NOTE 2: The UE can locally start a back-off timer after receiving a PDU session reactivation result error cause IE with a 5GMM cause set to #69 "insufficient resources for specific slice". The value of the back-off timer is up to UE implementation. Upon expiry of the back-off timer, the UE can re-send a request for user-plane re-establishment for the associated PDU session.

NOTE 3: If the UE that does not support S-NSSAI location validity information is outside the NS-AoS of the S-NSSAI associated with the PDU session, the AMF may perform congestion control and indicate PDU session reactivation result error cause IE with the 5GMM cause set to #69 "insufficient resources for specific slice".

For case a, b and e,

- if the AMF has a service area list or LADN information which is applicable to the current TAI of the UE and was not yet provided to the UE, before sending the SERVICE ACCEPT message the AMF shall initiate the generic UE configuration update procedure and include the service area list or LADN information or both in the CONFIGURATION UPDATE COMMAND message;
- if timer T3540 is not started (see subclause 5.3.1.3, item f), and the UE did not receive a CONFIGURATION UPDATE COMMAND message during the service request procedure, the UE may initiate a registration procedure for mobility or periodic registration update. If timer T3540 is started and the UE does not receive a CONFIGURATION UPDATE COMMAND message before the established N1 NAS signalling connection is released by the network or timer T3540 expires or is stopped as specified in subclause 5.3.1.3, the UE may initiate the registration procedure for mobility or periodic registration update upon release of the N1 NAS signalling connection; and
- if the AMF has S-NSSAI location validity information that is applicable to the current cell of the UE and was not yet provided to the UE, before sending the SERVICE ACCEPT message the AMF shall initiate the generic UE configuration update procedure and include the S-NSSAI location validity information in the CONFIGURATION UPDATE COMMAND message.

If the PDU session reactivation result IE is included in the SERVICE ACCEPT message indicating that the user-plane resources cannot be established for a PDU session that was indicated by the UE in the Allowed PDU session status IE as allowed to be re-established over 3GPP access, the UE considers the corresponding PDU session to be associated with the non-3GPP access.

If the MUSIM UE does not include the Paging restriction IE in the SERVICE REQUEST message, the AMF shall delete any stored paging restriction for the UE and stop restricting paging.

For case m in subclause 5.6.1.1 when the MUSIM UE sets the Request type to "NAS signalling connection release" in the SERVICE REQUEST message, the AMF shall initiate the release of the N1 NAS signalling connection after the completion of the service request procedure.

For cases o and p in subclause 5.6.1.1 when the MUSIM UE sets the Request type to "NAS signalling connection release" or to "Rejection of paging" in the UE request type IE in the SERVICE REQUEST message and if the UE requests restriction of paging by including the Paging restriction IE, the AMF:

- if accepts the paging restriction, shall include the 5GS additional request result IE in the SERVICE ACCEPT message and set the Paging restriction decision to "paging restriction is accepted". The AMF shall store the

paging restriction of the UE and enforce these restrictions in the paging procedure as described in subclause 5.6.2; or

- if rejects the paging restriction, shall include the 5GS additional request result IE in the SERVICE ACCEPT message and set the Paging restriction decision to "paging restriction is rejected", and shall discard the received paging restriction. The AMF shall delete any stored paging restriction for the UE and stop restricting paging; and

the AMF shall initiate the release of the N1 NAS signalling connection as follows:

- for case o in subclause 5.6.1.1, after the completion of the service request procedure;
- for case p in subclause 5.6.1.1, after the completion of the generic UE configuration update procedure that is triggered after the completion of the service request procedure.

If the SERVICE REQUEST message is for emergency services fallback, the AMF triggers the emergency services fallback procedure as specified in subclause 4.13.4.2 of 3GPP TS 23.502 [9].

If the UE having an emergency PDU session associated with 3GPP access sent the SERVICE REQUEST message via:

- a) a CAG cell and none of the CAG-ID(s) of the CAG cell are authorized based on the "Allowed CAG list" for the current PLMN in the UE's subscription; or
- b) a non-CAG cell in a PLMN for which the UE's subscription contains an "indication that the UE is only allowed to access 5GS via CAG cells";

the network shall accept the SERVICE REQUEST message and release all non-emergency PDU sessions associated with 3GPP access locally. The emergency PDU session associated with 3GPP access and PDU sessions associated with non-3GPP access shall not be released.

If the AMF received the list of TAIs from the satellite NG-RAN as described in 3GPP TS 23.501 [8], and determines that, by UE subscription and operator's preferences, any but not all TAIs in the received list of TAIs is forbidden for roaming or for regional provision of service, the AMF shall include the TAI(s) in:

- a) the Forbidden TAI(s) for the list of "5GS forbidden tracking areas for roaming" IE; or
- b) the Forbidden TAI(s) for the list of "5GS forbidden tracking areas for regional provision of service" IE; or
- c) both;

in the SERVICE ACCEPT message.

NOTE 9: Void.

If the UE receives the Forbidden TAI(s) for the list of "5GS forbidden tracking areas for roaming" IE in the SERVICE ACCEPT message and the TAI(s) included in the IE is not part of the list of "5GS forbidden tracking areas for roaming", the UE shall store the TAI(s) belonging to the serving PLMN or equivalent PLMN(s) and ignore the TAI(s) which do not belong to the serving PLMN or equivalent PLMN(s) included in the IE into the list of "5GS forbidden tracking areas for roaming" and remove the TAI(s) from the stored TAI list if present.

If the UE receives the Forbidden TAI(s) for the list of "5GS forbidden tracking areas for regional provision of service" IE in the SERVICE ACCEPT message and the TAI(s) included in the IE is not part of the list of "5GS forbidden tracking areas for regional provision of service", the UE shall store the TAI(s) belonging to the serving PLMN or equivalent PLMN(s) and ignore the TAI(s) which do not belong to the serving PLMN or equivalent PLMN(s) included in the IE into the list of "5GS forbidden tracking areas for regional provision of service" and remove the TAI(s) from the stored TAI list if present.

5.6.1.4.2 UE is using 5GS services with control plane Clot 5GS optimization

For case a in subclause 5.6.1.1, upon receipt of the CONTROL PLANE SERVICE REQUEST message with Control plane service type indicating "mobile terminating request", after completion of the 5GMM common procedures (if initiated) according to subclause 5.6.1.3, the AMF shall send a SERVICE ACCEPT message.

For cases c, d and m in subclause 5.6.1.1, upon receipt of the CONTROL PLANE SERVICE REQUEST message with Control plane service type indicating "mobile originating request", after completion of the 5GMM common procedures (if initiated) according to subclause 5.6.1.3, the AMF shall send a SERVICE ACCEPT message, except for case d when

the DDX field of the Release assistance indication IE or the DDX field of the CIoT small data container IE indicates "No further uplink and no further downlink data transmission subsequent to the uplink data transmission is expected".

For case a, c and d:

- a) if the CIoT small data container IE is included in the message, the AMF shall decipher the value part of the CIoT small data container IE and:
 - 1) if the Data type field indicates "control plane user data", extract the PDU session ID and data content from the CIoT small data container IE, look up a PDU session routing context for the UE and the PDU session ID, and forward the content of the CIoT small data container IE to the SMF associated with the UE. If the corresponding PDU session is a PDU session for LADN, the AMF determines the UE presence in LADN service area (see subclause 6.2.6) and forwards the UE presence in LADN service area towards the SMF;
 - 2) if the Data type field indicates "SMS", forward the content of the CIoT small data container IE to the SMSF associated with the UE; or
 - 3) if the Data type field indicates "Location services message container", and if
 - i) length of additional information field in the CIoT small data container IE is zero, forward the value of Data type field and the content of the CIoT small data container IE to the location services application; or
 - ii) otherwise forward the value of Data type field and the content of the CIoT small data container IE to the LMF associated with the routing information that is included in the additional information field of the CIoT small data container IE; or

NOTE 1: If the AMF determines there is no pending data or signalling for the UE, the AMF provides an indication of control plane CIoT 5GS Optimisation to the LMF as specified in 3GPP TS 29.518 [20B].

- b) otherwise, the AMF shall decipher the value part of NAS message container IE and:
 - 1) if the Payload container IE is included in the CONTROL PLANE SERVICE REQUEST message and if the Payload container type IE is set to "CIoT user data container", the AMF shall look up a PDU session routing context for the UE and the PDU session ID, and forward the content of the Payload container IE to the SMF associated with the UE. If the corresponding PDU session is a PDU session for LADN, the AMF determines the UE presence in LADN service area (see subclause 6.2.6) and forwards the UE presence in LADN service area towards the SMF;
 - 2) if the Payload container IE is included in the CONTROL PLANE SERVICE REQUEST message and if the Payload container type IE is set to "SMS", the AMF shall forward the content of the Payload container IE to the SMSF associated with the UE;
 - 3) if the PDU session status IE is included in the CONTROL PLANE SERVICE REQUEST message or the AMF needs to perform a PDU session status synchronization, the AMF shall include a PDU session status IE in the SERVICE ACCEPT message to indicate which PDU sessions associated with the access type the SERVICE ACCEPT message is sent over are active in the AMF;
 - 4) if the Uplink data status IE is included in the CONTROL PLANE SERVICE REQUEST message and the UE is:
 - i) not in NB-N1 mode; or
 - ii) in NB-N1 mode and the UE does not indicate a request to have user-plane resources established for a number of PDU sessions that exceeds the UE's maximum number of supported user-plane resources;
 the AMF shall:
 - i) indicate the SMF to re-establish the user-plane resources for the corresponding PDU sessions; and
 - ii) include the PDU session reactivation result IE in the SERVICE ACCEPT message to indicate the user-plane resources re-establishment result of the PDU sessions for which the UE requested to re-establish the user-plane resources;
 - 5) if the Uplink data status IE is included in the CONTROL PLANE SERVICE REQUEST, the UE is in NB-N1 mode, and the UE indicates a request to have user-plane resources established for a number of PDU sessions

that exceeds the UE's maximum number of supported user-plane resources, the AMF shall not indicate to the SMF to re-establish the user-plane resources for the corresponding PDU sessions; or

- 6) otherwise, if the Payload container IE is included in the message and if the Payload container type IE is set to "Location services message container", the AMF shall forward the Payload container type and the content of the Payload container IE to the LMF associated with the routing information included in the Additional information IE of the CONTROL PLANE SERVICE REQUEST message.

NOTE 2: If the AMF determines there is no pending data or signalling for the UE, the AMF provides an indication of control plane CIoT 5GS Optimisation to the LMF as specified in 3GPP TS 29.518 [20B].

For case k) in subclause 5.6.1.1, if the Uplink data status IE is included in the CONTROL PLANE SERVICE REQUEST message and the UE is:

- a) not in NB-N1 mode; or
- b) in NB-N1 mode and the UE does not indicate a request to have user-plane resources established for a number of PDU sessions that exceeds the UE's maximum number of supported user-plane resources,

the AMF shall:

- a) indicate the SMF to re-establish the user-plane resources for the corresponding PDU sessions; and
- b) include the PDU session reactivation result IE in the SERVICE ACCEPT message to indicate the user-plane resources re-establishment result of the PDU sessions for which the UE requested to re-establish the user-plane resources.

If the Allowed PDU session status IE is included in the CONTROL PLANE SERVICE REQUEST message, the AMF shall:

- a) for a 5GSM message from each SMF that has indicated pending downlink signalling only, forward the received 5GSM message via 3GPP access to the UE after the SERVICE ACCEPT message is sent;
- b) for each SMF that has indicated pending downlink data only:
 - 1) notify the SMF that reactivation of the user-plane resources for the corresponding PDU session(s) associated with non-3GPP access cannot be performed if the corresponding PDU session ID(s) are not indicated in the Allowed PDU session status IE; and
 - 2) notify the SMF that reactivation of the user-plane resources for the corresponding PDU session(s) associated with non-3GPP access can be performed if:
 - i) for a UE not in NB-N1 mode, the corresponding PDU session ID(s) are indicated in the Allowed PDU session status IE; or
 - ii) for a UE in NB-N1 mode, the corresponding PDU session ID(s) are indicated in the Allowed PDU session status IE and the resulting number of PDU sessions with established user-plane resources does not exceed the UE's maximum number of supported user-plane resources;
- c) for each SMF that have indicated pending downlink signalling and data:
 - 1) notify the SMF that reactivation of the user-plane resources for the corresponding PDU session(s) associated with non-3GPP access cannot be performed if the corresponding PDU session ID(s) are not indicated in the Allowed PDU session status IE;
 - 2) notify the SMF that reactivation of the user-plane resources for the corresponding PDU session(s) associated with non-3GPP access can be performed if:
 - i) for a UE not in NB-N1 mode, the corresponding PDU session ID(s) are indicated in the Allowed PDU session status IE; or
 - ii) for a UE in NB-N1 mode, the corresponding PDU session ID(s) are indicated in the Allowed PDU session status IE and the resulting number of PDU sessions with established user-plane resources does not exceed the UE's maximum number of supported user-plane resources; and
 - 3) discard the received 5GSM message for PDU session(s) associated with non-3GPP access; and

- d) include the PDU session reactivation result IE in the SERVICE ACCEPT message to indicate the successfully re-established user-plane resources for the corresponding PDU sessions, if any.

If the DDX field in the CIoT small data container IE or the DDX field of the Release assistance indication IE indicates:

- 1) "No further uplink and no further downlink data transmission subsequent to the uplink data transmission is expected" and if there is no downlink signalling or downlink data for the UE; or
- 2) "Only a single downlink data transmission and no further uplink data transmission subsequent to the uplink data transmission is expected" and upon subsequent delivery of the next received downlink data transmission to the UE and if there is no additional downlink signalling or downlink data for the UE,

the AMF initiates the release of the N1 NAS signalling connection (see 3GPP TS 23.502 [9]).

If the MUSIM UE does not include the Paging restriction IE in the CONTROL PLANE SERVICE REQUEST message, the AMF shall delete any stored paging restriction for the UE and stop restricting paging.

For case m in subclause 5.6.1.1 when the MUSIM UE sets the Request type to "NAS signalling connection release" in the CONTROL PLANE SERVICE REQUEST message, the AMF shall initiate the release of the N1 NAS signalling connection after the completion of the service request procedure.

For cases o and p in subclause 5.6.1.1 when the MUSIM UE sets the Request type to "NAS signalling connection release" or to "Rejection of paging" in the UE request type IE in the CONTROL PLANE SERVICE REQUEST message and if the UE requests restriction of paging by including the Paging restriction IE, the AMF:

- if accepts the paging restriction, shall include the 5GS additional request result IE in the SERVICE ACCEPT message and set the Paging restriction decision to "paging restriction is accepted". The AMF shall store the paging restriction of the UE and enforce these restrictions in the paging procedure as described in subclause 5.6.2; or
- if rejects the paging restriction, shall include the 5GS additional request result IE in the SERVICE ACCEPT message and set the Paging restriction decision to "paging restriction is rejected", and shall discard the received paging restriction. The AMF shall delete any stored paging restriction for the UE and stop restricting paging; and

the AMF shall send the SERVICE ACCEPT message and initiate the release of the N1 NAS signalling connection as follows:

- for case o in subclause 5.6.1.1, after the completion of the service request procedure;
- for case p in subclause 5.6.1.1, after the completion of the generic UE configuration update procedure that is triggered after the completion of the service request procedure.

Upon successful completion of the procedure, the UE shall reset the service request attempt counter, stop the timer T3517 and enter the state 5GMM-REGISTERED.

If the PDU session status information element is included in the CONTROL PLANE SERVICE REQUEST message, then the AMF:

- a) shall perform a local release of all those PDU sessions which are not in 5GSM state PDU SESSION INACTIVE on the AMF side associated with the access type the CONTROL PLANE SERVICE REQUEST message is sent over, but are indicated by the UE as being inactive, and
- b) request the SMF to perform a local release of all those PDU sessions. If any of those PDU sessions is associated with one or more multicast MBS sessions, the SMF shall consider the UE as removed from the associated multicast MBS sessions.

If the PDU session status information element is included in the SERVICE ACCEPT message, then the UE shall perform a local release of all those PDU sessions which are not in 5GSM state PDU SESSION INACTIVE or PDU SESSION ACTIVE PENDING on the UE side associated with the 3GPP access but are indicated by the AMF as being inactive. If a locally released PDU session:

- a) is associated with one or more multicast MBS sessions, the UE shall locally leave the associated multicast MBS sessions; or

- b) has the same PDU session identity value as that used by the UE in the CONTROL PLANE SERVICE REQUEST message, and the message contained CIoT user data, then the UE determines that the CIoT user data was not successfully sent.

If the user-plane resources cannot be established for a PDU session, the AMF shall include the PDU session reactivation result IE in the SERVICE ACCEPT message indicating that user-plane resources for the corresponding PDU session cannot be re-established, and:

- a) if the user-plane resources cannot be established because the SMF indicated to the AMF that the UE is located out of the LADN service area (see 3GPP TS 29.502 [20A]), the AMF shall include the PDU session reactivation result error cause IE with the 5GMM cause set to #43 "LADN not available";
- b) if the user-plane resources cannot be established because the SMF indicated to the AMF that only prioritized services are allowed (see 3GPP TS 29.502 [20A]), the AMF shall include the PDU session reactivation result error cause IE with the 5GMM cause set to #28 "restricted service area";
- c) if the user-plane resources cannot be established because:
 - 1) the SMF indicated to the AMF that the resource is not available in the UPF (see 3GPP TS 29.502 [20A]); or
 - 2) the UE is in NB-N1 mode and the result will lead to user-plane resources established for more than two PDU sessions (see 3GPP TS 23.502 [9])

the AMF shall include the PDU session reactivation result error cause IE with the 5GMM cause set to #92 "insufficient user-plane resources for the PDU session";

NOTE 3: For a UE that is not in NB-N1 mode, it is up to UE implementation when to re-send a request for user-plane re-establishment for the associated PDU session after receiving a PDU session reactivation result error cause IE with a 5GMM cause set to #92 "insufficient user-plane resources for the PDU session"; or

- d) if the user-plane resources cannot be established because the AMF determines that the UE is outside the NS-AoS of the S-NSSAI associated with the PDU session, the AMF may include the PDU session reactivation result error cause IE with the 5GMM cause set to #69 "insufficient resources for specific slice" to indicate the cause of failure to re-establish the user-plane resources.

NOTE 4: If the UE that does not support S-NSSAI location validity information is outside the NS-AoS of the S-NSSAI associated with the PDU session, the AMF may perform congestion control and indicate PDU session reactivation result error cause IE with the 5GMM cause set to #69 "insufficient resources for specific slice".

For case a, b and d,

- if the AMF has a service area list or LADN information which is applicable to the current TAI of the UE and was not yet provided to the UE, before sending the SERVICE ACCEPT message the AMF shall initiate the generic UE configuration update procedure and include the service area list or LADN information or both in the CONFIGURATION UPDATE COMMAND message; and
- if timer T3540 is not started (see subclause 5.3.1.3, item f), and the UE did not receive a CONFIGURATION UPDATE COMMAND message during the service request procedure, the UE may initiate a registration procedure for mobility or periodic registration update. If timer T3540 is started and the UE does not receive a CONFIGURATION UPDATE COMMAND message before the established N1 NAS signalling connection is released by the network or timer T3540 expires or is stopped as specified in subclause 5.3.1.3, the UE may initiate the registration procedure for mobility or periodic registration update upon release of the N1 NAS signalling connection.
- if the AMF has S-NSSAI location validity information that is applicable to the current cell of the UE and was not yet provided to the UE, before sending the SERVICE ACCEPT message the AMF shall initiate the generic UE configuration update procedure and include the S-NSSAI location validity information in the CONFIGURATION UPDATE COMMAND message.

If the PDU session reactivation result IE is included in the SERVICE ACCEPT message indicating that the user-plane resources cannot be established for a PDU session that was indicated by the UE in the Allowed PDU session status IE as allowed to be re-established over 3GPP access, the UE considers the corresponding PDU session to be associated with the non-3GPP access.

For case d) in subclause 5.6.1.1, the UE shall also treat the indication from the lower layers that the RRC connection has been released as successful completion of the procedure. The UE shall reset the service request attempt counter, stop the timer T3517 and enter the state 5GMM-REGISTERED.

Upon receipt of the CONTROL PLANE SERVICE REQUEST message with uplink data:

- if the DDX field of the Release assistance indication IE or the DDX field of the CIoT small data container IE is set to "No further uplink and no further downlink data transmission subsequent to the uplink data transmission is expected" in the message;
- if the AMF decides to forward the uplink data piggybacked in the CONTROL PLANE SERVICE REQUEST message; and
- if the AMF decides to activate the congestion control for transport of user data via the control plane,

then the AMF shall send SERVICE ACCEPT message with the T3448 value IE included.

If the AMF decides to deactivate the congestion control for transport of user data via the control plane, then the AMF shall delete the stored control plane data back-off time for the UE and the AMF shall not include timer T3448 value IE in the SERVICE ACCEPT message.

If the T3448 value IE is present in the received SERVICE ACCEPT message and the value indicates that this timer is neither zero nor deactivated, the UE shall:

- a) stop timer T3448 if it is running;
- b) consider the transport of user data via the control plane as successful; and
- c) start timer T3448 with the value provided in the T3448 value IE.

If the UE is using 5GS services with control plane CIoT 5GS optimization, the T3448 value IE is present in the SERVICE ACCEPT message and the value indicates that this timer is either zero or deactivated, the UE shall ignore the T3448 value IE and proceed as if the T3448 value IE was not present.

If the UE in 5GMM-IDLE mode initiated the service request procedure by sending a CONTROL PLANE SERVICE REQUEST message and the SERVICE ACCEPT message does not include the T3448 value IE and if timer T3448 is running, then the UE shall stop timer T3448.

For case h) in subclause 5.6.1.1,

- a) the UE shall treat the indication from the lower layers when the UE has changed to S1 mode as successful completion of the procedure and stop timer T3517;
- b) if a UE operating in single-registration mode has changed to S1 mode, it shall disable the N1 mode capability for 3GPP access (see subclause 4.9.2); and
- c) the AMF shall not check for CAG restrictions.

If the CONTROL PLANE SERVICE REQUEST message is for emergency services fallback, the AMF triggers the emergency services fallback procedure as specified in subclause 4.13.4.2 of 3GPP TS 23.502 [9].

5.6.1.5 Service request procedure not accepted by the network

If the service request cannot be accepted, the network shall return a SERVICE REJECT message to the UE including an appropriate 5GMM cause value.

If the SERVICE REJECT message with 5GMM cause #76 or #78 was received without integrity protection, then the UE shall discard the message.

If the AMF needs to initiate PDU session status synchronisation or a PDU session status IE was included in the SERVICE REQUEST message, the AMF shall include a PDU session status IE in the SERVICE REJECT message to indicate which PDU sessions associated with the access type the SERVICE REJECT message is sent over are active in the AMF. If the PDU session status IE is included in the SERVICE REJECT message and if the message is integrity protected, then:

- a) for single access PDU sessions, the UE shall perform a local release of all those PDU sessions which are not in 5GSM state PDU SESSION INACTIVE or PDU SESSION ACTIVE PENDING on the UE side associated with the access type the SERVICE REJECT message is sent over, but are indicated by the AMF as being in 5GSM state PDU SESSION INACTIVE. If a locally released PDU session is associated with one or more MBS sessions, the UE shall locally leave the associated MBS multicast sessions; and
- b) for MA PDU sessions, for all those PDU sessions which are not in 5GSM state PDU SESSION INACTIVE or PDU SESSION ACTIVE PENDING and have user plane resources established on the UE side associated with the access the SERVICE REJECT message is sent over, but are indicated by the AMF as no user plane resources established:
 - 1) for MA PDU sessions having user plane resources established only on the access type the SERVICE REJECT message is sent over, the UE shall perform a local release of those MA PDU sessions. If a locally released PDU session is associated with one or more MBS sessions, the UE shall locally leave the associated MBS multicast sessions; and
 - 2) for MA PDU sessions having user plane resources established on both accesses, the UE shall perform a local release on the user plane resources on the access type the SERVICE REJECT message is sent over. If a locally released PDU session is associated with one or more MBS sessions, the UE shall locally leave the associated MBS multicast sessions.

If the service request for mobile originated services is rejected due to general NAS level mobility management congestion control, the network shall set the 5GMM cause value to #22 "congestion" and assign a value for back-off timer T3346.

If the service request for mobile originated services is rejected due to general NAS level mobility management congestion control for the SNPN selected for localized services in SNPN (see 3GPP TS 23.122 [5]), the network may set an appropriate cause value other than 5GMM cause value to #22 "congestion" and does not assign a value for back-off timer T3346.

In NB-N1 mode, if the service request for mobile originated services is rejected due to operator determined barring (see 3GPP TS 29.503 [20AB]), the network shall set the 5GMM cause value to #22 "congestion" and assign a value for back-off timer T3346.

If the service request from a UE supporting CAG is rejected due to CAG restrictions, the network shall set the 5GMM cause value to #76 "Not authorized for this CAG or authorized for CAG cells only" and should include the "CAG information list" in the CAG information list IE or the Extended CAG information list IE in the SERVICE REJECT message.

NOTE 1: The network cannot be certain that "CAG information list" stored in the UE is updated as result of sending of the SERVICE REJECT message with the CAG information list IE or the Extended CAG information list IE, as the SERVICE REJECT message is not necessarily delivered to the UE (e.g., due to abnormal radio conditions).

NOTE 2: The "CAG information list" can be provided by the AMF and include no entry if no "CAG information list" exists in the subscription.

NOTE 2A: If the UE supports extended CAG information list, the CAG information list can be included either in the CAG information list IE or Extended CAG information list IE.

NOTE 2B: It is unexpected for network to send REGISTRATION REJECT message to the UE with 5GMM cause value #76 in non-CAG cell and not indicate "Indication that the UE is only allowed to access 5GS via CAG cells" for the serving PLMN in the Extended CAG information list or the CAG information list.

If the UE does not support extended CAG information list, the CAG information list shall not be included in the Extended CAG information list IE.

If the service request from a UE not supporting CAG is rejected due to CAG restrictions, the network shall operate as described in bullet h) of subclause 5.6.1.8.

Upon receipt of the CONTROL PLANE SERVICE REQUEST message with uplink data:

- if the AMF decides to not forward the uplink data piggybacked in the CONTROL PLANE SERVICE REQUEST message; and

- if the AMF decides to activate the congestion control for transport of user data via the control plane,

then the AMF shall send a SERVICE REJECT message and set the 5GMM cause value to #22 "congestion" and assign a value for control plane data back-off timer T3448.

If the AMF determines that the UE is in a non-allowed area or is not in an allowed area as specified in subclause 5.3.5, then:

- a) if the service type IE in the SERVICE REQUEST message is set to "high priority access" and service area restrictions are applicable for high priority access based on operator policy, or set to "signalling" or "data", the AMF shall send a SERVICE REJECT message with the 5GMM cause value set to #28 "Restricted service area";
- b) otherwise, if the service type IE in the SERVICE REQUEST message is set to "high priority access" and service area restrictions are not applicable for high priority access based on operator policy, or set to "mobile terminated services", "emergency services", "emergency services fallback" or "elevated signalling", the AMF shall continue the process as specified in subclause 5.6.1.4 unless for other reasons the service request cannot be accepted.

If the service request for mobile originated services is rejected due to service gap control as specified in subclause 5.3.17, i.e. the T3447 timer is running in AMF, the network shall set the 5GMM cause value to #22 "Congestion" and may include T3346 value IE in the SERVICE REJECT message set to the remaining time of the running T3447 timer.

Based on operator policy, if the service request procedure is rejected due to core network redirection for CIoT optimizations, the network shall set the 5GMM cause value to #31 "Redirection to EPC required".

NOTE 3: The network can take into account the UE's S1 mode capability, the EPS CIoT network behaviour supported by the UE or the EPS CIoT network behaviour supported by the EPC to determine the rejection with the 5GMM cause value #31 "Redirection to EPC required".

If the service request is via a satellite NG-RAN cell, and the network determines that the UE is in a location where the network is not allowed to operate, see 3GPP TS 23.502 [9], the network shall set the 5GMM cause value in the SERVICE REJECT message to #78 "PLMN not allowed to operate at the present UE location".

NOTE 3A: While location determination is ongoing to ensure that operator and regulatory policies are met, the AMF can perform DNN-based or S-NSSAI based congestion control as specified in subclauses 5.3.10 and 5.3.11 to prevent the UE from accessing network.

If the service request from a UE supporting MINT is rejected due to a disaster condition no longer being applicable in the current location of the UE, the network shall set the 5GMM cause value to #11 "PLMN not allowed" or #13 "Roaming not allowed in this tracking area" and may include a disaster return wait range in the Disaster return wait range IE in the SERVICE REJECT message.

On receipt of the SERVICE REJECT message, if the UE is in state 5GMM-SERVICE-REQUEST-INITIATED, the UE shall reset the service request attempt counter and stop timer T3517 if running.

If

- 1) the UE indicated support of the access technology utilization control;
- 2) the network determines to apply the access technology utilization control based on the operator policy; and
- 3) the secure exchange of NAS messages via an N1 NAS signalling connection is established between the UE and the AMF;

the AMF shall send the integrity protected SERVICE REJECT message with the 5GMM cause value set to #15 "No suitable cells in tracking area" and include the Access technology utilization control IE. In the Access technology utilization control IE, the AMF shall indicate that the access technology of the NG-RAN cell on which the SERVICE REQUEST message was received is restricted.

NOTE 3B: Other restricted access technologies can be indicated in the Access technology utilization control IE, if any.

If the AMF received multiple TAIs from the satellite NG-RAN as described in 3GPP TS 23.501 [8], and determines that, by UE subscription and operator's preferences, all of the received TAIs are forbidden, for roaming or for regional provision of service, the AMF shall include the TAI(s) in:

- a) the Forbidden TAI(s) for the list of "5GS forbidden tracking areas for roaming" IE; or
- b) the Forbidden TAI(s) for the list of "5GS forbidden tracking areas for regional provision of service" IE; or
- c) both;

in the SERVICE REJECT message.

Regardless of the 5GMM cause value received in the SERVICE REJECT message via satellite NG-RAN,

- if the UE receives the Forbidden TAI(s) for the list of "5GS forbidden tracking areas for roaming" IE and the Access technology utilization control IE is not included in the SERVICE REJECT message, the UE shall store the TAI(s) belonging to the serving PLMN or equivalent PLMN(s) and ignore the TAI(s) which do not belong to the serving PLMN or equivalent PLMN(s) included in the IE, if not already stored, into the list of "5GS forbidden tracking areas for roaming"; and
- if the UE receives the Forbidden TAI(s) for the list of "5GS forbidden tracking areas for regional provision of service" IE in the SERVICE REJECT message, the UE shall store the TAI(s) belonging to the serving PLMN or equivalent PLMN(s) and ignore the TAI(s) which do not belong to the serving PLMN or equivalent PLMN(s) included in the IE, if not already stored, into the list of "5GS forbidden tracking areas for regional provision of service".

Furthermore, the UE shall take the following actions depending on the 5GMM cause value received in the SERVICE REJECT message.

#3 (Illegal UE);

#6 (Illegal ME);

The UE shall set the 5GS update status to 5U3 ROAMING NOT ALLOWED (and shall store it according to subclause 5.1.3.2.2) and shall delete any 5G-GUTI, last visited registered TAI, TAI list and ngKSI.

In case of PLMN, the UE shall consider the USIM as invalid for 5GS services until switching off, the UICC containing the USIM is removed or the timer T3245 expires as described in subclause 5.3.19A.1;

In case of SNPN, if the UE is not registered for onboarding services in SNPN and the UE does not support access to an SNPN using credentials from a credentials holder and does not support equivalent SNPNs, the UE shall consider the selected entry of the "list of subscriber data" with the SNPN identity of the current SNPN as invalid until the UE is switched off, the entry is updated or the timer T3245 expires as described in subclause 5.3.19A.2. In case of SNPN, if the UE is not registered for onboarding services in SNPN and the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs, or both, the UE shall consider the selected entry of the "list of subscriber data" as invalid for 3GPP access until the UE is switched off, the entry is updated or the timer T3245 expires as described in subclause 5.3.19A.2. Additionally, if EAP based primary authentication and key agreement procedure using EAP-AKA' or 5G AKA based primary authentication and key agreement procedure was performed in the current SNPN, the UE shall consider the USIM as invalid for the current SNPN until switching off, the UICC containing the USIM is removed or the timer T3245 expires as described in subclause 5.3.19A.2.

If the UE is not registered for onboarding services in SNPN, the UE shall delete the list of equivalent PLMNs (if any) or the list of equivalent SNPNs (if any), and shall enter the state 5GMM-DEREGISTERED.NO-SUPI. If the message has been successfully integrity checked by the NAS, then the UE shall:

- 1) set the counter for "SIM/USIM considered invalid for GPRS services" events and the counter for "USIM considered invalid for 5GS services over non-3GPP access" events to UE implementation-specific maximum value in case of PLMN if the UE maintains these counters; or
- 2) set the counter for "the entry for the current SNPN considered invalid for 3GPP access" events and the counter for "the entry for the current SNPN considered invalid for non-3GPP access" events to UE implementation-specific maximum value in case of SNPN if the UE maintains these counters.

If the message was received via 3GPP access and the UE is operating in the single-registration mode, the UE shall handle the EMM parameters EMM state, EPS update status, 4G-GUTI, last visited registered TAI, TAI list and eKSI as specified in 3GPP TS 24.301 [15] for the case when the service request procedure is rejected with the EMM cause with the same value. The USIM shall be considered as invalid also for non-EPS services until switching off, the UICC containing the USIM is removed or the timer T3245 expires as described in

subclause 5.3.7a in 3GPP TS 24.301 [15]. If the message has been successfully integrity checked by the NAS and the UE maintains a counter for "SIM/USIM considered invalid for non-GPRS services", then the UE shall set this counter to UE implementation-specific maximum value.

If the UE is registered for onboarding services in SNPN, the UE shall store the SNPN identity in the "permanently forbidden SNPNs for onboarding services in SNPN" list, enter state 5GMM-DEREGISTERED.PLMN-SEARCH, and perform an SNPN selection or an SNPN selection for onboarding services according to 3GPP TS 23.122 [5]. If the message has been successfully integrity checked by the NAS, the UE shall set the SNPN-specific attempt counter to the UE implementation-specific maximum value.

If the message has been successfully integrity checked by the NAS and the UE also supports the registration procedure over the other access, the UE shall in addition handle 5GMM parameters and 5GMM state for this access, as described for this 5GMM cause value.

#7 (5GS services not allowed).

The UE shall set the 5GS update status to 5U3 ROAMING NOT ALLOWED (and shall store it according to subclause 5.1.3.2.2) and shall delete any 5G-GUTI, last visited registered TAI, TAI list and ngKSI.

In case of PLMN, the UE shall consider the USIM as invalid for 5GS services until switching off, the UICC containing the USIM is removed or the timer T3245 expires as described in subclause 5.3.19A.1;

In case of SNPN, if the UE is not registered for onboarding services in SNPN and the UE does not support access to an SNPN using credentials from a credentials holder and does not support equivalent SNPNs, the UE shall consider the selected entry of the "list of subscriber data" with the SNPN identity of the current SNPN as invalid for 5GS services until the UE is switched off, the entry is updated or the timer T3245 expires as described in subclause 5.3.19A.2. In case of SNPN, if the UE is not registered for onboarding services in SNPN and the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs, or both, the UE shall consider the selected entry of the "list of subscriber data" as invalid for 3GPP access until the UE is switched off, the entry is updated or the timer T3245 expires as described in subclause 5.3.19A.2. Additionally, if EAP based primary authentication and key agreement procedure using EAP-AKA' or 5G AKA based primary authentication and key agreement procedure was performed in the current SNPN, the UE shall consider the USIM as invalid for the current SNPN until switching off, the UICC containing the USIM is removed or the timer T3245 expires as described in subclause 5.3.19A.2.

If the UE is not registered for onboarding services in SNPN, the UE shall enter the state 5GMM-DEREGISTERED.NO-SUPI. If the message has been successfully integrity checked by the NAS, then the UE shall:

- 1) set the counter for "SIM/USIM considered invalid for GPRS services" events and the counter for "USIM considered invalid for 5GS services over non-3GPP access" events to UE implementation-specific maximum value in case of PLMN if the UE maintains these counters; or
- 2) set the counter for "the entry for the current SNPN considered invalid for 3GPP access" events and the counter for "the entry for the current SNPN considered invalid for non-3GPP access" events to UE implementation-specific maximum value in case of SNPN if the UE maintains these counters.

If the message was received via 3GPP access and the UE is operating in single-registration mode, the UE shall handle the EMM parameters EMM state, EPS update status, 4G-GUTI, last visited registered TAI, TAI list and eKSI as specified in 3GPP TS 24.301 [15] for the case when the service request procedure is rejected with the EMM cause with the same value.

If the UE is registered for onboarding services in SNPN, the UE shall store the SNPN identity in the "permanently forbidden SNPNs for onboarding services in SNPN" list, enter state 5GMM-DEREGISTERED.PLMN-SEARCH, and perform an SNPN selection or an SNPN selection for onboarding services according to 3GPP TS 23.122 [5]. If the message has been successfully integrity checked by the NAS, the UE shall set the SNPN-specific attempt counter to the UE implementation-specific maximum value.

If the message has been successfully integrity checked by the NAS and the UE also supports the registration procedure over the other access, the UE shall in addition handle 5GMM parameters and 5GMM state for this access, as described for this 5GMM cause value.

NOTE 4: The possibility to configure a UE so that the radio transceiver for a specific radio access technology is not active, although it is implemented in the UE, is outside the scope of the present document.

#9 (UE identity cannot be derived by the network).

The UE shall set the 5GS update status to 5U2 NOT UPDATED (and shall store it according to subclause 5.1.3.2.2) and shall delete any 5G-GUTI, last visited registered TAI, TAI list and ngKSI. The UE shall enter the state 5GMM-DEREGISTERED.

If the service request was initiated for emergency services fallback, the UE shall attempt to select an E-UTRA cell connected to EPC or 5GCN according to the domain priority and selection rules specified in 3GPP TS 23.167 [6]. If the UE finds a suitable E-UTRA cell, it then proceeds with the appropriate EMM or 5GMM procedures. If the UE operating in single-registration mode has changed to S1 mode, it shall disable the N1 mode capability for 3GPP access.

If the service request was initiated for any reason other than emergency services fallback or initiating an emergency PDU session, the UE shall perform a new initial registration procedure.

NOTE 5: User interaction is necessary in some cases when the UE cannot re-establish the PDU session(s) automatically.

If the message was received via 3GPP access and the UE is operating in the single-registration mode, the UE shall handle the EMM parameters EMM state, EPS update status, 4G-GUTI, last visited registered TAI, TAI list and eKSI as specified in 3GPP TS 24.301 [15] for the case when the service request procedure is rejected with the EMM cause with the same value.

#10 (Implicitly de-registered).

The UE shall enter the state 5GMM-DEREGISTERED.NORMAL-SERVICE. The UE shall delete any mapped 5G NAS security context or partial native 5G NAS security context.

If the service request was initiated for emergency services fallback, the UE shall attempt to select an E-UTRA cell connected to EPC or 5GCN according to the domain priority and selection rules specified in 3GPP TS 23.167 [6]. If the UE finds a suitable E-UTRA cell, it then proceeds with the appropriate EMM or 5GMM procedures. If the UE operating in single-registration mode has changed to S1 mode, it shall disable the N1 mode capability for 3GPP access.

If the rejected request was neither for initiating an emergency PDU session nor for emergency services fallback, the UE shall perform a new initial registration procedure.

NOTE 6: User interaction is necessary in some cases when the UE cannot re-establish the PDU session(s) automatically.

If the message was received via 3GPP access and the UE is operating in the single-registration mode, the UE shall handle the EMM state as specified in 3GPP TS 24.301 [15] for the case when the service request procedure is rejected with the EMM cause with the same value.

#11 (PLMN not allowed).

This cause value received from a cell belonging to an SNPN and the UE is operating in SNPN access operation mode is considered as an abnormal case and the behaviour of the UE is specified in subclause 5.6.1.7.

The UE shall set the 5GS update status to 5U3 ROAMING NOT ALLOWED (and shall store it according to subclause 5.1.3.2.2) and shall delete any 5G-GUTI, last visited registered TAI, TAI list and ngKSI. The UE shall delete the list of equivalent PLMNs and store the PLMN identity in the forbidden PLMN list as specified in subclause 5.3.13A and if the UE is configured to use timer T3245 then the UE shall start timer T3245 and proceed as described in subclause 5.3.19A.1. For 3GPP access, the UE shall enter the state 5GMM-DEREGISTERED.PLMN-SEARCH and perform a PLMN selection according to 3GPP TS 23.122 [5], and for non-3GPP access the UE shall enter state 5GMM-DEREGISTERED.LIMITED-SERVICE and perform network selection as defined in 3GPP TS 24.502 [18]. If the message has been successfully integrity checked by the NAS and the UE maintains the PLMN-specific attempt counter and the PLMN-specific attempt counter for non-3GPP access for that PLMN, the UE shall set the PLMN-specific attempt counter and the PLMN-specific attempt counter for non-3GPP access for that PLMN to the UE implementation-specific maximum value.

If the message was received via 3GPP access and the UE is operating in single-registration mode, the UE shall in addition handle the EMM parameters EMM state, EPS update status, 4G-GUTI, last visited registered TAI, TAI list and eKSI as specified in 3GPP TS 24.301 [15] for the case when the service request procedure is rejected with the EMM cause with the same value.

If the message has been successfully integrity checked by the NAS and the UE also supports the registration procedure over the other access to the same PLMN, the UE shall in addition handle 5GMM parameters and 5GMM state for this access, as described for this 5GMM cause value.

If the UE receives the Disaster return wait range IE in the SERVICE REJECT message and the UE supports MINT, the UE shall delete the disaster return wait range stored in the ME, if any, and store the disaster return wait range included in the Disaster return wait range IE in the ME.

#12 (Tracking area not allowed).

The UE shall set the 5GS update status to 5U3 ROAMING NOT ALLOWED (and shall store it according to subclause 5.1.3.2.2) and shall delete last visited registered TAI and TAI list. If the UE is not registering or has not registered to the same PLMN over both 3GPP access and non-3GPP access, the UE shall additionally delete 5G-GUTI and ngKSI.

If:

- 1) the UE is not operating in SNPN access operation mode, the UE shall store the current TAI in the list of "5GS forbidden tracking areas for regional provision of service" and enter the state 5GMM-DEREGISTERED.LIMITED-SERVICE. If the SERVICE REJECT message is not integrity protected, the UE shall memorize the current TAI was stored in the list of "5GS forbidden tracking areas for regional provision of service" for non-integrity protected NAS reject message; or
- 2) the UE is operating in SNPN access operation mode, the UE shall store the current TAI in the list of "5GS forbidden tracking areas for regional provision of service" for the current SNPN and the selected entry of the "list of subscriber data" or the selected PLMN subscription, and enter the state 5GMM-DEREGISTERED.LIMITED-SERVICE. If the SERVICE REJECT message is not integrity protected, the UE shall memorize the current TAI was stored in the list of "5GS forbidden tracking areas for regional provision of service" for the current SNPN and the selected entry of the "list of subscriber data" or the selected PLMN subscription, for non-integrity protected NAS reject message.

If the message was received via 3GPP access and the UE is operating in single-registration mode, the UE shall handle the EMM parameters EMM state, EPS update status, 4G-GUTI, last visited registered TAI, TAI list and eKSI as specified in 3GPP TS 24.301 [15] for the case when the service request procedure is rejected with the EMM cause with the same value.

#13 (Roaming not allowed in this tracking area).

The UE shall set the 5GS update status to 5U3 ROAMING NOT ALLOWED (and shall store it according to subclause 5.1.3.2.2). For 3GPP access the UE shall enter the state 5GMM-REGISTERED.PLMN-SEARCH, and for non-3GPP access the UE shall enter the state 5GMM-REGISTERED.LIMITED-SERVICE.

If:

- 1) the UE is not operating in SNPN access operation mode, the UE shall store the current TAI in the list of "5GS forbidden tracking areas for roaming" and remove the current TAI from the stored TAI list if present. If the SERVICE REJECT message is not integrity protected, the UE shall memorize the current TAI was stored in the list of "5GS forbidden tracking areas for roaming" for non-integrity protected NAS reject message; or
- 2) the UE is operating in SNPN access operation mode, the UE shall store the current TAI in the list of "5GS forbidden tracking areas for roaming" for the current SNPN and the selected entry of the "list of subscriber data" or the selected PLMN subscription, and remove the current TAI from the stored TAI list if present. If the SERVICE REJECT message is not integrity protected, the UE shall memorize the current TAI was stored in the list of "5GS forbidden tracking areas for roaming" for the current SNPN and the selected entry of the "list of subscriber data" or the selected PLMN subscription, for non-integrity protected NAS reject message.

For 3GPP access the UE shall perform a PLMN selection or SNPN selection according to 3GPP TS 23.122 [5], and for non-3GPP access the UE shall perform network selection as defined in 3GPP TS 24.502 [18].

If the message was received via 3GPP access and the UE is operating in single-registration mode, the UE shall handle the EMM parameters EMM state and EPS update status as specified in 3GPP TS 24.301 [15] for the case when the service request procedure is rejected with the EMM cause with the same value.

If the UE receives the Disaster return wait range IE in the SERVICE REJECT message and the UE supports MINT, the UE shall delete the disaster return wait range stored in the ME, if any, and store the disaster return wait range included in the Disaster return wait range IE in the ME.

#15 (No suitable cells in tracking area).

The UE shall enter the state 5GMM-REGISTERED.LIMITED-SERVICE.

If:

1)

- i) the UE is not operating in SNPN access operation mode;
- ii) the Forbidden TAI(s) for the list of "5GS forbidden tracking areas for roaming" IE is not included in the SERVICE REJECT message; and
- iii) the Access technology utilization control IE is not included in the SERVICE REJECT message or the SERVICE REJECT message is not integrity protected,

then the UE shall store the current TAI in the list of "5GS forbidden tracking areas for roaming" and remove the current TAI from the stored TAI list if present.

If the UE stores the current TAI in the list of "5GS forbidden tracking areas for roaming" and the SERVICE REJECT message is not integrity protected, the UE shall memorize the current TAI was stored in the list of "5GS forbidden tracking areas for roaming" for non-integrity protected NAS reject message; or

- 2) the UE is operating in SNPN access operation mode, the UE shall store the current TAI in the list of "5GS forbidden tracking areas for roaming" for the current SNPN and the selected entry of the "list of subscriber data" or the selected PLMN subscription, and remove the current TAI from the stored TAI list if present. If the SERVICE REJECT message is not integrity protected, the UE shall memorize the current TAI was stored in the list of "5GS forbidden tracking areas for roaming" for the current SNPN and the selected entry of the "list of subscriber data" or the selected PLMN subscription, for non-integrity protected NAS reject message.

If the UE initiated service request for emergency services fallback, the UE shall attempt to select an E-UTRA cell connected to the EPC or the 5GCN according to the emergency services support indicator (see 3GPP TS 36.331 [25A]). If the UE finds a suitable E-UTRA cell, it then proceeds with the appropriate EMM or 5GMM procedures. If the UE operating in single-registration mode has changed to S1 mode, it shall disable the N1 mode capability for 3GPP access.

If the Access technology utilization control IE is present in the SERVICE REJECT message and the message is successfully integrity checked by the NAS; the UE shall store the received access technology utilization control information together with the PLMN identity of the current PLMN in the list of "PLMNs with associated access technology restrictions" and replace the previously stored one associated with the current PLMN, if any, with the newly received access technology utilization control information; otherwise, the UE shall ignore the Access technology utilization control IE.

If the service request was not initiated for emergency services fallback, the UE shall search for a suitable cell in another tracking area according to 3GPP TS 38.304 [28] or 3GPP TS 36.304 [25C].

If the message was received via 3GPP access and the UE is operating in the single-registration mode, the UE shall handle the EMM parameters EMM state and EPS update status as specified in 3GPP TS 24.301 [15] for the case when the service request procedure is rejected with the EMM cause with the same value.

If received over non-3GPP access the cause shall be considered as an abnormal case and the behaviour of the UE for this case is specified in subclause 5.6.1.7.

#22 (Congestion).

If the T3346 value IE is present in the SERVICE REJECT message and the value indicates that this timer is neither zero nor deactivated, the UE shall proceed as described below, otherwise it shall be considered as an abnormal case and the behaviour of the UE for this case is specified in subclause 5.6.1.7.

If the rejected request was not for initiating an emergency PDU session, the UE shall abort the service request procedure and enter state 5GMM-REGISTERED and stop timer T3517 if still running.

The UE shall stop timer T3346 if it is running.

If the SERVICE REJECT message is integrity protected, the UE shall start timer T3346 with the value provided in the T3346 value IE.

If the SERVICE REJECT message is not integrity protected, the UE shall start timer T3346 with a random value from the default range specified in 3GPP TS 24.008 [12].

For all other cases the UE stays in the current serving cell and applies normal cell reselection process. The service request procedure is started, if still necessary, when timer T3346 expires or is stopped.

If the message was received via 3GPP access and the UE is operating in the single-registration mode, the UE shall handle the EMM parameters EMM state and EPS update status as specified in 3GPP TS 24.301 [15] for the case when the service request procedure is rejected with the EMM cause with the same value.

If the service request procedure was initiated for an MO MMTEL voice call (i.e. access category 4), or for an MO MMTEL video call (i.e. access category 5) or for an MO IMS registration related signalling (i.e. access category 9), a notification that the service request was not accepted due to congestion shall be provided to the upper layers.

If the UE is using 5GS services with control plane CIoT 5GS optimization and if the T3448 value IE is present in the SERVICE REJECT message and the value indicates that this timer is neither zero nor deactivated, the UE shall:

- a) stop timer T3448 if it is running;
- b) consider the transport of user data via the control plane as unsuccessful; and
- c) start timer T3448:
 - 1) with the value provided in the T3448 value IE if the SERVICE REJECT message is integrity protected; or
 - 2) with a random value from the default range specified in 3GPP TS 24.301 [15] table 10.2.1 if the SERVICE REJECT message is not integrity protected.

If the UE is using 5GS services with control plane CIoT 5GS optimization, the T3448 value IE is present in the SERVICE REJECT message and the value indicates that this timer is either zero or deactivated, the UE shall ignore the T3448 value IE and:

- a) stop timer T3448 if it is running; and
- b) consider the transport of user data via the control plane as unsuccessful.

If the UE is using 5GS services with control plane CIoT 5GS optimization and if the T3448 value IE is not present in the SERVICE REJECT message, it shall be considered as an abnormal case and the behaviour of UE for this case is specified in subclause 5.6.1.7.

#27 (N1 mode not allowed).

The UE shall set the 5GS update status to 5U3 ROAMING NOT ALLOWED (and shall store it according to subclause 5.1.3.2.2) and shall enter the state 5GMM-REGISTERED.LIMITED-SERVICE. If the message has been successfully integrity checked by the NAS, the UE shall set:

- 1) the PLMN-specific N1 mode attempt counter for 3GPP access and the PLMN-specific N1 mode attempt counter for non-3GPP access for that PLMN in case of PLMN; or
- 2) the SNPN-specific attempt counter for 3GPP access for the current SNPN and the SNPN-specific attempt counter for non-3GPP access for the current SNPN in case of SNPN

to the UE implementation-specific maximum value.

The UE shall disable the N1 mode capability for the specific access type for which the message was received (see subclause 4.9).

If the message has been successfully integrity checked by the NAS, the UE shall disable the N1 mode capability also for the other access type (see subclause 4.9).

If the message was received via 3GPP access and the UE is operating in single-registration mode, the UE shall in addition set the EPS update status to EU3 ROAMING NOT ALLOWED and enter the state EMM-REGISTERED.

#28 (Restricted service area).

This cause value received from non-3GPP access other than wireline access is considered as an abnormal case, and the behaviour of the UE is specified in subclause 5.6.1.7.

The UE shall enter the state 5GMM-REGISTERED.NON-ALLOWED-SERVICE, wait for the release of the N1 NAS signalling connection and perform the registration procedure for mobility and periodic registration update if the service type IE in the SERVICE REQUEST message was not set to "elevated signalling" and the SERVICE REJECT message is received over 3GPP access (see subclause 5.3.5 and 5.5.1.3).

If the service type IE in the SERVICE REQUEST message was set to "elevated signalling", the UE shall not re-initiate service request procedure until the UE enters an allowed area or leaves a non-allowed area, except for emergency services, high priority access or responding to paging or notification.

If the service type IE in the SERVICE REQUEST message was set to "high priority access" and the network indicates "High priority access UEs are not exempt from service area restrictions", the UE shall not perform the procedure for mobility and periodic registration update or the service request procedure until the UE enters an allowed area or leaves a non-allowed area.

If the service type IE in the SERVICE REQUEST message was set to "high priority access" and the network does not indicate "High priority access UEs are not exempt from service area restrictions", the UE may perform the procedure for mobility and periodic registration update or the service request procedure.

#31 (Redirection to EPC required).

5GMM cause #31 received by a UE that has not indicated support for CIoT optimizations or received by a UE over non-3GPP access is considered an abnormal case and the behaviour of the UE is specified in subclause 5.6.1.7.

This cause value received from a cell belonging to an SNPN and the UE is operating in SNPN access operation mode is considered as an abnormal case and the behaviour of the UE is specified in subclause 5.6.1.7.

The UE shall set the 5GS update status to 5U3 ROAMING NOT ALLOWED (and shall store it according to subclause 5.1.3.2.2). The UE shall reset the service request attempt counter and enter the state 5GMM-REGISTERED.LIMITED-SERVICE.

The UE shall enable the E-UTRA capability if it was disabled and disable the N1 mode capability for 3GPP access (see subclause 4.9.2).

If the message was received via 3GPP access and the UE is operating in single-registration mode, the UE shall handle the EMM parameters, EMM state, and EPS update status as specified in 3GPP TS 24.301 [15] for the case when the service request procedure is rejected with the EMM cause with the same value.

#36 (IAB-node operation not authorized).

This cause value is only applicable when received over 3GPP access by a UE operating as an IAB-node. This cause value received from a 5G access network other than 3GPP access or received by a UE not operating as an IAB-node is considered as an abnormal case and the behaviour of the UE is specified in subclause 5.6.1.7.

The UE shall set the 5GS update status to 5U3 ROAMING NOT ALLOWED (and shall store it according to subclause 5.1.3.2.2) and shall delete any 5G-GUTI, last visited registered TAI, TAI list and ngKSI.

If:

1) the UE is not operating in SNPN access operation mode,

- i) the UE shall delete the list of equivalent PLMNs and store the PLMN identity in the forbidden PLMN list as specified in subclause 5.3.13A and if the UE is configured to use timer T3245 then the UE shall start timer T3245 and proceed as described in subclause 5.3.19a.1. The UE shall enter the state 5GMM-DEREGISTERED.PLMN-SEARCH and perform a PLMN selection according to 3GPP TS 23.122 [5]. If the message has been successfully integrity checked by the NAS and the UE maintains the PLMN-

specific attempt counter for 3GPP access for that PLMN, the UE shall set the PLMN-specific attempt counter for 3GPP access for that PLMN to the UE implementation-specific maximum value; and

- ii) If the UE is operating in single-registration mode, the UE shall in addition handle the EMM parameters EMM state, EPS update status, 4G-GUTI, last visited registered TAI, TAI list and eKSI as specified in 3GPP TS 24.301 [15] for the case when the service request procedure is rejected with the EMM cause with the same value; or
- 2) the UE is operating in SNPN access operation mode,
- i) the UE shall delete the list of equivalent SNPNs (if available). The UE shall store the SNPN identity in the "temporarily forbidden SNPNs" list for 3GPP access and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, the selected entry of the "list of subscriber data" or the selected PLMN subscription or "temporarily forbidden SNPNs for access for localized services in SNPN" list if the SNPN is an SNPN selected for localized services in SNPN (see 3GPP TS 23.122 [5]) for 3GPP access and the selected entry of the "list of subscriber data" or the selected PLMN subscription or the selected PLMN subscription or in the "temporarily forbidden SNPNs for onboarding services in SNPN" list, if the UE is performing initial registration for onboarding services in SNPN, for 3GPP access. If the UE supports access to an SNPN using credentials from a credentials holder, the UE shall store the SNPN identity in the "temporarily forbidden SNPNs" list along with the GIN(s) broadcasted by the SNPN if any, for the selected entry of the "list of subscriber data" or the selected PLMN subscription. If the UE supports access to an SNPN providing access for localized services in SNPN and the access for localized services in SNPN has been enabled, the UE shall store the SNPN identity in the list of "temporarily forbidden SNPNs for access for localized services in SNPN" (if the SNPN is an SNPN selected for localized services in SNPN (see 3GPP TS 23.122 [5]) along with the GIN(s) broadcasted by the SNPN if any, for the selected entry of the "list of subscriber data" or the selected PLMN subscription. The UE shall enter state 5GMM-DEREGISTERED.PLMN-SEARCH and perform an SNPN selection according to 3GPP TS 23.122 [5]. If the message has been successfully integrity checked by the NAS, the UE shall set the SNPN-specific attempt counter for 3GPP access for the current SNPN to the UE implementation-specific maximum value.

#72 (Non-3GPP access to 5GCN not allowed).

If the UE initiated the service request procedure over non-3GPP access, the UE shall set the 5GS update status to 5U3 ROAMING NOT ALLOWED (and shall store it according to subclause 5.1.3.2.2) and shall delete last visited registered TAI and TAI list. If the UE is not registering or has not registered to the same PLMN over both 3GPP access and non-3GPP access, the UE shall additionally delete 5G-GUTI and ngKSI. Additionally, the UE shall enter the state 5GMM-DEREGISTERED for non-3GPP access. If the message has been successfully integrity checked by the NAS, the UE shall set:

- 1) the PLMN-specific N1 mode attempt counter for non-3GPP access for that PLMN in case of PLMN; or
 - 2) the SNPN-specific attempt counter for non-3GPP access for that SNPN in case of SNPN;
- to the UE implementation-specific maximum value.

NOTE 7: The 5GMM sublayer states, the 5GMM parameters and the registration status are managed per access type independently, i.e. 3GPP access or non-3GPP access (see subclauses 4.7.2 and 5.1.3).

The UE shall disable the N1 mode capability for non-3GPP access (see subclause 4.9.3).

As an implementation option, if the UE is not currently registered over 3GPP access, the UE may enter the state 5GMM-DEREGISTERED.PLMN-SEARCH in order to perform a PLMN selection according to 3GPP TS 23.122 [5].

If received over 3GPP access the cause shall be considered as an abnormal case and the behaviour of the UE for this case is specified in subclause 5.6.1.7.

#73 (Serving network not authorized).

This cause value received from a cell belonging to an SNPN and the UE is operating in SNPN access operation mode is considered as an abnormal case and the behaviour of the UE is specified in subclause 5.6.1.7.

The UE shall set the 5GS update status to 5U3 ROAMING NOT ALLOWED (and shall store it according to subclause 5.1.3.2.2) and shall delete any 5G-GUTI, last visited registered TAI, TAI list and ngKSI. The UE shall

delete the list of equivalent PLMNs, store the PLMN identity in the forbidden PLMN list as specified in subclause 5.3.13A. For 3GPP access the UE shall enter state 5GMM-DEREGISTERED.PLMN-SEARCH in order to perform a PLMN selection according to 3GPP TS 23.122 [5], and for non-3GPP access the UE shall enter state 5GMM-DEREGISTERED.LIMITED-SERVICE in order to perform network selection as defined in 3GPP TS 24.502 [18]. If the message has been successfully integrity checked by the NAS, the UE shall set the PLMN-specific attempt counter and the PLMN-specific attempt counter for non-3GPP access for that PLMN to the UE implementation-specific maximum value.

If the message was received via 3GPP access and the UE is operating in single-registration mode, the UE shall in addition set the EPS update status to EU3 ROAMING NOT ALLOWED, enter the state EMM-DEREGISTERED and shall delete any 4G-GUTI, last visited registered TAI, TAI list and eKSI.

#74 (Temporarily not authorized for this SNPN).

5GMM cause #74 is only applicable when received from a cell belonging to an SNPN and the UE is operating in SNPN access operation mode. 5GMM cause #74 received from a cell not belonging to an SNPN is considered as an abnormal case and the behaviour of the UE is specified in subclause 5.6.1.7.

The UE shall set the 5GS update status to 5U3 ROAMING NOT ALLOWED (and shall store it according to subclause 5.1.3.2.2) and shall delete any 5G-GUTI, last visited registered TAI, TAI list, ngKSI and the list of equivalent SNPNs (if available). The UE shall store the SNPN identity in the "temporarily forbidden SNPNs" list for the specific access type for which the message was received and the selected entry of the "list of subscriber data" or the selected PLMN subscription, or in the "temporarily forbidden SNPNs for onboarding services in SNPN" list, if the UE is registered for onboarding services in SNPN, for the specific access type for which the message was received. If the UE supports access to an SNPN using credentials from a credentials holder, the UE shall store the SNPN identity in the "temporarily forbidden SNPNs" list along with the GIN(s) broadcasted by the SNPN if any, for the selected entry of the "list of subscriber data" or the selected PLMN subscription. If the UE supports access to an SNPN providing access for localized services in SNPN and the access for localized services in SNPN has been enabled, the UE shall store the SNPN identity in the list of "temporarily forbidden SNPNs for access for localized services in SNPN" (if the SNPN is an SNPN selected for localized services in SNPN (see 3GPP TS 23.122 [5]) along with the GIN(s) broadcasted by the SNPN if any, for the selected entry of the "list of subscriber data" or the selected PLMN subscription. If the UE is not registered for onboarding services in SNPN, the UE shall enter state 5GMM-DEREGISTERED.PLMN-SEARCH and perform an SNPN selection according to 3GPP TS 23.122 [5]. If the UE is registered for onboarding services in SNPN, the UE shall enter state 5GMM-DEREGISTERED.PLMN-SEARCH and perform an SNPN selection or an SNPN selection for onboarding services according to 3GPP TS 23.122 [5]. If the message has been successfully integrity checked by the NAS, the UE shall set the SNPN-specific attempt counter for 3GPP access and the SNPN-specific attempt counter for non-3GPP access for the current SNPN to the UE implementation-specific maximum value.

If the message has been successfully integrity checked by the NAS and the UE also supports the registration procedure over the other access to the same SNPN, the UE shall in addition handle 5GMM parameters and 5GMM state for this access, as described for this 5GMM cause value.

#75 (Permanently not authorized for this SNPN).

5GMM cause #75 is only applicable when received from a cell belonging to an SNPN with a globally-unique SNPN identity and the UE is operating in SNPN access operation mode. 5GMM cause #75 received from a cell not belonging to an SNPN or a cell belonging to an SNPN with a non-globally-unique SNPN identity is considered as an abnormal case and the behaviour of the UE is specified in subclause 5.6.1.7.

The UE shall set the 5GS update status to 5U3 ROAMING NOT ALLOWED (and shall store it according to subclause 5.1.3.2.2) and shall delete any 5G-GUTI, last visited registered TAI, TAI list, ngKSI and the list of equivalent SNPNs (if available). The UE shall store the SNPN identity in the "permanently forbidden SNPNs" list for the specific access type for which the message was received and the selected entry of the "list of subscriber data" or the selected PLMN subscription, or in the "permanently forbidden SNPNs for onboarding services in SNPN" list, if the UE is registered for onboarding services in SNPN, for the specific access type for which the message was received. If the UE is not registered for onboarding services in SNPN, the UE shall enter state 5GMM-DEREGISTERED.PLMN-SEARCH and perform an SNPN selection according to 3GPP TS 23.122 [5]. If the UE supports access to an SNPN using credentials from a credentials holder, the UE shall store the SNPN identity in the "permanently forbidden SNPNs" list along with the GIN(s) broadcasted by the SNPN if any, for the selected entry of the "list of subscriber data" or the selected PLMN subscription. If the UE supports access to an SNPN providing access for localized services in SNPN and the access for localized

services in SNPN has been enabled, the UE shall store the SNPN identity in the list of "permanently forbidden SNPNs for access for localized services in SNPN" (if the SNPN is an SNPN selected for localized services in SNPN (see 3GPP TS 23.122 [5]) along with the GIN(s) broadcasted by the SNPN if any, for the selected entry of the "list of subscriber data" or the selected PLMN subscription. If the UE is registered for onboarding services in SNPN, the UE shall enter state 5GMM-DEREGISTERED.PLMN-SEARCH and perform an SNPN selection or an SNPN selection for onboarding services according to 3GPP TS 23.122 [5]. If the message has been successfully integrity checked by the NAS, the UE shall set the SNPN-specific attempt counter for 3GPP access and the SNPN-specific attempt counter for non-3GPP access for the current SNPN to the UE implementation-specific maximum value.

If the message has been successfully integrity checked by the NAS and the UE also supports the registration procedure over the other access to the same SNPN, the UE shall in addition handle 5GMM parameters and 5GMM state for this access, as described for this 5GMM cause value.

#76 (Not authorized for this CAG or authorized for CAG cells only).

This cause value received via non-3GPP access or from a cell belonging to an SNPN and the UE is operating in SNPN access operation mode is considered as an abnormal case and the behaviour of the UE is specified in subclause 5.6.1.7.

The UE shall set the 5GS update status to 5U3.ROAMING NOT ALLOWED, store the 5GS update status according to subclause 5.1.3.2.2.

If 5GMM cause #76 is received from:

- 1) a CAG cell, and if the UE receives a "CAG information list" in the CAG information list IE or the Extended CAG information list IE included in the SERVICE REJECT message, the UE shall:
 - i) replace the "CAG information list" stored in the UE with the received "CAG information list" when received in the HPLMN or EHPLMN;
 - ii) replace the serving VPLMN's entry of the "CAG information list" stored in the UE with the serving VPLMN's entry of the received CAG information list IE or the Extended CAG information list IE when the UE receives the CAG information list IE or the Extended CAG information list IE in a serving PLMN other than the HPLMN or EHPLMN; or

NOTE 8: When the UE receives the CAG information list IE or the Extended CAG information list IE in a serving PLMN other than the HPLMN or EHPLMN, entries of a PLMN other than the serving VPLMN, if any, in the received CAG information list IE or the Extended CAG information list IE are ignored.

- iii) remove the serving VPLMN's entry of the "CAG information list" stored in the UE when the UE receives the CAG information list IE or the Extended CAG information list IE in a serving PLMN other than the HPLMN or EHPLMN and the CAG information list IE or the Extended CAG information list IE does not contain the serving VPLMN's entry.

Otherwise, the UE shall delete the CAG-ID(s) of the cell from the "allowed CAG list" for the current PLMN, if the CAG-ID(s) are authorized based on the "Allowed CAG list". In the case the "allowed CAG list" for the current PLMN only contains a range of CAG-IDs, how the UE deletes the CAG-ID(s) of the cell from the "allowed CAG list" for the current PLMN is up to UE implementation. In addition:

- i) if the entry in the "CAG information list" for the current PLMN does not include an "indication that the UE is only allowed to access 5GS via CAG cells" or if the entry in the "CAG information list" for the current PLMN includes an "indication that the UE is only allowed to access 5GS via CAG cells" and one or more CAG-ID(s) are authorized based on the updated "allowed CAG list" for the current PLMN, then the UE shall enter the state 5GMM-REGISTERED.LIMITED-SERVICE and shall search for a suitable cell according to 3GPP TS 38.304 [28] or 3GPP TS 36.304 [25C] with the updated "CAG information list";
 - ii) if the entry in the "CAG information list" for the current PLMN includes an "indication that the UE is only allowed to access 5GS via CAG cells" and no CAG-ID is authorized based on the updated "allowed CAG list" for the current PLMN, then the UE shall enter the state 5GMM-REGISTERED.PLMN-SEARCH and shall apply the PLMN selection process defined in 3GPP TS 23.122 [5] with the updated "CAG information list"; or

- iii) if the "CAG information list" does not include an entry for the current PLMN, then the UE shall enter the state 5GMM-REGISTERED.LIMITED-SERVICE and shall search for a suitable cell according to 3GPP TS 38.304 [28] or 3GPP TS 36.304 [25C] with the updated "CAG information list".
- 2) a non-CAG cell, and if the UE receives a "CAG information list" in the CAG information list IE or the Extended CAG information list IE included in the SERVICE REJECT message, the UE shall:
 - i) replace the "CAG information list" stored in the UE with the received "CAG information list" when received in the HPLMN or EHPLMN;
 - ii) replace the serving VPLMN's entry of the "CAG information list" stored in the UE with the serving VPLMN's entry of the received CAG information list IE or the Extended CAG information list IE when the UE receives the CAG information list IE or the Extended CAG information list IE in a serving PLMN other than the HPLMN or EHPLMN; or

NOTE 9: When the UE receives the CAG information list IE or the Extended CAG information list IE in a serving PLMN other than the HPLMN or EHPLMN, entries of a PLMN other than the serving VPLMN, if any, in the received CAG information list IE or the Extended CAG information list IE are ignored.

- iii) remove the serving VPLMN's entry of the "CAG information list" stored in the UE when the UE receives the CAG information list IE or the Extended CAG information list IE in a serving PLMN other than the HPLMN or EHPLMN and the CAG information list IE or the Extended CAG information list IE does not contain the serving VPLMN's entry.

Otherwise, the UE shall store an "indication that the UE is only allowed to access 5GS via CAG cells" in the entry of the "CAG information list" for the current PLMN, if any. If the "CAG information list" stored in the UE does not include the current PLMN's entry, the UE shall add an entry for the current PLMN to the "CAG information list" and store an "indication that the UE is only allowed to access 5GS via CAG cells" in the entry of the "CAG information list" for the current PLMN. If the UE does not have a stored "CAG information list", the UE shall create a new "CAG information list" and add an entry with an "indication that the UE is only allowed to access 5GS via CAG cells" for the current PLMN.

In addition:

- i) if one or more CAG-ID(s) are authorized based on the "allowed CAG list" for the current PLMN, then the UE shall enter the state 5GMM-REGISTERED.LIMITED-SERVICE and shall search for a suitable cell according to 3GPP TS 38.304 [28] with the updated CAG information; or
- ii) if no CAG-ID is authorized based on the "allowed CAG list" for the current PLMN, then the UE shall enter the state 5GMM-REGISTERED.PLMN-SEARCH and shall apply the PLMN selection process defined in 3GPP TS 23.122 [5] with the updated "CAG information list".

If the message was received via 3GPP access and the UE is operating in single-registration mode, the UE shall in addition set the EPS update status to EU3 ROAMING NOT ALLOWED, reset the service request attempt counter and enter the state EMM-REGISTERED.

#77 (Wireline access area not allowed).

5GMM cause #77 is only applicable when received from a wireline access network by the 5G-RG or the W-AGF acting on behalf of the FN-CRG (or on behalf of the N5GC device). 5GMM cause #77 received from a 5G access network other than a wireline access network and 5GMM cause #77 received by the W-AGF acting on behalf of the FN-BRG are considered as abnormal cases and the behaviour of the UE is specified in subclause 5.6.1.7.

When received over wireline access network, the 5G-RG and the W-AGF acting on behalf of the FN-CRG (or on behalf of the N5GC device) shall set the 5GS update status to 5U3 ROAMING NOT ALLOWED (and shall store it according to subclause 5.1.3.2.2), shall delete 5G-GUTI, last visited registered TAI, TAI list and ngKSI, shall enter the state 5GMM-DEREGISTERED and shall act as specified in subclause 5.3.23.

NOTE 10: The 5GMM sublayer states, the 5GMM parameters and the registration status are managed per access type independently, i.e. 3GPP access or non-3GPP access (see subclauses 4.7.2 and 5.1.3).

#78 (PLMN not allowed to operate at the present UE location).

This cause value received from a non-satellite NG-RAN cell is considered as an abnormal case and the behaviour of the UE is specified in subclause 5.6.1.7.

The UE shall set the 5GS update status to 5U3 ROAMING NOT ALLOWED (and shall store it according to subclause 5.1.3.2.2) and shall delete last visited registered TAI and TAI list. If the UE is not registering or has not registered to the same PLMN over both 3GPP access and non-3GPP access, the UE shall additionally delete the list of equivalent PLMNs, 5G-GUTI and ngKSI. Additionally, the UE shall reset the service request attempt counter. The UE shall store the PLMN identity and, if it is known, the current geographical location in the list of "PLMNs not allowed to operate at the present UE location" and shall start a corresponding timer instance (see subclause 4.23.2). The UE shall enter state 5GMM-DEREGISTERED.PLMN-SEARCH and perform a PLMN selection according to 3GPP TS 23.122 [5].

If the message was received via 3GPP access and the UE is operating in single-registration mode, the UE shall handle the EMM parameters EMM state, EPS update status, 4G-GUTI, last visited registered TAI, TAI list and eKSI as specified in 3GPP TS 24.301 [15] for the case when the service request procedure is rejected with the EMM cause with the same value.

5.6.1.6 Service request procedure for initiating an emergency PDU session not accepted by the network

If the service request for initiating an emergency PDU session cannot be accepted by the network, the UE shall perform the procedures as described in subclause 5.6.1.5. If the service request for initiating an emergency PDU session fails due to receiving the AUTHENTICATION REJECT message, the UE shall perform the procedures as described in subclauses 5.4.1.2.2.11, 5.4.1.2.3.1, 5.4.1.2.3A.1 or 5.4.1.3.5. Then if the UE is in the same selected PLMN where the last service request was attempted, the UE shall:

- a) inform the upper layers of the failure of the procedure; or

NOTE 1: This can result in the upper layers requesting another emergency call attempt using domain selection as specified in 3GPP TS 23.167 [6].

- b) de-register locally, if not de-registered already, attempt initial registration for emergency services.

If the service request for initiating an emergency PDU session fails due to abnormal cases a), f) or l) in subclause 5.6.1.7, the UE shall perform the procedures as described in subclause 5.6.1.7. Then if the UE is in the same selected PLMN where the last SERVICE REQUEST message was attempted, the UE shall:

- a) inform the upper layers of the failure of the procedure; or

NOTE 2: This can result in the upper layers requesting another emergency call attempt using domain selection as specified in 3GPP TS 23.167 [6] and 3GPP TS 24.229 [14].

- b) de-register locally, if not de-registered already, attempt initial registration for emergency services.

If the service request for initiating a PDU session for emergency services fails due to abnormal case b) in subclause 5.6.1.7, the UE shall perform the actions as described in subclause 5.6.1.7 and inform the upper layers of the failure to access the network.

NOTE 3: This can result in the upper layers requesting another emergency call attempt using domain selection as specified in 3GPP TS 23.167 [6].

5.6.1.6A Service request procedure for an emergency services fallback not accepted by the network

If the service request for initiating an emergency services fallback cannot be accepted by the network, the UE shall perform the procedures as described in subclause 5.6.1.5. If the service request for initiating an emergency services fallback fails due to receiving the AUTHENTICATION REJECT message, the UE shall perform the procedures as described in subclauses 5.4.1.2.2.11, 5.4.1.2.3.1, 5.4.1.2.3A.1 or 5.4.1.3.5, and if the UE does not attempt to select an E-UTRA cell connected to EPC or 5GCN as described in subclause 5.6.1.5 and is camped on NR or E-UTRA cell connected to 5GCN in the same PLMN where the last service request was attempted, the UE shall inform the upper layers of the failure of the procedure.

NOTE 1: This can result in the upper layers requesting another emergency call attempt using domain selection as specified in 3GPP TS 23.167 [6].

If the service request for initiating an emergency services fallback fails due to abnormal cases a) in subclause 5.6.1.7, the UE shall inform the upper layers of the failure of the emergency services fallback.

NOTE 2: This can result in the upper layers requesting another emergency call attempt using domain selection as specified in 3GPP TS 23.167 [6].

If the service request procedure for initiating an emergency services fallback fails due to abnormal cases other than a) in subclause 5.6.1.7, the UE may abort the service request procedure, if not aborted already and attempt to select an E-UTRA cell connected to EPC or 5GCN according to the domain priority and selection rules specified in 3GPP TS 23.167 [6]. If the UE finds a suitable E-UTRA cell, it then proceeds with the appropriate EMM or 5GMM procedures. If the UE operating in single-registration mode has changed to S1 mode, it shall disable the N1 mode capability for 3GPP access.

5.6.1.7 Abnormal cases in the UE

The following abnormal cases can be identified:

- a) T3517 expired.

The UE shall enter the state 5GMM-REGISTERED.

If the UE triggered the service request procedure in 5GMM-IDLE mode sending a:

- 1) SERVICE REQUEST message and the service type of the SERVICE REQUEST message was not set to "emergency services fallback"; or
- 2) CONTROL PLANE SERVICE REQUEST message and the control plane service type of the CONTROL PLANE SERVICE REQUEST message was not set to "emergency services fallback";

then the 5GMM sublayer shall increment the service request attempt counter, abort the procedure and release locally any resources allocated for the service request procedure. The service request attempt counter shall not be incremented, if:

- 1) the service request procedure is initiated to establish an emergency PDU session;
- 2) the UE has an emergency PDU session established;
- 3) the UE is a UE configured for high priority access in selected PLMN or SNPN;
- 4) the service request procedure is initiated in response to paging or notification from the network; or
- 5) the UE in NB-N1 mode is requested by the upper layer to transmit user data related to an exceptional event and the UE is allowed to use exception data reporting (see the ExceptionDataReportingAllowed leaf of the NAS configuration MO in 3GPP TS 24.368 [17] or the USIM file EF_{NASCONFIG} in 3GPP TS 31.102 [22]).

If the service request attempt counter is greater than or equal to 5, the UE shall start timer T3525. Additionally,

if the service request procedure was initiated for an MO MMTEL voice call, for an MO MMTEL video call or for an MO IMS registration related signalling, a notification that the service request was not initiated due to the UE having started timer T3525 shall be provided to the upper layers; and

NOTE 1: This can result in the upper layers requesting implementation specific mechanisms, e.g. the MMTEL voice call being attempted to another IP-CAN, or establishment of a CS voice call (if supported and not already attempted in the CS domain).

if the service request procedure was initiated for other than an MO MMTEL voice call, an MO MMTEL video call and an MO IMS registration related signalling, then upon an upper layer request, the UE as an implementation option may attempt to select E-UTRA cell connected to EPC or any other suitable cell of other RAT.

The UE shall not attempt service request until expiry of timer T3525 unless:

- 1) the service request procedure is initiated in response to paging or notification from the network;

- 2) the UE is a UE configured for high priority access in selected PLMN or SNPN;
- 3) the service request procedure is initiated to establish an emergency PDU session;
- 4) the UE has an emergency PDU session established;
- 5) the service request procedure is initiated for emergency services fallback;
- 6) the UE is registered in a new PLMN or SNPN;

NOTE 2: According to Table 10.2.1, when "UE camped on a new PLMN other than the PLMN on which timer started", timer T3525 is stopped, hence this check may be skipped.

- 7) the UE in NB-N1 mode is requested by the upper layer to transmit user data related to an exceptional event and the UE is allowed to use exception data reporting (see the ExceptionDataReportingAllowed leaf of the NAS configuration MO in 3GPP TS 24.368 [17] or the USIM file EF_{NASCONFIG} in 3GPP TS 31.102 [22]); or
- 8) the UE supports the reconnection to the network due to RAN timing synchronization status change and receives an indication of a change in the RAN timing synchronization status.

NOTE 3: The NAS signalling connection can also be released if the UE deems that the network has failed the authentication check as specified in subclause 5.4.1.3.7.

If the UE triggered the service request procedure in 5GMM-CONNECTED mode sending a:

- 1) SERVICE REQUEST message and the service type of the SERVICE REQUEST message was not set to "emergency services fallback"; or
- 2) CONTROL PLANE SERVICE REQUEST message and the control plane service type of the CONTROL PLANE SERVICE REQUEST message was not set to "emergency services fallback",

the 5GMM sublayer shall abort the procedure, and stay in 5GMM-CONNECTED mode.

If the service type of the SERVICE REQUEST message was set to "emergency services fallback" or the control plane service type of the CONTROL PLANE SERVICE REQUEST message was set to "emergency services fallback" and:

- 1) the service request procedure was triggered in 5GMM-IDLE mode, the 5GMM sublayer shall abort the procedure, release locally any resources allocated for the service request procedure; or
- 2) the service request procedure was triggered in 5GMM-CONNECTED mode, the 5GMM sublayer shall abort the procedure, stay in 5GMM-CONNECTED mode.

b) The lower layers indicate that the access attempt is barred.

The UE shall not start the service request procedure. The UE stays in the current serving cell and applies the normal cell reselection process. Receipt of the access barred indication shall not trigger the selection of a different core network type (EPC or 5GCN).

The service request procedure is started, if still needed, when the lower layers indicate that the barring is alleviated for the access category with which the access attempt was associated.

ba) The lower layers indicate that:

- 1) access barring is applicable for all access categories except categories 0 and 2 and the access category with which the access attempt was associated is other than 0 and 2; or
- 2) access barring is applicable for all access categories except category 0 and the access category with which the access attempt was associated is other than 0.

If the SERVICE REQUEST message or CONTROL PLANE SERVICE REQUEST has not been sent, the UE shall proceed as specified for case b).

If the SERVICE REQUEST message or CONTROL PLANE SERVICE REQUEST has been sent:

- 1) the UE shall abort the service request procedure and stop timer T3517. The UE stays in the current serving cell and applies the normal cell reselection process; and

- 2) the service request procedure is started, if still needed, when the lower layers indicate that the barring is alleviated for the access category with which the access attempt was associated.

For additional UE requirements for both cases see subclause 4.5.5.

- c) Timer T3346 is running.

The UE shall not start the service request procedure unless:

- 1) the UE receives a paging;
- 2) the UE receives a NOTIFICATION message over non-3GPP access when the UE is in 5GMM-CONNECTED mode over non-3GPP access and in 5GMM-IDLE mode over 3GPP access;
- 3) the UE receives a NOTIFICATION message over 3GPP access when the UE is in 5GMM-CONNECTED mode over 3GPP access and in 5GMM-IDLE mode over non-3GPP access;
- 4) the UE is a UE configured for high priority access in selected PLMN or SNPN;
- 5) the UE has an emergency PDU session established or is establishing an emergency PDU session;
- 6) the service request procedure is initiated for emergency services fallback;
- 7) the service request procedure is initiated for elevated signalling;
- 8) the UE in NB-N1 mode is requested by the upper layer to transmit user data related to an exceptional event and:
 - the UE is allowed to use exception data reporting (see the ExceptionDataReportingAllowed leaf of the NAS configuration MO in 3GPP TS 24.368 [17] or the USIM file EF_{NASCONFIG} in 3GPP TS 31.102 [22]); and
 - timer T3346 was not started when N1 NAS signalling connection was established with RRC establishment cause set to "mo-ExceptionData"; or
- 9) the MUSIM UE is in 5GMM-CONNECTED mode and requests the network to release the NAS signalling connection (see case o in subclause 5.6.1.1).

If the UE is in 5GMM-IDLE mode, the UE stays in the current serving cell and applies normal cell reselection process. The service request procedure is started, if still necessary, when timer T3346 expires or is stopped.

If the service request procedure was triggered for an MO MMTEL voice call (i.e. access category 4), or for an MO MMTEL video call (i.e. access category 5) or for an MO IMS registration related signalling (i.e. access category 9), a notification that the service request procedure was not initiated due to congestion shall be provided to the upper layers.

If the UE receives a paging with access type set to "Non-3GPP access" and the non-3GPP access is available and UE is in 5GMM-REGISTERED.NORMAL SERVICE over non-3GPP access, the UE shall stop timer T3346 and send the SERVICE REQUEST message over non-3GPP access.

- d) Registration procedure for mobility and periodic registration update is triggered.

The UE shall abort the service request procedure, stop timer T3517, if running and perform the registration procedure for mobility and periodic registration update. The Follow-on request indicator in the REGISTRATION REQUEST message shall be handled as specified in subclause 5.5.1.3.2.

- e) Switch off.

If the UE is in state 5GMM-SERVICE-REQUEST-INITIATED at switch off, the de-registration procedure shall be performed.

- f) De-registration procedure collision.

If the UE receives a DEREGISTRATION REQUEST message from the network in state 5GMM-SERVICE-REQUEST-INITIATED, the UE shall progress the DEREGISTRATION REQUEST message and the service request procedure shall be aborted.

NOTE 4: The above collision case is valid if the DEREGISTRATION REQUEST message indicates the access type over which the service request procedure is attempted otherwise both the procedures are progressed.

- g) Transmission failure of SERVICE REQUEST or CONTROL PLANE SERVICE REQUEST message indication with change in the current TAI.

If the current TAI is not in the TAI list, UE shall abort the service request procedure to perform the registration procedure for mobility and periodic registration update as specified in subclause 5.5.1.3.2.

If the current TAI is part of the TAI list, the UE shall restart the service request procedure unless the service request procedure is initiated for case o) or p) in subclause 5.6.1.1. For case o) and p) in subclause 5.6.1.1 the UE shall abort the service request procedure, enters state 5GMM-REGISTERED, locally release the N1 NAS signalling connection, stop timer T3517 and locally release any resources allocated for the service request procedure.

- h) Transmission failure of SERVICE REQUEST or CONTROL PLANE SERVICE REQUEST message indication without change in the current TAI.

The UE shall restart the service request procedure unless the service request procedure is initiated for case o) or p) in subclause 5.6.1.1. For case o) and p) in subclause 5.6.1.1 the UE shall abort the service request procedure, enters state 5GMM-REGISTERED, locally release the N1 NAS signalling connection, stop timer T3517 and locally release any resources allocated for the service request procedure.

- i) SERVICE REJECT message received with other 5GMM cause values than those treated in subclause 5.6.1.5, and cases of 5GMM cause values #11, #15, #22, #28, #31, #36, #72, #73, #74, #75, #76, #77 and #78 that are considered as abnormal cases according to subclause 5.6.1.5.

The UE shall enter state 5GMM-REGISTERED.

The UE shall abort the service request procedure, stop timer T3517 and locally release any resources allocated for the service request procedure.

- j) The UE in 5GMM-CONNECTED mode with RRC inactive indication over the 3GPP access, and in 5GMM-CONNECTED mode over non-3GPP access, receives a NOTIFICATION message over the non-3GPP access with access type indicating 3GPP access.

The UE shall transition from 5GMM-CONNECTED mode with RRC inactive indication to 5GMM-IDLE mode over 3GPP access and initiate the service request procedure over the 3GPP access.

- k) Timer T3447 is running

The UE shall not start any service request procedure unless:

- 1) the UE in 5GMM-IDLE receives a paging request;
- 2) the UE is a UE configured for high priority access;
- 3) the UE has a PDU session for emergency services established or is establishing a PDU session for emergency services;
- 4) the service request procedure is initiated for emergency services fallback;
- 5) the UE in 5GMM-CONNECTED mode receives mobile terminated signalling or downlink data over the user-plane;
- 6) the service request procedure is initiated for elevated signalling;
- 7) the MUSIM UE requests the network to release the NAS signalling connection (see case o in subclause 5.6.1.1); or
- 8) the UE in NB-N1 mode is requested by the upper layer to transmit user data related to an exceptional event and the UE is allowed to use exception data reporting (see the ExceptionDataReportingAllowed leaf of the NAS configuration MO in 3GPP TS 24.368 [17] or the USIM file EF_{NASCONFIG} in 3GPP TS 31.102 [22]).

The UE stays in the current serving cell and applies the normal cell reselection process. The service request procedure is started, if still necessary, when timer T3447 expires or timer T3447 is stopped.

- l) Lower layer failure, release of the N1 signalling connection received from lower layers or the lower layers indicate that the RRC connection has been suspended before the service request procedure is completed or SERVICE REJECT message is received.

The UE shall abort the service request procedure, stop timer T3517, locally release any resources allocated for the service request procedure and enters state 5GMM-REGISTERED. For case m) in subclause 5.6.1.1 the UE may retry the service request procedure a certain number of times (maximum re-attempts 5).

- m) Timer T3448 is running

The UE in 5GMM-IDLE mode shall not initiate the service request procedure for transport of user data via the control plane unless:

- 1) the UE is a UE configured for high priority access in selected PLMN;
- 2) the UE which is only using 5GS services with control plane CIoT 5GS optimization received a paging request;
- 3) the UE in NB-N1 mode is requested by the upper layer to transmit user data related to an exceptional event and the UE is allowed to use exception data reporting (see the ExceptionDataReportingAllowed leaf of the NAS configuration MO in 3GPP TS 24.368 [17] or the USIM file EF_{NASCONFIG} in 3GPP TS 31.102 [22]); or
- 4) the UE is initiating the service request procedure to request emergency services or emergency services fallback.

The UE stays in the current serving cell and applies the normal cell reselection process. The service request procedure is started, if still necessary, when timer T3448 expires.

- n) Access for localized services in current SNPN is no longer allowed.

If the service request procedure is not to request emergency services and there is no PDU session for emergency services, the registered SNPN is an SNPN selected for localized services in SNPN (see 3GPP TS 23.122 [5]) and:

- access for localized services in SNPN is disabled; or
- the validity information for the selected SNPN is no longer met;

then the UE shall reset the service request attempt counter, stop T3517, abort the service request procedure, locally release the NAS signalling connection, if any, and enter state 5GMM-REGISTERED.LIMITED-SERVICE or 5GMM-REGISTERED.PLMN-SEARCH in order to perform SNPN selection according to 3GPP TS 23.122 [5].

5.6.1.8 Abnormal cases on the network side

The following abnormal cases can be identified:

- a) Lower layer failure.

If a lower layer failure occurs before a SERVICE REJECT message has been sent to the UE or the service request procedure has been completed by the AMF, the AMF enters/stays in 5GMM-IDLE.

- b) Protocol error.

If the SERVICE REQUEST message or the CONTROL PLANE SERVICE REQUEST message is received with a protocol error, the AMF shall return a SERVICE REJECT message with one of the following 5GMM cause values:

- #96 invalid mandatory information;
- #99 information element non-existent or not implemented;
- #100 conditional IE error; or
- #111 protocol error, unspecified.

The AMF stays in the current 5GMM mode.

- c) More than one SERVICE REQUEST message or CONTROL PLANE SERVICE REQUEST message received before the procedure has been completed (i.e., before SERVICE REJECT message has been sent or service request procedure has been completed).
- If one or more of the information elements in the SERVICE REQUEST message or CONTROL PLANE SERVICE REQUEST message differs from the ones received within the previous SERVICE REQUEST message or CONTROL PLANE SERVICE REQUEST message, the previously initiated service request procedure shall be aborted, and the new service request procedure shall be progressed;
 - If the information elements do not differ, then the AMF shall continue with the previous service request procedure and shall not treat any further this SERVICE REQUEST message or this CONTROL PLANE SERVICE REQUEST message.

- d) REGISTRATION REQUEST message received with "initial registration" or "emergency registration" in the 5GS registration type IE before a SERVICE REJECT message has been sent or the service request procedure has been completed.

If a REGISTRATION REQUEST message with "initial registration" or "emergency registration" in the 5GS registration type IE is received and the service request procedure has not been completed or a SERVICE REJECT message has not been sent, the AMF may initiate the 5GMM common procedures, e.g. the primary authentication and key agreement procedure. The AMF may e.g. after a successful primary authentication and key agreement procedure execution, abort the service request procedure, delete the 5GMM context, indicate towards the SMF that the 5GMM context has been deleted and progress the new REGISTRATION REQUEST message.

- e) REGISTRATION REQUEST message received with "mobility registration updating" or "periodic registration updating" in the 5GS registration type IE received before the service request procedure has been completed or a SERVICE REJECT message has been sent.

If a REGISTRATION REQUEST message with "mobility registration updating" or "periodic registration updating" in the 5GS registration type IE is received and the service request procedure has not been completed or a SERVICE REJECT message has not been sent, the AMF may initiate the 5GMM common procedures, e.g. the primary authentication and key agreement procedure. The AMF may e.g. after a successful primary authentication and key agreement procedure execution, abort the service request procedure and progress the new REGISTRATION REQUEST message.

- f) If a CONTROL PLANE SERVICE REQUEST message with Control plane service type indicating "mobile originating request" is received after the AMF initiated a paging procedure, the AMF shall treat this CONTROL PLANE SERVICE REQUEST as a paging response and handle the message according to subclauses 5.6.1.4 and 5.6.1.5.

- g) CONTROL PLANE SERVICE REQUEST message received with the Data type field indicates "control plane user data" in the CIoT small data container IE or received with Payload container type IE set to "CIoT user data container" and:

- 1) the AMF does not have a PDU session routing context for the PDU session ID and the UE; or
- 2) the AMF unsuccessfully attempted to forward the user data container and the PDU session ID,

then the AMF may send back to the UE the CIoT user data container or control plane user data which was not forwarded as specified in subclause 5.4.5.3.1 case l1) or case l2).

- h) Based on operator policy, if the service request from a UE not supporting CAG is rejected due to CAG restrictions, the network shall reject the service request with a 5GMM cause value other than the 5GMM cause #76 (Not authorized for this CAG or authorized for CAG cells only).

NOTE: 5GMM cause #7 (5GS services not allowed), 5GMM cause #11 (PLMN not allowed), 5GMM cause #27 (N1 mode not allowed), 5GMM cause #73 (Serving network not authorized) can be used depending on the subscription of the UE and whether the UE roams or not.

- i) CIoT user data received for a PDU session ID which is inactive in the network.

If a CONTROL PLANE SERVICE REQUEST message is received with CIoT user data for a PDU session that is inactive in the network, the AMF shall discard the CIoT user data. The AMF shall send the SERVICE ACCEPT message and indicate that this PDU session ID is inactive using the PDU session status IE.

5.6.2 Paging procedure

5.6.2.1 General

The paging procedure is performed only in 3GPP access and used by the network to request the establishment of a NAS signalling connection to the UE. The paging procedure is also used by the network to request the UE to re-establish the user-plane resources of PDU sessions for downlink user data transport. Another purpose of the paging procedure is to request the UE to re-establish the user-plane resources of PDU session(s) associated with non-3GPP access over 3GPP access.

Additionally, the network can use the paging procedure to initiate the mobile terminating SMS.

For the UE using eDRX, the network initiates the paging procedure when NAS signalling messages or user data is pending to be sent to the UE within the paging time window and requests the lower layers to include the eDRX cycle length and paging time window length in the paging message. If NAS signalling messages or user data is pending to be sent to the UE outside the paging time window and the eDRX value that the network provides to the UE in the Negotiated extended DRX parameters IE during the last registration procedure indicates:

- a) the eDRX cycle length duration of the E-UTRA cell connected to 5GCN, is higher than 5.12 seconds; or
- b) the eDRX cycle length duration of the NR cell connected to 5GCN, is higher than 10.24 seconds,

the network initiates the paging procedure at T time ahead of the beginning of the next paging time window.

NOTE: T time is a short time period based on implementation. The operator can take possible imperfections in the synchronization between the 5GCN and the UE into account when choosing T time.

If the network detects that the pending user data to be sent to the UE is related to the voice service as specified in 3GPP TS 23.502 [9] and the network decides to initiate the paging procedure based on the stored paging restriction information, if any, the AMF should request the lower layer to include the Voice Service Indication in the paging message when the UE and the network support the paging indication for voice services.

5.6.2.2 Paging for 5GS services

5.6.2.2.1 General

The network shall initiate the paging procedure for 5GS services when NAS signalling messages or user data is pending to be sent to the UE in 5GMM-IDLE mode over 3GPP access (see example in figure 5.6.2.2.1.1) and there is no paging restriction applied in the network for that paging.

Figure 5.6.2.2.1.1: Paging procedure

To initiate the procedure the 5GMM entity in the AMF requests the lower layer to start paging and shall start timer T3513.

If downlink signalling or user data is pending to be sent over non-3GPP access, the 5GMM entity in the AMF shall indicate to the lower layer that the paging is associated to non-3GPP access.

The network shall not page the UE to re-establish user-plane resources of PDU session(s) associated with non-3GPP access over 3GPP access if all the PDU sessions of the UE that are established over the 3GPP access are associated with control plane only indication or S-NSSAI(s) associated with PDU session(s) are not in the UE's allowed NSSAI and partially allowed NSSAI for a PLMN on 3GPP access.

If the network has downlink user data pending for a UE, the AMF has stored paging restriction of the UE and the Paging restriction type in the stored paging restriction is set to:

- a) "All paging is restricted", the network should not page the UE;
- b) "All paging is restricted except for voice service", the network should page the UE only when:
 - 1) the pending downlink user data for the UE is considered as voice service related by the network;
- c) "All paging is restricted except for specified PDU session(s)", the network should page the UE only when:
 - 1) for PDU session(s) that paging is not restricted based on the stored paging restriction, the network has downlink user data pending; or
- d) "All paging is restricted except for voice service and specified PDU session(s)", the network should page the UE only when:
 - 1) the pending downlink user data for the UE is considered as voice service related by the network; or
 - 2) for PDU session(s) that paging is not restricted based on the stored paging restriction, the network has downlink user data pending.

If the network has downlink signalling pending for a UE and the AMF has stored paging restriction of the UE and the Paging restriction type in the stored paging restriction is set to:

- a) "All paging is restricted", the network should not page the UE;
- b) "All paging is restricted except for voice service", the network should page the UE only when:
 - 1) the pending downlink signalling for the UE is 5GMM signalling or 5GSM signalling of the PDU session of voice service;
- c) "All paging is restricted except for specified PDU session(s)", the network should page the UE only when:
 - 1) the pending downlink signalling for the UE is 5GMM signalling; or
 - 2) for PDU session(s) that paging is not restricted based on the stored paging restriction, the network has downlink 5GSM signalling pending; or
- d) "All paging is restricted except for voice service and specified PDU session(s)", the network should page the UE only when:
 - 1) the pending downlink signalling for the UE is 5GMM signalling or 5GSM signalling of the PDU session of voice service; or
 - 2) for PDU session(s) that paging is not restricted based on the stored paging restriction, the network has downlink 5GSM signalling pending.

NOTE 1: If the network pages the UE due to downlink signalling pending, the network initiates the release of the N1 NAS signalling connection after network-requested procedure is completed.

The 5GMM entity in the AMF may provide the lower layer with the "allowed CAG list" and an "indication that the UE is only allowed to access 5GS via CAG cells" for the current PLMN, if available, and with the "allowed CAG list" and an "indication that the UE is only allowed to access 5GS via CAG cells" per equivalent PLMN, if available. If there is an active emergency PDU session, the 5GMM entity in the AMF shall not provide the lower layer with the "allowed CAG list" and an "indication that the UE is only allowed to access 5GS via CAG cells" for the current PLMN, even if available, or with the "allowed CAG list" and an "indication that the UE is only allowed to access 5GS via CAG cells" per equivalent PLMN, even if available.

Upon reception of a paging indication, the UE shall stop the timer T3346, if running, and:

- a) if control plane CIoT 5GS optimization is not used by the UE, the UE shall:
 - 1) initiate a service request procedure over 3GPP access to respond to the paging as specified in subclauses 5.6.1.2.1 if the UE is in 5GMM-REGISTERED.NORMAL-SERVICE or 5GMM-REGISTERED.NON-ALLOWED-SERVICE (as described in subclause 5.3.5.2) state and the UE is in the 5GMM-IDLE mode without suspend indication;
 - 2) initiate a service request procedure over non-3GPP access to respond to the paging as specified in subclauses 5.6.1;
 - 3) initiate a registration procedure for mobility and periodic registration update over 3GPP access to respond to the paging as specified in subclauses 5.5.1.3.2; or
 - 4) proceed as specified in subclause 5.3.1.5 if the UE is in the 5GMM-IDLE mode with suspend indication; or
- b) if control plane CIoT 5GS optimization is used by the UE, the UE shall:
 - 1) initiate a service request procedure as specified in subclause 5.6.1.2.2 if the UE is in the 5GMM-IDLE mode without suspend indication;
 - 2) initiate a registration procedure for mobility and periodic registration update over 3GPP access as specified in subclauses 5.5.1.3.2; or
 - 3) proceed as specified in subclause 5.3.1.5 if the UE is in the 5GMM-IDLE mode with suspend indication.

NOTE 2: If the UE is in the 5GMM-IDLE mode without suspend indication and has an uplink user data to be sent to the network using control plane CIoT 5GS optimization when receiving the paging indication, the UE can piggyback the uplink user data during the service request procedure initiated to respond to the paging, as specified in subclause 5.6.1.2.2.

The MUSIM UE based on implementation may use the paging cause indicated by lower layers (see 3GPP TS 38.331 [30]), if any, to accept the paging, reject the paging or ignore the paging indication.

Upon reception of a paging indication, if the network supports the rejection of paging request and if a MUSIM UE decides not to accept the paging, the UE may initiate a service request procedure to reject the paging as specified in subclause 5.6.1.1.

NOTE 3: As an implementation option, MUSIM UE is allowed to not respond to paging based on the information available in the paging message, e.g. voice service indication.

If TMGI is used as paging identity and the TMGI matches with multicast MBS session which the UE has joined, the UE shall respond to the paging. Otherwise, the UE shall not respond to the paging.

The network shall stop timer T3513 for the paging procedure when an integrity-protected response is received from the UE and successfully integrity checked by the network or when the 5GMM entity in the AMF receives an indication from the lower layer that it has received the NGAP UE context resume request message as specified in 3GPP TS 38.413 [31]. If the response received is not integrity protected, or the integrity check is unsuccessful, timer T3513 for the paging procedure shall be kept running unless:

- a) the UE is registered for emergency services;
- b) the UE has an emergency PDU session; or
- c) the response received is a REGISTRATION REQUEST message for mobility and periodic registration update and the security mode control procedure or authentication procedure performed during mobility and periodic registration update has completed successfully.

Upon expiry of timer T3513, the network may reinitiate paging.

If the network:

- a) receives downlink signalling, downlink data or both associated with priority user-plane resources for PDU sessions;

- b) receives an MT SMS over NAS and the MPS priority for messaging is enabled as specified in 3GPP TS 29.503 [20AB]; or
- c) receives a request message as specified in 3GPP TS 29.518 [20B] for delivery of an MT SMS over NAS and the request message contains the 3gpp-Sbi-Message-Priority HTTP header as specified in 3GPP TS 29.500 [20AA] set to a value appropriate for MPS for messaging;

is allowed by local policy, and:

- a) waits for a response to the paging sent without paging priority, the network shall stop timer T3513, and then initiate the paging procedure with paging priority; or
- b) does not have a paging procedure ongoing, the network shall perform the paging procedure with paging priority.

5.6.2.2.2 Abnormal cases on the network side

The following abnormal case can be identified:

- a) void.

5.6.2.2.3 Abnormal cases in the UE

The following abnormal cases can be identified:

- a) Paging message received with access type set to non-3GPP access while the UE is in 5GMM-CONNECTED mode over non-3GPP access.

The UE shall not respond to paging message.

- b) Paging message received with access type set to 3GPP access when UE-initiated 5GMM specific procedure or service request procedure is ongoing.

The UE shall proceed with 5GMM specific procedure or service request procedure. If for registration procedure and service request procedure lower layers indicate that the access attempt is barred, then the UE shall handle the pending paging message as specified in subclause 5.6.2.2.1. Otherwise, the UE shall ignore the paging once lower layers confirm the establishment of the signalling connection.

5.6.3 Notification procedure

5.6.3.1 General

The notification procedure is used by the network:

- a) to request the UE, by sending the NOTIFICATION message over 3GPP access, to re-establish the user-plane resources of PDU session(s) associated with non-3GPP access over 3GPP access or to deliver 5GSM downlink signalling messages associated with non-3GPP access over 3GPP access when the UE is in 5GMM-IDLE mode over non-3GPP access and in 5GMM-CONNECTED mode over 3GPP access; or
- b) to request the UE, by sending the NOTIFICATION message over non-3GPP access, to re-establish user-plane resources of the PDU session(s) or to deliver downlink signalling associated with 3GPP access over 3GPP access when the UE is in 5GMM-CONNECTED mode over non-3GPP access and:
 - 1) in 5GMM-IDLE mode over 3GPP access when the UE is not in MICO mode or when the network determines the unavailability period is not activated for the UE; or
 - 2) in 5GMM-IDLE mode with suspend indication over 3GPP access when the UE is not in MICO mode or when the network determines the unavailability period is not activated for the UE.

The network shall not use the NOTIFICATION message to re-establish user-plane resources of PDU session(s) associated with non-3GPP access over 3GPP access if all the PDU sessions of the UE that are established over the 3GPP access are associated with control plane only indication. .

The network shall not use the NOTIFICATION message over non-3GPP access, if:

- a) the MUSIM UE supports the paging indication for voice services;
- b) the network has indicated "paging indication for voice services supported" to the UE; and
- c) the AMF detects that the downlink data is related to voice service (see 3GPP TS 23.501 [8]).

5.6.3.2 Notification procedure initiation

The network shall initiate the notification procedure by sending the NOTIFICATION message to the UE and start timer T3565 (see example in figure 5.6.3.2.1).

For case a) in subclause 5.6.3.1, the NOTIFICATION message is sent from the network to the UE via 3GPP access with access type indicating non-3GPP access.

For case b) in subclause 5.6.3.1, the NOTIFICATION message is sent from the network to the UE via non-3GPP access with access type indicating 3GPP access when the UE is not in MICO mode or when the network determines the unavailability period is not activated for the UE.

Figure 5.6.3.2.1: Notification procedure

For case b) in subclause 5.6.3.1, if the network has downlink user data pending for a UE and the AMF has stored paging restriction of the UE and the Paging restriction type in the stored paging restriction is set to:

- a) "All paging is restricted", the network should not send the NOTIFICATION message to the UE;
- b) "All paging is restricted except for voice service", the network should send the NOTIFICATION message to the UE only when the pending downlink user data for the UE is considered as voice service related by the network and the MUSIM UE does not support the paging indication for voice services or the network has not indicated "paging indication for voice services supported" to the UE;
- c) "All paging is restricted except for specified PDU session(s)", the network should send the NOTIFICATION message to the UE only when:
 - 1) for PDU session(s) that paging is not restricted based on the stored paging restriction, the network has downlink user data pending;
- d) "All paging is restricted except for voice service and specified PDU session(s)" the network should send the NOTIFICATION message to the UE only:
 - 1) when the pending downlink user data for the UE is considered as voice service related by the network and the MUSIM UE does not support the paging indication for voice services, or the network has not indicated "paging indication for voice services supported" to the UE; or

- 2) for PDU session(s) that paging is not restricted based on the stored paging restriction, the network has downlink user data pending.

For case b) in subclause 5.6.3.1, if the network has downlink signalling pending for a UE and the AMF has stored paging restriction of the UE and the Paging restriction type in the stored paging restriction is set to:

- a) "All paging is restricted", the network should not send the NOTIFICATION message to the UE;
- b) "All paging is restricted except for voice service", then the network should send the NOTIFICATION message to the UE only when:
 - 1) the pending downlink signalling for the UE is 5GMM signalling or 5GSM signalling of the PDU session of voice service;
- c) "All paging is restricted except for specified PDU session(s)", the network should send the NOTIFICATION message to the UE only when:
 - 1) the pending downlink signalling for the UE is 5GMM signalling; or
 - 2) for PDU session(s) that paging is not restricted based on the stored paging restriction, the network has downlink 5GSM signalling pending; or
- d) "All paging is restricted except for voice service and specified PDU session(s)" then the network should send the NOTIFICATION message to the UE only when:
 - 1) the pending downlink signalling for the UE is 5GMM signalling or 5GSM signalling pending of the PDU session of voice service; or
 - 2) for PDU session(s) that paging is not restricted based on the stored paging restriction, the network has downlink 5GSM signalling pending.

NOTE 1: If the network sends NOTIFICATION message to the UE due to downlink signalling pending, the network initiates the release of the N1 NAS signalling connection over 3GPP access after network-requested procedure is completed.

Upon reception of a NOTIFICATION message, the UE shall stop the timer T3346, if running.

For case a) in subclause 5.6.3.1, upon reception of NOTIFICATION message, the UE shall initiate a service request procedure over 3GPP access as specified in subclauses 5.6.1.

NOTE 2: For a UE in NB-NI mode, if there is DL user data pending for a PDU session associated with non-3GPP access then the AMF notifies the SMF that reactivation of user plane resources cannot be performed if the number of PDU sessions that currently has user-plane resources established equals to the UE's maximum number of supported user-plane resources.

For case b) in subclause 5.6.3.1, upon reception of NOTIFICATION message:

- a) if control plane CIoT 5GS optimization is not used by the UE, the UE shall:
 - 1) initiate a service request procedure over 3GPP access as specified in subclause 5.6.1.2.1, if the UE is in 5GMM-REGISTERED.NORMAL-SERVICE or 5GMM-REGISTERED.NON-ALLOWED-SERVICE (as described in subclause 5.3.5.2) state over 3GPP access or 5GMM-REGISTERED.NON-ALLOWED-SERVICE state (see subclause 5.3.5.2), and the UE is in the 5GMM-IDLE mode without suspend indication;
 - 2) initiate a registration procedure for mobility and periodic registration update over 3GPP access as specified in subclause 5.5.1.3.2, if the UE is in 5GMM-REGISTERED.ATTEMPTING-REGISTRATION-UPDATE state over 3GPP access; or
 - 3) proceed as specified in subclause 5.3.1.5 if the UE is in the 5GMM-IDLE mode with suspend indication;
- b) if control plane CIoT 5GS optimization is used by the UE, the UE shall:
 - 1) initiate a service request procedure over 3GPP access as specified in subclause 5.6.1.2.2, if the UE is in 5GMM-REGISTERED.NORMAL-SERVICE or 5GMM-REGISTERED.NON-ALLOWED-SERVICE (as described in subclause 5.3.5.2) state and the UE is in the 5GMM-IDLE mode without suspend indication;

- 2) initiate a registration procedure for mobility and periodic registration update over 3GPP access as specified in subclause 5.5.1.3.2, if the UE is in 5GMM-REGISTERED.ATTEMPTING-REGISTRATION-UPDATE state; or
 - 3) proceed as specified in subclause 5.3.1.5 if the UE is in the 5GMM-IDLE mode with suspend indication; or
- c) if:
- 1) the UE is in 5GMM-REGISTERED.NO-CELL-AVAILABLE state, 5GMM-REGISTERED.PLMN-SEARCH state, 5GMM-REGISTERED.LIMITED-SERVICE state or 5GMM-REGISTERED.UPDATE-NEEDED state over 3GPP access; or
 - 2) the MUSIM UE is not able to respond the NOTIFICATION message as specified in case a) and b) above, e.g., due to UE implementation constraints;

the UE shall respond with NOTIFICATION RESPONSE message over non-3GPP access indicating inability of the UE to initiate a service request procedure or a registration procedure over 3GPP access and may include the PDU session status information element to indicate:

- 1) the single access PDU session(s) not in 5GSM state PDU SESSION INACTIVE in the UE associated with the 3GPP access type; and
- 2) the MA PDU session(s) not in 5GSM state PDU SESSION INACTIVE in the UE and having user plane resources established associated with the 3GPP access type.

Upon reception of NOTIFICATION message:

For case b) in subclause 5.6.3.1, if the UE is in 5GMM-REGISTERED.NO-CELL-AVAILABLE state or 5GMM-REGISTERED.PLMN-SEARCH state and a local release was performed in the UE for the single access PDU sessions associated with the 3GPP access or for user plane resources on the 3GPP access of MA PDU sessions;

then the UE shall respond with NOTIFICATION RESPONSE message over non-3GPP access indicating with the PDU session status information element that:

- the local release of its single access PDU sessions associated with the 3GPP access was performed; and
- the local release of its 3GPP access user plane resources of MA PDU sessions was performed.

5.6.3.3 Notification procedure completion

Upon reception of SERVICE REQUEST message, CONTROL PLANE SERVICE REQUEST message or REGISTRATION REQUEST message, the AMF shall stop timer T3565 and proceed service request procedure as specified in subclauses 5.6.3.1 or registration procedure for mobility and periodic registration update as specified in subclauses 5.5.1.3. If no user-plane resources of PDU session(s) need to be re-established, the AMF should notify the SMF that the UE was reachable but did not accept to re-establish the user-plane resources of PDU session(s).

When the 5GMM entity in the AMF receives an indication from the lower layer that it has received the NGAP UE context resume request message as specified in 3GPP TS 38.413 [31], the AMF shall stop timer T3565.

Upon reception of NOTIFICATION RESPONSE message over non-3GPP access, the AMF shall stop timer T3565 and should notify the SMF that the UE is unreachable.

If the NOTIFICATION RESPONSE message includes the PDU session status information element, then:

- a) for single access PDU sessions, the AMF shall:
 - 1) perform a local release of all those PDU sessions which are not in 5GSM state PDU SESSION INACTIVE on the AMF side associated with 3GPP access, but are indicated by the UE in the PDU session status information element in the NOTIFICATION RESPONSE message as being in 5GSM state PDU SESSION INACTIVE; and
 - 2) shall request the SMF to perform a local release of all those PDU sessions associated with 3GPP access. If any of those PDU sessions is associated with one or more multicast MBS sessions, the SMF shall consider the UE as removed from the associated multicast MBS sessions; and

b) For MA PDU sessions, the AMF shall:

- 1) for MA PDU sessions having user plane resources established only on the 3GPP access in the AMF side, but are indicated by the UE in the PDU session status information element in the NOTIFICATION RESPONSE message as no user plane resources established on the 3GPP access:
 - i) perform a local release of all those MA PDU sessions; and
 - ii) request the SMF to perform a local release of all those MA PDU sessions. If the MA PDU session is associated with one or more multicast MBS sessions, the SMF shall consider the UE as removed from the associated multicast MBS sessions; and
- 2) for MA PDU sessions having user plane resources established on both accesses in the AMF side, but are indicated by the UE in the PDU session status information element in the NOTIFICATION RESPONSE message as no user plane resources established on the 3GPP access:
 - i) perform a local release of 3GPP access user plane resources of all those MA PDU sessions; and
 - ii) request the SMF to perform a local release of 3GPP access user plane resources of all those MA PDU sessions. If the MA PDU session is associated with one or more MBS sessions, the SMF shall consider the UE as removed from the associated MBS sessions.

5.6.3.4 Abnormal cases on the network side

The following abnormal cases can be identified:

a) Expiry of timer T3565.

The network shall, on the first expiry of the timer T3565, retransmit the NOTIFICATION message and shall reset and start timer T3565. This retransmission is repeated four times, i.e. on the fifth expiry of timer T3565, the procedure shall be aborted. In addition, upon the fifth expiry of timer T3565:

For case a) in subclause 5.6.3.1, the AMF should notify the SMF that the UE is unreachable. The AMF may enter 5GMM-IDLE mode over 3GPP access.

For case b) in subclause 5.6.3.1, the AMF may either:

- 1) perform the paging procedure over the 3GPP access; or
- 2) notify the SMF that the UE is unreachable.

NOTE: Whether the AMF performs the paging procedure or notifies the SMF is up to operator's policies.

b) De-registration procedure collision

If the network receives a DEREGISTRATION REQUEST message before it receives a SERVICE REQUEST message or REGISTRATION REQUEST message, the AMF shall stop timer T3565 and proceed de-registration procedure as specified in subclause 5.5.2.

5.6.3.5 Abnormal cases on the UE side

The following abnormal cases can be identified:

a) NOTIFICATION message received via non-3GPP access with access type indicating 3GPP access when UE-initiated 5GMM specific procedure or service request procedure over 3GPP access is ongoing.

The UE shall proceed with 5GMM specific procedure or service request procedure. If for registration procedure and service request procedure lower layers indicate that the access attempt is barred, then the UE shall handle the pending NOTIFICATION message as specified in subclause 5.6.3.2. Otherwise, the UE shall ignore the NOTIFICATION message once lower layers confirms the establishment of the signalling connection.

b) NOTIFICATION message received via non-3GPP access with access type indicating 3GPP access when the unavailability period is activated in the UE or the UE is about to activate unavailability period.

The UE shall respond with NOTIFICATION RESPONSE message over non-3GPP access indicating inability of the UE to initiate a service request procedure or a registration procedure over 3GPP access.

6 Elementary procedures for 5GS session management

6.1 Overview

6.1.1 General

This clause describes the procedures used for 5GS session management (5GSM) performed over an N1 NAS signalling connection.

The main function of the 5GSM sublayer is to support the PDU session handling in the UE and in the SMF (transferred via the AMF).

The 5GSM comprises procedures for:

- the authentication and authorization, establishment, modification and release of PDU sessions; and
- request for performing handover of an existing PDU session between 3GPP access and non-3GPP access, or to transfer an existing PDN connection in the EPS to the 5GS.

Each PDU session represents a PDU session established between the UE and an SMF. PDU sessions can remain established even if the radio and network resources constituting the corresponding PDU session between the UE and the SMF are temporarily released.

5GSM procedures can be performed only if a 5GMM context has been established between the UE and the AMF, and the secure exchange of NAS messages has been initiated by the AMF by use of the 5GMM procedures described in clause 5. Once the UE is successfully registered to a PLMN, a PDU session can be established. If no 5GMM context has been established, the 5GMM sublayer has to initiate the establishment of a 5GMM context by use of the 5GMM procedures as described in clause 5.

The UE can request the network to modify or release PDU sessions. The network can fulfil such a request from the UE by modifying a PDU session or releasing a PDU session using network-requested procedures (see subclause 6.3).

6.1.2 Types of 5GSM procedures

Three types of 5GSM procedures can be distinguished:

a) Procedures related to PDU sessions:

These procedures are initiated by the network and are used for authentication and authorization or manipulation of PDU sessions:

- 1) PDU authentication and authorization;
- 2) network-requested PDU session modification;
- 3) network-requested PDU session release; and
- 4) service-level authentication and authorization.

This procedure is initiated by the UE and to request for establishment of PDU sessions or to perform handover of an existing PDU session between 3GPP access and non-3GPP access, or to transfer an existing PDN connection in the EPS to the 5GS:

UE-requested PDU session establishment.

b) Transaction related procedures:

These procedures are initiated by the UE to request for handling of PDU sessions, i.e. to modify a PDU session, or to release a PDU session:

- 1) UE-requested PDU session modification; and
- 2) UE-requested PDU session release.

This procedure is initiated by the 5G ProSe UE-to-network relay UE and is used for the manipulation of PDU sessions:

- remote UE report.

A successful transaction related procedure initiated by the UE triggers the network to execute one of the following procedures related to PDU session; network-requested PDU session modification procedure or network-requested PDU session release procedure. The UE treats the start of the procedure related to the PDU session as completion of the transaction related procedure.

- c) Common procedure:

The following 5GSM procedure can be related to a PDU session or to a procedure transaction:

5GSM status procedure.

6.1.3 5GSM sublayer states

6.1.3.1 General

In the following subclauses, the possible states of a PDU session in the UE and the network side are described.

6.1.3.2 5GSM sublayer states in the UE

6.1.3.2.1 Overview

In the following subclauses, the possible 5GSM sublayer states of the UE are described and shown in figure 6.1.3.2.1.1.

Figure 6.1.3.2.8.1: The procedure transaction states in the UE (overview)

6.1.3.3 5GSM sublayer states in the network side

6.1.3.3.1 Overview

In the following subclauses, the possible 5GSM sublayer states of the network are described and shown in Figure 6.1.3.3.1.1.

NOTE 1: Not all possible transitions are shown in this figure.

NOTE 2: Some transitions shown in this figure are not applicable to the MA PDU session.

Figure 6.1.3.3.1.1: The 5GSM sublayer states for PDU session handling in the network (overview)

6.1.3.3.2 PDU SESSION INACTIVE

No PDU session exists.

6.1.3.3.3 PDU SESSION ACTIVE

The PDU session is active in the network.

6.1.3.3.4 PDU SESSION INACTIVE PENDING

The network has initiated a PDU session release procedure towards the UE and is waiting for a response from the UE.

6.1.3.3.5 PDU SESSION MODIFICATION PENDING

The network has initiated a PDU session modification procedure towards the UE and is waiting for a response from the UE.

6.1.3.3.6 PROCEDURE TRANSACTION INACTIVE

No procedure transaction exists.

6.1.3.3.7 PROCEDURE TRANSACTION PENDING

The network has initiated a procedure transaction towards the UE.

Figure 6.1.3.3.7.1: The procedure transaction states in the network (overview)

6.1.4 Coordination between 5GSM and ESM

6.1.4.1 Coordination between 5GSM and ESM with N26 interface

Interworking with EPS is supported for a PDU session, if the PDU session includes the mapped EPS bearer context(s) or has association(s) between QoS flow and mapped EPS bearer after inter-system change from S1 mode to N1 mode. The SMF shall not include any mapped EPS bearer contexts associated with a PDU session for LADN, with a PDU session which is a multi-homed IPv6 PDU session, and with a PDU session with the selected SSC mode set to "SSC mode 2" or "SSC mode 3". If the UE receives any mapped EPS bearer context for a PDU session for LADN, for a multi-homed IPv6 PDU session, or for a PDU session with the selected SSC mode set to "SSC mode 2" or "SSC mode 3", the UE may locally delete the mapped EPS bearer context. See coding of the Mapped EPS bearer contexts IE in subclause 9.11.4.8. In an MA PDU session, the UE shall have one set of the mapped EPS bearer contexts. The network can provide the set of the mapped EPS bearer contexts of the MA PDU session via either access of the MA PDU session. In an MA PDU session, the UE shall support modification or deletion via an access of a mapped EPS bearer context of the MA PDU session created via the same or the other access.

Upon inter-system change from N1 mode to S1 mode, the UE shall create the default EPS bearer context and the dedicated EPS bearer context(s) based on the parameters of the mapped EPS bearer contexts or the associations between QoS flow and mapped EPS bearer in the PDU session, if available. The EPS bearer identity assigned for the QoS flow of the default QoS rule becomes the EPS bearer identity of the default bearer in the corresponding PDN connection. If there is no EPS bearer identity assigned to the QoS flow of the default QoS rule of a PDU session associated with 3GPP access, or if there is no corresponding mapped EPS bearer contexts associated with the EPS bearer identity assigned to the QoS flow of the default QoS rule of a PDU session associated with 3GPP access:

- a) the PDU session is not an MA PDU session established over both 3GPP access and non-3GPP access, the UE shall perform a local release of the PDU session; or
- b) the PDU session is an MA PDU session established over both 3GPP access and non-3GPP access, the UE shall perform a local release of the PDU session over 3GPP access and consider that the MA PDU session is established over non-3GPP access only.

If there is no EPS bearer identity assigned to the QoS flow(s) of a PDU session associated with 3GPP access which is not associated with the default QoS rule, or if there is no corresponding mapped EPS bearer contexts associated with the EPS bearer identity assigned to the QoS flow of the non-default QoS rule of a PDU session associated with 3GPP access, unless the PDU session is an MA PDU session established over 3GPP access and over non-3GPP access, the UE shall locally delete the QoS rules and the QoS flow description(s). The UE uses the parameters from each PDU session

for which interworking with EPS is supported to create corresponding default EPS bearer context and optionally dedicated EPS bearer context(s) as follows:

- a) the PDU session type of the PDU session shall be mapped to the PDN type of the default EPS bearer context as follows:
 - 1) the PDN type shall be set to "non-IP" if the PDU session type is "Unstructured";
 - 2) the PDN type shall be set to "IPv4" if the PDU session type is "IPv4";
 - 3) the PDN type shall be set to "IPv6" if the PDU session type is "IPv6";
 - 4) the PDN type shall be set to "IPv4v6" if the PDU session type is "IPv4v6";
 - 5) the PDN type shall be set to "non-IP" if the PDU session type is "Ethernet", and the UE, the network or both of them do not support Ethernet PDN type in S1 mode; and
 - 6) the PDN type shall be set to "Ethernet" if the PDU session type is "Ethernet" and the UE and the network support Ethernet PDN type in S1 mode;
- b) the PDU address of the PDU session shall be mapped to the PDN address of the default EPS bearer context as follows:
 - 1) the PDN address of the default EPS bearer context is set to the PDU address of the PDU session, if the PDU session type is "IPv4", "IPv6" or "IPv4v6"; and
 - 2) the PDN address of the default EPS bearer context is set to zero, if the PDU session type is "Ethernet" or "Unstructured";
- c) the DNN of the PDU session shall be mapped to the APN of the default EPS bearer context, unless the PDU session is an emergency PDU session;
- d) the APN-AMBR and extended APN-AMBR received in the parameters of the default EPS bearer context of the mapped EPS bearer contexts shall be mapped to the APN-AMBR and extended APN-AMBR of the default EPS bearer context;
- e) for each PDU session in state PDU SESSION ACTIVE, PDU SESSION MODIFICATION PENDING or PDU SESSION INACTIVE PENDING:
 - 1) if the UE is performing an inter-system change from N1 mode to WB-S1 mode, the UE shall set the state of the mapped EPS bearer context(s) to BEARER CONTEXT ACTIVE; or
 - 2) if the UE is performing an inter-system change from N1 mode to NB-S1 mode, for the mapped EPS bearer context corresponding to the default EPS bearer, the UE shall set the state of the mapped EPS bearer context to BEARER CONTEXT ACTIVE. Additionally, if the UE is performing an inter-system change from WB-N1 mode to NB-S1 mode, for the mapped EPS bearer context corresponding to a dedicated EPS bearer, if any, the UE shall set the state of the mapped EPS bearer context to BEARER CONTEXT INACTIVE; and
- f) for any other PDU session the UE shall set the state of the mapped EPS bearer context(s) to BEARER CONTEXT INACTIVE.

Additionally, for each mapped EPS bearer context or the association between QoS flow and mapped EPS bearer in the PDU session:

- a) the EPS bearer identity shall be set to the EPS bearer identity received in the mapped EPS bearer context, or the EPS bearer identity associated with the QoS flow;
- b) the EPS QoS parameters shall be set to the mapped EPS QoS parameters of the EPS bearer received in the mapped EPS bearer context, or the EPS QoS parameters associated with the QoS flow;
- c) the extended EPS QoS parameters shall be set to the mapped extended EPS QoS parameters of the EPS bearer received in the mapped EPS bearer context, or the extended EPS QoS parameters associated with the QoS flow; and
- d) the traffic flow template shall be set to the mapped traffic flow template of the EPS bearer received in the mapped EPS bearer context, or the stored traffic flow template associated with the QoS flow, if available.

After inter-system change from N1 mode to S1 mode, the UE shall associate the PDU session identity, the S-NSSAI, and the session-AMBR with the default EPS bearer context, and for each EPS bearer context mapped from one or more QoS flows, associate the QoS rule(s) for the QoS flow(s) and the QoS flow description(s) for the QoS flow(s) with the EPS bearer context.

If the PDU session is associated with the control plane only indication and supports interworking with EPS, after inter-system change from N1 mode to S1 mode, the UE shall associate the EPS bearer context(s) of the PDN connection corresponding to the PDU session with the control plane only indication.

If the PDU session is associated with a PDU session pair ID, after inter-system change from N1 mode to S1 mode, the UE shall associate the default EPS bearer context of the PDN connection corresponding to the PDU session with the PDU session pair ID. If the PDU session is associated with an RSN, after inter-system change from N1 mode to S1 mode, the UE shall associate the default EPS bearer context of the PDN connection corresponding to the PDU session with the RSN.

After inter-system change from N1 mode to S1 mode, if:

- a) the UE sent the URSP provisioning in EPS support indicator and received the URSP provisioning in EPS support indicator in the PDU session; or
- b) the PDU session is associated with the URSP provisioning in EPS support indicators;

the UE shall associate the default EPS bearer context of the PDN connection corresponding to the PDU session with the URSP provisioning in EPS support indicators.

After inter-system change from N1 mode to S1 mode, the UE and the SMF shall maintain the PDU session type of the PDU session until the PDN connection corresponding to the PDU session is released if the UE supports non-IP PDN type and the PDU session type is "Ethernet" or "Unstructured".

After inter-system change from N1 mode to S1 mode, the UE and the SMF shall maintain the following 5GSM attributions and capabilities associated with the PDU session until the PDN connection corresponding to the PDU session is released:

- a) the always-on PDU session indication;
- b) the maximum number of supported packet filters;
- c) the support of reflective QoS;
- d) the maximum data rate per UE for user-plane integrity protection supported by the UE for uplink and the maximum data rate per UE for user-plane integrity protection supported by the UE for downlink;
- e) the support of multi-homed IPv6 PDU session; and
- f) if the PDU session is an MA PDU session established over 3GPP access, the PDN connection of the default EPS bearer corresponding to the MA PDU session shall be considered as a user-plane resource of the MA PDU session.

After inter-system change from N1 mode to S1 mode, the UE operating in single-registration mode in a network supporting N26 interface shall deem that the following features are supported by the network on the PDN connection corresponding to the PDU session:

- a) PS data off; and
- b) Local address in TFT.

If there is a QoS flow used for IMS signalling, after inter-system change from N1 mode to S1 mode, the EPS bearer associated with the QoS flow for IMS signalling becomes the EPS bearer for IMS signalling.

When the UE is provided with a new session-AMBR in the Protocol configuration options IE or Extended protocol configuration options IE in the MODIFY EPS BEARER CONTEXT REQUEST message, the UE shall discard the corresponding association and associate the new value with the default EPS bearer context.

The network may provide the UE with one or more QoS rules by including either one QoS rules parameter, or one QoS rules with the length of two octets parameter, but not both, in the Protocol configuration options IE or Extended protocol configuration options IE in the MODIFY EPS BEARER CONTEXT REQUEST message. The network may

provide the UE with one or more QoS flow descriptions corresponding to the EPS bearer context being modified, by including either one QoS flow descriptions parameter, or one QoS flow descriptions with the length of two octets parameter, but not both, in the Protocol configuration options IE or Extended protocol configuration options IE in the MODIFY EPS BEARER CONTEXT REQUEST message.

When the UE is provided with one or more QoS flow descriptions or the EPS bearer identity of an existing QoS flow description is modified in the Protocol configuration options IE or Extended protocol configuration options IE in the MODIFY EPS BEARER CONTEXT REQUEST message, the UE shall check the EPS bearer identity included in the QoS flow description; and:

- a) if the EPS bearer identity corresponds to the EPS bearer context being modified or the EPS bearer identity is not included, the UE shall store the QoS flow description and all the associated QoS rules, if any, for the EPS bearer context being modified for use during inter-system change from S1 mode to N1 mode; and
- b) otherwise the UE shall locally delete the QoS flow description and all the associated QoS rules, if any, and include a Protocol configuration options IE or Extended protocol configuration options IE with a 5GSM cause parameter set to 5GSM cause #84 "syntactical error in the QoS operation" in the MODIFY EPS BEARER CONTEXT ACCEPT message.

When the UE is provided with one or more QoS rules, or one or more QoS flow descriptions in the Protocol configuration options IE or Extended protocol configuration options IE in the MODIFY EPS BEARER CONTEXT REQUEST message, the UE shall process the QoS rules sequentially starting with the first QoS rule and shall process the QoS flow descriptions sequentially starting with the first QoS flow description. The UE shall check the QoS rules and QoS flow descriptions for different types of errors as follows:

NOTE 1: If an error is detected in a QoS rule or a QoS flow description which requires sending a Protocol configuration options IE or Extended protocol configuration options IE with a 5GSM cause value, then the QoS rules parameter, the QoS rules with the length of two octets parameter, the QoS flow descriptions parameter and the QoS flow descriptions with the length of two octets parameter included in the Protocol configuration options IE or Extended protocol configuration options IE in the MODIFY EPS BEARER CONTEXT REQUEST message are discarded, if any.

NOTE 2: If the EPS bearer context modification procedure is rejected, then the QoS rules parameter, the QoS rules with the length of two octets parameter, the QoS flow descriptions parameter and the QoS flow descriptions with the length of two octets parameter included in the Protocol configuration options IE or Extended protocol configuration options IE in the MODIFY EPS BEARER CONTEXT REQUEST message are discarded, if any.

a) Semantic errors in QoS operations:

- 1) When the rule operation is "Modify existing QoS rule and add packet filters", "Modify existing QoS rule and replace all packet filters", "Modify existing QoS rule and delete packet filters" or "Modify existing QoS rule without modifying packet filters" on the default QoS rule and the DQR bit is set to "the QoS rule is not the default QoS rule".
- 2) When the rule operation is "Modify existing QoS rule and add packet filters", "Modify existing QoS rule and replace all packet filters", "Modify existing QoS rule and delete packet filters" or "Modify existing QoS rule without modifying packet filters" on a QoS rule which is not the default QoS rule and the DQR bit is set to "the QoS rule is the default QoS rule".
- 3) When the rule operation is "Create new QoS rule" and the DQR bit is set to "the QoS rule is the default QoS rule" when there's already a default QoS rule with different QoS rule identifier.
- 4) When the rule operation is "Delete existing QoS rule" on the default QoS rule.
- 5) When the rule operation is "Create new QoS rule", "Modify existing QoS rule and add packet filters", "Modify existing QoS rule and replace all packet filters", "Modify existing QoS rule and delete packet filters", or "Modify existing QoS rule without modifying packet filters" and two or more QoS rules associated with this PDU session would have identical precedence values.
- 6) When the rule operation is "Modify existing QoS rule and delete packet filters", the QoS rule is a QoS rule of a PDU session of IPv4, IPv6, IPv4v6 or Ethernet PDU session type, and the packet filter list in the resultant QoS rule is empty.

- 7) When the rule operation is "Create new QoS rule", and there is already an existing QoS rule with the same QoS rule identifier and the existing QoS rule is associated with a QoS flow description stored for the EPS bearer context being modified or the existing QoS rule is not associated with any QoS flow description.
- 8) When the rule operation is "Modify existing QoS rule and add packet filters", "Modify existing QoS rule and replace all packet filters", "Modify existing QoS rule and delete packet filters", or "Modify existing QoS rule without modifying packet filters" and there is no existing QoS rule with the same QoS rule identifier associated with a QoS flow description stored for the EPS bearer context being modified.
- 9) When the rule operation is "Delete existing QoS rule" and there is no existing QoS rule with the same QoS rule identifier associated with a QoS flow description stored for the EPS bearer context being modified.
- 10) When the flow description operation is "Create new QoS flow description" and there is already an existing QoS flow description with the same QoS flow identifier stored for the EPS bearer context being modified.
- 11) When the flow description operation is "Modify existing QoS flow description" and there is no existing QoS flow description with the same QoS flow identifier stored for the EPS bearer context being modified.
- 12) When the flow description operation is "Delete existing QoS flow description" and there is no existing QoS flow description with the same QoS flow identifier stored for the EPS bearer context being modified.
- 13) When the UE determines that:
 - i) the default EPS bearer context is associated with one or more QoS flows but the default EPS bearer context is not associated with the default QoS rule.
 - ii) a dedicated EPS bearer context is associated with one or more QoS flows but the dedicated EPS bearer context is associated with the default QoS rule.
- 14) When the rule operation is "Create new QoS rule" and there is already an existing QoS rule with the same QoS rule identifier associated with a QoS flow description stored for an EPS bearer context different from the EPS bearer context being modified and belonging to the same PDN connection as the EPS bearer context being modified.
- 15) When the flow description operation is "Create new QoS flow description", and there is already an existing QoS flow description with the same QoS flow identifier stored for an EPS bearer context different from the EPS bearer context being modified and belonging to the same PDN connection as the EPS bearer context being modified.
- 16) When the rule operation is "Create new QoS rule", "Modify existing QoS rule and add packet filters", "Modify existing QoS rule and replace all packet filters", "Modify existing QoS rule and delete packet filters", or "Modify existing QoS rule without modifying packet filters" and the resultant QoS rule is associated with a QoS flow description stored for an EPS bearer context different from the EPS bearer context being modified.
- 17) When the rule operation is "Create new QoS rule", the DQR bit is set to "the QoS rule is not the default QoS rule", the QoS rule is provided for a PDN connection of PDN type "non-IP" and there is locally available information associated with the PDN connection that is set to "Unstructured".
- 18) When the flow description operation is "Create new QoS flow description" or "Modify existing QoS flow description", the QFI associated with the QoS flow description is not the same as the QFI of the default QoS rule, the QoS flow description is provided for a PDN connection of PDN type "non-IP" and there is locally available information associated with the PDN connection that is set to "Unstructured".
- 19) When the rule operation is "Modify existing QoS rule and add packet filters", the "packet filter list" field contains a match-all packet filter, the resultant QoS rule is the default QoS rule and there is already an existing match-all packet filter associated with the default QoS rule.
- 20) When the rule operation is "Create new QoS rule" and the DQR bit is set to "the QoS rule is not the default QoS rule", or the rule operation is "Modify existing QoS rule and add packet filters" on a QoS rule which is not the default QoS rule or "Modify existing QoS rule and replace all packet filters" on a QoS rule which is not the default QoS rule, and one match-all packet filter is to be associated with the resultant QoS rule.

In case 5, if the old QoS rule (i.e. the QoS rule that existed before the MODIFY EPS BEARER CONTEXT REQUEST message was received) is not the default QoS rule and the old QoS rule is associated with a QoS flow

description stored for the EPS bearer context being modified, the UE shall not diagnose an error, shall further process the new request and, if it was processed successfully, shall delete the old QoS rule which has identical precedence value. Otherwise, the UE shall include a Protocol configuration options IE or Extended protocol configuration options IE with a 5GSM cause parameter set to 5GSM cause #83 "semantic error in the QoS operation" in the MODIFY EPS BEARER CONTEXT ACCEPT message.

In case 6, if the QoS rule is not the default QoS rule, the UE shall delete the QoS rule. If the QoS rule is the default QoS rule, the UE shall include a Protocol configuration options IE or Extended protocol configuration options IE with a 5GSM cause parameter set to 5GSM cause #83 "semantic error in the QoS operation" in the MODIFY EPS BEARER CONTEXT ACCEPT message.

In case 7, if the existing QoS rule is not the default QoS rule and the DQR bit of the new QoS rule is set to "the QoS rule is not the default QoS rule", the UE shall not diagnose an error, further process the create request and, if it was processed successfully, delete the old QoS rule (i.e. the QoS rule that existed when case 7 was detected). If the existing QoS rule is the default QoS rule or the DQR bit of the new QoS rule is set to "the QoS rule is the default QoS rule", the UE shall include a Protocol configuration options IE or Extended protocol configuration options IE with a 5GSM cause parameter set to 5GSM cause #83 "semantic error in the QoS operation" in the MODIFY EPS BEARER CONTEXT ACCEPT message.

In case 9, the UE shall not diagnose an error, further process the delete request and, if it was processed successfully, consider the respective QoS rule as successfully deleted.

In case 10, the UE shall not diagnose an error, further process the create request and, if it was processed successfully, delete the old QoS flow description (i.e. the QoS flow description that existed when case 10 was detected).

In case 12, the UE shall not diagnose an error, further process the delete request and, if it was processed successfully, consider the respective QoS flow description as successfully deleted.

Otherwise, the UE shall include a Protocol configuration options IE or Extended protocol configuration options IE with a 5GSM cause parameter set to 5GSM cause #83 "semantic error in the QoS operation" in the MODIFY EPS BEARER CONTEXT ACCEPT message.

b) Syntactical errors in QoS operations:

- 1) When the rule operation is "Create new QoS rule", "Modify existing QoS rule and add packet filters", "Modify existing QoS rule and replace all packet filters" or "Modify existing QoS rule and delete packet filters", the packet filter list in the QoS rule is empty, and the QoS rule is provided for a PDN connection of PDN type IPv4, IPv6, IPv4v6 or Ethernet, or for a PDN connection of PDN type "non-IP" and there is locally available information associated with the PDN connection that is set to "Ethernet".
- 2) When the rule operation is "Delete existing QoS rule" or "Modify existing QoS rule without modifying packet filters" with a non-empty packet filter list in the QoS rule.
- 3) When the rule operation is "Modify existing QoS rule and delete packet filters" and the packet filter to be deleted does not exist in the original QoS rule.
- 4) Void.
- 5) When there are other types of syntactical errors in the coding of the QoS rules parameter, the QoS rules with the length of two octets parameter, the QoS flow descriptions parameter or the QoS flow descriptions with the length of two octets parameter, such as a mismatch between the number of packet filters subfield, and the number of packet filters in the packet filter list when the rule operation is "delete existing QoS rule" or "create new QoS rule", or the number of packet filters subfield is larger than the maximum possible number of packet filters in the packet filter list (i.e., there is no QoS rule precedence subfield included in the QoS rule IE), the QoS Rule Identifier is set to "no QoS rule identifier assigned" when the rule operation is not "delete existing QoS rule", or the QoS flow identifier is set to "no QoS flow identifier assigned" when the flow description operation is not "Delete existing QoS flow description".
- 6) When, the
 - A) rule operation is "Create new QoS rule", "Modify existing QoS rule and add packet filters", "Modify existing QoS rule and replace all packet filters", "Modify existing QoS rule and delete packet filters" or "Modify existing QoS rule without modifying packet filters", the UE determines, by using the QoS rule's QFI as the 5QI, that there is a resulting QoS rule for a GBR QoS flow (as described in

3GPP TS 23.501 [8] table 5.7.4-1), and there is no QoS flow description with a QFI corresponding to the QFI of the resulting QoS rule.

- B) flow description operation is "Delete existing QoS flow description", and the UE determines, by using the QoS rule's QFI as the 5QI, that there is a resulting QoS rule for a GBR QoS flow (as described in 3GPP TS 23.501 [8] table 5.7.4-1) with a QFI corresponding to the QFI of the QoS flow description that is deleted (i.e. there is no associated QoS flow description with the same QFI).
- 7) When the flow description operation is "Create new QoS flow description" or "Modify existing QoS flow description", and the UE determines that there is a QoS flow description of a GBR QoS flow (as described in 3GPP TS 23.501 [8] table 5.7.4-1) which lacks at least one of the mandatory parameters (i.e., GFBR uplink, GFBR downlink, MFBR uplink and MFBR downlink). If the QoS flow description does not include a 5QI, the UE determines this by using the QFI as the 5QI.
- 8) When the rule operation is "Create new QoS rule", "Modify existing QoS rule and add packet filters" or "Modify existing QoS rule and replace all packet filters" with a non-empty packet filter list in the QoS rule, and the DQR bit is set to "the QoS rule is the default QoS rule", the QoS rule is provided for a PDN connection of PDN type "non-IP" and there is locally available information associated with the PDN connection that is set to "Unstructured".

In case 3 the UE shall not diagnose an error, further process the deletion request and, if no error according to items c and d was detected, consider the respective packet filter as successfully deleted.

Otherwise the UE shall include a Protocol configuration options IE or Extended protocol configuration options IE with a 5GSM cause parameter set to 5GSM cause #84 "syntactical error in the QoS operation" in the MODIFY EPS BEARER CONTEXT ACCEPT message.

NOTE 3: It is not considered an error if the UE determines that after processing all QoS operations on QoS rules and QoS flow descriptions there is a QoS flow description that is not associated with any QoS rule and the UE is not in NB-N1 mode.

NOTE 3a: An implementation that strictly follows QoS rule operation as defined in subclause 9.11.4.13 might not detect case 2).

c) Semantic errors in packet filters:

- 1) When a packet filter consists of conflicting packet filter components which would render the packet filter ineffective, i.e. no IP packet will ever fit this packet filter. How the UE determines a semantic error in a packet filter is outside the scope of the present document.

The UE shall include a Protocol configuration options IE or Extended protocol configuration options IE with a 5GSM cause parameter set to 5GSM cause #44 "semantic errors in packet filter(s)" in the MODIFY EPS BEARER CONTEXT ACCEPT message.

d) Syntactical errors in packet filters:

- 1) When the rule operation is "Modify existing QoS rule and add packet filters" or "Modify existing QoS rule and replace all packet filters", and two or more packet filters in the resultant QoS rule would have identical packet filter identifiers.
- 2) When the rule operation is "Create new QoS rule", and two or more packet filters in the resultant QoS rule would have identical packet filter identifiers.
- 3) When there are other types of syntactical errors in the coding of packet filters, such as the use of a reserved value for a packet filter component identifier.
- 4) Void.

In case 1, if two or more packet filters with identical packet filter identifiers are contained in the MODIFY EPS BEARER CONTEXT REQUEST message, the UE shall include a Protocol configuration options IE or Extended protocol configuration options IE with a 5GSM cause parameter set to 5GSM cause #45 "syntactical error in packet filter(s)" in the MODIFY EPS BEARER CONTEXT ACCEPT message. Otherwise, the UE shall not diagnose an error, further process the MODIFY EPS BEARER CONTEXT REQUEST message and, if it was processed successfully, delete the old packet filters which have the identical packet filter identifiers.

Otherwise the UE shall include a Protocol configuration options IE or Extended protocol configuration options IE with a 5GSM cause parameter set to 5GSM cause #45 "syntactical error in packet filter(s)" in the MODIFY EPS BEARER CONTEXT ACCEPT message.

If the UE detects different errors in the QoS rules and QoS flow descriptions as described in this subclause which requires sending a 5GSM cause parameter in the MODIFY EPS BEARER CONTEXT ACCEPT message, the UE shall include a single 5GSM cause parameter in the MODIFY EPS BEARER CONTEXT ACCEPT message.

NOTE 4: The 5GSM cause to use cannot be different from #44 "semantic error in packet filter(s)", #45 "syntactical errors in packet filter(s)", #83 "semantic error in the QoS operation" or #84 "syntactical error in the QoS operation". The selection of a 5GSM cause is up to UE implementation.

Upon successful completion of an EPS attach procedure or tracking area updating procedure after inter-system change from N1 mode to S1 mode (see 3GPP TS 24.301 [15]), unless the PDU session is an MA PDU session established over 3GPP access and over non-3GPP access both connected to 5GCN,

- a) the UE shall delete any UE derived QoS rules of each PDU session which has been transferred to EPS;
- b) the UE and the SMF shall perform a local release of the PDU session(s) associated with 3GPP access which have not been transferred to EPS; and
- c) the UE and the SMF shall perform a local release of QoS flow(s) which have not been transferred to EPS, of the PDU session(s) which have been transferred to EPS. The UE and the SMF shall also perform a local release of any QoS flow description not associated with any QoS rule and not associated with any mapped EPS bearer context. If there is a QoS flow description not associated with any QoS rule, but associated with a mapped EPS bearer context, and after the inter-system change from N1 mode to S1 mode the respective EPS bearer context is active, then the UE shall associate the QoS flow description with the EPS bearer context.

For PDU session(s) associated with non-3GPP access in 5GS, if present, the UE may:

- a) keep some or all of these PDU sessions still associated with non-3GPP access in 5GS, if supported;
- b) release some or all of these PDU sessions explicitly by initiating the UE requested PDU session release procedure(s); or
- c) attempt to transfer some or all of these PDU sessions from N1 mode to S1 mode by initiating the UE requested PDN connectivity procedure(s) with the PDN CONNECTIVITY REQUEST message created as follows:
 - 1) if the PDU session is an emergency PDU session, the request type shall be set to "handover of emergency bearer services". Otherwise the request type shall be set to "handover";
 - 2) the PDU session type of the PDU session shall be mapped to the PDN type of the default EPS bearer context as follows:
 - i) the PDN type shall be set to "non-IP" if the PDU session type is "Unstructured";
 - ii) the PDN type shall be set to "IPv4" if the PDU session type is "IPv4";
 - iii) the PDN type shall be set to "IPv6" if the PDU session type is "IPv6";
 - iv) the PDN type shall be set to "IPv4v6" if the PDU session type is "IPv4v6";
 - v) the PDN type shall be set to "non-IP" if the PDU session type is "Ethernet" and the UE, the network or both of them do not support Ethernet PDN type in S1 mode; and
 - vi) the PDN type shall be set to "Ethernet" if the PDU session type is "Ethernet" and the UE and the network support Ethernet PDN type in S1 mode;
 - 3) the DNN of the PDU session shall be mapped to the APN of the default EPS bearer context, unless the PDN connection is an emergency PDN connection; and
 - 4) the PDU session ID parameter in the Protocol configuration options IE or the Extended protocol configuration options IE shall be set to the PDU session identity of the PDU session.

If a PDU session associated with non-3GPP access is transferred to EPS, the UE shall associate the PDU session identity with the default EPS bearer context and shall delete any UE derived QoS rules of such PDU session.

Interworking to 5GS is supported for a PDN connection, if the corresponding default EPS bearer context includes a PDU session identity, an S-NSSAI, if the PDN connection is a non-emergency PDN connection, session AMBR and one or more QoS flow descriptions received in the Protocol configuration options IE or Extended protocol configuration options IE (see 3GPP TS 24.301 [15]), or the default EPS bearer context has association with the PDU session identity, the S-NSSAI, if the PDU session is a non-emergency PDU session, the session-AMBR and one or more QoS flow descriptions after inter-system change from N1 mode to S1 mode.

For a PDN connection established in S1 mode, to enable the UE to attempt to transfer the PDN connection from S1 mode to N1 mode in case of inter-system change, the UE shall allocate a PDU session identity, indicate the allocated PDU session identity in the PDU session ID parameter in the Protocol configuration options IE of the PDN CONNECTIVITY REQUEST message and associate the allocated PDU session identity with the default EPS bearer context of the PDN connection. If an N5CW device supporting 3GPP access establishes a new PDN connection in S1 mode, the N5CW device supporting 3GPP access shall refrain from allocating "PDU session identity value 15".

For a PDN connection established in S1 mode, the SMF assigning the QoS rules shall consider that the UE supports 16 packet filters for the corresponding PDU session until the UE indicates a higher number (as specified in subclause 6.4.2.2).

The network may provide the UE with one or more QoS rules by including either one QoS rules parameter, or one QoS rules with the length of two octets parameter, but not both, in the Protocol configuration options IE or Extended protocol configuration options IE in the ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST or ACTIVATE DEDICATED EPS BEARER CONTEXT REQUEST message. The network may provide the UE with one or more QoS flow descriptions corresponding to the EPS bearer context being activated, by including either one QoS flow descriptions parameter, or one QoS flow descriptions with the length of two octets parameter, but not both, in the Protocol configuration options IE or Extended protocol configuration options IE in the ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST or ACTIVATE DEDICATED EPS BEARER CONTEXT REQUEST message.

When the UE is provided with one or more QoS flow descriptions in the Protocol configuration options IE or Extended protocol configuration options IE of the ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST or ACTIVATE DEDICATED EPS BEARER CONTEXT REQUEST message, the UE shall check the EPS bearer identity included in the QoS flow description; and:

- a) if the EPS bearer identity corresponds to the EPS bearer context being activated or the EPS bearer identity is not included, the UE shall store the QoS flow description and all the associated QoS rules, if any, for the EPS bearer context being activated for use during inter-system change from S1 mode to N1 mode; and
- b) otherwise the UE shall locally delete the QoS flow description and all the associated QoS rules, if any, and include a Protocol configuration options IE or Extended protocol configuration options IE with a 5GSM cause parameter set to 5GSM cause #84 "syntactical error in the QoS operation" in the ACTIVATE DEFAULT EPS BEARER CONTEXT ACCEPT or ACTIVATE DEDICATED EPS BEARER CONTEXT ACCEPT message.

When the UE is provided with one or more QoS rules, or one or more QoS flow descriptions in the Protocol configuration options IE or Extended protocol configuration options IE of the ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST or ACTIVATE DEDICATED EPS BEARER CONTEXT REQUEST message, the UE shall process the QoS rules sequentially starting with the first QoS rule and shall process the QoS flow descriptions sequentially starting with the first QoS flow description. The UE shall check QoS rules and QoS flow descriptions for different types of errors as follows:

NOTE 5: If an error is detected in a QoS rule or a QoS flow description which requires sending a Protocol configuration options IE or Extended protocol configuration options IE with a 5GSM cause value, then the QoS rules parameter, the QoS rules with the length of two octets parameter, the QoS flow descriptions parameter and the QoS flow descriptions with the length of two octets parameter included in the Protocol configuration options IE or Extended protocol configuration options IE in the ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST or ACTIVATE DEDICATED EPS BEARER CONTEXT REQUEST message are discarded, if any.

NOTE 6: If the default EPS bearer context activation procedure or the dedicated EPS bearer context activation procedure is rejected, then the QoS rules parameter, the QoS rules with the length of two octets parameter, the QoS flow descriptions parameter and the QoS flow descriptions with the length of two octets parameter included in the Protocol configuration options IE or Extended protocol configuration options IE in the ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST or ACTIVATE DEDICATED EPS BEARER CONTEXT REQUEST message are discarded, if any.

- a) Semantic errors in QoS operations:

- 1) When the rule operation is "Create new QoS rule" and the DQR bit is set to "the QoS rule is the default QoS rule" when there's already a default QoS rule.
- 2) When the rule operation is received in an ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST message, the rule operation is "Create new QoS rule", and there is no rule with the DQR bit set to "the QoS rule is the default QoS rule".
- 3) When the rule operation is "Create new QoS rule" and two or more QoS rules associated with this PDU session would have identical precedence values.
- 4) When the rule operation is an operation other than "Create new QoS rule".
- 5) When the flow description operation is an operation other than "Create new QoS flow description".
- 6) When the UE determines that:
 - i) the default EPS bearer context is associated with one or more QoS flows but the default EPS bearer context is not associated with the default QoS rules.
 - ii) a dedicated EPS bearer context is associated with one or more QoS flows but the dedicated EPS bearer context is associated with the default QoS rule.
- 7) When the flow description operation is received in an ACTIVATE DEDICATED EPS BEARER CONTEXT REQUEST message, the flow description operation is "Create new QoS flow description" and there is already an existing QoS flow description with the same QoS flow identifier stored for an EPS bearer context different from the EPS bearer context being activated and belonging to the same PDN connection as the EPS bearer context being activated.
- 8) When the rule operation is received in an ACTIVATE DEDICATED EPS BEARER CONTEXT REQUEST message, the rule operation is "Create new QoS rule" and there is already an existing QoS rule with the same QoS rule identifier stored for an EPS bearer context different from the EPS bearer context being activated and belonging to the same PDN connection as the EPS bearer context being activated.
- 9) When the rule operation is received in an ACTIVATE DEDICATED EPS BEARER CONTEXT REQUEST message, the rule operation is "Create new QoS rule" and the resultant QoS rule is associated with a QoS flow description stored for an EPS bearer context different from the EPS bearer context being activated and belonging to the same PDN connection as the EPS bearer context being activated.
- 10) When the rule operation is "Create new QoS rule" and the DQR bit is set to "the QoS rule is not the default QoS rule" and one match-all packet filter is to be associated with the QoS rule.
- 11) When the flow description operation is "Create new QoS flow description" and there is already an existing QoS flow description with the same QoS flow identifier stored for the EPS bearer context being activated.
- 12) When the rule operation is "Create new QoS rule", and there is already an existing QoS rule with the same QoS rule identifier and the existing QoS rule is associated with a QoS flow description stored for the EPS bearer context being activated or the existing QoS rule is not associated with any QoS flow description.

In case 4, if the rule operation is for a non-default QoS rule, the UE shall delete the QoS rule. If the QoS rule is the default QoS rule, the UE shall include a Protocol configuration options IE or Extended protocol configuration options IE with a 5GSM cause parameter set to 5GSM cause #83 "semantic error in the QoS operation" in the ACTIVATE DEFAULT EPS BEARER CONTEXT ACCEPT or ACTIVATE DEDICATED EPS BEARER CONTEXT ACCEPT message.

In case 11, the UE shall not diagnose an error, further process the create request and, if it was processed successfully, delete the old QoS flow description (i.e. the QoS flow description that existed when case 11 was detected).

In case 12, if the existing QoS rule is not the default QoS rule and the DQR bit of the new QoS rule is set to "the QoS rule is not the default QoS rule", the UE shall not diagnose an error, further process the create request and, if it was processed successfully, delete the old QoS rule (i.e. the QoS rule that existed when case 12 was detected). If the existing QoS rule is the default QoS rule or the DQR bit of the new QoS rule is set to "the QoS rule is the default QoS rule", the UE shall include a Protocol configuration options IE or Extended protocol configuration options IE with a 5GSM cause parameter set to 5GSM cause #83 "semantic error in the QoS

operation" in the ACTIVATE DEFAULT EPS BEARER CONTEXT ACCEPT or ACTIVATE DEDICATED EPS BEARER CONTEXT ACCEPT message.

Otherwise for all the cases above, the UE shall include a Protocol configuration options IE or Extended protocol configuration options IE with a 5GSM cause parameter set to 5GSM cause #83 "semantic error in the QoS operation" in the ACTIVATE DEFAULT EPS BEARER CONTEXT ACCEPT or ACTIVATE DEDICATED EPS BEARER CONTEXT ACCEPT message.

b) Syntactical errors in QoS operations:

- 1) When the rule operation is "Create new QoS rule", the packet filter list in the QoS rule is empty, and the QoS rule is provided for a PDN connection of PDN type IPv4, IPv6, IPv4v6 or Ethernet, or for a PDN connection of PDN type "non-IP" and there is locally available information associated with the PDN connection that is set to "Ethernet".
- 2) Void.
- 3) When there are other types of syntactical errors in the coding of the QoS rules parameter, the QoS rules with the length of two octets parameter, the QoS flow descriptions parameter or the QoS flow descriptions with the length of two octets parameter, such as a mismatch between the number of packet filters subfield, and the number of packet filters in the packet filter list when the rule operation is "delete existing QoS rule" or "create new QoS rule", or the number of packet filters subfield is larger than the maximum possible number of packet filters in the packet filter list (i.e., there is no QoS rule precedence subfield included in the QoS rule IE), the QoS Rule Identifier is set to "no QoS rule identifier assigned", or the QoS flow identifier is set to "no QoS flow identifier assigned".
- 4) When, the
 - A) rule operation is "Create new QoS rule", the UE determines, by using the QoS rule's QFI as the 5QI, that there is a resulting QoS rule for a GBR QoS flow (as described in 3GPP TS 23.501 [8] table 5.7.4-1), and there is no QoS flow description with a QFI corresponding to the QFI of the resulting QoS rule.
- 5) When the flow description operation is "Create new QoS flow description", and the UE determines that there is a QoS flow description of a GBR QoS flow (as described in 3GPP TS 23.501 [8] table 5.7.4-1) which lacks at least one of the mandatory parameters (i.e., GFBR uplink, GFBR downlink, MFBR uplink and MFBR downlink). If the QoS flow description does not include a 5QI, the UE determines this by using the QFI as the 5QI.

The UE shall include a Protocol configuration options IE or Extended protocol configuration options IE with a 5GSM cause parameter set to 5GSM cause #84 "syntactical error in the QoS operation" in the ACTIVATE DEFAULT EPS BEARER CONTEXT ACCEPT or ACTIVATE DEDICATED EPS BEARER CONTEXT ACCEPT message.

NOTE 7: It is not considered an error if the UE determines that after processing all QoS operations on QoS rules and QoS flow descriptions there is a QoS flow description that is not associated with any QoS rule and the UE is not in NB-N1 mode.

c) Semantic errors in packet filters:

- 1) When a packet filter consists of conflicting packet filter components which would render the packet filter ineffective, i.e. no IP packet will ever fit this packet filter. How the UE determines a semantic error in a packet filter is outside the scope of the present document.

The UE shall include a Protocol configuration options IE or Extended protocol configuration options IE with a 5GSM cause parameter set to 5GSM cause #44 "semantic errors in packet filter(s)" in the ACTIVATE DEFAULT EPS BEARER CONTEXT ACCEPT or ACTIVATE DEDICATED EPS BEARER CONTEXT ACCEPT message.

d) Syntactical errors in packet filters:

- 1) When the rule operation is "Create new QoS rule" and two or more packet filters in the resultant QoS rule would have identical packet filter identifiers.
- 2) When there are other types of syntactical errors in the coding of packet filters, such as the use of a reserved value for a packet filter component identifier.

The UE shall delete the QoS rule and include a Protocol configuration options IE or Extended protocol configuration options IE with a 5GSM cause parameter set to 5GSM cause #45 "syntactical error in packet filter(s)" in the ACTIVATE DEFAULT EPS BEARER CONTEXT ACCEPT or ACTIVATE DEDICATED EPS BEARER CONTEXT ACCEPT message.

If the UE detects different errors in the QoS rules and QoS flow descriptions as described in this subclause which requires sending a 5GSM cause parameter in the ACTIVATE DEFAULT EPS BEARER CONTEXT ACCEPT or ACTIVATE DEDICATED EPS BEARER CONTEXT ACCEPT message, the UE shall include a single 5GSM cause parameter in the ACTIVATE DEFAULT EPS BEARER CONTEXT ACCEPT or ACTIVATE DEDICATED EPS BEARER CONTEXT ACCEPT message.

NOTE 8: The 5GSM cause to use cannot be different from #44 "semantic error in packet filter(s)", #45 "syntactical errors in packet filter(s)", #83 "semantic error in the QoS operation" or #84 "syntactical error in the QoS operation". The selection of a 5GSM cause is up to UE implementation.

Upon inter-system change from S1 mode to N1 mode, the UE uses the parameters from the default EPS bearer context of each PDN connection for which interworking to 5GS is supported to create a corresponding PDU session associated with 3GPP access as follows, unless the PDN connection is a user-plane resource of an MA PDU session:

- a) the PDN type of the default EPS bearer context shall be mapped to the PDU session type of the PDU session as follows:
 - 1) if the PDN type is "non-IP":
 - the PDU session type is set to the locally available information associated with the PDN connection (either "Ethernet" or "Unstructured"), if available; or
 - otherwise, the PDU session type is set to "Unstructured";
 - 2) if the PDN type is "IPv4" the PDU session type is set to "IPv4";
 - 3) if the PDN type is "IPv6", the PDU session type is set to "IPv6";
 - 4) if the PDN type is "IPv4v6", the PDU session type is set to "IPv4v6"; and
 - 5) if the PDN type is "Ethernet", the PDU session type is "Ethernet";
- b) the PDN address of the default EPS bearer context shall be mapped to PDU address of the PDU session, if the PDN type is "IPv4", "IPv6" or "IPv4v6";
- c) the APN of the default EPS bearer context shall be mapped to the DNN of the PDU session, unless the PDN connection is an emergency PDN connection;
- d) for each default EPS bearer context in state BEARER CONTEXT ACTIVE the UE shall set the state of the mapped PDU session to PDU SESSION ACTIVE; and
- e) for any other default EPS bearer context the UE shall set the state of the mapped PDU session to PDU SESSION INACTIVE.

Additionally, the UE shall set:

- a) the PDU session identity of the PDU session to the PDU session identity included by the UE in the Protocol configuration options IE or Extended protocol configuration options IE in the PDN CONNECTIVITY REQUEST message, or the PDU session identity associated with the default EPS bearer context;
- b) the S-NSSAI of the PDU session to the S-NSSAI included by the network in the Protocol configuration options IE or Extended protocol configuration options IE in the ACTIVATE DEFAULT EPS BEARER REQUEST message, or the S-NSSAI associated with the default EPS bearer context, if the PDN connection is a non-emergency PDN connection;
- c) the session-AMBR of the PDU session to the session-AMBR included by the network in the Protocol configuration options IE or Extended protocol configuration options IE in the ACTIVATE DEFAULT EPS BEARER REQUEST message or the MODIFY EPS BEARER CONTEXT REQUEST message, or the session-AMBR associated with the default EPS bearer context;
- d) the SSC mode of the PDU session to "SSC mode 1"; and

- e) the always-on PDU session indication to the always-on PDU session indication maintained in the UE, if any.

Upon inter-system change from S1 mode to N1 mode, the UE shall locally release the PDN connection(s) for which interworking to 5GS is not supported.

Upon inter-system change from S1 mode to N1 mode, for each PDN connection which is a user-plane resource of MA PDU session and for which interworking to 5GS is supported, the UE shall consider that the MA PDU session is established over 3GPP access and, unless the MA PDU session is established over non-3GPP access too, the UE shall set the session-AMBR of the PDU session to the session-AMBR included by the network in the Protocol configuration options IE or Extended protocol configuration options IE in the ACTIVATE DEFAULT EPS BEARER REQUEST message or the MODIFY EPS BEARER CONTEXT REQUEST message, or the session-AMBR associated with the default EPS bearer context of the PDN connection.

Upon inter-system change from S1 mode to N1 mode, if:

- a) the UE sent the URSP provisioning in EPS support indicator and received the URSP provisioning in EPS support indicator in the PDN connection corresponding to the PDU session; or
- b) the default EPS bearer context of the PDN connection corresponding to the PDU session is associated with the URSP provisioning in EPS support indicators;

then the UE shall associate the PDU session with the URSP provisioning in EPS support indicators.

Additionally, for each EPS bearer context of the PDN connection, the UE shall create QoS flow(s) each of which is associated with the QoS flow description received in the Protocol configuration options IE or Extended protocol configuration options IE in the ACTIVATE DEFAULT EPS BEARER REQUEST message, ACTIVATE DEDICATED EPS BEARER REQUEST message, or MODIFY EPS BEARER REQUEST message (see 3GPP TS 24.301 [15]), or the QoS flow description associated with EPS bearer context, unless:

- a) the PDU session is an MA PDU session which:
 - 1) is established over non-3GPP access; and
 - 2) has a PDN connection as a user-plane resource; and
- b) the QoS flow already exists over the non-3GPP access.

Additionally, for each EPS bearer context of the PDN connection, the UE shall create QoS rules(s), if any, each of which is associated with the QoS rule received in the Protocol configuration options IE or Extended protocol configuration options IE in the ACTIVATE DEFAULT EPS BEARER REQUEST message, ACTIVATE DEDICATED EPS BEARER REQUEST message, or MODIFY EPS BEARER CONTEXT REQUEST message (see 3GPP TS 24.301 [15]), or the QoS rules associated with EPS bearer context, unless:

- a) the PDU session is an MA PDU session which:
 - 1) is established over non-3GPP access; and
 - 2) has a PDN connection as a user-plane resource; and
- b) the QoS rule already exists over the non-3GPP access.

NOTE 9: For a QoS rule which does not exist over non-3GPP access, the UE does not create the QoS rule if the QoS rule is the default QoS rule, or the precedence value of the QoS rule equals to the precedence value of a QoS rule exists over the non-3GPP access.

Additionally, for each PDU session which was created at inter-system change from S1 mode to N1 mode from a corresponding PDN connection of the "Ethernet" PDN type, the UE shall consider that Ethernet PDN type in S1 mode is supported by the network and the SMF shall consider that Ethernet PDN type in S1 mode is supported by the UE.

The UE and the network shall locally release the PDN connection(s) and EPS bearer context(s) associated with the 3GPP access which have not been transferred to 5GS.

After inter-system change from S1 mode to N1 mode, for each QoS flow mapped from an EPS bearer context the UE shall associate the EPS bearer identity, the EPS QoS parameters, the extended EPS QoS parameters, and the traffic flow template, if available, of the EPS bearer context with the QoS flow.

After inter-system change from S1 mode to N1 mode, for each QoS flow of an MA PDU session which:

- a) is established over non-3GPP access; and
- b) has a PDN connection as a user-plane resource;

such that the QoS flow was received in the Protocol configuration options IE or Extended protocol configuration options IE in the ACTIVATE DEFAULT EPS BEARER REQUEST message, ACTIVATE DEDICATED EPS BEARER REQUEST message, MODIFY EPS BEARER CONTEXT REQUEST message, (see 3GPP TS 24.301 [15]), or associated with EPS bearer context, the UE shall associate the EPS bearer identity, the EPS QoS parameters, the extended EPS QoS parameters, and the traffic flow template, if available, of the EPS bearer context with the QoS flow.

If the EPS bearer context(s) of the PDN connection are associated with the control plane only indication, and the PDN connection supports interworking to 5GS, after inter-system change from S1 mode to N1 mode, the UE shall associate the PDU session corresponding to the PDN connection with the control plane only indication.

If the default EPS bearer context of the PDN connection is associated with the PDU session pair ID, and the PDN connection supports interworking to 5GS, after inter-system change from S1 mode to N1 mode, the UE shall associate the PDU session corresponding to the PDN connection with the PDU session pair ID. If the default EPS bearer context of the PDN connection is associated with the RSN, and the PDN connection supports interworking to 5GS, after inter-system change from S1 mode to N1 mode, the UE shall associate the PDU session corresponding to the PDN connection with the RSN.

If there is an EPS bearer used for IMS signalling, after inter-system change from S1 mode to N1 mode, the QoS flow of the default QoS rule in the corresponding PDU session is used for IMS signalling.

For a PDN connection established when in S1 mode, upon an inter-system change from S1 mode to N1 mode, if a UE-requested PDU session modification procedure has not been successfully performed yet, the SMF shall determine the always-on PDU session indication as specified in subclause 6.3.2.2.

