Notice of disclaimer & limitation of liability

The information provided in the present deliverable is directed solely to professionals who have the appropriate degree of experience to understand and interpret its content in accordance with generally accepted engineering or other professional standard and applicable regulations.

No recommendation as to products and services or vendors is made or should be implied.

No representation or warranty is made that this deliverable is technically accurate or sufficient or conforms to any law and/or governmental rule and/or regulation and further, no representation or warranty is made of merchantability or fitness for any particular purpose or against infringement of intellectual property rights.

In no event shall ETSI be held liable for loss of profits or any other incidental or consequential damages.

Any software contained in this deliverable is provided "AS IS" with no warranties, express or implied, including but not limited to, the warranties of merchantability, fitness for a particular purpose and non-infringement of intellectual property rights and ETSI shall not be held liable in any event for any damages whatsoever (including, without limitation, damages for loss of profits, business interruption, loss of information, or any other pecuniary loss) arising out of or related to the use of or inability to use the software.

Copyright Notification

No part may be reproduced or utilized in any form or by any means, electronic or mechanical, including photocopying and microfilm except as authorized by written permission of ETSI.

The content of the PDF version shall not be modified without the written authorization of ETSI.

The copyright and the foregoing restriction extend to reproduction in all media.

Intellectual Property Rights

Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The declarations pertaining to these essential IPRs, if any, are publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (https://ipr.etsi.org/).

Pursuant to the ETSI Directives including the ETSI IPR Policy, no investigation regarding the essentiality of IPRs, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

DECTTM, **PLUGTESTS**TM, **UMTS**TM and the ETSI logo are trademarks of ETSI registered for the benefit of its Members. **3GPP**TM and **LTE**TM are trademarks of ETSI registered for the benefit of its Members and of the 3GPP Organizational Partners. **oneM2M**TM logo is a trademark of ETSI registered for the benefit of its Members and of the oneM2M Partners. **GSM**[®] and the GSM logo are trademarks registered and owned by the GSM Association.

Legal Notice

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities. These shall be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between 3GPP and ETSI identities can be found under https://webapp.etsi.org/key/queryform.asp.

Modal verbs terminology

In the present document "shall", "shall not", "should", "should not", "may", "need not", "will", "will not", "can" and "cannot" are to be interpreted as described in clause 3.2 of the <u>ETSI Drafting Rules</u> (Verbal forms for the expression of provisions).

"must" and "must not" are NOT allowed in ETSI deliverables except when used in direct citation.

4.2.5	Npcf_SMPolicyControl_Delete Service Operation	85
4.2.5.1	General	85
4.2.5.2	SM Policy Association termination	86
4.2.5.3	Report Accumulated Usage	87
4.2.5.4	Report Access Network Information	87
4.2.5.5	Void	87
4.2.5.6	Network slice related data rate policy control	
4.2.5.7	Group related data rate policy control	
4.2.6	Provisioning and Enforcement of Policy Decisions	87
4.2.6.1	General	87
4.2.6.2	PCC Rules	90
4.2.6.2.1	Overview	
4.2.6.2.2	Gate Function	
4.2.6.2.3	Policy enforcement for authorized QoS per PCC Rule	92
4.2.6.2.4	Redirect Function	
4.2.6.2.5	Usage Monitoring Control	
4.2.6.2.6	Traffic Steering Control support	
4.2.6.2.6.1	Steering the traffic in the N6-LAN or steering the 5G-LAN type of services	
4.2.6.2.6.2	Steering the traffic to a local access of the data network	94
4.2.6.2.7	Conditioned PCC rule	
4.2.6.2.8	PCC rule for resource sharing	
4.2.6.2.9	Resource reservation for services sharing priority	
4.2.6.2.10	PCC rule bound to the default QoS flow	
4.2.6.2.11	PCC rule for Application Detection and Control	
4.2.6.2.12	Provisioning of PCC Rules for Multimedia Priority Services	102
4.2.6.2.12.1	General	
4.2.6.2.12.2	Invocation/Revocation of Priority PDU connectivity services	
4.2.6.2.12.3	Invocation/Revocation of IMS Multimedia Priority Services	
4.2.6.2.12.4	Invocation/Revocation of MPS for DTS	
4.2.6.2.13	Sponsored Data Connectivity	
4.2.6.2.14	Support for PCC rule versioning	105
4.2.6.2.15	Background data transfer support	
4.2.6.2.16	Number of supported packet filter for signalled QoS rule limitation support	
4.2.6.2.17	Access traffic steering, switching and splitting support	107
4.2.6.2.18	Void	
4.2.6.2.19	Provisioning of PCC Rules for Mission Critical Services	111

4.2.6.2.19.	1 General	111
4.2.6.2.19.	2 Invocation/Revocation of Priority PDU connectivity services	112
4.2.6.2.19.	3 Invocation/Revocation of IMS Mission Critical Services	113
4.2.6.2.20	PCC rules authorization with preliminary service information	113
4.2.6.2.21	Policy Control for L4S	114
4.2.6.2.22	UL/DL policy control based on Round-Trip latency requirements	115
4.2.6.2.23	Policy Decision for AF requested QoS for a target UE or group of UE(s) not identified by UE	3
	address(es)	
4.2.6.3	Session Rules	
4.2.6.3.1	Overview	
4.2.6.3.2	Conditioned Session rule	
4.2.6.3.2.1		
4.2.6.3.2.2		
4.2.6.3.2.3		
4.2.6.3.2.4		
4.2.6.3.3	Provisioning of authorized default QoS	
4.2.6.3.4	Access traffic steering, switching and splitting support	
4.2.6.3.5	Usage Monitoring Control	
4.2.6.4	Policy control request triggers.	
4.2.6.5	Encoding of the request of information reporting	
4.2.6.5.1	Request of Access Network Charging Identifier	
4.2.6.5.2	RAN NAS Cause Support	
4.2.6.5.3	Provisioning of the Usage Monitoring Control Policy	
4.2.6.5.3.1		
4.2.6.5.3.2		
4.2.6.5.3.3		
4.2.6.5.3.4		
4.2.6.5.4	Request for Access Network Information	
4.2.6.5.5	Request for the successful resource allocation notification	
4.2.6.5.6	Provisioning of Presence Reporting Area Information	
4.2.6.5.7	Policy provisioning and enforcement of reflective QoS	
4.2.6.6	Authorized QoS	
4.2.6.6.1	General	
4.2.6.6.2	Policy provisioning and enforcement of authorized QoS per service data flow	
4.2.6.6.3	Policy provisioning and enforcement of authorized explicitly signalled QoS Characteristics	
4.2.6.7	Monitoring the data rate per network slice for a UE	
4.2.6.8	Network slice related data rate policy control	
4.2.6.8.1	General	
4.2.6.8.2	PCF-based network slice data rate policy control by using QoS parameters	
4.2.6.8.3	Network slice data rate policy control with assistance of the NWDAF	
4.2.6.9	Group related data rate policy control	
4.2.6.9.1	General	
4.2.6.10	Policy Provisioning for eXtended Reality and Interactive Media Services	
4.2.6.10	Support for delivery of multi-modal services	
	Traffic Parameter Information and N6 Traffic Parameter Measurement	
4.2.6.10.2 4.2.6.10.3		
	PDU Set handling	
4.2.6.10.4	End of Data Burst Handling	
4.2.7	Handling of requests which collide with an existing SM Policy Association	
4.2.8	UE IP address support	134

Annex	x D (informative): Change history	314
Histor	y	329

Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
 - 1 presented to TSG for information;
 - 2 presented to TSG for approval;
 - 3 or greater indicates TSG approved document under change control.
- Y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

1 Scope

The present document provides the stage 3 specification of the Session Management Policy Control Service of 5G system. The stage 2 definition and related procedures of the Session Management Policy Control Service are contained in 3GPP TS 23.502 [3] and 3GPP TS 23.503 [6]. The 5G System Architecture is defined in 3GPP TS 23.501 [2].

Stage 3 call flows are provided in 3GPP TS 29.513 [7].

The Technical Realization of the Service Based Architecture and the Principles and Guidelines for Services Definition of the 5G System are specified in 3GPP TS 29.500 [4] and 3GPP TS 29.501 [5].

The Policy Control Function with session related policies provides the Session Management Policy Control Service to the NF server consumers (e.g. Session Management Function).

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

3 Definitions, symbols and abbreviations

3.1 Definitions

For the purposes of the present document, the terms and definitions given in 3GPP TR 21.905 [1] and the following apply. A term defined in the present document takes precedence over the definition of the same term, if any, in 3GPP TR 21.905 [1].

5G QoS Flow: The finest granularity for QoS forwarding treatment in the 5G System. All traffic mapped to the same 5G QoS Flow receive the same forwarding treatment (e.g. scheduling policy, queue management policy, rate shaping policy, RLC configuration, etc.). Providing different QoS forwarding treatment requires separate 5G QoS Flow.

5G QoS Identifier: A scalar that is used as a reference to a specific QoS forwarding behaviour (e.g. packet loss rate, packet delay budget) to be provided to a 5G QoS Flow. This may be implemented in the access network by the 5QI referencing node specific parameters that control the QoS forwarding treatment (e.g. scheduling weights, admission thresholds, queue management thresholds, link layer protocol configuration, etc.).

Access Traffic Steering: The procedure that selects an access network for a new data flow and transfers the traffic of this data flow over the selected access network. Access traffic steering is applicable between one 3GPP access and one non-3GPP access.

Access Traffic Switching: The procedure that moves all traffic of an ongoing data flow from one access network to another access network in a way that maintains the continuity of the data flow. Access traffic switching is applicable between one 3GPP access and one non-3GPP access.

Access Traffic Splitting: The procedure that splits the traffic of a data flow across multiple access networks. When traffic splitting is applied to a data flow, some traffic of the data flow is transferred via one access and some other traffic of the same data flow is transferred via another access. Access traffic splitting is applicable between one 3GPP access and one non-3GPP access.

Application detection filter: A logic used to detect packets generated by an application based on extended inspection of these packets, e.g., header and/or payload information, as well as dynamics of packet flows. The logic is entirely internal to a UPF, and is out of scope of this specification.

Application identifier: An identifier, referring to a specific application detection filter.

Application service provider: A business entity responsible for the application that is being / will be used by a UE, which may be either an AF operator or has an association with the AF operator.

Binding: The association between a service data flow and the QoS Flow transporting that service data flow.

Binding mechanism: The method for creating, modifying and deleting bindings.

Charging control: The process of associating packets, belonging to a service data flow, to a charging key and applying online charging or offline charging, as appropriate.

Charging key: information used by the CHF for rating purposes.

Detected application traffic: An aggregate set of packet flows that are generated by a given application and detected by an application detection filter.

Dynamic PCC Rule: a PCC rule, for which the definition is provided to the SMF by the PCF.

Gating control: The process of blocking or allowing packets, belonging to a service data flow / detected application's traffic, to pass through to the UPF.

MA PDU Session: A PDU Session that provides a PDU connectivity service, which can use one access network at a time, or simultaneously one 3GPP access network and one non-3GPP access network.

Monitoring key: information used by the SMF and PCF for usage monitoring control purposes as a reference to a given set of service data flows or application (s), that all share a common allowed usage on a per UE and DNN and S-NSSAI basis.

Operating System (OS): Collection of UE software that provides common services for applications.

Operating System Identifier (OSId): An identifier identifying the operating system.

PCC decision: A PCF decision for policy and charging control provided to the SMF (consisting of PCC rules and PDU Session related attributes), a PCF decision for access and mobility related control provided to the AMF, a PCF decision for UE access selection and PDU Session selection related policy provided to the UE or a PCF decision for background data transfer policy provided to the AF.

PCC rule: A set of information enabling the detection of a service data flow and providing parameters for policy control and/or charging control and/or other control or support information. The possible information is described in clause 6.3.1.

PDU Session: Association between the UE and a Data Network that provides a PDU connectivity service.

Policy control: The process whereby the PCF indicates to the SMF how to control the QoS Flow. Policy control includes QoS control and/or gating control.

Policy Control Request trigger report: a notification, possibly containing additional information, of an event which occurs that corresponds with a Policy Control Request trigger.

Policy Control Request trigger: defines a condition when the SMF shall interact again with the PCF.

Predefined PCC Rule: a PCC rule that has been provisioned directly into the SMF by the operator.

Redirection: Redirect the detected service traffic to an application server (e.g. redirect to a top-up / service provisioning page).

Service data flow: An aggregate set of packet flows carried through the UPF that matches a service data flow template.

Service data flow filter: A set of packet flow header parameter values/ranges used to identify one or more of the packet flows in the UPF. The possible service data flow filters are defined in clause 6.2.2.2.

Service data flow filter identifier: A scalar that is unique for a specific service data flow (SDF) filter within a PDU session.

Service data flow template: The set of service data flow filters in a PCC Rule or an application identifier in a PCC rule referring to an application detection filter in the SMF or in the UPF, required for defining a service data flow.

Service identifier: An identifier for a service. The service identifier provides the most detailed identification, specified for flow based charging, of a service data flow. A concrete instance of a service may be identified if additional AF information is available (further details to be found in clause 6.3.1).

For the purposes of the present document, the following terms and definitions given in 3GPP TS 23.501 [2], subclause 3.1 apply:

Onboarding Network

3.2 Abbreviations

For the purposes of the present document, the abbreviations given in 3GPP TR 21.905 [1] and the following apply. An abbreviation defined in the present document takes precedence over the definition of the same abbreviation, if any, in 3GPP TR 21.905 [1].

4 Npcf_SMPolicyControl Service

4.1 Service Description

4.1.1 Overview

The Session Management Policy Control Service performs provisioning, update and removal of session related policies and PCC rules by the Policy Control Function (PCF) to the NF service consumer (e.g. SMF). The Session Management Policy Control Service can be used for charging control, policy control, application detection and control and/or access traffic steering, switching and splitting within a MA PDU Session. Session Management Policy Control Service applies to the cases where the SMF interacts with the PCF in the non-roaming scenario, the SMF interacts with the V-PCF in the local breakout roaming scenario and the H-SMF interacts with the H-PCF in the home-routed scenario.

4.1.2 Service Architecture

The Session Management Policy Control Service is provided by the PCF to the consumer and shown in the SBI representation model in figure 4.1.2-1 and in the reference point representation model in figure 4.1.2-2. The overall Policy and Charging Control related 5G architecture is depicted in 3GPP TS 29.513 [7].

The only known NF service consumer is the SMF.

Figure 4.1.2-1: Reference Architecture for the Npcf_SMPolicyControl Service; SBI representation

Figure 4.1.2-2: Reference Architecture for the Npcf_SMPolicyControl Service; reference point representation

NOTE: The PCF represents the V-PCF in the local breakout scenario. The SMF represents the H-SMF and the PCF represents the H-PCF in the home routed scenario.

4.1.3 Network Functions

4.1.3.1 Policy Control Function (PCF)

The PCF is responsible for policy control decisions and flow based charging control functionalities. The PCF provides policies to the SMF, for example:

- policies for application and service data flow detection;
- gating;
- QoS;
- flow based charging;
- traffic steering control;
- usage monitoring control;
- access traffic steering;
- switching and steering within a MA PDU Session;
- access network information report;

- UMIC, PMIC and TSCAI input container; and
- RAN support information to the SMF.

The policy decisions made by the PCF may be based on one or more of the following:

- Information obtained from the AF, e.g. the session, media and subscriber related information;
- Information obtained from the UDR;

NOTE: For local breakout roaming, session management policy data for the UE as defined in 3GPP TS 29.519 [15] is not available in the VPLMN and V-PCF uses locally configured information according to the roaming agreement with the HPLMN operator. All interactions to the UDR in this document are subject to this restriction.

- Information obtained from the AMF, e.g. UE related and access related information;
- Information obtained from the SMF;
- Information obtained from the NWDAF;
- Information obtained from the NEF:
- Information from the CHF about spending limits control;
- Information from the TSCTSF or TSN AF; and
- PCF pre-configured policy context.

4.1.3.2 NF Service Consumers

The SMF is responsible for the enforcement of session management related policy decisions from the PCF, related to service flow detection, QoS, charging, gating, traffic usage reporting, traffic steering and access traffic steering, switching and splitting within a MA PDU Session.

The SMF shall support:

- sending the PDU session related attributes to the PCF;
- requesting and receiving the PCC rule(s) from the PCF;
- binding of service data flows to QoS flow as defined in 3GPP TS 29.513 [7];
- deriving rule(s) from the PCC rule(s) and then providing those rules to the user plane function or remove the rule(s) from the user plane as defined in 3GPP TS 29.244 [13];
- deriving the QoS rules towards the UE;
- deriving the QoS profile towards the access network;
- deriving the ATSSS rules towards the UE if applicable;
- transferring the DS-TT PMIC transparently towards/from the UE/DS-TT and transferring the NW-TT U/PMIC transparently towards/from the UPF/NW-TT, if applicable;
- adapting received TSCAI input information (TSC assistance container) to 5GS GM and transferring the TSCAI to the AN-RAN;
- handling the policy control request trigger; and
- handling the PDU session related policy information.

NOTE: SMF functionality related to event exposure is defined in 3GPP TS 29.508 [12].

The SMF is also responsible for forwarding to the PCF the UE Policy information received from the UE in UE Policy Containers (information related to URSP delivery in EPS) and in URSP rule enforcement information reports.

4.1.4 Rules

4.1.4.1 General

A rule is a set of policy information elements associated with a PDU session, or with service data flows (i.e., with a PCC rule).

Two types of rules are defined:

- Session rule; and
- PCC rule.

Both Session rules and PCC rules are composed of embedded information elements as well as information elements that are part of the referenced objects (e.g. condition data, or usage monitoring policy data type) by the rule.

PCC rule is defined in clause 4.1.4.2. Session rule is defined in clause 4.1.4.3.

4.1.4.2 PCC rules

4.1.4.2.1 PCC rules definition

A PCC rule is a set of information elements enabling the detection of a service data flow and providing parameters for policy control and/or charging control. There are two different types of PCC rules as defined in 3GPP TS 23.503 [6]:

- Dynamic PCC rules: PCC rules that are dynamically provisioned by the PCF to the SMF. These PCC rules may be either predefined or dynamically generated in the PCF. Dynamic PCC rules can be installed, modified and removed at any time.
- Predefined PCC rules: PCC rules that are preconfigured in the SMF. Predefined PCC rules can be activated or deactivated by the PCF at any time. Predefined PCC rules within the PCF may be grouped allowing the PCF to dynamically activate a set of PCC rules.

Additionally, predefined PCC rules may be grouped within the SMF as predefined PCC rule bases which allow the PCF to dynamically activate these sets of rules. In this case, the PCC rule identifier is used to hold the predefined PCC rule base identifier.

NOTE 1: When the SMF interacts with the PCF for a PCC rule base, the PCF has no way of knowing which individual PCC rule of the PCC rule base caused the interaction. If such knowledge is required for specific PCC rules, then these PCC rules need to be implemented either as dynamic PCC rules or as predefined PCC rules that are not grouped in a PCC rule base. The SMF decision logic for interacting (or not) with the PCF about an event related to a PCC rule base is up to implementation and depends on the specific issue that triggered this interaction.

NOTE 2: The operator can define a predefined PCC rule, to be activated by the SMF. Such a predefined rule is not explicitly known in the PCF.

