# Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

In the present document, modal verbs have the following meanings:

- shall** indicates a mandatory requirement to do something
- shall not** indicates an interdiction (prohibition) to do something

The constructions "shall" and "shall not" are confined to the context of normative provisions, and do not appear in Technical Reports.

The constructions "must" and "must not" are not used as substitutes for "shall" and "shall not". Their use is avoided insofar as possible, and they are not used in a normative context except in a direct citation from an external, referenced, non-3GPP document, or so as to maintain continuity of style when extending or modifying the provisions of such a referenced document.

- should** indicates a recommendation to do something
- should not** indicates a recommendation not to do something
- may** indicates permission to do something
- need not** indicates permission not to do something

The construction "may not" is ambiguous and is not used in normative elements. The unambiguous constructions "might not" or "shall not" are used instead, depending upon the meaning intended.

- can** indicates that something is possible
- cannot** indicates that something is impossible

The constructions "can" and "cannot" are not substitutes for "may" and "need not".

- will** indicates that something is certain or expected to happen as a result of action taken by an agency the behaviour of which is outside the scope of the present document
- will not** indicates that something is certain or expected not to happen as a result of action taken by an agency the behaviour of which is outside the scope of the present document
- might** indicates a likelihood that something will happen as a result of action taken by some agency the behaviour of which is outside the scope of the present document

**might not** indicates a likelihood that something will not happen as a result of action taken by some agency the behaviour of which is outside the scope of the present document

In addition:

**is** (or any other verb in the indicative mood) indicates a statement of fact

**is not** (or any other negative verb in the indicative mood) indicates a statement of fact

The constructions "is" and "is not" do not indicate requirements.

## Introduction

The present document is part of a TS-family covering the 3rd Generation Partnership Project Technical Specification Group Services and System Aspects Management and orchestration of networks, as identified below:

TS 28.540: Management and orchestration of 5G networks; Network Resource Model (NRM); Stage 1.

**TS 28.541: Management and orchestration of 5G networks; Network Resource Model (NRM); Stage 2 and stage 3.**

---

# 1 Scope

The present document specifies the Information Model and Solution Set for the Network Resource Model (NRM) definitions of NR, NG-RAN, 5G Core Network (5GC) and network slice, to fulfil the requirements identified in TS 28.540 [10].

The Information Model defines the semantics and behaviour of information object class attributes and relations visible on the management interfaces in a protocol and technology neutral way. And Solution Set defines one or more solution set(s) with specific protocol(s) according to the Information Model definitions.

# 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

## 4.2 Class diagram

### 4.2.1 Class diagram for gNB and en-gNB

#### 4.2.1.1 Relationships

This clause depicts the set of classes (e.g. IOCs) that encapsulates the information relevant for this gNB and en-gNB. For the UML semantics, see 3GPP TS 32.156 [43]. Subsequent clauses provide more detailed specification of various aspects of these classes.

The model fragments are for management representation of gNB and en-gNB for all NG-RAN deployment scenario as listed below.

- Non-split NG-RAN deployment scenario, represents the gNB defined in TS 38.401[4]. In this scenario, a gNB is represented by a combination of a GNBCUCPFunction, one or more GNBCUUPFunctions and one or more GNBDUFunctions.

- 2-split NG-RAN deployment scenario, represents the gNB consist of gNB-CU and gNB-DU defined in TS 38.401[4] clause 6.1.1. In this scenario, a gNB-CU is represented by a combination of a GNBCUCPFunction and one or more GNBCUUPFunctions, whereas a gNB-DU is represented by a GNBDUFunction.
- 3-split NG-RAN deployment scenario, represents the gNB consist of gNB-CU-CP, gNB-CU-UP and gNB-DU defined in TS 38.401[4] clause 6.1.2. In this scenario, a gNB-CU-CP is represented by a GNBCUCPFunction, a gNB-CU-UP is represented by a GNBCUUPFunction, and a gNB-DU is represented by a GNBDUFunction.