When the UE is provided with one or more mapped EPS bearer contexts in the Mapped EPS bearer contexts IE of the PDU SESSION MODIFICATION COMMAND message, the UE shall process the mapped EPS bearer contexts sequentially starting with the first mapped EPS bearer context.

When the UE is provided with a new EPS bearer identity, a new EPS QoS parameters, a new extended EPS QoS parameters, a new APN-AMBR or a new extended APN-AMBR in the Mapped EPS bearer context IE of the PDU SESSION MODIFICATION COMMAND message for a QoS flow, the UE shall discard the corresponding association(s) and associate the new value(s) with the QoS flow.

When the UE is provided with a new traffic flow template in the Mapped EPS bearer contexts IE of the PDU SESSION MODIFICATION COMMAND message for a QoS flow, the UE shall check the traffic flow template for different types of TFT IE errors as specified in subclause 6.3.2.3.

When a QoS flow is deleted, the associated EPS bearer context information that are mapped from the deleted QoS flow shall be deleted from the UE and the network if there is no other existing QoS flow associated with this EPS bearer context. When the EPS bearer identity of a QoS flow is deleted, the associated EPS bearer context information that are mapped from the deleted EPS bearer identity shall be deleted from the UE and the network if there is no other existing QoS flow associated with this EPS bearer context. When an EPS bearer is released, all the associated QoS flow descriptions and QoS rules that are mapped from the released EPS bearer shall be deleted from the UE and the network.

NOTE 10: If T3584 is running or deactivated for the S-NSSAI and optionally the DNN combination, the UE is allowed to initiate ESM procedures in EPS with or without APN corresponding to that DNN, and if the APN is congested in EPS, the MME can send a back-off timer for the APN to the UE as specified in 3GPP TS 24.301 [15].

Upon inter-system change from N1 mode to S1 mode, if the UE has any PDU sessions associated with one or more multicast MBS sessions, the UE shall locally leave the associated multicast MBS sessions and the network shall consider the UE as removed from the associated MBS sessions.

For the case of handover of an existing PDU session from 3GPP access to non-3GPP access,

- upon receipt of the PDU SESSION ESTABLISHMENT ACCEPT message, the UE locally deletes the EPS bearer identities for the PDU session, if any (see subclause 6.4.1.3); and
- after successful handover, the network shall locally delete the EPS bearer identities for the PDU session, if any.

6.1.4.2 Coordination between 5GSM and ESM without N26 interface

When the network does not support N26 interface, the SMF does not provide the UE with the mapped EPS bearer context for a PDU session.

NOTE 1: Since the SMF does not provide the UE with the mapped EPS bearer context for a PDU session, the UE does not know whether interworking with EPS is supported for a PDU session before attempting to transfer the PDU session from N1 mode to S1 mode.

NOTE 2: It is up to UE implementation to decide which PDU session(s) to be attempted to transfer from N1 mode to S1 mode, e.g. based on UE policy or UE local configuration.

Upon inter-system change from N1 mode to S1 mode in EMM-IDLE mode, the UE shall not transfer a PDU session for LADN to EPS.

Upon inter-system change from N1 mode to S1 mode in EMM-IDLE mode, the UE shall not transfer a multi-homed IPv6 PDU session to EPS.

Upon inter-system change from N1 mode to S1 mode in EMM-IDLE mode, the UE shall not transfer a PDU session with the selected SSC mode set to "SSC mode 2" or "SSC mode 3" to EPS.

Upon inter-system change from N1 mode to S1 mode in EMM-IDLE mode, the UE shall use the parameters from each PDU session which the UE intends to transfer to EPS to create the contents of a PDN CONNECTIVITY REQUEST message as follows:

- a) if the PDU session is an emergency PDU session, the request type shall be set to "handover of emergency bearer services". Otherwise the request type shall be set to "handover";
- b) the PDU session type of the PDU session shall be mapped to the PDN type of the default EPS bearer context as follows:
 - 1) the PDN type shall be set to "non-IP" if the PDU session type is "Unstructured";
 - 2) the PDN type shall be set to "IPv4" if the PDU session type is "IPv4";
 - 3) the PDN type shall be set to "IPv6" if the PDU session type is "IPv6";
 - 4) the PDN type shall be set to "IPv4v6" if the PDU session type is "IPv4v6";
 - 5) the PDN type shall be set to "non-IP" if the PDU session type is "Ethernet" and the UE, the network or both of them do not support Ethernet PDN type in S1 mode; and
 - 6) the PDN type shall be set to "Ethernet" if the PDU session type is "Ethernet" and the UE and the network support Ethernet PDN type in S1 mode;
- c) the DNN of the PDU session shall be mapped to the APN of the default EPS bearer context, unless the PDU session is an emergency PDU session;
- d) the PDU session ID parameter in the Protocol configuration options IE or Extended protocol configuration options IE shall be set to the PDU session identity of the PDU session; and
- e) if the PDU session is an MA PDU session established over 3GPP access, the ATSSS request parameter shall be included in the Protocol configuration options IE or Extended protocol configuration options IE.

After inter-system change from N1 mode to S1 mode, the UE shall associate the PDU session identity with the default EPS bearer context. If the PDU session being transferred is a non-emergency PDU session, the UE shall in addition associate the S-NSSAI and the PLMN ID of the current PLMN with the default EPS bearer context.

Upon successful completion of an EPS attach procedure after inter-system change from N1 mode to S1 mode (see 3GPP TS 24.301 [15]), the UE shall delete any UE derived QoS rules except when the PDU session is an MA PDU session established over 3GPP access and non-3GPP access both connected to the 5GCN.

The UE shall perform a local release of the PDU session(s) and QoS flow(s) associated with the 3GPP access which have not been transferred to EPS. The UE shall also perform a local release of any QoS flow description not associated with any QoS rule.

For PDU session(s) associated with non-3GPP access in 5GS, if present, the UE may:

- a) keep some or all of these PDU sessions still associated with non-3GPP access in 5GS, if supported;
- b) release some or all of these PDU sessions explicitly by initiating the UE requested PDU session release procedure(s); or
- c) attempt to transfer some or all of these PDU sessions from N1 mode to S1 mode by initiating the UE requested PDN connectivity procedure(s) with the PDN CONNECTIVITY REQUEST message created as above.

When the network does not support N26 interface, the MME does not provide the UE with the mapped PDU session for a PDN connection but provides the UE with an S-NSSAI if the PDN connection is not for emergency bearer services. When establishing a new PDN connection in S1 mode, to enable the UE to attempt to transfer the PDN connection from S1 mode to N1 mode in case of inter-system change, the UE shall allocate a PDU session identity, indicate the allocated PDU session identity in the PDU session ID parameter in the Protocol configuration options IE of the PDN CONNECTIVITY REQUEST message and associate the allocated PDU session identity with the default EPS bearer context of the PDN connection. If an N5CW device supporting 3GPP access establishes a new PDN connection in S1 mode, the N5CW device supporting 3GPP access shall refrain from allocating "PDU session identity value 15". The network provides the UE with an S-NSSAI and the related PLMN ID in the Protocol configuration options IE or Extended protocol configuration options IE of the ACTIVATE DEFAULT EPS BEARER REQUEST message, the UE shall delete the stored S-NSSAI and the related PLMN ID, if any, and shall store the S-NSSAI and the related PLMN ID provided in the ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST message.

NOTE 3: Since the MME does not provide the UE with the mapped PDU session for a PDN connection, the UE does not know whether interworking to 5GS is supported for a PDN connection for which the UE assigned a PDU Session identity before attempting to transfer the PDN connection from S1 mode to N1 mode.

NOTE 4: It is up to UE implementation to decide which PDN connection(s) to be attempted to transfer from S1 mode to N1 mode, e.g. based on UE policy or UE local configuration.

NOTE 5: If the PDN connection has been transferred from a PDN connection established via non-3GPP access to EPC, it is possible that the network provided the S-NSSAI already during the establishment via non-3GPP access (see 3GPP TS 24.302 [16]).

Upon inter-system change from S1 mode to N1 mode in 5GMM-IDLE mode, the UE uses the parameters from the default EPS bearer context of each PDN connection which the UE intends to transfer to 5GS and for which the UE has allocated a PDU session identity to create a PDU SESSION ESTABLISHMENT REQUEST message as follows:

- a) if the PDN connection is for emergency bearer services, the request type shall be set to "existing emergency PDU session". Otherwise the request type shall be set to:
 - 1) "MA PDU request", if the PDN connection to be transferred is a user-plane resource of an MA PDU session;
or
 - 2) "existing PDU session";
- b) the PDN type of the default EPS bearer context shall be mapped to the PDU session type of the PDU session as follows:
 - 1) if the PDN type is "non-IP":
 - the PDU session type is set to the locally available information associated with the PDN connection (either "Ethernet" or "Unstructured"), if available; or
 - otherwise, the PDU session type is set to "Unstructured";
 - 2) if the PDN type is "IPv4" the PDU session type is set to "IPv4";
 - 3) if the PDN type is "IPv6", the PDU session type is set to "IPv6";
 - 4) if the PDN type is "IPv4v6", the PDU session type is set to "IPv4v6"; and
 - 5) if the PDN type is "Ethernet", the PDU session type is set to "Ethernet"; and

- c) the APN of the default EPS bearer context shall be mapped to the DNN of the PDU session, unless the PDN connection is an emergency PDN connection;
- d) the PDU session ID shall be set to the PDU session identity included by the UE in the Protocol configuration options IE or Extended protocol configuration options IE in the PDN CONNECTIVITY REQUEST message, or to the PDU session ID associated with the default EPS bearer context;
- e) if the PDU session is not an emergency PDU session, the S-NSSAI of the PDU session shall be set to the S-NSSAI included by the network in the Protocol configuration options IE or Extended protocol configuration options IE in the ACTIVATE DEFAULT EPS BEARER REQUEST message, if provided by the network, or the S-NSSAI associated with the default EPS bearer context, if available; and
- f) the SSC mode IE shall be set to "SSC mode 1".

NOTE 6: If T3584 is running or deactivated for the S-NSSAI and optionally the DNN combination, the UE is allowed to initiate ESM procedures in EPS with or without APN corresponding to that DNN, and if the APN is congested in EPS, the MME can send a back-off timer for the APN to the UE as specified in 3GPP TS 24.301 [15].

The UE shall locally release the PDN connection(s) and EPS bearer(s) associated with the 3GPP access which have not been transferred to 5GS.

Upon inter-system change from N1 mode to S1 mode, if the UE has any PDU sessions associated with one or more MBS multicast sessions, the UE shall locally leave the associated multicast MBS sessions and the network shall consider the UE as removed from the associated multicast MBS sessions.

Upon inter-system change from S1 mode to N1 mode, for the PDN connection(s) in the EPS transferred to the 5GS, if the UE supports reporting of URSP rule enforcement and is indicated to send URSP rule enforcement report to the network based on the matching URSP rule newly enforced while the UE was in S1 mode, which contains the URSP rule enforcement report indication set to "URSP rule enforcement report is required", the UE shall include the URSP rule enforcement reports IE in the PDU SESSION ESTABLISHMENT REQUEST message.

6.1.4A Coordination between 5GSM and SM

Coordination between 5GSM and SM states is not required.

After the 5G-SRVCC handover from NG-RAN to UTRAN (see 3GPP TS 23.216 [6A]), all the PDU sessions of the UE are locally released at the UE and the network. If the UE has any PDU sessions associated with one or more MBS multicast sessions, the UE shall locally leave the associated MBS multicast sessions and the network shall consider the UE as removed from the associated MBS sessions.

6.1.5 Coordination for interworking with ePDG connected to EPC

When the UE establishes a new PDN connection via an ePDG connected to EPC, to enable the transfer of the PDN connection to N1 mode over 3GPP access in case of inter-system change, the UE allocates a PDU session identity and indicates its value in the PDU session ID field in the N1_MODE_CAPABILITY Notify payload of the IKE_AUTH request message (see 3GPP TS 24.302 [16]). The network provides the UE with an S-NSSAI in the N1_MODE_INFORMATION Notify payload of the IKE_AUTH response message (see 3GPP TS 24.302 [16]).

NOTE: Interworking between N1 mode over non-3GPP access and ePDG connected to EPC is not specified in this release of the specification.

Upon inter-system change to N1 mode over 3GPP access, for PDN connection(s) established via an ePDG connected to EPC, if present, the UE may:

- a) keep some or all of these PDN connections still via ePDG connected to EPC, if supported;
- b) release some or all of these PDN connections explicitly by initiating the UE initiated tunnel disconnection procedure(s) as specified in 3GPP TS 24.302 [16]; or
- c) attempt to transfer some or all of these PDN connections to N1 mode over 3GPP access using the parameters of the PDN connection for which the UE has allocated a PDU session identity by initiating the PDU session

establishment procedure(s) with the PDU SESSION ESTABLISHMENT REQUEST message created. In that case, for each and every PDN connection to be transferred:

- 1) if the PDN connection is for emergency bearer services, the request type shall be set to "existing emergency PDU session". Otherwise the request type shall be set to "existing PDU session";
- 2) if the previously allocated home address information for a PDN connection consists of an IPv4 address only for an ePDG connected to EPC according to 3GPP TS 24.302 [16], the PDU session type shall be set to "IPv4";
- 3) if the previously allocated home address information for a PDN connection consists of an IPv6 prefix only for an ePDG connected to EPC according to 3GPP TS 24.302 [16], the PDU session type shall be set to "IPv6";
- 4) if the previously allocated home address information for a PDN connection consists of both an IPv4 address and an IPv6 prefix for an ePDG connected to EPC according to 3GPP TS 24.302 [16], the PDU session type shall be set to "IPv4v6";
- 5) the APN of the PDN connection shall be mapped to the DNN of the PDU session;
- 6) the PDU session ID shall be set to the PDU session identity in the N1_MODE_CAPABILITY Notify payload of the IKE_AUTH request message establishing IPsec tunnel of the PDN connection;
- 7) if the PDN connection is not for emergency bearer services, the S-NSSAI of the PDU session shall be set to the S-NSSAI associated with the PDN connection as specified in 3GPP TS 24.302 [16]. The UE shall not request to perform handover of an existing PDN connection to N1 mode over 3GPP access if the associated S-NSSAI is not included in the allowed NSSAI for 3GPP access; and
- 8) the SSC mode IE shall be set to "SSC mode 1".

If an existing PDU session is transferred from 3GPP access to an ePDG connected to EPC connection and that existing PDU session is associated with one or more MBS sessions, the UE shall locally leave the associated multicast MBS sessions and the SMF shall consider the UE as removed from the associated multicast MBS sessions.

Upon inter-system change to N1 mode, for the PDN connection(s) via an ePDG connected to EPC transferred to the 5GS, if the UE supports reporting of URSP rule enforcement and is indicated to send URSP rule enforcement report to the network based on the matching URSP rule newly enforced while the PDN connection is via an ePDG connected to EPC, which contains the URSP rule enforcement report indication set to "URSP rule enforcement report is required", the UE shall include the URSP rule enforcement reports IE in the PDU SESSION ESTABLISHMENT REQUEST message.

6.2 General on elementary 5GSM procedures

6.2.1 Principles of PTI handling for 5GSM procedures

When the UE or the network initiates a transaction related procedure (i.e. a procedure consisting of more than one message and the messages are related), it shall include a valid PTI value in the message header of the request message or of the command message.

If a response message is sent as result of a received request message or a received command message, the sending entity shall include in the response message the PTI value received within the request message or within the command message (see examples in figure 6.2.1.1, figure 6.2.1.2, and figure 6.2.1.3).

If a command message is sent as result of a received request message, the sending entity shall include in the command message the PTI value received with the request message (see examples in figure 6.2.1.3).

If a command message is not sent as result of a received request message, the sending entity shall include in the command message the PTI value set to "no procedure transaction identity assigned" (see examples in figure 6.2.1.4).

Figure 6.2.1.1: UE-requested transaction related procedure accepted by the network

Figure 6.2.1.2: UE-requested transaction related procedure rejected by the network

Figure 6.2.1.3: UE-requested transaction related procedure triggering a network-requested transaction related procedure

Figure 6.2.1.4: network-requested transaction related procedure not triggered by a UE-requested transaction related procedure

6.2.2 PDU session types

The following PDU Session types are supported:

- a) IPv4;
- b) IPv6;
- c) IPv4v6;
- d) Ethernet (EtherType as defined in IEEE Std 802.3 [31A]); and
- e) Unstructured.

IP address allocation for IPv4, IPv6 and IPv4v6 PDU session types is described in subclause 6.2.4.

Neither a MAC nor an IP address is allocated by the 5GCN to the UE for Ethernet PDU session type.

6.2.3 PDU session management

The SMF is responsible for the session management functions to provide the PDU connectivity service to the UE via the 5GSM signalling between UE and SMF. The session management procedures includes:

- a) the UE-requested PDU session establishment procedure;
- b) the PDU session authentication and authorization procedure;
- c) the UE-requested PDU session modification procedure;
- d) the network-requested PDU session modification procedure;
- e) the UE-requested PDU session release procedure; and
- f) the network-requested PDU session release procedure.

A UE may establish multiple PDU sessions, to the same data network or to different data networks, via 3GPP access and via non-3GPP access at the same time. It is not required for a UE to initiate the PDU session release procedure to release a PDU session associated with another access, if any, due to the reason that the UE initiates the registration procedure or PDU session establishment procedure over the current access.

NOTE: PDU session is managed independently between 3GPP access and non-3GPP access.

The session management messages between UE and SMF are transferred via AMF as specified in subclause 8.3.

6.2.4 IP address allocation

6.2.4.1 General

This clause specifies IP address allocation for the PDU session.

In this release of specification, PDU session can be initiated with one IP version, i.e. IPv4 PDU session type or IPv6 PDU session type, or with both IP versions, i.e. IPv4v6 PDU session type.

IP address allocation to the UE shall be performed by SMF based on one or both the selected IP versions and operator policies. If IPv4 PDU session type is selected, an IPv4 address is allocated to the UE. If IPv6 PDU session type is selected, an IPv6 prefix except when the SMF acts according to subclause 6.2.4.3, and an interface identifier for the IPv6 link local address are allocated to the UE. If IPv4v6 PDU session type is selected, an IPv4 address, an IPv6 prefix except when the SMF acts according to subclause 6.2.4.3 or 6.2.4.4, and an interface identifier for the IPv6 link local address are allocated to the UE. If IPv6 or IPv4v6 PDU session type is selected in a PDU session established by the W-AGF acting on behalf of the FN-RG and the PDU SESSION ESTABLISHMENT REQUEST message contains the Suggested interface identifier IE, the SMF shall allocate to the UE the interface identifier for the IPv6 link local address indicated in the Suggested interface identifier IE.

For IPv4 PDU session type and for IPv4v6 PDU session type, the UE:

- a) shall obtain an IPv4 address via:
 - 1) NAS signalling as specified in subclause 6.2.4.2; or
 - 2) DHCPv4 as specified in IETF RFC 2131 [33E]; and
- b) may obtain IPv4 configuration parameters (e.g. DNS server address) via DHCPv4 as specified in IETF RFC 2132 [33F] or may receive IPv4 configuration parameters (e.g. DNS server address) as specified in subclause 6.4.1 and subclause 6.3.2.

For IPv6 PDU session type and for IPv4v6 PDU session type, the UE:

- a) shall build an IPv6 link local address based on the allocated interface identifier for the IPv6 link local address;
- b) shall obtain /64 IPv6 prefix via IPv6 stateless address autoconfiguration as specified in 3GPP TS 23.501 [8] and IETF RFC 4862 [39], except when the 5G-RG or the W-AGF act according to subclause 6.2.4.3;
- c) may obtain IPv6 configuration parameters via stateless DHCPv6 as specified in IETF RFC 8415 [33D], except when the 5G-RG or the W-AGF act according to subclause 6.2.4.3, may receive IPv6 configuration parameters (e.g. DNS server address) as specified in subclause 6.4.1 and subclause 6.3.2, or may receive DNS server IPv6 addresses in a Router Advertisement Message as specified in IETF RFC 4861 [38B] with recursive DNS server option as specified in IETF RFC 8106 [52]; and
- d) may obtain an additional IPv6 prefix for a PDU session by IPv6 prefix delegation via DHCPv6 as specified in subclause 6.2.4.2a.

6.2.4.2 IP address allocation via NAS signalling

The UE shall set the PDU session type IE in the PDU SESSION ESTABLISHMENT REQUEST message, based on its IP stack capabilities if the UE requests IP connectivity as follows:

- a) A UE:
 - 1) which is IPv6 and IPv4 capable, shall set the PDU session type IE to IPv4, IPv6 or IPv4v6 according to UE configuration or received policy.
 - 2) which is only IPv6 capable, shall set the PDU session type IE to IPv6.
 - 3) which is only IPv4 capable, shall set the PDU session type IE to IPv4.
- b) When the IP version capability of the UE is unknown in the UE (as in the case when the MT and TE are separated and the capability of the TE is not known in the MT), the UE shall set the PDU session type IE to IPv4v6.

If the UE wants to use DHCPv4 for IPv4 address assignment, it shall indicate that to the network within the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT REQUEST.

On receipt of the PDU SESSION ESTABLISHMENT REQUEST message sent by the UE, the network when allocating an IP address shall take into account the PDU session type IE, the operator's policies of the network, and the user's subscription data and:

- a) if the network sets the Selected PDU session type IE to IPv4, the network shall include an IPv4 address in the PDU address IE;
- b) if the network sets the Selected PDU session type IE to IPv6, the network shall include an interface identifier for the IPv6 link local address in the PDU address IE; and
- c) if the network sets the Selected PDU session type IE to IPv4v6, the network shall include an IPv4 address and an interface identifier for the IPv6 link local address in the PDU address IE.

6.2.4.2a IPv6 prefix delegation via DHCPv6

In order to perform the IPv6 prefix delegation via DHCPv6, the UE shall use DHCPv6 to request additional IPv6 prefixes (i.e. prefixes shorter than the default /64 prefix) from the SMF. The UE shall act as a "Requesting Router" as described in IETF RFC 8415 [33D] and shall insert one or more identity association for prefix delegation options into a DHCPv6 Solicit message.

If the IPv6 address allocation using IPv6 stateless address autoconfiguration is used, the UE sends the DHCPv6 message to request additional IPv6 prefixes to the SMF after the PDU session establishment and IPv6 prefix allocation.

When the UE requests additional prefixes using DHCPv6, the UE may include DHCPv6 Rapid Commit option as specified in IETF RFC 8415 [33D] in a DHCPv6 Solicit message, and the UE other than the ones specified in subclause 6.2.4.3 shall include DHCPv6 OPTION_ORO option with the OPTION_PD_EXCLUDE option code as specified in IETF RFC 6603 [40A] in the DHCPv6 message.

Upon receiving one or more identity association for prefix delegation prefixes in a DHCPv6 Reply message, the UE is allowed to use the allocated additional prefixes after inter-system change from N1 mode to S1 mode or from S1 mode to N1 mode.

6.2.4.3 Additional RG related requirements for IP address allocation

If IPv6 PDU session type or IPv4v6 PDU session type is selected, an IPv6 address, one or more IPv6 prefixes or both are allocated to the 5G-RG or the W-AGF acting on behalf of the FN-RG (or on behalf of the N5GC device).

If the 5G-RG or the W-AGF acting on behalf of the FN-RG (or on behalf of the N5GC device) receives a Router Advertisement Message as specified in IETF RFC 4861 [38B] with the "Managed address configuration" flag set to zero, the 5G-RG and the W-AGF acting on behalf of the FN-RG (or on behalf of the N5GC device):

- a) shall obtain /64 IPv6 prefix via IPv6 stateless address autoconfiguration as specified in 3GPP TS 23.501 [8] and IETF RFC 4862 [39];
- b) may obtain IPv6 configuration parameters via stateless DHCPv6 as specified in IETF RFC 8415 [33D]; and
- c) may request additional IPv6 prefixes using DHCPv6. If the 5G-RG and the W-AGF acting on behalf of the FN-RG (or on behalf of the N5GC device) request IPv6 prefixes using DHCPv6, the 5G-RG and the W-AGF acting on behalf of the FN-RG (or on behalf of the N5GC device) shall act as a "Requesting Router" as described in IETF RFC 8415 [33D], shall perform procedures described in subclause 6.2.4.2a. Additionally, the 5G-RG or the W-AGF acting on behalf of the FN-RG (or on behalf of the N5GC device) may include DHCPv6 OPTION_ORO option with the OPTION_PD_EXCLUDE option code as specified in IETF RFC 6603 [40A] in the DHCP.

If the 5G-RG or the W-AGF acting on behalf of the FN-RG (or on behalf of the N5GC device) receives a Router Advertisement Message as specified in IETF RFC 4861 [38B] with the "Managed address configuration" flag set to one, the 5G-RG and the W-AGF acting on behalf of the FN-RG (or on behalf of the N5GC device):

- a) shall obtain an IPv6 address via DHCPv6 and the DHCPv6 Identity association for non-temporary addresses option as specified in IETF RFC 8415 [33D];

- b) may obtain IPv6 configuration parameters via DHCPv6 as specified in IETF RFC 8415 [33D]; and
- c) may request IPv6 prefixes using DHCPv6. If the 5G-RG and the W-AGF acting on behalf of the FN-RG (or on behalf of the N5GC device) requests IPv6 prefixes using DHCPv6, the 5G-RG and the W-AGF acting on behalf of the FN-RG (or on behalf of the N5GC device) shall act as a "Requesting Router" as described in IETF RFC 8415 [33D], shall perform procedures described in subclause 6.2.4.2a. Additionally, the 5G-RG or the W-AGF acting on behalf of the FN-RG (or on behalf of the N5GC device) may include DHCPv6 OPTION_ORO option with the OPTION_PD_EXCLUDE option code as specified in IETF RFC 6603 [40A] in the DHCP message. The 5G-RG or the W-AGF acting on behalf of the FN-RG (or on behalf of the N5GC device) may include both IA_PD option and IA_NA option to request the delegated prefix together with the IPv6 address in the same DHCPv6 message.

NOTE: The 5G-RG and the W-AGF acting on behalf of the FN-RG (or on behalf of the N5GC device) can send multiple DHCPv6 requests with different DHCPv6 Identity association for non-temporary addresses options when the 5G-RG or the FN-RG acts as a DHCP relay for devices behind the 5G-RG or the FN-RG.

The 5G-RG may obtain ACS information via DHCP as specified in subclause 3.1 of BBF TR-069 [49] or in BBF TR-369 [50] R-DIS.1 and R-DIS.2.

6.2.4.4 Additional requirements of the UE acting as 5G ProSe layer-3 UE-to-network relay UE for IP address allocation

If a UE acting as 5G ProSe layer-3 UE-to-network relay needs to indicate "IPv6 Router" or "DHCPv4 Server & IPv6 Router" in the IP address configuration IE as specified in 3GPP 24.554 [19E], the UE shall support acting as a "Requesting Router" as described in IETF RFC 8415 [33D] to request additional IPv6 prefixes (i.e. prefixes in addition to the /64 default prefix which was allocated via stateless IPv6 address autoconfiguration as specified in subclause 6.2.4.1) from the SMF as specified in subclause 5.5.2 of 3GPP TS 23.304 [6E].

When the UE acting as 5G ProSe layer-3 UE-to-network relay UE requests additional prefixes using DHCPv6, the UE shall perform procedures described in subclause 6.2.4.2a.

6.2.5 Quality of service

6.2.5.1 General

6.2.5.1.1 QoS rules

6.2.5.1.1.1 General

In a PDU session of IPv4, IPv6, IPv4v6 and Ethernet PDU session type, the NAS protocol enables different forwarding treatments of UL user data packets in one or more QoS flows based on signalled QoS rules, derived QoS rules or any combination of them.

In a PDU session of Unstructured PDU session type, all UL user data packets are associated with the same QoS flow.

6.2.5.1.1.2 Signalled QoS rules

The NAS protocol enables the network to provide the UE with signalled QoS rules associated with a PDU session.

The network can provide the UE with one or more signalled QoS rules associated with a PDU session at the PDU session establishment or at the PDU session modification.

Each signalled QoS rule contains:

- a) an indication of whether the QoS rule is the default QoS rule;
- b) a QoS rule identifier (QRI);
- c) a QoS flow identifier (QFI);
- d) optionally, a set of packet filters; and

e) a precedence value.

NOTE 1: The default QoS rule indication (DQR) of a signalled QoS rule cannot be changed.

For case d) above:

- 1) If the QoS rule is the default QoS rule of a PDU session of IPv4, IPv6, IPv4v6 or Ethernet PDU session type, the set of packet filters contains zero or more packet filters for DL direction, and may additionally contain one of the following:
 - A) a match-all packet filter for UL direction;
 - B) a match-all packet filter for UL and DL directions;
 - C) zero or more packet filters for UL direction (other than the match-all packet filter for UL direction);
 - D) zero or more packet filters for UL and DL directions (other than the match-all packet filter for UL and DL directions); or
 - E) one or more packet filters for UL direction (other than the match-all packet filter for UL direction) and one or more packet filters for UL and DL directions (other than the match-all packet filter for UL and DL directions).

The set of packet filters for the default QoS rule shall not be empty. If the default QoS rule contains a match-all packet filter, then the highest precedence value shall be used for the default QoS rule.

NOTE 1a: Set of packet filters for the default QoS rule can contain only packet filters for DL direction e.g. for determination that local preconditions are met in an IMS session (see 3GPP TS 24.229 [14]) with a receive only media.

- 2) If the QoS rule is a QoS rule of a PDU session of IPv4, IPv6, IPv4v6 or Ethernet PDU session type and is not the default QoS rule, the set of packet filters contains zero or more packet filters for the DL direction, and may additionally contain one of the following:
 - A) zero or more packet filters for UL direction (other than the match-all packet filter for UL direction); and
 - B) zero or more packet filters for both UL and DL directions (other than the match-all packet filter for UL and DL directions).

The set of packet filters for a QoS rule which is not the default QoS rule shall not be empty.

NOTE 1b: Set of packet filters for a QoS rule which is not the default QoS rule can contain only packet filters for DL direction e.g. for determination that local preconditions are met in an IMS session (see 3GPP TS 24.229 [14]) with a receive only media.

- 3) For PDU session of unstructured PDU session type, there is only one QoS rule associated with it and the set of packet filters of that QoS rule is empty.

If the UE requests a new QoS rule, it shall assign a precedence value for the signalled QoS rule which is not in the range from 70 to 99 (decimal).

NOTE 2: In this release of the specification, there is no support for a match-all packet filter for DL direction.

NOTE 3: In order to support QoS differentiation in case of access to PLMN services via an SNPN, the UE, within the SNPN, can construct packet filters based on the destination IP address to reach the N3IWF in the PLMN and the security parameters index (SPI) for the IPsec SA.

NOTE 4: In order to support QoS differentiation in case of access to SNPN services via a PLMN, the UE, within the PLMN, can construct packet filters based on the destination IP address to reach the N3IWF in the SNPN and the security parameters index (SPI) for the IPsec SA.

NOTE 5: The above described condition of assigning a precedence value for the signalled QoS rule is applied to the UE when the UE requests a QoS rule for network to bind service data flows described by the QoS rule to a dedicated QoS flow by setting the segregation bit to 1.

In NB-N1 mode, there is only one QoS rule associated with a PDU session and that is the default QoS rule. As described in 3GPP TS 23.501 [8], when the SMF determines that the UE has:

- a) moved from a tracking area in WB-N1 mode into a tracking area in NB-N1 mode;
- b) moved from a tracking area in WB-S1 mode into a tracking area in NB-N1 mode; or
- c) moved from a tracking area in NR connected to 5GCN into a tracking area in NB-N1 mode;

the SMF shall, for each PDU session that is kept active, initiate the PDU session modification procedure (see subclause 6.3.3.2) to delete every QoS rule that is not the default QoS rule, if any.

Within a PDU session:

- a) each signalled QoS rule has a unique QRI;
- b) there is at least one signalled QoS rule;
- c) one signalled QoS rule is the default QoS rule; and
- d) there can be zero, one or more signalled QoS rules associated with a given QFI.

6.2.5.1.1.3 Derived QoS rules

Derived QoS rules are applicable only for PDU session of IPv4, IPv6, IPv4v6 or Ethernet PDU session type.

The reflective QoS in the UE creates derived QoS rules associated with a PDU session based on DL user data packets received via the PDU session.

Each derived QoS rule contains:

- a) a QoS flow identifier (QFI);
- b) a packet filter for UL direction; and
- c) a precedence value of 80 (decimal).

NOTE: On the network side, the corresponding PCC rule can be associated with a different precedence value in the range from 70 to 99 (decimal).

Within a PDU session:

- a) there can be zero, one or more derived QoS rules associated with a given QFI; and
- b) there can be up to one derived QoS rule associated with a given packet filter for UL direction.

In the UE, a timer T3583 runs for each derived QoS rule.

Reflective QoS is not supported in NB-N1 mode. Reflective QoS is not applicable for a PDU session with control plane only indication.

6.2.5.1.1.4 QoS flow descriptions

The network can also provide the UE with one or more QoS flow descriptions associated with a PDU session at the PDU session establishment or at the PDU session modification.

Each QoS flow description contains:

- a) a QoS flow identifier (QFI);
- b) if the flow is a GBR QoS flow:
 - 1) Guaranteed flow bit rate (GFBR) for UL;
 - 2) Guaranteed flow bit rate (GFBR) for DL;
 - 3) Maximum flow bit rate (MFBR) for UL;

- 4) Maximum flow bit rate (MFBR) for DL; and
- 5) optionally averaging window, applicable for both UL and DL;
- c) 5QI, if the QFI is not the same as the 5QI of the QoS flow identified by the QFI; and
- d) optionally, an EPS bearer identity (EBI) if the QoS flow can be mapped to an EPS bearer as specified in subclause 4.11.1 of 3GPP TS 23.502 [9].

If the averaging window is not included in a QoS flow description for a GBR QoS flow with a 5QI indicated in 3GPP TS 23.501 [8] table 5.7.4-1, the averaging window associated with the 5QI in 3GPP TS 23.501 [8] table 5.7.4-1 applies for the averaging window.

If the averaging window is not included in a QoS flow description for a GBR QoS flow with a 5QI not indicated in 3GPP TS 23.501 [8] table 5.7.4-1, the standardized value of two seconds is used as the averaging window.

6.2.5.1.2 Session-AMBR

The NAS protocol enables the network to provide the UE with the session-AMBR associated with a PDU session.

The standardized value of two seconds is used as the averaging window for the UE's enforcement of the UL rate limitation indicated by the session-AMBR.

6.2.5.1.2A Void

6.2.5.1.3 UL user data packet matching

For PDU session of IPv4, IPv6, IPv4v6 or Ethernet PDU session type, upon receiving an UL user data packet from the upper layers for transmission via a PDU session, the UE shall attempt to associate the UL user data packet with:

- a) the QFI of a signalled QoS rule associated with the PDU session which has a set of packet filters containing a packet filter for UL direction matching the UL user data packet or containing a packet filter for both UL and DL directions matching the UL user data packet; or
- b) the QFI of a derived QoS rule associated with the PDU session which has the packet filter for UL direction matching the UL user data packet;

by evaluating the QoS rules in increasing order of their precedence values until the UL user data packet is associated with a QFI or all QoS rules are evaluated.

NOTE 1: In order to enable the QoS differentiation for media flows, the precedence value(s) of QoS rule(s) containing the (S)RTP multiplexed media identification information component are higher than the other QoS rules containing the same IP packet filter component value.

For PDU session of unstructured PDU session type, upon receiving an UL user data packet from the upper layers for transmission via a PDU session, the UE shall associate the UL user data packet with the QFI of the default QoS rule associated with the PDU session.

If the UL user data packet is associated with a QFI, the UE shall pass the QFI along the UL user data packet to the lower layers for transmission.

NOTE 2: Marking of the UL user data packet with the QFI is performed by the lower layers.

If all QoS rules are evaluated and the UL user data packet is not associated with a QFI, the UE shall discard the UL user data packet.

6.2.5.1.4 Reflective QoS

6.2.5.1.4.1 General

The UE may support reflective QoS.

If the UE supports the reflective QoS, the UE shall support the procedures in the following subclauses.

The reflective QoS is applicable in a PDU session of IPv4, IPv6, IPv4v6 and Ethernet PDU session type. The reflective QoS is not applicable in a PDU session of Unstructured PDU session type. Reflective QoS is not applicable for a PDU session with control plane only indication.

The UE may request to revoke the usage of reflective QoS for an existing PDU session for which the UE had previously indicated support for reflective QoS.

6.2.5.1.4.2 Derivation of packet filter for UL direction from DL user data packet

If the UE needs to derive a packet filter for UL direction from the DL user data packet (see subclause 6.2.5.1.4.3 and 6.2.5.1.4.4), the UE shall proceed as follows:

- a) if the received DL user data packet belongs to a PDU session of IPv4 or IPv4v6 PDU session type and is an IPv4 packet and:
 - 1) the protocol field of the received DL user data packet indicates TCP as specified in IETF RFC 793 [33];
 - 2) the protocol field of the received DL user data packet indicates UDP as specified in IETF RFC 768 [32]; or
 - 3) the protocol field of the received DL user data packet indicates ESP as specified in IETF RFC 4303 [38] and an uplink IPsec SA corresponding to a downlink IPsec SA indicated in the security parameters index field of the received DL user data packet exists;

then the packet filter for UL direction contains the following packet filter components:

- 1) an IPv4 remote address component set to the value of the source address field of the received DL user data packet;
- 2) an IPv4 local address component set to the value of the destination address field of the received DL user data packet;
- 3) a protocol identifier/next header type component set to the value of the protocol field of the received DL user data packet;
- 4) if the protocol field of the received DL user data packet indicates TCP as specified in IETF RFC 793 [33] or UDP as specified in IETF RFC 768 [32]:
 - i) a single local port type component set to the value of the destination port field of the received DL user data packet; and
 - ii) a single remote port type component set to the value of the source port field of the received DL user data packet;
- 5) if the protocol field of the received DL user data packet indicates ESP as specified in IETF RFC 4303 [38], an uplink IPsec SA corresponding to a downlink IPsec SA of the SPI in the DL user data packet exists and the SPI of the uplink IPsec SA is known to the NAS layer:
 - i) a security parameter index type component set to the security parameters index of the uplink IPsec SA corresponding to the downlink IPsec SA indicated in the security parameters index field of the received DL user data packet; and
- 6) if the protocol field of the received DL user data packet indicates UDP and the received DL user data packet contains a UDP-encapsulated ESP header as specified in IETF RFC 3948 [55], an uplink IPsec SA corresponding to a downlink IPsec SA of the SPI in the DL user data packet exists and the SPI of the uplink IPsec SA is known to the NAS layer:
 - i) a security parameter index type component set to the security parameters index of the uplink IPsec SA corresponding to the downlink IPsec SA indicated in the security parameters index field of the ESP header field of the UDP-encapsulated ESP header as specified in IETF RFC 3948 [55] of the received DL user data packet;

otherwise it is not possible to derive a packet filter for UL direction from the DL user data packet;

- b) if the received DL user data packet belongs to a PDU session of IPv6 or IPv4v6 PDU session type and is an IPv6 packet and:

- 1) the last next header field of the received DL user data packet indicates TCP as specified in IETF RFC 793 [33];
- 2) the last next header field of the received DL user data packet indicates UDP as specified in IETF RFC 768 [32]; or
- 3) the last next header field of the received DL user data packet indicates ESP as specified in IETF RFC 4303 [38] and an uplink IPsec SA corresponding to a downlink IPsec SA indicated in the security parameters index field of the received DL user data packet exists;

then the packet filter for UL direction contains the following packet filter components:

- 1) an IPv6 remote address/prefix length component set to the value of the source address field of the received DL user data packet;
- 2) an IPv6 local address/prefix length component set to the value of the destination address field of the received DL user data packet;
- 3) a protocol identifier/next header type component set to the value of the last next header field of the received DL user data packet;
- 4) if the last next header field of the received DL user data packet indicates TCP as specified in IETF RFC 793 [33] or UDP as specified in IETF RFC 768 [32]:
 - i) a single local port type component set to the value of the destination port field of the received DL user data packet; and
 - ii) a single remote port type component set to the value of the source port field of the received DL user data packet;
- 5) if the last next header field of the received DL user data packet indicates ESP as specified in IETF RFC 4303 [38], an uplink IPsec SA corresponding to a downlink IPsec SA of the SPI in the DL user data packet exists and the SPI of the uplink IPsec SA is known to the NAS layer:
 - i) a security parameter index type component set to the security parameters index of the uplink IPsec SA corresponding to the downlink IPsec SA indicated in the security parameters index field of the received DL user data packet; and
- 6) if the last next header field of the received DL user data packet indicates UDP, and the received DL user data packet contains a UDP-encapsulated ESP header as specified in IETF RFC 3948 [55], an uplink IPsec SA corresponding to a downlink IPsec SA of the SPI in the DL user data packet exists and the SPI of the uplink IPsec SA is known to the NAS layer:
 - i) a security parameter index type component set to the security parameters index of the uplink IPsec SA corresponding to the downlink IPsec SA indicated in the security parameters index field of the ESP header field of the UDP-encapsulated ESP header as specified in IETF RFC 3948 [55] of the received DL user data packet;

otherwise it is not possible to derive a packet filter for UL direction from the DL user data packet;

- c) if the received DL user data packet belongs to a PDU session of Ethernet PDU session type, the packet filter for UL direction contains the following packet filter components:
 - 1) a destination MAC address component set to the source MAC address of the received DL user data packet;
 - 2) a source MAC address component set to the destination MAC address of the received DL user data packet;
 - 3) if one or more 802.1Q C-TAG is included in the received DL user data packet, an 802.1Q C-TAG VID component set to the outermost 802.1Q C-TAG VID of the received DL user data packet and an 802.1Q C-TAG PCP/DEI component set to the outermost 802.1Q C-TAG PCP/DEI of the received DL user data packet;
 - 4) if one or more 802.1Q S-TAG is included in the received DL user data packet, an 802.1Q S-TAG VID component set to the outermost 802.1Q S-TAG VID of the received DL user data packet and an 802.1Q S-TAG PCP/DEI component set to the outermost 802.1Q S-TAG PCP/DEI of the received DL user data packet;

- 5) If the Ethertype field of the received DL user data packet is set to a value of 1536 or above, an Ethertype component set to the Ethertype of the received DL user data packet;
- 6) if the Ethertype field of the Ethernet frame header indicates that the data carried in the Ethernet frame is IPv4 data, the UE shall also add to the packet filter for UL direction the IP-specific components based on the contents of the IP header of the received DL user data packet as described in bullet a) above; and
- 7) if the Ethertype field of the Ethernet frame header indicates that the data carried in the Ethernet frame is IPv6 data, the UE shall also add to the packet filter for UL direction the IP-specific components based on the contents of the IP header of the received DL user data packet as described in bullet b) above; and
- d) if the received DL user data packet belongs to a PDU session of PDU session type other than Ethernet, IPv4, IPv6 and IPv4v6, it is not possible to derive a packet filter for UL direction from the DL user data packet.

6.2.5.1.4.3 Creating a derived QoS rule by reflective QoS in the UE

If the UE receives a DL user data packet marked with a QFI and an RQI, the DL user data packet belongs to a PDU session of IPv4, IPv6, IPv4v6 or Ethernet PDU session type, and the UE does not have a derived QoS rule with the same packet filter for UL direction as the packet filter for UL direction derived from the DL user data packet as specified in subclause 6.2.5.1.4.2, then the UE shall create a new derived QoS rule as follows:

- a) the QFI of the derived QoS rule is set to the received QFI;
- b) the precedence value of the derived QoS rule is set to 80 (decimal); and
- c) the packet filter for UL direction of the derived QoS rule is set to the derived packet filter for UL direction;

and the UE shall start the timer T3583 associated with the derived QoS rule with the RQ timer value last received during the UE-requested PDU session establishment procedure of the PDU session (see subclause 6.4.1) or the network-requested PDU session modification procedure of the PDU session (see subclause 6.4.2). If the RQ timer value was received neither in the UE-requested PDU session establishment procedure of the PDU session nor in any network-requested PDU session modification procedure of the PDU session, the default standardized RQ timer value is used.

6.2.5.1.4.4 Updating a derived QoS rule by reflective QoS in the UE

If the UE receives a DL user data packet associated with a QFI and an RQI, the DL user data packet belongs to a PDU session of IPv4, IPv6, IPv4v6 or Ethernet PDU session type, and the UE has a derived QoS rule with the same packet filter for UL direction as the packet filter for UL direction derived from the DL user data packet as specified in subclause 6.2.5.1.4.2:

- a) the UE shall re-start the timer T3583 associated with the derived QoS rule with the RQ timer value last received during the UE-requested PDU session establishment procedure of the PDU session (see subclause 6.4.1) or the network-requested PDU session modification procedure of the PDU session (see subclause 6.4.2). If the RQ timer value was received neither in the UE-requested PDU session establishment procedure of the PDU session nor in any network-requested PDU session modification procedure of the PDU session, the default standardized RQ timer value is used; and
- b) if the QFI value associated with the DL user data packet is different from the QFI value stored for the derived QoS rule, the UE shall replace the QFI value stored for the derived QoS rule with the new QFI value for the derived QoS rule.

6.2.5.1.4.5 Deleting a derived QoS rule in the UE

Upon expiry of timer T3583 associated with a derived QoS rule, the UE shall remove the derived QoS rule.

Upon release of the PDU session, the UE shall remove the derived QoS rule(s) associated with the PDU session.

If the network accepts the request from the UE to revoke the usage of reflective QoS and sets the value of the RQ timer to "deactivated" or zero, the UE shall remove the derived QoS rule(s) associated with the PDU session.

Upon inter-system mobility from WB-N1 mode to NB-N1 mode or from NR connected to 5GCN to NB-N1 mode, the UE shall remove the derived QoS rule(s) associated with the PDU session that is kept active.

When a derived QoS rule is deleted, the timer T3583 associated with the derived QoS rule shall be stopped.

6.2.5.1.4.6 Ignoring RQI in the UE

If the UE receives a DL user data packet marked with a QFI and an RQI and it is not possible to derive a packet filter for UL direction from the DL user data packet as specified in subclause 6.2.5.1.4.2, the UE shall ignore the RQI and shall handle the received DL user data packet.

6.2.5.2 QoS in MA PDU session

In an MA PDU session, unless it :

- a) is established over non-3GPP access; and
- b) has a PDN connection as a user-plane resource;

the UE shall have one set of QoS rules, one set of QoS flow descriptions and one session-AMBR. The network can provide the set of QoS rules, the set of QoS flow descriptions and the session-AMBR of the MA PDU session via either access of the MA PDU session. In an MA PDU session, the UE shall support:-

- modification or deletion via an access of a QoS rule or a QoS flow description; and
- modification via an access of the session-AMBR;

of the MA PDU session created via the same or the other access.

In an MA PDU session:

- a) established over non-3GPP access; and
- b) with a PDN connection as a user-plane resource;

the UE shall have two sets of QoS rules, two sets of QoS flow descriptions and two session-AMBR values - one is maintained via non-3GPP access and the other is associated with EPS bearer contexts of the PDN connection and maintained via Extended protocol configuration options IE parameters received via the PDN connection.

6.2.6 Local area data network (LADN)

The UE can receive the local area data network (LADN) information consisting of LADN DNNs and LADN service area information (a set of tracking areas that belong to the current registration area) during the registration procedure or the generic UE configuration update procedure (see subclause 5.5.1 and subclause 5.4.4).

If the UE supports LADN per DNN and S-NSSAI, the UE can additionally receive the extended local area data network (LADN) information consisting of LADN DNNs, S-NSSAIs and LADN service area information (a set of tracking areas configured per DNN and S-NSSAI that belong to the current registration area) during the registration procedure or the generic UE configuration update procedure (see subclause 5.5.1 and subclause 5.4.4).

If the UE is not operating in SNPN access operation mode, the UE considers the received LADN information or the extended LADN information to be valid only in the TAIs of the registered PLMN that are in the LADN service area information, and in the TAIs of the equivalent PLMNs if the LADN service area information includes TAIs for the equivalent PLMNs. When the AMF provides the UE with LADN service area information containing TAIs for the equivalent PLMNs, the AMF shall include these TAIs of the equivalent PLMNs in the UE's registration area.

If the UE is operating in SNPN access operation mode, the UE considers the received LADN information or the extended LADN information to be valid only in the TAIs of the registered SNPN that are in the LADN service area information.

The LADN DNN(s) received by the UE is also considered as LADN DNN(s) in the equivalent PLMNs.

The UE shall consider itself to be located inside the LADN service area based on the LADN service area information. If the UE does not have an LADN service area information for the LADN DNN, the UE shall consider itself to be located outside the LADN service area.

When the UE is located in the LADN service area and the UE is in substate 5GMM-REGISTERED.NORMAL-SERVICE, the UE may initiate:

- the UE-requested PDU session establishment procedure with an LADN DNN to establish a PDU session for LADN;
- the UE-requested PDU session establishment procedure with an LADN DNN and an S-NSSAI associated with the LADN to establish a PDU session for LADN if the extended LADN information is available at the UE;
- the UE-requested PDU session modification procedure to modify the PDU session for LADN;
- the service request procedure to re-establish the user-plane resources for the PDU session for LADN; or
- the service request procedure or the UE-initiated NAS transport procedure to send CIoT user data via the control plane for a PDU session for LADN.

NOTE 1: If the service area list for the service area restrictions is available in the UE, and at least one of the LADN information or the extended LADN information are available in the UE, the service area list is evaluated before the LADN information and extended LADN information.

NOTE 1A: If the partially allowed NSSAI, the partially rejected NSSAI, or both are available in the UE, and at least one of the LADN information or the extended LADN information are available in the UE, the UE evaluates the partially allowed NSSAI and the partially rejected NSSAI before the LADN information and extended LADN information.

When the UE is located outside the LADN service area, the UE is allowed:

- to initiate the UE-requested PDU session release procedure to release a PDU session for LADN; or
- to initiate the UE-requested PDU session modification procedure to indicate a change of 3GPP PS data off UE status.

The AMF shall determine the UE presence in LADN service area as out of the LADN service area in the following cases:

- if the DNN used for the LADN is included in the LADN information and the UE is located outside the LADN service area indicated in the LADN information;
- if the DNN and the S-NSSAI used for the LADN are included in the extended LADN information and the UE is located outside the LADN service area indicated in the extended LADN information;
- if the DNN used for the LADN is included in the extended LADN information and there is no S-NSSAI provided by the UE to establish a PDU session for LADN; or
- if the DNN used for the LADN is included in the extended LADN information and the S-NSSAI provided by the UE to establish a PDU session for LADN is not associated with that LADN.

If the UE has moved out of the LADN service area:

- a) the SMF shall:
 - 1) release the PDU session for LADN; or
 - 2) release the user-plane resources for the PDU session for LADN and maintain the PDU session for LADN; according to operator's policy; and
- b) the SMF shall not initiate the transfer of CIoT user data via the control plane to the UE for the PDU session for LADN.

In case a2) and b):

- if the UE has returned to the LADN service area within a specific period of time according to operator's policy, and the network has downlink user data pending, the network re-establishes the user-plane resources for the PDU session for LADN;
- if the UE has returned to the LADN service area within a specific period of time according to operator's policy, and the network has downlink CIoT user data pending, the SMF shall initiate the CIoT user data via the control plane transfer to the UE; and

- if the UE has not returned to the LADN service area after a specific period of time according to operator's policy, the SMF may release the PDU session for LADN.

When the UE moves to 5GMM-DEREGISTERED state, the UE shall delete the stored LADN information, if any, and the stored extended LADN information, if any.

NOTE 2: In this release, LADNs apply only to 3GPP access.

Upon inter-system change from N1 mode to S1 mode in EMM-IDLE mode, the UE shall not transfer a PDU session for LADN to EPS.

If:

- a) the UE supports LADN per DNN and S-NSSAI;
- b) the UE has a PDU session established using the DNN and S-NSSAI which are not associated with any LADN service area indicated in the extended LADN information;
- c) an LADN service area is configured in the extended LADN information which is associated with the DNN and S-NSSAI of the PDU session; and
- d) the AMF determines the UE presence in LADN service area as out of the LADN service area configured in the extended LADN information;

the AMF requests the SMF to release this PDU session as specified in 3GPP TS 23.502 [9].

If:

- a) the UE supports LADN per DNN and S-NSSAI;
- b) the UE has a PDU session for LADN established; and
- c) the AMF determines that the LADN service area associated with the DNN and S-NSSAI of the PDU session for LADN is removed from the extended LADN information;

the AMF requests the SMF to release this PDU session as specified in 3GPP TS 23.502 [9].

6.2.7 Handling of DNN based congestion control

The network may detect and start performing DNN based congestion control when one or more DNN congestion criteria as specified in 3GPP TS 23.501 [8] are met. If the UE does not provide a DNN for a non-emergency PDU session, then the network uses the selected DNN.

In the UE, 5GS session management timers T3396 for DNN based congestion control are started and stopped on a per DNN basis except for an LADN DNN in case of PLMN. For an LADN DNN, 5GS session management timers T3396 for DNN based congestion control is applied to the registered PLMN and its equivalent PLMNs. In case of SNPN, if the UE does not support access to an SNPN using credentials from a credentials holder and equivalent SNPNs, in the UE, 5GS session management timers T3396 for DNN based congestion control are started and stopped on a per DNN and SNPN basis. If the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, in the UE 5GS session management timers T3396 for DNN based congestion control are started and stopped on a per DNN, SNPN and selected entry of the "list of subscriber data" or selected PLMN subscription basis. Upon receipt of a 5GMM message or 5GSM message from the network for which the UE needs to stop the running timers T3396 associated with an LADN DNN as specified in subclause 6.3.2.3, 6.3.3.3, 6.4.1.4.2 and 6.4.2.4.2, only the running timer T3396 which is associated with the PLMN and equivalent PLMNs where the timer was started is stopped.

In an SNPN, if the UE supports equivalent SNPNs, the UE applies the timer T3396 for all the equivalent SNPNs, otherwise the UE applies the timer T3396 for the registered SNPN.

The DNN associated with T3396 is the DNN provided by the UE during the PDU session establishment. If no DNN is provided by the UE along the PDU SESSION ESTABLISHMENT REQUEST, then T3396 is associated with no DNN. For this purpose, the UE shall memorize the DNN provided to the network during the PDU session establishment. The timer T3396 associated with no DNN will never be started due to any 5GSM procedure related to an emergency PDU session. If the timer T3396 associated with no DNN is running, it does not affect the ability of the UE to request an emergency PDU session.

In a PLMN, if T3396 is running or is deactivated, then the UE is not allowed to initiate the:

- a) PDU session establishment procedure;
- b) PDU session modification procedure; or
- c) NAS transport procedure for sending CIoT user data;

for the respective DNN or without a DNN unless the UE is a UE configured for high priority access in selected PLMN or to report a change of 3GPP PS data off UE status.

In an SNPN, if T3396 is running or is deactivated for the registered SNPN, is associated with a DNN or with no DNN, with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, with the selected entry of the "list of subscriber data" or the selected PLMN subscription, then the UE is not allowed to initiate the

- a) PDU session establishment procedure; or
- b) PDU session modification procedure;

for the respective DNN or without a DNN unless the UE is a UE configured for high priority access in the RSNPN or to report a change of 3GPP PS data off UE status.

In an SNPN, if the UE supports equivalent SNPNs, the timer T3396 is running or is deactivated for all the equivalent SNPNs, is associated with a DNN or no DNN, with the RSNPN or an equivalent SNPN, and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, then the UE is not allowed to initiate the:

- a) PDU session establishment procedure; or
- b) PDU session modification procedure;

for the respective DNN or without a DNN unless the UE is a UE configured for high priority access in selected SNPN or to report a change of 3GPP PS data off UE status.

If the network does not include timer T3396 with 5GSM cause #26 "insufficient resources", the UE may use a local back-off timer that has exponential value or a default value, which is provisioned using implementation specific means, to:

- a) prevent sending any 5GSM procedure for the respective DNN till its expiry; and
- b) allow sending any 5GSM procedure for the respective DNN after its expiry.

6.2.8 Handling of S-NSSAI based congestion control

The network may detect and start performing S-NSSAI based congestion control when one or more S-NSSAI congestion criteria as specified in 3GPP TS 23.501 [8] are met. If the UE does not provide a DNN for a non-emergency PDU session, then the network uses the selected DNN. If the UE does not provide an S-NSSAI for a non-emergency PDU session, then the network uses the selected S-NSSAI.

In case of PLMN or SNPN, in the UE, 5GS session management timers T3584 for the S-NSSAI based congestion control are started and stopped on a per S-NSSAI, DNN and PLMN or SNPN basis. If the 5GSM congestion re-attempt indicator IE with the ABO bit set to "The back-off timer is applied in all PLMNs or equivalent SNPNs " is included in the 5GSM message with the 5GSM cause value #67 "insufficient resources for specific slice and DNN", then the UE applies the timer T3584 for all the PLMNs or all the equivalent SNPNs. Otherwise, the UE applies the timer T3584 for the registered PLMN or the registered SNPN. If the timer T3584 applies for all the PLMNs or all the equivalent SNPNs, the timer T3584 starts when the UE is registered in a VPLMN or an unsubscribed SNPN and the S-NSSAI is provided by the UE during the PDU session establishment, the timer T3584 is associated with the [mapped S-NSSAI, DNN] combination of the PDU session.

In case of PLMN or SNPN, in the UE, 5GS session management timers T3585 for the S-NSSAI based congestion control are started and stopped on a per S-NSSAI and PLMN or SNPN basis. If the 5GSM congestion re-attempt indicator IE with the ABO bit set to "The back-off timer is applied in all PLMNs or all equivalent SNPNs " is included in the 5GSM message with the 5GSM cause value #69 "insufficient resources for specific slice", then the UE applies the timer T3585 for all the PLMNs or all the equivalent SNPNs. Otherwise, the UE applies the timer T3585 for the registered PLMN or registered SNPN. If the timer T3585 applies for all the PLMNs or all the equivalent SNPNs, the

timer T3585 starts when the UE is registered in a VPLMN or an unsubscribed SNPN and the S-NSSAI is provided by the UE during the PDU session establishment, the timer T3585 is associated with the mapped S-NSSAI of the PDU session. Additionally, if the 5GSM congestion re-attempt indicator IE with the CATBO bit set to "The back-off timer is applied in the current access type" is included in the 5GSM message with the 5GSM cause value #69 "insufficient resources for specific slice", then the UE applies the timer T3585 for the current access type. Otherwise, the UE applies the timer T3585 for both 3GPP access type and non-3GPP access type and the UE shall stop any running timer T3585 for the applied PLMN or SNPN and for the access different from the access from which the message is received.

In case of SNPN, if the UE does not support access to an SNPN using credentials from a credentials holder and equivalent SNPNs, in the UE 5GS session management timers T3584 for the S-NSSAI based congestion control are started and stopped on a per S-NSSAI, DNN and SNPN basis. If the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, in the UE 5GS session management timers T3584 for the S-NSSAI based congestion control are started and stopped on a per S-NSSAI, DNN, SNPN and selected entry of the "list of subscriber data" or selected PLMN subscription basis.

In case of SNPN, if the UE does not support access to an SNPN using credentials from a credentials holder and equivalent SNPNs, in the UE 5GS session management timers T3585 for the S-NSSAI based congestion control are started and stopped on a per S-NSSAI and SNPN basis. If the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, in the UE 5GS session management timers T3585 for the S-NSSAI based congestion control are started and stopped on a per S-NSSAI, SNPN and selected entry of the "list of subscriber data" or selected PLMN subscription basis.

If the timer T3584 or timer T3585 was provided during the PDU session establishment procedure, the S-NSSAI associated with T3584 or T3585, respectively is the S-NSSAI, including no S-NSSAI, provided by the UE during the PDU session establishment.

If the timer T3584 is provided during the PDU session modification or PDU session release procedure, the UE behaves as follows: The DNN associated with T3584 is the DNN provided by the UE during the PDU session establishment. If no S-NSSAI but DNN is provided by the UE along the PDU SESSION ESTABLISHMENT REQUEST message, then T3584 is associated with no S-NSSAI and the DNN provided to the network during the PDU session establishment. If the PDN connection was established when in the S1 mode, then T3584 is associated with no S-NSSAI. If no DNN but S-NSSAI is provided by the UE along the PDU SESSION ESTABLISHMENT REQUEST message, then T3584 is associated with no DNN and the S-NSSAI of the PDU session. If no DNN and no S-NSSAI is provided by the UE along the PDU SESSION ESTABLISHMENT REQUEST message, then T3584 is associated with no DNN and no S-NSSAI. For this purpose, the UE shall memorize the DNN and the S-NSSAI provided to the network during the PDU session establishment. The timer T3584 associated with no DNN and an S-NSSAI will never be started due to any 5GSM procedure related to an emergency PDU session. If the timer T3584 associated with no DNN and an S-NSSAI is running, it does not affect the ability of the UE to request an emergency PDU session.

If the timer T3585 was provided during the PDU session modification or PDU session release procedure, the UE behaves as follows: if an S-NSSAI was provided by the UE during the PDU session establishment, then T3585 is associated with the S-NSSAI of the PDU session. If no S-NSSAI is provided by the UE along the PDU SESSION ESTABLISHMENT REQUEST message, then T3585 is associated with no S-NSSAI. If the PDN connection was established when in the S1 mode, then T3585 is associated with no S-NSSAI.

If T3584 is running or is deactivated, then the UE is not allowed to initiate the:

- a) PDU session establishment procedure;
- b) PDU session modification procedure; or
- c) NAS transport procedure for sending CIoT user data;

for the respective [S-NSSAI, no DNN] or [S-NSSAI, DNN] combination unless the UE is a UE configured for high priority access in selected PLMN or SNPN or to report a change of 3GPP PS data off UE status.

In a PLMN, if the timer T3584 is running or is deactivated for all the PLMNs and is associated with an S-NSSAI other than no S-NSSAI, then

- a) the UE registered in the HPLMN or in an EHPLMN where mapped S-NSSAI(s) are not provided by the network as specified in subclause 4.6.1 is not allowed to initiate the:
 - 1) PDU session establishment procedure;
 - 2) PDU session modification procedure; or

- 3) NAS transport procedure for sending CIoT user data;

when the [S-NSSAI, no DNN] or [S-NSSAI, DNN] combination provided by the UE during the PDU session establishment is the same as the [S-NSSAI, no DNN] or [S-NSSAI, DNN] combination associated with the timer T3584 unless the UE is a UE configured for high priority access in selected PLMN or to report a change of 3GPP PS data off UE status; and

- b) the UE registered in a VPLMN or in an EHPLMN where mapped S-NSSAI(s) are provided by the network as specified in subclause 4.6.1 is not allowed to initiate the:

- 1) PDU session establishment procedure;
- 2) PDU session modification procedure; or
- 3) NAS transport procedure for sending CIoT user data;

when the [mapped S-NSSAI, no DNN] or [mapped S-NSSAI, DNN] combination provided by the UE during the PDU session establishment is the same as the [S-NSSAI, no DNN] or [S-NSSAI, DNN] combination associated with the timer T3584 unless the UE is a UE configured for high priority access in selected PLMN or to report a change of 3GPP PS data off UE status.

In a PLMN, if the timer T3584 is running or is deactivated for all the PLMNs and is associated with [no S-NSSAI, no DNN] or [no S-NSSAI, DNN] combination, then the UE is not allowed to initiate the:

- a) PDU session establishment procedure;
- b) PDU session modification procedure; or
- c) NAS transport procedure for sending CIoT user data;

for [no S-NSSAI, no DNN] or [no S-NSSAI, DNN] combination in any PLMN unless the UE is a UE configured for high priority access in selected PLMN or to report a change of 3GPP PS data off UE status.

In an SNPN, if the UE supports equivalent SNPNs, the timer T3584 is running or is deactivated for all the equivalent SNPNs, is associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, with an S-NSSAI other than no S-NSSAI, and with the RSNPN or an equivalent SNPN:

- a) the UE registered in the subscribed SNPN is not allowed to initiate the:

- 1) PDU session establishment procedure; or
- 2) PDU session modification procedure;

when the [S-NSSAI, no DNN] or [S-NSSAI, DNN] combination provided by the UE during the PDU session establishment is the same as the [S-NSSAI, no DNN] or [S-NSSAI, DNN] combination associated with the timer T3584 unless the UE is a UE configured for high priority access in the RSNPN or to report a change of 3GPP PS data off UE status; and

- b) the UE registered in a non-subscribed SNPN is not allowed to initiate the:

- 1) PDU session establishment procedure; or
- 2) PDU session modification procedure;

when the [mapped S-NSSAI, no DNN] or [mapped S-NSSAI, DNN] combination provided by the UE during the PDU session establishment is the same as the [S-NSSAI, no DNN] or [S-NSSAI, DNN] combination associated with the timer T3584 unless the UE is a UE configured for high priority access in RSNPN or to report a change of 3GPP PS data off UE status.

In an SNPN, if the UE supports equivalent SNPNs, the timer T3584 is running or is deactivated for all the equivalent SNPNs, is associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, with [no S-NSSAI, no DNN] or [no S-NSSAI, DNN] combination, and with the RSNPN or an equivalent SNPN, then the UE is not allowed to initiate the:

- a) PDU session establishment procedure; or
- b) PDU session modification procedure;

for [no S-NSSAI, no DNN] or [no S-NSSAI, DNN] combination unless the UE is a UE configured for high priority access in the RSPN or to report a change of 3GPP PS data off UE status.

If T3585 is running or is deactivated, then the UE is neither allowed to initiate the PDU session establishment procedure nor the PDU session modification procedure for the respective S-NSSAI unless the UE is a UE configured for high priority access in selected PLMN or SNPN or to report a change of 3GPP PS data off UE status.

In a PLMN, if the timer T3585 is running or is deactivated for all the PLMNs and is associated with an S-NSSAI other than no S-NSSAI, then

- a) the UE registered in the HPLMN or in an EHPLMN where mapped S-NSSAI(s) are not provided by the network as specified in subclause 4.6.1 is not allowed to initiate the:

- 1) PDU session establishment procedure;
- 2) PDU session modification procedure; or
- 3) NAS transport procedure for sending CIoT user data;

when the S-NSSAI provided by the UE during the PDU session establishment is the same as the S-NSSAI associated with timer T3585 unless the UE is a UE configured for high priority access in selected PLMNs or to report a change of 3GPP PS data off UE status; and

- b) the UE registered in a VPLMN or in an EHPLMN where mapped S-NSSAI(s) are provided by the network as specified in subclause 4.6.1 is not allowed to initiate the:

- 1) PDU session establishment procedure;
- 2) PDU session modification procedure; or
- 3) NAS transport procedure for sending CIoT user data;

when the mapped S-NSSAI provided by the UE during the PDU session establishment is the same as the S-NSSAI associated the timer T3585 unless the UE is a UE configured for high priority access in selected PLMN or to report a change of 3GPP PS data off UE status.

In a PLMN, if the timer T3585 is running or is deactivated for all the PLMNs and is associated with no S-NSSAI, then the UE is not allowed to initiate the:

- a) PDU session establishment procedure;
- b) PDU session modification procedure;
- c) NAS transport procedure for sending CIoT user data;

for no S-NSSAI in any PLMN unless the UE is a UE configured for high priority access in selected PLMN or to report a change of 3GPP PS data off UE status.

In an SNPN, if the UE supports equivalent SNPNS, the timer T3585 is running or is deactivated for all the equivalent SNPNS, is associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, with an S-NSSAI other than no S-NSSAI, and with the RSNPN or an equivalent SNPN:

- a) the UE registered in the subscribed SNPN is not allowed to initiate the:

- 1) PDU session establishment procedure; or
- 2) PDU session modification procedure;

when the S-NSSAI provided by the UE during the PDU session establishment is the same as the S-NSSAI associated with timer T3585 unless the UE is a UE configured for high priority access in the RSNPN or to report a change of 3GPP PS data off UE status; and

- b) the UE registered in a non-subscribed SNPN is not allowed to initiate the:

- 1) PDU session establishment procedure; or
- 2) PDU session modification procedure;

when the mapped S-NSSAI provided by the UE during the PDU session establishment is the same as the S-NSSAI associated the timer T3585 unless the UE is a UE configured for high priority access in the RSNPN or to report a change of 3GPP PS data off UE status.

In an SNPN, if the UE supports equivalent SNPNs, the timer T3585 is running or is deactivated for all the equivalent SNPNs, is associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, with no S-NSSAI, and with the RSNPN or an equivalent SNPN, then the UE is not allowed to initiate the:

- a) PDU session establishment procedure; or
- b) PDU session modification procedure;

for no S-NSSAI unless the UE is a UE configured for high priority access in RSNPN or to report a change of 3GPP PS data off UE status.

If the network does not include timer T3584 with 5GSM cause #67 "insufficient resources for specific slice and DNN", the UE may use a local back-off timer that has exponential value or a default value, which is provisioned using implementation specific means, to:

- a) prevent sending any 5GSM procedure for the respective DNN and S-NSSAI till its expiry; and
- b) allow sending any 5GSM procedure for the respective DNN and S-NSSAI after its expiry.

If the network does not include timer T3585 with 5GSM cause #69 "insufficient resources for specific slice", the UE may use a local back-off timer that has exponential value or a default value, which is provisioned using implementation specific means, to:

- a) prevent sending any 5GSM procedure for the respective S-NSSAI till its expiry; and
- b) allow sending any 5GSM procedure for the respective S-NSSAI after its expiry.

6.2.9 Interaction with upper layers

6.2.9.1 General

A 5GSM entity interacts with upper layers. Subclause 6.2.9.2 describes how the 5GSM entity interacts with upper layers with respect to the URSP. Subclause 6.2.9.3 describes how the 5GSM entity interacts with upper layers with respect to the ProSeP.

6.2.9.2 URSP

The URSP requires interaction between upper layers and the 5GSM entities in the UE (see 3GPP TS 24.526 [19] for further details). Each of the 5GSM entities in the UE shall indicate attributes (e.g. PDU session identity, SSC mode, S-NSSAI, DNN, PDU session type, access type, PDU address) of a newly established PDU session to the upper layers. If a PDU session is released, the 5GSM entity handling the PDU session shall inform the PDU session identity of the released PDU session to the upper layers. The upper layers may request a 5GSM entity:

- a) to establish a PDU session indicating one or more PDU session attributes;
- b) to release an existing PDU session; or
- c) to establish a PDU session indicating one or more PDU session attributes, and to release an existing PDU session.

6.2.9.3 ProSeP

The ProSeP requires interaction between upper layers and the 5GSM entities in the UE acting as a 5G ProSe layer-3 UE-to-network relay UE (see 3GPP TS 24.554 [19E] for further details). The upper layers may request the 5GSM entity:

- a) to establish a PDU session indicating one or more PDU session attributes; or
- b) to release the existing PDU session; or

- c) to establish a PDU session indicating one or more PDU session attributes, and to release the existing PDU session.

Each of the 5GSM entities in the UE acting as a 5G ProSe layer-3 UE-to-network relay UE shall indicate attributes (e.g. PDU session identity, SSC mode, S-NSSAI, DNN, PDU session type, access type, PDU address) of the newly established PDU session to the upper layers. If the PDU session is released, the 5GSM entity handling the PDU session shall inform the PDU session identity of the released PDU session to the upper layers.

6.2.10 Handling of 3GPP PS data off

In case of PLMN, a UE, which supports 3GPP PS data off (see 3GPP TS 23.501 [8]), can be configured with up to two lists of 3GPP PS data off exempt services as specified in 3GPP TS 24.368 [17] or in the EF_{3GPPPSDATAOFF} USIM file as specified in 3GPP TS 31.102 [22]:

- a) a list of 3GPP PS data off exempt services to be used in the HPLMN or EHPLMN; and
- b) a list of 3GPP PS data off exempt services to be used in the VPLMN.

If only the list of 3GPP PS data off exempt services to be used in the HPLMN or EHPLMN is configured at the UE, this list shall be also used in the VPLMN.

In case of SNPN, a UE, which supports 3GPP PS data off (see 3GPP TS 23.501 [8]), can be configured with:

- a) up to two lists of 3GPP PS data off exempt services as specified in 3GPP TS 24.368 [17] for each subscribed SNPN whose entry exists in the "list of subscriber data":
 - 1) a list of 3GPP PS data off exempt services to be used in the subscribed SNPN; and
 - 2) a list of 3GPP PS data off exempt services to be used in the non-subscribed SNPN; and
- b) one list of 3GPP PS data off exempt services as specified in 3GPP TS 24.368 [17] for PLMN subscription:
 - 1) a list of 3GPP PS data off exempt services to be used in the non-subscribed SNPN.

If only the list of 3GPP PS data off exempt services to be used in the subscribed SNPN is configured for the selected entry of "list of subscriber data", this list shall be also used in the non-subscribed SNPN.

If the UE supports 3GPP PS data off, the UE shall provide the 3GPP PS data off UE status in the Extended protocol configuration options IE during UE-requested PDU session establishment procedure except for the transfer of a PDU session from non-3GPP access to 3GPP access and except for the establishment of user plane resources on the other access for the MA PDU session(see subclause 6.4.1), and during UE-requested PDU session modification procedure (see subclause 6.4.2), regardless of associated access type of the PDU session. If the UE requests a PDU session establishment procedure in order to transfer a PDU session from non-3GPP access to 3GPP access, or in order to establish user plane resources on the other access for the MA PDU session over 3GPP access or non-3GPP access, and:

- a) if the 3GPP PS data off UE status has changed since the last providing to the network, the UE shall provide the 3GPP PS data off UE status in the Extended protocol configuration options IE; or
- b) if the 3GPP PS data off UE status has not changed since the last providing to the network, the UE need not provide the 3GPP PS data off UE status.

The network shall support of 3GPP PS data off.

The UE shall indicate change of the 3GPP PS data off UE status for the PDU session by using the UE-requested PDU session modification procedure as specified in subclause 6.4.2.

When the 3GPP PS data off UE status is "activated":

- a) the UE does not send uplink IP packets via 3GPP access except:
 - 1) for those services indicated in the list of 3GPP PS data off exempt services to be used in the HPLMN or EHPLMN as specified in 3GPP TS 24.368 [17] when the UE is in its HPLMN or EHPLMN;

- 2) for those services indicated in the list of 3GPP PS data off exempt services to be used in the subscribed SNPN, configured for the selected entry of "list of subscriber data", as specified in 3GPP TS 24.368 [17] when the UE is in the subscribed SNPN;
 - 3) for those services indicated in the list of 3GPP PS data off exempt services to be used in the HPLMN or EHPLMN when the UE is in the VPLMN, if only the list of 3GPP PS data off exempt services to be used in the HPLMN or EHPLMN is configured to the UE as specified in 3GPP TS 24.368 [17];
 - 4) for those services indicated in the list of 3GPP PS data off exempt services to be used in the subscribed SNPN, configured for the selected entry of "list of subscriber data", when the UE is in a non-subscribed SNPN and only the list of 3GPP PS data off exempt services to be used in the subscribed SNPN is configured for the selected entry of "list of subscriber data" as specified in 3GPP TS 24.368 [17];
 - 5) for those services indicated in the list of 3GPP PS data off exempt services to be used in the VPLMN when the UE is in the VPLMN, if the list of 3GPP PS data off exempt services to be used in the VPLMN is configured to the UE as specified in 3GPP TS 24.368 [17];
 - 6) for those services indicated in the list of 3GPP PS data off exempt services to be used in the non-subscribed SNPN, configured for the selected entry of "list of subscriber data", when the UE is in a non-subscribed SNPN and the list of 3GPP PS data off exempt services to be used in the non-subscribed SNPN is configured for the selected entry of "list of subscriber data" as specified in 3GPP TS 24.368 [17];
 - 7) for those services indicated in the list of 3GPP PS data off exempt services to be used in the non-subscribed SNPN, configured for the selected PLMN subscription, when the UE is in the non-subscribed SNPN and the list of 3GPP PS data off exempt services to be used in the non-subscribed SNPN is configured for the selected PLMN subscription as specified in 3GPP TS 24.368 [17];
 - 8) for those services indicated in the EF_{3GPPPSDATAOFF} USIM file as specified in 3GPP TS 31.102 [22];
 - 9) any uplink traffic due to procedures specified in 3GPP TS 24.229 [14]; and
 - 10) any uplink traffic due to procedures specified in 3GPP TS 24.623 [20];
- b) the UE does not send uplink Ethernet user data packets via 3GPP access; and
- c) the UE does not send uplink Unstructured user data packets via 3GPP access.

Otherwise the UE sends uplink user data packets without restriction.

NOTE: If the UE supports 3GPP PS data off, uplink IP packets are filtered as specified in 3GPP TS 24.229 [14] in U.3.1.5.

3GPP PS data off does not restrict sending of uplink user data packets via non-3GPP access of a single access PDU session or an MA PDU session.

6.2.11 Multi-homed IPv6 PDU session

The UE supporting IPv6 may support multi-homed IPv6 PDU session.

If the UE supports the multi-homed IPv6 PDU session:

- a) the UE shall support acting as a type C host as specified in IETF RFC 4191 [36]; and
- b) the UE indicates support of the multi-homed IPv6 PDU session:
 - 1) during the UE-requested PDU session establishment of a PDU session of "IPv6" or "IPv4v6" PDU session type; and
 - 2) during the UE-requested PDU session modification performed after an inter-system change from S1 mode to N1 mode, for a PDU session associated with a PDN connection established when in S1 mode, if the UE is a UE operating in single-registration mode in a network supporting N26 interface, the PDU session is of "IPv6" or "IPv4v6" PDU session type, and the UE has not previously successfully performed the UE-requested PDU session modification to provide this indication.

6.2.12 Handling of network rejection not due to congestion control

The network may include a back-off timer value in a 5GS session management reject message to regulate the time interval at which the UE may retry the same procedure for 5GSM cause values other than #26 "insufficient resources", #28 "unknown PDU session type", #39 "reactivation requested", #46 "out of LADN service area", #50 "PDU session type IPv4 only allowed", #51 "PDU session type IPv6 only allowed", #54 "PDU session does not exist", #57 "PDU session type IPv4v6 only allowed", #58 "PDU session type Unstructured only allowed", #61 "PDU session type Ethernet only allowed", #67 "insufficient resources for specific slice and DNN", #68 "not supported SSC mode" and #69 "insufficient resources for specific slice". For 5GSM cause values other than #26 "insufficient resources", #28 "unknown PDU session type", #39 "reactivation requested", #46 "out of LADN service area", #54 "PDU session does not exist", #67 "insufficient resources for specific slice and DNN", #68 "not supported SSC mode", and #69 "insufficient resources for specific slice", and #86 "UAS services not allowed", the network may also include the re-attempt indicator to indicate whether the UE is allowed to re-attempt the corresponding session management procedure for the same DNN in S1 mode after inter-system change.

NOTE 1: In a PLMN, if the network includes this back-off timer value for 5GSM cause values other than #27 "missing or unknown DNN", then the UE is blocked from sending another 5GSM request for the same procedure for the same [PLMN, DNN, S-NSSAI], [PLMN, DNN, no S-NSSAI], [PLMN, no DNN, S-NSSAI], or [PLMN, no DNN, no S-NSSAI] combination for the specified duration. If the network includes this back-off timer value for 5GSM cause value #27 "missing or unknown DNN", then the UE is blocked from sending another 5GSM request for the same procedure for the same [PLMN, DNN], or [PLMN, no DNN] combination for the specified duration. In an SNPN, if the network includes this back-off timer value for 5GSM cause values other than #27 "missing or unknown DNN", then the UE is blocked from sending another 5GSM request for the same procedure for the same [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, S-NSSAI], [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, S-NSSAI], or [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI] combination for the specified duration. If the network includes this back-off timer value for 5GSM cause value #27 "missing or unknown DNN", then the UE is blocked from sending another 5GSM request for the same procedure for the same [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, DNN], or [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN] combination for the specified duration. Therefore, the operator needs to exercise caution in determining the use of this timer value.

NOTE 2: If the re-attempt indicator is not provided by the network, a UE registered in its HPLMN or in an EHPLMN can use the configured SM_RetryAtRATChange value specified in the NAS configuration MO or in the USIM NAS_{CONFIG} file to derive the re-attempt indicator as specified in subclauses 6.4.1.4.3 and 6.4.2.4.3.

If re-attempt in S1 mode is allowed for 5GSM cause values other than #27 "missing or unknown DNN", the UE shall consider the back-off timer to be applicable only to the 5GS session management in N1 mode for the rejected 5GS session management procedure and the given [PLMN, DNN, S-NSSAI], [PLMN, DNN, no S-NSSAI], [PLMN, no DNN, S-NSSAI], or [PLMN, no DNN, no S-NSSAI] combination. If re-attempt in S1 mode is allowed for 5GSM cause value #27 "missing or unknown DNN", the UE shall consider the back-off timer to be applicable only to the 5GS session management in N1 mode for the rejected 5GS session management procedure and the given [PLMN, DNN], or [PLMN, no DNN] combination. If re-attempt in S1 mode is not allowed, the UE shall consider the back-off timer to be applicable to both NAS protocols, i.e. applicable to the 5GS session management in N1 mode for the rejected 5GS session management procedure and to the EPS session management in S1 mode for the corresponding session management procedure and the given [PLMN, DNN] or [PLMN, no DNN] combination.

NOTE 3: In the present subclause the terms DNN and APN are referring to the same parameter.

In a PLMN, if the back-off timer was provided during the PDU session establishment procedure, the UE behaves as follows: for 5GSM cause values other than #27 "missing or unknown DNN", when the UE is registered in a HPLMN, the DNN and the S-NSSAI of the [PLMN, DNN, S-NSSAI] combination associated with the back-off timer is the DNN and the S-NSSAI provided by the UE when the PDU session is established. When the UE is registered in a VPLMN or in an EHPLMN where mapped S-NSSAI(s) are provided by the network as specified in subclause 4.6.1, the DNN and the S-NSSAI of the [PLMN, DNN, S-NSSAI] combination associated with the back-off timer is the DNN and the mapped S-NSSAI provided by the UE when the PDU session is established. For 5GSM cause value #27 "missing or unknown DNN", the DNN of the [PLMN, DNN] combination associated with the back-off timer is the DNN provided by the UE when the PDU session is established. If no DNN or no S-NSSAI was provided to the network during the PDU session establishment, then the back-off timer is associated with the [PLMN, DNN, no S-NSSAI], [PLMN, no

DNN, S-NSSAI], or [PLMN, no DNN, no S-NSSAI] combination, dependent on which parameters were provided for 5GSM cause values other than #27 "missing or unknown DNN". If no DNN was provided to the network during the PDU session establishment, then the back-off timer is associated with the [PLMN, no DNN] combination for 5GSM cause value #27 "missing or unknown DNN". For this purpose, the UE shall memorize the DNN and the S-NSSAI provided to the network during the PDU session establishment.

In a PLMN, if the back-off timer was provided during the PDU session modification procedure, the UE behaves as follows: the DNN associated with the back-off timer is the DNN, including no DNN, provided by the UE when the PDU session is established. If an S-NSSAI was provided by the UE during the PDU session establishment, when the UE is registered in a HPLMN, then the S-NSSAI associated with the back-off timer is the S-NSSAI of the PDU session. If an S-NSSAI was provided by the UE during the PDU session establishment, when the UE is registered in a VPLMN or in an EHPLMN where mapped S-NSSAI(s) are provided by the network as specified in subclause 4.6.1, then the S-NSSAI associated with the back-off timer is the mapped S-NSSAI of the PDU session. If no S-NSSAI was provided by the UE during the PDU session establishment, then the back-off timer is associated with no S-NSSAI. For this purpose, the UE shall memorize the DNN and the S-NSSAI provided to the network during the PDU session establishment.

In a PLMN, the back-off timer associated with the [PLMN, no DNN, no S-NSSAI], or [PLMN, no DNN] combination will never be started due to any 5GSM procedure related to an emergency PDU session. If the back-off timer associated with the [PLMN, no DNN, no S-NSSAI], or [PLMN, no DNN] combination is running, it does not affect the ability of the UE to request an emergency PDU session.

In an SNPN, the back-off timer associated with the [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI], or [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN] combination will never be started due to any 5GSM procedure related to an emergency PDU session. If the back-off timer associated with the back-off timer associated with the [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI], or [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN] combination, it does not affect the ability of the UE to request an emergency PDU session.

In a PLMN, the network may additionally indicate in the re-attempt indicator that a command to back-off is applicable not only for the PLMN in which the UE received the 5GS session management reject message, but for each PLMN included in the equivalent PLMN list at the time when the 5GS session management reject message was received.

In an SNPN, the network may additionally indicate in the re-attempt indicator that a command to back-off is applicable not only for the SNPN in which the UE received the 5GS session management reject message, but for each SNPN included in the equivalent SNPN list at the time when the 5GS session management reject message was received.

In a PLMN, if the back-off timer is running or is deactivated for a given [PLMN, DNN, S-NSSAI], [PLMN, DNN, no S-NSSAI], [PLMN, no DNN, S-NSSAI], [PLMN, no DNN, no S-NSSAI], [PLMN, DNN], or [PLMN, no DNN] combination, and the UE is a UE configured for high priority access in selected PLMN, then the UE is allowed to initiate 5GSM procedures for the [PLMN, DNN, S-NSSAI], [PLMN, DNN, no S-NSSAI], [PLMN, no DNN, S-NSSAI], [PLMN, no DNN, no S-NSSAI], [PLMN, DNN], or [PLMN, no DNN] combination.

In an SNPN, if the back-off timer is running or is deactivated for a given [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, S-NSSAI], [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, S-NSSAI], [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI], [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, DNN], or [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN] combination if the UE is a UE configured for high priority access in selected SNPN, then the UE is allowed to initiate 5GSM procedures for the [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, S-NSSAI], [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, S-NSSAI], [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI], [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, DNN], or [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN] combination.

The RATC bit in the re-attempt indicator IE and its derivation shall not be applicable in an SNPN.

If the network does not include a back-off timer with 5GSM cause #29 "user authentication or authorization failed", #31 "request rejected, unspecified", and #38 "network failure", the UE may use a local back-off timer that has exponential value or a default value, which is provisioned using implementation specific means, to:

- a) prevent sending the rejected 5GSM procedure for the respective DNN till its expiry; and

- b) allow sending the rejected 5GSM procedure for the respective DNN after its expiry.

6.2.13 Handling of Small data rate control

Small data rate control is applicable only to NB-N1 mode and WB-N1 mode.

Small data rate control controls the maximum number of uplink user data messages including uplink exception data reporting sent by the UE in a time interval for the PDU session in accordance with 3GPP TS 23.501 [8]. The UE shall limit the rate at which it generates uplink user data messages to comply with the small data rate control policy. The NAS shall provide the indicated rates to upper layers for enforcement. The indicated rates in a NAS procedure applies to the PDU session the NAS procedure corresponds to, and the indicated rates are valid until a new value is indicated or the PDU session is released.

If the UE indicates support for CIoT 5GS optimizations, the network may provide the small data rate control parameters to the UE and may provide the small data rate control parameters for exception data to the UE if and only if the small data rate control parameters is provided to the UE. Small data rate control parameters and small data rate control parameters for exception data can also be provided to the UE in S1 mode as specified in 3GPP TS 24.301 [15].

If an allowed indication of additional exception reports is provided with the small data rate control parameters and:

- the additional small data rate control parameters for exception data is provided and the limit for additional rate for exception data reporting is not reached; or
- the additional small data rate control parameters for exception data is not provided,

the UE is allowed to send uplink exception reports even if the limit for the small data rate control has been reached.

During a PDU session release procedure, if the small data rate control was applied to the PDU session that is being released, the network may store the small data rate control status for the released PDU session as specified in 3GPP TS 23.501 [8].

If:

- a) the UE indicates support for CIoT 5GS optimizations; and
- b) the small data rate control status was stored for the PDU session and is still valid,

the network may provide the remaining small data rate control status as initial small data rate control parameters to the UE and initial small data rate control parameters for exception data to the UE during a subsequent PDU session establishment procedure.

If received during the establishment of a PDU session, the UE shall apply the initial small data rate control parameters and the initial small data rate control parameters for exception data for the duration of the validity period. When the validity period expires the small data rate control parameters and the small data rate control parameters for exception data shall be applied (see 3GPP TS 23.501 [8]).

NOTE 1: The HPLMN can discard or delay user data that exceeds the limit provided for small data rate control.

Upon inter-system change from N1 mode to S1 mode, the UE shall store the current small data rate control status for PDU sessions to be transferred from N1 mode to S1 mode as specified in 3GPP TS 23.501 [8].

NOTE 2: How long the UE stores the current small data rate control status is implementation specific.

Upon inter-system change from S1 mode to N1 mode, the UE shall use the stored small data rate control status, if any, to comply with the small data rate control policy for PDU sessions transferred from S1 mode to N1 mode as specified in 3GPP TS 23.501 [8], if the validity period of the stored small data rate control status has not expired.

6.2.14 Handling of Serving PLMN rate control

Serving PLMN rate control is applicable only for PDU sessions established for control plane CIoT 5GS optimization.

Serving PLMN rate control protect its AMF from the load generated by user data over control plane.

The SMF can inform the UE of any local serving PLMN rate control during the PDU session establishment procedure (see subclause 6.4.1) or the PDU session modification procedure (see subclause 6.4.2). If serving PLMN rate control is

enabled, the SMF shall start the serving PLMN rate control for the PDU session when the first control plane user data is received over the PDU session. The UE shall limit the rate at which it generates uplink control plane user data to comply with the serving PLMN policy provided by the network. The indicated rate in a NAS procedure applies to the PDU session the NAS procedure corresponds to, and the indicated rate is valid until the PDU session is released.

Any Serving PLMN rate control information provided by the network to the UE is only applicable for the PLMN which provided this information. This serving PLMN rate control information shall be discarded when the UE successfully registers to another PLMN.

NOTE: The serving PLMN can discard or delay control plane user data that exceed the limit provided for Serving PLMN rate control.

6.2.15 Handling of Reliable Data Service

If the UE supports Reliable Data Service (see 3GPP TS 23.501 [8] and 3GPP TS 24.250 [14A]), the UE may request data transfer using Reliable Data Service for a PDU session in the Extended protocol configuration options IE during UE-requested PDU session establishment procedure (see subclause 6.4.1).

The Reliable Data Service may only be used with PDU sessions for which the "Control Plane CIoT 5GS Optimisation" indicator is set or with PDU sessions using the control plane CIoT 5GS optimization when the AMF does not move such PDU sessions to the user plane.

The network shall inform the UE about the acceptance of UE's request for Reliable Data Service usage during the PDU session establishment procedure (see subclause 6.4.1) in the Extended protocol configuration options IE.

If the network accepts the use of Reliable Data Service to transfer data for the specified PDU session, the UE shall use this PDU session exclusively for data transfer using Reliable Data Service; otherwise the UE shall not use this PDU session for data transfer using Reliable Data Service.

6.2.16 Handling of header compression for control plane CIoT optimizations

The UE and the SMF may use:

- IP header compression for PDU sessions of "IPv4", "IPv6" or "IPv4v6" PDU session type; and
- Ethernet header compression for PDU sessions of "Ethernet" PDU session type.

Both the UE and the AMF indicate whether header compression for control plane CIoT 5GS optimization is supported during registration procedures (see subclause 5.5.1). If both the UE and the network support header compression, the header compression configuration for each PDU session is negotiated during the PDU session establishment procedure and PDU session modification procedure as specified in subclauses 6.3.2, 6.4.1 and 6.4.2.

For IP header compression, ROHC protocol specified in IETF RFC 5795 [39B] is used. The IP header compression configuration used for IP header compression is (re-)negotiated between the UE and the SMF using the IP header compression configuration IE as specified in subclauses 6.3.2.2, 6.4.1.2, 6.4.1.3 and 6.4.2.2, respectively.

For Ethernet header compression, Ethernet Header Compression (EHC) protocol specified in 3GPP TS 38.323 [29] is used. The Ethernet header compression configuration used for Ethernet header compression is (re-)negotiated between the UE and the SMF using the Ethernet header compression configuration IE as specified in subclauses 6.3.2.2, 6.4.1.2, 6.4.1.3 and 6.4.2.2, respectively.

6.2.17 Handling of edge computing enhancements

EAS discovery, EAS rediscovery and ECS address provisioning provide enhanced edge computing support in 5GS (see 3GPP TS 23.548 [10A]).

If the network supports the session breakout connectivity model or distributed anchor connectivity model to enable edge computing enhancements and the UE generated DNS message is to be handled by an edge application server discovery function (EASDF) for EAS discovery as specified in 3GPP TS 23.548 [10A], the SMF selects the EASDF and it provides its IP address to the UE as the DNS server to be used for the PDU session in the Extended protocol

configuration options IE during the UE-requested PDU session establishment procedure as described in subclause 6.4.1.3.

NOTE 1: EASDF selection is outside the scope of the present document.

If the network supports the session breakout connectivity model to enable edge computing enhancements and the UE generated DNS message is to be handled by a local DNS server for EAS discovery as specified in 3GPP TS 23.548 [10A], the SMF selects the local DNS server, obtains its IP address and can provide the IP address of the local DNS server to the UE as the DNS server to be used for the PDU session in the Extended protocol configuration options IE during the UE-requested PDU session establishment procedure or the network-requested PDU session modification procedure as described in subclauses 6.4.1.3 and 6.3.2.2, respectively.

NOTE 2: Local DNS server selection and the acquisition of its IP address is outside the scope of the present document.

If the UE supports EAS rediscovery and the SMF decides to trigger the EAS rediscovery as specified in 3GPP TS 23.548 [10A], the SMF initiates a network-requested PDU session modification procedure to provide the EAS rediscovery information to the UE as described in subclauses 6.3.2.2. Upon receipt of the EAS rediscovery information, the UE provides the received information to the upper layers.

NOTE 3: The upper layers of the UE uses the EAS rediscovery information to trigger the EAS discovery procedure to get the new EAS information as specified in 3GPP TS 23.548 [10A].

If the UE supports ECS address provisioning over NAS as specified in 3GPP TS 23.548 [10A], the UE indicates its support of ECS configuration information provisioning over NAS in the Extended protocol configuration options IE either during the UE-requested PDU session establishment procedure as described in subclause 6.4.1.2 or while in S1 mode as described in 3GPP TS 24.301 [15], respectively.

If the UE indicated support of ECS configuration information address provisioning over NAS, the SMF can provide the ECS configuration information in the Extended protocol configuration options IE during the network-requested PDU session modification procedure, UE-requested PDU session establishment procedure or the UE-requested PDU session modification procedure as described in subclauses 6.3.2.2, 6.4.1.3 and 6.4.2.3, respectively.

NOTE 4: The SMF can obtain the ECS configuration information based on the local configuration, the UE's location, the UE's subscription information, or any combination of them.

If the UE supports the edge DNS client (EDC) as specified in 3GPP TS 23.548 [10A], the UE indicates its support of EDC in the Extended protocol configuration options IE during the UE-requested PDU session establishment procedure as described in subclause 6.4.1.2 or the UE-requested PDU session modification procedure as described in subclause 6.4.2.2.

If the UE indicates support of EDC, the SMF can indicate in the Extended protocol configuration options IE during the UE-requested PDU session establishment procedure as described in subclause 6.4.1.3 or the network-requested PDU session modification procedure as described in subclause 6.3.2.2, that the network allows the use of EDC for the applications which are mapped onto the PDU session and explicitly requested the use of EDC, or that the network requires the use of EDC for all applications mapped onto the PDU session.

6.2.18 Support of redundant PDU sessions

The 5GSM sublayer may support establishment of redundant PDU sessions (see subclause 5.33.2 of 3GPP TS 23.501 [8]).

In order to establish a set of two redundant PDU sessions, a UE can include a PDU session pair ID, an RSN, or both in a PDU SESSION ESTABLISHMENT REQUEST message for each of the two redundant PDU sessions (see subclause 6.4.1.2). The UE can set the PDU session pair ID, the RSN, or both according to URSP or UE local configuration (see 3GPP TS 24.526 [19]).

An SMF receiving a PDU session pair ID, an RSN, or both via a PDU SESSION ESTABLISHMENT REQUEST message operates as specified in subclause 5.33.2 of 3GPP TS 23.501 [8]. In addition, an SMF can handle two PDU sessions as redundant even if the UE provides neither a PDU session pair ID nor an RSN in a PDU SESSION ESTABLISHMENT REQUEST message for each of the PDU sessions (see subclause 5.33.2 of 3GPP TS 23.501 [8]).

6.2.19 Handling of maximum group data rate limitation control

The network can perform maximum group data rate limitation control to 5G VN groups as specified in 3GPP TS 23.503 [10]. If the maximum data rate of PDU sessions associated within a 5G VN group has been exceeded the maximum group data rate of the 5G VN group, the SMF may reject the PDU SESSION ESTABLISHMENT REQUEST message against the 5G VN group using S-NSSAI based congestion control as specified in subclause 6.2.8 and 6.4.1.4.2.

NOTE 1: The maximum group data rate limitation control does not apply for emergency services or for a UE configured for high priority access in selected PLMN or SNPN.

NOTE 2: The maximum group data rate limitation control is performed by the PCF.

6.2.20 Support of UL PDU set based handling

If the network supports PDU set based handling (see subclause 5.37.5 of 3GPP TS 23.501 [8]), based on operator policy, the SMF may provide the protocol description for UL PDU set based handling in the PDU SESSION ESTABLISHMENT ACCEPT message or the PDU SESSION MODIFICATION COMMAND message to the UE. The UE can store the protocol description and may use it to identify PDUs belong to PDU sets for the uplink direction.

NOTE 1: Whether and how to use the protocol description to identify PDUs belonging to a PDU set in the uplink direction, is up to UE implementation. The use of protocol description does not impact UL user data packet matching in the UE.

NOTE 2: Whether and how to process PDUs belonging to a PDU set in the uplink direction, is up to UE implementation.

NOTE 3: In this release of the specification, UL PDU set based handling is supported for non-3GPP access.

6.3 Network-requested 5GSM procedures

6.3.1 PDU session authentication and authorization procedure

6.3.1.1 General

The purpose of the PDU session authentication and authorization procedure is to enable the DN:

- a) to authenticate the upper layers of the UE, when establishing the PDU session;
- b) to authorize the upper layers of the UE, when establishing the PDU session;
- c) both of the above; or
- d) to re-authenticate the upper layers of the UE after establishment of the PDU session.

The PDU session authentication and authorization procedure can be performed only during or after the UE-requested PDU session procedure establishing a non-emergency PDU session. The PDU session authentication and authorization procedure shall not be performed during or after the UE-requested PDU session establishment procedure establishing an emergency PDU session.

The upper layers store the association between a DNN and corresponding credentials, if any, for the PDU session authentication and authorization.

If the UE is registered for onboarding services in SNPN the SMF may initiate the PDU session authentication and authorization procedure based on local policy with a DCS as specified in 3GPP TS 33.501 [24] subclause I.9.2.4.1 or a DN-AAA server as specified in 3GPP TS 33.501 [24] subclause I.9.2.4.2.

If the UE is registered for onboarding services in SNPN and the network initiates the PDU session authentication and authorization procedure, the UE shall use the default UE credentials for secondary authentication for the PDU session authentication and authorization procedure.

The network authenticates the UE using the Extensible Authentication Protocol (EAP) as specified in IETF RFC 3748 [34].

EAP has defined four types of EAP messages:

- a) an EAP-request message;
- b) an EAP-response message;
- c) an EAP-success message; and
- d) an EAP-failure message.

The EAP-request message is transported from the network to the UE using the PDU SESSION AUTHENTICATION COMMAND message of the PDU EAP message reliable transport procedure.

The EAP-response message to the EAP-request message is transported from the UE to the network using the PDU SESSION AUTHENTICATION COMPLETE message of the PDU EAP message reliable transport procedure.

If the PDU session authentication and authorization procedure is performed during the UE-requested PDU session establishment procedure:

- a) and the DN authentication of the UE completes successfully, the EAP-success message is transported from the network to the UE as part of the UE-requested PDU session establishment procedure in the PDU SESSION ESTABLISHMENT ACCEPT message.
- b) and the DN authentication of the UE completes unsuccessfully, the EAP-failure message is transported from the network to the UE as part of the UE-requested PDU session establishment procedure in the PDU SESSION ESTABLISHMENT REJECT message.

If the PDU session authentication and authorization procedure is performed after the UE-requested PDU session establishment procedure:

- a) and the DN authentication of the UE completes successfully, the EAP-success message is transported from the network to the UE using the PDU SESSION AUTHENTICATION RESULT message of the PDU EAP result message transport procedure.
- b) and the DN authentication of the UE completes unsuccessfully, the EAP-failure message is transported from the network to the UE using the PDU SESSION RELEASE COMMAND message of the network-requested PDU session release procedure.

There can be several rounds of exchange of an EAP-request message and a related EAP-response message for the DN to complete the authentication and authorization of the request for a PDU session (see example in figure 6.3.1.1).

The SMF shall set the authenticator retransmission timer specified in IETF RFC 3748 [34] subclause 4.3 to infinite value.

NOTE: The PDU session authentication and authorization procedure provides a reliable transport of EAP messages and therefore retransmissions at the EAP layer of the SMF do not occur.

Figure 6.3.1.1: PDU session authentication and authorization procedure

6.3.1.2 PDU EAP message reliable transport procedure

6.3.1.2.1 PDU EAP message reliable transport procedure initiation

In order to initiate the PDU EAP message reliable transport procedure, the SMF shall create a PDU SESSION AUTHENTICATION COMMAND message.

The SMF shall set the PTI IE of the PDU SESSION AUTHENTICATION COMMAND message to "No procedure transaction identity assigned".

The SMF shall set the EAP message IE of the PDU SESSION AUTHENTICATION COMMAND message to the EAP-request message provided by the DN or generated locally.

The SMF shall send the PDU SESSION AUTHENTICATION COMMAND message, and the SMF shall start timer T3590 (see example in figure 6.3.1.1).

Upon receipt of the PDU SESSION AUTHENTICATION COMMAND message, if the UE provided a DNN during the PDU session establishment, the UE shall stop timer T3396, if it is running for the DNN provided by the UE. If the UE did not provide a DNN during the PDU session establishment, the UE shall stop the timer T3396 associated with no DNN if it is running. In an SNPN, the timer T3396 to be stopped includes:

- a) the timer T3396 applied for all the equivalent SNPNs, associated with the RSNPN or an equivalent SNPN, and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- b) the timer T3396 applied for the registered SNPN, associated with the RSNPN, and, if the UE supports access to an SNPN using credentials from a credentials holder, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

Upon receipt of the PDU SESSION AUTHENTICATION COMMAND message, if the UE provided an S-NSSAI and a DNN during the PDU session establishment, the UE shall stop timer T3584, if it is running for the [S-NSSAI of the PDU session, DNN] combination. If the UE provided a DNN but did not provide an S-NSSAI during the PDU session establishment, the UE shall stop timer T3584, if it is running for the same [no S-NSSAI, DNN] combination provided by the UE. If the UE provided an S-NSSAI but did not provide a DNN during the PDU session establishment, the UE shall stop timer T3584, if it is running for the same [S-NSSAI, no DNN] combination provided by the UE. If the UE provided neither a DNN nor an S-NSSAI during the PDU session establishment, the UE shall stop timer T3584, if it is running for the same [no S-NSSAI, no DNN] combination provided by the UE. The timer T3584 to be stopped includes:

- a) in a PLMN:
 - 1) the timer T3584 applied for all the PLMNs, if running; and
 - 2) the timer T3584 applied for the registered PLMN, if running; or
- b) in an SNPN:
 - 1) the timer T3584 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - 2) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

Upon receipt of the PDU SESSION AUTHENTICATION COMMAND message, if the UE provided an S-NSSAI during the PDU session establishment, the UE shall stop timer T3585, if it is running for the S-NSSAI of the PDU session. If the UE did not provide an S-NSSAI during the PDU session establishment, the UE shall stop the timer T3585 associated with no S-NSSAI if it is running. The timer T3585 to be stopped includes:

- a) in a PLMN:
 - 1) the timer T3585 applied for all the PLMNs and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, if running;
 - 2) the timer T3585 applied for all the PLMNs and for both 3GPP access type and non-3GPP access type, if running;
 - 3) the timer T3585 applied for the registered PLMN and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, if running; and
 - 4) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, if running; or
- b) in an SNPN:

- 1) the timer T3585 applied for all the equivalent SNPNs and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
- 2) the timer T3585 applied for all the equivalent SNPNs and for both 3GPP access type and non-3GPP access type, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
- 3) the timer T3585 applied for the registered SNPN and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- 4) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

NOTE 1: Upon receipt of the PDU SESSION AUTHENTICATION COMMAND message for a PDU session, if the UE provided a DNN (or no DNN) and an S-NSSAI (or no S-NSSAI) when the PDU session is established, timer T3396 associated with the DNN (or no DNN, if no DNN was provided by the UE) is running, and timer T3584 associated with the DNN (or no DNN, if no DNN was provided by the UE) and the S-NSSAI (or no S-NSSAI, if no S-NSSAI was provided by the UE) is running, then the UE stops both the timer T3396 and the timer T3584.

NOTE 2: Upon receipt of the PDU SESSION AUTHENTICATION COMMAND message for a PDU session, if the UE provided a DNN (or no DNN) and an S-NSSAI (or no S-NSSAI) when the PDU session is established, timer T3585 associated with the S-NSSAI (or no S-NSSAI, if no S-NSSAI was provided by the UE) is running, and timer T3584 associated with the DNN (or no DNN, if no DNN was provided by the UE) and the S-NSSAI (or no S-NSSAI, if no S-NSSAI was provided by the UE) is running, then the UE stops both the timer T3585 and the timer T3584.

Upon receipt of a PDU SESSION AUTHENTICATION COMMAND message and a PDU session ID, using the NAS transport procedure as specified in subclause 5.4.5, the UE passes to the upper layers the EAP message received in the EAP message IE of the PDU SESSION AUTHENTICATION COMMAND message. Apart from this action and the stopping of timers T3396, T3584 and T3585 (if running), the authentication and authorization procedure initiated by the DN is transparent to the 5GSM layer of the UE.

6.3.1.2.2 PDU EAP message reliable transport procedure accepted by the UE

The UE shall create a PDU SESSION AUTHENTICATION COMPLETE message when the upper layers provide an EAP-response message responding to the received EAP-request message.

The UE shall set the EAP message IE of the PDU SESSION AUTHENTICATION COMPLETE message to the EAP-response message.

The UE shall transport the PDU SESSION AUTHENTICATION COMPLETE message and the PDU session ID, using the NAS transport procedure as specified in subclause 5.4.5. Apart from this action, the authentication and authorization procedure initiated by the DN is transparent to the 5GSM layer of the UE.

Upon receipt of a PDU SESSION AUTHENTICATION COMPLETE message, the SMF shall stop timer T3590 and provides the EAP message received in the EAP message IE of the PDU SESSION AUTHENTICATION COMPLETE message to the DN or handles it locally.

6.3.1.2.3 Abnormal cases on the network side

The following abnormal cases can be identified:

- a) T3590 expired.

The SMF shall, on the first expiry of the timer T3590, retransmit the PDU SESSION AUTHENTICATION COMMAND message and shall reset and start timer T3590. This retransmission is repeated four times, i.e. on the fifth expiry of timer T3590, the SMF shall abort the procedure.

- b) Collision of UE-requested PDU session release procedure and a PDU session authentication and authorization procedure.

When the SMF receives a PDU SESSION RELEASE REQUEST message during the PDU session authentication and authorization procedure, and the PDU session indicated in the PDU SESSION RELEASE REQUEST message is the PDU session that the SMF had requested to authenticate, the SMF shall abort the PDU session authentication and authorization procedure and proceed with the UE-requested PDU session release procedure.

6.3.1.2.4 Abnormal cases in the UE

The following abnormal cases can be identified:

- a) PDU session inactive for the received PDU session ID.

If the PDU session ID in the PDU SESSION AUTHENTICATION COMMAND message belongs to any PDU session in state PDU SESSION INACTIVE in the UE, the UE shall send a 5GSM STATUS message with the 5GSM cause IE set to #43 "Invalid PDU session identity".

- b) Collision of UE-requested PDU session release procedure and a PDU session authentication and authorization procedure.

When the UE receives a PDU SESSION AUTHENTICATION COMMAND message during the UE-requested PDU session release procedure, and the PDU session indicated in PDU SESSION AUTHENTICATION COMMAND message is the PDU session that the UE had requested to release, the UE shall ignore the PDU SESSION AUTHENTICATION COMMAND message and proceed with the UE-requested PDU session release procedure.

6.3.1.3 PDU EAP result message transport procedure

6.3.1.3.1 PDU EAP result message transport procedure initiation

PDU EAP result message transport procedure is initiated by the SMF if the PDU session authentication and authorization procedure is performed after the PDU session is established and the DN authentication of the UE completes successfully.

In order to initiate the PDU EAP result message transport procedure, the SMF shall create a PDU SESSION AUTHENTICATION RESULT message.

The SMF shall set the PTI IE of the PDU SESSION AUTHENTICATION RESULT message to "No procedure transaction identity assigned".

The SMF shall set the EAP message IE of the PDU SESSION AUTHENTICATION RESULT message to the EAP-success message provided by the DN.

The SMF shall send the PDU SESSION AUTHENTICATION RESULT message.

Upon receipt of a PDU SESSION AUTHENTICATION RESULT message and a PDU session ID, using the NAS transport procedure as specified in subclause 5.4.5, the UE passes to the upper layers the EAP message received in the EAP message IE of the PDU SESSION AUTHENTICATION RESULT message. Apart from this action, the authentication and authorization procedure initiated by the DN is transparent to the 5GSM layer of the UE.

6.3.1.3.2 Abnormal cases in the UE

The following abnormal cases can be identified:

- a) PDU session inactive for the received PDU session ID.

If the PDU session ID in the PDU SESSION AUTHENTICATION RESULT message belongs to any PDU session in state PDU SESSION INACTIVE in the UE, the UE shall send a 5GSM STATUS message with the 5GSM cause IE set to #43 "Invalid PDU session identity".

- b) Collision of UE-requested PDU session release procedure and a PDU EAP result message transport procedure.

When the UE receives a PDU SESSION AUTHENTICATION RESULT message during the UE-requested PDU session release procedure, and the PDU session indicated in PDU SESSION AUTHENTICATION RESULT message is the PDU session that the UE had requested to release, the UE shall ignore the PDU SESSION AUTHENTICATION RESULT message and proceed with the UE-requested PDU session release procedure.

6.3.1A Service-level authentication and authorization procedure

6.3.1A.1 General

The purpose of the service-level authentication and authorization (service-level-AA) procedure is to enable the DN using NEF services for authentication:

- a) to authenticate the upper layers of the UE, when establishing the PDU session;
- b) to authorize the upper layers of the UE, when establishing the PDU session;
- c) both of the above; or
- d) to re-authenticate the upper layers of the UE after establishment of the PDU session.

The service-level authentication and authorization procedure is used for UUAA as specified in 3GPP TS 23.256 [6AB].

NOTE 1: The authentication protocol for UUAA is out of scope of 3GPP in this release of specification.

The service-level authentication and authorization procedure can be performed only during or after the UE-requested PDU session procedure establishing a non-emergency PDU session. The service-level authentication and authorization procedure shall not be performed during or after the UE-requested PDU session establishment procedure establishing an emergency PDU session.

If the service-level authentication and authorization procedure is performed during the UE-requested PDU session establishment procedure:

- a) and the service-level-AA procedure of the UE completes successfully, the service-level-AA response is transported from the network to the UE as a part of the UE-requested PDU session establishment procedure in the PDU SESSION ESTABLISHMENT ACCEPT message; or
- b) and the service-level-AA procedure of the UE completes unsuccessfully, the service-level-AA response is transported from the network to the UE as a part of the UE-requested PDU session establishment procedure in the PDU SESSION ESTABLISHMENT REJECT message.

NOTE 2: If the SMF receives the HTTP code set to "4xx" or "5xx" as specified in 3GPP TS 29.500 [20AA] or the SMF detects a UUAA-SM failure as specified in 3GPP TS 29.256 [21B], then the SMF considers that the UUAA-SM procedure has completed unsuccessfully.

If the service-level authentication and authorization procedure is performed for the established PDU session with re-authentication purpose:

- a) and the service-level-AA procedure of the UE completes successfully, the service-level-AA response is transported from the network to the UE as a part of the network-requested PDU session modification procedure in the PDU SESSION MODIFICATION COMMAND message; or
- b) and the service-level-AA procedure of the UE completes unsuccessfully, the service-level-AA response is transported from the network to the UE as a part of the network-requested PDU session release procedure in the PDU SESSION RELEASE COMMAND message.

There can be several rounds of exchange of a service-level-AA payload for the service to complete the service-level authentication and authorization of the request for a PDU session (see example in figure 6.3.1A.1-1).

If the UE receives the service-level-AA response in the PDU SESSION ESTABLISHMENT ACCEPT message or the PDU SESSION ESTABLISHMENT REJECT message, the UE passes it to the upper layer.

Figure 6.3.1A.1-1: Service-level authentication and authorization procedure

6.3.1A.2 Service-level authentication and authorization procedure initiation

In order to initiate the service-level authentication and authorization procedure, the SMF shall create a SERVICE-LEVEL AUTHENTICATION COMMAND message.

The SMF shall set the PTI IE of the SERVICE-LEVEL AUTHENTICATION COMMAND message to "No procedure transaction identity assigned".

The SMF shall set the service-level-AA payload in the Service-level-AA container IE of the SERVICE-LEVEL AUTHENTICATION COMMAND message to the payload provided by the DN via the NEF. If a payload type associated with the payload is provided by the DN via the NEF, the SMF shall set the service-level-AA payload type with the value set to the payload type.

NOTE 1: In case of UUA, the service-level-AA payload is provided by the DN via the UAS-NF.

The SMF shall send the SERVICE-LEVEL AUTHENTICATION COMMAND message, and the SMF shall start timer T3594 (see example in figure 6.3.1A.1-1).

Upon receipt of the SERVICE-LEVEL AUTHENTICATION COMMAND message, if the UE provided a DNN during the PDU session establishment, the UE shall stop timer T3396, if it is running for the DNN provided by the UE. If the UE did not provide a DNN during the PDU session establishment, the UE shall stop the timer T3396 associated with no DNN if it is running. In an SNPN, the timer T3396 to be stopped includes:

- a) the timer T3396 applied for all the equivalent SNPNs, associated with the RSNPN or an equivalent SNPN, and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and

- b) the timer T3396 applied for the registered SNPN, associated with the RSNPN, and, if the UE supports access to an SNPN using credentials from a credentials holder, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

Upon receipt of the SERVICE-LEVEL AUTHENTICATION COMMAND message, if the UE provided an S-NSSAI and a DNN during the PDU session establishment, the UE shall stop timer T3584, if it is running for the [S-NSSAI of the PDU session, DNN] combination. If the UE provided a DNN but did not provide an S-NSSAI during the PDU session establishment, the UE shall stop timer T3584, if it is running for the same [no S-NSSAI, DNN] combination provided by the UE. If the UE provided an S-NSSAI but did not provide a DNN during the PDU session establishment, the UE shall stop timer T3584, if it is running for the same [S-NSSAI, no DNN] combination provided by the UE. If the UE provided neither a DNN nor an S-NSSAI during the PDU session establishment, the UE shall stop timer T3584, if it is running for the same [no S-NSSAI, no DNN] combination provided by the UE. The timer T3584 to be stopped includes:

- a) in a PLMN:
 - 1) the timer T3584 applied for all the PLMNs, if running, and
 - 2) the timer T3584 applied for the registered PLMN, if running; or
- b) in an SNPN:
 - 1) the timer T3584 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - 2) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

Upon receipt of the SERVICE-LEVEL AUTHENTICATION COMMAND message, if the UE provided an S-NSSAI during the PDU session establishment, the UE shall stop timer T3585, if it is running for the S-NSSAI of the PDU session. If the UE did not provide an S-NSSAI during the PDU session establishment, the UE shall stop the timer T3585 associated with no S-NSSAI if it is running. The timer T3585 to be stopped includes:

- a) in a PLMN:
 - the timer T3585 applied for all the PLMNs and for the access over which the SERVICE-LEVEL AUTHENTICATION COMMAND message is received, if running;
 - the timer T3585 applied for all the PLMNs and for both 3GPP access type and non-3GPP access type, if running;
 - the timer T3585 applied for the registered PLMN and for the access over which the SERVICE-LEVEL AUTHENTICATION COMMAND message is received, if running; and
 - the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, if running; or
- b) in an SNPN:
 - 1) the timer T3585 applied for all the equivalent SNPNs and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
 - 2) the timer T3585 applied for all the equivalent SNPNs and for both 3GPP access type and non-3GPP access type, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
 - 3) the timer T3585 applied for the registered SNPN and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - 4) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials

holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

NOTE 2: Upon receipt of the SERVICE-LEVEL AUTHENTICATION COMMAND message for a PDU session, if the UE provided a DNN (or no DNN) and an S-NSSAI (or no S-NSSAI) when the PDU session is established, timer T3396 associated with the DNN (or no DNN, if no DNN was provided by the UE) is running, and timer T3584 associated with the DNN (or no DNN, if no DNN was provided by the UE) and the S-NSSAI (or no S-NSSAI, if no S-NSSAI was provided by the UE) is running, then the UE stops both the timer T3396 and the timer T3584.

NOTE 3: Upon receipt of the SERVICE-LEVEL AUTHENTICATION COMMAND message for a PDU session, if the UE provided a DNN (or no DNN) and an S-NSSAI (or no S-NSSAI) when the PDU session is established, timer T3585 associated with the S-NSSAI (or no S-NSSAI, if no S-NSSAI was provided by the UE) is running, and timer T3584 associated with the DNN (or no DNN, if no DNN was provided by the UE) and the S-NSSAI (or no S-NSSAI, if no S-NSSAI was provided by the UE) is running, then the UE stops both the timer T3585 and the timer T3584.

Upon receipt of a SERVICE-LEVEL AUTHENTICATION COMMAND message and a PDU session ID, using the NAS transport procedure as specified in subclause 5.4.5, the UE passes to the upper layers the service-level-AA payload received in the Service-level-AA container IE of the SERVICE-LEVEL AUTHENTICATION COMMAND message. Apart from this action, the service-level authentication and authorization procedure initiated by the DN is transparent to the 5GSM layer of the UE.

6.3.1A.3 Service-level authentication and authorization procedure accepted by the UE

When the upper layers provide a service-level-AA payload, the UE shall create a SERVICE-LEVEL AUTHENTICATION COMPLETE message and set the service-level-AA payload of the Service-level-AA container IE to the service-level-AA payload received from the upper layers, and if the service-level-AA payload type is received in the SERVICE-LEVEL AUTHENTICATION COMMAND message from the SMF, set the service-level-AA payload type of the Service-level-AA container IE to the service-level-AA payload type received from the SMF.

The UE shall transport the SERVICE-LEVEL AUTHENTICATION COMPLETE message and the PDU session ID, using the NAS transport procedure as specified in subclause 5.4.5. Apart from this action, the service-level authentication and authorization procedure initiated by the DN is transparent to the 5GSM layer of the UE.

Upon receipt of a SERVICE-LEVEL AUTHENTICATION COMPLETE message, the SMF shall stop timer T3594 and provides the service-level-AA payload received in the Service-level-AA container IE of the SERVICE-LEVEL AUTHENTICATION COMPLETE message to the DN.

6.3.1A.4 Abnormal cases on the network side

The following abnormal cases can be identified:

- a) Expiry of timer T3594.

On the first expiry of the timer T3594, the SMF shall resend the SERVICE-LEVEL AUTHENTICATION COMMAND message and shall reset and restart timer T3594. This retransmission is repeated four times, i.e., on the fifth expiry of timer T3594, the SMF shall abort the procedure and send PDU SESSION ESTABLISHMENT REJECT message with the 5GSM cause #29 "user authentication or authorization failed" as specified in subclause 6.4.1.4.1.

6.3.1A.5 Abnormal cases in the UE

The following abnormal case can be identified:

- a) Collision of UE-requested PDU session release procedure and a service-level authentication and authorization procedure.

When the UE receives a SERVICE-LEVEL AUTHENTICATION COMMAND message during the UE-requested PDU session release procedure, and the PDU session indicated in SERVICE-LEVEL AUTHENTICATION COMMAND message is the PDU session that the UE has requested to release, the UE shall ignore the SERVICE-LEVEL AUTHENTICATION COMMAND message and proceed with the UE-requested PDU session release procedure.

6.3.2 Network-requested PDU session modification procedure

6.3.2.1 General

The purpose of the network-requested PDU session modification procedure is to enable the network to modify a PDU session, re-negotiate header compression configuration associated to a PDU session, convey a port management information container, to trigger EAS rediscovery, provide updated DNS server address(es) due to the newly selected local DNS server or the newly selected EASDF, provide updated ECS configuration information, remove joined UE from one or more multicast MBS sessions associated with a PDU session, update ATSSS parameters (e.g. ATSSS rules), update the MBS service area or the security information of multicast MBS session that the UE has joined or to inform about the result of service-level AA procedure or C2 authorization for UAS services.

6.3.2.2 Network-requested PDU session modification procedure initiation

In order to initiate the network-requested PDU session modification procedure, the SMF shall create a PDU SESSION MODIFICATION COMMAND message.

If the authorized QoS rules of the PDU session is modified or is marked as to be synchronised with the UE, the SMF shall set the Authorized QoS rules IE of the PDU SESSION MODIFICATION COMMAND message to the authorized QoS rules of the PDU session. The SMF shall ensure that the number of the packet filters used in the authorized QoS rules of the PDU Session does not exceed the maximum number of packet filters supported by the UE for the PDU session. The SMF may bind service data flows for which the UE has requested traffic segregation to a dedicated QoS flow for the PDU session, if possible. Otherwise the SMF may bind the service data flows to an existing QoS flow. The SMF shall use only one dedicated QoS flow for traffic segregation. If the UE has requested traffic segregation for multiple service data flows with different QoS handling, the SMF shall bind all these service data flows to a single QoS flow. If the SMF allows traffic segregation for service data flows in a QoS rule, then the SMF shall create a new authorized QoS rule for these service data flows and shall delete packet filters corresponding to these service data flows from the other authorized QoS rules.

If the authorized QoS flow descriptions of the PDU session is modified or is marked as to be synchronised with the UE, the SMF shall set the Authorized QoS flow descriptions IE of the PDU SESSION MODIFICATION COMMAND message to the authorized QoS flow descriptions of the PDU session.

If SMF creates a new authorized QoS rule for a new QoS flow, then SMF shall include the authorized QoS flow description for that QoS flow in the Authorized QoS flow descriptions IE of the PDU SESSION MODIFICATION COMMAND message, if:

- a) the newly created authorized QoS rules is for a new GBR QoS flow;
- b) the QFI of the new QoS flow is not the same as the 5QI of the QoS flow identified by the QFI;
- c) the new QoS flow can be mapped to an EPS bearer as specified in subclause 4.11.1 of 3GPP TS 23.502 [9]; or
- d) the new QoS flow is established for the PDU session used for relaying, as specified in subclause 5.6.2.1 of 3GPP TS 23.304 [6E].

NOTE 0: In cases other than above listed cases, it is up to the SMF implementation to include the authorized QoS flow description of the new QoS flow for the new authorized QoS rule in the Authorized QoS flow descriptions IE of the PDU SESSION MODIFICATION COMMAND message.

If the session-AMBR of the PDU session is modified, the SMF shall set the selected Session-AMBR IE of the PDU SESSION MODIFICATION COMMAND message to the session-AMBR of the PDU session.

If interworking with EPS is supported for the PDU session and if the mapped EPS bearer contexts of the PDU session is modified, the SMF shall set the Mapped EPS bearer contexts IE of the PDU SESSION MODIFICATION COMMAND message to the mapped EPS bearer contexts of the PDU session. If the association between a QoS flow and the mapped EPS bearer context is changed, the SMF shall set the EPS bearer identity parameter in Authorized QoS flow descriptions IE of the PDU SESSION MODIFICATION COMMAND message to the new EPS bearer identity associated with the QoS flow.

NOTE 0A: The SMF can include multiple mapped EPS bearer context fields with the same EPS bearer identity in the Mapped EPS bearer contexts IE of the PDU SESSION MODIFICATION COMMAND message in cases, e.g. the packet filters need to be modified and the modification requires more than one TFT operation codes or the mapped traffic flow template needs to be modified and the modification exceeds the maximum size of the TFT IE.

If the network-requested PDU session modification procedure is triggered by a UE-requested PDU session modification procedure and the PDU SESSION MODIFICATION REQUEST message includes a 5GSM capability IE, the SMF shall:

- a) if the RQoS bit is set to:
 - 1) "Reflective QoS supported", consider that the UE supports reflective QoS for this PDU session; or
 - 2) "Reflective QoS not supported", consider that the UE does not support reflective QoS for this PDU session; and;
- b) if the MH6-PDU bit is set to:
 - 1) "Multi-homed IPv6 PDU session supported", consider that this PDU session is supported to use multiple IPv6 prefixes; or
 - 2) "Multi-homed IPv6 PDU session not supported", consider that this PDU session is not supported to use multiple IPv6 prefixes.

If the SMF considers that reflective QoS is supported for QoS flows belonging to this PDU session, the SMF may include the RQ timer IE set to an RQ timer value in the PDU SESSION MODIFICATION COMMAND message.

If a port management information container needs to be delivered (see 3GPP TS 23.501 [8] and 3GPP TS 23.502 [9]) and the UE has set the TPMIC bit to "Transfer of port management information containers supported" in the 5GSM capability IE, the SMF shall include a Port management information container IE in the PDU SESSION MODIFICATION COMMAND message.

For a PDN connection established when in S1 mode, upon an inter-system change from S1 mode to N1 mode, if the network-requested PDU session modification procedure is triggered by a UE-requested PDU session modification procedure and a UE-requested PDU session modification procedure has not been successfully performed yet, the PDU session type is "IPv4", "IPv6", "IPv4v6" or "Ethernet" and the PDU SESSION MODIFICATION REQUEST message includes a Maximum number of supported packet filters IE, the SMF shall consider this number as the maximum number of packet filters that can be supported by the UE for this PDU session. Otherwise the SMF considers that the UE supports 16 packet filters for this PDU session.

For a PDN connection established when in S1 mode, upon an inter-system change from S1 mode to N1 mode, if the network-requested PDU session modification procedure is triggered by a UE-requested PDU session modification procedure and a UE-requested PDU session modification procedure has not been successfully performed yet, the SMF shall consider that the maximum data rate per UE for user-plane integrity protection supported by the UE for uplink and the maximum data rate per UE for user-plane integrity protection supported by the UE for downlink are valid for the lifetime of the PDU session.

For a PDN connection established when in S1 mode, upon an inter-system change from S1 mode to N1 mode, if the network-requested PDU session modification procedure is triggered by a UE-requested PDU session modification procedure and a UE-requested PDU session modification procedure has not been successfully performed yet, and the SMF determines, based on local policies or configurations in the SMF and the Always-on PDU session requested IE in the PDU SESSION MODIFICATION REQUEST message (if available), that either:

- a) the requested PDU session needs to be an always-on PDU session, the SMF shall include the Always-on PDU session indication IE in the PDU SESSION MODIFICATION COMMAND message and shall set the value to "Always-on PDU session required"; or
- b) the requested PDU session shall not be an always-on PDU session and:
 - 1) if the UE included the Always-on PDU session requested IE, the SMF shall include the Always-on PDU session indication IE in the PDU SESSION MODIFICATION COMMAND message and shall set the value to "Always-on PDU session not allowed"; or

- 2) if the UE did not include the Always-on PDU session requested IE, the SMF shall not include the Always-on PDU session indication IE in the PDU SESSION MODIFICATION COMMAND message.

For a PDN connection established when in S1 mode, upon an inter-system change from S1 mode to N1 mode, if the network-requested PDU session modification procedure is triggered by a UE-requested PDU session modification procedure, a UE-requested PDU session modification procedure has not been successfully performed yet, the UE supports EDC and the network allows the use of EDC, then the SMF shall include the Extended protocol configuration options IE in the PDU SESSION MODIFICATION COMMAND message with the EDC usage allowed indicator.

For a PDN connection established when in S1 mode, upon an inter-system change from S1 mode to N1 mode, if the network-requested PDU session modification procedure is triggered by a UE-requested PDU session modification procedure, a UE-requested PDU session modification procedure has not been successfully performed yet, the UE supports EDC and the network requires the use of EDC, then the SMF shall include the Extended protocol configuration options IE in the PDU SESSION MODIFICATION COMMAND message with the EDC usage required indicator.

If a QoS flow for URLLC is created in a PDU session and the SMF has not provided the Always-on PDU session indication IE with the value set to "Always-on PDU session required" in the UE-requested PDU session establishment procedure or a network-requested PDU session modification procedure for the PDU session, the SMF shall include the Always-on PDU session indication IE in the PDU SESSION MODIFICATION COMMAND message and shall set the value to "Always-on PDU session required".

For a PDN connection, upon an inter-system change from S1 mode to N1 mode, if the network-requested PDU session modification procedure is triggered by a UE-requested PDU session modification procedure and a UE-requested PDU session modification procedure has not been successfully performed yet, the PDU session is a single access PDU session over 3GPP access with IP PDU session type, the SMF may decide to provide the protocol description associated with the PDU session and may include the Protocol description IE in the PDU SESSION MODIFICATION COMMAND message.

If the value of the RQ timer is set to "deactivated" or has a value of zero, the UE considers that RQoS is not applied for this PDU session and remove the derived QoS rule(s) associated with the PDU session, if any.

If the network-requested PDU session modification procedure is triggered by a UE-requested PDU session modification procedure, the SMF shall set the PTI IE of the PDU SESSION MODIFICATION COMMAND message to the PTI of the PDU SESSION MODIFICATION REQUEST message received as part of the UE-requested PDU session modification procedure.

If the network-requested PDU session modification procedure is triggered by a UE-requested PDU session modification procedure and the UE has included the Requested MBS container IE in the PDU SESSION MODIFICATION REQUEST message with the MBS operation set to "Join multicast MBS session", the SMF:

- a) shall include the TMGI for the multicast MBS session IDs that the UE is allowed to join, if any, in the Received MBS container IE, shall set the MBS decision to "MBS join is accepted" for each of those Received MBS information, may include the MBS start time to indicate the time when the multicast MBS session starts, and shall include the MBS security container in each of those Received MBS information if security protection is applied for that multicast MBS session and the control plane security procedure is used as specified in subclause W.4.1.2 in 3GPP TS 33.501 [24], and shall use separate QoS flows dedicated for multicast by including the Authorized QoS flow descriptions IE if no separate QoS flows dedicated for multicast exist or if the SMF wants to establish new QoS flows dedicated for multicast;

NOTE 1: The network determines whether security protection applies or not for the multicast MBS session as specified in 3GPP TS 33.501 [24].

- b) shall include the TMGI for multicast MBS session IDs that the UE is rejected to join, if any, in the Received MBS container IE, shall set the MBS decision to "MBS join is rejected" for each of those Received MBS information, shall set the Rejection cause for each of those Received MBS information with the reason of rejection and, if the Rejection cause is set to "multicast MBS session has not started or will not start soon", may include an MBS back-off timer value; and
- c) may include in the Received MBS container IE the MBS service area for each multicast MBS session and include in it the MBS TAI list, the NR CGI list or both, that identify the service area(s) for the local MBS service;

NOTE 2: For an multicast MBS session that has multiple MBS service areas, the MBS service areas are indicated to the UE using MBS service announcement as described in 3GPP TS 23.247 [53], which is out of scope of this specification.

in the PDU SESSION MODIFICATION COMMAND message. If the UE has set the Type of multicast MBS session ID to "Source specific IP multicast address" in the Requested MBS container IE for certain multicast MBS session(s) in the PDU SESSION MODIFICATION REQUEST message, the SMF shall include the Source IP address information and Destination IP address information in the Received MBS information together with the TMGI for each of those multicast MBS sessions.

NOTE 3: Including the Source IP address information and Destination IP address information in the Received MBS information in that case is to allow the UE to perform the mapping between the requested multicast MBS session ID and the provided TMGI.

NOTE 4: In SNPN, TMGI is used together with NID to identify an MBS Session.

If:

- a) the SMF wants to remove joined UE from one or more multicast MBS sessions; or
- b) the network-requested PDU session modification procedure is triggered by a UE-requested PDU session modification procedure and the UE has included the Requested MBS container IE in the PDU SESSION MODIFICATION REQUEST message with the MBS operation set to "Leave multicast MBS session",

the SMF shall include the multicast MBS session IDs that the UE is removed from, if any, in the Received MBS container IE in the PDU SESSION MODIFICATION COMMAND message and shall set the MBS decision to "Remove UE from multicast MBS session" for each of those Received MBS information. The SMF may include the updated MBS service area in each of the Received MBS information, if any. The SMF may delete the QoS flows associated for the multicast by including the Authorized QoS flow descriptions IE in the PDU SESSION MODIFICATION COMMAND message. If the UE is removed from multicast MBS session due to the MBS session release, the SMF shall set the Rejection cause to "multicast MBS session is released". The SMF shall include the Rejection cause for each of the Received MBS information, if any, and set its value with the reason of removing the UE from the corresponding multicast MBS session.

NOTE 5: based on operator's policy, e.g. after a locally configured time period, the SMF is allowed to trigger the removal of joined UE from an multicast MBS session when the UE moves outside all the MBS service area(s) of that multicast MBS session.

If the SMF wants to update the MBS security information of an multicast MBS session that the UE has joined, the SMF shall include the corresponding multicast MBS session ID and the MBS security container in the Received MBS container IE in the PDU SESSION MODIFICATION COMMAND message, and shall set the MBS Decision to "MBS security information update" in the Received MBS information.

If the SMF wants to update the MBS service area of an multicast MBS session that the UE has joined, the SMF shall include the corresponding multicast MBS session ID and the updated MBS service area in the Received MBS container IE in the PDU SESSION MODIFICATION COMMAND message, and shall set the MBS decision to "MBS service area update" in the Received MBS information.

NOTE 6: The MBS service area of an multicast MBS session is also allowed to be updated to the UE using the MBS service announcement as described in 3GPP TS 23.247 [53], which is out of scope of this specification.

If the network needs to update ATSSS parameters (see subclause 5.2.4 of 3GPP TS 24.193 [13B]), the SMF shall include the ATSSS container IE with the updates of ATSSS parameters in the PDU SESSION MODIFICATION COMMAND message.

If the network-requested PDU session modification procedure is not triggered by a UE-requested PDU session modification procedure, the SMF shall set the PTI IE of the PDU SESSION MODIFICATION COMMAND message to "No procedure transaction identity assigned".

If the selected SSC mode of the PDU session is "SSC mode 3" and the SMF requests the relocation of SSC mode 3 PDU session anchor with multiple PDU sessions as specified in 3GPP TS 23.502 [9], the SMF shall include 5GSM cause #39 "reactivation requested", in the PDU SESSION MODIFICATION COMMAND message, and may include the PDU session address lifetime in a PDU session address lifetime parameter in the Extended protocol configuration options IE of the PDU SESSION MODIFICATION COMMAND message. If the selected SSC mode of the PDU

session is "SSC mode 3", the S-NSSAI or the mapped S-NSSAI associated with the PDU session needs to be replaced and the SMF determines that the PDU session needs to be re-established on the alternative S-NSSAI, the SMF shall include the Alternative S-NSSAI IE and 5GSM cause #39 "reactivation requested" in the PDU SESSION MODIFICATION COMMAND message. If the selected SSC mode of the PDU session is "SSC mode 3", the replaced S-NSSAI is available and the SMF determines that the PDU session needs to be re-established on the replaced S-NSSAI, the SMF shall include and 5GSM cause #39 "reactivation requested" and include the replaced S-NSSAI in the Alternative S-NSSAI IE in the PDU SESSION MODIFICATION COMMAND message.

NOTE 7: The relocation of SSC mode 3 PDU session anchor with multiple PDU sessions can also be initiated by the SMF in case of the SMF is requested by the AMF to release the PDU session due to the network slice instance of the PDU session is changed as specified in subclause 5.15.5.3 of 3GPP TS 23.501 [8].

The SMF shall send the PDU SESSION MODIFICATION COMMAND message, and the SMF shall start timer T3591 (see example in figure 6.3.2.2.1).

NOTE 8: If the SMF requests the relocation of SSC mode 3 PDU session anchor with multiple PDU sessions as specified in 3GPP TS 23.502 [9], the reallocation requested indication indicating whether the SMF is to be reallocated or the SMF is to be reused is provided to the AMF.

If the control plane CIoT 5GS optimization is enabled for a PDU session and the IP header compression configuration IE was included in the PDU SESSION ESTABLISHMENT REQUEST message or the PDU SESSION MODIFICATION REQUEST message, and the SMF supports control plane CIoT 5GS optimization and IP header compression for control plane CIoT 5GS optimization, the SMF may include the IP header compression configuration IE in the PDU SESSION MODIFICATION COMMAND message to re-negotiate IP header compression configuration associated to the PDU session.

If the control plane CIoT 5GS optimization is enabled for a PDU session and the Ethernet header compression configuration IE was included in the PDU SESSION ESTABLISHMENT REQUEST message or the PDU SESSION MODIFICATION REQUEST message, and the SMF supports control plane CIoT 5GS optimization and Ethernet header compression for control plane CIoT 5GS optimization, the SMF may include the Ethernet header compression configuration IE in the PDU SESSION MODIFICATION COMMAND message to re-configure Ethernet header compression configuration associated with the PDU session.

If the network-requested PDU session modification procedure is associated with C2 authorization procedure, the SMF shall send the PDU SESSION MODIFICATION COMMAND message by including the Service-level-AA container IE containing:

- a) the service-level-AA response with the value of C2AR field set to the "C2 authorization was successful";
- b) if a payload is provided from the UAS-NF, the service-level-AA payload with the value set to the payload; and
- c) if a payload type associated with the payload is provided from the UAS-NF, the service-level-AA payload type with the value set to the payload type; and
- d) if the CAA-level UAV ID is provided from the UAS-NF, the service-level device ID set to the CAA-level UAV ID.

NOTE 9: The C2 authorization payload in the service-level-AA payload can include one, some or all of the pairing information for C2 communication, and the pairing information for direct C2 communication,

NOTE 9A: The C2 authorization payload in the service-level-AA payload can include the security information for C2 session as specified in TS 33.256 [24B].

If the service-level-AA procedure is triggered for the established PDU session for UAS services with re-authentication purpose, and the SMF is provided by the UAS-NF with the successful UUAA-SM result, the SMF shall transmit a PDU SESSION MODIFICATION COMMAND message to the UE, where the PDU SESSION MODIFICATION COMMAND message shall include the Service-level-AA container IE containing:

- a) the service-level-AA response with the value of SLAR field set to "Service level authentication and authorization was successful";
- b) if received the CAA-level UAV ID from the UAS-NF, the service-level device ID with the value set to the CAA-level UAV ID;
- c) if received a payload from the UAS-NF, the service-level-AA payload with the value set to the payload; and

- d) if received a payload type associated with the payload, the service-level-AA payload type with the value set to the payload type.

If the SMF needs to provide new ECS configuration information to the UE and the UE has indicated support for ECS configuration information provisioning in the PDU SESSION ESTABLISHMENT REQUEST message or while in S1 mode, then the SMF may include the Extended protocol configuration options IE in the PDU SESSION MODIFICATION COMMAND message with:

- a) at least one of ECS IPv4 Address(es), ECS IPv6 Address(es), ECS FQDN(s);
- b) at least one associated ECSP identifier;
- c) optionally, spatial validity conditions associated with the ECS address;
- d) optionally, ECS authentication methods associated with the ECS address; and
- e) optionally, ECS supported PLMNs information list, including the associated ECSP information for which the EDN configuration information can be provided by the ECS.

NOTE 10: The IP address(es), FQDN(s), or both are associated with the ECSP identifier and replace previously provided ECS configuration information associated with the same ECSP identifier, if any.

If the SMF needs to provide DNS server address(es) to the UE and the UE has provided the DNS server IPv4 address request, the DNS server IPv6 address request or both of them, in the PDU SESSION ESTABLISHMENT REQUEST message or a PDU SESSION MODIFICATION REQUEST message, then the SMF shall include the Extended protocol configuration options IE in the PDU SESSION MODIFICATION COMMAND message with one or more DNS server IPv4 address(es), one or more DNS server IPv6 address(es) or both of them.

If the SMF needs to trigger EAS rediscovery and the UE has indicated support of the EAS rediscovery in the PDU SESSION ESTABLISHMENT REQUEST message or the PDU SESSION MODIFICATION REQUEST message, then the SMF shall include the Extended protocol configuration options IE in the PDU SESSION MODIFICATION COMMAND message:

- a) with the EAS rediscovery indication without indicated impact; or
- b) with the following:
 - 1) one or more EAS rediscovery indication(s) with impacted EAS IPv4 address range, if the UE supports EAS rediscovery indication(s) with impacted EAS IPv4 address range;
 - 2) one or more EAS rediscovery indication(s) with impacted EAS IPv6 address range, if the UE supports EAS rediscovery indication(s) with impacted EAS IPv6 address range;
 - 3) one or more EAS rediscovery indication(s) with impacted EAS FQDN, if the UE supports EAS rediscovery indication(s) with impacted EAS FQDN; or
 - 4) any combination of the above.

When UE has requested P-CSCF IPv6 address or P-CSCF IPv4 address and the SMF has provided P-CSCF address(es) during the PDU session establishment procedure, if the network-requested PDU session modification procedure is triggered for P-CSCF restoration, the SMF shall include the P-CSCF IP address(es) in the Extended protocol configuration options IE in the PDU SESSION MODIFICATION COMMAND message as specified in subclause 5.8.2.2 of 3GPP TS 23.380 [54].

If the S-NSSAI or the mapped S-NSSAI of the PDU session needs to be replaced and the SMF determines that the PDU session needs to be retained, the SMF shall include the Alternative S-NSSAI IE in the PDU SESSION MODIFICATION COMMAND message. If the replaced S-NSSAI is available and the SMF determines that the PDU session needs to be retained, the SMF include replaced S-NSSAI in the Alternative S-NSSAI IE in the PDU SESSION MODIFICATION COMMAND message.

If the SMF includes the authorized QoS flow descriptions and the SMF determines to provide the N3QAI to the UE, the SMF shall include the N3QAI IE in the PDU SESSION MODIFICATION COMMAND message.

If the PDU session was a single access PDU session established with IP PDU session type and based on operator policy the SMF determines to provide the protocol description for UL PDU set based handling to the UE, the SMF may include the Protocol description IE in the PDU SESSION MODIFICATION COMMAND message.

If the UE has indicated support for (S)RTP multiplexed media identification information in the PDU SESSION ESTABLISHMENT REQUEST message or in the PDU SESSION MODIFICATION REQUEST message, then the SMF may include the (S)RTP multiplexed media packet filter component in the packet filters of the QoS rules IE in the PDU SESSION MODIFICATION COMMAND message.

If the PDU session was a single access PDU session established over wireline access with IP PDU session type and based on operator policy the SMF determines the ECN marking for L4S for the 5G-RG (see subclause 4.17.2 of 3GPP TS 23.316 [6D]), the SMF may include the ECN marking for L4S indication IE in the PDU SESSION MODIFICATION COMMAND message.

Figure 6.3.2.2.1: Network-requested PDU session modification procedure

6.3.2.3 Network-requested PDU session modification procedure accepted by the UE

Upon receipt of the PDU SESSION MODIFICATION COMMAND message, if the UE provided a DNN during the PDU session establishment, the UE shall stop timer T3396, if it is running for the DNN provided by the UE. If the UE did not provide a DNN during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop the timer T3396 associated with no DNN if it is running. If the PDU SESSION MODIFICATION COMMAND message was received for an emergency PDU session, the UE shall not stop the timer T3396 associated with no DNN if it is running. In an SNPN, the timer T3396 to be stopped includes:

- b) the timer T3396 applied for all the equivalent SNPNs, associated with the RSNPN or an equivalent SNPN, and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- a) the timer T3396 applied for the registered SNPN, associated with the RSNPN, and, if the UE supports access to an SNPN using credentials from a credentials holder, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

Upon receipt of the PDU SESSION MODIFICATION COMMAND message, if the UE provided an S-NSSAI and a DNN during the PDU session establishment, the UE shall stop timer T3584, if it is running for the [S-NSSAI of the PDU session, DNN] combination provided by the UE. If the UE provided a DNN and did not provide an S-NSSAI during the PDU session establishment, the UE shall stop timer T3584, if it is running for the same [no S-NSSAI, DNN] combination provided by the UE. If the UE provided an S-NSSAI and did not provide a DNN during the PDU session establishment, the UE shall stop timer T3584, if it is running for the same [S-NSSAI, no DNN] combination provided by the UE. If the UE provided neither a DNN nor an S-NSSAI during the PDU session establishment, the UE shall stop timer T3584, if it is running for the same [no S-NSSAI, no DNN] combination provided by the UE. The timer T3584 to be stopped includes:

- a) in a PLMN:
 - 1) the timer T3584 applied for all the PLMNs, if running; and
 - 2) the timer T3584 applied for the registered PLMN, if running; or

b) in an SNPN:

- 1) the timer T3584 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- 2) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

Upon receipt of the PDU SESSION MODIFICATION COMMAND message, if the UE provided an S-NSSAI during the PDU session establishment, the UE shall stop timer T3585, if it is running for the S-NSSAI of the PDU session. If the UE did not provide an S-NSSAI during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop the timer T3585 associated with no S-NSSAI if it is running. The timer T3585 to be stopped includes:

a) in a PLMN:

- 1) the timer T3585 applied for all the PLMNs and for the access over which the PDU SESSION MODIFICATION COMMAND is received, if running;
- 2) the timer T3585 applied for all the PLMNs and for both 3GPP access type and non-3GPP access type, if running;
- 3) the timer T3585 applied for the registered PLMN and for the access over which the PDU SESSION MODIFICATION COMMAND is received, if running; and
- 4) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, if running; or

b) in an SNPN:

- 1) the timer T3585 applied for all the equivalent SNPNs and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
- 2) the timer T3585 applied for all the equivalent SNPNs and for both 3GPP access type and non-3GPP access type, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
- 3) the timer T3585 applied for the registered SNPN and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- 4) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

If the PDU SESSION MODIFICATION COMMAND message was received for an emergency PDU session, the UE shall not stop the timer T3585 associated with no S-NSSAI if it is running.

NOTE 1: Upon receipt of the PDU SESSION MODIFICATION COMMAND message for a PDU session, if the UE provided a DNN (or no DNN) and an S-NSSAI (or no S-NSSAI) when the PDU session is established, timer T3396 associated with the DNN (or no DNN, if no DNN was provided by the UE) is running, and timer T3584 associated with the DNN (or no DNN, if no DNN was provided by the UE) and the S-NSSAI of the PDU session (or no S-NSSAI, if no S-NSSAI was provided by the UE) is running, then the UE stops both the timer T3396 and the timer T3584.

NOTE 2: Upon receipt of the PDU SESSION MODIFICATION COMMAND message for a PDU session, if the UE provided a DNN (or no DNN) and an S-NSSAI (or no S-NSSAI) when the PDU session is established, timer T3585 associated with the S-NSSAI of the PDU session (or no S-NSSAI, if no S-NSSAI was provided by the UE) is running, and timer T3584 associated with the DNN (or no DNN, if no DNN was provided by the UE) and the S-NSSAI of the PDU session (or no S-NSSAI, if no S-NSSAI was provided by the UE) is running, then the UE stops both the timer T3585 and the timer T3584.

If the PDU SESSION MODIFICATION COMMAND message includes the Authorized QoS rules IE, the UE shall process the QoS rules sequentially starting with the first QoS rule.

If the PDU SESSION MODIFICATION COMMAND message includes the Authorized QoS rules IE with the Rule operation code is set to "Delete existing QoS rule" for one or more QoS rules, the UE shall delete the protocol descriptions associated with the QoS rules, if any.

If the PDU SESSION MODIFICATION COMMAND message includes the Authorized QoS rules IE with the Rule operation code set to "Delete existing QoS rule" for one or more QoS rules, the 5G-RG shall delete the ECN marking for L4S indication associated with the QoS rules, if any.

If the PDU SESSION MODIFICATION COMMAND message includes the Mapped EPS bearer contexts IE, the UE shall process the mapped EPS bearer contexts sequentially starting with the first mapped EPS bearer context.

If the PDU SESSION MODIFICATION COMMAND message includes the Authorized QoS flow descriptions IE, the UE shall process the QoS flow descriptions sequentially starting with the first QoS flow description. If the PDU session has the association between the QoS flow and the mapped EPS bearer context, and the PDU SESSION MODIFICATION COMMAND message includes the authorized QoS flow descriptions IE with the authorized QoS flow descriptions but without the EPS bearer identity parameter associated with the QoS flow, the UE shall consider that the association between the QoS flow and the mapped EPS bearer context has not been changed.

The UE shall replace the stored authorized QoS rules, authorized QoS flow descriptions and session-AMBR of the PDU session with the received value(s), if any, in the PDU SESSION MODIFICATION COMMAND message.

If the PDU SESSION MODIFICATION COMMAND message includes a Mapped EPS bearer contexts IE, the UE shall check each mapped EPS bearer context for different types of errors as follows:

NOTE 3: An error detected in a mapped EPS bearer context does not cause the UE to discard the Authorized QoS rules IE and Authorized QoS flow descriptions IE included in the PDU SESSION MODIFICATION COMMAND message, if any.

a) Semantic error in the mapped EPS bearer operation:

- 1) operation code = "Create new EPS bearer" and there is already an existing mapped EPS bearer context with the same EPS bearer identity associated with any PDU session.
- 2) operation code = "Delete existing EPS bearer" and there is no existing mapped EPS bearer context with the same EPS bearer identity associated with the PDU session that is being modified.
- 3) operation code = "Modify existing EPS bearer" and there is no existing mapped EPS bearer context with the same EPS bearer identity associated with the PDU session that is being modified.
- 4) operation code = "Create new EPS bearer" or "Modify existing EPS bearer" and the resulting mapped EPS bearer context has invalid mandatory parameters or missing mandatory parameters (e.g., mapped EPS QoS parameters or traffic flow template for a dedicated EPS bearer context).

In case 1, if the existing mapped EPS bearer context is associated with the PDU session that is being modified, the UE shall not diagnose an error, further process the create request and, if it was process successfully, delete the old EPS bearer context.

In case 2, the UE shall not diagnose an error, further process the delete request and, if it was processed successfully, consider the mapped EPS bearer context as successfully deleted.

Otherwise, after sending the PDU SESSION MODIFICATION COMPLETE for the ongoing PDU session modification procedure, the UE shall initiate a PDU session modification procedure by sending a PDU SESSION MODIFICATION REQUEST message to delete the mapped EPS bearer context with 5GSM cause #85 "Invalid mapped EPS bearer identity".

b) if the mapped EPS bearer context includes a traffic flow template, the UE shall check the traffic flow template for different types of TFT IE errors as follows:

1) Semantic errors in TFT operations:

- i) TFT operation = "Create new TFT" when there is already an existing TFT for the EPS bearer context.
- ii) When the TFT operation is an operation other than "Create new TFT" and there is no TFT for the EPS bearer context.
- iii) TFT operation = "Delete packet filters from existing TFT" when it would render the TFT empty.
- iv) TFT operation = "Delete existing TFT" for a dedicated EPS bearer context.

In case iv, after sending the PDU SESSION MODIFICATION COMPLETE for the ongoing PDU session modification procedure, the UE shall initiate a PDU session modification procedure by sending a PDU SESSION MODIFICATION REQUEST message to delete the mapped EPS bearer context with 5GSM cause #41 "semantic error in the TFT operation".

In the other cases the UE shall not diagnose an error and perform the following actions to resolve the inconsistency:

In case i, the UE shall further process the new activation request to create a new TFT and, if it was processed successfully, delete the old TFT.

In case ii, the UE shall:

- process the new request and if the TFT operation is "Delete existing TFT" or "Delete packet filters from existing TFT", and if no error according to items 2, 3, and 4 was detected, consider the TFT as successfully deleted;
- process the new request as an activation request, if the TFT operation is "Add packet filters to existing TFT" or "Replace packet filters in existing TFT".

In case iii, if the packet filters belong to a dedicated EPS bearer context, the UE shall process the new deletion request and, if no error according to items 2, 3, and 4 was detected, after sending the PDU SESSION MODIFICATION COMPLETE for the ongoing PDU session modification procedure, the UE shall initiate a PDU session modification procedure by sending a PDU SESSION MODIFICATION REQUEST message to delete the mapped EPS bearer context with 5GSM cause #41 "semantic error in the TFT operation".

In case iii, if the packet filters belong to the default EPS bearer context, the UE shall process the new deletion request and if no error according to items 2, 3, and 4 was detected then delete the existing TFT, this corresponds to using match-all packet filter for the default EPS bearer context.

2) Syntactical errors in TFT operations:

- i) When the TFT operation = "Create new TFT", "Add packet filters to existing TFT", "Replace packet filters in existing TFT" or "Delete packet filters from existing TFT" and the packet filter list in the TFT IE is empty.
- ii) TFT operation = "Delete existing TFT" or "No TFT operation" with a non-empty packet filter list in the TFT IE.
- iii) TFT operation = "Replace packet filters in existing TFT" when the packet filter to be replaced does not exist in the original TFT.
- iv) TFT operation = "Delete packet filters from existing TFT" when the packet filter to be deleted does not exist in the original TFT.
- v) Void.
- vi) When there are other types of syntactical errors in the coding of the TFT IE, such as a mismatch between the number of packet filters subfield, and the number of packet filters in the packet filter list.

In case iii, the UE shall not diagnose an error, further process the replace request and, if no error according to items 3 and 4 was detected, include the packet filters received to the existing TFT.

In case iv, the UE shall not diagnose an error, further process the deletion request and, if no error according to items 3 and 4 was detected, consider the respective packet filter as successfully deleted.

Otherwise, after sending the PDU SESSION MODIFICATION COMPLETE for the ongoing PDU session modification procedure, the UE shall initiate a PDU session modification procedure by sending a PDU SESSION MODIFICATION REQUEST message to delete the mapped EPS bearer context with 5GSM cause #42 "syntactical error in the TFT operation".

NOTE 3a: An implementation that strictly follows packet filter list as defined in subclause 10.5.6.12 in 3GPP TS 24.008 [12] might not detect case 2) ii).

3) Semantic errors in packet filters:

- i) When a packet filter consists of conflicting packet filter components which would render the packet filter ineffective, i.e. no IP packet will ever fit this packet filter. How the UE determines a semantic error in a packet filter is outside the scope of the present document.
- ii) When the resulting TFT, which is assigned to a dedicated EPS bearer context, does not contain any packet filter applicable for the uplink direction among the packet filters created on request from the network.

After sending the PDU SESSION MODIFICATION COMPLETE for the ongoing PDU session modification procedure, the UE shall initiate a PDU session modification procedure by sending a PDU SESSION MODIFICATION REQUEST message to delete the mapped EPS bearer context with 5GSM cause #44 "semantic errors in packet filter(s)".

4) Syntactical errors in packet filters:

- i) When the TFT operation = "Create new TFT", "Add packet filters to existing TFT", or "Replace packet filters in existing TFT" and two or more packet filters in the resultant TFT would have identical packet filter identifiers.
- ii) When the TFT operation = "Create new TFT", "Add packet filters to existing TFT" or "Replace packet filters in existing TFT", and two or more packet filters among all TFTs associated with this PDN connection would have identical packet filter precedence values.
- iii) When there are other types of syntactical errors in the coding of packet filters, such as the use of a reserved value for a packet filter component identifier.

In case i, if two or more packet filters with identical packet filter identifiers are contained in the new request, after sending the PDU SESSION MODIFICATION COMPLETE for the ongoing PDU session modification procedure, the UE shall initiate a PDU session modification procedure by sending a PDU SESSION MODIFICATION REQUEST message to delete the mapped EPS bearer context with 5GSM cause #45 "syntactical error in packet filter(s)". Otherwise, the UE shall not diagnose an error, further process the new request and, if it was processed successfully, delete the old packet filters which have the identical packet filter identifiers.

In case ii, if the old packet filters do not belong to the default EPS bearer context, the UE shall not diagnose an error, shall further process the new request and, if it was processed successfully, shall delete the old packet filters which have identical filter precedence values.

In case ii, if one or more old packet filters belong to the default EPS bearer context, after sending the PDU SESSION MODIFICATION COMPLETE for the ongoing PDU session modification procedure, the UE shall initiate a PDU session modification procedure by sending a PDU SESSION MODIFICATION REQUEST message to delete the mapped EPS bearer context with 5GSM cause #45 "syntactical errors in packet filter(s)".

Otherwise, after sending the PDU SESSION MODIFICATION COMPLETE for the ongoing PDU session modification procedure, the UE shall initiate a PDU session modification procedure by sending a PDU SESSION MODIFICATION REQUEST message to delete the mapped EPS bearer context with 5GSM cause #45 "syntactical error in packet filter(s)".

And if a new EPS bearer identity parameter in Authorized QoS flow descriptions IE is received for a QoS flow which can be transferred to EPS, the UE shall update the association between the QoS flow and the mapped EPS bearer context, based on the new EPS bearer identity and the mapped EPS bearer contexts. If the "Delete existing EPS bearer"

operation code in the Mapped EPS bearer contexts IE was received, the UE shall discard the association between the QoS flow and the corresponding mapped EPS bearer context and delete the corresponding mapped EPS bearer context.

If:

- a) the UE detects different errors in the mapped EPS bearer contexts as described above which requires sending a PDU SESSION MODIFICATION REQUEST message to delete the erroneous mapped EPS bearer contexts; and
- b) optionally, if the UE detects errors in QoS rules that require to delete at least one QoS rule as described in subclause 6.3.2.4 which requires sending a PDU SESSION MODIFICATION REQUEST message to delete the erroneous QoS rules;

the UE, after sending the PDU SESSION MODIFICATION COMPLETE message for the ongoing PDU session modification procedure, may send a single PDU SESSION MODIFICATION REQUEST message to delete the erroneous mapped EPS bearer contexts, and optionally to delete the erroneous QoS rules. The UE shall include a 5GSM cause IE in the PDU SESSION MODIFICATION REQUEST message.

NOTE 4: The 5GSM cause to use cannot be different from #41 "semantic error in the TFT operation", #42 "syntactical error in the TFT operation", #44 "semantic error in packet filter(s)", #45 "syntactical errors in packet filter(s)", #83 "semantic error in the QoS operation", #84 "syntactical error in the QoS operation", or #85 "Invalid mapped EPS bearer identity". The selection of a 5GSM cause is up to UE implementation.

Upon receipt of a PDU SESSION MODIFICATION COMMAND message and a PDU session ID, using the NAS transport procedure as specified in subclause 5.4.5, if the UE accepts the PDU SESSION MODIFICATION COMMAND message, the UE considers the PDU session as modified and the UE shall create a PDU SESSION MODIFICATION COMPLETE message.

If the PDU SESSION MODIFICATION COMMAND message contains the PTI value allocated in the UE-requested PDU session modification procedure, the UE shall stop the timer T3581. The UE should ensure that the PTI value assigned to this procedure is not released immediately.

NOTE 5: The way to achieve this is implementation dependent. For example, the UE can ensure that the PTI value assigned to this procedure is not released during the time equal to or greater than the default value of timer T3591.

While the PTI value is not released, the UE regards any received PDU SESSION MODIFICATION COMMAND message with the same PTI value as a network retransmission (see subclause 7.3.1).

If the selected SSC mode of the PDU session is "SSC mode 3" and the PDU SESSION MODIFICATION COMMAND message includes 5GSM cause #39 "reactivation requested", the UE can provide to the upper layers the PDU session address lifetime if received in the PDU session address lifetime parameter of the Extended protocol configuration options IE of the PDU SESSION MODIFICATION COMMAND message. After the completion of the network-requested PDU session modification procedure:

- a) if the PDU session is an MA PDU session:
 - 1) established over both 3GPP access and non-3GPP access, and:
 - the UE is registered over both 3GPP access and non-3GPP access in the same PLMN:
 - the UE should re-initiate a UE-requested PDU session establishment procedure as specified in subclause 6.4.1 over the access the PDU SESSION MODIFICATION COMMAND message is received; or
 - the UE is registered over both 3GPP access and non-3GPP access in different PLMNs:
 - the UE should re-initiate UE-requested PDU session establishment procedures as specified in subclause 6.4.1 over both accesses. The UE should re-initiate the UE-requested PDU session establishment procedure over the access the PDU SESSION MODIFICATION COMMAND message is received first; or
 - 2) established over only single access:
 - the UE should re-initiate a UE-requested PDU session establishment procedure as specified in subclause 6.4.1 over the access the user plane resources were established; or

b) if the PDU session is a single access PDU session:

- the UE should re-initiate a UE-requested PDU session establishment procedure as specified in subclause 6.4.1 over the access the PDU session was associated with; and

for the re-initiated UE-requested PDU session establishment procedure(s) the UE should set a new PDU session ID different from the PDU session ID associated with the present PDU session and should set:

- a) the PDU session type to the PDU session type associated with the present PDU session;
- b) the SSC mode to the SSC mode associated with the present PDU session;
- c) the DNN to the DNN associated with the present PDU session;
- d) the S-NSSAI as follows:
 - 1) if the Alternative S-NSSAI IE was not included in the PDU SESSION MODIFICATION COMMAND message, the UE shall set the S-NSSAI to the S-NSSAI associated with (if provided by the network) a mapped S-NSSAI if provided in the UE-requested PDU session establishment procedure of the present PDU session; and
 - 2) if the Alternative S-NSSAI IE was included in the PDU SESSION MODIFICATION COMMAND message, the UE proceeds as follows:
 - i) if the Alternative S-NSSAI IE includes alternative S-NSSAI, the UE shall set the S-NSSAI to the S-NSSAI received in the PDU SESSION ESTABLISHMENT ACCEPT message of the existing PDU session; and
 - ii) if the Alternative S-NSSAI IE includes replaced S-NSSAI, the UE shall set the S-NSSAI to the replaced S-NSSAI associated with (if provided by the network) a mapped S-NSSAI; and
- e) the alternative S-NSSAI to the S-NSSAI associated with (if provided by the network) a mapped S-NSSAI if received in the Alternative S-NSSAI IE of the PDU SESSION MODIFICATION COMMAND message.

If the UE has indicated support for CIoT 5GS optimizations and receives a small data rate control parameters container in the Extended protocol configuration options IE in the PDU SESSION MODIFICATION COMMAND message, the UE shall store the small data rate control parameters value and use the stored small data rate control parameters value as the maximum allowed limit of uplink user data for the PDU session in accordance with 3GPP TS 23.501 [8]. If the UE has a previously stored small data rate control parameter value for the PDU session, the UE shall replace the stored small data rate control parameters value for the PDU session with the received small data rate control parameters value in the Extended protocol configuration options IE in the PDU SESSION MODIFICATION COMMAND message.

If the UE has indicated support for CIoT 5GS optimizations and receives an additional small data rate control parameters for exception data container in the Extended protocol configuration options IE in the PDU SESSION MODIFICATION COMMAND message, the UE shall store the additional small data rate control parameters for exception data value and use the stored additional small data rate control parameters for exception data value as the maximum allowed limit of uplink exception data for the PDU session in accordance with 3GPP TS 23.501 [8]. If the UE has a previously stored additional small data rate control parameters for exception data value for the PDU session, the UE shall replace the stored additional small data rate control parameters for exception data value for the PDU session with the received additional small data rate control parameters for exception data value in the Extended protocol configuration options IE in the PDU SESSION MODIFICATION COMMAND message.

The UE shall include the PDU session ID of the old PDU session which is about to get released in the old PDU session ID IE of the UL NAS TRANSPORT message that transports the PDU SESSION ESTABLISHMENT REQUEST message.

NOTE 6: The UE is expected to maintain the PDU session for which the PDU SESSION MODIFICATION COMMAND message including 5GSM cause #39 "reactivation requested" is received during the time indicated by the PDU session address lifetime value or until receiving an indication from upper layers (e.g. that the old PDU session is no more needed).

If the selected PDU session type of the PDU session is "Unstructured", the UE supports inter-system change from N1 mode to S1 mode, the UE does not support establishment of a PDN connection for the PDN type set to "non-IP" in S1 mode, and the parameters list field of one or more authorized QoS flow descriptions received in the Authorized QoS flow descriptions IE of the PDU SESSION MODIFICATION COMMAND message contains an EPS bearer identity

(EBI), then the UE shall locally remove the EPS bearer identity (EBI) from the parameters list field of such one or more authorized QoS flow descriptions. After sending the PDU SESSION MODIFICATION COMPLETE message for the ongoing PDU session modification procedure, the UE shall initiate a PDU session modification procedure by sending a PDU SESSION MODIFICATION REQUEST message to delete the mapped EPS bearer context with 5GSM cause #85 "Invalid mapped EPS bearer identity".

If the selected PDU session type of the PDU session is "Ethernet", the UE supports inter-system change from N1 mode to S1 mode, the UE does not support establishment of a PDN connection for the PDN type set to "non-IP" in S1 mode, the UE, the network or both of them do not support Ethernet PDN type in S1 mode, and the parameters list field of one or more authorized QoS flow descriptions received in the Authorized QoS flow descriptions IE of the PDU SESSION MODIFICATION COMMAND message contains an EPS bearer identity (EBI), the UE shall locally remove the EPS bearer identity (EBI) from the parameters list field of such one or more authorized QoS flow descriptions. After sending the PDU SESSION MODIFICATION COMPLETE message for the ongoing PDU session modification procedure, the UE shall initiate a PDU session modification procedure by sending a PDU SESSION MODIFICATION REQUEST message to delete the mapped EPS bearer context with 5GSM cause #85 "Invalid mapped EPS bearer identity".

For a UE which is registered for disaster roaming services and for a PDU session which is not a PDU session for emergency services:

- a) if the parameters list field of one or more authorized QoS flow descriptions received in the Authorized QoS flow descriptions IE of the PDU SESSION MODIFICATION COMMAND message contains an EPS bearer identity (EBI), then the UE shall locally remove the EPS bearer identity (EBI) from the parameters list field of such one or more authorized QoS flow descriptions; and
- b) the UE shall locally delete the contents of the Mapped EPS bearer contexts IE if it is received in the PDU SESSION MODIFICATION COMMAND message.

If the Always-on PDU session indication IE is included in the PDU SESSION MODIFICATION COMMAND message and:

- a) the value of the IE is set to "Always-on PDU session required", the UE shall consider the established PDU session as an always-on PDU session; or
- b) the value of the IE is set to "Always-on PDU session not allowed", the UE shall not consider the established PDU session as an always-on PDU session.

If the UE does not receive the Always-on PDU session indication IE in the PDU SESSION MODIFICATION COMMAND message:

- a) if the network-requested PDU session modification procedure is triggered by a UE-requested PDU session modification procedure upon an inter-system change from S1 mode to N1 mode for a PDN connection established when in S1 mode, the UE shall not consider the modified PDU session as an always-on PDU session; or
- b) otherwise:
 - 1) if the UE has received the Always-on PDU session indication IE with the value set to "Always-on PDU session required" for this PDU session, the UE shall consider the PDU session as an always-on PDU session; or
 - 2) otherwise the UE shall not consider the PDU session as an always-on PDU session.

If the PDU SESSION MODIFICATION COMMAND message contains a Port management information container IE, the UE shall forward the contents of the Port management information container IE to the DS-TT (see 3GPP TS 23.501 [8] and 3GPP TS 23.502 [9]).

If the UE receives a Serving PLMN rate control IE in the PDU SESSION MODIFICATION COMMAND message, the UE shall store the Serving PLMN rate control IE value, replacing any existing value, and use the stored serving PLMN rate control value as the maximum allowed limit of uplink control plane user data for the corresponding PDU session in accordance with 3GPP TS 23.501 [8].