A PCC rule consists of:

Table 4.1.4.2.1-1: PCC rule information elements

Information name	Description	Category
Rule identifier	Uniquely identifies the PCC rule, within a PDU Session.	Mandatory
	It is used between PCF and SMF for referencing PCC rules.	
	Service data flow detection	
Precedence	Determines the order, in which the service data flow templates are	Mandatory
Service Data Flow Template	applied at service data flow detection, enforcement and charging. For IP PDU traffic: Either a list of service data flow filters or an	Mandatory
Service Data Flow Template	application identifier that references the corresponding application	iviaridatory
	detection filter for the detection of the service data flow.	
	For Ethernet PDU traffic: Combination of traffic patterns of the	
	Ethernet PDU traffic.	
Mute for notification	Defines whether application's start or stop notification is to be	Optional
	muted.	
Charging kay	Charging The charging system (CHF) uses the charging leaves determine	Ontional
Charging key	The charging system (CHF) uses the charging key to determine the tariff to apply to the service data flow.	Optional
Service identifier	The identity of the service or service component the service data	Optional
Gervice identifier	flow in a rule relates to.	Optional
Sponsor Identifier	An identifier, provided from the AF, which identifies the Sponsor,	Optional
•	used for sponsored flows to correlate measurements from	
	different users for accounting purposes.	
Application Service Provider	An identifier, provided from the AF, which identifies the Application	Optional
Identifier	Service Provider, used for sponsored flows to correlate	
Oh a saisa sa sa ath a d	measurements from different users for accounting purposes.	0-4:
Charging method	Indicates the required charging method for the PCC rule. Values: online or offline or none.	Optional
Service Data flow handling while	Indicates whether the service data flow is allowed to start while	Optional
requesting credit	the SMF is waiting for the response to the credit request.	Optional
requeeting ereals	Only applicable for charging method online.	
Measurement method	Indicates whether the service data flow data volume, duration,	Optional
	combined volume/duration or event shall be measured.	
	This is applicable to reporting, if the charging method is online or	
	offline.	
	Note: Event based charging is only applicable to predefined PCC rules and PCC rules used for application detection filter (i.e. with	
	an application identifier).	
Application Function Record	An identifier, provided from the AF, correlating the measurement	Optional
Information	for the Charging key/Service identifier values in this PCC rule with	
	application level reports.	
Service identifier level reporting	Indicates that separate usage reports shall be generated for this	Optional
	Service identifier.	
	Values: mandated or not required.	
5QI	Policy control Identifier of the authorized QoS parameters for the service data	Mandatory
5Q1	flow.	iviaridatory
ARP	The Allocation and Retention Priority for the service data flow	Mandatory
,	consisting of the priority level, the pre-emption capability and the	Managery
	pre-emption vulnerability.	
Gate status	The gate status indicates whether the service data flow, detected	Optional
	by the service data flow template, may pass (Gate is open) or	
	shall be discarded (Gate is closed).	
QoS Notification Control (QNC)	Indicates whether notifications are requested from 3GPP NG-RAN	Optional
	when the GFBR can no longer (or again) be guaranteed for a QoS	
Reflective QoS Control	Flow during the lifetime of the QoS Flow. Indicates to apply reflective QoS for the SDF.	Optional
MBR (UL/DL)	The uplink/downlink maximum bitrate authorized for the service	Optional
	data flow.	Phonai
GBR (UL/DL)	The uplink/downlink guaranteed bitrate authorized for the service	Optional
	data flow.	-
UL sharing indication	Indicates resource sharing in uplink direction with service data	Optional
	flows having the same value in their PCC rule.	
DL sharing indication	Indicates resource sharing in downlink direction with service data	Optional
Dadinast	flows having the same value in their PCC rule.	01;
Redirect	Redirect state of the service data flow (enabled/disabled).	Optional
Redirect Destination	Controlled Address to which the service data flow is redirected	Optional
	when redirect is enabled.	ļ

Bind to default QoS Flow	Indicates that the dynamic PCC rule shall always have its binding	Optional
D: VI	with the default QoS Flow.	0 11 1
Priority Level Averaging Window	Indicates a priority in scheduling resources among QoS Flows. Represents the duration over which the guaranteed and maximum	Optional Optional
	bitrate shall be calculated.	
Maximum Data Burst Volume	Denotes the largest amount of data that is required to be transferred within a period of 5G-AN PDB.	Optional
Disable UE notifications at changes related to Alternative QoS Profiles	Indicates to disable QoS flow parameters signalling to the UE when the SMF is notified by the NG-RAN of changes in the fulfilled QoS situation. The fulfilled situation is either the QoS profile or an Alternative QoS Profile.	Optional
Precedence for TFT packet filter allocation	Determines the order of TFT packet filter allocation for PCC rules	Optional
ECN marking for L4S	The ECN marking for L4S indicates that the UL and/or DL of the service data flow, detected by the service data flow template, supports ECN marking for L4S and enables ECN marking for L4S support. (NOTE 6)	Optional
Lloor Location Dequired	Access Network Information Reporting	Ontional
User Location Required	The UE location(s) (e.g. the serving cell of the UE) is to be reported. When the corresponding QoS flow is deactivated, and if available, information on when the UE was last known to be in that location is also to be reported.	Optional
UE Timezone Required	The time zone of the UE is to be reported.	Optional
·	Usage Monitoring Control	
Monitoring key	The PCF uses the monitoring key to group services that share a common allowed usage.	Optional
	N6-LAN Traffic Steering Enforcement Control	
Traffic steering policy identifier(s)	Reference to a pre-configured traffic steering policy at the SMF.	Optional
Metadata	Metadata of traffic for service fuction chaining handling Application Function influence on traffic routing Enforcement Control	Optional
Data Network Access Identifier	Identifier of the target Data Network Access.	Optional
Per DNAI: Traffic steering policy identifier	Reference to a pre-configured traffic steering policy at the SMF.	Optional
Per DNAI: N6 traffic routing information	Describes the information necessary for traffic steering to the DNAI.	Optional
Information on AF subscription to UP path changes events	Indicates whether a notification in case of UP path change is requested, as well as the destination(s) for where to provide the notification.	Optional
Indication of UE IP address preservation	Indicates UE IP address should be preserved.	Optional
Indication of traffic correlation	Indicates that the target PDU Sessions should be correlated via a common DNAI in the user plane. (NOTE 5)	Optional
Information on User Plane Latency requirements	Indicates the user plane latency requirements.	Optional
EAS IP replacement information	Contains EAS IP replacement information (i.e. IP addresses and port numbers of source and target EAS).	Optional
Indication for simultaneous connectivity at edge relocation	Indicates request from the AF for temporary simultaneous connectivity over source and target PSA at edge relocation. It may provide AF guidance to determine when the connectivity over the source PSA can be removed.	Optional
Traffic Correlation ID	Identification of a set of UEs accessing the application identified by the Service data flow template	Optional
Common EAS IP address	IP address of the common EAS for the application identified by the Service Data Flow Template for the UEs the AF request aims at	Optional
FQDN(s)	FQDN(s) for the application indicated in the PCC rule.	Optional
NEF information	Notification Endpoint of NEF subscription to be notified with information related to UE members of the set of UEs identified by	Optional
	traffic correlation ID.	
Indication of EAS rediscovery.	traffic correlation ID. Indicates the rediscovery of EAS.	Optional
Indication of EAS rediscovery.	traffic correlation ID. Indicates the rediscovery of EAS. RAN support information	•
	traffic correlation ID. Indicates the rediscovery of EAS.	Optional Optional

	MA PDU Session Control	
A li ti l i- t		Ontinual
Application descriptors	Identifies the application traffic for which MA PDU Session control	Optional
	is required based on the Steering functionality, the Steering mode,	
0: 5 : 5:	the Steering mode indicator and the Threshold values.	0 (; 1
Steering Functionality	Indicates the applicable traffic steering functionality.	Optional
Steering mode (UL/DL)	Indicates the UL and/or DL traffic distribution rules between the	Optional
	3GPP and Non-3GPP accesses together with associated	
	parameters (when applicable) for the traffic matching the service	
	data flow.	
Steering mode indicator	Indicates either autonomous load-balance operation or UE-	Optional
	assistance operation, if the steering mode is set to	
	"LOAD_BALANCING".	
Threshold value(s)	Indicates, as applicable for the steering mode, the threshold	Optional
	value(s) for maximum RTT or maximum Packet Loss Rate, or	
	both.	
Charging for Non-3GPP access	Indicates parameters used for charging packets carried via Non-	Optional
	3GPP access for a MA PDU Session. The same set of parameters	
	as for the Charging information above applies. If a parameter is	
	not included here, the value provided in the Charging information	
	above applies.	
Usage Monitoring for Non-3GPP	Indicates parameters used to monitor usage of the packets carried	Optional
access	via Non-3GPP access for a MA PDU Session. The same set of	
	parameters as for the Usage Monitoring information above	
	applies. If a parameter is not included here, the value provided in	
	the Usage Monitoring information above applies.	
Transport Mode	The Transport Mode indicates the transport mode for transimitting	Conditional
	a UDP flow between UE and UPF. The transport mode should be	
	applied by the MPQUIC functionality for the matching traffic. It	
	shall only be included when the steering functionality is MPQUIC	
	functionality.	
	IPTV (NOTE 1)	
IP Multicast traffic control	Indicates whether the service data flow, corresponding to the	Optional
information	service data flow template, is allowed or not allowed.	
	QoS Monitoring	
QoS parameter(s) to be	Indicates the QoS parameters to be monitored, e.g.UL packet	Optional
measured	delay, DL packet delay or round trip packet delay.	
Reporting frequency	Defines the frequency for the reporting, such as event triggered or	Optional
3 - 1 - 3	periodic.	
Target of reporting	Defines the target of the QoS Monitoring reports; it corresponds	Optional
l sangura raparanig	tor the AF, as decided by the PCF or included when the indication	
	of direct event notification is received from the AF.	
Indication of direct event	Indicates that the QoS Monitoring event shall be reported by the	Optional
notification	UPF directly to the AF or Local NEF indicated by the Target of	Optional
Troumbation.	reporting.	
Data Collection Application	Indicates that the PCC Rule is associated to a QoS monitoring	Optional
Identifier	event exposure subscription initiated by the NF service consumer	Optional
Identifier	(e.g. NWDAF) that provides an application identifier that matches	
	this value.	
	Alternative QoS Parameter Sets (NOTE 2)	
Packet Delay Budget	Indicates the packet delay budget in this Alternative QoS	Optional
i acket belay buuyet	Parameter Set.	Optional
Dacket Error Data		Optional
Packet Error Rate	Indicates the packet error rate in this Alternative QoS Parameter	Optional
CDD (UL/DL)	Set.	Ontional
GBR (UL/DL)	The uplink/downlink guaranteed bitrate authorized for the service	Optional
	data flow in this Alternative QoS Parameter Set.	
D (A) : 1	TSCAI Input container	0 11 1
Burst Arrival Time	Indicates the burst arrival time in reference to TSN GM for TSN or	Optional
	external GM for non-TSN applications at ingress port.	
Periodicity	The time period (in reference to TSN GM for TSN or external GM	Optional
	for non-TSN applications) between start of two bursts.	
Flow Direction	Direction of the flow.	Optional
Survival Time	It refers to the time period an application can survive without any	Optional
	burst. It is expressed in reference to the TSN GM for TSN and	
	external GM for non-TSN applications.	
Time Domain	Indicate the (g)PTP domain the (TSN)AF is located in.	Optional

Burst Arrival Time window	Indicates the acceptable earliest and latest arrival time of the data burst in reference to the external GM for non-TSN applications at ingress port.	Optional		
Capability for BAT adaptation	Indicates the capability for AF to adjust the burst sending time according to the network provided Burst Arrival Time offset.	Optional		
Periodicity Range	Indicates the capability for AF to adjust the periodicity and provides either the acceptable periodicity range or the acceptable periodicity set. It can be formulated as lower bound and upper bound of the periodicity for the acceptable periodicity range, or as a list of value(s) of the periodicity for the acceptable periodicity set.	Optional		
	Traffic Parameter Information			
Periodicity (UL/DL)	Indicates the time period between start of two data bursts in UL/DL direction (represents Traffic Parameter information for power saving as specified in clause 5.37.8 of 3GPP TS 23.501 [2]). Traffic Parameter Measurement	Optional		
Traffic Parameter(s) to be	Indicates to measure the N6 Jitter information associated with DL	Optional		
measured	Periodicity and, optionally, the UL/DL Periodicity.			
Reporting condition	Defines the condition for the reporting, such as event triggered or periodic, frequency.	Optional		
	Indirect Feature Negotiation			
Supported Features of NF Service Consumer	Network Function Service Consumer features supported per service.	Optional		
Convice Consumer	PDU Set Control Information	1		
PDU Set QoS parameters (UL/DL)	The UL and/or DL PDU Set QoS parameter(s), including both PDU Set Delay Budget and PDU Set Error Rate, and/or PDU Set Integrated Handling Information, authorized for the service data flow (See clause 5.7.7 of 3GPP TS 23.501 [2]).	Optional		
	Protocol Description			
Protocol Description (UL/DL)	Indicates the protocol used by the application server. It is used to detect PDU Set Information of packets and/or last packet of the Data Burst (See 3GPP TS 23.501 [2] clause 5.37.5 and clause 5.37.8).	Optional		
Data Burst Handling Information				
End of Data Burst Marking Indication	Indicates to detect last PDU of the data burst and to mark End of Data Burst Indication (See clause 5.37.8 of TS 23.501 [2]) on the last PDU.	Optional		
NOTE 2: Only applicable for GBR NOTE 3: The parameter "Bind to O defined in table 6.3.1 of 3 delay critical GBR type 5 clause 4.2.6.2.1. NOTE 4: The parameter "Indication 3GPP TS 23.503 [6] is im "exUsagePccRuleIds" att monitoring to indicate that defined in clause 4.2.6.5. NOTE 5: The indication of traffic or group member UEs shou 3GPP TS 23.501 [2], clau NOTE 6: When the "L4S" feature is	orrelation shall be provided only when all the PDU sessions related to all be correlated by a common DNAI in the user plane for the traffic as use 5.6.7.1 and clause 5.29. s supported, the indication of ECN marking for L4S shall be provided provide an explicit indicator to the SMF to enable ECN marking for L4	GBR type or defined in age onitoring as the 5G VN s described in only when		

The above information is organized into a set of decision data objects as defined in clause 4.1.4.4. The exact encoding of PCC rules is defined in clause 5.6.2.6.

4.1.4.2.2 PCC rules operation

For dynamic PCC rules, the following applies:

- Installation: to provision the PCC rules.

- Modification: to modify the PCC rules.
- Removal: to remove the PCC rules.

For predefined PCC rules, the following operations are available:

- Activation: to activate the PCC rules.
- Deactivation: to deactivate the PCC rules.

4.1.4.3 Session rule

4.1.4.3.1 Session rules definition

A session rule consists of policy information elements associated with PDU session. A session rule is dynamically provisioned by the PCF to the SMF (i.e., there are only dynamic session rules). The encoding of the SessionRule data type is defined in clause 5.6.2.7.

A session rule shall include:

- Session Rule Identifer.

A session rule may include:

- Authorized Session-AMBR;
- Authorized Default QoS;
- Reference to Usage Monitoring Data;
- Reference to Usage Monitoring Data for Non-3GPP access of MA PDU session; and
- Reference to Condition Data.

4.1.4.3.2 Session rules operation

For Session rules, the following applies:

- Installation: to provision the session rules.
- Modification: to modify the session rules.
- Removal: to remove the session rules.

4.1.4.4 Policy Decision types

4.1.4.4.1 General

A policy decision is a grouping of cohesive information elements describing a specific type of decision, e.g. QoS, Charging data, etc. A policy decision can be linked to one or more PCC rules or one or more Session rules. A PCC rule or session rule can at most refer to one instance of the policy decision for each type.

The following types of policy decision are defined:

- Traffic control data;
- QoS data;
- Charging data;
- Usage Monitoring data; and
- QoS Monitoring data.

4.1.4.4.2 Traffic control data definition

Traffic control data defines how traffic data flows associated with a rule are treated (e.g. blocked, redirected). The traffic control data encoding table is defined in clause 5.6.2.10.

Traffic control data shall include:

- Traffic Control Data ID.

Traffic control data may include:

- Flow status;
- ECN marking for L4S support indication;
- Redirect Information;
- Mute Notification;
- Traffic Steering Policy ID UL;
- Traffic Steering Policy ID DL;
- Metadata;
- Routing requirements;
- UP path change event subscription from the AF;
- Information on User Plane Latency requirements;
- EAS IP replacement information;
- Indication of traffic correlation;
- Correlation information for common EAS and DNAI selection potentially together with the NEF information for the notification related to UE members of the set of UEs identified by traffic correlation ID;
- Indication of simultaneous connectivity temporarily maintained for source and target PSA during edge relocation and guidance about when the connectivity over the source PSA can be removed;
- Access Traffic Steering Functionality;
- Transport Mode, if the steering functionality is MPQUIC functionality;
- Access Traffic Steering Mode DL;
 - Access Traffic Steering Mode; and
 - Optionally, Access Traffic Steering Mode Indicator or Access Traffic Steering Mode Threshold;
- Access Traffic Steering Mode UL; and
 - Access Traffic Steering Mode; and
 - Optionally, Access Traffic Steering Mode Indicator or Access Traffic Steering Mode Threshold;
- Multicast Access Control; and
- The data burst end marking indication.

4.1.4.4.3 QoS data definition

QoS data defines QoS parameters (e.g. bitrates) associated with a rule. The QoS data encoding table is defined in clause 5.6.2.8.

QoS data shall include:

- QoS Data ID;

QoS data may include:

- 5QI;
- ARP:
- QNC;
- Maximum Packet Loss Rate UL;
- Maximum Packet Loss Rate DL;
- Maximum Bit Rate UL;
- Maximum Bit Rate DL;
- Guaranteed Bit Rate UL;
- Guaranteed Bit Rate DL;
- 5QI Priority Level;
- Averaging window;
- Maximum Data Burst Volume;
- Bound to default QoS flow indication;
- Resource Sharing Key UL;
- Resource Sharing Key DL;
- Reflective QoS attribute;
- Packet Delay Budget;
- Packet Error Rate;
- PDU Set QoS parameter(s) UL; and
- PDU Set QoS parameter(s) DL.

NOTE: Either 5QI and ARP combination or Bound to default QoS flow indication is provided.

4.1.4.4.4 Charging data definition

Charging data defines charging related parameters (e.g. rating group) associated with a rule. The charging data encoding table is defined in clause 5.6.2.11.

Charging data shall include:

- Charging Data ID;
- Rating Group.

Charging data may include:

- Metering Method;
- Charging Method;
- Service Data flow handling while requesting credit;
- Reporting Level;
- Service ID;

- Sponsor ID;
- Application Service Provider ID; and
- AF Charging ID.

4.1.4.4.5 UsageMonitoring data definition

UsageMonitoring data defines usage monitoring information associated with a rule. The UsageMonitoring data encoding table is defined in clause 5.6.2.12.

Usage Monitoring Data shall include:

- Usage Monitoring ID.

NOTE: A Usage Monitoring ID corresponds to a valid Monitoring Key.

Usage Monitoring Data may include:

- Volume Threshold;
- Volume Threshold UL;
- Volume Threshold DL;
- Time Threshold;
- Monitoring Time;
- Next Volume Threshold;
- Next Volume Threshold UL;
- Next Volume Threshold DL;
- Next Time Threshold;
- Inactivity Time; and
- PCC rule identifier(s) corresponding to the service data flow(s) which need to be excluded from PDU session level usage monitoring.

4.1.4.4.6 QoS Monitoring data definition

QoS Monitoring data defines QoS Monitoring related parameters (e.g. request QoS monitoring parameters to be measured) associated with a rule. The QoS Monitoring data encoding table is defined in clause 5.6.2.40.

QoS Monitoring data shall include:

- QoS Monitoring Data ID;
- requested QoS monitoring parameters to be measured;
- reporting frequency.

QoS monitoring data may include:

- reporting thresholds;
- wait time;
- reporting period;
- target of reporting;
- indication of direct event notification; and

- data collection application identifier.

4.1.5 Policy control request trigger

A policy control request trigger is a condition pre-configured in the SMF (i.e. always report) or provisioned by the PCF to the SMF, which defines when the SMF shall interact again with PCF for further policy decision related to a PDU session.

The policy control request trigger is designed as an Enumeration type defined in clause 5.6.3.6.

The PCF can provide an array of policy control request triggers in a policy decision to subscribe to the associated triggers in the SMF.

When the SMF interacts with the PCF when the condition(s) associated with policy control request triggers are met, the SMF shall the corresponding trigger(s) together with the related attribute(s) that have changed if applicable.

4.1.6 Requested rule data

Requested rule data consists of requested information by the PCF associated with one or more PCC rules.

The requested rule data is designed as a subresource of the policy decision within an attribute called "lastReqRuleData". The PCF only records the last requested rule data.

When requesting rule data, the PCF shall include the types of data requested for the rules within the "reqData" array of the "lastReqRuleData" and shall also provide the corresponding policy control request triggers if the triggers are not yet set.

The encoding of the requested rule data is further specified in clause 5.6.2.24.

When the SMF receives the requested rule data, the SMF shall report the corresponding information to the PCF for the associated PCC rule(s).

4.1.7 Requested usage data

Requested Usage data consists of the requested accumulated usage reports by the PCF for one or more instances of Usage Monitoring data decision.

The requested usage data is designed as a sub resource of the policy decision within an attribute called "lastReqUsageData". The PCF only records the last requested usage data.

The encoding of the requested usage data is further specified in clause 5.6.2.25.

When the SMF receives the requested usage data attribute, the SMF shall report to the PCF the corresponding accumulated usage reports for the corresponding Usage Monitoring data decision(s). Requested usage data shall not be valid anymore for these Usage Monitoring data decision(s) after the reporting.

4.1.8 Condition data

Condition data defines the condition(s) where the PCC rules or session rules are applicable and/or not applicable. The condition data encoding is defined in clause 5.6.2.9.

Condition data shall include:

- Condition Data ID.

Condition data may include:

- Activation Time;
- Deactivation Time;
- Access Type; and

- RAT Type

NOTE: Access type and RAT type are only applicable to the session rule.

4.2 Service Operations

4.2.1 Introduction

The service operations defined for Npcf_SMPolicyControl are shown in table 4.2.1-1.

Table 4.2.1-1: Npcf_SMPolicyControl Operations

Service Operation Name	Description	Initiated by
Npcf_SMPolicyControl_Create	Request to create an SM Policy Association with the PCF to receive the policy for a PDU session.	NF consumer (SMF)
Npcf_SMPolicyControl_Update	Request to update the SM Policy association with the PCF to receive the updated policy when Policy Control Request Trigger(s) condition is met.	NF consumer (SMF)
Npcf_SMPolicyControl_UpdateNotify	Update and/or delete PCC rule(s), PDU session related policy context at the SMF and Policy Control Request Trigger(s) information.	PCF
Npcf_SMPolicyControl_Delete	Request to delete the SM Policy Association and the associated resources.	NF consumer (SMF)

4.2.2 Npcf_SMPolicyControl_Create Service Operation

4.2.2.1 General

The Npcf_SMPolicyControl_Create service operation provides means for the SMF to request the creation of a corresponding SM Policy Association with PCF.

The Session Management procedures of the SMF and related policies are defined in 3GPP TS 23.501 [2], 3GPP TS 23.502 [3] and 3GPP TS 23.503 [6].

The following procedures using the Npcf_SMPolicyControl_Create service operation are supported:

- Request the creation of a corresponding SM Policy Association with the PCF.
- Provisioning of PCC rules.
- Provisioning of policy control request triggers.
- Provisioning of charging related information for a PDU session.
- Provisioning of revalidation time.
- Policy provisioning and enforcement of authorized AMBR per PDU session.
- Policy provisioning and enforcement of authorized default QoS.
- Provisioning of PCC rule for Application Detection and Control.
- 3GPP PS Data Off Support.
- IMS Emergency Session Support.
- Request Usage Monitoring Control.
- Access Network Charging Identifier report.
- Request for the successful resource allocation notification.
- Provisioning of IP Index Information.

- Negotiation of the QoS flow for IMS signalling.
- PCF resource cleanup.
- Access traffic steering, switching and splitting support.
- DNN Selection Mode Support.
- Detection of the SM Policy Association enabling Time Sensitive Communications, Time Synchronization and Deterministic Networking.
- Support of Dual Connectivity end to end redundant User Plane paths.
- User Plane Remote Provisioning of UE SNPN Credentials in Onboarding Network.
- Network slice related data rate policy control.
- Request of Presence Reporting Area Change Report.
- Group related data rate policy control.
- Support of Network Slice Usage Control.
- VPLMN Specific Offloading Policy.
- Network Slice Replacement.
- Reporting of URSP rule enforcement infomation.

When the EMDBV feature defined in clause 5.8 is supported by both the PCF and the SMF, the PCF shall use the extMaxDataBurstVol attribute instead of the maxDataBurstVol attribute to signal maximum data burst volume values higher than 4095 Bytes.