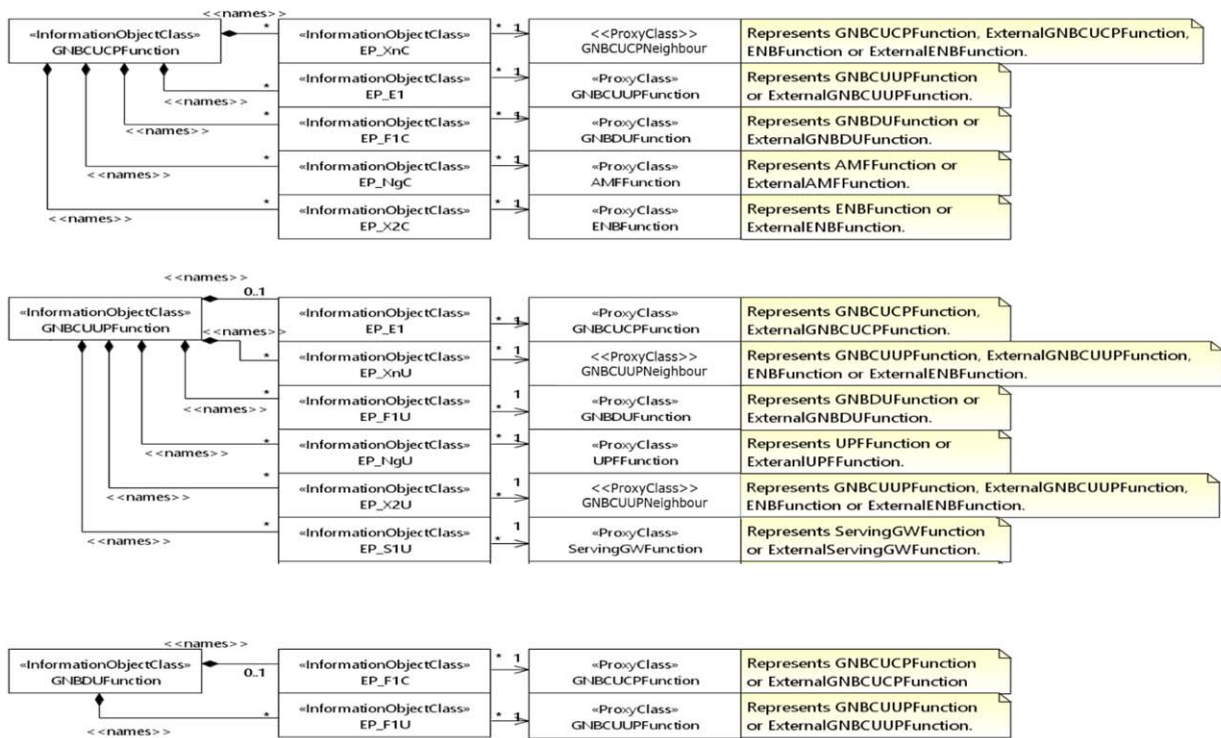

Figure 4.2.1.1-2: NRM for EPs for all deployment scenarios

NOTE 2: The above NRM fragment uses NRNetwork to hold NR external entities and frequency and using EUltraNetwork to hold LTE external entities and frequency. The NRNetwork and EUltraNetwork are subclasses of SubNetwork (defined in TS 28.622 [30]) with no additional attributes. The reason using NRNetwork and EUltraNetwork is for a clean separation of NR external entities and frequency and LTE external entities and frequency.

## 4.3.5 NRCellIDU

### 4.3.5.1 Definition

This IOC represents the part of NR cell information that describes the specific resources instances.

An NR cell transmits SS/PBCH block and always requires downlink transmission at a certain carrier frequency with a certain channel bandwidth. Transmission may be performed from multiple sector-carriers using different transmission points, and these may be configured with different carrier frequencies and channel bandwidths, as long as they are aligned to the cell's downlink resource grids as defined in subclause 4.4 in TS 38.211 [32]. The values of `arfcnDL` and `bSChannelBwDL` attributes define the resource grids which each sector-carrier needs to be aligned to. See subclauses 5.3 and 5.4.2 of TS 38.104 for definitions of BS channel bandwidth and NR-ARFCN, respectively.

An NR cell requires an uplink in order to provide initial access. In case of TDD, the values of `arfcnUL` and `bSChannelBwUL` have to always be set to the same values as for the corresponding DL attributes. For both FDD and TDD, the `arfcnUL` and `bSChannelBwUL` define uplink resource grids to which each sector-carrier needs to align to.

An NR cell can in addition be configured with a supplementary uplink, which has its own `arfcnSUL` and `bSChannelBwSUL`, which define resource grids for supplementary uplink sector-carriers.

Each of downlink, uplink and supplementary uplink (if configured) need an initial bandwidth part (BWP), which defines resources to be used by UEs during and immediately after initial access. Additional BWPs can be either configured or calculated by gNB internally and be applied to UEs dynamically by gNB based on e.g. UE capability and bandwidth need of each UE.

### 4.3.5.4 Notifications

## 4.3.6 NRSectorCarrier

### 4.3.6.1 Definition

This <<IOC>>NRSectorCarrier represents the resources of each transmission point associated to corresponding cell(s). These in general have different physical locations (of the antennae), and possibly different frequencies or bandwidths. The UE is not directly aware of which NRSectorCarrier resources the network uses for its connection.