If the PDU SESSION MODIFICATION COMMAND message includes the Received MBS container IE, for each of the Received MBS informations:

- a) if MBS decision is set to "MBS join is accepted", the UE shall consider that it has successfully joined the multicast MBS session. The UE shall store the received TMGI and shall use it for any further operation on that multicast MBS session. The UE shall store the received MBS service area associated with the received TMGI, if any, and provide the received TMGI to lower layers. The UE may provide the MBS start time if it is included in the Received MBS information to upper layers;
- b) if MBS decision is set to "MBS join is rejected", the UE shall consider the requested join as rejected. The UE shall store the received MBS service area associated with the received TMGI, if any. If the received Rejection cause is set to "User is outside of local MBS service area", the UE shall not request to join the same multicast MBS session if neither current TAI nor CGI of the current cell is part of the received MBS service area. If the received Rejection cause is set to "multicast MBS session has not started or will not start soon" and an MBS back-off timer value is included with value that indicates neither zero nor deactivated, the UE shall start a back-off timer T3587 with the value provided in the MBS back-off timer value for the received TMGI, and shall not attempt to join the multicast MBS session with the same TMGI, the Source IP address information of the TMGI, or the Destination IP address information of the TMGI until the expiry of T3587. If the MBS back-off timer value indicates that this timer is deactivated, the UE shall not attempt to join the multicast MBS session with the same TMGI until the UE is switched off, the USIM is removed, or the entry in the "list of subscriber data" for the current SNPN is updated. If the MBS back-off timer value indicates zero, the UE may attempt to join the MBS session with the same TMGI;
- c) if the MBS decision is set to "Remove UE from multicast MBS session", the UE shall consider that it has successfully left the multicast MBS session, and if the received Rejection cause is set to "multicast MBS session is released", the UE shall consider the multicast MBS session as released. Then the UE shall indicate to lower layers to delete the stored TMGI;
- d) if the MBS decision is set to "MBS service area update", the UE shall store the received MBS service area associated with the received TMGI and replace the current MBS service area with the received one. or
- e) if the MBS decision is set to "MBS security information update", the UE shall replace the current MBS security information with the MBS security information received in the MBS security container associated with the received TMGI.

If the UE is switched off when the timer T3587 is running, the UE may behave as follows when the UE is switched on and the USIM in the UE remains the same:

let t_1 be the time remaining for T3587 timeout at switch off and let t be the time elapsed between switch off and switch on. If t_1 is greater than t , then the timer shall be restarted with the value $t_1 - t$. If t_1 is equal to or less than t , then the timer need not be restarted.

If the UE has indicated support for ECS configuration information provisioning in the SESSION ESTABLISHMENT REQUEST message or while in S1 mode, then upon receiving

- a) one or more ECS IPv4 address(es), ECS IPv6 address(es), ECS FQDN(s);
- b) one or more associated ECSP identifier(s);
- c) optionally spatial validity conditions associated with the ECS address;
- d) optionally, ECS authentication methods associated with the ECS address; and
- e) optionally, ECS supported PLMNs information list, including the associated ECSP information for which the EDN configuration information can be provided by the ECS.

in the Extended protocol configuration options IE of the PDU SESSION MODIFICATION COMMAND message, then the UE shall pass them to the upper layers.

If the UE supports receiving DNS server addresses in protocol configuration options and receives one or more DNS server IPv4 address(es), one or more DNS server IPv6 address(es) or both of them, in the Extended protocol configuration options IE of the PDU SESSION MODIFICATION COMMAND message, then the UE shall pass the received DNS server IPv4 address(es), if any, and the received DNS server IPv6 address(es), if any, to upper layers.

NOTE 7: The received DNS server address(es) replace previously provided DNS server address(es), if any.

If the UE supports the EAS rediscovery and receives:

- a) the EAS rediscovery indication without indicated impact; or
- b) the following:
 - 1) one or more EAS rediscovery indication(s) with impacted EAS IPv4 address range, if supported by the UE;
 - 2) one or more EAS rediscovery indication(s) with impacted EAS IPv6 address range, if supported by the UE;
 - 3) one or more EAS rediscovery indication(s) with impacted EAS FQDN, if supported by the UE; or
 - 4) any combination of the above;

in the Extended protocol configuration options IE of the PDU SESSION MODIFICATION COMMAND message, then the UE shall pass the EAS rediscovery indication and the received impacted EAS IPv4 address range(s), if supported and included, the received EAS IPv6 address range(s), if supported and included, and the received EAS FQDN(s), if supported and included, to upper layers.

NOTE 8: The upper layers handle the EAS rediscovery indication and the impacted EAS IPv4 address range(s), if any, the impacted EAS IPv6 address range(s), if any, and the received EAS FQDN(s), if any, according to 3GPP TS 23.548 [10A].

Upon receipt of PDU SESSION MODIFICATION COMMAND message, if the network-requested PDU session modification procedure is triggered by a UE-requested PDU session modification procedure, the Service-level-AA container IE is included, then the UE shall forward the service-level-AA contents of the Service-level-AA container IE to the upper layers.

If the UE supports EDC and receives the EDC usage allowed indicator in the Extended protocol configuration options IE of the PDU SESSION MODIFICATION COMMAND message, the UE shall indicate to upper layers that network allows the use of EDC.

If the UE supports EDC and receives the EDC usage required indicator in the Extended protocol configuration options IE of the PDU SESSION MODIFICATION COMMAND message, the UE shall indicate to upper layers that network requires the use of EDC.

NOTE 9: Handling of indication that network allows the use of EDC or that network requires the use of EDC is specified in 3GPP TS 23.548 [182].

If the Alternative S-NSSAI IE is included in the PDU SESSION MODIFICATION COMMAND message, the UE shall replace the S-NSSAI or the mapped S-NSSAI associated with the PDU session according to the Alternative S-NSSAI IE. The S-NSSAI for the established PDU session shall be the S-NSSAI to be replaced and the alternative S-NSSAI on the UE side.

If the Protocol description IE is included in the PDU SESSION MODIFICATION COMMAND message, for each existing QoS rule,

- a) for the protocol description field with the value of the length of protocol description field set to 1 for the associated QoS rule, the UE shall delete any previously stored protocol description for the QoS rule indicated by the QRI field of the protocol description field; and
- b) for the protocol description field with the value of the length of protocol description field greater than 1 for the associated QoS rule, the UE shall, store the associated protocol description if there is no stored protocol description or replace any previously stored protocol description with the new received protocol description when there is stored protocol description for the QoS rule.

The UE may use the protocol description information associated with the QoS rule(s) provided by the Protocol description IE to identify PDUs belonging to PDU sets for the uplink direction.

NOTE 10: Whether and how to use the protocol description information to identify PDU sets is up to the UE implementation.

If the ECN marking for L4S indication IE is included in the PDU SESSION MODIFICATION COMMAND message, for each existing QoS rule,

- a) for the value of the length of ECN marking for L4S indication contents set to 0, the 5G-RG shall delete any previously stored ECN marking for L4S indication for all QoS rule(s), if any; and

- b) for the value of the length of ECN marking for L4S indication contents greater than 0 for the associated QoS rule, the 5G-RG shall, store the associated ECN marking for L4S indication if the corresponding QoS rule identifier is present in the ECN marking for L4S indication entry and there is no stored ECN marking for L4S indication, or delete the previously stored ECN marking for L4S indication for the QoS rule not indicated by the QRI in the ECN marking for L4S indication entry field.

The 5G-RG may perform the ECN marking for L4S for the corresponding QoS flow based on the ECN marking for L4S indication.

NOTE 11: How to perform the ECN marking for L4S for 5G-RG is out of the scope of this specification.

The UE shall transport the PDU SESSION MODIFICATION COMPLETE message and the PDU session ID, using the NAS transport procedure as specified in subclause 5.4.5.

After sending the PDU SESSION MODIFICATION COMPLETE message, if the "Create new EPS bearer" operation code in the Mapped EPS bearer contexts IE was received in the PDU SESSION MODIFICATION COMMAND message and there is neither a corresponding Authorized QoS flow descriptions IE in the PDU SESSION MODIFICATION COMMAND message nor an existing QoS flow description corresponding to the EPS bearer identity included in the mapped EPS bearer context, the UE shall send a PDU SESSION MODIFICATION REQUEST message including a Mapped EPS bearer contexts IE to delete the mapped EPS bearer context.

After sending the PDU SESSION MODIFICATION COMPLETE message, if for the PDU session being modified, there are mapped EPS bearer context(s) but none of them is associated with the default QoS rule, the UE shall locally delete the mapped EPS bearer context(s) and shall locally delete the stored EPS bearer identity (EBI) in all the QoS flow descriptions of the PDU session, if any.

If a port management information container needs to be delivered (see 3GPP TS 23.501 [8] and 3GPP TS 23.502 [9]), the UE shall include a Port management information container IE in the PDU SESSION MODIFICATION COMPLETE message.

Upon receipt of a PDU SESSION MODIFICATION COMPLETE message, the SMF shall stop timer T3591 and shall consider the PDU session as modified. If the selected SSC mode of the PDU session is "SSC mode 3" and the PDU SESSION MODIFICATION COMMAND message included 5GSM cause #39 "reactivation requested", the SMF shall start timer T3593. If the PDU Session Address Lifetime value is sent to the UE in the PDU SESSION MODIFICATION COMMAND message then timer T3593 shall be started with the same value, otherwise it shall use a default value. If the PDU SESSION MODIFICATION COMPLETE message contains a Port management information container IE, the SMF shall handle the contents of the Port management information container IE as specified in 3GPP TS 23.501 [8] and 3GPP TS 23.502 [9].

6.3.2.4 Network-requested PDU session modification procedure not accepted by the UE

Upon receipt of a PDU SESSION MODIFICATION COMMAND message and a PDU session ID, using the NAS transport procedure as specified in subclause 5.4.5, if the UE rejects the PDU SESSION MODIFICATION COMMAND message, the UE shall create a PDU SESSION MODIFICATION COMMAND REJECT message.

If the PDU SESSION MODIFICATION COMMAND message contains the PTI value allocated in the UE-requested PDU session modification procedure, the UE shall stop the timer T3581. The UE should ensure that the PTI value assigned to this procedure is not released immediately.

NOTE 1: The way to achieve this is implementation dependent. For example, the UE can ensure that the PTI value assigned to this procedure is not released during the time equal to or greater than the default value of timer T3591.

While the PTI value is not released, the UE regards any received PDU SESSION MODIFICATION COMMAND message with the same PTI value as a network retransmission (see subclause 7.3.1).

The UE shall set the 5GSM cause IE of the PDU SESSION MODIFICATION COMMAND REJECT message to indicate the reason for rejecting the PDU session modification.

The 5GSM cause IE typically indicates one of the following 5GSM cause values:

- #26 insufficient resources;

- #44 semantic error in packet filter(s);
- #45 syntactical error in packet filter(s);
- #83 semantic error in the QoS operation; or
- #84 syntactical error in the QoS operation.

If the selected SSC mode of the PDU session is "SSC mode 3" and the PDU SESSION MODIFICATION COMMAND messages includes 5GSM cause #39 "reactivation requested", while the UE does not have sufficient resources for initiating the PDU session establishment procedure as specified in subclause 6.4.1 then the UE shall set cause IE to #26 "insufficient resources".

If the PDU SESSION MODIFICATION COMMAND message includes a request to add a new authorized QoS rule, or a request to modify the authorized QoS rules, or both, and the UE decides to reject the request due to e.g. the supported number of authorized QoS rules or number of packet filters associated with a PDU session having reached the maximum number, then the UE shall set the 5GSM cause IE to #26 "insufficient resources".

NOTE 2: The maximum number of supported authorized QoS rules or packet filters associated with a PDU session is implementation specific.

If the PDU SESSION MODIFICATION COMMAND message includes a request to add a new authorized QoS flow description, or a request to modify the authorized QoS flow descriptions, or both and the UE decides to reject the request due to e.g. the supported number of authorized QoS flow descriptions, then the UE shall set the 5GSM cause IE to #26 "insufficient resources".

NOTE 3: The maximum number of supported authorized QoS flow descriptions associated with a PDU session is implementation specific.

If the PDU SESSION MODIFICATION COMMAND message includes the Authorized QoS rules IE, the UE shall process the QoS rules sequentially starting with the first QoS rule. The UE shall check the QoS rule and the QoS flow description provided in the PDU SESSION MODIFICATION COMMAND message for different types of errors as follows:

NOTE 4: If an error is detected in a QoS rule or a QoS flow description which requires rejecting the PDU SESSION MODIFICATION COMMAND message, then the Authorized QoS rules IE, the Authorized QoS flow descriptions IE, the Mapped EPS bearer contexts IE and any other IE (RQ timer value IE, Always-on PDU session indication IE, etc) included in the PDU SESSION MODIFICATION COMMAND message are discarded, if any.

a) Semantic errors in QoS operations:

- 1) When the rule operation is "Modify existing QoS rule and add packet filters", "Modify existing QoS rule and replace all packet filters", "Modify existing QoS rule and delete packet filters" or "Modify existing QoS rule without modifying packet filters" on the default QoS rule and the DQR bit is set to "the QoS rule is not the default QoS rule".
- 2) When the rule operation is "Modify existing QoS rule and add packet filters", "Modify existing QoS rule and replace all packet filters", "Modify existing QoS rule and delete packet filters" or "Modify existing QoS rule without modifying packet filters" on a QoS rule which is not the default QoS rule and the DQR bit is set to "the QoS rule is the default QoS rule".
- 3) When the rule operation is "Create new QoS rule" and the DQR bit is set to "the QoS rule is the default QoS rule" when there's already a default QoS rule with different QoS rule identifier.
- 4) When the rule operation is "Delete existing QoS rule" on the default QoS rule.
- 5) When the rule operation is "Create new QoS rule", "Modify existing QoS rule and add packet filters", "Modify existing QoS rule and replace all packet filters", "Modify existing QoS rule and delete packet filters", or "Modify existing QoS rule without modifying packet filters" and two or more QoS rules associated with this PDU session would have identical precedence values, and the UE is not in NB-N1 mode.
- 6) When the rule operation is "Modify existing QoS rule and delete packet filters", the QoS rule is a QoS rule of a PDU session of IPv4, IPv6, IPv4v6 or Ethernet PDU session type, and the packet filter list in the resultant QoS rule is empty.

- 7) When the rule operation is "Create new QoS rule", there is already an existing QoS rule with the same QoS rule identifier and the UE is not in NB-N1 mode.
- 8) When the rule operation is "Modify existing QoS rule and add packet filters", "Modify existing QoS rule and replace all packet filters", "Modify existing QoS rule and delete packet filters" or "Modify existing QoS rule without modifying packet filters", the associated QoS rule does not exist and the UE is not in NB-N1 mode.
- 9) When the rule operation is different than "Delete existing QoS rule", the DQR bit of the QoS rule is set to "the QoS rule is not the default QoS rule" and the UE is in NB-N1 mode.
- 10) When the rule operation is "Create new QoS rule", the DQR bit is set to "the QoS rule is not the default QoS rule", and the PDU session type of the PDU session is "Unstructured".
- 11) When the rule operation is "Delete existing QoS rule" and there is no existing QoS rule with the same QoS rule identifier.
- 12) When the flow description operation is "Create new QoS flow description", there is already an existing QoS flow description with the same QoS flow identifier and the UE is not in NB-N1 mode.
- 13) When the flow description operation is "Modify existing QoS flow description", the associated QoS flow description does not exist and the UE is not in NB-N1 mode.
- 14) When the flow description operation is "Delete existing QoS flow description" and there is no existing QoS flow description with the same QoS flow identifier.
- 15) When the flow description operation is different than "Delete existing QoS flow description", the QFI is not the same as the QFI of the default QoS rule and the UE is in NB-N1 mode.
- 16) When the flow description operation is "Create new QoS flow description" or "Modify existing QoS flow description", the QFI associated with the QoS flow description is not the same as the QFI of the default QoS rule, and the PDU session type of the PDU session is "Unstructured".
- 17) When the rule operation is "Modify existing QoS rule and add packet filters", the "packet filter list" field contains a match-all packet filter, the resultant QoS rule is the default QoS rule and there is already an existing match-all packet filter associated with the default QoS rule.
- 18) When the rule operation is "Create new QoS rule" and the DQR bit is set to "the QoS rule is not the default QoS rule", or the rule operation is "Modify existing QoS rule and add packet filters" on a QoS rule which is not the default QoS rule or "Modify existing QoS rule and replace all packet filters" on a QoS rule which is not the default QoS rule, and one match-all packet filter is to be associated with the resultant QoS rule.

In case 4, the UE shall initiate a PDU session release procedure by sending a PDU SESSION RELEASE REQUEST message with 5GSM cause #83 "semantic error in the QoS operation".

In case 5, if the old QoS rule (i.e. the QoS rule that existed before the PDU SESSION MODIFICATION COMMAND message was received) is not the default QoS rule, the UE shall not diagnose an error, shall further process the new request and, if it was processed successfully, shall delete the old QoS rule which has identical precedence value. Furthermore, after sending the PDU SESSION MODIFICATION COMPLETE for the ongoing PDU session modification procedure, the UE shall send a PDU SESSION MODIFICATION REQUEST message with 5GSM cause #83 "semantic error in the QoS operation" to delete the QoS rule.

In case 5, if the old QoS rule (i.e. the QoS rule that existed before the PDU SESSION MODIFICATION COMMAND message was received) is the default QoS rule, the UE shall initiate a PDU session release procedure by sending a PDU SESSION RELEASE REQUEST message with 5GSM cause #83 "semantic error in the QoS operation".

In case 6, if the QoS rule is not the default QoS rule, after sending the PDU SESSION MODIFICATION COMPLETE for the ongoing PDU session modification procedure, the UE shall send a PDU SESSION MODIFICATION REQUEST message with 5GSM cause #83 "semantic error in the QoS operation" to delete the QoS rule.

In case 6, if the QoS rule is the default QoS rule, the UE shall initiate a PDU session release procedure by sending a PDU SESSION RELEASE REQUEST message with 5GSM cause #83 "semantic error in the QoS operation".

In case 7, if the existing QoS rule is not the default QoS rule and the DQR bit of the new QoS rule is set to "the QoS rule is not the default QoS rule", the UE shall not diagnose an error, further process the create request and, if it was processed successfully, delete the old QoS rule (i.e. the QoS rule that existed when case 7 was detected). If the existing QoS rule is the default QoS rule or the DQR bit of the new QoS rule is set to "the QoS rule is the default QoS rule", the UE shall reject the PDU SESSION MODIFICATION COMMAND message with 5GSM cause #83 "semantic error in the QoS operation".

In case 9 or case 10, after sending the PDU SESSION MODIFICATION COMPLETE for the ongoing PDU session modification procedure, the UE shall send a PDU SESSION MODIFICATION REQUEST message with 5GSM cause #83 "semantic error in the QoS operation" to delete the QoS rule.

In case 11, the UE shall not diagnose an error, further process the delete request and, if it was processed successfully, consider the respective QoS rule as successfully deleted.

In case 12, the UE shall not diagnose an error, further process the create request and, if it was processed successfully, delete the old QoS flow description (i.e. the QoS flow description that existed when case 12 was detected).

In case 14, the UE shall not diagnose an error, further process the delete request and, if it was processed successfully, consider the respective QoS flow description as successfully deleted.

In case 15 or case 16, after sending the PDU SESSION MODIFICATION COMPLETE for the ongoing PDU session modification procedure, the UE shall send a PDU SESSION MODIFICATION REQUEST message with 5GSM cause #83 "semantic error in the QoS operation" to delete the QoS flow description.

Otherwise, the UE shall reject the PDU SESSION MODIFICATION COMMAND message with 5GSM cause #83 "semantic error in the QoS operation".

b) Syntactical errors in QoS operations:

- 1) When the rule operation is "Create new QoS rule", "Modify existing QoS rule and add packet filters", "Modify existing QoS rule and replace all packet filters" or "Modify existing QoS rule and delete packet filters", the PDU session type of the PDU session is IPv4, IPv6, IPv4v6 or Ethernet PDU session type, and the packet filter list in the QoS rule is empty.
- 2) When the rule operation is "Delete existing QoS rule" or "Modify existing QoS rule without modifying packet filters" with a non-empty packet filter list in the QoS rule.
- 3) When the rule operation is "Modify existing QoS rule and delete packet filters" and the packet filter to be deleted does not exist in the original QoS rule.
- 4) Void.
- 5) When there are other types of syntactical errors in the coding of the Authorized QoS rules IE or the Authorized QoS flow descriptions IE, such as: a mismatch between the number of packet filters subfield and the number of packet filters in the packet filter list when the rule operation is "delete existing QoS rule" or "create new QoS rule", or the number of packet filters subfield is larger than the maximum possible number of packet filters in the packet filter list (i.e., there is no QoS rule precedence subfield included in the QoS rule IE), the QoS Rule Identifier is set to "no QoS rule identifier assigned" when the rule operation is not "delete existing QoS rule", or the QoS flow identifier is set to "no QoS flow identifier assigned" when the flow description operation is not "Delete existing QoS flow description".
- 6) When the rule operation is "Modify existing QoS rule and add packet filters" or "Modify existing QoS rule and replace all packet filters", the DQR bit is set to "the QoS rule is the default QoS rule", the PDU session type of the PDU session is "Unstructured", and the packet filter list in the QoS rule is not empty.
- 7) When, the
 - A) rule operation is "Create new QoS rule", "Modify existing QoS rule and add packet filters", "Modify existing QoS rule and replace all packet filters", "Modify existing QoS rule and delete packet filters" or "Modify existing QoS rule without modifying packet filters", there is no QoS flow description with a QFI corresponding to the QFI of the resulting QoS rule and the UE determines, by using the QoS rule's QFI as the 5QI, that there is a resulting QoS rule for a GBR QoS flow (as described in 3GPP TS 23.501 [8] table 5.7.4-1).

B) flow description operation is "Delete existing QoS flow description", and the UE determines, by using the QoS rule's QFI as the 5QI, that there is a resulting QoS rule for a GBR QoS flow (as described in 3GPP TS 23.501 [8] table 5.7.4-1) with a QFI corresponding to the QFI of the QoS flow description that is deleted (i.e. there is no associated QoS flow description with the same QFI).

- 8) When the flow description operation is "Create new QoS flow description" or "Modify existing QoS flow description", and the UE determines that there is a QoS flow description of a GBR QoS flow (as described in 3GPP TS 23.501 [8] table 5.7.4-1) which lacks at least one of the mandatory parameters (i.e., GFBR uplink, GFBR downlink, MFBR uplink and MFBR downlink). If the QoS flow description does not include a 5QI, the UE determines this by using the QFI as the 5QI,

In case 3 the UE shall not diagnose an error, further process the deletion request and, if no error according to items c and d was detected, consider the respective packet filter as successfully deleted.

In case 6, after completion of the PDU session modification procedure, the UE shall send a PDU SESSION MODIFICATION REQUEST message with 5GSM cause #84 "syntactical error in the QoS operations" to delete all the packet filters for the default QoS rule.

In case 7, if the Authorized QoS rules IE contains at least one other valid QoS rule, the UE shall not diagnose an error and shall further process the request, if no error according to items c and d was detected. After completion of the PDU session modification procedure, if the resulting QoS rule for a GBR QoS flow which has no QoS flow description is the default QoS rule, the UE shall initiate a PDU session release procedure by sending a PDU SESSION RELEASE REQUEST message with 5GSM cause #84 "syntactical error in the QoS operation". Otherwise, the UE shall delete the QoS rule for which no corresponding QoS flow description is available and initiate UE-requested PDU session modification procedure with 5GSM cause #84 "syntactical error in the QoS operation" to delete the QoS rule for which it has deleted.

In case 8, if the default QoS rule is associated with the QoS flow description which lacks at least one of the mandatory parameters, the UE shall initiate a PDU session release procedure by sending a PDU SESSION RELEASE REQUEST message with 5GSM cause #84 "syntactical error in the QoS operation". Otherwise, if the Authorized QoS rules IE contains at least one other valid QoS rule or the QoS flow description IE contains at least one other valid QoS flow description, the UE shall not diagnose an error and shall further process the request, if no error according to items c and d was detected. After completion of the PDU session modification procedure, the UE shall delete the QoS flow description which lacks at least one of the mandatory parameters and the associated QoS rule(s), if any, and initiate UE-requested PDU session modification procedure with 5GSM cause #84 "syntactical error in the QoS operation" to delete the QoS flow description and the associated QoS rule(s), if any, which it has deleted.

Otherwise the UE shall reject the PDU SESSION MODIFICATION COMMAND message with 5GSM cause #84 "syntactical error in the QoS operation".

NOTE 5: It is not considered an error if the UE determines that after processing all QoS operations on QoS rules and QoS flow descriptions there is a QoS flow description that is not associated with any QoS rule and the UE is not in NB-N1 mode.

NOTE 5A: An implementation that strictly follows QoS rule operation as defined in subclause 9.11.4.13 might not detect case 2).

c) Semantic errors in packet filters:

- 1) When a packet filter consists of conflicting packet filter components which would render the packet filter ineffective, i.e. no IP packet will ever fit this packet filter. How the UE determines a semantic error in a packet filter is outside the scope of the present document.

The UE shall reject the PDU SESSION MODIFICATION COMMAND message with 5GSM cause #44 "semantic error in packet filter(s)".

d) Syntactical errors in packet filters:

- 1) When the rule operation is "Create new QoS rule", "Modify existing QoS rule and add packet filters" or "Modify existing QoS rule and replace all packet filters", and two or more packet filters in the resultant QoS rule would have identical packet filter identifiers.
- 2) When there are other types of syntactical errors in the coding of packet filters, such as the use of a reserved value for a packet filter component identifier.

In case 1, if two or more packet filters with identical packet filter identifiers are contained in the PDU SESSION MODIFICATION COMMAND message, the UE shall reject the PDU SESSION MODIFICATION COMMAND with 5GSM cause #45 "syntactical errors in packet filter(s)". Otherwise, the UE shall not diagnose an error, further process the PDU SESSION MODIFICATION COMMAND message and, if it was processed successfully, replace the old packet filter with the new packet filter which have the identical packet filter identifiers.

Otherwise the UE shall reject the PDU SESSION MODIFICATION COMMAND message with 5GSM cause #45 "syntactical errors in packet filter(s)".

If:

- a) the UE detects errors in QoS rules that require to delete at least one QoS rule as described above which requires sending a PDU SESSION MODIFICATION REQUEST message to delete the erroneous mapped EPS bearer contexts; and
- b) optionally, if the UE detects different errors in the mapped EPS bearer contexts as described in subclause 6.3.2.3 which requires sending a PDU SESSION MODIFICATION REQUEST message to delete the erroneous QoS rules;

the UE, after sending the PDU SESSION MODIFICATION COMPLETE message for the ongoing PDU session modification procedure, may send a single PDU SESSION MODIFICATION REQUEST message to delete the erroneous QoS rules, and optionally to delete the erroneous mapped EPS bearer contexts. The UE shall include a 5GSM cause IE in the PDU SESSION MODIFICATION REQUEST message.

NOTE 6: The 5GSM cause to use cannot be different from #41 "semantic error in the TFT operation", #42 "syntactical error in the TFT operation", #44 "semantic error in packet filter(s)", #45 "syntactical errors in packet filter(s)", #83 "semantic error in the QoS operation", #84 "syntactical error in the QoS operation", or #85 "Invalid mapped EPS bearer identity". The selection of a 5GSM cause is up to UE implementation.

The UE shall transport the PDU SESSION MODIFICATION COMMAND REJECT message and the PDU session ID, using the NAS transport procedure as specified in subclause 5.4.5.

Upon receipt of a PDU SESSION MODIFICATION COMMAND REJECT message with 5GSM cause value in state PDU SESSION MODIFICATION PENDING, the SMF shall stop timer T3591, enter the state PDU SESSION ACTIVE and abort the PDU session modification procedure.

6.3.2.5 Abnormal cases on the network side

The following abnormal cases can be identified:

- a) Expiry of timer T3591.

On the first expiry of the timer T3591, the SMF shall resend the PDU SESSION MODIFICATION COMMAND message and shall reset and restart timer T3591. This retransmission is repeated four times, i.e. on the fifth expiry of timer T3591, the SMF shall abort the procedure and enter the state PDU SESSION ACTIVE.

The SMF may continue to use the previous configuration of the PDU session or initiate the network-requested PDU session release procedure. If the SMF decides to continue to use the previous configuration of the PDU session and

- i) the Authorized QoS rules IE is included in the PDU SESSION MODIFICATION COMMAND message, the SMF may mark the corresponding authorized QoS rule(s) of the PDU session as to be synchronised with the UE; and
 - ii) the Authorized QoS flow descriptions IE is included in the PDU SESSION MODIFICATION COMMAND message, the SMF may mark the corresponding authorized QoS flow description(s) of the PDU session as to be synchronised with the UE.
- b) Void.
 - c) Collision of UE-requested PDU session release procedure and network-requested PDU session modification procedure.

If the SMF receives a PDU SESSION RELEASE REQUEST message during the network-requested PDU session modification procedure, and the PDU session indicated in the PDU SESSION RELEASE REQUEST message is the PDU session that the SMF had requested to modify, the SMF shall abort the PDU session modification procedure and proceed with the UE-requested PDU session release procedure.

- d) Collision of UE-requested PDU session modification procedure and network-requested PDU session modification procedure.

If the network receives a PDU SESSION MODIFICATION REQUEST message during the network-requested PDU session modification procedure, and the PDU session indicated in the PDU SESSION MODIFICATION REQUEST message is the PDU session that the network had requested to modify, the network shall:

- i) if the received PDU SESSION MODIFICATION REQUEST message includes the URSP rule enforcement reports IE, ignore the PDU SESSION MODIFICATION REQUEST message received in the state PDU SESSION MODIFICATION PENDING except for the URSP rule enforcement reports IE and proceed with the network-requested PDU session modification procedure; or
 - ii) otherwise, ignore the PDU SESSION MODIFICATION REQUEST message received in the state PDU SESSION MODIFICATION PENDING and proceed with the network-requested PDU session modification procedure as if no PDU SESSION MODIFICATION REQUEST message was received from the UE.
- e) 5G access network cannot forward the message.

If the SMF determines based on content of the n2SmInfo attribute specified in 3GPP TS 29.502 [20A] that the DL NAS TRANSPORT message carrying the PDU SESSION MODIFICATION COMMAND message was not forwarded to the UE by the 5G access network, then the SMF shall abort the procedure and enter the state PDU SESSION ACTIVE.

- f) 5G access network cannot forward the message due to handover.

If the SMF determines based on content of the n2SmInfo attribute specified in 3GPP TS 29.502 [20A] that the DL NAS TRANSPORT message carrying the PDU SESSION MODIFICATION COMMAND message was not forwarded to the UE by the 5G access network due to handover, then the SMF shall abort the procedure and enter the state PDU SESSION ACTIVE.

The SMF may re-initiate, up to a pre-configured number of times, the network-requested PDU session modification procedure when the SMF detects that the handover is completed successfully or has failed or at the expiry of the configured guard timer as specified in 3GPP TS 23.502 [9].

- g) Collision of re-establishment of the user-plane resources and network-requested PDU session modification procedure for the same PDU session.

If the SMF receives an indication from the AMF to re-establish the user-plane resources during the network-requested PDU session modification procedure for the same PDU session, the network shall abort the network-requested PDU session modification procedure and proceed with re-establishment of the user-plane resources for the PDU session as specified in 3GPP TS 29.502 [20A] subclause 5.2.2.3.2.2.

NOTE: After the completion of re-establishment of the user-plane resources for the PDU session, the SMF can re-initiate the network-requested PDU session modification procedure for the PDU session.

- h) Collision of UE-requested PDU session establishment procedure and network-requested PDU session modification procedure.

If the network receives a PDU SESSION ESTABLISHMENT REQUEST message with request type set to "existing PDU session" or "existing emergency PDU session" during the network-requested PDU session modification procedure, and the PDU session ID indicated in the PDU SESSION ESTABLISHMENT REQUEST message is the PDU session that the network had requested to modify, the network shall abort the network-requested PDU session modification procedure and proceed with the UE-requested PDU session establishment procedure.

6.3.2.6 Abnormal cases in the UE

The following abnormal cases can be identified:

- a) PDU session inactive for the received PDU session ID.

If the PDU session ID in the PDU SESSION MODIFICATION COMMAND message belongs to any PDU session in state PDU SESSION INACTIVE in the UE, the UE shall set the 5GSM cause IE to #43 "Invalid PDU session identity" in the 5GSM STATUS message, and set the PDU session ID to the received PDU session ID in the UL NAS TRANSPORT message as specified in subclause 5.4.5.

- b) Collision of network-requested PDU session modification procedure and UE-requested PDU session modification procedure.

If the UE receives a PDU SESSION MODIFICATION COMMAND message during the UE-requested PDU session modification procedure, the PTI IE of the PDU SESSION MODIFICATION COMMAND message is set to "No procedure transaction identity assigned", and the PDU session indicated in the PDU SESSION MODIFICATION COMMAND message is the PDU session that the UE had requested to modify, the UE shall abort internally the UE-requested PDU session modification procedure, enter the state PDU SESSION ACTIVE and proceed with the network-requested PDU session modification procedure.

- c) A semantic error in QoS operations or a semantic error in packet filters is detected in a PDU SESSION MODIFICATION COMMAND message that contains other optional information elements.

If the UE diagnoses a semantic error in QoS operations or a semantic error in packet filters in the PDU SESSION MODIFICATION COMMAND, as specified in subclause 6.3.2.4, and the message contains other optional information elements, the UE shall discard the other optional information elements and shall send the PDU SESSION MODIFICATION REJECT message as specified in subclause 6.3.2.4.

6.3.3 Network-requested PDU session release procedure

6.3.3.1 General

The purpose of the network-requested PDU session release procedure is to enable the network to release a PDU session or the user-plane resources on a single access of an MA PDU session.

6.3.3.2 Network-requested PDU session release procedure initiation

In order to initiate the network-requested PDU session release procedure, the SMF shall create a PDU SESSION RELEASE COMMAND message.

The SMF shall set the 5GSM cause IE of the PDU SESSION RELEASE COMMAND message to indicate the reason for releasing the PDU session.

The 5GSM cause IE typically indicates one of the following 5GSM cause values:

- #8 operator determined barring;
- #26 insufficient resources;
- #29 user authentication or authorization failed;
- #36 regular deactivation;
- #38 network failure;
- #39 reactivation requested;
- #46 out of LADN service area;
- #67 insufficient resources for specific slice and DNN;
- #69 insufficient resources for specific slice.

If the selected SSC mode of the PDU session is "SSC mode 2" and the SMF requests the relocation of SSC mode 2 PDU session anchor with different PDU sessions as specified in 3GPP TS 23.502 [9], the SMF shall include 5GSM cause #39 "reactivation requested". If the selected SSC mode of the PDU session is "SSC mode 2" or "SSC mode 1", the S-NSSAI or the mapped S-NSSAI of the PDU session needs to be replaced, the SMF shall include the Alternative S-NSSAI IE and 5GSM cause #39 "reactivation requested" in the PDU SESSION RELEASE COMMAND message. If the selected SSC mode of the PDU session is "SSC mode 2" or "SSC mode 1", replaced S-NSSAI is available and the

SMF determines that the PDU session needs to be re-established on the replaced S-NSSAI, the SMF shall include 5GSM cause #39 "reactivation requested" and the replaced S-NSSAI in the Alternative S-NSSAI IE in the PDU SESSION RELEASE COMMAND message.

NOTE 1: The relocation of SSC mode 2 PDU session anchor with different PDU sessions can also be initiated by the SMF in case of the SMF is requested by the AMF to release the PDU session due to the network slice instance of the PDU session is changed as specified in subclause 5.15.5.3 of 3GPP TS 23.501 [8].

If the network-requested PDU session release procedure is triggered by a UE-requested PDU session release procedure, the SMF shall set the PTI IE of the PDU SESSION RELEASE COMMAND message to the PTI of the PDU SESSION RELEASE REQUEST message received as part of the UE-requested PDU session release procedure and shall not include the Access type IE in the PDU SESSION RELEASE COMMAND.

If the network-requested PDU session release procedure is not triggered by a UE-requested PDU session release procedure, the SMF shall set the PTI IE of the PDU SESSION RELEASE COMMAND message to "No procedure transaction identity assigned".

If the PDU session ID included in PDU SESSION RELEASE COMMAND message is associated with one or more multicast MBS sessions and either the Access type IE is not included or the Access type IE indicates "3GPP access", the SMF shall consider the UE as removed from the associated multicast MBS sessions.

Based on the local policy and user's subscription data, if the SMF decides to release the PDU session after determining:

- a) the UE has moved between a tracking area in NB-N1 mode and a tracking area in WB-N1 mode;
- b) the UE has moved between a tracking area in NB-S1 mode and a tracking area in WB-N1 mode;
- c) the UE has moved between a tracking area in WB-S1 mode and a tracking area in NB-N1 mode; or
- d) a PDU session is not only for control plane CIoT 5GS optimization any more,

the SMF shall:

- a) include the 5GSM cause value #39 "reactivation requested" in the 5GSM cause IE of the PDU SESSION RELEASE COMMAND message; or
- b) include a 5GSM cause value other than #39 "reactivation requested" in the 5GSM cause IE of the PDU SESSION RELEASE COMMAND message.

NOTE 2: The included 5GSM cause value is up to the network implementation.

If the SMF receives UE presence in LADN service area from the AMF indicating that the UE is out of the LADN service area and the SMF decides to release the PDU session, the SMF shall include the 5GSM cause value #46 "out of LADN service area" in the 5GSM cause IE of the PDU SESSION RELEASE COMMAND message. Upon receipt of the 5GSM cause value #46 "out of LADN service area" in the 5GSM cause IE of the PDU SESSION RELEASE COMMAND message, the UE shall release the PDU session.

The SMF may include a Back-off timer value IE in the PDU SESSION RELEASE COMMAND message when the 5GSM cause value #26 "insufficient resources" is included in the PDU SESSION RELEASE COMMAND message. If the 5GSM cause value is #26 "insufficient resources" and the PDU SESSION RELEASE COMMAND message is sent to a UE configured for high priority access in selected PLMN or SNPN or the request type was set to "initial emergency request" or "existing emergency PDU session" for the establishment of the PDU session, the network shall not include a Back-off timer value IE.

The SMF may include a Back-off timer value IE in the PDU SESSION RELEASE COMMAND message when the 5GSM cause value #67 "insufficient resources for specific slice and DNN" is included in the PDU SESSION RELEASE COMMAND message. If the 5GSM cause value is #67 "insufficient resources for specific slice and DNN" and the PDU SESSION RELEASE COMMAND message is sent to a UE configured for high priority access in selected PLMN or SNPN or the request type was set to "initial emergency request" or "existing emergency PDU session" for the establishment of the PDU session, the network shall not include a Back-off timer value IE.

The SMF may include a Back-off timer value IE in the PDU SESSION RELEASE COMMAND message when the 5GSM cause #69 "insufficient resources for specific slice" is included in the PDU SESSION RELEASE COMMAND message. If the 5GSM cause value is #69 "insufficient resources for specific slice" and the PDU SESSION RELEASE COMMAND message is sent to a UE configured for high priority access in selected PLMN or SNPN or the request

type was set to "initial emergency request" or "existing emergency PDU session" for the establishment of the PDU session, the network shall not include a Back-off timer value IE.

The SMF should include a Back-off timer value IE in the PDU SESSION RELEASE COMMAND message when the 5GSM cause value #29 "user authentication or authorization failed" is included in the PDU SESSION RELEASE COMMAND message.

If the service-level-AA procedure is triggered for the established PDU session for UAS services with re-authentication purpose, and the SMF is informed by the UAS-NF that UUAA-SM is unsuccessful or if the SMF receives UUAA revocation notification message from the UAS-NF as described in 3GPP TS 23.256 [6AB], the SMF shall transmit the PDU SESSION RELEASE COMMAND message to the UE, including:

- a) the service-level-AA response in the Service-level-AA container IE, with the SLAR field set to the value of "Service level authentication and authorization was not successful or service level authorization is revoked"; and
- b) the 5GSM cause value #29 "user authentication or authorization failed" in the 5GSM cause IE of the PDU SESSION RELEASE COMMAND message.

If the PDU session was established for C2 communication and the SMF is informed by UAS-NF that C2 authorization is revoked, the SMF shall include:

- a) the service-level-AA response with the value of the C2AR field set to the "C2 authorization was not successful or C2 authorization is revoked" in the service-level-AA container IE of the PDU SESSION RELEASE COMMAND message, and
- b) the 5GSM cause value #29 "user authentication or authorization failed" in the 5GSM cause IE of the PDU SESSION RELEASE COMMAND message.

The SMF shall send:

- a) the PDU SESSION RELEASE COMMAND message; and
- b) the N1 SM delivery skip allowed indication:
 - 1) if the SMF allows the AMF to skip sending the N1 SM container to the UE and the 5GSM cause IE is not set to #39 "reactivation requested"; or
 - 2) if the SMF allows the AMF to skip sending the N1 SM container to the UE and the Access type IE is not included

towards the AMF, and the SMF shall start timer T3592 (see example in figure 6.3.3.2.1).

Figure 6.3.3.2.1: Network-requested PDU session release procedure

6.3.3.3 Network-requested PDU session release procedure accepted by the UE

For a single access PDU session, upon receipt of a PDU SESSION RELEASE COMMAND message and a PDU session ID, using the NAS transport procedure as specified in subclause 5.4.5, the UE considers the PDU session as released and the UE shall create a PDU SESSION RELEASE COMPLETE message.

For an MA PDU session, upon receipt of the PDU SESSION RELEASE COMMAND message, the UE shall behave as follows:

- a) if the PDU SESSION RELEASE COMMAND message includes the Access type IE and the MA PDU session has user-plane resources established on both 3GPP access and non-3GPP access, the UE shall consider the user-plane resources on the access indicated in the Access type IE as released and shall create a PDU SESSION RELEASE COMPLETE message. If the Access type IE indicates "3GPP access" and there is one or more multicast MBS sessions associated with the MA PDU session, the UE shall locally leave these associated multicast MBS sessions;
- b) if the PDU SESSION RELEASE COMMAND message includes the Access type IE and the MA PDU session has user-plane resources established on only the access indicated in the Access type IE, the UE shall consider the MA PDU session as released and shall create a PDU SESSION RELEASE COMPLETE message; and
- c) if the PDU SESSION RELEASE COMMAND message does not include the Access type IE, the UE shall consider the MA PDU session as released and shall create a PDU SESSION RELEASE COMPLETE message.

If the UE is configured with on-demand S-NSSAI including slice deregistration inactivity timer:

- a) if the PDU session associated with an on-demand S-NSSAI is released and there are no established user plane resources of an MA PDU session associated with this on-demand S-NSSAI and there is no PDU session associated with this on-demand S-NSSAI, the UE shall start the slice deregistration inactivity timer for this on-demand S-NSSAI over the corresponding access type;
- b) if the MA PDU session associated with an on-demand S-NSSAI is released:

for each registered access type, if there is no PDU session associated with this on-demand S-NSSAI and there are no established user plane resources of an MA PDU session associated with this on-demand S-NSSAI over the registered access type, the UE shall start the slice deregistration inactivity timer for this on-demand S-NSSAI over the corresponding registered access type; or
- c) if the user plane resources of an MA PDU session associated with on-demand S-NSSAI are released over the access type and there is no PDU session associated with this on-demand S-NSSAI and there are no established user plane resources of an MA PDU session associated with this on-demand S-NSSAI over the corresponding access type, then UE shall start the slice deregistration inactivity timer over the corresponding access type.

If there is one or more multicast MBS sessions associated with the PDU session the UE considers as released, the UE shall locally leave these associated multicast MBS sessions.

If the PDU SESSION RELEASE COMMAND message contains the PTI value allocated in the UE-requested PDU session release procedure, the UE shall stop the timer T3582. The UE should ensure that the PTI value assigned to this procedure is not released immediately.

NOTE 1: The way to achieve this is implementation dependent. For example, the UE can ensure that the PTI value assigned to this procedure is not released during the time equal to or greater than the default value of timer T3592.

While the PTI value is not released, the UE regards any received PDU SESSION RELEASE COMMAND message with the same PTI value as a network retransmission (see subclause 7.3.1).

If the PDU SESSION RELEASE COMMAND message includes 5GSM cause #39 "reactivation requested", then after completion of the network-requested PDU session release procedure, the UE should re-initiate the UE-requested PDU session establishment procedure as specified in subclause 6.4.1 for:

- a) the PDU session type associated with the released PDU session;
- b) the SSC mode associated with the released PDU session;
- c) the DNN associated with the released PDU session; and

- d) the S-NSSAI associated with (if provided by the network) a mapped S-NSSAI if provided in the UE-requested PDU session establishment procedure of the released PDU session. If the PDU SESSION RELEASE COMMAND message contains the Alternative S-NSSAI IE, the UE shall include both the S-NSSAI to be replaced and the alternative S-NSSAI during the UE-requested PDU session establishment procedure.

NOTE 2: User interaction is necessary in some cases when the UE cannot re-initiate the UE-requested PDU session establishment procedure automatically.

If the PDU SESSION RELEASE COMMAND message is received without the Back-off timer value IE or includes 5GSM cause #39 "reactivation requested", and the UE provided an S-NSSAI during the PDU session establishment, the UE shall stop timer T3585 if it is running for the S-NSSAI of the PDU session. If the UE did not provide an S-NSSAI during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop the timer T3585 associated with no S-NSSAI if it is running. If the PDU SESSION RELEASE COMMAND message was received for an emergency PDU session, the UE shall not stop the timer T3585 associated with no S-NSSAI if it is running. The timer T3585 to be stopped includes:

- a) in a PLMN:
- 1) the timer T3585 applied for all the PLMNs and for the access over which the PDU SESSION RELEASE COMMAND is received, if running;
 - 2) the timer T3585 applied for all the PLMNs and for both 3GPP access type and non-3GPP access type, if running;
 - 3) the timer T3585 applied for the registered PLMN and for the access over which the PDU SESSION RELEASE COMMAND is received, if running; and
 - 4) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, if running; or
- b) in an SNPN:
- 1) the timer T3585 applied for all the equivalent SNPNs and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
 - 2) the timer T3585 applied for all the equivalent SNPNs and for both 3GPP access type and non-3GPP access type, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
 - 3) the timer T3585 applied for the registered SNPN and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - 4) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

If the PDU SESSION RELEASE COMMAND message is received without the Back-off timer value IE or includes 5GSM cause #39 "reactivation requested", and the UE provided a DNN during the PDU session establishment, the UE shall stop timer T3396 if it is running for the DNN provided by the UE. If the UE did not provide a DNN during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop the timer T3396 associated with no DNN if it is running. If the PDU SESSION RELEASE COMMAND message was received for an emergency PDU session, the UE shall not stop the timer T3396 associated with no DNN if it is running. In an SNPN, the timer T3396 to be stopped includes:

- a) the timer T3396 applied for all the equivalent SNPNs, associated with the RSNPN or an equivalent SNPN, and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- b) the timer T3396 applied for the registered SNPN, associated with the RSNPN, and, if the UE supports access to an SNPN using credentials from a credentials holder, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

If the PDU SESSION RELEASE COMMAND message is received without the Back-off timer value IE or includes 5GSM cause #39 "reactivation requested", and the UE provided an S-NSSAI and a DNN during the PDU session establishment, the UE shall stop timer T3584 if it is running for the [S-NSSAI of the PDU session, DNN] combination provided by the UE. If the UE did not provide an S-NSSAI during the PDU session establishment, the UE shall stop the timer T3584 associated with [no S-NSSAI, DNN] if it is running. If the UE did not provide a DNN during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop the timer T3584 associated with [S-NSSAI of the PDU session, no DNN] combination, if it is running. If the PDU SESSION RELEASE COMMAND message was received for an emergency PDU session, the UE shall not stop the timer T3584 associated with [S-NSSAI of the PDU session, no DNN] if it is running. If the UE provided neither a DNN nor an S-NSSAI during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop the timer T3584 associated with [no S-NSSAI, no DNN] if it is running. If the PDU SESSION RELEASE COMMAND message was received for an emergency PDU session, the UE shall not stop the timer T3584 associated with [no S-NSSAI, no DNN] if it is running. The timer T3584 to be stopped includes:

a) in a PLMN:

- 1) the timer T3584 applied for all the PLMNs, if running; and
- 2) the timer T3584 applied for the registered PLMN, if running; or

b) in an SNPN:

- 1) the timer T3584 applied for all the equivalent SNPNS, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- 2) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNS or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

NOTE 3: If the PDU SESSION RELEASE COMMAND message is received without the Back-off timer value IE or includes 5GSM cause #39 "reactivation requested" for a PDU session, the UE provided a DNN (or no DNN) and an S-NSSAI (or no S-NSSAI) when the PDU session is established, timer T3396 associated with the DNN (or no DNN, if no DNN was provided by the UE) is running, and timer T3584 associated with the DNN (or no DNN, if no DNN was provided by the UE) and the S-NSSAI of the PDU session (or no S-NSSAI, if no S-NSSAI was provided by the UE) is running, then the UE stops both the timer T3396 and the timer T3584.

NOTE 4: If the PDU SESSION RELEASE COMMAND message is received without the Back-off timer value IE or includes 5GSM cause #39 "reactivation requested" for a PDU session, the UE provided a DNN (or no DNN) and an S-NSSAI of the PDU session (or no S-NSSAI) when the PDU session is established, timer T3585 associated with the S-NSSAI of the PDU session (or no S-NSSAI, if no S-NSSAI was provided by the UE) is running, and timer T3584 associated with the DNN (or no DNN, if no DNN was provided by the UE) and the S-NSSAI of the PDU session (or no S-NSSAI, if no S-NSSAI was provided by the UE) is running, then the UE stops both the timer T3585 and the timer T3584.

If the PDU SESSION RELEASE COMMAND message includes 5GSM cause #26 "insufficient resources" and the Back-off timer value IE, the UE shall ignore the 5GSM congestion re-attempt indicator IE provided by the network, if any, and the UE shall take different actions depending on the timer value received for timer T3396 in the Back-off timer value:

a) If the timer value indicates neither zero nor deactivated and a DNN was provided during the PDU session establishment, the UE shall stop timer T3396 associated with the corresponding DNN, if it is running. If the timer value indicates neither zero nor deactivated and no DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3396 associated with no DNN if it is running. In an SNPN, the timer T3396 to be stopped includes:

- 1) the timer T3396 applied for all the equivalent SNPNS, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and

- 2) the timer T3396 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE shall then start timer T3396 with the value provided in the Back-off timer value IE and:

- 1) shall not send a PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the same DNN that was sent by the UE, until timer T3396 expires or timer T3396 is stopped; and
- 2) shall not send a PDU SESSION ESTABLISHMENT REQUEST message without an DNN and with request type different from "initial emergency request" and different from "existing emergency PDU session", or a PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for a non-emergency PDU session established without an DNN provided by the UE, if no DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", until timer T3396 expires or timer T3396 is stopped.

The UE shall not stop timer T3396 upon a PLMN change, SNPN change, or inter-system change;

- b) if the timer value indicates that this timer is deactivated and a DNN was provided during the PDU session establishment, the UE shall stop timer T3396 associated with the corresponding DNN, if it is running. If the timer value indicates that this timer is deactivated and no DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3396 associated with no DNN if it is running. In an SNPN, the timer T3396 to be stopped includes:
 - 1) the timer T3396 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - 2) the timer T3396 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE:

- 1) shall not send a PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the same DNN until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated, or the UE receives a PDU SESSION MODIFICATION COMMAND message for the same DNN from the network, or a PDU SESSION AUTHENTICATION COMMAND message for the same DNN, or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE or including 5GSM cause #39 "reactivation requested" for the same DNN from the network; and
- 2) shall not send a PDU SESSION ESTABLISHMENT REQUEST message without a DNN and with request type different from "initial emergency request" and different from "existing emergency PDU session", or a PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for a non-emergency PDU session established without a DNN provided by the UE, if no DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated, or the UE receives a PDU SESSION MODIFICATION COMMAND message for a non-emergency PDU session established without an DNN provided by the UE, or a PDU SESSION AUTHENTICATION COMMAND message for a non-emergency PDU session established without a DNN provided by the UE, or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE or including 5GSM cause #39 "reactivation requested" for a non-emergency PDU session established without a DNN provided by the UE.

The timer T3396 remains deactivated upon a PLMN change, SNPN change, or inter-system change; and

- c) if the timer value indicates zero, the UE:

- 1) shall stop timer T3396 associated with the corresponding DNN, if running. In an SNPN, the timer T3396 to be stopped includes:
 - i) the timer T3396 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - ii) the timer T3396 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send a PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message for the same DNN; and

- 2) if no DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3396 associated with no DNN, if running. In an SNPN, the timer T3396 to be stopped includes:
 - i) the timer T3396 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - ii) the timer T3396 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send a PDU SESSION ESTABLISHMENT REQUEST message without a DNN, or a PDU SESSION MODIFICATION REQUEST message without an DNN provided by the UE.

In an SNPN, if the UE supports equivalent SNPNs, then the UE shall apply the timer T3396 for all the equivalent SNPNs. Otherwise, the UE shall apply the timer T3396 for the registered SNPN.

If the PDU SESSION RELEASE COMMAND message includes 5GSM cause #26 "insufficient resources" and the Back-off timer value IE is not included, then the UE may send a PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message for the same DNN or without a DNN.

When the timer T3396 is running or the timer is deactivated, the UE is allowed to initiate a PDU session establishment procedure for emergency services.

If the timer T3396 is running when the UE enters state 5GMM-DEREGISTERED, the UE remains switched on, and the USIM in the UE (if any) remains the same and the entry in the "list of subscriber data" for the SNPN to which timer T3396 is associated (if any) is not updated, then timer T3396 is kept running until it expires or it is stopped.

If the UE is switched off when the timer T3396 is running, and if the USIM in the UE (if any) remains the same and the entry in the "list of subscriber data" for the SNPN to which timer T3396 is associated (if any) is not updated when the UE is switched on, the UE shall behave as follows:

- let t_1 be the time remaining for T3396 timeout at switch off and let t be the time elapsed between switch off and switch on. If t_1 is greater than t , then the timer shall be restarted with the value $t_1 - t$. If t_1 is equal to or less than t , then the timer need not be restarted. If the UE is not capable of determining t , then the UE shall restart the timer with the value t_1 .

If the 5GSM cause value is #39 "reactivation requested", the UE shall ignore the Back-off timer value IE provided by the network, if any.

If the 5GSM cause value is #67 "insufficient resources for specific slice and DNN" and the Back-off timer value IE is included, the UE shall take different actions depending on the timer value received for timer T3584 in the Back-off timer value:

- a) If the timer value indicates neither zero nor deactivated, and both an S-NSSAI and a DNN were provided by the UE during the PDU session establishment the UE shall stop timer T3584 associated with the [S-NSSAI of the PDU session, DNN] combination, if it is running. If the timer value indicates neither zero nor deactivated, an S-NSSAI and no DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3584 associated with [S-NSSAI of the PDU session, no DNN] combination, if it is running. If the timer value indicates

neither zero nor deactivated, no S-NSSAI and a DNN was provided during the PDU session establishment, the UE shall stop timer T3584 associated with the [no S-NSSAI, DNN] combination, if it is running. If the timer value indicates neither zero nor deactivated and neither S-NSSAI nor DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3584 associated with the [no S-NSSAI, no DNN] combination, if it is running. The timer T3584 to be stopped includes:

- 1) in a PLMN:
 - i) the timer T3584 applied for all the PLMNs, if running; and
 - ii) the timer T3584 applied for the registered PLMN, if running; or
- 2) in an SNPN:
 - i) the timer T3584 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - ii) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE shall then start timer T3584 with the value provided in the Back-off timer value IE.

- 1) The UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message with request type different from "initial emergency request" and different from "existing emergency PDU session", or PDU SESSION MODIFICATION REQUEST message with the exception of those identified in subclause 6.4.2.1, for the [S-NSSAI of the PDU session, DNN] combination, until timer T3584 expires or timer T3584 is stopped;
- 2) shall not send another PDU SESSION ESTABLISHMENT REQUEST message with request type different from "initial emergency request" and different from "existing emergency PDU session", or another PDU SESSION MODIFICATION REQUEST message with the exception of those identified in subclause 6.4.2.1, for the [S-NSSAI of the PDU session, no DNN] combination, if no DNN was provided during the PDU session establishment, until timer T3584 expires or timer T3584 is stopped;
- 3) shall not send another PDU SESSION ESTABLISHMENT REQUEST message, or another PDU SESSION MODIFICATION REQUEST message with the exception of those identified in subclause 6.4.2.1, for the same [no S-NSSAI, DNN] combination, if no S-NSSAI was provided during the PDU session establishment, until timer T3584 expires or timer T3584 is stopped; and
- 4) shall not send another PDU SESSION ESTABLISHMENT REQUEST message with request type different from "initial emergency request" and different from "existing emergency PDU session", or another PDU SESSION MODIFICATION REQUEST message with the exception of those identified in subclause 6.4.2.1, for the same [no S-NSSAI, no DNN] combination, if neither S-NSSAI nor DNN was provided during the PDU session establishment, until timer T3584 expires or timer T3584 is stopped.

The UE shall not stop timer T3584 upon a PLMN change, SNPN change, or inter-system change;

- b) if the timer value indicates that this timer is deactivated:
 - 1) if both S-NSSAI and DNN were provided by the UE during the PDU session establishment, the UE shall stop timer T3584 associated with the [S-NSSAI of the PDU session, DNN] combination, if running. The timer T3584 to be stopped includes:
 - i) in a PLMN:
 - A) the timer T3584 applied for all the PLMNs, if running; and
 - B) the timer T3584 applied for the registered PLMN, if running; or
 - ii) in an SNPN:

- A) the timer T3584 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- B) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message with request type different from "initial emergency request" and different from "existing emergency PDU session", or PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the [S-NSSAI of the PDU session, DNN] combination that was sent by the UE, until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated, or the UE receives a PDU SESSION MODIFICATION COMMAND message for the [S-NSSAI of the PDU session, DNN] combination from the network, or a PDU SESSION AUTHENTICATION COMMAND message for the [S-NSSAI of the PDU session, DNN] combination from the network, or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE or including 5GSM cause #39 "reactivation requested" for the [S-NSSAI of the PDU session, DNN] combination from the network;

- 2) if an S-NSSAI was provided but a DNN was not provided by the UE during the PDU session establishment, the UE shall stop timer T3584 associated with the [S-NSSAI of the PDU session, no DNN] combination, if running. The timer T3584 to be stopped includes:
 - i) in a PLMN:
 - A) the timer T3584 applied for all the PLMNs, if running; and
 - B) the timer T3584 applied for the registered PLMN, if running; or
 - ii) in an SNPN:
 - A) the timer T3584 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - B) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE shall not send a PDU SESSION ESTABLISHMENT REQUEST message with request type different from "initial emergency request" and different from "existing emergency PDU session", or a PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the [S-NSSAI of the PDU session, no DNN] combination, if no DNN was provided during the PDU session establishment, until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated, or the UE receives an PDU SESSION MODIFICATION COMMAND message for a non-emergency PDU session established for the [S-NSSAI of the PDU session, no DNN] combination from the network, or a PDU SESSION AUTHENTICATION COMMAND message for a non-emergency PDU session established the [S-NSSAI of the PDU session, DNN] combination from the network, or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE or including 5GSM cause #39 "reactivation requested" for a non-emergency PDU session established for the [S-NSSAI of the PDU session, no DNN] combination from the network;

- 3) if an S-NSSAI was not provided but a DNN was provided by the UE during the PDU session establishment, the UE shall stop timer T3584 associated with the [no S-NSSAI, DNN] combination, if running. The timer T3584 to be stopped includes:
 - i) in a PLMN:
 - A) the timer T3584 applied for all the PLMNs, if running; and
 - B) the timer T3584 applied for the registered PLMN, if running; or
 - ii) in an SNPN:

- A) the timer T3584 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- B) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE shall not send a PDU SESSION ESTABLISHMENT REQUEST message, or a PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the [no S-NSSAI, DNN], if no S-NSSAI was provided during the PDU session establishment, until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated, or the UE receives an PDU SESSION MODIFICATION COMMAND message for the [no S-NSSAI, DNN] combination from the network, or a PDU SESSION AUTHENTICATION COMMAND message for the [no S-NSSAI, DNN] combination from the network, or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE or including 5GSM cause #39 "reactivation requested" for the same [no S-NSSAI, DNN] combination from the network; and

- 4) if neither S-NSSAI nor DNN were provided by the UE during the PDU session establishment, the UE shall stop timer T3584 associated with the [no S-NSSAI, no DNN] combination, if running. The timer T3584 to be stopped includes:
 - i) in a PLMN:
 - A) the timer T3584 applied for all the PLMNs, if running; and
 - B) the timer T3584 applied for the registered PLMN, if running; or
 - ii) in an SNPN:
 - A) the timer T3584 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - B) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE shall not send a PDU SESSION ESTABLISHMENT REQUEST message with request type different from "initial emergency request" and different from "existing emergency PDU session", or a PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the [no S-NSSAI, no DNN] combination, if neither S-NSSAI nor DNN was provided during the PDU session establishment, until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated, or the UE receives an PDU SESSION MODIFICATION COMMAND message for a non-emergency PDU session established for the [no S-NSSAI, no DNN] combination from the network, or a PDU SESSION AUTHENTICATION COMMAND message for a non-emergency PDU session established for the [no S-NSSAI, no DNN] combination from the network or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE or including 5GSM cause #39 "reactivation requested" for a non-emergency PDU session established for the [no S-NSSAI, no DNN] combination from the network.

The timer T3584 remains deactivated upon a PLMN change, SNPN change, or inter-system change; and

- c) if the timer value indicates zero:
 - 1) if both S-NSSAI and DNN were provided by the UE during the PDU session establishment, the UE shall stop timer T3584 associated with the [S-NSSAI of the PDU session, DNN] combination, if running. The timer T3584 to be stopped includes:
 - i) in a PLMN:
 - A) the timer T3584 applied for all the PLMNs, if running; and
 - B) the timer T3584 applied for the registered PLMN, if running; or

ii) in an SNPN:

- A) the timer T3584 applied for all the equivalent SNPNS, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- B) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNS or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message for the [S-NSSAI of the PDU session, DNN] combination;

- 2) if an S-NSSAI was provided but a DNN was not provided by the UE during the PDU session establishment, the UE shall stop timer T3584 associated with the [S-NSSAI of the PDU session, no DNN] combination, if running. The timer T3584 to be stopped includes:

i) in a PLMN:

- A) the timer T3584 applied for all the PLMNs, if running; and
- B) the timer T3584 applied for the registered PLMN, if running; or

ii) in an SNPN:

- A) the timer T3584 applied for all the equivalent SNPNS, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- B) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNS or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message for the [S-NSSAI of the PDU session, no DNN] combination if the request type was different from "initial emergency request" and different from "existing emergency PDU session";

- 3) if an S-NSSAI was not provided but a DNN was provided by the UE during the PDU session establishment, the UE shall stop timer T3584 associated with the [no S-NSSAI, DNN] combination, if running. The timer T3584 to be stopped includes:

i) in a PLMN:

- A) the timer T3584 applied for all the PLMNs, if running; and
- B) the timer T3584 applied for the registered PLMN, if running; or

ii) in an SNPN:

- A) the timer T3584 applied for all the equivalent SNPNS, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- B) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNS or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send another PDU SESSION ESTABLISHMENT REQUEST message, or PDU SESSION MODIFICATION REQUEST message for the [no S-NSSAI, DNN] combination; and

- 4) if neither S-NSSAI nor DNN were provided by the UE during the PDU session establishment, the UE shall stop timer T3584 associated with the [no S-NSSAI, no DNN] combination, if running. The timer T3584 to be stopped includes:

i) in a PLMN:

- A) the timer T3584 applied for all the PLMNs, if running; and
 - B) the timer T3584 applied for the registered PLMN, if running; or
- ii) in an SNPN:
- A) the timer T3584 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - B) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send another PDU SESSION ESTABLISHMENT REQUEST message, or PDU SESSION MODIFICATION REQUEST message for the [no S-NSSAI, no DNN] combination if the request type was different from "initial emergency request" and different from "existing emergency PDU session".

If the 5GSM congestion re-attempt indicator IE with the ABO bit set to "The back-off timer is applied in all PLMNs or all equivalent SNPNs " is included in the PDU SESSION RELEASE COMMAND message with the 5GSM cause value #67 "insufficient resources for specific slice and DNN", then the UE shall apply the timer T3584 for all the PLMNs or all the equivalent SNPNs. Otherwise, the UE shall apply the timer T3584 for the registered PLMN or the registered SNPN.

If the 5GSM cause value is #67 "insufficient resources for specific slice and DNN" and the Back-off timer value IE is not included, then the UE may send another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message for the same [S-NSSAI, DNN] combination.

When the timer T3584 is running or the timer is deactivated, the UE is allowed to initiate a PDU session establishment procedure for emergency services.

If the timer T3584 is running when the UE enters state 5GMM-DEREGISTERED, the UE remains switched on, and the USIM in the UE (if any) remains the same and the entry in the "list of subscriber data" for the SNPN to which timer T3584 is associated (if any) is not updated, then timer T3584 is kept running until it expires or it is stopped.

If the UE is switched off when the timer T3584 is running, and if the USIM in the UE (if any) remains the same and the entry in the "list of subscriber data" for the SNPN to which timer T3584 is associated (if any) is not updated when the UE is switched on, the UE shall behave as follows:

- let t_1 be the time remaining for T3584 timeout at switch off and let t be the time elapsed between switch off and switch on. If t_1 is greater than t , then the timer shall be restarted with the value $t_1 - t$. If t_1 is equal to or less than t , then the timer need not be restarted. If the UE is not capable of determining t , then the UE shall restart the timer with the value t_1 .

If the 5GSM cause value is #69 "insufficient resources for specific slice" and the Back-off timer value IE is included, the UE shall take different actions depending on the timer value received for timer T3585 in the Back-off timer value:

- a) If the timer value indicates neither zero nor deactivated and an S-NSSAI was provided during the PDU session establishment, the UE shall stop timer T3585 associated with the S-NSSAI of the PDU session, if it is running. If the timer value indicates neither zero nor deactivated and no S-NSSAI was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3585 associated with no S-NSSAI if it is running. The timer T3585 to be stopped includes:

1) in a PLMN:

- i) the timer T3585 applied for all the PLMNs and for the access over which the PDU SESSION RELEASE COMMAND is received, if running;
- ii) the timer T3585 applied for all the PLMNs and for both 3GPP access type and non-3GPP access type, if running;
- iii) the timer T3585 applied for the registered PLMN and for the access over which the PDU SESSION RELEASE COMMAND is received, if running; and

- iv) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, if running; or
- 2) in an SNPN:
 - i) the timer T3585 applied for all the equivalent SNPNs and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
 - ii) the timer T3585 applied for all the equivalent SNPNs and for both 3GPP access type and non-3GPP access type, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
 - iii) the timer T3585 applied for the registered SNPN and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - iv) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE shall then start timer T3585 with the value provided in the Back-off timer value IE and:

- 1) if an S-NSSAI was provided by the UE during the PDU session establishment, the UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message, or PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the S-NSSAI of the PDU session, until timer T3585 expires or timer T3585 is stopped; and
- 2) if the request type was different from "initial emergency request" and from "existing emergency PDU session", and an S-NSSAI was not provided by the UE during the PDU session establishment, the UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message without an S-NSSAI and with request type different from "initial emergency request" and different from "existing emergency PDU session", or another PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for a non-emergency PDU session established without an S-NSSAI provided by the UE, until timer T3585 expires or timer T3585 is stopped.

The UE shall not stop timer T3585 upon a PLMN change, SNPN change, or inter-system change;

- b) if the timer value indicates that this timer is deactivated and an S-NSSAI was provided during the PDU session establishment, the UE shall stop timer T3585 associated with the S-NSSAI of the PDU session, if it is running. If the timer value indicates that this timer is deactivated and no S-NSSAI was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3585 associated with no S-NSSAI if it is running. The timer T3585 to be stopped includes:
 - 1) in a PLMN:
 - i) the timer T3585 applied for all the PLMNs and for the access over which the PDU SESSION RELEASE COMMAND is received, if running;
 - ii) the timer T3585 applied for all the PLMNs and for both 3GPP access type and non-3GPP access type, if running;
 - iii) the timer T3585 applied for the registered PLMN and for current access type or both 3GPP access type and non-3GPP access type, if running; and
 - iv) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, if running; or
 - 2) in an SNPN:

- i) the timer T3585 applied for all the equivalent SNPNs and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
- ii) the timer T3585 applied for all the equivalent SNPNs and for both 3GPP access type and non-3GPP access type, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
- iii) the timer T3585 applied for the registered SNPN and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- iv) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

In addition:

- 1) if an S-NSSAI was provided by the UE during the PDU session establishment, the UE shall not send another PDU SESSION ESTABLISHMENT REQUEST, or PDU SESSION MODIFICATION REQUEST with exception of those identified in subclause 6.4.2.1, for the S-NSSAI of the PDU session until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated, or a PDU SESSION MODIFICATION COMMAND message for the S-NSSAI of the PDU session from the network, or a PDU SESSION AUTHENTICATION COMMAND message for the S-NSSAI of the PDU session from the network, or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE or including 5GSM cause #39 "reactivation requested" for the S-NSSAI of the PDU session from the network; and
- 2) if the request type was different from "initial emergency request" and from "existing emergency PDU session", and an S-NSSAI was not provided by the UE during the PDU session establishment, the UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message without an S-NSSAI and with request type different from "initial emergency request" and different from "existing emergency PDU session", or another PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for a non-emergency PDU session established without an S-NSSAI provided by the UE, until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated, or a PDU SESSION MODIFICATION COMMAND message for a non-emergency PDU session established without an S-NSSAI provided by the UE, or a PDU SESSION AUTHENTICATION COMMAND message for a non-emergency PDU session established without an S-NSSAI provided by the UE, or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE or including 5GSM cause #39 "reactivation requested" for a non-emergency PDU session established without an S-NSSAI provided by the UE.

The timer T3585 remains deactivated upon a PLMN change, SNPN change, or inter-system change; and

c) if the timer value indicates zero:

- 1) if an S-NSSAI was provided by the UE during the PDU session establishment, the UE shall stop timer T3585 associated with the S-NSSAI of the PDU session, if running. The timer T3585 to be stopped includes:
 - i) in a PLMN:
 - A) the timer T3585 applied for all the PLMNs and for the access over which the PDU SESSION RELEASE COMMAND is received, if running;
 - B) the timer T3585 applied for all the PLMNs and for the access over which the PDU SESSION RELEASE COMMAND is received, if running;
 - C) the timer T3585 applied for the registered PLMN and for current access type or both 3GPP access type and non-3GPP access type, if running; and

D) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, if running; or

ii) in an SNPN:

- A) the timer T3585 applied for all the equivalent SNPNs and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
- B) the timer T3585 applied for all the equivalent SNPNs and for both 3GPP access type and non-3GPP access type, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
- C) the timer T3585 applied for the registered SNPN and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- D) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send another PDU SESSION ESTABLISHMENT REQUEST, or PDU SESSION MODIFICATION REQUEST message for the S-NSSAI of the PDU session; and

- 2) if no S-NSSAI was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3585 associated with no S-NSSAI

i) in a PLMN:

- A) the timer T3585 applied for all the PLMNs and for the access over which the PDU SESSION RELEASE COMMAND is received, if running,;
- B) the timer T3585 applied for all the PLMNs and for the access over which the PDU SESSION RELEASE COMMAND is received, if running;
- C) the timer T3585 applied for the registered PLMN and for current access type or both 3GPP access type and non-3GPP access type, if running; and
- D) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, if running; or

ii) in an SNPN:

- A) the timer T3585 applied for all the equivalent SNPNs and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
- B) the timer T3585 applied for all the equivalent SNPNs and for both 3GPP access type and non-3GPP access type, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
- C) the timer T3585 applied for the registered SNPN and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- D) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, associated with the RSNPN and, if the UE supports access to an SNPN using credentials

from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send another PDU SESSION ESTABLISHMENT REQUEST message without an S-NSSAI, or another PDU SESSION MODIFICATION REQUEST message without an S-NSSAI provided by the UE.

If the 5GSM congestion re-attempt indicator IE with the ABO bit set to "The back-off timer is applied in all PLMNs or all equivalent SNPNs " is included in the PDU SESSION RELEASE COMMAND message with the 5GSM cause value #69 "insufficient resources for specific slice", then the UE shall apply the timer T3585 for all the PLMNs or all the equivalent SNPNs. Otherwise, the UE shall apply the timer T3585 for the registered PLMN or the registered SNPN.

If the 5GSM cause value is #69 "insufficient resources for specific slice" and the Back-off timer value IE is not included, then the UE may send another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message for the same S-NSSAI or without an S-NSSAI.

When the timer T3585 is running or the timer is deactivated, the UE is allowed to initiate a PDU session establishment procedure for emergency services.

If the timer T3585 is running when the UE enters state 5GMM-DEREGISTERED, the UE remains switched on, and the USIM in the UE (if any) remains the same and the entry in the "list of subscriber data" for the SNPN to which timer T3585 is associated (if any) is not updated, then timer T3585 is kept running until it expires or it is stopped.

If the UE is switched off when the timer T3585 is running, and if the USIM in the UE (if any) remains the same and the entry in the "list of subscriber data" for the SNPN to which timer T3585 is associated (if any) is not updated when the UE is switched on, the UE shall behave as follows:

- let t_1 be the time remaining for T3585 timeout at switch off and let t be the time elapsed between switch off and switch on. If t_1 is greater than t , then the timer shall be restarted with the value $t_1 - t$. If t_1 is equal to or less than t , then the timer need not be restarted. If the UE is not capable of determining t , then the UE shall restart the timer with the value t_1 .

NOTE 5: As described in this subclause, upon PLMN change, SNPN change or inter-system change, the UE does not stop the timer T3584 or T3585. This means the timer T3584 or T3585 can still be running or be deactivated for the given 5GSM procedure, the PLMN or SNPN, the S-NSSAI and optionally the DNN combination when the UE returns to the PLMN or SNPN or when it performs inter-system change back from S1 mode to N1 mode. Thus the UE can still be prevented from sending another PDU SESSION ESTABLISHMENT REQUEST or PDU SESSION MODIFICATION REQUEST message in the PLMN for the same S-NSSAI and optionally the same DNN.

Upon PLMN change or SNPN change, if T3584 applied for the registered PLMN or the registered SNPN is running or is deactivated for an S-NSSAI, a DNN, and old PLMN or old SNPN, but T3584 is not running and is not deactivated for the S-NSSAI, the DNN, and new PLMN or new SNPN, then the UE is allowed to send a PDU SESSION ESTABLISHMENT REQUEST message for the same S-NSSAI and the same DNN in the new PLMN or new SNPN.

Upon PLMN change or SNPN change, if T3585 applied for the registered PLMN or the registered SNPN is running or is deactivated for an S-NSSAI and old PLMN or old SNPN, but T3585 is not running and is not deactivated for the S-NSSAI and new PLMN or new SNPN, then the UE is allowed to send a PDU SESSION ESTABLISHMENT REQUEST message for the same S-NSSAI in the new PLMN or new SNPN.

Upon SNPN change, if T3584 applied for all the equivalent SNPNs is running or is deactivated for an S-NSSAI, a DNN, and old SNPN, but T3584 is not running and is not deactivated for the S-NSSAI, the DNN, and new non-equivalent SNPN, then the UE is allowed to send a PDU SESSION ESTABLISHMENT REQUEST message for the same S-NSSAI and the same DNN in the new SNPN.

Upon SNPN change, if T3585 applied for all the equivalent SNPNs is running or is deactivated for an S-NSSAI and old SNPN, but T3585 is not running and is not deactivated for the S-NSSAI and new non-equivalent SNPN, then the UE is allowed to send a PDU SESSION ESTABLISHMENT REQUEST message for the same S-NSSAI in the new SNPN.

If the PDU SESSION RELEASE COMMAND message includes 5GSM cause #29 "user authentication or authorization failed" and the Back-off timer value IE, the UE shall behave as follows:

- a) if the timer value indicates neither zero nor deactivated and:

- 1) if the UE provided a DNN and S-NSSAI to the network during the PDU session establishment, the UE shall start the back-off timer with the value provided in the Back-off timer value IE for the PDU session establishment procedure and:
 - i) in a PLMN, [PLMN, DNN, (mapped) HPLMN S-NSSAI] combination. The UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for the same DNN and (mapped) HPLMN S-NSSAI in the current PLMN, until the back-off timer expires, the UE is switched off, or the USIM is removed; or
 - ii) in an SNPN, [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, (mapped) subscribed SNPN S-NSSAI] combination. The UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for the same DNN and (mapped) subscribed SNPN S-NSSAI in the current SNPN using the selected entry of the "list of subscriber data" or selected PLMN subscription, until the back-off timer expires, the UE is switched off, the USIM is removed, or the selected entry of the "list of subscriber data" is updated;
- 2) if the UE provided a DNN to the network during the PDU session establishment, the UE shall start the back-off timer with the value provided in the Back-off timer value IE for the PDU session establishment procedure and:
 - i) in a PLMN, [PLMN, DNN] combination. The UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for the same DNN in the current PLMN, until the back-off timer expires, the UE is switched off, or the USIM is removed; or
 - ii) in an SNPN, [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN] combination. The UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for the same DNN in the current PLMN using the selected entry of the "list of subscriber data" or selected PLMN subscription, until the back-off timer expires, the UE is switched off, the USIM is removed or the selected entry of the "list of subscriber data" is updated;
- 3) if the UE did not provide a DNN or S-NSSAI or any of the two parameters to the network during the PDU session establishment, it shall start the back-off timer accordingly for the PDU session establishment procedure and:
 - i) in a PLMN, the [PLMN, DNN, no S-NSSAI], [PLMN, no DNN, (mapped) HPLMN S-NSSAI] or [PLMN, no DNN, no S-NSSAI] combination. Dependent on the combination, the UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for the same [PLMN, DNN, no S-NSSAI], [PLMN, no DNN, (mapped) HPLMN S-NSSAI] or [PLMN, no DNN, no S-NSSAI] combination in the current PLMN, until the back-off timer expires, the UE is switched off, or the USIM is removed; or
 - ii) in an SNPN, [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, (mapped) subscribed SNPN S-NSSAI] or [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI] combination. Dependent on the combination, the UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for the same [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, (mapped) subscribed SNPN S-NSSAI] or [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI] combination in the current PLMN using the selected entry of the "list of subscriber data" or selected PLMN subscription, until the back-off timer expires, the UE is switched off, the USIM is removed or the selected entry of the "list of subscriber data" is updated; or
- 4) if the UE did not provide a DNN to the network during the PDU session establishment, it shall start the back-off timer accordingly for the PDU session establishment procedure and:
 - i) in a PLMN, the [PLMN, no DNN] combination. The UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for the same [PLMN, no DNN] in the current PLMN, until the back-off timer expires, the UE is switched off, or the USIM is removed; or
 - ii) in an SNPN, [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN] combination. The UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for the same [SNPN, the selected entry of the "list of subscriber data" or selected PLMN

subscription, no DNN] in the current SNPN using the selected entry of the "list of subscriber data" or selected PLMN subscription, until the back-off timer expires, the UE is switched off, the USIM is removed, or the selected entry of the "list of subscriber data" is updated;

b) if the timer value indicates that this timer is deactivated and:

- 1) if the UE provided a DNN and S-NSSAI to the network during the PDU session establishment, the UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for:
 - i) in a PLMN, the same DNN and (mapped) HPLMN S-NSSAI in the current PLMN, until the UE is switched off, or the USIM is removed; or
 - ii) in an SNPN, the same DNN and (mapped) subscribed SNPN S-NSSAI in the current SNPN using the selected entry of the "list of subscriber data" or selected PLMN subscription, until the UE is switched off, or the USIM is removed, or the selected entry of the "list of subscriber data" is updated;
- 2) if the UE provided a DNN to the network during the PDU session establishment, the UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for:
 - i) in a PLMN, the same DNN in the current PLMN, until the UE is switched off, or the USIM is removed; or
 - ii) in an SNPN, the same DNN in the current SNPN using the selected entry of the "list of subscriber data" or selected PLMN subscription, until the UE is switched off, or the USIM is removed, or the selected entry of the "list of subscriber data" is updated;
- 3) if the UE did not provide a DNN or S-NSSAI or any of the two parameters to the network during the PDU session establishment, the UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for:
 - i) in a PLMN, the same [PLMN, DNN, no S-NSSAI], [PLMN, no DNN, (mapped) HPLMN S-NSSAI] or [PLMN, no DNN, no S-NSSAI] combination in the current PLMN, until the UE is switched off, or the USIM is removed; or
 - ii) in an SNPN, the same [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, (mapped) subscribed SNPN S-NSSAI] or [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI] combination in the current SNPN using the selected entry of the "list of subscriber data" or selected PLMN subscription, until the UE is switched off, or the USIM is removed, or the selected entry of the "list of subscriber data" is updated; or
- 4) if the UE did not provide a DNN to the network during the PDU session establishment, the UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for:
 - i) in a PLMN, the same [PLMN, no DNN] in the current PLMN, until the UE is switched off, or the USIM is removed; or
 - ii) in an SNPN, the same [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN] combination in the current SNPN using the selected entry of the "list of subscriber data" or selected PLMN subscription, until the UE is switched off, or the USIM is removed, or the selected entry of the "list of subscriber data" is updated; and

c) if the timer value indicates zero, the UE may send another PDU SESSION ESTABLISHMENT REQUEST message:

- 1) in a PLMN, for the same combination of [PLMN, DNN, (mapped) HPLMN S-NSSAI], [PLMN, DNN, no S-NSSAI], [PLMN, no DNN, (mapped) HPLMN S-NSSAI], or [PLMN, no DNN, no S-NSSAI] in the current PLMN; or
- 2) in an SNPN, for the same combination of [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, (mapped) subscribed SNPN S-NSSAI], [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, (mapped) subscribed SNPN S-NSSAI],

or [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI] in the current SNPN.

The UE shall not stop any back-off timer:

- a) upon a PLMN or SNPN change;
- b) upon an inter-system change; or
- c) upon registration over another access type.

If the PDU SESSION RELEASE COMMAND message includes:

- a) 5GSM cause #29 "user authentication or authorization failed"; and
- b) the service-level-AA response in the Service-level-AA container IE with the SLAR field set to the value of "Service level authentication and authorization was not successful or service level authorization is revoked",

the UE shall forward the service-level-AA response to the upper layers, so the UUA authorization data is deleted as specified in 3GPP TS 33.256 [24B].

The UE shall transport the PDU SESSION RELEASE COMPLETE message and the PDU session ID, using the NAS transport procedure as specified in subclause 5.4.5.

Upon receipt of a PDU SESSION RELEASE COMPLETE message, the SMF shall stop timer T3592 and shall consider the PDU session as released.

6.3.3.4 N1 SM delivery skipped

If the PDU SESSION RELEASE COMMAND message was sent along the N1 SM delivery skip allowed indication towards AMF, then upon receipt of an indication that N1 SM delivery was skipped, the SMF shall stop timer T3592 and shall consider the PDU session as released.

6.3.3.5 Abnormal cases on the network side

The following abnormal cases can be identified:

- a) Expiry of timer T3592.

The SMF shall, on the first expiry of the timer T3592, retransmit the PDU SESSION RELEASE COMMAND message and shall reset and start timer T3592. This retransmission is repeated four times, i.e., on the fifth expiry of timer T3592, the SMF shall abort the procedure and perform a local release of the PDU session.

- b) Collision of network-requested PDU session release procedure and UE-requested PDU session modification procedure.

When the SMF receives a PDU SESSION MODIFICATION REQUEST message during the network-requested PDU session release procedure, and the PDU session indicated in PDU SESSION MODIFICATION REQUEST message is the PDU session that the SMF had requested to release, the SMF shall ignore the PDU SESSION MODIFICATION REQUEST message and proceed with the PDU session release procedure.

- c) Collision of network-requested PDU session release procedure and UE-requested PDU session release procedure.

If the SMF receives a PDU SESSION RELEASE REQUEST message after sending a PDU SESSION RELEASE COMMAND message with the PTI IE set to "No procedure transaction identity assigned" to the UE, and the PDU session ID in the PDU SESSION RELEASE REQUEST message is the same as the PDU session ID in the PDU SESSION RELEASE COMMAND message:

- if the Access type IE is included in the PDU SESSION RELEASE COMMAND message and the PDU session is an MA PDU session and having user-plane resources established on the access different from the access indicated in the Access type IE in the PDU SESSION RELEASE COMMAND message, the SMF shall proceed both the UE-requested PDU session release procedure and network-requested PDU session release procedure;

- otherwise, the SMF shall ignore the PDU SESSION RELEASE REQUEST message and proceed with the network-requested PDU session release procedure.

- d) Collision of re-establishment of the user-plane resources and network-requested PDU session release procedure for the same PDU session.

If the SMF receives an indication from the AMF to re-establish the user-plane resources during the network-requested PDU session release procedure for the same PDU session, the SMF shall not re-establish the user-plane resources for the PDU session as specified in 3GPP TS 29.502 [20A] subclause 5.2.2.3.2.2 and proceed with the network-requested PDU session release procedure.

6.3.3.6 Abnormal cases in the UE

The following abnormal cases can be identified:

- a) PDU session inactive for the received PDU session ID.

If the PDU session ID in the PDU SESSION RELEASE COMMAND message belongs to any PDU session in state PDU SESSION INACTIVE in the UE, the UE shall include the 5GSM cause #43 "Invalid PDU session identity" in the 5GSM STATUS message, and set the PDU session ID to the received PDU session ID in the UL NAS TRANSPORT message as specified in subclause 5.4.5.

- b) User-plane resources of the MA PDU session on the access indicated in the Access type IE not established.

If the PDU session is an MA PDU session and has user-plane resources established on a single access different from the access indicated in the Access type IE, the UE shall not diagnose an error, further process the release command and consider the user-plane resources of the MA PDU session on the access indicated in the Access type IE as successfully released.

6.4 UE-requested 5GSM procedures

6.4.1 UE-requested PDU session establishment procedure

6.4.1.1 General

The purpose of the UE-requested PDU session establishment procedure is to establish a new PDU session with a DN, to perform handover of an existing PDU session between 3GPP access and non-3GPP access, to transfer an existing PDN connection in the EPS to the 5GS, to transfer an existing PDN connection in an untrusted non-3GPP access connected to the EPC to the 5GS, to establish an MA PDU session to support ATSSS (see 3GPP TS 24.193 [13B]), or to relay the service associated with the RSC for 5G ProSe layer-3 UE-to-network relay or for 5G ProSe multi-hop layer-3 UE-to-network relay (see 3GPP TS 24.554 [19E]). If accepted by the network, the PDU session enables exchange of PDUs between the UE and the DN.

The UE shall not request a PDU session establishment:

- a) for an LADN, if the DNN used for that LADN is included in the LADN information IE and the UE is located outside the LADN service area indicated in the LADN information IE;
- a1) for an LADN, if the DNN used for that LADN is included in the Extended LADN information IE and there is no S-NSSAI used for PDU session establishment;
- a2) for an LADN, if the DNN used for that LADN is included in the Extended LADN information IE and the S-NSSAI used for PDU session establishment is not associated with that LADN;
- a3) for an LADN, if the DNN and the S-NSSAI used for that LADN are included in the Extended LADN information IE and the UE is located outside the LADN service area indicated in the Extended LADN information IE;
- b) to transfer a PDU session from non-3GPP access to 3GPP access when the 3GPP PS data off UE status is "activated" and the UE is not using the PDU session to send uplink IP packets for any of the 3GPP PS data off exempt services (see subclause 6.2.10);

- c) when the UE is in NB-N1 mode, the UE has indicated preference for user plane CIoT 5GS optimization, the network has accepted the use of user plane CIoT 5GS optimization for the UE, and the number of PDU sessions that currently has user-plane resources established equals to the UE's maximum number of supported user-plane resources;
- d) to transfer a PDU session from 3GPP access to non-3GPP access when the UE has indicated preference for control plane CIoT 5GS optimization, the network has accepted the use of control plane CIoT 5GS optimization for the UE, and the Control plane only indication IE was received in the PDU SESSION ESTABLISHMENT ACCEPT message;
- e) to transfer a PDU session from the non-3GPP access to the 3GPP access when the UE is in NB-N1 mode, the UE has indicated preference for user plane CIoT 5GS optimization, the network has accepted the use of user plane CIoT 5GS optimization for the UE, and the number of PDU sessions that currently has user-plane resources established equals to the UE's maximum number of supported user-plane resources;
- f) associated to an S-NSSAI when the UE is not in the NS-AoS of the S-NSSAI; or
- g) associated to an S-NSSAI included in the partially allowed NSSAI when the current TA is not in the list of TAs where the S-NSSAI is allowed.

6.4.1.2 UE-requested PDU session establishment procedure initiation

In order to initiate the UE-requested PDU session establishment procedure, the UE shall create a PDU SESSION ESTABLISHMENT REQUEST message.

NOTE 0: When IMS voice is available over either 3GPP access or non-3GPP access, the "voice centric" UE in 5GMM-REGISTERED state will receive a request from upper layers to establish the PDU session for IMS signalling, if the conditions for performing an initial registration with IMS indicated in 3GPP TS 24.229 [14] subclause U.3.1.2 are satisfied.

If the UE requests to establish a new PDU session, the UE shall allocate a PDU session ID which is not currently being used by another PDU session over either 3GPP access or non-3GPP access. If the N5CW device supporting 3GPP access requests to establish a new PDU session via 3GPP access, the N5CW device supporting 3GPP access shall refrain from allocating "PDU session identity value 15". If the TWIF acting on behalf of the N5CW device requests to establish a new PDU session, the TWIF acting on behalf of the N5CW device shall allocate the "PDU session identity value 15".

The UE shall allocate a PTI value currently not used and shall set the PTI IE of the PDU SESSION ESTABLISHMENT REQUEST message to the allocated PTI value.

If the UE is registered for emergency services over the current access, the UE shall not request establishing a non-emergency PDU session over the current access. If the UE is registered for emergency services over the current access it shall not request establishing an emergency PDU session over the non-current access except if the request is for transferring the emergency PDU session to the non-current access. Before transferring an emergency PDU session from non-3GPP access to 3GPP access, or before transferring a PDN connection for emergency bearer services from untrusted non-3GPP access connected to EPC to 3GPP access, the UE shall check whether emergency services are supported in the NG-RAN cell (either an NR cell or an E-UTRA cell) on which the UE is camping.

NOTE 1: Transfer of an existing emergency PDU session or PDN connection for emergency bearer services between 3GPP access and non-3GPP access is needed e.g. if the UE determines that the current access is no longer available.

If the UE requests to establish a new emergency PDU session, the UE shall include the PDU session type IE in the PDU SESSION ESTABLISHMENT REQUEST message and shall set the IE to the IP version capability as specified in subclause 6.2.4.2.

If the UE requests to establish a new non-emergency PDU session with a DN, the UE shall include the PDU session type IE in the PDU SESSION ESTABLISHMENT REQUEST message and shall set the IE to one of the following values: "IPv4", "IPv6", "IPv4v6", "Ethernet" or "Unstructured" based on the URSP rules or based on UE local configuration (see 3GPP TS 24.526 [19]) and based on the IP version capability as specified in subclause 6.2.4.2.

NOTE 2: When the UE initiates the UE-requested PDU session establishment procedure to transfer an existing non-IP PDN connection in the EPS to the 5GS, the UE can use locally available information associated with the PDN connection to select the PDU session type between "Ethernet" and "Unstructured".

If the UE requests to establish a new non-emergency PDU session with a DN and the UE requests an SSC mode, the UE shall set the SSC mode IE of the PDU SESSION ESTABLISHMENT REQUEST message to the SSC mode. If the UE requests to establish a PDU session of "IPv4", "IPv6" or "IPv4v6" PDU session type, the UE shall either omit the SSC mode IE or set the SSC mode IE to "SSC mode 1", "SSC mode 2", or "SSC mode 3". If the UE requests to establish a PDU session of "Ethernet" or "Unstructured" PDU session type, the UE shall either omit the SSC mode IE or set the SSC mode IE to "SSC mode 1" or "SSC mode 2". If the UE requests transfer of an existing PDN connection in the EPS to the 5GS or the UE requests transfer of an existing PDN connection in an untrusted non-3GPP access connected to the EPC to the 5GS, the UE shall set the SSC mode IE to "SSC mode 1".

If the UE requests to establish a new emergency PDU session, the UE shall set the SSC mode IE of the PDU SESSION ESTABLISHMENT REQUEST message to "SSC mode 1".

A UE supporting PDU connectivity service shall support SSC mode 1 and may support SSC mode 2 and SSC mode 3 as specified in 3GPP TS 23.501 [8].

If the UE requests to establish a new non-emergency PDU session with a DN, the UE may include the SM PDU DN request container IE with a DN-specific identity of the UE complying with network access identifier (NAI) format as specified in IETF RFC 7542 [37].

NOTE 3: The UE can avoid including both the SM PDU DN request container IE and the Extended protocol configuration options IE with PAP/CHAP protocol identifiers in the PDU SESSION ESTABLISHMENT REQUEST message. The way to achieve this is implementation dependent.

If the UE requests to:

- a) establish a new PDU session;
- b) perform handover of an existing PDU session from non-3GPP access to 3GPP access;
- c) transfer an existing PDN connection in the EPS to the 5GS according to subclause 4.8.2.3.1;
- d) transfer an existing PDN connection in untrusted non-3GPP access connected to the EPC to the 5GS; or
- e) establish user plane resources over 3GPP access of an MA PDU session established over non-3GPP access only;

and the UE at the same time intends to join one or more multicast MBS sessions that is associated to the PDU session, the UE should include the Requested MBS container IE in the PDU SESSION ESTABLISHMENT REQUEST message. In that case, the UE shall set the MBS operation to "Join multicast MBS session" and include the multicast MBS session information(s) and shall set the Type of multicast MBS session ID for each of the multicast MBS session information to either "Temporary Mobile Group Identity (TMGI)" or "Source specific IP multicast address" depending on the type of the multicast MBS session ID available in the UE. Then the remaining values of each of the multicast MBS session information shall be set as following:

- a) if the Type of multicast MBS session ID is set to "Temporary Mobile Group Identity (TMGI)", the UE shall set the multicast MBS session ID to the TMGI; or
- b) if the Type of multicast MBS session ID is set to "Source specific IP multicast address for IPv4" or "Source specific IP multicast address for IPv6", the UE shall set the Source IP address information and the Destination IP address information to the corresponding values.

The UE should not request to join a multicast MBS session for local MBS service if neither current TAI nor CGI of the current cell is part of the MBS service area(s) of the multicast MBS session, if the UE has valid information of the MBS service area(s) of the multicast MBS session.

NOTE 4: The UE obtains the details of the MBS session ID(s) e.g., TMGI, Source IP address information and Destination IP address information as a pre-configuration in the UE or during the MBS service announcement, which is out of scope of this specification. Pre-configuration can be provided in one or more of the following ways:

- a) in a UE implementation-specific way (e.g. factory configuration);
- b) in the USIM (see EF_{5MBSUECONFIG} file in 3GPP TS 31.102 [22]); or
- c) in the UE pre-configuration MO for MBS (see 3GPP TS 24.575 [65]).

The UE should set the RQoS bit to "Reflective QoS supported" in the 5GSM capability IE of the PDU SESSION ESTABLISHMENT REQUEST message if the UE supports reflective QoS and:

- a) the UE requests to establish a new PDU session of "IPv4", "IPv6", "IPv4v6" or "Ethernet" PDU session type;
- b) the UE requests to transfer an existing PDN connection in the EPS of "IPv4", "IPv6", "IPv4v6" or "Ethernet" PDN type or of "Non-IP" PDN type mapping to "Ethernet" PDU session type, to the 5GS; or
- c) the UE requests to transfer an existing PDN connection in an untrusted non-3GPP access connected to the EPC of "IPv4", "IPv6" or "IPv4v6" PDN type to the 5GS.

NOTE 5: The determination to not request the usage of reflective QoS by the UE for a PDU session is implementation dependent.

The UE shall indicate the maximum number of packet filters that can be supported for the PDU session in the Maximum number of supported packet filters IE of the PDU SESSION ESTABLISHMENT REQUEST message if:

- a) the UE requests to establish a new PDU session of "IPv4", "IPv6", "IPv4v6", or "Ethernet" PDU session type, and the UE can support more than 16 packet filters for this PDU session;
- b) the UE requests to transfer an existing PDN connection in the EPS of "IPv4", "IPv6", "IPv4v6", or "Ethernet" PDN type or of "Non-IP" PDN type mapping to "Ethernet" PDU session type, to the 5GS and the UE can support more than 16 packet filters for this PDU session; or
- c) the UE requests to transfer an existing PDN connection in an untrusted non-3GPP access connected to the EPC of "IPv4", "IPv6" or "IPv4v6" PDN type to the 5GS and the UE can support more than 16 packet filters for this PDU session.

The UE shall include the Integrity protection maximum data rate IE in the PDU SESSION ESTABLISHMENT REQUEST message to indicate the maximum data rate per UE for user-plane integrity protection supported by the UE for uplink and the maximum data rate per UE for user-plane integrity protection supported by the UE for downlink.

The UE shall set the MH6-PDU bit to "Multi-homed IPv6 PDU session supported" in the 5GSM capability IE of the PDU SESSION ESTABLISHMENT REQUEST message if the UE supports multi-homed IPv6 PDU session and:

- a) the UE requests to establish a new PDU session of "IPv6" or "IPv4v6" PDU session type; or.
- b) the UE requests to transfer an existing PDN connection of "IPv6" or "IPv4v6" PDN type in the EPS or in an untrusted non-3GPP access connected to the EPC to the 5GS.

The UE shall set the EPT-S1 bit to "Ethernet PDN type in S1 mode supported" in the 5GSM capability IE of the PDU SESSION ESTABLISHMENT REQUEST message if the UE supports Ethernet PDN type in S1 mode and requests "Ethernet" PDU session type.

If the UE requests to establish a new PDU session as an always-on PDU session (e.g. because the PDU session is for time synchronization or TSC), the UE shall include the Always-on PDU session requested IE and set the value of the IE to "Always-on PDU session requested" in the PDU SESSION ESTABLISHMENT REQUEST message.

NOTE 6: Determining whether a PDU session is for time synchronization or TSC is UE implementation dependent.

If the UE has an emergency PDU session, the UE shall not perform the UE-requested PDU session establishment procedure to establish another emergency PDU session. The UE may perform the UE-requested PDU session establishment procedure to transfer an existing emergency PDU session or an existing PDN connection for emergency services.

If:

- a) the UE requests to perform handover of an existing PDU session between 3GPP access and non-3GPP access;
- b) the UE requests to perform transfer an existing PDN connection in the EPS to the 5GS; or
- c) the UE requests to perform transfer an existing PDN connection in an untrusted non-3GPP access connected to the EPC to the 5GS;

the UE shall:

- a) set the PDU session ID in the PDU SESSION ESTABLISHMENT REQUEST message and in the UL NAS TRANSPORT message to the stored PDU session ID corresponding to the PDN connection; and
- b) set the S-NSSAI in the UL NAS TRANSPORT message to the stored S-NSSAI associated with the PDU session ID of a non-emergency PDU session. The UE shall not request to perform handover of an existing non-emergency PDU session:
 - 1) between 3GPP access and non-3GPP access if the S-NSSAI is not included in the allowed NSSAI for the target access; or
 - 2) from non-3GPP access to 3GPP access:
 - i) if the S-NSSAI is not in the partially allowed NSSAI for 3GPP access; or
 - ii) if the S-NSSAI is in the partially allowed NSSAI for 3GPP access but the current TAI is not in the list of TAs for which the S-NSSAI is allowed.

If the N5CW device supporting 3GPP access requests to perform handover of an existing PDU session from non-3GPP access to 3GPP access, the N5CW device supporting 3GPP access shall set the PDU session ID in the PDU SESSION ESTABLISHMENT REQUEST message and in the UL NAS TRANSPORT message to "PDU session identity value 15".

If the UE is registered to a network which supports ATSSS and the UE requests to establish a new PDU session the UE may allow the network to upgrade the requested PDU session to an MA PDU session. In order to allow the network to upgrade the requested PDU session to an MA PDU session, the UE shall set "MA PDU session network upgrade is allowed" in the MA PDU session information IE and shall set the request type to "initial request" in the UL NAS TRANSPORT message. If the UE is registered to a network which does not support ATSSS, the UE shall not perform the procedure to allow the network to upgrade the requested PDU session to an MA PDU session.

If the UE is registered to a network which supports ATSSS, the UE may request to establish an MA PDU session. If the UE requests to establish an MA PDU session, the UE shall set the request type to "MA PDU request" in the UL NAS TRANSPORT message. If the UE is registered to a network which does not support ATSSS, the UE shall not request to establish an MA PDU session.

When the UE is registered over both 3GPP access and non-3GPP access in the same PLMN and the UE requests to establish a new MA PDU session, the UE may provide an S-NSSAI in the UL NAS TRANSPORT message only if the S-NSSAI is included in the allowed NSSAIs of both accesses.

NOTE 7: If the UE requested DNN corresponds to an LADN DNN, the AMF does not forward the MA PDU session information IE to the SMF but sends the message back to the UE to inform of the unhandled request (see subclause 5.4.5.2.5).

NOTE 7B: The "MPQUIC-UDP functionality" is referred to as "MPQUIC functionality" in previous releases of this specification.

If the UE is registered to a network which supports ATSSS and the UE has already an MA PDU session established over one access, the UE may perform the UE-requested PDU session establishment procedure to establish user-plane resources over the other access for the MA PDU session as specified in subclause 4.22 of 3GPP TS 23.502 [9] and the S-NSSAI associated with the MA PDU session is included in the allowed NSSAI of the other access. If the UE establishes user-plane resources over the other access for the MA PDU session, the UE shall:

- a) set the request type to "MA PDU request" in the UL NAS TRANSPORT message;
- b) set the PDU session ID to the stored PDU session ID corresponding to the established MA PDU session in the PDU SESSION ESTABLISHMENT REQUEST message and in the UL NAS TRANSPORT message; and
- c) set the S-NSSAI in the UL NAS TRANSPORT message to the stored S-NSSAI associated with the PDU session ID.

If the UE requests to establish a new MA PDU session or if the UE requests to establish a new PDU session and the UE allows the network to upgrade the requested PDU session to an MA PDU session, the UE shall:

- a) set the ATSSS-ST bits in the 5GSM capability IE of the PDU SESSION ESTABLISHMENT REQUEST message to indicate the ATSSS-LL and MPTCP functionalities, respectively, which the UE supports (see table 9.11.4.1.1) according to what is specified in subclause 5.32.6.1 of 3GPP TS 23.501 [8]; and

- b) set the ATSSS-LL, MPTCP, MPQUIC-UDP, MPQUIC-IP and MPQUIC-E bits in the 5GSM capability IE of the PDU SESSION ESTABLISHMENT REQUEST message to indicate the ATSSS-LL, MPTCP, MPQUIC-UDP, MPQUIC-IP and MPQUIC-E functionalities, respectively, which the UE supports (see table 9.11.4.1.1) according to what is specified in subclause 5.32.6.1 of 3GPP TS 23.501 [8].

NOTE 7A: Usage of the ATSSS-ST bits to indicate support for ATSSS functionality was deprecated in Rel-18 in favor of the ATSSS-LL, MPTCP, MPQUIC-UDP, MPQUIC-IP and MPQUIC-E bits. The setting of the ATSSS-ST bits is necessary for backward compatibility with the earlier releases. The UE sets the ATSSS-ST field in the same way as a UE from previous releases.

NOTE 8: The ATSSS LL functionality cannot be used together with the redundant steering mode. When the UE indicates that it is capable of supporting the ATSSS LL functionality with any steering mode allowed for ATSSS-LL, it implies that the UE supports the ATSSS LL functionality with any steering mode except the redundant steering mode.

- c) void;
- d) void;
- e) void;
- f) void;
- g) void;
- h) void.

If a performance measurement function in the UE can perform access performance measurements using the QoS flow of the non-default QoS rule as specified in subclause 5.32.5 of 3GPP TS 23.501 [8], the UE shall set the APMQF bit to "Access performance measurements per QoS flow supported" in the 5GSM capability IE of the PDU SESSION ESTABLISHMENT REQUEST message.

Upon receipt of a PDU SESSION ESTABLISHMENT REQUEST message for MA PDU session establishment, the SMF shall check if:

- a) the ATSSS-LL, MPTCP, MPQUIC-UDP, MPQUIC-IP and MPQUIC-E bits (if any of the ATSSS-LL, MPTCP, MPQUIC-UDP, MPQUIC-IP and MPQUIC-E bits, respectively, is set); or
- b) the ATSSS-ST bits (if none of the ATSSS-LL, MPTCP, MPQUIC-UDP, MPQUIC-IP and MPQUIC-E bits, respectively, is set);

in the 5GSM capability IE in the PDU SESSION ESTABLISHMENT REQUEST message, indicate:

NOTE 8A: If any of the ATSSS-LL, MPTCP, MPQUIC-UDP, MPQUIC-IP and MPQUIC-E bits, respectively, is set, then the SMF ignores the values in the ATSSS-ST bits.

- a) support for any of the possible steering functionalities in addition to the ATSSS-LL functionality with only active-standby steering mode. If so, and:
 - i) the DNN configuration allows for the indicated steering functionality(ies) and the ATSSS-LL functionality with any steering mode allowed for ATSSS-LL but does not allow RTT measurement without using PMF protocol, the SMF shall ensure that the PDU session being established has the capability of indicated steering functionality(ies) (except MPQUIC-E functionality if indicated for the case specified in clause 4.22.2.2 of 3GPP TS 23.502 [9]) and the ATSSS-LL with only active-standby steering mode, load balancing steering mode or priority based steering mode steering mode in the downlink and indicated steering functionality(ies) (except MPQUIC-E functionality if indicated for the case specified in clause 4.22.2.2 of 3GPP TS 23.502 [9]) and the ATSSS-LL with only active-standby steering mode in the uplink;
 - ii) the DNN configuration allows for indicated steering functionality(ies) and the ATSSS-LL functionality with any steering mode allowed for ATSSS-LL and allows RTT measurement without using PMF protocol, the SMF shall ensure that the PDU session being established has the capability of indicated steering functionality(ies) (except MPQUIC-E functionality if indicated for the case specified in clause 4.22.2.2 of 3GPP TS 23.502 [9]) and the ATSSS-LL functionality with any steering mode in the downlink and indicated steering functionality(ies) (except MPQUIC-E functionality if indicated for the case specified in

clause 4.22.2.2 of 3GPP TS 23.502 [9]) and the ATSSS-LL with only active-standby steering mode in the uplink; or

- iii) the DNN configuration allows for indicated steering functionality(ies) and the ATSSS-LL functionality with only active-standby steering mode, the SMF shall ensure that the PDU session being established has the capability of indicated steering functionality(ies) (except MPQUIC-E functionality if indicated for the case specified in clause 4.22.2.2 of 3GPP TS 23.502 [9]) and the ATSSS-LL with only active-standby steering mode in the downlink and the uplink;
- b) support for ATSSS LL functionality with any steering mode allowed for ATSSS-LL. If so, and the DNN configuration allows for the ATSSS-LL functionality with any steering mode allowed for ATSSS-LL, the SMF shall ensure that the PDU session being established has the capability of ATSSS-LL functionality with any steering mode allowed for ATSSS-LL in the downlink and the uplink;
- c) void;
- d) void;
- e) void;
- f) void;
- g) void;
- h) support for any of the possible steering functionalities in addition to the ATSSS-LL functionality with any steering mode allowed for ATSSS-LL. If so, and the DNN configuration does not allow for the indicated steering functionality and allows for the ATSSS-LL functionality with any steering mode, allowed for ATSSS-LL, the SMF shall ensure that the PDU session being established has the capability of ATSSS-LL with any steering mode allowed for ATSSS-LL in the downlink and the uplink;
- i) support for any of the possible steering functionalities in addition to at least ATSSS-LL functionality with only active-standby steering mode. If so, and the DNN configuration does not allow for the indicated steering functionality and allows at least for the ATSSS-LL functionality with only active-standby steering mode, the SMF shall ensure that the PDU session being established has the capability of ATSSS-LL with only active-standby steering mode in the downlink and the uplink; or
- j) support for only MPQUIC-IP functionality with any steering mode. If so, and the DNN configuration allows the MPQUIC-IP functionality with any steering mode, the SMF shall ensure that the PDU session being established has the capability of MPQUIC-IP with any steering mode in the downlink and the uplink.

If the UE requests to establish a new MA PDU session and the UE supports to establish a PDN connection as the user plane resource of an MA PDU session, the UE shall include the ATSSS request parameter in the Extended protocol configuration options IE of the PDU SESSION ESTABLISHMENT REQUEST message.

If the UE is registered to a network which does not support ATSSS and the UE has already an MA PDU session established over one access, the UE shall not attempt to establish user-plane resources for the MA PDU session over the network which does not support ATSSS as specified in subclause 4.22 of 3GPP TS 23.502 [9].

If the UE supports 3GPP PS data off, except for the transfer of a PDU session from non-3GPP access to 3GPP access and except for the establishment of user plane resources on the other access for the MA PDU session, the UE shall include the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT REQUEST message and include the 3GPP PS data off UE status. The UE behaves as described in subclause 6.2.10.

If the UE supports Reliable Data Service, the UE shall include the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT REQUEST message and include the Reliable Data Service request indicator. The UE behaves as described in subclause 6.2.15.

If the UE supports DNS over (D)TLS (see 3GPP TS 33.501 [24]), the UE shall include the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT REQUEST message and include DNS server security information indicator and optionally, if the UE wishes to indicate which security protocol type(s) are supported by the UE, it may include the DNS server security protocol support.

NOTE 9: Support of DNS over (D)TLS is based on the requirements as specified in 3GPP TS 33.501 [24].

If:

- a) the PDU session type value of the PDU session type IE is set to "IPv4", "IPv6" or "IPv4v6";
- b) the UE indicates "Control plane CIoT 5GS optimization supported" and "IP header compression for control plane CIoT 5GS optimization supported" in the 5GMM capability IE of the REGISTRATION REQUEST message; and
- c) the network indicates "Control plane CIoT 5GS optimization supported" and "IP header compression for control plane CIoT 5GS optimization supported" in the 5GS network support feature IE of the REGISTRATION ACCEPT message;

the UE shall include the IP header compression configuration IE in the PDU SESSION ESTABLISHMENT REQUEST message.

If:

- a) the PDU session type value of the PDU session type IE is set to "Ethernet";
- b) the UE indicates "Control plane CIoT 5GS optimization supported" and "Ethernet header compression for control plane CIoT 5GS optimization supported" in the 5GMM capability IE of the REGISTRATION REQUEST message; and
- c) the network indicates "Control plane CIoT 5GS optimization supported" and "Ethernet header compression for control plane CIoT 5GS optimization supported" in the 5GS network support feature IE of the REGISTRATION ACCEPT message;

the UE shall include the Ethernet header compression configuration IE in the PDU SESSION ESTABLISHMENT REQUEST message.

If the UE supports transfer of port management information containers, the UE shall:

- a) set the TPMIC bit to "Transfer of port management information containers supported" in the 5GSM capability IE of the PDU SESSION ESTABLISHMENT REQUEST message;
- b) if the UE requests to establish a PDU session of "Ethernet" PDU session type, include the DS-TT Ethernet port MAC address IE in the PDU SESSION ESTABLISHMENT REQUEST message and set its contents to the MAC address of the DS-TT Ethernet port used for the PDU session;
- c) if the UE-DS-TT residence time is available at the UE, include the UE-DS-TT residence time IE and set its contents to the UE-DS-TT residence time; and
- d) if a Port management information container is provided by the DS-TT, include the Port management information container IE in the PDU SESSION ESTABLISHMENT REQUEST message.

NOTE 10: Only SSC mode 1 is supported for a PDU session which is for time synchronization or TSC.

If the UE supports secondary DN authentication and authorization over EPC, the UE shall set the SDNAEPC bit to "Secondary DN authentication and authorization over EPC supported" in the 5GSM capability IE of the PDU SESSION ESTABLISHMENT REQUEST message.

If the UE supports (S)RTP multiplexed media identification information, the UE shall set the RTPMMII bit to "(S)RTP multiplexed media identification information supported" in the 5GSM capability IE of the PDU SESSION ESTABLISHMENT REQUEST message.

If the UE supporting S1 mode supports receiving QoS rules with the length of two octets or QoS flow descriptions with the length of two octets via the Extended protocol configuration options IE, the UE shall include the QoS rules with the length of two octets support indicator or the QoS flow descriptions with the length of two octets support indicator, respectively, in the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT REQUEST message.

If the UE supports URSP provisioning in EPS, the UE shall include the URSP provisioning in EPS support indicator in the Extended protocol configuration options IE of the PDU SESSION ESTABLISHMENT REQUEST message.

If:

- a) the UE is operating in single-registration mode;

- b) the UE supports local IP address in traffic flow aggregate description and TFT filter in S1 mode; and
- c) the PDU session Type requested is different from "Unstructured".

the UE shall indicate the support of local address in TFT in S1 mode in the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT REQUEST message.

If the W-AGF acting on behalf of the FN-RG requests to establish a PDU session of "IPv6" or "IPv4v6" PDU session type, the W-AGF acting on behalf of the FN-RG may include in the PDU SESSION ESTABLISHMENT REQUEST message the Suggested interface identifier IE with the PDU session type value field set to "IPv6" and containing the interface identifier for the IPv6 link local address associated with the PDU session suggested to be allocated to the FN-RG.

If the UE supports provisioning of ECS configuration information to the EEC in the UE, then the UE shall include the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT REQUEST message and shall include the ECS configuration information provisioning support indicator.

If the UE supports receiving DNS server addresses in protocol configuration options, the UE shall include the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT REQUEST message and in the Extended protocol configuration options IE:

- a) if the UE requests to establish a PDU session of "IPv4" or "IPv4v6" PDU session type, the UE shall include the DNS server IPv4 address request; and
- b) if the UE requests to establish a PDU session of "IPv6" or "IPv4v6" PDU session type, the UE shall include the DNS server IPv6 address request.

If the UE supporting UAS services requests to establish a PDU session for C2 communication, the UE shall include the Service-level-AA container IE in the PDU SESSION ESTABLISHMENT REQUEST message. In the Service-level-AA container IE, the UE shall include:

- a) the service-level device ID with the value set to the CAA-level UAV ID of the UE; and
- b) if available, the service-level-AA payload with the value set to the C2 authorization payload and the service-level-AA payload type with the value set to "C2 authorization payload".

NOTE 11: The C2 authorization payload in the service-level-AA payload can include one, some or all of the pairing information for C2 communication, an indication of the request for direct C2 communication, pairing information for direct C2 communication, and the UAV flight authorization information.

If the UE supports the EAS rediscovery, the UE shall include the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT REQUEST message and shall include the EAS rediscovery support indication in the Extended protocol configuration options IE.

If the UE needs to include a PDU session pair ID based on the matching URSP rule or UE local configuration, the UE shall include the PDU session pair ID IE in the PDU SESSION ESTABLISHMENT REQUEST message. If the UE needs to include an RSN based on the matching URSP rule or UE local configuration, the UE shall include the RSN IE in the PDU SESSION ESTABLISHMENT REQUEST message.

If the UE is not registered for onboarding services in SNPN and needs PVS information, the UE shall include the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT REQUEST message and include the PVS information request in the Extended protocol configuration options IE.

If the UE supports the EDC, the UE shall include the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT REQUEST message and shall include the EDC support indicator in the Extended protocol configuration options IE.

If the UE supports a "destination MAC address range type" packet filter component and a "source MAC address range type" packet filter component, the UE shall include the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT REQUEST message and shall include the MS support of MAC address range in 5GS indicator in the Extended protocol configuration options IE.

If the UE supports reporting of URSP rule enforcement and is indicated to send URSP rule enforcement report to network based on the matching URSP rule which contains the URSP rule enforcement report indication set to "URSP

rule enforcement report is required", the UE shall include the URSP rule enforcement reports IE in the PDU SESSION ESTABLISHMENT REQUEST message.

The UE shall transport:

- a) the PDU SESSION ESTABLISHMENT REQUEST message;
- b) the PDU session ID of the PDU session being established, being handed over, being transferred, or been established as an MA PDU session;
- c) if the request type is set to:
 - 1) "initial request" or "MA PDU request" and the UE determined to establish a new PDU session or an MA PDU session based on either a URSP rule including one or more S-NSSAIs in the URSP (see subclause 6.2.9) or UE local configuration, according to subclause 4.2.2 of 3GPP TS 24.526 [19]:
 - i) if the UE is in the PLMN whose PLMN code is the PLMN code derived from the IMSI or in the subscribed SNPN, an S-NSSAI in the allowed NSSAI which corresponds to one of the S-NSSAI(s) in the matching URSP rule, if any, or else to the S-NSSAI(s) in the UE local configuration or in the default URSP rule, if any, according to the conditions given in subclause 4.2.2 of 3GPP TS 24.526 [19];
 - ii) if the UE is in a non-subscribed SNPN, the UE determined according to the conditions given in subclause 4.2.2 of 3GPP TS 24.526 [19] to establish a new PDU session or an MA PDU session based on a URSP rule including one or more S-NSSAIs, and the URSP rule is a part of a non-subscribed SNPN signalled URSP (see 3GPP TS 24.526 [19]):
 - A) an S-NSSAI in the allowed NSSAI, which is one of the S-NSSAI(s) in the URSP rule; and
 - B) a mapped S-NSSAI associated with the S-NSSAI in A); or
 - iii) if the UE is in a PLMN whose PLMN code is not the PLMN code derived from the IMSI:
 - A) one of the mapped S-NSSAI(s) which is equal to one of the S-NSSAI(s) in the matching URSP rule, if any, or else to the S-NSSAI(s) in the UE local configuration or in the default URSP rule, if any, according to the conditions given in subclause 4.2.2 of 3GPP TS 24.526 [19]; and
 - B) the S-NSSAI in the allowed NSSAI associated with the mapped S-NSSAI in A);

NOTE 11A: When the UE is roaming and the AMF is compliant with earlier versions of the specification or when the UE is in an EHPLMN in which the AMF does not provide mapped S-NSSAIs as specified in clause 4.6.1, the AMF can omit providing to the UE a mapped S-NSSAI for one or more S-NSSAIs in the allowed NSSAI. The UE then locally sets the mapped S-NSSAI as specified in subclause 4.6.2.1 and uses it for item A), but does not include it in the NAS signalling towards the network.

- 1a) "initial request" and the UE determined to establish a new PDU session based on the PDU session parameters for 5G ProSe layer-3 UE-to-network relay UE including an S-NSSAI in the UE policies for 5G ProSe UE-to-network relay UE as defined in 3GPP TS 24.555 [19F]:
 - i) if the UE is in the PLMN whose PLMN code is the PLMN code derived from the IMSI, an S-NSSAI in the allowed NSSAI which corresponds to the S-NSSAI in the selected PDU session parameters for 5G ProSe layer-3 UE-to-network relay UE, if any; or
 - ii) if the UE is in a PLMN whose PLMN code is not the PLMN code derived from the IMSI:
 - A) one of the mapped S-NSSAI(s) which corresponds to the S-NSSAI in the selected PDU session parameters for 5G ProSe layer-3 UE-to-network relay UE, if any; and
 - B) the S-NSSAI in the allowed NSSAI associated with the S-NSSAI in A);

NOTE 12: When the UE is roaming and the AMF is compliant with earlier versions of the specification or when the UE is in an EHPLMN in which the AMF does not provide mapped S-NSSAIs as specified in clause 4.6.1, the AMF can omit providing to the UE a mapped S-NSSAI for one or more S-NSSAIs in the allowed NSSAI. The UE then locally sets the mapped S-NSSAI as specified in subclause 4.6.2.1 and uses it for item A), but does not include it in the NAS signalling towards the network.

1b) "initial request" and the UE has the partially allowed NSSAI and determined to establish a new PDU session based on either a URSP rule including one or more S-NSSAIs in the URSP (see subclause 6.2.9) or UE local configuration, according to subclause 4.2.2 of 3GPP TS 24.526 [19]:

- i) if the UE is in the PLMN whose PLMN code is the PLMN code derived from the IMSI or in the subscribed SNPN and the current TA is in the list of TAs for which the S-NSSAI is allowed, an S-NSSAI in the partially allowed NSSAI which corresponds to one of the S-NSSAI(s) in the matching URSP rule, if any, or else to the S-NSSAI(s) in the UE local configuration or in the default URSP rule, if any, according to the conditions given in subclause 4.2.2 of 3GPP TS 24.526 [19];
- ii) if the UE is in a non-subscribed SNPN, the UE determined according to the conditions given in subclause 4.2.2 of 3GPP TS 24.526 [19] to establish a new PDU session based on a URSP rule including one or more S-NSSAIs, the URSP rule is a part of a non-subscribed SNPN signalled URSP (see 3GPP TS 24.526 [19]) and the current TA is in the list of TAs for which the S-NSSAI is allowed:
 - A) an S-NSSAI in the partially allowed NSSAI, which is one of the S-NSSAI(s) in the URSP rule; and
 - B) a mapped S-NSSAI associated with the S-NSSAI in A); or
- iii) if the UE is in a PLMN whose PLMN code is not the PLMN code derived from the IMSI and the current TA is in the list of TAs for which the S-NSSAI is allowed:
 - A) one of the mapped S-NSSAI(s) which is equal to one of the S-NSSAI(s) in the matching URSP rule, if any, or else to the S-NSSAI(s) in the UE local configuration or in the default URSP rule, if any, according to the conditions given in subclause 4.2.2 of 3GPP TS 24.526 [19]; and
 - B) the S-NSSAI in the partially allowed NSSAI associated with the mapped S-NSSAI in A); or

NOTE 12A: When the UE is in an EHPLMN in which the AMF does not provide mapped S-NSSAIs as specified in clause 4.6.1, the AMF can omit providing to the UE a mapped S-NSSAI for the S-NSSAIs in the partially allowed NSSAI. The UE then locally sets the mapped S-NSSAI as specified in subclause 4.6.2.1 and uses it for item A), but does not include it in the NAS signalling towards the network.

- 2) "existing PDU session", an S-NSSAI, which is an S-NSSAI in the allowed NSSAI associated with the PDU session and a mapped S-NSSAI, with exception when S-NSSAI is not provided by the network as described in subclause 4.6.1 or 6.1.4.2;
- c1) the alternative S-NSSAI associated with the S-NSSAI to be replaced, if an alternative S-NSSAI for the S-NSSAI or the mapped S-NSSAI exists;
- d) if the request type is set to:
- 1) "initial request" or "MA PDU request" and the UE determined to establish a new PDU session or an MA PDU session based on either a URSP rule including one or more DNNs in the URSP (see subclause 6.2.9) or UE local configuration, according to subclause 4.2.2 of 3GPP TS 24.526 [19], a DNN which corresponds to one of the DNN(s) in the matching URSP rule, if any, or else to the DNN(s) in the UE local configuration or in the default URSP rule, if any, according to the conditions given in subclause 4.2.2 of 3GPP TS 24.526 [19];
 - 1a) "initial request" and the UE determined to establish a new PDU session based on the PDU session parameters for 5G ProSe layer-3 UE-to-network relay UE including a DNN in the UE policies for 5G ProSe UE-to-network relay UE as defined in 3GPP TS 24.555 [19F], a DNN which corresponds to the DNN in the selected PDU session parameters for 5G ProSe layer-3 UE-to-network relay UE, if any; or
 - 2) "existing PDU session", a DNN which is a DNN associated with the PDU session;
- e) the request type which is set to:
- 1) "initial request", if the UE is not registered for emergency services and the UE requests to establish a new non-emergency PDU session;
 - 2) "existing PDU session", if the UE is not registered for emergency services and the UE requests:
 - i) handover of an existing non-emergency PDU session between 3GPP access and non-3GPP access;
 - ii) transfer of an existing PDN connection for non-emergency bearer services in the EPS to the 5GS; or

- iii) transfer of an existing PDN connection for non-emergency bearer services in an untrusted non-3GPP access connected to the EPC to the 5GS;
- 3) "initial emergency request", if the UE requests to establish a new emergency PDU session;
- 4) "existing emergency PDU session", if the UE requests:
 - i) handover of an existing emergency PDU session between 3GPP access and non-3GPP access;
 - ii) transfer of an existing PDN connection for emergency bearer services in the EPS to the 5GS; or
 - iii) transfer of an existing PDN connection for emergency bearer services in an untrusted non-3GPP access connected to the EPC to the 5GS; or
- 5) "MA PDU request", if:
 - i) the UE requests to establish an MA PDU session;
 - ii) the UE requests to establish user plane resources over other access of an MA PDU session established over one access only; or
 - iii) the UE performs inter-system change from S1 mode to N1 mode according to subclause 4.8.2.3.1 and requests transfer of a PDN connection which is a user plane resource of an MA PDU session; and
- f) the old PDU session ID which is the PDU session ID of the existing PDU session, if the UE initiates the UE-requested PDU session establishment procedure upon receiving the PDU SESSION MODIFICATION COMMAND messages with the 5GSM cause IE set to #39 "reactivation requested";

NOTE 13: If the PDU SESSION MODIFICATION COMMAND message included alternative S-NSSAI, the UE includes alternative S-NSSAI in the PDU SESSION ESTABLISHMENT REQUEST message for PDU session re-establishment.

using the NAS transport procedure as specified in subclause 5.4.5, and the UE shall start timer T3580 (see example in figure 6.4.1.2.1).

For bullet c) 1), if the matching URSP rule does not have an associated S-NSSAI, or if the UE does not have any matching URSP rule and there is no S-NSSAI in the UE local configuration or in the default URSP rule, the UE shall not provide any S-NSSAI in a PDU session establishment procedure.

For bullet c) 1a), if the selected PDU session parameters for 5G ProSe layer-3 UE-to-network relay UE do not have an associated S-NSSAI, the UE shall not provide any S-NSSAI in a PDU session establishment procedure.

For bullet d) 1),

- If the matching non-default URSP rule does not have an associated DNN, then the UE shall not provide any DNN in a PDU session establishment procedure;
- If the UE does not have any matching non-default URSP rule, the UE requests a connectivity that requires PAP/CHAP and the UE is configured with the default DNN for the S-NSSAI in the UE local configuration corresponding to the request, then the UE should provide such DNN in a PDU session establishment procedure;
- If the UE does not have any matching non-default URSP rule, the UE requests a connectivity that requires PAP/CHAP, the UE is not configured with the default DNN for the S-NSSAI in the UE local configuration corresponding to the request, and the application provides the DNN, then the UE shall use such DNN in a PDU session establishment procedure;
- If the UE does not have any matching non-default URSP rule, the UE requests a connectivity that does not require PAP/CHAP, the UE is not configured with the DNN for the S-NSSAI in the UE local configuration corresponding to the request, and the application provides the DNN, then the UE shall use such DNN in a PDU session establishment procedure;
- If the UE does not have any matching non-default URSP rule, the UE requests a connectivity that requires PAP/CHAP, the UE is not configured with the default DNN for the S-NSSAI in the UE local configuration corresponding to the request, the application does not provide the DNN and there is no DNN in the default URSP rule, then the UE shall not provide any DNN in a PDU session establishment procedure; or

- If the UE does not have any matching non-default URSP rule, the UE requests a connectivity that does not require PAP/CHAP, the UE is not configured with the DNN for the S-NSSAI in the UE local configuration corresponding to the request, the application does not provide the DNN and there is no DNN in the default URSP rule, then the UE shall not provide any DNN in a PDU session establishment procedure.

For bullet d) 1a), if the selected the PDU session parameters for 5G ProSe layer-3 UE-to-network relay UE do not have an associated DNN, the UE shall not provide any DNN in a PDU session establishment procedure.

If the request type is set to "initial emergency request" or "existing emergency PDU session" or the UE is registered for onboarding services in SNPN, neither DNN nor S-NSSAI is transported by the UE using the NAS transport procedure as specified in subclause 5.4.5.

Figure 6.4.1.2.1: UE-requested PDU session establishment procedure

Upon receipt of a PDU SESSION ESTABLISHMENT REQUEST message, a PDU session ID, optionally an S-NSSAI associated with optionally a mapped S-NSSAI, optionally a DNN determined by the AMF, optionally a DNN selected by the network (if different from the DNN determined by the AMF), the request type, and optionally an old PDU session ID, the SMF checks whether connectivity with the requested DN can be established. If the requested DNN is not included, the SMF shall use the default DNN.

If the PDU session being established is a non-emergency PDU session, the request type is not set to "existing PDU session" and the PDU session authentication and authorization by the external DN is required due to local policy, the SMF shall check whether the PDU SESSION ESTABLISHMENT REQUEST message includes the SM PDU DN request container IE or the Service-level-AA container IE.

If the PDU session being established is a non-emergency PDU session, the request type is not set to "existing PDU session", the SM PDU DN request container IE is included in the PDU SESSION ESTABLISHMENT REQUEST message, the PDU session authentication and authorization by the external DN is required due to local policy and user's subscription data, and:

- a) the information for the PDU session authentication and authorization by the external DN in the SM PDU DN request container IE is compliant with the local policy and user's subscription data, the SMF shall proceed with the EAP Authentication procedure specified in 3GPP TS 33.501 [24] and refrain from accepting or rejecting the PDU SESSION ESTABLISHMENT REQUEST message until the EAP Authentication procedure finalizes; or
- b) the information for the PDU session authentication and authorization by the external DN in the SM PDU DN request container IE is not compliant with the local policy and user's subscription data, the SMF shall consider it as an abnormal case and proceed as specified in subclause 6.4.1.7.

If the PDU session being established is a non-emergency PDU session, the request type is not set to "existing PDU session", the SM PDU DN request container IE is not included in the PDU SESSION ESTABLISHMENT REQUEST message and the PDU session authentication and authorization by the external DN is required due to local policy and user's subscription data, the SMF shall proceed with the EAP Authentication procedure specified in

3GPP TS 33.501 [24] and refrain from accepting or rejecting the PDU SESSION ESTABLISHMENT REQUEST message until the EAP Authentication procedure finalizes.

If the SMF receives the old PDU session ID from the AMF and a PDU session exists for the old PDU session ID, the SMF shall consider that the request for the relocation of SSC mode 3 PDU session anchor with multiple PDU sessions as specified in 3GPP TS 23.502 [9] is accepted by the UE.

If the SMF receives the onboarding indication from the AMF, the SMF shall consider that the PDU session is established for onboarding services in SNPN.

If the UE has set the TPMIC bit to "Transfer of port management information containers supported" in the 5GSM capability IE of the PDU SESSION ESTABLISHMENT REQUEST message and has included a DS-TT Ethernet port MAC address IE (if the PDU session type is "Ethernet"), the Port management information container IE, and, optionally, the UE-DS-TT residence time IE in the PDU SESSION ESTABLISHMENT REQUEST message, the SMF shall operate as specified in 3GPP TS 23.502 [9] subclause 4.3.2.2.1.

If requested by the upper layers, the UE supporting UAS services shall initiate a request to establish a PDU session for UAS services, where the UE:

- a) shall include the service-level device ID with the value set to the CAA-level UAV ID;
- b) if provided by the upper layers, shall include the service-level-AA server address, with the value set to the USS address; and
- c) if provided by the upper layers, shall include:
 - i) the service-level-AA payload type, with the value set to "UUA payload"; and
 - ii) the service-level-AA payload, with the value set to UUA payload,

in the Service-level-AA container IE of the PDU SESSION ESTABLISHMENT REQUEST message.

If the PDU session being established is a non-emergency PDU session, the request type is not set to "existing PDU session", the Service-level-AA container IE is included in the PDU SESSION ESTABLISHMENT REQUEST message, and

- a) the service-level authentication and authorization by the external DN is required due to local policy;
- b) there is a valid user's subscription information for the requested DNN or for the requested DNN and S-NSSAI; and
- c) the information for the service-level authentication and authorization by the external DN in the Service-level-AA container IE includes CAA-level UAV ID,

then the SMF shall proceed with the UUA-SM procedure as specified in 3GPP TS 23.256 [6AB] and refrain from accepting or rejecting the PDU SESSION ESTABLISHMENT REQUEST message until the service-level authentication and authorization procedure is completed.

The UE supporting UAS services shall not request a PDU session establishment procedure to the same DNN (or no DNN, if no DNN was indicated by the UE) and the same S-NSSAI (or no S-NSSAI, if no S-NSSAI was indicated by the UE) for which the UE has requested a service level authentication and authorization procedure which is ongoing.

If the PDU SESSION ESTABLISHMENT REQUEST message includes the PDU session pair ID IE, the RSN IE, or both, the SMF shall operate as specified in subclause 5.33.2 of 3GPP TS 23.501 [8].

6.4.1.3 UE-requested PDU session establishment procedure accepted by the network

If the connectivity with the requested DN is accepted by the network, the SMF shall create a PDU SESSION ESTABLISHMENT ACCEPT message.

If the UE requests establishing an emergency PDU session, the network shall not check for service area restrictions or subscription restrictions when processing the PDU SESSION ESTABLISHMENT REQUEST message.

The SMF shall set the Authorized QoS rules IE of the PDU SESSION ESTABLISHMENT ACCEPT message to the authorized QoS rules of the PDU session and may include the authorized QoS flow descriptions IE of the PDU SESSION ESTABLISHMENT ACCEPT message set to the authorized QoS flow descriptions of the PDU session.

NOTE 1: This is applicable also if the PDU session establishment procedure was initiated to perform handover of an existing PDU session between 3GPP access and non-3GPP access, and even if the authorized QoS rules and authorized QoS flow descriptions for source and target access of the handover are the same.

The SMF shall ensure that the number of the packet filters used in the authorized QoS rules of the PDU Session does not exceed the maximum number of packet filters supported by the UE for the PDU session. If the received request type is "initial emergency request", the SMF shall set the Authorized QoS flow descriptions IE according to the QoS parameters used for establishing emergency services as specified in subclause 5.16.4 of 3GPP TS 23.501 [8].

SMF shall set the Authorized QoS flow descriptions IE to the authorized QoS flow descriptions of the PDU session, if:

- a) the Authorized QoS rules IE contains at least one GBR QoS flow;
- b) the QFI is not the same as the 5QI of the QoS flow identified by the QFI;
- c) the QoS flow can be mapped to an EPS bearer as specified in subclause 4.11.1 of 3GPP TS 23.502 [9]; or
- d) the QoS flow is established for the PDU session used for relaying, as specified in subclause 5.6.2.1 of 3GPP TS 23.304 [6E].

NOTE 2: In cases other than above listed cases, it is up to the SMF implementation to include the authorized QoS flow description for the QoS flow in the Authorized QoS flow descriptions IE of the PDU SESSION ESTABLISHMENT ACCEPT message.

If interworking with EPS is supported for the PDU session, the SMF shall set in the PDU SESSION ESTABLISHMENT ACCEPT message:

- a) the Mapped EPS bearer contexts IE to the EPS bearer contexts mapped from one or more QoS flows of the PDU session; and
- b) the EPS bearer identity parameter in the Authorized QoS flow descriptions IE to the EPS bearer identity corresponding to the QoS flow, for each QoS flow which can be transferred to EPS.

If the "Create new EPS bearer" operation code in the Mapped EPS bearer contexts IE was received, and there is no corresponding Authorized QoS flow descriptions IE in the PDU SESSION ESTABLISHMENT ACCEPT message, the UE shall send a PDU SESSION MODIFICATION REQUEST message including a Mapped EPS bearer contexts IE to delete the mapped EPS bearer context. If the EPS bearer identity parameter in the Authorized QoS flow descriptions IE was received, the operation code is "Create new QoS flow description" and there is no corresponding Mapped EPS bearer contexts IE in the PDU SESSION ESTABLISHMENT ACCEPT message, the UE shall not diagnose an error, and shall keep storing the association between the QoS flow and the corresponding EPS bearer identity.

Furthermore, the SMF shall store the association between the QoS flow and the mapped EPS bearer context, for each QoS flow which can be transferred to EPS.

The SMF shall set the selected SSC mode IE of the PDU SESSION ESTABLISHMENT ACCEPT message to:

- a) the received SSC mode in the SSC mode IE included in the PDU SESSION ESTABLISHMENT REQUEST message based on one or more of the PDU session type, the subscription and the SMF configuration;
- b) either the default SSC mode for the data network listed in the subscription or the SSC mode associated with the SMF configuration, if the SSC mode IE is not included in the PDU SESSION ESTABLISHMENT REQUEST message.

NOTE 3: For bullet b), to avoid issues for UEs not supporting all SSC modes, the network operator can, in the subscription data and local configuration, include at least SSC mode 1 in the allowed SSC modes, and set the default SSC mode to "SSC mode 1" as per 3GPP TS 23.501 [8].

If the PDU session is an emergency PDU session, the SMF shall set the Selected SSC mode IE of the PDU SESSION ESTABLISHMENT ACCEPT message to "SSC mode 1". If the PDU session is a non-emergency PDU session of "Ethernet" or "Unstructured" PDU session type, the SMF shall set the Selected SSC mode IE to "SSC mode 1" or "SSC mode 2". If the PDU session is a non-emergency PDU session of "IPv4", "IPv6" or "IPv4v6" PDU session type, the SMF shall set the selected SSC mode IE to "SSC mode 1", "SSC mode 2", or "SSC mode 3".

If the PDU session is a non-emergency PDU session and the UE is not registered for onboarding services in SNPN, the SMF shall set the S-NSSAI IE of the PDU SESSION ESTABLISHMENT ACCEPT message to:

- a) the S-NSSAI of the PDU session; and
- b) the mapped S-NSSAI (if mapped S-NSSAIs are provided as specified in subclause 4.6.1).

The S-NSSAI or the mapped S-NSSAI (if included by the SMF) of the PDU session shall be the alternative S-NSSAI if the SMF has received an alternative S-NSSAI from the AMF.

The SMF shall set the Selected PDU session type IE of the PDU SESSION ESTABLISHMENT ACCEPT message to the selected PDU session type, i.e. the PDU session type of the PDU session.

If the PDU SESSION ESTABLISHMENT REQUEST message includes a PDU session type IE set to "IPv4v6", the SMF shall select "IPv4", "IPv6" or "IPv4v6" as the Selected PDU session type. If the subscription, the SMF configuration, or both, are limited to IPv4 only or IPv6 only for the DNN selected by the network, the SMF shall include the 5GSM cause value #50 "PDU session type IPv4 only allowed", or #51 "PDU session type IPv6 only allowed", respectively, in the 5GSM cause IE of the PDU SESSION ESTABLISHMENT ACCEPT message.

If the selected PDU session type is "IPv4", the SMF shall include the PDU address IE in the PDU SESSION ESTABLISHMENT ACCEPT message and shall set the PDU address IE to an IPv4 address allocated to the UE in the PDU session.

If the selected PDU session type is "IPv6", the SMF shall include the PDU address IE in the PDU SESSION ESTABLISHMENT ACCEPT message and shall set the PDU address IE to an interface identifier for the IPv6 link local address allocated to the UE in the PDU session.

If the selected PDU session type is "IPv4v6", the SMF shall include the PDU address IE in the PDU SESSION ESTABLISHMENT ACCEPT message and shall set the PDU address IE to an IPv4 address and an interface identifier for the IPv6 link local address, allocated to the UE in the PDU session.

If the selected PDU session type of a PDU session established by the W-AGF acting on behalf of the FN-RG is "IPv4v6" or "IPv6", the SMF shall also indicate the SMF's IPv6 link local address in the PDU address IE of the PDU SESSION ESTABLISHMENT ACCEPT message.

If the PDU session is a non-emergency PDU session and the UE is not registered for onboarding services in SNPN, the SMF shall set the DNN IE of the PDU SESSION ESTABLISHMENT ACCEPT message to the DNN determined by the AMF of the PDU session.

The SMF shall set the Session-AMBR IE of the PDU SESSION ESTABLISHMENT ACCEPT message to the Session-AMBR of the PDU session.

If the selected PDU session type is "IPv4", "IPv6", "IPv4v6" or "Ethernet" and if the PDU SESSION ESTABLISHMENT REQUEST message includes a 5GSM capability IE with the RQoS bit set to "Reflective QoS supported", the SMF shall consider that reflective QoS is supported for QoS flows belonging to this PDU session and may include the RQ timer IE set to an RQ timer value in the PDU SESSION ESTABLISHMENT ACCEPT message.

If the selected PDU session type is "IPv4", "IPv6", "IPv4v6" or "Ethernet" and if the PDU SESSION ESTABLISHMENT REQUEST message includes a Maximum number of supported packet filters IE, the SMF shall consider this number as the maximum number of packet filters that can be supported by the UE for this PDU session. Otherwise the SMF considers that the UE supports 16 packet filters for this PDU session.

The SMF shall consider that the maximum data rate per UE for user-plane integrity protection supported by the UE for uplink and the maximum data rate per UE for user-plane integrity protection supported by the UE for downlink are valid for the lifetime of the PDU session.

If the value of the RQ timer is set to "deactivated" or has a value of zero, the UE considers that RQoS is not applied for this PDU session.

NOTE 4: If the 5G core network determines that reflective QoS is to be used for a service data flow of a QoS flow, the SMF sends reflective QoS indication (RQI) to UPF to activate reflective QoS for this service data flow. If the QoS flow is established over 3GPP access, the SMF also includes reflective QoS Attribute (RQA) in QoS profile of the QoS flow during QoS flow establishment.

If the selected PDU session type is "IPv6" or "IPv4v6" and if the PDU SESSION ESTABLISHMENT REQUEST message includes a 5GSM capability IE with the MH6-PDU bit set to "Multi-homed IPv6 PDU session supported", the SMF shall consider that this PDU session is supported to use multiple IPv6 prefixes.

If the selected PDU session type is "Ethernet", the PDU SESSION ESTABLISHMENT REQUEST message includes a 5GSM capability IE with the EPT-S1 bit set to "Ethernet PDN type in S1 mode supported" and the network supports Ethernet PDN type in S1 mode, the SMF shall set the EPT-S1 bit of the 5GSM network feature support IE of the PDU SESSION ESTABLISHMENT ACCEPT message to "Ethernet PDN type in S1 mode supported".

If the AMF has indicated to the SMF that the UE supports the non-3GPP access path switching and the SMF supports the non-3GPP access path switching, the SMF shall set the NAPS bit of the 5GSM network feature support IE of the PDU SESSION ESTABLISHMENT ACCEPT message to "non-3GPP access path switching supported".

If the DN authentication of the UE was performed and completed successfully, the SMF shall set the EAP message IE of the PDU SESSION ESTABLISHMENT ACCEPT message to an EAP-success message as specified in IETF RFC 3748 [34], provided by the DN.

Based on local policies or configurations in the SMF and the Always-on PDU session requested IE in the PDU SESSION ESTABLISHMENT REQUEST message (if available), if the SMF determines that either:

- a) the requested PDU session needs to be established as an always-on PDU session (e.g. because the PDU session is for time synchronization or TSC, for URLLC, or for both), the SMF shall include the Always-on PDU session indication IE in the PDU SESSION ESTABLISHMENT ACCEPT message and shall set the value to "Always-on PDU session required"; or
- b) the requested PDU session shall not be established as an always-on PDU session and:
 - i) if the UE included the Always-on PDU session requested IE, the SMF shall include the Always-on PDU session indication IE in the PDU SESSION ESTABLISHMENT ACCEPT message and shall set the value to "Always-on PDU session not allowed"; or
 - ii) if the UE did not include the Always-on PDU session requested IE, the SMF shall not include the Always-on PDU session indication IE in the PDU SESSION ESTABLISHMENT ACCEPT message.

If the PDU session is an MA PDU session, the SMF shall include the ATSSS container IE in the PDU SESSION ESTABLISHMENT ACCEPT message. The SMF shall set the content of the ATSSS container IE as specified in 3GPP TS 24.193 [13B]. If the UE requests to establish user plane resources over the second access of an MA PDU session which has already been established over the first access and the parameters associated with ATSSS previously provided to the UE are not to be updated, the "ATSSS container contents" shall not be included in the ATSSS container IE in the PDU SESSION ESTABLISHMENT ACCEPT message.

If the PDU session is a single access PDU session containing the MA PDU session information IE with the value set to "MA PDU session network upgrade is allowed" and:

- a) if the SMF decides to establish a single access PDU session, the SMF shall not include the ATSSS container IE in the PDU SESSION ESTABLISHMENT ACCEPT message; or
- b) if the SMF decides to establish an MA PDU session, the SMF shall include the ATSSS container IE in the PDU SESSION ESTABLISHMENT ACCEPT message, which indicates to the UE that the requested single access PDU session was established as an MA PDU Session.

If the network decides that the PDU session is only for control plane CIoT 5GS optimization, the SMF shall include the control plane only indication in the PDU SESSION ESTABLISHMENT ACCEPT message.

If:

- a) the UE provided the IP header compression configuration IE in the PDU SESSION ESTABLISHMENT REQUEST message; and
- b) the SMF supports IP header compression for control plane CIoT 5GS optimization;

the SMF shall include the IP header compression configuration IE in the PDU SESSION ESTABLISHMENT ACCEPT message.

If:

- a) the UE provided the Ethernet header compression configuration IE in the PDU SESSION ESTABLISHMENT REQUEST message; and
- b) the SMF supports Ethernet header compression for control plane CIoT 5GS optimization;

the SMF shall include the Ethernet header compression configuration IE in the PDU SESSION ESTABLISHMENT ACCEPT message.

If the PDU SESSION ESTABLISHMENT REQUEST included the Requested MBS container IE with the MBS operation set to "Join MBS session", the SMF:

- a) shall include the TMGI for the multicast MBS session IDs that the UE is allowed to join, if any, in the Received MBS container IE, shall set the MBS decision to "MBS join is accepted" for each of those Received MBS information, may include the MBS start time to indicate the time when the multicast MBS session starts and shall include the MBS security container in each of those Received MBS information if security protection is applied for that multicast MBS session and the control plane security procedure is used as specified in subclause W.4.1.2 in 3GPP TS 33.501 [24], and shall use separate QoS flows dedicated for multicast by including the Authorized QoS flow descriptions IE if no separate QoS flows dedicated for multicast exist or if the SMF wants to establish new QoS flows dedicated for multicast;

NOTE 5: The network determines whether security protection applies or not for the multicast MBS session as specified in 3GPP TS 33.501 [24].

- b) shall include the TMGI for multicast MBS session IDs that the UE is not allowed to join, if any, in the Received MBS container IE, shall set the MBS decision to "MBS join is rejected" for each of those Received MBS information, shall set the Rejection cause for each of those Received MBS information with the reason of rejection, and if the Rejection cause is set to "multicast MBS session has not started or will not start soon", may include an MBS back-off timer value; and
- c) may include in the Received MBS container IE the MBS service area for each multicast MBS session and include in it the MBS TAI list, the NR CGI list or both, that identify the service area(s) for the local MBS service

NOTE 6: For an multicast MBS session that has multiple MBS service areas, the MBS service areas are indicated to the UE using MBS service announcement as described in 3GPP TS 23.247 [53], which is out of scope of this specification.

in the PDU SESSION ESTABLISHMENT ACCEPT message. If the UE has set the Type of multicast MBS session ID to "Source specific IP multicast address" in the Requested multicast MBS container IE for certain MBS session(s) in the PDU SESSION ESTABLISHMENT REQUEST message, the SMF shall include the Source IP address information and Destination IP address information in the Received MBS information together with the TMGI for each of those multicast MBS sessions.

NOTE 7: Including the Source IP address information and Destination IP address information in the Received MBS information in that case is to allow the UE to perform the mapping between the requested multicast MBS session ID and the provided TMGI.

NOTE 8: In SNPN, TMGI is used together with NID to identify an MBS Session.

If the request type is "existing PDU session", the SMF shall not perform network slice admission control for the PDU session, except for the following cases:

- a) when EPS counting is not required for the S-NSSAI of the PDU session for network slice admission control and the PDU session is established due to transfer the PDN connection from S1 mode to N1 mode in case of inter-system change; or
- b) handover of an existing PDU session between 3GPP access and non-3GPP access is performed.

The SMF shall send the PDU SESSION ESTABLISHMENT ACCEPT message.

Upon receipt of a PDU SESSION ESTABLISHMENT ACCEPT message and a PDU session ID, using the NAS transport procedure as specified in subclause 5.4.5, the UE shall stop timer T3580, shall release the allocated PTI value and shall consider that the PDU session was established.

If the PDU session establishment procedure was initiated to perform handover of an existing PDU session between 3GPP access and non-3GPP access, then upon receipt of the PDU SESSION ESTABLISHMENT ACCEPT message

the UE shall locally delete any authorized QoS rules, authorized QoS flow descriptions, the session-AMBR and the parameters provided in the Protocol configuration options IE when in S1 mode or the Extended protocol configuration options IE stored for the PDU session before processing the new received authorized QoS rules, authorized QoS flow descriptions, the session-AMBR and the parameters provided in the Extended protocol configuration options IE, if any.

NOTE 9: For the case of handover from 3GPP access to non-3GPP access, deletion of the QoS flow descriptions implies deletion of the associated EPS bearer identities, if any, and according to subclause 6.1.4.1 also deletion of the associated EPS bearer contexts. Regarding the reverse direction, for PDU sessions via non-3GPP access the network does not allocate associated EPS bearer identities (see 3GPP TS 23.502 [9], subclause 4.11.1.4.1).

If the PDU session establishment procedure was initiated to perform handover of an existing PDU session from 3GPP access to non-3GPP access and that existing PDU session is associated with one or more multicast MBS sessions, the UE shall locally leave the associated multicast MBS sessions and the SMF shall consider the UE as removed from the associated multicast MBS sessions.

For an MA PDU session already established on a single access, except for all those MA PDU sessions with a PDN connection established as a user-plane resource, upon receipt of PDU SESSION ESTABLISHMENT ACCEPT message over the other access:

- a) the UE shall delete the stored authorized QoS rules and the stored session-AMBR;
- b) if the authorized QoS flow descriptions IE is included in the PDU SESSION ESTABLISHMENT ACCEPT message, the UE shall delete the stored authorized QoS flow descriptions; and
- c) if the mapped EPS bearer contexts IE is included in the PDU SESSION ESTABLISHMENT ACCEPT message, the UE shall delete the stored mapped EPS bearer contexts.

If the UE supports network slice usage control and:

- a) a PDU session is successfully established for the on-demand S-NSSAI, the UE shall stop and reset the slice deregistration inactivity timer for the on-demand S-NSSAI over corresponding access type, if running; and
- b) an MA PDU session is successfully established for the on-demand S-NSSAI, the UE shall stop and reset the slice deregistration inactivity timer for the on-demand S-NSSAI over both 3GPP access and non-3GPP access, if running.

The UE shall store the authorized QoS rules, and the session-AMBR received in the PDU SESSION ESTABLISHMENT ACCEPT message for the PDU session. The UE shall also store the authorized QoS flow descriptions if it is included in the Authorized QoS flow descriptions IE of the PDU SESSION ESTABLISHMENT ACCEPT message for the PDU session.

If the number of the authorized QoS rules, the number of the packet filters, or the number of the authorized QoS flow descriptions associated with the PDU session have reached the maximum number supported by the UE upon receipt of a PDU SESSION ESTABLISHMENT ACCEPT message, then the UE may initiate the PDU session release procedure by sending a PDU SESSION RELEASE REQUEST message with 5GSM cause #26 "insufficient resources".

For a PDU session that is being established with the request type set to "initial request", "initial emergency request" or "MA PDU request", or a PDU session that is being transferred from EPS to 5GS and established with the request type set to "existing PDU session" or "existing emergency PDU session" or a PDU session that is being handed over between non-3GPP access and 3GPP access and established with the request type set to "existing PDU session" or "existing emergency PDU session", the UE shall verify the authorized QoS rules and the authorized QoS flow descriptions provided in the PDU SESSION ESTABLISHMENT ACCEPT message for different types of errors as follows:

- a) Semantic errors in QoS operations:
 - 1) When the rule operation is "Create new QoS rule", and the DQR bit is set to "the QoS rule is the default QoS rule" when there's already a default QoS rule.
 - 2) When the rule operation is "Create new QoS rule", and there is no rule with the DQR bit set to "the QoS rule is the default QoS rule".
 - 3) When the rule operation is "Create new QoS rule" and two or more QoS rules associated with this PDU session would have identical precedence values.

- 4) When the rule operation is an operation other than "Create new QoS rule".
- 5) When the rule operation is "Create new QoS rule", the DQR bit is set to "the QoS rule is not the default QoS rule", and the UE is in NB-N1 mode.
- 6) When the rule operation is "Create new QoS rule" and there is already an existing QoS rule with the same QoS rule identifier.
- 7) When the rule operation is "Create new QoS rule", the DQR bit is set to "the QoS rule is not the default QoS rule", and the PDU session type of the PDU session is "Unstructured".
- 8) When the flow description operation is an operation other than "Create new QoS flow description".
- 8a) When the flow description operation is "Create new QoS flow description" and there is already an existing QoS flow description with the same QoS flow identifier.
- 9) When the flow description operation is "Create new QoS flow description", the QFI associated with the QoS flow description is not the same as the QFI of the default QoS rule and the UE is NB-N1 mode.
- 10) When the flow description operation is "Create new QoS flow description", the QFI associated with the QoS flow description is not the same as the QFI of the default QoS rule, and the PDU session type of the PDU session is "Unstructured".
- 11) When the rule operation is "Create new QoS rule" and the DQR bit is set to "the QoS rule is not the default QoS rule" and one match-all packet filter is to be associated with the QoS rule.

In case 4, case 5, or case 7 if the rule operation is for a non-default QoS rule, the UE shall send a PDU SESSION MODIFICATION REQUEST message to delete the QoS rule with 5GSM cause #83 "semantic error in the QoS operation".

In case 6, if the existing QoS rule is not the default QoS rule and the DQR bit of the new QoS rule is set to "the QoS rule is not the default QoS rule", the UE shall not diagnose an error, further process the create request and, if it was processed successfully, delete the old QoS rule (i.e. the QoS rule that existed when case 6 was detected). If the existing QoS rule is the default QoS rule or the DQR bit of the new QoS rule is set to "the QoS rule is the default QoS rule", the UE shall initiate a PDU session release procedure by sending a PDU SESSION RELEASE REQUEST message with 5GSM cause #83 "semantic error in the QoS operation".

In case 8, case 9, or case 10, the UE shall send a PDU SESSION MODIFICATION REQUEST message to delete the QoS flow description with 5GSM cause #83 "semantic error in the QoS operation".

In case 8a, the UE shall not diagnose an error, further process the create request and, if it was processed successfully, delete the old QoS flow description (i.e. the QoS flow description that existed when case 8a was detected).

Otherwise for all the cases above, the UE shall initiate a PDU session release procedure by sending a PDU SESSION RELEASE REQUEST message with 5GSM cause #83 "semantic error in the QoS operation".

b) Syntactical errors in QoS operations:

- 1) When the rule operation is "Create new QoS rule", the QoS rule is a QoS rule of a PDU session of IPv4, IPv6, IPv4v6 or Ethernet PDU session type, and the packet filter list in the QoS rule is empty.
- 2) When the rule operation is "Create new QoS rule", the DQR bit is set to "the QoS rule is the default QoS rule", the PDU session type of the PDU session is "Unstructured", and the packet filter list in the QoS rule is not empty.
- 3) When there are other types of syntactical errors in the coding of the Authorized QoS rules IE or the Authorized QoS flow descriptions IE, such as: a mismatch between the number of packet filters subfield and the number of packet filters in the packet filter list when the rule operation is create new QoS rule", or the number of packet filters subfield is larger than the maximum possible number of packet filters in the packet filter list (i.e., there is no QoS rule precedence subfield included in the QoS rule IE), the QoS Rule Identifier is set to "no QoS rule identifier assigned", or the QoS flow identifier is set to "no QoS flow identifier assigned".
- 4) When, the rule operation is "Create new QoS rule", there is no QoS flow description with a QFI corresponding to the QFI of the resulting QoS rule and the UE determines, by using the QoS rule's QFI as

the 5QI, that there is a resulting QoS rule for a GBR QoS flow (as described in 3GPP TS 23.501 [8] table 5.7.4-1).

- 5) When the flow description operation is "Create new QoS flow description", and the UE determines that there is a QoS flow description of a GBR QoS flow (as described in 3GPP TS 23.501 [8] table 5.7.4-1) which lacks at least one of the mandatory parameters (i.e., GFBR uplink, GFBR downlink, MFBR uplink and MFBR downlink). If the QoS flow description does not include a 5QI, the UE determines this by using the QFI as the 5QI.

In case 1, case 3 or case 4, if the QoS rule is the default QoS rule, the UE shall initiate a PDU session release procedure by sending a PDU SESSION RELEASE REQUEST message with 5GSM cause #84 "syntactical error in the QoS operation". Otherwise, the UE shall send a PDU SESSION MODIFICATION REQUEST message including a requested QoS rule IE, a requested QoS flow description IE or both to delete the QoS rule, the QoS flow description or both with 5GSM cause #84 "syntactical error in the QoS operation".

In case 2, if the QoS rule is the default QoS rule, the UE shall send a PDU SESSION MODIFICATION REQUEST message including a requested QoS rule IE to delete all the packet filters of the default QoS rule. The UE shall include the 5GSM cause #84 "syntactical error in the QoS operation".

In case 5, if the default QoS rule is associated with the QoS flow description which lacks at least one of the mandatory parameters, the UE shall initiate a PDU session release procedure by sending a PDU SESSION RELEASE REQUEST message with 5GSM cause #84 "syntactical error in the QoS operation". Otherwise, the UE shall send a PDU SESSION MODIFICATION REQUEST message to delete the QoS flow description which lacks at least one of the mandatory parameters and the associated QoS rule(s), if any, with 5GSM cause #84 "syntactical error in the QoS operation".

NOTE 10: It is not considered an error if the UE determines that after processing all QoS operations on QoS rules and QoS flow descriptions there is a QoS flow description that is not associated with any QoS rule and the UE is not in NB-N1 mode.

c) Semantic errors in packet filters:

- 1) When a packet filter consists of conflicting packet filter components which would render the packet filter ineffective, i.e. no IP packet will ever fit this packet filter. How the UE determines a semantic error in a packet filter is outside the scope of the present document.

If the QoS rule is the default QoS rule, the UE shall initiate a PDU session release procedure by sending a PDU SESSION RELEASE REQUEST message with 5GSM cause #44 "semantic error in packet filter(s)". Otherwise, the UE shall send a PDU SESSION MODIFICATION REQUEST message to delete the QoS rule with 5GSM cause #44 "semantic error in packet filter(s)".

d) Syntactical errors in packet filters:

- 1) When the rule operation is "Create new QoS rule" and two or more packet filters in the resultant QoS rule would have identical packet filter identifiers.
- 2) When there are other types of syntactical errors in the coding of packet filters, such as the use of a reserved value for a packet filter component identifier.

If the QoS rule is the default QoS rule, the UE shall initiate a PDU session release procedure by sending a PDU SESSION RELEASE REQUEST message with 5GSM cause #45 "syntactical errors in packet filter(s)". Otherwise, the UE shall send a PDU SESSION MODIFICATION REQUEST message to delete the QoS rule with 5GSM cause #45 "syntactical errors in packet filter(s)".

If the Always-on PDU session indication IE is included in the PDU SESSION ESTABLISHMENT ACCEPT message and:

- a) the value of the IE is set to "Always-on PDU session required", the UE shall consider the established PDU session as an always-on PDU session; or
- b) the value of the IE is set to "Always-on PDU session not allowed", the UE shall not consider the established PDU session as an always-on PDU session.

The UE shall not consider the established PDU session as an always-on PDU session if the UE does not receive the Always-on PDU session indication IE in the PDU SESSION ESTABLISHMENT ACCEPT message.

The UE shall store the mapped EPS bearer contexts, if received in the PDU SESSION ESTABLISHMENT ACCEPT message. Furthermore, the UE shall also store the association between the QoS flow and the mapped EPS bearer context, for each QoS flow which can be transferred to EPS, based on the received EPS bearer identity parameter in Authorized QoS flow descriptions IE and the mapped EPS bearer contexts. The UE shall check each mapped EPS bearer context for different types of errors as follows:

NOTE 11: An error detected in a mapped EPS bearer context does not cause the UE to discard the Authorized QoS rules IE and Authorized QoS flow descriptions IE included in the PDU SESSION ESTABLISHMENT ACCEPT, if any.

a) Semantic error in the mapped EPS bearer operation:

- 1) When the operation code is an operation code other than "Create new EPS bearer".
- 2) When the operation code is "Create new EPS bearer" and there is already an existing mapped EPS bearer context with the same EPS bearer identity associated with any PDU session.
- 3) When the operation code is "Create new EPS bearer" and the resulting mapped EPS bearer context has invalid mandatory parameters or missing mandatory parameters (e.g., mapped EPS QoS parameters or traffic flow template for a dedicated EPS bearer context).

In case 2, if the existing mapped EPS bearer context is associated with the PDU session that is being established, the UE shall not diagnose an error, further process the create request and, if it was process successfully, delete the old EPS bearer context.

Otherwise, the UE shall initiate a PDU session modification procedure by sending a PDU SESSION MODIFICATION REQUEST message to delete the mapped EPS bearer context with 5GSM cause #85 "Invalid mapped EPS bearer identity".

b) if the mapped EPS bearer context includes a traffic flow template, the UE shall check the traffic flow template for different types of TFT IE errors as follows:

1) Semantic errors in TFT operations:

- i) When the TFT operation is an operation other than "Create new TFT"

The UE shall initiate a PDU session modification procedure by sending a PDU SESSION MODIFICATION REQUEST message to delete the mapped EPS bearer context with 5GSM cause #41 "semantic error in the TFT operation".

2) Syntactical errors in TFT operations:

- i) When the TFT operation = "Create new TFT" and the packet filter list in the TFT IE is empty.
- ii) When there are other types of syntactical errors in the coding of the TFT IE, such as a mismatch between the number of packet filters subfield, and the number of packet filters in the packet filter list.

The UE shall initiate a PDU session modification procedure by sending a PDU SESSION MODIFICATION REQUEST message with to delete the mapped EPS bearer context 5GSM cause #42 "syntactical error in the TFT operation".

3) Semantic errors in packet filters:

- i) When a packet filter consists of conflicting packet filter components which would render the packet filter ineffective, i.e. no IP packet will ever fit this packet filter. How the UE determines a semantic error in a packet filter is outside the scope of the present document.
- ii) When the resulting TFT, which is assigned to a dedicated EPS bearer context, does not contain any packet filter which applicable for the uplink direction.

The UE shall initiate a PDU session modification procedure by sending a PDU SESSION MODIFICATION REQUEST message to delete the mapped EPS bearer context with 5GSM cause #44 "semantic errors in packet filter(s)".

4) Syntactical errors in packet filters:

- i) When the TFT operation = "Create new TFT" and two or more packet filters in the resultant TFT would have identical packet filter identifiers.
- ii) When the TFT operation = "Create new TFT" and two or more packet filters in all TFTs associated with this PDN connection would have identical packet filter precedence values.
- iii) When there are other types of syntactical errors in the coding of packet filters, such as the use of a reserved value for a packet filter component identifier.

In case ii, if the old packet filters do not belong to the default EPS bearer context, the UE shall not diagnose an error and shall delete the old packet filters which have identical filter precedence values.

In case ii, if one or more old packet filters belong to the default EPS bearer context, the UE shall initiate a PDU session modification procedure by sending a PDU SESSION MODIFICATION REQUEST message to delete the mapped EPS bearer context with 5GSM cause #45 "syntactical errors in packet filter(s)".

In cases i and iii the UE shall initiate a PDU session modification procedure by sending a PDU SESSION MODIFICATION REQUEST message to delete the mapped EPS bearer context with 5GSM cause #45 "syntactical error in packet filter(s)".

If the UE detects different errors in the mapped EPS bearer contexts, QoS rules or QoS flow descriptions, the UE may send a single PDU SESSION MODIFICATION REQUEST message to delete the erroneous mapped EPS bearer contexts, QoS rules or QoS flow descriptions. In that case, the UE shall include a single 5GSM cause in the PDU SESSION MODIFICATION REQUEST message.

NOTE 12: The 5GSM cause to use cannot be different from: #41 "semantic error in the TFT operation", #42 "syntactical error in the TFT operation", #44 "semantic error in packet filter(s)", #45 "syntactical errors in packet filter(s)", #83 "semantic error in the QoS operation", #84 "syntactical error in the QoS operation", and #85 "Invalid mapped EPS bearer identity". The selection of a 5GSM cause is up to the UE implementation.

If there are mapped EPS bearer context(s) associated with a PDU session, but none of them is associated with the default QoS rule, the UE shall initiate a PDU session modification procedure by sending a PDU SESSION MODIFICATION REQUEST message to delete the mapped EPS bearer context(s) with 5GSM cause #85 "Invalid mapped EPS bearer identity" and shall locally delete the stored EPS bearer identity (EBI) in all the QoS flow descriptions of the PDU session, if any.

The UE shall only use the Control plane CIoT 5GS optimization for this PDU session if the Control plane only indication is included in the PDU SESSION ESTABLISHMENT ACCEPT message.

If the UE requests the PDU session type "IPv4v6" and:

- a) the UE receives the selected PDU session type set to "IPv4" and does not receive the 5GSM cause value #50 "PDU session type IPv4 only allowed"; or
- b) the UE receives the selected PDU session type set to "IPv6" and does not receive the 5GSM cause value #51 "PDU session type IPv6 only allowed";

the UE may subsequently request another PDU session for the other IP version using the UE-requested PDU session establishment procedure to the same DNN (or no DNN, if no DNN was indicated by the UE) and the same S-NSSAI associated with (if available) a mapped S-NSSAI (or no S-NSSAI, if no S-NSSAI was indicated by the UE) with a single address PDN type (IPv4 or IPv6) other than the one already activated.

If the UE requests the PDU session type "IPv4v6", receives the selected PDU session type set to "IPv4" and the 5GSM cause value #50 "PDU session type IPv4 only allowed", the UE shall not subsequently request another PDU session using the UE-requested PDU session establishment procedure to the same DNN (or no DNN, if no DNN was indicated by the UE) and the same S-NSSAI associated with (if available) a mapped S-NSSAI (or no S-NSSAI, if no S-NSSAI was indicated by the UE) to obtain a PDU session type different from the one allowed by the network until any of the following conditions is fulfilled:

- a) the UE is registered to a new PLMN;
- b) the UE is switched off;
- c) the USIM is removed;

- d) the entry in the "list of subscriber data" for the current SNPN is updated if the UE does not support access to an SNPN using credentials from a credentials holder and equivalent SNPNs; or
- e) the selected entry of the "list of subscriber data" is updated or USIM is removed for the selected PLMN subscription, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both.

If the UE requests the PDU session type "IPv4v6", receives the selected PDU session type set to "IPv6" and the 5GSM cause value #51 "PDU session type IPv6 only allowed", the UE shall not subsequently request another PDU session using the UE-requested PDU session establishment procedure to the same DNN (or no DNN, if no DNN was indicated by the UE) and the same S-NSSAI associated with (if available) a mapped S-NSSAI (or no S-NSSAI, if no S-NSSAI was indicated by the UE) to obtain a PDU session type different from the one allowed by the network until any of the following conditions is fulfilled:

- a) the UE is registered to a new PLMN;
- b) the UE is switched off;
- c) the USIM is removed
- d) the entry in the "list of subscriber data" for the current SNPN is updated if the UE does not support access to an SNPN using credentials from a credentials holder and equivalent SNPNs; or
- e) the selected entry of the "list of subscriber data" is updated or USIM is removed for the selected PLMN subscription, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both.

NOTE 13: For the 5GSM cause values #50 "PDU session type IPv4 only allowed", and #51 "PDU session type IPv6 only allowed", re-attempt in S1 mode for the same DNN (or no DNN, if no DNN was indicated by the UE) is only allowed using the PDU session type(s) indicated by the network.

If the selected PDU session type of the PDU session is "Unstructured" or "Ethernet", the UE supports inter-system change from N1 mode to S1 mode, the UE does not support establishment of a PDN connection for the PDN type set to "non-IP" in S1 mode, and the parameters list field of one or more authorized QoS flow descriptions received in the Authorized QoS flow descriptions IE of the PDU SESSION ESTABLISHMENT ACCEPT message contains an EPS bearer identity (EBI), then the UE shall locally remove the EPS bearer identity (EBI) from the parameters list field of such one or more authorized QoS flow descriptions. Additionally the UE shall also initiate a PDU session modification procedure by sending a PDU SESSION MODIFICATION REQUEST message to delete the mapped EPS bearer context with 5GSM cause #85 "Invalid mapped EPS bearer identity".

