {
    "type": "Relationship",
    "@id": "urn:ngsi-ld:Agent:SALTED"
  },
  "dataset": {
    "type": "Relationship",
    "@id": [
      "urn:ngsi-ld:Dataset:Environment:AirQualityObserved",
      "urn:ngsi-ld:Dataset:Transportation:TrafficFlowObserved",
      "urn:ngsi-ld:Dataset:Parking:ParkingSpot"
    ]
  },
  "homepage": {

```

NOTE: Further countries and places can be added to the @context so that the bbox and centroid VocabProperties can be properly coerced to the corresponding EU Vocabularies Name Authority Lists as they are available at <http://publications.europa.eu/resource/authority/continent>, <http://publications.europa.eu/resource/authority/country>, <http://publications.europa.eu/resource/authority/place>, or, if a particular location is not in one of the mentioned Named Authority Lists, the Geonames URI provided at <http://sws.geonames.org/>.

Annex B: DCAT-AP Entities JSON Schemas

B.0 Foreword

This Annex presents the complete JSON Schemas for the DCAT-AP classes mapping as NGSI-LD entities.

B.1 Catalogue entity JSON Schema

Listing B-1: JSON Schema for the NGSI-LD Catalogue entity

```
{
  "$schema": "https://json-schema.org/draft/2020-12/schema",
  "$schemaVersion": "1.0.1",
  "$id": "DCAT-AP_NGSI-LD_Mapping/Catalogue/schema.json",
  "title": "Catalogue DCAT-AP",
  "description": "Catalogue of datasets compliant with DCAT-AP specification version 3.0.0.",
  "type": "object",
  "properties": {
    "type": {
      "description": "Property. Model:'https://schema.org/Text'. It has to be Catalogue",
      "type": "string",
      "enum": [
        "Catalogue"
      ]
    },
    "id": {
      "description": "Identifier format of any NGSI entity of type Catalogue.",
      "type": "string",
      "minLength": 1,