An NR sector-carrier can have downlink, uplink or both as specified by txDirection. Attributes related to unavailable direction (DL or UL) shall not be set.

Additional NRSectorCarriers not directly associated to one cell only can also be configured.

If a value of arfcnDL, arfcnUL, bSChannelBwDL or bSChannelBwUL can be derived unambiguously from the referring cell, then that attribute needs not be present. That will not be possible if the NRSectorCarrier is used for supplementary uplink, if it is not directly associated to a cell, or if the sector-carrier uses only a part of the cell's channel bandwidth. Thus, at least in those cases the applicable attributes have to be present and their values need to be set.

### 4.3.36 RRMPolicyRatio

#### 4.3.36.1 Definition

This IOC represents the properties of RRMPolicyRatio. RRMPolicyRatio is one realization of abstract *RRMPolicy\_IOC*. RRMPolicyRatio has three attributes, apart from those inherited (DN, resourceType, rRMPolicyMemberList).

**Figure 4.3.36-1 Structure of RRMPolicyRatio**

- The attribute `rRMPolicyMaxRatio` defines the maximum resource usage quota for the associated `rRMPolicyMemberList`, including at least one of shared resources, prioritized resources and dedicated resources. The sum of the ‘`rRMPolicyMaxRatio`’ values assigned to all `RRMPolicyRatio(s)` name-contained by same `ManagedEntity` can be greater than 100.
- The attribute `rRMPolicyMinRatio` defines the minimum resource usage quota for the associated `RRMPolicyMemberList`, including at least one of prioritized resources and dedicated resources, which means the resources quota that need to be guaranteed for use by the associated `rRMPolicyMemberList`. The sum of the ‘`rRMPolicyMinRatio`’ values assigned to all `RRMPolicyRatio(s)` name-contained by same `ManagedEntity` shall be less than or equal to 100.
- The attribute `rRMPolicyDedicatedRatio` defines the dedicated resource usage quota for the `RRMPolicyMemberList`, including dedicated resources. The sum of the ‘`rRMPolicyDedicatedRatio`’ values assigned to all `RRMPolicyRatio(s)` name-contained by same `ManagedEntity` shall be less than or equal to 100.

The following are the definition for above mentioned three resource categories:

- **Shared resources:** means the resources that are shared with other `rRMPolicyMemberList(s)` (i.e. the `rRMPolicyMemberList(s)` defined in `RRMPolicyRatio(s)` name-contained by the same `ManagedEntity`). The shared resources are not guaranteed for use by the associated `rRMPolicyMemberList`. The shared resources quota is represented by [`rRMPolicyMaxRatio-rRMPolicyMinRatio`].
- **Prioritized resources:** means the resources are preferentially used by the associated `RRMPolicyMemberList`. These resources are guaranteed for use by the associated `RRMPolicyMemberList` when it needs to use them. When not used, these resources may be used by other `rRMPolicyMemberList(s)` (i.e. the `rRMPolicyMemberList(s)` defined in `RRMPolicyRatio(s)` name-contained by the same `ManagedEntity`). The prioritized resources quota is represented by [`rRMPolicyMinRatio-rRMPolicyDedicatedRatio`]
- **Dedicated resources:** means the resources are dedicated for use by the associated `RRMPolicyMemberList`. These resources can not be shared even if the associated `RRMPolicyMember` does not use them. The Dedicated resources quota is represented by [`rRMPolicyDedicatedRatio`].

NOTE: The resources shown in Figure 4.3.36-1 could be reserved or allocated for user and bearer related requests, e.g. a user connection, a PDU session, etc., if the user is entitled to use the allocated resources according the ratios defined above.

### 4.3.36.2 Attributes

## 4.3.39 CommonBeamformingFunction

### 4.3.39.1 Definition

This <<IOC>>CommonBeamformingFunction represents common beamforming functionality (eg: SSB beams) for the NRSectorCarrier.

The CommonBeamformingFunction provides capability to configure the advanced antenna for a sector carrier. The configuration capability is provided by selection of coverageShape, digitalTilt and digitalAzimuth. These attributes represent the wanted coverage area and radiation pattern on a sector carrier related to an antenna transmission point.

This configuration capability assumes the system shall handle configuration of SSB beams within the sector carrier. Individual SSB beams within a sector carrier cannot be independently configured as this depends on many conditions and constraints, for instance TDD patterns, allocations of PRACH occasions, SIB1 and mobility considerations.

The associated <<IOC>> Beam provides information beam direction and beam width for the associated SSB beams as a result of the configuration. The beams addressed in this definition are the common beams. There may be more than one beam per CommonBeamformingFunction for the NRSectorCarrier.