If the selected PDU session type of the PDU session is "Ethernet", the UE supports inter-system change from N1 mode to S1 mode, the UE does not support establishment of a PDN connection for the PDN type set to "non-IP" in S1 mode, the UE, the network or both of them do not support Ethernet PDN type in S1 mode, and the parameters list field of one or more authorized QoS flow descriptions received in the Authorized QoS flow descriptions IE of the PDU SESSION ESTABLISHMENT ACCEPT message contains an EPS bearer identity (EBI), then the UE shall locally remove the EPS bearer identity (EBI) from the parameters list field of such one or more authorized QoS flow descriptions. Additionally, the UE shall also initiate a PDU session modification procedure by sending a PDU SESSION MODIFICATION REQUEST message to delete the mapped EPS bearer context with 5GSM cause #85 "Invalid mapped EPS bearer identity".

For a UE which is registered for disaster roaming services and for a PDU session which is not a PDU session for emergency services:

- a) if the parameters list field of one or more authorized QoS flow descriptions received in the Authorized QoS flow descriptions IE of the PDU SESSION ESTABLISHMENT ACCEPT message contains an EPS bearer identity (EBI), then the UE shall locally remove the EPS bearer identity (EBI) from the parameters list field of such one or more authorized QoS flow descriptions; and
- b) the UE shall locally delete the contents of the Mapped EPS bearer contexts IE if it is received in the PDU SESSION ESTABLISHMENT ACCEPT message.

If the UE receives an IPv4 Link MTU parameter, an Ethernet Frame Payload MTU parameter, an Unstructured Link MTU parameter, or a Non-IP Link MTU parameter in the Extended protocol configuration options IE of the PDU SESSION ESTABLISHMENT ACCEPT message, the UE shall pass to the upper layer the received IPv4 link MTU size, the received Ethernet frame payload MTU size, the unstructured link MTU size, or the non-IP link MTU size.

NOTE 14: The IPv4 link MTU size corresponds to the maximum length of user data packet that can be sent either via the control plane or via N3 interface for a PDU session of the "IPv4" PDU session type.

NOTE 15: The Ethernet frame payload MTU size corresponds to the maximum length of a payload of an Ethernet frame that can be sent either via the control plane or via N3 interface for a PDU session of the "Ethernet" PDU session type.

NOTE 16: The unstructured link MTU size correspond to the maximum length of user data packet that can be sent either via the control plane or via N3 interface for a PDU session of the "Unstructured" PDU session type.

NOTE 17: A PDU session of "Ethernet" or "Unstructured" PDU session type can be transferred to a PDN connection of "non-IP" PDN type, thus the UE can request the non-IP link MTU parameter in the PDU session establishment procedure. The non-IP link MTU size corresponds to the maximum length of user data that can be sent either in the user data container in the ESM DATA TRANSPORT message or via S1-U interface as specified in 3GPP TS 24.301 [15].

If the 5G-RG receives an ACS information parameter in the Extended protocol configuration options IE of the PDU SESSION ESTABLISHMENT ACCEPT message, the 5G-RG shall pass the ACS URL in the received ACS information parameter to the upper layer.

If the UE has indicated support for CIoT 5GS optimizations and receives a small data rate control parameters container in the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT ACCEPT message, the UE shall store the small data rate control parameters value and use the stored small data rate control parameters value as the maximum allowed limit of uplink user data for the PDU session in accordance with 3GPP TS 23.501 [8].

If the UE has indicated support for CIoT 5GS optimizations and receives an additional small data rate control parameters for exception data container in the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT ACCEPT message, the UE shall store the additional small data rate control parameters for exception data value and use the stored additional small data rate control parameters for exception data value as the maximum allowed limit of uplink exception data for the PDU session in accordance with 3GPP TS 23.501 [8].

If the UE has indicated support for CIoT 5GS optimizations and receives an initial small data rate control parameters container or an initial additional small data rate control parameters for exception data container in the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT ACCEPT message, the UE shall use these parameters for the newly established PDU Session. When the validity period of the initial parameters expire, the parameters received in a small data rate control parameters container or an additional small data rate control parameters for exception data container shall be used.

If the UE receives a Serving PLMN rate control IE in the PDU SESSION ESTABLISHMENT ACCEPT message, the UE shall store the Serving PLMN rate control IE value and use the stored serving PLMN rate control value as the maximum allowed limit of uplink control plane user data for the corresponding PDU session in accordance with 3GPP TS 23.501 [8].

If the UE receives an APN rate control parameters container or an additional APN rate control for exception data parameters container in the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT ACCEPT message, the UE shall store these parameters and use them to limit the rate at which it generates uplink user data messages for the PDN connection corresponding to the PDU session if the PDU session is transferred to EPS upon inter-system change from N1 mode to S1 mode in accordance with 3GPP TS 24.301 [15]. The received APN rate control parameters and additional APN rate control for exception data parameters shall replace any previously stored APN rate control parameters and additional APN rate control for exception data parameters, respectively, for this PDN connection.

If the UE receives an initial APN rate control parameters container or an initial additional APN rate control for exception data parameters container in the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT ACCEPT message, the UE shall store these parameters in the APN rate control status and use them to limit the rate at which it generates exception data messages for the PDN connection corresponding to the PDU session if the PDU session is transferred to EPS upon inter-system change from N1 mode to S1 mode in accordance with 3GPP TS 24.301 [15]. The received APN rate control status shall replace any previously stored APN rate control status for this PDN connection.

NOTE 18: In the PDU SESSION ESTABLISHMENT ACCEPT message, the SMF provides either APN rate control parameters container, or initial APN rate control parameters container, in the Extended protocol configuration options IE, but not both.

NOTE 19: In the PDU SESSION ESTABLISHMENT ACCEPT message, the SMF provides either additional APN rate control for exception data parameters container, or initial additional APN rate control for exception data parameters container, in the Extended protocol configuration options IE, but not both.

If the network accepts the use of Reliable Data Service to transfer data for the PDU session, the network shall include the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT ACCEPT message and include the Reliable Data Service accepted indicator. The UE behaves as described in subclause 6.2.15.

If

- the UE indicates support of DNS over (D)TLS by providing DNS server security information indicator to the network;
- optionally, the UE indicates which security protocol type(s) are supported by the UE, by providing the DNS server security protocol support to the network; and
- the network wants to enforce the use of DNS over (D)TLS,

the network may include the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT ACCEPT message and include the DNS server security information with length of two octets. Upon receiving the DNS server security information, the UE shall pass it to the upper layer. The UE shall use this information to send the DNS over (D)TLS (See 3GPP TS 33.501 [24]).

NOTE 20: Support of DNS over (D)TLS is based on the requirements as specified in 3GPP TS 33.501 [24] and it is implemented based on the operator requirement.

If the PDU SESSION ESTABLISHMENT REQUEST message includes the Service-level-AA container IE with the service-level device ID set to the CAA-level UAV ID, and the SMF is provided by the UAS-NF the successful UUAA-SM result and the CAA-level UAV ID, the SMF shall store the successful result together with the authorized CAA-level UAV ID and transmit the PDU SESSION ESTABLISHMENT ACCEPT message to the UE, where the PDU SESSION ESTABLISHMENT ACCEPT message shall include the Service-level-AA container IE containing:

- a) the service-level-AA response, with the SLAR field set to "Service level authentication and authorization was successful";
- b) the service-level device ID with the value set to the CAA-level UAV ID; and
- c) if a payload is received from the UAS-NF, the service-level-AA payload, with the value set to the payload;
- d) if a payload type associated with the payload is received from the UAS-NF, the service-level-AA payload type with the values set to the associated payload type.

NOTE 21: UAS security information can be included in the UUAA payload by the USS as specified in 3GPP TS 33.256 [24B].

NOTE 21A: A list of USS addresses, where each entry contains a USS address and a corresponding geographical area, can be included in the UUAA payload by the USS as specified in 3GPP TS 23.256 [6AB].

If the network accepts the request of the PDU session establishment for C2 communication, the network shall send the PDU SESSION ESTABLISHMENT ACCEPT message including the Service-level-AA container IE containing:

- a) the service-level-AA response with the value of C2AR field set to the "C2 authorization was successful";
- b) if a payload is provided from the UAS-NF, the service-level-AA payload with the value set to the payload;
- c) if a payload type associated with the payload is provided from the UAS-NF, the service-level-AA payload type with the value set to the payload type; and
- d) if the CAA-level UAV ID is provided from the UAS-NF, the service-level device ID with the value set to the CAA-level UAV ID.

NOTE 22: The C2 authorization payload in the service-level-AA payload can include one or both of the C2 session security information, and pairing information for direct C2 communication.

Upon receipt of the PDU SESSION ESTABLISHMENT ACCEPT message of the PDU session for C2 communication, if the Service-level-AA container IE is included, the UE shall forward the service-level-AA contents of the Service-level-AA container IE to the upper layers.

The SMF may be configured with one or more PVS IP addresses or PVS names or both associated with the DNN and S-NSSAI used for onboarding services in SNPN, for configuration of SNPN subscription parameters in PLMN via the user plane, or for configuration of a UE via the user plane with credentials for NSSAA or PDU session authentication and authorization procedure. If the PDU session was established for onboarding services in SNPN, or the PVS information request is included in the Extended protocol configuration options IE of the PDU SESSION ESTABLISHMENT REQUEST message establishing a PDU session providing connectivity for configuration of SNPN subscription parameters in PLMN via the user plane, the network may include the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT ACCEPT message and include the PVS IP address(es) or the PVS name(s) or both associated with the DNN and S-NSSAI of the established PDU session, if available. If the PVS information request is included in the Extended protocol configuration options IE of the PDU SESSION ESTABLISHMENT REQUEST message establishing the PDU session providing connectivity for configuration of a UE via the user plane with credentials for PDU session authentication and authorization procedure, based on the subscribed DNN(s) and S-NSSAI(s) of the UE and the DNN and S-NSSAI of the established PDU session, the network should include the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT ACCEPT message and include the PVS IP address(es) or the PVS name(s) or both, which are associated with the established PDU session and per subscribed DNN(s) and S-NSSAI(s) of the UE, if available. If the PVS information request is included in the Extended protocol configuration options IE of the PDU SESSION ESTABLISHMENT REQUEST message establishing the PDU session providing connectivity for configuration of a UE via the user plane with credentials for NSSAA, based on the subscribed S-NSSAI(s) of the UE and the S-NSSAI of the established PDU session, the network should include the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT ACCEPT message and include the PVS IP address(es) or the PVS name(s) or both, which are associated with the established PDU session and per subscribed S-NSSAI(s) of the UE, if available.

NOTE 23: If the PVS information request is included in the Extended protocol configuration options IE of the PDU SESSION ESTABLISHMENT REQUEST message establishing a PDU session providing connectivity for configuration of SNPN subscription parameters in SNPN via the user plane by a UE which is not registered for onboarding services in SNPN, the SMF can include the PVS IP address(es) or the PVS name(s) or both, associated with the DNN and S-NSSAI of the established PDU session, if available, in the Extended protocol configuration options IE of the PDU SESSION ESTABLISHMENT ACCEPT message.

NOTE 24: The PVS IP address(es) or the PVS name(s) or both in the SMF can either be locally configured or provided by DCS. The SMF can send the PVS IP address(es) or the PVS name(s) or both that are available in the SMF as the PVS IP address(es) or the PVS name(s) or both to the UE, respectively. If the PDU session was established for onboarding services in SNPN not supporting localized services in SNPN, the PVS IP address(es) or the PVS name(s) or both provided by DCS takes precedence over the PVS IP address(es) or the PVS name(s) or both locally configured, respectively. If the PDU session was established for onboarding services in SNPN supporting localized services in SNPN, the SMF can include both the DCS provided PVS IP address(es) or the PVS name(s) or both associated with the DNN and S-NSSAI of the established PDU session and the locally configured PVS IP address(es) or the PVS name(s) or both associated with the DNN and S-NSSAI of the established PDU session, if available.

The UE upon receiving one or more PVS IP address(es), if any, one or more the PVS name(s), if any, or both shall pass them to the upper layers.

NOTE 25: If several PVS IP addresses, several PVS name(s), or one or more PVS IP addresses and one or more PVS name(s) are received, how the UE uses this information is up to UE implementation.

If the UE indicates support for ECS configuration information provisioning by providing the ECS configuration information provisioning support indicator in the Extended protocol configuration options IE of the PDU SESSION ESTABLISHMENT REQUEST message, then the SMF may include the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT ACCEPT message with

- a) at least one of ECS IPv4 Address(es), ECS IPv6 Address(es), and ECS FQDN(s);
- b) at least one associated ECSP identifier;
- c) optionally, spatial validity conditions associated with the ECS address;
- d) optionally, ECS authentication methods associated with the ECS address; and

- e) optionally, ECS supported PLMNs information list, including the associated ECSP information for which the EDN configuration information can be provided by the ECS.

The UE upon receiving one or more ECS IPv4 address(es), if any, ECS IPv6 address(es), if any, or ECS FQDN(s), if any, with the associated spatial validity condition, if any, the associated ECS authentication methods, if any, ECS supported PLMNs information list, if any and an ECSP identifier shall pass them to the upper layers.

NOTE 26: The IP address(es), FQDN(s), or both are associated with the ECSP identifier and replace previously provided ECS configuration information associated with the same ECSP identifier, if any.

If the SMF needs to provide DNS server address(es) to the UE and the UE has provided the DNS server IPv4 address request, the DNS server IPv6 address request or both of them, in the PDU SESSION ESTABLISHMENT REQUEST message, then the SMF shall include the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT ACCEPT message with one or more DNS server IPv4 address(es), one or more DNS server IPv6 address(es) or both of them. If the UE supports receiving DNS server addresses in protocol configuration options and receives one or more DNS server IPv4 address(es), one or more DNS server IPv6 address(es) or both of them, in the Extended protocol configuration options IE of the PDU SESSION ESTABLISHMENT ACCEPT message, then the UE shall pass the received DNS server IPv4 address(es), if any, and the received DNS server IPv6 address(es), if any, to upper layers.

NOTE 27: The received DNS server address(es) replace previously provided DNS server address(es), if any.

If the PDU SESSION ESTABLISHMENT ACCEPT message includes the Received MBS container IE, for each of the Received MBS information:

- a) if MBS decision is set to "MBS join is accepted", the UE shall consider that it has successfully joined the multicast MBS session. The UE shall store the received TMGI and shall use it for any further operation on that multicast MBS session. The UE shall store the received MBS service area associated with the received TMGI, if any, and provide the received TMGI to lower layers. The UE may provide the MBS start time if it is included in the Received MBS information to upper layers; or
- b) if MBS decision is set to "MBS join is rejected", the UE shall consider the requested join as rejected. The UE shall store the received MBS service area associated with the received TMGI, if any. If the received Rejection cause is set to "User is outside of local MBS service area", the UE shall not request to join the same multicast MBS session if neither current TAI nor CGI of the current cell is part of the received MBS service area. If the received Rejection cause is set to "multicast MBS session has not started or will not start soon" and an MBS back-off timer value is included with value that indicates neither zero nor deactivated, the UE shall start a back-off timer T3587 with the value provided in the MBS back-off timer value for the received TMGI, and shall not attempt to join the multicast MBS session with the same TMGI until the expiry of T3587. If the MBS back-off timer value indicates that this timer is deactivated, the UE shall not attempt to join the multicast MBS session with the same TMGI, the Source IP address information of the TMGI, or the Destination IP address information of the TMGI until the UE is switched off, the USIM is removed, or the entry in the "list of subscriber data" for the current SNPN is updated. If the MBS back-off timer value indicates zero, the UE may attempt to join the multicast MBS session with the same TMGI.

If the UE is switched off when the timer T3587 is running, the UE may behave as follows when the UE is switched on and the USIM in the UE remains the same:

let t_1 be the time remaining for T3587 timeout at switch off and let t be the time elapsed between switch off and switch on. If t_1 is greater than t , then the timer shall be restarted with the value $t_1 - t$. If t_1 is equal to or less than t , then the timer need not be restarted.

If the PDU session is established for IMS signalling and the UE has requested P-CSCF IPv6 address or P-CSCF IPv4 address, the SMF shall include P-CSCF IP address(es) in the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT ACCEPT message.

NOTE 28: The P-CSCF selection functionality is specified in subclause 5.16.3.11 of 3GPP TS 23.501 [8].

Upon receipt of the PDU SESSION ESTABLISHMENT ACCEPT message, if the UE included the PDU session pair ID in the PDU SESSION ESTABLISHMENT REQUEST message, the UE shall associate the PDU session with the PDU session pair ID. If the UE included the RSN in the PDU SESSION ESTABLISHMENT REQUEST message, the UE shall associate the PDU session with the RSN.

If the PDU SESSION ESTABLISHMENT ACCEPT message include alternative S-NSSAI, the S-NSSAI for the established PDU session shall be the S-NSSAI to be replaced and the alternative S-NSSAI on the UE side.

If the UE supports EDC and the network allows the use of EDC, the SMF shall include the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT ACCEPT message with the EDC usage allowed indicator. If the UE supports EDC and receives the EDC usage allowed indicator in the Extended protocol configuration options IE of the PDU SESSION ESTABLISHMENT ACCEPT message, the UE shall indicate to upper layers that network allows the use of EDC.

If the UE supports EDC and the network requires the use of EDC, the SMF shall include the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT ACCEPT message with the EDC usage required indicator. If the UE supports EDC and receives the EDC usage required indicator in the Extended protocol configuration options IE of the PDU SESSION ESTABLISHMENT ACCEPT message, the UE shall indicate to upper layers that network requires the use of EDC.

If the PDU SESSION ESTABLISHMENT REQUEST message includes a MS support of MAC address range in 5GS indicator in the Extended protocol configuration options IE, the SMF:

- a) shall consider that the UE supports a "destination MAC address range type" packet filter component and a "source MAC address range type" packet filter component; and
- b) if the SMF supports a "destination MAC address range type" packet filter component and a "source MAC address range type" packet filter component and enables the UE to request QoS rules with a "destination MAC address range type" packet filter component and a "source MAC address range type" packet filter component, shall include the Extended protocol configuration options IE in the PDU SESSION ESTABLISHMENT ACCEPT message and shall include the Network support of MAC address range in 5GS indicator in the Extended protocol configuration options IE.

If the UE receives the 5GSM network feature support IE in the PDU SESSION ESTABLISHMENT ACCEPT message with the NAPS bit set to "non-3GPP access path switching supported" during the PDU session establishment procedure of any PDU session, the UE may include the NSONR bit with value set to "non-3GPP path switching while using old non-3GPP resources requested" in the Non-3GPP path switching information IE in the REGISTRATION REQUEST message while performing the registration procedure for mobility registration update for non-3GPP access path switching.

NOTE 29: If the UE is registered to different PLMNs over 3GPP and non-3GPP accesses, the UE uses the capability received over non-3GPP access to determine whether to initiate the registration procedure for mobility registration update for non-3GPP path switching.

NOTE 30: If the AMF selects an SMF not supporting non-3GPP access path switching, the non-3GPP access path switching can still be performed with the AMF triggering release of the old user plane resources before new user plane resources are established.

If the PDU SESSION ESTABLISHMENT ACCEPT message includes a Network support of MAC address range in 5GS indicator in the Extended protocol configuration options IE, the UE shall consider that the network supports a "destination MAC address range type" packet filter component and a "source MAC address range type" packet filter component.

NOTE 31: Handling of indication that network allows the use of EDC or that network requires the use of EDC is specified in 3GPP TS 23.548 [182].

If the SMF includes the authorized QoS flow descriptions and the SMF determines to provide the N3QAI to the UE, the SMF shall include the N3QAI IE in the PDU SESSION ESTABLISHMENT ACCEPT message.

If the SMF supports URSP provisioning in EPS and the URSP provisioning in EPS support indicator is included in the Extended protocol configuration options IE of the PDU SESSION ESTABLISHMENT REQUEST message, the SMF shall insert the URSP provisioning in EPS support indicator in the Extended protocol configuration options IE of the PDU SESSION ESTABLISHMENT ACCEPT message.

If the PDU session to be established is a single access PDU session with IP PDU session type and based on operator policy the SMF determines to provide the protocol description for UL PDU set based handling to the UE, the SMF may include the Protocol description IE in the PDU SESSION ESTABLISHMENT ACCEPT message.

If the PDU session was a single access PDU session established over wireline access with IP PDU session type and based on operator policy the SMF determines the ECN marking for L4S for the 5G-RG (see subclause 4.17.2 of

3GPP TS 23.316 [6D]), the SMF may include the ECN marking for L4S indication IE in the PDU SESSION ESTABLISHMENT ACCEPT message.

If the UE has set the RTPMMII bit to "(S)RTP multiplexed media identification information supported" in the 5GSM capability IE of the PDU SESSION ESTABLISHMENT REQUEST message, the SMF may include the (S)RTP multiplexed media packet filter component in the packet filters of the QoS rules IE in the PDU SESSION ESTABLISHMENT ACCEPT message.

If the Protocol description IE is included in the PDU SESSION ESTABLISHMENT ACCEPT message, the UE shall, for each existing QoS rule, store the associated protocol description included in the Protocol description IE. The UE may use the protocol description information associated with the QoS rule(s) provided by the Protocol description IE to identify PDUs belonging to PDU sets for the uplink direction.

NOTE 32: Whether and how to use the protocol description information to identify PDU sets is up to the UE implementation.

If the ECN marking for L4S indication IE is included in the PDU SESSION ESTABLISHMENT ACCEPT message, the 5G-RG shall, for each existing QoS rule, store the associated ECN marking for L4S indication included in the ECN marking for L4S indication IE. The 5G-RG may perform the ECN marking for L4S for the corresponding QoS flow based on the ECN marking for L4S indication.

NOTE 33: How to perform the ECN marking for L4S for 5G-RG is out of the scope of this specification.

6.4.1.4 UE-requested PDU session establishment procedure not accepted by the network

6.4.1.4.1 General

If the connectivity with the requested DN is rejected by the network, the SMF shall create a PDU SESSION ESTABLISHMENT REJECT message.

The SMF shall set the 5GSM cause IE of the PDU SESSION ESTABLISHMENT REJECT message to indicate the reason for rejecting the PDU session establishment.

The 5GSM cause IE typically indicates one of the following SM cause values:

- #8 operator determined barring;
- #26 insufficient resources;
- #27 missing or unknown DNN;
- #28 unknown PDU session type;
- #29 user authentication or authorization failed;
- #31 request rejected, unspecified;
- #32 service option not supported;
- #33 requested service option not subscribed;
- #35 PTI already in use;
- #38 network failure;
- #39 reactivation requested;
- #46 out of LADN service area;
- #50 PDU session type IPv4 only allowed;
- #51 PDU session type IPv6 only allowed;
- #54 PDU session does not exist;

- #57: PDU session type IPv4v6 only allowed;
- #58: PDU session type Unstructured only allowed;
- #61: PDU session type Ethernet only allowed;
- #67 insufficient resources for specific slice and DNN;
- #68 not supported SSC mode;
- #69 insufficient resources for specific slice;
- #70 missing or unknown DNN in a slice;
- #82 maximum data rate per UE for user-plane integrity protection is too low;
- #86 UAS services not allowed; or
- #95 – 111 protocol errors.

If the PDU SESSION ESTABLISHMENT REQUEST message includes a PDU session type IE set to "IPv6", and the subscription, the SMF configuration, or both, are limited to IPv4 only for the requested DNN, the SMF shall include the 5GSM cause value #50 "PDU session type IPv4 only allowed" in the 5GSM cause IE of the PDU SESSION ESTABLISHMENT REJECT message.

If the PDU SESSION ESTABLISHMENT REQUEST message includes a PDU session type IE set to "IPv6", and the subscription, the SMF configuration, or both, support none of "IPv4" and "IPv6" PDU session types for the requested DNN, the SMF shall include the 5GSM cause value #28 "unknown PDU session type" in the 5GSM cause IE of the PDU SESSION ESTABLISHMENT REJECT message.

If the PDU SESSION ESTABLISHMENT REQUEST message includes a PDU session type IE set to "IPv4", and the subscription, the SMF configuration, or both, are limited to IPv6 only for the requested DNN, the SMF shall include the 5GSM cause value #51 "PDU session type IPv6 only allowed" in the 5GSM cause IE of the PDU SESSION ESTABLISHMENT REJECT message.

If the PDU SESSION ESTABLISHMENT REQUEST message includes a PDU session type IE set to "IPv4", and the subscription, the SMF configuration, or both, support none of "IPv4" and "IPv6" PDU session types for the requested DNN, the SMF shall include the 5GSM cause value #28 "unknown PDU session type" in the 5GSM cause IE of the PDU SESSION ESTABLISHMENT REJECT message.

If the PDU SESSION ESTABLISHMENT REQUEST message includes a PDU session type IE set to "IPv4v6", and the subscription, the SMF configuration, or both, support none of "IPv4v6", "IPv4" and "IPv6" PDU session types for the requested DNN, the SMF shall include the 5GSM cause value #28 "unknown PDU session type" in the 5GSM cause IE of the PDU SESSION ESTABLISHMENT REJECT message.

If the PDU SESSION ESTABLISHMENT REQUEST message includes a PDU session type IE set to "Unstructured" or "Ethernet", and the subscription, the SMF configuration, or both, do not support the PDU session type for the requested DNN, the SMF shall include the 5GSM cause value #28 "unknown PDU session type" in the 5GSM cause IE of the PDU SESSION ESTABLISHMENT REJECT message.

If the PDU SESSION ESTABLISHMENT REQUEST message is to establish an MA PDU session and includes a PDU session type IE set to "Unstructured", and the SMF configuration does not support the PDU session type, the SMF shall include the 5GSM cause value #28 "unknown PDU session type" in the 5GSM cause IE of the PDU SESSION ESTABLISHMENT REJECT message.

If the PDU SESSION ESTABLISHMENT REQUEST message contains the SSC mode IE indicating an SSC mode not supported by the subscription, the SMF configuration, or both of them, and the SMF decides to reject the PDU session establishment, the SMF shall include the 5GSM cause value #68 "not supported SSC mode" in the 5GSM cause IE and the SSC modes allowed by SMF in the Allowed SSC mode IE of the PDU SESSION ESTABLISHMENT REJECT message.

If the PDU SESSION ESTABLISHMENT REQUEST message is to establish an MA PDU session and MA PDU session is not allowed due to operator policy and subscription, and the SMF decides to reject the PDU session establishment, the SMF shall include the 5GSM cause value #33 "requested service option not subscribed" in the 5GSM cause IE of the PDU SESSION ESTABLISHMENT REJECT message.

If the PDU SESSION ESTABLISHMENT REQUEST message is identified to be for C2 communication and:

- a) does not include the Service-level-AA container IE with the service-level device ID set to the CAA-level UAV ID;
- b) does not include the Service-level-AA container IE with the service-level-AA payload and the Service-level-AA payload type; or
- c) the SMF is informed by the UAS-NF that the UAS service is not allowed,

the SMF shall reject the PDU SESSION ESTABLISHMENT REQUEST message by transmitting a PDU SESSION ESTABLISHMENT REJECT message with 5GSM cause IE set to 5GSM cause value #86 "UAS services not allowed".

In 3GPP access, if the operator's configuration requires user-plane integrity protection for the PDU session and, the maximum data rate per UE for user-plane integrity protection supported by the UE for uplink or the maximum data rate per UE for user-plane integrity protection supported by the UE for downlink, or both, are lower than required by the operator's configuration, the SMF shall include the 5GSM cause value #82 "maximum data rate per UE for user-plane integrity protection is too low" in the 5GSM cause IE of the PDU SESSION ESTABLISHMENT REJECT message.

If the UE requests a PDU session establishment for an LADN when the UE is located outside of the LADN service area, the SMF shall include the 5GSM cause value #46 "out of LADN service area" in the 5GSM cause IE of the PDU SESSION ESTABLISHMENT REJECT message.

If the DN authentication of the UE was performed with the PDU session authentication and authorization procedure and completed unsuccessfully, the SMF shall include the 5GSM cause value #29 "user authentication or authorization failed" in the 5GSM cause IE of the PDU SESSION ESTABLISHMENT REJECT message and shall set the EAP message IE of the PDU SESSION ESTABLISHMENT REJECT message to an EAP-failure message as specified in IETF RFC 3748 [34], provided by the DN.

If the DN authentication of the UE was performed with the service-level authentication and authorization procedure and completed unsuccessfully, the SMF shall include the 5GSM cause value #29 "user authentication or authorization failed" in the 5GSM cause IE of the PDU SESSION ESTABLISHMENT REJECT message and shall include the service-level-AA response provided by DN in the Service-level-AA container IE of the PDU SESSION ESTABLISHMENT REJECT message.

Based on the local policy and user's subscription data, if a PDU session is being established with the request type set to "existing PDU session" and the SMF determines the UE has:

- a) moved between a tracking area in NB-N1 mode and a tracking area in WB-N1 mode;
- b) moved between a tracking area in NB-S1 mode and a tracking area in WB-N1 mode; or
- c) moved between a tracking area in WB-S1 mode and a tracking area in NB-N1 mode,

the SMF may reject the PDU SESSION ESTABLISHMENT REQUEST message and:

- a) include the 5GSM cause value #39 "reactivation requested" in the 5GSM cause IE of the PDU SESSION ESTABLISHMENT REJECT message; or
- b) include a 5GSM cause value other than #39 "reactivation requested" in the 5GSM cause IE of the PDU SESSION ESTABLISHMENT REJECT message.

NOTE 1: The included 5GSM cause value is up to the network implementation.

If the PDU session cannot be established due to resource unavailability in the UPF, the SMF shall include the 5GSM cause value #26 "insufficient resources" in the 5GSM cause IE of the PDU SESSION ESTABLISHMENT REJECT message.

Based on the user's subscription data and the operator policy, if the SMF determines that the UUAA-SM procedure needs to be performed for a UE but the SMF does not receive the service-level device ID set to the CAA-level UAV ID in the Service-level-AA container IE of the PDU SESSION ESTABLISHMENT REQUEST message from the UE, the SMF shall include the 5GSM cause value #86 "UAS services not allowed" in the 5GSM cause IE of the PDU SESSION ESTABLISHMENT REJECT message.

The network may include a Back-off timer value IE in the PDU SESSION ESTABLISHMENT REJECT message.

If the 5GSM cause value is #26 "insufficient resources", #67 "insufficient resources for specific slice and DNN", or #69 "insufficient resources for specific slice" and the PDU SESSION ESTABLISHMENT REQUEST message was received from a UE configured for high priority access in selected PLMN or SNPN or the request type provided during the PDU session establishment is set to "initial emergency request" or "existing emergency PDU session", the network shall not include a Back-off timer value IE.

If the 5GSM cause value is #29 "user authentication or authorization failed ", the network should include a Back-off timer value IE.

If the Back-off timer value IE is included and the 5GSM cause value is different from #26 "insufficient resources", #28 "unknown PDU session type", #46 "out of LADN service area", #50 "PDU session type IPv4 only allowed", #51 "PDU session type IPv6 only allowed", #54 "PDU session does not exist", #57 "PDU session type IPv4v6 only allowed", #58 "PDU session type Unstructured only allowed", #61 "PDU session type Ethernet only allowed", #67 "insufficient resources for specific slice and DNN", #68 "not supported SSC mode", and #69 "insufficient resources for specific slice", the network may include the Re-attempt indicator IE to indicate whether the UE is allowed to attempt a PDN connectivity procedure in the PLMN for the same DNN in S1 mode, whether another attempt in S1 mode or in N1 mode is allowed in an equivalent PLMN or whether another attempt in N1 mode is allowed in an equivalent SNPN.

If the 5GSM cause value is #50 "PDU session type IPv4 only allowed", #51 "PDU session type IPv6 only allowed", #57 "PDU session type IPv4v6 only allowed", #58 "PDU session type Unstructured only allowed", or #61 "PDU session type Ethernet only allowed", the network may include the Re-attempt indicator IE without Back-off timer value IE to indicate whether the UE is allowed to attempt a PDU session establishment procedure in an equivalent PLMN or equivalent SNPN in N1 mode using the same PDU session type for the same DNN (or no DNN, if no DNN was indicated by the UE) and the same S-NSSAI (or no S-NSSAI, if no S-NSSAI was indicated by the UE).

The SMF shall send the PDU SESSION ESTABLISHMENT REJECT message.

Upon receipt of a PDU SESSION ESTABLISHMENT REJECT message and a PDU session ID, using the NAS transport procedure as specified in subclause 5.4.5, the UE shall stop timer T3580 shall release the allocated PTI value and shall consider that the PDU session was not established.

If the PDU SESSION ESTABLISHMENT REQUEST message was sent with request type set to "initial emergency request" or "existing emergency PDU session" and the UE receives a PDU SESSION ESTABLISHMENT REJECT message, then the UE may:

- a) inform the upper layers of the failure of the procedure; or

NOTE 2: This can result in the upper layers requesting another emergency call attempt using domain selection as specified in 3GPP TS 23.167 [6].

- b) de-register locally, if not de-registered already, attempt initial registration for emergency services.

If the PDU SESSION ESTABLISHMENT REJECT message includes 5GSM cause #39 "reactivation requested" and the PDU session is being transferred from EPS to 5GS and established with the request type set to "existing PDU session", the UE should re-initiate the UE-requested PDU session establishment procedure as specified in subclause 6.4.1 for:

- a) the PDU session type associated with the transferred PDU session;
- b) the SSC mode associated with the transferred PDU session;
- c) the DNN associated with the transferred PDU session; and
- d) the S-NSSAI associated with (if provided by the network) a mapped S-NSSAI if provided in the UE-requested PDU session establishment procedure of the transferred PDU session.

If the PDU SESSION ESTABLISHMENT REJECT message includes 5GSM cause #86 "UAS services not allowed" and the UE has not included the service-level device ID in the Service-level-AA container IE of the PDU SESSION ESTABLISHMENT REQUEST message and set the value to the CAA-level UAV ID:

- a) the UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for UAS services without including the CAA-level UAV ID in the service-level device ID of the Service-level-AA container IE; and

- b) upon receipt of the request from the upper layers to establish a PDU session for UAS services, the UE shall initiate the UE-requested PDU session establishment procedure by including the service-level device ID in the Service-level-AA container IE of the PDU SESSION ESTABLISHMENT REQUEST message and set the value to the CAA-level UAV ID as specified in subclause 6.4.1.2.

If the 5GSM cause value is different from #26 "insufficient resources", #28 "unknown PDU session type", #39 "reactivation requested", #46 "out of LADN service area", #50 "PDU session type IPv4 only allowed", #51 "PDU session type IPv6 only allowed", #54 "PDU session does not exist", #57 "PDU session type IPv4v6 only allowed", #58 "PDU session type Unstructured only allowed", #61 "PDU session type Ethernet only allowed", #67 "insufficient resources for specific slice and DNN", #68 "not supported SSC mode", #69 "insufficient resources for specific slice", #86 "UAS services not allowed", and #33 "requested service option not subscribed", and the PDU SESSION ESTABLISHMENT REQUEST message was received from a UE configured for high priority access in selected PLMN, the network shall not include a Back-off timer value IE.

6.4.1.4.2 Handling of network rejection due to congestion control

If:

- the 5GSM cause value #26 "insufficient resources" and the Back-off timer value IE are included in the PDU SESSION ESTABLISHMENT REJECT message; or
- an indication that the 5GSM message was not forwarded due to DNN based congestion control is received along a Back-off timer value and a PDU SESSION ESTABLISHMENT REQUEST message with the PDU session ID IE set to the PDU session ID of the PDU session;

the UE shall ignore the 5GSM congestion re-attempt indicator or the Re-attempt indicator IE provided by the network, if any, and the UE shall take different actions depending on the timer value received for timer T3396 in the Back-off timer value IE or depending on the Back-off timer value received from the 5GMM sublayer (if the UE is a UE configured for high priority access in selected PLMN or SNPN, exceptions are specified in subclause 6.2.7):

- a) If the timer value indicates neither zero nor deactivated and a DNN was provided during the PDU session establishment, the UE shall stop timer T3396 associated with the corresponding DNN, if it is running. If the timer value indicates neither zero nor deactivated and no DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3396 associated with no DNN if it is running. In an SNPN, the timer T3396 to be stopped includes:
 - 1) the timer T3396 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - 2) the timer T3396 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE shall then start timer T3396 with the value provided in the Back-off timer value IE or with the Back-off timer value received from the 5GMM sublayer and:

- 1) shall not send another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the same DNN that was sent by the UE, until timer T3396 expires or timer T3396 is stopped; and
- 2) shall not send another PDU SESSION ESTABLISHMENT REQUEST message without a DNN and with request type different from "initial emergency request" and different from "existing emergency PDU session", or another PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for a non-emergency PDU session established without a DNN provided by the UE, if no DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", until timer T3396 expires or timer T3396 is stopped.

The UE shall not stop timer T3396 upon a PLMN change, SNPN change, or inter-system change;

- b) if the timer value indicates that this timer is deactivated and a DNN was provided during the PDU session establishment, the UE shall stop timer T3396 associated with the corresponding DNN, if it is running. If the

timer value indicates that this timer is deactivated and no DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3396 associated with no DNN if it is running. In an SNPN, the timer T3396 to be stopped includes:

- 1) the timer T3396 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- 2) the timer T3396 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE:

- 1) shall not send another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the same DNN until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated if the UE does not support access to an SNPN using credentials from a credentials holder, or the selected entry of the "list of subscriber data" is updated if the UE supports access to an SNPN using credentials from a credentials holder, or the UE receives a PDU SESSION MODIFICATION COMMAND message for the same DNN from the network, or a PDU SESSION AUTHENTICATION COMMAND message for the same DNN from the network, or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE for the same DNN from the network; and
- 2) shall not send another PDU SESSION ESTABLISHMENT REQUEST message without a DNN and with request type different from "initial emergency request" and different from "existing emergency PDU session", or another PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for a non-emergency PDU session established without a DNN provided by the UE, if no DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated if the UE does not support access to an SNPN using credentials from a credentials holder, or the selected entry of the "list of subscriber data" is updated if the UE supports access to an SNPN using credentials from a credentials holder, or the UE receives a PDU SESSION MODIFICATION COMMAND message for a non-emergency PDU session established without a DNN provided by the UE, or a PDU SESSION AUTHENTICATION COMMAND message for a non-emergency PDU session established without a DNN provided by the UE, or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE for a non-emergency PDU session established without a DNN provided by the UE.

The timer T3396 remains deactivated upon a PLMN change, SNPN change, or inter-system change; and

c) if the timer value indicates zero, the UE:

- 1) shall stop timer T3396 associated with the corresponding DNN, if running. In an SNPN, the timer T3396 to be stopped includes:
 - i) the timer T3396 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - ii) the timer T3396 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message for the same DNN; and

- 2) if no DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3396 associated with no DNN, if running. In an SNPN, the timer T3396 to be stopped includes:

- i) the timer T3396 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- ii) the timer T3396 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send another PDU SESSION ESTABLISHMENT REQUEST message without a DNN, or another PDU SESSION MODIFICATION REQUEST message without a DNN provided by the UE.

In an SNPN, if the UE supports equivalent SNPNs, then the UE shall apply the timer T3396 for all the equivalent SNPNs. Otherwise, the UE shall apply the timer T3396 for the registered SNPN.

If the Back-off timer value IE is not included or no Back-off timer value is received from the 5GMM sublayer, then the UE may send another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message for the same DNN or without a DNN as specified in subclause 6.2.7.

When the timer T3396 is running or the timer is deactivated, the UE is allowed to initiate a PDU session establishment procedure for emergency services.

If the timer T3396 is running when the UE enters state 5GMM-DEREGISTERED, the UE remains switched on, and the USIM in the UE (if any) remains the same and the entry in the "list of subscriber data" to which timer T3396 is associated (if any) is not updated, then timer T3396 is kept running until it expires or it is stopped.

If the UE is switched off when the timer T3396 is running, and if the USIM in the UE (if any) remains the same and the entry in the "list of subscriber data" to which timer T3396 is associated (if any) is not updated when the UE is switched on, the UE shall behave as follows:

- let t_1 be the time remaining for T3396 timeout at switch off and let t be the time elapsed between switch off and switch on. If t_1 is greater than t , then the timer shall be restarted with the value $t_1 - t$. If t_1 is equal to or less than t , then the timer need not be restarted. If the UE is not capable of determining t , then the UE shall restart the timer with the value t_1 .

If:

- the 5GSM cause value #67 "insufficient resources for specific slice and DNN" and the Back-off timer value IE are included in the PDU SESSION ESTABLISHMENT REJECT message; or
- an indication that the 5GSM message was not forwarded due to S-NSSAI and DNN based congestion control is received along a Back-off timer value and a PDU SESSION ESTABLISHMENT REQUEST message with the PDU session ID IE set to the PDU session ID of the PDU session;

the UE shall ignore the Re-attempt indicator IE provided by the network, if any, and take different actions depending on the timer value received for timer T3584 in the Back-off timer value IE or depending on the Back-off timer value received from the 5GMM sublayer (if the UE is a UE configured for high priority access in selected PLMN or SNPN, exceptions are specified in subclause 6.2.8):

- a) If the timer value indicates neither zero nor deactivated, the UE shall stop timer T3584 associated with the same [S-NSSAI, DNN] combination as that the UE provided during the PDU session establishment, if it is running. If the timer value indicates neither zero nor deactivated and no DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3584 associated with [S-NSSAI, no DNN] combination as that the UE provided during the PDU session establishment, if it is running. If the timer value indicates neither zero nor deactivated and no S-NSSAI was provided during the PDU session establishment, the UE shall stop timer T3584 associated with [no S-NSSAI, DNN] combination as that the UE provided during the PDU session establishment, if it is running. If the timer value indicates neither zero nor deactivated and neither S-NSSAI nor DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3584 associated with [no S-NSSAI, no DNN] combination as that the UE provided during the PDU session establishment, if it is running. The timer T3584 to be stopped includes:

1) in a PLMN:

- i) the timer T3584 applied for all the PLMNs, if running; and

- ii) the timer T3584 applied for the registered PLMN, if running; or
- 2) in an SNPN:
 - i) the timer T3584 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - ii) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE shall then start timer T3584 with the value provided in the Back-off timer value IE or with the Back-off timer value received from the 5GMM sublayer and:

- 1) shall not send another PDU SESSION ESTABLISHMENT REQUEST message, or PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the same [S-NSSAI, DNN] combination that was sent by the UE, until timer T3584 expires or timer T3584 is stopped;
- 2) shall not send another PDU SESSION ESTABLISHMENT REQUEST message with request type different from "initial emergency request" and different from "existing emergency PDU session", or another PDU SESSION MODIFICATION REQUEST with exception of those identified in subclause 6.4.2.1, message for the same [S-NSSAI, no DNN] combination that was sent by the UE, if no DNN was provided during the PDU session establishment, until timer T3584 expires or timer T3584 is stopped;
- 3) shall not send another PDU SESSION ESTABLISHMENT REQUEST message, or another PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the same [no S-NSSAI, DNN] combination that was sent by the UE, if no S-NSSAI was provided during the PDU session establishment, until timer T3584 expires or timer T3584 is stopped; and
- 4) shall not send another PDU SESSION ESTABLISHMENT REQUEST message with request type different from "initial emergency request" and different from "existing emergency PDU session", or another PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the same [no S-NSSAI, no DNN] combination that was sent by the UE, if neither S-NSSAI nor DNN was provided during the PDU session establishment, until timer T3584 expires or timer T3584 is stopped.

The UE shall not stop timer T3584 upon a PLMN change, SNPN change, or inter-system change;

- b) if the timer value indicates that this timer is deactivated, the UE:

- 1) shall stop timer T3584 associated with the same [S-NSSAI, DNN] combination as that the UE provided during the PDU session establishment, if running. The timer T3584 to be stopped includes:
 - i) in a PLMN:
 - A) the timer T3584 applied for all the PLMNs, if running; and
 - B) the timer T3584 applied for the registered PLMN, if running; or
 - ii) in an SNPN:
 - A) the timer T3584 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - B) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message, or PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the same [S-NSSAI, DNN] combination that was sent by the UE, until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated if the UE does not support access to an SNPN using credentials from a credentials holder, or the selected entry of the "list of subscriber data" is updated if the UE supports access to an SNPN using credentials from a credentials holder, or the UE receives a PDU SESSION MODIFICATION COMMAND message for the same [S-NSSAI, DNN] combination from

the network, or a PDU SESSION AUTHENTICATION COMMAND message for the same [S-NSSAI, DNN] combination from the network, or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE for the same [S-NSSAI, DNN] combination from the network;

- 2) shall stop timer T3584 associated with the same [S-NSSAI, no DNN] combination as that the UE provided during the PDU session establishment, if running. The timer T3584 to be stopped includes:

i) in a PLMN:

- A) the timer T3584 applied for all the PLMNs, if running; and
- B) the timer T3584 applied for the registered PLMN, if running; or

ii) in an SNPN:

- A) the timer T3584 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- B) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE shall not send a PDU SESSION ESTABLISHMENT REQUEST message with request type different from "initial emergency request" and different from "existing emergency PDU session", or a PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the same [S-NSSAI, no DNN] combination that was sent by the UE, if no DNN was provided during the PDU session establishment, until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated if the UE does not support access to an SNPN using credentials from a credentials holder, or the selected entry of the "list of subscriber data" if the UE supports access to an SNPN using credentials from a credentials holder, or the UE receives a PDU SESSION MODIFICATION COMMAND message for a non-emergency PDU session established for the same [S-NSSAI, no DNN] combination from the network, or a PDU SESSION AUTHENTICATION COMMAND message for a non-emergency PDU session established for the same [S-NSSAI, DNN] combination from the network, or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE for a non-emergency PDU session established for the same [S-NSSAI, no DNN] combination from the network;

- 3) shall stop timer T3584 associated with the same [no S-NSSAI, DNN] combination as that the UE provided during the PDU session establishment, if running. The timer T3584 to be stopped includes:

i) in a PLMN:

- A) the timer T3584 applied for all the PLMNs, if running; and
- B) the timer T3584 applied for the registered PLMN, if running; or

ii) in an SNPN:

- A) the timer T3584 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- B) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE shall not send a PDU SESSION ESTABLISHMENT REQUEST message, or a PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the same [no S-NSSAI, DNN] combination that was sent by the UE, if no S-NSSAI was provided during the PDU session establishment, until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated, or the UE receives a PDU SESSION MODIFICATION COMMAND message for the same [no S-NSSAI, DNN] combination from the network, or a PDU SESSION AUTHENTICATION COMMAND message for a non-emergency PDU session established for the same [no S-NSSAI, no DNN] combination from the network, or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE for the same [no S-NSSAI, DNN] combination from the network; and

- 4) shall stop timer T3584 associated with the same [no S-NSSAI, no DNN] combination as that the UE provided during the PDU session establishment, if running. The timer T3584 to be stopped includes:

i) in a PLMN:

- A) the timer T3584 applied for all the PLMNs, if running; and
- B) the timer T3584 applied for the registered PLMN, if running; or

ii) in an SNPN:

- A) the timer T3584 applied for all the equivalent SNPNS, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- B) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNS or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE shall not send a PDU SESSION ESTABLISHMENT REQUEST message with request type different from "initial emergency request" and different from "existing emergency PDU session", or a PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the same [no S-NSSAI, no DNN] combination that was sent by the UE, if neither S-NSSAI nor DNN was provided during the PDU session establishment, until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated if the UE does not support access to an SNPN using credentials from a credentials holder, or the selected entry of the "list of subscriber data" is updated if the UE supports access to an SNPN using credentials from a credentials holder, or the UE receives an PDU SESSION MODIFICATION COMMAND message for a non-emergency PDU session established for the same [no S-NSSAI, no DNN] combination from the network or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE for a non-emergency PDU session established for the same [no S-NSSAI, no DNN] combination from the network.

The timer T3584 remains deactivated upon a PLMN change, SNPN change, or inter-system change; and

c) if the timer value indicates zero, the UE:

- 1) shall stop timer T3584 associated with the same [S-NSSAI, DNN] combination as that the UE provided during the PDU session establishment, if running. The timer T3584 to be stopped includes:

i) in a PLMN:

- A) the timer T3584 applied for all the PLMNs, if running; and
- B) the timer T3584 applied for the registered PLMN, if running; or

ii) in an SNPN:

- A) the timer T3584 applied for all the equivalent SNPNS, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- B) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNS or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message for the same [S-NSSAI, DNN] combination;

- 2) shall stop timer T3584 associated with the same [S-NSSAI, no DNN] combination as that the UE provided during the PDU session establishment, if running. The timer T3584 to be stopped includes:

i) in a PLMN:

- A) the timer T3584 applied for all the PLMNs, if running; and
- B) the timer T3584 applied for the registered PLMN, if running; or

ii) in an SNPN:

- A) the timer T3584 applied for all the equivalent S-NPNs, and associated with the R-SNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- B) the timer T3584 applied for the registered SNPN, associated with the R-SNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent S-NPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message for the same [S-NSSAI, no DNN] combination if no DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session";

- 3) shall stop timer T3584 associated with the same [no S-NSSAI, DNN] combination as that the UE provided during the PDU session establishment, if running. The timer T3584 to be stopped includes:

i) in a PLMN:

- A) the timer T3584 applied for all the PLMNs, if running; and
- B) the timer T3584 applied for the registered PLMN, if running; or

ii) in an SNPN:

- A) the timer T3584 applied for all the equivalent S-NPNs, and associated with the R-SNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- B) the timer T3584 applied for the registered SNPN, associated with the R-SNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent S-NPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send another PDU SESSION ESTABLISHMENT REQUEST message, or PDU SESSION MODIFICATION REQUEST message for the same [no S-NSSAI, DNN] combination if no S-NSSAI was provided during the PDU session establishment; and

- 4) shall stop timer T3584 associated with the same [no S-NSSAI, no DNN] combination as that the UE provided during the PDU session establishment, if running. The timer T3584 to be stopped includes:

i) in a PLMN:

- A) the timer T3584 applied for all the PLMNs, if running; and
- B) the timer T3584 applied for the registered PLMN, if running; or

ii) in an SNPN:

- A) the timer T3584 applied for all the equivalent S-NPNs, and associated with the R-SNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- B) the timer T3584 applied for the registered SNPN, associated with the R-SNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent S-NPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send another PDU SESSION ESTABLISHMENT REQUEST message, or PDU SESSION MODIFICATION REQUEST message for the same [no S-NSSAI, no DNN] combination if neither S-NSSAI nor DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session".

If the 5GSM congestion re-attempt indicator IE with the ABO bit set to "The back-off timer is applied in all PLMNs or all equivalent S-NPNs" is included in the PDU SESSION ESTABLISHMENT REJECT message with the 5GSM cause value #67 "insufficient resources for specific slice and DNN", then the UE shall apply the timer T3584 for all the PLMNs or all the equivalent S-NPNs. Otherwise, the UE shall apply the timer T3584 for the registered PLMN.

If the Back-off timer value IE is not included or no Back-off timer value is received from the 5GMM sublayer, then the UE may send another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message for the same [S-NSSAI, DNN] combination, or for the same [S-NSSAI, no DNN] combination, or for the same [no S-NSSAI, DNN] combination, or for the same [no S-NSSAI, no DNN] combination as specified in subclause 6.2.8.

When the timer T3584 is running or the timer is deactivated, the UE is allowed to initiate a PDU session establishment procedure for emergency services.

If the timer T3584 is running when the UE enters state 5GMM-DEREGISTERED, the UE remains switched on, and the USIM in the UE (if any) remains the same and the entry in the "list of subscriber data" to which timer T3584 is associated (if any) is not updated, then timer T3584 is kept running until it expires or it is stopped.

If the UE is switched off when the timer T3584 is running, and if the USIM in the UE (if any) remains the same and the entry in the "list of subscriber data" to which timer T3584 is associated (if any) is not updated when the UE is switched on, the UE shall behave as follows:

- let t_1 be the time remaining for T3584 timeout at switch off and let t be the time elapsed between switch off and switch on. If t_1 is greater than t , then the timer shall be restarted with the value $t_1 - t$. If t_1 is equal to or less than t , then the timer need not be restarted. If the UE is not capable of determining t , then the UE shall restart the timer with the value t_1 .

If:

- the 5GSM cause value #69 "insufficient resources for specific slice" and the Back-off timer value IE are included in the PDU SESSION ESTABLISHMENT REJECT message; or
- an indication that the 5GSM message was not forwarded due to S-NSSAI only based congestion control is received along a Back-off timer value and a PDU SESSION ESTABLISHMENT REQUEST message with the PDU session ID IE set to the PDU session ID of the PDU session;

the UE shall ignore the Re-attempt indicator IE provided by the network, if any, and take different actions depending on the timer value received for timer T3585 in the Back-off timer value IE or depending on the Back-off timer value received from the 5GMM sublayer (if the UE is a UE configured for high priority access in selected PLMN or SNPN, exceptions are specified in subclause 6.2.8):

- a) If the timer value indicates neither zero nor deactivated and an S-NSSAI was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3585 associated with the corresponding S-NSSAI, if it is running. If the timer value indicates neither zero nor deactivated and no S-NSSAI was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3585 associated with no S-NSSAI if it is running. The timer T3585 to be stopped includes:

1) in a PLMN:

- i)- the timer T3585 applied for all the PLMNs and for the access over which the PDU SESSION ESTABLISHMENT REJECT is received, if running;
- ii) the timer T3585 applied for all the PLMNs and for both 3GPP access type and non-3GPP access type, if running;
- iii) the timer T3585 applied for the registered PLMN and for the access over which the PDU SESSION ESTABLISHMENT REJECT is received, if running; and
- iv) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, if running; or

2) in an SNPN:

- i) the timer T3585 applied for all the equivalent SNPNs and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;

- ii) the timer T3585 applied for all the equivalent SNPNs and for both 3GPP access type and non-3GPP access type, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
- iii) the timer T3585 applied for the registered SNPN and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- iv) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE shall then start timer T3585 with the value provided in the Back-off timer value IE or with the Back-off timer value received from the 5GMM sublayer and:

- 1) shall not send another PDU SESSION ESTABLISHMENT REQUEST message with request type different from "initial emergency request" and different from "existing emergency PDU session", or another PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for a non-emergency PDU session for the same S-NSSAI that was sent by the UE, until timer T3585 expires or timer T3585 is stopped; and
- 2) shall not send another PDU SESSION ESTABLISHMENT REQUEST message without an S-NSSAI and with request type different from "initial emergency request" and different from "existing emergency PDU session", or another PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for a non-emergency PDU session established without an S-NSSAI provided by the UE, if no S-NSSAI was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", until timer T3585 expires or timer T3585 is stopped.

The UE shall not stop timer T3585 upon a PLMN change, SNPN change, or inter-system change;

- b) if the timer value indicates that this timer is deactivated and an S-NSSAI was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3585 associated with the corresponding S-NSSAI, if it is running. If the timer value indicates that this timer is deactivated and no S-NSSAI was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3585 associated with no S-NSSAI if it is running. The timer T3585 to be stopped includes:

- 1) in a PLMN:

- i) the timer T3585 applied for all the PLMNs and for the access over which the PDU SESSION ESTABLISHMENT REJECT is received, if running;
- ii) the timer T3585 applied for all the PLMNs and for both 3GPP access type and non-3GPP access type, if running;
- iii) the timer T3585 applied for the registered PLMN and for the access over which the PDU SESSION ESTABLISHMENT REJECT is received, if running; and
- iv) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, if running; or

- 2) in an SNPN:

- i) the timer T3585 applied for all the equivalent SNPNs and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;

- ii) the timer T3585 applied for all the equivalent SNPNs and for both 3GPP access type and non-3GPP access type, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
- iii) the timer T3585 applied for the registered SNPN and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- iv) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE:

- 1) shall not send another PDU SESSION ESTABLISHMENT REQUEST message with request type different from "initial emergency request" and different from "existing emergency PDU session", or another PDU SESSION MODIFICATION REQUEST with exception of those identified in subclause 6.4.2.1, for a non-emergency PDU session for the same S-NSSAI until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated if the UE does not support access to an SNPN using credentials from a credentials holder, or the selected entry of the "list of subscriber data" is updated if the UE supports access to an SNPN using credentials from a credentials holder, or the UE receives a PDU SESSION MODIFICATION COMMAND message for a non-emergency PDU session for the same S-NSSAI from the network, or a PDU SESSION AUTHENTICATION COMMAND message for a non-emergency PDU session for the same S-NSSAI from the network, or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE for the same S-NSSAI from the network; and
- 2) shall not send another PDU SESSION ESTABLISHMENT REQUEST message without an S-NSSAI and with request type different from "initial emergency request" and different from "existing emergency PDU session", or another PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for a non-emergency PDU session established without an S-NSSAI provided by the UE, if no S-NSSAI was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated if the UE does not support access to an SNPN using credentials from a credentials holder, or the selected entry of the "list of subscriber data" is updated if the UE supports access to an SNPN using credentials from a credentials holder, or the UE receives a PDU SESSION MODIFICATION COMMAND message for a non-emergency PDU session established without an S-NSSAI provided by the UE, or a PDU SESSION AUTHENTICATION COMMAND message for a non-emergency PDU session established without an S-NSSAI provided by the UE, or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE for a non-emergency PDU session established without an S-NSSAI provided by the UE.

The timer T3585 remains deactivated upon a PLMN change, SNPN change, or inter-system change; and

- c) if the timer value indicates zero, the UE:

- 1) shall stop timer T3585 associated with the corresponding S-NSSAI, if running. The timer T3585 to be stopped includes:
 - i) in a PLMN:
 - A) the timer T3585 applied for all the PLMNs and for the access over which the PDU SESSION RELEASE COMMAND is received, if running;
 - B) the timer T3585 applied for all the PLMNs and for the access over which the PDU SESSION RELEASE COMMAND is received, if running;
 - C) the timer T3585 applied for the registered PLMN and for current access type or both 3GPP access type and non-3GPP access type, if running; and

D) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, if running; or

ii) in an SNPN:

- A) the timer T3585 applied for all the equivalent SNPNs and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
- B) the timer T3585 applied for all the equivalent SNPNs and for both 3GPP access type and non-3GPP access type, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
- C) the timer T3585 applied for the registered SNPN and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- D) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message for the same S-NSSAI; and

- 2) if no S-NSSAI was provided during the PDU session establishment and the request type was different from "initial emergency request " and different from "existing emergency PDU session", the UE shall stop timer T3585 associated with no S-NSSAI, if running. The timer T3585 to be stopped includes:

i) in a PLMN:

- A) the timer T3585 applied for all the PLMNs and for the access over which the PDU SESSION RELEASE COMMAND is received, if running;
- B) the timer T3585 applied for all the PLMNs and for the access over which the PDU SESSION RELEASE COMMAND is received, if running;
- C) the timer T3585 applied for the registered PLMN and for current access type or both 3GPP access type and non-3GPP access type, if running; and
- D) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, if running; or

ii) in an SNPN:

- A) the timer T3585 applied for all the equivalent SNPNs and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
- B) the timer T3585 applied for all the equivalent SNPNs and for both 3GPP access type and non-3GPP access type, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
- C) the timer T3585 applied for the registered SNPN and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- D) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, associated with the RSNPN and, if the UE supports access to an SNPN using credentials

from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send another PDU SESSION ESTABLISHMENT REQUEST message without an S-NSSAI, or another PDU SESSION MODIFICATION REQUEST message without an S-NSSAI provided by the UE.

If the 5GSM congestion re-attempt indicator IE with the ABO bit set to "The back-off timer is applied in all PLMNs or equivalent SNPNs" is included in the PDU SESSION ESTABLISHMENT REJECT message with the 5GSM cause value #69 "insufficient resources for specific slice", then the UE shall apply the timer T3585 for all the PLMNs or all the equivalent SNPNs. Otherwise, the UE shall apply the timer T3585 for the registered PLMN or the registered SNPN. Additionally, if the 5GSM congestion re-attempt indicator IE with the CATBO bit set to "The back-off timer is applied in the current access type" is included in the PDU SESSION ESTABLISHMENT REJECT message with the 5GSM cause value #69 "insufficient resources for specific slice", then the UE shall apply the timer T3585 for the current access type. Otherwise, the UE shall apply the timer T3585 for both 3GPP access type and non-3GPP access type and the UE shall stop any running timer T3585 for the applied PLMN or SNPN and for the access different from the access from which the PDU SESSION ESTABLISHMENT REJECT message is received.

If the Back-off timer value IE is not included or no Back-off timer value is received from the 5GMM sublayer, then the UE may send another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message for the same S-NSSAI or without an S-NSSAI as specified in subclause 6.2.8.

When the timer T3585 is running or the timer is deactivated, the UE is allowed to initiate a PDU session establishment procedure for emergency services.

If the timer T3585 is running when the UE enters state 5GMM-DEREGISTERED, the UE remains switched on, and the USIM in the UE (if any) remains the same and the entry in the "list of subscriber data" to which timer T3585 is associated (if any) is not updated, then timer T3585 is kept running until it expires or it is stopped.

If the UE is switched off when the timer T3585 is running, and if the USIM in the UE (if any) remains the same and the entry in the "list of subscriber data" to which timer T3585 is associated (if any) is not updated when the UE is switched on, the UE shall behave as follows:

let t_1 be the time remaining for T3585 timeout at switch off and let t be the time elapsed between switch off and switch on. If t_1 is greater than t , then the timer shall be restarted with the value $t_1 - t$. If t_1 is equal to or less than t , then the timer need not be restarted. If the UE is not capable of determining t , then the UE shall restart the timer with the value t_1 .

NOTE: As described in this subclause, upon PLMN change, SNPN change or inter-system change, the UE does not stop the timer T3584 or T3585. This means the timer T3584 or T3585 can still be running or be deactivated for the given 5GSM procedure, the PLMN or SNPN, the S-NSSAI and optionally the DNN combination when the UE returns to the PLMN or SNPN or when it performs inter-system change back from S1 mode to N1 mode. Thus the UE can still be prevented from sending another PDU SESSION ESTABLISHMENT REQUEST or PDU SESSION MODIFICATION REQUEST message in the PLMN or SNPN for the same S-NSSAI and optionally the same DNN.

Upon PLMN change or SNPN change, if T3584 applied for the registered PLMN or the registered SNPN is running or is deactivated for an S-NSSAI, a DNN, and old PLMN or old SNPN, but T3584 is not running and is not deactivated for the S-NSSAI, the DNN, and new PLMN or new SNPN, then the UE is allowed to send a PDU SESSION ESTABLISHMENT REQUEST message for the same S-NSSAI and the same DNN in the new PLMN or new SNPN.

Upon PLMN change or SNPN change, if T3585 applied for the registered PLMN or the registered SNPN is running or is deactivated for an S-NSSAI and old PLMN or old SNPN, but T3585 is not running and is not deactivated for the S-NSSAI and new PLMN or new SNPN, then the UE is allowed to send a PDU SESSION ESTABLISHMENT REQUEST message for the same S-NSSAI in the new PLMN or new SNPN.

Upon SNPN change, if T3585 applied for all the equivalent SNPNs is running or is deactivated for an S-NSSAI and old SNPN, but T3585 is not running and is not deactivated for the S-NSSAI and new non-equivalent SNPN, then the UE is allowed to send a PDU SESSION ESTABLISHMENT REQUEST message for the same S-NSSAI in the new SNPN.

6.4.1.4.3 Handling of network rejection not due to congestion control

If the 5GSM cause value is different from #26 "insufficient resources", #28 "unknown PDU session type", #39 "reactivation requested", #46 "out of LADN service area", #50 "PDU session type IPv4 only allowed", #51 "PDU session type IPv6 only allowed", #54 "PDU session does not exist", #57 "PDU session type IPv4v6 only allowed", #58

"PDU session type Unstructured only allowed", #61 "PDU session type Ethernet only allowed", #67 "insufficient resources for specific slice and DNN", #68 "not supported SSC mode", #69 "insufficient resources for specific slice", #86 "UAS services not allowed", and #33 "requested service option not subscribed" upon sending PDU SESSION ESTABLISHMENT REQUEST to establish an MA PDU session, and the Back-off timer value IE is included, the UE shall behave as follows: (if the UE is a UE configured for high priority access in selected PLMN or SNPN, exceptions are specified in subclause 6.2.12):

a) if the timer value indicates neither zero nor deactivated and:

- 1) if the UE provided a DNN and S-NSSAI to the network during the PDU session establishment and the 5GSM cause value is different from #27 "missing or unknown DNN", the UE shall start the back-off timer with the value provided in the Back-off timer value IE for the PDU session establishment procedure and:
 - i) in a PLMN, [PLMN, DNN, (mapped) HPLMN S-NSSAI] combination. The UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for the same DNN and (mapped) HPLMN S-NSSAI in the current PLMN, until the back-off timer expires, the UE is switched off, or the USIM is removed; or
 - ii) in an SNPN, [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, (mapped) subscribed SNPN S-NSSAI] combination. The UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for the same DNN and (mapped) subscribed SNPN S-NSSAI in the current SNPN using the selected entry of the "list of subscriber data" or selected PLMN subscription, until the back-off timer expires, the UE is switched off, the USIM is removed, or the selected entry of the "list of subscriber data" is updated;
- 2) if the UE provided a DNN to the network during the PDU session establishment and the 5GSM cause value is #27 "missing or unknown DNN", the UE shall start the back-off timer with the value provided in the Back-off timer value IE for the PDU session establishment procedure and:
 - i) in a PLMN, [PLMN, DNN] combination. The UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for the same DNN in the current PLMN, until the back-off timer expires, the UE is switched off, or the USIM is removed; or
 - ii) in an SNPN, [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, DNN] combination. The UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for the same DNN in the current SNPN using the selected entry of the "list of subscriber data" or selected PLMN subscription, until the back-off timer expires, the UE is switched off, the USIM is removed, or the selected entry of the "list of subscriber data" is updated;
- 3) if the UE did not provide a DNN or S-NSSAI or any of the two parameters to the network during the PDU session establishment and the 5GSM cause value is different from #27 "missing or unknown DNN", it shall start the back-off timer accordingly for the PDU session establishment procedure and:
 - i) in a PLMN, [PLMN, DNN, no S-NSSAI], [PLMN, no DNN, (mapped) HPLMN S-NSSAI] or [PLMN, no DNN, no S-NSSAI] combination. Dependent on the combination, the UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for the same [PLMN, DNN, no S-NSSAI], [PLMN, no DNN, (mapped) HPLMN S-NSSAI] or [PLMN, no DNN, no S-NSSAI] combination in the current PLMN, until the back-off timer expires, the UE is switched off, or the USIM is removed; or
 - ii) in an SNPN, [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, (mapped) subscribed SNPN S-NSSAI] or [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI] combination. Dependent on the combination, the UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for the same [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, (mapped) subscribed SNPN S-NSSAI] or [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI] combination in the current PLMN using the selected entry of the "list of subscriber data" or selected PLMN subscription, until the back-off timer expires, the UE is switched off, the USIM is removed or the selected entry of the "list of subscriber data" is updated; or
- 4) if the UE did not provide a DNN to the network during the PDU session establishment and the 5GSM cause value is #27 "missing or unknown DNN", it shall start the back-off timer accordingly for the PDU session establishment procedure and:

- i) in a PLMN, [PLMN, no DNN] combination. The UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for the same [PLMN, no DNN] in the current PLMN, until the back-off timer expires, the UE is switched off, or the USIM is removed; or
 - ii) in an SNPN, [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN] combination. The UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for the same [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN] in the current PLMN, using the selected entry of the "list of subscriber data" or selected PLMN subscription, until the back-off timer expires, the UE is switched off, the USIM is removed or the selected entry of the "list of subscriber data" is updated;
- b) if the timer value indicates that this timer is deactivated and:
- 1) if the UE provided a DNN and S-NSSAI to the network during the PDU session establishment and the 5GSM cause value is different from #27 "missing or unknown DNN", the UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for:
 - i) in a PLMN, the same DNN and (mapped) HPLMN S-NSSAI in the current PLMN, until the UE is switched off, or the USIM is removed; or
 - ii) in an SNPN, the same DNN and (mapped) subscribed SNPN S-NSSAI in the current SNPN using the selected entry of the "list of subscriber data" or selected PLMN subscription, until the UE is switched off, the USIM is removed, or the selected entry of the "list of subscriber data" is updated;
 - 2) if the UE provided a DNN to the network during the PDU session establishment and the 5GSM cause value is #27 "missing or unknown DNN", the UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for:
 - i) in a PLMN, the same DNN in the current PLMN, until the UE is switched off, or the USIM is removed; or
 - ii) in an SNPN, the same DNN in the current SNPN using the selected entry of the "list of subscriber data" or selected PLMN subscription, until the UE is switched off, the USIM is removed, or the selected entry of the "list of subscriber data" is updated;
 - 3) if the UE did not provide a DNN or S-NSSAI or any of the two parameters to the network during the PDU session establishment and the 5GSM cause value is different from #27 "missing or unknown DNN", the UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for:
 - i) in a PLMN, the same [PLMN, DNN, no S-NSSAI], [PLMN, no DNN, (mapped) HPLMN S-NSSAI] or [PLMN, no DNN, no S-NSSAI] combination in the current PLMN, until the UE is switched off, or the USIM is removed; or
 - ii) in an SNPN, the same [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, (mapped) subscribed SNPN S-NSSAI] or [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI] combination in the current SNPN using the selected entry of the "list of subscriber data" or selected PLMN subscription, until the UE is switched off, the USIM is removed, or the selected entry of the "list of subscriber data" is updated; or
 - 4) if the UE did not provide a DNN to the network during the PDU session establishment and the 5GSM cause value is #27 "missing or unknown DNN", the UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for:
 - i) in a PLMN, the same [PLMN, no DNN] in the current PLMN, until the UE is switched off, or the USIM is removed; or
 - ii) in an SNPN, the same [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN] in the current SNPN using the selected entry of the "list of subscriber data" or selected PLMN subscription, until the UE is switched off, the USIM is removed, or the selected entry of the "list of subscriber data" is updated; and
- c) if the timer value indicates zero and the 5GSM cause value is different from #27 "missing or unknown DNN", the UE may send another PDU SESSION ESTABLISHMENT REQUEST message for:

- 1) in a PLMN, the same combination of [PLMN, DNN, (mapped) HPLMN S-NSSAI], [PLMN, DNN, no S-NSSAI], [PLMN, no DNN, (mapped) HPLMN S-NSSAI], or [PLMN, no DNN, no S-NSSAI] in the current PLMN. If the timer value indicates zero and the 5GSM cause value is #27 "missing or unknown DNN", the UE may send another PDU SESSION ESTABLISHMENT REQUEST message for the same combination of [PLMN, DNN], or [PLMN, no DNN] in the current PLMN; or
- 2) in an SNPN, the same combination of [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, (mapped) subscribed SNPN S-NSSAI], [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, (mapped) subscribed S-NSSAI], or [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI] in the current SNPN using the selected entry of the "list of subscriber data" or selected PLMN subscription. If the timer value indicates zero and the 5GSM cause value is #27 "missing or unknown DNN", the UE may send another PDU SESSION ESTABLISHMENT REQUEST message for the same combination of [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN], or [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN] in the current SNPN using the selected entry of the "list of subscriber data" or selected PLMN subscription.

If the Back-off timer value IE is not included, then the UE shall ignore the Re-attempt indicator IE provided by the network in the PDU SESSION ESTABLISHMENT REJECT message, if any.

- a) Additionally, if the 5GSM cause value is #8 "operator determined barring", #32 "service option not supported", #33 "requested service option not subscribed" upon sending PDU SESSION ESTABLISHMENT REQUEST not to establish an MA PDU session, or #70 "missing or unknown DNN in a slice", then:

- 1) the UE not operating in SNPN access operation mode shall proceed as follows:
 - i) if the UE is registered in the HPLMN or in a PLMN that is within the EHPLMN list, the UE shall behave as described above in the present subclause using the configured SM Retry Timer value as specified in 3GPP TS 24.368 [17] or in USIM file NAS_{CONFIG} as specified in 3GPP TS 31.102 [22], if available, as back-off timer value; and

NOTE 1: The way to choose one of the configured SM Retry Timer values for back-off timer value is up to UE implementation if the UE is configured with:

- an SM Retry Timer value in ME as specified in 3GPP TS 24.368 [17]; and
- an SM Retry Timer value in USIM file NAS_{CONFIG} as specified in 3GPP TS 31.102 [22].

- ii) otherwise, if the UE is not registered in its HPLMN or in a PLMN that is within the EHPLMN list, or if the SM Retry Timer value is not configured, the UE shall behave as described above in the present subclause, using the default value of 12 minutes for the back-off timer; or

- 2) the UE operating in SNPN access operation mode shall proceed as follows:

- i) if:

- A) the SM Retry Timer value for the current SNPN as specified in 3GPP TS 24.368 [17] is available; or
- B) the UE used the USIM for registration to the current SNPN and the SM Retry Timer value in USIM file NAS_{CONFIG} as specified in 3GPP TS 31.102 [22] is available;

then the UE shall behave as described above in the present subclause using the configured SM Retry Timer value as back-off timer value; or

NOTE 2: The way to choose one of the configured SM Retry Timer values for back-off timer value is up to UE implementation if both conditions in bullets A) and B) above are satisfied.

- ii) otherwise, the UE shall behave as described above in the present subclause, using the default value of 12 minutes for the back-off timer.

- b) For 5GSM cause value #27 "missing or unknown DNN", then:

- 1) the UE not operating in SNPN access operation mode shall proceed as follows:
 - i) if the UE is registered in the HPLMN or in a PLMN that is within the EHPLMN list, the UE shall start the back-off timer with the configured SM Retry Timer value as specified in 3GPP TS 24.368 [17] or in

USIM file NAS_{CONFIG} as specified in 3GPP TS 31.102 [22], if available, as back-off timer value for the PDU session establishment procedure and the [PLMN, DNN] or [PLMN, no DNN] combination. The UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for the same DNN in the current PLMN, until the back-off timer expires, the UE is switched off or the USIM is removed; and

NOTE 3: The way to choose one of the configured SM Retry Timer values for back-off timer value is up to UE implementation if the UE is configured with:

- an SM Retry Timer value in ME as specified in 3GPP TS 24.368 [17]; and
- an SM Retry Timer value in USIM file NAS_{CONFIG} as specified in 3GPP TS 31.102 [22].

ii) otherwise, if the UE is not registered in its HPLMN or in a PLMN that is within the EHPLMN list, or if the SM Retry Timer value is not configured, the UE shall start the back-off timer with the default value of 12 minutes as back-off timer value for the PDU session establishment procedure and the [PLMN, DNN] or [PLMN, no DNN] combination. The UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for the same DNN in the current PLMN, until the back-off timer expires, the UE is switched off or the USIM is removed; or

2) the UE operating in SNPN access operation mode shall proceed as follows:

i) if:

- A) the SM Retry Timer value for the current SNPN as specified in 3GPP TS 24.368 [17] is available; or
- B) the UE used the USIM for registration to the current SNPN and the SM Retry Timer value in USIM file NAS_{CONFIG} as specified in 3GPP TS 31.102 [22] is available;

then:

the UE shall start the back-off timer with the configured SM Retry Timer value as back-off timer value for the PDU session establishment procedure and the [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, DNN] or [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN] combination. The UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for the same DNN in the current SNPN using the selected entry in the "list of subscriber data" or selected PLMN subscription, until the back-off timer expires, the UE is switched off, the UICC containing the USIM is removed or the selected entry of the "list of subscriber data" is updated; or

NOTE 4: The way to choose one of the configured SM Retry Timer values for back-off timer value is up to UE implementation if both conditions in bullets A) and B) above are satisfied.

ii) otherwise:

- the UE shall start the back-off timer with the default value of 12 min as back-off timer value for the PDU session establishment procedure and the [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, DNN] or [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN] combination. The UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message for the same DNN in the current SNPN using the selected entry of the "list of subscriber data", until the back-off timer expires, the UE is switched off, the UICC containing the USIM is removed or the selected entry of the "list of subscriber data" is updated; and

c) For 5GSM cause values different from #8 "operator determined barring", #27 "missing or unknown DNN", #32 "service option not supported", #33 "requested service option not subscribed" and #70 "missing or unknown DNN in a slice", the UE behaviour regarding the start of a back-off timer is specified in subclause 6.2.12.

The UE shall not stop any back-off timer:

- a) upon a PLMN or SNPN change;
- b) upon an inter-system change; or
- c) upon registration over another access type.

If the network indicates that a back-off timer for the PDU session establishment procedure is deactivated, then it remains deactivated;

- a) upon a PLMN or SNPN change;

- b) upon an inter-system change; or
- c) upon registration over another access type.

NOTE 5: This means the back-off timer can still be running or be deactivated for the given 5GSM procedure when the UE returns to the PLMN or SNPN or when it performs inter-system change back from S1 mode to N1 mode. Thus, the UE can still be prevented from sending another PDU SESSION ESTABLISHMENT REQUEST message for the combination of [PLMN, DNN, (mapped) HPLMN S-NSSAI], [PLMN, DNN, no S-NSSAI], [PLMN, no DNN, (mapped) HPLMN S-NSSAI], [PLMN, no DNN, no S-NSSAI], [PLMN, DNN], or [PLMN, no DNN] in the PLMN, or for the combination of [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, (mapped) subscribed S-NSSAI], [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, (mapped) subscribed S-NSSAI], [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI], [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN], or [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN] in the SNPN.

If the back-off timer is started upon receipt of a PDU SESSION ESTABLISHMENT REJECT (i.e. the timer value was provided by the network, a configured value is available or the default value is used as explained above) or the back-off timer is deactivated, the UE behaves as follows:

- a) after a PLMN or SNPN change:

- 1) the UE may send a PDU SESSION ESTABLISHMENT REQUEST message for:
 - i) in a PLMN, the combination of [new PLMN, DNN, (mapped) HPLMN S-NSSAI], [new PLMN, DNN, no S-NSSAI], [new PLMN, no DNN, (mapped) HPLMN S-NSSAI], or [new PLMN, no DNN, no S-NSSAI] in the new PLMN, if the back-off timer is not running and is not deactivated for the PDU session establishment procedure and the combination of [new PLMN, DNN, (mapped) HPLMN S-NSSAI], [new PLMN, DNN, no S-NSSAI], [new PLMN, no DNN, (mapped) HPLMN S-NSSAI], or [new PLMN, no DNN, no S-NSSAI]; or
 - ii) in an SNPN, the combination of [new SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, (mapped) subscribed SNPN S-NSSAI], [new SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [new PLMN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, (mapped) subscribed SNPN S-NSSAI], or [new SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI] in the new SNPN, if the back-off timer is not running and is not deactivated for the PDU session establishment procedure and the combination of [new SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, (mapped) subscribed SNPN S-NSSAI], [new SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [new SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, (mapped) subscribed SNPN S-NSSAI], or [new SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI];
- 2) as an implementation option, for the 5GSM cause value #8 "operator determined barring", #32 "service option not supported", #33 "requested service option not subscribed" and #70 "missing or unknown DNN in a slice", if the network does not include a Re-attempt indicator IE, the UE may decide not to automatically send another PDU SESSION ESTABLISHMENT REQUEST message for:
 - i) in a PLMN, the same combination of [PLMN, DNN, (mapped) HPLMN S-NSSAI], [PLMN, DNN, no S-NSSAI], [PLMN, no DNN, (mapped) HPLMN S-NSSAI], or [PLMN, no DNN, no S-NSSAI] using the same PDU session type if the UE is registered to a new PLMN which is in the list of equivalent PLMNs; or
 - ii) in an SNPN, if the UE supports equivalent SNPNs, the same combination of [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, (mapped) subscribed SNPN S-NSSAI], [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, (mapped) subscribed SNPN S-NSSAI], or [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI] using the same PDU session type and using the selected entry of the "list of subscriber data" or selected PLMN subscription, if the UE is registered to a new SNPN which is in the list of equivalent SNPNs; and

- 3) as an implementation option, for the 5GSM cause value #27 "missing or unknown DNN", if the network does not include a Re-attempt indicator IE, the UE may decide not to automatically send another PDU SESSION ESTABLISHMENT REQUEST message for:
 - i) in a PLMN, the same combination of [PLMN, DNN] or [PLMN, no DNN] using the same PDU session type if the UE is registered to a new PLMN which is in the list of equivalent PLMNs; or
 - ii) in an SNPN, if the UE supports equivalent S-NPNs, the same combination of [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN] or [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN] using the same PDU session type if the UE is registered to a new SNPN which is in the list of equivalent S-NPNs; or
 - b) if the network does not include the Re-attempt indicator IE to indicate whether re-attempt in S1 mode is allowed, or the UE ignores the Re-attempt indicator IE, e.g. because the Back-off timer value IE is not included, then:
 - 1) if the UE is registered in its HPLMN or in a PLMN that is within the EHPLMN list and the back-off timer is running for the combination of [PLMN, DNN, (mapped) HPLMN S-NSSAI] or [PLMN, DNN, no S-NSSAI], the UE shall apply the configured SM_RetryAtRATChange value as specified in 3GPP TS 24.368 [17] or in USIM file NAS_{CONFIG} as specified in 3GPP TS 31.102 [22], if available, to determine whether the UE may attempt a PDN connectivity procedure for the same [PLMN, DNN] combination in S1 mode. If the back-off timer is running for the combination of [PLMN, no DNN, (mapped) HPLMN S-NSSAI] or [PLMN, no DNN, no S-NSSAI], the same applies for the PDN connectivity procedure for the [PLMN, no DNN] combination in S1 mode accordingly; and
- NOTE 6: The way to choose one of the configured SM_RetryAtRATChange values for back-off timer value is up to UE implementation if the UE is configured with:
- an SM_RetryAtRATChange value in ME as specified in 3GPP TS 24.368 [17]; and
 - an SM_RetryAtRATChange value in USIM file NAS_{CONFIG} as specified in 3GPP TS 31.102 [22].
- 2) if the UE is not registered in its HPLMN or in a PLMN that is within the EHPLMN list, or if the NAS configuration MO as specified in 3GPP TS 24.368 [17] is not available and the value for inter-system change is not configured in the USIM file NAS_{CONFIG}, then the UE behaviour regarding a PDN connectivity procedure for the same [PLMN, DNN] or [PLMN, no DNN] combination in S1 mode is unspecified; and
 - c) if the network includes the Re-attempt indicator IE indicating that re-attempt in an equivalent PLMN or SNPN is not allowed, then depending on the timer value received in the Back-off timer value IE, for:
 - 1) in a PLMN, each combination of a PLMN from the equivalent PLMN list and the respective [DNN, (mapped) HPLMN S-NSSAI], [DNN, no S-NSSAI], [no DNN, (mapped) HPLMN S-NSSAI], or [no DNN, no S-NSSAI] combination, the UE shall start a back-off timer for the PDU session establishment procedure with the value provided by the network, or deactivate the respective back-off timer as follows:
 - i) if the Re-attempt indicator IE additionally indicates that re-attempt in S1 mode is allowed, the UE shall start or deactivate the back-off timer for N1 mode only; and
 - ii) otherwise, the UE shall start or deactivate the back-off timer for S1 and N1 mode; or
 - 2) in a SNPN, if the UE supports equivalent S-NPNs, each combination of a SNPN from the equivalent S-NPN list and the respective [the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, (mapped) subscribed SNPN S-NSSAI], [the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, (mapped) subscribed SNPN S-NSSAI], or [the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI] combination, the UE shall start a back-off timer for the PDU session establishment procedure with the value provided by the network, or deactivate the respective back-off timer, for N1 mode.

If the back-off timer for a [PLMN, DNN] or [PLMN, no DNN] combination, was started or deactivated in S1 mode upon receipt of PDN CONNECTIVITY REJECT message (see 3GPP TS 24.301 [15]) and the network indicated that re-attempt in N1 mode is allowed, then this back-off timer does not prevent the UE from sending a PDU SESSION ESTABLISHMENT REQUEST message in this PLMN for the same DNN, or without DNN, after inter-system change to N1 mode. If the network indicated that re-attempt in N1 mode is not allowed, the UE shall not send any PDU SESSION ESTABLISHMENT REQUEST message in this PLMN for the same DNN in combination with any S-NSSAI or without S-NSSAI, or in this PLMN without DNN in combination with any S-NSSAI or without S-NSSAI, after inter-system change to N1 mode until the timer expires, the UE is switched off or the USIM is removed.

NOTE 7: The back-off timer is used to describe a logical model of the required UE behaviour. This model does not imply any specific implementation, e.g. as a timer or timestamp.

NOTE 8: Reference to back-off timer in this section can either refer to use of timer T3396 or to use of a different packet system specific timer within the UE. Whether the UE uses T3396 as a back-off timer or it uses different packet system specific timers as back-off timers is left up to UE implementation.

When the back-off timer is running or the timer is deactivated, the UE is allowed to initiate a PDU session establishment procedure if the procedure is for emergency services.

If the 5GSM cause value is #28 "unknown PDU session type" and the PDU SESSION ESTABLISHMENT REQUEST message contained a PDU session type IE indicating a PDU session type, the UE shall ignore the Back-off timer value IE and Re-attempt indicator IE provided by the network, if any. The UE may send another PDU SESSION ESTABLISHMENT REQUEST message to establish a new PDU session with the PDU session type IE indicating another PDU session type, e.g. using another value which can be used for the rejected component in another route selection descriptor, if any, as specified in 3GPP TS 24.526 [19]. The behaviour of the UE for 5GSM cause value #28 also applies if the PDU session is a MA PDU Session.

If the 5GSM cause value is #39 "reactivation requested", the UE shall ignore the Back-off timer value IE and Re-attempt indicator IE provided by the network, if any.

NOTE 9: Further UE behaviour upon receipt of 5GSM cause value #39 is up to the UE implementation.

If the 5GSM cause value is #46 "out of LADN service area", the UE shall ignore the Back-off timer value IE and Re-attempt indicator IE provided by the network, if any. If the UE is not located inside the LADN service area, the UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message or another PDU SESSION MODIFICATION REQUEST message except for indicating a change of 3GPP PS data off UE status for the LADN DNN provided by the UE during the PDU session establishment procedure until the LADN information for the specific LADN DNN or the extended LADN information for the specific LADN DNN and S-NSSAI is updated as described in subclause 5.4.4 and subclause 5.5.1. If the UE is not located inside the LADN service area, the UE shall not indicate the PDU session(s) for the LADN DNN provided by the UE during the PDU session establishment procedure in the Uplink data status IE included in the SERVICE REQUEST message until the LADN information for the specific LADN DNN or the extended LADN information for the specific LADN DNN and S-NSSAI is updated as described in subclause 5.4.4 and subclause 5.5.1.

NOTE 10: Based on UE implementation, the UE locating inside the LADN service area can send another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message for the LADN DNN which was rejected with the 5GSM cause value #46 "out of LADN service area".

NOTE 10A: If the UE does not receive a CONFIGURATION UPDATE COMMAND message with new LADN information within an implementation dependent time, the UE can request this information by initiating a registration procedure for mobility or periodic registration update (see subclause 5.5.1.3.2, item q).

If the 5GSM cause value is #50 "PDU session type IPv4 only allowed", #51 "PDU session type IPv6 only allowed", #57 "PDU session type IPv4v6 only allowed", #58 "PDU session type Unstructured only allowed", or #61 "PDU session type Ethernet only allowed", the UE shall ignore the Back-off timer value IE provided by the network, if any. The UE shall evaluate the URSP rules if available as specified in 3GPP TS 24.526 [19]. The UE shall not subsequently send another PDU SESSION ESTABLISHMENT REQUEST message for:

- a) in a PLMN, the same DNN (or no DNN, if no DNN was indicated by the UE) and the same (mapped) HPLMN S-NSSAI (or no S-NSSAI, if no S-NSSAI was indicated by the UE) to obtain a PDU session type different from the one allowed by the network until any of the following conditions is fulfilled:
 - 1) the UE is registered to a new PLMN which was not in the list of equivalent PLMNs at the time when the PDU SESSION ESTABLISHMENT REJECT message was received;
 - 2) the UE is registered to a new PLMN which was in the list of equivalent PLMNs at the time when the PDU SESSION ESTABLISHMENT REJECT message was received, and either the network did not include a Re-attempt indicator IE in the PDU SESSION ESTABLISHMENT REJECT message or the Re-attempt indicator IE included in the message indicated that re-attempt in an equivalent PLMN is allowed;
 - 3) the UE is switched off; or
 - 4) the USIM is removed; or

- b) in an SNPN, the same DNN (or no DNN, if no DNN was indicated by the UE) and the same (mapped) subscribed SNPN S-NSSAI (or no S-NSSAI, if no S-NSSAI was indicated by the UE), using the selected entry of the "list of subscriber data" or selected PLMN subscription until any of the following conditions is fulfilled:
- 1) the UE is registered to a new SNPN which was not in the list of equivalent SNPNs at the time when the PDU SESSION ESTABLISHMENT REJECT message was received;
 - 2) the UE is registered to a new SNPN which was in the list of equivalent SNPNs at the time when the PDU SESSION ESTABLISHMENT REJECT message was received, and either the network did not include a Re-attempt indicator IE in the PDU SESSION ESTABLISHMENT REJECT message or the Re-attempt indicator IE included in the message indicated that re-attempt in an equivalent SNPN is allowed;
 - 3) the UE is switched off;
 - 4) the USIM is removed; or
 - 5) the selected entry of the "list of subscriber data" is updated.

For the 5GSM cause values #50 "PDU session type IPv4 only allowed", #51 "PDU session type IPv6 only allowed", #57 "PDU session type IPv4v6 only allowed", #58 "PDU session type Unstructured only allowed", and #61 "PDU session type Ethernet only allowed", the UE shall ignore the value of the RATC bit in the Re-attempt indicator IE provided by the network, if any.

NOTE 11: For the 5GSM cause values #50 "PDU session type IPv4 only allowed", #51 "PDU session type IPv6 only allowed", #57 "PDU session type IPv4v6 only allowed", #58 "PDU session type Unstructured only allowed", and #61 "PDU session type Ethernet only allowed", re-attempt in S1 mode for the same DNN (or no DNN, if no DNN was indicated by the UE) is only allowed using the PDU session type(s) indicated by the network.

If the 5GSM cause value is #54 "PDU session does not exist", the UE shall ignore the Back-off timer value IE and Re-attempt indicator IE provided by the network, if any. If the PDU session establishment procedure is to perform handover of an existing PDU session between 3GPP access and non-3GPP access, the UE shall release locally the existing PDU session with the PDU session ID included in the PDU SESSION ESTABLISHMENT REJECT message. The UE may initiate another UE-requested PDU session establishment procedure with the request type set to "initial request" in the subsequent PDU SESSION ESTABLISHMENT REQUEST message to establish a PDU session with:

- a) in a PLMN, the same DNN (or no DNN, if no DNN was indicated by the UE) and the same (mapped) HPLMN S-NSSAI (or no S-NSSAI, if no S-NSSAI was indicated by the UE); or
- b) in an SNPN, the same DNN (or no DNN, if no DNN was indicated by the UE) and the same (mapped) subscribed SNPN S-NSSAI (or no S-NSSAI, if no S-NSSAI was indicated by the UE) using the selected entry of the "list of subscriber data" or selected PLMN subscription.

NOTE 12: User interaction is necessary in some cases when the UE cannot re-establish the PDU session(s) automatically.

If the 5GSM cause value is #68 "not supported SSC mode", the UE shall ignore the Back-off timer value IE and Re-attempt indicator IE provided by the network, if any. The UE shall evaluate the URSP rules if available as specified in 3GPP TS 24.526 [19]. The UE shall not subsequently send another PDU SESSION ESTABLISHMENT REQUEST message for:

- a) in a PLMN, the same DNN (or no DNN, if no DNN was indicated by the UE) and the same (mapped) HPLMN S-NSSAI (or no S-NSSAI, if no S-NSSAI was indicated by the UE) using the same SSC mode or an SSC mode which was not included in the Allowed SSC mode IE until any of the following conditions is fulfilled:
 - 1) the UE is registered to a new PLMN which was not in the list of equivalent PLMNs at the time when the PDU SESSION ESTABLISHMENT REJECT message was received;
 - 2) the SSC mode which is used to access to the DNN (or no DNN, if no DNN was indicated by the UE) and the (mapped) HPLMN S-NSSAI (or no S-NSSAI, if no S-NSSAI was indicated by the UE) is changed by the UE which subsequently requests a new SSC mode in the Allowed SSC mode IE or no SSC mode;
 - 3) the UE is switched off; or
 - 4) the USIM is removed; or

- b) in an SNPN, the same DNN (or no DNN, if no DNN was indicated by the UE) and the same subscribed SNPN S-NSSAI (or no S-NSSAI, if no S-NSSAI was indicated by the UE) using the same SSC mode or an SSC mode which was not included in the Allowed SSC mode IE, using the selected entry of the "list of subscriber data" or selected PLMN subscription until any of the following conditions is fulfilled:
- 1) the UE is registered to a new SNPN which was not in the list of equivalent SNPNs at the time when the PDU SESSION ESTABLISHMENT REJECT message was received;
 - 2) the SSC mode which is used to access to the DNN (or no DNN, if no DNN was indicated by the UE) and the (mapped) subscribed SNPN S-NSSAI (or no S-NSSAI, if no S-NSSAI was indicated by the UE) is changed by the UE which subsequently requests a new SSC mode in the Allowed SSC mode IE or no SSC mode;
 - 3) the UE is switched off;
 - 4) the USIM is removed, or
 - 5) the selected entry of the "list of subscriber data" is updated.

If the UE receives the 5GSM cause value is #33 "requested service option not subscribed" upon sending PDU SESSION ESTABLISHMENT REQUEST to establish an MA PDU session, the UE shall ignore the Back-off timer value IE and Re-attempt indicator IE provided by the network, if any. The UE shall evaluate URSP rules, if available, as specified in 3GPP TS 24.526 [19] and the UE may send PDU SESSION ESTABLISHMENT REQUEST after evaluating those URSP rules.

If the 5GSM cause value is #86 "UAS services not allowed", the UE shall ignore the Back-off timer value IE and Re-attempt indicator IE provided by the network, if any, and shall behave as specified in subclause 6.4.1.4.1.

Upon receipt of an indication from 5GMM sublayer that the 5GSM message was not forwarded because the DNN is not supported or not subscribed in a slice along with a PDU SESSION ESTABLISHMENT REQUEST message with the PDU session ID IE set to the PDU session ID of the PDU session, the UE shall stop timer T3580, shall abort the procedure and shall behave as follows:

- a) if the timer value indicates neither zero nor deactivated, the UE shall start the back-off timer with the value received from the 5GMM sublayer for the PDU session establishment procedure and:
- 1) in a PLMN, the [PLMN, DNN, S-NSSAI] combination or the [PLMN, DNN, no S-NSSAI] combination, if no S-NSSAI was provided during the PDU session establishment. The UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message in the PLMN for the same DNN and the same S-NSSAI that were sent by the UE, or for the same DNN and no S-NSSAI if S-NSSAI that was not sent by the UE, until:
 - i) the back-off timer expires;
 - ii) the UE is switched off;
 - iii) the USIM is removed; or
 - iv) the DNN is included in the LADN information or extended LADN information and the network provides the LADN information or extended LADN information during the registration procedure or the generic UE configuration update procedure; or
 - 2) in an SNPN, the [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, S-NSSAI] combination or the [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI] combination, if no S-NSSAI was provided during the PDU session establishment. The UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message in the SNPN for the same DNN and the same S-NSSAI that were sent by the UE, or for the same DNN and no S-NSSAI if S-NSSAI that was not sent by the UE, using the selected entry of the "list of subscriber data" or selected PLMN subscription, until:
 - i) the back-off timer expires;
 - ii) the UE is switched off;
 - iii) the USIM is removed;
 - iv) the selected entry of the "list of subscriber data" is updated; or

- v) the DNN is included in the LADN information or extended LADN information and the network provides the LADN information or extended LADN information during the registration procedure or the generic UE configuration update procedure;
- b) if the timer value is not received from the 5GMM sublayer or the timer value indicates that this timer is deactivated, the UE shall not send another PDU SESSION ESTABLISHMENT REQUEST message:
 - 1) in the PLMN for the same DNN and the same S-NSSAI that were sent by the UE, or for the same DNN and no S-NSSAI if S-NSSAI that was not sent by the UE, until:
 - i) the UE is switched off;
 - ii) the USIM is removed; or
 - iii) the DNN is included in the LADN information or extended LADN information and the network provides the LADN information or extended LADN information during the registration procedure or the generic UE configuration update procedure; and
 - 2) in the SNPN, for the same DNN and the same S-NSSAI that were sent by the UE, or for the same DNN and no S-NSSAI if S-NSSAI that was not sent by the UE, using the selected entry of the "list of subscriber data" or selected PLMN subscription, until:
 - i) the UE is switched off;
 - ii) the USIM is removed;
 - iii) the selected entry of the "list of subscriber data" is updated; or
 - iii) the DNN is included in the LADN information or extended LADN information and the network provides the LADN information or extended LADN information during the registration procedure or the generic UE configuration update procedure; and
- c) if the timer value indicates zero, the UE may send another PDU SESSION ESTABLISHMENT REQUEST message:
 - 1) in a PLMN, for the same combination of [PLMN, DNN, S-NSSAI], [PLMN, DNN, no S-NSSAI] in the current PLMN; or
 - 2) in an SNPN, for the same combination of [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, S-NSSAI], [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI] in the current SNPN.

6.4.1.5 Handling the maximum number of established PDU sessions

The maximum number of PDU sessions which a UE can establish in a PLMN or SNPN is limited by whichever is the lowest of: the maximum number of PDU session IDs allowed by the protocol (as specified in 3GPP TS 24.007 [11] subclause 11.2.3.1b), the PLMN's or SNPN's maximum number of PDU sessions and the UE's implementation-specific maximum number of PDU sessions.

If during a UE-requested PDU session establishment procedure the 5GSM sublayer in the UE receives an indication that the 5GSM message was not forwarded because:

- a) the PLMN's maximum number of PDU sessions has been reached, then the UE determines the PLMN's maximum number of PDU sessions as the number of active PDU sessions it has; or
- b) the SNPN's maximum number of PDU sessions has been reached, then the UE determines the SNPN's maximum number of PDU sessions as the number of active PDU sessions it has and associates the determined maximum number of PDU sessions with:
 - 1) the entry in the "list of subscriber data" for the current SNPN if the UE does not support access to an SNPN using credentials from a credentials holder and equivalent SNPNs; or
 - 2) the selected entry of the "list of subscriber data" or the selected PLMN subscription if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both.

NOTE 1: In some situations, when attempting to establish multiple PDU sessions, the number of active PDU sessions that the UE has when 5GMM cause #65 is received is not equal to the maximum number of PDU sessions reached in the network.

NOTE 2: When the network supports emergency services, it is not expected that 5GMM cause #65 is returned by the network when the UE requests an emergency PDU session.

NOTE 3: The network maintains only one maximum number of PDU sessions for a PLMN regardless of which access the PDU session exists in.

NOTE 3a: When the UE is registered on the same PLMN for both 3GPP access and non-3GPP access, the UE maintains single maximum number of PDU sessions for respective PLMN. When the UE is registered on two different PLMNs over 3GPP access and non-3GPP access, the UE maintains maximum number of PDU sessions for a PLMN separately for each PLMN.

NOTE 4: An MA PDU session which (only) has a PDN connection established as a user-plane resource is counted as an active PDU session when determining the PLMN's maximum number of PDU sessions.

The PLMN's maximum number of PDU sessions applies to the PLMN in which the 5GMM cause #65 "maximum number of PDU sessions reached" is received. When the UE is switched off or when the USIM is removed, the UE shall clear all previous determinations representing PLMN's maximum number of PDU sessions.

The SNPN's maximum number of PDU sessions applies to the SNPN in which the 5GMM cause #65 "maximum number of PDU sessions reached" is received. When the UE is switched off, the UE shall clear all previous determinations representing SNPN's maximum number of PDU sessions. In addition:

- a) if the UE does not support access to an SNPN using credentials from a credentials holder and equivalent SNPNs, and the entry in the "list of subscriber data" for the current SNPN is updated, then the UE shall clear all previous determinations representing SNPN's maximum number of PDU sessions associated with the entry in the "list of subscriber data" for the current SNPN; and
- b) if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, and:
 - 1) the selected entry of the "list of subscriber data" is updated, then UE shall clear all previous determinations representing SNPN's maximum number of PDU sessions associated with the selected entry in the "list of subscriber data"; or
 - 2) the USIM associated with the selected PLMN subscription is removed, then UE shall clear all previous determinations representing SNPN's maximum number of PDU sessions associated with the selected PLMN subscription.

Upon successful registration with a new PLMN or SNPN, the UE may clear previous determinations representing any PLMN's or SNPN's maximum number(s) of PDU sessions, if the previous PLMN or SNPN is not registered over both 3GPP access and non-3GPP access.

If the maximum number of established PDU sessions is reached at the UE and the upper layers of the UE request connectivity to a DNN the UE shall not send a PDU SESSION ESTABLISHMENT REQUEST message unless an established PDU session is released. If the UE needs to release an established PDU session, choosing which PDU session to release is implementation specific, however the UE shall not release the emergency PDU session.

If the UE needs to release a PDU session in order to request an emergency PDU session, it shall either perform a local release of a PDU session or release a PDU session via explicit signalling. If the UE performs a local release, the UE shall:

- a) if the PDU session is an MA PDU session:
 - 1) perform a registration procedure for mobility and periodic registration update to indicate PDU session status to the network over each access that user plane resources have been established; and
 - 2) perform a normal and periodic tracking area updating to indicate EPS bearer context status to the network as specified in subclause 5.5.3.2.2 of 3GPP TS 24.301 [15] when a PDN connection has been established as a user plane resource; or

- b) if the PDU session is a single access PDU session, perform a registration procedure for mobility and periodic registration update to indicate PDU session status to the network over the access the PDU session is associated with.

6.4.1.5A Handling the maximum number of allowed active user-plane resources for PDU sessions of UEs in NB-N1 mode

For a UE in NB-N1 mode, the UE's maximum number of supported user-plane resources is two (as defined in 3GPP TS 36.300 [25B]) when the UE sets the Multiple user-plane resources support bit to "Multiple user-plane resources supported" during the registration procedure for initial registration or for mobility and periodic registration update, and one otherwise.

For a UE operating in NB-N1 mode, if:

- a) the UE's maximum number of supported user-plane resources is one, then only one PDU session can have active user-plane resources even though that UE might have established more than one PDU session; or
- b) the UE's maximum number of supported user-plane resources is two, then only two PDU sessions can have active user-plane resources even though that UE might have established more than two PDU sessions.

When the maximum number of active user-plane resources is reached and upper layers request for more user-plane resources for PDU sessions other than the PDU sessions with those active user-plane resources, the UE can choose to release one or more of the PDU sessions with active user-plane resources to cater for the upper layer request. The choice of which PDU sessions to be released is implementation specific. However if there is a PDU session with an active user-plane that is used for exception data reporting (see subclause 6.2.13), that PDU session shall not be released.

If the maximum number of active user-plane resources is reached and the upper layers of the UE request user-plane resources for exception data reporting (see subclause 6.2.13), the UE shall release a PDU session that has user-plane resources to cater for the request for exception data reporting. The choice of which PDU session to be released is implementation specific.

If the UE decides to release one or more active user-plane resources to cater for upper layer request, the UE shall release the PDU session via explicit 5GSM signalling.

6.4.1.6 Abnormal cases in the UE

The following abnormal cases can be identified:

- a) Expiry of timer T3580

The UE shall, on the first expiry of the timer T3580:

- if the PDU SESSION ESTABLISHMENT REQUEST message was sent with request type set to "initial emergency request" or "existing emergency PDU session", then the UE may:

- a) inform the upper layers of the failure of the procedure; or

NOTE: This can result in the upper layers requesting another emergency call attempt using domain selection as specified in 3GPP TS 23.167 [6].

- b) de-register locally, if not de-registered already, attempt initial registration for emergency services.

If the UE sent the PDU SESSION ESTABLISHMENT REQUEST message in order to perform a handover of an existing emergency PDU session between 3GPP access and non-3GPP access, the UE shall consider that the emergency PDU session is associated with the source access type.

- otherwise, retransmit the PDU SESSION ESTABLISHMENT REQUEST message and the PDU session information which was transported together with the initial transmission of the PDU SESSION ESTABLISHMENT REQUEST message and shall reset and start timer T3580, if still needed. This retransmission can be repeated up to four times, i.e. on the fifth expiry of timer T3580, the UE shall abort the procedure, release the allocated PTI and enter the state PROCEDURE TRANSACTION INACTIVE. If the UE sent the PDU SESSION ESTABLISHMENT REQUEST message in order to perform a handover of an existing non-emergency PDU session between 3GPP access and non-3GPP access, the UE shall consider that the PDU session is associated with the source access type.

- b) Upon receiving an indication that the 5GSM message was not forwarded due to routing failure along with a PDU SESSION ESTABLISHMENT REQUEST message with the PDU session ID IE set to the same value as the PDU session ID that was sent by the UE, the UE shall stop timer T3580 and shall abort the procedure. If the UE sent the PDU SESSION ESTABLISHMENT REQUEST message in order to perform a handover of an existing PDU session between 3GPP access and non-3GPP access, the UE shall consider that the PDU session is associated with the source access type.
- b1) Upon receiving an indication that the 5GSM message was not forwarded due to service area restrictions along with a PDU SESSION ESTABLISHMENT REQUEST message with the PDU session ID IE set to the same value as the PDU session ID that was sent by the UE, the UE shall stop timer T3580 and shall abort the procedure. If the UE sent the PDU SESSION ESTABLISHMENT REQUEST message in order to perform a handover of an existing PDU session between 3GPP access and non-3GPP access, the UE shall consider that the PDU session is associated with the source access type.
- b2) Upon receiving an indication that the 5GSM message was not forwarded because the UE is registered to a PLMN via a satellite NG-RAN cell that is not allowed to operate at the present UE location along with a PDU SESSION ESTABLISHMENT REQUEST message with the PDU session ID IE set to the same value as the PDU session ID that was sent by the UE, the UE shall stop timer T3580 and shall abort the procedure.
- b3) Upon receiving an indication that the 5GSM message was not forwarded because the UE is marked in the UE's 5GMM context that it is not allowed to request UAS services along with a PDU SESSION ESTABLISHMENT REQUEST message with the PDU session ID IE set to the same value as the PDU session ID that was sent by the UE, the UE shall stop timer T3580 and shall abort the procedure. The UE shall not trigger the PDU session establishment procedure until the UE is deregistered from the PLMN.
- b4) Upon receiving an indication that the 5GSM message was not forwarded because the PLMN's maximum number of PDU sessions has been reached along with a PDU SESSION ESTABLISHMENT REQUEST message with the PDU session ID IE set to the same value as the PDU session ID that was sent by the UE, the UE shall stop timer T3580 and shall abort the procedure.
- b5) Upon receiving an indication that the 5GSM message was not forwarded due to unexpected cause along with a PDU SESSION ESTABLISHMENT REQUEST message with the PDU session ID IE set to the same value as the PDU session ID that was sent by the UE, the UE shall stop timer T3580 and shall abort the procedure.
- c) Collision of UE-requested PDU session establishment procedure and network-requested PDU session release procedure.

If the UE receives a PDU SESSION RELEASE COMMAND message after sending a PDU SESSION ESTABLISHMENT REQUEST message to the network, and the PDU session ID in the PDU SESSION RELEASE COMMAND message is the same as the PDU session ID in the PDU SESSION ESTABLISHMENT REQUEST message:

- i) if the UE-requested PDU session establishment procedure was to request the establishment of user plane resources on the second access for an MA PDU session established on a first access and the Access type IE is not included in PDU SESSION RELEASE COMMAND or the Access type IE included in PDU SESSION RELEASE COMMAND indicates the first access, the UE shall proceed with the network-requested PDU session release procedure, abort the UE-requested PDU session establishment procedure, stop timer T3580, release the allocated PTI and enter the state PROCEDURE TRANSACTION INACTIVE;
 - ii) if the PDU SESSION ESTABLISHMENT REQUEST message was sent with request type set to "existing PDU session" or "existing emergency PDU session" in order to perform a handover of an existing PDU session between 3GPP access and non-3GPP access, the UE shall abort the PDU session establishment procedure and proceed with the network-requested PDU session release procedure; or
 - iii) otherwise, the UE shall ignore the PDU SESSION RELEASE COMMAND message and proceed with the UE-requested PDU session establishment procedure.
- d) void
- e) For an MA PDU session established on a single access, upon receipt of a PDU SESSION ESTABLISHMENT ACCEPT message over the other access, if any value of the selected PDU session type, selected SSC mode, 5GSM cause, PDU address, S-NSSAI, DNN IEs in the PDU SESSION ESTABLISHMENT ACCEPT message is different from the corresponding stored value, the UE shall perform a local release of the MA PDU session,

and perform the registration procedure for mobility and periodic registration update with a REGISTRATION REQUEST message including the PDU session status IE over both accesses.

- f) For an MA PDU session has a PDN connection as a user-plane resource, upon receipt of a PDU SESSION ESTABLISHMENT ACCEPT message over non-3GPP access, if any value of the selected PDU session type, selected SSC mode, 5GSM cause, PDU address, S-NSSAI, DNN IEs in the PDU SESSION ESTABLISHMENT ACCEPT message is different from the corresponding stored mapped value, the UE shall perform a local release of the MA PDU session, perform the registration procedure for mobility and periodic registration update with a REGISTRATION REQUEST message including the PDU session status IE over non-3GPP access, and perform the tracking area updating procedure as specified in subclause 5.5.3.2.2 of 3GPP TS 24.301 [15] with a TRACKING AREA UPDATE REQUEST message including EPS bearer context status IE.
- g) Collision of UE-requested PDU session establishment procedure initiated to perform handover of an existing PDU session from non-3GPP access to 3GPP access and a notification from the network with access type indicating non-3GPP access.

If the UE receives a notification from the network with access type indicating non-3GPP access after sending a PDU SESSION ESTABLISHMENT REQUEST message to perform handover of an existing PDU session from non-3GPP access to 3GPP access, the UE shall abort the PDU session establishment procedure, stop timer T3580, proceed with the service request procedure to perform handover of existing PDU session(s) from non-3GPP access to 3GPP access.

- h) Collision of UE-requested PDU session establishment procedure and N1 NAS signalling connection release

The UE may immediately retransmit the PDU SESSION ESTABLISHMENT REQUEST message and stop, reset and restart timer T3580, if the following conditions apply:

- 1) The original UE-requested PDU session establishment procedure was initiated over an existing N1 NAS signalling connection;
- 2) the previous transmission of the PDU SESSION ESTABLISHMENT REQUEST message was not initiated due to timer T3580 expiry; and
- 3) no 5GSM message related to the PDU session (e.g. PDU SESSION AUTHENTICATION COMMAND message) was received after the PDU SESSION ESTABLISHMENT REQUEST message was transmitted.
- i) Collision of UE-requested PDU session establishment procedure and network-requested PDU session modification procedure

If the UE receives a PDU SESSION MODIFICATION COMMAND message after sending a PDU SESSION ESTABLISHMENT REQUEST message to the network, and the PDU session ID in the PDU SESSION MODIFICATION COMMAND message is the same as the PDU session ID in the PDU SESSION ESTABLISHMENT REQUEST message:

- i) if the UE-requested PDU session establishment procedure was to request the establishment of user plane resources on the second access for an MA PDU session established on a first access, the UE shall proceed with both the UE-requested PDU session establishment procedure and the network-requested PDU session modification procedure; or
- ii) if the PDU SESSION ESTABLISHMENT REQUEST message was sent with request type set to "existing PDU session" or "existing emergency PDU session" in order to perform a handover of an existing PDU session between 3GPP access and non-3GPP access, the UE shall proceed with the UE-requested PDU session establishment procedure and abort the network-requested PDU session modification procedure.

6.4.1.7 Abnormal cases on the network side

The following abnormal cases can be identified:

- a) If the received request type is "initial emergency request" and there is an existing emergency PDU session for the UE, regardless whether the PDU session ID in the PDU SESSION ESTABLISHMENT REQUEST message is identical to the PDU session ID of the existing PDU session, the SMF shall locally release the existing emergency PDU session and proceed the new PDU SESSION ESTABLISHMENT REQUEST message

- b) The information for the PDU session authentication and authorization by the external DN in the SM PDU DN request container IE is not compliant with local policy and user's subscription data

If the PDU session being established is a non-emergency PDU session, the request type is not set to "existing PDU session", the PDU session authentication and authorization by the external DN is required due to local policy and user's subscription data and the information for the PDU session authentication and authorization by the external DN in the SM PDU DN request container IE is not compliant with the local policy and user's subscription data, the SMF shall reject the PDU session establishment request including the 5GSM cause #29 "user authentication or authorization failed", in the PDU SESSION ESTABLISHMENT REJECT message.

- c) UE-requested PDU session establishment with request type set to "initial request" for an existing PDU session:

If the SMF receives a PDU SESSION ESTABLISHMENT REQUEST message with a PDU session ID identical to the PDU session ID of an existing PDU session and with request type set to "initial request", the SMF shall locally release the existing PDU session and proceed with the PDU session establishment procedure.

- d) UE-requested PDU session establishment with request type "existing PDU session" or "existing emergency PDU session" for a PDU session that does not exist:

If the SMF receives a PDU SESSION ESTABLISHMENT REQUEST message with request type set to "existing PDU session" or "existing emergency PDU session", and the SMF does not have any information about that PDU session, then the SMF shall reject the PDU session establishment procedure with the 5GSM cause set to #54 "PDU session does not exist" in the PDU SESSION ESTABLISHMENT REJECT message.

- e) 5G access network cannot forward the message:

If the SMF determines based on content of the n2SmInfo attribute specified in 3GPP TS 29.502 [20A] that the DL NAS TRANSPORT message carrying the PDU SESSION ESTABLISHMENT ACCEPT was not forwarded to the UE by the 5G access network, then the SMF shall reject the PDU session establishment procedure with the 5GSM cause set to #26 "insufficient resources" in the PDU SESSION ESTABLISHMENT REJECT message.

- f) UE-requested MA PDU session establishment with unspecified steering functionality and steering mode:

If the SMF receives the PDU SESSION ESTABLISHMENT REQUEST message for an MA PDU session including the 5GSM capability information element that does not indicate support for any steering functionality or steering mode, the SMF shall reject the PDU session establishment procedure with the 5GSM cause set to #95 "Semantically incorrect message" in the PDU SESSION ESTABLISHMENT REJECT message.

6.4.2 UE-requested PDU session modification procedure

6.4.2.1 General

The purpose of the UE-requested PDU session modification procedure is:

- a) to enable the UE to request modification of a PDU session;
- b) to indicate a change of 3GPP PS data off UE status for a PDU session;
- c) to revoke the previously indicated support for reflective QoS;
- d) to request specific QoS handling and segregation of service data flows;
- e) to indicate to the network the relevant 5GSM parameters and capabilities (e.g. the UE's 5GSM capabilities, whether the UE supports more than 16 packet filters, the maximum data rate per UE for user-plane integrity protection supported by the UE for uplink, the maximum data rate per UE for user-plane integrity protection supported by the UE for downlink and whether the UE requests the PDU session to be an always-on PDU session in the 5GS) for a PDN connection established when in S1 mode, after an inter-system change from S1 mode to N1 mode, if the UE is a UE operating in single-registration mode in a network supporting N26 interface and the UE has not previously successfully performed the UE-requested PDU session modification to indicate to the network the relevant 5GSM parameters and capabilities;
- f) to delete one or more mapped EPS bearer contexts;
- g) to convey a port management information container;

- h) to re-negotiate header compression configuration associated to a PDU session using control plane ClIoT 5GS optimization;
- i) to enable the UE to request to join or leave one or more multicast MBS sessions associated with a PDU session;
- j) to send the URSP rule enforcement report to the network associated to:
 - 1) an established PDU session; or
 - 2) a PDN connection, after an inter-system change from S1 mode to N1 mode, if the UE is a UE operating in single-registration mode in a network supporting N26 interface; or
- k) to request QoS differentiation of traffic or to request suspend of QoS differentiation of traffic from one or more non-3GPP devices connecting through the UE.

NOTE 1: The case c), d), e), f) and g) do not apply to PDU sessions associated with the control plane only indication.

NOTE 2: For case e), the procedure is attempted after the first inter-system change from S1 mode to N1 mode.

When the UE-requested PDU session modification procedure is used to indicate a change of 3GPP PS data off UE status for a PDU session (see subclause 6.2.10), the UE shall initiate the UE-requested PDU session modification procedure even if the UE is outside the LADN service area or the timer T3396, T3584, T3585 or the back-off timer is running or is deactivated.

If the UE needs to revoke the previously indicated support for reflective QoS for a PDU session and timer T3396, T3584, T3585 or the back-off timer is running or is deactivated, the UE shall not initiate the UE-requested PDU session modification procedure and shall instead initiate the UE-requested PDU session release procedure.

If the UE needs to initiate the UE-requested PDU session modification procedure to indicate to the network the relevant 5GSM parameters and capabilities (e.g. the UE's 5GSM capabilities, whether the UE supports more than 16 packet filters, the maximum data rate per UE for user-plane integrity protection supported by the UE for uplink, the maximum data rate per UE for user-plane integrity protection supported by the UE for downlink and whether the UE requests the PDU session to be an always-on PDU session in the 5GS) for a PDN connection established when in S1 mode, after an inter-system change from S1 mode to N1 mode, the UE is a UE operating in single-registration mode in the network supporting N26 interface, the UE has not previously successfully performed the UE-requested PDU session modification to indicate to the network the relevant 5GSM parameters and capabilities, and:

- a) timer T3396, T3584, T3585 or the back-off timer is running, the UE shall initiate the UE-requested PDU session modification procedure after expiry of timer T3396, T3584 or T3585 or after expiry of the back-off timer; or
- b) the UE is in substate 5GMM-REGISTERED.NON-ALLOWED-SERVICE and has not performed the the UE-requested PDU session modification procedure (see subclause 5.3.5), the UE shall initiate the UE-requested PDU session modification procedure after entering substate 5GMM-REGISTERED.NORMAL-SERVICE.

6.4.2.2 UE-requested PDU session modification procedure initiation

In order to initiate the UE-requested PDU session modification procedure, the UE shall create a PDU SESSION MODIFICATION REQUEST message.

The UE shall allocate a PTI value currently not used and shall set the PTI IE of the PDU SESSION MODIFICATION REQUEST message to the allocated PTI value.

The UE shall not perform the UE-requested PDU session modification procedure for an emergency PDU session, except for a procedure initiated according to subclause 6.4.2.1, item e) only, and for the error cases described in subclause 6.4.1.3 and subclause 6.3.2.3.

The UE shall not perform the UE-requested PDU session modification procedure for a PDU session for LADN when the UE is located outside the LADN service area except for indicating a change of 3GPP PS data off UE status.

If the UE requests a specific QoS handling and the PDU session is not associated with the control plane only indication, the UE shall include the Requested QoS rules IE indicating requested QoS rules or the Requested QoS flow descriptions IE indicating requested QoS flow descriptions or both for the specific QoS handling. The Requested QoS rules IE includes the packet filters which describe the service data flows requested by the UE. The UE shall only request to modify or delete the packet filters that the UE has created. The specific QoS parameters requested by the UE are

specified in the Requested QoS flow descriptions IE. If the UE requests the network to bind specific service data flows to a dedicated QoS flow, the UE shall create a new QoS rule by setting the rule operation code to "Create new QoS rule" and shall set the segregation bit to "Segregation requested" for the corresponding QoS rule in the Requested QoS rules IE. The UE shall set the QRI values to "no QoS rule identifier assigned" in the Requested QoS rules IE, if the QoS rules are newly created; otherwise, the UE shall set the QRI values to those of the existing QoS rules for which the specific QoS handling applies. The UE shall set the QFI values to "no QoS flow identifier assigned" in the Requested QoS flow descriptions IE, if the QoS flow descriptions are newly created; otherwise, the UE shall set the QFI values to the QFIs of the existing QoS flow descriptions for which the specific QoS handling applies. The UE shall not request to create more than one QoS flow in a UE-requested PDU session modification procedure. If the SMF receives a PDU SESSION MODIFICATION REQUEST message with a Requested QoS rules IE containing more than one QoS rule with the rule operation code set to "Create new QoS rule", the SMF shall assign the same QFI to all the QoS rules which are created.

If the UE requests to join or leave one or more multicast MBS sessions associated with a PDU session, the UE shall include the Requested MBS container IE in the PDU SESSION MODIFICATION REQUEST message and shall set the MBS operation to "Join multicast MBS session" for the join case or to "Leave MBS session" for the leave case. The UE shall include the multicast MBS session information(s) and shall set the Type of multicast MBS session ID for each of the multicast MBS session information to either "Temporary Mobile Group Identity (TMGI)" or "Source specific IP multicast address" depending on the type of the multicast MBS session ID available in the UE. Then the remaining values of each of the multicast MBS session informations shall be set as following:

- a) if the Type of multicast MBS session ID is set to "Temporary Mobile Group Identity (TMGI)", the UE shall set the multicast MBS session ID to the TMGI; or
- b) if the Type of multicast MBS session ID is set to "Source specific IP multicast address for IPv4" or "Source specific IP multicast address for IPv6", the UE shall set the Source IP address information and the Destination IP address information to the corresponding values.

The UE should not request to join a multicast MBS session for local MBS service if neither current TAI nor CGI of the current cell is part of the MBS service area(s) of the multicast MBS session, if the UE has valid information of the MBS service area(s) of the multicast MBS session.

NOTE 1: The UE obtains the details of the multicast MBS session ID(s) e.g., TMGI, Source IP address information and Destination IP address information as a pre-configuration in the UE or during the MBS service announcement which is out of scope of this specification. Pre-configuration can be provided in one or more of the following ways:

- a) in a UE implementation-specific way (e.g. factory configuration);
- b) in the USIM (see EF_{5MBSUECONFIG} file in 3GPP TS 31.102 [22]); or
- c) in the UE pre-configuration MO for MBS (see 3GPP TS 24.575 [65]).

For a PDN connection established when in S1 mode, after an inter-system change from S1 mode to N1 mode, if the UE is a UE operating in single-registration mode in a network supporting N26 interface, the PDU session is of "IPv4", "IPv6", "IPv4v6", or "Ethernet" PDU session type, the PDU session is not associated with the control plane only indication:

- a) the UE is performing the PDU session modification procedure to indicate the support of reflective QoS and the UE has not previously successfully performed the UE-requested PDU session modification to provide this indication, the UE shall set the RQoS bit to "Reflective QoS supported" in the 5GSM capability IE of the PDU SESSION MODIFICATION REQUEST message; or
- b) the UE is performing the PDU session modification procedure to indicate that reflective QoS is not supported and the UE has not previously successfully performed the UE-requested PDU session modification to provide this indication, the UE shall set the RQoS bit to "Reflective QoS not supported" in the 5GSM capability IE of the PDU SESSION MODIFICATION REQUEST message.

If the UE is performing the PDU session modification procedure to revoke the previously indicated support of reflective QoS and the PDU session is not associated with the control plane only indication, the UE shall set the RQoS bit to "Reflective QoS not supported" in the 5GSM capability IE of the PDU SESSION MODIFICATION REQUEST message. The UE shall not indicate support for reflective QoS for this PDU Session for the remaining lifetime of the PDU Session.

NOTE 2: The determination to revoke the usage of reflective QoS by the UE for a PDU session is implementation dependent.

For a PDN connection established when in S1 mode, after an inter-system change from S1 mode to N1 mode, if the UE is a UE operating in single-registration mode in a network supporting N26 interface, the PDU session is of "IPv6" or "IPv4v6" PDU session type, the PDU session is not associated with the control plane only indication:

- a) the UE is performing the PDU session modification procedure to indicate the support of Multi-homed IPv6 PDU session and the UE has not previously successfully performed the UE-requested PDU session modification to provide this indication, the UE shall set the MH6-PDU bit to "Multi-homed IPv6 PDU session supported" in the 5GSM capability IE of the PDU SESSION MODIFICATION REQUEST message; or
- b) the UE is performing the PDU session modification procedure to indicate that Multi-homed IPv6 PDU session is not supported and the UE has not previously successfully performed the UE-requested PDU session modification to provide this indication, the UE shall set the MH6-PDU bit to "Multi-homed IPv6 PDU session not supported" in the 5GSM capability IE of the PDU SESSION MODIFICATION REQUEST message.

For a PDN connection established when in S1 mode, after an inter-system change from S1 mode to N1 mode, if the UE is a UE operating in single-registration mode in a network supporting N26 interface, the PDU session is of "IPv4", "IPv6", "IPv4v6", or "Ethernet" PDU session type, the PDU session is not associated with the control plane only indication, the UE supports more than 16 packet filters for this PDU session, and the UE has not previously successfully performed the UE-requested PDU session modification to provide this indication, the UE shall indicate the maximum number of packet filters supported for the PDU session in the Maximum number of supported packet filters IE of the PDU SESSION MODIFICATION REQUEST message.

For a PDN connection established when in S1 mode, after an inter-system change from S1 mode to N1 mode, if the UE is a UE operating in single-registration mode in a network supporting N26 interface, the PDU session is not associated with the control plane only indication, and the UE has not previously successfully performed the UE-requested PDU session modification to include the Integrity protection maximum data rate IE in the PDU SESSION MODIFICATION REQUEST message, the UE shall include the Integrity protection maximum data rate IE in the PDU SESSION MODIFICATION REQUEST message.

If the UE is performing the PDU session modification procedure

- a) to request the deletion of a non-default QoS rule due to errors in QoS operations or packet filters;
- b) to request the deletion of a QoS flow description due to errors in QoS operations; or
- c) to request the deletion of a mapped EPS bearer context due to errors in mapped EPS bearer operation, TFT operation or packet filters,

the UE shall include the 5GSM cause IE in the PDU SESSION MODIFICATION REQUEST message as described in subclauses 6.3.2.3, 6.3.2.4 and 6.4.1.3.

When the UE-requested PDU session modification procedure is used to indicate a change of 3GPP PS data off UE status for a PDU session, the UE shall include the Extended protocol configuration options IE in the PDU SESSION MODIFICATION REQUEST message and setting the 3GPP PS data off UE status.

For a PDN connection established when in S1 mode, after an inter-system change from S1 mode to N1 mode, if the UE is a UE operating in single-registration mode in a network supporting N26 interface, the PDU session is not associated with the control plane only indication, the UE requests the PDU session to be an always-on PDU session in the 5GS and the UE has not previously successfully performed the UE-requested PDU session modification to request this, the UE shall include the Always-on PDU session requested IE and set the value of the IE to "Always-on PDU session requested" in the PDU SESSION MODIFICATION REQUEST message.

If the UE supports transfer of port management information containers, the UE may set the TPMIC bit to "Transfer of port management information containers supported" in the 5GSM capability IE of the PDU SESSION MODIFICATION REQUEST message.

If a port management information container needs to be delivered (see 3GPP TS 23.501 [8] and 3GPP TS 23.502 [9]), the UE shall include a Port management information container IE in the PDU SESSION MODIFICATION REQUEST message.

To request re-negotiation of IP header compression configuration, the UE shall include the IP header compression configuration IE in the PDU SESSION MODIFICATION REQUEST message if the network indicated "Control plane

CIoT 5GS optimization supported" and "IP header compression for control plane CIoT 5GS optimization supported" in the 5GS network support feature support IE.

To request re-negotiation of Ethernet header compression configuration, the UE shall include the Ethernet header compression configuration IE in the PDU SESSION MODIFICATION REQUEST message if the network indicated "Control plane CIoT 5GS optimization supported" and "Ethernet header compression for control plane CIoT 5GS optimization supported" in the 5GS network support feature support IE.

After an inter-system change from S1 mode to N1 mode, if:

- a) the UE is operating in single-registration mode in the network supporting N26 interface;
- b) the PDU session type value of the PDU session type IE is set to "IPv4", "IPv6" or "IPv4v6";
- c) the UE indicates "Control plane CIoT 5GS optimization supported" and "IP header compression for control plane CIoT 5GS optimization supported" in the 5GMM capability IE of the REGISTRATION REQUEST message; and
- d) the network indicates "Control plane CIoT 5GS optimization supported" and "IP header compression for control plane CIoT 5GS optimization supported" in the 5GS network support feature IE of the REGISTRATION ACCEPT message;

the UE shall initiate the PDU session modification procedure to negotiate the IP header compression configuration and include the IP header compression configuration IE in the PDU SESSION MODIFICATION REQUEST message.

The UE shall include the Service-level-AA container IE in the PDU SESSION MODIFICATION REQUEST message, when requesting to modify an established PDU session for C2 communication. In the Service-level-AA container IE, the UE shall include:

- a) the service-level device ID with the value set to the CAA-level UAV ID of the UE; and
- b) if available, the service-level-AA payload with the value set to the C2 authorization payload and the service-level-AA payload type with the value set to "C2 authorization payload".

NOTE 3: The C2 authorization payload in the service-level-AA payload can include one, some or all of the pairing information for C2 communication, an indication of the request for direct C2 communication, pairing information for direct C2 communication, and the UAV flight authorization information.

The UE may include the Non-3GPP delay budget IE in the PDU SESSION MODIFICATION REQUEST message, when requesting to modify an established PDU session for PIN-DN communication or PIN indirect communication.

NOTE 3A: The Non-3GPP delay budget IE can assist the network in providing specific QoS handling for a set of packet filter(s) for the PDU session as specified in subclause 5.44.3.4 of 3GPP TS 23.501 [8].

After an inter-system change from S1 mode to N1 mode, if:

- a) the UE is operating in single-registration mode in a network that supports N26 interface;
- b) the PDU session type value of the PDU session type IE is set to "Ethernet";
- c) the UE indicates "Control plane CIoT 5GS optimization supported" and "Ethernet header compression for control plane CIoT 5GS optimization supported" in the 5GMM capability IE of the REGISTRATION REQUEST message; and
- d) the network indicates "Control plane CIoT 5GS optimization supported" and "Ethernet header compression for control plane CIoT 5GS optimization supported" in the 5GS network support feature IE of the REGISTRATION ACCEPT message;

the UE shall initiate the PDU session modification procedure to negotiate the Ethernet header compression configuration and include the Ethernet header compression configuration IE in the PDU SESSION MODIFICATION REQUEST message.

For a PDN connection established when in S1 mode, after an inter-system change from S1 mode to N1 mode, and if the UE is a UE operating in single-registration mode in a network supporting N26 interface, and the UE supports receiving DNS server addresses in protocol configuration options and the UE has not previously successfully performed the UE-

requested PDU session modification to indicate this support, the UE shall include the Extended protocol configuration options IE in the PDU SESSION MODIFICATION REQUEST message and:

- a) if the PDU session is of "IPv4" or "IPv4v6" PDU session type, the UE shall include the DNS server IPv4 address request; and
- b) if the PDU session is of "IPv6" or "IPv4v6" PDU session type, the UE shall include the DNS server IPv6 address request.

For a PDN connection established when in S1 mode, after an inter-system change from S1 mode to N1 mode, and if the UE is a UE operating in single-registration mode in a network supporting N26 interface, and the UE supports the EAS rediscovery and the UE has not previously successfully performed the UE-requested PDU session modification to indicate this support, the UE shall include the Extended protocol configuration options IE in the PDU SESSION MODIFICATION REQUEST message and shall include the EAS rediscovery support indication in the Extended protocol configuration options IE.

For a PDN connection established when in S1 mode, after an inter-system change from S1 mode to N1 mode, and if the UE is a UE operating in single-registration mode in a network supporting N26 interface, and the UE supports the EDC and the UE has not previously successfully performed the UE-requested PDU session modification to indicate this support, then the UE shall include the Extended protocol configuration options IE in the PDU SESSION MODIFICATION REQUEST message and shall include the EDC support indicator in the Extended protocol configuration options IE.

If the UE supports reporting of URSP rule enforcement and is indicated to send URSP rule enforcement report to network based on the matching URSP rule which contains the URSP rule enforcement report indication set to "URSP rule enforcement report is required", the URSP rule enforcement report is associated to:

- a) an established PDU session; or
- b) a PDN connection, after an inter-system change from S1 mode to N1 mode, and if the UE is a UE operating in single-registration mode in a network supporting N26 interface, the matching URSP rule is newly enforced while the UE was in S1 mode,

then the UE shall include the URSP rule enforcement reports IE in the PDU SESSION MODIFICATION REQUEST message.

If the UE supports (S)RTP multiplexed media information, the UE may set the RTPMMI bit to "(S)RTP multiplexed media information supported" in the 5GSM capability IE of the PDU SESSION MODIFICATION REQUEST message.

The UE shall transport:

- a) the PDU SESSION MODIFICATION REQUEST message;
- b) the PDU session ID; and
- c) if the UE-requested PDU session modification:
 - 1) is not initiated to indicate a change of 3GPP PS data off UE status associated to a PDU session, then the request type set to "modification request"; and
 - 2) is initiated to indicate a change of 3GPP PS data off UE status associated to a PDU session, then without transporting the request type;

using the NAS transport procedure as specified in subclause 5.4.5, and the UE shall start timer T3581 (see example in figure 6.4.2.2.1).

For a PDN connection established when in S1 mode and not associated with the control plane only indication, after inter-system change from S1 mode to N1 mode, if the UE is registered in a network supporting the ATSSS,

- a) the UE may request to modify a PDU session to an MA PDU session; or
- b) the UE may allow the network to upgrade the PDU session to an MA PDU session. In order for the UE to allow the network to upgrade the PDU session to an MA PDU session, the UE shall set "MA PDU session network upgrade is allowed" in the MA PDU session information IE and set the request type to "modification request" in the UL NAS TRANSPORT message.

NOTE 4: If the DNN corresponds to an LADN DNN, the AMF does not forward the MA PDU session information IE to the SMF but sends the message back to the UE to inform of the unhandled request (see subclause 5.4.5.2.5).

In case the UE executes case a) or b), the UE shall:

- 1) set the ATSSS-ST bits in the 5GSM capability IE of the PDU SESSION MODIFICATION REQUEST message to indicate the ATSSS-LL and MPTCP functionalities, respectively, which the UE supports (see table 9.11.4.1.1) according to what is specified in subclause 5.32.6.1 of 3GPP TS 23.501 [8]; and
- 2) set the ATSSS-LL, MPTCP, MPQUIC-UDP, MPQUIC-IP and MPQUIC-E bits in the 5GSM capability IE of the PDU SESSION MODIFICATION REQUEST message to indicate the ATSSS-LL, MPTCP, MPQUIC-UDP, MPQUIC-IP and MPQUIC-E functionalities, respectively, which the UE supports (see table 9.11.4.1.1) according to what is specified in subclause 5.32.6.1 of 3GPP TS 23.501 [8].

NOTE 4A: Usage of the ATSSS-ST bits to indicate support for ATSSS functionality was deprecated in Rel-18 in favor of the ATSSS-LL, MPTCP, MPQUIC-UDP, MPQUIC-IP and MPQUIC-E bits. The setting of the ATSSS-ST in the 5GSM capability IE bits is necessary for backward compatibility with the earlier releases. The UE sets the ATSSS-ST field in the same way as a UE from previous releases.

NOTE 5: The ATSSS LL functionality cannot be used together with the redundant steering mode. When the UE indicates that it is capable of supporting the ATSSS LL functionality with any steering mode allowed for ATSSS-LL, it implies that the UE supports the ATSSS LL functionality with any steering mode except the redundant steering mode.

- 3) void;
- 4) void;
- 5) void;
- 6) void;
- 7) void;
- 8) void.

If a performance measurement function in the UE can perform access performance measurements using the QoS flow of the non-default QoS rule as specified in subclause 5.32.5 of 3GPP TS 23.501 [8], the UE shall set the APMQF bit to "Access performance measurements per QoS flow supported" in the 5GSM capability IE of the PDU SESSION MODIFICATION REQUEST message.

When requesting to modify an established PDU session for QoS differentiation of traffic from one or more non-3GPP devices connecting through the UE, the UE shall include the Non-3GPP device information IE in the PDU SESSION MODIFICATION REQUEST message, and the UE should not include parameters other than Non-3GPP device information IE in the same PDU SESSION MODIFICATION REQUEST message. If the UE requests to suspend previously requested QoS differentiation for one or more non-3GPP device identifiers, the UE shall include the corresponding non-3GPP device identifier connection information entries without the connection information field.

Upon receipt of a PDU SESSION MODIFICATION REQUEST message for MA PDU session modification, the SMF shall check if:

- a) the ATSSS-LL, MPTCP, MPQUIC-UDP, MPQUIC-IP and MPQUIC-E bits (if any of the ATSSS-LL, MPTCP, MPQUIC-UDP, MPQUIC-IP and MPQUIC-E bits, respectively, is set); or
- b) the ATSSS-ST bits (if none of the ATSSS-LL, MPTCP, MPQUIC-UDP, MPQUIC-IP and MPQUIC-E bits, respectively, is set);

in the 5GSM capability IE in the PDU SESSION MODIFICATION REQUEST message, indicate:

- a) support for any of the possible steering functionalities in addition to the ATSSS-LL functionality with only active-standby steering mode. If so, and:
 - i) the DNN configuration allows for indicated steering functionality(ies) and the ATSSS-LL functionality with any steering mode allowed for ATSSS-LL but does not allow RTT measurement without using PMF protocol, the SMF shall ensure that the PDU session being modified has the capability of the indicated

- steering functionality(ies) except MPQUIC-E functionality (if indicated) and the ATSSS-LL with only active-standby steering mode, load balancing steering mode or priority based steering mode in the downlink and the indicated steering functionality(ies) except MPQUIC-E functionality (if indicated) and the ATSSS-LL with only active-standby steering mode in the uplink;
- ii) the DNN configuration allows for the indicated steering functionality(ies) and the ATSSS-LL functionality with any steering mode allowed for ATSSS-LL and allows RTT measurement without using PMF protocol, the SMF shall ensure that the PDU session being modified has the capability of the indicated steering functionality(ies) except MPQUIC-E functionality (if indicated) and the ATSSS-LL functionality with any steering mode allowed for ATSSS-LL in the downlink and the indicated steering functionality(ies) except MPQUIC-E functionality (if indicated) and the ATSSS-LL with only active-standby steering mode in the uplink; or
 - iii) the DNN configuration allows for the indicated steering functionality(ies) and the ATSSS-LL functionality with only active-standby steering mode, the SMF shall ensure that the PDU session being modified has the capability of the indicated steering functionality(ies) except MPQUIC-E functionality (if indicated) and the ATSSS-LL with only active-standby steering mode in the downlink and the uplink;
- b) support for ATSSS LL functionality with any steering mode allowed for ATSSS-LL. If so, and the DNN configuration allows for the ATSSS-LL functionality with any steering mode allowed for ATSSS-LL, the SMF shall ensure that the PDU session being modified has the capability of ATSSS-LL functionality with any steering mode allowed for ATSSS-LL in the downlink and the uplink;
 - c) void;
 - d) void;
 - e) void;
 - f) void;
 - g) void;
 - h) support for any of the possible steering functionalities in addition to the ATSSS-LL functionality with any steering mode allowed for ATSSS-LL. If so, and the DNN configuration does not allow for the indicated steering functionality and allows for the ATSSS-LL functionality with any steering mode allowed for ATSSS-LL, the SMF shall ensure that the PDU session being modified has the capability of ATSSS-LL with any steering mode allowed for ATSSS-LL in the downlink and the uplink;
 - i) support for any of the possible steering functionalities in addition to at least ATSSS-LL functionality with only active-standby steering mode. If so, and the DNN configuration does not allow for the indicated steering functionality and allows at least for the ATSSS-LL functionality with only active-standby steering mode, the SMF shall ensure that the PDU session being modified has the capability of ATSSS-LL with only active-standby steering mode in the downlink and the uplink; or
 - j) support for only MPQUIC-IP functionality with any steering mode. If so, and the DNN configuration allows the MPQUIC-IP functionality with any steering mode, the SMF shall ensure that the PDU session being modified has the capability of MPQUIC-IP with any steering mode in the downlink and the uplink.

Figure 6.4.2.2.1: UE-requested PDU session modification procedure

6.4.2.3 UE-requested PDU session modification procedure accepted by the network

Upon receipt of a PDU SESSION MODIFICATION REQUEST message, if the SMF accepts the request to modify the PDU session, the SMF shall perform the network-requested PDU session modification procedure as specified in subclause 6.3.2.

If the PDU SESSION MODIFICATION REQUEST message contains a Port management information container IE, the SMF shall handle the contents of the Port management information container IE as specified in 3GPP TS 23.501 [8] and 3GPP TS 23.502 [9].

6.4.2.4 UE-requested PDU session modification procedure not accepted by the network

6.4.2.4.1 General

Upon receipt of a PDU SESSION MODIFICATION REQUEST message, if the SMF does not accept the request to modify the PDU session, the SMF shall create a PDU SESSION MODIFICATION REJECT message.

The SMF shall set the 5GSM cause IE of the PDU SESSION MODIFICATION REJECT message to indicate the reason for rejecting the PDU session modification.

The 5GSM cause IE typically indicates one of the following SM cause values:

- #26 insufficient resources;
- #29 user authentication or authorization failed;
- #31 request rejected, unspecified;
- #32 service option not supported;
- #33 requested service option not subscribed;
- #35 PTI already in use;
- #37 5GS QoS not accepted;
- #43 Invalid PDU session identity;
- #44 Semantic errors in packet filter(s);
- #45 Syntactical error in packet filter(s);

- #46 out of LADN service area;
- #59 unsupported 5QI value;
- #67 insufficient resources for specific slice and DNN;
- #69 insufficient resources for specific slice;
- #83 Semantic error in the QoS operation;
- #84 Syntactical error in the QoS operation;
- #87 QoS differentiation for non-3GPP device identifier(s) not available;
- #95 – 111 protocol errors.

If the UE requests a PDU session modification for an LADN when the UE is located outside of the LADN service area, the SMF shall include the 5GSM cause value #46 "out of LADN service area" in the 5GSM cause IE of the PDU SESSION MODIFICATION REJECT message.

If the UE initiates the UE-requested PDU session modification procedure to modify or delete the packet filter(s) which were created by the network without a request from the UE, the SMF shall include the 5GSM cause value #44 "semantic errors in packet filter(s)" in the 5GSM cause IE of the PDU SESSION MODIFICATION REJECT message.

If the Extended protocol configuration options IE of the PDU SESSION MODIFICATION REQUEST message indicates 3GPP PS data off UE status and the SMF detects the change of the 3GPP PS data off UE status, the SMF shall not include the 5GSM cause value #26 "insufficient resources", the 5GSM cause value #67 "insufficient resources for specific slice and DNN", the 5GSM cause value #69 "insufficient resources for specific slice" and the 5GSM cause value #46 "out of LADN service area" in the 5GSM cause IE of the PDU SESSION MODIFICATION REJECT message.

If the UE initiates UE-requested PDU session modification procedure to modify the PDU session transferred from EPS to an MA PDU session with the Request type IE set to "MA PDU request" in the UL NAS TRANSPORT message as specified in 3GPP TS 24.193 [13B] and the SMF determines, based on operator policy and subscription information, that the PDU SESSION MODIFICATION REQUEST message is to be rejected, the SMF shall include the 5GSM cause value #33 "requested service option not subscribed" in the 5GSM cause IE of the PDU SESSION MODIFICATION REJECT message.

NOTE: If the SMF determines, based on operator policy and subscription information, that the PDU SESSION MODIFICATION REQUEST message is to be accepted as single access PDU session, the ATSSS container IE cannot be included in the PDU SESSION MODIFICATION COMMAND message.

If the PDU SESSION MODIFICATION REQUEST message includes a Non-3GPP device information IE and one or more of the non-3GPP device identifiers included in the Non-3GPP device information IE are not available for the UE, the SMF shall include the 5GSM cause value #87 "QoS differentiation for non-3GPP device identifier(s) not available" in the 5GSM cause IE of the PDU SESSION MODIFICATION REJECT message.

The network may include a Back-off timer value IE in the PDU SESSION MODIFICATION REJECT message.

If the 5GSM cause value is #26 "insufficient resources", #67 "insufficient resources for specific slice and DNN", or #69 "insufficient resources for specific slice" and the PDU SESSION MODIFICATION REQUEST message was received from a UE configured for high priority access in selected PLMN or SNPN or the request type provided during the PDU session establishment is set to "initial emergency request" or "existing emergency PDU session", the network shall not include a Back-off timer value IE.

The SMF shall send the PDU SESSION MODIFICATION REJECT message.

Upon receipt of a PDU SESSION MODIFICATION REJECT message and a PDU session ID, using the NAS transport procedure as specified in subclause 5.4.5, the UE shall stop timer T3581, release the allocated PTI value, and enter the state PROCEDURE TRANSACTION INACTIVE.

If the PDU SESSION MODIFICATION REQUEST message was sent with the Requested MBS container IE included and the MBS operation set to "Join MBS session", and the UE receives a PDU SESSION MODIFICATION REJECT message, then the UE shall consider the requested MBS join as rejected.

If the PDU SESSION MODIFICATION REQUEST message was sent with the Requested MBS container IE included and the MBS operation set to "Leave MBS session", and the UE receives a PDU SESSION MODIFICATION REJECT message, then the UE shall locally leave the multicast MBS session(s) corresponding to the TMGI(s) in the Requested MBS container IE of the PDU SESSION MODIFICATION REQUEST message.

If the PDU SESSION MODIFICATION REJECT message includes 5GSM cause #87 "QoS differentiation for non-3GPP device identifier(s) not available", the UE behaves as specified in subclause 6.4.2.4.3.

6.4.2.4.2 Handling of network rejection due to congestion control

If:

- a) the 5GSM cause value #26 "insufficient resources" and the Back-off timer value IE are included in the PDU SESSION MODIFICATION REJECT message;
- b) an indication that the 5GSM message was not forwarded due to DNN based congestion control is received along a Back-off timer value and a PDU SESSION MODIFICATION REQUEST message with the PDU session ID IE set to the PDU session ID of the PDU session; or
- c) an indication that the CIoT user data container was not forwarded due to DNN based congestion control is received along with CIoT user data, a back-off timer value, and a PDU session ID;

the UE shall ignore the Re-attempt indicator IE or the 5GSM congestion re-attempt indicator IE provided by the network, if any, and the UE shall take different actions depending on the timer value received for timer T3396 in the Back-off timer value IE or depending on the Back-off timer value received from the 5GMM sublayer (if the UE is a UE configured for high priority access in selected PLMN or SNPN, exceptions are specified in subclause 6.2.7).

- a) If the timer value indicates neither zero nor deactivated and a DNN was provided during the PDU session establishment, the UE shall stop timer T3396 associated with the corresponding DNN, if it is running. If the timer value indicates neither zero nor deactivated and no DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3396 associated with no DNN if it is running. In an SNPN, the timer T3396 to be stopped includes:
 - 1) the timer T3396 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - 2) the timer T3396 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE shall then start timer T3396 with the value provided in the Back-off timer value IE or with the Back-off timer value received from the 5GMM sublayer.

If the timer T3396 is associated with:

- 1) a DNN, then the UE shall not send:
 - i) another PDU SESSION ESTABLISHMENT REQUEST message, or PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the same DNN that was sent by the UE; or
 - ii) CIoT user data via the control plane for a PDU session for which the UE provided the DNN during the PDU session establishment;until timer T3396 expires or timer T3396 is stopped; or
- 2) no DNN, then the UE shall not send:
 - i) another PDU SESSION ESTABLISHMENT REQUEST message without a DNN and with request type different from "initial emergency request" and different from "existing emergency PDU session", or another PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for a non-emergency PDU session established without a DNN provided by the UE, if

no DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session"; or

- ii) CIoT user data via the control plane for a PDU session for which the UE did not provide a DNN during the PDU session establishment;

until timer T3396 expires or timer T3396 is stopped.

The UE shall not stop timer T3396 upon a PLMN change, SNPN change, or inter-system change.

- b) if the timer value indicates that this timer is deactivated and a DNN was provided during the PDU session establishment, the UE shall stop timer T3396 associated with the corresponding DNN, if it is running. If the timer value indicates that this timer is deactivated and no DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3396 associated with no DNN if it is running. In an SNPN, the timer T3396 to be stopped includes:
 - 1) the timer T3396 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - 2) the timer T3396 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

If the timer T3396 is associated with:

- 1) a DNN, then the UE shall not send:

- i) another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST with exception of those identified in subclause 6.4.2.1, for the same DNN; or
- ii) CIoT user data via the control plane for a PDU session for which the UE provided the DNN during the PDU session establishment;

until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated, or the UE receives:

- i) a PDU SESSION MODIFICATION COMMAND message for the same DNN from the network, or a PDU SESSION AUTHENTICATION COMMAND message for the same DNN from the network, or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE for the same DNN from the network; or
- ii) a DL NAS TRANSPORT message including a CIoT user data container without a 5GMM cause value for a PDU session for which the UE provided the DNN during the PDU session establishment; or

- 2) no DNN, then the UE shall not send:

- i) another PDU SESSION ESTABLISHMENT REQUEST message without a DNN and with request type different from "initial emergency request" and different from "existing emergency PDU session", or another PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for a non-emergency PDU session established without a DNN provided by the UE, if no DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session"; or
- ii) CIoT user data via the control plane for a PDU session for which the UE did not provide a DNN during the PDU session establishment;

until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated, or the UE receives:

- i) a PDU SESSION MODIFICATION COMMAND message for a non-emergency PDU session established without a DNN provided by the UE, a PDU SESSION AUTHENTICATION COMMAND message for a non-emergency PDU session established without a DNN provided by the UE, or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE for a non-emergency PDU session established without a DNN provided by the UE; or

- ii) a DL NAS TRANSPORT message including a CIoT user data container without a 5GMM cause value for a PDU session for which the UE did not provide a DNN during the PDU session establishment.

The timer T3396 remains deactivated upon a PLMN change, SNPN change, or inter-system change.

- c) if the timer value indicates zero, the UE:

- 1) shall stop timer T3396 associated with the corresponding DNN, if running. In an SNPN, the timer T3396 to be stopped includes:
 - i) the timer T3396 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - ii) the timer T3396 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send:

- i) another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message for the same DNN; or
 - ii) CIoT user data via the control plane for a PDU session for which the UE provided the DNN during the PDU session establishment; or
- 2) if no DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3396 associated with no DNN, if running. In an SNPN, the timer T3396 to be stopped includes:
 - i) the timer T3396 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - ii) the timer T3396 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send:

- i) another PDU SESSION ESTABLISHMENT REQUEST message without a DNN, or another PDU SESSION MODIFICATION REQUEST message without a DNN provided by the UE; or
- ii) CIoT user data via the control plane for a PDU session for which the UE did not provide a DNN during the PDU session establishment.

In an SNPN, if the UE supports equivalent SNPNs then the UE shall apply the timer T3396 for all the equivalent SNPNs. Otherwise, the UE shall apply the timer T3396 for the registered SNPN.

If the Back-off timer value IE is not included or no Back-off timer value is received from the 5GMM sublayer, then the UE may send another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message for the same DNN or without a DNN as specified in subclause 6.2.7.

If the timer T3396 is running when the UE enters state 5GMM-DEREGISTERED, the UE remains switched on, and the USIM in the UE (if any) remains the same and the entry in the "list of subscriber data" for the SNPN to which timer T3396 is associated (if any) is not updated, then timer T3396 is kept running until it expires or it is stopped

When the timer T3396 is running or the timer is deactivated, the UE is allowed to initiate a PDU session establishment procedure for emergency services.

If the UE is switched off when the timer T3396 is running, and if the USIM in the UE (if any) remains the same and the entry in the "list of subscriber data" for the SNPN to which timer T3396 is associated (if any) is not updated when the UE is switched on, the UE shall behave as follows:

- let t_1 be the time remaining for T3396 timeout at switch off and let t be the time elapsed between switch off and switch on. If t_1 is greater than t , then the timer shall be restarted with the value $t_1 - t$. If t_1 is equal to or less than

t, then the timer need not be restarted. If the UE is not capable of determining t, then the UE shall restart the timer with the value t1.

If the UE is a UE operating in single-registration mode in a network supporting N26 interface and the PDU SESSION MODIFICATION REQUEST message was sent for a PDN connection established when in S1 mode after an inter-system change from S1 mode to N1 mode and timer T3396 associated with the corresponding DNN (or no DNN) is running, then the UE shall re-initiate the UE-requested PDU session modification procedure after expiry of timer T3396.

If:

- the 5GSM cause value #67 "insufficient resources for specific slice and DNN" and the Back-off timer value IE are included in the PDU SESSION MODIFICATION REJECT message;
- an indication that the 5GSM message was not forwarded due to S-NSSAI and DNN based congestion control is received along a Back-off timer value and a PDU SESSION MODIFICATION REQUEST message with the PDU session ID IE set to the PDU session ID of the PDU session; or
- an indication that the CIoT user data was not forwarded due to S-NSSAI and DNN based congestion control along with CIoT user data, a back-off timer value, and a PDU session ID;

the UE shall ignore the Re-attempt indicator IE provided by the network, if any, and take different actions depending on the timer value received for timer T3584 in the Back-off timer value IE or depending on the Back-off timer value received from the 5GMM sublayer (if the UE is a UE configured for high priority access in selected PLMN or SNPN, exceptions are specified in subclause 6.2.8):

- a) If the timer value indicates neither zero nor deactivated, and both an S-NSSAI and a DNN were provided by the UE during the PDU session establishment, the UE shall stop timer T3584 associated with the [S-NSSAI of the PDU session, DNN] combination, if it is running. If the timer value indicates neither zero nor deactivated, an S-NSSAI and no DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3584 associated with [S-NSSAI of the PDU session, no DNN] combination, if it is running. If the timer value indicates neither zero nor deactivated, no S-NSSAI and a DNN was provided during the PDU session establishment, the UE shall stop timer T3584 associated with the [no S-NSSAI, DNN] combination, if it is running. If the timer value indicates neither zero nor deactivated and neither S-NSSAI nor DNN was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3584 associated with the [no S-NSSAI, no DNN] combination, if it is running. The timer T3584 to be stopped includes:

1) in a PLMN:

- i) the timer T3584 applied for all the PLMNs, if running; and
- ii) the timer T3584 applied for the registered PLMN, if running; or

2) in an SNPN:

- i) the timer T3584 applied for all the equivalent SNPNS, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
- ii) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNS or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE shall then start timer T3584 with the value provided in the Back-off timer value IE or with the Back-off timer value received from the 5GMM sublayer.

If the timer T3584 is associated with:

1) a [S-NSSAI of the PDU session, DNN] combination, then the UE shall not send:

- i) another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message with the exception of those identified in subclause 6.4.2.1, for the [S-NSSAI of the PDU session, DNN] combination; or

- ii) CIoT user data via the control plane for a PDU session for which the UE provided the S-NSSAI and the DNN during the PDU session establishment;
until timer T3584 expires or timer T3584 is stopped;
- 2) a [S-NSSAI of the PDU session, no DNN], then the UE shall not send:
 - i) another PDU SESSION ESTABLISHMENT REQUEST message with request type different from "initial emergency request" and different from "existing emergency PDU session", or another PDU SESSION MODIFICATION REQUEST message with the exception of those identified in subclause 6.4.2.1, for the [S-NSSAI of the PDU session, no DNN] combination, if no DNN was provided during the PDU session establishment;; or
 - ii) CIoT user data via the control plane for a PDU session for which the UE provided the S-NSSAI and did not provide a DNN during the PDU session establishment;
until timer T3584 expires or timer T3584 is stopped;
- 3) a [no S-NSSAI, DNN] combination, then the UE shall not send:
 - i) another PDU SESSION ESTABLISHMENT REQUEST message, or another PDU SESSION MODIFICATION REQUEST message with the exception of those identified in subclause 6.4.2.1, for the [no S-NSSAI, DNN] combination, if no S-NSSAI was provided during the PDU session establishment; or
 - ii) CIoT user data via the control plane for a PDU session for which the UE did not provide an S-NSSAI and provided the DNN during the PDU session establishment;
until timer T3584 expires or timer T3584 is stopped; or
- 4) the [no S-NSSAI, no DNN] combination, then the UE shall not send:
 - i) another PDU SESSION ESTABLISHMENT REQUEST message with request type different from "initial emergency request" and different from "existing emergency PDU session", or another PDU SESSION MODIFICATION REQUEST message with the exception of those identified in subclause 6.4.2.1, for the [no S-NSSAI, no DNN] combination, if neither S-NSSAI nor DNN was provided during the PDU session establishment; or
 - ii) CIoT user data via the control plane for a PDU session for which the UE provided neither an S-NSSAI nor a DNN during the PDU session establishment;
until timer T3584 expires or timer T3584 is stopped.

The UE shall not stop timer T3584 upon a PLMN change, SNPN change, or inter-system change;

- b) if the timer value indicates that this timer is deactivated:
 - 1) if both S-NSSAI and DNN were provided by the UE during the PDU session establishment, the UE shall stop timer T3584 associated with the [S-NSSAI of the PDU session, DNN] combination, if running. The timer T3584 to be stopped includes:
 - i) in a PLMN:
 - A) the timer T3584 applied for all the PLMNs, if running; and
 - B) the timer T3584 applied for the registered PLMN, if running; or
 - ii) in an SNPN:
 - A) the timer T3584 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - B) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE shall not send:

- i) another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the [S-NSSAI of the PDU session, DNN] combination that was sent by the UE; or
- ii) CIoT user data via the control plane for a PDU session for which the UE provided the S-NSSAI and the DNN during the PDU session establishment;

until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated, or the UE receives:

- i) a PDU SESSION MODIFICATION COMMAND message for the [S-NSSAI of the PDU session, DNN] combination from the network, or a PDU SESSION AUTHENTICATION COMMAND message for the [S-NSSAI of the PDU session, DNN] combination from the network, or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE for the [S-NSSAI of the PDU session, DNN] combination from the network; or
 - ii) a DL NAS TRANSPORT message including a CIoT user data container without a 5GMM cause value for a PDU session for which the UE provided the S-NSSAI and the DNN during the PDU session establishment;
- 2) if an S-NSSAI was provided but a DNN was not provided by the UE during the PDU session establishment, the UE shall stop timer T3584 associated with the [S-NSSAI of the PDU session, no DNN] combination, if running. The timer T3584 to be stopped includes:
- i) in a PLMN:
 - A) the timer T3584 applied for all the PLMNs, if running; and
 - B) the timer T3584 applied for the registered PLMN, if running; or
 - ii) in an SNPN:
 - A) the timer T3584 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - B) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE shall not send:

- i) a PDU SESSION ESTABLISHMENT REQUEST message with request type different from "initial emergency request" and different from "existing emergency PDU session", or a PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the [S-NSSAI of the PDU session, no DNN] combination, if no DNN was provided during the PDU session establishment; or
- ii) CIoT user data via the control plane for a PDU session for which the UE provided the S-NSSAI and did not provide a DNN during the PDU session establishment;

until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated, or the UE receives:

- i) a PDU SESSION MODIFICATION COMMAND message for a non-emergency PDU session established for the [S-NSSAI of the PDU session, no DNN] combination from the network, or a PDU SESSION AUTHENTICATION COMMAND message for a non-emergency PDU session established for the [S-NSSAI of the PDU session, no DNN] combination from the network, or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE for a non-emergency PDU session established for the [S-NSSAI of the PDU session, no DNN] combination from the network; or
- ii) a DL NAS TRANSPORT message including a CIoT user data container without a 5GMM cause value for a PDU session for which the UE provided the S-NSSAI and did not provide a DNN during the PDU session establishment;

- 3) if an S-NSSAI was not provided but a DNN was provided by the UE during the PDU session establishment, the UE shall stop timer T3584 associated with the [no S-NSSAI, DNN] combination, if running. The timer T3584 to be stopped includes:
- i) in a PLMN:
 - A) the timer T3584 applied for all the PLMNs, if running; and
 - B) the timer T3584 applied for the registered PLMN, if running; or
 - ii) in an SNPN:
 - A) the timer T3584 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - B) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE shall not send:

- i) a PDU SESSION ESTABLISHMENT REQUEST message, or a PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the [no S-NSSAI, DNN] combination, if no S-NSSAI was provided during the PDU session establishment,
 - ii) CIoT user data via the control plane for a PDU session for which the UE did not provide an S-NSSAI and provided the DNN during the PDU session establishment;
- until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated, or the UE receives:
- i) a PDU SESSION MODIFICATION COMMAND message for the [no S-NSSAI, DNN] combination from the network, or a PDU SESSION AUTHENTICATION COMMAND message for the [no S-NSSAI, DNN] combination from the network, or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE for the [no S-NSSAI, DNN] combination from the network; or
 - ii) a DL NAS TRANSPORT message including a CIoT user data container without a 5GMM cause value for a PDU session for which the UE did not provide an S-NSSAI and provided the DNN during the PDU session establishment; or
- 4) if neither S-NSSAI nor DNN were provided by the UE during the PDU session establishment, the UE shall stop timer T3584 associated with the [no S-NSSAI, no DNN] combination, if running. The timer T3584 to be stopped includes:
- i) in a PLMN:
 - A) the timer T3584 applied for all the PLMNs, if running; and
 - B) the timer T3584 applied for the registered PLMN, if running; or
 - ii) in an SNPN:
 - A) the timer T3584 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - B) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE shall not send:

- i) a PDU SESSION ESTABLISHMENT REQUEST message with request type different from "initial emergency request" and different from "existing emergency PDU session", or a PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the [no

S-NSSAI, no DNN] combination, if neither S-NSSAI nor DNN was provided during the PDU session establishment; or

- ii) CIoT user data via the control plane for a PDU session for which the UE provided neither an S-NSSAI nor a DNN during the PDU session establishment;

until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated, or the UE receives:

- i) a PDU SESSION MODIFICATION COMMAND message for a non-emergency PDU session established for the [no S-NSSAI, no DNN] combination from the network, or a PDU SESSION AUTHENTICATION COMMAND message for a non-emergency PDU session established for the [no S-NSSAI, no DNN] combination from the network, or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE for a non-emergency PDU session established for the [no S-NSSAI, no DNN] combination from the network; or
- ii) a DL NAS TRANSPORT message including a CIoT user data container without a 5GMM cause value for a PDU session for which the UE provided neither an S-NSSAI nor a DNN during the PDU session establishment.

The timer T3584 remains deactivated upon a PLMN change, SNPN change, or inter-system change; and

- c) if the timer value indicates zero:

- 1) if both S-NSSAI and DNN were provided by the UE during the PDU session establishment, the UE shall stop timer T3584 associated with the [S-NSSAI of the PDU session, DNN] combination, if running. The timer T3584 to be stopped includes:
 - i) in a PLMN:
 - A) the timer T3584 applied for all the PLMNs, if running; and
 - B) the timer T3584 applied for the registered PLMN, if running; or
 - ii) in an SNPN:
 - A) the timer T3584 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - B) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message for the [S-NSSAI of the PDU session, DNN] combination;

- 2) if an S-NSSAI was provided but a DNN was not provided by the UE during the PDU session establishment, the UE shall stop timer T3584 associated with the [S-NSSAI of the PDU session, no DNN] combination, if running. The timer T3584 to be stopped includes:
 - i) in a PLMN:
 - A) the timer T3584 applied for all the PLMNs, if running; and
 - B) the timer T3584 applied for the registered PLMN, if running; or
 - ii) in an SNPN:
 - A) the timer T3584 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - B) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send:

- i) another PDU SESSION ESTABLISHMENT REQUEST message, or PDU SESSION MODIFICATION REQUEST message for the [S-NSSAI of the PDU session, no DNN] combination if the request type was different from "initial emergency request" and different from "existing emergency PDU session"; or
 - ii) CIoT user data via the control plane for a PDU session for which the UE provided the S-NSSAI and did not provide a DNN during the PDU session establishment;
- 3) if an S-NSSAI was not provided but a DNN was provided by the UE during the PDU session establishment, the UE shall stop timer T3584 associated with the [no S-NSSAI, DNN] combination, if running. The timer T3584 to be stopped includes:
- i) in a PLMN:
 - A) the timer T3584 applied for all the PLMNs, if running; and
 - B) the timer T3584 applied for the registered PLMN, if running; or
 - ii) in an SNPN:
 - A) the timer T3584 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - B) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send:

- i) another PDU SESSION ESTABLISHMENT REQUEST message, or PDU SESSION MODIFICATION REQUEST message for the [no S-NSSAI, DNN] combination; or
 - ii) CIoT user data via the control plane for a PDU session for which the UE did not provide an S-NSSAI and provided the DNN during the PDU session establishment; or
- 4) if neither S-NSSAI nor DNN were provided by the UE during the PDU session establishment, the UE shall stop timer T3584 associated with the [no S-NSSAI, no DNN] combination, if running. The timer T3584 to be stopped includes:
- i) in a PLMN:
 - A) the timer T3584 applied for all the PLMNs, if running; and
 - B) the timer T3584 applied for the registered PLMN, if running; or
 - ii) in an SNPN:
 - A) the timer T3584 applied for all the equivalent SNPNs, and associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - B) the timer T3584 applied for the registered SNPN, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send:

- i) another PDU SESSION ESTABLISHMENT REQUEST message, or PDU SESSION MODIFICATION REQUEST message for the [no S-NSSAI, no DNN] combination and the request type was different from "initial emergency request" and different from "existing emergency PDU session"; or
- ii) CIoT user data via the control plane for a PDU session for which the UE provided neither an S-NSSAI nor a DNN during the PDU session establishment.

If the 5GSM congestion re-attempt indicator IE with the ABO bit set to "The back-off timer is applied in all PLMNs or all equivalent SNPNs" is included in the PDU SESSION MODIFICATION REJECT message with the 5GSM cause value #67 "insufficient resources for specific slice and DNN", then the UE shall apply the timer T3584 for all the PLMNs or all the equivalent SNPNs. Otherwise, the UE shall apply the timer T3584 for the registered PLMN or the registered SNPN.

If the Back-off timer value IE is not included or no Back-off timer value is received from the 5GMM sublayer, then the UE may send another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message for the same [S-NSSAI, DNN] combination, or for the same [S-NSSAI, no DNN] combination, or for the same [no S-NSSAI, DNN] combination, or for the same [no S-NSSAI, no DNN] combination as specified in subclause 6.2.8.

When the timer T3584 is running or the timer is deactivated, the UE is allowed to initiate a PDU session establishment procedure for emergency services.

If the timer T3584 is running when the UE enters state 5GMM-DEREGISTERED, the UE remains switched on, and the USIM in the UE (if any) remains the same and the entry in the "list of subscriber data" for the SNPN to which timer T3584 is associated (if any) is not updated, then timer T3584 is kept running until it expires or it is stopped.

If the UE is switched off when the timer T3584 is running, and if the USIM in the UE (if any) remains the same and the entry in the "list of subscriber data" for the SNPN to which timer T3584 is associated (if any) is not updated when the UE is switched on, the UE shall behave as follows:

- let t_1 be the time remaining for T3584 timeout at switch off and let t be the time elapsed between switch off and switch on. If t_1 is greater than t , then the timer shall be restarted with the value $t_1 - t$. If t_1 is equal to or less than t , then the timer need not be restarted. If the UE is not capable of determining t , then the UE shall restart the timer with the value t_1 .

If the UE is a UE operating in single-registration mode in a network supporting N26 interface and the PDU SESSION MODIFICATION REQUEST message was sent for a PDN connection established when in S1 mode after an inter-system change from S1 mode to N1 mode and timer T3584 associated with the corresponding [no S-NSSAI, DNN] combination or [no S-NSSAI, no DNN] combination is running, then the UE shall re-initiate the UE-requested PDU session modification procedure after expiry of timer T3584.