When the EMDBV feature is supported by the PCF but not supported by the SMF and the PCF needs to signal maximum data burst volume values higher than 4095 Bytes, the PCF shall use the maxDataBurstVol attribute set to 4095 Bytes.

For values lower than or equal to 4095 Bytes, the PCF shall use the maxDataBurstVol attribute.

NOTE: Maximum data burst volume values are sent by the PCF in responses to the SMF or in an SM Policy Association Update request i.e. after feature negotiation, so the PCF knows whether the SMF supports the EMDBV feature.

4.2.2.2 SM Policy Association establishment

Figure 4.2.2.2-1: SM Policy Association establishment

When the NF service consumer receives the Nsmf_PDUSession_CreateSMContext Request as defined in clause 5.2.2.2 of 3GPP TS 29.502 [22], if the NF service consumer was requested not to interact with the PCF, the NF service consumer shall not interact with the PCF. Otherwise, the NF service consumer shall send an HTTP POST request to the PCF to create an "Individual SM Policy" resource as described in step 1 of figure 4.2.2.2-1.

NOTE 1: The decision to not interact with the PCF applies for the entire lifetime of the PDU session.

NOTE 2: The indicator to not interact with the PCF is configured in the UDM. It is delivered by the UDM to the NF service consumer within the Charging Characteristics using the Session Management Subscription Data Retrieval service operation as described in 3GPP TS 29.503 [34]. The indicator is operator specific, therefore it can only be used in non-roaming and home routed roaming cases.

The NF service consumer shall include the "SmPolicyContextData" data structure in the content of the HTTP POST request in order to request the creation of a representation of the "Individual SM Policy" resource as described below.

The NF service consumer shall include (if available) in the "SmPolicyContextData" data structure:

- SUPI of the user within the "supi" attribute;
- PDU Session Id within the "pduSessionId" attribute;
- DNN within the "dnn" attribute;
- DNN selection mode within the "dnnSelMode" attribute, if the "DNNSelectionMode" feature is supported;
- URL identifying the recipient of SM policies update notifications within the "notificationUri" attribute;
- PDU Session Type within the "pduSessionType" attribute;
- PEI within the "pei" attribute;
- Internal Group Id(s) within the "interGrpIds" attribute;
- type of access within the "accessType" attribute;
- type of the radio access technology within the "ratType" attribute;
- the combination of additional access type and RAT type within the "addAccessInfo" attribute, if the ATSSS feature is supported;
- the UE Ipv4 address within the "ipv4Address" attribute and/or the UE Ipv6 prefix within the "ipv6AddressPrefix" attribute;
- the UE time zone information within the "ueTimeZone" attribute;
- the UDM subscribed Session-AMBR or, if the "DN-Authorization" feature is supported, the DN-AAA authorized Session-AMBR within the "subsSessAmbr" attribute;
- NOTE 3: When both, the UDM subscribed Session-AMBR and the DN-AAA authorized Session-AMBR are available in the NF service consumer, the NF service consumer includes the DN-AAA authorized Session-AMBR.
- if the "VPLMN-QoS-Control" feature is supported, the highest Session-AMBR and the default QoS supported in the VPLMN within the "vplmnQos" attribute, if available;
- NOTE 4: In home routed roaming, the H-SMF may provide the QoS constraints received from the VPLMN (defined in 3GPP TS 23.502 [3] clause 4.3.2.2.2) to the PCF.
- the DN-AAA authorization profile index within the "authProfIndex" attribute, if the "DN-Authorization" feature is supported;
- subscribed Default QoS Information within the "subsDefQos" attribute;
- the number of supported packet filters for signalled QoS rules within the "numOfPackFilter" attribute;
- the online charging status within the "online" attribute;
- the offline charging status within the "offline" attribute;
- the charging characteristics within the "chargingCharacteristics" attribute;
- the access network charging identifier within the "accNetChId" attribute;
- the address of the network entity performing charging within the "chargEntityAddr" attribute;

- the 3GPP PS data off status within the "3gppPsDataOffStatus" attribute, if the "3GPP-PS-Data-Off" feature is supported;
- indication of UE support of reflective QoS within the "refQosIndication" attribute;
- user location(s) information within the "userLocationInfo" attribute;
- NOTE 5: The SMF encodes both 3GPP and non-3GPP access UE location in the "userLocationInfo" attribute when they are both received from the AMF.
- the S-NSSAI corresponding to the network slice to which the PDU session is allocated within the "sliceInfo" attribute:
- when the "NetSliceRepl" feature is supported and the initial S-NSSAI provided within the "sliceInfo" attribute is replaced by an Alternative S-NSSAI, the Alternative S-NSSAI provided within the "altSliceInfo" attribute;
- NOTE 6: For session binding with the BSF, the PCF uses the initial S-NSSAI, regardless of whether it is currently replaced with an Alternative S-NSSAI or not.
- the required QoS flow usage for the default QoS flow within the "qosFlowUsage" attribute;
- the MA PDU session indication within the "maPduInd" attribute, if the "ATSSS" feature is supported;
- the ATSSS capability within the "atsssCapab" attribute, if the "ATSSS" feature is supported;
- the identifier of the serving network (the PLMN Identifier or the SNPN Identifier) within the "servingNetwork" attribute:
- NOTE 7: The SNPN Identifier consists of the PLMN Identifier and the NID.
- one or more framed routes within the "ipv4FrameRouteList" attribute for IPv4 and/or one or more framed routes within the "ipv6FrameRouteList" attribute;
- NOTE 8: When both, the UDM subscribed framed routes and the DN-AAA authorized framed routes are available in the NF service consumer, the NF service consumer includes the DN-AAA authorized framed routes. If the UDM or DN-AAA updates the framed routes during the lifetime of the PDU Session, the NF service consumer releases the PDU Session as defined in clause 4.2.5.2.
- the serving network function identifier within the "servNfId" attribute;
- when the "PvsSupport" feature is supported, the onboarding indication within the "onboardInd" attribute and the Provisioning Server address(es) within the "pvsInfo" attribute;
- when the "SatBackhaulCategoryChg" feature is supported, the satellite backhaul category within the "satBackhaulCategory" attribute and, when the "EnSatBackhaulCatChg" feature is supported, also including the dynamic satellite backhaul category;
- NOTE 9: When the "satBackhaulCategory" attribute is not present, non-satellite backhaul applies.
- when the "AMInfluence" feature is supported, the PCF for the UE callback URI and, if received, SBA binding information within the "pcfUeInfo" attribute;
- when the "URSPEnforcement" feature is supported, the URSP rule enforcement information provided by the UE within the "urspEnfInfo" attribute. In this case, the NF service consumer shall also include the SSC mode within the "sscMode" attribute, the UE requested DNN (if available and different from the selected DNN) within the "ueReqDnn" attribute, and the UE requested PDU session Type (if available and different from the selected PDU session Type) within the "ueReqPduSessionType" attribute;
- trace control and configuration parameters information within the "traceReq" attribute;
- when the "EneNA" feature is supported, the list of NWDAF instance IDs used for the PDU Session within the "nwdafInstanceId" and their associated Analytic ID(s) within "nwdafEvents" consumed by the NF service consumer, included within the "nwdafDatas" attribute; and
- for HR-SBO scenario, if the "HR-SBO" feature is supported, the HR-SBO support indication within the "hrsboInd" attribute in the SM policy association.

The NF service consumer may include in the "SmPolicyContextData" data structure the IPv4 address domain identity within the "ipDomain" attribute.

NOTE 9: The "ipDomain" attribute is helpful when within a network slice, there are several separate IP address domains, with SMF/UPF(s) that allocate Ipv4 IP addresses out of the same private address range to UE PDU Sessions. The same IP address can thus be allocated to UE PDU sessions served by SMF/UPFs in different IPv4 address domains. If one PCF controls several SMF/UPFs in different IP address domains, the UE IP address is thus not sufficient for the AF session binding procedure, as described in 3GPP TS 29.514 [17]. The SMF assists the PCF in the session binding supplying an "ipDomain" attribute denoting the IPv4 address domain identity of the allocated UE IPv4 address.

When the PCF receives the HTTP POST request from the NF service consumer, the PCF shall make a policy authorization based on the information received from the NF service consumer and, if available, information received from the AMF, the CHF, the AF, the UDR and/or the NWDAF and operator policies pre-configured at the PCF. If the policy authorization is successful, the PCF shall create a new resource, which represents a new "Individual SM Policy" instance, addressed by a URI as defined in clause 5.3.3.2 and containing a PCF created resource identifier. The PCF shall respond to the NF service consumer with an HTTP 201 Created response, including:

- a Location header field containing the URI of the created resource; and
- a response body providing the session management related policies, e.g. provisioning of PCC rules as defined in clause 4.2.6.2, provisioning of policy control request triggers as defined in clause 4.2.6.4.

The NF service consumer shall use the URI received in the Location header in subsequent requests to the PCF to refer to the created "Individual SM Policy" resource.

If the PCF received the list of NWDAF instance IDs used for the PDU Session in "nwdafInstanceId" attribute and their associated Analytic IDs in "nwdafEvents" attribute included within the "nwdafDatas" attribute the PCF may select those NWDAF instances as described in 3GPP TS 29.513 [7].

It the PCF received a "traceReq" attribute in the HTTP POST request from the SMF, it shall perform trace procedures as defined in 3GPP TS 32.422 [24].

If the PCF received the "hrsboInd" attribute indicating the support of HR-SBO, the PCF may provide a VPLMN Specific Offloading Policy as described in clause 4.2.2.25.

If errors occur when processing the HTTP POST request, the PCF shall apply the error handling procedures specified in clause 5.7.

If the user information received within the "supi" attribute is unknown, the PCF shall reject the request with an HTTP "400 Bad Request" response message including the "cause" attribute of the ProblemDetails data structure set to "USER_UNKNOWN".

If the PCF is not able, due to incomplete, erroneous or missing information (e.g. QoS, RAT type, subscriber information), to provision a policy decision as response to the request for PCC rules from the NF service consumer, the PCF may reject the request with an HTTP "400 Bad Request" response message including the "cause" attribute of the ProblemDetails data structure set to "ERROR_INITIAL_PARAMETERS".

If the NF service consumer receives an HTTP response with the above error codes, the NF service consumer shall reject the PDU session establishment procedure that initiated the HTTP POST Request.

If the PCF, based on local configuration and/or operator policies, denies the creation of the Individual SM Policy resource, the PCF may reject the request with in an HTTP "403 Forbidden" response message including the "cause" attribute of the ProblemDetails data structure set to "POLICY_CONTEXT_DENIED". At reception of this error code and based on configured failure actions, the NF service consumer may reject or allow, by applying local policies, the PDU session establishment.

If the "SamePcf" feature as defined in clause 5.8 is supported, when the PCF determines that the same PCF shall be selected for the SM Policy associations to the same UE ID, S-NSSAI and DNN combination in the non-roaming or home-routed scenario and there is no SM Policy association for the UE ID, S-NSSAI and DNN combination, the PCF, after determining whether the BSF supports the "SamePcf" or the "ExtendedSamePcf" feature as described in 3GPP TS 29.521 [39], shall request the BSF to check if there is an existing PCF binding information for the same UE ID, S-NSSAI and DNN combination registered by other PCF(s) as defined in clause 4.2.2.2 of 3GPP TS 29.521 [39]. If the PCF receives the from the BSF "403 Forbidden" status code with the "cause" attribute of the ProblemDetails data structure set to "EXISTING_BINDING_INFO_FOUND" and the FQDN or description of IP endpoints of the

Npcf_SMPolicyControl service of the existing PCF (i.e. that handles SM Policy association(s) to the same UE ID, S-NSSAI and DNN combination) within the "pcfSmFqdn" attribute or the "pcfSmIpEndPoints" attribute of the BindingResp data structure respectively as defined in clause 4.2.2.2 of 3GPP TS 29.521 [39], the PCF shall reply to the SMF with an HTTP "308 Permanent Redirect" error response and the Location header containing a URI as defined in clause 5.3.2.2, with the FQDN or IP endpoint of this PCF's Npcf_SMPolicyControl service as {apiRoot}. Upon reception of the response, the NF service consumer shall initiate a new HTTP POST request based on the returned URI.

The forwarding of the Origination Time Stamp parameter shall apply as described hereafter, if the NF service consumer supports the detection and handling of late arriving requests as specified in clause 5.2.3.3 of 3GPP TS 29.502 [22] and the procedure is enabled by the operator. If the NF service consumer receives a request to create an SM Context or a PDU session context, which includes the 3gpp-Sbi-Origination-Timestamp header as defined in clause 5.2.3.2, the NF service consumer shall forward this header to the PCF as HTTP custom header. See also clause 4.2.7 for the handling at the PCF, when the PCF receives the 3gpp-Sbi-Origination-Timestamp header.

4.2.2.3 Provisioning of charging related information for PDU session

4.2.2.3.1 Provisioning of Charging Addresses

The PCF may provide the SMF with the charging information, i.e. the CHF address(es), and if available, the associated CHF instance ID(s) and CHF set ID(s), during the initial interaction with the SMF defining the charging function respectively based on the operator policy. In this case, the PCF may retrieve the CHF addresses, and if available, the associated CHF instance ID(s) and CHF set ID(s) as follows:

- The PCF receives it from the UDR as part of the Policy Data Subscription information, as defined in clause 5.2.10 of 3GPP TS 29.519 [15].
- It is locally configured in the PCF based on operator policies.
- The PCF discovers it by interacting with the NRF, as described in clause 6.1 of 3GPP TS 32.290 [30].

In order to provision the CHF information to the SMF, the PCF shall include the "chargingInfo" attribute containing the charging information within the SmPolicyDecision data structure.

Within the ChargingInformation data structure, both the primary CHF address, within the "primaryChfAddress" attribute, and secondary CHF address, within the "secondaryChfAddress" attribute, shall be provided simultaneously when the feature "CHFsetSupport" is not supported. When the feature "CHFsetSupport" is supported, the PCF shall include the "secondaryChfAddress" attribute if available (i.e. if previously retrieved from the UDR, locally configured in the PCF or discovered from the NRF).

When the CHF supports redundancy based on NF Set concepts as described in 3GPP TS 29.500 [4], the required charging information consists of CHF address, encoded within the "primaryChfAddress" attribute, CHF instance, encoded within the "primaryChfInstanceId" attribute, and primary CHF set id, encoded within the "primaryChfSetId". The CHF set information may be also complemented by secondary CHF address, encoded within the "secondaryChfAddress", for backwards compatibility purposes with the primary/secondary redundancy mechanism. These shall overwrite any predefined CHF addresses and associated CHF instance ID and CHF set ID at the SMF.

NOTE: When the feature "CHFsetSupport" is supported by the NF service consumer, it indicates the NF service consumer supports CHF redundancy based on NF Set concepts as described in 3GPP TS 29.500 [4], clause 6.5.3.

Provisioning charging information without PCC rules for charged service data flows shall not be considered as an error, since such PCC rules may be provided later. If the PCF has provided the charging information within the SmPolicyDecision data structure during the initial interaction with the SMF, the PCF shall not modify the charging information in subsequent interactions.

If no charging information is provisioned by the PCF, the SMF shall use the charging information obtained via one of the following procedures, with the precedence order highest to lowest (see 3GPP TS 32.255 [35], clause 5.1.8):

- 1. UDM provided charging characteristics.
- 2. NRF based discovery.
- 3. SMF locally configured charging characteristics.

4.2.2.3.2 Provisioning of Default Charging Method

The default charging method indicates what charging method shall be used for every PCC rule within which the charging method is omitted, i.e. either both the "online" and the "offline" attributes are not provided or only one of them is provided and set to "false" within the ChargingData data structure to which the PCC rule refers. The SMF may have a pre-configured default charging method.

Upon the initial interaction with the PCF, the SMF shall provide the pre-configured default charging method, if available, within the "offline" attribute and/or the "online" attribute, and embedded directly within the SmPolicyContextData data structure of the HTTP POST message sent to the PCF.

The PCF may provide in the response to the received HTTP POST message the default charging method which applies to the PDU session. In order to do so, if offline charging applies, the PCF shall include the "offline" attribute set to "true" within the SmPolicyDecision data structure, or if online charging applies, the PCF shall include the "online" attribute set to "true" within the SmPolicyDecision data structure. The default charging method provided by the PCF shall overwrite any predefined default charging method available at the SMF. If the PCF has provided the default charging method during the initial interaction with the SMF, it shall not modify the default charging method in subsequent interactions.

When the "OfflineChOnly" feature is supported, the PCF may include the "PDU Session with offline charging only" indication as specified in clause 4.2.2.3.3.

NOTE: It is possible that there is no default charging method applied to a PDU session.

4.2.2.3.3 Provisioning of the "PDU Session with offline charging only" indication

If the "OfflineChOnly" feature, specified in clause 5.8, is supported, the PCF may provide in the response to the received HTTP POST message from the SMF the "PDU Session with offline charging only" indication, within the "offlineChOnly" attribute, to signal that the online charging method shall never be configured for any of the PCC Rules activated during the lifetime of the PDU Session, nor provided as the Default Charging Method, as specified in clause 6.4 of 3GPP TS 23.503.

If the "OfflineChOnly" feature, specified in clause 5.8, is supported and the PCF includes the "PDU Session with offline charging only" indication set to "true" in the "offlineChOnly" attribute within the SmPolicyDecision data structure, then the default charging method for the PDU session is offline charging, and the "online" attribute and the "offline" attribute shall not be provisioned by the PCF within the SmPolicyDecision data structure.

NOTE: If the PCF includes the "PDU Session with offline charging only" indication set to "true" in the "offlineChOnly" attribute within the SmPolicyDecision data structure, and the "online" attribute and the "offline" attribute are also provisioned by the PCF within the SmPolicyDecision data structure, then the SMF could ignore the values of the "online" attribute and the "offline" attribute.

4.2.2.4 Provisioning of revalidation time

The PCF may provide within the SmPolicyDecision data structure the revalidation time within the "revalidationTime" attribute and the "RE_TIMEOUT" policy control request trigger within the "policyCtrlReqTriggers" attribute to instruct the SMF to trigger an interaction with the PCF to request PCC rule(s).

The SMF shall start the timer based on the revalidation time and shall trigger a PCC rule request towards the PCF before the indicated revalidation time.

4.2.2.5 Policy provisioning and enforcement of authorized AMBR per PDU session

The SMF shall, if available include either the UDM subscribed Session-AMBR or, if the "DN-Authorization" feature is supported, the DN-AAA authorized Session-AMBR per PDU session within the "subsSessAmbr" attribute in the SmPolicyContextData data structure, as defined in clause 4.2.2.2. When both the UDM subscribed Session-AMBR and the DN-AAA authorized Session-AMBR are available in the SMF, the DN-AAA authorized Session-AMBR shall take precedence over the UDM subscribed Session-AMBR.

NOTE 1: The SMF always provides either the UDM subscribed Session-AMBR or the DN-AAA authorized Session-AMBR per PDU session during an SM policy association establishment procedure except when the SM policy association corresponds to an emergency PDU session.

In home routed roaming, and if the "VPLMN-QoS-Control" feature is supported, the SMF shall provide the Session-AMBR constraints received from the VPLMN, if available, within the "vplmnQos" attribute.

When the SMF provides the subscribed Session-AMBR to the PCF, the PCF shall authorize the Session-AMBR based on the operator's policy and, in the home routed scenario, shall ensure that the authorized Session-AMBR value does not exceed the Session-AMBR value provided by the VPLMN, if available. For emergency PDU sessions, the PCF shall behave as specified in clause 4.2.2.9.

NOTE 2: If the SMF does not provide the Session-AMBR constraints in the VPLMN to the PCF, the PCF considers that no Session-AMBR constrains apply unless operator policies define any.

When network slice data rate policy control applies, the PCF shall authorize the Session-AMBR as described in clause 4.2.6.8.

The PCF shall provision the authorized Session-AMBR to the SMF in the response to the received HTTP POST message, as defined in clauses 4.2.6.3.1 and 4.2.6.3.2.

Upon reception of the authorized Session-AMBR from the PCF, the SMF shall apply the corresponding procedures towards the access network, the UE and the UPF for the enforcement of the Session-AMBR for the concerned PDU session.

4.2.2.6 Policy provisioning and enforcement of authorized default QoS

During PDU session establishment, as defined in clause 4.2.2.2, the SMF shall, if available, include the subscribed default QoS within the "subsDefQos" attribute.

NOTE 1: The SMF always provides the subscribed default QoS during an SM policy association establishment procedure except when the SM policy association corresponds to an emergency PDU session.

In home routed roaming, and if the "VPLMN-QoS-Control" feature is supported, the SMF shall provide the default QoS constraints received from the VPLMN, if available, within the "vplmnQos" attribute.

When the SMF provides the subscribed default QoS to the PCF, the PCF shall authorize the default QoS based on the operator's policy and, in the home routed scenario, shall ensure that the authorized default QoS contains 5QI and ARP values, and MBR/GBR values, if applicable, and if the feature "VPLMN-5QIPrioLevel" is supported, a 5QI Priority Level (when the required 5QI Priority Level is different from the standardized Default Priority Level value in the QoS characteristics Table 5.7.4-1 in 3GPP TS 23.501 [2]), supported by the VPLMN, if available. For emergency PDU sessions, the PCF shall behave as specified in clause 4.2.2.9.

NOTE 2: If the SMF does not provide the default QoS constraints in the VPLMN to the PCF, the PCF considers that no default QoS constrains apply unless operator policies define any.

The PCF shall provision the authorized default QoS to the SMF in the response to the received HTTP POST message, as defined in clauses 4.2.6.3.1 and 4.2.6.3.2.

Upon reception of the authorized default QoS, the SMF enforces it, which may lead to the change of the subscribed default QoS. The SMF shall apply the corresponding procedures towards the access network, the UE and the UPF for this enforcement of the authorized default QoS for the concerned PDU session.

- NOTE 3: If dynamic PCC is not deployed, the SMF can have a DNN based configuration to enable the establishment of a GBR resource type default QoS flow. This configuration contains a standardized GBR 5QI as well as GFBR and MFBR for UL and DL.
- NOTE 4: GBR resource type is not applicable to the default QoS flow of a PDU session that is interworking with EPS.