### 4.3.39.2 Attributes

The CommonBeamformingFunction IOC includes attributes inherited from Top IOC (defined in TS 28.622[30]) and the following attributes:

## 4.3.40 Beam

### 4.3.40.1 Definition

Measurements on common beams may be correlated with associated spatial beam information to assist use cases like troubleshooting performance problems, or SON functions like Coverage & Capacity Optimization.

<<IOC>>Beam can have spatial attributes of horizontal/azimuth (ie: Phi  $\phi$ -axis) and vertical/tilt (ie: Theta  $\theta$ -axis) beam pointing direction and beam width attributes. There may be more than one beam per CommonBeamformingFunction for an NRSectorCarrier. Informational note, beam direction and width are characteristics—a representation—of directional energy vectors.

## 4.3.43 RRMPolicy\_

### 4.3.43.1 Definition

This IOC represents the properties of an abstract `RRMPolicy`. The `RRMPolicy_` IOC needs to be subclassed to be instantiated. It defines two attributes apart from those inherited from TOP IOC, the `resourceType` attribute defines type of resource (PRB, PRB in uplink, PRB in downlink, RRC connected users, DRB usage etc.) and the `rRRMPolicyMemberList` attribute defines the `RRMPolicyMember(s)` that is subject to this policy. An RRM resource (defined in `resourceType` attribute) is located in `NRCeLLDU`, `NRCeLLCU`, `GNBDUFunction`, `GNBCUCPFFunction` or in `GNBCUUPFunction`. The `RRMPolicyRatio` IOC is one realization of a `RRMPolicy_` IOC, see the inheritance in Figure 4.2.1.2-1. This RRM framework allows adding new policies, both standardized or as vendor specific, by inheriting from the abstract `RRMPolicy_ IOC`.

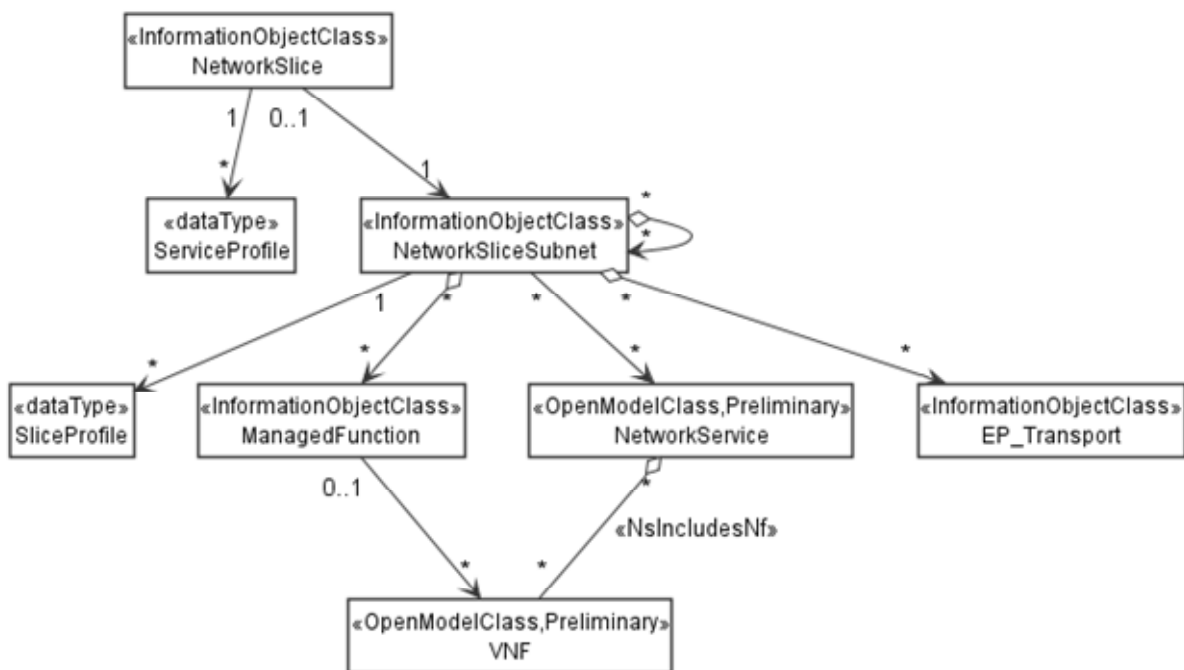

Figure 6.2.1-1: Network slice NRM fragment relationship

NOTE 1: The <<OpenModelClass>> NetworkService and <<OpenModelClass>> VNF are defined in [40].