If:

- the 5GSM cause value #69 "insufficient resources for specific slice" and the Back-off timer value IE are included in the PDU SESSION MODIFICATION REJECT message;
- an indication that the 5GSM message was not forwarded due to S-NSSAI only based congestion control is received along a Back-off timer value and a PDU SESSION MODIFICATION REQUEST message with the PDU session ID IE set to the PDU session ID of the PDU session; or
- an indication that the CIoT user data was not forwarded due to S-NSSAI only based congestion control along with CIoT user data, a back-off timer value, and a PDU session ID;

the UE shall ignore the bit "RATC" and the bit "EPLMNC" in the Re-attempt indicator IE provided by the network, if any, and take different actions depending on the timer value received for timer T3585 in the Back-off timer value IE or depending on the Back-off timer value received from the 5GMM sublayer (if the UE is a UE configured for high priority access in selected PLMN or SNPN, exceptions are specified in subclause 6.2.8):

- a) If the timer value indicates neither zero nor deactivated and an S-NSSAI was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3585 associated with the S-NSSAI of the PDU session, if it is running. If the timer value indicates neither zero nor deactivated and no S-NSSAI was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3585 associated with no S-NSSAI if it is running. The timer T3585 to be stopped includes:

- 1) in a PLMN:

- i) the timer T3585 applied for all the PLMNs and for the access over which the PDU SESSION MODIFICATION REJECT is received, if running;

- ii) the timer T3585 applied for all the PLMNs and for both 3GPP access type and non-3GPP access type, if running;
 - iii) the timer T3585 applied for the registered PLMN and for the access over which the PDU SESSION MODIFICATION REJECT is received, if running; and
 - iv)- the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, if running; or
- 2) in an SNPN:
- i) the timer T3585 applied for all the equivalent SNPNs and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
 - ii) the timer T3585 applied for all the equivalent SNPNs and for both 3GPP access type and non-3GPP access type, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
 - iii) the timer T3585 applied for the registered SNPN and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - iv) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE shall then start timer T3585 with the value provided in the Back-off timer value IE or with the Back-off timer value received from the 5GMM sublayer and:

- 1) if an S-NSSAI was provided by the UE during the PDU session establishment, the UE shall not send:
- i) another PDU SESSION ESTABLISHMENT REQUEST message with request type different from "initial emergency request" and different from "existing emergency PDU session", or another PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for a non-emergency PDU session for the S-NSSAI of the PDU session; or
 - ii) CIoT user data via the control plane for a PDU session for which the UE provided the S-NSSAI during the PDU session establishment;
- until timer T3585 expires or timer T3585 is stopped; and
- 2) if the request type was different from "initial emergency request" and from "existing emergency PDU session", and an S-NSSAI was not provided by the UE during the PDU session establishment, the UE shall not send:
- i) another PDU SESSION ESTABLISHMENT REQUEST message without an S-NSSAI and with request type different from "initial emergency request" and different from "existing emergency PDU session", or another PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for a non-emergency PDU session established without an S-NSSAI provided by the UE; or
 - ii) CIoT user data via the control plane for a PDU session for which the UE did not provide an S-NSSAI during the PDU session establishment;
- until timer T3585 expires or timer T3585 is stopped.

The UE shall not stop timer T3585 upon a PLMN change, SNPN change, or inter-system change;

- b) if the timer value indicates that this timer is deactivated and an S-NSSAI was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3585 associated with the S-NSSAI of the PDU session, if it

is running. If the timer value indicates that this timer is deactivated and no S-NSSAI was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3585 associated with no S-NSSAI if it is running. The timer T3585 to be stopped includes:

- 1) in a PLMN:
 - i) the timer T3585 applied for all the PLMNs and for the access over which the PDU SESSION MODIFICATION REJECT is received, if running;
 - ii) the timer T3585 applied for all the PLMNs and for both 3GPP access type and non-3GPP access type, if running;
 - iii) the timer T3585 applied for the registered PLMN and for the access over which the PDU SESSION MODIFICATION REJECT is received, if running; and
 - iv) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, if running; or
- 2) in an SNPN:
 - i) the timer T3585 applied for all the equivalent SNPNs and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
 - ii) the timer T3585 applied for all the equivalent SNPNs and for both 3GPP access type and non-3GPP access type, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
 - iii) the timer T3585 applied for the registered SNPN and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - iv) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

In addition:

- 1) if an S-NSSAI was provided by the UE during the PDU session establishment, the UE shall not send :
 - i) another PDU SESSION ESTABLISHMENT REQUEST message with request type different from "initial emergency request" and different from "existing emergency PDU session", or another PDU SESSION MODIFICATION REQUEST with exception of those identified in subclause 6.4.2.1, for a non-emergency PDU session for the S-NSSAI of the PDU session; or
 - ii) CIoT user data via the control plane for a PDU session for which the UE provided the S-NSSAI during the PDU session establishment;

until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated, or the UE receives:

- i) a PDU SESSION MODIFICATION COMMAND message for a non-emergency PDU session for the S-NSSAI of the PDU session from the network, or a PDU SESSION AUTHENTICATION COMMAND message for a non-emergency PDU session for the S-NSSAI of the PDU session from the network, or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE for the S-NSSAI of the PDU session from the network; or
- ii) a DL NAS TRANSPORT message including a CIoT user data container without a 5GMM cause value for a PDU session for which the UE provided the S-NSSAI during the PDU session establishment; or

- 2) if the request type was different from "initial emergency request" and from "existing emergency PDU session", and an S-NSSAI was not provided by the UE during the PDU session establishment, the UE shall not send:
- i) another PDU SESSION ESTABLISHMENT REQUEST message without an S-NSSAI and with request type different from "initial emergency request" and different from "existing emergency PDU session", or another PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for a non-emergency PDU session established without an S-NSSAI provided by the UE; or
 - ii) CIoT user data via the control plane for a PDU session for which the UE did not provide an S-NSSAI during the PDU session establishment;

until the UE is switched off, the USIM is removed, the entry in the "list of subscriber data" for the current SNPN is updated, or the UE receives:

- i) a PDU SESSION MODIFICATION COMMAND message for a non-emergency PDU session established without an S-NSSAI provided by the UE, or a PDU SESSION AUTHENTICATION COMMAND message for a non-emergency PDU session established without an S-NSSAI provided by the UE, or a PDU SESSION RELEASE COMMAND message without the Back-off timer value IE for a non-emergency PDU session established without an S-NSSAI provided by the UE; or
- ii) a DL NAS TRANSPORT message including a CIoT user data container without a 5GMM cause value for a PDU session for which the UE did not provide an S-NSSAI during the PDU session establishment.

The timer T3585 remains deactivated upon a PLMN change, SNPN change, or inter-system change; and

- c) if the timer value indicates zero:

- 1) if an S-NSSAI was provided by the UE during the PDU session establishment, the UE shall stop timer T3585 associated with the S-NSSAI of the PDU session, if running. The timer T3585 to be stopped includes:
 - i) in a PLMN:
 - A) including the timer T3585 applied for all the PLMNs and for the access over which the PDU SESSION RELEASE COMMAND is received, if running;
 - B) the timer T3585 applied for all the PLMNs and for the access over which the PDU SESSION RELEASE COMMAND is received, if running;
 - C) the timer T3585 applied for the registered PLMN and for current access type or both 3GPP access type and non-3GPP access type, if running; and
 - D) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, if running; or
 - ii) in an SNPN:
 - A) the timer T3585 applied for all the equivalent SNPNs and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
 - B) the timer T3585 applied for all the equivalent SNPNs and for both 3GPP access type and non-3GPP access type, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
 - C) the timer T3585 applied for the registered SNPN and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - D) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, associated with the RSNPN and, if the UE supports access to an SNPN using credentials

from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send:

- i) another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message for the S-NSSAI of the PDU session; or
 - ii) CIoT user data via the control plane for a PDU session for which the UE provided the S-NSSAI during the PDU session establishment; or
- 2) if no S-NSSAI was provided during the PDU session establishment and the request type was different from "initial emergency request" and different from "existing emergency PDU session", the UE shall stop timer T3585 associated with no S-NSSAI. The timer T3585 to be stopped includes:
- i) in a PLMN:
 - A) the timer T3585 applied for all the PLMNs and for the access over which the PDU SESSION RELEASE COMMAND is received, if running;
 - B) the timer T3585 applied for all the PLMNs and for the access over which the PDU SESSION RELEASE COMMAND is received, if running;
 - C) the timer T3585 applied for the registered PLMN and for current access type or both 3GPP access type and non-3GPP access type, if running; and
 - D) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, if running; or
 - ii) in an SNPN:
 - A) the timer T3585 applied for all the equivalent SNPNs and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
 - B) the timer T3585 applied for all the equivalent SNPNs and for both 3GPP access type and non-3GPP access type, associated with the RSNPN or an equivalent SNPN and with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running;
 - C) the timer T3585 applied for the registered SNPN and for the access over which the PDU SESSION AUTHENTICATION COMMAND message is received, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running; and
 - D) the timer T3585 applied for the registered PLMN and for both 3GPP access type and non-3GPP access type, associated with the RSNPN and, if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, associated with the selected entry of the "list of subscriber data" or the selected PLMN subscription, if running.

The UE may send:

- i) another PDU SESSION ESTABLISHMENT REQUEST message without an S-NSSAI, or another PDU SESSION MODIFICATION REQUEST message without an S-NSSAI provided by the UE; or
- ii) CIoT user data via the control plane for a PDU session for which the UE did not provide an S-NSSAI during the PDU session establishment.

If the 5GSM congestion re-attempt indicator IE with the ABO bit set to "The back-off timer is applied in all PLMNs or all SNPNs" is included in the PDU SESSION MODIFICATION REJECT message with the 5GSM cause value #69 "insufficient resources for specific slice", then the UE shall apply the timer T3585 for all the PLMNs or all the equivalent SNPNs. Otherwise, the UE shall apply the timer T3585 for the registered PLMN or the registered SNPN.

If the Back-off timer value IE is not included or no Back-off timer value is received from the 5GMM sublayer, then the UE may send another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message for the same S-NSSAI or without an S-NSSAI as specified in subclause 6.2.8.

When the timer T3585 is running or the timer is deactivated, the UE is allowed to initiate a PDU session establishment procedure for emergency services.

If the timer T3585 is running when the UE enters state 5GMM-DEREGISTERED, the UE remains switched on, and the USIM in the UE (if any) remains the same and the entry in the "list of subscriber data" for the SNPN to which timer T3585 is associated (if any) is not updated, then timer T3585 is kept running until it expires or it is stopped.

If the UE is switched off when the timer T3585 is running, and if the USIM in the UE (if any) remains the same and the entry in the "list of subscriber data" for the SNPN to which timer T3585 is associated (if any) is not updated when the UE is switched on, the UE shall behave as follows:

- let t_1 be the time remaining for T3585 timeout at switch off and let t be the time elapsed between switch off and switch on. If t_1 is greater than t , then the timer shall be restarted with the value $t_1 - t$. If t_1 is equal to or less than t , then the timer need not be restarted. If the UE is not capable of determining t , then the UE shall restart the timer with the value t_1 .

If the UE is a UE operating in single-registration mode in a network supporting N26 interface and the PDU SESSION MODIFICATION REQUEST message was sent for a PDN connection established when in S1 mode after an inter-system change from S1 mode to N1 mode and timer T3585 associated with no S-NSSAI is running, then the UE shall re-initiate the UE-requested PDU session modification procedure after expiry of timer T3585.

NOTE 3: As described in this subclause, upon PLMN change, SNPN change, or inter-system change, the UE does not stop the timer T3584 or T3585. This means the timer T3584 or T3585 can still be running or be deactivated for the given 5GSM procedure, the PLMN, the S-NSSAI and optionally the DNN combination when the UE returns to the PLMN or when it performs inter-system change back from S1 mode to N1 mode. Thus the UE can still be prevented from sending another PDU SESSION ESTABLISHMENT REQUEST or PDU SESSION MODIFICATION REQUEST message in the PLMN for the same S-NSSAI and optionally the same DNN.

Upon PLMN change or SNPN change, if T3584 applied for the registered PLMN or the registered SNPN is running or is deactivated for an S-NSSAI, a DNN, and old PLMN or old SNPN, but T3584 is not running and is not deactivated for the S-NSSAI, the DNN, and new PLMN or new SNPN, then the UE is allowed to send a PDU SESSION ESTABLISHMENT REQUEST message for the same S-NSSAI and the same DNN in the new PLMN or new SNPN.

Upon PLMN change or SNPN change, if T3585 applied for the registered PLMN or the registered SNPN is running or is deactivated for an S-NSSAI and old PLMN or old SNPN, but T3585 is not running and is not deactivated for the S-NSSAI and new PLMN or new SNPN, then the UE is allowed to send a PDU SESSION ESTABLISHMENT REQUEST message for the same S-NSSAI in the new PLMN or new SNPN.

Upon SNPN change, if T3585 applied for all the equivalent SNPNs is running or is deactivated for an S-NSSAI and old SNPN, but T3585 is not running and is not deactivated for the S-NSSAI and new non-equivalent SNPN, then the UE is allowed to send a PDU SESSION ESTABLISHMENT REQUEST message for the same S-NSSAI in the new SNPN.

6.4.2.4.3 Handling of network rejection not due to congestion control

If the 5GSM cause value is different from #26 "insufficient resources", #37 "5GS QoS not accepted", #44 "Semantic errors in packet filter(s)", #45 "Syntactical error in packet filter(s)", #46 "out of LADN service area", #59 "unsupported 5QI value", #67 "insufficient resources for specific slice and DNN", #69 "insufficient resources for specific slice", #83 "Semantic error in the QoS operation", and #84 "Syntactical error in the QoS operation", and the Back-off timer value IE is included, the UE shall behave as follows: (if the UE is a UE configured for high priority access in selected PLMN or SNPN, exceptions are specified in subclause 6.2.12):

- a) if the timer value indicates neither zero nor deactivated and:
 - 1) if the UE provided DNN and S-NSSAI to the network during the PDU session establishment, the UE shall start the back-off timer with the value provided in the Back-off timer value IE for the PDU session modification procedure and:
 - i) in a PLMN, [PLMN, DNN, (mapped) HPLMN S-NSSAI of the PDU session] combination. The UE shall not send another PDU SESSION MODIFICATION REQUEST message with exception of those

identified in subclause 6.4.2.1, for the same DNN and the (mapped) HPLMN S-NSSAI of the PDU session in the current PLMN, until the back-off timer expires, the UE is switched off, or the USIM is removed; or

- ii) in an SNPN, [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, (mapped) subscribed SNPN S-NSSAI] combination. The UE shall not send another PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the same DNN and (mapped) subscribed SNPN S-NSSAI of the PDU session in the current SNPN using the selected entry of the "list of subscriber data" or selected PLMN subscription, until the back-off timer expires, the UE is switched off, the USIM is removed, or the selected entry of the "list of subscriber data" is updated;
- 2) if the UE did not provide a DNN or S-NSSAI or any of the two parameters to the network during the PDU session establishment, it shall start the back-off timer accordingly for the PDU session modification procedure and:
- i) in a PLMN, [PLMN, DNN, no S-NSSAI], [PLMN, no DNN, (mapped) HPLMN S-NSSAI of the PDU session] or [PLMN, no DNN, no S-NSSAI] combination. Dependent on the combination, the UE shall not send another PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the same [PLMN, DNN, no S-NSSAI], [PLMN, no DNN, (mapped) HPLMN S-NSSAI of the PDU session] or [PLMN, no DNN, no S-NSSAI] combination in the current PLMN, until the back-off timer expires, the UE is switched off, or the USIM is removed; or
 - ii) in an SNPN, [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, (mapped) subscribed SNPN S-NSSAI of the PDU session] or [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI] combination. Dependent on the combination, the UE shall not send another PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for the same [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, (mapped) subscribed SNPN S-NSSAI of the PDU session] or [SNPN, selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI] combination in the current SNPN, until the back-off timer expires, the UE is switched off, the USIM is removed, or the selected entry in the "list of subscriber data" is updated;
- b) if the timer value indicates that this timer is deactivated and:
- 1) if the UE provided DNN and S-NSSAI to the network during the PDU session establishment, the UE shall not send another PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for:
 - i) in a PLMN, the same DNN and the (mapped) HPLMN S-NSSAI of the PDU session in the current PLMN, until the UE is switched off, or the USIM is removed; or
 - ii) in an SNPN, the same DNN and the (mapped) subscribed SNPN S-NSSAI of the PDU session in the current SNPN using the selected entry of the "list of subscriber data" or selected PLMN subscription, until the UE is switched off, or the USIM is removed, or the selected entry in the "list of subscriber data";
 - 2) if the UE did not provide a DNN or S-NSSAI or any of the two parameters to the network during the PDU session establishment, the UE shall not send another PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, for:
 - i) in a PLMN; the same [PLMN, DNN, no S-NSSAI], [PLMN, no DNN, (mapped) HPLMN S-NSSAI of the PDU session] or [PLMN, no DNN, no S-NSSAI] combination in the current PLMN, until the UE is switched off, or the USIM is removed; or
 - ii) in an SNPN, the same [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, (mapped) subscribed SNPN S-NSSAI of the PDU session] or [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI] combination in the current SNPN using the selected entry of the "list of subscriber data" or selected PLMN subscription, until the UE is switched off, the USIM is removed, or the selected entry in the "list of subscriber data" is updated; and

- c) if the timer value indicates zero, the UE may send another PDU SESSION MODIFICATION REQUEST message for:
- 1) in a PLMN, the same combination of [PLMN, DNN, (mapped) HPLMN S-NSSAI of the PDU session], [PLMN, DNN, no S-NSSAI], [PLMN, no DNN, (mapped) HPLMN S-NSSAI of the PDU session], or [PLMN, no DNN, no S-NSSAI] in the current PLMN; or
 - 2) in an SNPN, the same combination of [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, (mapped) subscribed SNPN S-NSSAI of the PDU session], [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, (mapped) subscribed SNPN S-NSSAI of the PDU session], or [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI] in the current SNPN.

If the Back-off timer value IE is not included, then the UE shall ignore the Re-attempt indicator IE provided by the network in the PDU SESSION MODIFICATION REJECT message, if any.

- a) Additionally, if the 5GSM cause value is #32 "service option not supported", or #33 "requested service option not subscribed", then:
- 1) the UE not operating in SNPN access operation mode shall proceed as follows:
 - i) if the UE is registered in the HPLMN or in a PLMN that is within the EHPLMN list, the UE shall behave as described above in the present subclause using the configured SM Retry Timer value as specified in 3GPP TS 24.368 [17] or in USIM file NAS_{CONFIG} as specified in 3GPP TS 31.102 [22], if available, as back-off timer value; and

NOTE 1: The way to choose one of the configured SM Retry Timer values for back-off timer value is up to UE implementation if the UE is configured with:

- an SM Retry Timer value in the ME as specified in 3GPP TS 24.368 [17]; and
- an SM Retry Timer value in USIM file NAS_{CONFIG} as specified in 3GPP TS 31.102 [22].

- ii) otherwise, if the UE is not registered in its HPLMN or in a PLMN that is within the EHPLMN list, or if the SM Retry Timer value is not configured, the UE shall behave as described above in the present subclause, using the default value of 12 minutes for the back-off timer; or

- 2) the UE operating in SNPN access operation mode shall proceed as follows:

- i) if:

- A) the SM Retry Timer value for the current SNPN as specified in 3GPP TS 24.368 [17] is available; or
- B) the SM Retry Timer value in USIM file NAS_{CONFIG} as specified in 3GPP TS 31.102 [22] is available and the UE used the USIM for registration to the current SNPN;

then the UE shall behave as described above in the present subclause using the configured SM Retry Timer value as back-off timer value; or

NOTE 2: The way to choose one of the configured SM Retry Timer values for back-off timer value is up to UE implementation if both conditions in bullets A) and B) above are satisfied.

- ii) otherwise, the UE shall behave as described above in the present subclause, using the default value of 12 minutes for the back-off timer.

- b) For 5GSM cause values different from #32 "service option not supported", or #33 "requested service option not subscribed", the UE behaviour regarding the start of a back-off timer is specified in subclause 6.2.12.

The UE shall not stop any back-off timer:

- a) upon a PLMN or SNPN change;
- b) upon an inter-system change; or
- c) upon registration over another access type.

If the network indicates that a back-off timer for the PDU session modification procedure is deactivated, then it remains deactivated:

- a) upon a PLMN or SNPN change;
- b) upon an inter-system change; or
- c) upon registration over another access type.

NOTE 3: This means the back-off timer can still be running or be deactivated for the given 5GSM procedure when the UE returns to the PLMN or SNPN or when it performs inter-system change back from S1 mode to N1 mode. Thus the UE can still be prevented from sending another PDU SESSION MODIFICATION REQUEST message for the combination of [PLMN, DNN, (mapped) HPLMN S-NSSAI of the PDU session], [PLMN, DNN, no S-NSSAI], [PLMN, no DNN, (mapped) HPLMN S-NSSAI of the PDU session], or [PLMN, no DNN, no S-NSSAI] in the PLMN, or for the combination of [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, (mapped) subscribed S-NSSAI], [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, (mapped) subscribed S-NSSAI], or [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI] in the SNPN.

If the back-off timer is started upon receipt of a PDU SESSION MODIFICATION REJECT (i.e. the timer value was provided by the network, a configured value is available or the default value is used as explained above) or the back-off timer is deactivated, the UE behaves as follows:

- a) after a PLMN or SNPN change the UE may send a PDU SESSION MODIFICATION REQUEST message for:
 - 1) in a PLMN, the combination of [new PLMN, DNN, (mapped) HPLMN S-NSSAI of the PDU session], [new PLMN, DNN, no S-NSSAI], [new PLMN, no DNN, (mapped) HPLMN S-NSSAI of the PDU session], or [new PLMN, no DNN, no S-NSSAI] in the new PLMN, if the back-off timer is not running and is not deactivated for the PDU session modification procedure and the combination of [new PLMN, DNN, (mapped) HPLMN S-NSSAI of the PDU session], [new PLMN, DNN, no S-NSSAI], [new PLMN, no DNN, (mapped) HPLMN S-NSSAI of the PDU session], or [new PLMN, no DNN, no S-NSSAI]; or
 - 2) in an SNPN, the combination of [new SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, (mapped) subscribed SNPN S-NSSAI of the PDU session], [new SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [new SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, (mapped) subscribed SNPN S-NSSAI of the PDU session], or [new SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI] in the new SNPN, if the back-off timer is not running and is not deactivated for the PDU session modification procedure and the combination of [new SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, (mapped) subscribed SNPN S-NSSAI of the PDU session], [new SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [new SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, (mapped) subscribed SNPN S-NSSAI of the PDU session], or [new SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI];

Furthermore, as an implementation option, for the 5GSM cause value #32 "service option not supported" or #33 "requested service option not subscribed", if the network does not include a Re-attempt indicator IE, the UE may decide not to automatically send another PDU SESSION MODIFICATION REQUEST message:

- 1) in a PLMN, the same combination of [PLMN, DNN, (mapped) HPLMN S-NSSAI of the PDU session], [PLMN, DNN, no S-NSSAI], [PLMN, no DNN, (mapped) HPLMN S-NSSAI of the PDU session], or [PLMN, no DNN, no S-NSSAI], if the UE is registered to a new PLMN which is in the list of equivalent PLMNs; or
- 2) in an SNPN, if the UE supports equivalent SNPNs, the same combination of [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, (mapped) subscribed SNPN S-NSSAI of the PDU session], [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, (mapped) subscribed SNPN S-NSSAI of the PDU session], or [SNPN, the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI], if the UE is registered to a new SNPN which is in the list of equivalent SNPNs.

b) if the network does not include the Re-attempt indicator IE to indicate whether re-attempt in S1 mode is allowed, or the UE ignores the Re-attempt indicator IE, e.g. because the Back-off timer value IE is not included, then:

- 1) if the UE is registered in its HPLMN or in a PLMN that is within the EHPLMN list and the back-off timer is running for the combination of [PLMN, DNN, (mapped) HPLMN S-NSSAI of the PDU session] or [PLMN DNN, no S-NSSAI], the UE shall apply the configured SM_RetryAtRATChange value as specified in 3GPP TS 24.368 [17] or in USIM file NAS_{CONFIG} as specified in 3GPP TS 31.102 [22], if available, to determine whether the UE may attempt an EPS bearer resource allocation procedure or an EPS bearer resource modification procedure for the same [PLMN, DNN] combination in S1 mode; and

NOTE 4: The way to choose one of the configured SM_RetryAtRATChange values for back-off timer value is up to UE implementation if the UE is configured with:

- an SM_RetryAtRATChange value in ME as specified in 3GPP TS 24.368 [17]; and
- an SM_RetryAtRATChange value in USIM file NAS_{CONFIG} as specified in 3GPP TS 31.102 [22].

- 2) if the UE is not registered in its HPLMN or in a PLMN that is within the EHPLMN list, or if the NAS configuration MO as specified in 3GPP TS 24.368 [17] is not available and the value for inter-system change is not configured in the USIM file NAS_{CONFIG}, then the UE behaviour regarding an EPS bearer resource allocation procedure or an EPS bearer resource modification procedure for the same [PLMN, DNN] combination in S1 mode is unspecified; and

c) if the network includes the Re-attempt indicator IE indicating that re-attempt in an equivalent PLMN or equivalent SNPN is not allowed, then depending on the timer value received in the Back-off timer value IE, for:

- 1) in a PLMN, each combination of a PLMN from the equivalent PLMN list and the respective [DNN, (mapped) HPLMN S-NSSAI of the PDU session], [DNN, no S-NSSAI], [no DNN, (mapped) HPLMN S-NSSAI of the PDU session], or [no DNN, no S-NSSAI] combination, the UE shall start a back-off timer for the PDU session modification procedure with the value provided by the network, or deactivate the respective back-off timer as follows:
 - i) if the Re-attempt indicator IE additionally indicates that re-attempt in S1 mode is allowed, the UE shall start or deactivate the back-off timer for N1 mode only; and
 - ii) otherwise, the UE shall start or deactivate the back-off timer for S1 and N1 mode
- 2) in a SNPN, if the UE supports equivalent SNPNs, each combination of a SNPN from the equivalent SNPN list and the respective [the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, (mapped) subscribed SNPN S-NSSAI of the PDU session], [the selected entry of the "list of subscriber data" or selected PLMN subscription, DNN, no S-NSSAI], [the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, (mapped) subscribed SNPN S-NSSAI of the PDU session], or [the selected entry of the "list of subscriber data" or selected PLMN subscription, no DNN, no S-NSSAI] combination, the UE shall start a back-off timer for the PDU session modification procedure with the value provided by the network, or deactivate the respective back-off timer, for N1 mode in an SNPN.

If the back-off timer for a [PLMN, DNN] or [PLMN, no DNN] combination was started or deactivated in S1 mode upon receipt of BEARER RESOURCE ALLOCATION REJECT message or BEARER RESOURCE MODIFICATION REJECT message (see 3GPP TS 24.301 [15]) and the network indicated that re-attempt in N1 mode is allowed, then this back-off timer does not prevent the UE from sending a PDU SESSION MODIFICATION REQUEST message in this PLMN for the same DNN after inter-system change to N1 mode. If the network indicated that re-attempt in N1 mode is not allowed, the UE shall not send any PDU SESSION MODIFICATION REQUEST message with exception of those identified in subclause 6.4.2.1, in this PLMN for the same DNN in combination with any S-NSSAI or without S-NSSAI, after inter-system change to N1 mode until the timer expires, the UE is switched off or the USIM is removed.

NOTE 5: The back-off timer is used to describe a logical model of the required UE behaviour. This model does not imply any specific implementation, e.g. as a timer or timestamp.

NOTE 6: Reference to back-off timer in this section can either refer to use of timer T3396 or to use of a different packet system specific timer within the UE. Whether the UE uses T3396 as a back-off timer or it uses different packet system specific timers as back-off timers is left up to UE implementation.

If the 5GSM cause value is #46 "out of LADN service area", the UE shall ignore the Back-off timer value IE and Re-attempt indicator IE provided by the network, if any. If the UE is not located inside the LADN service area, the UE shall not send another PDU SESSION MODIFICATION REQUEST message except for indicating a change of 3GPP PS data off UE status or another PDU SESSION ESTABLISHMENT REQUEST message for the LADN DNN

provided by the UE during the PDU session establishment procedure until the LADN information for the specific LADN DNN or the extended LADN information for the specific LADN DNN and S-NSSAI is updated as described in subclause 5.4.4 and subclause 5.5.1. If the UE is not located inside the LADN service area, the UE shall not indicate the PDU session(s) for the LADN DNN provided by the UE during the PDU session establishment procedure in the Uplink data status IE included in the SERVICE REQUEST message until the LADN information for the specific LADN DNN or the extended LADN information for the specific LADN DNN and S-NSSAI is provided by network as described in subclause 5.4.4 and subclause 5.5.1.

NOTE 7: Based on UE implementation, the UE locating inside the LADN service area can send another PDU SESSION ESTABLISHMENT REQUEST message or PDU SESSION MODIFICATION REQUEST message for the LADN DNN which was rejected with the 5GSM cause value #46 "out of LADN service area".

NOTE 7A: If the UE does not receive a CONFIGURATION UPDATE COMMAND message with new LADN information within an implementation dependent time, the UE can request this information by initiating a registration procedure for mobility or periodic registration update (see subclause 5.5.1.3.2, item q).

If the 5GSM cause value is #87 "QoS differentiation for non-3GPP device identifier(s) not available", the UE shall ignore the Back-off timer value IE and Re-attempt indicator IE provided by the network, if any. The UE should pass the corresponding error cause to the upper layers.

NOTE 7B: On receiving 5GSM cause value #87, upper layers can provide the UE with a list of available non-3GPP device information to trigger another UE-requested PDU session modification procedure.

If the 5GSM cause value is #37 "5GS QoS not accepted", #44 "Semantic errors in packet filter(s)", #45 "Syntactical error in packet filter(s)", #59 "unsupported 5QI value", #83 "Semantic error in the QoS operation" or #84 "Syntactical error in the QoS operation", the UE shall ignore the Back-off timer value IE and Re-attempt indicator IE provided by the network, if any. The UE should pass the corresponding error cause to the upper layers.

NOTE 8: How to solve the issues of not accepted 5GS QoS and unsupported 5QI value in the upper layers is UE implementation specific.

6.4.2.5 Abnormal cases in the UE

The following abnormal cases can be identified:

a) Expiry of timer T3581.

The UE shall, on the first expiry of the timer T3581, retransmit the PDU SESSION MODIFICATION REQUEST message and the PDU session information which was transported together with the initial transmission of the PDU SESSION MODIFICATION REQUEST message and shall reset and start timer T3581. This retransmission is repeated four times, i.e. on the fifth expiry of timer T3581, the UE shall abort the procedure and shall release the allocated PTI.

b) Invalid PDU session identity.

Upon receipt of the PDU SESSION MODIFICATION REJECT message including 5GSM cause #43 "invalid PDU session identity", the UE shall perform a local release of the existing PDU session and shall stop the timer T3581.

c) Collision of network-requested PDU session release procedure and UE-requested PDU session modification procedure.

If the UE receives a PDU SESSION RELEASE COMMAND message during the UE-requested PDU session modification procedure, and the PDU session indicated in the PDU SESSION RELEASE COMMAND message is the PDU session that the UE had requested to modify, the UE shall abort the PDU session modification procedure and proceed with the network-requested PDU session release procedure.

d) Handling DL user data packets marked with RQI when UE has already revoked the usage of reflective QoS

If the UE receives a DL user data packet marked with a RQI and the DL user data packet belongs to a PDU session of IPv4, IPv6, IPv4v6 or Ethernet PDU session type for which the UE has already revoked the usage of reflective QoS, then the UE shall ignore the RQI and shall handle the received DL user data packet.

- e) Collision of network-requested PDU session modification procedure and UE-requested PDU session modification procedure.

The handling of the same abnormal case as described in subclause 6.3.2.6 applies.

- f) Upon receiving an indication that the 5GSM message was not forwarded due to service area restrictions along with a PDU SESSION MODIFICATION REQUEST message with the PDU session ID IE set to the same value as the PDU session ID that was sent by the UE, the UE shall abort the procedure and shall stop the timer T3581.
- g) Upon receiving an indication that the 5GSM message was not forwarded due to routing failure along with a PDU SESSION MODIFICATION REQUEST message with the PDU session ID IE set to the same value as the PDU session ID that was sent by the UE, the UE shall stop timer T3581 and shall abort the procedure.
- g1) Upon receiving an indication that the 5GSM message was not forwarded because the UE accessing via a satellite NG-RAN cell is informed that the PLMN is not allowed to operate at the present UE location along with a PDU SESSION MODIFICATION REQUEST message with the PDU session ID IE set to the same value as the PDU session ID that was sent by the UE, the UE shall stop timer T3581 and shall abort the procedure.
- g2) Upon receiving an indication that the 5GSM message was not forwarded due to unexpected cause along with a PDU SESSION MODIFICATION REQUEST message with the PDU session ID IE set to the same value as the PDU session ID that was sent by the UE, the UE shall stop timer T3581 and shall abort the procedure.

- h) Collision of UE-requested PDU session modification procedure and N1 NAS signalling connection release

The UE may immediately retransmit the PDU SESSION MODIFICATION REQUEST message and stop, reset and restart timer T3581, if the following conditions apply:

- 1) The original UE-requested PDU session modification procedure was initiated over an existing N1 NAS signalling connection; and
- 2) the previous transmission of the PDU SESSION MODIFICATION REQUEST message was not initiated due to timer T3581 expiry.
- i) Rejection of a UE-requested PDU session modification procedure when the UE has initiated the procedure to delete one or more non-default QoS rules for the PDU session:

Upon receipt of a PDU SESSION MODIFICATION REJECT message with 5GSM cause value #31 "request rejected, unspecified", if the UE had initiated deletion of one or more non-default QoS rules for the PDU session, as an implementation option,

- 1) it may perform a local release of the PDU session and shall stop the timer T3581. In order to synchronize the PDU session context with the AMF, the UE shall perform the registration procedure for mobility and periodic registration update with a REGISTRATION REQUEST message including the PDU session status IE; or
- 2) it shall stop the timer T3581 and initiate the UE-requested PDU session release procedure.

NOTE: The UE can delay the release of the PDU session until there is no pending data transferred through the other QoS flows of the PDU session.

6.4.2.6 Abnormal cases on the network side

The following abnormal cases can be identified:

- a) If the PDU session is an emergency PDU session and the 5GSM cause IE is not included in the PDU SESSION MODIFICATION REQUEST message which is not triggered according to subclause 6.4.2.1, item e), or is set to a 5GSM cause other than the 5GSM causes #41, #42, #44, #45, #83, #84, and #85, the SMF shall reject the PDU SESSION MODIFICATION REQUEST message with 5GSM cause #31 "request rejected, unspecified".
- b) PDU session inactive for the received PDU session identity.

If the PDU session ID in the PDU SESSION MODIFICATION REQUEST message belongs to any PDU session in state PDU SESSION INACTIVE in the SMF, the SMF shall set the 5GSM cause IE to #43 "Invalid PDU session identity" in the PDU SESSION MODIFICATION REJECT message.

- c) Collision of network-requested PDU session modification procedure and UE-requested PDU session modification procedure.

The handling of the same abnormal case as described in subclause 6.3.2.5 applies.

- d) AMF provides a "message was exempted from the DNN based congestion activated in the AMF" but the UE-requested PDU session modification procedure is not exempt from DNN based congestion control.

If the SMF receives an exemptionInd attribute indicating "message was exempted from the DNN based congestion activated in the AMF" as specified in 3GPP TS 29.502 [20A], and the Extended protocol configuration options IE of the PDU SESSION MODIFICATION REQUEST message does not indicate 3GPP PS data off UE status, then the SMF shall set the 5GSM cause #26 "insufficient resources" in the PDU SESSION MODIFICATION REJECT message.

- e) AMF provides a "message was exempted from the S-NSSAI and DNN based congestion activated in the AMF" but the UE-requested PDU session modification procedure is not exempt from S-NSSAI only based congestion control.

If the SMF receives an exemptionInd attribute indicating "message was exempted from the S-NSSAI and DNN based congestion activated in the AMF" as specified in 3GPP TS 29.502 [20A], and the Extended protocol configuration options IE of the PDU SESSION MODIFICATION REQUEST message does not indicate 3GPP PS data off UE status, then the SMF shall set the 5GSM cause #67 "insufficient resources for specific slice and DNN" in the PDU SESSION MODIFICATION REJECT message.

- f) AMF provides a "message was exempted from the S-NSSAI only based congestion activated in the AMF" but the UE-requested PDU session modification procedure is not exempt from S-NSSAI only based congestion control.

If the SMF receives an exemptionInd attribute indicating "message was exempted from the S-NSSAI only based congestion activated in the AMF" as specified in 3GPP TS 29.502 [20A], and the Extended protocol configuration options IE of the PDU SESSION MODIFICATION REQUEST message does not indicate 3GPP PS data off UE status, then the SMF shall set the 5GSM cause #69 "insufficient resources for specific slice" in the PDU SESSION MODIFICATION REJECT message.

- g) 5G access network cannot forward the message.

If the SMF determines based on content of the n2SmInfo attribute specified in 3GPP TS 29.502 [20A] that the DL NAS TRANSPORT message carrying the PDU SESSION MODIFICATION COMMAND message was not forwarded to the UE by the 5G access network due to a cause other than handover procedure in progress, then the SMF shall reject the UE-requested PDU session modification procedure with an appropriate 5GSM cause value in the PDU SESSION MODIFICATION REJECT message.

NOTE: The use of an appropriate 5GSM cause value is implementation specific.

- h) UE-requested MA PDU session modification with unspecified steering functionality and steering mode:

If the SMF receives the PDU SESSION MODIFICATION REQUEST message for an MA PDU session including the 5GSM capability information element that does not indicate support for any steering functionality or steering mode, the SMF shall reject the PDU session modification procedure with the 5GSM cause set to #95 "Semantically incorrect message" in the PDU SESSION MODIFICATION REJECT message.

6.4.3 UE-requested PDU session release procedure

6.4.3.1 General

The purpose of the UE-requested PDU session release procedure is to enable by the UE to request a release of a PDU session.

The UE is allowed to initiate the PDU session release procedure even if the timer T3396 is running.

The UE is allowed to initiate the PDU session release procedure even if the timer T3584 is running.

The UE is allowed to initiate the PDU session release procedure even if the timer T3585 is running.

The UE is allowed to initiate the PDU session release procedure even if the UE is outside the LADN service area.

6.4.3.2 UE-requested PDU session release procedure initiation

In order to initiate the UE-requested PDU session release procedure, the UE shall create a PDU SESSION RELEASE REQUEST message.

The UE may set the 5GSM cause IE of the PDU SESSION RELEASE REQUEST message to indicate the reason for releasing the PDU session.

The 5GSM cause IE typically indicates one of the following 5GSM cause values:

- #26 insufficient resources;
- #36 regular deactivation;
- #44 Semantic errors in packet filter(s);
- #45 Syntactical error in packet filter(s);
- #83 Semantic error in the QoS operation;
- #84 Syntactical error in the QoS operation;
- #96 Invalid mandatory information.

The UE shall allocate a PTI value currently not used and shall set the PTI IE of the PDU SESSION RELEASE REQUEST message to the allocated PTI value.

The UE shall transport the PDU SESSION RELEASE REQUEST message and the PDU session ID, using the NAS transport procedure as specified in subclause 5.4.5, and the UE shall start timer T3582 (see example in figure 6.4.3.2.1).

If the UE is releasing the PDU session due to:

- a) errors in QoS operations or packet filters; or
- b) the number of the authorized QoS rules, the number of the packet filters, or the number of the authorized QoS flow descriptions associated with the PDU session have reached the maximum number supported by the UE,

the UE shall include the 5GSM cause IE in the PDU SESSION RELEASE REQUEST message as described in subclauses 6.3.2.4 and 6.4.1.3.

Figure 6.4.3.2.1: UE-requested PDU session release procedure

6.4.3.3 UE-requested PDU session release procedure accepted by the network

Upon receipt of a PDU SESSION RELEASE REQUEST message and a PDU session ID, if the SMF accepts the request to release the PDU session, and shall perform the network-requested PDU session release procedure as specified in subclause 6.3.3.

6.4.3.4 UE-requested PDU session release procedure not accepted by the network

Upon receipt of a PDU SESSION RELEASE REQUEST message, if the SMF does not accept the request to release the PDU session, the SMF shall create a PDU SESSION RELEASE REJECT message.

The SMF shall set the 5GSM cause IE of the PDU SESSION RELEASE REJECT message to indicate the reason for rejecting the PDU session release.

The 5GSM cause IE typically indicates one of the following SM cause values:

- #35 PTI already in use; or
- #43 Invalid PDU session identity; or
- #95 – 111: protocol errors.

The SMF shall send the PDU SESSION RELEASE REJECT message.

Upon receipt of a PDU SESSION RELEASE REJECT message and a PDU session ID, using the NAS transport procedure as specified in subclause 5.4.5, the UE shall stop timer T3582, release the allocated PTI value and locally release the PDU session. If there is one or more multicast MBS sessions associated with the PDU session, the UE shall locally leave the associated multicast MBS sessions.

6.4.3.5 Abnormal cases in the UE

The following abnormal cases can be identified:

a) Expiry of timer T3582.

The UE shall, on the first expiry of the timer T3582, retransmit the PDU SESSION RELEASE REQUEST message and the PDU session information which was transported together with the initial transmission of the PDU SESSION RELEASE REQUEST message and shall reset and start timer T3582. This retransmission is repeated four times, i.e. on the fifth expiry of timer T3582, the UE shall abort the procedure, release the allocated PTI, perform a local release of the PDU session, and perform the registration procedure for mobility and periodic registration update by sending a REGISTRATION REQUEST message including the PDU session status IE over each access that user plane resources have been established if the PDU session is an MA PDU session, or over the access the PDU session is associated with if the PDU session is a single access PDU session. If there is one or more multicast MBS sessions associated with the PDU session, the UE shall locally leave the associated multicast MBS sessions.

b) Collision of UE-requested PDU session release procedure and network-requested PDU session modification procedure.

When the UE receives a PDU SESSION MODIFICATION COMMAND message during the UE-requested PDU session release procedure, and the PDU session indicated in PDU SESSION MODIFICATION COMMAND message is the PDU session that the UE had requested to release, the UE shall ignore the PDU SESSION MODIFICATION COMMAND message and proceed with the PDU session release procedure.

c) Collision of UE-requested PDU session release procedure and network-requested PDU session release procedure.

When the UE receives a PDU SESSION RELEASE COMMAND message with the PTI IE set to "No procedure transaction identity assigned" during the UE-requested PDU session release procedure, the PDU session indicated in the PDU SESSION RELEASE COMMAND message is the same as the PDU session that the UE requests to release:

- if the Access type IE is included in the PDU SESSION RELEASE COMMAND message and the PDU session is an MA PDU session and having user-plane resources established on the access different from the

access indicated in the Access type IE in the PDU SESSION RELEASE COMMAND message, the UE shall proceed both the UE-requested PDU session release procedure and network-requested PDU session release procedure; or

- otherwise, the UE shall abort the UE-requested PDU session release procedure and shall stop the timer T3582 and proceed with the network-requested PDU session release procedure.

NOTE 1: Whether the UE ignores the 5GSM cause #39 "reactivation requested" if received in the PDU SESSION RELEASE COMMAND is up to the UE implementation.

d) Receipt of an indication that the 5GSM message was not forwarded due to routing failure

Upon receiving an indication that the 5GSM message was not forwarded due to routing failure along with a PDU SESSION RELEASE REQUEST message with the PDU session ID IE set to the same value as the PDU session ID that was sent by the UE, the UE shall stop timer T3582, abort the procedure, release the allocated PTI, perform a local release of the PDU session, and perform the registration procedure for mobility and periodic registration update by sending a REGISTRATION REQUEST message including the PDU session status IE over each access that user plane resources have been established if the PDU session is an MA PDU session, or over the access the PDU session is associated with if the PDU session is a single access PDU session. If there is one or more multicast MBS sessions associated with the released PDU session, the UE shall locally leave the associated multicast MBS sessions.

e) PDU session release signalling restricted due to service area restrictions

The UE may delay the release of the PDU session until the UE is not restricted by service area restrictions, or it may release the allocated PTI, perform a local release of the PDU session, and include the PDU session status IE over each access that user plane resources have been established if the PDU session is an MA PDU session, or over the access the PDU session is associated with if the PDU session is a single access PDU when performing the next registration procedure. If the UE performs the local release of the PDU session and there is one or more multicast MBS sessions associated with the released PDU session, the UE shall locally leave the associated multicast MBS sessions.

f) Collision of UE-requested PDU session release procedure and N1 NAS signalling connection release

The UE may immediately retransmit the PDU SESSION RELEASE REQUEST message and stop, reset and restart timer T3582, if the following conditions apply:

- 1) The original UE-requested PDU session release procedure was initiated over an existing N1 NAS signalling connection; and
- 2) the previous transmission of the PDU SESSION RELEASE REQUEST message was not initiated due to timer T3582 expiry.

g) Receipt of an indication that the 5GSM message was not forwarded due to the PLMN is not allowed to operate at the present UE location

Upon receiving an indication that the 5GSM message was not forwarded because the UE accessing via a satellite NG-RAN cell is informed that the PLMN is not allowed to operate at the present UE location along with a PDU SESSION RELEASE REQUEST message with the PDU session ID IE set to the same value as the PDU session ID that was sent by the UE, the UE shall stop timer T3582, abort the procedure and locally release the PDU session.

h) Upon receiving an indication that the 5GSM message was not forwarded due to unexpected cause along with a PDU SESSION RELEASE REQUEST message with the PDU session ID IE set to the same value as the PDU session ID that was sent by the UE, the UE shall stop timer T3582, abort the procedure and locally release the PDU session.

6.4.3.6 Abnormal cases on the network side

The following abnormal cases can be identified:

- a) PDU session inactive for the received PDU session identity.

If the PDU session ID in the PDU SESSION RELEASE REQUEST message belongs to any PDU session in state PDU SESSION INACTIVE in the SMF, the SMF shall send the PDU SESSION RELEASE REJECT message to the UE with the 5GSM cause #43 "Invalid PDU session identity".

6.5 5GSM status procedure

6.5.1 General

The purpose of the sending of the 5GSM STATUS message is to report at any time certain error conditions detected upon receipt of 5GSM protocol data. The 5GSM STATUS message can be sent by both the network and the UE (see example in figure 6.5.1.1).

Figure 6.5.1.1: 5GSM status procedure

6.5.2 5GSM status received in the UE

If the 5GSM entity of the UE receives a 5GSM STATUS message the UE shall take different actions depending on the received 5GSM cause value:

#43 Invalid PDU session identity.

The UE shall abort any ongoing 5GSM procedure related to the PDU session identity, locally release the PDU session, stop any related timer and change the PDU session state to PDU SESSION INACTIVE.

#47 PTI mismatch.

The UE shall abort any ongoing 5GSM procedure related to the received PTI value and stop any related timer.

#81 invalid PTI value.

The UE shall abort any ongoing 5GSM procedure related to the received PTI value and stop any related timer.

#97 Message type non-existent or not implemented.

The UE shall abort any ongoing 5GSM procedure related to the PTI or PDU session ID and stop any related timer.

On receipt of a 5GSM STATUS message with any other 5GSM cause value no state transition and no specific action shall be taken as seen from the radio interface, i.e. local actions are possible.

6.5.3 5GSM status received in the SMF

If the SMF receives a 5GSM STATUS message the SMF shall take different actions depending on the received 5GSM cause value:

#43 invalid PDU session identity.

The SMF shall abort any ongoing 5GSM procedure related to the PTI or PDU session ID, stop any related timer and locally release the PDU session indicated in the 5GSM STATUS message.

#47 PTI mismatch.

The SMF shall abort any ongoing 5GSM procedure related to the received PTI value and stop any related timer.

If the PTI indicated in the 5GSM STATUS message is related to a PDU SESSION ESTABLISHMENT ACCEPT message, the SMF shall perform a local release of the PDU session indicated in the PDU SESSION ESTABLISHMENT ACCEPT message.

#81 invalid PTI value.

The SMF shall abort any ongoing 5GSM procedure related to the received PTI value and stop any related timer.

#96 invalid mandatory information.

The SMF shall abort any ongoing 5GSM procedure related to the PTI or PDU session ID and stop any related timer.

#97 message type non-existent or not implemented.

The SMF shall abort any ongoing 5GSM procedure related to the PTI or PDU session ID and stop any related timer.

The local actions to be taken by the SMF on receipt of a 5GSM STATUS message with any other 5GSM cause value are implementation dependent.

6.6 Miscellaneous procedures

6.6.1 Exchange of extended protocol configuration options

The UE and the SMF can exchange protocol configuration options via 5GSM procedures.

The protocol configuration options shall be exchanged via the Extended protocol configuration options IE.

6.6.2 Remote UE report procedure

6.6.2.1 General

The purpose of the 5G ProSe remote UE report procedure is for a UE acting as a 5G ProSe layer-3 UE-to-network relay UE to notify the network that one or more 5G ProSe remote UEs are connected to the 5G ProSe layer-3 UE-to-network relay UE or disconnected from the 5G ProSe layer-3 UE-to-network relay UE as specified in 3GPP TS 23.304 [6E].

The UE does not initiate the remote UE report procedure if the timer T3396 is running.

The UE does not initiate the remote UE report procedure if the timer T3584 is running.

The UE does not initiate the remote UE report procedure if the timer T3585 is running.

6.6.2.2 Remote UE report procedure initiation

In order to initiate the 5G ProSe remote UE report procedure, the UE shall create a REMOTE UE REPORT message.

The UE shall include information of newly connected or disconnected 5G ProSe remote UEs to the network in the REMOTE UE REPORT message by setting the values of the Remote UE context connected IE or the Remote UE context disconnected IE to the 5G ProSe remote UE identities that are being connected or disconnected, respectively.

The UE shall set the Remote UE ID with:

- a) the UP-PRUK ID of the 5G ProSe remote UE, if the security for 5G ProSe communication via 5G ProSe UE-to-network relay is performed over user plane as specified in 3GPP TS 33.503 [56];

- b) the CP-PRUK ID of the 5G ProSe remote UE, if the security for 5G ProSe communication via 5G ProSe UE-to-network relay is performed over control plane as specified in 3GPP TS 33.503 [56]; or
- c) the PEI of the 5G ProSe remote UE, if the RSC is specific for emergency services as specified in 3GPP TS 24.554 [19E], and the 5G ProSe remote UE is identified by a PEI.

If the UE sets the Remote UE ID with the PRUK ID of the 5G ProSe remote UE and the UP-PRUK ID is in 64-bit string format, the UE shall include the HPLMN ID of the 5G ProSe remote UE.

If the UE allocated an IPv4 address to a 5G ProSe remote UE and enabled UDP usage to the 5G ProSe remote UE, the UE shall include in the REMOTE UE REPORT message the UDP port range assigned to the 5G ProSe remote UE in the NAT function of 5G ProSe layer-3 UE-to-network relay. If the UE allocated an IPv4 address to a 5G ProSe remote UE and enabled TCP usage to the 5G ProSe remote UE, the UE shall include in the REMOTE UE REPORT message the TCP port range assigned to the 5G ProSe remote UE in the NAT function of 5G ProSe layer-3 UE-to-network relay.

The UE shall set the PDU session ID IE to the value of the PDU session associated with the 5G ProSe remote UE connected to the 5G ProSe layer-3 UE-to-network relay UE or disconnected from the 5G ProSe layer-3 UE-to-network relay UE.

The UE shall allocate a PTI value currently not used and shall set the PTI IE of the REMOTE UE REPORT message to the allocated PTI value.

The UE shall transport the REMOTE UE REPORT message and the PDU session ID, using the NAS transport procedure as specified in subclause 5.4.5, and the UE shall start timer T3586 (see example in figure 6.6.2.2.1).

Figure 6.6.2.2.1: Remote UE report procedure

6.6.2.3 Remote UE report procedure accepted by the network

Upon receipt of the REMOTE UE REPORT message, the SMF shall send a REMOTE UE REPORT RESPONSE message to the UE. The SMF shall include the PTI from the REMOTE UE REPORT message.

The SMF shall set the EAP message IE to an EAP-success message or an EAP-failure message to be sent to the 5G ProSe layer-3 remote UE if the EAP-success message or the EAP-failure message is received from the DN.

Upon receipt of the REMOTE UE REPORT RESPONSE message, the UE shall stop timer T3586 and enter the state PROCEDURE TRANSACTION INACTIVE.

6.6.2.4 Abnormal cases in the UE

The following abnormal cases can be identified:

- a) Expiry of timer T3586:

On the first expiry of the timer T3586, the UE shall resend the REMOTE UE REPORT message and shall reset and restart timer T3586. This retransmission is repeated two times, i.e. on the third expiry of timer T3586, the UE shall abort the procedure and release any resources for this procedure.

NOTE: After the abortion of the remote UE report procedure, the remote UE report procedure for the remote UE(s) can be restarted and how to restart the procedure is left to UE implementation.

- b) Collision of network-requested PDU session release procedure and remote UE report procedure:

If the UE receives a PDU SESSION RELEASE COMMAND message during the remote UE report procedure, and the PDU session indicated in the PDU SESSION RELEASE COMMAND message is the PDU session ID that the UE had indicated in the REMOTE UE REPORT message, the UE shall abort the remote UE report procedure and proceed with the network-requested PDU session release procedure.

- c) Collision of remote UE report procedure and N1 NAS signalling connection release:

The UE may immediately retransmit the REMOTE UE REPORT message and stop, reset and restart timer T3586, if following conditions apply:

- 1) the original REMOTE UE REPORT was initiated over an existing N1 NAS signalling connection; and
- 2) the previous transmission of the REMOTE UE REPORT message was not initiated due to timer T3586 expiry.

6.6.2.5 Abnormal cases on the network side

The following abnormal cases have been identified:

- a) Collision of network-requested PDU session release procedure and remote UE report procedure:

If the SMF receives a REMOTE UE REPORT message during a network-requested PDU session release procedure, and the PDU session indicated in the PDU SESSION RELEASE COMMAND message is the PDU session ID that is in the REMOTE UE REPORT message, the SMF shall abort the remote UE report procedure and proceed with the network-requested PDU session release procedure.

- b) PDU session inactive for the received PDU session identity:

If the PDU session ID in the REMOTE UE REPORT message belongs to any PDU session in state PDU SESSION INACTIVE in the SMF, the SMF shall send the 5GSM STATUS message to the UE with the 5GSM cause #43 "Invalid PDU session identity".

7 Handling of unknown, unforeseen, and erroneous protocol data

7.1 General

The procedures specified in the present document apply to those messages which pass the checks described in this subclause.

This subclause also specifies procedures for the handling of unknown, unforeseen, and erroneous protocol data by the receiving entity. These procedures are called "error handling procedures", but in addition to providing recovery mechanisms for error situations they define a compatibility mechanism for future extensions of the protocols.

Subclauses 7.1 to 7.8 shall be applied in order of precedence.

Detailed error handling procedures in the network are implementation dependent and may vary from PLMN to PLMN. However, when extensions of this protocol are developed, networks are assumed to have the error handling which is indicated in this subclause as mandatory ("shall") and that is indicated as strongly recommended ("should").

Also, the error handling of the network is only considered as mandatory or strongly recommended when certain thresholds for errors are not reached during a dedicated connection.

For definition of semantical and syntactical errors see 3GPP TS 24.007 [11], subclause 11.4.2.

7.2 Message too short or too long

7.2.1 Message too short

When a message is received that is too short to contain a complete message type information element, that message shall be ignored, cf. 3GPP TS 24.007 [11].

7.2.2 Message too long

The maximum size of a NAS message for NR connected to 5GCN is specified in 3GPP TS 38.323 [29].

The maximum size of a NAS message for E-UTRA connected to 5GCN is specified 3GPP TS 36.323 [25].

The maximum size of a NAS message for non-3GPP access connected to 5GCN is specified in 3GPP TS 24.502 [18]

7.3 Unknown or unforeseen procedure transaction identity or PDU Session identity

7.3.1 Procedure transaction identity

The following network procedures shall apply for handling an unknown, erroneous, or unforeseen PTI received in a 5GSM message:

- a) In case the network receives a PDU SESSION MODIFICATION COMPLETE, a PDU SESSION RELEASE COMPLETE message or a PDU SESSION MODIFICATION COMMAND REJECT message in which the PTI value is an assigned or unassigned value that does not match any PTI in use, the network shall respond with a 5GSM STATUS message including 5GSM cause #47 "PTI mismatch".
- b) In case the network receives a PDU SESSION AUTHENTICATION COMPLETE message or a SERVICE-LEVEL AUTHENTICATION COMPLETE message in which the PTI value is an assigned value, the network shall respond with a 5GSM STATUS message including 5GSM cause #81 "invalid PTI value".
- c) In case the network receives a PDU SESSION ESTABLISHMENT REQUEST message, a PDU SESSION MODIFICATION REQUEST message or a PDU SESSION RELEASE REQUEST message in which the PTI value is an unassigned value, the network shall respond with a 5GSM STATUS message including 5GSM cause #81 "invalid PTI value".
- d) In case the network receives a 5GSM message in which the PTI value is a reserved value, the network shall ignore the message.

The following UE procedures shall apply for handling an unknown, erroneous, or unforeseen PTI received in a 5GSM message:

- a) In case the UE receives a PDU SESSION MODIFICATION COMMAND message or a PDU SESSION MODIFICATION REJECT message in which the PTI value is an assigned value that does not match any PTI in use:
 - 1) if the UE detects that this PDU SESSION MODIFICATION COMMAND message is a network retransmission of an already accepted request (see subclause 6.3.2.3), the UE shall respond with a PDU SESSION MODIFICATION COMPLETE message;
 - 2) if the UE detects that this PDU SESSION MODIFICATION COMMAND message is a network retransmission of an already rejected request (see subclause 6.3.2.4), the UE shall respond with a PDU SESSION MODIFICATION COMAND REJECT message; or
 - 3) otherwise, the UE shall respond with a 5GSM STATUS message including 5GSM cause #47 "PTI mismatch".
- b) In case the UE receives a PDU SESSION RELEASE COMMAND message or a PDU SESSION RELEASE REJECT message in which the PTI value is an assigned value that does not match any PTI in use:

- 1) if the UE detects that this PDU SESSION RELEASE COMMAND message is a network retransmission of an already accepted request (see subclause 6.3.3.3), the UE shall respond with a PDU SESSION RELEASE COMPLETE message; or
 - 2) otherwise, the UE shall respond with a 5GSM STATUS message including 5GSM cause #47 "PTI mismatch".
- c) In case the UE receives a PDU SESSION ESTABLISHMENT ACCEPT message or a PDU SESSION ESTABLISHMENT REJECT message in which the PTI value is an assigned value that does not match any PTI in use:
- 1) the UE shall respond with a 5GSM STATUS message including 5GSM cause #47 "PTI mismatch".
- d) In case the UE receives a PDU SESSION AUTHENTICATION COMMAND message, a PDU SESSION AUTHENTICATION RESULT message or a SERVICE-LEVEL AUTHENTICATION COMMAND message in which the PTI value is an assigned value, the UE shall respond with a 5GSM STATUS message including 5GSM cause #81 "invalid PTI value".
- e) In case the UE receives a PDU SESSION ESTABLISHMENT ACCEPT message, a PDU SESSION ESTABLISHMENT REJECT message, a PDU SESSION MODIFICATION REJECT message or a PDU SESSION RELEASE REJECT message in which the PTI value is an unassigned value, the UE shall ignore the message.
- f) In case the UE receives a 5GSM message in which the PTI value is a reserved value, the UE shall ignore the message.

7.3.2 PDU Session identity

The following network procedures shall apply for handling an unknown, erroneous, or unforeseen PDU session identity received in the header of a 5GSM message (specified as the header of a standard L3 message, see 3GPP TS 24.007 [11]) or in the header of DL NAS TRANSPORT message (see clause 5.4.5) as identified by 5GSM:

- a) If the network receives a PDU SESSION MODIFICATION REQUEST message which includes an unassigned or reserved PDU session identity value, the network shall respond with a PDU SESSION MODIFICATION REJECT message including 5GSM cause #43 "invalid PDU session identity".
- b) If the network receives PDU SESSION RELEASE REQUEST message which includes an unassigned or reserved PDU session identity value, the network shall respond with a PDU SESSION RELEASE REJECT message including 5GSM cause #43 "invalid PDU session identity".
- c) Upon receipt of an UL NAS TRANSPORT message, the network takes the following actions:
 - 1) If the Request type IE is set to "initial request" or "initial emergency request" and the message includes a reserved PDU session identity value, the network shall respond with a DL NAS TRANSPORT message with 5GMM cause #90 "payload was not forwarded";
 - 2) otherwise, if the message includes an unassigned PDU session identity value, a reserved PDU session identity value or an assigned PDU session identity value that does not match an existing PDU session, the network shall respond with a DL NAS TRANSPORT message with 5GMM cause #90 "payload was not forwarded".
- d) If the network receives a 5GSM message other than those listed in items a) through c) above in which the message includes a reserved PDU session identity value or an assigned value that does not match an existing PDU session, the network shall ignore the message.

The following UE procedures shall apply for handling an unknown, erroneous, or unforeseen PDU session identity received in the header of a 5GSM message or in the header of DL NAS TRANSPORT message (see clause 5.4.5) as identified by 5GSM:

- a) If the UE receives a 5GSM message which includes an unassigned or reserved PDU session identity value, the UE shall ignore the message.

- b) If the UE receives a 5GSM message or DL NAS TRANSPORT message which includes a PDU session identity belonging to any PDU session in state PDU SESSION INACTIVE in the UE, the UE shall respond with a 5GSM STATUS message including 5GSM cause #43 "invalid PDU session identity".

7.4 Unknown or unforeseen message type

If UE receives a 5GMM message or 5GSM message with message type not defined for the extended protocol discriminator (EPD) or not implemented by the receiver, it shall return a status message (5GMM STATUS or 5GSM STATUS depending on the EPD) with cause #97 "message type non-existent or not implemented".

If the network receives a 5GMM or 5GSM message with message type not defined for the EPD or not implemented by the receiver in a protocol state where reception of an unsolicited message with the given EPD from the UE is not foreseen in the protocol, the network actions are implementation dependent. Otherwise, if the network receives a message with message type not defined for the EPD or not implemented by the receiver, it shall ignore the message except that it should return a status message (5GMM STATUS or 5GSM STATUS depending on the EPD) with cause #97 "message type non-existent or not implemented".

NOTE: A message type not defined for the EPD in the given direction is regarded by the receiver as a message type not defined for the EPD, see 3GPP TS 24.007 [11].

If the UE receives a message not compatible with the protocol state, the UE shall return a status message (5GMM STATUS or 5GSM STATUS depending on the EPD) with cause #98 "message type not compatible with protocol state".

If the network receives a message not compatible with the protocol state, the network actions are implementation dependent.

7.5 Non-semantical mandatory information element errors

7.5.1 Common procedures

When on receipt of a message,

- a) an "imperative message part" error; or
- b) a "missing mandatory IE" error

is diagnosed or when a message containing:

- a) a syntactically incorrect mandatory IE;
- b) an IE with an IEI unknown in the message, but encoded as "comprehension required" (see 3GPP TS 24.007 [11]); or
- c) an out of sequence IE encoded as "comprehension required" (see 3GPP TS 24.007 [11]) is received,

the UE shall proceed as follows:

If the message is not one of the messages listed in the UE procedures in subclause 7.5.3, item a), b) or c), the UE shall return a status message (5GMM STATUS or 5GSM STATUS depending on the EPD) with cause #96 "invalid mandatory information";

the network shall proceed as follows:

If the message is not one of the messages listed in the network procedures in subclause 7.5.3, item a), b) or c), the network shall either:

- 1) try to treat the message (the exact further actions are implementation dependent); or
- 2) ignore the message except that it should return a status message (5GMM STATUS or 5GSM STATUS depending on the EPD) with cause #96 "invalid mandatory information".

7.5.2 5GS mobility management

No exceptional cases are described for 5GS mobility management messages.

No semantical or syntactical diagnosis other than presence and length shall be performed on the EPS NAS message container information element in the REGISTRATION REQUEST message.

7.5.3 5GS session management

The following UE procedures shall apply for handling an error encountered with a mandatory information element in a 5GSM message:

- a) If the message is a PDU SESSION ESTABLISHMENT ACCEPT, the UE shall initiate PDU session release procedure by sending a PDU SESSION RELEASE REQUEST message with 5GSM cause #96 "invalid mandatory information".
- b) Void.
- c) If the message is a PDU SESSION RELEASE COMMAND, a PDU SESSION RELEASE COMPLETE message with 5GSM cause #96 "invalid mandatory information" shall be returned.

The following network procedures shall apply for handling an error encountered with a mandatory information element in a 5GSM message:

- a) If the message is a PDU SESSION ESTABLISHMENT REQUEST, a PDU SESSION ESTABLISHMENT REJECT message with 5GSM cause #96 "invalid mandatory information" shall be returned.
- b) If the message is a PDU SESSION MODIFICATION REQUEST, a PDU SESSION MODIFICATION REJECT message with 5GSM cause #96 "invalid mandatory information" shall be returned.
- c) If the message is a PDU SESSION RELEASE REQUEST, a PDU SESSION RELEASE REJECT message with 5GSM cause #96 "invalid mandatory information" shall be returned.

7.6 Unknown and unforeseen IEs in the non-imperative message part

7.6.1 IEs unknown in the message

The UE shall ignore all IEs with an IEI unknown in a message which are not encoded as "comprehension required" (see 3GPP TS 24.007 [11]).

The network shall take the same approach.

7.6.2 Out of sequence IEs

The UE shall ignore all out of sequence IEs in a message which are not encoded as "comprehension required" (see 3GPP TS 24.007 [11]).

The network should take the same approach.

7.6.3 Repeated IEs

If an information element with format T, TV, TLV, or TLV-E is repeated in a message in which repetition of the information element is not specified in clause 8 and clause 9 of the present document, the UE shall handle only the contents of the information element appearing first and shall ignore all subsequent repetitions of the information element. When repetition of information elements is specified, the UE shall handle only the contents of specified repeated information elements. If the limit on repetition of information elements is exceeded, the UE shall handle the contents of information elements appearing first up to the limit of repetitions and shall ignore all subsequent repetitions of the information element.

The network should follow the same procedures.

7.6.4 Unknown and unforeseen IEs in a Type 6 IE container information element

7.6.4.1 IEs unknown in the Type 6 IE container information element

The UE shall ignore all IEs with an IEI unknown in a Type 6 IE container information element which are not encoded as "comprehension required" (see 3GPP TS 24.007 [11]).

The network shall take the same approach.

NOTE: The set of IEIs defined for a Type 6 IE container information element is independent of the set of IEIs defined for other parts of the message. Therefore, an IE can be unknown in a Type 6 IE container information element, even if an IE with the same IEI is known in other parts of the message, and vice versa.

7.6.4.2 Out of sequence IEs

The UE shall ignore all out of sequence IEs in a Type 6 IE container information element which are not encoded as "comprehension required" (see 3GPP TS 24.007 [11]).

The network should take the same approach.

7.6.4.3 Repeated IEs

If an information element with format TLV-E is repeated in a Type 6 IE container information element in which repetition of the information element is not specified in clause 8 and clause 9 of the present document, the UE shall handle only the contents of the information element appearing first and shall ignore all subsequent repetitions of the information element. When repetition of information elements in the Type 6 IE container information element is specified, the UE shall handle only the contents of specified repeated information elements. If the limit on repetition of information elements is exceeded, the UE shall handle the contents of information elements appearing first up to the limit of repetitions and shall ignore all subsequent repetitions of the information element.

The network should follow the same procedures.

7.7 Non-imperative message part errors

This category includes:

- a) syntactically incorrect optional IEs; and
- b) conditional IE errors.

7.7.1 Syntactically incorrect optional IEs

The UE shall treat all optional IEs that are syntactically incorrect in a message as not present in the message.

The network shall take the same approach.

7.7.2 Conditional IE errors

When upon receipt of a 5GMM or 5GSM message the UE diagnoses a "missing conditional IE" error or an "unexpected conditional IE" error, or when it receives a 5GMM or 5GSM message containing at least one syntactically incorrect conditional IE, the UE shall ignore the message and shall return a status message (5GMM STATUS or 5GSM STATUS depending on the EPD) with cause #100 "conditional IE error".

When the network receives a message and diagnoses a "missing conditional IE" error or an "unexpected conditional IE" error or when it receives a message containing at least one syntactically incorrect conditional IE, the network shall either:

- a) try to treat the message (the exact further actions are implementation dependent); or
- b) ignore the message except that it should return a status message (5GMM STATUS or 5GSM STATUS depending on the EPD) with cause #100 "conditional IE error".

7.7.3 Errors in a Type 6 IE container information element

7.7.3.1 Syntactically incorrect optional IEs

The UE shall treat all optional IEs that are syntactically incorrect in a Type 6 IE container information element as not present in the Type 6 IE container information element.

The network shall take the same approach.

- EXAMPLE 1: If the Type 6 IE container information element includes 2 type 6 information elements, and the first one is syntactically incorrect, the receiver ignores the first information element and continues with the processing of the second one.
- EXAMPLE 2: If the remaining value part of a Type 6 IE container information element is too short to contain a complete type 6 information element, the receiver ignores these octets and continues with the processing of the octets following the Type 6 IE container information element, if there are any.

7.7.3.2 Conditional IE errors

When upon receipt of a 5GMM or 5GSM message the UE diagnoses a "missing conditional IE" error or an "unexpected conditional IE" error for the contents of a Type 6 IE container information element, or when it receives a 5GMM or 5GSM message with a Type 6 IE container information element containing at least one syntactically incorrect conditional IE, the UE shall ignore the message and shall return a status message (5GMM STATUS or 5GSM STATUS depending on the EPD) with cause #100 "conditional IE error".

When the network receives a message and diagnoses a "missing conditional IE" error or an "unexpected conditional IE" error for the contents of a Type 6 IE container information element or when it receives a message with a Type 6 IE container information element containing at least one syntactically incorrect conditional IE, the network shall either:

- a) try to treat the message (the exact further actions are implementation dependent); or
- b) ignore the message except that it should return a status message (5GMM STATUS or 5GSM STATUS depending on the EPD) with cause #100 "conditional IE error".

7.8 Messages with semantically incorrect contents

When a message with semantically incorrect contents is received, the UE shall perform the foreseen reactions of the procedural part of the present document (i.e. of clauses 5, 6). If, however no such reactions are specified, the UE shall ignore the message except that it shall return a status message (5GMM STATUS or 5GSM STATUS depending on the EPD) with cause #95 "semantically incorrect message".

The network should follow the same procedure except that a status message is not normally transmitted.

8 Message functional definitions and contents

8.1 Overview

This clause defines the structure of the messages of the Layer 3 (L3) protocols defined in the present document. These are standard L3 messages as defined in 3GPP TS 24.007 [12].

Each definition given in the present clause includes:

- a) a brief description of the message direction and use, including whether the message has:
 - 1. Local significance, i.e. relevant only on the originating or terminating access;
 - 2. Access significance, i.e. relevant in the originating and terminating access, but not in the network;
 - 3. Dual significance, i.e. relevant in either the originating or terminating access and in the network; or
 - 4. Global significance, i.e. relevant in the originating and terminating access and in the network.
- b) a table listing the Information Elements (IE) known in the message and the order of their appearance in the message. All IEs that may be repeated are explicitly indicated (The V, LV and LV-E formatted IEs, which compose the imperative part of the message, occur before the T, TV, TLV and TLV-E formatted IEs which compose the non-imperative part of the message, see 3GPP TS 24.007 [12]). In a (maximal) sequence of consecutive IEs with half octet length, the first IE with half octet length occupies bits 1 to 4 of octet N, the second IE bits 5 to 8 of octet N, the third IE bits 1 to 4 of octet N+1 etc. Such a sequence always has an even number of elements.

For each information element the table indicates:

- 1. The Information Element Identifier (IEI), in hexadecimal notation, if the IE has format T, TV, TLV or TLV-E. If the IEI has half octet length, it is specified by a notation representing the IEI as a hexadecimal digit followed by a "-" (example: B-).

NOTE 1: The same IEI can be used for different information element types in different messages of the same protocol.

NOTE 2: If a message includes a Type 6 IE container information element, then the same IEI can be used for different information element types in the Type 6 IE container information element and in other parts of the same message.

- 2. The name of the information element (which may give an idea of the semantics of the element). The name of the information element followed by "IE" or "information element" is used in this technical report as reference to the information element within a message.
 - 3. The name of the type of the information element (which indicates the coding of the value part of the IE), and generally, the referenced subclause of clause 9 of the present document describing the value part of the information element.
 - 4. The presence requirement indication (M, C, or O) for the IE as defined in 3GPP TS 24.007 [12].
 - 5. The format of the information element (T, V, TV, LV, TLV, LV-E or TLV-E) as defined in 3GPP TS 24.007 [12].
 - 6. The length of the information element (or permissible range of lengths), in octets, in the message, where "?" means that the maximum length of the IE is only constrained by link layer protocol. This indication is non-normative.
- c) subclauses specifying, where appropriate, conditions for IEs with presence requirement C or O in the relevant message which together with other conditions specified in the present document define when the information elements shall be included or not, what non-presence of such IEs means, and – for IEs with presence requirement C – the static conditions for presence or non-presence of the IEs or for both cases (see 3GPP TS 24.007 [12]). If new IEs are added to a message, the respective subclauses are included in the same order or sequence as the IEs appear in the message. I.e., they are appended after the existing subclauses at the end of the message description or at the end of the type 6 IE container information element description, if the new IE is added to such a container information element.

8.2 5GS mobility management messages

8.2.1 Authentication request

8.2.1.1 Message definition

The AUTHENTICATION REQUEST message is sent by the AMF to the UE to initiate authentication of the UE identity. See table 8.2.1.1.1.

Message type: AUTHENTICATION REQUEST

Significance: dual

Direction: network to UE

Table 8.2.1.1.1: AUTHENTICATION REQUEST message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Authentication request message identity	Message type 9.7	M	V	1
	ngKSI	NAS key set identifier 9.11.3.32	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	ABBA	ABBA 9.11.3.10	M	LV	3-n
21	Authentication parameter RAND (5G authentication challenge)	Authentication parameter RAND 9.11.3.16	O	TV	17
20	Authentication parameter AUTN (5G authentication challenge)	Authentication parameter AUTN 9.11.3.15	O	TLV	18
78	EAP message	EAP message 9.11.2.2	O	TLV-E	7-1503

8.2.1.2 Authentication parameter RAND

Authentication parameter RAND IE is included if the AUTHENTICATION REQUEST message is used in a 5G AKA authentication procedure.

8.2.1.3 Authentication parameter AUTN

Authentication parameter AUTN IE is included if the AUTHENTICATION REQUEST message is used in a 5G AKA authentication procedure.

8.2.1.4 Void

8.2.1.5 EAP message

EAP message IE is included if the AUTHENTICATION REQUEST message is used in an EAP based primary authentication and key agreement procedure.

8.2.2 Authentication response

8.2.2.1 Message definition

The AUTHENTICATION RESPONSE message is sent by the UE to the AMF to deliver a calculated authentication response to the network. See table 8.2.2.1.1.

Message type: AUTHENTICATION RESPONSE

Significance: dual

Direction: UE to network

Table 8.2.2.1.1: AUTHENTICATION RESPONSE message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Authentication response message identity	Message type 9.7	M	V	1
2D	Authentication response parameter	Authentication response parameter 9.11.3.17	O	TLV	18
78	EAP message	EAP message 9.11.2.2	O	TLV-E	7-1503

8.2.2.2 Authentication response parameter

This IE is included if the message is sent in a 5G AKA based primary authentication and key agreement procedure.

8.2.2.3 EAP message

EAP message IE is included if the EAP message received in a related AUTHENTICATION REQUEST message was an EAP-request.

8.2.3 Authentication result

8.2.3.1 Message definition

The AUTHENTICATION RESULT message is sent by the AMF to the UE to provide result of EAP authentication of the UE identity. See table 8.2.3.1.1.

Message type: AUTHENTICATION RESULT

Significance: dual

Direction: network to UE

Table 8.2.3.1.1: AUTHENTICATION RESULT message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Authentication result message identity	Message type 9.7	M	V	1
	ngKSI	NAS key set identifier 9.11.3.32	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	EAP message	EAP message 9.11.2.2	M	LV-E	6-1502
38	ABBA	ABBA 9.11.3.10	O	TLV	4-n
55	AUN3 device security key	AUN3 device security key 9.11.3.107	O	TLV	36-n

NOTE: It is possible for AMFs compliant with version 18.3.0 or 18.3.1 of this specification to send the AUN3 device security key IE with a fixed length of 66 octets.

8.2.3.2 ABBA

This IE shall be included if the message contains an EAP message IE with an EAP-success message.

8.2.3.3 AUN3 device security key

This IE shall be included when the AUTHENTICATION RESULT message is provided to a 5G-RG that is acting on behalf of an AUN3 device if the EAP message IE is set to an EAP-success message.

8.2.4 Authentication failure

8.2.4.1 Message definition

The AUTHENTICATION FAILURE message is sent by the UE to the AMF to indicate that authentication of the network has failed. See table 8.2.4.1.1.

Message type: AUTHENTICATION FAILURE

Significance: dual

Direction: UE to network

Table 8.2.4.1.1: AUTHENTICATION FAILURE message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Authentication failure message identity	Message type 9.7	M	V	1
	5GMM cause	5GMM cause 9.11.3.2	M	V	1
30	Authentication failure parameter	Authentication failure parameter 9.11.3.14	O	TLV	16

8.2.4.2 Authentication failure parameter

This IE shall be included in a 5G AKA based primary authentication and key agreement procedure if and only if the 5GMM cause was #21 "synch failure". It shall include the response to the authentication challenge from the USIM, which is made up of the AUTS parameter (see 3GPP TS 33.501 [24]).

8.2.5 Authentication reject

8.2.5.1 Message definition

The AUTHENTICATION REJECT message is sent by the AMF to the UE to indicate that the authentication procedure has failed and that the UE shall abort all activities. See table 8.2.5.1.1.

Message type: AUTHENTICATION REJECT

Significance: dual

Direction: network to UE

Table 8.2.5.1.1: AUTHENTICATION REJECT message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Authentication reject message identity	Message type 9.7	M	V	1
78	EAP message	EAP message 9.11.2.2	O	TLV-E	7-1503

8.2.5.2 EAP message

EAP message IE is included if the AUTHENTICATION REJECT message is used to convey EAP-failure message.

8.2.6 Registration request

8.2.6.1 Message definition

The REGISTRATION REQUEST message is sent by the UE to the AMF. See table 8.2.6.1.1.

Message type: REGISTRATION REQUEST

Significance: dual

Direction: UE to network

Table 8.2.6.1.1: REGISTRATION REQUEST message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended Protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Registration request message identity	Message type 9.7	M	V	1
	5GS registration type	5GS registration type 9.11.3.7	M	V	1/2
	ngKSI	NAS key set identifier 9.11.3.32	M	V	1/2
	5GS mobile identity	5GS mobile identity 9.11.3.4	M	LV-E	6-n
C-	Non-current native NAS key set identifier	NAS key set identifier 9.11.3.32	O	TV	1
10	5GMM capability	5GMM capability 9.11.3.1	O	TLV	3-15
2E	UE security capability	UE security capability 9.11.3.54	O	TLV	4-10
2F	Requested NSSAI	NSSAI 9.11.3.37	O	TLV	4-74
52	Last visited registered TAI	5GS tracking area identity 9.11.3.8	O	TV	7
17	S1 UE network capability	S1 UE network capability 9.11.3.48	O	TLV	4-15
40	Uplink data status	Uplink data status 9.11.3.57	O	TLV	4-34
50	PDU session status	PDU session status 9.11.3.44	O	TLV	4-34
B-	MICO indication	MICO indication 9.11.3.31	O	TV	1
2B	UE status	UE status 9.11.3.56	O	TLV	3
77	Additional GUTI	5GS mobile identity 9.11.3.4	O	TLV-E	14
25	Allowed PDU session status	Allowed PDU session status 9.11.3.13	O	TLV	4-34
18	UE's usage setting	UE's usage setting 9.11.3.55	O	TLV	3
51	Requested DRX parameters	5GS DRX parameters 9.11.3.2A	O	TLV	3
70	EPS NAS message container	EPS NAS message container 9.11.3.24	O	TLV-E	4-n
74	LADN indication	LADN indication 9.11.3.29	O	TLV-E	3-811
8-	Payload container type	Payload container type 9.11.3.40	O	TV	1
7B	Payload container	Payload container 9.11.3.39	O	TLV-E	4-65538
9-	Network slicing indication	Network slicing indication 9.11.3.36	O	TV	1
53	5GS update type	5GS update type 9.11.3.9A	O	TLV	3
41	Mobile station classmark 2	Mobile station classmark 2 9.11.3.31C	O	TLV	5
42	Supported codecs	Supported codec list 9.11.3.51A	O	TLV	5-n

8.2.6.2 Non-current native NAS key set identifier

The UE shall include this IE if the UE has a valid non-current native 5G NAS security context when the UE performs an inter-system change from S1 mode to N1 mode in 5GMM-CONNECTED mode and the UE uses a mapped 5G NAS security context to protect the REGISTRATION REQUEST message.

8.2.6.3 5GMM capability

The UE shall include this IE, unless the UE performs a periodic registration updating procedure.

8.2.6.4 UE security capability

The UE shall include this IE, unless the UE performs a periodic registration updating procedure.

8.2.6.5 Requested NSSAI

This IE is included if the UE needs to indicate the requested NSSAI to the network.

8.2.6.6 Last visited registered TAI

This IE shall be included if the UE holds a valid last visited registered TAI.

8.2.6.7 S1 UE network capability

A UE supporting S1 mode shall include this IE, unless the UE performs a periodic registration updating procedure.

8.2.6.8 Uplink data status

This IE shall be included if the UE has uplink user data pending to be sent or the UE has active multicast MBS session(s), unless the UE performs a periodic registration updating procedure.

8.2.6.9 PDU session status

This IE shall be included when the UE needs to indicate the PDU sessions that are associated with the access type that the message is sent over, that are active within the UE.

8.2.6.10 MICO indication

The UE may include this IE to request the use of MICO mode.

8.2.6.11 UE status

This IE shall be included if the UE in single-registration mode performs the registration procedure due to inter-system change from S1 mode to N1 mode or if the UE in dual-registration mode and EMM state EMM-REGISTERED performs initial registration.

8.2.6.12 Additional GUTI

This IE shall be included:

- a) if the UE performs the registration procedure due to inter-system change from S1 mode to N1 mode, the UE operates in single-registration mode and the UE has a valid 5G-GUTI; or
- b) the UE holds two valid native 5G-GUTIs and one of the valid native 5G-GUTI was assigned by the PLMN with which the UE is performing the registration.

8.2.6.13 Allowed PDU session status

This IE shall be included if the REGISTRATION REQUEST message is sent as a response to paging with the access type indicating non-3GPP access.

8.2.6.14 UE's usage setting

This IE shall be included if the UE supports IMS voice.

8.2.6.15 Requested DRX parameters

If the UE wants to use or change the UE specific DRX parameters, the UE shall include the Requested DRX parameters IE in the REGISTRATION REQUEST message.

8.2.6.16 EPS NAS message container

The UE operating in the single-registration mode shall include this information element as specified in subclause 5.5.1.3.2 if the UE performs mobility from S1 mode to N1 mode in 5GMM-IDLE mode. The content of this message container is the complete integrity protected TRACKING AREA UPDATE REQUEST message, using EPS security context.

The UE performing initial registration shall include this information element if

- a) the UE:
 - 1) was previously registered in S1 mode before entering state EMM-DEREGISTERED; and

- 2) has received an "interworking without N26 interface not supported" indication from the network; and
- b) EPS security context and a valid 4G-GUTI are available.

The content of this message container is the complete integrity protected ATTACH REQUEST message, using EPS security context.

8.2.6.17 LADN indication

The UE shall include this information element when the UE needs to request LADN information for specific LADN DNN(s) or to indicate a request for LADN information.

8.2.6.17A Payload container type

This IE shall be included if the UE includes the Payload container IE.

NOTE: In this version of the protocol, the Payload container type IE in the REGISTRATION REQUEST message is set to "UE policy container" as described in subclauses 5.5.1.2.2 and 5.5.1.3.2.

8.2.6.18 Payload container

Within a PLMN, this IE shall be included if:

- a) the UE has one or more stored UE policy sections identified by a UPSI with the PLMN ID part indicating the HPLMN or the selected PLMN for the registration procedure for mobility and periodic registration update due to inter-system change from S1 mode to N1 mode of a UE operating in the single-registration mode or for the registration procedure for initial registration; or
- b) the UE does not have any stored UE policy section identified by a UPSI with the PLMN ID part indicating the HPLMN or the selected PLMN for the registration procedure for mobility and periodic registration update due to inter-system change from S1 mode to N1 mode of a UE operating in the single-registration mode or for the registration procedure for initial registration and the UE needs to send a UE policy container to the network.

Within an SNPN, this IE shall be included if:

- a) the UE has one or more stored UE policy sections for the selected SNPN for the registration procedure for initial registration; or
- b) the UE does not have any UE policy section for the selected SNPN for the registration procedure for initial registration and the UE needs to send a UE policy container to the network.

8.2.6.19 Network slicing indication

This IE shall be included when a requested NSSAI is included in the REGISTRATION REQUEST message and the requested NSSAI is created from the default configured NSSAI.

8.2.6.20 5GS update type

This IE shall be included when the UE is performing the registration procedure to indicate any of the following:

- a) the UE requests the use of SMS over NAS or there is a change in the UE's requirements to use SMS over NAS;
- b) a change in the UE's radio capability for NG-RAN; or
- c) the UE requests CIoT 5GS optimizations.

8.2.6.21 NAS message container

This IE shall be included if the UE is sending a REGISTRATION REQUEST message as an initial NAS message, the UE has a valid 5G NAS security context and the UE needs to send non-plaintext IEs.

8.2.6.22 Requested extended DRX parameters

The UE shall include this IE if the UE needs to use extended DRX or change the extended DRX parameters.

8.2.6.23 EPS bearer context status

The UE shall include this IE if the UE operating in the single-registration mode performs inter-system change from S1 mode to N1 mode and the UE has locally deactivated EPS bearer context(s) for which interworking to 5GS is supported while the UE was in S1 mode without notifying the network.

8.2.6.24 T3324 value

The UE may include this IE during the registration update procedure if it requests to use MICO mode and use the active time timer.

8.2.6.25 Mobile station classmark 2

This IE shall be included if the UE supports 5G-SRVCC from NG-RAN to UTRAN (see 3GPP TS 23.216 [6A]).

8.2.6.26 Supported codecs

This IE shall be included if the UE supports 5G-SRVCC from NG-RAN to UTRAN.

8.2.6.27 UE radio capability ID

This IE shall be included if the UE is not in NB-N1 mode, the UE supports RACS and the UE needs to signal a UE radio capability ID to the network.

8.2.6.28 Requested mapped NSSAI

This IE shall be included by the UE when the UE has a PDN connection or a PDU session to transfer to visited PLMN associated only with an HPLMN S-NSSAI as specified in subclause 5.5.1.3.2.

8.2.6.29 Additional information requested

The UE shall include this IE if the UE supports ciphered broadcast assistance data and the UE needs to obtain new ciphering keys for ciphered broadcast assistance data.

8.2.6.30 Requested WUS assistance information

The UE may include this IE if:

- the UE supports WUS assistance information;
- the UE is not performing initial registration for emergency services; and
- the UE does not have an active emergency PDU session.

8.2.6.31 Void

8.2.6.32 N5GC indication

This IE shall be included in the REGISTRATION REQUEST message when the W-AGF acting on behalf of an N5GC device performs registration procedure for initial registration.

8.2.6.33 Requested NB-N1 mode DRX parameters

The UE shall include this IE if the UE wants to use or change the UE specific DRX parameters for NB-N1 mode.

8.2.6.34 UE request type

The UE shall include this IE if the MUSIM UE requests the release of the NAS signalling connection.

8.2.6.35 Paging restriction

The UE shall include this IE if the Request type is set to "NAS signalling connection release" in the UE request type IE and the UE requests the network to restrict paging.

8.2.6.35 Service-level-AA container

The UE shall include this IE if the UE supporting UAS services requests a registration for UAS services.

8.2.6.36 NID

The UE shall include this IE if the 5G-GUTI in the 5GS mobile identity IE was assigned by an SNPN other than the SNPN with which the UE is registering.

8.2.6.37 UE determined PLMN with disaster condition

The UE shall include this IE when the UE needs to indicate the UE determined PLMN with disaster condition determined as specified in 3GPP TS 23.122 [5].

8.2.6.38 Requested PEIPS assistance information

The UE may include this IE if the UE supports PEIPS assistance information, the UE is not performing initial registration for emergency services, is not registered for emergency services and does not have an active emergency PDU session, and the UE does not perform a periodic registration updating procedure.

8.2.6.38A Void

8.2.6.39 Requested T3512 value

The UE may include this IE during the registration procedure if it requests to use MICO mode and T3324 IE is included, to request a particular T3512 timer value.

8.2.6.40 Unavailability information

This IE shall be included if an event is triggered in the UE that would make the UE unavailable for a certain period.

8.2.6.41 Non-3GPP path switching information

The UE may include this IE during the registration procedure for mobility registration update if it requests from the network to keep using the user plane resources of the old non-3GPP access during path switching to the new non-3GPP access.

8.2.6.42 AUN3 indication

This IE shall be included in the REGISTRATION REQUEST message when the 5G-RG is acting on behalf of an AUN3 device performs registration procedure for initial registration.

8.2.6.43 Requested LP-WUSPS assistance information

The UE may include this IE if the UE supports the LP-WUSPS assistance information, unless the UE performs a periodic registration updating procedure.

8.2.7 Registration accept

8.2.7.1 Message definition

The REGISTRATION ACCEPT message is sent by the AMF to the UE. See table 8.2.7.1.1.

Message type: REGISTRATION ACCEPT

Significance: dual

Direction: network to UE

Table 8.2.7.1.1: REGISTRATION ACCEPT message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2

8.2.7.2 5G-GUTI

This IE may be included to assign a 5G-GUTI to a UE.

8.2.7.3 Equivalent PLMNs

This IE may be included in order to assign an equivalent PLMNs list to a UE.

8.2.7.4 TAI list

This IE may be included to assign a TAI list to a UE.

8.2.7.5 Allowed NSSAI

This IE shall be included:

- a) if:
 - 1) one or more S-NSSAIs in the requested NSSAI of the REGISTRATION REQUEST message are allowed by the AMF for a network not supporting NSSAA;
 - 2) one or more S-NSSAIs in the requested NSSAI of the REGISTRATION REQUEST message are not subject to network slice-specific authentication and authorization and are allowed by the AMF; or
 - 3) the network slice-specific authentication and authorization has been successfully performed for one or more S-NSSAIs in the requested NSSAI of the REGISTRATION REQUEST message; or
- b) if the initial registration request is not for onboarding services in SNPN or the UE is not registered for onboarding services in SNPN, the requested NSSAI was not included in the REGISTRATION REQUEST message or none of the requested NSSAI are allowed; and
 - 1) the network does not support NSSAA; or
 - 2) the network has one or more default S-NSSAIs which are not subject to network slice-specific authentication and authorization.

8.2.7.6 Rejected NSSAI

The network may include this IE to inform the UE of one or more S-NSSAIs that were included in the requested NSSAI in the REGISTRATION REQUEST message but were rejected by the network.

8.2.7.7 Configured NSSAI

The network may include this IE if the network needs to provide the UE with a new configured NSSAI for the current PLMN or SNPN and the UE is neither registering nor registered for onboarding services in SNPN.

8.2.7.8 5GS network feature support

The network may include this IE to inform the UE of the support of certain features. If this IE is not included then the UE shall interpret this as a receipt of an information element with all bits of the value part coded as zero.

8.2.7.9 PDU session status

This IE shall be included when the network needs to indicate the PDU sessions that are associated with the access type the message is sent over, that are active in the network.

8.2.7.10 PDU session reactivation result

This IE shall be included:

- if the Uplink data status IE is included in the REGISTRATION REQUEST message; or
- if the Allowed PDU session status IE is included in the REGISTRATION REQUEST message and there is at least one PDU session indicated in the Allowed PDU session status IE for which the user-plane resources can be re-established over 3GPP access.

8.2.7.11 PDU session reactivation result error cause

This IE may be included, if the PDU session reactivation result IE is included and there exist one or more PDU sessions for which the user-plane resources cannot be re-established, to indicate the cause of failure to re-establish the user-plane resources.

8.2.7.12 LADN information

The network shall include this IE if there are valid LADN service area(s) for the subscribed DNN(s) of the UE in the current registration area.

8.2.7.13 MICO indication

The network shall include the MICO indication IE if:

- a)- the UE included the MICO indication IE in the REGISTRATION REQUEST message; and
- b) the network supports and accepts the use of MICO mode.

8.2.7.14 Network slicing indication

This IE shall be included if the user's network slicing subscription has changed in the UDM of a PLMN or an SNPN.

8.2.7.15 Service area list

This IE may be included to assign new service area restrictions to the UE.

8.2.7.16 T3512 value

The AMF shall include this IE during a registration procedure over 3GPP access when the 5GS registration type IE does not indicate "periodic registration updating". The AMF may include this IE during the mobility and periodic registration update procedure over 3GPP access when the 5GS registration type IE indicates "periodic registration updating".

8.2.7.17 Non-3GPP de-registration timer value

This IE may be included if the network needs to indicate to the UE registered over non-3GPP access the value of a non-3GPP de-registration timer value.

8.2.7.18 T3502 value

This IE may be included to indicate a value for timer T3502.

8.2.7.19 Emergency number list

This IE may be sent by the network. If this IE is sent, the contents of this IE indicates a list of emergency numbers valid within the same country as in the PLMN from which this IE is received.

8.2.7.20 Extended emergency number list

This IE may be sent by the network. If this IE is sent, the contents of this IE indicates a list of emergency numbers (with URN information) valid within the same country as in the PLMN from which this IE is received or valid only in the PLMN or SNPN from which this IE is received.

8.2.7.21 SOR transparent container

This IE may be sent by the network.

8.2.7.22 EAP message

EAP message IE is included if the REGISTRATION ACCEPT message is sent as part of registration for emergency services and is used to convey EAP-failure message.

8.2.7.23 NSSAI inclusion mode

This IE shall be included if required by operator policy.

8.2.7.24 Operator-defined access category definitions

This IE may be included to assign new operator-defined access category definitions to the UE or delete the operator-defined access category definitions at the UE side.

8.2.7.25 Negotiated DRX parameters

The network shall include this IE if the Requested DRX parameters IE was included in the REGISTRATION REQUEST message.

8.2.7.26 Non-3GPP NW policies

The AMF shall not include this IE during a registration procedure over non-3GPP access.

This IE is included if the network needs to indicate whether emergency numbers provided via non-3GPP access can be used to initiate UE detected emergency calls (see 3GPP TS 24.302 [16]). If this IE is not included then the UE shall interpret this as a receipt of an information element with all bits of the value part coded as zero.

NOTE: In this version of the specification, this IE is applicable in case the UE is connected to a PLMN using an ePDG as specified in 3GPP TS 24.302 [16].

8.2.7.26A EPS bearer context status

This IE shall be included when the network generated an EPS bearer context status information for the UE during the inter-system change from S1 mode to N1 mode and the network supports N26 interface.

8.2.7.27 Negotiated extended DRX parameters

The network shall include the Negotiated extended DRX parameters IE if:

- the UE included the Requested extended DRX parameters IE in the REGISTRATION REQUEST message; and

- the network supports eDRX and accepts the use of eDRX.

8.2.7.28 T3447 value

The network may include T3447 value IE if:

- the UE has indicated support for service gap control in the REGISTRATION REQUEST message; and
- the 5GMM context contains a service gap time value.

8.2.7.29 T3448 value

The network may include this IE if the congestion control for transport of user data via the control plane is active and the UE supports the control plane CIoT 5GS optimizations.

8.2.7.30 T3324 value

The AMF shall include this IE if the UE has requested active time value in the REGISTRATION REQUEST message and the AMF decides to accept the use of MICO mode and the use of the active time.

8.2.7.31 void

8.2.7.32 UE radio capability ID

This IE may be included if the UE is not in NB-N1 mode, both the UE and the network support RACS and the network needs to assign a network-assigned UE radio capability ID to the UE.

8.2.7.33 UE radio capability ID deletion indication

This IE may be included if the UE is not in NB-N1 mode, both the UE and the network support RACS and the network needs to trigger the UE to delete all network-assigned UE radio capability IDs stored at the UE for the serving PLMN or SNPN.

8.2.7.34 Pending NSSAI

The network may include this IE to inform the UE of one or more S-NSSAIs that are pending as the network slice-specific authentication and authorization procedure is not completed.

8.2.7.35 Ciphering key data

This IE is included if the network needs to send ciphering key data to the UE for ciphered broadcast assistance data.

8.2.7.36 CAG information list

This IE may be included to assign a new "CAG information list" to the UE or delete the "CAG information list" at the UE side.

8.2.7.37 Truncated 5G-S-TMSI configuration

The network shall include this IE if:

- the UE is in NB-N1 mode;
- the UE requests "control plane CIoT 5GS optimization" in the 5GS update type IE of REGISTRATION REQUEST message;
- the AMF decides to accept the requested CIoT 5GS optimization; and
- the network is configured to provide the truncated 5G-S-TMSI configuration for control plane CIoT 5GS optimizations.

8.2.7.38 Negotiated NB-N1 mode DRX parameters

The network shall include the Negotiated NB-N1 mode DRX parameters IE if the requested NB-N1 mode DRX parameters IE was included in the REGISTRATION REQUEST message.

8.2.7.39 Negotiated WUS assistance information

The network shall include the Negotiated WUS assistance information IE if:

- the UE supports WUS assistance information;
- the AMF supports and accepts the use of WUS assistance information;
- the UE is not performing the initial registration for emergency services; and
- the UE does not have an active emergency PDU session.

8.2.7.40 Extended rejected NSSAI

If the UE supports Extended rejected NSSAI, the network may include this IE to inform the UE of one or more S-NSSAIs that were included in the requested NSSAI in the REGISTRATION REQUEST message but were rejected by the network.

8.2.7.41 Service-level-AA container

The network shall include this IE if the UUAA procedure is triggered for the UE supporting UAS services. The network may include this IE if there is a valid successful UUAA result for the UE in the UE 5GMM context upon a registration for UAS services is requested from the UE.

8.2.7.42 Negotiated PEIPS assistance information

The network shall include the Negotiated PEIPS assistance information IE if the network needs to provide the PEIPS assistance information to the UE.

8.2.7.42A Void

8.2.7.43 5GS additional request result

The network may include this IE to inform the UE about the result of additional request.

8.2.7.44 NSSRG information

This IE may be included to provide NSSRG information associated with the configured NSSAI.

8.2.7.45 Disaster roaming wait range

This IE may be included to assign a new disaster roaming wait range to the UE.

8.2.7.46 Disaster return wait range

This IE may be included to assign a new disaster return wait range to the UE.

8.2.7.47 List of PLMNs to be used in disaster condition

This IE may be included by an allowed PLMN to assign a new "list of PLMN(s) to be used in disaster condition" associated with the serving PLMN to the UE.

8.2.7.48 Forbidden TAI(s) for the list of "5GS forbidden tracking areas for roaming"

This IE is included to indicate the forbidden TAI(s) to be stored in the list of "5GS forbidden tracking areas for roaming". This IE is included only if the message is sent via satellite NG-RAN access.

8.2.7.49 Forbidden TAI(s) for the list of "5GS forbidden tracking areas for regional provision of service"

This IE is included to indicate the forbidden TAI(s) to be stored in the list of "5GS forbidden tracking areas for regional provision of service". This IE is included only if the message is sent via satellite NG-RAN access.

8.2.7.50 Extended CAG information list

If the UE supports Extended CAG information list, the network may include this IE to assign a new "CAG information list" to the UE or delete the "CAG information list" at the UE side.

8.2.7.51 NSAG information

If the UE has set the NSAG bit to "NSAG supported" in the 5GMM capability IE of the REGISTRATION REQUEST message over 3GPP access, the network may include this IE to provide NSAG information to the UE. Otherwise, the network shall not include this IE (see the 'comprehension required' scheme in subclause 11.2.5 of 3GPP TS 24.007 [11]).

8.2.7.52 Equivalent SNPNs

This IE may be included in order to assign an equivalent SNPNs list to a UE, by an AMF of an SNPN.

8.2.7.53 NID

This IE shall be included if the UE supports equivalent SNPNs and the serving SNPN changes.

8.2.7.54 Registration accept type 6 IE container

8.2.7.54.1 General

This information element may be included only if the network knows that the UE will not treat this IE as unknown 'comprehension required' IE. Otherwise, the network shall not include this IE (see the 'comprehension required' scheme in subclause 11.2.5 of 3GPP TS 24.007 [11]).

In this version of the specification, only the transfer of the information elements specified in table 8.2.7.54.1.1 is supported in the Registration accept type 6 IE container information element in the present message. For the handling of an information element with an IEI not listed in table 8.2.7.54.1.1, i.e., with an IEI unknown in the Registration accept type 6 IE container information element, see subclause 7.6.4.1.

Table 8.2.7.54.1.1: Information elements and IEIs for the Registration accept type 6 IE container

IEI	Information Element	Type/Reference	Presence	Format	Length
01	Extended LADN information	Extended LADN information 9.11.3.96	O	TLV-E	15-1787
02	S-NSSAI location validity information	S-NSSAI location validity information 9.11.3.100	O	TLV-E	17-38611
03	Partially allowed NSSAI	Partial NSSAI 9.11.3.103	O	TLV-E	3-808
04	Partially rejected NSSAI	Partial NSSAI 9.11.3.103	O	TLV-E	3-808

8.2.7.54.2 Extended LADN information

The network shall include this IE if the UE supports LADN per DNN and S-NSSAI and there are valid LADN service area(s) for the subscribed DNN(s) of the UE and S-NSSAI associated with the LADN in the current registration area.

8.2.7.54.3 S-NSSAI location validity information

The network may include this IE to update the S-NSSAI location validity information.

8.2.7.54.4 Void

8.2.7.54.5 Partially allowed NSSAI

The network may include this IE to assign a partially allowed NSSAI to the UE.

8.2.7.54.6 Partially rejected NSSAI

The network may include this IE to assign a partially rejected NSSAI to the UE.

8.2.7.55 RAN timing synchronization

This IE may be included to provide information related to the RAN timing synchronization to a UE which has set the Reconnection to the network due to RAN timing synchronization status change (RANtiming) bit to "Reconnection to the network due to RAN timing synchronization status change supported" in the 5GMM capability IE of the REGISTRATION REQUEST message.

8.2.7.56 Alternative NSSAI

The network may include this IE to provide the alternative NSSAI to the UE.

8.2.7.57 Discontinuous coverage maximum time offset

This IE may be included to provide the UE with a discontinuous coverage maximum time offset.

8.2.7.58 S-NSSAI time validity information

If the UE supports S-NSSAI time validity information, the network may include this IE to update the S-NSSAI time validity information.

8.2.7.59 Unavailability configuration

The network should include this IE if the network needs to provide parameters related to unavailability period to the UE.

8.2.7.60 Feature authorization indication

The network may include this IE to inform to the UE about the features for which the UE is authorized to use.

8.2.7.61 On-demand NSSAI

The network may include this IE to provide the on-demand NSSAI to the UE.

8.2.7.62 Access technology utilization control

This IE is included to indicate the restricted access technology(s).

8.2.7.63 Negotiated LP-WUSPS assistance information

The network shall include the Negotiated LP-WUSPS assistance information IE if the network needs to provide the LP-WUSPS assistance information to the UE.

8.2.8 Registration complete

8.2.8.1 Message definition

The REGISTRATION COMPLETE message is sent by the UE to the AMF. See table 8.2.8.1.1.

Message type: REGISTRATION COMPLETE

Significance: dual

Direction: UE to network

Table 8.2.8.1.1: REGISTRATION COMPLETE message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Registration complete message identity	Message type 9.7	M	V	1
73	SOR transparent container	SOR transparent container 9.11.3.51	O	TLV-E	20

8.2.8.2 SOR transparent container

This IE may be sent by the UE. If this IE is sent, the contents of this IE indicates the UE acknowledgement of successful reception of the SOR transparent container IE in the REGISTRATION ACCEPT message. This IE shall indicate the ME support of SOR-CMCI.

8.2.9 Registration reject

8.2.9.1 Message definition

The REGISTRATION REJECT message is sent by the AMF to the UE. See table 8.2.9.1.1.

Message type: REGISTRATION REJECT

Significance: dual

Direction: network to UE

Table 8.2.9.1.1: REGISTRATION REJECT message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Registration reject message identity	Message type 9.7	M	V	1
	5GMM cause	5GMM cause 9.11.3.2	M	V	1
5F	T3346 value	GPRS timer 2 9.11.2.4	O	TLV	3
16	T3502 value	GPRS timer 2 9.11.2.4	O	TLV	3
78	EAP message	EAP message 9.11.2.2	O	TLV-E	7-1503
69	Rejected NSSAI	Rejected NSSAI 9.11.3.46	O	TLV	4-42
75	CAG information list	CAG information list 9.11.3.18A	O	TLV-E	3-n
68	Extended rejected NSSAI	Extended rejected NSSAI 9.11.3.75	O	TLV	5-90
2C	Disaster return wait range	Registration wait range 9.11.3.84	O	TLV	4
71	Extended CAG information list	Extended CAG information list 9.11.3.86	O	TLV-E	3-n
3A	Lower bound timer value	GPRS timer 3 9.11.2.5	O	TLV	3
1D	Forbidden TAI(s) for the list of "5GS forbidden tracking areas for roaming"	5GS tracking area identity list 9.11.3.9	O	TLV	9-114
1E	Forbidden TAI(s) for the list of "5GS forbidden tracking areas for regional provision of service"	5GS tracking area identity list 9.11.3.9	O	TLV	9-114
3E	N3IWF identifier	N3IWF identifier 9.11.3.93	O	TLV	7-n
4D	TNAN information	TNAN information 9.11.3.94	O	TLV	3-n
62	Extended 5GMM cause	Extended 5GMM cause 9.11.3.109	O	TLV	3
63	Access technology utilization control	Access technology utilization control 9.11.3.110	O	TLV	4-5

NOTE: It is possible for AMFs compliant with version 17.7.0 or 17.8.0 of this specification to send the Forbidden TAI(s) for the list of "5GS forbidden tracking areas for roaming" IE with IEI of value "3B" for this message or the Forbidden TAI(s) for the list of "5GS forbidden tracking areas for regional provision of service" IE with IEI of value "3C" for this message.

8.2.9.2 T3346 value

The AMF may include this IE when the general NAS level mobility management congestion control is active

8.2.9.3 T3502 value

This IE may be included to indicate a value for timer T3502 during the initial registration.

8.2.9.4 EAP message

EAP message IE is included if the REGISTRATION REJECT message is used to convey EAP-failure message.

8.2.9.5 Rejected NSSAI

The network may include this IE to inform the UE of one or more S-NSSAIs that were included in the requested NSSAI in the REGISTRATION REQUEST message but were rejected by the network.

8.2.9.6 CAG information list

This IE may be included to assign a new "CAG information list" to the UE or delete the "CAG information list" at the UE side.

8.2.9.7 Extended rejected NSSAI

If the UE supports Extended rejected NSSAI, the network may include this IE to inform the UE of one or more S-NSSAIs that were included in the requested NSSAI in the REGISTRATION REQUEST message but were rejected by the network.

8.2.9.8 Disaster return wait range

This IE may be included to assign a new disaster return wait range to the UE.

8.2.9.9 Extended CAG information list

If the UE supports Extended CAG information list, the network may include this IE to assign a new "CAG information list" to the UE or delete the "CAG information list" at the UE side.

8.2.9.10 Lower bound timer value

The AMF may include this IE when the 5GMM cause is set to #78 "PLMN not allowed to operate at the present UE location", to provide a minimum time value for an entry added to the list of "PLMNs not allowed to operate at the present UE location".

8.2.9.11 Forbidden TAI(s) for the list of "5GS forbidden tracking areas for roaming"

This IE is included to indicate the forbidden TAI(s) to be stored in the list of "5GS forbidden tracking areas for roaming". This IE is included only if the message is sent via satellite NG-RAN access.

8.2.9.12 Forbidden TAI(s) for the list of "5GS forbidden tracking areas for regional provision of service"

This IE is included to indicate the forbidden TAI(s) to be stored in the list of "5GS forbidden tracking areas for regional provision of service". This IE is included only if the message is sent via satellite NG-RAN access.

8.2.9.13 N3IWF identifier

The network may include this IE if the UE supports slice-based N3IWF selection over non-3GPP access network.

8.2.9.14 TNAN information

The network may include this IE if the UE supports slice-based TNGF selection over trusted non-3GPP access network.

8.2.9.15 Extended 5GMM cause

This IE may be included by the network to indicate additional information associated with the 5GMM cause value #15 "no suitable cells in tracking area".

8.2.9.16 Access technology utilization control

This IE is included to indicate the restricted access technology(s).

8.2.10 UL NAS transport

8.2.10.1 Message definition

The UL NAS TRANSPORT message transports message payload and associated information to the AMF. See table 8.2.10.1.1.

Message type: UL NAS TRANSPORT

Significance: dual

Direction: UE to network

Table 8.2.10.1.1: UL NAS TRANSPORT message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	UL NAS TRANSPORT message identity	Message type 9.7	M	V	1
	Payload container type	Payload container type 9.11.3.40	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Payload container	Payload container 9.11.3.39	M	LV-E	3-65537
12	PDU session ID	PDU session identity 2 9.11.3.41	C	TV	2
59	Old PDU session ID	PDU session identity 2 9.11.3.41	O	TV	2
8-	Request type	Request type 9.11.3.47	O	TV	1
22	S-NSSAI	S-NSSAI 9.11.2.8	O	TLV	3-10
25	DNN	DNN 9.11.2.1B	O	TLV	3-102
24	Additional information	Additional information 9.11.2.1	O	TLV	3-n
A-	MA PDU session information	MA PDU session information 9.11.3.31A	O	TV	1
F-	Release assistance indication	Release assistance indication 9.11.3.46A	O	TV	1
4E	Non-3GPP access path switching indication	Non-3GPP access path switching indication 9.11.3.99	O	TLV	3
5A	Alternative S-NSSAI	S-NSSAI 9.11.2.8	O	TLV	3-10
9-	Payload container information	Payload container information 9.11.3.106	O	TV	1

8.2.10.2 PDU session ID

The UE shall include this IE when the Payload container type IE is set to "N1 SM information" or "CIoT user data".

8.2.10.3 Old PDU session ID

The UE shall include this IE if the UL NAS TRANSPORT message transports a PDU SESSION ESTABLISHMENT REQUEST message upon receiving the PDU SESSION MODIFICATION COMMAND message with the 5GSM cause IE set to #39 "reactivation requested" and the Payload container type IE is set to "N1 SM information".

8.2.10.4 Request type

The UE shall include this IE when the PDU session ID IE is included and the Payload container IE contains the PDU SESSION ESTABLISHMENT REQUEST message or the PDU SESSION MODIFICATION REQUEST which is not initiated to indicate a change of 3GPP PS data off UE status associated to a PDU session.

8.2.10.5 S-NSSAI

The UE may include this IE when the Request type IE is set to "initial request", "existing PDU session" or "MA PDU request", the Payload container type IE is set to "N1 SM information" and the UE is not registered for onboarding services in SNPN.

8.2.10.6 DNN

The UE may include this IE when the Request type IE is set to "initial request", "existing PDU session" or "MA PDU request", the Payload container type IE is set to "N1 SM information" and the UE is not registered for onboarding services in SNPN.

8.2.10.7 Additional information

This IE is included when the Payload container type IE is set to "LTE Positioning Protocol (LPP) message container" or "SLPP message container". This IE may be included when the Payload container type IE is set to "Location services message container" or "UPP-CMI container".

8.2.10.8 MA PDU session information

The UE may include this IE if the Request type IE is included and is not set to "initial emergency request " or "existing emergency PDU session" in the UL NAS TRANSPORT message.

8.2.10.9 Release assistance indication

The UE may include this IE to inform the network whether:

- no further uplink and no further downlink data transmission is expected; or
- only a single downlink data transmission (e.g. acknowledgement or response to uplink data) and no further uplink data transmission subsequent to the uplink data transmission is expected.

8.2.10.10 Non-3GPP access path switching indication

The UE may include this IE when the Payload container type IE is set to "N1 SM information" to indicate whether the UE supports the non-3GPP access path switching for the PDU session.

8.2.10.11 Alternative S-NSSAI

The UE shall include this IE if the UE can provide alternative S-NSSAI associated with the S-NSSAI to be replaced to the network.

8.2.10.12 Payload container information

The UE may include this IE when the Payload container type IE is set to "Location services message container".

8.2.11 DL NAS transport

8.2.11.1 Message definition

The DL NAS TRANSPORT message transports message payload and associated information to the UE. See table 8.2.11.1.1.

Message type: DL NAS TRANSPORT

Significance: dual

Direction: network to UE

Table 8.2.11.1.1: DL NAS TRANSPORT message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	DL NAS TRANSPORT message identity	Message type 9.7	M	V	1
	Payload container type	Payload container type 9.11.3.40	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Payload container	Payload container 9.11.3.39	M	LV-E	3-65537
12	PDU session ID	PDU session identity 2 9.11.3.41	C	TV	2
24	Additional information	Additional information 9.11.2.1	O	TLV	3-n
58	5GMM cause	5GMM cause 9.11.3.2	O	TV	2
37	Back-off timer value	GPRS timer 3 9.11.2.5	O	TLV	3
3A	Lower bound timer value	GPRS timer 3 9.11.2.5	O	TLV	3

8.2.11.2 PDU session ID

The AMF shall include this IE when the Payload container type IE is set to "N1 SM information" or "CIoT user data container".

8.2.11.3 Additional information

This IE is included when the Payload container type IE is set to "LTE Positioning Protocol (LPP) message container", "UPP-CMI container", "SLPP message container", or "Location services message container".

8.2.11.4 5GMM cause

The AMF shall include this IE when the Payload container IE contains an uplink payload which was not forwarded and the Payload container type IE is not set to "Multiple payloads".

8.2.11.5 Back-off timer value

The AMF may include this IE to indicate the back-off timer value when the Payload container IE is included and the Payload container type IE is not set to "Multiple payloads".

8.2.11.6 Lower bound timer value

The AMF may include this IE when the 5GMM cause is set to #78 "PLMN not allowed to operate at the present UE location", to provide a minimum time value for an entry added to the list of "PLMNs not allowed to operate at the present UE location".

8.2.12 De-registration request (UE originating de-registration)

8.2.12.1 Message definition

The DEREGISTRATION REQUEST message is sent by the UE to the AMF. See table 8.2.12.1.1.

Message type: DEREGISTRATION REQUEST

Significance: dual

Direction: UE to network

Table 8.2.12.1.1: DEREGISTRATION REQUEST message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	De-registration request message identity	Message type 9.7	M	V	1
	De-registration type	De-registration type 9.11.3.20	M	V	1/2
	ngKSI	NAS key set identifier 9.11.3.32	M	V	1/2
	5GS mobile identity	5GS mobile identity 9.11.3.4	M	LV-E	6-n
3C	Unavailability information	Unavailability information 9.11.2.20	O	TLV	3-9
71	NAS message container	NAS message container 9.11.3.33	O	TLV-E	4-n

8.2.12.2 Unavailability information

The UE may include this IE when an event is triggered in the UE that would make the UE unavailable for a certain period and the use of unavailability period is not due to NR satellite access discontinuous coverage.

8.2.12.3 NAS message container

This IE shall be included if the UE is sending a DEREGISTRATION REQUEST message as an initial NAS message and the UE needs to send non-cleartext IEs.

8.2.13 De-registration accept (UE originating de-registration)

8.2.13.1 Message definition

The DEREGISTRATION ACCEPT message is sent by the AMF to the UE. See table 8.2.13.1.1.

Message type: DEREGISTRATION ACCEPT

Significance: dual

Direction: network to UE

Table 8.2.13.1.1: DEREGISTRATION ACCEPT message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	De-registration accept message identity	Message type 9.7	M	V	1

8.2.14 De-registration request (UE terminated de-registration)

8.2.14.1 Message definition

The DEREGISTRATION REQUEST message is sent by the AMF to the UE. See table 8.2.14.1.1.

Message type: DEREGISTRATION REQUEST

Significance: dual

Direction: network to UE

Table 8.2.14.1.1: DEREGISTRATION REQUEST message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	De-registration request message identity	Message type 9.7	M	V	1
	De-registration type	De-registration type 9.11.3.20	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
58	5GMM cause	5GMM cause 9.11.3.2	O	TV	2
5F	T3346 value	GPRS timer 2 9.11.2.4	O	TLV	3
6D	Rejected NSSAI	Rejected NSSAI 9.11.3.46	O	TLV	4-42
75	CAG information list	CAG information list 9.11.3.18A	O	TLV-E	3-n
68	Extended rejected NSSAI	Extended rejected NSSAI 9.11.3.75	O	TLV	5-90
2C	Disaster return wait range	Registration wait range 9.11.3.84	O	TLV	4
71	Extended CAG information list	Extended CAG information list 9.11.3.86	O	TLV-E	3-n
3A	Lower bound timer value	GPRS timer 3 9.11.2.5	O	TLV	3
1D	Forbidden TAI(s) for the list of "5GS forbidden tracking areas for roaming"	5GS tracking area identity list 9.11.3.9	O	TLV	9-114
1E	Forbidden TAI(s) for the list of "5GS forbidden tracking areas for regional provision of service"	5GS tracking area identity list 9.11.3.9	O	TLV	9-114
63	Access technology utilization control	Access technology utilization control 9.11.3.110	O	TLV	4-5

NOTE: It is possible for AMFs compliant with version 17.7.0 or 17.8.0 of this specification to send the Forbidden TAI(s) for the list of "5GS forbidden tracking areas for roaming" IE with IEI of value "3B" for this message or the Forbidden TAI(s) for the list of "5GS forbidden tracking areas for regional provision of service" IE with IEI of value "3C" for this message.

8.2.14.2 5GMM cause

This information element is included if a 5GMM cause is provided.

8.2.14.3 T3346 value

The AMF may include this IE when the general NAS level mobility management congestion control is active.

8.2.14.4 Rejected NSSAI

The AMF may include this IE to inform the UE of one or more S-NSSAIs that were rejected by the network.

8.2.14.5 CAG information list

This IE may be included to assign a new "CAG information list" to the UE or delete the "CAG information list" at the UE side.

8.2.14.6 Extended rejected NSSAI

If the UE supports Extended rejected NSSAI, the AMF may include this IE to inform the UE of one or more S-NSSAIs that were rejected by the network.

8.2.14.7 Disaster return wait range

This IE may be included to assign a new disaster return wait range to the UE.

8.2.14.7A Extended CAG information list

If the UE supports Extended CAG information list, the network may include this IE to assign a new "CAG information list" to the UE or delete the "CAG information list" at the UE side.

8.2.14.8 Lower bound timer value

The AMF may include this IE when the 5GMM cause is set to #78 "PLMN not allowed to operate at the present UE location", to provide a minimum time value for an entry added to the list of "PLMNs not allowed to operate at the present UE location".

8.2.14.9 Forbidden TAI(s) for the list of "5GS forbidden tracking areas for roaming"

This IE is included to indicate the forbidden TAI(s) to be stored in the list of "5GS forbidden tracking areas for roaming". This IE is included only if the message is sent via satellite NG-RAN access.

8.2.14.10 Forbidden TAI(s) for the list of "5GS forbidden tracking areas for regional provision of service"

This IE is included to indicate the forbidden TAI(s) to be stored in the list of "5GS forbidden tracking areas for regional provision of service". This IE is included only if the message is sent via satellite NG-RAN access.

8.2.14.11 Access technology utilization control

This IE is included to indicate the restricted access technology(s).

8.2.15 De-registration accept (UE terminated de-registration)

8.2.15.1 Message definition

The DEREGISTRATION ACCEPT message is sent by the UE to the AMF. See table 8.2.15.1.1.

Message type: DEREGISTRATION ACCEPT

Significance: dual

Direction: UE to network

Table 8.2.15.1.1.1: DEREGISTRATION ACCEPT message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	De-registration accept message identity	Message type 9.7	M	V	1

8.2.16 Service request

8.2.16.1 Message definition

The SERVICE REQUEST message is sent by the UE to the AMF in order to request the establishment of an N1 NAS signalling connection, to request the establishment of user-plane resources for PDU sessions which are established without user-plane resources, or both. See table 8.2.16.1.1.

Message type: SERVICE REQUEST

Significance: dual

Direction: UE to network

Table 8.2.16.1.1: SERVICE REQUEST message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Service request message identity	Message type 9.7	M	V	1
	ngKSI	NAS key set identifier 9.11.3.32	M	V	1/2
	Service type	Service type 9.11.3.50	M	V	1/2
	5G-S-TMSI	5GS mobile identity 9.11.3.4	M	LV-E	9
40	Uplink data status	Uplink data status 9.11.3.57	O	TLV	4-34
50	PDU session status	PDU session status 9.11.3.44	O	TLV	4-34
25	Allowed PDU session status	Allowed PDU session status 9.11.3.13	O	TLV	4-34
71	NAS message container	NAS message container 9.11.3.33	O	TLV-E	4-n
29	UE request type	UE request type 9.11.3.76	O	TLV	3
28	Paging restriction	Paging restriction 9.11.3.77	O	TLV	3-35

8.2.16.2 Uplink data status

This IE shall be included if the UE has uplink user data pending to be sent.

8.2.16.3 PDU session status

This IE shall be included when the UE needs to indicate the PDU sessions that are associated with the access type that the message is sent over, that are active within the UE.

8.2.16.4 Allowed PDU session status

This IE shall be included if the SERVICE REQUEST message is sent as a response to paging with the access type indicating non-3GPP access or notification via 3GPP access for PDU session(s) associated with non-3GPP access.

8.2.16.5 NAS message container

This IE shall be included if the UE is sending a SERVICE REQUEST message as an initial NAS message and the UE needs to send non-cleartext IEs.

8.2.16.6 UE request type

The UE shall include this IE if the MUSIM UE requests the release of the NAS signalling connection or rejects the paging request from the network.

8.2.16.7 Paging restriction

The UE shall include this IE if the Request type is set to "NAS signalling connection release" or to "Rejection of paging" in the UE request type IE and the UE requests the network to restrict paging.

8.2.17 Service accept

8.2.17.1 Message definition

The SERVICE ACCEPT message is sent by the AMF to the UE in order to accept the service request procedure. See table 8.2.17.1.1.

Message type: SERVICE ACCEPT

Significance: dual

Direction: network to UE

Table 8.2.17.1.1: SERVICE ACCEPT message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Service accept message identity	Message type 9.7	M	V	1
50	PDU session status	PDU session status 9.11.3.44	O	TLV	4-34
26	PDU session reactivation result	PDU session reactivation result 9.11.3.42	O	TLV	4-34
72	PDU session reactivation result error cause	PDU session reactivation result error cause 9.11.3.43	O	TLV-E	5-515
78	EAP message	EAP message 9.11.2.2	O	TLV-E	7-1503
6B	T3448 value	GPRS timer 2 9.11.2.4	O	TLV	3
34	5GS additional request result	5GS additional request result 9.11.3.81	O	TLV	3
1D	Forbidden TAI(s) for the list of "5GS forbidden tracking areas for roaming"	5GS tracking area identity list 9.11.3.9	O	TLV	9-114
1E	Forbidden TAI(s) for the list of "5GS forbidden tracking areas for regional provision of service"	5GS tracking area identity list 9.11.3.9	O	TLV	9-114

8.2.17.2 PDU session status

This IE shall be included when the network needs to indicate the PDU sessions that are associated with the access type that the message is sent over that are active within the network.

8.2.17.3 PDU session reactivation result

This IE shall be included:

- if the Uplink data status IE is included in the SERVICE REQUEST message; or
- if the Allowed PDU session status IE is included in the SERVICE REQUEST message and there is at least one PDU session indicated in the Allowed PDU session status IE for which user-plane resources can be re-established over 3GPP access.

8.2.17.4 PDU session reactivation result error cause

This IE may be included if the PDU session reactivation result IE is included and there exist one or more PDU sessions for which the user-plane resources cannot be re-established, to indicate the cause of failure to re-establish the user-plane resources.

8.2.17.5 EAP message

EAP message IE is included if the SERVICE ACCEPT message is sent to a UE registered for emergency services and is used to convey EAP-failure message.

8.2.17.6 T3448 value

The network may include this IE if the congestion control for transport of user data via the control plane is active and the UE supports the control plane CIoT 5GS optimizations.

8.2.17.7 5GS additional request result

The network may include this IE to inform the UE about the result of additional request.

8.2.17.8 Forbidden TAI(s) for the list of "5GS forbidden tracking areas for roaming"

This IE is included to indicate the forbidden TAI(s) to be stored in the list of "5GS forbidden tracking areas for roaming". This IE is included only if the message is sent via satellite NG-RAN access.

8.2.17.9 Forbidden TAI(s) for the list of "5GS forbidden tracking areas for regional provision of service"

This IE is included to indicate the forbidden TAI(s) to be stored in the list of "5GS forbidden tracking areas for regional provision of service". This IE is included only if the message is sent via satellite NG-RAN access.

8.2.18 Service reject

8.2.18.1 Message definition

The SERVICE REJECT message is sent by the AMF to the UE in order to reject the service request procedure. See table 8.2.18.1.1.

Message type: SERVICE REJECT

Significance: dual

Direction: network to UE

Table 8.2.18.1.1: SERVICE REJECT message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Service reject message identity	Message type 9.7	M	V	1
	5GMM cause	5GMM cause 9.11.3.2	M	V	1
50	PDU session status	PDU session status 9.11.3.44	O	TLV	4-34
5F	T3346 value	GPRS timer 2 9.11.2.4	O	TLV	3
78	EAP message	EAP message 9.11.2.2	O	TLV-E	7-1503
6B	T3448 value	GPRS timer 2 9.11.2.4	O	TLV	3
75	CAG information list	CAG information list 9.11.3.18A	O	TLV-E	3-n
2C	Disaster return wait range	Registration wait range 9.11.3.84	O	TLV	4
71	Extended CAG information list	Extended CAG information list 9.11.3.86	O	TLV-E	3-n
3A	Lower bound timer value	GPRS timer 3 9.11.2.5	O	TLV	3
1D	Forbidden TAI(s) for the list of "5GS forbidden tracking areas for roaming"	5GS tracking area identity list 9.11.3.9	O	TLV	9-114
1E	Forbidden TAI(s) for the list of "5GS forbidden tracking areas for regional provision of service"	5GS tracking area identity list 9.11.3.9	O	TLV	9-114
63	Access technology utilization control	Access technology utilization control 9.11.3.110	O	TLV	4-5

NOTE: It is possible for AMFs compliant with version 17.7.0 or 17.8.0 of this specification to send the Forbidden TAI(s) for the list of "5GS forbidden tracking areas for roaming" IE with IEI of value "3B" for this message or the Forbidden TAI(s) for the list of "5GS forbidden tracking areas for regional provision of service" IE with IEI of value "3C" for this message.

8.2.18.2 PDU session status

This IE shall be included when the network needs to indicate the PDU sessions that are associated with the access type that the message is sent over, that are active within the network.

8.2.18.3 T3346 value

The AMF may include this IE when the general NAS level mobility management congestion control is active.

8.2.18.4 EAP message

EAP message IE is included if the SERVICE REJECT message is used to convey EAP-failure message.

8.2.18.5 T3448 value

The network may include this IE if the congestion control for transport of user data via the control plane is active and the UE supports the control plane ClOT 5GS optimizations.

8.2.18.6 CAG information list

This IE may be included to assign a new "CAG information list" to the UE or delete the "CAG information list" at the UE side.

8.2.18.7 Disaster return wait range

This IE may be included to assign a new disaster return wait range to the UE.

8.2.18.8 Extended CAG information list

If the UE supports Extended CAG information list, the network may include this IE to assign a new "CAG information list" to the UE or delete the "CAG information list" at the UE side.

8.2.18.9 Lower bound timer value

The AMF may include this IE when the 5GMM cause is set to #78 "PLMN not allowed to operate at the present UE location", to provide a minimum time value for an entry added to the list of "PLMNs not allowed to operate at the present UE location".

8.2.18.10 Forbidden TAI(s) for the list of "5GS forbidden tracking areas for roaming"

This IE is included to indicate the forbidden TAI(s) to be stored in the list of "5GS forbidden tracking areas for roaming". This IE is included only if the message is sent via satellite NG-RAN access.

8.2.18.11 Forbidden TAI(s) for the list of "5GS forbidden tracking areas for regional provision of service"

This IE is included to indicate the forbidden TAI(s) to be stored in the list of "5GS forbidden tracking areas for regional provision of service". This IE is included only if the message is sent via satellite NG-RAN access.

8.2.18.12 Access technology utilization control

This IE is included to indicate the restricted access technology(s).

8.2.19 Configuration update command

8.2.19.1 Message definition

The CONFIGURATION UPDATE COMMAND message is sent by the AMF to the UE. See table 8.2.19.1.1.

Message type: CONFIGURATION UPDATE COMMAND

Significance: dual

Direction: network to UE

Table 8.2.19.1.1: CONFIGURATION UPDATE COMMAND message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2

8.2.19.2 Configuration update indication

The AMF shall include this IE if the AMF needs to request an acknowledgement or a registration procedure from the UE.

8.2.19.3 5G-GUTI

This IE may be included to assign a new 5G-GUTI to the UE.

8.2.19.4 TAI list

This IE may be included to assign a new TAI list to the UE.

8.2.19.5 Allowed NSSAI

This IE may be included to assign a new allowed NSSAI to the UE not registered for onboarding services in SNPN.

8.2.19.6 Service area list

This IE may be included to assign a new service area list to the UE.

8.2.19.7 Full name for network

This IE may be included to assign a new full name for network to the UE.

8.2.19.8 Short name for network

This IE may be included to assign a new short name for network to the UE.

8.2.19.9 Local time zone

This IE may be included to assign a new local time zone to the UE.

8.2.19.10 Universal time and local time zone

This IE may be included to assign new universal time and local time zone to the UE.

8.2.19.11 Network daylight saving time

This IE may be included to assign new network daylight saving time to the UE.

8.2.19.12 LADN information

This IE may be included to assign new LADN information to the UE or delete the LADN information at the UE side.

8.2.19.13 MICO indication

This IE may be included to request the UE to re-negotiate MICO mode.

8.2.19.14 Network slicing indication

This IE shall be included if the user's network slicing subscription has changed in the UDM of a PLMN or an SNPN.

8.2.19.15 Configured NSSAI

The AMF shall include this IE when the AMF needs to provide the UE with a new configured NSSAI for the current PLMN or SNPN and the UE is neither registering nor registered for onboarding services in SNPN.

8.2.19.16 Rejected NSSAI

The network may include this IE to inform the UE of one or more S-NSSAIs that were previously sent to the UE in the allowed NSSAI or the pending NSSAI, but are now considered rejected by the network.

8.2.19.17 Operator-defined access category definitions

This IE may be included to assign new operator-defined access category definitions to the UE or delete the operator-defined access category definitions at the UE side.

8.2.19.18 SMS indication

This IE may be included to indicate that the ability for the UE to use SMS over NAS has changed.

8.2.19.19 T3447 value

This IE may be included to assign a new T3447 value to the UE.

8.2.19.20 CAG information list

This IE may be included to assign new "CAG information list" to the UE or delete the "CAG information list" at the UE side.

8.2.19.21 UE radio capability ID

This IE may be included if the UE is not in NB-N1 mode, both the UE and the network support RACS and the network needs to assign a network-assigned UE radio capability ID to the UE.

8.2.19.22 UE radio capability ID deletion indication

This IE may be included if the UE is not in NB-N1 mode, both the UE and the network support RACS and the network needs to trigger the UE to delete all network-assigned UE radio capability IDs stored at the UE for the serving PLMN or serving SNPN.

8.2.19.23 5GS registration result

This IE shall be included if the network wants to indicate to the UE that the UE is registered for emergency services.

8.2.19.24 Truncated 5G-S-TMSI configuration

This IE may be included to provide a new truncated 5G-S-TMSI configuration to the UE in NB-N1 mode if the network is configured to provide the truncated 5G-S-TMSI configuration for control plane CIoT 5GS optimizations.

8.2.19.25 Additional configuration indication

The network may include this IE when requesting the UE to register without the release of the N1 NAS signalling connection.

8.2.19.26 Extended rejected NSSAI

If the UE supports Extended rejected NSSAI, the network may include this IE to inform the UE of one or more S-NSSAIs that were previously sent to the UE in the allowed NSSAI or the pending NSSAI, but are now considered rejected by the network.

8.2.19.27 Service-level-AA container

The network shall include this IE when the AMF receives the Service-level-AA payload or the UUAA-MM result from the UAS-NF during the UUAA-MM procedure or the UUAA revocation procedure. The network shall also include this IE if the AMF receives from the UAS-NF, the CAA-level UAV ID as part of the UUAA-MM procedure.

8.2.19.28 NSSRG information

This IE may be included to provide NSSRG information associated with the configured NSSAI.

8.2.19.29 Disaster roaming wait range

This IE may be included to assign a new disaster roaming wait range to the UE.

8.2.19.30 Disaster return wait range

This IE may be included to assign a new disaster return wait range to the UE.

8.2.19.31 List of PLMNs to be used in disaster condition

This IE may be included by an allowed PLMN to assign a new "list of PLMN(s) to be used in disaster condition" associated with the serving PLMN to the UE.

8.2.19.32 Extended CAG information list

If the UE supports Extended CAG information list, the network may include this IE to assign a new "CAG information list" to the UE or delete the "CAG information list" at the UE side.

8.2.19.33 Updated PEIPS assistance information

The AMF may include this IE if the UE supports NR paging subgrouping, the AMF supports and accepts the use of PEIPIS assistance information for the UE, the UE is not registered for emergency services, the UE does not have an active emergency PDU session, and the network needs to update PEIPS assistance information for the UE.

8.2.19.34 NSAG information

If the UE has set the NSAG bit to "NSAG supported" in the 5GMM capability IE of the REGISTRATION REQUEST message and the CONFIGURATION UPDATE COMMAND message is sent over 3GPP access, the network may include this IE to provide NSAG information to the UE.

8.2.19.35 Priority indicator

The network shall include this IE when it needs to inform the UE that the use of access identity 1 is valid or is no longer valid.

8.2.19.36 RAN timing synchronization

This IE may be included to provide information related to the RAN timing synchronization to a UE which has set the Reconnection to the network due to RAN timing synchronization status change (RANtiming) bit to "Reconnection to the network due to RAN timing synchronization status change supported" in the 5GMM capability IE of the REGISTRATION REQUEST message.

8.2.19.37 Extended LADN information

This IE may be included to assign new extended LADN information to the UE or delete the extended LADN information at the UE side.

8.2.19.38 Alternative NSSAI

The network may include this IE to provide the mapping information between the S-NSSAI to be replaced and the alternative S-NSSAI to the UE.

8.2.19.39 S-NSSAI location validity information

The network may include this IE to update the S-NSSAI location validity information.

8.2.19.40 S-NSSAI time validity information

The network may include this IE to update the S-NSSAI time validity information.

8.2.19.41 Discontinuous coverage maximum time offset

This IE may be included to provide the UE with a discontinuous coverage maximum time offset.

8.2.19.42 Partially allowed NSSAI

The network may include this IE to assign a partially allowed NSSAI to the UE.

8.2.19.43 Partially rejected NSSAI

The network may include this IE to assign a partially rejected NSSAI to the UE.

8.2.19.44
Feature authorization indication

The network may include this IE to inform to the UE about the features for which the UE is authorized to use.

8.2.19.45
On-demand NSSAI

The network may include this IE to provide the on-demand NSSAI to the UE.

8.2.19.46
Access technology utilization control

This IE is included to indicate the restricted access technology(s).

8.2.19.47
Updated LP-WUSPS assistance information

The AMF shall include this IE if the network needs to update the LP-WUSPS assistance information for the UE.

8.2.20
Configuration update complete

8.2.20.1
Message definition

The CONFIGURATION UPDATE COMPLETE message is sent by the UE to the AMF. See table 8.2.20.1.1.

Message type: CONFIGURATION UPDATE COMPLETE

Significance: dual

Direction: UE to network

Table 8.2.20.1.1: CONFIGURATION UPDATE COMPLETE message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Configuration update complete message identity	Message type 9.7	M	V	1

8.2.20.2
Void

8.2.21
Identity request

8.2.21.1
Message definition

The IDENTITY REQUEST message is sent by the AMF to the UE to request the UE to provide specified identity. See table 8.2.21.1.1

Message type: IDENTITY REQUEST

Significance: dual

Direction: AMF to UE

Table 8.2.21.1.1: IDENTITY REQUEST message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Identity request message identity	Message type 9.7	M	V	1
	Identity type	5GS identity type 9.11.3.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2

8.2.22 Identity response

8.2.22.1 Message definition

The IDENTITY RESPONSE message is sent by the UE to the AMF to provide the requested identity. See table 8.2.22.1.

Message type: IDENTITY RESPONSE

Significance: dual

Direction: UE to AMF

Table 8.2.22.1.1: IDENTITY RESPONSE message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Identity response message identity	Message type 9.7	M	V	1
	Mobile identity	5GS mobile identity 9.11.3.4	M	LV-E	3-n

8.2.23 Notification

8.2.23.1 Message definition

The NOTIFICATION message is sent by the AMF to the UE to notify the UE to initiate a service request procedure. See table 8.2.23.1.1.

Message type: NOTIFICATION

Significance: dual

Direction: network to UE

Table 8.2.23.1.1: NOTIFICATION message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Notification message identity	Message type 9.7	M	V	1
	Access type	Access type 9.11.2.1A	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2

8.2.24 Notification response

8.2.24.1 Message definition

The NOTIFICATION RESPONSE message is sent by the UE to the AMF to notify the failure to initiate the service request procedure as a response of notification. See table 8.2.24.1.1.

Message type: NOTIFICATION RESPONSE

Significance: dual

Direction: UE to network

Table 8.2.2341.1: NOTIFICATION RESPONSE message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Notification response message identity	Message type 9.7	M	V	1
50	PDU session status	PDU session status 9.11.3.44	O	TLV	4-34

8.2.24.2 PDU session status

This information element shall be included when the UE needs to indicate over non-3GPP access the PDU sessions that are associated with the 3GPP access type that are active within the UE.

8.2.25 Security mode command

8.2.25.1 Message definition

The SECURITY MODE COMMAND message is sent by the AMF to the UE to establish NAS signalling security. See table 8.2.25.1.1.

Message type: SECURITY MODE COMMAND

Significance: dual

Direction: network to UE

Table 8.2.25.1.1: SECURITY MODE COMMAND message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Security mode command message identity	Message type 9.7	M	V	1
	Selected NAS security algorithms	NAS security algorithms 9.11.3.34	M	V	1
	ngKSI	NAS key set identifier 9.11.3.32	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Replayed UE security capabilities	UE security capability 9.11.3.54	M	LV	3-9
E-	IMEISV request	IMEISV request 9.11.3.28	O	TV	1
57	Selected EPS NAS security algorithms	EPS NAS security algorithms 9.11.3.25	O	TV	2
36	Additional 5G security information	Additional 5G security information 9.11.3.12	O	TLV	3
78	EAP message	EAP message 9.11.2.2	O	TLV-E	7-1503
38	ABBA	ABBA 9.11.3.10	O	TLV	4-n
19	Replayed S1 UE security capabilities	S1 UE security capability 9.11.3.48A	O	TLV	4-7
55	AUN3 device security key	AUN3 device security key 9.11.3.107	O	TLV	36-257

NOTE: It is possible for AMFs compliant with version 18.3.0 or 18.3.1 of this specification to send the AUN3 device security key IE with a fixed length of 66 octets.

8.2.25.2 IMEISV request

The AMF may include this information element to request the UE to send its IMEISV with the corresponding SECURITY MODE COMPLETE message.

8.2.25.3 Void

8.2.25.4 Selected EPS NAS security algorithms

This IE shall be included if the AMF supports N26 interface, the UE set the S1 mode bit to "S1 mode supported" in the 5GMM capability IE of the REGISTRATION REQUEST message, and the AMF needs to provide the selected EPS NAS security algorithms to the UE.

8.2.25.5 Additional 5G security information

The network shall include this IE if:

- the network needs to provide the UE with horizontal derivation parameter; or
- the applicable initial NAS message (i.e. REGISTRATION REQUEST, CONTROL PLANE SERVICE REQUEST or SERVICE REQUEST) does not successfully pass the integrity check at the AMF (see subclause 5.4.2.2).

8.2.25.6 EAP message

This IE is included when the EAP Success message is sent as part of the EAP based primary authentication and key agreement procedure, as specified in subclause 5.4.1.2.

8.2.25.7 ABBA

This IE shall be included if the message contains an EAP message IE with an EAP-success message.

8.2.25.8 Replayed S1 UE security capabilities

This IE shall be included if the Selected EPS NAS security algorithms information element is included.

8.2.25.9 AUN3 device security key

This IE shall be included when the SECURITY MODE COMMAND message is provided to a 5G-RG that is acting on behalf of an AUN3 device if the EAP message IE is set to an EAP-success message.

8.2.26 Security mode complete

8.2.26.1 Message definition

The SECURITY MODE COMPLETE message is sent by the UE to the AMF in response to a SECURITY MODE COMMAND message. See table 8.2.26.1.1.

Message type: SECURITY MODE COMPLETE

Significance: dual

Direction: UE to network

Table 8.2.26.1.1: SECURITY MODE COMPLETE message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Security mode complete message identity	Message type 9.6	M	V	1
77	IMEISV	5GS mobile identity 9.11.3.4	O	TLV-E	12
71	NAS message container	NAS message container 9.11.3.33	O	TLV-E	4-n
78	non-IMEISV PEI	5GS mobile identity 9.11.3.4	O	TLV-E	7-n

8.2.26.2 IMEISV

The UE shall include this information element, if the IMEISV was requested within the corresponding SECURITY MODE COMMAND message.

8.2.26.3 NAS message container

The UE shall include this information element:

- a) if during an ongoing registration procedure or service request procedure, the AMF included the Additional 5G security information with the RINMR bit set to "Retransmission of the initial NAS message requested" in the SECURITY MODE COMMAND message as described in 3GPP TS 33.501 [24]; or
- b) if during an ongoing registration procedure, the UE does not have a valid 5G NAS security context.

8.2.26.4 non-IMEISV PEI

The 5G-RG or the W-AGF acting on behalf of the FN-RG (or on behalf of the N5GC device) shall include this information element, if the IMEISV was requested within the corresponding SECURITY MODE COMMAND message, the IMEISV is not available but MAC address is available.

The UE shall include this information element, if the IMEISV was requested within the corresponding SECURITY MODE COMMAND message, the IMEISV is not available but EUI-64 is available.

8.2.27 Security mode reject

8.2.27.1 Message definition

The SECURITY MODE REJECT message is sent by the UE to the AMF to indicate that the corresponding security mode command has been rejected. See table 8.2.27.1.1.

Message type: SECURITY MODE REJECT

Significance: dual

Direction: UE to network

Table 8.2.27.1.1: SECURITY MODE REJECT message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Security mode reject message identity	Message type 9.6	M	V	1
	5GMM cause	5GMM cause 9.11.3.2	M	V	1

8.2.28 Security protected 5GS NAS message

8.2.28.1 Message definition

This message is sent by the UE or the network to transfer a plain 5GS NAS message as specified in subclause 8.2 together with the sequence number and the message authentication code protecting the message. See table 8.2.28.1.1.

Message type: SECURITY PROTECTED 5GS NAS MESSAGE

Significance: dual

Direction: both

Table 8.2.28.1.1: SECURITY PROTECTED 5GS NAS MESSAGE message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Message authentication code	Message authentication code 9.8	M	V	4
	Sequence number	Sequence number 9.10	M	V	1
	Plain 5GS NAS message	Plain 5GS NAS message 9.9	M	V	3-n

NOTE: The minimum length of Plain 5GS NAS message IE can be 2 octets if it includes a Test Mode Control message specified in 3GPP TS 38.509 [31AA].

8.2.29 5GMM status

8.2.29.1 Message definition

The 5GMM STATUS message is sent by the UE or by the AMF at any time to report certain error conditions. See table 8.2.29.1.1.

Message type: 5GMM STATUS

Significance: local

Direction: both

Table 8.2.29.1.1: 5GMM STATUS message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	5GMM STATUS message identity	Message type 9.7	M	V	1
	5GMM cause	5GMM cause 9.11.3.2	M	V	1

8.2.30 Control Plane Service request

8.2.30.1 Message definition

The CONTROL PLANE SERVICE REQUEST message is sent by the UE to the AMF when the UE is using 5GS services with control plane CIoT 5GS optimization. See table 8.2.30.1.1.

Message type: CONTROL PLANE SERVICE REQUEST

Significance: dual

Direction: UE to network

Table 8.2.30.1.1: CONTROL PLANE SERVICE REQUEST message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Control plane service request message identity	Message type 9.7	M	V	1
	Control plane service type	Control plane service type 9.11.3.18D	M	V	1/2
	ngKSI	NAS key set identifier 9.11.3.32	M	V	1/2
6F	CIoT small data container	CIoT small data container 9.11.3.18B	O	TLV	4-257
8-	Payload container type	Payload container type 9.11.3.40	O	TV	1
7B	Payload container	Payload container 9.11.3.39	O	TLV-E	4-65538
12	PDU session ID	PDU session identity 2 9.11.3.41	C	TV	2
50	PDU session status	PDU session status 9.11.3.44	O	TLV	4-34
F-	Release assistance indication	Release assistance indication 9.11.3.46A	O	TV	1
40	Uplink data status	Uplink data status 9.11.3.57	O	TLV	4-34
71	NAS message container	NAS message container 9.11.3.33	O	TLV-E	4-n
24	Additional information	Additional information 9.11.2.1	O	TLV	3-n
25	Allowed PDU session status	Allowed PDU session status 9.11.3.13	O	TLV	4-34
29	UE request type	UE request type 9.11.3.76	O	TLV	3
28	Paging restriction	Paging restriction 9.11.3.77	O	TLV	3-35

8.2.30.2 CIoT small data container

This IE shall be included if the UE needs to send uplink small user data, SMS or location services message that is not more than 254 bytes, and there is no other optional IE to be sent.

NOTE: When the UE determines to use the CIoT small data container IE to send uplink data in this message, there is no other optional IEs in this message.

8.2.30.3 Payload container type

This IE shall be included if the UE includes the Payload container IE.

8.2.30.4 Payload container

This IE shall be included if the UE needs to send uplink CIoT user data, SMS or location services message.

8.2.30.5 PDU session ID

The UE shall include this IE when the Payload container type IE is set to "CIoT user data container".

8.2.30.6 PDU session status

This IE shall be included when the UE needs to indicate the PDU sessions that are associated with the access type that the message is sent over, that are active within the UE.

8.2.30.7 Release assistance indication

The UE may include this IE to inform the network whether:

- no further uplink and no further downlink data transmission is expected; or
- only a single downlink data transmission (e.g. acknowledgement or response to uplink data) and no further uplink data transmission subsequent to the uplink data transmission is expected.

8.2.30.8 Uplink data status

This IE shall be included if the UE has uplink user data pending to be sent over the user plane.

8.2.30.9 NAS message container

This IE shall be included if the UE is sending a CONTROL PLANE SERVICE REQUEST message as an initial NAS message and the UE needs to send non-clear-text IEs.

8.2.30.10 Additional information

The UE may include this IE when the Payload container type IE is set to "Location services message container".

8.2.30.11 Allowed PDU session status

This IE shall be included if the CONTROL PLANE SERVICE REQUEST message is sent as a response to paging with the access type indicating non-3GPP access or notification via 3GPP access for PDU session(s) associated with non-3GPP access.

8.2.30.12 UE request type

The UE shall include this IE if the MUSIM UE requests the release of the NAS signalling connection or rejects the paging request from the network.

8.2.30.13 Paging restriction

The UE shall include this IE if the Request type is set to "NAS signalling connection release" or to "Rejection of paging" in the UE request type IE and the UE requests the network to restrict paging.

8.2.31 Network slice-specific authentication command

8.2.31.1 Message definition

The NETWORK SLICE-SPECIFIC AUTHENTICATION COMMAND message is sent by the AMF to the UE for authentication of the upper layers of the UE. See table 8.2.31.1.1.

Message type: NETWORK SLICE-SPECIFIC AUTHENTICATION COMMAND

Significance: dual

Direction: network to UE

Table 8.2.31.1.1: NETWORK SLICE-SPECIFIC AUTHENTICATION COMMAND message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	NETWORK SLICE-SPECIFIC AUTHENTICATION COMMAND message identity	Message type 9.7	M	V	1
	S-NSSAI	S-NSSAI 9.11.2.8	M	LV	2-5
	EAP message	EAP message 9.11.2.2	M	LV-E	6-1502

8.2.32 Network slice-specific authentication complete

8.2.32.1 Message definition

The NETWORK SLICE-SPECIFIC AUTHENTICATION COMPLETE message is sent by the UE to the AMF in response to the NETWORK SLICE-SPECIFIC AUTHENTICATION COMMAND message and indicates acceptance of the NETWORK SLICE-SPECIFIC AUTHENTICATION COMMAND message. See table 8.2.32.1.1.

Message type: NETWORK SLICE-SPECIFIC AUTHENTICATION COMPLETE

Significance: dual

Direction: UE to network

Table 8.2.32.1.1: NETWORK SLICE-SPECIFIC AUTHENTICATION COMPLETE message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	NETWORK SLICE-SPECIFIC AUTHENTICATION COMPLETE message identity	Message type 9.7	M	V	1
	S-NSSAI	S-NSSAI 9.11.2.8	M	LV	2-5
	EAP message	EAP message 9.11.2.2	M	LV-E	6-1502

8.2.33 Network slice-specific authentication result

8.2.33.1 Message definition

The NETWORK SLICE-SPECIFIC AUTHENTICATION RESULT message is sent by the AMF to the UE for indicating the result of the network slice-specific authentication and authorization procedure. See table 8.2.33.1.1.

Message type: NETWORK SLICE-SPECIFIC AUTHENTICATION RESULT

Significance: dual

Direction: network to UE

Table 8.2.33.1.1: NETWORK SLICE-SPECIFIC AUTHENTICATION RESULT message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	NETWORK SLICE-SPECIFIC AUTHENTICATION RESULT message identity	Message type 9.7	M	V	1
	S-NSSAI	S-NSSAI 9.11.2.8	M	LV	2-5
	EAP message	EAP message 9.11.2.2	M	LV-E	6-1502

8.2.34 Relay key request

8.2.34.1 Message definition

The RELAY KEY REQUEST message is sent by the UE to the AMF for initiation of PC5 keys establishment with the 5G ProSe remote UE or the 5G ProSe end UE as specified in 3GPP TS 33.503 [56]. See table 8.2.34.1.

Message type: RELAY KEY REQUEST

Significance: dual

Direction: UE to network

Table 8.2.34.1: RELAY KEY REQUEST message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Relay key request message identity	Message type 9.7	M	V	1
	PRTI	ProSe relay transaction identity 9.11.3.88	M	V	1
	Relay key request parameters	Relay key request parameters 9.11.3.89	M	LV	22-65537

8.2.35 Relay key accept

8.2.35.1 Message definition

The RELAY KEY ACCEPT message is sent by the AMF to the UE as specified in 3GPP TS 33.503 [56]. See table 8.2.35.1.

Message type: RELAY KEY ACCEPT

Significance: dual

Direction: network to UE

Table 8.2.35.1: RELAY KEY ACCEPT message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Relay key accept message identity	Message type 9.7	M	V	1
	PRTI	ProSe relay transaction identity 9.11.3.88	M	V	1
	Relay key response parameters	Relay key response parameters 9.11.3.90	M	LV-E	51-65537
78	EAP message	EAP message 9.11.2.2	O	TLV-E	7-1503

8.2.35.2 EAP message

The AMF shall include the EAP message IE if the AMF has received an EAP-success message from the AUSF.

8.2.36 Relay key reject

8.2.36.1 Message definition

The RELAY KEY REJECT message is sent by the AMF to the UE to indicate the rejection of the relay key request. See table 8.2.36.1.

Message type: RELAY KEY REJECT

Significance: dual

Direction: network to UE

Table 8.2.36.1: RELAY KEY REJECT message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Relay key reject message identity	Message type 9.7	M	V	1
	PRTI	ProSe relay transaction identity 9.11.3.88	M	V	1
78	EAP message	EAP message 9.11.2.2	O	TLV-E	7-1503

8.2.36.2 EAP message

EAP message IE is included if the RELAY KEY REJECT message is used to convey EAP-failure message.

8.2.37 Relay authentication request

8.2.37.1 Message definition

The RELAY AUTHENTICATION REQUEST message is sent by the network to the UE to initiate authentication of the 5G ProSe remote UE or the 5G ProSe end UE as specified in 3GPP TS 33.503 [56]. See table 8.2.37.1.

Message type: RELAY AUTHENTICATION REQUEST

Significance: dual

Direction: Network to UE

Table 8.2.37.1: RELAY AUTHENTICATION REQUEST message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2
	Relay authentication request message identity	Message type 9.7	M	V	1
	PRTI	ProSe relay transaction identity 9.11.3.88	M	V	1
	EAP message	EAP message 9.11.2.2	M	LV-E	7-1503

8.2.38 Relay authentication response

8.2.38.1 Message definition

The RELAY AUTHENTICATION RESPONSE message is sent by the UE to the network to forward the authentication response from the 5G ProSe remote UE or the 5G ProSe end UE as specified in 3GPP TS 33.503 [56]. See table 8.2.38.1.

Message type: RELAY AUTHENTICATION RESPONSE

Significance: dual

Direction: UE to network

Table 8.2.38.1: RELAY AUTHENTICATION RESPONSE message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	Security header type	Security header type 9.3	M	V	1/2
	Spare half octet	Spare half octet 9.5	M	V	1/2

	EAP message	EAP message 9.11.2.2	M	LV-E	6-1502

8.3 5GS session management messages

8.3.1 PDU session establishment request

8.3.1.1 Message definition

The PDU SESSION ESTABLISHMENT REQUEST message is sent by the UE to the SMF to initiate establishment of a PDU session. See table 8.3.1.1.1.

Message type: PDU SESSION ESTABLISHMENT REQUEST

Significance: dual

Direction: UE to network

Table 8.3.1.1.1: PDU SESSION ESTABLISHMENT REQUEST message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	PDU session ID	PDU session identity 9.4	M	V	1
	PTI	Procedure transaction identity 9.6	M	V	1

29	Suggested interface identifier	PDU address 9.11.4.10	O	TLV	11
72	Service-level-AA container	Service-level-AA container 9.11.2.10	O	TLV-E	4-65538
70	Requested MBS container	Requested MBS container 9.11.4.30	O	TLV-E	8-65538
34	PDU session pair ID	PDU session pair ID 9.11.4.32	O	TLV	3
35	RSN	RSN 9.11.4.33	O	TLV	3
36	URSP rule enforcement reports	URSP rule enforcement reports 9.11.4.38	O	TLV	4-n

8.3.1.2 PDU session type

This IE shall be included in the message when the UE requests to establish a new PDU session.

8.3.1.3 SSC mode

This IE is included in the message when the UE requests to establish a new PDU session with a DN and requests an SSC mode.

8.3.1.4 Maximum number of supported packet filters

This IE shall be included in the message when the selected PDU session type is "IPv4", "IPv6", "IPv4v6" or "Ethernet" and the UE can support more than 16 packet filters for this PDU session.

8.3.1.5 5GSM capability

This IE is included in the message when the UE requests to establish a new PDU session or to transfer an existing PDN connection and any of the 5GSM capabilities supported by the UE is relevant for the PDU session.

8.3.1.6 Void

8.3.1.7 Always-on PDU session requested

The UE shall include this IE if the UE requests to establish a PDU session as an always-on PDU session.

8.3.1.8 SM PDU DN request container

This IE is included in the message when the UE requests to establish a new PDU session with a DN and needs to provide information for the PDU session authentication and authorization by the external DN.

8.3.1.9 Extended protocol configuration options

This IE is included in the message when the UE needs to transmit (protocol) data (e.g. configuration parameters, error codes or messages/events) to the network.

8.3.1.10 IP header compression configuration

The UE shall include the IP header compression configuration IE if:

- the PDU session type value of the PDU session type IE is set to "IPv4", "IPv6" or "IPv4v6";
- the UE indicates "Control Plane CIoT 5GS optimization supported" and "IP header compression for control plane CIoT 5GS optimization supported" in the 5GMM capability IE of the REGISTRATION REQUEST message; and
- the network indicates "Control plane CIoT 5GS optimization supported" and "IP header compression for control plane CIoT 5GS optimization supported" in the 5GS network support feature IE of the REGISTRATION ACCEPT message.

8.3.1.11 DS-TT Ethernet port MAC address

This IE shall be included in the message if the UE supports transfer of port management information containers and the UE requests to establish a new PDU session of "Ethernet" PDU session type.

8.3.1.12 UE-DS-TT residence time

This IE shall be included in the message if:

- a) the UE supports transfer of port management information containers; and
- b) the UE-DS-TT residence time is available at the UE.

8.3.1.13 Port management information container

This IE shall be included in the message if the UE supports transfer of port management information containers.

8.3.1.14 Ethernet header compression configuration

The UE shall include the Ethernet header compression configuration IE if:

- the PDU session type value of the PDU session type IE is set to "Ethernet";
- the UE indicated "Control Plane CIoT 5GS optimization supported" and "Ethernet header compression for control plane CIoT 5GS optimization supported" in the 5GMM capability IE of the REGISTRATION REQUEST message; and
- the network indicated "Control plane CIoT 5GS optimization supported" and "Ethernet header compression for control plane CIoT 5GS optimization supported" in the 5GS network support feature IE of the REGISTRATION ACCEPT message.

8.3.1.15 Suggested interface identifier

This IE may be included by the W-AGF acting on behalf of the FN-RG.

8.3.1.16 Service-level-AA container

This IE shall be included in the message when the UE needs to establish a PDU session for the UAS services.

8.3.1.17 Requested MBS container

This IE is included in the message when the UE requests to join one or more multicast MBS sessions that are associated with the PDU session.

8.3.1.18 PDU session pair ID

This IE shall be included in the message when the UE needs to include a PDU session pair ID.

8.3.1.19 RSN

This IE shall be included in the message when the UE needs to include an RSN.

8.3.1.20 URSP rule enforcement reports

This IE is included in the message when the UE sends one or more URSP rule enforcement reports to the network.

8.3.2 PDU session establishment accept

8.3.2.1 Message definition

The PDU SESSION ESTABLISHMENT ACCEPT message is sent by the SMF to the UE in response to PDU SESSION ESTABLISHMENT REQUEST message and indicates successful establishment of a PDU session. See table 8.3.2.1.1.

Message type: PDU SESSION ESTABLISHMENT ACCEPT

Significance: dual

Direction: network to UE

Table 8.3.2.1.1: PDU SESSION ESTABLISHMENT ACCEPT message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	PDU session ID	PDU session identity 9.4	M	V	1
	PTI	Procedure transaction identity 9.6	M	V	1
	PDU SESSION ESTABLISHMENT ACCEPT message identity	Message type 9.7	M	V	1
	Selected PDU session type	PDU session type 9.11.4.11	M	V	1/2
	Selected SSC mode	SSC mode 9.11.4.16	M	V	1/2
	Authorized QoS rules	QoS rules 9.11.4.13	M	LV-E	6-65538
	Session AMBR	Session-AMBR 9.11.4.14	M	LV	7
59	5GSM cause	5GSM cause 9.11.4.2	O	TV	2
29	PDU address	PDU address 9.11.4.10	O	TLV	7-31
56	RQ timer value	GPRS timer 9.11.2.3	O	TV	2
22	S-NSSAI	S-NSSAI 9.11.2.8	O	TLV	3-10
8-	Always-on PDU session indication	Always-on PDU session indication 9.11.4.3	O	TV	1
75	Mapped EPS bearer contexts	Mapped EPS bearer contexts 9.11.4.8	O	TLV-E	7-65538
78	EAP message	EAP message 9.11.2.2	O	TLV-E	7-1503
79	Authorized QoS flow descriptions	QoS flow descriptions 9.11.4.12	O	TLV-E	6-65538
7B	Extended protocol configuration options	Extended protocol configuration options 9.11.4.6	O	TLV-E	4-65538
25	DNN	DNN 9.11.2.1B	O	TLV	3-102
17	5GSM network feature support	5GSM network feature support 9.11.4.18	O	TLV	3-15
18	Serving PLMN rate control	Serving PLMN rate control 9.11.4.20	O	TLV	4
77	ATSSS container	ATSSS container 9.11.4.22	O	TLV-E	3-65538
C-	Control plane only indication	Control plane only indication 9.11.4.23	O	TV	1
66	IP header compression configuration	IP header compression configuration 9.11.4.24	O	TLV	5-257
1F	Ethernet header compression configuration	Ethernet header compression configuration 9.11.4.28	O	TLV	3
72	Service-level-AA container	Service-level-AA container 9.11.2.10	O	TLV-E	4-65538
71	Received MBS container	Received MBS container 9.11.4.31	O	TLV-E	9-65538
70	N3QAI	N3QAI 9.11.4.36	O	TLV-E	9-n
73	Protocol description	Protocol description 9.11.4.39	O	TLV-E	6-n
38	ECN marking for L4S indication	ECN marking for L4S indication 9.11.4.40	O	TLV	2-257

8.3.2.2 5GSM cause

This IE is included when the selected PDU session type is different from the PDU session type requested by the UE.

8.3.2.3 PDU address

This IE is included when the selected PDU session type is "IPv4", "IPv6" or "IPv4v6".

8.3.2.4 RQ timer value

This IE is included when the network needs to provide the RQ timer value.

8.3.2.5 S-NSSAI

This IE shall be included in the message when the SMF received from the AMF an S-NSSAI together with the PDU SESSION ESTABLISHMENT REQUEST message, the PDU session is a non-emergency PDU session and the UE is not registered for onboarding services in SNPN.

8.3.2.6 Always-on PDU session indication

The network shall include this IE if the network decides to inform the UE whether the PDU session is established as an always-on PDU session.

8.3.2.7 Mapped EPS bearer contexts

This IE is included when interworking with EPS is supported for the PDU session.

8.3.2.8 EAP message

This IE is included when the external DN successfully performed authentication and authorization of the UE using EAP.

8.3.2.9 Authorized QoS flow descriptions

This IE is included when the network needs to provide authorized QoS flow descriptions.

8.3.2.10 Extended protocol configuration options

This IE is included in the message when the network needs to transmit (protocol) data (e.g. configuration parameters, error codes or messages/events) to the UE.

8.3.2.11 DNN

The IE shall be included in the message when the PDU session is a non-emergency PDU session and the UE is not registered for onboarding services in SNPN.

8.3.2.12 5GSM network feature support

This IE is included when the network needs to indicate support of 5GSM network features.

8.3.2.13 Void

8.3.2.14 Serving PLMN rate control

This IE shall be included when the network needs to indicate the maximum uplink control plane user data the UE is allowed to send per 6 minute interval.

8.3.2.15 ATSSS container

The IE shall be included in the message when the PDU session is an MA PDU session.

8.3.2.16 Control plane only indication

The network shall include the control plane only indication IE if the network determines that the associated PDU session is only for control plane CIoT 5GS optimization.

8.3.2.17 IP header compression configuration

The SMF may include the IP header compression configuration IE if:

- the network accepts an IP PDU session type;
- control plane CIoT 5GS optimization is selected; and
- the UE provided the IP header compression configuration IE in the PDU SESSION ESTABLISHMENT REQUEST message.

8.3.2.18 Ethernet header compression configuration

The SMF may include the Ethernet header compression configuration IE if:

- the network accepts an Ethernet PDU session type;
- control plane CIoT 5GS optimization is selected; and
- the UE provided the Ethernet header compression configuration IE in the PDU SESSION ESTABLISHMENT REQUEST message.

8.3.2.19 Service-level-AA container

The SMF shall include the Service-level-AA container IE if the service-level authentication and authorization procedure is completed successfully by the external DN.

8.3.2.20 Received MBS container

The network shall include this IE if the UE has requested to join one or more multicast MBS sessions.

8.3.2.21 N3QAI

This IE is included when the network needs to provide the N3QAI to the UE.

8.3.2.22 Protocol description

This IE is included when the network needs to indicate the protocol description for UL PDU set based handling to the UE.

8.3.2.23 ECN marking for L4S indication

This IE is included when the network determines the ECN marking for L4S for the 5G-RG.

8.3.3 PDU session establishment reject

8.3.3.1 Message definition

The PDU SESSION ESTABLISHMENT REJECT message is sent by the SMF to the UE in response to PDU SESSION ESTABLISHMENT REQUEST message and indicates unsuccessful establishment of a PDU session. See table 8.3.3.1.1.

Message type: PDU SESSION ESTABLISHMENT REJECT

Significance: dual

Direction: network to UE

Table 8.3.3.1.1: PDU SESSION ESTABLISHMENT REJECT message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	PDU session ID	PDU session identity 9.4	M	V	1
	PTI	Procedure transaction identity 9.6	M	V	1
	PDU SESSION ESTABLISHMENT REJECT message identity	Message type 9.7	M	V	1
	5GSM cause	5GSM cause 9.11.4.2	M	V	1
37	Back-off timer value	GPRS timer 3 9.11.2.5	O	TLV	3
F-	Allowed SSC mode	Allowed SSC mode 9.11.4.5	O	TV	1
78	EAP message	EAP message 9.11.2.2	O	TLV-E	7-1503
61	5GSM congestion re-attempt indicator	5GSM congestion re-attempt indicator 9.11.4.21	O	TLV	3
7B	Extended protocol configuration options	Extended protocol configuration options 9.11.4.6	O	TLV-E	4-65538
1D	Re-attempt indicator	Re-attempt indicator 9.11.4.17	O	TLV	3
72	Service-level-AA container	Service-level-AA container 9.11.2.10	O	TLV-E	4-65538
77	ATSSS container	ATSSS container 9.11.4.22	O	TLV-E	3-65538

8.3.3.2 Back-off timer value

The network may include this IE if the 5GSM cause is not #28 "unknown PDU session type", #39 "reactivation requested", #46 "out of LADN service area", #50 "PDU session type IPv4 only allowed", #51 "PDU session type IPv6 only allowed", #54 "PDU session does not exist", #57 "PDU session type IPv4v6 only allowed", #58 "PDU session type Unstructured only allowed", #61 "PDU session type Ethernet only allowed", #68 "not supported SSC mode", or #86 "UAS services not allowed" to request a minimum time interval before procedure retry is allowed.

8.3.3.3 Allowed SSC mode

This IE is included when the network rejects the PDU SESSION ESTABLISHMENT REQUEST with cause #68 "not supported SSC mode".

8.3.3.4 EAP message

This IE is included when the external DN unsuccessfully performed authentication and authorization of the UE using EAP.

8.3.3.4A 5GSM congestion re-attempt indicator

The network may include this IE only if it includes the Back-off timer value IE and the 5GSM cause value is either #67 "insufficient resources for specific slice and DNN" or #69 "insufficient resources for specific slice".

8.3.3.5 Extended protocol configuration options

This IE is included in the message when the network needs to transmit (protocol) data (e.g. configuration parameters, error codes or messages/events) to the UE.

8.3.3.6 Re-attempt indicator

The network may include this IE if the network includes the Back-off timer value IE and the 5GSM cause value is not #26 "insufficient resources", #28 "unknown PDU session type", #39 "reactivation requested", #46 "out of LADN service area", #54 "PDU session does not exist", #67 "insufficient resources for specific slice and DNN", #68 "not supported SSC mode", or #69 "insufficient resources for specific slice".

8.3.3.7 Service-level-AA container

The network shall include this IE if the service-level authentication and authorization procedure has completed unsuccessfully and the 5GSM cause is #29 "user authentication or authorization failed". The network shall include the service-level-AA response if provided by the DN in the service-level-AA container.

8.3.3.8 ATSSS container

The network may include this IE to indicate the reason for the failure of the MA PDU session establishment procedure as specified in 3GPP TS 24.193 [13B].

8.3.4 PDU session authentication command

8.3.4.1 Message definition

The PDU SESSION AUTHENTICATION COMMAND message is sent by the SMF to the UE for authentication of the UE establishing the PDU session or of the UE participating in the PDU session. See table 8.3.4.1.1.

Message type: PDU SESSION AUTHENTICATION COMMAND

Significance: dual

Direction: network to UE

Table 8.3.4.1.1: PDU SESSION AUTHENTICATION COMMAND message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	PDU session ID	PDU session identity 9.4	M	V	1
	PTI	Procedure transaction identity 9.6	M	V	1
	PDU SESSION AUTHENTICATION COMMAND message identity	Message type 9.7	M	V	1
	EAP message	EAP message 9.11.2.2	M	LV-E	6-1502
7B	Extended protocol configuration options	Extended protocol configuration options 9.11.4.6	O	TLV-E	4-65538

8.3.4.2 Extended protocol configuration options

This IE is included in the message when the network needs to transmit (protocol) data (e.g. configuration parameters, error codes or messages/events) to the UE.