4.2.2.7 Provisioning of PCC rule for Application Detection and Control

If the ADC feature is supported, and the user subscription indicates that application detection and control is required, the PCF may provision PCC rule(s) for application detection and control as defined in clause 4.2.6.2.11 in the response message to the received HTTP POST request from the SMF.

If the SMF receives a PCC rule for application detection and control, the SMF shall instruct the UPF to detect the associated application traffic as defined in 3GPP TS 29.244 [13].

4.2.2.8 3GPP PS Data Off Support

When the 3GPP-PS-Data-Off feature, as defined in clause 5.8, is supported, and if the SMF is informed that the 3GPP PS Data Off status of the UE is set to active during the establishment of a PDU session over 3GPP access and/or non-3GPP access, it shall include the "3gppPsDataOffStatus" attribute set to true within the SmPolicyContextData data structure in the HTTP POST message that it sends to the PCF, as defined in clause 4.2.2.2.

If the PCF receives that HTTP POST message with a SmPolicyContextData data structure containing a "3gppPsDataOffStatus" attribute set to true as above and the "accessType" attribute indicating "3GPP_ACCESS", the PCF shall configure the SMF to block any downlink and optionally uplink IP flows that are not related to a service contained in the list of 3GPP PS Data Off Exempt Services, e.g. by not installing any related dynamic PCC rule(s) or by not activating the related predefined PCC rule(s) such as PCC rule(s) with wild-carded service data flow filters. The PCF may also, subject to its normal policies, provide the PCC rule(s) for the service(s) included in the list of 3GPP PS Data Off Exempt Services, as defined in clause 4.2.6.2.1.

The PCF shall subscribe to the "AC_TY_CH" policy control request trigger with the SMF, as defined in clause 4.2.6.4, in order to support this feature, if the PCF determines that the UE is allowed to access the network via non-3GPP access.

- NOTE 1: The PCF can be configured with a list of 3GPP PS Data Off Exempt Services per DNN and S-NSSAI.

 The list of 3GPP PS Data Off Exempt Services for an DNN and S-NSSAI can also be empty, or can allow for any service within that DNN and S-NSSAI, according to operator policy.
- NOTE 2: For the PDU session used for IMS services, the 3GPP Data Off Exempt Services are enforced in the IMS domain as specified in 3GPP TS 23.228 [16]. Policies configured in the PCF need to ensure that IMS services are allowed when the 3GPP Data Off status of the UE is set to active, e.g. by treating any service within a well-known IMS DNN as part of the 3GPP PS Data Off Exempt Services.
- NOTE 3: The packets transferred over non-3GPP access are unaffected by the 3GPP PS Data Off functionality.

If the "ATSSS" feature, as defined in clause 5.8 is supported, and the PCF receives in the SmPolicyContextData data structure the "maPduInd" attribute, the "3gppPsDataOffStatus" attribute set to true and the "accessType" attribute or the "addAccInfo" attribute set to "3GPP_ACCESS", the PCF shall configure the SMF in such a way that:

- packets for services belonging to the 3GPP PS Data Off Exempt services are forwarded over 3GPP access and non-3GPP access as indicated by the policy for ATSSS Control, as specified in clause 4.2.6.2.17; and
- for downlink and optionally uplink flows not related to a service contained in the list of 3GPP PS Data Off Exempt services, the PCF may configure the SMF to handle the associated traffic only via non-3GPP access, if available, by providing the corresponding ATSSS policy within the related PCC rule, as specified in clause 4.2.6.2.17.

4.2.2.9 IMS Emergency Session Support

A SMF that requests PCC Rules at PDU Session Establishment for an IMS emergency session in a PLMN or an SNPN shall send an HTTP POST message to the PCF, as defined in clause 4.2.2.2, including the "dnn" attribute containing the Emergency DNN. The "supi" attribute may contain the SUPI value or an implementation specific value if the SUPI is not available. If the SUPI is not available or unauthenticated, the SMF shall include the PEI within the "pei" attribute and set the "invalidSupi" attribute to "true". The SMF may include the rest of the attributes described in clause 4.2.2.2. The SMF may also include the GPSI, if available, within the "gpsi" attribute.

- NOTE 1: The SMF will not provide subscribed information (e.g. subscribed default QoS or subscribed Session AMBR) to the PCF when the SUPI is not available, unauthenticated or based on local configuration.
- NOTE 2: IMS Emergency services are not supported for SNPN when the UE accesses the SNPN over NWu via a PLMN.

The PCF shall detect that a PDU session is restricted to IMS Emergency services when the "dnn" attribute included in the HTTP POST message received from the SMF includes a data network identifier that matches one of the Emergency DNs from the configurable list. The PCF does not perform in this case subscription check procedures with UDR; it uses instead the locally configured operator policies to make authorization and policy decisions. The PCF:

- shall provision PCC Rules restricting the access to Emergency Services (e.g. P-CSCF(s), DHCP(s), DNS(s) and SUPL(s) addresses), as required by local operator policies, in a response message to the SMF according to the procedures described in clause 4.2.6;
- may provision the authorized QoS that applies to the default QoS flow in the response message to the SMF within the "authDefQos" attribute of a session rule according to the procedures described in clause 4.2.3.6, except for obtaining the authorized QoS upon interaction with the UDR. The value of the "priorityLevel" attribute included within the "arp" attribute shall be assigned as required by local operator policies (e.g. if an IMS Emergency session is prioritized, the "priorityLevel" attribute may contain a value that is reserved for an operator domain use of IMS Emergency sessions). If the "accessType" attribute is set to "3GPP_ACCESS", the values of the "preemptCap" and the "preemptVuln" attributes included within the "arp" attribute shall be assigned as required by local operator policies,
- may provision the authorized Session-AMBR in the response message to the SMF, according to the procedures described in clause 4.2.3.5.

When the SMF detects that the provisioning of PCC Rules failed, the PCC rule error handling procedures shall be performed.

4.2.2.10 Request Usage Monitoring Control

If the UMC as defined in clause 5.8 is supported, the PCF may provision the usage monitoring control policy to the SMF as defined in clause 4.2.6.5.3.

4.2.2.11 Access Network Charging Identifier report

During the PDU session establishment procedure, if the Access Network Charging Identifier is within the Uint32 value range, the SMF may provide the access network charging identifier information within the "accNetChId" attribute of the SmPolicyContextData data structure. Within the associated AccNetChId data structure, the SMF shall include the "accNetChaIdValue" attribute containing the Access Network Charging Identifier for the PDU session (i.e., for the default QoS flow) and the "sessionChScope" attribute set to true. The SMF may provide the address of the network entity performing the charging functionality within the "chargEntityAddr" attribute.

NOTE: As specified in 3GPP TS 32.255 [35] clause 5.1.4, the SMF assigns a charging identifier per PDU session and is used through the PDU session's lifetime. The report of Access Network Charging Identifier(s) in 5GS and EPS interworking scenarios is described in clause B.3.2.3.

If the "AccNetChargId_String" feature is supported by the SMF, and the Access Network Charging Identifier value is longer than Uint32:

- if the SMF doesn't know if the PCF supports the "AccNetChargId_String" feature, the SMF shall not provide the access network charging identifier information;
- if the SMF knows the PCF supports the feature "AccNetChargId_String", the SMF shall encode the access network charging identifier within "accNetChargIdString" attribute.

4.2.2.12 Request for the successful resource allocation notification

The PCF may request the SMF to confirm that the resources associated to a PCC rule are successfully allocated as defined in clause 4.2.6.5.5.

4.2.2.13 Request of Presence Reporting Area Change Report

If the PRA or ePRA feature, as defined in clause 5.8, is supported, the PCF may provision the Presence Reporting Area Information to the SMF as defined in clause 4.2.6.5.6.

4.2.2.14 Provisioning of IP Index Information

If the PDU session type received within the "pduSessionType" attribute is "IPV4" or "IPV6" or "IPV4V6", and no corresponding IP address/prefix is received, the PCF may include within the SmPolicyDecision data structure the IP index information within the "ipv4Index" attribute, for IPv4 address allocation, and/or the "ipv6Index" attribute, for IPv6 address allocation, based on the user's subscription information retrieved from the UDR and operator's policy.

The SMF may use this IP index information to assist in selecting how the IP address is to be allocated when multiple allocation methods or multiple instances of the same method are supported.

4.2.2.15 Negotiation of the QoS flow for IMS signalling

If the SMF includes the "qosFlowUsage" attribute required for the default QoS flow within the SmPolicyContextData data structure during the PDU session establishment procedure, the PCF shall provide the "qosFlowUsage" attribute back in the response with the authorized usage.

If during PDU session establishment procedure, the SMF includes the "IMS_SIG" value within the "qosFlowUsage" attribute and the PCF accepts that default QoS flow is dedicated to IMS signalling, the PCF shall within the SmPolicyDecision data structure include the "IMS_SIG" value within the "qosFlowUsage" attribute. In this case, the PCF shall restrict the QoS flow to only be used for IMS signalling as specified in 3GPP TS 23.228 [16] by applying the applicable 5QI for IMS signalling.

If the SMF include the "IMS_SIG" value within the "qosFlowUsage" attribute of the SmPolicyContextData data structure, but the PCF does not include the "IMS_SIG" within the "qosFlowUsage" attribute of SmPolicyDecision data structure, the PCC Rules provided by the PCF shall have a 5QI value different from the 5QI value for the IMS signalling.

4.2.2.16 PCF resource cleanup

In the Npcf_SMPolicyControl_Create service operation, the SMF as NF service consumer may provide SMF Id in "smfId" attribute and recovery timestamp in "recoveryTime" attribute. The PCF may use the "smfId" attribute to supervise the status of the SMF as described in clause 5.2 of 3GPP TS 29.510 [29] and perform necessary cleanup upon status change of the SMF later, and/or both the "smfId" attribute and the "recoveryTime" attribute in cleanup procedure as described in clause 6.4 of 3GPP TS 23.527 [33].

4.2.2.17 Access traffic steering, switching and splitting support

If the SMF supports the "ATSSS" feature defined in clause 5.8, the SMF shall within the SmPolicyContextData data structure include the ATSSS capability within the "atsssCapab" attribute and the MA PDU session Indication within the "maPduInd" attribute as defined in clause 4.2.2.2.

The SMF determines the ATSSS capability supported for the MA PDU Session based on the ATSSS capabilities provided by the UE and per DNN configuration on SMF, as follows:

- a. If the SMF receives the UE's ATSSS capabilities "MPTCP functionality with any steering mode and ATSSS-LL functionality with only Active-Standby steering mode" and;
 - i. if the DNN configuration allows both MPTCP and ATSSS-LL with any steering mode, including RTT measurement without using PMF protocol, the SMF shall set the "atsssCapab" attribute to the value "MPTCP_ATSSS_LL_WITH_ASMODE_UL", or;
 - ii. if the DNN configuration allows both MPTCP and ATSSS-LL with any steering mode, including RTT measurement without using PMF protocol, but the UPF does not support the RTT measurement without using PMF protocol, the SMF shall set the "atsssCapab" attribute to the value "MPTCP_ATSSS_LL_WITH_EXSDMODE_DL_ASMODE_UL".
 - iii. if the DNN configuration allows MPTCP with any steering mode and ATSSS-LL with only Active-Standby steering mode, the SMF shall set the "atsssCapab" attribute to the value "MPTCP_ATSSS_LL_WITH_ASMODE_DLUL".
- b. If the SMF receives the UE's ATSSS capabilities "ATSSS-LL functionality with any steering mode" and the DNN configuration allows ATSSS-LL with any steering mode, the SMF shall set the "atsssCapab" attribute to the value "ATSSS LL".
- c. If the SMF receives the UE's ATSSS capabilities "MPTCP functionality with any steering mode and ATSSS-LL functionality with any steering mode", and the DNN configuration allows both MPTCP and ATSSS-LL with any steering mode, the SMF shall set the "atsssCapab" attribute to the value "MPTCP ATSSS LL".

If the SMF supports the "EnATSSS_v2" feature defined in clause 5.8

- a. If the SMF receives the UE's ATSSS capabilities "MPQUIC functionality with any steering mode and ATSSS-LL functionality with only Active-Standby steering mode" and;
 - if the DNN configuration allows both MPQUIC and ATSSS-LL with any steering mode, including RTT measurement without using PMF protocol, the SMF shall set the "atsssCapab" attribute to the value "MPQUIC_ATSSS_LL_WITH_ASMODE_UL";
 - ii. if the DNN configuration allows both MPQUIC and ATSSS-LL with any steering mode, including RTT measurement without using PMF protocol, but the UPF does not support the RTT measurement without using PMF protocol, the SMF shall set the "atsssCapab" attribute to the value "MPQUIC_ATSSS_LL_WITH_EXSDMODE_DL_ASMODE_UL"; or
 - iii. if the DNN configuration allows MPQUIC with any steering mode and ATSSS-LL with only Active-Standby steering mode, the SMF shall set the "atsssCapab" attribute to the value "MPQUIC_ATSSS_LL_WITH_ASMODE_DLUL".
- b. If the SMF receives the UE's ATSSS capabilities "MPQUIC functionality with any steering mode and ATSSS-LL functionality with any steering mode", and the DNN configuration allows both MPQUIC and ATSSS-LL with any steering mode, the SMF shall set the "atsssCapab" attribute to the value "MPQUIC_ATSSS_LL".
- If the SMF receives the UE's ATSSS capabilities "MPTCP functionality with any steering mode, MPQUIC functionality with any steering mode and ATSSS-LL functionality with only Active-Standby steering mode" and;
 - i. if the DNN configuration allows MPTCP, MPQUIC and ATSSS-LL with any steering mode, including RTT measurement without using PMF protocol, the SMF shall set the "atsssCapab" attribute to the value "MPTCP_MPQUIC_ATSSS_LL_WITH_ASMODE_UL";
 - ii. if the DNN configuration allows MPTCP, MPQUIC and ATSSS-LL with any steering mode, including RTT measurement without using PMF protocol, but the UPF does not support the RTT measurement without using PMF protocol, the SMF shall set the "atsssCapab" attribute to the value "MPTCP_MPQUIC_ATSSS_LL_WITH_EXSDMODE_DL_ASMODE_UL"; or
 - iii. if the DNN configuration allows MPTCP and MPQUIC with any steering mode and ATSSS-LL with only Active-Standby steering mode, the SMF shall set the "atsssCapab" attribute to the value "MPTCP_MPQUIC_ATSSS_LL_WITH_ASMODE_DLUL".
- d. If the SMF receives the UE's ATSSS capabilities "MPTCP functionality with any steering mode, MPQUIC functionality with any steering mode and ATSSS-LL functionality with any steering mode", and the DNN configuration allows MPTCP, MPQUIC and ATSSS-LL with any steering mode, the SMF shall set the "atsssCapab" attribute to the value "MPTCP_MPQUIC_ATSSS_LL".

If the SMF receives the MA PDU Request Indication from the UE and the SMF determines that the MA PDU session is allowed based on the Session Management subscription data retrieved from the UDM and the operator policy, the SMF shall include the "MA_PDU_REQUEST" within the "maPduInd" attribute; otherwise if the SMF receives the MA PDU Network-Upgrade Allowed indication from the UE and the SMF determines that the MA PDU session is allowed based on the Session Management subscription data retrieved from the UDM and the operator policy, the SMF shall include the "MA_PDU_NETWORK_UPGRADE_ALLOWED" within the "maPduInd" attribute.

If the PCF supports the "ATSSS" feature, the PCF may provide PCC rules and/or session rules of ATSSS policy for the MA PDU session as defined in clause 4.2.6.2.17 and clause 4.2.6.3.4; otherwise the PCF shall not provide any PCC rules and/or session rules of ATSSS policy.

4.2.2.18 DNN Selection Mode Support

If the SMF supports the "DNNSelectionMode" feature defined in clause 5.8, when the SMF receives from the AMF the DNN selection mode, the SMF shall send an HTTP POST message as defined in clause 4.2.2.2 and shall include the received information in the "dnnSelMode" attribute.

The "dnnSelMode" attribute indicates whether the DNN suplied in the "dnn" attribute is an explicitly subscribed DNN and thus verified by the network against UDM subscription (regardless of whether it was originally provided by the UE or replaced by the network), or if it is a non-subscribed DNN (and provided by the UE, or replaced by the network).

If the PCF supports the "DNNSelectionMode" feature, when the "dnnSelMode" attribute indicates:

- the DNN is not explicitly subscribed, the PCF may provision PCC rules and Session rules according to the PCF local configuration for the UE provided and/or network provided non-subscribed DNN;
- the DNN is explicitly subscribed and verified by the network against UDM subscription, the PCF proceeds according to existing specified procedures.

4.2.2.19 Detection of the SM Policy Association enabling Time Sensitive Communications, Time Synchronization and Deterministic Networking

When the feature "TimeSensitiveNetworking" is supported, the PCF detects if the Npcf_SMPolicyControl_Create request relates to SM Policy Association enabling Time Sensitive Communications Time Synchronization and/or Deterministic Networking based on the received DNN and S-NSSAI. The PCF then may provide within the SmPolicyDecision data structure the "TSN_BRIDGE_INFO" policy control request trigger within the "policyCtrlReqTriggers" attribute to instruct the SMF to trigger a PCF interaction when the trigger is met; i.e., new TSC user plane node information (e.g. TSN Bridge or DetNet router information) is available.

NOTE: Time sensitive communication, time synchronization and deterministic networking are not supported in home-routed roaming scenarios, and service continuity is not supported when the UE moves from 5GS to EPS.

4.2.2.20 Support of Dual Connectivity end to end redundant User Plane paths

Upon the initial interaction with the PCF, if the "Dual-Connectivity-redundant-UP-paths" feature is supported, the PCF shall determine, based on operator's policy (e.g. when some of the allowed services require redundancy), whether the PDU session is a redundant one.

When the PCF determines that the PDU session is a redundant PDU session, the PCF shall provision the "redSessIndication" attribute set to true within the SmPolicyDecisionData returned in the response to the HTTP POST request. Upon receiving the indication from the PCF that the PDU session is a redundant PDU session, the SMF shall apply the corresponding procedures towards the access network and the UPF for the establishment of the redundant user plane paths as defined in clause 5.33.2.1 of 3GPP TS 23.501 [2].

The PCF shall not modify during the PDU session lifetime the indication of whether the redundant user plane paths are allowed for the PDU session.

4.2.2.21 User Plane Remote Provisioning of UE SNPN Credentials in Onboarding Network

User Plane Remote Provisioning of UEs SNPN Credentials when in Onboarding Network (ONN) is provided using a PDU session for a DNN and S-NSSAI used for onboarding.

The PCF may make authorization and policy decisions to restrict the use of the PDU Session established to the DNN and S-NSSAI used for onboarding in an ONN, e.g., by restricting the traffic to/from Provisioning Server address(es) and DNS server address(es) only. An ONN is either an ON-SNPN or a PLMN/SNPN.

When the ONN is an ON-SNPN and the "PvsSupport" feature is supported, during the PDU session establishment procedure related to a PDU session used for User Plane Remote Provisioning, the SMF shall include the indication that the PDU session is used for onboarding with the "onboardInd" attribute set to true and provide within "pvsInfo" attribute, if available, the information related to the Provisioning Server(s) that provisions the UE with credentials and other data to enable SNPN access.

NOTE 1: When an SNPN that provides access to localized services is acting as ON-SNPN, the SMF includes both DCS provided and the locally configured PVS IP address(es) and/or PVS FQDN(s), in the request to the PCF.

If the "onboardInd" attribute set to true is received during the SM policy association establishment, the PCF deducts that the combination of the received DNN within "dnn" attribute and the S-NSSAI within "sliceInfo" attribute corresponds to a PDU session used for User Plane Remote Provisioning. In this case, the PCF shall omit the subscription data check with UDR. Instead, the PCF shall use the locally stored Onboarding Configuration Data for this DNN and S-NSSAI combination to make authorization and policy decisions.

If the "pvsInfo" attribute with the Provisioning Server(s) information is received in the request, the PCF shall use the received information to create the service data flow template of the Provisioning Server(s) in the derived PCC Rule(s). If the "pvsInfo" attribute is not received, the PCF shall construct this service data flow template(s) based on the local configuration stored as part of the Onboarding Configuration Data. In addition, the PCF may create service data flow templates for the DNS server address(es) stored as part of the Onboarding Configuration Data. The "pvsInfo" attribute provided by the SMF may include, for each provided Provsioning Server, the Provisioning Server IP address(es) and/or FQDN(s).

NOTE 2: How the PCF resolves a Provisioning Server FQDN to an IP address or IP address range with other mechanism than local configuration in the Onboarding Configuration Data is not specified in this release of the specification

The PCF shall select the QoS information of the PCC rule(s) applicable to the User Plane Remote Provisioning service based on policies locally configured at the PCF as part of the Onboarding Configuration Data.

The PCF shall install the derived PCC Rule(s) in the response. The installed PCC Rule(s) shall take precedence over the locally stored PCC Rule(s) in the SMF.

When the SMF detects that the provisioning of PCC Rules failed, the PCC rule error handling procedures shall be performed.

NOTE 3: When the ONN is a PLMN or a SNPN, the SMF does not provide the "onboardInd" attribute and the "pvsInfo" attribute. The PCF retrieves policy control subscription profile for this SUPI, DNN, S-NSSAI from UDR, that includes the list of allowed services. If the list of allowed services includes both PVS and DNS services, then the PCF, based on local policies, determines the PVS and DNS address(es) to be used in the SDF template of the PCC Rule(s) and allows traffic to/from these destinations as per currently specified procedures.

4.2.2.22 Network slice related data rate policy control

When an Npcf_SMPolicyControl_Create request is received, the PCF may check if the S-NSSAI to which the received request relates is subject to network slice data rate policy control. If it is the case, the PCF shall apply network slice data rate control as described in clause 4.2.6.8.

4.2.2.23 Group related data rate policy control

When a Npcf_SMPolicyControl_Create request is received, the PCF may apply group data rate policy control as defined in clause 4.2.6.9.