NOTE 2: The target Network Service (NS) instance represents a group of VNFs and PNFs that are supporting the source network slice subnet instance.

NOTE 3: The instance tree of this NRM fragment would not contain the instances of NetworkService and VNF. However, the NetworkSliceSubNet instances would have an attribute holding the identifiers of NetworkService instances and the ManagedFunction instance would have an attribute holding identifiers of VNF instances.

NOTE 4: NOTE 4: Any instance of the NetworkSliceSubnet IOC is associated to 0 to 1 instance of the NetworkSlice IOC:

- 1: applies to the top/root NetworkSliceSubnet IOC instance directly associated to a NetworkSlice IOC instance.

- 0: applies to all non-top/non-root NetworkSliceSubnet IOC instances, also known as constituent network slice subnets, not directly associated to a NetworkSlice IOC instance.

Any instance of the NetworkSlice IOC is associated to exactly one instance of NetworkSliceSubnet IOC (i.e. the top/root NetworkSliceSubnet IOC instance).

### 6.3.2 NetworkSliceSubnet

#### 6.3.2.1 Definition

This IOC represents the properties of a network slice subnet in a 5G network. For more information about the network slice subnet instance, see 3GPP TS 28.530 [70].

The NetworkSliceSubnet can be categorized by following types:

- RANsliceSubnet represent the RAN network slice subnet in a 5G network, which is associated to one or multiple "RANsliceSubnetProfile".
- CNSliceSubnet represent the CN network slice subnet in a 5G network, which is associated to one or multiple "CNSliceSubnetProfile".
- TopSliceSubnet represent the top network slice subnet in a 5G network, which is associated to one or multiple "TopSliceSubnetProfile".

The attribute `epTransportRef` is used to specify a list of `EP_Transport` instance as transport resources to be aggregated to a `NetworkSliceSubnet` instance. The MnS consumer determines the `EP_Transport` instance(s) to support `EP_Application` instances as part of the `NetworkSliceSubnet` instance and request the MnS producer to configure the attribute `epTransportRef` of the `NetworkSliceSubnet`.

The `EP_Transport` is name contained by `SubNetwork`, and an `EP_Transport` instance can be a new instance created for the `EP_Application` instances as part of `NetworkSliceSubnet` instance or an existing instance reused for `EP_Application` instance.

An instance of `NetworkSliceSubnet` that represents top network slice subnet shall be associated with one `NetworkSlice` instance. An instance of `NetworkSliceSubnet` that represents CN network slice subnet or RAN network slice subnet shall be associated with one instance of `NetworkSliceSubnet` that represents the top network slice subnet. An instance of `NetworkSliceSubnet` that represents CN network slice subnet or RAN network slice subnet may be associated with one or more constituent `NetworkSliceSubnet` instance(s) represented by attribute `networkSliceSubnetRef`.

## 6.3.3 ServiceProfile <<dataType>>

### 6.3.3.1 Definition

This data type represents the properties of the network slice related requirements that should be supported by a `NetworkSlice` instance in a 5G network. The network slice related requirements apply to a one-to-one relationship between a Network Slice Customer (NSC) and a Network Slice Provider (NSP). A network slice can be tailored based on the specific requirements adhered to an SLA agreed between NSC and NSP, see clause 2 of [50]. An NSP may add additional requirements not directly derived from SLA's, associated to the NSP internal [business] goals. The GST defined by GSMA (see [50]) and the service performance requirements defined in 3GPP TS 22.261 [28] and TS 22.104 [51] are all considered as input for the network slice related requirements.

## 6.3.36 NetworkSliceSubnetProviderCapabilities

### 6.3.36.1 Definition

The NetworkSliceSubnetProviderCapabilities IOC store the capabilities/features of the network slice subnet provider in terms of network slice subnets it can manage/provide. The attributes of this IOC can be queried, using getMOIAttributes operation, to know the capabilities of the provider. Based on the capabilities decision can be made e.g derivation of subnet requirements by the consumer.

### 6.3.36.2 Attributes

The NetworkSliceSubnetProviderCapabilities IOC includes attributes inherited from Top IOC (defined in TS 28.622[30]) and the following attributes. The attributes here are subjected to updates, e.g. after each successful subnet allocation or because of any other operator internals decision.

## 6.3.37 FeasibilityCheckAndReservationJob

### 6.3.37.1 Definition

This IOC represents a feasibility check and reservation job for network slicing related requirements (i.e. *ServiceProfile* for network slice related requirements, *SliceProfile* for network slice subnet related requirements) to determine whether the network slicing related requirements can be satisfied. It can be name-contained by *SubNetwork*.