NOTE: How the Extended protocol configuration options IE is used by the network and the UE during the PDU session authentication and authorization procedure is not specified in this release of the specification.

8.3.4.3 Void

8.3.5 PDU session authentication complete

8.3.5.1 Message definition

The PDU SESSION AUTHENTICATION COMPLETE message is sent by the UE to the SMF in response to the PDU SESSION AUTHENTICATION COMMAND message and indicates acceptance of the PDU SESSION AUTHENTICATION COMMAND message. See table 8.3.5.1.1.

Message type: PDU SESSION AUTHENTICATION COMPLETE

Significance: dual

Direction: UE to network

Table 8.3.5.1.1: PDU SESSION AUTHENTICATION COMPLETE message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	PDU session ID	PDU session identity 9.4	M	V	1
	PTI	Procedure transaction identity 9.6	M	V	1
	PDU SESSION AUTHENTICATION COMPLETE message identity	Message type 9.7	M	V	1
	EAP message	EAP message 9.11.2.2	M	LV-E	6-1502
7B	Extended protocol configuration options	Extended protocol configuration options 9.11.4.6	O	TLV-E	4-65538

8.3.5.2 Extended protocol configuration options

This IE is included in the message when the UE needs to transmit (protocol) data (e.g. configuration parameters, error codes or messages/events) to the network.

NOTE: How the Extended protocol configuration options IE is used by the network and the UE during the PDU session authentication and authorization procedure is not specified in this release of the specification.

8.3.5.3 Void

8.3.6 PDU session authentication result

8.3.6.1 Message definition

The PDU SESSION AUTHENTICATION RESULT message is sent by the SMF to the UE for indication of successful result of authentication of the UE participating in the PDU session. See table 8.3.6.1.1.

Message type: PDU SESSION AUTHENTICATION RESULT

Significance: dual

Direction: network to UE

Table 8.3.6.1.1: PDU SESSION AUTHENTICATION RESULT message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	PDU session ID	PDU session identity 9.4	M	V	1
	PTI	Procedure transaction identity 9.6	M	V	1
	PDU SESSION AUTHENTICATION RESULT message identity	Message type 9.7	M	V	1
78	EAP message	EAP message 9.11.2.2	O	TLV-E	7-1503
7B	Extended protocol configuration options	Extended protocol configuration options 9.11.4.6	O	TLV-E	4-65538

8.3.6.2 EAP message

This IE shall be included when the external DN performs authentication and authorization of the UE using EAP and it completes successfully.

8.3.6.3 Extended protocol configuration options

This IE is included in the message when the network needs to transmit (protocol) data (e.g. configuration parameters, error codes or messages/events) to the UE.

NOTE: How the Extended protocol configuration options IE is used by the network and the UE during the PDU session authentication and authorization procedure is not specified in this release of the specification.

8.3.7 PDU session modification request

8.3.7.1 Message definition

The PDU SESSION MODIFICATION REQUEST message is sent by the UE to the SMF to request a modification of a PDU session. See table 8.3.7.1.1.

Message type: PDU SESSION MODIFICATION REQUEST

Significance: dual

Direction: UE to network

Table 8.3.7.1.1: PDU SESSION MODIFICATION REQUEST message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	PDU session ID	PDU session identity 9.4	M	V	1
	PTI	Procedure transaction identity 9.6	M	V	1
	PDU SESSION MODIFICATION REQUEST message identity	Message type 9.7	M	V	1
28	5GSM capability	5GSM capability 9.11.4.1	O	TLV	3-15
59	5GSM cause	5GSM cause 9.11.4.2	O	TV	2
55	Maximum number of supported packet filters	Maximum number of supported packet filters 9.11.4.9	O	TV	3
B-	Always-on PDU session requested	Always-on PDU session requested 9.11.4.4	O	TV	1
13	Integrity protection maximum data rate	Integrity protection maximum data rate 9.11.4.7	O	TV	3
7A	Requested QoS rules	QoS rules 9.11.4.13	O	TLV-E	7-65538
79	Requested QoS flow descriptions	QoS flow descriptions 9.11.4.12	O	TLV-E	6-65538
75	Mapped EPS bearer contexts	Mapped EPS bearer contexts 9.11.4.8	O	TLV-E	7-65538
7B	Extended protocol configuration options	Extended protocol configuration options 9.11.4.6	O	TLV-E	4-65538
74	Port management information container	Port management information container 9.11.4.27	O	TLV-E	4-65538
66	IP header compression configuration	Header compression configuration 9.11.4.24	O	TLV	5-257
1F	Ethernet header compression configuration	Ethernet header compression configuration 9.11.4.28	O	TLV	3
70	Requested MBS container	Requested MBS container 9.11.4.30	O	TLV-E	8-65538
72	Service-level-AA container	Service-level-AA container 9.11.2.10	O	TLV-E	4-65538
73	Non-3GPP delay budget	Non-3GPP delay budget 9.11.4.37	O	TLV-E	6-n
36	URSP rule enforcement reports	URSP rule enforcement reports 9.11.4.38	O	TLV	4-n
7C	Non-3GPP device information	Non-3GPP device information 9.11.4.41	O	TLV-E	7-n

NOTE: It is possible for UEs compliant with version 15.2.1 or earlier versions of this specification to send the Mapped EPS bearer contexts IE with IEI of value "7F" for this message.

8.3.7.2 5GSM capability

This IE is included in the message when UE needs to indicate the 5GSM capability IE as defined in clause 6.4.2.2.

8.3.7.3 5GSM cause

This IE is included in the message to indicate the reason for the deletion of one or more non-default QoS rules, QoS flow descriptions or mapped EPS bearer contexts.

8.3.7.4 Maximum number of supported packet filters

This IE shall be included in the message for a PDN connection established when in S1 mode, after an inter-system change from S1 mode to N1 mode, if the UE is a UE operating in single-registration mode in a network supporting N26 interface, the UE has not previously successfully performed the UE-requested PDU session modification to provide this capability, the PDU session type is "IPv4", "IPv6", "IPv4v6" or "Ethernet", and the UE can support more than 16 packet filters for this PDU session.

8.3.7.5 Always-on PDU session requested

This IE shall be included in the message for a PDN connection established when in S1 mode, after an inter-system change from S1 mode to N1 mode, if the UE is a UE operating in single-registration mode in a network supporting N26 interface, the UE has not previously successfully performed the UE-requested PDU session modification to provide this capability, and the UE requests the PDU session to be an always-on PDU session in the 5GS.

8.3.7.6 Integrity protection maximum data rate

This IE shall be included in the message for a PDN connection established when in S1 mode, after an inter-system change from S1 mode to N1 mode, if the UE is a UE operating in single-registration mode in a network supporting N26 interface, and the UE has not previously successfully performed the UE-requested PDU session modification to provide this capability.

8.3.7.7 Requested QoS rules

This IE is included in the message when the UE requests a specific QoS handling.

8.3.7.8 Requested QoS flow descriptions

This IE is included in the message when the UE requests a specific QoS flow descriptions.

8.3.7.9 Extended protocol configuration options

This IE is included in the message when the UE needs to transmit (protocol) data (e.g. configuration parameters, error codes or messages/events) to the network.

8.3.7.10 Mapped EPS bearer contexts

This IE is included when the UE requests to delete one or more mapped EPS bearer contexts.

8.3.7.11 Port management information container

This IE shall be included when the UE needs to convey a port management information container.

8.3.7.12 IP header compression configuration

This IE is included in the message:

- a) if the UE wishes to re-negotiate IP header compression configuration associated to a PDU session and both the UE and the network supports Control plane CIoT 5GS optimization and IP header compression; or
- b) to negotiate IP header compression configuration associated to a PDU session after an inter-system change from S1 mode to N1 mode when both the UE and the network support control plane CIoT 5GS optimization and IP header compression, and the UE is operating in single-registration mode in the network supporting N26 interface.

8.3.7.13 Ethernet header compression configuration

This IE is included in the message:

- a) if the UE wishes to re-negotiate Ethernet header compression configuration associated to a PDU session and both the UE and the network support Control plane ClIoT 5GS optimization and Ethernet header compression; or
- b) to negotiate Ethernet header compression configuration associated to a PDU session after an inter-system change from S1 mode to N1 mode.

8.3.7.14 Requested MBS container

This IE is included in the message when the UE requests to join or leave one or more multicast MBS sessions that are associated with the PDU session.

8.3.7.15 Service-level-AA container

This IE shall be included in the message when the UE needs to modify an established PDU session for C2 communication.

8.3.7.16 Non-3GPP delay budget

This IE is included in the message when the UE requests a specific QoS handling for the PDU session established for PIN.

8.3.7.17 URSP rule enforcement reports

This IE is included in the message when the UE sends one or more URSP rule enforcement reports to the network.

8.3.7.18 Non-3GPP device information

This IE shall be included in the message when the UE requests QoS differentiation of traffic or requests suspend of QoS differentiation of traffic from one or more non-3GPP devices connecting through the UE.

8.3.8 PDU session modification reject

8.3.8.1 Message definition

The PDU SESSION MODIFICATION REJECT message is sent by the SMF to the UE to indicate rejection of the PDU SESSION MODIFICATION REQUEST. See table 8.3.8.1.1.

Message type: PDU SESSION MODIFICATION REJECT

Significance: dual

Direction: network to UE

Table 8.3.8.1.1: PDU SESSION MODIFICATION REJECT message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	PDU session ID	PDU session identity 9.4	M	V	1
	PTI	Procedure transaction identity 9.6	M	V	1
	PDU SESSION MODIFICATION REJECT message identity	Message type 9.7	M	V	1
	5GSM cause	5GSM cause 9.11.4.2	M	V	1
37	Back-off timer value	GPRS timer 3 9.11.2.5	O	TLV	3
61	5GSM congestion re-attempt indicator	5GSM congestion re-attempt indicator 9.11.4.21	O	TLV	3
7B	Extended protocol configuration options	Extended protocol configuration options 9.11.4.6	O	TLV-E	4-65538
1D	Re-attempt indicator	Re-attempt indicator 9.11.4.17	O	TLV	3

8.3.8.2 Back-off timer value

The network may include this IE if the 5GSM cause is not #26 "insufficient resources", #37 "5GS QoS not accepted", #44 "Semantic errors in packet filter(s)", #45 "Syntactical error in packet filter(s)", #46 "out of LADN service area", #59 "unsupported 5QI value", #67 "insufficient resources for specific slice and DNN", #69 "insufficient resources for specific slice", #83 "Semantic error in the QoS operation", #84 "Syntactical error in the QoS operation" or #87 "QoS differentiation for non-3GPP device identifier(s) not available" to request a minimum time interval before procedure retry is allowed.

8.3.8.2A 5GSM congestion re-attempt indicator

The network may include this IE only if it includes the Back-off timer value IE and the 5GSM cause value is either #67 "insufficient resources for specific slice and DNN" or #69 "insufficient resources for specific slice".

8.3.8.3 Extended protocol configuration options

This IE is included in the message when the network needs to transmit (protocol) data (e.g. configuration parameters, error codes or messages/events) to the UE.

8.3.8.4 Re-attempt indicator

The network may include this IE only if it includes the Back-off timer value IE and the 5GSM cause value is not #26 "insufficient resources", #37 "5GS QoS not accepted", #44 "Semantic errors in packet filter(s)", #45 "Syntactical error in packet filter(s)", #46 "out of LADN service area", #59 "unsupported 5QI value", #67 "insufficient resources for specific slice and DNN", #69 "insufficient resources for specific slice", #83 "Semantic error in the QoS operation", #84 "Syntactical error in the QoS operation" or #87 "QoS differentiation for non-3GPP device identifier(s) not available".

8.3.9 PDU session modification command

8.3.9.1 Message definition

The PDU SESSION MODIFICATION COMMAND message is sent by the SMF to the UE to indicate a modification of a PDU session. See table 8.3.9.1.1.

Message type: PDU SESSION MODIFICATION COMMAND

Significance: dual

Direction: network to UE

Table 8.3.9.1.1: PDU SESSION MODIFICATION COMMAND message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	PDU session ID	PDU session identity 9.4	M	V	1
	PTI	Procedure transaction identity 9.6	M	V	1
	PDU SESSION MODIFICATION COMMAND message identity	Message type 9.7	M	V	1
59	5GSM cause	5GSM cause 9.11.4.2	O	TV	2
2A	Session AMBR	Session-AMBR 9.11.4.14	O	TLV	8
56	RQ timer value	GPRS timer 9.11.2.3	O	TV	2

NOTE: It is possible for networks compliant with version 15.2.1 or earlier versions of this specification to send the Mapped EPS bearer contexts IE with IEI of value "7F" for this message.

8.3.9.2 5GSM cause

This IE is included when the network performs the PDU session anchor relocation for SSC mode 3.

8.3.9.3 Session-AMBR

This IE is included when the session-AMBR of the PDU session is modified.

8.3.9.4 RQ timer value

This IE is included when the network needs to provide the RQ timer value.

8.3.9.5 Always-on PDU session indication

The network shall include this IE if the network decides to inform the UE whether the PDU session is an always-on PDU session.

8.3.9.6 Authorized QoS rules

This IE is included when the authorized QoS rules of the PDU session are modified.

8.3.9.7 Mapped EPS bearer contexts

This IE is included when interworking with EPS is supported for the PDU session and the mapped EPS bearer contexts is modified.

8.3.9.8 Authorized QoS flow descriptions

This IE is included when the authorized QoS flow descriptions of the PDU session are modified.

8.3.9.9 Extended protocol configuration options

This IE is included in the message when the network needs to transmit (protocol) data (e.g. configuration parameters, error codes or messages/events) to the UE.

8.3.9.10 Void

8.3.9.11 ATSSS container

The IE is included in the message when the network needs to indicate that the ATSSS parameters of the MA PDU session are modified.

8.3.9.12 IP header compression configuration

This IE is included in the message if the network wishes to re-negotiate IP header compression configuration associated to a PDU session and both the UE and the network support Control plane ClIoT 5GS optimization and IP header compression.

8.3.9.13 Port management information container

This IE shall be included when the network needs to convey a port management information container.

8.3.9.14 Serving PLMN rate control

This IE shall be included when the network needs to indicate the maximum uplink control plane user data the UE is allowed to send per 6 minute interval.

8.3.9.15 Ethernet header compression configuration

This IE is included in the message if the network wishes to re-negotiate Ethernet header compression configuration associated to a PDU session and both the UE and the network support Control plane ClIoT 5GS optimization and Ethernet header compression.

8.3.9.16 Received MBS container

The network shall include this IE if:

- the UE has requested to join or leave one or more multicast MBS sessions;
- the network wants to remove joined UE from one or more multicast MBS sessions; or
- the network wants to update the MBS service area of multicast MBS session that the UE has joined; or
- the network wants to update the MBS security information of multicast MBS session that the UE has joined.

8.3.9.17 Service-level-AA container

The SMF shall include the service-level-AA container IE if the service-level authentication and authorization procedure for re-authentication purpose is completed successfully by the external DN.

8.3.9.18 Alternative S-NSSAI

This IE shall be included when the network needs to provide the alternative S-NSSAI to replace the S-NSSAI of the SSC mode 1 or SSC mode 3 PDU session.

8.3.9.19 N3QAI

This IE is included when the network needs to provide the N3QAI to the UE.

8.3.9.20 Protocol description

This IE is included when the network needs to provide the protocol description for UL PDU set based handling to the UE.

8.3.9.21 ECN marking for L4S indication

This IE is included when the network determines the ECN marking for L4S for the 5G-RG.

8.3.10 PDU session modification complete

8.3.10.1 Message definition

The PDU SESSION MODIFICATION COMPLETE message is sent by the UE to the SMF in response to the PDU SESSION MODIFICATION COMMAND message and indicates an acceptance of the PDU SESSION MODIFICATION COMMAND message. See table 8.3.10.1.1.

Message type: PDU SESSION MODIFICATION COMPLETE

Significance: dual

Direction: UE to network

Table 8.3.10.1.1: PDU SESSION MODIFICATION COMPLETE message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	PDU session ID	PDU session identity 9.4	M	V	1
	PTI	Procedure transaction identity 9.6	M	V	1
	PDU SESSION MODIFICATION COMPLETE message identity	Message type 9.7	M	V	1
7B	Extended protocol configuration options	Extended protocol configuration options 9.11.4.6	O	TLV-E	4-65538
74	Port management information container	Port management information container 9.11.4.27	O	TLV-E	4-65538

NOTE: It is possible for UEs compliant with version 15.3.0 of this specification to include the 5GSM cause IE with IEI 59 in the PDU SESSION MODIFICATION COMPLETE message, and therefore the IEI 59 cannot be used for other optional IEs other than the 5GSM cause IE for future extensions of the PDU SESSION MODIFICATION COMPLETE message.

8.3.10.2 Extended protocol configuration options

This IE is included in the message when the UE needs to transmit (protocol) data (e.g. configuration parameters, error codes or messages/events) to the network.

8.3.10.3 Port management information container

This IE shall be included when the UE needs to convey a port management information container.

8.3.11 PDU session modification command reject

8.3.11.1 Message definition

The PDU SESSION MODIFICATION COMMAND REJECT message is sent by the UE to the SMF to indicate rejection of the PDU SESSION MODIFICATION COMMAND message. See table 8.3.11.1.1.

Message type: PDU SESSION MODIFICATION COMMAND REJECT

Significance: dual

Direction: UE to network

Table 8.3.11.1.1: PDU SESSION MODIFICATION COMMAND REJECT message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	PDU session ID	PDU session identity 9.4	M	V	1
	PTI	Procedure transaction identity 9.6	M	V	1
	PDU SESSION MODIFICATION COMMAND REJECT message identity	Message type 9.7	M	V	1
	5GSM cause	5GSM cause 9.11.4.2	M	V	1
7B	Extended protocol configuration options	Extended protocol configuration options 9.11.4.6	O	TLV-E	4-65538

8.3.11.2 Extended protocol configuration options

This IE is included in the message when the UE needs to transmit (protocol) data (e.g. configuration parameters, error codes or messages/events) to the network.

8.3.12 PDU session release request

8.3.12.1 Message definition

The PDU SESSION RELEASE REQUEST message is sent by the UE to the SMF to request a release of a PDU session. See table 8.3.12.1.1.

Message type: PDU SESSION RELEASE REQUEST

Significance: dual

Direction: UE to network

Table 8.3.12.1.1: PDU SESSION RELEASE REQUEST message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	PDU session ID	PDU session identity 9.4	M	V	1
	PTI	Procedure transaction identity 9.6	M	V	1
	PDU SESSION RELEASE REQUEST message identity	Message type 9.7	M	V	1
59	5GSM cause	5GSM cause 9.11.4.2	O	TV	2
7B	Extended protocol configuration options	Extended protocol configuration options 9.11.4.6	O	TLV-E	4-65538

8.3.12.2 5GSM cause

This IE is included in the message to indicate the reason for releasing the PDU session.

8.3.12.3 Extended protocol configuration options

This IE is included in the message when the UE needs to transmit (protocol) data (e.g. configuration parameters, error codes or messages/events) to the network.

8.3.13 PDU session release reject

8.3.13.1 Message definition

The PDU SESSION RELEASE REJECT message is sent by the SMF to the UE to indicate rejection of request a release of a PDU session. See table 8.3.13.1.1.

Message type: PDU SESSION RELEASE REJECT

Significance: dual

Direction: network to UE

Table 8.3.13.1.1: PDU SESSION RELEASE REJECT message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	PDU session ID	PDU session identity 9.4	M	V	1
	PTI	Procedure transaction identity 9.6	M	V	1
	PDU SESSION RELEASE REJECT message identity	Message type 9.7	M	V	1
	5GSM cause	5GSM cause 9.11.4.2	M	V	1
7B	Extended protocol configuration options	Extended protocol configuration options 9.11.4.6	O	TLV-E	4-65538

8.3.13.2 Extended protocol configuration options

This IE is included in the message when the network needs to transmit (protocol) data (e.g. configuration parameters, error codes or messages/events) to the UE.

8.3.14 PDU session release command

8.3.14.1 Message definition

The PDU SESSION RELEASE COMMAND message is sent by the SMF to the UE to indicate a release of a PDU session. See table 8.3.14.1.1.

Message type: PDU SESSION RELEASE COMMAND

Significance: dual

Direction: network to UE

Table 8.3.14.1.1: PDU SESSION RELEASE COMMAND message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	PDU session ID	PDU session identity 9.4	M	V	1
	PTI	Procedure transaction identity 9.6	M	V	1
	PDU SESSION RELEASE COMMAND message identity	Message type 9.7	M	V	1
	5GSM cause	5GSM cause 9.11.4.2	M	V	1
37	Back-off timer value	GPRS timer 3 9.11.2.5	O	TLV	3
78	EAP message	EAP message 9.11.2.2	O	TLV-E	7-1503
61	5GSM congestion re-attempt indicator	5GSM congestion re-attempt indicator 9.11.4.21	O	TLV	3
7B	Extended protocol configuration options	Extended protocol configuration options 9.11.4.6	O	TLV-E	4-65538
D-	Access type	Access type 9.11.2.1A	O	TV	1
72	Service-level-AA container	Service-level-AA container 9.11.2.10	O	TLV-E	4-65538
5A	Alternative S-NSSAI	S-NSSAI 9.11.2.8	O	TLV	3-10

8.3.14.2 Back-off timer value

The network may include this IE to request a minimum time interval before procedure retry is allowed.

8.3.14.3 EAP message

This IE is included when the external DN performs re-authentication and re-authorization of the UE using EAP and it completes unsuccessfully.

8.3.14.4 Extended protocol configuration options

This IE is included in the message when the network wants to transmit (protocol) data (e.g. configuration parameters, error codes or messages/events) to the UE.

8.3.14.5 5GSM congestion re-attempt indicator

The network may include this IE only if it includes the Back-off timer value IE and the 5GSM cause value is either #67 "insufficient resources for specific slice and DNN" or #69 "insufficient resources for specific slice".

8.3.14.6 Access type

This IE is included in the message when the network releases user-plane resources of an MA PDU session specifically over either 3GPP access or non-3GPP access.

8.3.14.7 Service-level-AA container

The SMF shall include the service-level-AA container IE if the service-level authentication and authorization procedure for re-authentication purpose is completed unsuccessfully by the external DN.

8.3.14.8 Alternative S-NSSAI

This IE shall be included when the network needs to trigger the re-establishment of the PDU Session with the alternative S-NSSAI in SSC mode 2 or SSC mode 1.

8.3.15 PDU session release complete

8.3.15.1 Message definition

The PDU SESSION RELEASE COMPLETE message is sent by the UE to the SMF in response to the PDU SESSION RELEASE COMMAND message and indicates an acceptance of a release of the PDU session. See table 8.3.15.1.1.

Message type: PDU SESSION RELEASE COMPLETE

Significance: dual

Direction: UE to network

Table 8.3.15.1.1: PDU SESSION RELEASE COMPLETE message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	PDU session ID	PDU session identity 9.4	M	V	1
	PTI	Procedure transaction identity 9.6	M	V	1
	PDU SESSION RELEASE COMPLETE message identity	Message type 9.7	M	V	1
59	5GSM cause	5GSM cause 9.11.4.2	O	TV	2
7B	Extended protocol configuration options	Extended protocol configuration options 9.11.4.6	O	TLV-E	4-65538

8.3.15.2 5GSM cause

This IE is included in the message when the UE needs to indicate to the network that an error encountered with a mandatory information element in the PDU SESSION RELEASE COMMAND message.

8.3.15.3 Extended protocol configuration options

This IE is included in the message when the UE needs to transmit (protocol) data (e.g. configuration parameters, error codes or messages/events) to the network.

8.3.16 5GSM status

8.3.16.1 Message definition

The 5GSM STATUS message is sent by the SMF or the UE to pass information on the status of the indicated PDU session and report certain error conditions. See table 8.3.16.1.1.

Message type: 5GSM STATUS

Significance: dual

Direction: both

Table 8.3.16.1.1: 5GSM STATUS message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	PDU session ID	PDU session identity 9.4	M	V	1
	PTI	Procedure transaction identity 9.6	M	V	1
	5GSM STATUS message identity	Message type 9.7	M	V	1
	5GSM cause	5GSM cause 9.11.4.2	M	V	1

8.3.17 Service-level authentication command

8.3.17.1 Message definition

The SERVICE-LEVEL AUTHENTICATION COMMAND message is sent by the SMF to the UE for service-level authentication and authorization procedure. See table 8.3.17.1.1.

Message type: SERVICE-LEVEL AUTHENTICATION COMMAND

Significance: dual

Direction: network to UE

Table 8.3.17.1.1: SERVICE-LEVEL AUTHENTICATION COMMAND message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	PDU session ID	PDU session identity 9.4	M	V	1
	PTI	Procedure transaction identity 9.6	M	V	1
	SERVICE-LEVEL AUTHENTICATION COMMAND message identity	Message type 9.7	M	V	1
	Service-level-AA container	Service-level-AA container 9.11.2.10	M	LV-E	5-65538

8.3.18 Service-level authentication complete

8.3.18.1 Message definition

The SERVICE-LEVEL AUTHENTICATION COMPLETE message is sent by the UE to the SMF in response to the SERVICE-LEVEL AUTHENTICATION COMMAND message and indicates acceptance of the SERVICE-LEVEL AUTHENTICATION COMMAND message. See table 8.3.18.1.1.

Message type: SERVICE-LEVEL AUTHENTICATION COMPLETE

Significance: dual

Direction: UE to network

Table 8.3.18.1.1: SERVICE-LEVEL AUTHENTICATION COMPLETE message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	PDU session ID	PDU session identity 9.4	M	V	1
	PTI	Procedure transaction identity 9.6	M	V	1
	SERVICE-LEVEL AUTHENTICATION COMPLETE message identity	Message type 9.7	M	V	1
	Service-level-AA container	Service-level-AA container 9.11.2.10	M	LV-E	5-65538

8.3.19 Remote UE report

8.3.19.1 Message definition

The REMOTE UE REPORT message is sent by the UE to the network to report connection or disconnection of 5G ProSe remote UE(s). See table 8.3.19.1.

Message type: REMOTE UE REPORT

Significance: dual

Direction: UE to network

Table 8.3.19.1: REMOTE UE REPORT message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	PDU session ID	PDU session identity 9.4	M	V	1
	PTI	Procedure transaction identity 9.6	M	V	1
	Remote UE report message identity	Message type 9.7	M	V	1
76	Remote UE context connected	Remote UE context list 9.11.4.29	O	TLV-E	16-65538
70	Remote UE context disconnected	Remote UE context list 9.11.4.29	O	TLV-E	16-65538

8.3.19.2 Remote UE context connected

This IE is included in the message by the UE acting as a 5G ProSe layer-3 UE-to-network relay UE to provide the network with newly connected 5G ProSe remote UE information as specified in 3GPP TS 23.304 [6E].

8.3.19.3 Remote UE context disconnected

This IE is included in the message by the UE acting as a 5G ProSe layer-3 UE-to-network relay UE to provide the network with disconnected 5G ProSe remote UE information as specified in 3GPP TS 23.304 [6E].

8.3.20 Remote UE report response

8.3.20.1 Message definition

The REMOTE UE REPORT RESPONSE message is sent by the network to the UE to acknowledge receipt of a remote UE report message. See table 8.3.20.1.

Message type: REMOTE UE REPORT RESPONSE

Significance: dual

Direction: network to UE

Table 8.3.20.1: REMOTE UE REPORT RESPONSE message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	Extended protocol discriminator	Extended protocol discriminator 9.2	M	V	1
	PDU session ID	PDU session identity 9.4	M	V	1
	PTI	Procedure transaction identity 9.6	M	V	1
	Remote UE report response message identity	Message type 9.7	M	V	1

8.3.20.2 Void

8.3.20.3 Void

8.3.20.4 Void

9 General message format and information elements coding

9.1 Overview

9.1.1 NAS message format

Within the protocols defined in the present document, every 5GS NAS message is a standard L3 message as defined in 3GPP TS 24.007 [11]. This means that the message consists of the following parts:

- 1) if the message is a plain 5GS NAS message:
 - a) extended protocol discriminator;
 - b) security header type associated with a half spare octet or PDU session identity;
 - c) procedure transaction identity;
 - d) message type;
 - e) other information elements, as required.
- 2) if the message is a security protected 5GS NAS message:
 - a) extended protocol discriminator;

- b) security header type associated with a half spare octet;
- c) message authentication code;
- d) sequence number;
- e) plain 5GS NAS message, as defined in item 1

The organization of a plain 5GS NAS message is illustrated in the example shown in figure 9.1.1.1.

Figure 9.1.1.1: General message organization example for a plain 5GS NAS message

The PDU session identity and the procedure transaction identity are only used in messages with extended protocol discriminator 5GS session management. Octet 2a with the procedure transaction identity shall only be included in these messages.

The organization of a security protected 5GS NAS message is illustrated in the example shown in figure 9.1.1.2.

Figure 9.1.1.2: General message organization example for a security protected 5GS NAS message

Unless specified otherwise in the message descriptions of clause 8 and annex D, a particular information element shall not be present more than once in a given message.

9.1.2 Field format and mapping

When a field is contained within a single octet, the lowest numbered bit of the field represents the least significant bit.

When a field extends over more than one octet, the order of bit values progressively decreases as the octet number increases. In that part of the field contained in a given octet, the lowest numbered bit represents the least significant bit. The most significant bit of the field is represented by the highest numbered bit of the lowest numbered octet of the field. The least significant bit of the field is represented by the lowest numbered bit of the highest numbered octet of the field.

For example, a bit number can be identified as a couple (o, b) where o is the octet number and b is the relative bit number within the octet. Figure 9.1.2.1 illustrates a field that spans from bit (1, 3) to bit (2, 7). The most significant bit of the field is mapped on bit (1, 3) and the least significant bit is mapped on bit (2, 7).

Figure 9.1.2.1: Field mapping convention

9.2 Extended protocol discriminator

Bits 1 to 8 of the first octet of every 5GS NAS message contain the Extended protocol discriminator (EPD) IE. The EPD and its use are defined in 3GPP TS 24.007 [11]. The extended protocol discriminator in the header (see 3GPP TS 24.007 [11]) of a security protected 5GS NAS message is encoded as "5GS mobility management messages".

9.3 Security header type

Bits 1 to 4 of the second octet of every 5GMM message contain the Security header type IE. This IE includes control information related to the security protection of a 5GMM message. The total size of the Security header type IE is 4 bits.

The Security header type IE can take the values shown in table 9.3.1.

Table 9.3.1: Security header type

Security header type (octet 1)				
Bits				
4	3	2	1	
0	0	0	0	Plain 5GS NAS message, not security protected
Security protected 5GS NAS message:				
0	0	0	1	Integrity protected
0	0	1	0	Integrity protected and ciphered
0	0	1	1	Integrity protected with new 5G NAS security context (NOTE 1)
0	1	0	0	Integrity protected and ciphered with new 5G NAS security context (NOTE 2)
All other values are reserved.				
NOTE 1: This codepoint may be used only for a SECURITY MODE COMMAND message.				
NOTE 2: This codepoint may be used only for a SECURITY MODE COMPLETE message.				

A 5GMM message received with the security header type encoded as 0000 shall be treated as not security protected, plain 5GS NAS message. A protocol entity sending a not security protected 5GMM message shall send the message as plain 5GS NAS message and encode the security header type as 0000.

9.4 PDU session identity

Bits 1 to 8 of the second octet of every 5GSM message contain the PDU session identity IE. The PDU session identity and its use to identify a message flow are defined in 3GPP TS 24.007 [11].

9.5 Spare half octet

This element is used in the description of 5GMM and 5GSM messages when an odd number of half octet type 1 information elements are used. This element is filled with spare bits set to zero and is placed in bits 5 to 8 of the octet unless otherwise specified.

9.6 Procedure transaction identity

Bits 1 to 8 of the third octet of every 5GSM message contain the procedure transaction identity. Bits 1 to 8 of the first octet of every UE policy delivery message contain the procedure transaction identity. The procedure transaction identity and its use are defined in 3GPP TS 24.007 [11].

9.7 Message type

The Message type IE and its use are defined in 3GPP TS 24.007 [11]. Tables 9.7.1 and 9.7.2 define the value part of the message type IE used in the 5GS mobility management protocol and 5GS session management protocol.

Table 9.7.1: Message types for 5GS mobility management

Bits								
8	7	6	5	4	3	2	1	
0	1	-	-	-	-	-	-	5GS mobility management messages
0	1	0	0	0	0	0	1	Registration request
0	1	0	0	0	0	1	0	Registration accept
0	1	0	0	0	0	1	1	Registration complete
0	1	0	0	0	1	0	0	Registration reject
0	1	0	0	0	1	0	1	Deregistration request (UE originating) as specified in subclause 8.2.12)
0	1	0	0	0	1	1	0	Deregistration accept (UE originating) as specified in subclause 8.2.13)
0	1	0	0	0	1	1	1	Deregistration request (UE terminated) as specified in subclause 8.2.14)
0	1	0	0	1	0	0	0	Deregistration accept (UE terminated) as specified in subclause 8.2.15)
0	1	0	0	1	1	0	0	Service request
0	1	0	0	1	1	0	1	Service reject
0	1	0	0	1	1	1	0	Service accept
0	1	0	0	1	1	1	1	Control plane service request
0	1	0	1	0	0	0	0	Network slice-specific authentication command
0	1	0	1	0	0	0	1	Network slice-specific authentication complete
0	1	0	1	0	0	1	0	Network slice-specific authentication result
0	1	0	1	0	1	0	0	Configuration update command
0	1	0	1	0	1	0	1	Configuration update complete
0	1	0	1	0	1	1	0	Authentication request
0	1	0	1	0	1	1	1	Authentication response
0	1	0	1	1	0	0	0	Authentication reject
0	1	0	1	1	0	0	1	Authentication failure
0	1	0	1	1	0	1	0	Authentication result
0	1	0	1	1	0	1	1	Identity request
0	1	0	1	1	1	0	0	Identity response

0	1	1	0	1	0	0	0	DL NAS transport
0	1	1	0	1	0	0	1	Relay key request
0	1	1	0	1	0	1	0	Relay key accept
0	1	1	0	1	0	1	1	Relay key reject
0	1	1	0	1	1	0	0	Relay authentication request
0	1	1	0	1	1	0	1	Relay authentication response

Table 9.7.2: Message types for 5GS session management

Bits								
8	7	6	5	4	3	2	1	
1	1	-	-	-	-	-	-	5GS session management messages
1	1	0	0	0	0	0	1	PDU session establishment request
1	1	0	0	0	0	1	0	PDU session establishment accept
1	1	0	0	0	0	1	1	PDU session establishment reject
1	1	0	0	0	1	0	1	PDU session authentication command
1	1	0	0	0	1	1	0	PDU session authentication complete
1	1	0	0	0	1	1	1	PDU session authentication result
1	1	0	0	1	0	0	1	PDU session modification request
1	1	0	0	1	0	1	0	PDU session modification reject
1	1	0	0	1	0	1	1	PDU session modification command
1	1	0	0	1	1	0	0	PDU session modification complete
1	1	0	0	1	1	0	1	PDU session modification command reject
1	1	0	1	0	0	0	1	PDU session release request
1	1	0	1	0	0	1	0	PDU session release reject
1	1	0	1	0	0	1	1	PDU session release command
1	1	0	1	0	1	0	0	PDU session release complete
1	1	0	1	0	1	1	0	5GSM status
1	1	0	1	1	0	0	0	Service-level authentication command
1	1	0	1	1	0	0	1	Service-level authentication complete
1	1	0	1	1	0	1	0	Remote UE report
1	1	0	1	1	0	1	1	Remote UE report response

9.8 Message authentication code

The message authentication code (MAC) information element contains the integrity protection information for the message. The MAC IE shall be included in the SECURITY PROTECTED 5GS NAS MESSAGE message if a valid 5G NAS security context exists and security functions are started.

The message authentication code (MAC) is also included in the Intra N1 mode NAS transparent container IE and in the S1 mode to N1 mode NAS transparent container IE.

The usage of MAC is specified in subclause 4.4.3.3.

9.9 Plain 5GS NAS message

This IE includes a complete plain 5GS NAS message as specified in subclauses 8.2 and 8.3. The SECURITY PROTECTED 5GS NAS MESSAGE (see subclause 8.2.28) includes a complete plain 5GS NAS message as specified in subclauses 8.2. The SECURITY PROTECTED 5GS NAS MESSAGE message (see subclause 8.2.28) is not plain 5GS NAS messages and shall not be included in this IE.

9.10 Sequence number

This IE includes the NAS message sequence number (SN) which consists of the eight least significant bits of the NAS COUNT for a SECURITY PROTECTED 5GS NAS MESSAGE message.

The NAS message sequence number (SN) with the eight least significant bits of the NAS COUNT is also included in the Intra N1 mode NAS transparent container IE and in the N1 mode to S1 mode NAS transparent container IE.

The usage of SN is specified in subclause 4.4.3.

9.11 Other information elements

9.11.1 General

The different formats (V, LV, T, TV, TLV, LV-E, TLV-E) and the five categories of information elements (type 1, 2, 3, 4 and 6) are defined in 3GPP TS 24.007 [11].

The first octet of an information element in the non-imperative part contains the IEI of the information element. If this octet does not correspond to an IEI known in the message, the receiver shall determine whether this IE is of type 1 or 2 (i.e. it is an information element of one octet length) or an IE of type 4 or 6 (i.e. that the next octet is the length indicator or, for a type 6 IE, the next 2 octets are the length indicator indicating the length of the remaining of the information element) (see 3GPP TS 24.007 [11]).

NOTE: This requirement for the receiver is not applicable for information elements included in a Type 6 IE container information element. Any IE in the Type 6 IE container information element is of type 6 with format TLV-E; therefore, the rules for the IEI value encoding defined in 3GPP TS 24.007 [11], subclause 11.2.4, are not applicable.

This allows the receiver to jump over unknown information elements and to analyse any following information elements of a particular message.

The definitions of information elements which are:

- a) common for the 5GMM and 5GSM protocols;
- b) used by access stratum protocols; or
- c) sent to upper layers

are described in subclause 9.11.2.

The information elements of the 5GMM or 5GSM protocols can be defined by reference to an appropriate specification which provides the definition of the information element, e.g., "see subclause 10.5.6.3A in 3GPP TS 24.008 [12]".

9.11.2 Common information elements

9.11.2.1 Additional information

The purpose of the Additional information information element is to provide additional information to upper layers in relation to the NAS transport mechanism.

The Additional information information element is coded as shown in figure 9.11.2.1.1 and table 9.11.2.1.1.

The Additional information is a type 4 information element with a minimum length of 3 octets.

Figure 9.11.2.1.1: Additional information information element

Table 9.11.2.1.1 : Additional information information element

Additional information value (octet 3 to octet n)
The coding of the additional information value is dependent on the LCS application.

9.11.2.1A Access type

The purpose of the access type information element is to indicate the access type over which the signalling or user data is pending to be sent to the UE.

The access type is a type 1 information element.

The access type information element is coded as shown in figure 9.11.2.1A.1 and table 9.11.2.1A.1.

Figure 9.11.2.1A.1: Access type information element

Table 9.11.2.1A.1: Access type information element

Access type value (octet 1, bit 1 to bit 2)		
Bits		
2	1	
0	1	3GPP access
1	0	Non-3GPP access
All other values are reserved.		

9.11.2.1B DNN

The purpose of the DNN information element is to identify the data network.

The DNN information element is coded as shown in figure 9.11.2.1B.1.

The DNN is a type 4 information element with a minimum length of 3 octets and a maximum length of 102 octets.

Figure 9.11.2.1B.1: DNN information element

A DNN value field contains an APN as defined in 3GPP TS 23.003 [4].

9.11.2.2 EAP message

The purpose of the EAP message information element is to transport an EAP message as specified in IETF RFC 3748 [34].

The EAP message information element is coded as shown in figure 9.11.2.2.1 and table 9.11.2.2.1.

The EAP message is a type 6 information element with minimum length of 7 octets and maximum length of 1503 octets.

Figure 9.11.2.2.1: EAP message information element

Table 9.11.2.2.1: EAP message information element

EAP message (octet 4 to n) An EAP message as specified in IETF RFC 3748 [34].

9.11.2.3 GPRS timer

See subclause 10.5.7.3 in 3GPP TS 24.008 [12].

9.11.2.4 GPRS timer 2

See subclause 10.5.7.4 in 3GPP TS 24.008 [12].

9.11.2.5 GPRS timer 3

See subclause 10.5.7.4a in 3GPP TS 24.008 [12].

9.11.2.6 Intra N1 mode NAS transparent container

The purpose of the Intra N1 mode NAS transparent container information element is to provide the UE with parameters that enable the UE to handle the 5G NAS security context after N1 mode to N1 mode handover.

The Intra N1 mode NAS transparent container information element is coded as shown in figure 9.11.2.6.1 and table 9.11.2.6.1.

The Intra N1 mode NAS transparent container is a type 4 information element with a length of 9 octets.

The value part of the Intra N1 mode NAS transparent container information element is included in specific information elements within some RRC messages sent to the UE.

NOTE: For these cases the coding of the information element identifier and length information of RRC is defined in 3GPP TS 38.331 [30].

8	7	6	5	4	3	2	1

								octet 6
Type of ciphering algorithm				Type of integrity protection algorithm				octet 7
0	0	0	KACF	TSC	Key set identifier in 5G			octet 8
		Spare						octet 9
Sequence number								

Figure 9.11.2.6.1: Intra N1 mode NAS transparent container information element

Table 9.11.2.6.1: Intra N1 mode NAS transparent container information element

Message authentication code (octet 3 to 6)
This field is coded as the Message authentication code information element (see subclause 9.8).
Type of integrity protection algorithm (octet 7, bit 1 to 4) and type of ciphering algorithm (octet 7, bit 5 to 8)
These fields are coded as the type of integrity protection algorithm and type of ciphering algorithm in the NAS security algorithms information element (see subclause 9.11.3.34).
K_AMF_change_flag (KACF) (octet 8, bit 5)
Bit
5
0 a new K _{AMF} has not been calculated by the network
1 a new K _{AMF} has been calculated by the network
Key set identifier in 5G (octet 8, bit 1 to 3) and Type of security context flag (TSC) (octet 8, bit 4)
These fields are coded as the NAS key set identifier and type of security context flag in the NAS key set identifier information element (see subclause 9.11.3.32).
Sequence number (octet 9)
This field is coded as the Sequence number information element (see subclause 9.10)

9.11.2.7 N1 mode to S1 mode NAS transparent container

The purpose of the N1 mode to S1 mode NAS transparent container information element is to provide the UE with information that enables the UE to create a mapped EPS security context.

The N1 mode to S1 mode NAS transparent container information element is coded as shown in figure 9.11.2.7.1 and table 9.11.2.7.1.

The N1 mode to S1 mode NAS transparent container is a type 3 information element with a length of 2 octets.

The value part of the N1 mode to S1 mode NAS transparent container information element is included in specific information elements within some RRC messages sent to the UE; see 3GPP TS 38.331 [30]. For these cases the coding of the information element identifier and length information is defined in 3GPP TS 38.331 [30].

Figure 9.11.2.7.1: N1 mode to S1 mode NAS transparent container information element

Table 9.11.2.7.1: N1 mode to S1 mode NAS transparent container information element

Sequence number (octet 2)
This field is coded as the Sequence number information element (see subclause 9.10).

9.11.2.8 S-NSSAI

The purpose of the S-NSSAI information element is to identify a network slice.

The S-NSSAI information element is coded as shown in figure 9.11.2.8.1 and table 9.11.2.8.1.

The S-NSSAI is a type 4 information element with a minimum length of 3 octets and a maximum length of 10 octets.

Figure 9.11.2.8.1: S-NSSAI information element

Table 9.11.2.8.1: S-NSSAI information element

Length of S-NSSAI contents (octet 2)									
This field indicates the length of the included S-NSSAI contents, and it can have the following values. Depending on the value of the length field the following S-NSSAI contents are included:									
Bits									
8	7	6	5	4	3	2	1		
0	0	0	0	0	0	0	1	SST	
0	0	0	0	0	0	1	0	SST and mapped HPLMN SST	
0	0	0	0	0	1	0	0	SST and SD	
0	0	0	0	0	1	0	1	SST, SD and mapped HPLMN SST	
0	0	0	0	1	0	0	0	SST, SD, mapped HPLMN SST and mapped HPLMN SD	
All other values are reserved.									
Slice/service type (SST) (octet 3)									
This field contains the 8 bit SST value. The coding of the SST value part is defined in 3GPP TS 23.003 [4]. If this IE is included during the network slice-specific authentication and authorization procedure, this field contains the 8 bit SST value of an S-NSSAI in the S-NSSAI(s) of the HPLMN or the RSNPN.									
Slice differentiator (SD) (octet 4 to octet 6)									
This field contains the 24 bit SD value. The coding of the SD value part is defined in 3GPP TS 23.003 [4]. If this IE is included during the network slice-specific authentication and authorization procedure, this field contains the 24 bit SD value of an S-NSSAI in the S-NSSAI(s) of the HPLMN or the RSNPN.									
If the SST encoded in octet 3 is not associated with a valid SD value, and the sender needs to include a mapped HPLMN SST (octet 7) and a mapped HPLMN SD (octets 8 to 10), then the sender shall set the SD value (octets 4 to 6) to "no SD value associated with the SST".									
mapped HPLMN Slice/service type (SST) (octet 7)									
This field contains the 8 bit SST value of an S-NSSAI in the S-NSSAI(s) of the HPLMN to which the SST value is mapped. The coding of the SST value part is defined in 3GPP TS 23.003 [4].									
mapped HPLMN Slice differentiator (SD) (octet 8 to octet 10)									
This field contains the 24 bit SD value of an S-NSSAI in the S-NSSAI(s) of the HPLMN to which the SD value is mapped. The coding of the SD value part is defined in 3GPP TS 23.003 [4].									
NOTE 1: Octet 3 shall always be included.									
NOTE 2: If the octet 4 is included, then octet 5 and octet 6 shall be included.									
NOTE 3: If the octet 7 is included, then octets 8, 9, and 10 may be included.									
NOTE 4: If the octet 8 is included, then octet 9 and octet 10 shall be included.									
NOTE 5: If only HPLMN S-NSSAI or subscribed SNPN S-NSSAI is included, then octets 7 to 10 shall not be included.									

9.11.2.9 S1 mode to N1 mode NAS transparent container

The purpose of the S1 mode to N1 mode NAS transparent container information element is to provide the UE with parameters that enable the UE to create a mapped 5G NAS security context and take this context into use after inter-system change to N1 mode in 5GMM-CONNECTED mode.

The S1 mode to N1 mode NAS transparent container information element is coded as shown in figure 9.11.2.9.1 and table 9.11.2.9.1.

The S1 mode to N1 mode NAS transparent container is a type 4 information element with a length of 10 octets.

The value part of the S1 mode to N1 mode NAS transparent container information element is included in specific information elements within some RRC messages sent to the UE.

NOTE: For these cases the coding of the information element identifier and length information of RRC is defined in 3GPP TS 38.331 [30].

8	7	6	5	4	3	2	1	
S1 mode to N1 mode NAS transparent container IEI								octet 1
Length of S1 mode to N1 mode NAS transparent container contents								octet 2
Message authentication code								octet 3
								octet 6
Type of ciphering algorithm				Type of integrity protection algorithm				octet 7
0 Spare	NCC			TSC	Key set identifier in 5G			octet 8
0 Spare	0 Spare	0 Spare	0 Spare	0 Spare	0 Spare	0 Spare	0 Spare	octet 9
0 Spare	0 Spare	0 Spare	0 Spare	0 Spare	0 Spare	0 Spare	0 Spare	octet 10

Figure 9.11.2.9.1: S1 mode to N1 mode NAS transparent container information element

Table 9.11.2.9.1: S1 mode to N1 mode NAS transparent container information element

Message authentication code (octet 3 to 6)	
This field is coded as the Message authentication code information element (see subclause 9.8).	
Type of integrity protection algorithm (octet 7, bit 1 to 4) and type of ciphering algorithm (octet 7, bit 5 to 8)	
These fields are coded as the type of integrity protection algorithm and type of ciphering algorithm in the NAS security algorithms information element (see subclause 9.11.3.34).	
NCC (octet 8, bits 5 to 7)	
This field contains the 3 bit Next hop chaining counter (see 3GPP TS 33.501 [24])	
Key set identifier in 5G (octet 8, bit 1 to 3) and type of security context flag (TSC) (octet 8, bit 4)	
These fields are coded as the NAS key set identifier and type of security context flag in the NAS key set identifier information element (see subclause 9.11.3.32).	
Octets 9 and 10 are spare and shall be coded as zero.	
NOTE:	In earlier versions of this protocol, octets 9 and 10 can have any value. In this version of the protocol, octets 9 and 10 can always be ignored by the UE.

9.11.2.10 Service-level-AA container

The purpose of the Service-level-AA container information element is to transfer upper layer information for authentication and authorization between the UE and the network.

The Service-level-AA container information element is coded as shown in figure 9.11.2.10.1, figure 9.11.2.10.2, figure 9.11.2.10.3, figure 9.11.2.10.4 and table 9.11.2.10.1.

The Service-level-AA container information element is a type 6 information element with a minimum length of 4 octets and a maximum length of 65538 octets.

Figure 9.11.2.10.1: Service-level-AA container information element

Figure 9.11.2.10.2: Service-level-AA container contents

Figure 9.11.2.10.3: Service-level-AA parameter (when the type of service-level-AA parameter field contains an IEI of a type 4 information element as specified in 3GPP TS 24.007 [11])

Figure 9.11.2.10.4: Service-level-AA parameter (when the type of service-level-AA parameter field contains an IEI of a type 6 information element as specified in 3GPP TS 24.007 [11])

Figure 9.11.2.10.5: Service-level-AA parameter (when Service-level-AA payload type and its associated Service-level-AA payload are included in the Service-level-AA container contents)

Figure 9.11.2.10.6: Service-level-AA parameter (when the type of service-level-AA parameter field contains an IEI of a type 1 information element as specified in 3GPP TS 24.007 [11])

Table 9.11.2.10.1: Service-level-AA container information element

Service-level-AA container contents (octet 4 to octet n); max value of 65535 octets		
The error handlings for service-level-AA parameters specified in subclauses 7.6.1, 7.6.3 and 7.7.1 shall apply to the service-level-AA parameters included in the service-level-AA container contents.		
Service-level-AA parameters		
Type of service-level-AA parameter (octet xi +1)		
This field contains the IEI of the service-level-AA parameter.		
Length of service-level-AA parameter		
This field indicates binary coded length of the value of the service-level-AA parameter.		
Value of service-level-AA parameter		
This field contains the value of the service-level-AA parameter with the value part of the referred information element based on following service-level-AA parameter reference.		
The receiving entity shall ignore service-level-AA parameter with type of service-level-AA parameter field containing an unknown IEI.		
IEI (hexadecimal)	Service-level-AA parameter name	Service-level-AA parameter reference
10	Service-level device ID	Service-level device ID (see subclause 9.11.2.11)
20	Service-level-AA server address	Service-level-AA server address (see subclause 9.11.2.12)
30	Service-level-AA response	Service-level-AA response (see subclause 9.11.2.14)
40	Service-level-AA payload type	Service-level-AA payload type (see subclause 9.11.2.15)
70	Service-level-AA payload	(NOTE) Service-level-AA payload (see subclause 9.11.2.13)
A-	Service-level-AA pending indication	Service-level-AA pending indication (see subclause 9.11.2.17)
50	Service-level-AA service status indication	Service-level-AA service status indication (see subclause 9.11.2.18)
NOTE: A service-level-AA payload type is always followed by the associated service-level-AA payload as shown in figure 9.11.2.10.5.		

9.11.2.11 Service-level device ID

The purpose of the Service-level device ID information element is to carry the necessary identity for authentication and authorization by the external DN.

The Service-level device ID information element is coded as shown in figure 9.11.2.11.1 and table 9.11.2.11.1.

The Service-level device ID information element is a type 4 information element with minimum length of 3 octets and maximum length of 257 octets.

Figure 9.11.2.11.1: Service-level device ID information element

Table 9.11.2.11.1: Service-level device ID information element

Service-level device ID (octet 3 to octet y)
A service-level device ID encoded as UTF-8 string.

9.11.2.12 Service-level-AA server address

The purpose of the Service-level-AA server address information element is to carry the address of the service level authentication and authorization server.

The Service-level-AA server address information element is coded as shown in figure 9.11.2.12.1 and table 9.11.2.12.1.

The Service-level-AA server address information element is a type 4 information element with minimum length of 4 octets and maximum length of 257 octets.

Figure 9.11.2.12.1: Service-level-AA server address information element

Table 9.11.2.12.1: Service-level-AA server address information element

Service-level-AA server address type (octet 3):								
Bits								
8	7	6	5	4	3	2	1	
0	0	0	0	0	0	0	1	IPv4
0	0	0	0	0	0	1	0	IPv6
0	0	0	0	0	0	1	1	IPv4v6
0	0	0	0	0	1	0	0	FQDN
All other values are spare. If received they shall be ignored.								
If the service-level-AA server address type indicates IPv4, then the service-level-AA server address field contains an IPv4 address in octet 4 to octet 7.								
If the service-level-AA server address type indicates IPv6, then the service-level-AA server address field contains an IPv6 address in octet 4 to octet 19.								
If the service-level-AA server address type indicates IPv4v6, then the service-level-AA server address field contains two IP addresses. The first IP address is an IPv4 address in octet 4 to octet 7. The second IP address is an IPv6 address in octet 8 to octet 23.								
If the service-level-AA server address type indicates FQDN, octet 4 to octet z is encoded as defined in subclause 19.4.2.1 in 3GPP TS 23.003 [4].								

9.11.2.13 Service-level-AA payload

The purpose of the Service-level-AA payload information element is to carry the upper layer payload for authentication and authorization between the UE and the service-level-AA server.

The Service-level-AA payload information element is coded as shown in figure 9.11.2.13.1 and table 9.11.2.13.1.

The Service-level-AA payload information element is a type 6 information element with minimum length of 4 octets and maximum length of 65538 octets.

Figure 9.11.2.13.1: Service-level-AA payload information element

Table 9.11.2.13.1: Service-level-AA payload information element

Service-level-AA payload (octet 4 to octet s)
A payload for authentication and authorization transparently transported and which is provided from/to the upper layers.

9.11.2.14 Service-level-AA response

The purpose of the Service-level-AA response information element is to provide information regarding the service level authentication and authorization request, e.g. to indicate that the authentication and authorization request to the service level authentication server was successful, or to notify that service level authorization is revoked.

The Service-level-AA response information element is coded as shown in figure 9.11.2.14.1 and table 9.11.2.14.1.

The Service-level-AA response information element is a type 4 information element with length of 3 octets.

Figure 9.11.2.14.1: Service-level-AA response information element

Table 9.11.2.14.1: Service-level-AA response information element

Service-level-AA result field (SLAR) (octet 3, bits 1 and 2)	
Bits	
1 2	
0 0	No information
0 1	Service level authentication and authorization was successful.
1 0	Service level authentication and authorization was not successful or service level authorization is revoked.
1 1	Reserved
C2 authorization result field (C2AR) (octet 3, bits 3 and 4)	
Bits	
3 4	
0 0	No information
0 1	C2 authorization was successful.
1 0	C2 authorization was not successful or C2 authorization is revoked.
1 1	Reserved
Bits 5 to 8 of octet 3 are spare and shall be coded as zero.	

9.11.2.15 Service-level-AA payload type

The purpose of the Service-level-AA payload type information element is to indicate type of payload included in the Service-level-AA payload information element.

The Service-level-AA payload type information element is coded as shown in figure 9.11.2.15.1 and table 9.11.2.15.1.

The Service-level-AA payload type information element is a type 4 information element with length of 3 octets.

8	7	6	5	4	3	2	1	
Service-level-AA payload type IEI								octet 1
Service-level-AA payload type length								octet 2
Service-level-AA payload type								octet 3

Figure 9.11.2.15.1: Service-level-AA payload type information element

Table 9.11.2.15.1: Service-level-AA payload type information element

Service-level-AA payload type (octet 3):								
Bits								
8	7	6	5	4	3	2	1	
0	0	0	0	0	0	0	1	UUAA payload (see NOTE 1)
0	0	0	0	0	0	1	0	C2 authorization payload (see NOTE 2)
All other values are spare, and the receiving entity shall ignore the service-level-AA payload type value set to a spare value.								
NOTE 1: If the service-level-AA payload type indicates UUAA payload, the field for the service-level-AA payload of the Service-level AA payload information element is an application layer payload for UUAA procedure between the UE supporting UAS services and the USS.								
NOTE 2: If the service-level-AA payload type indicates C2 authorization payload, the field for the service-level-AA payload of the Service-level-AA payload information element is an application layer payload for C2 authorization procedure between the UE supporting UAS services and the USS.								

9.11.2.16 Void

9.11.2.17 Service-level-AA pending indication

The purpose of the Service-level-AA pending indication information element is to provide an indication that the service level authentication and authorization procedure is to be performed.

The Service-level-AA pending indication information element is coded as shown in figure 9.11.2.17.1 and table 9.11.2.17.1.

The Service-level-AA pending indication information element is a type 1 information element.

8	7	6	5	4	3	2	1	
Service-level-AA pending indication IEI				0	0	0	SLAPI	octet 1
				Spare	Spare	Spare		

Figure 9.11.2.17.1: Service-level-AA pending indication

Table 9.11.2.17.1: Service-level-AA pending indication

Service-level-AA pending indication (SLAPI) (octet 1, bit 1)	
Bit	
1	
0	reserved
1	Service-level-AA procedure is to be performed

9.11.2.18 Service-level-AA service status indication

The purpose of the Service-level-AA service status indication information element is to provide an indication of the service availability to the UE.

The Service-level-AA service status indication information element is coded as shown in figure 9.11.2.18.1 and table 9.11.2.18.1.

The Service-level-AA service status indication information element is a type 4 information element with a length of 3 octets.

Figure 9.11.2.18.1: Service-level-AA-service-status indication information element

Table 9.11.2.18.1: Service-level-AA-service-status indication information element

UAS (octet 3, bit 1)
Bit
1
0 UAS services not enabled
1 UAS services enabled
Bits 2 to 8 of octet 3 are spare and shall be encoded as zero.

9.11.2.19 Time duration

See subclause 9.9.3.68 in 3GPP TS 24.301 [15].

9.11.2.20 Unavailability information

See subclause 9.9.3.69 in 3GPP TS 24.301 [15].

9.11.2.21 Unavailability configuration

See subclause 9.9.3.70 in 3GPP TS 24.301 [15].

9.11.3 5GS mobility management (5GMM) information elements

9.11.3.1 5GMM capability

The purpose of the 5GMM capability information element is to provide the network with information concerning aspects of the UE related to the 5GCN or interworking with the EPS. The contents might affect the manner in which the network handles the operation of the UE.

The 5GMM capability information element is coded as shown in figure 9.11.3.1.1 and table 9.11.3.1.1.

The 5GMM capability is a type 4 information element with a minimum length of 3 octets and a maximum length of 15 octets.

8	7	6	5	4	3	2	1

Figure 9.11.3.1.1: 5GMM capability information element

Table 9.11.3.1.1: 5GMM capability information element

EPC NAS supported (S1 mode) (octet 3, bit 1)	
Bit	
1	
0	S1 mode not supported
1	S1 mode supported
ATTACH REQUEST message containing PDN CONNECTIVITY REQUEST message for handover support (HO attach) (octet 3, bit 2)	
Bit	
2	
0	ATTACH REQUEST message containing PDN CONNECTIVITY REQUEST message with request type set to "handover" or "handover of emergency bearer services" to transfer PDU session from N1 mode to S1 mode not supported
1	ATTACH REQUEST message containing PDN CONNECTIVITY REQUEST message with request type set to "handover" or "handover of emergency bearer services" to transfer PDU session from N1 mode to S1 mode supported
LTE Positioning Protocol (LPP) capability (octet 3, bit 3)	
This bit indicates the capability to support LTE Positioning Protocol (LPP) (see 3GPP TS 37.355 [26]).	
Bit	
3	
0	LPP in N1 mode not supported
1	LPP in N1 mode supported
Restriction on use of enhanced coverage support (RestrictEC) (octet 3, bit 4)	
This bit indicates the capability to support restriction on use of enhanced coverage.	
Bit	
4	
0	Restriction on use of enhanced coverage not supported
1	Restriction on use of enhanced coverage supported
Control plane CIoT 5GS optimization (5G-CP CIoT) (octet 3, bit 5)	
This bit indicates the capability for control plane CIoT 5GS optimization.	
Bit	
5	
0	Control plane CIoT 5GS optimization not supported
1	Control plane CIoT 5GS optimization supported
N3 data transfer (N3 data) (octet 3, bit 6)	
This bit indicates the capability for N3 data transfer.	
Bit	
6	
0	N3 data transfer supported
1	N3 data transfer not supported
IP header compression for control plane CIoT 5GS optimization (5G-IPHC-CP CIoT) (octet 3, bit 7)	
This bit indicates the capability for IP header compression for control plane CIoT 5GS optimization.	
Bit	
7	
0	IP header compression for control plane CIoT 5GS optimization not supported
1	IP header compression for control plane CIoT 5GS optimization supported
Service gap control (SGC) (octet 3, bit 8)	
Bit	
8	
0	service gap control not supported
1	service gap control supported
5G-SRVCC from NG-RAN to UTRAN (5GSRVCC) capability (octet 4, bit 1)	
This bit indicates the capability for 5G-SRVCC from NG-RAN to UTRAN (5GSRVCC) (see 3GPP TS 23.216 [6A]).	
Bit	
1	
0	5G-SRVCC from NG-RAN to UTRAN not supported
1	5G-SRVCC from NG-RAN to UTRAN supported

User plane CIoT 5GS optimization (5G-UP CIoT) (octet 4, bit 2)	
This bit indicates the capability for user plane CIoT 5GS optimization.	
Bit	
2	
0	User plane CIoT 5GS optimization not supported
1	User plane CIoT 5GS optimization supported
V2X-Uu capability (V2X-Uu) (octet 4, bit 3)	
This bit indicates the capability for V2X over Uu, as specified in 3GPP TS 24.587 [19B].	
Bit	
3	
0	V2X over Uu not supported
1	V2X over Uu supported
V2X communication over E-UTRA-PC5 capability (V2XCEPC5) (octet 4, bit 4)	
This bit indicates the capability for V2X communication over E-UTRA-PC5, as specified in 3GPP TS 24.587 [19B].	
Bit	
4	
0	V2X communication over E-UTRA-PC5 not supported
1	V2X communication over E-UTRA-PC5 supported
V2X communication over NR-PC5 capability (V2XCNPC5) (octet 4, bit 5)	
This bit indicates the capability for V2X communication over NR-PC5, as specified in 3GPP TS 24.587 [19B].	
Bit	
5	
0	V2X communication over NR-PC5 not supported
1	V2X communication over NR-PC5 supported
Location Services (5G-LCS) notification mechanisms capability (octet 4, bit 6)	
This bit indicates the capability to support Location Services (5G-LCS) notification mechanisms (see 3GPP TS 23.273 [6B]).	
Bit	
6	
0	LCS notification mechanisms not supported
1	LCS notification mechanisms supported
Network slice-specific authentication and authorization (NSSAA) (octet 4, bit 7)	
This bit indicates the capability to support network slice-specific authentication and authorization.	
Bit	
7	
0	Network slice-specific authentication and authorization not supported
1	Network slice-specific authentication and authorization supported
Radio capability signalling optimisation (RACS) capability (octet 4, bit 8)	
Bit	
8	
0	RACS not supported
1	RACS supported
Closed Access Group (CAG) capability (octet 5, bit 1)	
Bit	
1	
0	CAG not supported
1	CAG supported
WUS assistance (WUSA) information reception capability (octet 5, bit 2)	
Bit	
2	
0	WUS assistance information reception not supported
1	WUS assistance information reception supported
Multiple user-plane resources support (multipleUP) (octet 5, bit 3)	
This bit indicates the capability to support multiple user-plane resources in NB-N1 mode.	
Bit	
3	
0	Multiple user-plane resources not supported

1	Multiple user-plane resources supported
Ethernet header compression for control plane Clot 5GS optimization (5G-EHC-CP Clot) (octet 5, bit 4)	
Bit	
4	
0	Ethernet header compression for control plane Clot 5GS optimization not supported
1	Ethernet header compression for control plane Clot 5GS optimization supported
Extended rejected NSSAI support (ER-NSSAI) (octet 5, bit 5)	
This bit indicates the capability to support extended rejected NSSAI.	
Bit	
5	
0	Extended rejected NSSAI not supported
1	Extended rejected NSSAI supported
5G ProSe direct discovery (5G ProSe-dd) (octet 5, bit 6)	
This bit indicates the capability for 5G ProSe direct discovery.	
Bit	
6	
0	5G ProSe direct discovery not supported
1	5G ProSe direct discovery supported
5G ProSe direct communication (5G ProSe-dc) (octet 5, bit 7)	
This bit indicates the capability for 5G ProSe direct communication.	
Bit	
7	
0	5G ProSe direct communication not supported
1	5G ProSe direct communication supported
5G ProSe layer-2 UE-to-network-relay (5G ProSe-l2relay) (octet 5, bit 8)	
This bit indicates the capability to act as a 5G ProSe layer-2 UE-to-network relay UE.	
Bit	
8	
0	Acting as a 5G ProSe layer-2 UE-to-network relay UE not supported
1	Acting as a 5G ProSe layer-2 UE-to-network relay UE supported
5G ProSe layer-3 UE-to-network-relay (5G ProSe-l3relay) (octet 6, bit 1)	
This bit indicates the capability to act as a 5G ProSe layer-3 UE-to-network relay UE	
Bit	
1	
0	Acting as a 5G ProSe layer-3 UE-to-network relay UE not supported
1	Acting as a 5G ProSe layer-3 UE-to-network relay UE supported
5G ProSe layer-2 UE-to-network-remote (5G ProSe-l2rmt) (octet 6, bit 2)	
This bit indicates the capability to act as a 5G ProSe layer-2 UE-to-network remote UE	
Bit	
2	
0	Acting as a 5G ProSe layer-2 UE-to-network remote UE not supported
1	Acting as a 5G ProSe layer-2 UE-to-network remote UE supported
5G ProSe layer-3 UE-to-network-remote (5G ProSe-l3rmt) (octet 6, bit 3)	
This bit indicates the capability to act as a 5G ProSe layer-3 UE-to-network remote UE	
Bit	
3	
0	Acting as a 5G ProSe layer-3 UE-to-network remote UE not supported
1	Acting as a 5G ProSe layer-3 UE-to-network remote UE supported
NR paging subgroup support indication (NR-PSSI) (octet 6, bit 4)	
This bit indicates the support of PEIPS assistance information for NR paging subgrouping	
Bit	
4	
0	NR paging subgrouping not supported
1	NR paging subgrouping supported
N1 NAS signalling connection release (NCR) (octet 6, bit 5)	

This bit indicates whether N1 NAS signalling connection release is supported.

Bit

5

0 N1 NAS signalling connection release not supported

1 N1 NAS signalling connection release supported

Paging indication for voice services (PIV) (octet 6, bit 6)

This bit indicates whether paging indication for voice services is supported.

Bit

6

0 paging indication for voice services not supported

1 paging indication for voice services supported

Reject paging request (RPR) (octet 6, bit 7)

This bit indicates whether reject paging request is supported.

Bit

7

0 reject paging request not supported

1 reject paging request supported

Paging restriction (PR) (octet 6, bit 8)

This bit indicates whether paging restriction is supported.

Bit

8

0 paging restriction not supported

1 paging restriction supported

NSSRG (octet 7, bit 1)

This bit indicates the capability to support the NSSRG.

Bit

1

0 NSSRG not supported

1 NSSRG supported

Minimization of service interruption (MINT) (octet 7, bit 2)

This bit indicates the capability to support Minimization of service interruption (MINT)

Bit

2

0 MINT not supported

1 MINT supported

Event notification (EventNotification) (octet 7, bit 3)

This bit indicates the capability to support event notification for upper layers

Bit

3

0 Event notification not supported

1 Event notification supported

SOR-SNPN-SI (SOR SNPN SI) (octet 7, bit 4)

This bit indicates the capability to support SOR-SNPN-SI.

Bit

4

0 SOR-SNPN-SI not supported

1 SOR-SNPN-SI supported

Extended CAG information list support (Ex-CAG) (octet 7, bit 5)

This bit indicates the capability to support extended CAG information list.

Bit

5

0 Extended CAG information list not supported

1 Extended CAG information list supported

NSAG (octet 7, bit 6)

This bit indicates the capability to support NSAG.

Bit

6

0 NSAG not supported

1 NSAG supported

UAS (octet 7, bit 7)	
This bit indicates the capability to support UAS services.	
Bit	
7	
0	UAS services not supported
1	UAS services supported
MPS indicator update (MPSIU) (octet 7, bit 8)	
This bit indicates the capability to support MPS indicator update via the UE configuration update procedure.	
Bit	
8	
0	MPS indicator update not supported
1	MPS indicator update supported
Registration complete message for acknowledging negotiated PEIPS assistance information (RCMAP) (octet 8, bit 1)	
This bit indicates the capability for sending REGISTRATION COMPLETE message when Negotiated PEIPS assistance information IE is included in the REGISTRATION ACCEPT message.	
Bit	
1	
0	Sending of REGISTRATION COMPLETE message for negotiated PEIPS assistance information not supported
1	Sending of REGISTRATION COMPLETE message for negotiated PEIPS assistance information supported
Registration complete message for acknowledging NSAG information (RCMAN) (octet 8, bit 2)	
This bit indicates the capability for sending REGISTRATION COMPLETE message when NSAG information IE is included in the REGISTRATION ACCEPT message.	
Bit	
2	
0	Sending of REGISTRATION COMPLETE message for NSAG information not supported
1	Sending of REGISTRATION COMPLETE message for NSAG information supported
Equivalent SNPNs indicator (ESI) (octet 8, bit 3)	
This bit indicates the capability to support equivalent SNPNs.	
Bit	
3	
0	Equivalent SNPNs not supported
1	Equivalent SNPNs supported
Enhanced CAG information (ECI) (octet 8, bit 4)	
This bit indicates the capability to support enhanced CAG information.	
Bit	
4	
0	Enhanced CAG information not supported
1	Enhanced CAG information supported
Reconnection to the network due to RAN timing synchronization status change (RANtiming) (octet 8, bit 5)	
This bit indicates the capability to support Reconnection to the network due to RAN timing synchronization status change.	
Bit	
5	
0	Reconnection to the network due to RAN timing synchronization status change not supported
1	Reconnection to the network due to RAN timing synchronization status change supported
LADN per DNN and S-NSSAI support (LADN-DS) (octet 8, bit 6)	
This bit indicates the capability to support LADN per DNN and S-NSSAI.	
Bit	
6	
0	LADN per DNN and S-NSSAI not supported
1	LADN per DNN and S-NSSAI supported

Network slice replacement (NSR) (octet 8, bit 7)	
This bit indicates the capability to support network slice replacement.	
Bit	
7	
0	Network slice replacement not supported
1	Network slice replacement supported
Slice-based TNGF selection support (SBTS) (octet 8, bit 8)	
This bit indicates the capability to support slice-based TNGF selection.	
Bit	
8	
0	Slice-based TNGF selection not supported
1	Slice-based TNGF selection supported
A2X over E-UTRA-PC5 (A2XEPC5) (octet 9, bit 1)	
This bit indicates the capability for A2X over E-UTRA-PC5, as specified in 3GPP TS 24.577 [60].	
Bit	
1	
0	A2X over E-UTRA-PC5 not supported
1	A2X over E-UTRA-PC5 supported
A2X over NR-PC5 (A2XNPC5) (octet 9, bit 2)	
This bit indicates the capability for A2X over NR-PC5, as specified in 3GPP TS 24.577 [60].	
Bit	
2	
0	A2X over NR-PC5 not supported
1	A2X over NR-PC5 supported
Unavailability period (UN-PER) (octet 9, bit 3)	
This bit indicates the capability to support unavailability period.	
Bit	
3	
0	Unavailability period not supported
1	Unavailability period supported
Slice-based N3IWFselection support (SBNS) (octet 9, bit 4)	
This bit indicates the capability to support slide-based N3IWF selection	
Bit	
4	
0	Slice-based N3IWF selection not supported
1	Slice-based N3IWF selection supported
SL positioning server UE (RSLPS) (octet 9, bit 5)	
This bit indicates the capability for SL positioning server UE, as specified in 3GPP TS 24.586 [ts23586].	
Bit	
5	
0	Ranging and sidelink positioning for SL positioning server UE not supported
1	Ranging and sidelink positioning for SL positioning server UE supported
5G ProSe layer-2 UE-to-UE relay (5G ProSe-l2U2U relay) (octet 9, bit 6)	
This bit indicates the capability to act as a 5G ProSe layer-2 UE-to-UE relay UE.	
Bit	
6	
0	Acting as a 5G ProSe layer-2 UE-to-UE relay UE not supported
1	Acting as a 5G ProSe layer-2 UE-to-UE relay UE supported
5G ProSe layer-3 UE-to-UE relay (5G ProSe-l3U2U relay) (octet 9, bit 7)	
This bit indicates the capability to act as a 5G ProSe layer-3 UE-to-UE relay UE.	
Bit	
7	
0	Acting as a 5G ProSe layer-3 UE-to-UE relay UE not supported
1	Acting as a 5G ProSe layer-3 UE-to-UE relay UE supported
5G ProSe layer-2 end UE (5G ProSe-l2end) (octet 9, bit 8)	
This bit indicates the capability to act as a 5G ProSe layer-2 end UE.	
Bit	
8	
0	Acting as a 5G ProSe layer-2 UE-to-UE relay end UE not supported

1	Acting as a 5G ProSe layer-2 UE-to-UE relay end UE supported
5G ProSe layer-3 end UE (5G ProSe-l3end) (octet 10, bit 1)	
This bit indicates the capability to act as a 5G ProSe layer-3 end UE.	
Bit	
1	
0	Acting as a 5G ProSe layer-3 end UE not supported
1	Acting as a 5G ProSe layer-3 end UE supported
Ranging and sidelink positioning support (RSLP) (octet 10, bit 2)	
Bit	
2	
0	Ranging and sidelink positioning not supported
1	Ranging and sidelink positioning supported
Partial network slice (PNS) (octet 10, bit 3)	
This bit indicates whether the UE support partial network slice in the registration area.	
Bit	
3	
0	Partial network slice not supported
1	Partial network slice supported
LCS-UPP user plane positioning (LCS-UPP) (octet 10, bit 4)	
This bit indicates the capability to support LCS-UPP user plane positioning (see 3GPP TS 23.273 [6B]).	
Bit	
4	
0	User plane positioning using LCS-UPP not supported
1	User plane positioning using LCS-UPP supported
SUPL user plane positioning (SUPL) (octet 10, bit 5)	
This bit indicates the capability to support SUPL user plane positioning (see 3GPP TS 38.305 [67] and 3GPP TS 23.271 [68]).	
Bit	
5	
0	User plane positioning using SUPL not supported
1	User plane positioning using SUPL supported
S-NSSAI time validity information (TempNS) (octet 10, bit 6)	
This bit indicates the capability to support the S-NSSAI time validity information.	
Bit	
6	
0	S-NSSAI time validity information not supported
1	S-NSSAI time validity information supported
S-NSSAI location validity information (SLVI) (octet 10, bit 7)	
This bit indicates the capability to support S-NSSAI location validity information.	
Bit	
7	
0	S-NSSAI location validity information not supported
1	S-NSSAI location validity information supported
A2X over Uu capability (A2X-Uu) (octet 10, bit 8)	
This bit indicates the capability for A2X over Uu, as specified in 3GPP TS 24.577 [60].	
Bit	
8	
0	A2X over Uu not supported
1	A2X over Uu supported
MCS indicator update (MCSIU) (octet 11, bit 1)	
This bit indicates the capability to support MCS indicator update via the UE configuration update procedure.	
Bit	
1	
0	MCS indicator update not supported
1	MCS indicator update supported
Network verified UE location over satellite NG-RAN (NVL-SATNR) (octet 11, bit 2)	

This bit indicates the capability to support network verified UE location over satellite NG-RAN as specified in 3GPP TS 23.501 [8].

Bit

2

0 Network verified UE location over satellite NG-RAN not supported

1 Network verified UE location over satellite NG-RAN supported

Ranging and sidelink positioning over PC5 for located UE support (RSLPL) (octet 11, bit 3)

This bit indicates the capability to support ranging and sidelink positioning over PC5 for located UE support.

Bit

3

0 Ranging and sidelink positioning for located UE not supported

1 Ranging and sidelink positioning for located UE supported

Network slice usage control (NSUC) (octet 11, bit 4)

This bit indicates the capability to support network slice usage control.

Bit

4

0 Network slice usage control not supported

1 Network slice usage control supported

Ranging and sidelink positioning with V2X capable UE (RSLPVU) (octet 11, bit 5) (see NOTE 1)

Bit

5

0 Ranging and sidelink positioning with V2X capable UE not supported

1 Ranging and sidelink positioning with V2X capable UE supported

Ranging and sidelink positioning with 5G ProSe capable UE support (RSLPPU) (octet 11, bit 6) (see NOTE 1)

Bit

6

0 Ranging and sidelink positioning with 5G ProSe capable UE not supported

1 Ranging and sidelink positioning with 5G ProSe capable UE supported

Access technology utilization control (ATUC) (octet 11, bit 7)

This bit indicates the support of access technology utilization control.

Bit

7

0 access technology utilization control not supported

1 access technology utilization control supported

LP-WUSPS assistance information support indication (LP-WUSPSAI-SI) (octet 11, bit 8)

This bit indicates the support of LP-WUSPS assistance information.

Bit

8

0 LP-WUSPS assistance information not supported

1 LP-WUSPS assistance information supported

Operator policy for high priority access exemptions for service area restrictions (OPHPAE) (octet 12, bit 1)

This bit indicates the capability to support operator policy for high priority access exemptions for service area restrictions.

Bit

1

0 Operator policy for high priority access exemption for service area restrictions is not supported

1 Operator policy for high priority access exemption for service area restrictions is supported

5G ProSe Multi-hop relay communication indication (5G ProSe-MCI) (octet 12, bit 2) (see NOTE 2)

This bit indicates the support of multi-hop relay communication capability.

Bit

2

0 Multi-hop relay communication not supported

1 Multi-hop relay communication supported

Multiple LCS secured user plane connections (MLCSUP) (octet 12, bit 3) This bit indicates the capability to support multiple LCS secured user plane connections (see 3GPP TS 23.273 [6B]).	
Bit	
3	
0	Multiple LCS secured user plane connections not supported
1	Multiple LCS secured user plane connections supported
5G ProSe layer-3 intermediate UE-to-network relay UE (5G ProSe-L3IMrelay) (octet 12, bit 4) This bit indicates the capability to act as a 5G ProSe layer-3 intermediate UE-to-network relay UE.	
Bit	
4	
0	Acting as a 5G ProSe layer-3 intermediate UE-to-network relay UE not supported
1	Acting as a 5G ProSe layer-3 intermediate UE-to-network relay UE supported
5G ProSe layer-2 intermediate UE-to-network relay UE (5G ProSe-L2IMrelay) (octet 12, bit 5) This bit indicates the capability to act as a 5G ProSe layer-2 intermediate UE-to-network relay UE.	
Bit	
5	
0	Acting as a 5G ProSe layer-2 intermediate UE-to-network relay UE not supported
1	Acting as a 5G ProSe layer-2 intermediate UE-to-network relay UE supported
Minimization of service interruption support in EPS (MINT-EPS) (octet 12, bit 6) This bit indicates the capability to support MINT-EPS.	
Bit	
6	
0	MINT-EPS not supported
1	MINT-EPS supported
Bits 7 to 8 in octet 12 and bits in octets 13 to 15 are spare and shall be coded as zero, if the respective octet is included in the information element.	
NOTE 1: If both the RSLPVU bit is set to "Ranging and sidelink positioning with V2X capable UE not supported" and the RSLPPU bit is set to "Ranging and sidelink positioning with 5G ProSe capable UE not supported" in the 5GMM capability IE, then the receiving entity shall ignore the RSLPVU bit and the RSLPPU bit.	
NOTE 2: If the 5G ProSe-MCI bit is set to "Multi-hop relay communication supported", then at least one of the following bits should be included in the 5GMM capability IE and set to 1: "5G ProSe-I2relay", "5G ProSe-I3relay", "5G ProSe-I2rmt", "5G ProSe-I3rmt", "5G ProSe-I3U2U relay", "5G ProSe-I3end", "5G ProSe-L2IMrelay" or "5G ProSe-L3IMrelay". The UE supporting only multi-hop UE-to-network relay or multi-hop UE-to-UE relay as specified in 3GPP TS 24.554 [19E] shall set the 5G ProSe-MCI bit to "Multi-hop relay communication supported" along with the corresponding 5GMM capability IE(s).	

9.11.3.2 5GMM cause

The purpose of the 5GMM cause information element is to indicate the reason why a 5GMM request is rejected.

The 5GMM cause information element is coded as shown in figure 9.11.3.2.1 and table 9.11.3.2.1.

The 5GMM cause is a type 3 information element with length of 2 octets.

Figure 9.11.3.2.1: 5GMM cause information element

Table 9.11.3.2.1: 5GMM cause information element

Cause value (octet 2)

Bits

8 7 6 5 4 3 2 1

0	0	0	0	0	0	1	1	Illegal UE
0	0	0	0	0	1	0	1	PEI not accepted
0	0	0	0	0	1	1	0	Illegal ME
0	0	0	0	0	1	1	1	5GS services not allowed
0	0	0	0	1	0	0	1	UE identity cannot be derived by the network
0	0	0	0	1	0	1	0	Implicitly de-registered
0	0	0	0	1	0	1	1	PLMN not allowed
0	0	0	0	1	1	0	0	Tracking area not allowed
0	0	0	0	1	1	0	1	Roaming not allowed in this tracking area
0	0	0	0	1	1	1	1	No suitable cells in tracking area
0	0	0	1	0	1	0	0	MAC failure
0	0	0	1	0	1	0	1	Synch failure
0	0	0	1	0	1	1	0	Congestion
0	0	0	1	0	1	1	1	UE security capabilities mismatch
0	0	0	1	1	0	0	0	Security mode rejected, unspecified
0	0	0	1	1	0	1	0	Non-5G authentication unacceptable
0	0	0	1	1	0	1	1	N1 mode not allowed
0	0	0	1	1	1	0	0	Restricted service area
0	0	0	1	1	1	1	1	Redirection to EPC required
0	0	1	0	0	1	0	0	IAB-node operation not authorized
0	0	1	0	1	0	1	1	LADN not available
0	0	1	1	1	1	1	0	No network slices available
0	1	0	0	0	0	0	1	Maximum number of PDU sessions reached
0	1	0	0	0	0	1	1	Insufficient resources for specific slice and DNN
0	1	0	0	0	1	0	1	Insufficient resources for specific slice
0	1	0	0	0	1	1	1	ngKSI already in use
0	1	0	0	1	0	0	0	Non-3GPP access to 5GCN not allowed
0	1	0	0	1	0	0	1	Serving network not authorized
0	1	0	0	1	0	1	0	Temporarily not authorized for this SNPN
0	1	0	0	1	0	1	1	Permanently not authorized for this SNPN
0	1	0	0	1	1	0	0	Not authorized for this CAG or authorized for CAG cells only
0	1	0	0	1	1	0	1	Wireline access area not allowed
0	1	0	0	1	1	1	0	PLMN not allowed to operate at the present UE location
0	1	0	0	1	1	1	1	UAS services not allowed
0	1	0	1	0	0	0	0	Disaster roaming for the determined PLMN with disaster condition not allowed
0	1	0	1	0	0	0	1	Selected N3IWF is not compatible with the allowed NSSAI
0	1	0	1	0	0	1	0	Selected TNGF is not compatible with the allowed NSSAI
0	1	0	1	1	0	1	0	Payload was not forwarded
0	1	0	1	1	0	1	1	DNN not supported or not subscribed in the slice
0	1	0	1	1	1	0	0	Insufficient user-plane resources for the PDU session
0	1	0	1	1	1	0	1	Onboarding services terminated
0	1	0	1	1	1	1	0	User plane positioning not authorized
0	1	0	1	1	1	1	1	Semantically incorrect message
0	1	1	0	0	0	0	0	Invalid mandatory information
0	1	1	0	0	0	0	1	Message type non-existent or not implemented
0	1	1	0	0	0	1	0	Message type not compatible with the protocol state
0	1	1	0	0	0	1	1	Information element non-existent or not implemented
0	1	1	0	0	1	0	0	Conditional IE error
0	1	1	0	0	1	0	1	Message not compatible with the protocol state
0	1	1	0	1	1	1	1	Protocol error, unspecified

Any other value received by the mobile station shall be treated as 0110 1111, "protocol error, unspecified". Any other value received by the network shall be treated as 0110 1111, "protocol error, unspecified".

9.11.3.2A 5GS DRX parameters

The purpose of the 5GS DRX parameters information element is to indicate that the UE wants to use DRX and for the network to indicate the DRX cycle value to be used at paging.

The 5GS DRX parameters is a type 4 information element with a length of 3 octets.

The 5GS DRX parameters information element is coded as shown in figure 9.11.3.2A.1 and table 9.11.3.2A.1.

The value part of a DRX parameter information element is coded as shown in table 9.11.3.2A.1.

8	7	6	5	4	3	2	1	
5GS DRX parameters IEI								octet 1
Length of 5GS DRX parameters contents								octet 2
0	0	0	0	DRX value				octet 3
spare								

Figure 9.11.3.2A.1: 5GS DRX parameters information element

Table 9.11.3.2A.1: 5GS DRX parameters information element

DRX value (bits 4 to 1 of octet 3)				
This field represents the DRX cycle parameter 'T' as defined in 3GPP TS 38.304 [28] or 3GPP TS 36.304 [25C].				
Bits				
4	3	2	1	
0	0	0	0	DRX value not specified
0	0	0	1	DRX cycle parameter T = 32
0	0	1	0	DRX cycle parameter T = 64
0	0	1	1	DRX cycle parameter T = 128
0	1	0	0	DRX cycle parameter T = 256
All other values shall be interpreted as "DRX value not specified" by this version of the protocol.				
Bits 5 to 8 of octet 3 are spare and shall be coded as zero.				

9.11.3.3 5GS identity type

The purpose of the 5GS identity type information element is to specify which identity is requested.

The 5GS identity type is a type 1 information element.

The 5GS identity type information element is coded as shown in figure 9.11.3.3.1 and table 9.11.3.3.1.

8	7	6	5	4	3	2	1	
5GS identity type IEI				0 spare	Type of identity			octet 1

Figure 9.11.3.3.1: 5GS identity type information element

Table 9.11.3.3.1: 5GS identity type information element

Type of identity (octet 1)			
Bits			
3	2	1	
0	0	1	SUCI
0	1	0	5G-GUTI
0	1	1	IMEI
1	0	0	5G-S-TMSI
1	0	1	IMEISV
1	1	0	MAC address
1	1	1	EUI-64
All other values are unused and shall be interpreted as "SUCI", if received by the UE.			

9.11.3.4 5GS mobile identity

The purpose of the 5GS mobile identity information element is to provide either the SUCI, the 5G-GUTI, the IMEI, the IMEISV, the 5G-S-TMSI, the MAC address or the EUI-64.

The 5GS mobile identity information element is coded as shown in figures 9.11.3.4.1, 9.11.3.4.2, 9.11.3.4.3, 9.11.3.4.4, 9.11.3.4.5, 9.11.3.4.6, 9.11.3.4.8 and 9.11.3.4.7, and table 9.11.3.4.1.

The 5GS mobile identity is a type 6 information element with a minimum length of 4.

Figure 9.11.3.4.1: 5GS mobile identity information element for type of identity "5G-GUTI"

Figure 9.11.3.4.2: 5GS mobile identity information element for type of identity "IMEI" or "IMEISV"

Figure 9.11.3.4.6: 5GS mobile identity information element for type of identity "No identity"

Figure 9.11.3.4.7: 5GS mobile identity information element for type of identity "MAC address"

Figure 9.11.3.4.8: 5GS mobile identity information element for type of identity "EUI-64"

Table 9.11.3.4.1: 5GS mobile identity information element

Type of identity (octet 4 bits 1 to 3)

Bits

3 2 1

0	0	0	No identity (see NOTE 1)
0	0	1	SUCI
0	1	0	5G-GUTI
0	1	1	IMEI
1	0	0	5G-S-TMSI
1	0	1	IMEISV
1	1	0	MAC address
1	1	1	EUI-64

Odd/even indication (octet 4 bit 4)

Bit

4

0	even number of identity digits
1	odd number of identity digits

For the 5G-GUTI, then bits 5 to 8 of octet 4 are coded as "1111", octet 5 through 7 contain the MCC and MNC values as specified below, octet 8 through 10 contain the AMF Region ID, the AMF Set ID and the AMF Pointer values and octet 11 through 14 contain the 5G-TMSI as defined in 3GPP TS 23.003 [4].

MCC, Mobile country code (octet 5, octet 6 bits 1 to 4)

The MCC field is coded as in ITU-T Recommendation E.212 [42], annex A.

MNC, Mobile network code (octet 6 bits 5 to 8, octet 7)

The coding of this field is the responsibility of each administration but BCD coding shall be used. The MNC shall consist of 2 or 3 digits. If a network operator decides to use only two digits in the MNC, bits 5 to 8 of octet 6 shall be coded as "1111".

The MCC and MNC digits are coded as octets 6 to 8 of the Temporary mobile group identity IE in figure 10.5.154 of 3GPP TS 24.008 [12].

AMF Region ID (octet 8)

This field contains the binary encoding of the AMF Region ID. Bit 8 of octet 7 is the most significant bit and bit 1 of octet 7 is the least significant bit.

AMF Set ID (octet 9, octet 10 bits 7 to 8)

This field contains the binary encoding of the AMF Set ID. Bit 8 of octet 9 is the most significant bit and bit 7 of octet 10 is the least significant bit.

AMF Pointer (octet 10 bits 1 to 6)

This field contains the binary encoding of the AMF Pointer. Bit 6 of octet 9 is the most significant bit and bit 1 of octet 9 is the least significant bit.

5G-TMSI (octet 11 to 14)

Bit 8 of octet 11 is the most significant bit and bit 1 of octet 14 is the least significant bit.

Identity digit (octet 4 bits 5 to 8, octet 5 etc.)

For the IMEI, Identity digit field is coded using BCD coding. If the number of identity digits is even then bits 5 to 8 of the last octet shall be filled with an end mark coded as "1111". The format of the IMEI is described in 3GPP TS 23.003 [4].

For the IMEISV, Identity digit field is coded using BCD coding. Bits 5 to 8 of the last octet shall be filled with an end mark coded as "1111". The format of the IMEISV is described in 3GPP TS 23.003 [4].

For the SUCI, bit 8 of octet 4 is spare and shall be coded as zero. Bits 5-7 of octet 4 contain the SUPI format and are coded as shown below.

SUPI format (octet 4, bits 5-7)

Bits

7 6 5

0	0	0	IMSI
0	0	1	Network specific identifier
0	1	0	GCI
0	1	1	GLI

All other values are interpreted as IMSI by this version of the protocol.

For the SUCI with SUPI format "IMSI", octets 5 through 7 contain the MCC and MNC values as specified below. For subsequent fields, bit 8 of octet 8 is the most significant bit and bit 1 of the last octet the least significant bit. The required fields for the SUCI are as defined in 3GPP TS 23.003 [4].

MCC, Mobile country code (octet 5, octet 6 bits 1 to 4)

The MCC field is coded as in ITU-T Recommendation E.212 [42], annex A.

MNC, Mobile network code (octet 6 bits 5 to 8, octet 7)

The coding of this field is the responsibility of each administration but BCD coding shall be used. The MNC shall consist of 2 or 3 digits. If a network operator decides to use only two digits in the MNC, bits 5 to 8 of octet 6 shall be coded as "1111".

The MCC and MNC digits are coded as octets 6 to 8 of the Temporary mobile group identity IE in figure 10.5.154 of 3GPP TS 24.008 [12].

Routing indicator (octets 8-9)

Routing Indicator shall consist of 1 to 4 digits. The coding of this field is the responsibility of home network operator but BCD coding shall be used. If a network operator decides to assign less than 4 digits to Routing Indicator, the remaining digits shall be coded as "1111" to fill the 4 digits coding of Routing Indicator (see NOTE 2). If no Routing Indicator is configured in the USIM or the ME, the UE shall code bits 1 to 4 of octet 8 of the Routing Indicator as "0000" and the remaining digits as "1111".

Protection scheme identifier (octet 10 bits 1 to 4)

Bits

4	3	2	1	
0	0	0	0	Null scheme
0	0	0	1	ECIES scheme profile A
0	0	1	0	ECIES scheme profile B
0	0	1	1	
				to
1	0	1	1	
1	1	0	0	
				to
1	1	1	1	Operator-specific protection scheme

Bits 5-8 of octet 10 are spare and shall be coded as zero.

Home network public key identifier (octet 11)

The Home network public key identifier (PKI) field is coded as defined in 3GPP TS 23.003 [4]. Home network public key identifier shall be coded as "00000000" when Protection scheme identifier is set to "0000" (i.e. Null scheme).

Bits

8	7	6	5	4	3	2	1	
0	0	0	0	0	0	0	0	Home network PKI value 0
0	0	0	0	0	0	0	1	
								to
1	1	1	1	1	1	1	0	Home network PKI value (1-254)
1	1	1	1	1	1	1	1	Reserved

Scheme output (octets 12 to x)

The Scheme output field consists of a string of characters with a variable length or hexadecimal digits as specified in 3GPP TS 23.003 [4]. If Protection scheme identifier is set to "0000" (i.e. Null scheme), then the Scheme output consists of the MSIN and is coded using BCD coding with each digit of the MSIN coded over 4 bits. If the MSIN includes an odd number of digits, bits 5 to 8 of octet x shall be coded as "1111". If Protection scheme identifier is not "0000" (i.e. ECIES scheme profile A, ECIES scheme profile B or Operator-specific protection scheme), then Scheme output is coded as hexadecimal digits.

For the SUCI with SUPI format set to "Network specific identifier", the SUCI NAI field contains an NAI constructed as specified in subclause 28.7.3 of 3GPP TS 23.003 [4] and encoded as UTF-8 string.

For the SUCI with SUPI format set to "GCI", the SUCI NAI field contains an NAI constructed as specified in subclause 28.15.5 of 3GPP TS 23.003 [4] and encoded as UTF-8 string.

For the SUCI with SUPI format set to "GLI", the SUCI NAI field contains an NAI constructed as specified in subclause 28.16.5 of 3GPP TS 23.003 [4] and encoded as UTF-8 string.

For the 5G-S-TMSI, bits 5 to 8 of octet 4 are coded as "1111". The coding of the 5G-S-TMSI is left open for each administration.

AMF Set ID (octet 5, octet 6 bits 7 to 8)

This field contains the binary encoding of the AMF Set ID. Bit 8 of octet 5 is the most significant bit and bit 7 of octet 6 is the least significant bit.

AMF Pointer (octet 6 bits 1 to 6)

This field contains the binary encoding of the AMF Pointer. Bit 6 of octet 6 is the most significant bit and bit 1 of octet 6 is the least significant bit.

5G-TMSI (octet 7 to 10)

Bit 8 of octet 7 is the most significant bit and bit 1 of octet 10 is the least significant bit.

For Type of identity "No identity", the length of mobile identity contents parameter shall be set to 1 and the bits 4-8 of octet 4 are spare and shall be coded as zero.

MAC address usage restriction indication (MAURI) (octet 4 bit 4)

Bit

4

0 No restrictions

1 MAC address is not usable as an equipment identifier

MAC address (octets 5 to 10)

This field contains the MAC address as defined in subclause 8 of IEEE Std 802 [43]. Bit 8 of octet 5 is the most significant bit and bit 1 of octet 10 is the least significant bit.

EUI-64 (octets 5 to 12)

This field contains an EUI-64 as defined in [48].

Bit 8 of octet 5 is the most significant bit and bit 1 of octet 12 is the least significant bit.

NOTE 1: This can be used when the requested identity is not available at the UE during the identification procedure.

NOTE 2: For a 3-digit Routing Indicator, e.g "567", bits 1 to 4 of octet 8 are coded as "0101", bits 5 to 8 of octet 8 are coded as "0110", bits 1 to 4 of octet 9 are coded as "0111", bits 5 to 8 of octet 9 are coded as "1111".

9.11.3.5 5GS network feature support

The purpose of the 5GS network feature support information element is to indicate whether certain features are supported by the network.

The 5GS network feature support information element is coded as shown in figure 9.11.3.5.1 and table 9.11.3.5.1.

The 5GS network feature support is a type 4 information element with a minimum length of 3 octets and a maximum length of 6 octets.

If:

- the length of 5GS network feature support contents field is set to one, then the UE shall interpret this as a receipt of an information element with all bits of octet 4, octet 5 and octet 6 coded as zero.
- the length of 5GS network feature support contents field is set to two, the UE shall interpret this as a receipt of an information element with all bits of octet 5 and octet 6 coded as zero.
- the length of 5GS network feature support contents field is set to three, the UE shall interpret this as a receipt of an information element with all bits of octet 6 coded as zero.

IMS voice over PS session over 3GPP access indicator (IMS-VoPS-3GPP) (octet 3, bit 1)

This bit indicates the support of IMS voice over PS session over 3GPP access (see NOTE 1).

Bit

1

0 IMS voice over PS session not supported over 3GPP access

1 IMS voice over PS session supported over 3GPP access

IMS voice over PS session over non-3GPP access indicator (IMS-VoPS-N3GPP) (octet 3, bit 2)

This bit indicates the support of IMS voice over PS session over non-3GPP access.

Bit

2

0 IMS voice over PS session not supported over non-3GPP access

1 IMS voice over PS session supported over non-3GPP access

Emergency service support indicator for 3GPP access (EMC) (octet 3, bit 3 and bit 4)

These bits indicate the support of emergency services in 5GS for 3GPP access (see NOTE 1).

Bits

4 3

0 0 Emergency services not supported

0 1 Emergency services supported in NR connected to 5GCN only

1 0 Emergency services supported in E-UTRA connected to 5GCN only

1 1 Emergency services supported in NR connected to 5GCN and E-UTRA connected to 5GCN

Emergency services fallback indicator for 3GPP access (EMF) (octet 3, bit 5 and bit 6)

These bits indicate the support of emergency services fallback for 3GPP access (see NOTE 1).

Bits

6 5

0 0 Emergency services fallback not supported

0 1 Emergency services fallback supported in NR connected to 5GCN only

1 0 Emergency services fallback supported in E-UTRA connected to 5GCN only

1 1 Emergency services fallback supported in NR connected to 5GCN and E-UTRA connected to 5GCN

Interworking without N26 interface indicator (IWK N26) (octet 3, bit 7)

This bit indicates whether interworking without N26 interface is supported.

Bit

7

0 Interworking without N26 interface not supported

1 Interworking without N26 interface supported

MPS indicator (MPSI) (octet 3, bit 8)

This bit indicates the validity of MPS.

Bit

8

0 Access identity 1 not valid

1 Access identity 1 valid

Emergency service support for non-3GPP access indicator (EMCN3) (octet 4, bit 1)

This bit indicates the support of emergency services in 5GS for non-3GPP access.

Bit (see NOTE 2)

1

0 Emergency services not supported over non-3GPP access

1 Emergency services supported over non-3GPP access

MCS indicator (MCSI) (octet 4, bit 2)

This bit indicates the validity of MCS.

Bit

2

0 Access identity 2 not valid

1 Access identity 2 valid

Restriction on enhanced coverage (RestrictEC) (octet 4, bit 3 and bit 4)

These bits indicate enhanced coverage restricted information.

In WB-N1 mode these bits are set as follows:

Bits

4 3

0	0	Both CE mode A and CE mode B are not restricted
0	1	Both CE mode A and CE mode B are restricted
1	0	CE mode B is restricted
1	1	Reserved

In NB-N1 mode these bits are set as follows

Bits

4 3

0	0	Use of enhanced coverage is not restricted
0	1	Use of enhanced coverage is restricted
1	0	Reserved
1	1	Reserved

Control plane CIoT 5GS optimization (5G-CP CIoT) (octet 4, bit 5)

This bit indicates the capability for control plane CIoT 5GS optimization.

Bit

5

0	Control plane CIoT 5GS optimization not supported
1	Control plane CIoT 5GS optimization supported

N3 data transfer (N3 data) (octet 4, bit 6)

This bit indicates the capability for N3 data transfer.

Bit

6

0	N3 data transfer supported
1	N3 data transfer not supported

IP header compression for control plane CIoT 5GS optimization (5G-IPHC-CP CIoT) (octet 4, bit 7)

This bit indicates the capability for IP header compression for control plane CIoT 5GS optimization.

Bit

7

0	IP header compression for control plane CIoT 5GS optimization not supported
1	IP header compression for control plane CIoT 5GS optimization supported

User plane CIoT 5GS optimization (5G-UP CIoT) (octet 4, bit 8)

This bit indicates the capability for user plane CIoT 5GS optimization.

Bit

8

0	User plane CIoT 5GS optimization not supported
1	User plane CIoT 5GS optimization supported

Location Services indicator in 5GC (5G-LCS) (octet 5, bit 1)

Bit

1

0	Location services via 5GC not supported
1	Location services via 5GC supported

ATSSS support indicator (ATS-IND) (octet 5, bit 2)

This bit indicates the network support for ATSSS.

Bit

2

0	ATSSS not supported
1	ATSSS supported

Ethernet header compression for control plane CIoT 5GS optimization (5G-EHC-CP CIoT) (octet 5, bit 3)

This bit indicates the capability for Ethernet header compression for control plane CIoT 5GS optimization

Bit

3

0	Ethernet header compression for control plane CIoT 5GS optimization not supported
1	Ethernet header compression for control plane CIoT 5GS optimization supported
N1 NAS signalling connection release (NCR) (octet 5, bit 4) This bit indicates whether N1 NAS signalling connection release is supported.	
Bit	
4	
0	N1-NAS signalling connection release not supported
1	N1-NAS signalling connection release supported
Paging indication for voice services (PIV) (octet 5, bit 5) This bit indicates whether paging indication for voice services is supported.	
Bit	
5	
0	paging indication for voice services not supported
1	paging indication for voice services supported
Reject paging request (RPR) (octet 5, bit 6) This bit indicates whether reject paging request is supported.	
Bit	
6	
0	reject paging request not supported
1	reject paging request supported
Paging restriction (PR) (octet 5, bit 7) This bit indicates whether paging restriction is supported.	
Bit	
7	
0	paging restriction not supported
1	paging restriction supported
UN-PER (octet 5, bit 8) This bit indicates the capability to support Unavailability period	
Bit	
8	
0	unavailability period not supported
1	unavailability period supported
Non-3GPP access path switching (NAPS) (octet 6, bit 1) This bit indicates whether non-3GPP access path switching is supported.	
Bit	
1	
0	non-3GPP access path switching not supported
1	non-3GPP access path switching supported
LCS-UPP user plane positioning (LCS-UPP) (octet 6, bit 2) This bit indicates the capability to support LCS-UPP user plane positioning (see 3GPP TS 23.273 [6B]).	
Bit	
2	
0	User plane positioning using LCS-UPP not supported
1	User plane positioning using LCS-UPP supported
SUPL user plane positioning (SUPL) (octet 6, bit 3) This bit indicates the capability to support SUPL user plane positioning (see 3GPP TS 38.305 [67] and 3GPP TS 23.271 [68]).	
Bit	
3	
0	User plane positioning using SUPL not supported
1	User plane positioning using SUPL supported
Ranging and sidelink positioning support (RSLP) (octet 6, bit 4)	

This bit indicates the capability to support ranging and sidelink positioning.	
Bit	
4	
0	Ranging and sidelink positioning not supported
1	Ranging and sidelink positioning supported
Multiple LCS secured user plane connections (MLCSUP) (octet 6, bit 5)	
This bit indicates the capability to support multiple LCS secured user plane connections.	
Bit	
5	
0	Multiple LCS secured user plane connections not supported
1	Multiple LCS secured user plane connections supported
Bits 6 to 8 of octet 6 are spare and shall be coded as zero.	
NOTE 1: For a registration procedure over non-3GPP access, bit 1 of octet 3 and bits 3 to 7 of octet 3 are ignored.	
NOTE 2: For a registration procedure over 3GPP access, bit 2 of octet 3 and bit 1 of octet 4 are ignored.	

9.11.3.6 5GS registration result

The purpose of the 5GS registration result information element is to specify the result of a registration procedure.

The 5GS registration result information element is coded as shown in figure 9.11.3.6.1 and table 9.11.3.6.1.

The 5GS registration result is a type 4 information element with a length of 3 octets.

8	7	6	5	4	3	2	1

Bit 8 of octet 3 is spare and shall be coded as zero.			
NOTE: All bits other than bit 6 in octet 3 shall be ignored by the UE when the 5GS registration result IE is received in the CONFIGURATION UPDATE COMMAND message			

9.11.3.7 5GS registration type

The purpose of the 5GS registration type information element is to indicate the type of the requested registration.

The 5GS registration type information element is coded as shown in figure 9.11.3.7.1 and table 9.11.3.7.1.

The 5GS registration type is a type 1 information element with a length of 1 octet.

Figure 9.11.3.7.1: 5GS registration type information element

All other values are unused and shall be interpreted as "initial registration", if received by the network.			
Follow-on request bit (FOR) (octet 1, bit 4)			
Bit			
4			
0	No follow-on request pending		
1	Follow-on request pending		

9.11.3.8 5GS tracking area identity

The purpose of the 5GS tracking area identity information element is to provide an unambiguous identification of tracking areas within the area covered by the 5GS.

The 5GS tracking area identity information element is coded as shown in figure 9.11.3.8.1 and table 9.11.3.8.1.

The 5GS tracking area identity is a type 3 information element with a length of 7 octets.

8	7	6	5	4	3	2	1	
5GS tracking area identity IEI								octet 1
MCC digit 2				MCC digit 1				octet 2

MNC digit 2				MNC digit 1				octet 4
TAC								octet 5
TAC (continued)								octet 6
TAC (continued)								octet 7

Figure 9.11.3.8.1: 5GS tracking area identity information element

Table 9.11.3.8.1: 5GS tracking area identity information element

MCC, Mobile country code (octets 2 and 3) The MCC field is coded as in ITU-T Recommendation E212 [42], annex A. If the TAI is deleted the MCC and MNC shall take the value from the deleted TAI. In abnormal cases, the MCC stored in the UE can contain elements not in the set {0, 1 ... 9}. In such cases the UE should transmit the stored values using full hexadecimal encoding. When receiving such an MCC, the network shall treat the TAI as deleted. MNC, Mobile network code (octet 3 bits 5 to 8, octet 4) The coding of this field is the responsibility of each administration, but BCD coding shall be used. The MNC shall consist of 2 or 3 digits. For PCS 1900 for NA, Federal regulation mandates that a 3-digit MNC shall be used. However, a network operator may decide to use only two digits in the MNC in the TAI over the radio interface. In this case, bits 5 to 8 of octet 3 shall be coded as "1111". Mobile equipment shall accept a TAI coded in such a way. In abnormal cases, the MNC stored in the UE can have: - digit 1 or 2 not in the set {0, 1 ... 9}, or - digit 3 not in the set {0, 1 ... 9, F} hex. In such cases the UE shall transmit the stored values using full hexadecimal encoding. When receiving such an MNC, the network shall treat the TAI as deleted. The same handling shall apply for the network, if a 3-digit MNC is sent by the UE to a network using only a 2-digit MNC. TAC, Tracking area code (octets 5 to 7) In the TAC field bit 8 of octet 5 is the most significant bit and bit 1 of octet 7 the least significant bit. The coding of the tracking area code is the responsibility of each administration except that two values are used to mark the TAC, and hence the TAI, as deleted. Coding using full hexadecimal representation may be used. The tracking area code consists of 3 octets. If a TAI has to be deleted, then all bits of the tracking area code shall be set to one with the exception of the least significant bit which shall be set to zero. If a USIM is inserted in a mobile equipment with the tracking area code containing all zeros, then the mobile equipment shall recognise this TAC as part of a deleted TAI.

9.11.3.9 5GS tracking area identity list

The purpose of the 5GS tracking area identity list information element is to transfer a list of tracking areas from the network to the UE.

The coding of the information element allows combining different types of lists. The lists of type "00" and "01" allow a more compact encoding, when the different TAIs are sharing the PLMN identity.

The 5GS tracking area identity list information element is coded as shown in figure 9.11.3.8.1, figure 9.11.3.8.2, figure 9.11.3.9.3, figure 9.11.3.9.4 and table 9.11.3.9.1.

The 5GS tracking area identity list is a type 4 information element, with a minimum length of 9 octets and a maximum length of 114 octets. The list can contain a maximum of 16 different tracking area identities.

Figure 9.11.3.9.4: Partial tracking area identity list – type of list = "10"

Table 9.11.3.9.1: Tracking area identity list information element

Value part of the Tracking area identity list information element (octets 3 to n)

The value part of the Tracking area identity list information element consists of one or several partial tracking area identity lists. The length of each partial tracking area identity list can be determined from the 'type of list' field and the 'number of elements' field in the first octet of the partial tracking area identity list.

The UE shall store the complete list received. If more than 16 TAIs are included in this information element, the UE shall store the first 16 TAIs and ignore the remaining octets of the information element.

Partial tracking area identity list:

Type of list (octet 1)

Bits

7 6

0 0 list of TACs belonging to one PLMN or SNPN, with non-consecutive TAC values
 0 1 list of TACs belonging to one PLMN or SNPN, with consecutive TAC values
 1 0 list of TAIs belonging to different PLMNs (see NOTE)

All other values are reserved.

Number of elements (octet 1)

Bits

5 4 3 2 1

0 0 0 0 0 1 element
 0 0 0 0 1 2 elements
 0 0 0 1 0 3 elements

...

0 1 1 0 1 14 elements
 0 1 1 1 0 15 elements
 0 1 1 1 1 16 elements

All other values are unused and shall be interpreted as 16, if received by the UE.

Bit 8 of octet 1 is spare and shall be coded as zero.

For type of list = "00" and number of elements = k:

octet 2 to 4 contain the MCC+MNC, and

for $j = 1, \dots, k$:

octets $3j+2$ to $3j+4$ contain the TAC of the j -th TAI belonging to the partial list,

For type of list = "01" and number of elements = k:

octet 2 to 4 contain the MCC+MNC, and

octets 5 to 7 contain the TAC of the first TAI belonging to the partial list.

The TAC values of the other $k-1$ TAIs are TAC+1, TAC+2, ..., TAC+k-1.

For type of list = "10" and number of elements = k:

for $j = 1, \dots, k$.

octets $6j-4$ to $6j-2$ contain the MCC+MNC, and

octets $6j-1$ to $6j+1$ contain the TAC of the j -th TAI belonging to the partial list.

MCC, Mobile country code

The MCC field is coded as in ITU-T Recommendation E.212 [42], annex A.

MNC, Mobile network code

The coding of this field is the responsibility of each administration but BCD coding shall be used. The MNC shall consist of 2 or 3 digits. If a network operator decides to use only two digits in the MNC, MNC digit 3 shall be coded as "1111".

TAC, Tracking area code

In the TAC field bit 8 of the first octet is the most significant bit and bit 1 of third octet the least significant bit.
The coding of the tracking area code is the responsibility of each administration.
Coding using full hexadecimal representation may be used. The tracking area code consists of 3 octets.

NOTE: If the "list of TAIs belonging to different PLMNs" is used, the PLMNs included in the list need to be present in the list of "equivalent PLMNs". This type of list is not applicable in an SNPN.

9.11.3.9A 5GS update type

The purpose of the 5GS update type IE is to allow the UE to provide additional information to the network when performing a registration procedure.

The 5GS update type information element is coded as shown in figure 9.11.3.9A.1 and table 9.11.3.9A.1.

The 5GS update type is a type 4 information element with a length of 3 octets.

Figure 9.11.3.9A.1: 5GS update type information element

Table 9.11.3.9A.1: 5GS update type information element

SMS over NAS transport requested (SMS requested) (octet 3, bit 1)

Bits 7 to 8 of octet 3 are spare and shall be coded as zero.	

9.11.3.10 ABBA

The purpose of the ABBA information element is to enable the bidding down protection of security features.

The ABBA information element is coded as shown in figure 9.11.3.10.1 and table 9.11.3.10.1.

The ABBA is a type 4 information element with a minimum length of 4 octets and maximum length of 257 octets.

Figure 9.11.3.10.1: ABBA information element

Table 9.11.3.10.1: ABBA information element

ABBA contents (octet 3-n): indicate set of security features defined for 5GS as described in 3GPP TS 33.501 [24].
NOTE 1: If the UE receives the ABBA IE with a length that is set to a value of 2 and with a value of 0000H, the UE shall use the length and the contents of the ABBA IE as received from the network.
NOTE 2: If the UE receives the ABBA IE with a length that is set to a value larger than 2 or with a value that is different from 0000H, the UE shall use the length and the contents of the ABBA IE as received from the network.

9.11.3.11 Void

9.11.3.12 Additional 5G security information

The purpose of the Additional 5G security information information element is to provide the UE with additional security parameters (e.g. horizontal derivation parameter) or to request the UE to retransmit an initial NAS message during a security mode control procedure as defined in 3GPP TS 33.501 [24]. The UE uses these parameters for completion of security mode control procedure.

The Additional 5G security information information element is coded as shown in figure 9.11.3.12.1 and table 9.11.3.12.1.

The Additional 5G security information is a type 4 information element with a length of 3 octets.

Figure 9.11.3.12.1: Additional 5G security information information element

Table 9.11.3.12.1: Additional 5G security information information element

Horizontal derivation parameter (HDP) (octet 3, bit 1)	
0	K _{AMF} derivation is not required
1	K _{AMF} derivation is required
Retransmission of initial NAS message request (octet 3, bit 2)	
0	Retransmission of the initial NAS message not requested
1	Retransmission of the initial NAS message requested
Bits 3 to 8 of octet 3 are spare and shall be coded as zero.	

9.11.3.12A Additional information requested

The purpose of the Additional information requested information element is to enable the UE to request ciphering keys for deciphering of ciphered broadcast assistance data.

The Additional information requested information element is coded as shown in figure 9.11.3.12A.1 and table 9.11.3.12A.1.

The Additional information requested is a type 4 information element with a length of 3 octets.

8	7	6	5	4	3	2	1	
Additional information requested IEI								octet 1
Length of additional information requested contents								octet 2
0	0	0	0	0	0	0	Cipher Key	octet 3

Bit	
1	
0	ciphering keys for ciphered broadcast assistance data not requested
1	ciphering keys for ciphered broadcast assistance data requested
Bits 8 to 2 of octet 3 are spare and shall be coded as zero.	

9.11.3.13 Allowed PDU session status

The purpose of the Allowed PDU session status information element is to indicate to the network user-plane resources of PDU sessions associated with non-3GPP access that are allowed to be re-established over 3GPP access or if there is no PDU session(s) for which the UE allows the user-plane resources to be re-established over 3GPP access.

NOTE: Allowed PDU session status IE is not applicable for MA PDU session(s) in this release of specification.

The Allowed PDU session status information element is coded as shown in figure 9.11.3.13.1 and table 9.11.3.13.1.

The Allowed PDU session status is a type 4 information element with minimum length of 4 octets and maximum length of 34 octets.

8	7	6	5	4	3	2	1	
Allowed PDU session status IEI								octet 1
Length of Allowed PDU session status contents								octet 2
PSI (7)	PSI (6)	PSI (5)	PSI (4)	PSI (3)	PSI (2)	PSI (1)	PSI (0)	octet 3
PSI (15)	PSI (14)	PSI (13)	PSI (12)	PSI (11)	PSI (10)	PSI (9)	PSI (8)	octet 4
0	0	0	0	0	0	0	0	
Spare								octet 5* -34*

Figure 9.11.3.13.1: Allowed PDU session status information element

Table 9.11.3.13.1: Allowed PDU session status information element

PSI(x) shall be coded as follows:				
PSI(0):				
Bit 1 octet 3 is spare and shall be coded as zero.				
PSI(1) – PSI(15):				
0 indicates that the user-plane resources of corresponding PDU session is not allowed to be re-established over 3GPP access.				
1 indicates that the user-plane resources of corresponding PDU session can be re-established over 3GPP access.				
If there is no PDU session for which the user-plane resources can be re-established over 3GPP access, all bits in PSI(1) – PSI(15) shall be coded as zero.				
All bits in octet 5 to 34 are spare and shall be coded as zero, if the respective octet is included in the information element.				

9.11.3.14 Authentication failure parameter

See subclause 10.5.3.2.2 in 3GPP TS 24.008 [12].

9.11.3.15 Authentication parameter AUTN

See subclause 10.5.3.1.1 in 3GPP TS 24.008 [12].

9.11.3.16 Authentication parameter RAND

See subclause 10.5.3.1 in 3GPP TS 24.008 [12].

9.11.3.17 Authentication response parameter

See subclause 9.9.3.4 in 3GPP TS 24.301 [15].

9.11.3.18 Configuration update indication

The purpose of the Configuration update indication information element is to indicate the additional information associated with the generic UE configuration update procedure.

The Configuration update indication information element is coded as shown in figure 9.11.3.18.1 and table 9.11.3.18.1.

The Configuration update indication is a type 1 information element.

8	7	6	5	4	3	2	1	octet 1
Configuration update indication IEI				0 Spare	0 Spare	RED	ACK

9.11.3.18A CAG information list

The purpose of the CAG information list information element is to provide "CAG information list" or to delete the "CAG information list" at the UE.

The CAG information list information element is coded as shown in figures 9.11.3.18A.1 and 9.11.3.18A.2 and table 9.11.3.18A.1.

The CAG information list is a type 6 information element, with a minimum length of 3 octets.

Figure 9.11.3.18A.2: Entry n

Table 9.11.3.18A.1: CAG information list information element

MCC, Mobile country code (octet q+1 and bits 1 to 4 octet q+2)	
The MCC field is coded as in ITU-T Recommendation E.212 [42], annex A.	
MNC, Mobile network code (bits 5 to 8 of octet q+2 and octet q+3)	
The coding of this field is the responsibility of each administration, but BCD coding shall be used. The MNC shall consist of 2 or 3 digits. If a network operator decides to use only two digits in the MNC, bits 5 to 8 of octet q+2 shall be coded as "1111".	
The MCC and MNC digits are coded as octets 6 to 8 of the Temporary mobile group identity IE in figure 10.5.154 of 3GPP TS 24.008 [12].	
Indication that the UE is only allowed to access 5GS via CAG cells (CAGOnly) (bit 1 of octet q+4)	
Bit	
1	
0	"Indication that the UE is only allowed to access 5GS via CAG cells" is not set (i.e., the UE is allowed to access 5GS via non-CAG cells)
1	"Indication that the UE is only allowed to access 5GS via CAG cells" is set (i.e., the UE is not allowed to access 5GS via non-CAG cells)
CAG-ID m (octet q+4m+1 to octet q+4m+4)	
This field contains the 32 bit CAG-ID. The coding of the CAG-ID is defined as the CAG-Identifier in 3GPP TS 23.003 [4].	
NOTE 1: The Length of CAG information list contents shall be 0 if no subscription data for CAG information list exists.	
NOTE 2: The Length of entry contents shall be 4 if there is no allowed CAG-ID for the PLMN.	
NOTE 3: Bit 2 in octet q+4 may be set to 1 in the USIM (see 3GPP TS 31.102 [22]).	
NOTE 4: For a given PLMN ID, there shall be up to one Entry containing the MCC value and the MNC value of the PLMN ID.	

9.11.3.18B CIoT small data container

This information element is used to encapsulate the CIoT user data, SMS, or location services message with a size that is not more than 254 octets between the UE and the AMF when the UE is using control plane CIoT 5GS optimization. The CIoT small data container information element is coded as shown in figure 9.11.3.18B.1, figure 9.11.3.18B.2, figure 9.11.3.18B.3, figure 9.11.3.18B.4 and table 9.11.3.18B.1.

The CIoT small data container is a type 4 information element with a minimum length of 4 octets and a maximum length of 257 octets.

Figure 9.11.3.18B.1: CIoT small data container information element

Figure 9.11.3.18B.2: CIoT small data container contents for Data type "Control plane user data"

Figure 9.11.3.18B.3: CIoT small data container contents for Data type "Location services message container"

Figure 9.11.3.18B.4: CIoT small data container contents for Data type "SMS"

Table 9.11.3.18B.1: CIoT small data container information element

CIoT small data container contents (octet 3 to octet 257)

These octets include user data to be delivered between UE and AMF.

Data type (octet 3, bits 6 to 8)

Bits

8 7 6

0	0	0	Control plane user data
0	0	1	SMS
0	1	0	Location services message container

All other values are spare. If received they shall be ignored.

When the Data type is "Control plane user data ", the PDU session identity and Downlink data expected (DDX) fields are encoded as follows:

PDU session identity (octet 3, bits 1 to 4)

Bit

3 2 1

0	0	0	No PDU session identity assigned
0	0	1	PDU session identity value 1
0	1	0	PDU session identity value 2
0	1	1	PDU session identity value 3
1	0	0	PDU session identity value 4
1	0	1	PDU session identity value 5
1	1	0	PDU session identity value 6
1	1	1	PDU session identity value 7

Downlink data expected (DDX) (octet 3, bits 5 to 6)

Bits

5 4

0	0	No information available
0	1	No further uplink and no further downlink data transmission subsequent to the uplink data transmission is expected
1	0	Only a single downlink data transmission and no further uplink data transmission subsequent to the uplink data transmission is expected
1	1	reserved

NOTE: The DDX field is only used in the UE to network direction.

Data contents (octet 4 to octet 257)

This field contains the control plane user data.

When the Data type is "SMS", Bits 1 to 5 of octet 3 are spare and shall be coded as zero.

Data contents (octet 4 to octet 257)

This field contains an SMS message.

When the Data type is "Location services message container":

Downlink data expected (DDX) (octet 3, bits 5 to 4)

This field is encoded as described above for the case when the Data type is "Control plane user data".

Bits 3 to 1 of octet 3 are spare and shall be encoded as zero.

Length of Additional information (octet 4) (see NOTE)

Indicates the length, in octets, of the Additional information field.

Additional information (octets 5 to m)

Contains additional information if provided by the upper layer location services application.

Data contents (octets m+1 to n)

Contains the location services message payload.

NOTE: The Length of Additional information shall be set to zero if the upper layer location service application does not provide routing information.

9.11.3.18C Cipherring key data

The purpose of the Cipherring key data information element is to transfer a list of cipherring data sets from the network to the UE for deciphering of ciphered assistance data.

The Cipherring key data information element is coded as shown in figure 9.11.3.18C.1, figure 9.11.3.18C.2 and table 9.11.3.18C.1.

The Cipherring key data is a type 6 information element, with a minimum length of 34 octets and a maximum length of 2675 octets. The list can contain a maximum of 16 cipherring data sets.

Figure 9.11.3.18C.2: Ciphering data set

Table 9.11.3.18C.1: Ciphering key data information element

Value part of the Ciphering key data information element (octets 4 to n)

The value part of the Ciphering key data information element consists of one or several ciphering data sets.

The UE shall store the complete list received. If more than 16 ciphering data sets are included in this information element, the UE shall store the first 16 ciphering data sets and ignore the remaining octets of the information element.

Ciphering data set:

Ciphering set ID (octets 1 to 2)

This field contains the binary encoding of the ID identifying the ciphering set.

Ciphering key (octets 3 to octet 18)

This field contains the 128 bit ciphering key.

c0 length (octet 19, bits 5 to 1)

This field contains the binary encoding of the length, in octets, of the c0 counter. The maximum value for the length of the c0 counter is 16 octets.

Bits 8 to 6 of octet 19 are spare and shall be coded as zero.

c0 (octets 20 to k)

This field contains the binary encoding of the c0 counter.

E-UTRA posSIB length (octet k+1, bits 4 to 1)

This field contains the length in octets of the E-UTRA Positioning SIB types. A length of zero means E-UTRA Positioning SIB types are not included (see NOTE).

E-UTRA Positioning SIB types for which the ciphering data set is applicable (octets k+2 to p). Unassigned bits shall be ignored by a UE. Non-included bits shall be assumed to be zero by a UE.

Ciphering data set applicable for positioning SIB type 1-1 (octet k+2, bit 8)

0	Ciphering data set not applicable to positioning SIB type 1-1
1	Ciphering data set applicable to positioning SIB type 1-1

Ciphering data set applicable for positioning SIB type 1-2 (octet k+2, bit 7)

0	Ciphering data set not applicable to positioning SIB type 1-2
1	Ciphering data set applicable to positioning SIB type 1-2

Ciphering data set applicable for positioning SIB type 1-3 (octet k+2, bit 6)

0	Ciphering data set not applicable to positioning SIB type 1-3
1	Ciphering data set applicable to positioning SIB type 1-3

Ciphering data set applicable for positioning SIB type 1-4 (octet k+2, bit 5)

0	Ciphering data set not applicable to positioning SIB type 1-4
1	Ciphering data set applicable to positioning SIB type 1-4

Ciphering data set applicable for positioning SIB type 1-5 (octet k+2, bit 4)

0	Ciphering data set not applicable to positioning SIB type 1-5
1	Ciphering data set applicable to positioning SIB type 1-5

Ciphering data set applicable for positioning SIB type 1-6 (octet k+2, bit 3)

0	Ciphering data set not applicable to positioning SIB type 1-6
1	Ciphering data set applicable to positioning SIB type 1-6

Ciphering data set applicable for positioning SIB type 1-7 (octet k+2, bit 2)

0	Ciphering data set not applicable to positioning SIB type 1-7
1	Ciphering data set applicable to positioning SIB type 1-7

Cipherring data set applicable for positioning SIB type 1-8 (octet k+2, bit 1)	
0	Cipherring data set not applicable to positioning SIB type 1-8
1	Cipherring data set applicable to positioning SIB type 1-8
Cipherring data set applicable for positioning SIB type 2-1 (octet k+3, bit 8)	
0	Cipherring data set not applicable to positioning SIB type 2-1
1	Cipherring data set applicable to positioning SIB type 2-1
Cipherring data set applicable for positioning SIB type 2-2 (octet k+3, bit 7)	
0	Cipherring data set not applicable to positioning SIB type 2-2
1	Cipherring data set applicable to positioning SIB type 2-2
Cipherring data set applicable for positioning SIB type 2-3 (octet k+3, bit 6)	
0	Cipherring data set not applicable to positioning SIB type 2-3
1	Cipherring data set applicable to positioning SIB type 2-3
Cipherring data set applicable for positioning SIB type 2-4 (octet k+3, bit 5)	
0	Cipherring data set not applicable to positioning SIB type 2-4
1	Cipherring data set applicable to positioning SIB type 2-4
Cipherring data set applicable for positioning SIB type 2-5 (octet k+3, bit 4)	
0	Cipherring data set not applicable to positioning SIB type 2-5
1	Cipherring data set applicable to positioning SIB type 2-5
Cipherring data set applicable for positioning SIB type 2-6 (octet k+3, bit 3)	
0	Cipherring data set not applicable to positioning SIB type 2-6
1	Cipherring data set applicable to positioning SIB type 2-6
Cipherring data set applicable for positioning SIB type 2-7 (octet k+3, bit 2)	
0	Cipherring data set not applicable to positioning SIB type 2-7
1	Cipherring data set applicable to positioning SIB type 2-7
Cipherring data set applicable for positioning SIB type 2-8 (octet k+3, bit 1)	
0	Cipherring data set not applicable to positioning SIB type 2-8
1	Cipherring data set applicable to positioning SIB type 2-8
Cipherring data set applicable for positioning SIB type 2-9 (octet k+4, bit 8)	
0	Cipherring data set not applicable to positioning SIB type 2-9
1	Cipherring data set applicable to positioning SIB type 2-9
Cipherring data set applicable for positioning SIB type 2-10 (octet k+4, bit 7)	
0	Cipherring data set not applicable to positioning SIB type 2-10
1	Cipherring data set applicable to positioning SIB type 2-10
Cipherring data set applicable for positioning SIB type 2-11 (octet k+4, bit 6)	
0	Cipherring data set not applicable to positioning SIB type 2-11
1	Cipherring data set applicable to positioning SIB type 2-11
Cipherring data set applicable for positioning SIB type 2-12 (octet k+4, bit 5)	
0	Cipherring data set not applicable to positioning SIB type 2-12
1	Cipherring data set applicable to positioning SIB type 2-12
Cipherring data set applicable for positioning SIB type 2-13 (octet k+4, bit 4)	
0	Cipherring data set not applicable to positioning SIB type 2-13
1	Cipherring data set applicable to positioning SIB type 2-13
Cipherring data set applicable for positioning SIB type 2-14 (octet k+4, bit 3)	
0	Cipherring data set not applicable to positioning SIB type 2-14
1	Cipherring data set applicable to positioning SIB type 2-14
Cipherring data set applicable for positioning SIB type 2-15 (octet k+4, bit 2)	
0	Cipherring data set not applicable to positioning SIB type 2-15
1	Cipherring data set applicable to positioning SIB type 2-15
Cipherring data set applicable for positioning SIB type 2-16 (octet k+4, bit 1)	
0	Cipherring data set not applicable to positioning SIB type 2-16

1	Ciphering data set applicable to positioning SIB type 2-16
Ciphering data set applicable for positioning SIB type 2-17 (octet k+5, bit 8)	
0	Ciphering data set not applicable to positioning SIB type 2-17
1	Ciphering data set applicable to positioning SIB type 2-17
Ciphering data set applicable for positioning SIB type 2-18 (octet k+5, bit 7)	
0	Ciphering data set not applicable to positioning SIB type 2-18
1	Ciphering data set applicable to positioning SIB type 2-18
Ciphering data set applicable for positioning SIB type 2-19 (octet k+5, bit 6)	
0	Ciphering data set not applicable to positioning SIB type 2-19
1	Ciphering data set applicable to positioning SIB type 2-19
Ciphering data set applicable for positioning SIB type 2-20 (octet k+5, bit 5)	
0	Ciphering data set not applicable to positioning SIB type 2-20
1	Ciphering data set applicable to positioning SIB type 2-20
Ciphering data set applicable for positioning SIB type 2-21 (octet k+5, bit 4)	
0	Ciphering data set not applicable to positioning SIB type 2-21
1	Ciphering data set applicable to positioning SIB type 2-21

0	Ciphering data set not applicable to positioning SIB type 1-9
1	Ciphering data set applicable to positioning SIB type 1-9
Ciphering data set applicable for positioning SIB type 1-10 (octet p+7, bit 7)	
0	Ciphering data set not applicable to positioning SIB type 1-10
1	Ciphering data set applicable to positioning SIB type 1-10
Ciphering data set applicable for positioning SIB type 2-24 (octet p+7, bit 6)	
0	Ciphering data set not applicable to positioning SIB type 2-24
1	Ciphering data set applicable to positioning SIB type 2-24
Ciphering data set applicable for positioning SIB type 2-25 (octet p+7, bit 5)	
0	Ciphering data set not applicable to positioning SIB type 2-25
1	Ciphering data set applicable to positioning SIB type 2-25
Ciphering data set applicable for positioning SIB type 2-17a (octet p+7 bit 4)	

0	Ciphering data set not applicable to positioning SIB type 2-17a
1	Ciphering data set applicable to positioning SIB type 2-17a
Ciphering data set applicable for positioning SIB type 2-18a (octet p+7, bit 3)	
0	Ciphering data set not applicable to positioning SIB type 2-18a
1	Ciphering data set applicable to positioning SIB type 2-18a
Ciphering data set applicable for positioning SIB type 2-20a (octet p+7, bit 2)	
0	Ciphering data set not applicable to positioning SIB type 2-20a
1	Ciphering data set applicable to positioning SIB type 2-20a
Ciphering data set applicable for positioning SIB type 2-26 (octet p+7, bit 1)	
0	Ciphering data set not applicable to positioning SIB type 2-26
1	Ciphering data set applicable to positioning SIB type 2-26
Ciphering data set applicable for positioning SIB type 2-27 (octet p+8, bit 8)	
0	Ciphering data set not applicable to positioning SIB type 2-27
1	Ciphering data set applicable to positioning SIB type 2-27
Ciphering data set applicable for positioning SIB type 1-11 (octet p+8, bit 7)	
0	Ciphering data set not applicable to positioning SIB type 1-11
1	Ciphering data set applicable to positioning SIB type 1-11
Ciphering data set applicable for positioning SIB type 1-12 (octet p+8, bit 6)	
0	Ciphering data set not applicable to positioning SIB type 1-12
1	Ciphering data set applicable to positioning SIB type 1-12
Ciphering data set applicable for positioning SIB type 6-7 (octet p+8, bit 5)	
0	Ciphering data set not applicable to positioning SIB type 6-7
1	Ciphering data set applicable to positioning SIB type 6-7
Ciphering data set applicable for positioning SIB type 7-1 (octet p+8, bit 4)	
0	Ciphering data set not applicable to positioning SIB type 7-1
1	Ciphering data set applicable to positioning SIB type 7-1
Ciphering data set applicable for positioning SIB type 7-2 (octet p+8, bit 3)	
0	Ciphering data set not applicable to positioning SIB type 7-2
1	Ciphering data set applicable to positioning SIB type 7-2
Ciphering data set applicable for positioning SIB type 7-3 (octet p+8, bit 2)	
0	Ciphering data set not applicable to positioning SIB type 7-3
1	Ciphering data set applicable to positioning SIB type 7-3
Ciphering data set applicable for positioning SIB type 7-4 (octet p+8, bit 1)	
0	Ciphering data set not applicable to positioning SIB type 7-4
1	Ciphering data set applicable to positioning SIB type 7-4
Any unassigned bits shall be coded as zero.	
Validity start time (octets q+1 to q+5)	
This field contains the UTC time when the ciphering data set becomes valid, encoded as octets 2 to 6 of the Time zone and time IE specified in 3GPP TS 24.008 [12].	
Validity duration (octets q+6 to q+7)	
This field contains the duration for which the ciphering data set is valid after the validity start time, in units of minutes.	
TAIs list (octets q+8 to r)	
This field contains the list of tracking areas for which the ciphering data set is applicable, encoded as octets 2 to n of the Tracking area identity list IE as specified in subclause 9.11.3.9. If the TAIs list is empty (as indicated by a zero length), the ciphering data set is applicable to the entire serving PLMN.	
NOTE: The ciphering data set is always applicable to at least one of the E-UTRA Positioning SIB types or the NR Positioning SIB types.	

9.11.3.18D Control plane service type

The purpose of the Control plane service type information element is to specify the purpose of the CONTROL PLANE SERVICE REQUEST message.

The Control plane service type information element is coded as shown in figure 9.11.3.18D.1 and table 9.11.3.18D.1.

The Control plane service type is a type 1 information element.

Figure 9.9.3.18D.1: Control plane service type information element

Table 9.9.3.18D.1: Control plane service type information element

Control plane service type value (octet 1, bit 1 to 3)			
Bits

0	0	0	mobile originating request
0	0	1	mobile terminating request
0	1	0	emergency services
0	1	1	emergency services fallback
1	0	0	
to			unused; shall be interpreted as " mobile originating request", if received by the network.
1	1	1	

9.11.3.19 Daylight saving time

See subclause 10.5.3.12 in 3GPP TS 24.008 [12].

9.11.3.20 De-registration type

The purpose of the De-registration type information element is to indicate the type of de-registration.

The De-registration type information element is coded as shown in figure 9.11.3.20.1 and table 9.11.3.20.1.

The De-registration type is a type 1 information element.

Figure 9.11.3.20.1: Deregistration type information element

Table 9.11.3.20.1: Deregistration type information element

Switch off (octet 1, bit 4)	
In the UE to network direction:	
Bit	
4	
0	Normal de-registration
1	Switch off
In the network to UE direction bit 4 is spare. The network shall set this bit to zero.	
Re-registration required (octet 1, bit 3)	
In the network to UE direction:	
Bit	
3	
0	re-registration not required
1	re-registration required
In the UE to network direction bit 3 is spare. The UE shall set this bit to zero.	
Access type (octet 1,bit 2, bit 1)	
Bit	
2 1	
0 1	3GPP access
1 0	Non-3GPP access
1 1	3GPP access and non-3GPP access
All other values are reserved.	

9.11.3.21 Void

9.11.3.22 Void

9.11.3.23 Emergency number list

See subclause 10.5.3.13 in 3GPP TS 24.008 [12].

9.11.3.23A EPS bearer context status

See subclause 9.9.2.1 in 3GPP TS 24.301 [15].

9.11.3.24 EPS NAS message container

The purpose of the EPS NAS message container information element is to transport an EPS NAS message as specified in 3GPP TS 24.301 [15].

The EPS NAS message container information element is coded as shown in figure 9.11.3.24.1 and table 9.11.3.24.1.

The EPS NAS message container is a type 6 information element.

Figure 9.11.3.24.1: EPS NAS message container information element

Table 9.11.3.24.1: EPS NAS message container information element

EPS NAS message container (octet 4 to n) An EPS NAS message as specified in 3GPP TS 24.301 [15].

9.11.3.25 EPS NAS security algorithms

See subclause 9.9.3.23 in 3GPP TS 24.301 [15].

9.11.3.26 Extended emergency number list

See subclause 9.9.3.37A in 3GPP TS 24.301 [15].

9.11.3.26A Extended DRX parameters

See subclause 10.5.5.32 in 3GPP TS 24.008 [12].

9.11.3.27 Void

9.11.3.28 IMEISV request

See subclause 10.5.5.10 in 3GPP TS 24.008 [12].

9.11.3.29 LADN indication

The purpose of the LADN indication information element is to request the network for LADN information for specific LADN DNN(s) or to indicate a request for LADN information.

The LADN indication information element is coded as shown in figure 9.11.3.29.1 and table 9.11.3.29.1.

The LADN indication is a type 6 information element with a minimum length of 3 octets and a maximum length of 811 octets.

The LADN indication information element can contain a minimum of 0 and a maximum of 8 different LADN DNN values.

Figure 9.11.3.29.1: LADN indication information element

Table 9.11.3.29.1: LADN indication information element

Value part of the LADN indication information element (octet 4 to h):
The value part of the LADN indication information element consists of zero or more LADN DNN values. If the LADN indication information element conveys more than 8 LADN DNN values in this information element, the network shall consider the first 8 LADN DNN values and ignore the remaining octets of the information element.
LADN DNN value:
LADN DNN value is coded as the length and value part of DNN information element as specified in subclause 9.11.2.1B starting with the second octet.

9.11.3.30 LADN information

The purpose of the LADN information information element is to provide the UE with the LADN service area for each available LADN in the current registration area or to delete the LADN information at the UE.

The LADN information information element is coded as shown in figure 9.11.3.30.1, figure 9.11.3.30.2 and table 9.11.3.30.1.

The LADN information is a type 6 information element with a minimum length of 3 octets and a maximum length of 1715 octets.

The LADN information information element can contain a minimum of 0 and a maximum of 8 different LADNs each including a DNN and a 5GS tracking area identity list.

Figure 9.11.3.30.1: LADN information information element

Figure 9.11.3.30.2: LADN

Table 9.11.3.30.1: LADN information information element

Value part of the LADN information information element (octet 4 to octet h) The value part of the LADN information information element consists of one or several LADNs. Each LADN (e.g. octet 4 to octet a) consists one DNN value and one 5GS tracking area identity list. The length of each LADN is determined by the length of DNN value field and the length of 5GS tracking area identity list field. The UE shall store the complete list as received. If more than 8 LADNs are included in this information element, the UE shall store the first 8 LADNs and ignore the remaining octets of the information element.
DNN value (octet 5 to octet m): DNN value field is coded as DNN value part of DNN information element as specified in subclause 9.11.2.1B starting with the third octet.
5GS tracking area identity list (octet m+1 to octet a): 5GS tracking area identity list field is coded as the length and the value part of the 5GS Tracking area identity list information element as specified in subclause 9.11.3.9 starting with the second octet.

9.11.3.31 MICO indication

The purpose of the MICO indication information element is to indicate the use of MICO mode or the re-negotiation of MICO mode.

The MICO indication information element is coded as shown in figure 9.11.3.31.1 and table 9.11.3.31.1.

The MICO indication is a type 1 information element.

Figure 9.11.3.31.1: MICO indication

Table 9.11.3.31.1: MICO indication

Registration Area Allocation Indication (RAAI) (octet 1, bit 1) In the network to UE direction: Bit 1 0 all PLMN registration area not allocated 1 all PLMN registration area allocated In the UE to network direction bit 1 is spare. The UE shall set this bit to zero.
Strictly Periodic Registration Timer Indication (SPRTI) (octet 1, bit 2) In the network to UE and the UE to network direction: Bit 2 0 strictly periodic registration timer not supported 1 strictly periodic registration timer supported Bits 3 and 4 are spare and shall be coded as zero.
NOTE: In the network to UE direction in the CONFIGURATION UPDATE COMMAND message, bits 1 and 2 shall be coded as zero.

9.11.3.31A MA PDU session information

The purpose of the MA PDU session information information element is to convey the MA-related information for the PDU session.

The MA PDU session information information element is coded as shown in figure 9.11.3.31A.1 and table 9.11.3.31A.1.

The MA PDU session information is a type 1 information element.

Figure 9.11.3.31A.1: MA PDU session information information element

Table 9.11.3.31A.1: MA PDU session information information element

MA PDU session information value (octet 1, bit 1 to bit 4)				
Bits				
4	3	2	1	
0	0	0	0	No additional information
0	0	0	1	MA PDU session network upgrade is allowed
All other values are spare. If received they shall be ignored.				

9.11.3.31B Mapped NSSAI

The purpose of the Mapped NSSAI information element is to transfer S-NSSAI(s) applicable in the HPLMN to the visited PLMN.

The Mapped NSSAI information element is coded as shown in figure 9.11.3.31B.1, figure 9.11.3.31B.2 and table 9.11.3.31B.1.

The Mapped NSSAI is a type 4 information element with a minimum length of 4 octets and a maximum length of 42 octets.

NOTE 1: The total number of S-NSSAI values in a requested mapped NSSAI cannot exceed eight.

Figure 9.11.3.31B.1: Mapped NSSAI information element

Figure 9.11.3.31B.2: Mapped S-NSSAI content

Table 9.11.3.31B.1: Mapped NSSAI information element

Value part of the Mapped NSSAI information element (octet 3 to v) The value part of the Mapped NSSAI information element consists of one or more mapped S-NSSAI contents. Mapped S-NSSAI content: Length of S-NSSAI contents (octet 3) Mapped HPLMN Slice/service type (SST) (octet 4) This field contains the 8 bit SST value of an S-NSSAI in the S-NSSAI(s) of the HPLMN to which the SST value is mapped. The coding of the SST value part is defined in 3GPP TS 23.003 [4]. NOTE 1: Octet 4 (i.e. mapped HPLMN SST) shall always be included. Mapped HPLMN Slice differentiator (SD) (octet 5 to octet 7) This field contains a 24-bit SD value of an S-NSSAI in the S-NSSAI(s) of the HPLMN to which the SD value is mapped. The coding of the SD value part is defined in 3GPP TS 23.003 [4]. NOTE 2: If the octet 5 is included, then octet 6 and octet 7 shall be included.

9.11.3.31C Mobile station classmark 2

See subclause 10.5.1.6 in 3GPP TS 24.008 [12].

9.11.3.32 NAS key set identifier

The NAS key set identifier is allocated by the network.

The NAS key set identifier information element is coded as shown in figure 9.11.3.32.1 and table 9.11.3.32.1.

The NAS key set identifier is a type 1 information element.

Figure 9.11.3.32.1: NAS key set identifier information element

Table 9.11.3.32.1: NAS key set identifier information element

Type of security context flag (TSC) (octet 1) Bit 4 0 native security context (for KSI _{AMF}) 1 mapped security context (for KSI _{ASME}) TSC does not apply for NAS key set identifier value "111". NAS key set identifier (octet 1) Bits 3 2 1 0 0 0 through possible values for the NAS key set identifier 1 1 0 1 1 1 no key is available (UE to network); reserved (network to UE)

9.11.3.33 NAS message container

The purpose of the NAS message container IE is to encapsulate a plain 5GS NAS REGISTRATION REQUEST, DEREGISTRATION REQUEST, or SERVICE REQUEST message, or to encapsulate non-cleartext IEs of a CONTROL PLANE SERVICE REQUEST message.

The NAS message container information element is coded as shown in figure 9.11.3.33.1 and table 9.11.3.33.1.

The NAS message container is a type 6 information element.

Figure 9.11.3.33.1: NAS message container information element

Table 9.11.3.33.1: NAS message container information element

NAS message container contents (octet 4 to octet n); Max value of 65535 octets
This IE can contain a REGISTRATION REQUEST message as defined in subclause 5.5.1, DEREGISTRATION REQUEST message as defined in subclause 5.5.2.2.1, or a SERVICE REQUEST message as defined in subclause 5.6.1, or non-cleartext IEs of a CONTROL PLANE SERVICE REQUEST message as defined in subclause 5.6.1.

9.11.3.34 NAS security algorithms

The purpose of the NAS security algorithms information element is to indicate the 5G algorithms to be used for ciphering and integrity protection.

The NAS security algorithms information element is coded as shown in figure 9.11.3.34.1 and table 9.11.3.34.1.

The NAS security algorithms is a type 3 information element with a length of 2 octets.

Figure 9.11.3.34.1: NAS security algorithms information element

Table 9.11.3.34.1: NAS security algorithms information element

Type of integrity protection algorithm (octet 2, bit 1 to 3)				
Bits				
4	3	2	1	
0	0	0	0	5G integrity algorithm 5G-IA0 (null integrity protection algorithm)
0	0	0	1	5G integrity algorithm 128-5G-IA1
0	0	1	0	5G integrity algorithm 128-5G-IA2
0	0	1	1	5G integrity algorithm 128-5G-IA3
0	1	0	0	5G integrity algorithm 5G-IA4
0	1	0	1	5G integrity algorithm 5G-IA5
0	1	1	0	5G integrity algorithm 5G-IA6
0	1	1	1	5G integrity algorithm 5G-IA7
All other values are reserved.				
Type of ciphering algorithm (octet 2, bit 5 to 7)				
Bits				
8	7	6	5	
0	0	0	0	5G encryption algorithm 5G-EA0 (null ciphering algorithm)
0	0	0	1	5G encryption algorithm 128-5G-EA1
0	0	1	0	5G encryption algorithm 128-5G-EA2
0	0	1	1	5G encryption algorithm 128-5G-EA3
0	1	0	0	5G encryption algorithm 5G-EA4
0	1	0	1	5G encryption algorithm 5G-EA5
0	1	1	0	5G encryption algorithm 5G-EA6
0	1	1	1	5G encryption algorithm 5G-EA7
All other values are reserved.				

9.11.3.35 Network name

See subclause 10.5.3.5a in 3GPP TS 24.008 [12].

9.11.3.36 Network slicing indication

The purpose of the Network slicing indication information element is to indicate additional information associated with network slicing in the generic UE configuration update procedure and the registration procedure, other than the user's configured NSSAI, allowed NSSAI, pending NSSAI and rejected NSSAI information.

The Network slicing indication information element is coded as shown in figure 9.11.3.36.1 and table 9.11.3.36.1.

The Network slicing indication is a type 1 information element.

Figure 9.11.3.36.1: Network slicing indication

Table 9.11.3.36.1: Network slicing indication

Network slicing subscription change indication (NSSCI) (octet 1, bit 1)	
Bit	
1	
0	Network slicing subscription not changed
1	Network slicing subscription changed
Default configured NSSAI indication (DCNI) (octet 1, bit 2)	
Bit	
2	
0	Requested NSSAI not created from default configured NSSAI
1	Requested NSSAI created from default configured NSSAI
In the UE to network direction bit 1 is spare. The UE shall set this bit to zero.	
In the network to UE direction bit 2 is spare. The network shall set this bit to zero.	
Bits 3 and 4 are spare and shall be coded as zero.	

9.11.3.36A Non-3GPP NW provided policies

See subclause 10.5.5.37 in 3GPP TS 24.008 [12].

9.11.3.37 NSSAI

The purpose of the NSSAI information element is to identify a collection of S-NSSAIs

The NSSAI information element is coded as shown in figure 9.11.3.37.1 and table 9.11.3.37.1.

The NSSAI is a type 4 information element with a minimum length of 4 octets and a maximum length of 146 octets.

NOTE: More than one S-NSSAIs in an NSSAI can have the same SST values, and optionally same SD values, which are associated with different mapped HPLMN SST values and optionally mapped HPLMN SD values.

Figure 9.11.3.37.1: NSSAI information element

Table 9.11.3.37.1: NSSAI information element

Value part of the NSSAI information element (octet 3 to v) The value part of the NSSAI information element consists of one or more S-NSSAI values. Each S-NSSAI value consists of one S-NSSAI and optionally one mapped S-NSSAI. The recipient of this information element shall store the complete list received (NOTE 1, NOTE 2, NOTE 3). If the NSSAI information element conveys an allowed NSSAI and more than 8 S-NSSAI values are included in this information element, the UE shall store the first 8 S-NSSAI values and ignore the remaining octets of the information element. If the NSSAI information element conveys a configured NSSAI (including the default configured NSSAI) or pending NSSAI and more than 16 S-NSSAI values are included in this information element, the UE shall store the first 16 S-NSSAI values and ignore the remaining octets of the information element.
S-NSSAI value: S-NSSAI value is coded as the length and value part of S-NSSAI information element as specified in subclause 9.11.2.8 starting with the second octet.
NOTE 1: The total number of S-NSSAI values in a requested NSSAI shall not exceed eight. NOTE 2: The number of S-NSSAI values in an allowed NSSAI shall not exceed eight. NOTE 3: The number of S-NSSAI values in a configured NSSAI (including the default configured NSSAI) or pending NSSAI shall not exceed sixteen.

9.11.3.37A NSSAI inclusion mode

The purpose of the NSSAI inclusion mode information element is to indicate the NSSAI inclusion mode in which the UE shall operate.

The NSSAI inclusion mode is a type 1 information element.

The NSSAI inclusion mode information element is coded as shown in figure 9.11.3.37A.1 and table 9.11.3.37A.1.

8	7	6	5	4	3	2	1	
NSSAI inclusion mode IEI				0 spare	0 spare	NSSAI inclusion mode		octet 1

Figure 9.11.3.37A.1: NSSAI inclusion mode information element**Table 9.11.3.37A.1: NSSAI inclusion mode information element**

NSSAI inclusion mode (octet 1, bit 1 to bit 2)		
Bits		
2	1	
0	0	NSSAI inclusion mode A
0	1	NSSAI inclusion mode B
1	0	NSSAI inclusion mode C
1	1	NSSAI inclusion mode D

9.11.3.38 Operator-defined access category definitions

The purpose of the Operator-defined access category definitions information element is to provide the UE with the operator-defined access category definitions or to delete the operator-defined access category definitions at the UE.

The Operator-defined access category definitions information element is coded as shown in figure 9.11.3.38.1, figure 9.11.3.38.2 and table 9.11.3.38.1.

The Operator-defined access category definitions is a type 6 information element with a minimum length of 3 octets, and maximum length of 8323 octets.

Figure 9.11.3.38.1: Operator-defined access category definitions information element

Figure 9.11.3.38.2: Operator-defined access category definition

Table 9.11.3.38.1: Operator-defined access category definitions information element

Value part of the Operator-defined access category definitions information element (octet 4 to h)

The value part of the Operator-defined access category definitions information element consists of zero or no more than 32 operator-defined access category definition fields. Each operator-defined access category definition field is coded as described in figure 9.11.3.38.2. The length of each operator-defined access category definition field is determined by the length of operator-defined access category definition contents field.

Operator-defined access category definition (octet 4 to octet a):

Length of operator-defined access category definition contents (octet 4)

Length of operator-defined access category definition contents indicates binary coded length of the operator-defined access category definition value field (octet 5 to octet a).

Precedence value (octet 5)

Bits

8	7	6	5	4	3	2	1		
0	0	0	0	0	0	0	0	0	Precedence value 0
to									
1	1	1	1	1	1	1	1	1	Precedence value 255

Operator-defined access category number (bits 5 to 1 of octet 6)

Bits

5	4	3	2	1		
0	0	0	0	0		Access category number 32
to						
1	1	1	1	1		Access category number 63

Presence of standardized access category (PSAC) (bit 8 of octet 6)

PSAC field indicates whether the standardized access category field is present or absent.

Bit

8	
0	Standardized access category field is not included
1	Standardized access category field is included

Length of criteria (octet 7)

Length of criteria field indicates binary coded length of the criteria field.

Criteria (octets 8 to octet a-1)

The criteria field contains one or more criteria components fields. Each criteria component field shall be encoded as a sequence of a one octet criteria type field and zero or more octets criteria value field. The criteria type field shall be transmitted first.

Criteria type

Bits

8	7	6	5	4	3	2	1	
0	0	0	0	0	0	0	0	DNN type
0	0	0	0	0	0	0	1	OS id + OS App Id type
0	0	0	0	0	0	1	0	S-NSSAI type

All other values are reserved.

For "DNN type", the criteria value field shall be encoded as a sequence of one octet DNN length-value pair count field and one or more DNN length-value pair fields.

The DNN length-value pair count field indicates the number of included DNN length-value pair fields. Each DNN length-value pair field is coded as a sequence of one octet DNN value length field and a DNN value field. The DNN value length field indicates the length in octets of the DNN value field. The DNN value field contains an APN as specified in 3GPP TS 23.003 [4].

For "OS Id + OS App Id type", the criteria value field shall be encoded as a sequence of one octet app id value count field and one or more app id value fields. The app id value count field indicates the number of included app id value fields. Each app id value field is coded as a sequence of a sixteen octet OS id value field, one octet OS app id value length field and an OS app id value field. The OS app id value length field indicates the length in octets of the OS app id value field. The OS id value field contains a Universally Unique IDentifier (UUID) as specified in IETF RFC 9562 [35A]. The OS app id value field contains an OS specific application identifier. Coding of the OS app id value field is outside the scope of the present document.

For "S-NSSAI type", the criteria value field shall be encoded as a sequence of one octet S-NSSAI length-value pair count field and one or more S-NSSAI length-value value fields. The S-NSSAI length-value pair count field indicates the number of included S-NSSAI length-value pair fields. Each S-NSSAI length-value pair field is coded as a sequence of one octet S-NSSAI value length field and an S-NSSAI value field. The S-NSSAI value length field indicates the length in octets of the S-NSSAI value field. The S-NSSAI value field contains one octet SST field optionally followed by three octets SD field. The SST field contains a SST. The SD field contains an SD. SST and SD are specified in 3GPP TS 23.003 [4].

Standardized access category (bits 5 to 1 of octet a)
Standardized access category field indicates the access category number of the standardized access category that is used in combination with the access identities to determine the establishment cause.

Bits

5	4	3	2	1	
0	0	0	0	0	Access category number 0
					to
0	0	1	1	1	Access category number 7
0	1	0	0	1	Access category number 9
0	1	0	1	0	Access category number 10

All other values are reserved.

9.11.3.39 Payload container

The purpose of the Payload container information element is to transport one or multiple payloads. If multiple payloads are transported, the associated information of each payload are also transported together with the payload.

The Payload container information element is coded as shown in figure 9.11.3.39.1, figure 9.11.3.39.1A, figure 9.11.3.39.1B, figure 9.11.3.39.2, figure 9.11.3.39.3, figure 9.11.3.39.4 and table 9.11.3.39.1.

The Payload container information element is a type 6 information element with a minimum length of 4 octets and a maximum length of 65538 octets.

Figure 9.11.3.39.1: Payload container information element

Figure 9.11.3.39.1A: Payload container contents with Payload container type "Event notification"

Figure 9.11.3.39.1B: Even notification indicator n

Figure 9.11.3.39.2: Payload container contents with Payload container type "Multiple payloads"

Figure 9.11.3.39.3: Payload container entry

Figure 9.11.3.39.4: Optional IE

Table 9.11.3.39.1: Payload container information element

Payload container contents (octet 4 to octet n); max value of 65535 octets

If the payload container type is set to "N1 SM information" and is included in the UL NAS TRANSPORT or DL NAS TRANSPORT message, the payload container contents contain a 5GSM message as defined in subclause 8.3.

If the payload container type is set to "SOR transparent container" and is included in the DL NAS TRANSPORT message, the payload container contents are coded the same way as the contents of the SOR transparent container IE (see subclause 9.11.3.51) for SOR data type is set to value "0" except that the first three octets are not included.

If the payload container type is set to "SOR transparent container" and is included in the UL NAS TRANSPORT message, the payload container contents are coded the same way as the contents of the SOR transparent container IE (see subclause 9.11.3.51) for SOR data type is set to value "1" except that the first three octets are not included.

If the payload container type is set to "UE policy container" and is included in the DL NAS TRANSPORT, UL NAS TRANSPORT or REGISTRATION REQUEST message, the payload container contents are coded as defined in subclause Annex D.

If the payload container type is set to "UE parameters update transparent container" and is included in the DL NAS TRANSPORT message, the payload container contents are coded the same way as the contents of the UE parameters update transparent container IE (see subclause 9.11.3.53A) for UE parameters update data type is set to value "0" except that the first three octets are not included.

If the payload container type is set to "UE parameters update transparent container" and is included in the UL NAS TRANSPORT message, the payload container contents are coded the same way as the contents of the UE parameters update transparent container IE (see subclause 9.11.3.53A) for UE parameters update data type is set to value "1" except that the first three octets are not included.

If the payload container type is set to "SMS" and is included in the UL NAS TRANSPORT or DL NAS TRANSPORT message, the payload container contents contain an SMS message (i.e. CP-DATA, CP-ACK or CP-ERROR) as defined in subclause 7.2 in 3GPP TS 24.011 [13].

If the payload container type is set to "IoT user data container" and is included in the UL NAS TRANSPORT, DL NAS TRANSPORT or CONTROL PLANE SERVICE REQUEST message, the payload container contents are coded the same way as the contents of the user data container IE (see subclause 9.9.4.24 in 3GPP TS 24.301 [15]) except that the first three octets are not included.

If the payload container type is set to "SMS" and is included in the CONTROL PLANE SERVICE REQUEST message, the payload container contents are coded the same way as the contents of the NAS message container IE (see subclause 9.9.3.22 in 3GPP TS 24.301 [15]) except that the first two octets are not included.

If the payload container type is set to "Location services message container" and is included in the UL NAS TRANSPORT, DL NAS TRANSPORT or CONTROL PLANE SERVICE REQUEST message, the payload container contents include location services message payload.

If the payload container type is set to "LTE Positioning Protocol (LPP) message container" and is included in the UL NAS TRANSPORT or DL NAS TRANSPORT message, the payload container contents include LPP message payload.

If the payload container type is set to "SLPP message container" and is included in the UL NAS TRANSPORT or DL NAS TRANSPORT message, the payload container contents include SLPP message payload.

If the payload container type is set to "Service-level-AA container" and is included in the UL NAS TRANSPORT or DL NAS TRANSPORT message, the payload container contents are coded the same way as the contents of service-level-AA container (see subclause 9.11.2.10).

If the payload container type is set to "Event notification", the payload container contents include one or more event notification indicators.

Type of event notification indicator n (octet l+1)

Bits

8 7 6 5 4 3 2 1

0 0 0 0 0 0 0 0

"SRVCC handover cancelled, IMS session re-establishment required" indicator

0 0 0 0 0 0 0 1

to

Unused, shall be ignored if received by the UE

1 1 1 1 1 1 1 1

If the type of an event notification indicator is set to "SRVCC handover cancelled, IMS session re-establishment required" indicator, the value of the event notification indicator shall not be included.

If the payload container type is set to "UPP-CMI container" and is included in the UL NAS TRANSPORT or DL NAS TRANSPORT message, the payload container contents include UPP-CMI messages as specified in 3GPP TS 24.572 [64].

If the payload container type is set to "Multiple payloads", the number of entries field represents the total number of payload container entries, and the payload container entry contents field is coded as a list of payload container entry according to figure 9.11.3.39.2, with each payload container entry is coded according to figure 9.11.3.39.3 and figure 9.11.3.39.4.

The coding of Payload container contents is dependent on the particular application.

Payload container entry

For each payload container entry, the payload container type field represents the payload container type value as described in subclause 9.11.3.40, the coding of payload container contents field is dependent on the particular application, and the number of optional IEs field represents the total number of optional IEs associated with the payload container entry contents field in the payload container entry. The error handlings for optional IEs specified in subclauses 7.6.3 and 7.7.1 shall apply to the optional IEs included in the payload container entry.

The receiving entity shall ignore Optional IEs with type of optional IE parameter field containing an unknown IEI.

Optional IEs

Type of optional IE (octet xi +4)

This field contains the IEI of the optional IE.

Length of optional IE (octet xi+5)

This field indicates binary coded length of the value of the optional IE entry.

Value of optional IE (octet xi+6 to octet y2)

This field contains the value of the optional IE entry with the value part of the referred information element based on following optional IE reference. If the Request type is included, the value part of the Request type shall be encoded in the bits 1 to 4 and bits 5 to 8 shall be coded as zero. If the Release assistance indication is included, the value part of the Release assistance indication shall be encoded in the bits 1 to 4 and bits 5 to 8 shall be coded as zero. If the MA PDU session information is included, the value part of the MA PDU session information shall be encoded in the bits 1 to 4 and bits 5 to 8 shall be coded as zero.

IEI	Optional IE name	Optional IE reference
12	PDU session ID	PDU session identity 2 (see subclause 9.11.3.41)
24	Additional information	Additional information (see subclause 9.11.2.1)
58	5GMM cause	5GMM cause (see subclause 9.11.3.2)
37	Back-off timer value	GPRS timer 3 (see subclause 9.11.2.5)
59	Old PDU session ID	PDU session identity 2 (see subclause 9.11.3.41)
80	Request type	Request type (see subclause 9.11.3.47)
22	S-NSSAI	S-NSSAI (see subclause 9.11.2.8)
25	DNN	DNN (see subclause 9.11.2.1B)
F0	Release assistance indication	Release assistance indication (see subclause 9.11.3.46A)

A0	MA PDU session information	MA PDU session information (see subclause 9.11.3.31A)

9.11.3.40 Payload container type

The purpose of the Payload container type information element indicates type of payload included in the payload container information element.

The Payload container type information element is coded as shown in figure 9.11.3.40.1 and table 9.11.3.40.1.

The Payload container type information element is a type 1 information element.

Figure 9.11.3.40.1: Payload container type information element

Table 9.11.3.40.1: Payload container type information element

Payload container type value (octet 1)				
Bits				
4	3	2	1	
0	0	0	1	N1 SM information
0	0	1	0	SMS
0	0	1	1	LTE Positioning Protocol (LPP) message container
0	1	0	0	SOR transparent container
0	1	0	1	UE policy container
0	1	1	0	UE parameters update transparent container
0	1	1	1	Location services message container (see 3GPP TS 23.273 [6B])
1	0	0	0	CIoT user data container
1	0	0	1	Service-level-AA container
1	0	1	0	Event notification
1	0	1	1	UPP-CMI container
1	1	0	0	SLPP message container
1	1	1	1	Multiple payloads
All other values are reserved.				
NOTE: The value "Multiple payloads" is only used when the Payload container contents in figure 9.11.3.39.1 contains multiple payloads as shown in figure 9.11.3.39.2.				

9.11.3.41 PDU session identity 2

The purpose of the PDU session identity 2 information element is to indicate the identity of a PDU session in a 5GMM message.

The PDU session identity 2 information element is coded as shown in figure 9.11.3.41.1 and table 9.11.3.41.1.

The PDU session identity 2 is a type 3 information element with a length of 2 octets .

Figure 9.11.3.41.1: PDU session identity 2 information element

Table 9.11.3.41.1: PDU session identity 2 information element

PDU session identity 2 value (octet 2)
The coding of the PDU session identity 2 value is identical to the coding of the PDU session identity value as defined in 3GPP TS 24.007 [11] .

9.11.3.42 PDU session reactivation result

The purpose of the PDU session reactivation result information element is to indicate the result of establishments of user-plane resources of PDU sessions.

The PDU session reactivation result information element is coded as shown in figure 9.11.3.42.1 and table 9.11.3.42.1.

The PDU session reactivation result is a type 4 information element with minimum length of 4 octets and maximum length of 34 octets.

8	7	6	5	4	3	2	1	
PDU session reactivation result IEI								octet 1
Length of PDU session reactivation result								octet 2
PSI (7)	PSI (6)	PSI (5)	PSI (4)	PSI (3)	PSI (2)	PSI (1)	PSI (0)	octet 3
PSI (15)	PSI (14)	PSI (13)	PSI (12)	PSI (11)	PSI (10)	PSI (9)	PSI (8)	octet 4
0	0	0	0	0	0	0	0	octet 5* -34*
Spare								

Figure 9.11.3.42.1: PDU session reactivation result information element

Table 9.11.3.42.1: PDU session reactivation result information element

PSI(x) shall be coded as follows:

PSI(0):

Bit 1 of octet 3 is spare and shall be coded as zero.

PSI(1) – PSI(15):

0 indicates establishment of user-plane resources of the PDU session was not requested in the Uplink data status IE or establishment of user-plane resources of the PDU session was not allowed in the Allowed PDU session status IE or establishment of user-plane resource of the PDU session is successful.

1 indicates either establishment of user-plane resources of the PDU session was requested in the Uplink data status IE but establishment of user-plane resource of the PDU session is not successful or indicates establishment of user-plane resources of the PDU session was allowed in the Allowed PDU session status IE but establishment of user-plane resource of the PDU session is either not performed or not successful.

All bits in octet 5 to 34 are spare and shall be coded as zero, if the respective octet is included in the information element.

9.11.3.43 PDU session reactivation result error cause

The purpose of the PDU session reactivation result error cause information element is to indicate error causes for PDU session ID(s) where there was a failure to establish the user-plane resources.

The PDU session reactivation result error cause information element is coded as shown in figure 9.11.3.43.1 and table 9.11.3.43.1.

The PDU session reactivation result error cause is a type 6 information element with a minimum length of 5 octets and a maximum length of 515 octets.

8	7	6	5	4	3	2	1	
PDU session reactivation result error cause IEI								octet 1
Length of PDU session reactivation result error cause								octet 2
PDU session ID								octet 3
cause value								octet 4
....								octet 5
PDU session ID								octet 514*
cause value								octet 515*

Figure 9.11.3.43.1: PDU session reactivation result error cause information element

Table 9.11.3.43.1: PDU session reactivation result error cause information element

PDU session ID is coded same as PDU session ID IE (see subclause 9.4).
The cause value is coded same as second octet of 5GMM cause information element (see subclause 9.11.3.2).

9.11.3.44 PDU session status

The purpose of the PDU session status information element is to indicate the state of each PDU session that can be identified by a PDU session identity.

The PDU session status information element is coded as shown in figure 9.11.3.44.1 and table 9.11.3.44.1.

The PDU session status information element is a type 4 information element with minimum length of 4 octets and a maximum length of 34 octets.

8	7	6	5	4	3	2	1	
PDU session status IEI								octet 1
Length of PDU session status contents								octet 2

PSI (15)	PSI (14)	PSI (13)	PSI (12)	PSI (11)	PSI (10)	PSI (9)	PSI (8)	octet 4
0	0	0	0	0	0	0	0	octet 5*- 34*
spare								

Figure 9.11.3.44.1: PDU session status information element

Table 9.11.3.44.1: PDU session status information element

PSI(x) shall be coded as follows:
PSI(0): Bit 1 of octet 3 is spare and shall be coded as zero.
PSI(1) – PSI(15): 0 indicates that the 5GSM state of the corresponding PDU session is PDU SESSION INACTIVE. 1 indicates that the 5GSM state of the corresponding PDU session is not PDU SESSION INACTIVE
All bits in octet 5 to 34 are spare and shall be coded as zero, if the respective octet is included in the information element.

9.11.3.45 PLMN list

See subclause 10.5.1.13 in 3GPP TS 24.008 [12].

9.11.3.46 Rejected NSSAI

The purpose of the Rejected NSSAI information element is to identify a collection of rejected S-NSSAIs.

The Rejected NSSAI information element is coded as shown in figure 9.11.3.46.1, figure 9.11.3.46.2 and table 9.11.3.46.1.

The Rejected NSSAI is a type 4 information element with a minimum length of 4 octets and a maximum length of 42 octets.