4.2.2.24 Network slice usage control

When the PCF receives a Npcf_SMPolicyControl_Create request and the "NetSliceUsageCtrl" feature is supported, the PCF may check whether the S-NSSAI to which the received request relates is subject to network slice usage control. If it is the case, the PCF may provision within the Npcf_SMPolicyControl_Create response body the network slice usage control information (e.g., the slice PDU session inactivity timer value) within the "sliceUsgCtrlInfo" attribute of the SmPolicyDecision data structure, as specified in clause 5.15.15.3 of 3GPP TS 23.501 [2].

NOTE: In this release of the specification, network slice usage control information provisioning by the PCF is not supported in roaming scenarios.

4.2.2.25 VPLMN Specific Offloading Policy

For HR-SBO scenarios if the "HR-SBO" feature is supported and the H-PCF receives the "hrsboInd" attribute set to "true" as part of the Npcf_SMPolicyControl_Create request, the PCF may provision the Specific Offloading Policy for the current serving VPLMN. In this case, the PCF shall include the VPLMN Specific Offloading Policy within the "vplmnOffloadInfos" and/or "vplmnDlAmbr" attributes in the response. In this case, the H-PCF shall subscribe to "PLMN_CH" event trigger.

NOTE: VPLMN Specific Offloading Policy can be provisioned in HPLMN per each VPLMN based on the service level agreement between HPLMN and VPLMN.

4.2.3 Npcf_SMPolicyControl_UpdateNotify Service Operation

4.2.3.1 General

The UpdateNotify service operation provides updated Session Management related policies to the NF service consumer (SMF) or triggers the deletion of the context of SM related policies. The POST method is used for both update and terminate operations.

The following procedures using the Npcf_SMPolicyControl_UpdateNotify service operation are supported:

- PCF initiated update of the policies associated with a PDU session.
- PCF initiated deletion of the SM Policy Association of a PDU session.
- Provisioning of PCC rules.
- Provisioning of policy control request triggers.
- Provisioning of revalidation time.
- Policy provisioning and enforcement of the authorized AMBR per PDU session.
- Policy provisioning and enforcement of the authorized default QoS.
- Provisioning of PCC rules for Application Detection and Control.
- 3GPP PS Data Off Support.
- IMS Emergency Session Support.
- Request Access Network Information.
- Request Usage Monitoring Control.
- Request for the result of PCC rule removal.
- Access Network Charging Identifier request.
- Request successful resource allocation notifications.
- IMS Restoration Support.
- P-CSCF Restoration Enhancement Support.
- Access traffic steering, switching and splitting support.
- Policy provisioning and enforcement of AF session with required QoS.
- Forwarding of TSC user plane node management information and port management information received from the TSN AF or TSCTSF.
- Provisioning of TSCAI input information and TSC QoS related data.
- Policy provisioning of QoS Monitoring control.
- Policy decision and condition data error handling.
- Network slice related data rate policy control.
- Request of Presence Reporting Area Change Report.
- PCC Rule Error Report.
- Session Rule Error Report.
- Group related data rate policy control.

- VPLMN Specific Offloading Policy.
- Support of Network Slice Usage Control.

4.2.3.2 SM Policy Association Update request

Figure 4.2.3.2-1: SM Policy Association Update request

The PCF may decide to provision policies related to an Individual SM Policy resource without obtaining a request from the NF service consumer, e.g. in response to information provided to the PCF via the Rx or N5 reference points, or in response to an internal trigger within the PCF, e.g., the activation of a pending policy counter provided via the Nchf_SpendingLimitControl Service (see 3GPP TS 29.594 [63]). The PCF shall send for this purpose a POST request to the NF service consumer (e.g. SMF) using the URI"{notificationUri}/update". The content of the message shall contain a SmPolicyNotification data structure that contains:

- the representation of the updated policies within the "smPolicyDecision" attribute; and
- the resource URI of the Individual SM Policy resource related to the notification within the "resourceUri" attribute.

Detailed procedures related to the provisioning and enforcement of the policy decisions contained within the SmPolicyDecision data structure are provided in clause 4.2.6.

When the PCF received from an NF service consumer (e.g., an AF) temporal invalidity conditions information as part of AF requested QoS for a UE or group of UE(s), the PCF shall evaluate the temporal invalidity conditions of the AF request and may inform the SMF to install, modify or remove the corresponding policy decision(s) (e.g., PCC rule(s)) according to the evaluation result for the concerned PDU Session(s).

In case of a successful update of SM policies:

- if the PCF provisioned policy control request triggers (applicable triggers are as defined in Table 5.6.2.26-1), a "200 OK" response code and a response body with the corresponding available information in the "UeCampingRep" data structure shall be returned in the response;
- otherwise, a "204 No Content" response code shall be returned in the response.

NOTE: When there is an ongoing procedure that collisions with the update of SM policies (e.g. during handover from 5GS to EPS) the SMF, based on operator policies, can delay the update of SM policies and return a "204 No Content" response code. In this case the SMF will process the request when the procedure is finished

If errors occur when processing the HTTP POST request, the NF service consumer shall send an HTTP error response as specified in clause 5.7.

If the feature "ES3XX" is supported, and the NF service consumer determines the received HTTP POST request needs to be redirected, the NF service consumer shall send an HTTP redirect response as specified in clause 6.10.9 of 3GPP TS 29.500 [4].

If the "SessionRuleErrorHandling" feature is not supported and the NF service consumer received one or more PCC rules from the PCF, but the validation of all these PCC Rules was unsuccessful, the NF service consumer shall reject the request and include in an HTTP "400 Bad Request" response message the ErrorReport data structure. Within the ErrorReport data structure, the NF service consumer shall include the "error" attribute containing the "cause" attribute

of the ProblemDetails data structure set to "PCC_RULE_EVENT" or "PCC_QOS_FLOW_EVENT" and the "ruleReports" attribute to report the PCC rule status of the affected PCC rules as defined in clause 4.2.3.16.

If the "SessionRuleErrorHandling" feature is supported and the NF service consumer received one or more PCC rules and/or session rules from the PCF but the validation of all these PCC Rules and/or session rules was unsuccessful, the NF service consumer shall reject the request and include in an HTTP "400 Bad Request" response message the ErrorReport data structure. Within the ErrorReport data structure, the NF service consumer shall include the "error" attribute containing the "cause" attribute of the ProblemDetails data structure set to "RULE_PERMANENT_ERROR" or "RULE_TEMPORARY_ERROR" and the "ruleReports" attribute to report the PCC rule status of the affected PCC rules as defined in clause 4.2.3.16 and/or the "sessRuleReports" attribute to report the session rule status of the affected session rules as defined in clause 4.2.3.20.

If in the cases above, if the "PolicyDecisionErrorHandling" feature is supported, the PCF provisioned policy decisions and/or condition data which are not referred by any PCC rules or session rules and, in addition of the report of the faulty PCC rule(s) and/or session rule(s), the NF service consumer needs to report the failed policy decisions and/or condition data, the "policyDecFailureReports" attribute shall also be provided as described in clause 4.2.3.26. Additionally, if the "ExtPolicyDecisionErrorHandling" feature is supported the NF service consumer may also provide the "invalidPolicyDecs" as described in clause 4.2.3.26.2.

If the "Ext2PolicyDecisionErrorHandling" feature is supported, the NF service consumer did not receive neither PCC rules nor session rules and received policy decision types and/or condition types which are not referred by any PCC rules or session rules, and the storage of all the policy decision types and/or condition data was unsuccessful (e.g. the policy decision could not be successfully stored due to a limitation of resources at the SMF) or there were semantical inconsistencies in the provided data, the NF service consumer shall include in an HTTP "400 Bad Request" response message the ErrorReport data structure including the "error" attribute containing the "cause" attribute of the ProblemDetails data structure set to "POL_DEC_ERROR" and shall behave as defined in clause 4.2.3.26.

If the "SessionRuleErrorHandling" feature is not supported and if the NF service consumer received one or more PCC rules from the PCF but the validation of some of them was unsuccessful, the NF service consumer shall include an HTTP "200 OK" status code together with one or more RuleReport data structure(s) to report the PCC rule status of the affected PCC rules as defined in clause 4.2.3.16 in the "PartialSuccessReport" data structure included in the response message. The "failureCause" attribute of the "PartialSuccessReport" shall be set to "PCC_RULE_EVENT" or "PCC_OOS_FLOW_EVENT".

If the "SessionRuleErrorHandling" feature is supported and the NF service consumer received one or more PCC rule and/or session rules from the PCF but the validation of some of them was unsuccessful, the NF service consumer shall include an HTTP "200 OK" status code together with the "ruleReports" attribute to report the PCC rule status of the affected PCC rules as defined in clause 4.2.3.16 and/or the "sessRuleReports" attribute to report the session rule status of the affected session rules as defined in clause 4.2.3.20 in the "PartialSuccessReport" data structure included in the response message. The "failureCause" attribute of the "PartialSuccessReport" shall be set to "RULE_PERMANENT_ERROR" or "RULE_TEMPORARY_ERROR".

If the "PolicyDecisionErrorHandling" feature is supported, the NF service consumer received policy decision types and/or condition types which are not referred by any PCC rules or session rules, and the storage or validation of not all the policy decision types and/or condition data was unsuccessful, the NF service consumer shall reply with an HTTP "200 OK" response message and behave as described in clause 4.2.3.26.

If the PCF provisioned policy control request triggers and the NF service consumer needs to report partial success information, the NF service consumer may include in the "PartialSuccessReport" data structure the "ueCampingRep" attribute with the corresponding available information. When it is required to report multiple instances of the "PartialSuccessReport" data structure due to different "failureCause" values, the NF service consumer shall use only one instance of the "PartialSuccessReport" data structure to include the "ueCampingRep" attribute with the corresponding available information.

4.2.3.3 SM Policy Association termination request

Figure 4.2.3.3-1: SM Policy Association termination request

The PCF may request PDU session termination and the corresponding deletion of the Individual SM policy resource in the following circumstances:

- If the PCF decides to terminate a PDU session due to an internal trigger or a trigger from the UDR.
- The PCF may also decide to terminate a PDU session upon receiving a POST message from the NF service consumer (e.g. when data usage quota is reached).

The PCF shall send a POST request to the NF service consumer (e.g. SMF) using the URI {notificationUri}/terminate and include the TerminationNotification data structure in the body of the HTTP POST request. Within the TerminationNotification data structure, the PCF shall include:

- the resource URI of the Individual SM policy resource related to the termination request within the "resourceUri" attribute; and
- the cause of why the PCF requests the termination of the policy association within the "cause" attribute.

If the NF service consumer accepts the received POST request, the NF service consumer shall send a "204 No Content" response.

After the successful processing of the HTTP POST request, the NF service consumer shall invoke the Npcf_SMPolicyControl_Delete Service Operation defined in clause 4.2.5 to terminate the policy association and initiate the procedure to terminate the PDU session as defined in 3GPP TS 29.502 [22].

If errors occur when processing the HTTP POST request, the NF service consumer shall send an HTTP error response as specified in clause 5.7.

If the feature "ES3XX" is supported, and the NF service consumer determines the received HTTP POST request needs to be redirected, the NF service consumer shall send an HTTP redirect response as specified in clause 6.10.9 of 3GPP TS 29.500 [4].

4.2.3.4 Provisioning of revalidation time

During the lifetime of a PDU session, within the SmPolicyDecision data structure, the PCF may provide the revalidation time within the "revalidationTime" attribute and the "RE_TIMEOUT" policy control request trigger within the "policyCtrlReqTriggers" attribute to instruct the SMF to trigger an interaction with the PCF to request PCC rule(s) if not provided yet. The PCF may also update the revalidation time by including the new value within the "revalidationTime" attribute. The PCF may disable the revalidation function by removing the "RE_TIMEOUT" policy control request trigger, if it has been previously provided.

When the SMF receives the revalidation time within the "revalidationTime" attribute, the SMF shall store the received value and start the associated timer based on it. Then, the SMF shall trigger a PCC rule request towards the PCF before the indicated revalidation time.

If the "RE_TIMEOUT" policy control request trigger is removed, the SMF shall stop the associated timer.

NOTE: By disabling the revalidation function, the revalidation time value previously provided to the SMF is not applicable anymore.

4.2.3.5 Policy provisioning and enforcement of authorized AMBR per PDU session

The PCF may modify the authorized Session-AMBR at any time during the lifetime of the PDU session and provision it to the SMF by invoking the procedure defined in clause 4.2.3.2.

If the "VPLMN-QoS-Control" feature is supported, the PCF shall ensure that the authorized Session-AMBR value does not exceed the Session-AMBR supported by the VPLMN, if applicable.

The PCF shall provision the new authorized session AMBR to the SMF as defined in clauses 4.2.6.3.1 and 4.2.6.3.2.

Upon reception of the authorized Session-AMBRR, the SMF shall apply the corresponding procedures towards the access network, the UE and the UPF for the enforcement of the AMBR for the concerned PDU session.

For UL Classifier or Multi-homing PDU Sessions, the SMF will provision the policies of session-AMBR for the downlink and uplink directions to the UL Classifier/Branching Point functionality and in addition provision the policies of Session-AMBR for the downlink direction to all the PDU session anchors, as defined in clause 5.4.4 of 3GPP TS 29.244 [13].

4.2.3.6 Policy provisioning and enforcement of authorized default QoS

The PCF may modify the authorized default QoS during the lifetime of the PDU session and provision it to the SMF by invoking the procedure defined in clause 4.2.3.2.

If the "VPLMN-QoS-Control" feature is supported, the PCF shall ensure that the authorized default QoS contains 5QI and ARP values, and MBR/GBR values, if applicable, and if the feature "VPLMN-5QIPrioLevel" is supported, a 5QI Priority Level (when the required 5QI Priority Level is different from the standardized Default Priority Level value in the QoS characteristics Table 5.7.4-1 in 3GPP TS 23.501 [2]), supported by the VPLMN, if applicable.

The PCF shall provision the authorized default QoS to the SMF as defined in clauses 4.2.6.3.1 and 4.2.6.3.2.

Upon reception of the authorized default QoS, the SMF enforces it, which may lead to the change of the subscribed default QoS. The SMF shall apply the corresponding procedures towards the access network, the UE and the UPF for the enforcement of the authorized default QoS for the concerned PDU session.

4.2.3.7 Provisioning of PCC rule for Application Detection and Control

If the ADC feature is supported, the user subscription indicates that application detection and control is enabled, and the PCF determines that application detection is required because of e.g. an internal/external trigger or the PCF has received from an NF service consumer (e.g. another PCF or an AF) a subscription to the event for application start/stop traffic detection (see TS 29.514 [17], clause 4.2.6.9 for PCF subscription to application detection control and TS 29.523 [61], clause 4.2.2 for AF subscription to application detection control), the PCF may provision PCC rule(s) for application detection and control as defined in clause 4.2.6.2.11 in the notification (i.e. HTTP POST) request.

When the PCF provisions PCC rule(s) for application detection and control the PCF update of the mute indication is not allowed during the PDU session lifetime, i.e., if for the PCC rule, the application's start or stop notifications are muted, the PCC rule shall remain with the application's start or stop notifications muted along the PDU session lifetime, and viceversa, if for the PCC rule, the application's start or stop notifications are not muted, the PCC rule shall remain with the application's start or stop notifications not muted along the PDU session lifetime. The SMF shall reject the PCC rule modification as specified in clause 4.2.6.2.11.

If the SMF receives PCC rule(s) for application detection and control, the SMF shall instruct the UPF to detect the application traffic as defined in 3GPP TS 29.244 [13].

4.2.3.8 3GPP PS Data Off Support

When the PCF receives service information from the AF while the 3GPP PS Data Off handling functionality is active as described in clause 4.2.2.8 or 4.2.4.8, the PCF shall check:

- for a non-MA PDU session, whether the corresponding service is a 3GPP PS Data Off Exempt Service and permissible according to the user's subscription and the policies of the PCF;

- for a MA PDU session:
 - a. whether the corresponding service is a 3GPP Data Off Exempt Service and permissible according to the user's subscription and the policies of the PCF; or
 - b. whether the corresponding service does not belong to the 3GPP PS Data Off Exempt Services, but:
 - the non-3GPP access is available; and
 - the PCF policies allow all the traffic of the service to be forwarded using the non-3GPP access.

If so, the PCF shall install, modify or delete thecorresponding PCC rules. For a MA PDU session and when theservice does not belong to the 3GPP PS Data Off Exempt Services, the policy for ATSSS Control included in the PCC rule, as specified in clause 4.2.6.2.17, shall enable all the traffic to be forwarded using only the non-3GPP access.

Otherwise, the PCF shall reject the service information from the AF.

If the PCF determines that the 3GPP PS Data Off handling functionality becomes inactive, the PCF shall make the necessary policy control decisions and provision the PCC rules to make sure that services are allowed according to the user's subscription and operator policy (irrespective of whether they belong to the list of 3GPP PS Data Off Exempt Services).

NOTE: The PCF can then open gates via the "flowStatus" attribute for active PCC rules associated to services not contained in the list of 3GPP PS Data Off Exempt Services. The PCF can also install PCC rules or activate predefined PCC rules for some services not belonging to the list of 3GPP PS Data Off Exempt Services. If the PCF activates or installs a PCC rule with wildcarded filters, it can remove or de-activate PCC rules for 3GPP PS Data Off Exempt Services that are redundant to this PCC rule.

4.2.3.9 IMS Emergency Session Support

4.2.3.9.1 Provisioning of PCC rule

When the PCF receives IMS service information from the AF for an Emergency service and derives authorized PCC Rules from the service information, the "priorityLevel", the "preemptCap" and the "preemptVuln" attributes of the Arp data structure within the QoS data decision to which each PCC Rule refers shall be assigned values (i.e. priority and pre-emption level) as required by local operator policies (e.g. if an IMS Emergency session is prioritized, the "priorityLevel" attribute may contain a value that is reserved for an operator domain use of IMS Emergency session).

The PCF shall immediately initiate the procedures described in clause 4.2.6.2.1 to provision the necessary PCC Rules and the procedures described in clause 4.2.6.2.3 to provision the authorized QoS perPCC rule.

The provisioning at the SMF of PCC Rules, which require the establishment of a dedicated QoS flow for emergency services, shall cancel the inactivity timer in the SMF, if it started running as defined in the clause 4.2.3.9.2.

Any SMF-initiated request for PCC Rules for an IMS Emergency service with the "repPolicyCtrlReqTriggers" attribute containing the "RES_MO_RE" value (i.e. UE-initiated resource reservation) shall be rejected by the PCF via an HTTP "403 Forbidden" response message including the "cause" attribute of the ProblemDetails data structure set to "ERROR TRAFFIC MAPPING INFO REJECTED".

The SMF shall execute the procedures to ensure that a new QoS flow is established for the Emergency service.

When the SMF detects that the provisioning of PCC Rules failed, the PCC rule error handling procedure shall be performed.

4.2.3.9.2 Removal of PCC Rules for Emergency Services

The reception by the PCF of a request to terminate an AF session for an IMS Emergency service triggers the removal by the PCF of the PCC Rules assigned to the terminated IMS Emergency Service in the SMF, using the procedure defined in clause 4.2.6.2.1.

At reception of an HTTP POST message that removes one or several PCC Rules from a PDU Session restricted to emergency services, the SMF shall:

- initiate a QoS flow termination procedure, when all the PCC Rules bound to a QoS flow are removed; or

- initiate a QoS flow modification procedure, when not all the PCC Rules bound to a QoS flow are removed.

In addition, the SMF shall initiate an inactivity timer if all PCC Rules with a 5QI other than the 5QI of the default QoS flow or the 5QI used for IMS signalling were removed from the PDU session restricted to Emergency Services (e.g. to enable PSAP Callback session). When the inactivity timer expires, the SMF shall initiate a PDU session termination procedure as defined in clause 4.2.5.

4.2.3.10 Request of Access Network Information

If the NetLoc feature defined in clause 5.8 is supported, the PCF may request the SMF to report the access network information as defined in clause 4.2.6.5.4.

4.2.3.11 Request Usage Monitoring Control

If the UMC feature defined in clause 5.8 is supported, the PCF may provision the usage monitoring control policy to the SMF, as defined in clause 4.2.6.5.3, to request the activation of usage monitoring control.

4.2.3.12 Ipv6 Multi-homing support

During the lifetime of the Multi-homing PDU session, the PCF shall provision the PCC rules and session rules to the SMF. The SMF shall derive the appropriate policies based on the policies provisioned by the PCF and provision them to the appropriate UPF, if applicable, access network, if applicable, and UE, if applicable.

4.2.3.13 Request for the result of PCC rule removal

If the RAN-NAS-Cause feature is supported, the PCF may request the SMF to inform it of the result of PCC rule(s) removal, when the PCF removes PCC rule(s) as defined in clause 4.2.6.5.2.

When the SMF receives the request, the SMF shall maintain locally the removed PCC rules(s) until it receives the resource release outcome from the network.

4.2.3.14 Access Network Charging Identifier request

The PCF may request the SMF to provide the Access Network Charging Identifier associated to the dynamic PCC rules as defined in clause 4.2.6.5.1.

4.2.3.15 Request for the successful resource allocation notification

The PCF may request the SMF to confirm that the resources associated to a PCC rule are successfully allocated as defined in clause 4.2.6.5.5.

4.2.3.16 PCC Rule Error Report

If the SMF receives one or more PCC rule(s) as defined in clause 4.2.3.1. but the validation of all the received PCC Rules was unsuccessful, the SMF shall reject the request via an HTTP "400 Bad Request" status code and include in the corresponding response message the "ruleReports" attribute containing RuleReport data structure(s) to report the failure for the affected PCC rule(s) within the ErrorReport data structure; otherwise, if the validation of only some of the received PCC rules was unsuccessful, the SMF shall reply to the PCF with an HTTP "200 OK" status code and include in the corresponding response message one or more RuleReport data structure(s) to report the failure for the affected PCC rule(s) within the PartialSuccessReport data structure.

Within each RuleReport instance, the SMF shall identify the failed PCC rule(s) by including their identifiers within the "pccRuleIds" attribute, identify the failure reason code by including a "failureCode" attribute, and include the PCC rule(s) status within the "ruleStatus" attribute containing a value as follows:

- If the installation/activation of one or more new PCC rules (i.e. rules which were not previously successfully installed) fails, the SMF shall set the "ruleStatus" attribute value to "INACTIVE".
- If the modification of a currently active PCC rule fails, the SMF shall retain the existing PCC rule as active without any modification, unless the reason for the failure has an impact also on the existing PCC rule.