When the MnS Consumer derives the network slicing related requirements (i.e. *ServiceProfile*, *SliceProfile*), before request the MnS producer to allocate or modify an NSI or NSSI, MnS consumer may express a feasibility check and reservation job requirement for the specified network slicing related requirements to MnS producer.

To express a feasibility check and reservation job requirement for specific network slicing related requirements (i.e. *ServiceProfile*, *SliceProfile*), MnS consumer needs to request MnS producer to create a *FeasibilityCheckAndReservationJob* instance on the MnS producer side with the network slicing related requirements specified, and to execute the feasibility check and resource reservation process.

For deletion of feasibility check and reservation job, the MnS consumer needs to request the MnS producer to delete the *FeasibilityCheckAndReservationJob* instance on the MnS producer side.

Attribute "resourceReservation" is used to represent MnS consumer's requirements for resource reservation for corresponding network slicing related requirements (i.e. *ServiceProfile*, *SliceProfile*). In case the value is "True", which means MnS producer needs to reserve corresponding resources (i.e. radio access network resources and/or core network resources) when the feasibility check result is feasible. In this case, attribute "requestedReservationExpiration" is used to represent MnS's requirements for the validity period of the resource reservation, which is specified by MnS consumer. While "reservationExpiration" is used to represent the actual validity period of the resource reservation, which is specified by MnS producer based on requested reservation expiration from MnS consumer and its own reservation capabilities. After the period expires, no guarantees are given for the resources associated to the corresponding network slicing related requirements (i.e. *ServiceProfile*, *SliceProfile*). In case the value by is "False" which means MnS producer only check the feasibility for corresponding network slicing related requirements, no guarantee for the corresponding resources.

To obtain the progress information of a feasibility check and reservation job, MnS consumer needs to request MnS producer to query the values of attribute "processMonitor".

To obtain the feasibility check result of a feasibility check and reservation job, MnS consumer needs to request MnS producer to query the values of attribute "feasibilityResult" and "inFeasibleReason" when the feasibility check and reservation job is finished. If the feasibility check result indicated as feasible, MnS consumer can request MnS producer to allocate a network slice or network slice subnet with the checked network slicing related requirements (i.e. *ServiceProfile* or *SliceProfile*). In case the feasibility check result is infeasible, MnS consumer may update the network slicing related requirements, and may trigger the feasibility check and reservation job again.

To obtain the resource reservation status, MnS consumer need to request MnS producer to query the value of the attribute "resourceReservationStatus".

MnS producer will use the reserved resources to satisfy the corresponding network slicing related requirements in the allocation request. In case to use the reserved resources, MnS consumer will use the same *ServiceProfileId* or *SliceProfileId* value (which is obtained/queried from the *FeasibilityCheckAndReservationJob*) as input parameters for allocation request.

# Annex A (normative): Cell state handling

## A.1 Relation between the administrative state and the "Pre-operation state of the gNB-DU Cell"

The administrative state indicates the permission to use or prohibition against using the cell, imposed through the OAM services. The administrative state has three values: "LOCKED", "SHUTTING DOWN" or "UNLOCKED"

The meanings of these values are defined in ITU T Recommendation X.731 [18].

The relation between the administrative state and the "Pre-operation state of the gNB-DU Cell" is defined in clause 8.5 of TS 38.401 [4]. See below an extract from clause 8.5 of TS 38.401 [4] on the F1 startup and cell activation.

If the `operationalState` is "ENABLED" (i.e. the resource is physically installed and working) and if the `administrativeState` is "UNLOCKED", the step "0: Pre-operational state" will exit and the step "1: F1 Setup Request" will be executed."

### 8.5 F1 Startup and cells activation

This function allows to setup the F1 interface between a gNB-DU and a gNB-CU and it allows to activate the gNB-DU cells.

This is the Combined state diagram for gNB cell.

            An NR cell transmits SS/PBCH block and always requires downlink
            transmission at a certain carrier frequency with a certain channel
            bandwidth. Transmission may be performed from multiple sector-carriers
            using different transmission points, and these may be configured with
            different carrier frequencies and channel bandwidths, as long as they
            are aligned to the cell's downlink resource grids as defined in
            subclause 4.4 in TS 38.211. The values of arfcnDL and bSchannelBwDL
            attributes define the resource grids which each sector-carrier needs to
            be aligned to. See subclauses 5.3 and 5.4.2 of TS 38.104 for definitions
            of BS channel bandwidth and NR-ARFCN, respectively.

            An NR cell requires an uplink in order to provide initial access. In
            case of TDD, the values of arfcnUL and bSchannelBwUL have to always be
            set to the same values as for the corresponding DL attributes. For both
            FDD and TDD, the arfcnUL and bSchannelBwUL define uplink resource grids
            to which each sector-carrier needs to align to.