Figure 9.11.3.46.1: Rejected NSSAI information element

Figure 9.11.3.46.2: Rejected S-NSSAI

Table 9.11.3.46.1: Rejected NSSAI information element

Value part of the Rejected NSSAI information element (octet 3 to v)				
The value part of the Rejected NSSAI information element consists of one or more rejected S-NSSAIs. Each rejected S-NSSAI consists of one S-NSSAI and an associated cause value. The length of each rejected S-NSSAI can be determined by the 'length of rejected S-NSSAI' field in the first octet of the rejected S-NSSAI. The UE shall store the complete list received (NOTE 0). If more than 8 rejected S-NSSAIs are included in this information element, the UE shall store the first 8 rejected S-NSSAIs and ignore the remaining octets of the information element.				
Rejected S-NSSAI:				
Cause value (octet 3)				
Bits				
4	3	2	1	
0	0	0	0	S-NSSAI not available in the current PLMN or SNPN
0	0	0	1	S-NSSAI not available in the current registration area
0	0	1	0	S-NSSAI not available due to the failed or revoked network slice-specific authentication and authorization
All other values are reserved.				
Slice/service type (SST) (octet 4)				
This field contains the 8 bit SST value. The coding of the SST value part is defined in 3GPP TS 23.003 [4]. (NOTE 2)				
Slice differentiator (SD) (octet 5 to octet 7)				
This field contains the 24 bit SD value. The coding of the SD value part is defined in 3GPP TS 23.003 [4]. (NOTE 3)				
NOTE 0: The number of rejected S-NSSAI(s) shall not exceed eight.				
NOTE 1: If octet 5 is included, then octet 6 and octet 7 shall be included.				
NOTE 2: If the Cause value is "S-NSSAI not available due to the failed or revoked network slice-specific authentication and authorization", this field shall contain the 8 bit SST value of an S-NSSAI in the S-NSSAI(s) of the HPLMN.				
NOTE 3: If the Cause value is "S-NSSAI not available due to the failed or revoked network slice-specific authentication and authorization", this field, if included, shall contain the 24 bit SD value of an S-NSSAI in the S-NSSAI(s) of the HPLMN.				

9.11.3.46A Release assistance indication

See subclause 9.9.4.25 in 3GPP TS 24.301 [15].

9.11.3.47 Request type

The purpose of the Request type information element is to indicate the type of the 5GSM message.

The Request type information element is coded as shown in figure 9.11.3.47.1 and table 9.11.3.47.1.

The Request type is a type 1 information element.

Figure 9.11.3.47.1: Request type information element

Table 9.11.3.47.1: Request type information element

Request type value (octet 1, bit 1 to bit 4)			
Bits			
3	2	1	
0	0	1	initial request
0	1	0	existing PDU session
0	1	1	initial emergency request
1	0	0	existing emergency PDU session
1	0	1	modification request
1	1	0	MA PDU request (NOTE)
1	1	1	reserved
All other values are unused and shall be interpreted as "initial request", if received by the network.			
NOTE: This value shall be interpreted as "initial request", if received by a network not supporting MA PDU sessions.			

9.11.3.48 S1 UE network capability

See subclause 9.9.3.34 in 3GPP TS 24.301 [15].

9.11.3.48A S1 UE security capability

See subclause 9.9.3.36 in 3GPP TS 24.301 [15].

9.11.3.49 Service area list

The purpose of the Service area list information element is to transfer a list of allowed tracking areas for an allowed area or a list of non-allowed tracking areas for a non-allowed area from the network to the UE.

The coding of the information element allows combining different types of lists. The lists of type "00" and "01" allow a more compact encoding, when the different TAIs are sharing the PLMN identity. The lists of type "11" indicate all TAIs of the PLMNs in the registration area are allowed area.

The Service area list information element is coded as shown in figure 9.11.3.49.1, figure 9.11.3.49.2, figure 9.11.3.49.3, figure 9.11.3.49.4, figure 9.11.3.49.5 and table 9.11.3.49.1.

The Service area list is a type 4 information element with a minimum length of 6 octets and a maximum length of 114 octets. The list can contain a maximum of 16 different tracking area identities.

8	7	6	5	4	3	2	1

Figure 9.11.3.49.5: Partial service area list – type of list = "11"

Table 9.11.3.49.1: Service area list information element

Value part of the Service area list information element (octets 3 to n)

The value part of the Service area list information element consists of one or several partial service area lists. The length of each partial service area list can be determined from the 'type of list' field and the 'number of elements' field in the first octet of the partial service area list.

The "Allowed type" fields in all the partial service area lists shall have the same value. For allowed type "0", TAIs contained in all partial service area lists are in the allowed area. For allowed type "1", TAIs contained in all partial service area lists are in the non-allowed area.

The UE shall store the complete list received. If more than 16 TAIs are included in this information element, the UE shall store the first 16 TAIs and ignore the remaining octets of the information element.

Partial service area list:

Allowed type (octet 1)

Bit

8

0 TAIs in the list are in the allowed area

1 TAIs in the list are in the non-allowed area

Type of list (octet 1)

Bits

7 6

0 0 list of TACs belonging to one PLMN, with non-consecutive TAC values

0 1 list of TACs belonging to one PLMN, with consecutive TAC values

1 0 list of TAIs belonging to different PLMNs (see NOTE)

1 1 All TAIs belonging to the PLMNs in the registration area are in the allowed area

Number of elements (octet 1)

Bits

5 4 3 2 1

0 0 0 0 0 1 element

0 0 0 0 1 2 elements

0 0 0 1 0 3 elements

to

0 1 1 0 1 14 elements

0 1 1 1 0 15 elements

0 1 1 1 1 16 elements

All other values are unused and shall be interpreted as 16, if received by the UE.

For type of list = "00" and number of elements = k:

octets 2 to 4 contain the MCC+MNC, and

for j = 1, ..., k:

octets 3j+2 to 3j+4 contain the TAC of the j-th TAI belonging to the partial list,

For type of list = "01" and number of elements = k:

octets 2 to 4 contain the MCC+MNC, and

octets 5 to 7 contain the TAC of the first TAI belonging to the partial list.

The TAC values of the other k-1 TAIs are TAC+1, TAC+2, ..., TAC+k-1.

For type of list = "10" and number of elements = k:

for j = 1, ..., k.

octets 6j-4 to 6j-2 contain the MCC+MNC, and

octets 6j-1 to 6j+1 contain the TAC of the j-th TAI belonging to the partial list.

For type of list = "11":

Allowed type shall be coded as "0" and number of elements shall be ignored, and octets 2 to 4 containing the MCC+MNC can be ignored.

If allowed type is coded as "1", it shall be interpreted as "0".

MCC, Mobile country code
The MCC field is coded as in ITU-T Recommendation E.212 [42], annex A.
MNC, Mobile network code
The coding of this field is the responsibility of each administration but BCD coding shall be used. The MNC shall consist of 2 or 3 digits. If a network operator decides to use only two digits in the MNC, MNC digit 3 shall be coded as "1111".
TAC, Tracking area code
In the TAC field bit 8 of the first octet is the most significant bit and bit 1 of the third octet the least significant bit. The coding of the tracking area code is the responsibility of each administration. Coding using full hexadecimal representation may be used. The tracking area code consists of 3 octets.
NOTE: If the "list of TAs belonging to different PLMNs" is used, the PLMNs included in the list need to be present in the list of equivalent PLMNs. This type is not applicable in an SNPN.

9.11.3.50 Service type

The purpose of the service type information element is to specify the purpose of the service request procedure.

The service type is a type 1 information element.

The service type information element is coded as shown in figure 9.11.3.50.1 and table 9.11.3.50.1.

Figure 9.11.3.50.1: Service type information element

Table 9.11.3.50.1: Service type information element

Service type value (octet 1)				
Service type value

1	0	1	1	unused; shall be interpreted as "data", if received by the network
All other values are reserved.				

9.11.3.50A SMS indication

The purpose of the SMS indication information element is to indicate that the ability for the UE to use SMS over NAS has changed.

The SMS indication information element is coded as shown in figure 9.11.3.50A.1 and table 9.11.3.50A.1.

The SMS indication is a type 1 information element.

Figure 9.11.3.50A.1: SMS indication

Table 9.11.3.50A.1: SMS indication

SMS availability indication (SAI) (octet 1)	
Bit	
1	
0	SMS over NAS not available
1	SMS over NAS available
Bits 2, 3 and 4 are spare and shall be coded as zero,	

9.11.3.51 SOR transparent container

The purpose of the SOR transparent container information element in the REGISTRATION ACCEPT message is to provide the list of preferred PLMN/access technology combinations (or HPLMN indication that 'no change of the "Operator Controlled PLMN Selector with Access Technology" list stored in the UE is needed and thus no list of preferred PLMN/access technology combinations is provided'), or a secured packet (see 3GPP TS 23.122 [5] annex C) and optional indication of an acknowledgement request, SOR-CMCI, request the storage of the received SOR-CMCI in the ME, SOR-SNPN-SI (or subscribed SNPN or HPLMN indication that 'no change of the SOR-SNPN-SI stored in the UE is needed and thus no SOR-SNPN-SI is provided'), and SOR-SNPN-SI-LS. The purpose of the SOR transparent container information element in the REGISTRATION COMPLETE message is to indicate the UE acknowledgement of successful reception of the SOR transparent container IE in the REGISTRATION ACCEPT message as well as to indicate the ME support of SOR-CMCI, the ME support of SOR-SNPN-SI and the ME support of SOR-SNPN-SI-LS.

NOTE 1: When used in NAS transport procedure, the contents of the SOR transparent container information element in the Payload container IE of the DL NAS TRANSPORT message are used to provide the list of preferred PLMN/access technology combinations and optional indication of an acknowledgement request, SOR-CMCI, request the storage of the received SOR-CMCI in the ME, SOR-SNPN-SI, and SOR-SNPN-SI-LS. The contents of the SOR transparent container information element in the Payload container IE of the UL NAS TRANSPORT message are used to indicate the UE acknowledgement of successful reception of the SOR transparent container IE in the DL NAS TRANSPORT message as well as to indicate the ME support of SOR-CMCI, the ME support of SOR-SNPN-SI and the ME support of SOR-SNPN-SI-LS.

NOTE 2: The "Operator controlled signal threshold per access technology" content to update the USIM file EF_{OCST} (see 3GPP TS 31.102 [22]) can be included in the secured packet of the SOR transparent container.

The SOR transparent container information element is coded as shown in figure 9.11.3.51.1, figure 9.11.3.51.2, figure 9.11.3.51.3, figure 9.11.3.51.4, figure 9.11.3.51.5, figure 9.11.3.51.6, figure 9.11.3.51.7, figure 9.11.3.51.8, figure 9.11.3.51.9, figure 9.11.3.51.9A, figure 9.11.3.51.10, figure 9.11.3.51.11, figure 9.11.3.51.11A, figure 9.11.3.51.11B, figure 9.11.3.51.11C, figure 9.11.3.51.11D, figure 9.11.3.51.11E, figure 9.11.3.51.11F, figure 9.11.3.51.11G, figure 9.11.3.51.11H, figure 9.11.3.51.11I, figure 9.11.3.51.12, figure 9.11.3.51.13, table 9.11.3.51.1, table 9.11.3.51.2, table 9.11.3.51.3, table 9.11.3.51.4, table 9.11.3.51.4A, table 9.11.3.51.5 and table 9.11.3.51.6.

The SOR transparent container is a type 6 information element with a minimum length of 20 octets.

Figure 9.11.3.51.6: SOR header for SOR data type with value "1"

Table 9.11.3.51.1: SOR transparent container information element

SOR-MAC-I_{AUSF} (see NOTE 1), SOR-MAC-I_{UE} (see NOTE 2) and Counter_{SOR} (see NOTE 1) are coded as specified in 3GPP TS 33.501 [24].

SOR data type (octet 4, bit 1)

- 0 The SOR transparent container carries steering of roaming information.
- 1 The SOR transparent container carries acknowledgement of successful reception of the steering of roaming information.

List indication (octet 4, bit 2) (see NOTE 1 and NOTE 5)

- 0 HPLMN indication that 'no change of the "Operator Controlled PLMN Selector with Access Technology" list stored in the UE is needed and thus no list of preferred PLMN/access technology combinations is provided'
- 1 list of preferred PLMN/access technology combinations is provided

List type (octet 4, bit 3) (see NOTE 1)

- 0 The list type is a secured packet.
- 1 The list type is a "PLMN ID and access technology list".

Acknowledgement (ACK) value (octet 4, bit 4) (see NOTE 1)

- 0 acknowledgement not requested
- 1 acknowledgement requested

Additional parameters (AP) value (octet 4, bit 5)

Bit

5

- 0 Additional parameters not included
- 1 Additional parameters included (see NOTE 3)

If the SOR data type is set to value "0", the list type bit is set to value "1", and the additional parameters bit is set to value "1" then:

- the octet 0 is present.
- if the list indication bit is set to "0" then the PLMN ID and access technology list field and the length of PLMN ID and access technology list field are absent.
- if the list indication bit is set to "1" then the PLMN ID and access technology list field and the length of PLMN ID and access technology list field are present.

The secure packet is coded as specified in 3GPP TS 31.115 [22B]. (see NOTE 1)

The PLMN ID and access technology list consists of PLMN ID and access technology identifier and are coded as specified in 3GPP TS 31.102 [22] subclause 4.2.5. The PLMN ID and access technology identifier are provided in decreasing order of priority, i.e. PLMN ID 1 indicates highest priority and PLMN ID n indicates lowest priority. The PLMN ID and access technology list contains at minimum zero and at maximum 16 (decimal) PLMN IDs and access technology identifiers. (see NOTE 1)

ME support of SOR-CMCI indicator (MSSI) value (octet 4, bit 2) (see NOTE 2, NOTE 4)

- 0 SOR-CMCI not supported by the ME
- 1 SOR-CMCI supported by the ME

ME support of SOR-SNPN-SI indicator (MSSNPNSI) value (octet 4, bit 3) (see NOTE 2, NOTE 6)

- 0 SOR-SNPN-SI not supported by the ME
- 1 SOR-SNPN-SI supported by the ME

MS support of SOR-SNPN-SI-LS indicator (MSSNPNSILS) value (octet 4, bit 4) (see NOTE 2)

Bit

4

- 0 SOR-SNPN-SI-LS not supported by the ME
- 1 SOR-SNPN-SI-LS supported by the ME

SOR-CMCI indicator (SI) value (octet 0, bit 1)

Bit

1

- 0 SOR-CMCI absent
- 1 SOR-CMCI present

If the SOR-CMCI indicator bit is set to "SOR-CMCI present", the SOR-CMCI field is present. If the SI bit is set to "SOR-CMCI absent", the SOR-CMCI field is absent. Store SOR-CMCI in ME indicator (SSCMI) value (octet o, bit 2) Bit 2 0 Do not store SOR-CMCI in ME 1 Store SOR-CMCI in ME SOR-CMCI (octet o+1 to octet p) The SOR-CMCI field is coded according to figure 9.11.3.51.7 and table 9.11.3.51.2. SOR-SNPN-SI indicator (SSSI) value (octet o, bit 3) Bit 3 0 subscribed SNPN or HPLMN indication that 'no change of the SOR-SNPN-SI stored in the UE is needed and thus no SOR-SNPN-SI is provided' 1 SOR-SNPN-SI present If the SSSI bit is set to "SOR-SNPN-SI present", the SOR-SNPN-SI field is present. If the SSSI bit is set to "subscribed SNPN or HPLMN indication that 'no change of the SOR-SNPN-SI stored in the UE is needed and thus no SOR-SNPN-SI is provided'", the SOR-SNPN-SI is absent. SOR-SNPN-SI-LS indicator (SSSLI) value (octet o, bit 4) Bit 4 0 SOR-SNPN-SI-LS absent 1 SOR-SNPN-SI-LS present If the SSSLI bit is set to "SOR-SNPN-SI-LS present", the SOR-SNPN-SI-LS field is present. If the SSSLI bit is set to "SOR-SNPN-SI-LS absent", the SOR-SNPN-SI-LS is absent.							
NOTE 1: This bit or field applies for SOR header with SOR data type with value "0". NOTE 2: This bit or field applies for SOR header with SOR data type with value "1". NOTE 3: Additional parameters can be set to value "1" only when the ME supports SOR-CMCI, SOR-SNPN-SI or SOR-SNPN-SI-LS, and the list type bit is set to value "1". The ME supporting SOR-SNPN-SI-LS supports SOR-SNPN-SI as specified in 3GPP TS 23.122 [5]. NOTE 4: The "SOR-CMCI supported by the ME" is not set by a UE compliant to an earlier release of the specification. NOTE 5: This bit or field applies for SOR header with list type with value "1". NOTE 6: The "SOR-SNPN-SI supported by the ME" may only be set by a UE which supports access to an SNPN using credentials from a credentials holder and which is not operating in SNPN access operation mode.							

8	7	6	5	4	3	2	1	
Length of SOR-CMCI contents								octet (o+1)
SOR-CMCI rule 1								octet (o+2)
SOR-CMCI rule 2								octet (o+3)*

Figure 9.11.3.51.7: SOR-CMCI

Table 9.11.3.51.2: SOR-CMCI

SOR-CMCI rule:
The SOR-CMCI rule is coded according to figure 9.11.3.51.8 and table 9.11.3.51.3.

Figure 9.11.3.51.8: SOR-CMCI rule

Table 9.11.3.51.3: SOR-CMCI rule

Tsor-cm timer value The Tsor-cm timer value field is coded according to octet 2 of the GPRS timer information element as specified in 3GPP TS 24.008 [12] subclause 10.5.7.3 and indicates the Tsor-cm timer value. When the unit field of the Tsor-cm timer value field indicates that the timer is deactivated, the receiving entity shall consider that Tsor-cm timer value is set to the infinity value. Criterion type Bits 8 7 6 5 4 3 2 1 0 0 0 0 0 0 0 1 DNN 0 0 0 0 0 0 1 0 S-NSSAI SST 0 0 0 0 0 0 1 1 S-NSSAI SST and SD 0 0 0 0 0 1 0 0 IMS registration related signalling 0 0 0 0 0 1 0 1 MMTEL voice call 0 0 0 0 0 1 1 0 MMTEL video call 0 0 0 0 0 1 1 1 SMS over NAS or SMSoIP 0 0 0 0 1 0 0 0 SOR security check not successful 1 1 1 1 1 1 1 1 match all All other values are spare. The receiving entity shall ignore SOR-CMCI rule with criterion of criterion type set to a spare value. For "DNN", the criterion value field is coded as the length and value part of DNN information element as specified in subclause 9.11.2.1B starting with the second octet. For "S-NSSAI SST", the criterion value field shall be encoded as one octet SST field. For "S-NSSAI SST and SD", the criterion value field shall be encoded as a sequence of one octet SST field and three octets SD field. The SST field shall be transmitted first. The SST field contains SST of HPLMN's S-NSSAI. The SD field contains SD of HPLMN's S-NSSAI. For "match all", "SOR security check not successful", "IMS registration related signalling", "MMTEL voice call", "MMTEL video call", and "SMS over NAS or SMSoIP", the criterion value field is zero octets long. If the length of SOR-CMCI rule contents field indicates a length bigger than indicated in figure 9.11.3.51.8, receiving entity shall ignore any superfluous octets located at the end of the SOR-CMCI rule. The UE applies SOR-CMCI rules as described in 3GPP TS 23.122 [5] annex C.

Mobile country code (MCC):

The MCC field is coded as in ITU-T Recommendation E.212 [42], annex A.

Mobile network code (MNC):

The coding of MNC field is the responsibility of each administration but BCD coding shall be used. The MNC shall consist of 2 or 3 digits. If a network operator decides to use only two digits in the MNC, MNC digit 3 shall be coded as "1111".

NID assignment mode (see NOTE 1)

NID assignment mode is coded as specified in 3GPP TS 23.003 [4].

NID value (see NOTE 1)

NID value is coded as specified in 3GPP TS 23.003 [4].

1 Tracking area information of SNPNs included

Location assistance information

Location assistance information field contains the geographical area descriptions field, the tracking area information of PLMNs field, the tracking area information of SNPNs field. or any combination of them.

Time period

The time period field is coded as the route selection descriptor component value field for "time window type" specified in 3GPP TS 24.526 [19] table 5.2.1.

Type of shape

Type of shape is coded as specified in Table 2a in 3GPP TS 23.032 [4B].

Shape description Shape description is coded as specified in subclause 7.3 in 3GPP TS 23.032 [4B].
Tracking area information of PLMNs Tracking area information of PLMNs field contains one or more tracking area information of PLMN fields.
Tracking area information of PLMN Tracking area information of PLMN field contains an MCC and MNC of a PLMN identity and a TAC list field containing one or more tracking area code fields, each indicating a TAC of a PLMN identified by the PLMN identity.
Tracking area information of SNPNs Tracking area information of SNPNs field contains one or more tracking area information of SNPN fields. If the tracking area information of SNPNs field is included in a location assistance information field of an SNPN info field, the SNPN identity field in each tracking area information of SNPN field of the tracking area information of SNPNs field is different from the SNPN identity field in the SNPN info field.
Tracking area information of SNPN Tracking area information of SNPN field contains SNPN identity and a TAC list containing one or more tracking area code fields, each indicating a TAC of an SNPN identified by the SNPN identity.
Tracking area code (TAC) In the TAC field bit 8 of the first octet is the most significant bit and bit 1 of third octet the least significant bit. The coding of the tracking area code is the responsibility of each administration. Coding using full hexadecimal representation may be used. The tracking area code consists of 3 octets.
NOTE 1: NID coding deviates from coding of value part of NID IE as specified in subclause 9.2.7 of 3GPP TS 24.502 [18], coding of the NID field of the SNPN list IE as specified in subclause 9.11.3.92, and coding of the NID field of the SNPN list with trusted 5G connectivity IE as specified in subclause H.2.4.7 of 3GPP TS 24.302 [16].
NOTE 2: If the location validity information indicator is set to 'Location validity information included' but TAC list indicator is set to 'TAC list not included', the UE shall ignore the location validity information.

Table 9.11.3.51.6: CH controlled prioritized list of GINs and CH controlled prioritized list of preferred GINs for access for localized services in SNPN

Mobile country code (MCC): The MCC field is coded as in ITU-T Recommendation E.212 [42], annex A.	
Mobile network code (MNC): The coding of MNC field is the responsibility of each administration but BCD coding shall be used. The MNC shall consist of 2 or 3 digits. If a network operator decides to use only two digits in the MNC, MNC digit 3 shall be coded as "1111".	
NID assignment mode (see NOTE) NID assignment mode is coded as specified in 3GPP TS 23.003 [4].	
NID value (see NOTE) NID value is coded as specified in 3GPP TS 23.003 [4].	
Time indication (bit1 of octet v+5)	
Bit	
1	
0	Time validity information not included
1	Time validity information included
Location assistance information indicator (LAI) (bit 2 of octet v+5)	
Bit	
2	
0	Location assistance information not included
1	Location assistance information included
Location validity information indicator (LVII) (bit 3 of octet v+5)	
Bit	
3	
0	Location validity information not included
1	Location validity information included
Time period The time period field is coded as the route selection descriptor component value field for "time window type" specified in 3GPP TS 24.526 [19] table 5.2.1.	
Location assistance information (oct(s+1)* to (q)*) The Location assistance information is coded according to Figure 9.11.3.51.11B and Table 9.11.3.51.5.	
NOTE: NID coding deviates from coding of value part of NID IE as specified in subclause 9.2.7 of 3GPP TS 24.502 [18], coding of the NID field of the SNPN list IE as specified in subclause 9.11.3.92, and coding of the NID field of the SNPN list with trusted 5G connectivity IE as specified in subclause H.2.4.7 of 3GPP TS 24.302 [16].	

9.11.3.51A Supported codec list

See subclause 10.5.4.32 in 3GPP TS 24.008 [12].

9.11.3.52 Time zone

See subclause 10.5.3.8 in 3GPP TS 24.008 [12].

9.11.3.53 Time zone and time

See subclause 10.5.3.9 in 3GPP TS 24.008 [12].

9.11.3.53A UE parameters update transparent container

The purpose of the UE parameters update transparent container when sent from the network to the UE is to provide UE parameters update data, optional acknowledgement request and optional re-registration request. The purpose of the UE parameters update transparent container when sent from the UE to the network is to indicate the UE acknowledgement of successful reception of the UE parameters update transparent container.

The UE parameters update transparent container information element is coded as shown in figure 9.11.3.53A.1, figure 9.11.3.53A.2, figure 9.11.3.53A.3, figure 9.11.3.53A.4, figure 9.11.3.53A.4B, figure 9.11.3.53A.4C, figure 9.11.3.53A.5, figure 9.11.3.53A.6, figure 9.11.3.53A.7 and table 9.11.3.53A.1.

The UE parameters update transparent container is a type 6 information element with a minimum length of 20 octets.

Figure 9.11.3.53A.1: UE parameters update transparent container information element for UE parameters update data type with value "0"

Figure 9.11.3.53A.2: UE parameters update list

Figure 9.11.3.53A.6: UE parameters update header for UE parameters update data type with value "0"

Figure 9.11.3.53A.7: UE parameters update header for UE parameters update data type with value "1"

Table 9.11.3.53A.1: UE parameters update transparent container information element

UPU-MAC-I _{AUSF} , UPU-MAC-I _{UE} and Counter _{UPU} are coded as specified in 3GPP TS 33.501 [24]
UE parameters update (UPU) data type (octet 4, bit 1) 0 The UE parameters update transparent container carries a UE parameters update list (NOTE 2) 1 The UE parameters update transparent container carries an acknowledgement of successful reception of a UE parameters update list (NOTE 2, NOTE 4)
Acknowledgement (ACK) value (octet 4, bit 2) 0 acknowledgement not requested 1 acknowledgement requested
UE parameters update header protection (UHP) value (octet 4, bit 2) 0 UE parameters update header protection not supported 1 UE parameters update header protection supported
Re-registration (REG) value (octet 4, bit 3) 0 re-registration not requested 1 re-registration requested
UE parameters update data set type Bits 4 3 2 1 0 0 0 1 Routing indicator update data 0 0 1 0 Default configured NSSAI update data 0 0 1 1 Disaster roaming information update data 0 1 0 0 ME routing indicator update data 0 1 0 1 Protected UE parameters update header information (NOTE 5)
All other values are reserved
Disaster Roaming Enabled Indication (DREI) value (octet d*, bit 1) 0 Disaster roaming is disabled in the UE 1 Disaster roaming is enabled in the UE
Indication of 'applicability of "lists of PLMN(s) to be used in disaster condition" provided by a VPLMN' (AOL) value (octet d*, bit 2) 0 false 1 true
Disaster Roaming Enabled Indication in EPS (DREIEPS) value (octet d*, bit 3) 0 Disaster roaming in EPS is disabled in the UE 1 Disaster roaming in EPS is enabled in the UE
The secured packet is coded as specified in 3GPP TS 31.115 [22B].
The default configured NSSAI is encoded as the value part of the NSSAI IE (see subclause 9.11.3.37).
Routing indicator Routing indicator is encoded as the routing indicator field of the 5GS mobile identity IE (see subclause 9.11.3.4).

NOTE 1:	When the routing indicator is updated, if the SNPN uses the EAP based primary authentication and key agreement procedure using the EAP-AKA' or the 5G AKA based primary authentication and key agreement procedure, then UE parameter update data set type is set to "routing indicator update data", otherwise, UE parameter update data set type is set to "ME routing indicator update data".
NOTE 2:	The UPU data type set to "0" is used in the network to UE direction. The UPU data type set to "1" is used in the UE to network direction.
NOTE 4:	In the UE parameters update data set with the UE parameters update data set type indicating "protected UE parameters update header information", the UPU data type shall be set to "0".
NOTE 5:	If the UE supports UE parameters update header protection and the UE parameters update list includes a UE parameters update data set with the UE parameters update data set type indicating "protected UE parameters update header information", then the UE uses header information from the UE parameters update data set with the UE parameters update data set type indicating "protected UE parameters update header information".

9.11.3.54 UE security capability

The UE security capability information element is used by the UE and by the network to indicate which security algorithms are supported by the UE in N1 mode for NAS security as well as which security algorithms are supported over NR and E-UTRA connected to 5GCN for AS security.

The UE security capability information element is coded as shown in figure 9.11.3.54.1 and table 9.11.3.54.1.

The UE security capability is a type 4 information element with a minimum length of 4 octets and a maximum length of 10 octets.

Octets 5 to 10 are optional. If octet 5 is included, then also octet 6 shall be included.

If the UE does not support any security algorithm for AS security over E-UTRA connected to 5GCN, it shall not include octets 5 and 6. The UE shall not include octets 7 to 10.

If the UE does not support any security algorithm for AS security over E-UTRA connected to 5GCN, and if the network includes octets 7 to 10, then the network shall also include octets 5 to 6.

If the network includes octet 7, then it shall include also octet 8. If the network includes octet 9, then it shall include also octet 10.

0 EPS integrity algorithm EIA7 not supported
1 EPS integrity algorithm EIA7 supported

For the UE not supporting any security algorithm for AS security over E-UTRA connected to 5GCN, all bits in octets 5 to 10 are spare and shall be ignored, if the respective octet is received with the information element. For the UE supporting at least one security algorithm for AS security over E-UTRA connected to 5GCN all bits in octets 7 to 10 are spare and shall be ignored, if the respective octet is received with the information element. If the AMF receives any of the octets 7 to 10 (NOTE 5), it shall store the octets as received and include them when sending the UE security capability information element to the UE.
NOTE 1: The code points in octet 3 are used to indicate support for 5GS encryption algorithms for NAS security in N1 mode and support for 5GS encryption algorithms for AS security over NR.
NOTE 2: The code points in octet 4 are used to indicate support for 5GS integrity algorithms for NAS security in N1 mode and support for 5GS integrity algorithms for AS security over NR.
NOTE 3: The code points in octet 5 are used to indicate support for EPS encryption algorithms for AS security over E-UTRA connected to 5GCN.
NOTE 4: The code points in octet 6 are used to indicate support for EPS integrity algorithms for AS security over E-UTRA connected to 5GCN.
NOTE 5: The AMF can receive this information element also from another AMF or MME during N1 mode to N1 mode or S1 mode to N1 mode handover preparation.

9.11.3.55 UE's usage setting

The purpose of the UE's usage setting information element is to provide the network with the UE's usage setting as defined in 3GPP TS 24.301 [15]. The network uses the UE's usage setting to select the RFSP index.

The UE's usage setting information element is coded as shown in figure 9.11.3.55.1 and table 9.11.3.55.1.

The UE's usage setting is a type 4 information element with a length of 3 octets.

Figure 9.11.3.55.1: UE's usage setting information element

Table 9.11.3.55.1: UE's usage setting information element

UE's usage setting (octet 3, bit 1)	
0	voice centric
1	data centric
All other bits in the octet 3 are spare and shall be coded as zero,	

9.11.3.56 UE status

The purpose of the UE status information element is to provide the network with information concerning aspects of the current UE registration status which is used for interworking with EPS.

The UE status information element is coded as shown in figure 9.11.3.56.1 and table 9.11.3.56.1.

The UE status is a type 4 information element with a length of 3 octets.

**Figure 9.11.3.56.1: UE status information element****Table 9.11.3.56.1: UE status information element**

EMM registration status (S1 mode reg) (octet 3, bit 1)	
0	UE is not in EMM-REGISTERED state
1	UE is in EMM-REGISTERED state
5GMM registration status (N1 mode reg) (octet 3, bit 2)	
0	UE is not in 5GMM-REGISTERED state
1	UE is in 5GMM-REGISTERED state
All other bits in the octet 3 are spare and shall be coded as zero.	

9.11.3.57 Uplink data status

The purpose of the Uplink data status information element is to indicate to the network which preserved PDU session(s) have uplink data pending or which preserved PDU session(s) are associated with active multicast MBS session(s).

The Uplink data status information element is coded as shown in figure 9.11.3.57.1 and table 9.11.3.57.1.

The Uplink data status information element is a type 4 information element with minimum length of 4 octets a maximum length of 34 octets.

**Figure 9.11.3.57.1: Uplink data status information element****Table 9.11.3.57.1: Uplink data status information element**

PSI(x) shall be coded as follows:	
PSI(0):	
Bit 1 of octet 3 is spare and shall be coded as zero.	
PSI(1) – PSI(15):	
0 indicates that no uplink data are pending for the corresponding PDU session identity or the PDU session is in PDU SESSION INACTIVE state or is in PDU SESSION ACTIVE state with user-plane resources already established.	
1 indicates that uplink data are pending for the corresponding PDU session identity and the user-plane resources for the corresponding PDU session are not established, or the UE has active multicast MBS session(s) associated with the corresponding PDU session.	
All bits in octet 5 to 34 are spare and shall be coded as zero, if the respective octet is included in the information element.	

- 9.11.3.58 Void
- 9.11.3.59 Void
- 9.11.3.60 Void
- 9.11.3.61 Void
- 9.11.3.62 Void
- 9.11.3.63 Void
- 9.11.3.64 Void
- 9.11.3.65 Void
- 9.11.3.66 Void
- 9.11.3.67 Void

9.11.3.68 UE radio capability ID

The purpose of the UE radio capability ID information element is to carry a UE radio capability ID.

The UE radio capability ID information element is coded as shown in figure 9.11.3.68.1 and table 9.11.3.68.1.

The UE radio capability ID is a type 4 information element with a length of n octets.

Figure 9.11.3.68.1: UE radio capability ID information element

Table 9.11.3.68.1: UE radio capability ID information element

UE radio capability ID (octets 3 to n)
The UE radio capability ID contents contain the UE radio capability ID as specified in 3GPP TS 23.003 [4], with each hexadecimal digit coded over 4 bits, starting with the first hexadecimal digit coded in bits 4 to 1 of octet 3, the second hexadecimal digit coded in bits 8 to 5 of octet 3, and so on. If the UE radio capability ID contains an odd number of hexadecimal digits, bits 8 to 5 of the last octet (octet n) shall be coded as "1111".

9.11.3.69 UE radio capability ID deletion indication

The purpose of the UE radio capability ID deletion indication information element is to indicate to the UE that deletion of UE radio capability IDs is requested.

The UE radio capability ID deletion indication is a type 1 information element.

The UE radio capability ID deletion indication information element is coded as shown in figure 9.11.3.69.1 and table 9.11.3.69.1.

Figure 9.11.3.69.1: UE radio capability ID deletion indication information element

Table 9.11.3.69.1: UE radio capability ID deletion indication information element

Deletion requested (octet 1)									
Bits									
3	2	1							
0	0	0	UE radio capability ID deletion not requested						
0	0	1	Network-assigned UE radio capability IDs deletion requested						
All other values are unused and shall be interpreted as "UE radio capability ID deletion not requested", if received by the UE.									

9.11.3.70 Truncated 5G-S-TMSI configuration

The purpose of the Truncated 5G-S-TMSI configuration information element is to provide the size of the components of the truncated 5G-S-TMSI to the UE in NB-N1 mode to create the truncated 5G-S-TMSI.

The Truncated 5G-S-TMSI configuration information element is coded as shown in figure 9.11.3.70.1 and table 9.11.3.70.1.

The Truncated 5G-S-TMSI configuration is a type 4 information element with 3 octets length.

Figure 9.11.3.70.1: Truncated 5G-S-TMSI configuration information element

Table 9.11.3.70.1: Truncated 5G-S-TMSI configuration information element

Truncated AMF Pointer value (bits 4 to 1 of octet 3)				
This field represents the size of the least significant bits of the AMF Pointer.				
Bits				
4	3	2	1	
0	0	0	0	reserved
0	0	0	1	1 least significant bit of the AMF Pointer
0	0	1	0	2 least significant bits of the AMF Pointer
0	0	1	1	3 least significant bits of the AMF Pointer
0	1	0	0	4 least significant bits of the AMF Pointer
0	1	0	1	5 least significant bits of the AMF Pointer
0	1	1	0	6 least significant bits of the AMF Pointer
All other values shall be interpreted as "6 least significant bits of the AMF Pointer" by this version of the protocol.				
Truncated AMF Set ID value (bits 8 to 5 of octet 3)				
This field represents the size of the least significant bits of the AMF Set ID.				
Bits				
4	3	2	1	
0	0	0	0	reserved
0	0	0	1	1 least significant bit of the AMF Set ID
0	0	1	0	2 least significant bits of the AMF Set ID
0	0	1	1	3 least significant bits of the AMF Set ID
0	1	0	0	4 least significant bits of the AMF Set ID
0	1	0	1	5 least significant bits of the AMF Set ID
0	1	1	0	6 least significant bits of the AMF Set ID
0	1	1	1	7 least significant bits of the AMF Set ID
1	0	0	0	8 least significant bits of the AMF Set ID
1	0	0	1	9 least significant bits of the AMF Set ID
1	0	1	0	10 least significant bits of the AMF Set ID
All other values shall be interpreted as "10 least significant bits of the AMF Set ID" by this version of the protocol.				
NOTE: Total sum of the "Truncated AMF Set ID value" and the "Truncated AMF Pointer value" in the Truncated 5G-S-TMSI configuration IE is specified in 3GPP TS 23.003 [4] and 3GPP TS 36.300 [25B].				

9.11.3.71 WUS assistance information

See subclause 9.9.3.62 in 3GPP TS 24.301 [15].

9.11.3.72 N5GC indication

The purpose of the N5GC indication information element is to indicate to the network that the registration request by the W-AGF is on behalf of an N5GC device.

The N5GC indication information element is coded as shown in figure 9.11.3.72.1.

The N5GC indication is a type 1 information element.

Figure 9.11.3.72.1: N5GC indication

Table 9.11.3.72.1: N5GC indication

N5GC device indication bit (N5GCREG) (octet 1, bit 1)	
Bit	
1	
0	N5GC device registration is not requested
1	N5GC device registration is requested
Bits 2 to 4 are spare and shall be coded as zero.	

9.11.3.73 NB-N1 mode DRX parameters

The purpose of the NB-N1 mode DRX parameters information element is to indicate that the UE wants to use DRX in NB-N1 mode and for the network to indicate the DRX cycle value to be used at paging in NB-N1 mode.

The NB-N1 mode DRX parameters is a type 4 information element with a length of 3 octets.

The NB-N1 mode DRX parameters information element is coded as shown in figure 9.11.3.73.1 and table 9.11.3.73.1.

The value part of a DRX parameter information element is coded as shown in table 9.11.3.73.1.

8	7	6	5	4	3	2	1	
NB-N1 mode DRX parameters IEI								octet 1
Length of NB-N1 mode DRX parameters contents								octet 2
0	0	0	0	NB-N1 mode DRX value				octet 3
Spare								

Figure 9.11.3.73.1: NB-N1 mode DRX parameters information element

Table 9.11.3.73.1: NB-N1 mode DRX parameters information element

NB-N1 mode DRX value (octet 3, bits 1 to 4)	
This field represents the DRX cycle parameter 'T', for NB-N1 mode, as defined in 3GPP TS 36.304 [25C].	
Bits	
4	3 2 1
0 0 0 0	DRX value not specified
0 0 0 1	DRX cycle parameter T = 32
0 0 1 0	DRX cycle parameter T = 64
0 0 1 1	DRX cycle parameter T = 128
0 1 0 0	DRX cycle parameter T = 256
0 1 0 1	DRX cycle parameter T = 512
0 1 1 1	DRX cycle parameter T = 1024
All other values shall be interpreted as "DRX value not specified" by this version of the protocol.	
Bits 5 to 8 of octet 3 are spare and shall be coded as zero.	

9.11.3.74 Additional configuration indication

The purpose of the Additional configuration indication information element is to indicate additional information associated with the generic UE configuration update procedure.

The Additional configuration indication information element is coded as shown in figure 9.11.3.74.1 and table 9.11.3.74.1.

The Additional configuration indication is a type 1 information element.

8	7	6	5	4	3	2	1

0	no additional information
1	release of N1 NAS signalling connection not required
Bits 2 to 4 are spare and shall be coded as zero,	

9.11.3.75 Extended rejected NSSAI

The purpose of the Extended rejected NSSAI information element is to identify a collection of rejected S-NSSAIs if UE supports extended rejected NSSAI.

The Extended rejected NSSAI information element is coded as shown in figure 9.11.3.75.1, figure 9.11.3.75.2 and table 9.11.3.75.1.

The Extended rejected NSSAI is a type 4 information element with a minimum length of 5 octets and a maximum length of 90 octets.

8	7	6	5	4	3	2	1

Figure 9.11.3.75.3: Partial extended rejected NSSAI list – type of list = 001

Figure 9.11.3.75.4: Rejected S-NSSAI

Table 9.11.3.75.1: Extended rejected NSSAI information element

Value part of the Extended rejected NSSAI information element (octet 3 to v)

The value part of the Extended rejected NSSAI information element consists of one or more partial extended rejected NSSAI lists. The length of each partial extended rejected NSSAI list can be determined from the 'type of list' field and the 'number of elements' field in the first octet of the partial extended rejected NSSAI list.

Each rejected S-NSSAI consists of one S-NSSAI and an associated cause value. Each rejected S-NSSAI also includes the mapped HPLMN S-NSSAI if available. The length of each rejected S-NSSAI can be determined by the 'length of rejected S-NSSAI' field in the first octet of the rejected S-NSSAI.

The UE shall store the complete list received (NOTE 0). If more than 8 rejected S-NSSAIs are included in this information element, the UE shall store the first 8 rejected S-NSSAIs and ignore the remaining octets of the information element.

Partial extended rejected NSSAI list:

Number of elements (octet 3, bits 1 to 4)

Bits

4	3	2	1	
0	0	0	0	1 element
0	0	0	1	2 element
			...	
0	1	1	0	7 element
0	1	1	1	8 element

All other values are unused and shall be interpreted as 8, if received by the UE.

Type of list (octet 3, bits 5 to 7) (NOTE 7)

Bits

7	6	5	
0	0	0	list of S-NSSAIs without any associated back-off timer value
0	0	1	list of S-NSSAIs with one associated back-off timer value that applies to all S-NSSAIs in the list

All other values are reserved.

Bit 8 of octet 3 is spare and shall be coded as zero.

Back-off timer value (octet 4):

Back-off timer value is coded as the value part of GPRS timer 3 in subclause 10.5.7.4a in 3GPP TS 24.008 [12].

Rejected S-NSSAI:

Cause value (octet x) (NOTE 8)

Bits

4	3	2	1	
0	0	0	0	S-NSSAI not available in the current PLMN or SNPN
0	0	0	1	S-NSSAI not available in the current registration area
0	0	1	0	S-NSSAI not available due to the failed or revoked network slice-specific authentication and authorization
0	0	1	1	S-NSSAI not available due to maximum number of UEs reached

All other values are reserved.

Slice/service type (SST) (octet x+1)

This field contains the 8 bit SST value. The coding of the SST value part is defined in 3GPP TS 23.003 [4]. (NOTE 5)

Slice differentiator (SD) (octet x+2 to octet x+4)

This field contains the 24 bit SD value. The coding of the SD value part is defined in 3GPP TS 23.003 [4]. (NOTE 6) If the SST encoded in octet x+1 is not associated with a valid SD value, and the sender needs to include a mapped HPLMN SST (octet x+5) and a mapped HPLMN SD (octets x+6 to x+8), then the sender shall set the SD value (octets x+2 to x+4) to "no SD value associated with the SST". mapped HPLMN Slice/service type (SST) (octet x+5) This field contains the 8 bit SST value of an S-NSSAI in the S-NSSAI(s) of the HPLMN to which the SST value is mapped. The coding of the SST value part is defined in 3GPP TS 23.003 [4]. mapped HPLMN Slice differentiator (SD) (octet x+6 to octet x+8) This field contains the 24 bit SD value of an S-NSSAI in the S-NSSAI(s) of the HPLMN to which the SD value is mapped. The coding of the SD value part is defined in 3GPP TS 23.003 [4]. NOTE 0: The number of rejected S-NSSAI(s) shall not exceed eight. NOTE 1: Octet x and octet x+1 shall always be included. NOTE 2: If the octet x+2 is included, then octet x+3 and octet x+4 shall be included. NOTE 3: If the octet x+5 is included, then octets x+6, x+7, and x+8 may be included. NOTE 4: If the octet x+6 is included, then octet x+7 and octet x+8 shall be included. NOTE 5: If the Cause value is "S-NSSAI not available due to the failed or revoked network slice-specific authentication and authorization", this field shall contain the 8 bit SST value of an S-NSSAI in the S-NSSAI(s) of the HPLMN and octets x+5, x+6, x+7, and x+8 shall not be included. NOTE 6: If the Cause value is "S-NSSAI not available due to the failed or revoked network slice-specific authentication and authorization", this field shall contain the 24 bit SD value of an S-NSSAI in the S-NSSAI(s) of the HPLMN and octets x+5, x+6, x+7, and x+8 shall not be included. NOTE 7: The partial extended rejected NSSAI with type of list = 001 shall only be used for rejected S-NSSAI(s) with the rejection cause "S-NSSAI not available due to maximum number of UEs reached". NOTE 8: Octet x can be 4 or 5.	

9.11.3.76 UE request type

See subclause 9.9.3.65 in 3GPP TS 24.301 [15].

9.11.3.77 Paging restriction

The purpose of the Paging restriction information element is to request the network to restrict paging.

The Paging restriction information element is coded as shown in figure 9.11.3.77.1, figure 9.11.3.77.2 and table 9.11.3.77.1.

The Paging restriction is a type 4 information element with a minimum length of 3 octets and a maximum length of 35 octets.

8		7		6		5		4		3		2		1		
Paging restriction IEI																octet 1

Table 9.11.3.77.1: Paging restriction information element

Paging restriction type (bits 4 to 1 of octet 3)				
Bits				
4	3	2	1	
0	0	0	0	reserved
0	0	0	1	All paging is restricted
0	0	1	0	All paging is restricted except for voice service
0	0	1	1	All paging is restricted except for specified PDU session(s)
0	1	0	0	All paging is restricted except for voice service and specified PDU session(s)
All other values are reserved.				
Bits 5 to 8 of octet 3 are spare and shall be coded as zero.				
PSI(x) (bits 8 to 1 of octet 4 and octet 5):				
This field indicates the PDU session identity of the PDU session for which paging is restricted.				
PSI(0): (bit 1 of octet 4)				
Spare and shall be coded as zero.				
PSI(1) – PSI(15):				
0 indicates that paging is restricted for the PDU session associated with the PDU session identity.				
1 indicates that paging is not restricted for the PDU session associated with the PDU session identity.				
All bits in octet 6 to 35 are spare and shall be coded as zero, if the respective octet is included in the information element.				

9.11.3.78 Void

9.11.3.79 NID

See subclause 9.2.7 in 3GPP TS 24.502 [18].

9.11.3.80 PEIPS assistance information

The purpose of the PEIPS assistance information, information element is to transfer the required assistance information for PEIPS. The PEIPS assistance information, information element is coded as shown in figure 9.11.3.80.1, figure 9.11.3.80.2, figure 9.11.3.80.3 and table 9.11.3.80.1.

The PEIPS assistance information is a type 4 information element, with a length of 3 octets.

Figure 9.11.3.80.1: PEIPS assistance information information element

Figure 9.11.3.80.2: PEIPS assistance information type –type of information= "000"

Figure 9.11.3.80.3: PEIPS assistance information type –type of information= "001"

Table 9.11.3.80.1: PEIPS assistance information information element

Value part of the PEIPS assistance information information element (octet 3)

The value part of the PEIPS assistance information information element consists of one PEIPS assistance information type parameter.

PEIPS assistance information type:

Type of information (octet 3, bits 6 to 8)

Bits

8	7	6	
0	0	0	Paging subgroup ID
0	0	1	UE paging probability information

All other values are reserved.

Paging subgroup ID value (octet 3, bits 1 to 5)

This field contains the binary encoded value (in decimal) of paging subgroup ID that is assigned by the AMF for paging the UE. This field has a valid range of values from (0-7). All other values are unused and shall be interpreted as 0 by this version of the protocol.

UE paging probability information value (octet 3, bits 1 to 5)

This field contains the value of UE paging probability information provided by the UE to the AMF. It represents the probability of the UE receiving the paging.

Bit

5	4	3	2	1	UE paging probability information value
0	0	0	0	0	p00 (UE calculated paging probability is 0%)
0	0	0	0	1	p05 (UE calculated paging probability > 0% and <= 5%)
0	0	0	1	0	p10 (UE calculated paging probability > 5% and <= 10%)
0	0	0	1	1	p15 (UE calculated paging probability > 10% and <= 15%)
0	0	1	0	0	p20 (UE calculated paging probability > 15% and <= 20%)
0	0	1	0	1	p25 (UE calculated paging probability > 20% and <= 25%)
0	0	1	1	0	p30 (UE calculated paging probability > 25% and <= 30%)
0	0	1	1	1	p35 (UE calculated paging probability > 30% and <= 35%)
0	1	0	0	0	p40 (UE calculated paging probability > 35% and <= 40%)
0	1	0	0	1	p45 (UE calculated paging probability > 40% and <= 45%)
0	1	0	1	0	p50 (UE calculated paging probability > 45% and <= 50%)
0	1	0	1	1	p55 (UE calculated paging probability > 50% and <= 55%)
0	1	1	0	0	p60 (UE calculated paging probability > 55% and <= 60%)
0	1	1	0	1	p65 (UE calculated paging probability > 60% and <= 65%)
0	1	1	1	0	p70 (UE calculated paging probability > 65% and <= 70%)
0	1	1	1	1	p75 (UE calculated paging probability > 70% and <= 75%)
1	0	0	0	0	p80 (UE calculated paging probability > 75% and <= 80%)
1	0	0	0	1	p85 (UE calculated paging probability > 80% and <= 85%)
1	0	0	1	0	p90 (UE calculated paging probability > 85% and <= 90%)
1	0	0	1	1	p95 (UE calculated paging probability > 90% and <= 95%)
1	0	1	0	0	p100 (UE calculated paging probability > 95% and <= 100%)

All other values shall be interpreted as 10100 by this version of the protocol.

9.11.3.81 5GS additional request result

The purpose of the 5GS additional request result information element is to inform the UE about the result of additional request.

The 5GS additional request result information element is coded as shown in figure 9.11.3.81.1 and table 9.11.3.81.1.

The 5GS additional request result is a type 4 information element with a length of 3 octets.

Figure 9.11.3.81.1: 5GS additional request result information element

Table 9.11.3.81.1: 5GS additional request result information element

Paging restriction decision (PRD) (bits 2 to 1 of octet 3)		
Bits		
2	1	
0	0	no additional information
0	1	paging restriction is accepted
1	0	paging restriction is rejected
All other values are reserved.		
Bits 3 to 8 of octet 3 are spare and shall be coded as zero.		

9.11.3.82 NSSRG information

The purpose of the NSSRG information information element is to identify one or more NSSRG values associated with each of the HPLMN S-NSSAIs in a configured NSSAI.

The NSSRG information information element is coded as shown in figure 9.11.3.82.1, figure 9.11.3.82.2 and table 9.11.3.82.1.

The NSSRG information is a type 6 information element with minimum length of 7 octets and maximum length of 4099 octets.

Figure 9.11.3.82.1: NSSRG information information element

Figure 9.11.3.82.2: NSSRG values for S-NSSAI

Table 9.11.3.82.1: NSSRG information information element

Value part of the NSSRG information information element (octet 4 to v)
The value part of the NSSRG information information element consists of one or more NSSRG values for each S-NSSAI in the Configured NSSAI IE.
S-NSSAI value (octet 5 to w) (see NOTE 2)
S-NSSAI value is coded as the length and value part of S-NSSAI information element as specified in subclause 9.11.2.8 starting with the second octet. See NOTE 1.
NSSRG value for the S-NSSAI (octet w+1)
This field contains the 8 bit NSSRG value.
NOTE 1: If a mapped HPLMN SST is included in a S-NSSAI value, then the NSSRG value(s) are associated with the Mapped HPLMN SST, and the Mapped HPLMN SD, if included.
NOTE 2: The NSSRG information IE shall contain the complete set of S-NSSAI(s) included in the configured NSSAI.
NOTE 3: The number of NSSRG values associated with an S-NSSAI cannot exceed 16. If there are more than 16 NSSRG values for an S-NSSAI in the NSSRG information, then the UE shall retain only the first 16 NSSRG values and ignore the rest.

9.11.3.83 List of PLMNs to be used in disaster condition

The purpose of the list of PLMNs to be used in disaster condition information element is to provide the "list of PLMN(s) to be used in disaster condition" associated with the serving PLMN to the UE.

The list of PLMNs to be used in disaster condition information element is coded as shown in figures 9.11.3.83.1 and 9.11.3.83.2 and table 9.11.3.83.1.

The list of PLMNs to be used in disaster condition is a type 4 information element, with a minimum length of 2 octets.

8	7	6	5	4	3	2	1	
List of PLMNs to be used in disaster condition list IEI								octet 1
Length of list of PLMNs to be used in disaster condition contents								octet 2
PLMN ID 1								octet 3*
PLMN ID 2								octet 5*
PLMN ID 2								octet 6*
...								octet 8*
...								octet 9*
PLMN ID n								octet q*
PLMN ID n								octet q+1*
PLMN ID n								octet q+3*

MNC digit 2				MNC digit 1				octet q+3

Figure 9.11.3.83.2: PLMN ID n

Table 9.11.3.83.1: List of PLMNs to be used in disaster condition information element

MCC, Mobile country code (octet q+1 and bits 1 to 4 octet q+2) The MCC field is coded as in ITU-T Recommendation E.212 [42], annex A.
MNC, Mobile network code (bits 5 to 8 of octet q+2 and octet q+3) The coding of this field is the responsibility of each administration but BCD coding shall be used. The MNC shall consist of 2 or 3 digits. If a network operator decides to use only two digits in the MNC, bits 5 to 8 of octet q+2 shall be coded as "1111".
The MCC and MNC digits are coded as octets 6 to 8 of the Temporary mobile group identity IE in figure 10.5.154 of 3GPP TS 24.008 [12].
NOTE: The PLMN IDs are provided in decreasing order of priority, i.e. PLMN ID 1 indicates highest priority and PLMN ID n indicates lowest priority.

9.11.3.84 Registration wait range

The purpose of the registration wait range information element is to provide the disaster roaming wait range or the disaster return wait range to the UE.

The registration wait range information element is coded as shown in figure 9.11.3.84.1 and table 9.11.3.84.1.

The registration wait range is a type 4 information element, with a length of 4 octets.

8	7	6	5	4	3	2	1	
Registration wait range IEI								octet 1
Length of registration wait range								octet 2
Minimum registration wait time								octet 3
Maximum registration wait time								octet 4

Figure 9.11.3.84.1: Registration wait range information element

Table 9.11.3.84.1: Registration wait range information element

Minimum registration wait time (octet 3) The minimum registration wait time contains the minimum duration of the registration wait time, encoded as octet 2 of the GPRS timer information element (see 3GPP TS 24.008 [12] subclause 10.5.7.3).
Maximum registration wait time (octet 4) The maximum registration wait time contains the maximum duration of the registration wait time, encoded as octet 2 of the GPRS timer information element (see 3GPP TS 24.008 [12] subclause 10.5.7.3).

9.11.3.85 PLMN identity

The purpose of the PLMN identity information element is to provide a PLMN identity.

The PLMN identity information element is coded as shown in figure 9.11.3.85.1, and table 9.11.3.85.1.

The PLMN identity is a type 4 information element.

8	7	6	5	4	3	2	1	
PLMN identity IEI								octet 1
Length of PLMN identity contents								octet 2
MCC digit 2				MCC digit 1				octet 3
MNC digit 3				MCC digit 3				octet 4
MNC digit 2				MNC digit 1				octet 5

Figure 9.11.3.85.1: PLMN identity information element

Table 9.11.3.85.1: PLMN identity information element

MCC, Mobile country code (octet 3, octet 4 bits 1 to 4) The MCC field is coded as in ITU-T Recommendation E.212 [42], annex A.
MNC, Mobile network code (octet 4 bits 5 to 8, octet 5) The coding of this field is the responsibility of each administration but BCD coding shall be used. The MNC shall consist of 2 or 3 digits. If a network operator decides to use only two digits in the MNC, bits 5 to 8 of octet 4 shall be coded as "1111".
The MCC and MNC digits are coded as octets 6 to 8 of the Temporary mobile group identity IE in figure 10.5.154 of 3GPP TS 24.008 [12].

9.11.3.86 Extended CAG information list

The purpose of the Extended CAG information list information element is to provide "CAG information list" or to delete the "CAG information list" at the UE.

The Extended CAG information list information element is coded as shown in figures 9.11.3.86.1, figure 9.11.3.86.2, figure 9.11.3.86.3, figure 9.11.3.86.4, figure 9.11.3.86.5 and table 9.11.3.86.1.

The Extended CAG information list is a type 6 information element, with a minimum length of 3 octets.

8	7	6	5	4	3	2	1	
Extended CAG information list IEI								octet 1
Length of Extended CAG information list contents								octet 2

NOTE: The field is placed immediately after the last present preceding field.

Figure 9.11.3.86.4: CAG-ID with additional information

Figure 9.11.3.86.5: Time validity infomation

Table 9.11.3.86.1: Extended CAG information list information element

Value part of the Extended CAG information list information element (octet 4 to h)
The value part of the Extended CAG information list information element consists of one or more entries.

Entry n:

Length of entry contents (octet q and q+1)

MCC, Mobile country code (octet q+2 and bits 1 to 4 octet q+3)

The MCC field is coded as in ITU-T Recommendation E.212 [42], annex A.

MNC, Mobile network code (bits 5 to 8 of octet q+3 and octet q+4)

The coding of this field is the responsibility of each administration, but BCD coding shall be used. The MNC shall consist of 2 or 3 digits. If a network operator decides to use only two digits in the MNC, bits 5 to 8 of octet q+2 shall be coded as "1111".

The MCC and MNC digits are coded as octets 6 to 8 of the Temporary mobile group identity IE in figure 10.5.154 of 3GPP TS 24.008 [12].

Indication that the UE is only allowed to access 5GS via CAG cells (CAGonly) (bit 1 of octet q+5)

Bit

1

- 0 "Indication that the UE is only allowed to access 5GS via CAG cells" is not set (i.e., the UE is allowed to access 5GS via non-CAG cells)
- 1 "Indication that the UE is only allowed to access 5GS via CAG cells" is set (i.e., the UE is not allowed to access 5GS via non-CAG cells)

Length of CAG-ID without additional information list indicator (LCI) (bit 3 of octet q+5)

Bit

3

- 0 Length of CAG-ID without additional information list field is absent
 - 1 Length of CAG-ID without additional information list field is present
- If the UE does not support enhanced CAG information, the LCI bit shall be set to "Length of CAG-ID without additional information list field is absent".

CAG-ID with additional information list indicator (CAILI) (bit 4 of octet q+5)

Bit

4

- 0 CAG-ID with additional information list field is absent
- 1 CAG-ID with additional information list field is present

If the UE does not support enhanced CAG information or the LCI bit is set to "Length of CAG-ID without additional information list field is absent", the CAILI bit shall be set to "CAG-ID with additional information list field is absent".

Length of CAG-ID without additional information list (octet q+6 to octet q+7)

This field indicates length of CAG-ID fields in octet r to octet (r+4*m-1).

CAG-ID m (octet r+4*m-4 to octet r+4*m-1)

This field contains the 32 bit CAG-ID which is not associated with additional information. The coding of the CAG-ID is defined as the CAG-Identifier in 3GPP TS 23.003 [4]. See NOTE 4.

If the length of entry contents field indicates a length bigger than indicated in figure 9.11.3.86.1, receiving entity shall ignore any superfluous octets located at the end of the entry contents.

CAG-ID (octet x+3 to octet x+6)

This field contains the 32 bit CAG-ID which is associated with additional information. The additional information is indicated in remaining fields of figure 9.11.3.86.4. The coding of the CAG-ID is defined as the CAG-Identifier in 3GPP TS 23.003 [4].

Time validity information indicator (TVII) (bit 1 of octet x+7)

Bit

1

- 0 Time validity information field is absent
- 1 Time validity information field is present

Spare validity information indicator (SVII) 0 Spare validity information is absent 1 Spare validity information is present The SVII bit indicates presence of a validity information not specified in the present version of the present document. See NOTE 5. If the SVII bit is set to "Spare validity information is present", the receiving entity shall ignore the CAG-ID with additional information field. Time period (octet x+25 to octet x+40) The time period field is coded as the route selection descriptor component value field for "time window type" specified in 3GPP TS 24.526 [19] table 5.2.1. If the length of CAG-ID with additional information contents field indicates a length bigger than indicated in figure 9.11.3.86.4, receiving entity shall ignore any superfluous octets located at the end of the CAG-ID with additional information contents.
NOTE 1: The length of extended CAG information list contents field shall be 0 if no subscription data for CAG information list exists. NOTE 2: The length of entry contents field shall be 4 if there is no allowed CAG-ID for the PLMN. NOTE 3: For a given PLMN ID, there shall be up to one entry field containing the MCC value and the MNC value of the PLMN ID. NOTE 4: CAG-ID field containing a CAG-ID which is not associated with additional information, can be provided regardless whether the LCI bit is set to "Length of CAG-ID without additional information list field is absent" or "Length of CAG-ID without additional information list field is present". NOTE 5: In a future version of the present document, semantic of this bit can be changed to indicate presence or absence of an additional validity information.

9.11.3.87 NSAG information

The purpose of the NSAG information information element is to provide the NSAG information to the UE.

The NSAG information information element is coded as shown in figures 9.11.3.87.1, 9.11.3.87.2 and 9.11.3.87.3, and table 9.11.3.87.1.

The NSAG information information element can contain a maximum of 32 NSAG entries.

In the NSAG information information element, at most 4 NSAG entries can contain a TAI list.

The NSAG information is a type 6 information element, with a minimum length of 9 octets and a maximum length of 3143 octets.

Figure 9.11.3.87.1: NSAG information information element

Figure 9.11.3.87.2: NSAG

Figure 9.11.3.87.3: S-NSSAI list of NSAG

Table 9.11.3.87.1: NSAG information information element

NSAG part of the NSAG information information element (octet 4 to m)
Each entry of the NSAG information information element consists of one NSAG in the NSAG information IE.
NSAG identifier(octet 5) NSAG identifier field contains an 8 bits NSAG ID value.
S-NSSAI list of NSAG (octet 6 to j) S-NSSAI list of NSAG field consists of one or more S-NSSAIs in the configured NSSAI. Each S-NSSAI in S-NSSAI list of NSAG field is coded as the length and value part of S-NSSAI information element as specified in subclause 9.11.2.8 starting with the second octet, without the mapped HPLMN SST field and without the mapped HPLMN SD field.
NSAG priority (octet j+1) The NSAG priority field represents the binary coded value of NSAG priority for cell reselection (see 3GPP TS 38.304 [28]) and random access (see 3GPP TS 38.321 [58]). The range of the NSAG priority is 0 to 255. A lower value indicates a higher priority, with 0 as the highest priority.
TAI list (octet j+2 to m) The TAI list field is coded as the length and value part of the 5GS tracking area identity list IE defined in subclause 9.11.3.9 starting with the second octet.

9.11.3.88 ProSe relay transaction identity

The purpose of the ProSe relay transaction identity (PRTI) information element is to uniquely identify an authentication and key agreement procedure for 5G ProSe UE-to-network relay or 5G ProSe UE-to-UE relay. The PRTI allows distinguishing up to 254 different bi-directional messages.

The ProSe relay transaction identity information element is coded as shown in figure 9.11.3.88.1 and table 9.11.3.88.1.

The ProSe relay transaction identity is a type 3 information element with a length of 2 octets.

Figure 9.11.3.88.1: ProSe relay transaction identity information element

Table 9.11.3.88.1: ProSe relay transaction identity information element

ProSe relay transaction identity value (octet 2)							
Bits							
8	7	6	5	4	3	2	1
0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	1
to							}
1	1	1	1	1	1	1	
1	1	1	1	1	1	1	1
							Reserved

9.11.3.89 Relay key request parameters

The purpose of the relay key request parameters information element is to transport the parameters of the key request for 5G ProSe UE-to-network relay or 5G ProSe UE-to-UE relay as specified in 3GPP TS 33.503 [56].

The relay key request parameters information element is coded as shown in figure 9.11.3.89.1, figure 9.11.3.89.2 and table 9.11.3.89.1.

The relay key request parameters is a type 6 information element.

Figure 9.11.3.89.1: Relay key request parameters information element

Figure 9.11.3.89.2: UE identity

Table 9.11.3.89.1: Relay key request parameters information element

Relay service code (octet 4 to 6) The relay service code contains 24-bit relay service code as defined in 3GPP TS 24.554 [19E].
Nonce_1 (octet 7 to 22) Nonce_1 is the 128-bit nonce value as defined in 3GPP TS 24.554 [19E].
UE ID type (UIT) (octet 23, bit 1) Bit 1 0 SUCI 1 CP-PRUK ID
UE ID (octet 23+1 to n) UE ID indicates the value of the 5G ProSe remote UE identity or the 5G ProSe end UE identity. If the UE ID type is set to SUCI, the UE ID is coded as 5GS mobile identity IE starting from octet 2 with the Type of identity set to "SUCI" (see subclause 9.11.3.4). If the UE ID type is set to CP-PRUK ID, the UE ID is coded as the CP-PRUK ID as defined in 3GPP TS 33.503 [56].

9.11.3.90 Relay key response parameters

The purpose of the relay key response parameters information element is to transport the parameters of the key response for 5G ProSe UE-to-network relay or 5G ProSe UE-to-UE relay as specified in 3GPP TS 33.503 [56].

The relay key response parameters information element is coded as shown in figure 9.11.3.90.1 and table 9.11.3.90.1.

The relay key response parameters is a type 6 information element.

8	7	6	5	4	3	2	1	
Relay key response parameters IEI								octet 1
Length of Relay key response parameters								octet 2
								octet 3
Key K _{NR_ProSe}								octet 4
								octet 35
Nonce_2								octet 36
								octet 51
CP-PRUK ID								octet 52
								octet m

Figure 9.11.3.90.1: Relay key response parameters information element

Table 9.11.3.90.1: Relay key response parameters information element

Key K _{NR_ProSe} (octet 5 to 35) Key K _{NR_ProSe} contains a 256-bit root key that is established between the two entities that communicating using NR PC5 unicast link as defined in 3GPP TS 33.503 [56].
Nonce_2 (octet 36 to 51) Nonce_2 is the 128-bit nonce value as defined in 3GPP TS 24.554 [19E].
CP-PRUK ID (octet 52 to m) The CP-PRUK ID is defined in 3GPP TS 33.503 [56].

9.11.3.91 Priority indicator

The purpose of the Priority indicator information element is to convey a priority indication to the UE.

The Priority indicator information element is coded as shown in figure 9.11.3.91.1 and table 9.11.3.91.1.

The Priority indicator is a type 1 information element.

Figure 9.11.3.91.1: Priority indicator

Table 9.11.3.91.1: Priority indicator

MPS indicator (MPSI) (octet 1, bit 1)	
Bit	
1	
0	Access identity 1 not valid
1	Access identity 1 valid
MCS indicator (MCSI) (octet 1, bit 2)	
Bit	
2	
0	Access identity 2 not valid
1	Access identity 2 valid
Bits 3, 4 are spare and shall be coded as zero.	

9.11.3.92 SNPN list

The purpose of the SNPN list information element is to provide a list of SNPN identities.

The SNPN list information element is coded as shown in figure 9.11.3.92.1, table 9.11.3.92.1, figure 9.11.3.92.2 and table 9.11.3.92.2.

The SNPN list is a type 4 information element with a minimum length of 11 octets and a maximum length of 137 octets.

Figure 9.11.3.92.1: SNPN list information element

Table 9.11.3.92.1: SNPN list information element

Each SNPN identity field is coded according to figure 9.11.3.92.2 and table 9.11.3.92.2.

Figure 9.11.3.92.2: SNPN identity i

Table 9.11.3.92.2: SNPN identity i

MCC, Mobile country code (octet (i*9-6), octet (i*9-5) bits 1 to 4) The MCC field is coded as in ITU-T Recommendation E.212 [42], annex A.
MNC, Mobile network code (octet (i*9-5) bits 5 to 8, octet (i*9-4)) The coding of this field is the responsibility of each administration but BCD coding shall be used. The MNC shall consist of 2 or 3 digits. If a network operator decides to use only two digits in the MNC, bits 5 to 8 of octet 6 shall be coded as "1111"
The MCC and MNC digits are coded as octets 6 to 8 of the Temporary mobile group identity IE in figure 10.5.154 of 3GPP TS 24.008 [12].
NID (octet (i*9-3) to octet (i*9+2)) NID field is coded as the NID field of NID IE as specified in figure 9.2.7-2 and table 9.2.7-2 of 3GPP TS 24.502 [18] starting with the octet 3 and ending with the octet 8.

9.11.3.93 N3IWF identifier

The purpose of the N3IWF identifier information element is to enable the network to assign the UE, a suitable N3IWF for the requested NSSAI.

The N3IWF identifier information element is coded as shown in figure 9.11.3.93.1, figure 9.11.3.93.2, figure 9.11.3.93.3 and table 9.11.3.93.1.

The N3IWF identifier information element is a type 4 information element with a minimum length of 7 octets.

Figure 9.11.3.93.1: N3IWF identifier information element

Figure 9.11.3.93.2: N3IWF address entry (N3IWF identifier type = "IPv4", "IPv6" or "IPv4v6")

Figure 9.11.3.93.3: N3IWF identifier entry (N3IWF identiifiertype ="FQDN")

Table 9.11.3.93.1: N3IWF address entry

N3IWF identifier type (octet 3) is set as follows:								
8	7	6	5	4	3	2	1	
0	0	0	0	0	0	0	1	IPv4
0	0	0	0	0	0	1	0	IPv6
0	0	0	0	0	0	1	1	IPv4v6
0	0	0	0	0	1	0	0	FQDN
All other values are reserved.								
If the N3IWF identifier type indicates IPv4, then the N3IWF IP address field contains an IPv4 address in octet 4 to octet 7.								
If the N3IWF identifier type indicates IPv6, then the N3IWF IP address field contains an IPv6 address in octet 4 to octet 19.								
If the N3IWF identifier type indicates IPv4v6, then the N3IWF IP address field contains two IP addresses. The first IP address is an IPv4 address in octet 4 to octet 7. The second IP address is an IPv6 address in octet 8 to octet 23.								
If the N3IWF identifier type indicates FQDN, the N3IWF FQDN field in octet 4 to octet n is encoded as defined in subclauses 28.3.2.2.2, 28.3.2.2.3, 28.3.2.2.8 or 28.3.2.2.9 in 3GPP TS 23.003 [4].								

9.11.3.94 TNAN information

The purpose of the TNAN information information element is to enable the network to assign the UE, a suitable TNAN information (SSID and TNGF ID) for the requested NSSAI.

The TNAN information information element is coded as shown in figure 9.11.3.94.1 and table 9.11.3.94.1.

The TNAN information information element is a type 4 information element with a minimum length of 3 octets.

Figure 9.11.3.94.1: TNAN information information element

Table 9.11.3.94.1: TNAN information information element

TNGF ID indication (TNGF ID ind) (bit 1 of octet 3) The TNGF ID ind indicates whether the TNGF ID length field and the TNGF ID field are included in the TNAN information or not.	
Bit	
1	
0	TNGF ID length and TNGF ID not included
1	TNGF ID length and TNGF ID included
SSID indication (SSID ind) (bit 2 of octet 3) The SSID ind indicates whether the SSID length field and the SSID field are included in the TNAN information or not.	
Bit	
2	
0	SSID length and SSID not included
1	SSID length and SSID included
Bits 3 to 8 of octet 3 are spare and shall be coded as zero	
TNGF ID length (octet 4) indicates the length of the TNGF ID field. TNGF ID (octets 5 to m) The TNGF ID field is an octet string that indicates the TNGF ID.	
SSID length (octet m+1) indicates the length of the SSID field. SSID (octets m+2 to u) The SSID field is an octet string which shall have a maximum length of 32 octets (see IEEE Std 802.11 [59]).	

9.11.3.95 RAN timing synchronization

The purpose of the RAN timing synchronization IE is to provide information related to the RAN timing synchronization.

The RAN timing synchronization information element is coded as shown in figure 9.11.3.95.1 and table 9.11.3.95.1.

The RAN timing synchronization is a type 4 information element with a length of 3 octets.

Figure 9.11.3.95.1: RAN timing synchronization information element

Table 9.11.3.95.1: RAN timing synchronization information element

Request to reconnect to the network upon receiving an indication of a change in the RAN timing synchronization status (RecReq) (octet 3, bit 1)	
Bit	
1	
0	Reconnection not requested
1	Reconnection requested
Bits 2 to 8 of octet 3 are spare and shall be coded as zero.	

9.11.3.96 Extended LADN information

The purpose of the Extended LADN information information element is to provide the UE with the LADN service area for each available LADN associated for an LADN DNN and an S-NSSAI in the current registration area or to delete the Extended LADN information at the UE.

The Extended LADN information information element is coded as shown in figure 9.11.3.96.1, figure 9.11.3.96.2 and table 9.11.3.96.1.

The Extended LADN information is a type 6 information element with a minimum length of 3 octets and a maximum length of 1787 octets.

The Extended LADN information information element can contain a minimum of 0 and a maximum of 8 different LADNs each including a DNN, an S-NSSAI and a 5GS tracking area identity list.

Figure 9.11.3.96.1: Extended LADN information information element

Figure 9.11.3.96.2: LADN

Table 9.11.3.96.1: Extended LADN information information element

Value part of the Extended LADN information information element (octet 4 to octet h)
The value part of the Extended LADN information information element consists of one or several LADNs. Each LADN (e.g. octet 4 to octet a) consists of one DNN value, one S-NSSAI and one 5GS tracking area identity list. The length of each LADN is determined by the length of DNN value field, the length of S-NSSAI field and the length of 5GS tracking area identity list field. The UE shall store the complete list as received. If more than 8 LADNs are included in this information element, the UE shall store the first 8 LADNs and ignore the remaining octets of the information element.
DNN value (octet 5 to octet m):
DNN value field is coded as DNN value part of DNN information element as specified in subclause 9.11.2.1B starting with the third octet.
S-NSSAI (octet m+1 to n) (see NOTE 1)
S-NSSAI is coded as the length and value part of S-NSSAI information element as specified in subclause 9.11.2.8 starting with the second octet.
5GS tracking area identity list (octet m+1 to octet a):
5GS tracking area identity list field is coded as the length and the value part of the 5GS Tracking area identity list information element as specified in subclause 9.11.3.9 starting with the second octet.
NOTE 1: The S-NSSAI included in the Extended LADN information information element shall be an S-NSSAI from, an allowed NSSAI or a partially allowed NSSAI provided to the UE.

9.11.3.97 Alternative NSSAI

The purpose of the Alternative NSSAI information element is to identify a list of mapping information between the S-NSSAI to be replaced and the alternative S-NSSAI.

The Alternative NSSAI information element is coded as shown in figure 9.11.3.97.1, figure 9.11.3.97.2 and table 9.11.3.97.1.

The Alternative NSSAI is a type 4 information element with minimum length of 2 octets and maximum length of 146 octets.

Figure 9.11.3.97.1: Alternative NSSAI information element

Figure 9.11.3.97.2: Entry

Table 9.11.3.97.1: Alternative NSSAI information element

Value part of the Alternative NSSAI information element (octet 3 to d)
The value part of the Alternative NSSAI information element consists of one or more entries, each entry consists of one S-NSSAI to be replaced and one alternative S-NSSAI. The number of entries shall not exceed eight.
S-NSSAI to be replaced (octet 3 to x) (see NOTE)
S-NSSAI to be replaced is coded as the length and value part of S-NSSAI information element as specified in subclause 9.11.2.8 starting with the second octet.
Alternative S-NSSAI (octet x+1 to a)
Alternative S-NSSAI is coded as the length and value part of S-NSSAI information element as specified in subclause 9.11.2.8 starting with the second octet.
NOTE: The S-NSSAI to be replaced shall be one S-NSSAI included in the allowed NSSAI or partially allowed NSSAI.

9.11.3.98 Type 6 IE container

The purpose of the Type 6 IE container information element is to transfer type 6 IEs of format TLV-E explicitly specified for inclusion in this information element for the respective message.

NOTE: Use of this information element is intended only for type 6 IEs added to a message in Rel-18 or later.

The rules for the IEI value encoding specified in 3GPP TS 24.007 [11], subclause 11.2.4, are not applicable for the IEIs of the type 6 IEs within the Type 6 IE container information element. These IEIs can take any value in the range 00 to FF (hexadecimal).

The type 6 IE container information element is coded as shown in figure 9.11.3.98.1, figure 9.11.3.98.2 and table 9.11.3.98.1.

The type 6 IE container is a type 6 information element with a minimum length of 6 octets.

Figure 9.11.3.98.1: Type 6 IE container information element

Figure 9.11.3.98.2: Type 6 IE container contents

Table 9.11.3.98.1: Type 6 IE container contents

Type 6 IE container contents (octets 4 to n) The Type 6 IE container is coded according to figure 9.11.3.98.2. The sender of this information element shall encode each type 6 IE included in the contents in format TLV-E. For the coding of each of the type 6 IEs in the type 6 IE container, see the definition of the respective type 6 IE in subclause 9.11

9.11.3.99 Non-3GPP access path switching indication

The purpose of the Non-3GPP access path switching indication information element is to indicate whether the UE supports the non-3GPP access path switching for the PDU session.

The Non-3GPP access path switching indication information element is coded as shown in figure 9.11.3.99.1 and table 9.11.3.99.1.

The Non-3GPP access path switching indication is a type 4 information element with a length of 3 octets.

Figure 9.11.3.99.1: Non-3GPP access path switching indication information element

Table 9.11.3.99.1 : Non-3GPP access path switching indication information element

Non-3GPP access path switching (NAPS) (octet 3, bit 1) This bit indicates whether non-3GPP access path switching is supported. Bit 1 0 non-3GPP access path switching not supported 1 non-3GPP access path switching supported Bits 2 to 8 of octet 3 are spare and shall be coded as zero.	

9.11.3.100 S-NSSAI location validity information

The purpose of the S-NSSAI location validity information information element is to provide the S-NSSAI location validity information to the UE.

The S-NSSAI location validity information information element is coded as shown in figures 9.11.3.100.1, 9.11.3.100.2, 9.11.3.100.3, and 9.11.3.100.4 and table 9.11.3.100.1.

The S-NSSAI location validity information information element can contain per-S-NSSAI location validity information for maximum 16 S-NSSAIs.

The S-NSSAI location validity information information is a type 6 information element with a minimum length of 17 octets and a maximum length of 38611 octets.

Figure 9.11.3.100.4: NR CGI**Table 9.11.3.100.1: S-NSSAI location validity information information element**

S-NSSAI (octet 6 to e) S-NSSAI value is coded as the length and value part of S-NSSAI information element as specified in subclause 9.11.2.8 starting with the second octet. NS-AoS (octet e+1 to octet a) NS-AoS field consists of the Number of NR CGIs field and at least one NR CGI. Number of NR CGIs (octet e+1 to octet e+2) The field indicates the number of NR CGIs included in octets e+3 to octet a. (NOTE). NR CGI (octet e+3 to e+10) The NR CGI globally identifies an NR cell. It contains the NR Cell ID and the PLMN ID of that cell. NR Cell ID (octet e+3 to e+7) The NR Cell ID consists of 36 bits identifying an NR Cell ID as specified in subclause 9.3.1.7 of 3GPP TS 38.413 [31], in hexadecimal representation. Bit 8 of octet e+3 is the most significant bit and bit 5 of octet e+7 is the least significant bit. Bits 1 to 4 of octet e+7 are spare and shall be coded as zero. MCC, Mobile country code (octet e+8 and bits 1 to 4 octet e+9) The MCC field is coded as in ITU-T Recommendation E.212 [42], annex A. MNC, Mobile network code (bits 5 to 8 of octet e+9 and octet e+10) The coding of this field is the responsibility of each administration but BCD coding shall be used. The MNC shall consist of 2 or 3 digits. If a network operator decides to use only two digits in the MNC, bits 5 to 8 of octet e+9 shall be coded as "1111". The MCC and MNC digits are coded as octets 6 to 8 of the Temporary mobile group identity IE in figure 10.5.154 of 3GPP TS 24.008 [12]. NOTE: In this version of the specification, the maximum number of NR CGIs is 300.

9.11.3.101 S-NSSAI time validity information

The purpose of the S-NSSAI time validity information information element is to provide S-NSSAI time validity information of one or more S-NSSAIs to the UE.

The S-NSSAI time validity information information element is coded as shown in figures 9.11.3.101.1 and 9.11.3.101.2 and table 9.11.3.101.1.

The S-NSSAI time validity information information element can contain per-S-NSSAI time validity information for maximum 16 S-NSSAIs.

The S-NSSAI time validity information information is a type 4 information element with a minimum length of 23 octets and a maximum length of 257 octets.

Figure 9.11.3.101.4: Time window 1

Table 9.11.3.101.1: S-NSSAI time validity information information element

S-NSSAI (octet 6 to octet e)				
S-NSSAI value is coded as the length and value part of S-NSSAI information element as specified in subclause 9.11.2.8 starting with the second octet.				
Start time (octet e+3 to octet e+10)				
The field indicates the time when the network slice identified by the S-NSSAI becomes available (for the first time if octet e+20 is included) and is represented by the number of seconds since 00:00:00 on 1 January 1970 UTC and is encoded as the 64-bit NTP timestamp format defined in IETF RFC 5905 [36A], where binary encoding of the integer part is in the first 32 bits and binary encoding of the fraction part in the last 32 bits.				
Stop time (octet e+11 to octet e+18)				
The field indicates the time when the network slice identified by the S-NSSAI becomes unavailable (for the first time if octet e+20 is included) and is represented by the number of seconds since 00:00:00 on 1 January 1970 UTC and is encoded as the 64-bit NTP timestamp format defined in IETF RFC 5905 [36A], where binary encoding of the integer part is in the first 32 bits and binary encoding of the fraction part in the last 32 bits.				
Recurrence pattern (bit 1 to bit 4 of octet e+19)				
Bits				
4	3	2	1	
0	0	0	0	Everyday
0	0	0	1	Every weekday
0	0	1	0	Every week
0	0	1	1	Every 2 weeks
0	1	0	0	Every month (absolute)
0	1	0	1	Every month (relative)
0	1	1	0	Every quarter (absolute)
0	1	1	1	Every quarter (relative)
1	0	0	0	Every 6 months (absolute)
1	0	0	1	Every 6 months (relative)
All other values are reserved.				
The recurrence pattern indicates how often the time window is repeated. For example, if the time window starts at 13:00 on Wednesday January 1 st 2020 and stops at 13:30 on Wednesday January 1 st 2020 and the recurrent pattern is set to:				
- "Everyday", the time window repeats everyday from 13:00 to 13:30; - "Every week", the time window repeats every Wednesday from 13:00 to 13:30; - "Every month (absolute)", the time window repeats every 1st day of the month from 13:00 to 13:30; and - "Every month (relative)", the time window repeats every month on the first Wednesday from 13:00 to 13:30.				
Recurrence end time (octet e+20 to octet e+27)				
The field indicates the time when the repetition of the time window ends. If the field is not included and octet e+19 is included in the IE, the time window is repeated indefinitely.				
The field is represented by the number of seconds since 00:00:00 on 1 January 1970 UTC and is encoded as the 64-bit NTP timestamp format defined in IETF RFC 5905 [36A], where binary encoding of the integer part is in the first 32 bits and binary encoding of the fraction part in the last 32 bits.				

9.11.3.102 Non-3GPP path switching information

The purpose of the Non-3GPP path switching information information element is to request from the network to keep using the user plane resources of the old non-3GPP access during path switching to the new non-3GPP access.

The Non-3GPP path switching information information element is coded as shown in figure 9.11.3.102.1 and table 9.11.3.102.1.

The Non-3GPP path switching information is a type 4 information element with a length of 3 octets.

Figure 9.11.3.102.1: Non-3GPP path switching information information element

Table 9.11.3.102.1: Non-3GPP path switching information information element

Non-3GPP path switching while using old non-3GPP resources (NSONR) (octet 3, bit 1)	
Bit	
1	
0	non-3GPP path switching while using old non-3GPP resources not requested
1	non-3GPP path switching while using old non-3GPP resources requested
Bits 8 to 2 of octet 3 are spare and shall be coded as zero.	

9.11.3.103 Partial NSSAI

The purpose of the Partial NSSAI information element is to deliver one or more S-NSSAIs in a set of tracking areas of a registration area from the network to the UE.

The Partial NSSAI information element is coded as shown in figure 9.11.3.103.1, and table 9.11.3.103.1.

The Partial NSSAI information element is a type 6 information element, with a minimum length of 3 octets and a maximum length of 808 octets.

Figure 9.11.3.103.1: Partial NSSAI information element

Table 9.11.3.103.1: Partial NSSAI information element

S-NSSAI value (octet 4 to i) (NOTE 1) S-NSSAI value is coded as the length and value part of S-NSSAI information element as specified in subclause 9.11.2.8 starting with the second octet. Partial tracking area identity list (octet i+1 to j) The partial tracking area identity list field is coded as the length and value part of the 5GS tracking area identity list IE defined in subclause 9.11.3.9 starting with the second octet (NOTE 2).
NOTE 1: The maximum number of S-NSSAIs included in this information element is 7. NOTE 2: A registration area contains maximum 16 different tracking areas, therefore the partial tracking area identity list can contain at the most 15 tracking area identities. NOTE 3: The AMF shall set the Length of partial NSSAI contents to 0 if there are no S-NSSAIs to deliver in a set of tracking areas of a registration area and, the UE shall delete any existing stored partially allowed NSSAI for the current registration area or partially rejected NSSAI for the current registration area.

9.11.3.104 AUN3 indication

The purpose of the AUN3 indication information element is to indicate to the network that the registration request by the 5G-RG is on behalf of an AUN3 device.

The AUN3 indication information element is coded as shown in figure 9.11.3.104.1 and table 9.11.3.104.1.

The AUN3 indication is a type 4 information element with a length of 3 octets.

8	7	6	5	4	3	2	1	
AUN3 indication IEI								octet 1
Length of AUN3 indication								octet 2
0	0	0	0	0	0	0	AUN3 REG	octet 3
Spare

AUN3 device indication bit (AUN3REG) (octet 3, bit 1)	
Bit	
1	
0	AUN3 device registration is not requested
1	AUN3 device registration is requested
Bits 8 to 2 of octet 3 are spare and shall be coded as zero.	

9.11.3.105 Feature authorization indication

The purpose of the Feature authorization indication information element is to indicate whether the UE that is authorized to operate certain feature.

The Feature authorization indication is a type 4 information element with a minimum length of 3 octets and maximum length of 257 octets.

The Feature authorization indication information element is coded as shown in Figure 9.11.3.105.1 and Table 9.11.3.105.1.

Figure 9.11.3.105.1: Feature authorization indication information element

Table 9.11.3.105.1: Feature authorization indication information element

MBSR authorization indication (MBSRAI) (octet 3, bit 1 to bit 2)		
This field indicates whether UE is authorized or not to operate as an MBSR node		
Bits		
2	1	
0	0	no information
0	1	not authorized to operate as MBSR but allowed to operate as a UE
1	0	authorized to operate as MBSR
1	1	spare
High priority access service area restriction exempt (HPASE) (octet 3, bit 3)		
This field indicates the operator policy for high priority access exemption for service area restrictions		
Bit		
3		
0	High priority access UEs are exempt from service area restrictions or the network does not support operator policy for high priority access exemptions for service area restrictions	
1	High priority access UEs are not exempt from service area restrictions	
Bits 4 to 8 of octet 3 are spare and shall be coded as zero.		

9.11.3.106 Payload container information

The purpose of the Payload container information information element is to provide information related to a payload container.

The Payload container information is a type 1 information element.

The Payload container information information element is coded as shown in figure 9.11.3.106.1 and table 9.11.3.106.1.

Figure 9.11.3.106.1: Payload container information information element

Table 9.11.3.106.1: Payload container information information element

PRU related content (PRU) (octet 1, bit 1)	
Bit	
1	
0	Payload container not related to PRU
1	Payload container related to PRU
Bits 2 to 4 are spare and shall be coded as zero.	

9.11.3.107 AUN3 device security key

The purpose of the AUN3 device security key information element is to provide the security keys to the 5G-RG that is acting on behalf of an AUN3 device.

The AUN3 device security key information element is coded as shown in figure 9.11.3.107.1 and table 9.11.3.107.1.

The AUN3 device security key is a type 4 information element with a minimum length of 36 octets.

8	7	6	5	4	3	2	1			
AUN3 device security key IEI								octet 1		
Length of AUN3 device security key content								octet 2

Key content								octet 5		
								octet n		

Figure 9.11.3.107.1: AUN3 device security key information element

Table 9.11.3.107.1: AUN3 device security key information element

AUN3 device security key type (ASKT) (bits 1 and 2 of octet 3)	
The ASKT indicates which AUN3 device security key is included in the IE.	
Bits	
2 1	
0 0	Master session key is included
0 1	K _{WAGF} key is included
All other values are unused and shall be interpreted as "Master session key is included", if received by the UE.	
Key content (octets 5 to n)	
If ASKT is set to "Master session key included", the Key content contains the value of the Master session key as defined in 3GPP TS 33.501 [24]. If ASKT is set to "K _{WAGF} key included", the Key content contains the value of the K _{WAGF} key as defined in 3GPP TS 33.501 [24].	

9.11.3.108 On-demand NSSAI

The purpose of the On-demand NSSAI information element is to provide a list of one or more on-demand S-NSSAIs and the associated slice deregistration inactivity timer value per the on-demand S-NSSAI to the UE.

The On-demand NSSAI information element is coded as shown in figure 9.11.3.108.1, figure 9.11.3.108.2, and table 9.11.3.108.1.

The On-demand NSSAI is a type 4 information element with a minimum length of 5 octets and a maximum length of 210 octets.

8	7	6	5	4	3	2	1	
On-demand NSSAI IEI								octet 1

								octet a*

Figure 9.11.3.108.2: Information of on-demand S-NSSAI**Table 9.11.3.108.1: On-demand NSSAI information element**

Value part of the On-demand NSSAI information element (octet 3 to d)
The value part of the On-demand NSSAI information element consists of one or more Information of on-demand S-NSSAIs. Each Information of on-demand S-NSSAI consists of one on-demand S-NSSAI and optionally the slice deregistration inactivity timer of the on-demand S-NSSAI. The number of information of on-demand S-NSSAIs shall not exceed 16.
On-demand S-NSSAI (octet 4 to a-3)
On-demand S-NSSAI is coded as the length and value part of S-NSSAI information element as specified in subclause 9.11.2.8 starting with the second octet.
Slice deregistration inactivity timer (octet (a-2)* to a*)
Slice deregistration inactivity timer is coded as the value part of Time duration information element as specified in subclause 9.9.3.68 of 3GPP TS 24.301 [15] starting with the third octet.

9.11.3.109 Extended 5GMM cause

The purpose of the Extended 5GMM cause information element is to indicate additional information associated with a 5GMM cause.

The Extended 5GMM cause information element is coded as shown in figure 9.11.3.109.1 and table 9.11.3.109.1.

The Extended 5GMM cause is a type 4 information element with a length of 3 octets.

8	7	6	5	4	3	2	1

0	Satellite NG-RAN allowed in PLMN
1	Satellite NG-RAN not allowed in PLMN
Bit 2 to 8 of octet 3 are spare and shall be coded as zero.	

9.11.3.110 Access technology utilization control

See subclause 9.9.3.3A in 3GPP TS 24.301 [15].

9.11.3.111 LP-WUSPS assistance information

The purpose of the LP-WUSPS assistance information IE is to transfer the required assistance information for LP-WUSPS.

The LP-WUSPS assistance information, information element is coded as shown in figure 9.11.3.111.1, figure 9.11.3.111.2, figure 9.11.3.111.3 and table 9.11.3.111.1.

The LP-WUSPS assistance information is a type 4 information element, with a minimum length of 2 octets.

8	7	6	5	4	3	2	1	
LP-WUSPS assistance information IEI								octet 1
Length of LP-WUSPS assistance information contents								octet 2

Table 9.11.3.111.1: LP-WUSPS assistance information information element

Value part of the LP-WUSPS assistance information information element (octet 3)	
The value part of the LP-WUSPS assistance information information element consists of one LP-WUSPS assistance information type parameter.	
LP-WUSPS assistance information type:	
Type of information (octet 3, bits 6 to 8)	
Bits	
8 7 6	
0 0 0	LP-WUSPS paging subgroup ID
0 0 1	UE paging probability information
All other values are reserved.	
LP-WUSPS paging subgroup ID value (octet 3, bits 1 to 5)	
This field contains one out of 31 (decimal) LP-WUSPS paging subgroup IDs that is assigned by the AMF for paging the UE.	
Bits	
5 4 3 2 1	LP-WUSPS paging subgroup ID value
0 0 0 0 0	LP-WUSPS paging subgroup ID 0 (decimal)
t	
o	
1 1 1 1 0	LP-WUSPS paging subgroup ID 30 (decimal)
1 1 1 1 1	reserved
UE paging probability information value (octet 3, bits 1 to 5)	
This field contains the value of UE paging probability information provided by the UE to the AMF. It represents the probability of the UE receiving the paging.	
Bit	
5 4 3 2 1	UE paging probability information value
0 0 0 0 0	p00 (UE calculated paging probability is 0%)
0 0 0 0 1	p05 (UE calculated paging probability > 0% and <= 5%)
0 0 0 1 0	p10 (UE calculated paging probability > 5% and <= 10%)
0 0 0 1 1	p15 (UE calculated paging probability > 10% and <= 15%)
0 0 1 0 0	p20 (UE calculated paging probability > 15% and <= 20%)
0 0 1 0 1	p25 (UE calculated paging probability > 20% and <= 25%)
0 0 1 1 0	p30 (UE calculated paging probability > 25% and <= 30%)
0 0 1 1 1	p35 (UE calculated paging probability > 30% and <= 35%)
0 1 0 0 0	p40 (UE calculated paging probability > 35% and <= 40%)
0 1 0 0 1	p45 (UE calculated paging probability > 40% and <= 45%)
0 1 0 1 0	p50 (UE calculated paging probability > 45% and <= 50%)
0 1 0 1 1	p55 (UE calculated paging probability > 50% and <= 55%)
0 1 1 0 0	p60 (UE calculated paging probability > 55% and <= 60%)
0 1 1 0 1	p65 (UE calculated paging probability > 60% and <= 65%)
0 1 1 1 0	p70 (UE calculated paging probability > 65% and <= 70%)
0 1 1 1 1	p75 (UE calculated paging probability > 70% and <= 75%)
1 0 0 0 0	p80 (UE calculated paging probability > 75% and <= 80%)
1 0 0 0 1	p85 (UE calculated paging probability > 80% and <= 85%)
1 0 0 1 0	p90 (UE calculated paging probability > 85% and <= 90%)
1 0 0 1 1	p95 (UE calculated paging probability > 90% and <= 95%)
1 0 1 0 0	p100 (UE calculated paging probability > 95% and <= 100%)
All other values shall be interpreted as 10100 by this version of the protocol.	

9.11.4 5GS session management (5GSM) information elements

9.11.4.1 5GSM capability

The purpose of the 5GSM capability information element is to indicate UE capability related to the PDU session management.

The 5GSM capability information element is coded as shown in figure 9.11.4.1.1 and table 9.11.4.1.1.

The 5GSM capability is a type 4 information element with a minimum length of 3 octets and a maximum length of 15 octets.

Figure 9.11.4.1.1: 5GSM capability information element

Table 9.11.4.1.1: 5GSM capability information element

5GSM capability value	
RQoS (octet 3, bit 1)	
This bit indicates the 5GSM capability to support reflective QoS.	
0	Reflective QoS not supported
1	Reflective QoS supported
Multi-homed IPv6 PDU session (MH6-PDU) (octet 3, bit 2)	
This bit indicates the 5GSM capability for Multi-homed IPv6 PDU session.	
0	Multi-homed IPv6 PDU session not supported
1	Multi-homed IPv6 PDU session supported
Ethernet PDN type in S1 mode (EPT-S1) (octet 3, bit 3)	
This bit indicates UE's 5GSM capability for Ethernet PDN type in S1 mode.	
0	Ethernet PDN type in S1 mode not supported
1	Ethernet PDN type in S1 mode supported
Supported ATSSS steering functionalities and steering modes (ATSSS-ST) (octet 3, bits 4 to 7) (NOTE 1)	
These bits indicate the 5GSM capability of ATSSS steering functionalities and steering modes	
0 0 0 0	ATSSS not supported
0 0 0 1	ATSSS Low-Layer functionality with any steering mode allowed for ATSSS-LL supported
0 0 1 0	MPTCP functionality with any steering mode and ATSSS-LL functionality with only active-standby steering mode supported
0 0 1 1	MPTCP functionality with any steering mode and ATSSS-LL functionality with any steering mode allowed for ATSSS-LL supported
All other values are reserved.	
Transfer of port management information containers (TPMIC) (octet 3, bit 8)	
This bit indicates the 5GSM capability to support transfer of port management information containers	
0	Transfer of port management information containers not supported
1	Transfer of port management information containers supported
Access performance measurements per QoS flow rule (APMQF) (octet 4, bit1)	
This bit indicates the 5GSM capability to support access performance measurements using the QoS flow of the non default QoS rule, that is used by the service data flow (SDF) traffic.	
0	Access performance measurements per QoS flow not supported.
1	Access performance measurements per QoS flow supported.
Secondary DN authentication and authorization over EPC (SDNAEPC) (octet 4, bit 2)	
This bit indicates the 5GSM capability to support secondary DN authentication and authorization over EPC	
0	Secondary DN authentication and authorization over EPC not supported
1	Secondary DN authentication and authorization over EPC supported
(S)RTP multiplexed media identification information (RTPMMII) (octet 4, bit 3)	
0	(S)RTP multiplexed media identification information not supported.
1	(S)RTP multiplexed media identification information supported.
ATSSS-LL functionality support (ATSSS-LL) (octet 4 bits 4 and 5)	
This capability indicates the support for ATSSS-LL functionality.	
Bit	
5 4	
0 0	ATSSS-LL functionality not supported (NOTE 2)
0 1	ATSSS-LL functionality with only active-standby steering mode supported
1 0	ATSSS-LL functionality with any steering mode allowed for ATSSS-LL supported
1 1	spare
Supporting MPTCP functionality with any steering mode (MPTCP) (octet 4, bit 6)	
This bit indicates whether the MPTCP functionality with any steering mode is supported (NOTE 3).	
0	MPTCP functionality with any steering mode not supported (NOTE 2)
1	MPTCP functionality with any steering mode supported

Supporting MPQUIC-UDP functionality with any steering mode (MPQUIC-UDP) (octet 4, bit 7)	
This bit indicates whether the MPQUIC-UDP functionality with any steering mode is supported (NOTE 3).	
0	MPQUIC-UDP functionality with any steering mode not supported (NOTE 2)
1	MPQUIC-UDP functionality with any steering mode supported
Supporting MPQUIC-IP functionality with any steering mode (MPQUIC-IP) (octet 4, bit 8)	
This bit indicates whether the MPQUIC-IP functionality with any steering mode is supported.	
0	MPQUIC-IP functionality with any steering mode not supported (NOTE 2)
1	MPQUIC-IP functionality with any steering mode supported
Supporting MPQUIC-E functionality with any steering mode (MPQUIC-E) (octet 5, bit 1)	
This bit indicates whether the MPQUIC-E functionality with any steering mode is supported (NOTE 3).	
0	MPQUIC-E functionality with any steering mode not supported (NOTE 2)
1	MPQUIC-E functionality with any steering mode supported
All other bits in octet 5 and bits in octets 6 to 15 are spare and shall be coded as zero, if the respective octet is included in the information element.	
NOTE 1: The UE shall populate these bits in the same way as a UE from a previous release.	
NOTE 2: For MA PDU session, at least one of the following fields: ATSSS-ST, ATSSS-LL, MPTCP, MPQUIC-UDP, MPQUIC-IP and MPQUIC-E shall be set to a non-zero value.	
NOTE 3: If ATSSS-LL is set to 00 then this bit shall be set to 0.	

9.11.4.2 5GSM cause

The purpose of the 5GSM cause information element is to indicate the reason why a 5GSM request is rejected.

The 5GSM cause information element is coded as shown in figure 9.11.4.2.1 and table 9.11.4.2.1.

The 5GSM cause is a type 3 information element with a length of 2 octets.

Figure 9.11.4.2.1: 5GSM cause information element

Table 9.11.4.2.1: 5GSM cause information element

Cause value (octet 2)								
Bits								
8	7	6	5	4	3	2	1	
0	0	0	0	1	0	0	0	Operator determined barring
0	0	0	1	1	0	1	0	Insufficient resources
0	0	0	1	1	0	1	1	Missing or unknown DNN
0	0	0	1	1	1	0	0	Unknown PDU session type
0	0	0	1	1	1	0	1	User authentication or authorization failed
0	0	0	1	1	1	1	1	Request rejected, unspecified
0	0	1	0	0	0	0	0	Service option not supported
0	0	1	0	0	0	0	1	Requested service option not subscribed
0	0	1	0	0	0	1	1	PTI already in use
0	0	1	0	0	1	0	0	Regular deactivation
0	0	1	0	0	1	0	1	5GS QoS not accepted
0	0	1	0	0	1	1	0	Network failure
0	0	1	0	0	1	1	1	Reactivation requested
0	0	1	0	1	0	0	1	Semantic error in the TFT operation
0	0	1	0	1	0	1	0	Syntactical error in the TFT operation
0	0	1	0	1	0	1	1	Invalid PDU session identity
0	0	1	0	1	1	0	0	Semantic errors in packet filter(s)
0	0	1	0	1	1	0	1	Syntactical error in packet filter(s)
0	0	1	0	1	1	1	0	Out of LADN service area
0	0	1	0	1	1	1	1	PTI mismatch
0	0	1	1	0	0	1	0	PDU session type IPv4 only allowed
0	0	1	1	0	0	1	1	PDU session type IPv6 only allowed
0	0	1	1	0	1	1	0	PDU session does not exist
0	0	1	1	1	0	0	1	PDU session type IPv4v6 only allowed
0	0	1	1	1	0	1	0	PDU session type Unstructured only allowed
0	0	1	1	1	0	1	1	Unsupported 5QI value
0	0	1	1	1	1	0	1	PDU session type Ethernet only allowed
0	1	0	0	0	0	1	1	Insufficient resources for specific slice and DNN
0	1	0	0	0	1	0	0	Not supported SSC mode
0	1	0	0	0	1	0	1	Insufficient resources for specific slice
0	1	0	0	0	1	1	0	Missing or unknown DNN in a slice
0	1	0	1	0	0	0	1	Invalid PTI value
0	1	0	1	0	0	1	0	Maximum data rate per UE for user-plane integrity protection is too low
0	1	0	1	0	0	1	1	Semantic error in the QoS operation
0	1	0	1	0	1	0	0	Syntactical error in the QoS operation
0	1	0	1	0	1	0	1	Invalid mapped EPS bearer identity
0	1	0	1	0	1	1	0	UAS services not allowed
0	1	0	1	0	1	1	1	QoS differentiation for non-3GPP device identifier(s) not available
0	1	0	1	1	1	1	1	Semantically incorrect message
0	1	1	0	0	0	0	0	Invalid mandatory information
0	1	1	0	0	0	0	1	Message type non-existent or not implemented
0	1	1	0	0	0	1	0	Message type not compatible with the protocol state
0	1	1	0	0	0	1	1	Information element non-existent or not implemented
0	1	1	0	0	1	0	0	Conditional IE error
0	1	1	0	0	1	0	1	Message not compatible with the protocol state
0	1	1	0	1	1	1	1	Protocol error, unspecified

Any other value received by the UE shall be treated as 0001 1111, "Request rejected, unspecified". Any other value received by the network shall be treated as 0110 1111, "protocol error, unspecified".

9.11.4.3 Always-on PDU session indication

The purpose of the Always-on PDU session indication information element is to indicate whether a PDU session is established as an always-on PDU session.

The Always-on PDU session indication information element is coded as shown in figure 9.11.4.3.1 and table 9.11.4.3.1.

The Always-on PDU session indication is a type 1 information element.

8	7	6	5	4	3	2	1	
Always-on PDU session indication IEI				0	0	0	APSI	octet 1
				Spare	Spare	Spare

0	Always-on PDU session not allowed
1	Always-on PDU session required
Bits 2, 3 and 4 are spare and shall be coded as zero,	

9.11.4.4 Always-on PDU session requested

The purpose of the Always-on PDU session requested information element is to indicate whether a PDU session is requested to be established as an always-on PDU session.

The Always-on PDU session requested information element is coded as shown in figure 9.11.4.4.1 and table 9.11.4.4.1.

The Always-on PDU session requested is a type 1 information element.

8	7	6	5	4	3	2	1

0	Always-on PDU session not requested
1	Always-on PDU session requested
Bits 2, 3 and 4 are spare and shall be coded as zero,	

9.11.4.5 Allowed SSC mode

The purpose of the Allowed SSC mode information element is to indicate the SSC modes allowed to be used by the UE for the PDU session.

The Allowed SSC mode information element is coded as shown in figure 9.11.4.5.1 and table 9.11.4.5.1.

The Allowed SSC mode is a type 1 information element.

8	7	6	5	4	3	2	1	
Allowed SSC mode IEI				0	SSC3	SSC2	SSC1	octet 1

Bit 4 is spare and shall be encoded as zero.	

9.11.4.6 Extended protocol configuration options

See subclause 10.5.6.3A in 3GPP TS 24.008 [12].

9.11.4.7 Integrity protection maximum data rate

The purpose of the integrity protection maximum data rate information element is for the UE to indicate to the network the maximum data rate per UE for user-plane integrity protection for uplink and the maximum data rate per UE for user-plane integrity protection for downlink that are supported by the UE.

The integrity protection maximum data rate is coded as shown in figure 9.11.4.7.1 and table 9.11.4.7.2.

The integrity protection maximum data rate is a type 3 information element with a length of 3 octets.

Figure 9.11.4.7.1: Integrity protection maximum data rate information element

Table 9.11.4.7.2: Integrity protection maximum data rate information element

Maximum data rate per UE for user-plane integrity protection for uplink (octet 2)								
Bits								
8	7	6	5	4	3	2	1	
0	0	0	0	0	0	0	0	64 kbps (NOTE 3)
0	0	0	0	0	0	0	1	NULL (NOTE 1)
1	1	1	1	1	1	1	1	Full data rate (NOTE 2)
All other values are spare and shall not be used by a UE compliant to the present version of this specification. If received they shall be interpreted as "64 kbps".								
Maximum data rate per UE for user-plane integrity protection for downlink (octet 3)								
Bits								
8	7	6	5	4	3	2	1	
0	0	0	0	0	0	0	0	64 kbps (NOTE 3)
0	0	0	0	0	0	0	1	NULL (NOTE 1)
1	1	1	1	1	1	1	1	Full data rate (NOTE 2)
All other values are spare and shall not be used by a UE compliant to the present version of this specification. If received they shall be interpreted as "64 kbps".								
NOTE 1: This value shall be used when N3 data transfer is not supported by the UE or when the UE does not support standalone NR connected to 5GCN.								
NOTE 2: If the UE supports N3 data transfer and supports standalone NR connected to 5GCN (this includes UEs supporting NR-NR dual connectivity, NR-E-UTRA dual connectivity with MN terminated bearers or both of them as described in 3GPP TS 37.340 [51]), then the UE shall use this value.								
NOTE 3: The network can receive this value from a UE compliant to an earlier version of this specification.								

9.11.4.8 Mapped EPS bearer contexts

The purpose of the mapped EPS bearer contexts information element is to indicate a set of EPS bearer contexts for a PDU session, as described in subclause 6.1.4.1.

The mapped EPS bearer contexts information element is a type 6 information element with a minimum length of 7 octet and a maximum length of 65538 octets.

The mapped EPS bearer contexts information element is coded as shown in figure 9.11.4.8.1, figure 9.11.4.8.2, figure 9.11.4.8.3 and table 9.11.4.8.1.

Figure 9.11.4.8.1: Mapped EPS bearer contexts

Figure 9.11.4.8.2: Mapped EPS bearer context

Figure 9.11.4.8.3: EPS parameters list

Table 9.11.4.8.1: Mapped EPS bearer contexts information element

EPS bearer identity (octet 4)

Bits 5 to 8 contain the EPS bearer identity, and are coded as specified in subclause 9.3.2 of 3GPP TS 24.301 [15]. Bits 1 to 4 are spare and shall be coded as zero.

Operation code (bits 8 to 7 of octet 7)

Bits

8 7

0 0 Reserved

0 1 Create new EPS bearer

1 0 Delete existing EPS bearer

1 1 Modify existing EPS bearer

Bit 6 of octet 7 is spare and shall be coded as zero.

E bit (bit 5 of octet 7)

For the "create new EPS bearer" operation, the E bit is encoded as follows:

Bit

5

0 parameters list is not included (NOTE)

1 parameters list is included

For the "modify existing EPS bearer" operation, the E bit is encoded as follows:

Bit

5

0 extension of previously provided parameters list

1 replacement of all previously provided parameters list

If the E bit is set to "parameters list is included", the number of EPS parameters field has non-zero value. If the E bit is set to "extension of previously provided parameters list" or "replacement of previously provided parameters list", the number of parameters field has non-zero value. If the E bit is set to "extension of previously provided parameters" and one of the parameters in the new parameters list already exists in the previously provided parameters, the parameter shall be set to the new value. If the E bit is set to "replacement of all previously provided parameters list" and a parameter in the previously provided parameters is not provided in the new parameters list, the parameter shall be deleted.

For the "create new EPS bearer" operation and "delete existing EPS bearer" operation, bit 5 of octet 7 is ignored.

Number of EPS parameters (bits 4 to 1 of octet 7)

The number of EPS parameters contains the binary coding for the number of EPS parameters in the EPS parameters list field. The number of EPS parameters field is encoded in bits 4 through 1 of octet 7 where bit 4 is the most significant and bit 1 is the least significant bit.

EPS parameters list (octets 8 to u)

The EPS parameters list contains a variable number of EPS parameters.

Each EPS parameter included in the EPS parameters list is of variable length and consists of:

- an EPS parameter identifier (1 octet);
- the length of the EPS parameter contents (1 octet); and
- the EPS parameter contents itself (variable amount of octets).

The EPS parameter identifier field is used to identify each EPS parameter included in the EPS parameters list and it contains the hexadecimal coding of the EPS parameter identifier. Bit 8 of the EPS parameter identifier field contains the most significant bit and bit 1 contains the least significant bit. In this version of the protocol, the following EPS parameter identifiers are specified:

- 01H (Mapped EPS QoS parameters);
- 02H (Mapped extended EPS QoS parameters); and
- 03H (Traffic flow template).
- 04H (APN-AMBR).
- 05H (extended APN-AMBR).

If the EPS parameters list contains an EPS parameter identifier that is not supported by the receiving entity the corresponding EPS parameter shall be discarded.

The length of EPS parameter contents field contains the binary coded representation of the length of the EPS parameter contents field. The first bit in transmission order is the most significant bit.

When the parameter identifier indicates mapped EPS QoS parameters, the length and parameter contents field are coded as specified in subclause 9.9.4.3 of 3GPP TS 24.301 [15].

When the parameter identifier indicates mapped extended EPS QoS parameters, the length and parameter contents field are coded as specified in subclause 9.9.4.30 of 3GPP TS 24.301 [15].

When the parameter identifier indicates traffic flow template, the length and parameter contents field are coded from octet 2 as shown figure 10.5.144 and table 10.5.162 of 3GPP TS 24.008 [12].

When the parameter identifier indicates APN-AMBR, the length and parameter contents field are coded as specified in subclause 9.9.4.2 of 3GPP TS 24.301 [15].

When the parameter identifier indicates Extended APN-AMBR, the length and parameter contents field are coded as specified in subclause 9.9.4.29 of 3GPP TS 24.301 [15].

NOTE: This value shall not be used In this version of the specification.

9.11.4.9 Maximum number of supported packet filters

The purpose of the Maximum number of supported packet filters information element is for the UE to indicate to the network the maximum number of packet filters, associated with signaled QoS rules, that can be supported by the UE for the PDU session that is being established, when the PDU session type "IPv4", "IPv6", "IPv4v6" or "Ethernet".

The Maximum number of supported packet filters is coded as shown in figure 9.11.4.9.1 and table 9.11.4.9.1.

The Maximum number of supported packet filters is a type 3 information element with a length of 3 octets.

8	7	6	5	4	3	2	1	
Maximum number of supported packet filters IEI								octet 1
Maximum number of supported packet filters								octet 2
Maximum number of supported packet filters (continued)	0	Spare	0	Spare	0	Spare	0	octet 3

Figure 9.11.4.9.1: Maximum number of supported packet filters information element

Table 9.11.4.9.1: Maximum number of supported packet filters information element

Maximum number of supported packet filters (octet 2 to 3)
In the Maximum number of supported packet filters field bit 8 of the first octet is the most significant bit and bit 6 of second octet is the least significant bit. Bit 5 to bit 1 of the second octet are spare bits and shall be coded as zero.
The number of supported packet filters shall be in the range of 17 to 1024.

9.11.4.10 PDU address

The purpose of the PDU address information element is to assign to the UE:

- an IPv4 address associated with a PDU session;
- an interface identifier for the IPv6 link local address associated with the PDU session; or
- an IPv4 address and an interface identifier for the IPv6 link local address, associated with the PDU session.

This purpose of the PDU address information element is also to enable the W-AGF acting on behalf of the FN-RG to provide an interface identifier for the IPv6 link local address associated with the PDU session suggested to be allocated to the FN-RG, and to enable the SMF to provide SMF's IPv6 link local address to the W-AGF acting on behalf of the FN-RG.

The PDU address information element is coded as shown in figure 9.11.4.10.1 and table 9.11.4.10.1.

The PDU address is a type 4 information element with minimum length of 7 octets and a maximum length of 31 octets.

Figure 9.11.4.10.1: PDU address information element

Table 9.11.4.10.1: PDU address information element

PDU session type value (octet 3, bits 1 to 3)			
Bits			
3	2	1	
0	0	1	IPv4
0	1	0	IPv6
0	1	1	IPv4v6
All other values are reserved.			
SI6LLA (SMF's IPv6 link local address) bit (octet 3, bit 4) (see NOTE)			
Bit			
4			
0	SMF's IPv6 link local address field is absent		
1	SMF's IPv6 link local address field is present		
Bits 5 to 8 of octet 3 are spare and shall be coded as zero.			
PDU address information (octet 4 to n)			
If the PDU session type value indicates IPv4, the PDU address information in octet 4 to octet 7 contains an IPv4 address.			
If the PDU session type value indicates IPv6, the PDU address information in octet 4 to octet 11 contains an interface identifier for the IPv6 link local address.			
If the PDU session type value indicates IPv4v6, the PDU address information in octet 4 to octet 11 contains an interface identifier for the IPv6 link local address and in octet 12 to octet 15 contains an IPv4 address.			
SMF's IPv6 link local address (octet n+1 to n+16)			
SMF's IPv6 link local address field contains SMF's IPv6 link local address.			
NOTE: In the UE to network direction, the SI6LLA bit shall be set to "SMF's IPv6 link local address field is absent".			

9.11.4.11 PDU session type

The purpose of the PDU session type information element is to indicate type of the PDU session.

The PDU session type information element is coded as shown in figure 9.11.4.11.1 and table 9.11.4.11.1.

The PDU session type is a type 1 information element.

Figure 9.11.4.11.1: PDU session type information element

Table 9.11.4.11.1: PDU session type information element

PDU session type value (octet 1, bit 1 to bit 3)			
Bits			
3	2	1	
0	0	1	IPv4
0	1	0	IPv6
0	1	1	IPv4v6
1	0	0	Unstructured
1	0	1	Ethernet
1	1	1	reserved
All other values are unused and shall be interpreted as "IPv4v6", if received by the UE or the network.			

9.11.4.12 QoS flow descriptions

The purpose of the QoS flow descriptions information element is to indicate a set of QoS flow descriptions to be used by the UE, where each QoS flow description is a set of parameters as described in subclause 6.2.5.1.1.4.

The QoS flow descriptions information element is a type 6 information element with a minimum length of 6 octets. The maximum length for the information element is 65538 octets.

The QoS flow descriptions information element is coded as shown in figure 9.11.4.12.1, figure 9.11.4.12.2, figure 9.11.4.12.3, figure 9.11.4.12.4, and table 9.11.4.12.1.

Figure 9.11.4.12.1: QoS flow descriptions information element

Figure 9.11.4.12.2: QoS flow description

Figure 9.11.4.12.3: Parameters list

Figure 9.11.4.12.4: Parameter

Table 9.11.4.12.1: QoS flow descriptions information element

QoS flow identifier (QFI) (bits 6 to 1 of octet 4) QFI field contains the QoS flow identifier. Bits 6 5 4 3 2 1 0 0 0 0 0 0no QoS flow identifier assigned 0 0 0 0 0 1QFI 1 to 1 1 1 1 1 1QFI 63 The network shall not set the QFI value to 0. Operation code (bits 8 to 6 of octet 5) Bits 8 7 6 0 0 1 Create new QoS flow description 0 1 0 Delete existing QoS flow description 0 1 1 Modify existing QoS flow description All other values are reserved.

E bit (bit 7 of octet 6)

For the "create new QoS flow description" operation, the E bit is encoded as follows:

Bit

7

0 reserved

1 parameters list is included

For the "Delete existing QoS flow description" operation, the E bit is encoded as follows:

Bit

7

0 parameters list is not included

1 reserved

For the "modify existing QoS flow description" operation, the E bit is encoded as follows:

Bit

7

0 extension of previously provided parameters

1 replacement of all previously provided parameters

If the E bit is set to "parameters list is not included", the number of parameters field has zero value. If the E bit is set to "parameters list is included", the number of parameters field has non-zero value. If the E bit is set to "extension of previously provided parameters" or "replacement of all previously provided parameters", the number of parameters field has non-zero value. If the E bit is set to "extension of previously provided parameters" and one of the parameters in the new parameters list already exists in the previously provided parameters, the parameter shall be set to the new value. If the E bit is set to "replacement of all previously provided parameters list" and a parameter in the previously provided parameters is not provided in the new parameters list, the parameter shall be deleted.

Number of parameters (bits 6 to 1 of octet 6)

The number of parameters field contains the binary coding for the number of parameters in the parameters list field. The number of parameters field is encoded in bits 6 through 1 of octet 6 where bit 6 is the most significant and bit 1 is the least significant bit.

Parameters list (octets 7 to u)

The parameters list contains a variable number of parameters.

Each parameter included in the parameters list is of variable length and consists of:

- a parameter identifier (1 octet);
- the length of the parameter contents (1 octet); and
- the parameter contents itself (variable amount of octets).

The parameter identifier field is used to identify each parameter included in the parameters list and it contains the hexadecimal coding of the parameter identifier. Bit 8 of the parameter identifier field contains the most significant bit and bit 1 contains the least significant bit. In this version of the protocol, the following parameter identifiers are specified:

- 01H (5QI);
- 02H (GFBR uplink);
- 03H (GFBR downlink);
- 04H (MFBR uplink);
- 05H (MFBR downlink);
- 06H (Averaging window); and
- 07H (EPS bearer identity).

If the parameters list contains a parameter identifier that is not supported by the receiving entity the corresponding parameter shall be discarded.

The length of parameter contents field contains the binary coded representation of the length of the parameter contents field. The first bit in transmission order is the most significant bit.

When the parameter identifier indicates 5QI, the parameter contents field contains the binary representation of 5G QoS identifier (5QI) that is one octet in length.

5QI:

to Operator-specific 5QIs	
1 1 1 1 1 1 1 0	
1 1 1 1 1 1 1 1	Reserved

The network shall consider all other values not explicitly defined in this version of the protocol as unsupported.

If the UE receives a 5QI value (excluding the reserved 5QI values) that it does not understand, the UE shall choose a 5QI value from the set of 5QI values defined in this version of the protocol (see 3GPP TS 23.501 [8]) and associated with:

- GBR QoS flows, if the QoS flow includes a GFBR uplink parameter, a GFBR downlink parameter, a MFBR uplink parameter and a MFBR downlink parameter; and
- non-GBR QoS flows, if the QoS flow does not include any one of a GFBR uplink parameter, a GFBR downlink parameter, a MFBR uplink parameter or a MFBR downlink parameter.

The UE shall use this chosen 5QI value for internal operations only. The UE shall use the received 5QI value in subsequent NAS signalling procedures.

When the parameter identifier indicates "GFBR uplink", the parameter contents field contains one octet indicating the unit of the guaranteed flow bit rate for uplink followed by two octets containing the value of the guaranteed flow bit rate for uplink.

Unit of the guaranteed flow bit rate for uplink (octet 1)

0 0 0 1 0 1 1 1	value is incremented in multiples of 16 Pbps
0 0 0 1 1 0 0 0	value is incremented in multiples of 64 Pbps
0 0 0 1 1 0 0 1	value is incremented in multiples of 256 Pbps

Other values shall be interpreted as multiples of 256 Pbps in this version of the protocol.

Value of the guaranteed flow bit rate for uplink (octets 2 and 3)

Octets 2 and 3 represent the binary coded value of the guaranteed flow bit rate for uplink in units defined by the unit of the guaranteed flow bit rate for uplink.

When the UE indicates subscribed GFBF for uplink, the "GFBF uplink" parameter is not included in the "Parameters list".

When the parameter identifier indicates "GFBF downlink", the parameter contents field contains one octet indicating the unit of the guaranteed flow bit rate for downlink followed by two octets containing the value of the guaranteed flow bit rate for downlink.

Unit of the guaranteed flow bit rate for downlink (octet 1)

The coding is identical to that of the unit of the guaranteed flow bit rate for uplink.

Value of the guaranteed flow bit rate for downlink (octets 2 and 3)

Octets 2 and 3 represent the binary coded value of the guaranteed flow bit rate for downlink in units defined by the unit of the guaranteed flow bit rate for downlink.

When the UE indicates subscribed GFBF for downlink, the "GFBF downlink" parameter is not included in the "Parameters list".

When the parameter identifier indicates "MFBR uplink", the parameter contents field contains the one octet indicating the unit of the maximum flow bit rate for uplink followed by two octets containing the value of maximum flow bit rate for uplink.

Unit of the maximum flow bit rate for uplink (octet 1)

The coding is identical to that of the unit of the guaranteed flow bit rate for uplink.

Value of the maximum flow bit rate for uplink (octets 2 and 3)

Octets 2 and 3 represent the binary coded value of the maximum flow bit rate for uplink in units defined by the unit of the maximum flow bit rate for uplink.

When the UE indicates subscribed MFBR for uplink, the "MFBR uplink" parameter is not included in the "Parameters list".

When the parameter identifier indicates "MFBR downlink", the parameter contents field contains one octet indicating the unit of the maximum flow bit rate for downlink followed by two octets containing the value of the maximum flow bit rate for downlink. Unit of the maximum flow bit rate for downlink (octet 1) The coding is identical to that of the unit of the guaranteed flow bit rate for uplink. Value of the maximum flow bit rate for downlink (octets 2 and 3) Octets 2 and 3 represent the binary coded value of the maximum flow bit rate for downlink in units defined by the unit of the maximum flow bit rate for downlink. When the UE indicates subscribed MFBR for downlink, the "MFBR downlink" parameter is not included in the "Parameters list". In this version of the protocol, for messages specified in the present document, the sending entity shall not request 0 kbps for both the maximum flow bit rate for downlink and the maximum flow bit rate for uplink at the same time. Any entity receiving a request for 0 kbps in both the maximum flow bit rate for downlink and the maximum flow bit rate for uplink shall consider that as a syntactical error (see clause 7). When the parameter identifier indicates "averaging window", the parameter contents field contains the binary representation of the averaging window for both uplink and downlink in milliseconds and the parameter contents field is two octets in length. When the parameter identifier indicates EPS bearer identity, the length of EPS bearer identity is one octet, bits 5 to 8 of the parameter contents contain the EPS bearer identity as specified in subclause 9.3.2 of 3GPP TS 24.301 [15] and bits 1 to 4 of the parameter contents are spare and shall be coded as zero. The UE shall not include the EPS bearer identity parameter in any mobile originated 5GSM messages (see NOTE 1). NOTE 1: The total number of EPS bearer identities included in all QoS flow descriptions of a UE cannot exceed fifteen. NOTE 2: In this release of the specifications if received it shall be interpreted as value is incremented in multiples of 1 Kbps. In earlier releases of specifications, the interpretation of this value is up to implementation.

9.11.4.13 QoS rules

The purpose of the QoS rules information element is to indicate a set of QoS rules to be used by the UE, where each QoS rule is a set of parameters as described in subclause 6.2.5.1.1.2:

- a) for classification and marking of uplink user traffic; and
- b) for identification of a QoS flow which the network is to use for a particular downlink user traffic.

NOTE: The UE needs to be aware of a QoS flow which the network is to use for a particular downlink user traffic e.g. to determine whether a resource is available for downlink media of a media stream of an SDP media description provided by the UE in an IMS session.

The QoS rules may contain a set of packet filters consisting of zero or more packet filters for UL direction, zero or more packet filters for DL direction, zero or more packet filters for both UL and DL directions or any combinations of these. The set of packet filters determine the traffic mapping to QoS flows.

The QoS rules information element is a type 6 information element with a minimum length of 7 octets. The maximum length for the information element is 65538 octets.

The QoS rules information element is coded as shown in figure 9.11.4.13.1, figure 9.11.4.13.2, figure 9.11.4.13.3, figure 9.11.4.13.4 and table 9.11.4.13.1.

Figure 9.11.4.13.1: QoS rules information element

Figure 9.11.4.13.2: QoS rule (u=m+2)

Figure 9.11.4.13.3: Packet filter list when the rule operation is "modify existing QoS rule and delete packet filters" (m=N+7)

Figure 9.11.4.13.4: Packet filter list when the rule operation is "create new QoS rule", or "modify existing QoS rule and add packet filters" or "modify existing QoS rule and replace all packet filters"

NOTE: The field is placed immediately after the last present preceding field.

Figure 9.11.4.13.6: (S)RTP multiplexed media identification information entry

Table 9.11.4.13.1: QoS rules information element

QoS rule identifier (octet 4)

The QoS rule identifier field is used to identify the QoS rule.

Bits

8 7 6 5 4 3 2 1

0 0 0 0 0 0 0 0 no QoS rule identifier assigned

0 0 0 0 0 0 0 1 QRI 1

to

1 1 1 1 1 1 1 1 QRI 255

The network shall not set the QRI value to 0.

QoS rule precedence (octet m+1)

The QoS rule precedence field is used to specify the precedence of the QoS rule among all QoS rules (both the signalled QoS rules as described in subclause 6.2.5.1.1.2 and the derived QoS rules as described in subclause 6.2.5.1.1.3) associated with the PDU session of the QoS flow. This field includes the binary coded value of the QoS rule precedence in the range from 0 to 255 (decimal). The higher the value of the QoS rule precedence field, the lower the precedence of that QoS rule is. For the "delete existing QoS rule" operation, the QoS rule precedence value field shall not be included. For the "create new QoS rule" operation, the QoS rule precedence value field shall be included.

The value 80 (decimal) is reserved.

Segregation bit (bit 7 of octet m+2) (see NOTE 1)

In the UE to network direction the segregation bit indicates whether the UE is requesting the network to bind service data flows described by the QoS rule to a dedicated QoS Flow and it is encoded as follows. In the network to UE direction this bit is spare.

Bit

7

0 Segregation not requested

1 Segregation requested

QoS flow identifier (QFI) (bits 6 to 1 of octet m+2) (see NOTE 1)

The QoS flow identifier (QFI) field contains the QoS flow identifier.

Bits

6 5 4 3 2 1

0 0 0 0 0 0 no QoS flow identifier assigned

0 0 0 0 0 1 QFI 1

to

1 1 1 1 1 1 QFI 63

The network shall not set the QFI value to 0.

For the "delete existing QoS rule" operation, the QoS flow identifier value field shall not be included. For the "create new QoS rule" operation, the QoS flow identifier value field shall be included.

DQR bit (bit 5 of octet 7)

The DQR bit indicates whether the QoS rule is the default QoS rule and it is encoded as follows:

Bit

5

0 the QoS rule is not the default QoS rule.

1 the QoS rule is the default QoS rule.

Rule operation code (bits 8 to 6 of octet 7)

Bits

8 7 6

0 0 0 Reserved

0 0 1 Create new QoS rule

0 1 0 Delete existing QoS rule

0 1 1 Modify existing QoS rule and add packet filters

1 0 0 Modify existing QoS rule and replace all packet filters

1 0 1 Modify existing QoS rule and delete packet filters

1 1 0 Modify existing QoS rule without modifying packet filters

1 1 1 Reserved

Number of packet filters (bits 4 to 1 of octet 7)

The number of packet filters contains the binary coding for the number of packet filters in the packet filter list. The number of packet filters field is encoded in bits 4 through 1 of octet 7 where bit 4 is the most significant and bit 1 is the least significant bit. For the "delete existing QoS rule" operation and for the "modify existing QoS rule without modifying packet filters" operation, the number of packet filters shall be coded as 0. For the "create new QoS rule" operation and the "modify existing QoS rule and replace all packet filters" operation, the number of packet filters shall be greater than or equal to 0 and less than or equal to 15. For all other operations, the number of packet filters shall be greater than 0 and less than or equal to 15.

Packet filter list (octets 8 to m)

The packet filter list contains a variable number of packet filters.

For the "delete existing QoS rule" operation, the length of QoS rule field is set to one.

For the "delete existing QoS rule" operation and the "modify existing QoS rule without modifying packet filters" operation, the packet filter list shall be empty.

For the "modify existing QoS rule and delete packet filters" operation, the packet filter list shall contain a variable number of packet filter identifiers. This number shall be derived from the coding of the number of packet filters field in octet 7.

For the "create new QoS rule" operation and for the "modify existing QoS rule and replace all packet filters" operation, the packet filter list shall contain 0 or a variable number of packet filters. This number shall be derived from the coding of the number of packet filters field in octet 7.

For the "modify existing QoS rule and add packet filters" operation, the packet filter list shall contain a variable number of packet filters. This number shall be derived from the coding of the number of packet filters field in octet 7.

Each packet filter is of variable length and consists of

- a packet filter direction (2 bits);
- a packet filter identifier (4 bits);
- the length of the packet filter contents (1 octet); and
- the packet filter contents itself (variable amount of octets).

The packet filter direction field is used to indicate for what traffic direction the filter applies.

Bits

6 5

0 0 reserved

0 1 downlink only (see NOTE 2)

1 0 uplink only

1 1 bidirectional

The packet filter identifier field is used to identify each packet filter in a QoS rule. The least significant 4 bits are used. When the UE requests to "create new QoS rule", "modify existing QoS rule and replace all packet filters" or "modify existing QoS rule and add packet filters", the packet filter identifier values shall be set to 0.

The length of the packet filter contents field contains the binary coded representation of the length of the packet filter contents field of a packet filter. The first bit in transmission order is the most significant bit.

The packet filter contents field is of variable size and contains a variable number (at least one) of packet filter components. Each packet filter component shall be encoded as a sequence of a one octet packet filter component type identifier and a packet filter component value field. Furthermore, for all packet filter component type identifier values except for "(S)RTP multiplexed media identification information type", each of the other packet filter component value field has a fixed length. The packet filter component type identifier shall be transmitted first.

In each packet filter, there shall not be more than one occurrence of each packet filter component type. Among the "IPv4 remote address type" and "IPv6 remote address/prefix length type" packet filter components, only one shall be present in

one packet filter. Among the "IPv4 local address type" and "IPv6 local address/prefix length type" packet filter components, only one shall be present in one packet filter. Among the "single local port type" and "local port range type" packet filter components, only one shall be present in one packet filter. Among the "single remote port type" and "remote port range type" packet filter components, only one shall be present in one packet filter. Among the "destination MAC address type" and "destination MAC address range type" packet filter components, only one shall be present in one packet filter. Among the "source MAC address type" and "source MAC address range type" packet filter components, only one shall be present in one packet filter. If the "match-all type" packet filter component is present in the packet filter, no other packet filter component shall be present in the packet filter and the length of the packet filter contents field shall be set to one. If the "Ethernet type" packet filter component is present in the packet filter and the "Ethernet type" packet filter component value is neither "0800H" (for IPv4) nor "86DDH" (for IPv6), no IP packet filter component shall be present in the packet filter.

The term "IP packet filter component" refers to "IPv4 remote address type", "IPv4 local address type", "IPv6 remote address/prefix length type", "IPv6 local address/prefix length type", "Protocol identifier/Next header type", "Single local port type", "Local port range type", "Single remote port type", "Remote port range type", "Security parameter index type", "Type of service/Traffic class type" and "Flow label type".

The "(S)RTP multiplexed media identification information type" packet filter component can not be present in the packet filter with no "IP packet filter component".

The term local refers to the UE and the term remote refers to an external network entity.

Packet filter component type identifier

Bits

8	7	6	5	4	3	2	1	
0	0	0	0	0	0	0	1	Match-all type (see NOTE 2)
0	0	0	1	0	0	0	0	IPv4 remote address type
0	0	0	1	0	0	0	1	IPv4 local address type
0	0	1	0	0	0	0	1	IPv6 remote address/prefix length type
0	0	1	0	0	0	1	1	IPv6 local address/prefix length type
0	0	1	1	0	0	0	0	Protocol identifier/Next header type
0	1	0	0	0	0	0	0	Single local port type
0	1	0	0	0	0	0	1	Local port range type

0	1	0	1	0	0	0	1	Remote port range type
0	1	1	0	0	0	0	0	Security parameter index type
0	1	1	1	0	0	0	0	Type of service/Traffic class type
1	0	0	0	0	0	0	0	Flow label type
1	0	0	0	0	0	0	1	Destination MAC address type
1	0	0	0	0	0	1	0	Source MAC address type
1	0	0	0	0	0	1	1	802.1Q C-TAG VID type
1	0	0	0	0	1	0	0	802.1Q S-TAG VID type
1	0	0	0	0	1	0	1	802.1Q C-TAG PCP/DEI type
1	0	0	0	0	1	1	0	802.1Q S-TAG PCP/DEI type
1	0	0	0	0	1	1	1	Ethernet type
1	0	0	1	0	0	0	0	Destination MAC address range type
1	0	0	1	0	0	1	0	Source MAC address range type
1	0	0	1	0	0	0	1	(S)RTP multiplexed media identification information type (see NOTE 3, NOTE 4)

All other values are reserved.

The description and valid combinations of packet filter component type identifiers in a packet filter are defined in 3GPP TS 23.501 [8].

For "match-all type", the packet filter component shall not include the packet filter component value field.

For "IPv4 remote address type", the packet filter component value field shall be encoded as a sequence of a four octet IPv4 address field and a four octet IPv4 address mask field. The IPv4 address field shall be transmitted first.

For "IPv4 local address type", the packet filter component value field shall be encoded as defined for "IPv4 remote address type".

For "IPv6 remote address/prefix length type", the packet filter component value field shall be encoded as a sequence of a sixteen octet IPv6 address field and one octet prefix length field. The IPv6 address field shall be transmitted first.

For "IPv6 local address/prefix length type", the packet filter component value field shall be encoded as defined for "IPv6 remote address /prefix length".

For "protocol identifier/Next header type", the packet filter component value field shall be encoded as one octet which specifies the IPv4 protocol identifier or Ipv6 next header.

For "single local port type" and "single remote port type", the packet filter component value field shall be encoded as two octets which specify a port number.

For "local port range type" and "remote port range type", the packet filter component value field shall be encoded as a sequence of a two octet port range low limit field and a two octet port range high limit field. The port range low limit field shall be transmitted first.

For "security parameter index", the packet filter component value field shall be encoded as four octets which specify the IPsec security parameter index.

For "type of service/traffic class type", the packet filter component value field shall be encoded as a sequence of a one octet type-of-service/traffic class field and a one octet type-of-service/traffic class mask field. The type-of-service/traffic class field shall be transmitted first.

For "flow label type", the packet filter component value field shall be encoded as three octets which specify the IPv6 flow label. The bits 8 through 5 of the first octet shall be spare whereas the remaining 20 bits shall contain the IPv6 flow label.

For "destination MAC address type" and "source MAC address type", the packet filter component value field shall be encoded as 6 octets which specify a MAC address. When the packet filter direction field indicates "bidirectional", the destination MAC address is the remote MAC address and the source MAC address is the local MAC address.

For "802.1Q C-TAG VID type", the packet filter component value field shall be encoded as two octets which specify the VID of the customer-VLAN tag (C-TAG). The bits 8 through 5 of the first octet shall be spare whereas the remaining 12 bits shall contain the VID. If there are more than one C-TAG in the Ethernet frame header, the outermost C-TAG is evaluated.

For "802.1Q S-TAG VID type", the packet filter component value field shall be encoded as two octets which specify the VID of the service-VLAN tag (S-TAG). The bits 8 through 5 of the first octet shall be spare whereas the remaining 12 bits shall contain the VID. If there are more than one S-TAG in the Ethernet frame header, the outermost S-TAG is evaluated.

For "802.1Q C-TAG PCP/DEI type", the packet filter component value field shall be encoded as one octet which specifies the 802.1Q C-TAG PCP and DEI. The bits 8 through 5 of the octet shall be spare, the bits 4 through 2 contain the PCP and bit 1 contains the DEI. If there are more than one C-TAG in the Ethernet frame header, the outermost C-TAG is evaluated.

For "802.1Q S-TAG PCP/DEI type", the packet filter component value field shall be encoded as one octet which specifies the 802.1Q S-TAG PCP. The bits 8 through 5 of the octet shall be spare, the bits 4 through 2 contain the PCP and bit 1 contains the DEI. If there are more than one S-TAG in the Ethernet frame header, the outermost S-TAG is evaluated.

For "ethertype type", the packet filter component value field shall be encoded as two octets which specify an ethertype.

For "destination MAC address range type", the packet filter component value field shall be encoded as a sequence of a 6 octet destination MAC address range low limit field and a 6 octet destination MAC address range high limit field. The destination MAC address range low limit field shall be transmitted first. When the packet filter direction field indicates "bidirectional", the destination MAC address range is the remote MAC address range.

For "source MAC address range type", the packet filter component value field shall be encoded as a sequence of a 6 octet source MAC address range low limit field and a 6 octet source MAC address range high limit field. The source MAC address range low limit field shall be transmitted first. When the packet filter direction field indicates "bidirectional", the source MAC address is the local MAC address range.

For "(S)RTP multiplexed media identification information type", the packet filter component value field shall be encoded as figure 9.11.4.13.5 and figure 9.11.4.13.6.

An (S)RTP multiplexed media identification information entry for (s)RTCP shall contain the RTCP packet type field and at least one of the SSRC field and MID identification-tag field.

An (S)RTP multiplexed media identification information entry for (s)RTP shall contain payload type field, additionally, it may contain:

- a) SSRC field;
- b) MID identification-tag field and RTP SDES header extension id for MID; or
- c) both a) and b).

An (S)RTP multiplexed media identification information entry for (s)RTP and (s)RTCP shall contain:

- a) SSRC field;
- b) MID identification-tag field and RTP SDES header extension id for MID field; or
- c) both a) and b).

SSRC presence indicator (SSRCPI) (bit 1 of octet 12)

The SSRCPI field indicates whether the SSRC field is included or not.

Bit

1

0 SSRC not included

1 SSRC included

Payload type presence indicator (PTPI) (bit 2 of octet 12)

The PTPI field indicates whether the payload type field is included or not.

Bit

2

0 Payload type not included

1 Payload type included

MID identification-tag presence indicator (MITPI) (bit 3 of octet 12)

The MITPI field indicates whether the MID identification-tag field is included or not.

Bit

3

0 MID identification-tag not included

1 MID identification-tag included

RTP SDES header extension id for MID presence indicator (RSHEMPI) (bit 4 of octet 12)

The RSHEMPI field indicates whether the RTP SDES header extension id for MID field is included or not.

Bit

4

0 RTP SDES header extension id for MID not included

1 RTP SDES header extension id for MID included

RTCP packet type presence indicator (RPTPI) (bit 5 of octet 12)

The RPTPI field indicates whether the RTCP packet type field is included or not.

Bit	
5	
0	RTCP packet type not included
1	RTCP packet type included
The synchronization source (SSRC) field shall be encoded as 4 octet SSRC field which specify the synchronization source identifier in the RTP header as specified in IETF RFC 3550 [71]. The payload type field shall be encoded as octet payload type field which contains the binary representation of an integer between 0(inclusive) and 127(inclusive) as specified in IETF RFC 3550 [71] (see NOTE 5). The other values are spare. If a spare value is received, the UE shall ignore the corresponding (S)RTP multiplexed media identification information entry. The MID identification-tag field shall be encoded as length of the MID identification-tag which is one octet and followed by value of the MID identification-tag which is with a maximum length of 255 octets as specified in IETF RFC 9143 [72]. The RTP SDES header extension id for MID field contains the RTP SDES header extension id for MID, it shall be coded as the RTP SDES header extension id of the RTP SDES header extension for MID as specified in IETF RFC 9143 [72]. The RTCP packet type field shall be encoded as one octet and contains the binary representation of an unsigned integer in the range 0 to 255 inclusive as specified in IETF RFC 3550 [71] (see NOTE 5).	
NOTE 1: Octet m+2 shall not be included without octet m+1. NOTE 2: The "Match-all type" packet filter component type identifier shall not be used with packet filter direction "downlink only". NOTE 3: When the "(S)RTP multiplexed media identification information type" packet filter component type identifier is present in an uplink packet filter, if an UL user data packet matches any (S)RTP multiplexed media identification information entry, the UL user data packet is considered to match the (S)RTP multiplexed media identification information component of the UL packet filter. How to determine an UL user data packet matches the (S)RTP multiplexed media identification information entry is left to implementation. NOTE 4: At least one of the SSRCP, PTPI, MITPI, RSHEMPI, and RPTPI shall be set to 1 in the (S)RTP multiplexed media identification information entry. NOTE 5: As specified in clause 4 of IETF RFC 5761 [73], the RTP payload type values and RTCP packet type values in the multiplexed media shall not collide. The RTP payload type values plus 128 and RTCP packet type values in the multiplexed media shall not collide.	

9.11.4.14 Session-AMBR

The purpose of the Session-AMBR information element is to indicate the initial subscribed PDU session aggregate maximum bit rate when the UE establishes a PDU session or to indicate the new subscribed PDU session aggregate maximum bit rate if it is changed by the network.

The Session-AMBR information element is coded as shown in figure 9.11.4.14.1 and table 9.11.4.14.1.

The Session-AMBR is a type 4 information element with a length of 8 octets.

8	7	6	5	4	3	2	1

0 0 0 1 0 1 1 1	value is incremented in multiples of 16 Pbps
0 0 0 1 1 0 0 0	value is incremented in multiples of 64 Pbps
0 0 0 1 1 0 0 1	value is incremented in multiples of 256 Pbps
Other values shall be interpreted as multiples of 256 Pbps in this version of the protocol.	
Session-AMBR for downlink (octets 4 and 5)	
Octets 4 and 5 represent the binary coded value of PDU session aggregated maximum bit rate for downlink in units defined by octet 3.	
Unit for Session-AMBR for uplink (octet 6)	
The coding is identical to the unit coding defined for Session-AMBR for downlink (octet 3)	
Session-AMBR for uplink (octets 7 and 8)	
Octets 7 and 8 represent the binary coded value of PDU session aggregated maximum bit rate for uplink in units defined by octet 6.	
NOTE:	In this release of the specifications if received it shall be interpreted as value is incremented in multiples of 1 Kbps. In earlier releases of specifications, the interpretation of this value is up to implementation.

9.11.4.15 SM PDU DN request container

The purpose of the SM PDU DN request container information element is to carry a DN-specific identity of the UE in the network access identifier (NAI) format.

The SM PDU DN request container information element is coded as shown in figure 9.11.4.15.1 and table 9.11.4.15.1.

The SM PDU DN request container is a type 4 information element with minimal length of 3 octets and maximum length of 255 octets.

Figure 9.11.4.15.1: SM PDU DN request container information element

Table 9.11.4.15.1: SM PDU DN request container information element

DN-specific identity (octet 3 to octet n)
A DN-specific identity of the UE in the network access identifier (NAI) format according to IETF RFC 7542 [37], encoded as UTF-8 string.

9.11.4.16 SSC mode

The purpose of the SSC mode information element is to indicate SSC mode.

The SSC mode information element is coded as shown in figure 9.11.4.16.1 and table 9.11.4.16.1.

The SSC mode is a type 1 information element.

Figure 9.11.4.16.1: SSC mode information element

Table 9.11.4.16.1: SSC mode information element

SSC mode value (octet 1, bit 1 to bit 4)			
Bits			
3	2	1	
0	0	1	SSC mode 1
0	1	0	SSC mode 2
0	1	1	SSC mode 3
1	0	0	unused; shall be interpreted as "SSC mode 1", if received by the network
1	0	1	unused; shall be interpreted as "SSC mode 2", if received by the network
1	1	0	unused; shall be interpreted as "SSC mode 3", if received by the network
All other values are reserved.			

9.11.4.17 Re-attempt indicator

The purpose of the Re-attempt indicator information element is to indicate a condition under which the UE is allowed in the current PLMN or its equivalent PLMN(s) or the current SNPN or its equivalent SNPNs for the same DNN, to re-attempt a session management procedure (see 3GPP TS 24.301 [15]) corresponding to the 5GS session management procedure which was rejected by the network.

The Re-attempt indicator information element is coded as shown in figure 9.11.4.17.1 and table 9.11.4.17.1.

The Re-attempt indicator is a type 4 information element with a length of 3 octets.

Figure 9.11.4.17.1: Re-attempt indicator

Table 9.11.4.17.1: Re-attempt indicator

RATC (octet 3, bit 1)	
Bit	1
0	UE is allowed to re-attempt the procedure in S1 mode
1	UE is not allowed to re-attempt the procedure in S1 mode
EPLMNC (octet 3, bit 2)	
Bit	2
0	UE is allowed to re-attempt the procedure in an equivalent PLMN or equivalent SNPN
1	UE is not allowed to re-attempt the procedure in an equivalent PLMN or equivalent SNPN
Bits 3 to 8 of octet 3 are spare and shall be encoded as zero.	

9.11.4.18 5GSM network feature support

The purpose of the 5GSM network feature support information element is to indicate whether certain session management related features are supported by the network.

The 5GSM network feature support information element is coded as shown in figure 9.11.4.18.1 and table 9.11.4.18.1.

The 5GSM network feature support is a type 4 information element with a minimum length of 3 octets and a maximum length of 15 octets.

Figure 9.11.4.18.1: 5GSM network feature support information element

Table 9.11.4.18.1: 5GSM network feature support information element

5GSM network feature support contents	
Ethernet PDN type in S1 mode (IEPT-S1) (octet 3, bit 1)	
This bit indicates network's capability for Ethernet PDN type in S1 mode.	
0	Ethernet PDN type in S1 mode not supported
1	Ethernet PDN type in S1 mode supported
Non-3GPP access path switching (NAPS) (octet 3, bit 2)	
This bit indicates whether non-3GPP access path switching is supported.	
Bit	2
0	non-3GPP access path switching not supported
1	non-3GPP access path switching supported
All other bits in octet 3 to 15 are spare and shall be coded as zero, if the respective octet is included in the information element.	

9.11.4.19 Void

9.11.4.20 Serving PLMN rate control

See subclause 9.9.4.28 in 3GPP TS 24.301 [15].

9.11.4.21 5GSM congestion re-attempt indicator

The purpose of the 5GSM congestion re-attempt indicator information element is to indicate whether the back-off timer is applied in the registered PLMN or all PLMNs or in the registered SNPN or all equivalent SNPNS, and additionally to indicate whether the back-off timer is applied in the current access type or both 3GPP access type and non-3GPP access type.

The 5GSM congestion re-attempt indicator information element is coded as shown in figure 9.11.4.21.1 and table 9.11.4.21.1.

The 5GSM congestion re-attempt indicator is a type 4 information element with a length of 3 octets.

8	7	6	5	4	3	2	1	
5GSM congestion re-attempt indicator IEI								octet 1
Length of 5GSM congestion re-attempt indicator contents								octet 2
0	0	0	0	0	0	CATB	ABO	octet 3
Spare	Spare	Spare	Spare	Spare	Spare	O		

Figure 9.11.4.21.1: 5GSM congestion re-attempt indicator

Table 9.11.4.21.1: 5GSM congestion re-attempt indicator

ABO (All PLMNs Back-off timer) (octet 3, bit 1)	
Bit	
1	
0	The back-off timer is applied in the registered PLMN or registered SNPN.
1	The back-off timer is applied in all PLMNs or all equivalent SNPNS.
CATBO (Current Access Type Back-off Timer) (octet 3, bit 2)	
Bit	
2	
0	The back-off timer is applied in both 3GPP access type and non-3GPP access type
1	The back-off timer is applied in the current access type
Bits 3 to 8 of octet 3 are spare and shall be encoded as zero.	

9.11.4.22 ATSSS container

The purpose of the ATSSS container information element is to transfer parameters associated with ATSSS.

The ATSSS container information element is coded as shown in figure 9.11.4.22.1 and table 9.11.4.22.1.

The ATSSS container is a type 6 information element with a minimum length of 3 octets and a maximum length of 65538 octets.

8	7	6	5	4	3	2	1	
ATSSS container IEI								octet 1
Length of ATSSS container contents								octet 2
ATSSS container contents								octet 3

								octet x*

Figure 9.11.4.22.1: ATSSS container information element

Table 9.11.4.22.1: ATSSS container information element

ATSSS container contents are defined in 3GPP TS 24.193 [13B].

9.11.4.23 Control plane only indication

The purpose of the control plane only indication information element is to indicate that a PDU session is only for control plane ClIoT 5GS optimization.

The control plane only indication information element is coded as shown in figure 9.11.4.23.1.

The control plane only indication is a type 1 information element.

Figure 9.11.4.23.1: Control plane only indication information element

Table 9.11.4.23.1: Control plane only indication information element

Control plane only indication value (CPOI) (octet 1)	
Bit	
1	
0	reserved
1	PDU session can be used for control plane ClIoT 5GS optimization only
The value 0 is reserved. If received, it shall be interpreted as if the control plane only indication IE was not included in the message.	
Bits 4 to 2 of octet 1 are spare and shall be all encoded as zero.	

9.11.4.24 IP header compression configuration

The purpose of the IP header compression configuration information element is to negotiate ROHC channel setup parameters specified in IETF RFC 5795 [39B] and, optionally, provide additional header compression context setup parameters.

The IP header compression configuration information element is coded as shown in figure 9.11.4.24.1 and table 9.11.4.24.1.

The IP header compression configuration is a type 4 information element with a minimum length of 5 octets and a maximum length of 257 octets.

The optional Additional IP header compression parameters container field conveys the additional header compression context setup parameters as specified in 3GPP TS 23.501 [8] in a generic container. This field corresponds to the profile-specific information in the header of the ROHC IR packet type in IETF RFC 5795 [39B].

Figure 9.11.4.24.1: IP header compression configuration information element

Table 9.11.4.24.1: IP header compression configuration information element

ROHC Profiles (octet 3)

The ROHC Profiles shall indicate which of the ROHC profiles is supported. When a particular bit is set to 1, this indicates that the corresponding profile is supported. The No Compression profile 0x0000 (see IETF RFC 5795 [39B]) shall always be supported. When all the bits are set to 0, this indicates that only the No Compression profile 0x0000 is supported.

Profile 0x0002 support indicator (see IETF RFC 3095 [33A] and IETF RFC 4815 [38A]) (octet 3 bit 1)

- 0 RoHC profile 0x0002 (UDP/IP) is not supported
- 1 RoHC profile 0x0002 (UDP/IP) is supported

Profile 0x0003 support indicator (see IETF RFC 3095 [33A] and IETF RFC 4815 [38A]) (octet 3 bit 2)

- 0 RoHC profile 0x0003 (ESP/IP) is not supported
- 1 RoHC profile 0x0003 (ESP/IP) is supported

Profile 0x0004 support indicator (see IETF RFC 3843 [34A] and IETF RFC 4815 [38A]) (octet 3 bit 3)

- 0 RoHC profile 0x0004 (IP) is not supported
- 1 RoHC profile 0x0004 (IP) is supported

Profile 0x0006 support indicator (see IETF RFC 6846 [40B]) (octet 3 bit 4)

- 0 RoHC profile 0x0006 (TCP/IP) is not supported
- 1 RoHC profile 0x0006 (TCP/IP) is supported

Profile 0x0102 support indicator (see IETF RFC 5225 [39A]) (octet 3 bit 5)

- 0 RoHC profile 0x0102 (UDP/IP) is not supported
- 1 RoHC profile 0x0102 (UDP/IP) is supported

Profile 0x0103 support indicator (see IETF RFC 5225 [39A]) (octet 3 bit 6)

- 0 RoHC profile 0x0103 (ESP/IP) is not supported
- 1 RoHC profile 0x0103 (ESP/IP) is supported

Profile 0x0104 support indicator (see IETF RFC 5225 [39A]) (octet 3 bit 7)

- 0 RoHC profile 0x0104 (IP) is not supported
- 1 RoHC profile 0x0104 (IP) is supported

Bits 8 is spare and shall be set to 0.

MAX_CID (octet 4 and octet 5)

This is the MAX_CID value as specified in 3GPP TS 36.323 [25]. It is encoded in binary coding with a value in the range from 1 to 16383.

Additional IP header compression context parameters type (octet 6).

The Additional IP header compression context parameters type octet indicates the profile associated with the profile-specific information in the Additional IP header compression context parameters container.

Bits

8 7 6 5 4 3 2 1Type

0 0 0 0 0 0 0 0	0x0000 (No Compression)
0 0 0 0 0 0 0 1	0x0002 (UDP/IP)
0 0 0 0 0 0 1 0	0x0003 (ESP/IP)
0 0 0 0 0 0 1 1	0x0004 (IP)
0 0 0 0 0 1 0 0	0x0006 (TCP/IP)
0 0 0 0 0 1 0 1	0x0102 (UDP/IP)
0 0 0 0 0 1 1 0	0x0103 (ESP/IP)
0 0 0 0 0 1 1 1	0x0104 (IP)
0 0 0 0 1 0 0 0	Other

0 0 0 0 1 0 0 1
to
1 1 1 1 1 1 1 1 Spare

Additional IP header compression context parameters container (octets 7 to n).

Additional IP header compression context parameters container carries the profile-specific information (see IETF RFC 5795 [39B]). The maximum size is 251 octets.

NOTE: If the Additional IP header compression context setup parameters container is included, then the Additional IP header compression context parameters type shall be included in the octet 6.

9.11.4.25 DS-TT Ethernet port MAC address

The purpose of the DS-TT Ethernet port MAC address information element is to signal the MAC address of the DS-TT Ethernet port used for a PDU session of "Ethernet" PDU session type.

The DS-TT Ethernet port MAC address information element is coded as shown in figure 9.11.4.25.1 and table 9.11.4.25.1.

The DS-TT Ethernet port MAC address is a type 4 information element with a length of 8 octets.

Figure 9.11.4.25.1: DS-TT Ethernet port MAC address information element

Table 9.11.4.25.1: DS-TT Ethernet port MAC address information element

DS-TT Ethernet port MAC address contents (octets 3 to 8)
The DS-TT Ethernet port MAC address contents consist of the binary representation of the MAC address of the DS-TT Ethernet port used for the PDU session, starting with the LSB bit of the first octet of the MAC address included in bit 1 of octet 3.

9.11.4.26 UE-DS-TT residence time

The purpose of the UE-DS-TT residence time information element is to signal the time taken within the UE and the DS-TT to forward a packet i.e. between the ingress of the UE and the DS-TT port in the DL direction, or between the DS-TT port and the egress of the UE in the UL direction.

The UE- DS-TT residence time information element is coded as shown in figure 9.11.4.26.1 and table 9.11.4.26.1.

The UE-DS-TT residence time is a type 4 information element with a length of 10 octets.

Figure 9.11.4.26.1: UE-DS-TT residence time information element

Table 9.11.4.26.1: UE-DS-TT residence time information element

UE-DS-TT residence time contents (octets 3 to 10)
The UE-DS-TT residence time contents contain the UE-DS-TT residence time encoded as specified for the correctionField in IEEE Std 1588-2019 [43B], with the LSB bit of the first octet of the UE-DS-TT residence time included in bit 1 of octet 3. If the UE-DS-TT residence time.is too big to be represented, all bits of octets 3 to 10 shall be coded as "1" except the MSB bit of octet 10.

9.11.4.27 Port management information container

The purpose of the Port management information container information element is to transport a port management service message as specified in clause 8 of 3GPP TS 24.539 [19BA].

The Port management information container information element is coded as shown in figure 9.11.4.27.1 and table 9.11.4.27.1.

The Port management information container is a type 6 information element with a minimum length of 4 octets and a maximum length of 65538 octets.

Figure 9.11.4.27.1: Port management information container information element

Table 9.11.4.27.1: Port management information container information element

Port management information container (octet 4 to n)
A port management service message as specified in clause 8 of 3GPP TS 24.539 [19BA].

9.11.4.28 Ethernet header compression configuration

The purpose of the Ethernet header compression configuration information element is to negotiate the use of EHC and the length of the CID field in the EHC packet (see 3GPP TS 38.323 [29]).

The Ethernet header compression configuration information element is coded as shown in figure 9.11.4.28.1 and table 9.11.4.28.1.

The Ethernet header compression configuration is a type 4 information element with the length of 3 octets.

Figure 9.11.4.28.1: Ethernet header compression configuration information element

Table 9.11.4.28.1: Ethernet header compression configuration information element

Length of CID field value (CID Length) (octet 3 bits 1 and 2)	
Bit	
2 1	
0 0	Ethernet header compression not used
0 1	7 bits
1 0	15 bits
All other values shall be interpreted as "7 bits".	
Bits 3 to 8 of octet 3 are spare and shall be coded as zero.	

9.11.4.29 Remote UE context list

The purpose of the Remote UE context list information element is to provide identity and optionally IP address of a 5G ProSe remote UE connected to, or disconnected from, a UE acting as a 5G ProSe layer-3 UE-to-network relay.

The Remote UE context list information element is coded as shown in figure 9.11.4.29.1, figure 9.11.4.29.2, table 9.11.4.29.1 and table 9.11.4.29.2.

The Remote UE context list is a type 6 information element with a minimum length of 16 octets and a maximum length of 65538 octets.

Figure 9.11.4.29.1: Remote UE context list

Table 9.11.4.29.1: Remote UE context list

Remote UE context (octet 5 etc)
The contents of remote UE context are applicable for one individual UE and are coded as shown in figure 9.11.4.29.2 and table 9.11.4.29.2.

Figure 9.11.4.29.2: Remote UE context

Table 9.11.4.29.2: Remote UE context

Remote UE ID type (bits 1 to 3 of octet 6)

Bits

3 2 1

0 0 1 UP-PRUK ID

0 1 0 CP-PRUK ID

0 1 1 IMEI

1 0 0 IMEISV

All other values are reserved.

Remote UE ID format (bit 4 of octet 6) (NOTE)

Bit

4

0 Network access identifier (NAI)

1 64-bit string

Bits 5 to 8 of octet 6 are spare and shall be coded as zero.

Remote UE ID (octet 8 to octet j)

The UP-PRUK ID as specified in 3GPP TS 33.503 [56], the CP-PRUK ID as specified in 3GPP TS 33.503 [56], the IMEI or the IMEISV of the 5G ProSe Remote UE. If the remote UE ID type field indicates "UP-PRUK ID" or "CP-PRUK ID", and the remote UE ID format field indicates "NAI", the remote UE ID field contains the UP-PRUK ID or the CP-PRUK ID in the NAI format as defined in 3GPP TS 23.003 [4], encoded as UTF-8 string. If the remote UE ID type field indicates "UP-PRUK ID", and the remote UE ID format field indicates "64-bit string", the remote UE ID field contains the UP-PRUK ID as a 64-bit string, encoded using binary encoding. If the remote UE ID type field indicates "IMEI" or "IMEISV", the remote UE ID field contains the IMEI or the IMEISV encoded as 5GS mobile identity information element for type of identity "IMEI" or "IMEISV" as specified in subclause 9.11.3.4, starting with the fourth octet.

Protocol used by remote UE (octet j+1, bits 1 to 3)

Bits

3 2 1

0 0 0 No IP info

0 0 1 IPv4

0 1 0 IPv6

1 0 0 Unstructured

1 0 1 Ethernet

All other values are reserved.

TCP port range for IPv4 indicator (TPRI4I) (octet j+1, bits 4)

Bit

4

0 TCP port range for IPv4 absent

1 TCP port range for IPv4 present

UDP port range for IPv4 indicator (UPRI4I) (octet j+1, bits 5)

Bit

5

0 UDP port range for IPv4 absent

1 UDP port range for IPv4 present

Bits 4 to 8 of octet j+1 are spare and shall be coded as zero.

The length of remote UE ID field contains the binary coded representation of the length of the remote UE ID field. The first bit in transmission order is the most significant bit.

If the Protocol used by remote UE indicates IPv4 and: - TPRI4I bit indicates "TCP port range for IPv4 absent" and UPRI4I bit indicates "UDP port range for IPv4 absent", the Address information in octet j+2 to octet j+5 contains the IPv4 address. - TPRI4I bit indicates "TCP port range for IPv4 present" and UPRI4I bit indicates "UDP port range for IPv4 absent", the Address information in octet j+2 to octet j+9 contains the IPv4 address followed by the TCP port range field. - TPRI4I bit indicates "TCP port range for IPv4 absent" and UPRI4I bit indicates "UDP port range for IPv4 present", the Address information in octet j+2 to octet j+9 contains the IPv4 address followed by the UDP port range field. - TPRI4I bit indicates "TCP port range for IPv4 present" and UPRI4I bit indicates "UDP port range for IPv4 present", the Address information in octet j+2 to octet j+13 contains the IPv4 address followed by the UDP port range field followed by the TCP port range field. See NOTE. The UDP port range field consists of the lowest UDP port number field followed by the highest UDP port number field, of the UDP port range assigned to the remote UE in the NAT function of 5G ProSe layer-3 UE-to-network relay. The TCP port range field consists of the lowest TCP port number field followed by highest TCP port number field, of the TCP port range assigned to the remote UE in the NAT function of 5G ProSe layer-3 UE-to-network relay. Each port number field is two octets long and bit 8 of first octet of the port number field represents the most significant bit of the port number and bit 1 of second octet of the port number field the least significant bit. If the Protocol used by remote UE indicates IPv6, the Address information in octet j+2 to octet j+9 contains the /64 IPv6 prefix of a remote UE. Bit 8 of octet j+2 represents the most significant bit of the /64 IPv6 prefix and bit 1 of octet j+9 the least significant bit. If the Protocol used by remote UE indicates Ethernet, the Address information in octet j+2 to octet j+7 contains the remote UE MAC address. Bit 8 of octet j+2 represents the most significant bit of the MAC address and bit 1 of octet j+7 the least significant bit. If the Protocol used by remote UE indicates Unstructured, the Address information octets are not included. If the Protocol used by remote UE indicates No IP info, the Address information octets are not included If the Remote UE ID type field indicates "PRUK ID" and the Remote UE ID format field indicates "64-bit string", then the HPLMN ID field is present otherwise the HPLMN ID field is absent. The HPLMN ID field indicates HPLMN ID of the 5G ProSe remote UE and is coded as value part of the PLMN ID information element as specified in 3GPP TS 24.554 [19E] subclause 11.3.33 starting with the second octet.	
NOTE:	In the present release of the specification, providing information for IP protocols other than UDP or TCP is not specified

9.11.4.30 Requested MBS container

The purpose of the Requested MBS container information element is for UE to request to join or leave one or more multicast MBS sessions.

The Requested MBS container information element is coded as shown in figure 9.11.4.30.1, figure 9.11.4.30.2, figure 9.11.4.30.3, figure 9.11.4.30.4 and table 9.11.4.30.1.

The Requested MBS container is a type 6 information element with a minimum length of 8 octets and a maximum length of 65538 octets.

Figure 9.11.4.30.1: Requested MBS container information element

Figure 9.11.4.30.2: multicast MBS session information

Figure 9.11.4.30.3: multicast MBS session ID for Type of multicast MBS session ID = "Temporary Mobile Group Identity (TMGI)"

Figure 9.11.4.30.4: multicast MBS session ID for Type of multicast MBS session ID = "Source specific IP multicast address for IPv4" or "Source specific IP multicast address for IPv6"

Table 9.11.4.30.1: Requested MBS container information element

Type of multicast MBS session ID (bits 1 to 2 of octet 4)		
Bits		
2	1	
0	1	Temporary Mobile Group Identity (TMGI)
1	0	Source specific IP multicast address for IPv4
1	1	Source specific IP multicast address for IPv6
All other values are reserved.		
MBS operation (bits 3 to 4 of octet 4)		
Bits		
4	3	
0	1	Join multicast MBS session
1	0	Leave multicast MBS session
All other values are reserved.		
Bits 5 to 8 of octet 4 are spare and shall be coded as zero.		
If Type of multicast MBS session ID is set to "Temporary Mobile Group Identity (TMGI)", the multicast MBS session ID contains the TMGI (octet 5 to i) and is coded as described in subclause 10.5.6.13 in 3GPP TS 24.008 [12] starting from octet 2. The structure of the TMGI is defined in 3GPP TS 23.003 [4].		
If Type of multicast MBS session ID is set to "Source specific IP multicast address for IPv4" or "Source specific IP multicast address for IPv6", the multicast MBS session ID contains the Source IP address information and the Destination IP address information.		
Source IP address information (octet 5 to v)		
This field contains the IP unicast address used as source address in IP packets for identifying the source of the multicast service.		
If the type of multicast MBS session ID indicates "Source specific IP multicast address for IPv4", the Source IP address information in octet 5 to octet 8 contains an IPv4 address. If the type of multicast MBS session ID indicates "Source specific IP multicast address for IPv6", the Source IP address information in octet 5 to octet 20 contains an IPv6 address.		
Destination IP address information (octet v+1 to i)		
This field contains the IP multicast address used as destination address in related IP packets for identifying a multicast service associated with the source.		
If the type of multicast MBS session ID indicates "Source specific IP multicast address for IPv4", the Destination IP address information in octet v+1 to octet v+4 contains an IPv4 address. If the type of multicast MBS session ID indicates "Source specific IP multicast address for IPv6", the Source IP address information in octet v+1 to octet v+16 contains an IPv6 address.		

9.11.4.31 Received MBS container

The purpose of the Received MBS container information element is to indicate to the UE the information of the multicast MBS sessions that the network accepts or rejects the UE to join, the information of the multicast MBS sessions that the UE is removed from, or the information of the updated MBS service area.

The Received MBS container information element is coded as shown in figure 9.11.4.31.1, figure 9.11.4.31.2, figure 9.11.4.31.3, figure 9.11.4.31.4, figure 9.11.4.31.5, figure 9.11.4.31.6, figure 9.11.4.31.7, figure 9.11.4.31.8, figure 9.11.4.31.9, figure 9.11.4.31.10, figure 9.11.4.31.11 and table 9.11.4.31.1.

The Received MBS container is a type 6 information element with a minimum length of 9 octets and a maximum length of 65538 octets.

Figure 9.11.4.31.1: Received MBS container information element

Figure 9.11.4.31.9: MBS timers for MBS timer indication = "MBS back-off timer"

Figure 9.11.4.31.10: MBS security container

Figure 9.11.4.31.11: MBS security keys set

Table 9.11.4.31.1: Received MBS container information element

MBS decision (MD) (bits 1 to 3 of octet 4)

The MD indicates the network decision of the join requested by the UE, the network requests to remove the UE from the multicast MBS session or the network request to update the MBS service area or the security information of multicast MBS session.

Bits

3	2	1	
0	0	1	MBS service area update
0	1	0	MBS join is accepted
0	1	1	MBS join is rejected
1	0	0	Remove UE from multicast MBS session
1	0	1	MBS security information update

All other values are unused in this version of the specification and interpreted as 000 if received.

If MD is set to "MBS join is rejected" or "Remove UE from multicast MBS session", bits 6 to 8 of octet 4 shall contain the Rejection cause which indicates the reason of rejecting the MBS join request or the reason of removing the UE from multicast MBS session, respectively, otherwise bits 6 to 8 of octet 4 are spare and shall be coded as zero.