The removal of a PCC rule shall never fail, even if the related PDU session procedures with the UE fail. The SMF shall the retain information on the removal of the PDU session and conduct the necessary PDU session procedures with the UE when it is possible.

Depending on the value of the "failureCode" attribute, the PCF may decide whether retaining, re-installation, modification or removal of the old PCC rule or any other action applies.

If the "RuleVersioning" feature is supported and the PCF included the "contVer" attribute for a specific PCC rule instance in the "pccRules" attribute when provisioning this PCC rule to the SMF, then if the resource allocation for the corresponding PCC rule was unsuccessful, the SMF shall include the "contVers" attribute in the corresponding RuleReport instance within the "ruleReports" attribute. Depending on the value of the "failureCode" attribute, and when applicable, depending also on the value of the "contVer" attribute, the PCF may decide whether retaining, reinstallation, modification, removal of the old PCC rule or any other action applies.

4.2.3.17 IMS Restoration Support

If the ProvAFsignalFlow feature defined in clause 5.8 is supported, and in order to support IMS Restoration procedures (refer to 3GPP TS 23.380 [21]), the PCF needs to convey the AF address to the SMF. In order to do so, in case the AF provisions information about the AF signalling flows between the UE and the AF, as defined in clause 4.4.5a of 3GPP TS 29.214 [18], or in clauses 4.2.2.16 and 4.2.3.17 of 3GPP TS 29.514 [17], the PCF shall install the corresponding dynamic PCC rules (if not installed before) as defined in clause 4.2.6.2.1. The PCF shall include within the associated PccRule instance(s) the signalling flows between the UE and the AF within the "flowInfos" attribute and the "afSigProtocol" attribute set to the value corresponding to the signalling protocol used between the UE and the AF.

The SMF shall respond to the PCF with an HTTP "204 no content" and initiate the corresponding QoS flow procedures, if required. The SMF shall extract the AF address from the provisioned PCC rule(s) and use it for the monitoring procedures as defined for the different access types.

NOTE 1: The SMF can use the extracted AF address from the PCC rule(s) to check if the monitoring procedures have to be started for the corresponding AF.

In case the AF de-provisions information about the AF signalling flows between the UE and the AF, as defined in clause 4.4.5a of 3GPP TS 29.214 [18], or in clauses 4.2.2.16 and 4.2.3.17 of 3GPP TS 29.514 [17], the PCF shall remove the corresponding dynamic PCC rule(s) by triggering a notification (i.e. HTTP POST) message towards the SMF. The PCF shall then apply the procedures defined in clause 4.2.6.2.1.

The SMF shall send an HTTP response message to the PCF.

NOTE 2: The SMF can use the AF address associated with the removed PCC rule(s) to check if it can stop monitoring the corresponding AF.

4.2.3.18 P-CSCF Restoration Enhancement Support

This clause is applicable when the PCF-based P-CSCF Restoration Enhancement, as defined in 3GPP TS 23.380 [21] and controlled by the feature "PCSCF-Restoration-Enhancement" defined in clause 5.8, is supported by both the PCF and the SMF.

If the PCF receives a request for P-CSCF restoration from the P-CSCF as defined in clause 4.4.7 of 3GPP TS 29.214 [18] or in clause 4.2.2.27 of 3GPP TS 29.514 [17], the PCF shall send a notification (i.e. HTTP POST) message to the SMF including the "pcscfRestIndication" attribute set to true for the corresponding PDU session.

The SMF shall acknowledge the PCF and initiate the corresponding QoS flow procedures for the IMS PDU connection as defined in 3GPP TS 23.380 [21].

4.2.3.19 Request of Presence Reporting Area Change Report

If the PRA or ePRA feature defined in clause 5.8 is supported, the PCF may provision the Presence Reporting Area Information to the SMF as defined in clause 4.2.6.5.6.

4.2.3.20 Session Rule Error Report

If the "SessionRuleErrorHandling" feature is supported and the SMF receives one or more session rule(s) as defined in clause 4.2.6.3.1 but the validation of all the received session rules was unsuccessful, the SMF shall reject the request via an HTTP "400 Bad Request" status code and include in the corresponding response message the "sessRuleReports" attribute containing SessionRuleReport data structure(s) to report the failure for the affected session rule(s) within the ErrorReport data structure; otherwise, if the validation of some of the received session rules was unsuccessful, the SMF shall reply to the PCF with an HTTP "200 OK" status code and include in the corresponding response message the "sessRuleReports" attribute containing one or more SessionRuleReport data structure(s) to report the failure for the affected session rule(s) within the PartialSuccessReport data structure.

Within each SessionRuleReport instance, the SMF shall identify the failed session rule(s) by including their identifier(s) within the "ruleIds" attribute, identify the failure reason code by including a "sessRuleFailureCode" attribute, and include the session rule(s) status within the "ruleStatus" attribute containing a value as follows:

- If the installation of one or more new session rule(s) (i.e. rules which were not previously successfully installed) fails, the SMF shall set the "ruleStatus" attribute value to "INACTIVE".
- If the modification of a currently provisioned session rule fails, the SMF shall retain the existing session rule as provisioned without any modification, unless the reason for the failure has an impact also on the existing session rule. The SMF shall report the modification failure to the PCF.

The removal of a session rule shall never fail, even if the related PDU session procedures with the UE fail. The SMF shall then retain information on the removal of the PDU session and conduct the necessary PDU session procedures with the UE when it is possible.

Depending on the value of the "sessRuleFailureCode" attribute, the PCF may decide whether retaining, re-installation, modification or removal of the old session rule, or any other action applies.

4.2.3.21 Access traffic steering, switching and splitting support

If the PCF supports the "ATSSS" feature, the PCF may provide PCC rules and/or session rules for the MA PDU session as defined in clause 4.2.6.2.17 and clause 4.2.6.3.4.

4.2.3.22 Policy provisioning and enforcement of the AF session with required QoS

If the PCF receives a QoS reference parameter during the initial provisioning of service information as defined in clause 4.2.2.32 of 3GPP TS 29.514 [17], or if the PCF receives individual QoS parameters during the initial provisioning of service information as defined in clause 4.2.2.24 of 3GPP TS 29.514 [17], the PCF shall authorize the service information from the AF and derive the QoS parameters of the related PCC rule(s) based on the received service information and the indicated QoS reference parameter or the indicated individual QoS parameters (e.g, Requested Maximum Bitrate and Requested Guaranteed Bitrate).

NOTE: A SLA has to be in place between the operator and the ASP defining the possible QoS levels and their charging rates. For each possible pre-defined QoS information set, the PCF needs to be configured with the corresponding QoS parameters and their values as well as the appropriate Charging key (or receive this information from the UDR).

If the PCF receives a different QoS reference parameter or different individual QoS parameters during the modification of service information as defined in clause 4.2.3.30 of 3GPP TS 29.514 [17], the PCF shall update accordingly the related QoS parameters corresponding to the new QoS parameter in the related PCC rule(s).

If the AF subscribes to Service Data Flow QoS notification control, the PCF may additionally receive the Alternative Service Requirements during the initial provisioning of service information as defined in clause 4.2.2.32 of 3GPP TS 29.514 [17].

In this case, when the PCF authorizes service information based on the indicated QoS reference parameter or individual QoS parameters, and the "AuthorizationWithRequiredQoS" feature is supported, the PCF shall additionally derive alternative QoS parameter sets for the concerned PCC rule(s) based on the QoS reference parameters or individual QoS parameters provided in the Alternative Service Requirements. In order to do so, the PCF shall include one or more references to the QosData data structure within the "refAltQosParams" attribute of the concerned PCC rule(s) and a "qosDecs" attribute containing these QoS data decision(s) within the SmPolicyDecision data structure. In each QoS data decision instance, the PCF shall include the alternative QoS parameter set Id within the "qosId" attribute, the alternative

packet delay budget within the "packetDelayBudget" attribute, the alternative packet error rate within the "packetErrorRate" attribute, the alternative guaranteed bandwidth in uplink within the "gbrUl" attribute and the alternative guaranteed bandwidth in downlink within the "gbrDl" attribute. The "refAltQosParams" attribute is an ordered list of alternative QoS parameter sets, where the lower the index of the array for a given entry, the higher the priority.

If the AF changes or newly provides the Alternative Service Requirements during the modification of service information as defined in clause 4.2.3.30 of 3GPP TS 29.514 [17], the PCF shall update accordingly or provide the Alternative QoS parameter sets in the related PCC rule(s).

The PCF shall provision the related PCC rule(s) with alternative QoS parameter set(s) and enable QoS Notification Control, if it has not been enabled yet, as defined in clause 4.2.3.30 of 3GPP TS 29.514 [17].

If the "DisableUENotification" feature is supported and if the AF indicated to the PCF that the UE does not need to be informed about changes related to Alternative QoS Profiles as as defined in clause 4.2.2.32 or 4.2.3.30 of 3GPP TS 29.514 [17] and the PCF decides to disable the notifications to the UE when changes related to the Alternative QoS Profiles occur, the PCF shall include the "disUeNotif" attribute set to true within the corresponding the PCC rule instance.

When the SMF receives PCC rule(s) with alternative QoS parameter sets, the SMF shall enforce these PCC rule(s) and derive in addition the alternative QoS profile(s) towards the access network based on the received alternative QoS parameter set(s).

If the "PDUSetHandling" feature is supported, the PCF, based on local configuration and/or the PDU Set QoS requirements sent by the AF as defined in 3GPP TS 29.514 [17], may derive the PDU Set QoS parameters for the PCC rule and include them within the "pduSetQosDl" and/or "pduSetQosUl" attribute(s) of the QosData policy decision referenced from the PCC rule. The SMF adds the PDU Set QoS parameter(s) of the PCC rule to the derived QoS Profile of the QoS Flow as described in 3GPP TS 29.502 [22].

4.2.3.23 Forwarding of TSC user plane node management information and port management information received from the TSN AF or TSCTSF

During the lifetime of a PDU session enabling Time Sensitive Communications, Time Synchronization and Deterministic Networking the PCF may receive a UMIC and/or, when the DS-TT or the NW-TT functions are used, one or more PMIC(s) from the TSN AF or TSCTSF within the service information and/or, the indication of direct notification for the UPF to report the TSC management information as defined in 3GPP TS 29.514 [17]. A UMIC carries TSC user plane node management information. A PMIC carries port management information for a port located in DS-TT and/or NW-TT.

NOTE: The 5GS Architecture to support IETF Deterministic Networking (IETF RFC 8655 [55]) does not require the DS-TT functionality to be supported in the device nor require the user plane NW-TT functionality to be supported in the UPF. However, it can co-exist with such functions.

If the feature "TimeSensitiveNetworking" or "TimeSensitiveCommunication" is supported the PCF initiates the Npcf_SMPolicyControl_UpdateNotify request and sends possibly updated policy information about the PDU Session and/or the UMIC and/or the PMIC(s) to the SMF via the SmPolicyDecision structure, in which the UMIC is encoded in the "tsnBridgeManCont" attribute, the DS-TT PMIC is encoded in the "tsnPortManContDstt" attribute and the one or more NW-TT PMIC(s) are encoded in the "tsnPortManContNwtts" attribute.

The PMIC(s) are encoded in the "PortManagementContainer" data type, that includes the port management information in the "portManCont" attribute and the related port number in the "portNum" attribute. If the port is on DS-TT the SMF forwards the PMIC(s) to the DS-TT port. If the port is on NW-TT the SMF forwards the PMIC(s) to the NW-TT port.

The UMIC is encoded in the "BridgeManagementContainer" data type, that includes the TSC user plane node management information in the "bridgeManCont" attribute. The SMF always forwards the UMIC to the TSC user plane node functionality of the UPF/NW-TT.

If the "ExposureToTSC" feature is supported, and the TSCTSF or TSN AF has requested direct UPF notifications, the PCF shall set the notification URI within the "tscNotifUri" attribute and the notification correlation id within the "tscNotifCorreId" attribute corresponding to values provided by the TSCTSF or TSN AF. In this case, the SMF shall forward the received direct notification information to the UPF.

4.2.3.24 Provisioning of TSCAI input information and TSC QoS related data

The PCF may receive the TSCAI input information in the TSC assistance container and TSC traffic QoS related information from the TSN AF or TSCTSF.

If the feature "TimeSensitiveNetworking" or "TimeSensitiveCommunication" is supported by both the SMF and PCF as described in clause 5.8, the PCF shall provide for the derived PCC rule(s):

- the 5G QoS parameters and the optional 5G QoS characteristics corresponding to a 5QI for a delay-critical GBR derived from the TSC traffic QoS information received from the TSN AF or TSCTSF encoded within a QosData type referred in the "refQosData" of the PCC rule; and
- the TSCAI input information as received from the TSN AF or TSCTSF, which may contain the periodicity, and burst arrival time encoded in the "tscaiInputUl" attribute and/or "tscaiInputDl" attribute of the PCC rule, when the feature "TimeSensitiveCommunication" is supported, the survival time encoded in the "tscaiInputUl" attribute and/or "tscaiInputDl" attribute and the (TSN)AF (g)PTP domain encoded in the "tscaiTimeDom" attribute, and when the feature "EnTSCAC" is supported, the burst arrival time window within the "burstArrivalTimeWnd" attribute, or capability for BAT adaptation encoded in the "capBatAdaptation" attribute, and either the acceptable periodicity range includes a lower bound encoded in the "lowerBound" attribute and an upper bound encoded in the "upperBound" attribute or a list of the acceptable periodicity value(s) encoded in the "periodicVals" attribute within the "periodicityRange" attribute.

The values of MDBV and PDB applied to the derived 5QI shall follow principles defined in clause 5.27.3 of 3GPP TS 23.501 [2].

For IEEE TSN networks, the value of the MBR, if applicable, and the GBR are derived using the Maximum Bit Rate provided by the TSN AF. For other time sensitive communication networks, the value of the GBR may be derived using the input provided by the TSCTSF (e.g. the Minimum Bit Rate) and applying the QoS mapping procedures as specified in clause 7.3.3 of 3GPP TS 29.513 [7].

The ARP is assigned a value preconfigured for TSC services.

As specified in clause 4.2.3.22, when the PCF receives a QoS reference from the TSCTSF, the PCF shall derive the above QoS parameters based on pre-defined QoS parameters referenced by the QoS reference. When the PCF receives individual QoS parameters from the TSCTSF, the PCF shall set derived QoS parameters based on the received individual QoS parameters and applying the QoS mapping procedures as specified in clause 7.3.3 of 3GPP TS 29.513 [7].

If the PCF receives Alternative Service Requirements that contain QoS references from the TSCTSF, the PCF shall derive the alternative QoS parameter set(s) based on the pre-defined QoS parameters referenced by the received Alternative Service Requirements as defined in clause 4.2.3.22. If the PCF receives Alternative Service Requirements that contain Requested Alternative QoS Parameter Set(s) from the TSCTSF, the PCF shall set the alternative QoS parameter set(s) based on the Requested Alternative QoS Parameter Set(s) contained in the received Alternative Service Requirements as defined in clause 4.2.3.22.

The SMF shall convert the received TSCAI input information from the external GM into the 5G GM based on the time offset and cumulative rateRatio (when available) between external time and 5GS time as measured and reported by the UPF and, forward the derived TSCAI parameters per QoS Flow basis to the AN-RAN as follows:

- For the traffic in downlink direction, the SMF shall correct the value of the "burstArrivalTime" attribute of the "tscaiInputDl" attribute based on the latest received time offset measurement from the UPF and set the downlink TSCAI Burst Arrival Time as the sum of the corrected value and the static value for the CN PDB as described in clause 5.7.3.4 of 3GPP TS 23.501 [2], representing the latest possible time when the first packet of the data burts arrives at the AN.
- NOTE 1: If the dynamic value for the CN PDB is configured in NG-RAN or received from SMF, the NG-RAN can adjust the Burst Arrival Time in downlink by adding the dynamic value for the CN PDB and deducting the static value for the CN PDB.
- For the traffic in uplink direction, the SMF shall correct the value of "burstArrivalTime" attribute of the "tscaiInputUl" attribute based on the latest received time offset measurement from the UPF and set the uplink TSCAI Burst Arrival Time as the sum of corrected value and the UE-DS-TT Residence Time representing the latest possible time when the first packet of the data burst arrives at the egress of the UE. How the SMF corrects

the Burst Arrival Time if the UE-DS-TT residence time has not been provided by the UE is up to SMF implementation.

- The SMF shall correct the value of "periodicity" attribute of the "tscaiInputUl" and/or "tscaiInputDl" using the cumulative rateRatio if the cumulative rateRation measurement was previously received from the UPF and set the TSCAI Periodicity as the corrected value. Otherwise, the SMF shall set the periodicity in the TSCAI Periodicity without any correction.
- If the "TimeSensitiveCommunication" feature is supported and the TSCAI Survival Time Information is received:
 - when the "surTimeInNumMsg" attribute is received, the SMF shall convert the value of "surTimeInNumMsg" attribute of the "tscaiInputUl" and/or "tscaiInputDl" attributes into time units by multiplying its value by the corrected uplink TSCAI Periodicity and/or downlink TSCAI Periodicity respectively, and set the TSCAI Survival Time to the calculated value; or
 - when the "surTimeInTime" is received, the SMF shall correct the value of "surTimeInTime" attribute of the "tscaiInputUl" and/or "tscaiInputDl" attributes using the cumulative rateRatio if the cumulative rateRatio measurement was previously received from the UPF and set the TSCAI Survival Time to the corrected value. Otherwise, the SMF shall set the TSCAI Survival Time without correction.
- If the "EnTSCAC" feature is supported and the burst arrival time is provided, either the burst arrival time window or the capability for BAT adaptation may be received:
 - when the burst arrival time window is received, for the traffic in downlink direction, the SMF shall correct the value of the "burstArrivalTimeWnd" attribute of the "tscaiInputDl" attribute in the same ways it is described for the correction of the burst arrival time in downlink as above and for the traffic in uplink direction, the SMF shall correct the value of "burstArrivalTimeWnd" attribute of the "tscaiInputUl" attribute in the same ways it is described for the correction of the burst arrival time in uplink in this clause; or

NOTE 2: It is preferred that the range of the "burstArrivalTimeWnd" attribute contains the value of the "burstArrivalTime".

- when the capability for BAT adaptation is received, the SMF shall set the value of "capBatAdaptation" attribute as the value of capability for BAT adaptation in the TSCAI.
- when the PCF receives the subscription for the notification on network provided BAT offset from the AF/NEF or TSCTSF, then PCF shall include "BAT_OFFSET_INFO" policy control request trigger within the "policyCtrlReqTriggers" attribute in the SmPolicyDecision data structure, if it has not been provisioned yet.
- when the burst arrival time window is received, if the periodicity range (either the acceptable periodicity range or the acceptable periodicity set) is received, the SMF shall correct the value of the "lowerBound" attribute and the "upperBound" attribute, or the "periodicVals" attribute within the "periodicityRange" attribute of the "tscaiInputUl" and/or "tscaiInputDl" using the same way as it is described for the correction of the periodicity in this clause.
- If the "EnTSCAC" feature is supported and the burst arrival time is not provided, only the capability for BAT adaptation may be received:
 - when the value of the "capBatAdaptation" attribute as the capability for BAT adaptation is received, the SMF enables notification control for the QoS Flow (if not already enabled) in order to receive the BAT offset along with the "GFBR can no longer be guaranteed" notification from the NG-RAN.

If the "TimeSensitiveCommunication" feature is supported, depending on whether the Time Domain information is included in the "tscaiTimeDom" attribute of the PCC rule, SMF may perform the following:

- if the "tscaiTimeDom" attribute is not included in the PCC rule, the SMF provisions the UPF/NW-TT to report the clock drifting between 5G clock and the external GM clock for the (g)PTP time domain number that is configured to the NW-TT.
- if the "tscaiTimeDom" attribute is included in the PCC rule and does not indicate Time Domain = "5GS", the SMF provisions the UPF/NW-TT to report the clock drifting between 5G clock and the external GM clock for the received Time Domain information.

NOTE 3: The Time Domain value corresponding to "5GS" is locally configured in the SMF and in the TSCTSF and indicates that the AF does not provide a Time Domain, as specified in 3GPP TS 29.565 [53], and it is not needed to adjust the TSCAI input information. The omission of the Time Domain within the "tscaiTimeDom" attribute of the PCC rule indicates it is needed to apply the TSN AF time domain, configured in the NW-TT, to adjust the TSCAI input information.

The SMF shall use the N4 Association Setup or Update procedures as described in 3GPP TS 29.244 [13] to provision the UPF to report the clock drifting.

If the SMF receives the clock drifting from the UPF for a Time Domain, and

- if the received Time Domain matches the Time Domain information within the "tscaiTimeDom" attribute included in the PCC rule: or
- the "tscaiTimeDom" attribute is not included within the PCC rule.

then the SMF may determine the time offset and cumulative rateRatio (when available) based on received Time Domain information and adjust the TSCAI information as described above.

If the received clock drifting from the UPF does not match the Time Domain information within the "tscaiTimeDom" attribute of the PCC rule or the received "tscaiTimeDom" attribute of the PCC rule indicates Time Domain = "5GS" then the SMF will not adjust the TSCAI information.

The provisioning of TSCAI input information and TSC traffic QoS configuration per PCC Rule shall be performed using the PCC rule provisioning procedure as defined in clause 4.2.6.2.1.

4.2.3.25 Policy provisioning of QoS Monitoring control

4.2.3.25.1 General

The QoS Monitoring control refers to the real time measurement of QoS monitoring parameters between the UE and the UPF for a QoS flow.

NOTE 1: The AF can request measurements for one or more QoS monitoring parameters, which can trigger QoS monitoring control for service data flow(s). This clause describes QoS monitoring control for packet delay, congestion, and data rate.

If the "QosMonitoring" feature is supported, the PCF may generate the authorized QoS Monitoring data decision for the service data flow for packet delay based on the QoS Monitoring request if received from the AF, or when the feature "EnSatBackhaulCatChg" is supported, based on PCF local policy or configuration as described in subclause 4.2.3.25.2.