            An NR cell can in addition be configured with a supplementary uplink,
            which has its own arfcnSUL and bSchannelBwSUL, which define resource
            grids for supplementary uplink sector-carriers.

            Each of downlink, uplink and supplementary uplink (if configured) need
            an initial bandwidth part (BWP), which defines resources to be used by
            UEs during and immediately after initial access. Additional BWPs can be
            either configured or calculated by gNB internally and be applied to UEs
            dynamically by gNB based on e.g. UE capability and bandwidth need of

            of prioritized resources and dedicated resources, which means the
            resources quota that need to be guaranteed for use by the associated

            rRMPolicyMemberList. The shared resources quota is represented by
            [rRMPolicyMaxRatio-rRMPolicyMinRatio].
            - Priortized resources: means the resources are preferentially used by
            the associated RRMPolicyMemberList. These resources are guaranteed for
            use by the associated RRMPolicyMemberList when it needs to use them.
            When not used, these resources may be used by other

            The prioritized resources quota is represented by
            [rRMPolicyMinRatio-rRMPolicyDedicatedRatio]
            - Dedicated resources: means the resources are dedicated for use by

The time duration indicates how long the traffic load (both for UL and DL) in the candidate cell needs to have been below the threshold before any original cells which will be provided backup coverage by the candidate cell enters energySaving state.

In case the candidate cell is a UTRAN or GERAN cell, the load information refers to Cell Load Information Group IE (see 3GPP TS 36.413 [12] Annex B.1.5) and the following applies:  
Load= 'Load Value' \* 'Cell Capacity Class Value', where 'Load Value' and 'Cell Capacity Class Value' are defined in 3GPP TS 25.413 [19] (for UTRAN) / TS 48.008 [20] (for GERAN).

If the 'Cell Capacity Class Value' is not known, then 'Cell Capacity Class Value' should be set to 1 when calculating the load, and the load threshold should be set in range of 0..100.";

# Annex L (normative): Relation of GSMA GST, ServiceProfile and SliceProfile

## L.1 General

This annex describes the relation between GSMA GST [50] and the *ServiceProfile* and *SliceProfile* captured in the network slice NRM fragment (see clause 6).

## L.2 GSMA GST, ServiceProfile and sliceProfile

The GSMA GST is used as the SLA information for the communication between the NSC (e.g., vertical industry) and the NSP. The SLA requirements can be fulfilled from management aspect and control aspect in a coordinated way. The SLS includes *ServiceProfile* information model.

As shown in figure L.2.1, the GST parameters [50] are used as input to *ServiceProfile*. The *ServiceProfile* which defines the service requirements related to a particular NSC, is translated into the *SliceProfile*. In particular, the attributes captured in the *ServiceProfile* are mapped to *TopSliceSubnetProfile* attributes. Based on the *TopSliceSubnetProfile* attributes, the corresponding requirements for the dedicated domain specific network slice subnets are defined. For example, the *CNSliceSubnetProfile* attributes are used to carry 5GC domain requirements, the *RANSliceSubnetProfile* attributes are used to carry NG-RAN domain requirements, and the TN requirements are derived and provide input to the TN domain.

As shown in Table L.2.1 some of the attributes in *CNSliceSubnetProfile* and *RANSliceSubnetProfile* parameters can be translated to configurable parameters related to network function behaviour to satisfy SLS of the service in the control plane. While other information (e.g., delay tolerance, deterministic communication support) in *CNSliceSubnetProfile* and *RANSliceSubnetProfile* are kept at OAM domain and is used to determine the overall behaviour of the network slice.

The following table show the translation of GST attributes.

**Table L.2.1: GST translation**

GST parameter s	ServiceProfile attributes	SliceProfile Parameter			Configurati on Parameters
		TopSlice SubnetProfile attributes	RANSlice SubnetProfile attributes	CNSlice SubnetProfile attributes	
<b>Maximum number of UEs</b>	maxNumberOfUEs	maxNumberOfUE	maxNumberOfUEs	maxNumberOfUEs	attributes in NSACF
<b>Maximum number of PDU sessions</b>	maxNumberOfConns	maxNumberOfPDUSessions	N/A	maxNumberOfPDUSessions	TBD
<b>Downlink maximum throughput per UE</b>	dLThptPerUE	dLThptPerUE	dLThptPerUE	dLThptPerUE	TBD
<b>Uplink maximum throughput per UE</b>	uLThptPerUE	uLThptPerUE	uLThptPerUE	uLThptPerUE	TBD

**Editor's note:** The list of exact configurable parameters is to be revisited depending on the requirements from SA2 and RAN WGs.