MBS service area indication (MSAI) (bits 4 and 5 of octet 4)

The MSAI indicates whether and how the MBS service area is included in the IE.

Bits

5	4	
0	0	MBS service area not included
0	1	MBS service area included as MBS TAI list
1	0	MBS service area included as NR CGI list
1	1	MBS service area included as MBS TAI list and NR CGI list

Rejection cause (bits 6 to 8 of octet 4)

The Rejection cause indicates the reason of rejecting the join request or the reason of removing the UE from the MBS session.

Bits

8	7	6	
0	0	0	No additional information provided
0	0	1	Insufficient resources
0	1	0	User is not authorized to use MBS service
0	1	1	multicast MBS session has not started or will not start soon
1	0	0	User is outside of local MBS service area
1	0	1	Session context not found
1	1	0	multicast MBS session is released

All other values are unused in this version of the specification and interpreted as 000 if received.

IP address existence (IPAE) (bit1 of octet 5)

The IPAE indicates whether the Source IP address information and Destination IP address information are included in the IE or not.

Bit

1	
0	Source and destination IP address information not included
1	Source and destination IP address information included

If IPAE is set to "Source and destination IP address information included", Source IP address information and Destination IP address information shall be included in the IE, otherwise Source IP address information and Destination IP address information shall not be included in the IE (NOTE 1).

MBS timer indication (MTI) (bits 2 and 3 of octet 5)

The MTI indicates whether there is MBS timer included in the IE or not.

Bit

3	2	
0	0	No MBS timers included
0	1	MBS start time included
1	0	MBS back-off timer included

All other values are unused in this version of the specification and interpreted as 00 if received

MBS security container indication (MSCI) (bit 4 of octet 5)

The MSCI indicates whether the MBS security container is included in the IE or not

Bit

4

- 0 MBS security container not included
- 1 MBS security container included

IP address type (IPAT) (bit 5 of octet 5)

The IPAT indicates the type of the source IP address information and destination IP address information. This field is ignored when IPAE is set to "Source and destination IP address information not included".

Bit

5

- 0 Source IP address information and destination IP address information are IPv4
- 1 Source IP address information and destination IP address information are IPv6

Bits 6 to 8 of octet 5 are spare and shall be coded as zero.

TMGI (octets 6 to j)

The TMGI is coded as described in subclause 10.5.6.13 in 3GPP TS 24.008 [12] starting from octet 2. The structure of the TMGI is defined in 3GPP TS 23.003 [4].

Source IP address information (octet j+1 to v)

This field contains the IP unicast address used as source address in IP packets for identifying the source of the multicast service. The value of this field is copied from the corresponding source IP address information in the requested MBS container. If the IPAT indicates "Source and destination IP address information are IPv4", the Source IP address information in octet j+1 to octet j+4 contains an IPv4 address. If the IPAT indicates "Source and destination IP address information are IPv6", the Source IP address information in octet j+1 to octet j+16 contains an IPv6 address

Destination IP address information (octet v+1 to k)

This field contains the IP multicast address used as destination address in related IP packets for identifying a multicast service associated with the source. The value of this field is copied from the corresponding destination IP address information in the requested MBS container. If the IPAT indicates "Source and destination IP address information are IPv4", the Destination IP address information in octet v+1 to octet v+4 contains an IPv4 address. If the IPAT indicates "Source and destination IP address information are IPv6", the Destination IP address information in octet v+1 to octet v+16 contains an IPv6 address.

MBS service area (octet k+1 to s)

The MBS service area contains the MBS TAI list, the NR CGI list or both, that identifies the service area(s) for a local MBS service.

MBS TAI list (octet k+1 to s)

The MBS TAI list is coded as octet 2 and above of the 5GS tracking area identity list IE defined in subclause 9.11.3.9.

NR CGI (octet k+2 to k+9)

The NR CGI globally identifies an NR cell. It contains the NR Cell ID and the PLMN ID of that cell.

NR Cell ID (octet k+2 to k+6)

The NR Cell ID consists of 36 bits identifying an NR Cell ID as specified in subclause 9.3.1.7 of 3GPP TS 38.413 [31], in hexadecimal representation. Bit 8 of octet k+2 is the most significant bit and bit 5 of octet k+6 is the least significant bit. Bits 1 to 4 of octet k+6 are spare and shall be coded as zero.

MCC, Mobile country code (octet k+7 and bits 1 to 4 octet k+8)

The MCC field is coded as in ITU-T Recommendation E.212 [42], annex A.

MNC, Mobile network code (bits 5 to 8 of octet k+8 and octet k+9)

The coding of this field is the responsibility of each administration but BCD coding shall be used. The MNC shall consist of 2 or 3 digits. If a network operator decides to use only two digits in the MNC, bits 5 to 8 of octet k+8 shall be coded as "1111".

The MCC and MNC digits are coded as octets 6 to 8 of the Temporary mobile group identity IE in figure 10.5.154 of 3GPP TS 24.008 [12].

MBS start time (octets s+1 to s+6) The MBS start time is coded as described in subclause 10.5.3.9 in 3GPP TS 24.008 [12] starting from octet 2 till octet 7. MBS back-off timer (octet s+1) The MBS back-off timer is coded as octet 3 described in subclause 10.5.7.4a in 3GPP TS 24.008 [12]. MTK indication (MTKI) (bit1 of octet i+2) The MTKI indicates whether the MTK ID and Encrypted MTK are included in the MBS security keys set or not. Bit 1 0 MTK ID and Encrypted MTK not included 1 MTK ID and Encrypted MTK included Bits 2 to 8 of octet i+2 are spare and shall be coded as zero Key domain ID (octet i+3 to i+5) The key domain ID is 3 bytes long and is defined in 3GPP TS 33.246 [57] (NOTE 2). MBS Service Key Identifier (MSK ID) (octets i+6 to i+9) The MSK ID is 4 bytes long and is defined in 3GPP TS 33.246 [57]. MBS Service Key (MSK) (octets i+10 to i+25) The MSK is 16 bytes long and is defined in 3GPP TS 33.246 [57]. MBS Traffic Key Identifier (MTK ID) (octets i+26 to i+27) The MTK ID is 2 bytes long and is defined in 3GPP TS 33.246 [57]. Encrypted MBS Traffic Key (Encrypted MTK) (octets i+28 to i+43) The Encrypted MTK is 16 bytes long and contains the encrypted version of MTK using MSK as defined in 3GPP TS 33.246 [57].
NOTE 1: The IPAE bit is not expected to be set to "Source and destination IP address information included" when the MBS decision (MD) indicates "Remove UE from multicast MBS session". NOTE 2: As specified in annex W in 3GPP TS 33.501 [24], the UE should not try to use the MCC and MNC constructing the key domain ID in another context, e.g., the UE should not compare those MCC and MNC to parameters received from lower layers.

9.11.4.32 PDU session pair ID

The purpose of the PDU session pair ID information element is to indicate a PDU session pair ID.

The PDU session pair ID information element is coded as shown in figure 9.11.4.32.1 and table 9.11.4.32.1.

The PDU session pair ID is a type 4 information element with a length of 3 octets.

Figure 9.11.4.32.1: PDU session pair ID information element

Table 9.11.4.32.1: PDU session pair ID information element

PDU session pair ID (octet 3)							
Bits							
8	7	6	5	4	3	2	1
0	0	0	0	0	0	0	0
				to			
0	0	0	0	0	1	1	0

9.11.4.33 RSN

The purpose of the RSN information element is to indicate an RSN.

The RSN information element is coded as shown in figure 9.11.4.33.1 and table 9.11.4.33.1.

The RSN is a type 4 information element with a length of 3 octets.

8	7	6	5	4	3	2	1	
RSN IEI								octet 1
Length of RSN IE								octet 2
RSN								octet 3

0	0	0	0	0	0	0	1

9.11.4.34 ECS address

The purpose of the ECS address information element is to indicate the ECS address (either IPv4 address, IPv6 address, or FQDN) and the associated spatial validity condition.

The ECS address information element is coded as shown in figure 9.11.4.34.1, figure 9.11.4.34.2, figure 9.11.4.34.3, figure 9.11.4.34.4, figure 9.11.4.34.5, figure 9.11.4.34.6, table 9.11.4.34.1, table 9.11.4.34.2, table 9.11.4.34.4 and table 9.11.4.34.5.

The ECS address information element is a type 6 information element with minimum length of 8 octets and a maximum length of 65538 octets.

**Figure 9.11.4.34.1: ECS address information element****Figure 9.11.4.34.2: Spatial validity condition contents****Figure 9.11.4.34.3: ECS authentication methods****Figure 9.11.4.34.4: ECS supported PLMNs information list contents**

Figure 9.11.4.34.5: Supported PLMN information contents

Figure 9.11.4.34.6: ECSP information contents

Table 9.11.4.34.1: ECS address information element

Type of ECS address (octet 4, bit 1 to 4)

Bits

4	3	2	1	
0	0	0	0	IPv4
0	0	0	1	IPv6
0	0	1	0	FQDN
1	1	1	1	Unspecified

All other values are spare. The receiving entity shall ignore an ECS address IE with type of ECS address containing a spare value.

Type of spatial validity condition (octet 4, bit 5 to 8)

Bits

8	7	6	5	
0	0	0	0	No spatial validity condition
0	0	0	1	Geographical service area
0	0	1	0	Tracking area
0	0	1	1	Country-wide

All other values are spare. The receiving entity shall ignore a spatial validity condition with type of spatial validity condition containing an unknown value.

If the type of ECS address indicates IPv4, then the ECS address field contains an IPv4 address in octet 5 to octet 8.

If the type of ECS address indicates IPv6, then the ECS address field contains an IPv6 address in octet 5 to octet 20 and is encoded according to IETF RFC 4291 [66].

If the type of ECS address indicates FQDN, then the ECS address field contains in octet 5 the length of FQDN value and in octet 6 to octet a an FQDN value encoded as defined in subclause 19.4.2 in 3GPP TS 23.003 [4].

If the type of ECS address indicates unspecified, then the remaining fields of ECS address information element shall be passed to the upper layers.

Spatial validity condition contents (octet (a+1)* to n*)

The spatial validity condition contents contain a variable number of spatial validity condition information.

ECS authentication methods indicator (EAMI) (octet m*, bit 1)

Bits

1	
0	ECS authentication methods field is not included
1	ECS authentication methods field is included

If the EAMI bit is set to "ECS authentication methods field is included" then the ECS authentication methods field is included otherwise the ECS authentication methods field is not included. ECS authentication methods is an optional field and is included based on operator requirements.

ECS supported PLMNs information list indication (ESPILI) (octet m*, bit 2)

Bits

2	
0	ECS supported PLMNs information list field is not included
1	ECS supported PLMNs information list field is included

If the ESPILI bit is set to "ECS supported PLMNs information list field is included" then the ECS supported PLMNs information list field is included otherwise the ECS supported PLMNs information list field is not included.

ECS supported PLMNs information list (octet p* to w*)

The ECS supported PLMNs information list contains a variable number of supported PLMN information field. The supported PLMN information field is coded according to figure 9.11.4.34.5.

Table 9.11.4.34.2: Spatial validity condition contents

If the type of spatial validity condition of the ECS address indicates No spatial validity condition, then the spatial validity condition information field is empty. If the type of spatial validity condition of the ECS address indicates geographical service area, then the spatial validity condition information field contains a geographical service area which is specified by geographical descriptions as defined in 3GPP TS 23.032 [4B]. If the type of spatial validity condition of the ECS address indicates tracking area, then the spatial validity condition information field contains a TAI as defined in subclause 9.11.3.8 starting from octet 2. If the type of spatial validity condition of the ECS address indicates country-wide, then the spatial validity condition information field contains an MCC as defined in in ITU-T Recommendation E.212 [42], annex A. The first MCC digit is coded in bit 1 to 4 of the octet b, the second MCC digit is coded in bit 5 to 8 of the octet b, and the third MCC digit is coded in bit 1 to 4 of the octet b+1. Bit 5 to bit 8 of the octet b+1 shall be padded with 1. If only two digits are used for for MCC, octet b+1 shall be padded with 1.

Table 9.11.4.34.3: ECS authentication methods contents

ECS authentication methods (octet o*) TLS client server certificate indicator (TLSCSCI) (octet o*, bit 1) 0 TLS client server certificate not supported 1 TLS client server certificate supported TLS with AKMA indicator (TLSAI) (octet o*, bit 2) 0 TLS with AKMA not supported 1 TLS with AKMA supported TLS with GBA indicator (TLSGI) (octet o*, bit 3) 0 TLS with GBA not supported 1 TLS with GBA supported

Table 9.11.4.34.4: Supported PLMN information contents

PLMN identity: The PLMN identity for which the EDN configuration information can be provided by the ECS. This is encoded as octet 3 to octet 5 in figure 9.11.3.85.1. ECSP information: The identifier of the ECSP(s) associated with the PLMN and whose information is available at the ECS. The ECSP information is coded according to figure 9.11.4.34.6 and table 9.11.4.34.5.

Table 9.11.4.34.5: ECSP information contents

ECSP identifier This field contains one ECSP identifier. The ECSP identifier is encoded as a UTF-8 string.

9.11.4.35 Void

9.11.4.36 N3QAI

The purpose of the N3QAI information element is to indicate a set of QoS parameters to be used by the UE for non-3GPP access network resource management behind the UE.

The N3QAI information element is a type 6 information element with a minimum length of 9 octets. The maximum length for the information element is 65538 octets.

The N3QAI information element is coded as shown in figure 9.11.4.36.1, figure 9.11.4.36.2, figure 9.11.4.36.3, figure 9.11.4.36.4, and table 9.11.4.36.1.

Figure 9.11.4.36.1: N3QAI information element

Figure 9.11.4.36.2: N3QAI

Figure 9.11.4.36.3: N3QAI parameters list

Figure 9.11.4.36.4: N3QAI parameter

Table 9.11.4.36.1: N3QAI information element

Number of QFIs (octet 4)

The number of QFIs field contains the binary coding for the number of QFIs associated with the same N3QAI parameters. This field is encoded in bits 8 through 1 of octet 4 where bit 8 is the most significant and bit 1 is the least significant bit.

List of QFIs (octet 5 to octet m)

This field indicates QoS flow(s) associated with the same N3QAI parameters. This field contains QFI values encoded as below:

Bits

8 7 6 5 4 3 2 1

0 0 0 0 0 0 0 0 Reserved

0 0 0 0 0 0 0 1 QFI 1

to

0 0 1 1 1 1 1 1 QFI 63

The other values are spare. If spare value is used, the UE shall ignore the value.

Number of N3QAI parameters (bits 8 to 1 of octet (m+1))

The number of N3QAI parameters field contains the binary coding for the number of N3QAI parameters in the N3QAI parameters list field. The number of N3QAI parameters field is encoded in bits 8 through 1 of octet (m+1) where bit 8 is the most significant and bit 1 is the least significant bit.

N3QAI parameters list (octets (m+2) to q*)

The N3QAI parameters list field contains a variable number of N3QAI parameters.

Each N3QAI parameter included in the N3QAI parameters list is of variable length and consists of:

- a N3QAI parameter identifier (1 octet);
- the length of the N3QAI parameter contents (1 octet); and
- the N3QAI parameter contents itself (variable number of octets).

The N3QAI parameter identifier field is used to identify each parameter included in the N3QAI parameters list and it contains the hexadecimal coding of the parameter identifier. Bit 8 of the parameter identifier field contains the most significant bit and bit 1 contains the least significant bit. In this version of the protocol, the following parameter identifiers are specified:

- 01H (5QI);
- 02H (GFBR uplink);
- 03H (GFBR downlink);
- 04H (MFBR uplink);
- 05H (MFBR downlink);
- 06H (Averaging window);
- 07H (Resource type);
- 08H (Priority level);
- 09H (Packet delay budget);
- 0AH (Packet error rate);
- 0BH (Maximum data burst volume);
- 0CH (Maximum packet loss rate downlink);
- 0DH (Maximum packet loss rate uplink);
- 0EH (ARP); and
- 0FH (Periodicity).

If the N3QAI parameters list contains a N3QAI parameter identifier that is not supported by the receiving entity, the corresponding parameter shall be discarded.

The length of N3QAI parameter contents field contains the binary coded representation of the length of the parameter contents field. The first bit in transmission order is the most significant bit.

For the N3QAI parameter identifiers indicating "5QI", "GFBR uplink", "GFBR downlink", "MFBR uplink", "MFBR downlink", and "Averaging window", the format of the N3QAI parameter contents follows the table 9.11.4.12.1 of subclause 9.11.4.12 of this specification.

For the N3QAI parameter identifiers indicating "Resource type", "Priority level", "Packet delay budget", "Packet error rate", "Maximum data burst volume", "Maximum packet loss rate downlink", and "Maximum packet loss rate uplink", the format of the N3QAI parameter contents follows the table 9.3.1.1-2 of subclause 9.3.1.1 of 3GPP TS 24.502 [18].

When the N3QAI parameter identifier indicates "ARP", the N3QAI parameter contents field contains the binary representation of ARP that is one octet in length. The range of the ARP priority level is 1 to 15 with 1 as the highest priority as specified in subclause 5.7.2.2 of 3GPP TS.23.501 [8].

When the N3QAI parameter identifier indicates "Periodicity", the N3QAI parameter contents field contains the binary representation of the periodicity for the traffic with a unit of microsecond. (NOTE 1)

NOTE 1: The periodicity refers to the time interval between start of two data bursts for supporting consumer real time applications e.g., XR.

9.11.4.37 Non-3GPP delay budget

The purpose of the Non-3GPP delay budget information element is to indicate the non-3GPP delay budget for the non-3GPP network behind the UE to the network.

The Non-3GPP delay budget information element is a type 6 information element with a minimum length of 8 octets. The maximum length for the information element is 65538 octets.

The Non-3GPP delay budget information element is coded as shown in figure 9.11.4.37.1.

Figure 9.11.4.37.1: Non-3GPP delay budget information element

Figure 9.11.4.37.2: Non-3GPP delay budget

Table 9.11.4.37.1: Non-3GPP delay budget information element

The Non-3GPP delay budget value field contains the binary representation of the Non-3gpp delay budget in units of 0.5ms. Bits 8 7 6 5 4 3 2 1 8 7 6 5 4 3 2 1 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 thru 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1
Packet filter presence indicator (PFPI) (bit 1 of octet 6) Bit 1 0 Packet filter list associated with the Non-3GPP delay budget value is not present 1 Packet filter list associated with the Non-3GPP delay budget value is present
QoS flow identifier presence indicator (QFIPI) (bit 2 of octet 6) Bit 2 0 QoS flow identifier associated with the Non-3GPP delay budget value is not present 1 QoS flow identifier associated with the Non-3GPP delay budget value is present
Number of QFIs (octet n*) The number of QFIs field is present if QFIPI is set to 1. If QFIPI is not set to 1, this field shall not be included in the non-3GPP delay budget. The number of QFIs field contains the binary coding for the number of QFIs associated with the same non-3GPP delay budget value. This field is encoded in bits 8 through 1 of octet 4 where bit 8 is he most significant and bit 1 is the least significant bit.
List of QFIs (octet (n+1)* to octet m*) The list of QFIs field is present if QFIPI is set to 1. If QFIPI is not set to 1, this field shall not be included in the non-3GPP delay budget. This field indicates QoS flow(s) associated with the same non-3GPP delay budget value. This field contains QFI values encoded as below Bits 8 7 6 5 4 3 2 1 0 0 0 0 0 0 0 0 Reserved 0 0 0 0 0 0 0 1 QFI 1 to 0 0 1 1 1 1 1 1 QFI 63 The other values are spare. If spare value is used, the UE shall ignore the value.
Packet filter list (octet 7 to u) The packet filter list is present if PFPI is set to 1. If not present, this field shall not be included in the non-3GPP delay budget. The encoding of the packet filter list follows the figure 9.11.4.13.4 and the table 9.11.4.13.1.

9.11.4.38 URSP rule enforcement reports

The purpose of the URSP rule enforcement reports information element is to provide one or more URSP rule enforcement reports to the network. Each URSP rule enforcement report includes all the connection capabilities contained in the traffic descriptor of each URSP rule associated to the PDU session.

The URSP rule enforcement reports information element is coded as shown in figure 9.11.4.38.1, figure 9.11.4.38.2, and table 9.11.4.38.1.

The URSP rule enforcement reports is a type 4 information element with a minimum length of 4 octets.

Figure 9.11.4.38.1: URSP rule enforcement reports information element

Figure 9.11.4.38.2: URSP rule enforcement report

Table 9.11.4.38.1: URSP rule enforcement reports information element

URSP rule enforcement report (octet 3 to octet a) The URSP rule enforcement report field contains all the connection capabilities contained in the traffic descriptor of one reported URSP rule.
Number of connection capability identifiers (octet 3) The number of connection capability identifiers field indicates number of indicated connection capability identifiers in binary representation. The value of this field shall be set to at least one, and the receiving entity shall ignore the URSP rule enforcement reports IE with "Number of connection capability identifiers" field set to zero.
Connection capability identifier Connection capability identifier is encoded as defined in 3GPP TS 24.526 [19] table 5.2.1.

9.11.4.39 Protocol description

The purpose of the Protocol description information element is to provide protocol description for UL PDU set based handling to the UE.

The Protocol description information element is a type 6 information element with a minimum length of 6 octets.

The Protocol description information element is coded as shown in figure 9.11.4.39.1, figure 9.11.4.39.2, figure 9.11.4.39.3, figure 9.11.4.39.4, and table 9.11.4.39.1.

**Figure 9.11.4.39.1: Protocol description information element****Figure 9.11.4.39.2: Protocol description****Figure 9.11.4.39.3: RTP payload information list****Figure 9.11.4.39.4: RTP payload information**

Table 9.11.4.39.1: Protocol description information element

Length of protocol description (octet 4 and octet 5) (see NOTE 1)
The length of protocol description field indicates the length of the protocol description entry.

QoS Rule Identifier (QRI) (octet 6)

The QoS Rule Identifier (QRI) field contains the QoS rule identifier as specified in subclause 9.11.4.13. Each protocol description entry is associated with the QoS rule identified by the QRI field.

Transport Protocol (octet 7, bits 1 to 4)

The Transport Protocol field indicates the transport protocol used by the media flow, e.g., RTP or SRTP as specified in 3GPP TS 26.522 [69].

Bits

4	3	2	1	
0	0	0	1	RTP
0	0	1	0	SRTP

All other values are spare.

If Transport Protocol field indicates a spare value, the corresponding entry for the protocol description shall be ignored.

RTP header extension information presence indicator (HEIPI) (bit 5 of octet 7)

The HEIPI field indicates whether the RTP header extension information (RTP header extension type field and RTP header extension id field) is included in the IE or not.

Bit

5	
0	RTP header extension information not included
1	RTP header extension information included

RTP payload information list presence indicator (PILPI) (bit 6 of octet 7)

The PILPI field indicates whether the RTP payload information list is included in the IE or not.

Bit

6	
0	RTP payload information list not included
1	RTP payload information list included

RTP header extension type (octet 8)

The RTP header extension type field contains the RTP header extension type, i.e the RTP Header Extension for PDU Set Marking as specified in subclause 4.2 of 3GPP TS 26.522 [69].

Bits

8	7	6	5	4	3	2	1	
0	0	0	0	0	0	0	1	RTP Header Extension for PDU Set Marking

All other values are spare.

RTP header extension id (octet 9)

If RTP header extension type has a value other than spare values, the RTP header extension id field contains the RTP header extension id which is coded as binary representation of an integer between 1(inclusive) and 255(inclusive) as defined in IETF RFC 8285 [70].

RTP payload information list (octets 10 to u) (see NOTE 2)

The RTP payload information list contains the RTP payload information for the RTP stream, which can be used to derive the PDU set information.

RTP payload format (octet 12)

Bits

8	7	6	5	4	3	2	1	
0	0	0	0	0	0	0	1	RTP payload format for H.264/AVC codec as specified in subclause A.2.2 of 3GPP TS 26.522 [69]
0	0	0	0	0	0	1	0	RTP payload format for H.265/HEVC codec as specified in subclause A.2.2 of 3GPP TS 26.522 [69]

All other values are spare.

If the RTP payload format indicates a spare value, the corresponding entry for the RTP payload information shall be ignored. RTP payload type (octet 14) The RTP payload type field indicates the RTP or SRTP payload type, it contains the binary representation of an integer between 0(inclusive) and 127(inclusive). The other values are spare. If spare value is used, the UE shall ignore the value.
NOTE 1: If the value of the length of protocol description field is set to 1, the corresponding entry for the protocol description shall be deleted for the associated QoS rule. If the value of the length of protocol description field is greater than 1, the corresponding entry for the protocol description shall be added or replaced for the associated QoS rule. NOTE 2: In this release of the specification, the RTP payload information list shall contain only one RTP payload information entry.

9.11.4.40 ECN marking for L4S indication

The purpose of the ECN marking for L4S indication information element is to provide ECN marking for L4S indication to the 5G-RG.

The ECN marking for L4S indication information element is a type 4 information element with a minimum length of 2 octets.

The ECN marking for L4S indication information element is coded as shown in figure 9.11.4.40.1 and table 9.11.4.40.1.

Figure 9.11.4.40.1: ECN marking for L4S indication information element

Table 9.11.4.40.1: ECN marking for L4S indication information element

Length of ECN marking for L4S indication contents (octet 2) The length of ECN marking for L4S indication contents field indicates the length of the list of the ECN marking for L4S indication entries. ECN marking for L4S indication entry (octet 3) The ECN marking for L4S indication entry only contains the QRI required to perform the ECN marking for L4S for 5G-RG. The QRI contains the QoS rule identifier as specified in subclause 9.11.4.13.

9.11.4.41 Non-3GPP device information

The purpose of the Non-3GPP device information information element is to provide one or more non-3GPP device identifiers for which QoS differentiation of traffic is requested or for which suspend of QoS differentiation of traffic is requested.

The Non-3GPP device information information element is coded as shown in figure 9.11.4.41.1, figure 9.11.4.41.2, figure 9.11.4.41.3, figure 9.11.4.41.4, figure 9.11.4.41.5, figure 9.11.4.41.6, and table 9.11.4.41.1.

The Non-3GPP device information information element is a type 6 information element with minimum length of 7 octets.

Figure 9.11.4.41.1: Non-3GPP device information information element

Figure 9.11.4.41.6: Connection information when PDU session type value = "Ethernet"

Table 9.11.4.41.1: Non-3GPP device information information element

PDU session type value (octet 4, bits 1 to 3)

Bits

3 2 1

0	0	1	IPv4
0	1	0	IPv6
0	1	1	IPv4v6
1	0	1	Ethernet

All other values are reserved.

Non-3GPP device identifier (octet 7 to octet s)

The non-3GPP device identifier field contains the non-3GPP device identifier associated with a non-3GPP device connecting through the UE. The structure of the non-3GPP device identifier is defined in 3GPP TS 23.003 [4].

Connection information (octet s+1 to octet u)

The connection information field contains the connection information details for QoS differentiation of the non-3GPP device identifier indicated according to figures 9.11.4.3, 9.11.4.4, 9.11.4.5 and 9.11.4.6, depending on the PDU session type. If no connection information field is included for the non-3GPP device identifier, it indicates that the UE requests to suspend QoS differentiation for the non-3GPP device identifier.

For PDU session type value = "IPv4"

IPv4 address presence indicator (I4API) (octet s+1, bit 1)

The I4API field indicates whether IPv4 address is included in the connection information or not.

Bit

1

0	No IPv4 address included
1	IPv4 address included

If no IPv4 address is included in the connection information for the non-3GPP device identifier, the IPv4 address of the PDU session applies.

IPv4 port range presence indicator (I4PRPI) (octet s+1, bit 2)

The I4PRPI field indicates whether IPv4 port range fields are included in the IE or not.

Bit

2

0	No IPv4 port ranges included
1	One or more IPv4 port ranges included

IPv4 address (octet s+2 to octet s+5)

The IPv4 address field contains an IPv4 address for the QoS differentiation of the non-3GPP device identifier.

Number of port ranges for IPv4 (octet (s+6))

The number of port ranges for IPv4 field indicates the number of IPv4 port ranges for the non-3GPP devices connecting to the UE, and shall be included if the I4PRPI field indicates "One or more IPv4 port ranges included".

IPv4 port range (octet s+7 to octet s+10)

The IPv4 port range field indicates the port range associated with the traffic for the non-3GPP device identifier. The IPv4 port range field consists of the lowest port number in octets s+7 and s+8, and the highest port number in octets s+9 and s+10.

For PDU session type value = "IPv6"

IPv6 address type indicator (I6ATI) (octet s+1, bit 1)

The I6ATI field indicates whether the IPv6 address field includes an IPv6 address or an IPv6 prefix.

Bit

1

0	IPv6 address included
1	IPv6 prefix included

IPv6 port range presence indicator (I6PRPI) (octet s+1, bit 2)

The I6PRPI field indicates whether the IPv6 port range fields are included in the connection information or not.

Bit

2

0	No IPv6 port ranges included
1	One or more IPv6 port ranges included

IPv6 address (octet s+2 to octet s+17)

The IPv6 address field contains an IPv6 address.

IPv6 prefix (octet s+2 to octet s+18)

The IPv6 prefix field contains an IPv6 address in octets s+2 to octet s+17, and a prefix length value in octet s+18.

Number of port ranges for IPv6 (octet a)

The number of port ranges for IPv6 field indicates the number of IPv6 port ranges for the non-3GPP devices connecting to the UE, and shall be included if the I6PRPI field indicates "One or more IPv6 port ranges included".

IPv6 port range (octet (a+1) to octet (a+4))

The IPv6 port range field indicates the port range associated with the traffic for the non-3GPP device identifier. The IPv6 port range field consists of the lowest port number in octets a+1 and a+2, and the highest port number in octets a+3 and a+4.

For PDU session type value = "IPv4v6"

IPv4 address presence indicator (I4API) (octet s+1, bits 1 to 2)

The I4API field indicates whether a IPv4 address field or is applicable the connection information or not, and whether an applicable IPv4 address is included in the connection information or not.

Bits

2 1

0	0	No IPv4 address applicable
0	1	Applicable IPv4 address included in the connection information
1	0	Applicable IPv4 address not included in the connection information. PDU session IPv4 address applies.
1	1	reserved

IPv4 port range presence indicator (I4PRPI) (octet s+1, bit 3)

The I4PRPI field indicates whether IPv4 port range fields are included in the IE or not.

Bit

3

0	No IPv4 port ranges included
1	One or more IPv4 port ranges included

IPv6 address or prefix presence indicator (I6APPI) (octet s+1, bits 4 to 5)

The I6APPI field indicates whether a IPv6 address field or IPv6 prefix is included in the IE or not.

Bits

5 4

0	0	No IPv6 address or IPv6 prefix included
0	1	IPv6 address included
1	0	IPv6 prefix included
1	1	reserved

IPv6 port range presence indicator (I6PRPI) (octet s+1, bit 6)

The I6PRPI field indicates whether the IPv6 port range fields are included in the IE or not.

Bit

6

0	No IPv6 port ranges included
1	One or more IPv6 port ranges included

IPv4 address (octet s+2 to octet s+5)

The IPv4 address field contains an IPv4 address applicable for the QoS differentiation of the non-3GPP device identifier.

Number of port ranges for IPv4 (octet c)

The number of port ranges for IPv4 field indicates the number of IPv4 port ranges for the non-3GPP devices connecting to the UE, and shall be included if the I4PRPI field indicates "One or more IPv4 port ranges included".

IPv4 port range (octet c+1 to octet c+4)

The IPv4 port range field indicates the port range associated with the traffic for the non-3GPP device identifier. The IPv4 port range field consists of the lowest port number in octets c+1 and c+2, and the highest port number in octets c+3 and c+4.

IPv6 address (octet e to octet e+15)

The IPv6 address field contains an IPv6 address.

IPv6 prefix (octet e to octet e+16)

The IPv6 prefix field contains an IPv6 address in octets e to octet e+15, and a prefix length value in octet e+16.

Number of port ranges for IPv6 (octet f)

The number of port ranges for IPv6 field indicates the number of IPv6 port ranges for the non-3GPP devices connecting to the UE, and shall be included if the I6PRPI field indicates "One or more IPv6 port ranges included".

IPv6 port range (octet f+1 to octet f+4)

The IPv6 port range field indicates the port range associated with the traffic for the non-3GPP device identifier. The IPv6 port range field consists of the lowest port number in octets f+1 and f+2, and the highest port number in octets f+3 and f+4.

For PDU session type value = "Ethernet"

VLAN tag ID presence indicator (VTPI) (octet (s+1), bit 1)

The VTPI field indicates whether the VLAN tag ID field is included in the IE or not.

Bit

1

0 VLAN tag ID not included

1 VLAN tag ID included

MAC address (octet s+2 to octet s+7)

The MAC address field indicates the MAC address associated with the traffic for the non-3GPP device identifier. The MAC address is defined as in subclause 8 of IEEE Std 802 [43]. Bit 8 of octet s+2 is the most significant bit and bit 1 of octet s+7 is the least significant bit.

VLAN tag ID (octet s+8 to octet s+9)

The VLAN tag ID field indicates the VLAN tag ID associated with the traffic for the non-3GPP device identifier. The VLAN tag ID is defined as specified in IEEE Std 802.1Q [74]. Bit 8 of octet s+8 is the most significant bit and bit 1 of octet s+9 is the least significant bit.

9.12 3GPP specific coding information defined within present document

9.12.1 Serving network name (SNN)

The serving network name (SNN) is used:

- in the Network name field of the AT_KDF_INPUT attribute defined in IETF RFC 5448 [40];
- in K_{AUSF} derivation function as specified in 3GPP TS 33.501 [24] annex A; and
- in RES^* and XRES^* derivation function as specified in 3GPP TS 33.501 [24] annex A.

SNN shall contain a UTF-8 string without terminating null characters.

SNN is of maximum length of 1020 octets.

SNN consists of SNN-service-code and SNN-network-identifier, delimited by a colon.

SNN-network-identifier identifies the serving PLMN or the serving SNPN.

MCC and MNC in the SNN-PLMN-ID are MCC and MNC of the serving PLMN. If the MNC of the serving PLMN has two digits, then a zero is added at the beginning.

MCC and MNC in the SNN-SNPN-ID are MCC and MNC of the serving SNPN. If the MNC of the serving SNPN has two digits, then a zero is added at the beginning.

SNN-NID contains an NID in hexadecimal digits.

ABNF syntax of SNN is specified in table 9.12.1.1

Table 9.12.1.1: ABNF syntax of SNN

```

SNN = SNN-service-code ":" SNN-network-identifier
SNN-service-code = %x35.47 ; "5G"
SNN-network-identifier = SNN-PLMN-ID / SNN-SNPN-ID
SNN-PLMN-ID = SNN-mnc-string SNN-mnc-digits "." SNN-mcc-string SNN-mcc-digits "." SNN-3gppnetwork-
string "." SNN-org-string ; applicable when not operating in SNPN access operation mode.
SNN-SNPN-ID = SNN-mnc-string SNN-mnc-digits "." SNN-mcc-string SNN-mcc-digits "." SNN-3gppnetwork-
string "." SNN-org-string ":" SNN-NID ; applicable when operating in SNPN access operation mode.

SNN-mnc-digits = DIGIT DIGIT DIGIT ; MNC of the PLMN ID
SNN-mcc-digits = DIGIT DIGIT DIGIT ; MCC of the PLMN ID
SNN-mnc-string = %x6d.6e.63 ; "mnc" in lower case
SNN-mcc-string = %x6d.63.63 ; "mcc" in lower case
SNN-3gppnetwork-string = %x33.67.70.70.6e.65.74.77.6f.72.6b ; "3gppnetwork" in lower case
SNN-org-string = %x6f.72.67 ; "org" in lower case
SNN-NID = 11SNN-hexadecimal-digit ; NID in hexadecimal digits
SNN-hexadecimal-digit = DIGIT / %x41 / %x42 / %x43 / %x44 / %x45 / %x46

```

NOTE: SNN-service-code allows for distinguishing of ANID specified in 3GPP TS 24.302 [16] and SNN as either of SNN or ANID can be carried in the AT_KDF_INPUT attribute.

EXAMPLE 1: In case of a PLMN, if PLMN ID contains MCC = 234 and MNC = 15, SNN is 5G:mnc015.mcc234.3gppnetwork.org.

EXAMPLE 2: In case of an SNPN, if SNPN ID contains a PLMN ID of MCC = 234 and MNC = 15 and an NID of 123456ABCDEH, SNN is 5G:mnc015.mcc234.3gppnetwork.org:123456ABCDE.

10 List of system parameters

10.1 General

The description of timers in the following tables should be considered a brief summary. The precise details are found in clauses 4 to 6, which should be considered the definitive descriptions.

10.2 Timers of 5GS mobility management

Timers of 5GS mobility management are shown in table 10.2.1 and table 10.2.2.

NOTE: Timers T3324, T3346, T3245 and T3247 are defined in 3GPP TS 24.008 [12]. Timers T3444, T3445, T3447 and T3448 are defined in 3GPP TS 24.301 [15]. Timers TF, TG, TS are defined in 3GPP TS 23.122 [5].

Table 10.2.1: Timers of 5GS mobility management – UE side

TIMER NUM.	TIMER VALUE	STATE	CAUSE OF START	NORMAL STOP	ON EXPIRY
T3502	Default 12 min. NOTE 1	5GMM- DEREGISTERED 5GMM- REGISTERED	At registration failure and the attempt counter is equal to 5	Transmission of REGISTRATION REQUEST message	Initiation of the registration procedure, if still required
T3510	15s NOTE 7 NOTE 8 In WB-N1/CE mode, 85s For access via a satellite NG-RAN cell, 27s NOTE 12	5GMM- REGISTERED- INITIATED	Transmission of REGISTRATION REQUEST message	REGISTRATION ACCEPT message received or REGISTRATION REJECT message received	Start T3511 or T3502 as specified in subclause 5.5.1.2.7 if T3510 expired during registration procedure for initial registration. Start T3511 or T3502 as specified in subclause 5.5.1.3.7 if T3510 expired during the registration procedure for mobility and periodic registration update
T3511	10s	5GMM- DEREGISTERED. ATTEMPTING- REGISTRATION 5GMM- REGISTERED.AT TEMPTING- REGISTRATION- UPDATE 5GMM- REGISTERED.N ORMAL- SERVICE or 5GMM- REGISTERED.N ON-ALLOWED- SERVICE	At registration failure due to lower layer failure, T3510 timeout or registration rejected with other 5GMM cause values than those treated in subclause 5.5.1.2.5 for initial registration or subclause 5.5.1.3.5 for mobility and periodic registration	Transmission of REGISTRATION REQUEST message 5GMM- CONNECTED mode entered (NOTE 5)	Retransmission of the REGISTRATION REQUEST message, if still required
T3512	Default 54 min NOTE 1 NOTE 2	5GMM- REGISTERED	In 5GMM-REGISTERED, when 5GMM-CONNECTED mode is left and if the NW does not indicate support for strictly periodic registration timer as specified in subclause 5.3.7. If the network indicates support for strictly periodic registration timer, T3512 is started after the successful completion of registration update procedure. T3512 is restarted if it expires in 5GMM-CONNECTED mode as specified in subclause 5.3.7.	When entering state 5GMM- DEREGISTERED When entering 5GMM- CONNECTED mode if the NW does not indicate support for strictly periodic registration timer as specified in subclause 5.3.7.	In 5GMM-IDLE mode, Initiation of the periodic registration procedure if the UE is not registered for emergency services. In 5GMM- CONNECTED mode, restart the timer T3512. Locally deregister if the UE is registered for emergency services

TIMER NUM.	TIMER VALUE	STATE	CAUSE OF START	NORMAL STOP	ON EXPIRY
T3516	30s NOTE 7 NOTE 8 In WB-N1/CE mode, 48s For access via a satellite NG-RAN cell, 35s NOTE 12	5GMM-REGISTERED-INITIATED 5GMM-REGISTERED 5GMM-DEREGISTERED-INITIATED 5GMM-SERVICE-REQUEST-INITIATED	RAND and RES* stored as a result of an 5G authentication challenge	SECURITY MODE COMMAND message received SERVICE REJECT message received REGISTRATION ACCEPT message received AUTHENTICATION REJECT message received AUTHENTICATION FAILURE message sent 5GMM-DEREGISTERED, 5GMM-NULL or 5GMM-IDLE mode entered	Delete the stored RAND and RES*
T3517	(a) 5s for case h) in subclause 5.6.1.1; or (b) 15s for cases other than h) in subclause 5.6.1.1 NOTE 7 NOTE 8 NOTE 10 In WB-N1/CE mode, 61s For access via a satellite NG-RAN cell, 27s NOTE 12	5GMM-SERVICE-REQUEST-INITIATED	Transmission of SERVICE REQUEST message, or CONTROL PLANE SERVICE REQUEST message	(a) Indication from the lower layers that the UE has changed to S1 mode or E-UTRA connected to 5GCN for case h) in subclause 5.6.1.1; or (b) SERVICE ACCEPT message received, or SERVICE REJECT message received for cases other than h) in subclause 5.6.1.1 see subclause 5.6.1.4.2	Abort the procedure
T3519	60s NOTE 7 NOTE 8 In WB-N1/CE mode, 90s For access via a satellite NG-RAN cell, 65s NOTE 12	5GMM-REGISTERED-INITIATED 5GMM-REGISTERED 5GMM-DEREGISTERED-INITIATED 5GMM-SERVICE-REQUEST-INITIATED (NOTE 6)	Transmission of IDENTITY RESPONSE message, REGISTRATION REQUEST message, or DEREGISTRATION REQUEST message with freshly generated SUCI	REGISTRATION ACCEPT message with new 5G-GUTI received CONFIGURATION UPDATE COMMAND message with new 5G-GUTI received DEREGISTRATION ACCEPT message	Delete stored SUCI

TIMER NUM.	TIMER VALUE	STATE	CAUSE OF START	NORMAL STOP	ON EXPIRY
T3520	15s NOTE 7 NOTE 8 In WB-N1/CE mode, 33s For access via a satellite NG-RAN cell, 20s NOTE 12	5GMM-REGISTERED-INITIATED 5GMM-REGISTERED 5GMM-DEREGISTERED-INITIATED 5GMM-SERVICE-REQUEST-INITIATED	Transmission of AUTHENTICATION FAILURE message with any of the 5GMM cause #20, #21, #26 or #71 Transmission of AUTHENTICATION RESPONSE message with an EAP-response message after detection of an error as described in subclause 5.4.1.2.2.4	AUTHENTICATION REQUEST message received or AUTHENTICATION REJECT message received or SECURITY MODE COMMAND message received when entering 5GMM-IDLE mode indication of transmission failure of AUTHENTICATION FAILURE message from lower layers	On first expiry during a 5G AKA based primary authentication and key agreement procedure, the UE should consider the network as false and follow item g of subclause 5.4.1.3.7, if the UE is not registered for emergency services. On first expiry during a 5G AKA based primary authentication and key agreement procedure, the UE will follow subclause 5.4.1.3.7 under "For items c, d, e and f:", if the UE is registered for emergency services. On first expiry during an EAP based primary authentication and key agreement procedure, the UE should consider the network as false and follow item e of subclause 5.4.1.2.4.5, if the UE is not registered for emergency services. On first expiry during an EAP based primary authentication and key agreement procedure, the UE will follow subclause 5.4.1.2.4.5 under "For item e:", if the UE is registered for emergency services

TIMER NUM.	TIMER VALUE	STATE	CAUSE OF START	NORMAL STOP	ON EXPIRY
T3521	15s NOTE 7 NOTE 8 In WB-N1/CE mode, 45s For access via a satellite NG-RAN cell, 27s NOTE 12	5GMM- DEREGISTERED- INITIATED	Transmission of DEREGISTRATION REQUEST message when de-registration procedure is not due to a "switch off"	DEREGISTRATION ACCEPT message received	Retransmission of DEREGISTRATION REQUEST message
T3525	Default 60s NOTE 3 NOTE 7 NOTE 8 In WB-N1/CE mode, default 120s For access via a satellite NG-RAN cell, default 72s NOTE 12	5GMM- REGISTERED.N ORMAL- SERVICE or 5GMM- REGISTERED.N ON-ALLOWED- SERVICE	T3517 expires and service request attempt counter is greater than or equal to 5	When entering state other than 5GMM-REGISTERED.NORMAL-SERVICE state or 5GMM-REGISTERED.NON-ALLOWED-SERVICE, or UE camped on a new PLMN other than the PLMN on which timer started, Or UE camped on a new SNPN other than the SNPN on which timer was started, or User-plane resources established with the network	The UE may initiate service request procedure
T3540		5GMM- DEREGISTERED 5GMM- REGISTERED	REGISTRATION REJECT message or DEREGISTRATION REQUEST message received with any of the 5GMM cause #3, #6, #7, #11, #12, #13, #15, #27, #31, #36, #62, #72, #73, #74, #75, #76 or #78 SERVICE REJECT message received with any of the 5GMM cause #3, #6, #7, #11, #12, #13, #15, #27, #36, #72, #73, #74, #75, #76 or #78. REGISTRATION ACCEPT message received as described in subclause 5.3.1.3 case b) and case h) SERVICE ACCEPT message received as described in subclause 5.3.1.3 case f) AUTHENTICATION REJECT message received DEREGISTRATION ACCEPT message received as described in subclause 5.3.1.3 case k)	N1 NAS signalling connection released PDU sessions have been set up except for the case the UE has set Request type to "NAS signalling connection release" in the UE request type IE in the REGISTRATION REQUEST message as described in subclause 5.3.1.3 case b) Other use cases see subclause 5.3.1.3	Release the NAS signalling connection for the cases a), a1), b), c), d), e), f), g), h), i), j), k), l) as described in subclause 5.3.1.3

TIMER NUM.	TIMER VALUE	STATE	CAUSE OF START	NORMAL STOP	ON EXPIRY
	10s NOTE 7 (applicable to case f) in subclause 5.3.1.3) NOTE 8 In WB-N1/CE mode, 34s (applicable to case f) in subclause 5.3.1.3) NOTE 11 For access via a satellite NG-RAN cell, default 22s (applicable to case f) in subclause 5.3.1.3) NOTE 12 NOTE 13 NOTE 14	5GMM-REGISTERED	CONFIGURATION UPDATE COMMAND message received as described in subclause 5.3.1.3 case e) and h) SERVICE ACCEPT message received as described in subclause 5.3.1.3 case i)	N1 NAS signalling connection released Other use cases see subclause 5.3.1.3	Release the NAS signalling connection for the case e) as described in subclause 5.3.1.3 and perform a new registration procedure as described in subclause 5.5.1.3.2
		5GMM-DEREGISTERED	REGISTRATION REJECT message received with the 5GMM cause #9 or #10		Release the NAS signalling connection for the case h) and i) as described in subclause 5.3.1.3
		5GMM-DEREGISTERED. NORMAL-SERVICE 5GMM-REGISTERED.N ON-ALLOWED-SERVICE	SERVICE REJECT message received with the 5GMM cause #9, #10 or #28		Release the NAS signalling connection for the cases c) and d) as described in subclause 5.3.1.3 and initiation of the registration procedure as specified in subclause 5.5.1.2.2 or 5.5.1.3.2
Non-3GPP de-registration timer	Default 54 min. NOTE 1 NOTE 2 NOTE 4	All 5GMM state over non-3GPP access except 5GMM-DEREGISTERED over non-3GPP access	Entering 5GMM-IDLE mode over non-3GPP access	N1 NAS signalling connection over non-3GPP access established or when entering state 5GMM-DEREGISTERED over non-3GPP access	Implicitly de-register the UE for non-3GPP access on 1st expiry
T3526	NOTE 9	5GMM-DEREGISTERED 5GMM-REGISTERED	Rejected S-NSSAI with rejection cause "S-NSSAI not available due to maximum number of UEs reached" received.	Associated S-NSSAI in the rejected NSSAI for the maximum number of UEs reached as specified in subclause 4.6.2.2 deleted.	Remove the S-NSSAI in the rejected NSSAI for the maximum number of UEs reached associated with the T3526 timer.
T3527	15s	5GMM-REGISTERED.N ORMAL-SERVICE	Transmission of RELAY KEY REQUEST message Transmission of RELAY AUTHENTICATION RESPONSE message	RELAY KEY REJECT message received or RELAY AUTHENTICATION REQUEST message received or RELAY KEY ACCEPT message received	Retransmission of RELAY KEY REQUEST message

TIMER NUM.	TIMER VALUE	STATE	CAUSE OF START	NORMAL STOP	ON EXPIRY
NOTE 1:	The value of this timer is provided by the network operator during the registration procedure.				
NOTE 2:	The default value of this timer is used if the network does not indicate a value in the REGISTRATION ACCEPT message and the UE does not have a stored value for this timer.				
NOTE 3:	The default value of this timer is used when the UE is not configured with the implementation specific value. The minimum value of this timer is 60 seconds if not in NB-N1 mode and if not in WB-N1/CE mode.				
NOTE 4:	If the T3346 value received in the mobility management messages is greater than the value of the non-3GPP de-registration timer, the UE sets the non-3GPP de-registration timer value to be 4 minutes greater than the value of timer T3346.				
NOTE 5:	The conditions for which this applies are described in subclause 5.5.1.3.7.				
NOTE 6:	The conditions for which this applies to the 5GMM-SERVICE-REQUEST-INITIATED state are described in subclause 5.4.1.3.7 case c) and case d).				
NOTE 7:	In NB-N1 mode, the timer value shall be calculated as described in subclause 4.17.				
NOTE 8:	In WB-N1 mode, if the UE supports CE mode B and operates in either CE mode A or CE mode B, then the timer value is as described in this table for the case of WB-N1/CE mode (see subclause 4.19).				
NOTE 9:	The value of this timer is provided by the network operator during the registration procedure or the generic UE configuration update procedure along with the rejected S-NSSAI with rejection cause "S-NSSAI not available due to maximum number of UEs reached". The default value of this timer is implementation specific with a minimum value of 12 minutes and used if the network does not provide a value in the REGISTRATION ACCEPT message, the REGISTRATION REJECT message, or the CONFIGURATION UPDATE COMMAND message along with the rejected S-NSSAI with rejection cause "S-NSSAI not available due to maximum number of UEs reached".				
NOTE 10:	Based on implementation, the timer may be set to a value between 250ms and 15s when the MUSIM UE indicates "NAS signalling connection release" in the UE request type IE of the SERVICE REQUEST message or CONTROL PLANE SERVICE REQUEST message.				
NOTE 11:	Based on implementation, the timer may be set to a value between 250ms and 10s when the MUSIM UE not in NB-N1 mode or WB-N1 mode indicated "NAS signalling connection release" or "Rejection of paging" in the UE request type IE of the SERVICE REQUEST message or CONTROL PLANE SERVICE REQUEST message; or indicated "NAS signalling connection release" in the UE request type IE of the REGISTRATION REQUEST message.				
NOTE 12:	In satellite NG-RAN access, this value shall only be selected when satellite NG-RAN RAT type is NR(MEO) or NR(GEO).				
NOTE 13:	If the timer is started due the reception of a 5GMM reject cause triggering a PLMN selection according to 3GPP TS 23.122 [5] or a search for a suitable cell in another tracking area according to 3GPP TS 38.304 [28], the UE may start the timer with an implementation specific value which is lower than the value described in this table.				
NOTE 14:	For a UE configured for high priority access in selected PLMN or SNPN, the timer value shall be implementation specific which shall be greater than 1 second and less than 5 seconds.				

Table 10.2.2: Timers of 5GS mobility management – AMF side

TIMER NUM.	TIMER VALUE	STATE	CAUSE OF START	NORMAL STOP	ON EXPIRY
T3513 NOTE 7 NOTE 9	NOTE 4	5GMM-REGISTERED	Paging procedure initiated	Paging procedure completed as specified in subclause 5.6.2.2.1	Network dependent
T3522 NOTE 6 NOTE 8	6s In WB-N1/CE mode, 24s For access via a satellite NG-RAN cell, 11s NOTE 12	5GMM-DEREGISTERED-INITIATED	Transmission of DEREGISTRATION REQUEST message	DEREGISTRATION ACCEPT message received	Retransmission of DEREGISTRATION REQUEST message
T3550 NOTE 6 NOTE 8	6s In WB-N1/CE mode, 18s For access via a satellite NG-RAN cell, 11s NOTE 12	5GMM-COMMON-PROCEDURE-INITIATED	Transmission of REGISTRATION ACCEPT message as specified in subclause 5.5.1.2.4 and 5.5.1.3.4	REGISTRATION COMPLETE message received	Retransmission of REGISTRATION ACCEPT message
T3555 NOTE 6 NOTE 8	6s In WB-N1/CE mode, 24s For access via a satellite NG-RAN cell, 11s NOTE 12	5GMM-REGISTERED	Transmission of CONFIGURATION UPDATE COMMAND message with "acknowledgement requested" set in the Acknowledgement bit of the Configuration update indication IE	CONFIGURATION UPDATE COMPLETE message received	Retransmission of CONFIGURATION UPDATE COMMAND message
T3560 NOTE 6 NOTE 8	6s In WB-N1/CE mode, 24s For access via a satellite NG-RAN cell, 11s NOTE 12	5GMM-COMMON-PROCEDURE-INITIATED	Transmission of AUTHENTICATION REQUEST message Transmission of SECURITY MODE COMMAND message	AUTHENTICATION RESPONSE message received AUTHENTICATION FAILURE message received SECURITY MODE COMPLETE message received SECURITY MODE REJECT message received	Retransmission of AUTHENTICATION REQUEST message or SECURITY MODE COMMAND message

TIMER NUM.	TIMER VALUE	STATE	CAUSE OF START	NORMAL STOP	ON EXPIRY
T3565 NOTE 6 NOTE 8	6s In WB-N1/CE mode, 24s For access via a satellite NG-RAN cell, 11s NOTE 12	5GMM-REGISTERED	Transmission of NOTIFICATION message	SERVICE REQUEST message received CONTROL PLANE SERVICE REQUEST message received NOTIFICATION RESPONSE message received REGISTRATION REQUEST Message received DEREGISTRATION REQUEST message received NGAP UE context resume request message as specified in 3GPP TS 38.413 [31] received	Retransmission of NOTIFICATION message
T3570 NOTE 6 NOTE 8	6s In WB-N1/CE mode, 24s For access via a satellite NG-RAN cell, 11s NOTE 12	5GMM-COMMON-PROCEDURE-INITIATED	Transmission of IDENTITY REQUEST message	IDENTITY RESPONSE message received	Retransmission of IDENTITY REQUEST message
T3575 NOTE 6 NOTE 8	15s In WB-N1/CE mode, 60s For access via a satellite NG-RAN cell, 27s NOTE 12	5GMM-REGISTERED	Transmission of NETWORK SLICE-SPECIFIC AUTHENTICATION COMMAND message	NETWORK SLICE-SPECIFIC AUTHENTICATION COMPLETE message received	Retransmission of NETWORK SLICE-SPECIFIC AUTHENTICATION COMMAND message
Active timer	NOTE 10	All except 5GMM-DEREGISTERED	Entering 5GMM-IDLE mode after indicating MICO mode activation to the UE with an active timer value.	N1 NAS signalling connection established	Activate MICO mode for the UE.
Implicit de-registration timer	NOTE 2	All except 5GMM-DEREGISTERED	The mobile reachable timer expires while the network is in 5GMM-IDLE mode Entering 5GMM-IDLE mode over 3GPP access if the MICO mode is activated and strictly periodic monitoring timer is not running The strictly periodic monitoring timer expires while the network is in 5GMM-IDLE mode	N1 NAS signalling connection established	Implicitly de-register the UE on 1 st expiry

TIMER NUM.	TIMER VALUE	STATE	CAUSE OF START	NORMAL STOP	ON EXPIRY
Mobile reachable timer	NOTE 1	All except 5GMM-DEREGISTERED	Entering 5GMM-IDLE mode	N1 NAS signalling connection established	Network dependent, but typically paging is halted on 1 st expiry, and start implicit de-registration timer, if the UE is not registered for emergency services. Implicitly de-register the UE which is registered for emergency services
Non-3GPP implicit de-registration timer	NOTE 3	All except 5GMM-DEREGISTERED	Entering 5GMM-IDLE mode over non-3GPP access	N1 NAS signalling connection over non-3GPP access established	Implicitly de-register the UE for non-3GPP access on 1 ^s expiry
Strictly periodic monitoring timer	NOTE 5	All except 5GMM-DEREGISTERED	At the successful completion of registration update procedure if strictly periodic registration timer indication is supported as specified in subclause 5.3.7.	Entering 5GMM-DEREGISTERED.	In 5GMM-IDLE mode, start implicit de-registration timer as specified in subclause 5.3.7. In 5GMM-CONNECTED mode, Strictly periodic monitoring timer is started again as specified in subclause 5.3.7.
Implementation specific timer for onboarding services	NOTE 11	5GMM-REGISTERED	At the successful completion of initial registration for onboarding services in SNPN or initial registration for the UE which the subscription is only for configuration of SNPN subscription parameters in PLMN via the user plane or successful completion of registration procedure for mobility and periodic registration update if the implementation specific timer for onboarding services is not running and: - the UE is registered for onboarding services in SNPN; or - the UE's subscription only allows for configuration of SNPN subscription parameters in PLMN via the user plane.	DEREGISTRATION REQUEST message received.	Network-initiated de-registration procedure performed

TIMER NUM.	TIMER VALUE	STATE	CAUSE OF START	NORMAL STOP	ON EXPIRY
NOTE 1: The default value of this timer is 4 minutes greater than the value of timer T3512. If the UE is registered for emergency services, the value of this timer is set equal to the value of timer T3512. If the T3346 value provided in the mobility management messages is greater than the value of the timer T3512, the AMF sets the mobile reachable timer and the implicit de-registration timer such that the sum of the timer values is greater than the value of timer T3346.					
NOTE 2: The value of this timer is network dependent. If MICO is activated, the default value of this timer is 4 minutes greater than the value of timer T3512.					
NOTE 3: The value of this timer is network dependent. The default value of this timer is 4 minutes greater than the non-3GPP de-registration timer. If the T3346 value provided in the mobility management messages is greater than the value of the non-3GPP de-registration timer, the AMF sets the non-3GPP implicit de-registration timer value to be 8 minutes greater than the value of timer T3346.					
NOTE 4: The value of this timer is network dependent.					
NOTE 5: The value of this timer is the same as the value of timer T3512.					
NOTE 6: In NB-N1 mode, the timer value shall be calculated as described in subclause 4.17.					
NOTE 7: In NB-N1 mode, the timer value shall be calculated by using an NAS timer value which is network dependent.					
NOTE 8: In WB-N1 mode, if the UE supports CE mode B and operates in either CE mode A or CE mode B, then the timer value is as described in this table for the case of WB-N1/CE mode (see subclause 4.19).					
NOTE 9: In WB-N1 mode, if the UE supports CE mode B, then the timer value shall be calculated by using an NAS timer value which value is network dependent.					
NOTE 10: If the AMF includes timer T3324 in the REGISTRATION ACCEPT message and if the UE is not registered for emergency services, the value of this timer is equal to the value of timer T3324.					
NOTE 11: The value of this timer needs to be large enough to allow a UE to complete the configuration of one or more entries of the "list of subscriber data" and considering that configuration of SNPN subscription parameters in PLMN via the user plane or onboarding services in SNPN involves third party entities outside of the operator's network.					
NOTE 12: In satellite NG-RAN access, this value shall only be selected when satellite NG-RAN RAT type is NR(MEO) or NR(GEO).					

10.3 Timers of 5GS session management

Timers of 5GS session management are shown in table 10.3.1 and table 10.3.2.

NOTE: Timer T3396 is defined in 3GPP TS 24.008 [12].

Table 10.3.1: Timers of 5GS session management – UE side

TIMER NUM.	TIMER VALUE	STATE	CAUSE OF START	NORMAL STOP	ON THE 1 st , 2 nd , 3 rd , 4 th EXPIRY (NOTE 1)
T3580 NOTE 4 NOTE 5	16s In WB-N1/CE mode, 24s For access via a satellite NG-RAN cell, 21s NOTE 7	PDU SESSION ACTIVE PENDING	Transmission of PDU SESSION ESTABLISHMENT REQUEST message	PDU SESSION ESTABLISHMENT ACCEPT message received or PDU SESSION ESTABLISHMENT REJECT message received or PDU SESSION ESTABLISHMENT REQUEST message received in a DL NAS TRANSPORT message with 5GMM cause #22, #28, #65, #67, #69, #90, #91 or #92	Retransmission of PDU SESSION ESTABLISHMENT REQUEST message
T3581 NOTE 4 NOTE 5	16s In WB-N1/CE mode, 24s For access via a satellite NG-RAN cell, 21s NOTE 7	PDU SESSION MODIFICATION PENDING	Transmission of PDU SESSION MODIFICATION REQUEST message	PDU SESSION MODIFICATION COMMAND message with the same PTI is received or PDU SESSION MODIFICATION REJECT message received or PDU SESSION MODIFICATION REQUEST message received in a DL NAS TRANSPORT message with 5GMM cause #22, #28, #67, #69, or #90	Retransmission of PDU SESSION MODIFICATION REQUEST message
T3582 NOTE 4 NOTE 5	16s In WB-N1/CE mode, 24s For access via a satellite NG-RAN cell, 21s NOTE 7	PDU SESSION INACTIVE PENDING	Transmission of PDU SESSION RELEASE REQUEST message	PDU SESSION RELEASE COMMAND message with the same PTI is received or PDU SESSION RELEASE REJECT message received	Retransmission of PDU SESSION RELEASE REQUEST message
T3583	Default 1 min. NOTE 2	PDU SESSION ACTIVE	UE creates or updates a derived QoS rule	UE deletes the derived QoS rule (see subclause 6.2.5.1.4.5)	On 1 st expiry: Deletion of the derived QoS rule

TIMER NUM.	TIMER VALUE	STATE	CAUSE OF START	NORMAL STOP	ON THE 1 st , 2 nd , 3 rd , 4 th EXPIRY (NOTE 1)
T3584	NOTE 3	PDU SESSION ACTIVE PENDING PDU SESSION MODIFICATION PENDING PDU SESSION ACTIVE or PDU SESSION INACTIVE PENDING	PDU SESSION ESTABLISHMENT REJECT, PDU SESSION MODIFICATION REJECT, or PDU SESSION RELEASE COMMAND received with 5GSM cause #67 and with a timer value for T3584 PDU SESSION ESTABLISHMENT REQUEST, or PDU SESSION MODIFICATION REQUEST received in a DL NAS TRANSPORT message with 5GMM cause #67 and with a timer value for T3584 (see subclause 5.4.5.3.3)	PDU SESSION RELEASE COMMAND message (see NOTE 6) or PDU SESSION MODIFICATION COMMAND message or PDU SESSION AUTHENTICATION COMMAND message or DEREGISTRATION REQUEST message with the De-registration type IE indicating "re-registration required" or REGISTRATION ACCEPT message or CONFIGURATION UPDATE COMMAND message (see subclause 4.6.2.2) or DL NAS TRANSPORT message including a CIoT user data container without a 5GMM cause value (see subclause 5.4.5.3.3)	None

TIMER NUM.	TIMER VALUE	STATE	CAUSE OF START	NORMAL STOP	ON THE 1 st , 2 nd , 3 rd , 4 th EXPIRY (NOTE 1)
T3585	NOTE 3	PDU SESSION ACTIVE PENDING PDU SESSION MODIFICATION PENDING PDU SESSION ACTIVE or PDU SESSION INACTIVE PENDING	PDU SESSION ESTABLISHMENT REJECT, PDU SESSION MODIFICATION REJECT, or PDU SESSION RELEASE COMMAND received with 5GSM cause #69 and with a timer value for T3585 PDU SESSION ESTABLISHMENT REQUEST, or PDU SESSION MODIFICATION REQUEST received in a DL NAS TRANSPORT message with 5GMM cause #69 and with a timer value for T3585(see subclause 5.4.5.3.3)	PDU SESSION RELEASE COMMAND message (see NOTE 6) or PDU SESSION MODIFICATION COMMAND message or PDU SESSION AUTHENTICATION COMMAND message or DEREGISTRATION REQUEST message with the De-registration type IE indicating "re-registration required" or REGISTRATION ACCEPT message or CONFIGURATION UPDATE COMMAND message (see subclause 4.6.2.2) or DL NAS TRANSPORT message including a CIoT user data container without a 5GMM cause value (see subclause 5.4.5.3.3)	None
Back-off timer			defined in 3GPP TS 24.008 [12]		
T3586 NOTE 4 NOTE 5	8s In WB-N1/CE mode, 16s For access via a satellite NG-RAN cell, 13s NOTE 7	PDU SESSION ACTIVE	REMOTE UE REPORT message sent	REMOTE UE REPORT RESPONSE message received	On the 1 st and 2 nd expiry, retransmission of REMOTE UE REPORT message On the 3 rd expiry, the procedure is aborted (see subclause 6.6.2.4).
T3587	NOTE 8	PDU SESSION ACTIVE	PDU SESSION MODIFICATION COMMAND message or PDU SESSION ESTABLISHMENT ACCEPT message received with Received MBS information that includes MBS decision set to "MBS join is rejected" and Rejection cause set to "multicast MBS session has not started or will not start soon" and an MBS back-off timer value	None	Initiating a request to join the multicast MBS session associated with the PDU session if still needed

TIMER NUM.	TIMER VALUE	STATE	CAUSE OF START	NORMAL STOP	ON THE 1 st , 2 nd , 3 rd , 4 th EXPIRY (NOTE 1)
NOTE 1: Typically, the procedures are aborted on the fifth expiry of the relevant timer. Exceptions are described in the corresponding procedure description. NOTE 2: The network may provide the value of this timer applicable to the derived QoS rules of a specific PDU session as RQ timer value in the PDU SESSION ESTABLISHMENT ACCEPT message and PDU SESSION MODIFICATION COMMAND message. The maximum value of the timer is 30 min. If the network indicates a value greater than the maximum value, then the UE shall use the maximum value. NOTE 3: The value of this timer is provided by the network. NOTE 4: In NB-N1 mode, then the timer value shall be calculated as described in subclause 4.18. NOTE 5: In WB-N1 mode, if the UE supports CE mode B and operates in either CE mode A or CE mode B, then the timer value is as described in this table for the case of WB-N1/CE mode (see subclause 4.20). NOTE 6: If the PDU SESSION RELEASE COMMAND message includes the Back-off timer value IE where the timer value indicates neither zero nor deactivated and the 5GSM cause is not #39, the UE then starts the timer with the value provided in the Back-off timer value IE after stopping the existing timer (see subclause 6.3.3.3). NOTE 7: In satellite NG-RAN access, this value shall only be selected when satellite NG-RAN RAT type is NR(MEO) or NR(GEO). NOTE 8: The value of this timer is provided by the network in the Received MBS container IE (see subclause 6.3.2.3, subclause 6.4.1.3 and subclause 9.11.4.31).					

NOTE 1: The back-off timer is used to describe a logical model of the required UE behaviour. This model does not imply any specific implementation, e.g. as a timer of timestamp.

NOTE 2: Reference to back-off timer in this section can either refer to use of timer T3396 or to use of a different packet system specific timer within the UE. Whether the UE uses T3396 as a back-off timer or it uses different packet system specific timers as back-off timers is left up to UE implementation.

Table 10.3.2: Timers of 5GS session management – SMF side

TIMER NUM.	TIMER VALUE	STATE	CAUSE OF START	NORMAL STOP	ON THE 1 st , 2 nd , 3 rd , 4 th EXPIRY (NOTE 1)
T3590 NOTE 3 NOTE 4	15s In WB-N1/CE mode, 23s For access via a satellite NG-RAN cell, 21s NOTE 5	PROCEDURE TRANSACTION PENDING	Transmission of PDU SESSION AUTHENTICATION COMMAND message	PDU SESSION AUTHENTICATION COMPLETE message received	Retransmission of PDU SESSION AUTHENTICATION COMMAND message
T3591 NOTE 3 NOTE 4	16s In WB-N1/CE mode, 24s For access via a satellite NG-RAN cell, 22s NOTE 5	PDU SESSION MODIFICATION PENDING	Transmission of PDU SESSION MODIFICATION COMMAND message	PDU SESSION MODIFICATION COMPLETE message received or PDU SESSION MODIFICATION COMMAND REJECT message received	Retransmission of PDU SESSION MODIFICATION COMMAND message
T3592 NOTE 3 NOTE 4	16s In WB-N1/CE mode, 24s For access via a satellite NG-RAN cell, 22s NOTE 5	PDU SESSION INACTIVE PENDING	Transmission of PDU SESSION RELEASE COMMAND message	PDU SESSION RELEASE COMPLETE message received or N1 SM delivery skipped indication received	Retransmission of PDU SESSION RELEASE COMMAND message
T3593 NOTE 3 NOTE 4	Default 60s (NOTE 2)	PDU SESSION MODIFICATION PENDING	Reception of PDU SESSION MODIFICATION COMPLETE message for transmitted PDU SESSION MODIFICATION COMMAND message where the PDU SESSION MODIFICATION COMMAND message included 5GSM cause #39	PDU SESSION RELEASE REQUEST message received	Network-requested PDU session release procedure performed
T3594 NOTE 3 NOTE 4	15s In WB-N1/CE mode, 23s For access via a satellite NG-RAN cell, 21s NOTE 5	PROCEDURE TRANSACTION PENDING	Transmission of SERVICE-LEVEL AUTHENTICATION COMMAND message	SERVICE-LEVEL AUTHENTICATION COMPLETE message received	Retransmission of SERVICE-LEVEL AUTHENTICATION COMMAND message

NOTE 1: Typically, the procedures are aborted on the fifth expiry of the relevant timer. Exceptions are described in the corresponding procedure description.

NOTE 2: If the PDU Session Address Lifetime value is sent to the UE in the PDU SESSION MODIFICATION COMMAND message then timer T3593 shall be started with the same value, otherwise it shall use a default value.

NOTE 3: In NB-N1 mode, the timer value shall be calculated as described in subclause 4.18.

NOTE 4: In WB-N1 mode, if the UE supports CE mode B and operates in either CE mode A or CE mode B, then the timer value is as described in this table for the case of WB-N1/CE mode (see subclause 4.20).

NOTE 5: In satellite NG-RAN access, this value shall only be selected when satellite NG-RAN RAT type is NR(MEO) or NR(GEO).

10.4 Void

Annex A (informative): Cause values for 5GS mobility management

A.1 Causes related to UE identification

Cause #3 – Illegal UE

This 5GMM cause is sent to the UE when the network refuses service to the UE either because an identity of the UE is not acceptable to the network or because the UE does not pass the authentication check.

Cause #6 – Illegal ME

This 5GMM cause is sent to the UE if the ME used is not acceptable to the network, e.g. on the prohibited list.

Cause #9 – UE identity cannot be derived by the network.

This 5GMM cause is sent to the UE when the network cannot derive the UE's identity from the 5G-GUTI or 5G-S-TMSI because of e.g. no matching identity/context in the network, failure to validate the UE's identity due to integrity check failure of the received message.

Cause #10 – Implicitly de-registered

This 5GMM cause is sent to the UE either if the network has implicitly de-registered the UE, e.g. after the implicit de-registration timer has expired, or if the 5GMM context data related to the subscription does not exist in the AMF e.g. because of a AMF restart, or because of a registration request for mobility or registration update is routed to a new AMF.

A.2 Cause related to subscription options

Cause #5 – PEI not accepted

This cause is sent to the UE if the network does not accept an initial registration procedure for emergency services using a PEI.

Cause #7 – 5GS services not allowed

This 5GMM cause is sent to the UE when it is not allowed to operate 5GS services.

Cause #11 – PLMN not allowed

This 5GMM cause is sent to the UE if it requests service, or if the network initiates a de-registration request, in a PLMN where the UE, by subscription or due to operator determined barring, is not allowed to operate.

This 5GMM cause can also be sent to the UE when the disaster condition is no longer being applicable in the current location of the UE.

Cause #12 – Tracking area not allowed

This 5GMM cause is sent to the UE if it requests service, or if the network initiates a de-registration request, in a tracking area where the HPLMN or SNPN determines that the UE, by subscription, is not allowed to operate.

NOTE 1: If 5GMM cause #12 is sent to a roaming subscriber the subscriber is denied service even if other PLMNs are available on which registration was possible.

Cause #13 – Roaming not allowed in this tracking area

This 5GMM cause is sent to a UE which requests service, or if the network initiates a de-registration request, in a tracking area of a PLMN or SNPN which by subscription offers roaming to that UE but not in that tracking area.

This 5GMM cause can also be sent to the UE when the disaster condition is no longer being applicable in the current location of the UE.

Cause #15 – No suitable cells in tracking area

This 5GMM cause is sent to the UE if it requests service, or if the network initiates a de-registration request, in a tracking area where the UE, by subscription, is not allowed to operate, but when it should find another allowed tracking area in the same PLMN or an equivalent PLMN or the same SNPN or an equivalent SNPN.

NOTE 2: Cause #15 and cause #12 differ in the fact that cause #12 does not trigger the UE to search for another allowed tracking area on the same PLMN or SNPN.

Cause #27 – N1 mode not allowed

This 5GMM cause is sent to the UE if it requests service, or if the network initiates a de-registration request, in a PLMN or SNPN where the UE by subscription or operator policy, is not allowed to operate in N1 mode.

Cause #31 – Redirection to EPC required

This 5GMM cause is sent to the UE if it requests service in a PLMN where the UE by operator policy, is not allowed in 5GCN and redirection to EPC is required.

Cause #36 – IAB-node operation not authorized

This 5GMM cause is sent to the UE if a UE operating as an IAB-node requests service, or if the network initiates a de-registration procedure, in a PLMN or SNPN where the UE by subscription is not authorized for IAB operation.

Cause #72 – Non-3GPP access to 5GCN not allowed

This 5GMM cause is sent to the UE if it requests accessing 5GCN over non-3GPP access in a PLMN or SNPN, where the UE by subscription, is not allowed to access 5GCN over non-3GPP access.

Cause #74 – Temporarily not authorized for this SNPN

This 5GMM cause is sent to the UE if it requests access, or if the network initiates a de-registration procedure, in a cell belonging to an SNPN for which the UE has no subscription to operate or for which the UE is not allowed to operate onboarding services.

Cause #75 – Permanently not authorized for this SNPN

This 5GMM cause is sent to the UE if it requests access, or if the network initiates a de-registration procedure, in a cell belonging to an SNPN with a globally-unique SNPN identity for which the UE either has no subscription to operate, the UE's subscription has expired or the UE is not allowed to operate onboarding services.

Cause #76 – Not authorized for this CAG or authorized for CAG cells only

This 5GMM cause is sent to the UE if the UE requests access or de-registration:

- i) in a CAG cell with a CAG-ID which is not authorized based on the UE's "allowed CAG list" for the PLMN; or
- ii) in a non-CAG cell, wherein the UE is only allowed to access 5GS via CAG cells

Cause #77 – Wireline access area not allowed

This 5GMM cause is sent to the 5G-RG or the W-AGF acting on behalf of the FN-CRG (or on behalf of the N5GC device) if the 5G-RG or the W-AGF acting on behalf of the FN-CRG (or on behalf of the N5GC device) request accessing 5GCN over a wireline access network belonging to a wireline access area, where the 5G-RG or the W-AGF acting on behalf of the FN-CRG (or on behalf of the N5GC device) are not allowed by subscription to access the 5GCN over the wireline access.

Cause #79 – UAS services not allowed

This 5GMM cause is sent to the UE to indicate that the request of UAS services is not allowed.

Cause #80 – Disaster roaming for the determined PLMN with disaster condition not allowed

This 5GMM cause is sent by the network in a PLMN where the UE has requested registration for disaster roaming service for the determined PLMN with disaster condition, but the AMF determines that it does not support providing disaster roaming services to the UE for the determined PLMN with disaster condition as roaming agreement for disaster roaming services with HPLMN of the UE does not exist, or the determined PLMN with disaster condition is a forbidden PLMN of the UE.

Cause #94 – User plane positioning not authorized

This 5GMM cause is sent to the UE if it requests the user plane positioning, where the UE by subscription is not authorized for user plane positioning.

A.3 Causes related to PLMN or SNPN specific network failures and congestion/authentication failures

Cause #20 – MAC failure

This 5GMM cause is sent to the network if the USIM detects that the MAC in the AUTHENTICATION REQUEST message is not fresh.

Cause #21 – Synch failure

This 5GMM cause is sent to the network if the USIM detects that the SQN in the AUTHENTICATION REQUEST message is out of range.

Cause #22 – Congestion

This 5GMM cause is sent to the UE because of congestion in the network (e.g. no channel, facility busy/congested etc.).

Cause #23 – UE security capabilities mismatch

This 5GMM cause is sent to the network if the UE detects that the UE security capability does not match the one sent back by the network.

Cause #24 – Security mode rejected, unspecified

This 5GMM cause is sent to the network if the security mode command is rejected by the UE for unspecified reasons.

Cause #26 – Non-5G authentication unacceptable

This 5GMM cause is sent to the network in N1 mode if the "separation bit" in the AMF field of AUTN is set to 0 in the AUTHENTICATION REQUEST message (see 3GPP TS 33.501 [24]).

Cause #28 – Restricted service area

This 5GMM cause is sent to the UE if it requests service in a tracking area of the 3GPP access or in an area of the wireline access, which is a part of the UE's non-allowed area or is not a part of the UE's allowed area.

Cause #43 – LADN not available

This 5GMM cause is sent to the UE if the user-plane resources of the PDU session are not established when the UE is located outside the LADN service area.

Cause #62 – No network slices available

This 5GMM cause is sent by the network if there are no available network slices allowed for use by the UE.

NOTE: Network does not send this cause in REGISTRATION REJECT message if the UE does not include a requested NSSAI in the REGISTRATION REQUEST message. In that case, if the UE is not registered for onboarding services in SNPN, the network uses other causes (e.g. #13, #15, etc.) based on the subscription.

Cause #65 – Maximum number of PDU sessions reached

This 5GMM cause is used by the network to indicate that the procedure requested by the UE was rejected as the network has reached the maximum number of simultaneously active PDU sessions for the UE.

Cause #67 – Insufficient resources for specific slice and DNN

This 5GMM cause is sent by the network to indicate that the requested service cannot be provided due to insufficient resources for specific slice and DNN.

Cause #69 – Insufficient resources for specific slice

This 5GMM cause is sent by the network to indicate that the requested service cannot be provided due to insufficient resources for specific slice.

Cause #71 – ngKSI already in use

This 5GMM cause is sent to the network in N1 mode if the ngKSI value received in the AUTHENTICATION REQUEST message is already associated with one of the 5G security contexts stored in the UE.

Cause #73 – Serving network not authorized

This 5GMM cause is sent to the UE if the UE initiates registration towards a serving network and the serving network fails to be authorized by the UE's home network.

Cause #78 – PLMN not allowed to operate at the present UE location

This 5GMM cause is sent to the UE to indicate that the PLMN is not allowed to operate at the present UE location.

NOTE: This cause is only applicable for satellite NG-RAN access.

Cause #81 – Selected N3IWF is not compatible with the allowed NSSAI

This 5GMM cause is sent by the network to indicate that the requested service cannot be provided due to the selected N3IWF is not compatible with the allowed NSSAI.

Cause #82 – Selected TNGF is not compatible with the allowed NSSAI

This 5GMM cause is sent by the network to indicate that the requested service cannot be provided due to the selected TNGF is not compatible with the allowed NSSAI.

Cause #90 – Payload was not forwarded

This 5GMM cause is sent by the network to indicate that the requested service cannot be provided because payload could not be forwarded by AMF.

Cause #91 – DNN not supported or not subscribed in the slice

This 5GMM cause is sent by the network to indicate that the requested service cannot be provided because payload could not be forwarded by AMF because the DNN is not supported or not subscribed in the slice selected by the network if the UE did not indicate a slice, or the DNN is not supported or not subscribed in the slice indicated by the UE.

Cause #92 – Insufficient user-plane resources for the PDU session

This 5GMM cause is sent by the network to indicate that the requested service cannot be provided due to insufficient user-plane resources for the PDU session.

Cause #93 – Onboarding services terminated

This 5GMM cause is sent by the network if the network initiates a de-registration procedure because the onboarding services are terminated.

A.4 Causes related to invalid messages

Cause #95 – Semantically incorrect message

This 5GMM cause is used to report receipt of a message with semantically incorrect contents.

Cause #96 – Invalid mandatory information

This cause 5GMM indicates that the equipment sending this 5GMM cause has received a message with a non-semantic mandatory IE error.

Cause #97 – Message type non-existent or not implemented

This 5GMM cause indicates that the equipment sending this 5GMM cause has received a message with a message type it does not recognize either because this is a message not defined, or defined but not implemented by the equipment sending this 5GMM cause.

Cause #98 – Message type not compatible with protocol state

This 5GMM cause indicates that the equipment sending this 5GMM cause has received a message not compatible with the protocol state.

Cause #99 – Information element non-existent or not implemented

This 5GMM cause indicates that the equipment sending this 5GMM cause has received a message which includes information elements not recognized because the information element identifier is not defined or it is defined but not implemented by the equipment sending the 5GMM cause. However, the information element is not required to be present in the message in order for the equipment sending the 5GMM cause to process the message.

Cause #100 – Conditional IE error

This 5GMM cause indicates that the equipment sending this cause has received a message with conditional IE errors.

Cause #101 – Message not compatible with protocol state

This 5GMM cause indicates that a message has been received which is incompatible with the protocol state.

Cause #111 – Protocol error, unspecified

This 5GMM cause is used to report a protocol error event only when no other 5GMM cause in the protocol error class applies.

Annex B (informative): Cause values for 5GS session management

B.1 Causes related to nature of request

Cause #8 – Operator Determined Barring

This 5GSM cause is used by the network to indicate that the requested service was rejected by the SMF due to Operator Determined Barring.

Cause #26 – Insufficient resources

This 5GSM cause is used by the UE or by the network to indicate that the requested service cannot be provided due to insufficient resources.

Cause #27 – Missing or unknown DNN

This 5GSM cause is used by the network to indicate that the requested service was rejected by the external DN because the DNN was not included although required or if the DNN could not be resolved.

Cause #28 – Unknown PDU session type

This 5GSM cause is used by the network to indicate that the requested service was rejected by the external DN because the requested PDU session type could not be recognised or is not allowed.

Cause #29 – User authentication or authorization failed

This 5GSM cause is used by the network to indicate that the requested service was rejected by the external DN due to a failed user authentication, revoked by the external DN, or rejected by 5GCN due to a failed user authentication or authorization.

Cause #31 – Request rejected, unspecified

This 5GSM cause is used by the network or by the UE to indicate that the requested service or operation or the request for a resource was rejected due to unspecified reasons.

Cause #32 – Service option not supported

This 5GSM cause is used by the network when the UE requests a service which is not supported by the PLMN.

Cause #33 – Requested service option not subscribed

This 5GSM cause is sent when the UE requests a service option for which it has no subscription.

Cause #35 – PTI already in use

This 5GSM cause is used by the network to indicate that the PTI included by the UE is already in use by another active UE requested procedure for this UE.

Cause #36 – Regular deactivation

This 5GSM cause is used to indicate a regular UE or network initiated release of PDU session resources.

Cause #37 – 5GS QoS not accepted

This 5GSM cause is used by the network if the new 5GS QoS that was indicated in the UE request cannot be accepted.

Cause #38 – Network failure

This 5GSM cause is used by the network to indicate that the requested service was rejected due to an error situation in the network.

Cause #39 – Reactivation requested

This 5GSM cause is used by the network to request a PDU session reactivation.

Cause #41 – Semantic error in the TFT operation

This 5GSM cause is used by the UE to indicate a semantic error in the TFT operation included in the request.

Cause #42 – Syntactical error in the TFT operation

This 5GSM cause is used by the UE to indicate a syntactical error in the TFT operation included in the request.

Cause #43 – Invalid PDU session identity

This 5GSM cause is used by the network or the UE to indicate that the PDU session identity value provided to it is not a valid value or the PDU session identified by the PDU session identity IE in the request or the command is not active.

Cause #44 – Semantic errors in packet filter(s)

This 5GSM cause is used by the network or the UE to indicate that the requested service was rejected due to one or more semantic errors in packet filter(s) of the QoS rule included in the request.

Cause #45 – Syntactical error in packet filter(s)

This 5GSM cause is used by the network or the UE to indicate that the requested service was rejected due to one or more syntactical errors in packet filter(s) of the QoS rule included in the request.

Cause #46 – Out of LADN service area

This 5GSM cause is used by the network to indicate the UE is out of the LADN service area.

Cause #47 – PTI mismatch

This 5GSM cause is used by the network or UE to indicate that the PTI provided to it does not match any PTI in use.

Cause #50 – PDU session type IPv4 only allowed

This 5GSM cause is used by the network to indicate that only PDU session type IPv4 is allowed for the requested IP connectivity.

Cause #51 – PDU session type IPv6 only allowed

This 5GSM cause is used by the network to indicate that only PDU session type IPv6 is allowed for the requested IP connectivity.

Cause #54 – PDU session does not exist

This 5GSM cause is used by the network at handover of a PDU session between non-3GPP access and 3GPP access, or at interworking of a PDN connection from non-3GPP access network connected to EPC or from E-UTRAN connected to EPC to a PDU session, to indicate that the network does not have any information about the requested PDU session.

Cause #57 – PDU session type IPv4v6 only allowed

This 5GSM cause is used by the network to indicate that only PDU session types IPv4, IPv6 or IPv4v6 are allowed for the requested IP connectivity.

Cause #58 – PDU session type Unstructured only allowed

This 5GSM cause is used by the network to indicate that only PDU session type Unstructured is allowed for the requested DN connectivity.

Cause #59 – Unsupported 5QI value

This 5GSM cause is used by the network if the 5QI indicated in the UE request cannot be supported.

Cause #61 – PDU session type Ethernet only allowed

This 5GSM cause is used by the network to indicate that only PDU session type Ethernet is allowed for the requested DN connectivity.

Cause #67 – Insufficient resources for specific slice and DNN

This 5GSM cause is by the network to indicate that the requested service cannot be provided due to insufficient resources for specific slice and DNN or maximum group data rate on a 5G VN group identified by a specific slice and DNN has been exceeded.

Cause #68 – Not supported SSC mode

This 5GSM cause is used by the network to indicate that the requested SSC mode is not supported.

Cause #69 – Insufficient resources for specific slice

This 5GSM cause is used by the network to indicate that the requested service cannot be provided due to insufficient resources for specific slice, maximum number of PDU sessions on a specific slice has been already reached, data rate on a specific slice has been exceeded, or UE-Slice-MBR has been exceeded.

Cause #70 – Missing or unknown DNN in a slice

This 5GSM cause is used by the network to indicate that the requested service was rejected by the external DN because the DNN was not included although required or if the DNN could not be resolved, in the slice.

Cause #81 – Invalid PTI value

This 5GSM cause is used by the network or UE to indicate that the PTI provided to it is invalid for the specific 5GSM message.

Cause #82 – Maximum data rate per UE for user-plane integrity protection is too low

This 5GSM cause is used by the network to indicate that the requested service cannot be provided because the maximum data rate per UE for user-plane integrity protection is too low.

Cause #83 – Semantic error in the QoS operation

This 5GSM cause is used by the network or the UE to indicate that the requested service was rejected due to a semantic error in the QoS operation included in the request.

Cause #84 – Syntactical error in the QoS operation

This 5GSM cause is used by the network or the UE to indicate that the requested service was rejected due to a syntactical error in the QoS operation included in the request.

Cause #85 – Invalid mapped EPS bearer identity

This 5GSM cause is used by the network or the UE to indicate that the mapped EPS bearer identity value provided to it is not a valid value or the mapped EPS bearer identified by the mapped EPS bearer identity does not exist.

Cause #86 – UAS services not allowed

This 5GSM cause is used by the network to indicate that the requested UAS services are not allowed.

Cause #87 – QoS differentiation for non-3GPP device identifier(s) not available

This 5GSM cause is used by the network to indicate that one or more non-3GPP device identifiers requested are not available for the UE.

B.2 Protocol errors (e.g., unknown message)

Cause #95 – Semantically incorrect message

This 5GSM cause is used to report receipt of a message with semantically incorrect contents.

Cause #96 – Invalid mandatory information

This 5GSM cause indicates that the equipment sending this 5GSM cause has received a message with a non-semantic mandatory IE error.

Cause #97 – Message type non-existent or not implemented

This 5GSM cause indicates that the equipment sending this 5GSM cause has received a message with a message type it does not recognize either because this is a message not defined, or defined but not implemented by the equipment sending this 5GSM cause.

Cause #98 – Message type not compatible with protocol state

This 5GSM cause indicates that the equipment sending this 5GSM cause has received a message not compatible with the protocol state.

Cause #99 – Information element non-existent or not implemented

This 5GSM cause indicates that the equipment sending this 5GSM cause has received a message which includes information elements not recognized because the information element identifier is not defined or it is defined but not implemented by the equipment sending the 5GSM cause. However, the information element is not required to be present in the message in order for the equipment sending the 5GSM cause to process the message.

Cause #100 – Conditional IE error

This 5GSM cause indicates that the equipment sending this cause has received a message with conditional IE errors.

Cause #101 – Message not compatible with protocol state

This 5GSM cause indicates that a message has been received which is incompatible with the protocol state.

Cause #111 – Protocol error, unspecified

This 5GSM cause is used to report a protocol error event only when no other 5GSM cause in the protocol error class applies.

Annex C (normative): Storage of 5GMM information

C.1 Storage of 5GMM information for UEs not operating in SNPN access operation mode

The following 5GMM parameters shall be stored on the USIM if the corresponding file or file extension is present:

- a) 5G-GUTI;
- b) last visited registered TAI;
- c) 5GS update status;
- d) 5G NAS security context parameters from a full native 5G NAS security context (see 3GPP TS 33.501 [24]);
- e) K_{AUSF} and K_{SEAF} (see 3GPP TS 33.501 [24]);
- f) SOR counter (see subclause 9.11.3.51); and
- g) UE parameter update counter (see subclause 9.11.3.53A);

The UE may support multiple records of NAS security context storage for multiple registration (see 3GPP TS 31.102 [22]). If the UE supports multiple records of NAS security context storage for multiple registration, the first 5G security context of one access shall be stored in record 1 of the 5G NAS Security Context USIM file for that access and the second 5G security context of that access shall be stored in record 2 of the same file. The presence and format of corresponding files on the USIM is specified in 3GPP TS 31.102 [22].

If the corresponding file or file extension is not present on the USIM, these 5GMM parameters are stored in a non-volatile memory in the ME together with the SUPI from the USIM. These 5GMM parameters can only be used if the SUPI from the USIM matches the SUPI stored in the non-volatile memory; else the UE shall delete the 5GMM parameters.

Upon power up or when a USIM is inserted if K_{AUSF} is stored on the USIM but the SOR counter and the UE parameter update counter are not present on the USIM the UE may delete the K_{AUSF} and associated 5G security context that are stored at the USIM and set the KSI value of ngKSI to '111' (see 3GPP TS 33.501 [24]).

NOTE: The above handling can be used to prevent a stored CounterSoR and CounterUPU being associated with the wrong K_{AUSF} . Further criteria for deleting the security information are left to the UE implementation.

The following 5GMM parameters shall be stored in a non-volatile memory in the ME together with the SUPI from the USIM:

- configured NSSAI(s);
- NSSRG information;
- S-NSSAI time validity information;
- S-NSSAI location validity information;
- on-demand NSSAI;
- NSSAI inclusion mode(s);
- MPS indicator;
- MCS indicator;
- operator-defined access category definitions;

- network-assigned UE radio capability IDs;
- "CAG information list", if the UE supports CAG;
- signalled URSP (see 3GPP TS 24.526 [19]) and, for each URSP rule of the signalled URSP, a UPSI of a UE policy section in which the URSP rule was received;
- SOR-CMCI;
- one or more lists of type "list of PLMN(s) to be used in disaster condition", if the UE supports MINT, MINT-EPS or both;
- disaster roaming wait range, if the UE supports MINT, MINT-EPS or both;
- disaster return wait range, if the UE supports MINT, MINT-EPS or both;
- indication of whether disaster roaming is enabled in the UE;
- indication of whether disaster roaming in EPS is enabled in the UE;
- indication of 'applicability of "lists of PLMN(s) to be used in disaster condition" provided by a VPLMN';
- VPS URSP configuration;
- indication of whether interworking without N26 interface is supported;
- signalled ProSeP (see 3GPP TS 24.555 [19F]) and, for each ProSeP info (see subclause 5.2 of 3GPP TS 24.554 [19E]) of the signalled ProSeP, a UPSI of a UE policy section in which the ProSeP info of the signalled ProSeP was received;
- signalled V2XP (see 3GPP TS 24.588 [19C]) and, for each V2X info (see subclause 5.2 of 3GPP TS 24.588 [19C]) of the signalled V2XP, a UPSI of a UE policy section in which the V2X info of the signalled V2XP was received;
- signalled A2XP (see 3GPP TS 24.578 [61]) and, for each A2X info (see subclause 5.2 of 3GPP TS 24.577 [61]) of the signalled A2XP, a UPSI of a UE policy section in which the A2X info of the signalled A2XP was received; and
- signalled RSLPP (see 3GPP TS 24.514 [62]) and a UPSI of a UE policy section in which the signalled RSLPP was received.

The following 5GMM parameters should be stored in a non-volatile memory in the ME together with the SUPI from the USIM:

- allowed NSSAI(s); and
- partially allowed NSSAI(s).

The following 5GMM parameters may be stored in a non-volatile memory in the ME together with the SUPI from the USIM:

- N3AN node configuration information of HPLMN signalled ANDSP (see 3GPP TS 24.526 [19]) and a UPSI of a UE policy section in which the N3AN node configuration information of HPLMN signalled ANDSP was received.

Each configured NSSAI consists of S-NSSAI(s) stored together with a PLMN identity, if it is associated with a PLMN. The UE shall store the S-NSSAI(s) of the HPLMN. If the UE is in the VPLMN, the UE shall also store the configured NSSAI for the current PLMN and any necessary mapped S-NSSAI(s). The configured NSSAI(s) can only be used if the SUPI from the USIM matches the SUPI stored in the non-volatile memory of the ME; else the UE shall delete the configured NSSAI(s). A configured NSSAI may be associated with NSSRG information, S-NSSAI location validity information, S-NSSAI time validity information, NSAG information and on-demand NSSAI.

Each NSSAI inclusion mode is associated with a PLMN identity and access type. The NSSAI inclusion mode(s) can only be used if the SUPI from the USIM matches the SUPI stored in the non-volatile memory of the ME; else the UE shall delete the NSSAI inclusion mode(s).

The MPS indicator is stored together with a PLMN identity of the PLMN that provided it, and is valid in that RPLMN or equivalent PLMN. The MPS indicator can only be used if the SUPI from the USIM matches the SUPI stored in the non-volatile memory of the ME, else the UE shall delete the MPS indicator.

The MCS indicator is stored together with a PLMN identity of the PLMN that provided it, and is valid in that RPLMN or equivalent PLMN. The MCS indicator can only be used if the SUPI from the USIM matches the SUPI stored in the non-volatile memory of the ME, else the UE shall delete the MCS indicator.

Operator-defined access category definitions are stored together with a PLMN identity of the PLMN that provided them, and is valid in that PLMN or equivalent PLMN. The operator-defined access category definitions can only be used if the SUPI from the USIM matches the SUPI stored in the non-volatile memory of the ME, else the UE shall delete the operator-defined access category definitions. The maximum number of stored operator-defined access category definitions is UE implementation dependent.

Each network-assigned UE radio capability ID is stored together with a PLMN identity of the PLMN that provided it as well as a mapping to the corresponding UE radio configuration, and is valid in that PLMN. A network-assigned UE radio capability ID can only be used if the SUPI from the USIM matches the SUPI stored in the non-volatile memory of the ME, else the UE shall delete the network-assigned UE radio capability ID. The UE shall be able to store at least the last 16 received network-assigned UE radio capability IDs. There shall be only one network-assigned UE radio capability ID stored for a given combination of PLMN identity and UE radio configuration and any existing UE radio capability ID shall be deleted when a new UE radio capability ID is added for the same combination of PLMN identity and UE radio configuration. If the UE receives a network-assigned UE radio capability ID with a Version ID value different from the value included in the network-assigned UE radio capability ID(s) stored at the UE for the serving PLMN, the UE may delete these stored network-assigned UE radio capability ID(s).

The allowed NSSAI(s) can be stored in a non-volatile memory in the ME together with the SUPI from the USIM. Allowed NSSAI consists of S-NSSAI(s) stored together with a PLMN identity, if it is associated with a PLMN. If the allowed NSSAI is stored, then the UE shall store the S-NSSAI(s) of the HPLMN. If the UE is in the VPLMN, the UE shall also store the allowed NSSAI for the serving PLMN and any necessary mapping of the allowed NSSAI for the serving PLMN to the S-NSSAI(s) of the HPLMN. The allowed NSSAI(s) can only be used if the SUPI from the USIM matches the SUPI stored in the non-volatile memory of the ME; else the UE shall delete the allowed NSSAI(s).

The partially allowed NSSAI(s) can be stored as allowed NSSAI(s) in a non-volatile memory in the ME together with the SUPI from the USIM. Partially allowed NSSAI consists of allowed S-NSSAI(s) and for each S-NSSAI a list of TAs for which the S-NSSAI is allowed, together with a PLMN identity.

If the UE is registered for emergency services, the UE shall not store the 5GMM parameters described in this annex on the USIM or in non-volatile memory. Instead the UE shall temporarily store these parameters locally in the ME and the UE shall delete these parameters when the UE is deregistered from emergency services (e.g. before registering for normal service).

If the UE is configured for eCall only mode as specified in 3GPP TS 31.102 [22], the UE shall not store the 5GMM parameters described in this annex on the USIM or in non-volatile memory. Instead the UE shall temporarily store these parameters locally in the ME and the UE shall delete these parameters when the UE enters 5GMM-DEREGISTERED, eCALL-INACTIVE state, the UE is switched-off or the USIM is removed.

The "CAG information list" can only be used if the SUPI from the USIM matches the SUPI stored in the non-volatile memory of the ME; else the UE shall delete the "CAG information list".

The handling of the SOR-CMCI stored in the non-volatile memory in the ME is specified in 3GPP TS 23.122 [5].

Each "list of PLMN(s) to be used in disaster condition" is stored together with the PLMN identity of the PLMN that provided it. The stored lists of type "list of PLMN(s) to be used in disaster condition" can only be used if the SUPI from the USIM matches the SUPI stored in the non-volatile memory of the ME; else the UE shall delete the lists of type "list of PLMN(s) to be used in disaster condition". The UE shall store at least the "list of PLMN(s) to be used in disaster condition" provided by the HPLMN or EHPLMN. If the 'applicability of "lists of PLMN(s) to be used in disaster condition" provided by a VPLMN' is set to "true", the UE should also store the "list of PLMN(s) to be used in disaster condition" provided by the VPLMN. The maximum number of stored lists of type "list of PLMN(s) to be used in disaster condition" provided by a PLMN other than the HPLMN or EHPLMN is UE implementation dependent.

The disaster roaming wait range can only be used if the SUPI from the USIM matches the SUPI stored in the non-volatile memory of the ME; else the UE shall delete the disaster roaming wait range.

The disaster return wait range can only be used if the SUPI from the USIM matches the SUPI stored in the non-volatile memory of the ME; else the UE shall delete the disaster return wait range.

The indication of whether disaster roaming is enabled in the UE can only be used if the SUPI from the USIM matches the SUPI stored in the non-volatile memory of the ME; else the UE shall delete the indication of whether disaster roaming is enabled in the UE.

The indication of whether disaster roaming in EPS is enabled in the UE can only be used if the SUPI from the USIM matches the SUPI stored in the non-volatile memory of the ME; else the UE shall delete the indication of whether disaster roaming in EPS is enabled in the UE.

The indication of 'applicability of "lists of PLMN(s) to be used in disaster condition" provided by a VPLMN' can only be used if the SUPI from the USIM matches the SUPI stored in the non-volatile memory of the ME; else the UE shall delete the indication of 'applicability of "lists of PLMN(s) to be used in disaster condition" provided by a VPLMN'.

The indication of whether interworking without N26 interface is supported is stored together with a PLMN identity of the PLMN that provided it and is valid in that RPLMN or equivalent PLMN. The indication of whether interworking without N26 interface is supported can only be used if the SUPI from the USIM matches the SUPI stored in the non-volatile memory of the ME, else the UE shall delete the indication of whether interworking without N26 interface is supported.

The N3AN node configuration information of HPLMN signalled ANDSP can only be used if the SUPI from the USIM matches the SUPI stored in the non-volatile memory of the ME, else the UE shall delete the N3AN node configuration information of HPLMN signalled ANDSP.

C.2 Storage of 5GMM information for UEs operating in SNPN access operation mode

The 5GMM information for UEs operating in SNPN access operation mode and not registering or registered for the onboarding service in SNPN are stored according to the following conditions:

- if the UE does not support access to an SNPN using credentials from a credentials holder and equivalent SNPNs, the following 5GMM parameters shall be stored per subscribed SNPN in a non-volatile memory in the ME together with the subscriber identifier associated with the SNPN identity of the SNPN in the "list of subscriber data" configured in the ME (see 3GPP TS 23.122 [5]) or with the SUPI from the USIM if no subscriber identifier is configured in the entry of the "list of subscriber data" associated with the SNPN identity and the UE has a valid USIM; and
 - if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, the following 5GMM parameters shall be stored in a non-volatile memory in the ME per:
 - i) the subscribed SNPN together with the subscriber identifier associated with the selected entry in the "list of subscriber data" configured in the ME (see 3GPP TS 23.122 [5]) or with the SUPI from the USIM if no subscriber identifier is configured in the selected entry of the "list of subscriber data" configured in the ME and the UE has a valid USIM; or
 - ii) if the UE supports access to an SNPN using credentials from a credentials holder, the PLMN subscription together with the SUPI from the USIM which is associated with the PLMN subscription:
- a) 5G-GUTI;
 - a1) NID of the registered SNPN;
 - b) last visited registered TAI;
 - c) 5GS update status;
 - d) 5G NAS security context parameters from a full native 5G NAS security context (see 3GPP TS 33.501 [24]);
 - e) K_{AUSF} and K_{SEAF} (see 3GPP TS 33.501 [24]);
 - f) UE parameter update counter (see subclause 9.11.3.53A);

- g) configured NSSAI(s);
- g1) NSSRG information;
- g2) S-NSSAI time validity information;
- g3) S-NSSAI location validity information;
- g4) on-demand NSSAI;
- h) NSSAI inclusion mode(s);
- i) MPS indicator;
- j) MCS indicator;
- k) operator-defined access category definitions;
- l) network-assigned UE radio capability IDs;
- m) zero or more instances of signalled URSP (see 3GPP TS 24.526 [19]), each associated with a non-subscribed SNPN or, the subscribed SNPN, which provided the URSP and, for each URSP rule of the signalled URSP, a UPSI of a UE policy section in which the URSP rule was received;
- m1) zero or more instances of pre-configured URSP rules (see 3GPP TS 24.526 [19]), each associated with the subscribed SNPN or the HPLMN, which provided the URSP;
- n) optionally a non-subscribed SNPN signalled URSP handling indication indicating whether the UE is allowed to accept URSP signalled by non-subscribed SNPNs;
- o) "permanently forbidden SNPNs" list;
- o1) "permanently forbidden SNPNs for access for localized services in SNPN" list;
- p) "temporarily forbidden SNPNs" list;
- p1) "temporarily forbidden SNPNs for access for localized services in SNPN" list;
- q) SOR counter (see subclause 9.11.3.51);
- r) SOR-CMCI;
- s) optionally, the SNPN selection parameters associated with the PLMN subscription (see 3GPP TS 23.122 [5] subclause 4.9.3.0); and
- t) signalled ProSeP (see 3GPP TS 24.555 [19F]) and, for each ProSeP info (see subclause 5.2 of 3GPP TS 24.554 [19F]) of the signalled ProSeP, a UPSI of a UE policy section in which the ProSeP info of the signalled ProSeP was received.

The 5GMM information for UEs operating in SNPN access operation mode and registering or registered for the onboarding service in SNPN are stored as follows:

- a) 5G-GUTI;
- b) last visited registered TAI;
- c) 5GS update status;
- d) 5G NAS security context parameters from a full native 5G NAS security context (see 3GPP TS 33.501 [24]);
- e) K_{AUSF} and K_{SEAF} (see 3GPP TS 33.501 [24]);
- f) UE parameter update counter (see subclause 9.11.3.53A);
- g) network-assigned UE radio capability IDs;
- h) "permanently forbidden SNPNs for onboarding services in SNPN" list; and

- i) "temporarily forbidden SNPNs for onboarding services in SNPN" list.

The 5GMM information for UEs operating in SNPN access operation mode are stored according to the following conditions:

- if the UE does not support access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, the following 5GMM parameters should be stored per subscribed SNPN in a non-volatile memory in the ME together with the subscriber identifier associated with the SNPN identity of the SNPN in the "list of subscriber data" configured in the ME (see 3GPP TS 23.122 [5]) or with the SUPI from the USIM if no subscriber identifier is configured in the entry of the "list of subscriber data" associated with the SNPN identity and the UE has a valid USIM; and
- if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, the following 5GMM parameters should be stored in a non-volatile memory in the ME per:
 - i) the subscribed SNPN together with the subscriber identifier associated with the selected entry in the "list of subscriber data" configured in the ME (see 3GPP TS 23.122 [5]) or with the SUPI from the USIM if no subscriber identifier is configured in the selected entry of the "list of subscriber data" configured in the ME and the UE has a valid USIM; or
 - ii) if the UE supports access to an SNPN using credentials from a credentials holder, the PLMN subscription together with the SUPI from the USIM which is associated with the PLMN subscription:
 - a) allowed NSSAI(s).

The 5GMM information for UEs operating in SNPN access operation mode are stored according to the following conditions:

- if the UE does not support access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, the following 5GMM parameters may be stored per subscribed SNPN in a non-volatile memory in the ME together with the subscriber identifier associated with the SNPN identity of the SNPN in the "list of subscriber data" configured in the ME (see 3GPP TS 23.122 [5]) or with the SUPI from the USIM if no subscriber identifier is configured in the entry of the "list of subscriber data" associated with the SNPN identity and the UE has a valid USIM; and
- if the UE supports access to an SNPN using credentials from a credentials holder, equivalent SNPNs or both, the following 5GMM parameters may be stored in a non-volatile memory in the ME per:
 - i) the subscribed SNPN together with the subscriber identifier associated with the selected entry in the "list of subscriber data" configured in the ME (see 3GPP TS 23.122 [5]) or with the SUPI from the USIM if no subscriber identifier is configured in the selected entry of the "list of subscriber data" configured in the ME and the UE has a valid USIM; or
 - ii) if the UE supports access to an SNPN using credentials from a credentials holder, the PLMN subscription together with the SUPI from the USIM which is associated with the PLMN subscription:
 - a) the N3AN node configuration information of subscribed SNPN signalled ANDSP (see 3GPP TS 24.526 [19]) and a UPSI of a UE policy section in which the N3AN node configuration information of subscribed SNPN signalled ANDSP was received.

If the 5GMM parameters are associated with the PLMN subscription, then the 5GMM parameters can only be used if the SUPI from the USIM which is associated with the selected PLMN subscription matches the SUPI stored in the non-volatile memory; else the UE shall delete the 5GMM parameters.

If the 5GMM parameters are associated with the subscribed SNPN of the entry in the "list of subscriber data", then the 5GMM parameters can only be used if the subscriber identifier of the selected entry of the "list of subscriber data" matches the subscriber identifier stored in the non-volatile memory or if the subscriber identifier from the USIM matches the subscriber identifier stored in the non volatile memory, no subscriber identifier is configured in the selected entry of the "list of subscriber data" configured in the ME and the UE has a valid USIM.

Each configured NSSAI consists of S-NSSAI(s) stored together with an SNPN identity, if it is associated with an SNPN. A configured NSSAI may be associated with NSSRG information, S-NSSAI time validity information, S-NSSAI location validity information, NSAG information and on-demand NSSAI.

Each NSSAI inclusion mode is associated with an SNPN identity and access type.

The MPS indicator is stored together with an SNPN identity of the SNPN that provided it, and is valid in that registered SNPN or equivalent SNPN.

The MCS indicator is stored together with an SNPN identity of the SNPN that provided it, and is valid in that registered SNPN or equivalent SNPN.

Operator-defined access category definitions are stored together with an SNPN identity of the SNPN that provided them, and are valid in that SNPN or equivalent SNPN. The maximum number of stored operator-defined access category definitions is UE implementation dependent.

Each network-assigned UE radio capability ID is stored together with an SNPN identity of the SNPN that provided it as well as a mapping to the corresponding UE radio configuration, and is valid in that SNPN. The UE shall be able to store at least the last 16 received network-assigned UE radio capability IDs. There shall be only one network-assigned UE radio capability ID stored for a given combination of SNPN identity and UE radio configuration and any existing UE radio capability ID shall be deleted when a new UE radio capability ID is added for the same combination of SNPN identity and UE radio configuration. If the UE receives a network-assigned UE radio capability ID with a Version ID value different from the value included in the network-assigned UE radio capability ID(s) stored at the UE for the serving SNPN, the UE may delete these stored network-assigned UE radio capability ID(s).

The handling of the SOR-CMCI stored in the non-volatile memory in the ME is specified in 3GPP TS 23.122 [5].

The allowed NSSAI(s) can be stored in a non-volatile memory in the ME. Allowed NSSAI consists of S-NSSAI(s) stored together with an SNPN identity, if it is associated with an SNPN.

The partially allowed NSSAI(s) can be stored as allowed NSSAI(s) in a non-volatile memory in the ME. Partially allowed NSSAI consists of S-NSSAI(s) and a list of TAs for which the S-NSSAI is allowed, stored together with an SNPN identity, if it is associated with an SNPN.

Annex D (normative): UE policy delivery service

D.1 General

D.1.1 Overview

The UE provides the PCF with a list of one or more stored UE policy section identifiers (UPSIs) during the UE-initiated UE state indication procedure. The UPSI is composed of two parts:

- a) a PLMN ID part containing:
 - 1) the PLMN ID for the PLMN; or
 - 2) the PLMN ID part of the SNPN identity for the SNPN;of the PCF which provides the UE policies; and
- b) a UE policy section code (UPSC) containing a value assigned by the PCF.

During the UE-initiated UE state indication procedure, the UE also provides the PCF with the UE policy related capabilities such as the UE's support for ANDSP, the UE's support for URSP provisioning in EPS, and the UE's OS Id.

During the network-requested UE policy management procedure, the PCF provides the UE with one or more UE policy sections containing UE policies. The UE processes the received UE policy sections, each identified by the UPSI, received from the PCF and informs the PCF of the result.

In the present annex, the condition that the PLMN ID part of the UPSI is referring to the HPLMN shall be considered as fulfilled only if the PLMN ID is equal to the HPLMN code derived from the IMSI.

NOTE: This is also applicable if the UE has a non-empty EHPLMN list, even if the EHPLMN list does not include the PLMN ID derived from the IMSI.

The UE can also request the PCF to provide V2XP as specified in 3GPP TS 24.587 [19B].

The UE can also request the PCF to provide ProSeP as specified in 3GPP TS 24.554 [19E].

The UE can also request the PCF to provide A2XP as specified in 3GPP TS 24.577 [60].

The UE can also request the PCF to provide RSLPP as specified in 3GPP TS 24.514 [62].

D.1.2 Principles of PTI handling for UE policy delivery service procedures

When the PCF or the UE initiates a procedure, it shall include a valid PTI value in the message header of the command message or the request message. When the UE initiates a procedure, the UE shall use a PTI value in range between 01H and 77H. When the PCF initiates a procedure, the PCF shall use a PTI value in range between 80H and FEH.

When the PCF initiates a transaction related procedure (i.e. a procedure consisting of more than one message and the messages are related), it shall include a valid PTI value in the message header of the command message.

If a response message is sent as result of a received command or request message, the UE or the PCF shall include in the response message the PTI value received within the received command or request message (see examples in figure D.1.2.1, figure D.1.2.2 and figure D.1.2.3).

If a command message is sent as result of a received request message, the PCF shall include in the command message the PTI value received with the request message (see examples in figure D.1.2.3).

Figure D.1.2.1: Network-requested transaction related procedure

Figure D.1.2.2: UE-requested transaction related procedure rejected by the network

Figure D.1.2.3: UE-requested transaction related procedure triggering a network-requested transaction related procedure

NOTE: In earlier versions of this protocol, the UE can include in the response message a PTI value which is not the same as the one received within the command message, and therefore the PCF could not associate the response message from the UE to the command message sent.

D.2 Procedures

D.2.1 Network-requested UE policy management procedure

D.2.1.1 General

The purpose of the network-requested UE policy management procedure is to enable the network to:

- a) add one or more new UE policy sections to the UE;
- b) modify one or more UE policy sections stored at the UE; or
- c) delete one or more UE policy sections stored at the UE;

and optionally to enable the HPLMN or the subscribed SNPN to provide a UE accessing the subscribed SNPN or the HPLMN with a non-subscribed SNPN signalled URSP handling indication indicating whether the UE is allowed to accept URSP signalled by non-subscribed SNPNs.

D.2.1.2 Network-requested UE policy management procedure initiation

In order to initiate the network-requested UE policy management procedure, the PCF shall:

- a) if the network-requested UE policy management procedure is triggered by the UE-requested V2X policy provisioning procedure as specified in 3GPP TS 24.587 [19B], the UE-requested ProSe policy provisioning procedure as specified in 3GPP TS 24.554 [19E] or the UE-requested A2X policy provisioning procedure as specified in 3GPP TS 24.577 [60], then set the PTI IE to the PTI value of the received UE POLICY PROVISIONING REQUEST message of the UE-requested V2X policy provisioning procedure, the UE-requested ProSe policy provisioning procedure or the UE-requested A2X policy provisioning procedure, otherwise allocate a PTI value currently not used and set the PTI IE to the allocated PTI value;
- b) encode the information about the UE policy sections to be added, modified or deleted in a UE policy section management list IE as specified in subclause D.6.2 and include it in a MANAGE UE POLICY COMMAND message;
- c) if the PCF is a PCF of the HPLMN or the subscribed SNPN, optionally include the UE policy network classmark IE in a MANAGE UE POLICY COMMAND message and set the non-subscribed SNPN signalled URSP handling indication of the UE policy network classmark IE to "UE is not allowed to accept URSP signalled by non-subscribed SNPNs", or "UE is allowed to accept URSP signalled by non-subscribed SNPNs";
- c1) if the UE supports VPS URSP, optionally encode the information about entries of VPS URSP configuration to be added, modified or deleted in the VPS URSP configuration IE as specified in subclause D.6.8 and include it in a MANAGE UE POLICY COMMAND message;
- d) send the MANAGE UE POLICY COMMAND message to the UE via the AMF as specified in 3GPP TS 23.502 [9]; and
- e) start timer T3501 (see example in figure D.2.1.2.1).

NOTE: The PCF starts a different timer T3501 for each PTI value.

Figure D.2.1.2.1: Network-requested UE policy management procedure

Upon receipt of the MANAGE UE POLICY COMMAND message with a PTI value currently not used by a network-requested UE policy management procedure, for each instruction included in the UE policy section management list IE, the UE shall:

- a) store the received UE policy section of the instruction, if the UE has no stored UE policy section associated with the same UPSI as the UPSI associated with the instruction;
- b) replace the stored UE policy section with the received UE policy section of the instruction, if the UE has a stored UE policy section associated with the same UPSI as the UPSI associated with the instruction; or
- c) delete the stored UE policy section, if the UE has a stored UE policy section associated with the same UPSI as the UPSI associated with the instruction and the UE policy section of the instruction is empty;

additionally, if the UE policy network classmark IE is included in the MANAGE UE POLICY COMMAND message, and

- a) the UE has an empty EHPLMN list or the EHPLMN list is not present, and the UE's RPLMN is the HPLMN;
- b) the UE has a non-empty EHPLMN list, and the UE's RPLMN is an EHPLMN; or
- c) the UE's RSNPN is the subscribed SNPN,

the UE shall delete the non-subscribed SNPN signalled URSP handling indication stored for the selected entry of "list of subscriber data" or the selected PLMN subscription, if any, and store the non-subscribed SNPN signalled URSP handling indication received in the UE policy network classmark IE, for the selected entry of "list of subscriber data" or the selected PLMN subscription.

If the UE supports the VPS URSP, and the VPS URSP configuration is included in the MANAGE UE POLICY COMMAND message:

- a) if the replacement type field of the received VPS URSP configuration indicates "full list of tuples", the UE shall delete the stored VPS URSP configuration, if any; and
- b) if the received VPS URSP configuration contains one or more tuples:
 - 1) if the UE does not have the stored VPS URSP configuration, the UE shall store the received VPS URSP configuration except zero or more tuples with no UPSCs; or
 - 2) otherwise:
 - i) for each tuple with a tuple ID in the stored VPS URSP configuration:
 - A) if a tuple with the tuple ID is in the received VPS URSP configuration and contains:

- no UPSCs, the UE shall delete the tuple with the tuple ID from the stored VPS URSP configuration; or
 - one or more UPSCs, the UE shall replace the tuple with the tuple ID in the stored VPS URSP configuration with the tuple with the tuple ID from the received VPS URSP configuration; or
- B) if no tuple with the tuple ID is in the received VPS URSP configuration, the UE shall keep the tuple with the tuple ID in the stored VPS URSP configuration; and
- ii) for each tuple with a tuple ID in the received VPS URSP configuration, if no tuple with the tuple ID is in the stored VPS URSP configuration and:
- A) the tuple with the tuple ID in the received VPS URSP configuration contains no UPSCs, the UE shall ignore the tuple with the tuple ID in the received VPS URSP configuration; or
 - B) the tuple with the tuple ID in the received VPS URSP configuration contains one or more UPSCs, the UE shall add the tuple with the tuple ID from the received VPS URSP configuration to the stored VPS URSP configuration.

The UE may continue storing a received UE policy section for a PLMN or SNPN when the UE registers in another PLMN or SNPN. If necessary, the UE may delete UE policy sections stored for a PLMN other than the RPLMN and the HPLMN or for an SNPN other than the registered SNPN and the subscribed SNPN, before storing the new received UE policy sections.

When storing a UE policy section received from an SNPN, the UE shall associate the NID of that SNPN with the UPSI of the stored UE policy section.

NOTE: The maximum number of UE policy sections for PLMNs or SNPNs other than the HPLMN and the RPLMN or the registered SNPN and the subscribed SNPN that the UE can store and how the UE selects the UE policy sections to be deleted are up to the UE implementation.

D.2.1.3 Network-requested UE policy management procedure accepted by the UE

If all instructions included in the UE policy section management list IE were executed successfully by the UE, the UE shall:

- a) create a MANAGE UE POLICY COMPLETE message including the PTI value received within the MANAGE UE POLICY COMMAND message; and
- b) transport the MANAGE UE POLICY COMPLETE message using the NAS transport procedure as specified in subclause 5.4.5.

Upon receipt of the MANAGE UE POLICY COMPLETE message, the PCF shall stop timer T3501. The PCF should ensure that the PTI value assigned to this procedure is not released immediately.

NOTE: The way to achieve this is implementation dependent. For example, the PCF can ensure that the PTI value assigned to this procedure is not released during the time equal to or greater than the default value of timer T3501.

D.2.1.4 Network-requested UE policy management procedure not accepted by the UE

If the UE could not execute all instructions included in the UE policy section management list IE successfully, the UE shall:

- a) set the PTI IE to the PTI value received within the MANAGE UE POLICY COMMAND message and encode the results by including:
 - 1) the UPSI associated with the instructions which could not be executed successfully;
 - 2) the failed instruction order set to order of the instruction in the UE policy section management sublist of the received UE policy section management list IE which could not be executed successfully; and

3) the cause of the failure,

in the UE policy section management result IE as specified in subclause D.6.3 and include it in a MANAGE UE POLICY COMMAND REJECT message, and

- b) transport the MANAGE UE POLICY COMMAND REJECT message using the NAS transport procedure as specified in subclause 5.4.5.

Upon receipt of the MANAGE UE POLICY COMMAND REJECT message, the PCF shall stop timer T3501. Any instruction that was included in the UE policy section management list IE but not indicated in the UE policy section management result IE of the received MANAGE UE POLICY COMMAND REJECT message, shall be considered as successfully executed.

The PCF should ensure that the PTI value assigned to this procedure is not released immediately.

NOTE: The way to achieve this is implementation dependent. For example, the PCF can ensure that the PTI value assigned to this procedure is not released during the time equal to or greater than the default value of timer T3501.

Upon receipt of the notification from the AMF that the UE is not reachable, the PCF shall stop the T3501.

D.2.1.5 Abnormal cases on the network side

The following abnormal cases can be identified:

- a) T3501 expired.

The PCF shall, on the first expiry of the timer T3501, retransmit the MANAGE UE POLICY COMMAND message and shall reset and start timer T3501. This retransmission is repeated four times, i.e. on the fifth expiry of timer T3501, the PCF shall abort the procedure and release the allocated PTI.

D.2.1.6 Abnormal cases in the UE

The following abnormal cases can be identified:

- a) Receipt of an instruction associated with a UPSI which has a PLMN ID part that is not equal to the PLMN ID of the UE's HPLMN and the instruction contains a UE policy part with a UE policy part type set to "URSP" for a UE not operating in SNPN access operation mode, or receipt of an instruction associated with a UPSI which has a PLMN ID part that is not equal to the PLMN ID part of the selected SNPN and the instruction contains a UE policy part with a UE policy part type set to "URSP" for a UE operating in SNPN access operation mode.

The UE shall set the UE policy delivery service cause to #111 "Protocol error, unspecified" for the instruction in the UE policy section management result IE of the MANAGE UE POLICY COMMAND REJECT message.

- b) Receipt of an instruction associated with a UPSI which has a PLMN ID part that is not equal to the PLMN ID of the UE's HPLMN or the UE's RPLMN and the instruction contains a UE policy part with a UE policy part type set to "ANDSP" for a UE not operating in SNPN access operation mode or receipt of an instruction associated with a UPSI which has a PLMN ID part that is not equal to the PLMN ID part of the subscribed SNPN or the UE's RSNPN and the instruction contains a UE policy part with a UE policy part type set to "ANDSP" for a UE operating in SNPN access operation mode.

The UE shall set the UE policy delivery service cause to #111 "Protocol error, unspecified" for the instruction in the UE policy section management result IE of the MANAGE UE POLICY COMMAND REJECT message.

- c) Transmission failure of the MANAGE UE POLICY COMPLETE message indication from lower layers.

The UE shall not diagnose an error and consider the network-requested UE policy management procedure is complete.

NOTE 1: Considering the network-requested UE policy management procedure is complete as the result of this abnormal case, does not cause the UE to revert the execution of the successfully executed instructions included in the MANAGE UE POLICY COMMAND message.

- d) Transmission failure of the MANAGE UE POLICY COMMAND REJECT message indication from lower layers.

The UE shall not diagnose an error and consider the network-requested UE policy management procedure is complete.

NOTE 2: Considering the network-requested UE policy management procedure is complete as the result of this abnormal case, does not cause the UE to revert the execution of the successfully executed instructions included in the MANAGE UE POLICY COMMAND message.

- e) Receipt of a MANAGE UE POLICY COMMAND message with a PTI set to the same value as the PTI of a previously received MANAGE UE POLICY COMMAND message.

The UE shall discard the message and retransmit the MANAGE UE POLICY COMMAND COMPLETE or MANAGE UE POLICY COMMAND REJECT message transmitted in response to the previously received MANAGE UE POLICY COMMAND message.

NOTE 3: The way to achieve this is UE implementation dependent. For example, the UE can assume that on the fifth expiry of timer T3501, the PCF will abort the procedure and that the PTI value assigned to the procedure will be released.

- f) Receipt of an instruction associated with a UPSI which has a PLMN ID part that is equal to the PLMN ID part of the selected SNPN, the instruction contains a UE policy part with a UE policy part type set to "URSP", UE's RSNPN is a non-subscribed SNPN and:

- 1) the UE has a stored non-subscribed SNPN signalled URSP handling indication for the selected entry of "list of subscriber data" or the selected PLMN subscription indicating that the UE is not allowed to accept URSP signalled by non-subscribed SNPNs; or
- 2) the UE does not have a stored non-subscribed SNPN signalled URSP handling indication for the selected entry of "list of subscriber data" or the selected PLMN subscription, and the non-subscribed SNPN signalled URSP handling indication preconfigured in the selected entry of "list of subscriber data" or the selected PLMN subscription indicates that the UE is not allowed to accept URSP signalled by non-subscribed SNPNs;

for a UE operating in SNPN access operation mode.

The UE shall set the UE policy delivery service cause to #111 "Protocol error, unspecified" for the instruction in the UE policy section management result IE of the MANAGE UE POLICY COMMAND REJECT message.

D.2.2 UE-initiated UE state indication procedure

D.2.2.1 General

The purpose of the UE-initiated UE state indication procedure is:

- a) to deliver the UPSI(s) of the UE policy section(s) which are:
 - identified by a UPSI with the PLMN ID part indicating the HPLMN or the selected PLMN, and stored in the UE, if any; or
 - identified by a UPSI with the PLMN ID part indicating the PLMN ID part of the SNPN identity of the selected SNPN and associated with the NID of the selected SNPN, and stored in the UE, if any;
- b) to indicate whether UE supports ANDSP;
- c) to indicate whether UE supports URSP provisioning in EPS;
- c1) to indicate whether UE supports VPS URSP;
- d) to indicate whether UE supports reporting URSP rule enforcement; and
- e) to deliver the UE's one or more OS IDs;

to the PCF.

D.2.2.2 UE-initiated UE state indication procedure initiation

In order to initiate the UE-initiated UE state indication procedure, the UE shall create a UE STATE INDICATION message. The UE:

- a) shall allocate a PTI value currently not used and set the PTI IE to the allocated PTI value;
- b) if not operating in SNPN access operation mode, shall include the UPSI(s) of the UE policy section(s) which are identified by a UPSI with the PLMN ID part indicating the HPLMN or the selected PLMN available in the UE in the UPSI list IE, if any;

NOTE 1: If the UE does not have any UE policy section which is identified by a UPSI with the PLMN ID part indicating the HPLMN or the selected PLMN, the UE sets the Length of UPSI list contents field in the UPSI list IE to zero.

- c) if operating in SNPN access operation mode, shall include UPSI(s) of the UE policy section(s) which are identified by a UPSI:

- with the PLMN ID part indicating the MCC and MNC of the selected SNPN; and
- associated with the NID of the selected SNPN;

available in the UE in the UPSI list IE, if any;

NOTE 2: If the UE does not have any UE policy section which is identified by a UPSI with the PLMN ID part indicating the MCC and MNC of the selected SNPN and associated with the NID of the selected SNPN, the UE sets the Length of UPSI list contents field in the UPSI list IE to zero.

- d) shall specify whether the UE supports ANDSP in the UE policy classmark IE;
- e) shall specify whether the UE supports URSP provisioning in EPS in the UE policy classmark IE;

NOTE 3: ANDSP and URSP are specified in 3GPP TS 24.526 [19].

- e1) if the UE supports VPS URSP, shall set the SVPSU bit to "VPS URSP supported by the UE" in the UE policy classmark IE;
- f) if the UE supports reporting URSP rule enforcement, shall set the SupportRURE bit to "Reporting URSP rule enforcement supported by the UE"; and
- g) may include the UE's one or more OS IDs in the UE OS Id IE.

The UE shall send the UE STATE INDICATION message (see example in figure D.2.2.2.1). The UE shall transport the created UE STATE INDICATION message using the registration procedure (see subclause 5.5.1).

Figure D.2.2.2.1: UE-initiated UE state indication procedure

D.2.2.3 UE-initiated UE state indication procedure accepted by the network

Upon receipt of the UE STATE INDICATION message, the PCF shall operate as described in 3GPP TS 23.502 [9] and 3GPP TS 29.525 [21].

D.2.2.4 Abnormal cases on the network side

Apart from the case described in subclause D.2.2.3, no abnormal cases have been identified.

D.3 UE policy re-assembly at the UE

When the UE needs to apply ANDSP as specified in 3GPP TS 24.502 [18], the UE shall consider all UE policy parts with ANDSP contents currently stored at the UE.

When the UE needs to apply URSP as specified in 3GPP TS 24.526 [19], the UE shall consider all UE policy parts with URSP contents currently stored at the UE.

a) if the UE supports VPS URSP then:

- 1) the UE shall consider as VPS URSP of the RPLMN all UE policy parts with URSP contents currently stored at the UE, which are a part of one or more UE policy sections identified by a UPSI:
 - i) with the PLMN ID part indicating the HPLMN; and
 - ii) with UPSC indicated in a tuple of the stored VPS URSP configuration, such that the tuple contains the network descriptor with a network descriptor entry containing:
 - A) the network descriptor entry type field set to "one or more VPLMNs" and the network descriptor entry value field containing PLMN ID of the RPLMN of an access, if the UE is registered via one or both accesses and the RPLMN of each access is a VPLMN;
 - B) the network descriptor entry type field set to "one or more MCCs" and the network descriptor entry value field containing MCC of the PLMN ID of the RPLMN of an access, if the UE is registered via one or both accesses and the RPLMN of each access is a VPLMN; or
 - C) the network descriptor entry type field set to "any VPLMN", if the UE is registered via one or both accesses and the RPLMN of each access is a VPLMN;
- 2) the UE shall consider as VPS URSP of the equivalent PLMN of the RPLMN all UE policy parts with URSP contents currently stored at the UE, which are a part of one or more UE policy sections identified by a UPSI:
 - i) with the PLMN ID part indicating the HPLMN; and
 - ii) with UPSC indicated in a tuple of the stored VPS URSP configuration, such that the tuple contains the network descriptor with a network descriptor entry containing:
 - A) the network descriptor entry type field set to "one or more VPLMNs" and the network descriptor entry value field containing PLMN ID of an equivalent PLMN, if the UE is registered via one or both accesses, the RPLMN of each access is a VPLMN and the equivalent PLMN is a VPLMN;
 - B) the network descriptor entry type field set to "one or more MCCs" and the network descriptor entry value field containing MCC of the PLMN ID of an equivalent PLMN, if the UE is registered via one or both accesses, the RPLMN of each access is a VPLMN and the equivalent PLMN is a VPLMN; or
 - C) the network descriptor entry type field set to "any VPLMN", if the UE is registered via one or both accesses, the RPLMN of each access is a VPLMN and an equivalent PLMN is a VPLMN; and
- 3) the UE shall consider as PG URSP all UE policy parts with URSP contents currently stored at the UE except zero or more UE policy parts, if any, which are a part of one or more UE policy sections identified by a UPSI:
 - i) with the PLMN ID part indicating the HPLMN; and
 - ii) with UPSC indicated in any tuple of the stored VPS URSP configuration; and

b) the UE shall consider all UE policy parts with URSP contents currently stored at the UE as the signalled URSP.

When the UE needs to apply V2XP as specified in 3GPP TS 24.588 [19C], the UE shall consider all UE policy parts with V2XP contents currently stored at the UE.

When the UE needs to apply ProSeP as specified in 3GPP TS 24.555 [19F], the UE shall consider all UE policy parts with ProSeP contents currently stored at the UE.

When the UE needs to apply A2XP as specified in 3GPP TS 24.578 [61], the UE shall consider all UE policy parts with A2XP contents currently stored at the UE.

When the UE needs to apply RSLPP as specified in 3GPP TS 24.514 [62], the UE shall consider all UE policy parts with RSLPP contents currently stored at the UE.

D.4
Void

D.5
Message functional definition and contents

D.5.1
Manage UE policy command

D.5.1.1
Message definition

The MANAGE UE POLICY COMMAND message is sent by the PCF to the UE to request the UE to manage UE policy sections, see table D.5.1.1.1

Message type: MANAGE UE POLICY COMMAND

Significance: dual

Direction: network to UE

Table D.5.1.1.1: MANAGE UE POLICY COMMAND message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	PTI	Procedure transaction identity 9.6	M	V	1
	MANAGE UE POLICY COMMAND message identity	UE policy delivery service message type D.6.1	M	V	1
	UE policy section management list	UE policy section management list D.6.2	M	LV-E	11-65533
42	UE policy network classmark	UE policy network classmark D.6.7	O	TLV	3-5
70	VPS URSP configuration	VPS URSP configuration D.6.8	O	TLV-E	3-65533
NOTE: The total length of the MANAGE UE POLICY COMMAND message content cannot exceed 65535 octets (see Payload container contents maximum length as specified in subclause 9.11.3.39.1).					

D.5.1.2
UE policy network classmark

The UE policy network classmark is included when the PCF of a PLMN or an SNPN intends to provide the UE with information about the policy aspects of the network.

D.5.1.3
VPS URSP configuration

The VPS URSP configuration IE is included when the PCF of a PLMN intends to provide the UE with the VPS URSP configuration.

D.5.2 Manage UE policy complete

D.5.2.1 Message definition

The MANAGE UE POLICY COMPLETE message is sent by the UE to the PCF to report that all received instructions have been successfully executed at the UE, see table D.5.2.1.1

Message type: MANAGE UE POLICY COMPLETE

Significance: dual

Direction: UE to network

Table D.5.2.1.1: MANAGE UE POLICY COMPLETE message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	PTI	Procedure transaction identity 9.6	M	V	1
	MANAGE UE POLICY COMPLETE message identity	UE policy delivery service message type D.6.1	M	V	1

D.5.3 Manage UE policy command reject

D.5.3.1 Message definition

The MANAGE UE POLICY COMMAND REJECT message is sent by the UE to the PCF to report that one or more instructions could not be successfully executed at the UE, see table D.5.3.1.1

Message type: MANAGE UE POLICY COMMAND REJECT

Significance: dual

Direction: UE to network

Table D.5.3.1.1: MANAGE UE POLICY COMMAND REJECT message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	PTI	Procedure transaction identity 9.6	M	V	1
	MANAGE UE POLICY COMMAND REJECT message identity	UE policy delivery service message type D.6.1.	M	V	1
	UE policy section management result	UE policy section management result D.6.3	M	LV-E	11-65533
NOTE: The total length of the MANAGE UE POLICY COMMAND REJECT message content cannot exceed 65535 octets (see Payload container contents maximum length as specified in subclause 9.11.3.39.1).					

D.5.4 UE state indication

D.5.4.1 Message definition

The UE STATE INDICATION message is sent by the UE to the PCF:

- a) to deliver the UPSI(s) of the UE policy section(s) stored in the UE;
- b) to indicate whether the UE supports ANDSP;

- c) to indicate whether the UE supports URSP provisioning in EPS in the UE policy classmark IE;
- c1) to indicate whether the UE supports VPS URSP;
- c2) to indicate whether the UE supports reporting URSP rule enforcement; and
- d) to deliver the UE's one or more OS IDs;

see table D.5.4.1.1.

Message type: UE STATE INDICATION

Significance: dual

Direction: UE to network

Table D.5.4.1.1: UE STATE INDICATION message content

IEI	Information Element	Type/Reference	Presence	Format	Length
	PTI	Procedure transaction identity 9.6	M	V	1
	UE STATE INDICATION message identity	UE policy delivery service message type D.6.1	M	V	1
	UPSI list	UPSI list D.6.4	M	LV-E	2-65531
	UE policy classmark	UE policy classmark D.6.5	M	LV	2-4
41	UE OS Id	OS Id D.6.6	O	TLV	18-242
NOTE: The total length of the UE STATE INDICATION message content cannot exceed 65535 octets (see Payload container contents maximum length as specified in subclause 9.11.3.39.1).					

D.6 Information elements coding

D.6.1 UE policy delivery service message type

Table D.6.1.1: UE policy delivery service message type

NOTE:								Coding of UE POLICY PROVISIONING REQUEST message and UE POLICY PROVISIONING REJECT message are specified in 3GPP TS 24.587 [19B]. Usage of UE POLICY PROVISIONING REQUEST message and UE POLICY PROVISIONING REJECT message for V2X policy is specified in 3GPP TS 24.587 [19B]. Usage of UE POLICY PROVISIONING REQUEST message and UE POLICY PROVISIONING REJECT message for ProSeP policy is specified in 3GPP TS 24.554 [19E]. Usage of UE POLICY PROVISIONING REQUEST message and UE POLICY PROVISIONING REJECT message for A2X policy is specified in 3GPP TS 24.577 [60]. Usage of UE POLICY PROVISIONING REQUEST message and UE POLICY PROVISIONING REJECT message for RSLPP policy is specified in 3GPP TS 24.514 [62].

D.6.2 UE policy section management list

The purpose of the UE policy section management list information element is to transfer from the PCF to the UE a list of instructions to be performed at the UE for management of UE policy section stored at the UE.

The UE policy section management list information element is coded as shown in figure D.6.2.1, figure D.6.2.2, figure D.6.2.3, figure D.6.2.4, figure D.6.2.5, figure D.6.2.6, figure D.6.2.7 and table D.6.2.1.

The UE policy section management list information element has a minimum length of 12 octets and a maximum length of 65534 octets.

Figure D.6.2.1: UE policy section management list information element

Figure D.6.2.2: UE policy section management list contents

Figure D.6.2.3: UE policy section management sublist

Figure D.6.2.4: UE policy section management sublist contents

Figure D.6.2.5: Instruction

Figure D.6.2.6: UE policy section contents

Figure D.6.2.7: UE policy part

Table D.6.2.1: UE policy section management list information element

Value part of the UE policy section management list information element (octets 4 to z)

The value part of the UE policy section management list information element consists of one or several UE policy section management sublists.

UE policy section management sublist:

Length of UE policy section management sublist (octets d to d+1)

This field contains the binary encoding of the length of the UE policy section management sublist in units of octets.

MCC, Mobile country code (octet d+2, and bits 4 to 1 of octet d+3)

The MCC field is coded as in ITU-T Recommendation E.212 [42], annex A.

MNC, Mobile network code (bits 8 to 5 of octet d+3, and octet d+4)

The coding of this field is the responsibility of each administration but BCD coding shall be used. The MNC shall consist of 2 or 3 digits. If a network operator decides to use only two digits in the MNC, MNC digit 3 shall be coded as "1111". (NOTE 1)

UE policy section management sublist contents (octets d+5 to y)

The UE policy section management sublist contents consist of one or several instructions.

Instruction:

Instruction contents length (octets d+5 to d+6)

This field contains the binary encoding of the instruction contents length in units of octets.

UPSC (octets d+7 to d+8)

This field contains the binary encoding of the UPSC. The value of the UPSC is set by the PCF.

UE policy section contents (octets d+9 to k)

The UE policy section contents consist of one or several UE policy parts.

UE policy part:

UE policy part contents length (octets q to q+1)

This field contains the binary encoding of the UE policy part contents length in units of octets (NOTE 2).

UE policy part type (bits 4 to 1 of octet q+2)

Bits

4 3 2 1

0 0 0 0 Reserved

0 0 0 1 URSP

0 0 1 0 ANDSP

0 0 1 1 V2XP

0 1 0 0 ProSeP

0 1 0 1 A2XP

0 1 1 0 RSLPP

All other values are reserved.

Bits 8 to 5 of octet q+2 are spare and shall be coded as zero.

UE policy part contents (octets q+3 to r)

This field contains a UE policy part encoded as specified in 3GPP TS 24.526 [19] for the UE policy part type field set to "URSP" or "ANDSP", in 3GPP TS 24.588 [19C] for the UE policy part type field set to "V2XP", in 3GPP TS 24.555 [19F] for the UE policy part type field set to "ProSeP" and in 3GPP TS 24.514 [62] for the UE policy part type field set to "RSLPP" and in 3GPP TS 24.578 [61] for the UE policy part type field set to "A2XP" respectively.
NOTE 1: When the PCF is in an SNPN, the PCF shall include the PLMN ID part of the SNPN identity in the UE policy section management sublist.
NOTE 2: The UE policy part contents length indicates the length of the value part of the UE policy part field (i.e. octet q+2 to octet r).

D.6.3 UE policy section management result

The purpose of the UE policy section management result information element is to transfer from the UE to the PCF information about instructions for UE policy section management which the UE could not execute successfully.

The UE policy section management result information element is coded as shown in figure D.6.3.1, figure D.6.3.2, figure D.6.3.3, figure D.6.3.4, figure D.6.3.5 and table D.6.3.1.

The UE policy section management result information element has a minimum length of 12 octets and a maximum length of 65534 octets.

Figure D.6.3.1: UE policy section management result information element

Figure D.6.3.2: UE policy section management result contents

Figure D.6.3.3: UE policy section management subresult

Figure D.6.3.4: UE policy section management subresult contents

Figure D.6.3.5: Result

Table D.6.3.1: UE policy section management result information element

Value part of the UE policy section management result information element (octets 4 to z)																			
The value part of the UE policy section management result information element consists of one or several UE policy section management subresults.																			
UE policy section management subresult:																			
Number of results (octet d)																			
This field contains the binary encoding of number of results included in the UE policy section management subresult.																			
MCC, Mobile country code (octet d+1, and bits 4 to 1 of octet d+2)																			
The MCC field is coded as in ITU-T Recommendation E.212 [42], annex A.																			
MNC, Mobile network code (bits 8 to 5 of octet d+2, and octet d+3)																			
The coding of this field is the responsibility of each administration but BCD coding shall be used. The MNC shall consist of 2 or 3 digits. If a network operator decides to use only two digits in the MNC, MNC digit 3 shall be coded as "1111". (NOTE)																			
UE policy section management subresult contents (octets d+4 to y)																			
The UE policy section management subresult contents consist of one or several results.																			
Result (octet f to f+4)																			
UPSC (octet f to f+1)																			
This field contains the binary encoding of the UPSC. The value of the UPSC is set by the PCF																			
Failed instruction order (octets f+2 to f+3)																			
This field contains the binary encoding of the order of the instruction in the UE policy section management sublist contents as specified in Figure D.6.2.4, which could not be executed successfully. The value of failed instruction order set to one indicates that the first instruction in the UE policy section management sublist contents could not be executed successfully.																			
Cause (octet f+4)																			
Bits																			
<table><tr><td>8</td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td></td></tr><tr><td>0</td><td>1</td><td>1</td><td>0</td><td>1</td><td>1</td><td>1</td><td>1</td><td>Protocol error, unspecified</td></tr></table>		8	7	6	5	4	3	2	1		0	1	1	0	1	1	1	1	Protocol error, unspecified
8	7	6	5	4	3	2	1												
0	1	1	0	1	1	1	1	Protocol error, unspecified											
The receiving entity shall treat any other value as 0110 1111, "Protocol error, unspecified".																			
NOTE:	The UE operating in the SNPN access operation mode shall include the PLMN ID part of the SNPN identity of the SNPN in the UE policy section management subresult.																		

D.6.4 UPSI list

The purpose of the UPSI list information element is to transfer from the UE to the PCF a list of UPSIs.

The UPSI list information element is coded as shown in figure D.6.4.1, figure D.6.4.2, and table D.6.4.1.

The UPSI list information element has a minimum length of 3 octets and a maximum length of 65532 octets.

NOTE: A PCF implementing a previous version of the present specification will expect the UPSI list information element to have a minimum length of 10 octets and could be unable to decode a UPSI list information element with a length of 3 octets i.e. a UPSI list information element not containing any UPSI.

Figure D.6.4.1: UPSI list information element

Figure D.6.4.2: UPSI sublist

Table D.6.4.1: UPSI list information element

Length of UPSI list contents (octets 2 to 3)	
This field indicates the length of the UPSI list contents. If no UPSIs are included in the UPSI list, the UE shall set the length of UPSI list contents to zero.	
MCC, Mobile country code (octet d+2, and bits 4 to 1 of octet d+3)	
The MCC field is coded as in ITU-T Recommendation E.212 [42], annex A.	
MNC, Mobile network code (bits 8 to 5 of octet d+3, and octet d+4)	
The coding of this field is the responsibility of each administration but BCD coding shall be used. The MNC shall consist of 2 or 3 digits. If a network operator decides to use only two digits in the MNC, MNC digit 3 shall be coded as "1111".	
(NOTE)	
UPSC (octets d+5 to d+6)	
This field contains the binary encoding of the UPSC. The value of the UPSC is set by the PCF.	
NOTE:	The UE operating in the SNPN access operation mode shall include the PLMN ID part of the SNPN identity in the UPSI sublist.

D.6.5 UE policy classmark

The purpose of the UE policy classmark information element is to provide the network with information about the policy aspects of the UE.

The UE policy classmark information element is coded as shown in figure D.6.5.1 and table D.6.5.1.

The UE policy classmark is a type 4 information element with a minimum length of 3 octets and a maximum length of 5 octets.

Figure D.6.5.1: UE policy classmark information element

Table D.6.5.1: UE policy classmark information element

Support of ANDSP by the UE (SupportANDSP) (octet 3, bit 1)	
Bit	
1	
0	ANDSP not supported by the UE
1	ANDSP supported by the UE
Support of URSP provisioning in EPS by the UE (EPSURSP) (octet 3, bit 2) (see NOTE)	
Bit	
2	
0	URSP provisioning in EPS not supported by the UE
1	URSP provisioning in EPS supported by the UE
Support of VPS URSP (SVPSU) (octet 3, bit 3)	
Bit	
3	
0	VPS URSP not supported by the UE
1	VPS URSP supported by the UE
Support of Reporting URSP Rule Enforcement by the UE (SupportRURE) (octet 3, bit 4)	
Bit	
4	
0	Reporting URSP rule enforcement not supported by the UE
1	Reporting URSP rule enforcement supported by the UE
All other bits in octet 3 to 5 are spare and shall be coded as zero, if the respective octet is included in the information element.	
NOTE: This indicator shall be ignored by an EPS receiving entity as the UE in EPS providing UE STATE INDICATION message, supports URSP provisioning in EPS.	

D.6.6 UE OS Id

The purpose of the UE OS Id information element is to provide the network with information about the OS of the UE.

The UE OS Id information element is coded as shown in figure D.6.6.1 and table D.6.6.1.

The UE OS Id is a type 4 information element with a minimum length of 18 octet and a maximum length of 242 octets.

Figure D.6.6.1: UE OS Id information element

Table D.6.6.1: UE OS Id information element

OS Id:
The OS Id is coded as a sequence of a sixteen octet OS Id value field. The OS Id value field is defined as Universally Unique IDentifier (UUID) as specified in IETF RFC 9562 [35A].

D.6.7 UE policy network classmark

The purpose of the UE policy network classmark information element is to provide the UE with information about the policy aspects of the network.

The UE policy network classmark information element is coded as shown in figure D.6.7.1 and table D.6.7.1.

The UE policy network classmark is a type 4 information element with a minimum length of 3 octets and a maximum length of 5 octets.

Figure D.6.7.1: UE policy network classmark information element

Table D.6.7.1: UE policy network classmark information element

Non-subscribed SNPN signalled URSP handling indication (NSSUI) (octet 3, bit 1) (see NOTE)	
Bits	
1	
0	UE is allowed to accept URSP signalled by non-subscribed SNPNs
1	UE is not allowed to accept URSP signalled by non-subscribed SNPNs
All other bits in octet 3 to 5 are spare and shall be coded as zero, if the respective octet is included in the information element.	
NOTE: Receiving UE shall ignore this bit, if i) UE has an empty or non-present EHPLMN list and the bit is received from the RPLMN which is not the HPLMN, ii) UE has non-empty EHPLMN list and the bit is received from the RPLMN which is not an EHPLMN or iii) the bit is received from the RSNPN which is not the subscribed SNPN.	

D.6.8 VPS URSP configuration

The purpose of the VPS URSP configuration information element is to transfer the VPS URSP configuration from the PCF to the UE. The VPS URSP configuration contains zero or more tuples. Each tuple contains the tuple ID identifying the tuple, the network descriptor identifying one or more VPLMNs, and zero or more UPSCs of HPLMN's UE policy sections which contain solely one or more UE policy parts with the UE policy part type set to "URSP", such that the URSP rules in those one or more UE policy parts are applicable to the VPLMN and its equivalent PLMN.

The VPS URSP configuration information element is coded as shown in figure D.6.8.1, figure D.6.8.2, figure D.6.8.3, figure D.6.8.4, figure D.6.8.5, figure D.6.8.6, figure D.6.8.7, figure D.6.8.8, figure D.6.8.9, and table D.6.8.1.

The VPS URSP configuration is type 6 information element with a minimum length of 3 octets and a maximum length of 65533 octets.

Figure D.6.8.4: Network descriptor entry

Figure D.6.8.5: Network descriptor entry value for network descriptor entry type set to "one or more VPLMNs"

0	0	0	0	MCC digit 3	octet (m*3+f+4) = octet g
Spare	Spare	Spare	Spare		

Figure D.6.8.9: Odd MCC

Table D.6.8.1: VPS URSP configuration information element

Replacement type (octet 4, bits 1 and 2)								
Bits								
2	1							
0	1	per-tuple replacement						
1	0	full list of tuples						
All other values are reserved.								
Tuple ID (octet a+3)								
This field contains the binary encoding of the tuple ID. The value of the tuple ID is set by the PCF.								
Network descriptor entry type (octet f+1)								
Bits								
8	7	6	5	4	3	2	1	
0	0	0	0	0	0	0	1	one or more VPLMNs
0	0	0	0	0	0	1	0	one or more MCCs
0	0	0	0	0	0	1	1	any VPLMN
All other values are reserved.								
If the network descriptor entry type field is set to "one or more VPLMNs" or "one or more MCCs", then the network descriptor entry value field is present. If the network descriptor entry type field is set to "any VPLMN", then the network descriptor entry value field is absent.								
Number of PLMN IDs (octet (f+2) of the network descriptor entry value for network descriptor entry type set to "one or more VPLMNs")								
The number of PLMN IDs field indicates the number of the PLMN IDs in the network descriptor entry value field.								
MCC, Mobile country code (octet f+6 and bits 4 to 1 of octet f+7 of the PLMN ID, octet f+6 and bits 4 to 1 of octet f+7 of the MCC pair, and octet f+8 and bits 8 to 5 of octet f+7 of the MCC pair, octet m*3+f+3 and bits 4 to 1 of m*3+f+4 of the odd MCC)								
The MCC field is coded as in ITU-T Recommendation E.212 [42], annex A.								
MNC, Mobile network code (bits 8 to 5 of octet f+7, and octet f+8)								
The coding of this field is the responsibility of each administration but BCD coding shall be used. The MNC shall consist of 2 or 3 digits. If a network operator decides to use only two digits in the MNC, MNC digit 3 shall be coded as "1111".								
Number of MCCs (octet (f+2) of the network descriptor entry value for network descriptor entry type set to "one or more MCCs")								
The number of MCCs field indicates the number of the MCCs in the network descriptor entry value field. If the number of MCCs field is an odd value, then the odd MCC field is present otherwise the odd MCC field is absent.								
UPSC (octets e+3 to e+4)								
This field contains the binary encoding of the UPSC of an UPSI of a UE policy section of the HPLMN (see NOTE), which contains solely one or more UE policy parts with the UE policy part type set to "URSP", such that the URSP rules in those one or more UE policy parts are applicable to the VPLMN and its equivalent PLMN.								
NOTE: PLMN ID of the UPSI is not indicated.								

D.7 Timers of UE policy delivery service

Timers of UE policy delivery service are shown in table D.7.1.

Table D.7.1: Timers of UE policy delivery service – PCF side

TIMER NUM.	TIMER VALUE	CAUSE OF START	NORMAL STOP	ON THE 1 st , 2 nd , 3 rd , 4 th EXPIRY
T3501	NOTE 1	Transmission of MANAGE UE POLICY COMMAND	MANAGE UE POLICY COMMAND COMPLETE or MANAGE UE POLICY COMMAND REJECT message received	Retransmission of MANAGE UE POLICY COMMAND message
NOTE 1: The value of this timer is network dependent.				

D.8 Handling of unknown, unforeseen, and erroneous UPDS data

D.8.1 General

The procedures specified in the subclause apply to those messages which pass the checks described in this subclause.

This subclause also specifies procedures for the handling of unknown, unforeseen, and erroneous UPDS data by the receiving entity. These procedures are called "error handling procedures", but in addition to providing recovery mechanisms for error situations they define a compatibility mechanism for future extensions of the UPDS.

Subclauses D.8.1 to D.8.8 shall be applied in order of precedence.

Detailed error handling procedures in the network are implementation dependent and may vary from PLMN to PLMN. However, when extensions of UPDS are developed, networks are assumed to have the error handling which is indicated in this subclause as mandatory ("shall") and that is indicated as strongly recommended ("should").

Also, the error handling of the network is only considered as mandatory or strongly recommended when certain thresholds for errors are not reached during a dedicated connection.

For definition of semantical and syntactical errors see 3GPP TS 24.007 [11], subclause 11.4.2.

D.8.2 Message too short or too long

D.8.2.1 Message too short

When a message is received that is too short to contain a complete message type information element, that message shall be ignored, c.f. 3GPP TS 24.007 [11].

D.8.2.2 Message too long

The maximum size of a UE policy delivery service message is 65535 octets.

D.8.3 Unknown or unforeseen procedure transaction identity

D.8.3.1 Procedure transaction identity

The following network procedures shall apply for handling an unknown, erroneous, or unforeseen PTI received in a UPDS message:

- a) In case the network receives a MANAGE UE POLICY COMPLETE message or MANAGE UE POLICY COMMAND REJECT message in which the PTI value is an assigned or unassigned value that does not match any PTI in use, the network shall ignore the UPDS message.
- b) In case the network receives a UPDS message in which the PTI value is a reserved value, the network shall ignore the UPDS message.

The following UE procedures shall apply for handling an unknown, erroneous, or unforeseen PTI received in a UPDS message:

- a) In case the UE receives a UPDS message in which the PTI value is a reserved value, the UE shall ignore the UPDS message.

D.8.4 Unknown or unforeseen message type

If the UE or the network receives a UPDS message with message type not defined for the UPDS or not implemented by the receiver, it shall ignore the UPDS message.

NOTE: A message type not defined for the UPDS in the given direction is regarded by the receiver as a message type not defined for the UPDS, see 3GPP TS 24.007 [11].

If the UE receives a message not compatible with the UPDS state, the UE shall ignore the UPDS message.

If the network receives a message not compatible with the UPDS state, the network actions are implementation dependent.

D.8.5 Non-semantical mandatory information element errors

D.8.5.1 Common procedures

When on receipt of a message,

- a) an "imperative message part" error; or
- b) a "missing mandatory IE" error

is diagnosed or when a message containing:

- a) a syntactically incorrect mandatory IE;
- b) an IE with an IEI unknown in the message, but encoded as "comprehension required" (see 3GPP TS 24.007 [11]); or
- c) an out of sequence IE encoded as "comprehension required" (see 3GPP TS 24.007 [11]) is received,

the UE shall ignore the UPDS message;

the network shall proceed as follows:

the network shall:

- 1) try to treat the message (the exact further actions are implementation dependent); or
- 2) ignore the message.

D.8.6 Unknown and unforeseen IEs in the non-imperative message part

D.8.6.1 IEs unknown in the message

The UE shall ignore all IEs unknown in a message which are not encoded as "comprehension required" (see 3GPP TS 24.007 [11]).

The network shall take the same approach.

D.8.6.2 Out of sequence IEs

The UE shall ignore all out of sequence IEs in a message which are not encoded as "comprehension required" (see 3GPP TS 24.007 [11]).

The network should take the same approach.

D.8.6.3 Repeated IEs

If an information element with format T, TV, TLV, or TLV-E is repeated in a message in which repetition of the information element is not specified in subclause D.5, the UE shall handle only the contents of the information element appearing first and shall ignore all subsequent repetitions of the information element. When repetition of information elements is specified, the UE shall handle only the contents of specified repeated information elements. If the limit on repetition of information elements is exceeded, the UE shall handle the contents of information elements appearing first up to the limit of repetitions and shall ignore all subsequent repetitions of the information element.

The network should follow the same procedures.

D.8.7 Non-imperative message part errors

This category includes:

- a) syntactically incorrect optional IEs; and
- b) conditional IE errors.

D.8.7.1 Syntactically incorrect optional IEs

The UE shall treat all optional IEs that are syntactically incorrect in a message as not present in the message.

The network shall take the same approach.

D.8.7.2 Conditional IE errors

When upon receipt of a UPDS message the UE diagnoses a "missing conditional IE" error or an "unexpected conditional IE" error, or when it receives a UPDS message containing at least one syntactically incorrect conditional IE, the UE shall ignore the message.

When the network receives a message and diagnoses a "missing conditional IE" error or an "unexpected conditional IE" error or when it receives a message containing at least one syntactically incorrect conditional IE, the network shall either:

- a) try to treat the message (the exact further actions are implementation dependent); or
- b) ignore the message.

D.8.8 Messages with semantically incorrect contents

When a message with semantically incorrect contents is received, the UE shall perform the foreseen reactions of the procedural part of subclauses D.2. If, however no such reactions are specified, the UE shall ignore the message.

The network should follow the same procedure.

Annex E (informative): Void

Annex F (informative): Change history

Change history

2025-06	CT#108	CP-251170	6904	3	F	Abnormal case handling for Tso timer expiry when MRU ongoing	19.3.0
2025-09	CT#109	CP-252154	6940	-	F	Correcting wrong capability bit related to 5G ProSe layer-2 intermediate UE-to-network relay UE	19.4.0
2025-09	CT#109	CP-252144	6949	-	F	Restrictions by local regulations for emergency service	19.4.0
2025-09	CT#109	CP-252167	6952	-	B	Update of UE parameters update transparent container with Disaster Roaming Enabled Indication in EPS	19.4.0
2025-09	CT#109	CP-252144	6956	-	F	Unexpected MM cause for CIOT user data container	19.4.0
2025-09	CT#109	CP-252144	6958	-	F	Extend faster service recovery to CustomLLFailureRetry5G	19.4.0
2025-09	CT#109	CP-252144	6977	-	F	Conditions to include Additional information IE in UL NAS TRANSPORT message	19.4.0
2025-09	CT#109	CP-252155	6997	-	F	Correction to the handling of the EMM parameters in eCALL-INACTIVE state.	19.4.0
2025-09	CT#109	CP-252144	7003	-	F	Various corrections	19.4.0
2025-09	CT#109	CP-252144	7003	-	F	Various corrections	19.4.0
2025-09	CT#109	CP-252142	6967	1	F	Access technology utilization control IE in periodic registration	19.4.0
2025-09	CT#109	CP-252142	6976	1	F	Consistent usage of term access technology	19.4.0
2025-09	CT#109	CP-252142	6980	1	D	Clarification on general clause of access technology utilization control	19.4.0
2025-09	CT#109	CP-252142	6988	1	D	Editorial correction in Access utilization control information	19.4.0
2025-09	CT#109	CP-252142	7009	1	F	Clarify NW requirement in applying access technology utilization control	19.4.0
2025-09	CT#109	CP-252155	7006	1	F	Correction to MA PDU session establishment and modification	19.4.0
2025-09	CT#109	CP-252159	6939	1	F	Not allowing MPQUIC-E functionality for home-routed MA PDU sessions of type Ethernet	19.4.0
2025-09	CT#109	CP-252149	6986	1	F	Updates to N3DCI	19.4.0

2025-09	CT#109	CP-252149	6993	1	F	QoS differentiation for non-3GPP device identifiers clean up	19.4.0
2025-09	CT#109	CP-252149	6994	1	B	Procedure update for QoS differentiation of non-3GPP device identifiers	19.4.0
2025-09	CT#109	CP-252137	6973	1	A	User plane reactivation for always-on PDU session	19.4.0
2025-09	CT#109	CP-252137	6945	2	A	User plane resource request is prohibited for an always-on PDU session associated with an S-NSSAI not allowed by S-NSSAI location validity information	19.4.0
2025-09	CT#109	CP-252155	7001	1	F	Terminology alignment for ATSSS-LL steering functionality	19.4.0
2025-09	CT#109	CP-252160	6991	1	F	Term defined for IP PDU session type and minor fixes in ECN marking for L4S indication IE	19.4.0
2025-09	CT#109	CP-252160	6992	1	F	Correction to the RTCP packet type range	19.4.0
2025-09	CT#109	CP-252146	6975	1	F	Wording corrections for indirect network sharing clause	19.4.0
2025-09	CT#109	CP-252146	6780	3	F	Clarification of supported EHPLMN configurations for indirect network sharing	19.4.0
2025-09	CT#109	CP-252148	6948	1	B	Initial paging with priority in 5GS	19.4.0
2025-09	CT#109	CP-252132	6963	1	A	Correction on the additional info IE handling for UPP-CMI container type	19.4.0
2025-09	CT#109	CP-252144	6981	1	F	Clarification for the unavailability period	19.4.0
2025-09	CT#109	CP-252144	6983	1	F	Correction about the Discontinuous coverage maximum time offset IE	19.4.0
2025-09	CT#109	CP-252144	6990	1	F	Emergency call delay over 3GPP with ongoing procedure over non-3GPP	19.4.0
2025-09	CT#109	CP-252144	6767	4	F	5GSM sublayer operation upon receiving an indication that the CIoT user data was not forwarded due to congestion control and a timer value from the 5GMM sublayer	19.4.0
2025-09	CT#109	CP-252155	6989	1	F	Local de-registration during unavailability period in 5G.	19.4.0
2025-09	CT#109	CP-252144	6947	1	F	Enabling N1 mode capability when slice is available	19.4.0
2025-09	CT#109	CP-252144	6938	1	F	Clarification regarding providing replaced S-NSSAI in 5GSM signalling	19.4.0
2025-09	CT#109	CP-252149	6960	2	B	Connection information for QoS differentiation in PDU session modification procedure, coding	19.4.0
2025-09	CT#109	CP-252149	6985	2	F	Clarifications on non-3GPP device ID binding	19.4.0
2025-09	CT#109	CP-252144	6955	2	F	Emergency service fallback condition for attempt counters	19.4.0
2025-09	CT#109	CP-252142	6966	2	F	Current TAI is not stored in list of 5GS forbidden tracking areas for roaming	19.4.0
2025-09	CT#109	CP-252144	6969	2	F	Update to the handling of 5GSM status with #43	19.4.0
2025-09	CT#109	CP-252144	7002	2	F	Using CustomLLFailureRetry5G leaf in an equivalent PLMN	19.4.0
2025-09	CT#109	CP-252167	6950	3	B	Updates to registration procedure	19.4.0
2025-09	CT#109	CP-252149	6995	1	F	Resolving EN on VLAN tag id not allowed	19.4.0
2025-09	CT#109	CP-252167	6951	3	B	Update of Generic UE configuration update procedure	19.4.0
2025-09	CT#109	CP-252144	6825	4	F	slice deregistration inactivity timer value update clarification	19.4.0
2025-09	CT#109	CP-252155	6953	2	B	NW capability for multiple LCS-UPP connections per UE	19.4.0
2025-09	CT#109	CP-252142	6941	3	F	UE behaviour if both the Forbidden TAI(s) for the list of 5GS forbidden tracking areas for roaming IE and the Access technology utilization control IE are included	19.4.0
2025-09	CT#109	CP-252144	7005	2	F	Removal of forbidden SNPN lists upon expiry of T3245	19.4.0
2025-09	CT#109	CP-252159	7008	2	F	Correction on evaluation logic for steering functionalities	19.4.0
2025-09	CT#109	CP-252213	6942	4	F	Collision of registration and MT SM procedure	19.4.0
2025-12	CT#110	CP-253104	7018	-	F	MINT_Ph2: definition of MINT-EPS	19.5.0

2025-12	CT#110	CP-253076	7036	-	F	Deletion of forbidden PLMNs from list of equivalent PMNs when UE is registered for disaster roaming services	19.5.0
2025-12	CT#110	CP-253076	7042	-	F	Corrections to the 5GS mobile identity	19.5.0
2025-12	CT#110	CP-253118	7050	-	F	Correction to the Non-3GPP device identifier connection information IE	19.5.0
2025-12	CT#110	CP-253076	7053	-	F	Correction regarding ID_UAS	19.5.0
2025-12	CT#110	CP-253089	7020	1	A	Temporarily unavailable slice handling for non-supporting UE	19.5.0
2025-12	CT#110	CP-253118	7023	1	F	Determine which PDU session to use for non-3GPP device traffic	19.5.0
2025-12	CT#110	CP-253118	7031	1	F	Clarifications on the QoS differentiation of traffic for non-3GPP device(s)	19.5.0
2025-12	CT#110	CP-253076	7013	1	F	Correction of wrong term QoS rule	19.5.0
2025-12	CT#110	CP-253076	7016	1	F	PSAP emergency callback interaction with MICO mode	19.5.0
2025-12	CT#110	CP-253076	7024	1	F	Additional information IE setting for UL UPP-CMI container	19.5.0
2025-12	CT#110	CP-253120	7025	1	F	CUC: Conditions when to perform MRU via existing N1 signalling connection	19.5.0
2025-12	CT#110	CP-253120	7030	1	F	Clarification on handling of exemptions for high priority access	19.5.0
2025-12	CT#110	CP-253120	7032	1	F	Correction of codepoint	19.5.0
2025-12	CT#110	CP-253120	7046	1	F	Clarification to T3584 handling when removing S-NSSAI from allowed NSSAI	19.5.0
2025-12	CT#110	CP-253120	7049	1	F	SMF considering PDU session released	19.5.0
2025-12	CT#110	CP-253120	7054	1	F	Clarification to UE handling of collision between registration and de-registration procedure.	19.5.0
2025-12	CT#110	CP-253120	7043	2	F	Clarification on UE requested modification or deletion on TFT	19.5.0
2025-12	CT#110	CP-253120	7047	2	F	PDU session inactive handling for DL TRANSPORT	19.5.0
2025-12	CT#110	CP-253114	6943	4	F	UE actions upon 5G-GUTI deletion	19.5.0
2025-12	CT#110	CP-253120	7045	2	F	Clarification to network behavior when UL NAS TRANSPORT message is received with a PDU session in inactive state	19.5.0
2025-12	CT#110	CP-253127	7066	-	F	Correction in handling AUTHENTICATION REJECT message by a UE configured to use T3245	19.5.0
2025-12	CT#110	CP-253115	7072	-	F	Slice value setting in EHPLMN case	19.5.0
2025-12	CT#110	CP-253118	7085	-	F	Fixing non-3GPP device identifier connection information IE name	19.5.0
2025-12	CT#110	CP-253076	7088	-	F	Correction to PDU set based handling	19.5.0
2025-12	CT#110	CP-253076	7090	-	F	Correction of condition for sending the HPAOP bit	19.5.0
2025-12	CT#110	CP-253076	7092	-	F	Correction of IE length for Service-level AA container in Service-level authentication command/complete message	19.5.0
2025-12	CT#110	CP-253089	7074	1	A	AMF initiation of UCU procedure for network slice replacement	19.5.0
2025-12	CT#110	CP-253089	7076	1	A	Network slice replacement for partially allowed NSSAI	19.5.0
2025-12	CT#110	CP-253082	7035	3	F	Deletion of access technology utilization when UE supported access technology is restricted	19.5.0
2025-12	CT#110	CP-253097	7093	1	F	Add MPQUIC related references	19.5.0
2025-12	CT#110	CP-253118	7086	1	F	Length updates in Non-3GPP device information IE	19.5.0
2025-12	CT#110	CP-253118	7087	1	C	Suspending QoS differentiation for non-3GPP device identifier	19.5.0
2025-12	CT#110	CP-253076	7037	4	F	slice deregistration inactivity timer value update clarification	19.5.0
2025-12	CT#110	CP-253127	7061	2	F	Correcting references for encoding of parameters related to ECSP information	19.5.0
2025-12	CT#110	CP-253082	7102	3	F	Correction to the removal of RAT utilization control for EPLMN(s)	19.5.0

2025-12	CT#110	CP-253104			Update of MINT clause for MINT-EPS handling	Update of MINT clause for MINT-EPS handling	19.5.0
			7080	1			
2025-12	CT#110	CP-253076	7068	2	F	Switch off deregistration and registration collision	19.5.0
2025-12	CT#110	CP-253076	7100	2	F	Correction on N1 NAS signalling connection definition	19.5.0
2025-12	CT#110	CP-253076	7065	3	F	Clarification of NAS message ciphering	19.5.0
2025-12	CT#110	CP-253211	7060	2	F	Clarification for supported V2X capabilities in 5GS	19.5.0
2025-12	CT#110	CP-253172	7098	1	F	Correction on TFT operation	19.5.0