The PCF, when the request is received from the AF, may determine whether the QoS monitoring report is sent to the AF/NEF by the SMF bypassing the PCF or by the PCF. When the feature "ExposureToEAS" is supported and the AF indication of direct notification is received, the PCF may determine whether duplicate notification by the UPF is required, i.e., whether the QoS monitoring report is directly sent to the local AF/NEF and to the PCF/SMF. When the "UPEAS" feature is supported, the PCF may generate a Data Collection Application Identifier based on the AF request or local configuration to be used in the SMF to associate the PCC rule with a QoS monitoring event exposure subscription.

The PCF shall include within the SmPolicyDecision data structure one or more QosMonitoringData instances within the "qosMonDecs" attribute if not provided yet and, if the PCF determines that the QoS monitoring report shall be sent by the PCF from the SMF, "QOS_MONITORING" within the "policyCtrlReqTriggers" attribute, if it has not been provisioned yet.

NOTE 2: The QoS monitoring report can be sent by the SMF to the PCF as described in clause 4.2.4.24. The QoS monitoring report of the PCF to the AF/NEF is described in 3GPP TS 29.514 [17], the QoS monitoring report of the SMF to the AF/NEF bypassing the PCF is described in 3GPP TS 29.508 [12] and the QoS monitoring report to the Local NEF/AF by the UPF is described in 3GPP TS 29.564 [50].

When the feature "NscSupportedFeatures" is supported and if the NEF/AF provided information about the support of one or more QoS monitoring related features (e.g. "QoSMonitoring" feature and "EnQoSMon" feature) on Nsmf_EventExposure service, the PCF may also include this information within the "nscSuppFeats" attribute included within the PccRule data type.

For each QosMonitoringData instance, PCF shall include:

- if the "EnQoSMon" feature is supported, the indication of the type of QoS monitoring parameter (e.g. packet delay or congestion information or data rate) within the "qosMonParamType" attribute;
- the requested QoS monitoring parameter(s) to be measured for the indicated QoS monitoring parameter types (i.e. DL/UL round trip packet delay or, if the "EnQoSMon" feature is supported, UL/DL congestion information or UL/DL data rate) within the "reqQosMonParams" attribute;
- the frequency(s) of reporting (e.g. event triggered and/or periodic) within the "repFreqs" attribute;
- NOTE 3: When the "DOWNLINK_CONGESTION" and/or "UPLINK_CONGESTION" are included in "reqQosMonParams" attribute, only the "EVENT_TRIGGERED" reporting frequency within the "repFreqs" attribute is applicable.
- for the case the "repFreqs" attribute includes the value "EVENT_TRIGGERED":
 - a. when the "qosMonParamType" attribute is omitted or indicates packet delay:
 - the delay threshold for downlink with the "repThreshDl" attribute if "reqQosMonParams" attribute includes DOWNLINK;
 - the delay threshold for uplink with the "repThreshUl" attribute if "reqQosMonParams" attribute includes UPLINK; and/or
 - the delay threshold for round trip with the "repThreshRp" attribute if "reqQosMonParams" attribute includes ROUND_TRIP;
 - b. when the "qosMonParamType" attribute indicates data rate:
 - the data rate threshold for downlink within the "repThreshDatRateDl" attribute if the "reqQosMonParams" attribute includes DOWNLINK_DATA_RATE; and/or
 - the data rate threshold for uplink within the "repThreshDatRateUl" attribute if the "reqQosMonParams" attribute includes UPLINK_DATA_RATE;
 - c. when the "qosMonParamType" attribute indicates congestion information:
 - the congestion threshold for downlink within the "repThreshConDl" attribute if the "reqQosMonParams" attribute includes DOWNLINK CONGESTION; and/or
 - the congestion threshold for uplink within the "repThreshConUl" attribute if the "reqQosMonParams" attribute includes UPLINK_CONGESTION; and
 - d. the minimum waiting time between subsequent reports within the "waitTime" attribute; and
 - e. if the feature "PacketDelayFailureReport" is supported, the maximum period with no QoS measurement results reported within the "repPeriod" attribute;
- for the case the "repFreqs" attribute includes "PERIODIC", the periodic time for reporting and, if the feature "PacketDelayFailureReport" is supported, the maximum period with no QoS measurement results reported within the "repPeriod" attribute;
- either the notification URI within the "notifyUri" attribute and the notification correlation id within the "notifyCorreId" attribute if the PCF determines that the notification shall be sent to the AF directly from the SMF or the notification URI within the "notifyUri" attribute, the notification correlation id within the "notifyCorreId" attribute corresponding to the Local NEF or AF and the "directNotifInd" attribute set to true if the feature "ExposureToEAS" and/or the feature "EnQoSMon" is supported and the PCF determines that the direct notification by the UPF to the Local NEF or AF is required based on the indication of direct notification received from the AF; and
- NOTE 4: If the feature "ExposureToEAS" is supported and if the PCF determines to receive QoS Monitoring report while direct UPF notification is also required, the PCF can provision the "QOS_MONITORING" policy control request trigger to the SMF together with the "directNotifInd" attribute set to true.

- the Data Collection Application Identifier within the "dataCollAppId" attribute if the "UPEAS" feature is supported and if the PCF determines that the SMF has to associate the PCC rule with a QoS monitoring event exposure subscription for that application identifier as described in 3GPP TS 29.508 [12].

If the feature "EnQoSMon" is supported, and the "qosMonParamType" attribute indicates data rate, the QosMonitoringData instance may include the averaging window within the "avrgWndw" attribute.

The PCF shall include the value(s) of QoS Monitoring Data ID of QosMonitoringData instance(s) within the "refQosMon" attribute of the corresponding PCC rule and provide the QoS monitoring data decision(s) together with the PCC rule if it has not been provisioned to the SMF. When the SMF receives the PCC rule, the SMF shall send a QoS Monitoring request to the PSA UPF via N4 as defined in 3GPP TS 29.244 [13] and NG-RAN via N2 signalling to request the QoS monitoring between PSA UPF and NG-RAN as defined in 3GPP TS 29.502 [22]. If the feature "ExposureToEAS" or the "EnQoSMon" feature is supported and if the SMF receives both the "QOS_MONITORING" policy control request trigger and the indication of direct notification, the SMF shall request the UPF to perform duplicated notification as defined in 3GPP TS 29.244 [13]. If the "UPEAS" feature is supported, when the SMF receives the Data Collection Application Identifier within the "dataCollAppId" attribute as part of the QoSMonitoringData instance of the PCC rule, the SMF shall associate the PCC rule with the QoS monitoring event exposure subscription related to that application identifier as described in 3GPP TS 29.508 [12].

If the PCF receives the request from the local NEF/AF to disable the QoS monitoring for all the requested QoS monitoring parameters from the AF or the Local NEF, the PCF shall update the PCC rule with the "refQosMon" attribute set to NULL. The PCF may also remove the corresponding QoS Monitoring Data instance(s) if no PCC rule is referring to it.

If the PCF receives for the QoS monitoring parameter(s) the request to disable the direct event notification to the local NEF or AF by the UPF, the PCF shall determine whether the PCF or the SMF bypassing the PCF sends the QoS monitoring reports to the local AF/NEF. When no other QoS monitoring parameter is defined in the QosMonitoringData instance:

- a. if the QoS monitoring reports are sent by the SMF bypassing the PCF:
 - update the PCC rule with the "refQosMon" attribute referring a QosMonitoringData instance which does not include the "directNotifInd" attribute set to true and still includes the "notifyUri", and the "notifyCorreId" attributes; or
 - update the corresponding QosMonitoringData instance by including the "directNotifInd" attribute set to false and still keeping the "notifyUri", and the "notifyCorreId" attributes;
- b. if the QoS monitoring reports are sent by the PCF:
 - update the PCC rule with the "refQosMon" attribute referring a QosMonitoringData instance which does not include the "directNotifInd", the "notifyUri", and the "notifyCorreId" attributes or update the QosMonitoringData instance by removing the "directNotifInd", the "notifyUri", and the "notifyCorreId" attributes; and
 - provision the value "QOS_MONITORING" within the "policyCtrlReqTriggers" attribute, if not previously provided.

The SMF shall request to the UPF to disable the notification to the AF/(Local)NEF via N4 for the requested QoS monitoring parameter(s) as defined in 3GPP TS 29.244 [13] and shall start sending the related notifications to PCF or to the indicated Notification URI and notification correlation Id, as applicable.

If the PCF determines that for the QoS monitoring parameter the QoS monitoring report shall be sent to the PCF from the SMF instead of sent from the SMF bypassing the PCF, the PCF shall replace the QosMonitoringData instance with an instance that does not include the "notifyUri" and the "notifyCorreId" attributes and include "QOS_MONITORING" within the "policyCtrlReqTriggers" attribute if it has not been provisioned yet. If the PCF determines that QoS monitoring report shall be sent from the SMF bypassing the PCF instead of sent from the SMF to the PCF, the PCF shall update the QosMonitoringData instance by including the the notification URI within the "notifyUri" attribute and the notification correlation id within the "notifyCorreId" attribute, and remove the value "QOS_MONITORING" within the "policyCtrlReqTriggers" attribute.

4.2.3.25.2 QoS Monitoring when dynamic Satellite Backhaul is used

If the features "QosMonitoring" and "EnSatBackhaulCatChg" are supported, and if dynamic satellite backhaul is used, QoS monitoring may be used by the PCF to measure packet delay as specified in clause 4.2.3.25.1.

If the PCF has subscribed to satellite backhaul category changes within the "SAT_CATEGORY_CHG" policy control request trigger as described on clause 5.6.3.6, and the dynamic satellite backhaul is used to serve the PDU session, the PCF may, based on the local policy or configuration, request QoS Monitoring for the packet delay between UE and PSA UPF and the corresponding QoS Monitoring reports. The PCF shall include within the SmPolicyDecision data structure one or more QosMonitoringData instances within the "qosMonDecs" attribute if not provided yet, within the affected PCC rules, a reference to the corresponding QosMonitoringData instance, and the "QOS_MONITORING" value within the "policyCtrlReqTriggers" attribute, if it has not been provisioned yet The PCF may take the reported packet delay information into account for the policy decision along with other criteria, such as the AF requested QoS requirements.

4.2.3.26 Policy decision error handling

4.2.3.26.1 Policy decision types and condition data error handling

If the "PolicyDecisionErrorHandling" feature is supported and the "ExtPolicyDecisionErrorHandling" feature is not supported, and the SMF receives one or more policy decision type(s) (as defined in clause 4.1.4.4) and/or condition data (as defined in clause 4.1.8), which are not referred by any provisioned PCC rule or session rule as defined in clause 4.2.3.2, but the storage of the policy decision types and/or condition data was unsuccessful (e.g. the policy decision could not be successfully stored due to a limitation of resources at the SMF) or there are semantical inconsistencies in the provided data, the SMF shall behave as follows:

- Include an HTTP "200 OK" status code and one or more PolicyDecisionFailureCode data types to indicate the type(s) of the failed policy decisions and/or condition data in the response message, if the SMF does not need to report any other information (e.g. the failure reports of the PCC rule(s) or session rule(s) which are provisioned in the same message, are not needed).
- Include an HTTP "200 OK" status code and one or more PartialSuccessReport data structure(s) including the "policyDecFailureReports" attribute to indicate the type(s) of the failed policy decisions and/or condition data and the "failureCause" attribute set to "POL_DEC_ERROR" in the response message, if the SMF needs to report partial success (e.g. some of the PCC rules and/or session rules provisioned by the PCF in the same message were not installed/activated successfully).
- Include an HTTP "400 Bad Request" status code and the ErrorReport data structure including the "policyDecFailureReports" attribute to indicate the type(s) of the failed policy decisions and/or condition data in the response message, if the SMF needs to reject the request (e.g. all the PCC rules and/or session rules provisioned by the PCF in the same message were not installed/activated successfully).

NOTE: An error within a policy decision type and/or condition data not referred by any PCC rules or session rules is encoded within the "policyDecFailureReports" attribute as specified in the PolicyDecisionFailureCode data structure defined in clause 5.6.3.28.

When the PCF receives the above reports, the PCF shall consider all the instances of the policy decisions and/or condition data which were provisioned in the request message and indicated in the PolicyDecisionFailureCode data type as removed from the SMF. When the PCF receives a response with HTTP "400 Bad Request" status code but the "policyDecFailureReports" attribute is not included in the provided ErrorReport data structure, the PCF shall consider all the provisioned instances of the policy decisions and/or condition data in the request message as removed from the SMF.

The removal of a policy decision type and/or condition data shall not fail.

4.2.3.26.2 Policy decision types, condition data and other policy decisions error handling

If the "ExtPolicyDecisionErrorHandling" feature is supported and the SMF receives one or more policy decision type(s) (as defined in clause 4.1.4.4) and/or condition data (as defined in clause 4.1.8), which are not referred by any provisioned PCC rule or session rule as defined in clause 4.2.3.2, and/or other SM policy decisions (e.g. the SMF receives policy control request triggers and applicable additional information) and the SMF detects that the received policy decision(s) cannot be enforced (e.g. because of semantical inconsistencies in the provided data):

- If the SMF does not need to reject the request (e.g. none, or only some but not all, of the PCC rule(s) and/or session rule(s) provisioned by the PCF in the same message are not installed/activated successfully), the SMF shall include one or more PartialSuccessReport data structure(s) in the response message with an HTTP "200 OK" status code. In order to report the partial success of policy decision and/or condition data, the SMF shall include in the related PartialSuccessReport data structure(s) the "failureCause" attribute set to "POL_DEC_ERROR" and the "policyDecFailureReports" attribute to indicate the failed policy decision type(s) and/or condition data that are not referred by any provisioned PCC rule or session rule and/or in other SM policy decision type(s) and/or condition data that are not referred by any provisioned PCC rule or session rule and/or other SM policy decisions.
- If the SMF needs to reject the request (e.g. all the PCC rules and/or session rules provisioned by the PCF in the same message are not installed/activated successfully), the SMF shall include an ErrorReport data structure within a response message with an HTTP "400 Bad Request" status code. The SMF shall include the "policyDecFailureReports" attribute to indicate a failed policy decision type(s) and/or condition data that are not referred by any provisioned PCC rule or session rule and/or in other SM policy decisions, and may include the "invalidPolicyDecs" attribute to provide more details on these failed policy decision types and/or condition data that are not referred by any provisioned PCC rule or session rule and/or other SM policy decisions. In addition, when "Ext2PolicyDecisionErrorHandling" feature is supported and the NF service consumer needs to reject the request because the PCF only provided policy decision/condition data and all of them were faulty, the NF service consumer shall include the ErrorReport data structure with the "error" attribute containing the "cause" attribute of the ProblemDetails data structure set to "POL_DEC_ERROR".
- NOTE 1: An error within a policy decision type and/or condition data not referred by any PCC rules or session rules and/or an error in other policy decisions is encoded within the "policyDecFailureReports" attribute as specified in the PolicyDecisionFailureCode data structure defined in clause 5.6.3.28.

When the PCF receives the above reports, the PCF shall behave as follows:

- For the policy decisions and/or condition data:
 - a. The PCF shall consider all the instances of the policy decision(s) and/or condition data which are provisioned in the request message and indicated in the PolicyDecisionFailureCode data type as removed from the SMF.
 - b. When the PCF receives a response with HTTP "400 Bad Request" status code but the "policyDecFailureReports" attribute is not included in the provided ErrorReport data structure, the PCF shall consider all the provisioned instance(s) of the policy decision(s) and/or condition data in the request message as removed from the SMF.
 - c. The removal of a policy decision type and/or condition data shall not fail.
- For the other policy decisions:
 - a. The PCF shall consider all the new failed policy decisions provisioned in the request message and indicated in the PolicyDecisionFailureCode data type as not installed in the SMF.
 - b. The PCF shall consider all the modified policy decisions provisioned in the request message and indicated in the PolicyDecisionFailureCode data type as unmodified in the SMF.
 - c. The PCF shall consider all the removed policy decisions provided in the request message as deleted in the SMF.
- NOTE 2: The removal of a policy decision does not fail. Even if there is an inconsistency e.g. between the deletion of a policy control request trigger and the deletion of the applicable additional information, the whole related policy decision is removed.

4.2.3.27 Network slice related data rate policy control

At the time a PCF-initiated change of the authorized Session-AMBR occurs or PCC Rule(s) for GBR service data flow(s) need to be provisioned at the SMF, the PCF may check if the concerned S-NSSAI is subject to network slice data rate policy control. If it is the case, the PCF shall apply network slice data rate control as described in clause 4.2.6.8.

4.2.3.28 Group related data rate policy control

At the time a PCF-initiated change of the authorized Session-AMBR occurs or PCC Rule(s) for GBR service data flow(s) need to be provisioned at the SMF, the PCF may apply group data rate policy control as defined in clause 4.2.6.9.

4.2.3.29 Policy provisioning of Periodicity and N6 Traffic Parameter to be measured

If the "PowerSaving" feature is supported, to provide assitance information that enable UE power saving management, within the "traffParaData" attribute of the PCC rule, the PCF:

- shall send to the SMF the UL and/or DL Periodicity information within the "periodUl" and/or "periodDl" attributes, if received from the AF or NEF as specified in 3GPP TS 29.514 [17];and
- based on whether the "periodUl" and/or "periodDl" attributes are present and the operator's local policies, may send to the SMF the Traffic Parameter(s) measurement required to the UPF as follows:
 - a. within the "reqTrafficParas" attribute, the Traffic Parameter(s) to be measured, i.e., theN6 Jitter Information associated with the DL Periodicity and, if the UL/DL Periodicity information is not received from the AF (i.e., the "periodUl" and "periodDl" attributes are not included), the Uplink and/or Downlink periodicity information and
 - b. within the "repFreqs" attribute, the notification method(s) (periodic and/or on event detection) for the traffic parameters included in the "reqTrafficParas" attribute. When the "repFreqs" attribute indicates:
 - i. periodic, the PCF may indicate the reporting period within the "repPeriod" attribute; and/or
 - ii. event triggered, the PCF may indicate the threshold within the "dlN6JitterThr" attribute for N6 jitter information associated with the DL that, if matched or exceeded, triggers the report of the requested traffic parameters.

If the PCC rule includes the "periodUl" and/or "periodDl" attributes within the "traffParaData" attribute, the SMF derives the TSCAI and forwards it to NG-RAN as specified in 3GPP TS 29.502. When the "traffParaData" attribute includes the "reqTrafficParas" attribute, the SMF shall request to the UPF to perform the requested measurement and shall also send to the UPF the received DL Periodicity, if available, as described in 3GPP TS 29.244 [13]. The SMF requests the UPF to monitor and report the measured Traffic Parameter(s) using the N4 Session Modification procedure, as described in 3GPP TS 29.244 [13]. At reception of the measured Traffic Parameter(s) from the UPF, the SMF includes the measured N6 Jitter Information associated with the DL Periodicity and the measured periodicity (if applicable), in the TSCAI and forwards it to the NG-RAN as specified in 3GPP TS 29.502.

4.2.3.30 Network slice usage control

When a PCF-initiated change of the SM policies shall be performed by the PCF via the Npcf_SMPolicyControl_UpdateNotify service operation and the "NetSliceUsageCtrl" feature is supported, the PCF may check whether the S-NSSAI of the concerned SM Policy Association is subject to network slice usage control. If it is the case, the PCF may provision/update/remove via the Npcf_SMPolicyControl_UpdateNotify request the network slice usage control information (e.g., the slice PDU session inactivity timer value) within the "sliceUsgCtrlInfo" attribute of the SmPolicyDecision data structure provided within the "smPolicyDecision" attribute of the SmPolicyNotification data structure.

NOTE: In this release of the specification, network slice usage control information provisioning/update/removal by the PCF is not supported in roaming scenarios.

4.2.3.31 VPLMN Specific Offloading Policy

For HR-SBO scenarios, if the "HR-SBO" feature is supported and the H-PCF previously received the "hrsboInd" attribute set to "true" for the current serving VPLMN, the PCF may provision/update/remove the Specific Offloading Policy for the VPLMN where the UE is currently registered. In this case, the PCF may include within the Npcf_SMPolicyControl_UpdateNotify request the VPLMN Specific Offloading Policy within the "vplmnOffloadInfos" and/or "vplmnDlAmbr" attributes.

NOTE: VPLMN Specific Offloading Policy can be provisioned in HPLMN per each VPLMN based on the service level agreement between HPLMN and VPLMN.

4.2.4 Npcf_SMPolicyControl_Update Service Operation

4.2.4.1 General

The Npcf_SMPolicyControl_Update service operation provides means for the NF service consumer to inform the PCF that a policy control request trigger condition has been met and for the PCF to inform the NF service consumer of any resulting update of the Session Management related policies.

The following procedures using the Npcf_SMPolicyControl_Update service operation are supported:

- Provisioning of PCC rules.
- Provisioning of policy control request triggers.
- Request the policy based on revalidation time.
- Policy provisioning and enforcement of authorized AMBR per PDU session.
- Policy provisioning and enforcement of authorized default QoS.
- Application detection information reporting.
- Indication of QoS Flow Termination Implications.
- 3GPP PS Data Off Support.
- Request and report Access Network Information.
- Request Usage Monitoring Control and report Accumulated Usage.
- Ipv6 Multi-homing support.
- Request and report the result of PCC rule removal.
- Access Network Charging Identifier Request and report.
- Request and report the successful resource allocation notification.
- Negotiation of the QoS flow for IMS signalling.
- Notification about Service Data Flow QoS target enforcement.
- Request the termination of SM Policy association.
- Reporting of TSC user plane node management information and port management information.
- QoS Monitoring Report.
- Policy decision and condition data error handling.
- Request the policy after DDN failure events.
- Network slice related data rate policy control.
- Presence Reporting Area Information Report.
- PCC Rule Error Report.
- Session Rule Error Report.
- UE initiates a resource modification support.
- Trace Control.
- Group related data rate policy control.
- Support of Network Slice Usage Control.

- VPLMN Specific Offloading Policy.
- Reporting of URSP rule enforcement information.