NOTE: Void.

# Annex M (normative): Managed NF Service state handling

## M.1 Combined state diagram for a Managed NF Service

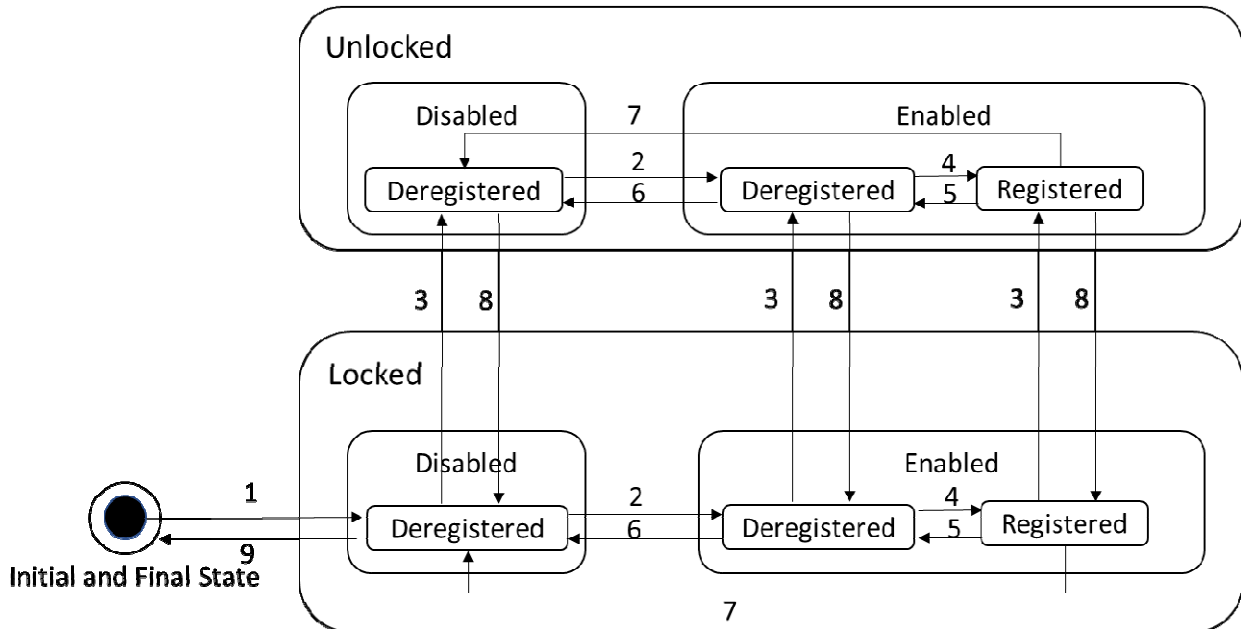

Figure M.1-1: Combined Managed NF Service state diagram

Table M.1-1: The Managed NF Service state transition table

Trigger number	The state transition events and actions
1	Event: Received information of deployment of a Network Function (NF) service. Action: Create a ManagedNFService instance (MSI) whose(Administrative/Operational/Registration) are set to Locked/Disabled/Deregistered.
2	Event: Received information of positive state change of the NF service. Action: Set the Operational state of the MSI to Enabled.
3	Event: Received CM operation to unlock the NF Service or the NF. Action: Set the Administrative state of the MSI to Unlocked.  Note: Changing Administrative state on NF service level is optional
4	Event: Received information that the NF Service is registered to an NRF either by the NF itself or by an OAM system on behalf of the NF. Action: Set the registration state of the MSI to Registered.
5	Event: Received information that the NF Service is deregistered from the NRF either by the NF itself or by an OAM system on behalf of the NF. Action: Set registration state of the MSI to Deregistered.
6	Event: Received information that the NF Service is unavailable because of, for example, limitation of resource or other exceptions. Action: Set the Operational state of the MSI to Disabled.
7	Event: Received information that the NF Service is unavailable. Action: Deregister the NF Service on behalf of the NF, and set the registration state of the MSI to Deregistered.
8	Event: Received CM operation to lock the NF Service or the NF. Action: Set the Administrative state of the MSI to Locked.  Note: Changing Administrative state on NF service level is optional
9	Event: Received information that the NF Service is terminated or deleted,

	Action: Delete the MSI and set its state to NULL.

# Annex N (normative): YANG definition of the Slice NRM

## N.1 General

This annex contains the YANG definitions for the Slice NRM in YANG format.

The Information Service (IS) of the Slice NRM is defined in clause 6.

Mapping rules to produce the YANG definition based on the IS are defined in TS 32.160 [14].