4.2.4.2 Requesting the update of the Session Management related policies

Figure 4.2.4.2-1: Requesting the update of the Session Management related policies

When the NF service consumer detects that one or more policy control request triggers are met, the NF service consumer shall send a POST request to the PCF to update an Individual SM Policy resource. The {smPolicyId} in the URI identifies the Individual SM Policy resource to be updated. The NF service consumer include SmPolicyUpdateContextData data structure in the content of the HTTP POST to request a update of representation of the "Individual SM Policy" resource. The NF service consumer shall include the met policy control request trigger(s) within the "repPolicyCtrlReqTriggers" attribute and applicable updated value(s) in the corresponding attribute(s).

The NF service consumer shall include (if the corresponding policy control request trigger is met and the applicable information is available) in the SmPolicyUpdateContextData data structure:

- type of access within the "accessType" attribute;
- type of the radio access technology within the "ratType" attribute;
- the new allocated UE Ipv4 address within the "ipv4Address" attribute and/or the UE Ipv6 prefix within the "ipv6AddressPrefix" attribute;
- an additional new allocated UE Ipv6 prefix within the "addIpv6AddrPrefixes" attribute, if the "MultiIpv6AddrPrefix" feature is supported;
- multiple new allocated UE Ipv6 prefixes within the "multiIpv6Prefixes" attribute, if the "UnlimitedMultiIpv6Prefix" feature is supported;
- the released UE Ipv4 address within the "relIpv4Address" attribute and/or the UE Ipv6 prefix within the "relIpv6AddressPrefix" attribute;
- an additional released UE Ipv6 prefix within the "addRelIpv6AddrPrefixes" attribute, if the "MultiIpv6AddrPrefix feature" is supported;
- multiple released UE Ipv6 prefixes within the "multiRelIpv6Prefixes" attribute, if the "UnlimitedMultiIpv6Prefix feature" is supported;
- the UE MAC address within the "ueMac" attribute;
- the released UE MAC address within the "relUeMac" attribute;
- the indication of UE supporting reflective QoS within the "refQosIndication" attribute;
- access network charging identifier within the "accNetChIds" attribute;

- the 3GPP PS data off status within the "3gppPsDataOffStatus" attribute, if the "3GPP-PS-Data-Off" feature is supported;
- the UE time zone information within the "ueTimeZone" attribute;
- the UDM subscribed Session-AMBR or, if the "DN-Authorization" feature is supported, the DN-AAA authorized Session-AMBR within the "subsSessAmbr" attribute;
- NOTE 1: When both, the UDM subscribed Session-AMBR and the DN-AAA authorized Session-AMBR are available in the NF service consumer, the NF service consumer includes the DN-AAA authorized Session-AMBR.
- if the "VPLMN-QoS-Control" feature is supported, the highest Session-AMBR and the default QoS supported in the VPLMN within the "vplmnQos" attribute, if available;
- NOTE 2: In home routed roaming, the H-SMF may provide the QoS constraints received from the VPLMN (defined in 3GPP TS 23.502 [3] clause 4.3.2.2.2) to the PCF.
- if the "DN-Authorization" feature is supported, the DN-AAA authorization profile index within the "authProfIndex" attribute;
- subscribed Default QoS Information within the "subsDefQos" attribute;
- detected application information within the "appDetectionInfos" attribute;
- if the "UMC" feature is supported, the accumulated usage reports within the "accuUsageReports" attribute;
- if the "PRA" feature is supported, the reported presence reporting area information within the "repPraInfos" attribute;
- the QoS flow usage required of the default QoS flow within the "qosFlowUsage" attribute;
- indication whether the QoS targets of one or more SDFs are not guaranteed or guaranteed again within the "qncReports" attribute;
- user location(s) information within the "userLocationInfo" attribute;
- NOTE 3: The SMF encodes both 3GPP and non-3GPP access UE location in the "userLocationInfo" attribute when they are both received from the AMF.
- if the "GroupIdListChange" feature is supported, the Internal Group Identifier(s) of the served UE within the "interGrpIds" attribute;
- if the "SatBackhaulCategoryChg" feature is supported, the satellite backhaul category or non-satellite backhaul and, when the "EnSatBackhaulCatChg" feature is supported, also the dynamic satellite backhaul category, within the "satBackhaulCategory" attribute;
- if the "AMInfluence" feature is supported, the PCF for the UE callback URI and, if received, SBA binding information within the "pcfUeInfo" attribute;
- serving network function identifier within the "servNfId" attribute;
- identifier of the serving network within the "servingNetwork" attribute;
- when the "URSPEnforcement" feature is supported, the URSP rule enforcement information provided by the UE within the "urspEnfInfo" attribute. In this case, the NF service consumer shall also include, if they were not previously provided, the SSC mode within the "sscMode" attribute, the UE requested DNN (if available and different from the selected DNN) within the "ueReqDnn" attribute, and the UE requested PDU session Type (if available and different from the selected PDU session Type) within the "ueReqPduSessionType" attribute;
- if the "EnTSCAC" feature is supported, the BAT offset and the optionally adjusted periodicity within the "batOffsetInfo" attribute;
- when the "EneNA" feature is supported, the list of NWDAF instance IDs used for the PDU Session within the "nwdafInstanceId" and their associated Analytic ID(s) within "nwdafEvents" updated with the new values included within the "nwdafDatas" attribute;

NOTE 4: The NF service consumer provides the complete updated list of NWDAF instance IDs and associated Analytic ID(s) used for the PDU session. If all NWDAF data is deleted an empty list is included.

- for HR-SBO scenario, if the "HR-SBO" feature is supported, the H-SMF may include the HR-SBO support indication within the "hrsboInd" attribute; and
- when the "NetSliceRepl" feature is supported:
 - if the NF service consumer reports a change from the initial S-NSSAI of the PDU Session to the Alternative S-NSSAI, the corresponding trigger and the Alternative S-NSSAI for the PDU Session within the "altSliceInfo" attribute; and
 - if the NF service consumer reports a change back from the Alternative S-NSSAI to the initial S-NSSAI of the PDU Session, only the corresponding trigger with no additional information.

The NF service consumer may include in "SmPolicyUpdateContextData" data structure the IPv4 address domain identity within the "ipDomain" attribute.

In case of a successful update, "200 OK" response shall be returned. The PCF shall include in the "200 OK" response the representation of the updated policies within the SmPolicyDecision data structure. Detailed procedures related to the provisioning and enforcement of the policy decisions within the SmPolicyDecision data structure are contained in clause 4.2.6.

NOTE 5: An empty SmPolicyDecision data structure is included in the "200 OK" response when the PCF decides not to update policies.

If the PCF received a new list of NWDAF instance IDs used for the PDU Session in "nwdafInstanceId" attribute and their associated Analytic IDs in "nwdafEvents" attribute included within the "nwdafDatas" attribute the PCF may select those NWDAF instances based on this new list as described in 3GPP TS 29.513 [7].

If the "HR-SBO" feature is supported and if the PCF received information related to the HR-SBO support, the PCF may provide the "vplmnOffloadInfos" and/or "vplmnDlAmbr" attribute(s) indicating the new/updated/removed Specific Offloading Policy for the VPLMN as described in clause 4.2.4.32.

If errors occur when processing the HTTP POST request, the PCF shall send an HTTP error response as specified in clause 5.7.

If the feature "ES3XX" is supported, and the PCF determines the received HTTP POST request needs to be redirected, the PCF shall send an HTTP redirect response as specified in clause 6.10.9 of 3GPP TS 29.500 [4].

If the PCF is, due to incomplete, erroneous or missing information (e.g. QoS, RAT type, subscriber information) not able to provision a policy decision as response to the request for PCC rules by the NF service consumer, the PCF may reject the request and include in an HTTP "400 Bad Request " response message the "cause" attribute of the ProblemDetails data structure set to "ERROR_INITIAL_PARAMETERS".

If the PCF receives the set of session information which is sent in the message originated due to a trigger being met is incoherent with the previous set of session information for the same session (E.g. trigger met was RAT changed, and the RAT notified is the same as before), the PCF may reject the request and include in an HTTP "400 Bad Request" response message the "cause" attribute of the ProblemDetails data structure set to "ERROR_TRIGGER_EVENT".

If the PCF detects that the packet filters in the request for new PCC rules received from the NF service consumer is covered by the packet filters of outstanding PCC rules that the PCF is provisioning to the NF service consumer, the PCF may reject the request and include in an HTTP "403 Forbidden" response message the "cause" attribute of the ProblemDetails data structure set to "ERROR_CONFLICTING_REQUEST".

If the PCF does not accept one or more of the traffic mapping filters provided by the NF service consumer in an HTTP POST request (e.g. because the PCF does not allow the UE to request enhanced QoS for services not known to the PCF), the PCF shall reject the request and include in an HTTP "403 Forbidden" response message the "cause" attribute of the ProblemDetails data structure set to "ERROR_TRAFFIC_MAPPING_INFO_REJECTED".

If the NF service consumer receives HTTP response with these codes, the NF service consumer shall reject the PDU session modification that initiated the HTTP Request.

The PCF shall not combine a rejection with provisioning of PCC rule operations in the same HTTP response message.

4.2.4.3 Request the policy based on revalidation time

If the timer for the policy revalidation is started, the SMF shall send the PCC rule request before the indicated revalidation time. The SMF shall within the SmPolicyUpdateContextData data structure include RE_TIMEOUT within the "repPolicyCtrlReqTriggers" attribute. The SMF shall stop the timer once the SMF sends the HTTP POST request.

NOTE 1: The PCF is expected to be prepared to provide a new policy, as desired for the revalidation time, during a preconfigured period before the revalidation time. The preconfigured periods in the SMF and PCF need to be aligned.

The PCF may instruct the SMF to revalidate the provided PCC rules by including the "revalidationTime" attribute within the SmPolicyDecision in the HTTP POST response.

NOTE 2: If the PCF omits the "revalidationTime" attribute the revalidation function remains enabled, but the timer remains stopped till the PCF provides a revalidation time within the "revalidationTime" attribute.

When the SMF receives the HTTP POST response message, the SMF shall start the timer for revalidation based on the received value of revalidation time if the revalidation function is not disabled; otherwise, the SMF shall not start the timer for revalidation.

The PCF may disable the revalidation function by removing the RE_TIMEOUT policy control request trigger in the HTTP POST response message. If the revalidation function is disabled, the SMF shall ignore any received value of revalidation time and shall not start the timer for revalidation.

NOTE 3: By disabling the revalidation function the revalidation time value previously provided to the SMF is not applicable anymore.

4.2.4.4 Policy provisioning and enforcement of authorized AMBR per PDU session

When the SMF detects that the Session-AMBR changes, the SMF shall notify of the change to the PCF by invoking the procedure defined in clause 4.2.4.2, and shall include the new Session-AMBR within the "subsSessAmbr" attribute and the "SE_AMBR_CH" policy control request trigger within the "repPolicyCtrlReqTriggers" attribute.

If the "DN-Authorization" feature is supported, when both, the UDM subscribed Session-AMBR and the DN-AAA authorized Session-AMBR are available in the SMF, the DN-AAA authorized/re-authorized Session-AMBR shall take precedence over the changes on UDM subscribed Session-AMBR.

If the "VPLMN-QoS-Control" feature is supported,

- in the home routed scenario, when the SMF detects that the Session-AMBR supported in the VPLMN changes (i.e. when the UE moves from the HPLMN to a VPLMN with Session-AMBR constraints or between VPLMNs with different Session-AMBR constraints), the SMF shall notify of the change to the PCF by invoking the procedure defined in clause 4.2.4.2, and shall include the new VPLMN Session-AMBR within the "vplmnQos" attribute and the "VPLMN_QOS_CH" policy control request trigger within the "repPolicyCtrlReqTriggers" attribute.
- when the SMF detects that the UE moves from a VPLMN with Session-AMBR constraints to a VPLMN where the QoS constraints are not applicable in the home routed scenario or the UE moves back to the non-roaming scenario, the SMF shall notify the PCF that the QoS constraints in the VPLMN are not applicable by invoking the procedure defined in clause 4.2.4.2, and shall include the "vplmnQosNotApp" attribute set to true and the "VPLMN_QOS_CH" policy control request trigger within the "repPolicyCtrlReqTriggers" attribute.

Upon receiving the change of Session-AMBR, the PCF shall ensure that the authorized Session-AMBR value does not exceed the Session-AMBR supported by the VPLMN, if applicable, and provision the new authorized Session-AMBR to the SMF in the response as defined in clauses 4.2.6.3.1 and 4.2.6.3.2.

Upon receiving the authorized Session-AMBR from the PCF, the SMF shall apply the corresponding procedures towards the access network, the UE and the UPF for the enforcement of the AMBR per PDU session.

For UL Classifier or Multi-homing PDU Session, the SMF will provision the policies of session-AMBR for downlink and uplink direction to the UL Classifier/Branching Point functionality and in addition provision the policies of session-AMBR in the downlink direction to all the PDU session anchors as defined in clause 5.4.4 of 3GPP TS 29.244 [13].

4.2.4.5 Policy provisioning and enforcement of authorized default QoS

When the SMF detects that the subscribed default QoS change, the SMF shall notify of the PCF by invoking the procedure as defined in clause 4.2.4.2, include the new subscribed default QoS within the "subsDefQos" attribute and "repPolicyCtrlReqTriggers" set to DEF_QOS_CH.

If the "VPLMN-QoS-Control" feature is supported,

- in the home routed scenario, when the SMF detects that the default QoS supported in the VPLMN changes (i.e. when the UE moves from the HPLMN to a VPLMN with default QoS constraints or between VPLMNs with different default QoS constraints), the SMF shall notify of the change to the PCF by invoking the procedure defined in clause 4.2.4.2, and shall include the new default QoS value supported in the VPLMN within the "vplmnQos" attribute and the "VPLMN_QOS_CH" policy control request trigger within the "repPolicyCtrlReqTriggers" attribute;
- when the SMF detects that the UE moves from a VPLMN with default QoS constraints to a VPLMN where the QoS constraints are not applicable in the home routed scenario or the UE moves back to the non-roaming scenario, the SMF shall notify the PCF that the QoS constraints in the VPLMN are not applicable by invoking the procedure defined in clause 4.2.4.2, and shall include the "vplmnQosNotApp" attribute set to true and the "VPLMN_QOS_CH" policy control request trigger within the "repPolicyCtrlReqTriggers" attribute.

Upon receiving the change of default QoS, the PCF shall ensure that the authorized default QoS contains a 5QI and ARP values supported by the VPLMN, if applicable, and shall provision the authorized default QoS to the SMF in the response of the message as defined in clauses 4.2.6.3.1 and 4.2.6.3.2.

Upon receiving the authorized default QoS, the SMF enforces it which may lead to the change of the subscribed default QoS. The SMF shall apply the corresponding procedures towards the access network, the UE and the UPF for the enforcement of the authorized default QoS.

4.2.4.6 Application detection information reporting

If the ADC feature is supported and if the SMF receives the PCC rule for application detection and control, the SMF shall instruct the UPF as defined in 3GPP TS 29.244 [13] to:

- Detect the application traffic.
- Report the detected application's traffic start/stop events along with the application instance identifier and service data flow descriptions when service data flow descriptions are deducible.

When the start of the application's traffic, identified by an application identifier, is received from the UPF, if PCF has previously provisioned the APP_STA/APP_STO policy control request trigger, unless a request to mute such a notification (i.e. the "muteNotif" attribute set to true within the Traffic Control Data decision which the PCC rule refers to), the SMF shall report the start of the application to the PCF.

In order to do so, the SMF shall perform the procedure as defined in clause 4.2.4.2 by including the information regarding the detected application's traffic within the "appDetectionInfos" attribute and the "APP_STA" within the "repPolicyCtrlReqTriggers" attribute even if the application traffic is discarded due to enforcement actions of the PCC rule. In this case, within the each AppDetectionInfo instance, the SMF shall include the received application identifier within the "appId" attribute, and may include the detected service data flow description within the "sdfDescriptions" attribute if deducible and received and an allocated application instance identifier for the detected service data flow descriptions if received within the "instanceId". The "sdfDescriptions" attribute, if present, shall contain the "flowDescription" attribute and "flowDirection" attribute. The application instance identifier allows the correlation of APP_STA and APP_STO policy control request trigger to the specific service data flow descriptions.

When the stop of the application's traffic, identified by an application identifier is received from the UPF and the SMF has reported the start of the application to the PCF, the SMF shall report the stop of the application to the PCF. In order to do so, the SMF shall perform the procedure as defined in clause 4.2.4.2 by including the information regarding the detected application's traffic within the "appDetectionInfos" attribute and the "APP_STO" within the "repPolicyCtrlReqTriggers" attribute. For each AppDetectionInfo instance, the SMF shall include the received application identifier within the "appId" attribute and the application instance identifier received from the UPF within the "instanceId" if it is provided along with the APP_STA to the PCF.

The PCF then may make policy decisions based on the information received and send the corresponding updated PCC rules to the SMF.

When a PFD provisioned by the PFDF as specified in 3GPP TS 29.551 [46] is removed/modified and the removed/modified PFD was used to detect application traffic related to an application identifier in a PCC rule installed or activated for a PDU session, if the removed/modified PFD results in that the stop of an application or an application instance is not able to be detected, and if the SMF has reported the application start as described in this clause to the PCF for the application or application instance represented by this PFD, the SMF shall report the application stop to the PCF for the corresponding application or the corresponding application instance, if the stop of the application's traffic, identified by the corresponding application or the corresponding application instance, is received from the UPF.

NOTE: Multiple PFDs can be associated with the application identifier. When the removed/modified PFD is the last one which is used to detect traffic identified by the "appId" attribute, the SMF reports application stop.

The PCF is not allowed to update the mute indication of a provisioned PCC rule(s) during the PDU session lifetime, i.e., if for the PCC rule, the application's start or stop notifications are muted, the PCC rule shall remain with the application's start or stop notifications muted along the PDU session lifetime, and viceversa, if for the PCC rule, the application's start or stop notifications are not muted, the PCC rule shall remain with the application's start or stop notifications not muted along the PDU session lifetime. The SMF shall reject the update of the mute indication for a provisioned PCC rule as specified in clause 4.2.6.2.11.

4.2.4.7 Indication of QoS Flow Termination Implications

When the SMF detects that a dedicated QoS flow could not be activated or has been terminated it shall remove the affected PCC rules and send an HTTP POST request to the PCF with an SmPolicyUpdateContextData data structure, including the "ruleReports" attribute containing the RuleReport data instance which specifies the affected PCC rules within the "pccRuleIds" attribute, "INACTIVE" as the value within the "ruleStatus" attribute and the "RES ALLO FAIL" as the value of the "failureCode" attribute.

If the RAN-NAS-Cause feature is supported, the SMF shall provide the available access network information within the "userLocationInfo" attribute (if available), "userLocationInfoTime" attribute (if available) and "ueTimezone" attribute (if available). Additionally, if the SMF receives from the access network the RAN cause and/or the NAS cause due to QoS flow termination the SMF shall provide the received cause(s) in the "ranNasRelCauses" attribute included in RuleReport data instance.

If the NetLoc feature is supported, and if the identifier of the affected PCC rule was included within the "refPccRuleIds" attribute of the RequestedRuleData data structure when the affected PCC rule was installed or modified, the SMF shall provide the access network information to the PCF by including the user location(s) information within the "userLocationInfo" attribute (if requested by the PCF and if provided to the SMF), the information on when the UE was last known to be in that location within "userLocationInfoTime" attribute (if user location information was requested by the PCF and if the corresponding information was provided to the SMF), the PLMN Identifier or the SNPN Identifier (the PLMN Identifier and the NID) within the "servingNetwork" attribute (if the user location information was requested by the PCF but it is not provided to the SMF) and the timezone information within the "ueTimeZone" attribute (if requested by the PCF and available).

- NOTE 1: The SMF derives the value of the "userLocationInfoTime" attribute from the age of location information received from the AMF at PDU session update as described in 3GPP TS 29.502[22]. Whether the "userLocationInfo" attribute also encodes the age of location is implementation specific.
- NOTE 2: The SMF encodes both 3GPP and non-3GPP access UE location in the "userLocationInfo" attribute when they are both received from the AMF.

This shall be done whenever one of these conditions applies:

- The SMF is requested by the RAN to initiate the deactivation of a QoS flow.
- PCC rule(s) are removed/deactivated by the SMF without PCF request (e.g. due to unsuccessful reservation of resources to satisfy the QoS flow binding).

NOTE 3: The SMF will not initiate the deactivation of the QoS flow upon reception of the UE-initiated resource modification procedure indicating packet filter deletion. If all the PCC rules associated to a QoS flow have been deleted as a consequence of the PCF interaction, the SMF will initiate the QoS flow termination procedure towards the RAN.

Signalling flows for the QoS flow termination and details of the binding mechanism are presented in 3GPP TS 29.513 [7].

4.2.4.8 3GPP PS Data Off Support

If the SMF is informed that the 3GPP PS Data Off status of the UE changed, the SMF shall send an HTTP POST message to the PCF, as defined in clause 4.2.4.2, providing the "PS_DA_OFF" value within the "repPolicyCtrlReqTriggers" attribute and the "3gppPsDataOffStatus" attribute set to the value indicated by the UE within the "SmPolicyUpdateContextData" data structure.

Upon reception of this HTTP POST message with the "repPolicyCtrlReqTriggers" attribute set to the value "PS_DA_OFF" or "AC_TY_CH" the PCF shall determine whether the 3GPP PS Data Off handling functionality (as described below) becomes active or inactive. The 3GPP PS Data Off handling functionality is active if, and only if,

- the latest received "3gppPsDataOffStatus" attribute is set to true; and

NOTE 1: If the PS_DA_OFF policy control request trigger is received, the latest received value is the one received in the HTTP POST message. Otherwise, it corresponds to the stored value.

- the UE uses 3GPP access, i.e.:
 - for a non MA PDU session, the "accessType" attribute is set to "3GPP_ACCESS"; and
 - for a MA PDU session, either the "accessType" attribute or the "addAccessInfo"attribute indicate "3GPP_ACCESS", and the "relAccessInfo" attribute either is not available or does not indicate "3GPP_ACCESS".

If the PCF determines that the 3GPP PS Data Off handling functionality becomes active, the PCF shall configure the SMF in such a way that:

- only packets for services belonging to the list of 3GPP PS Data Off Exempt Services are forwarded over 3GPP access; and
- all other downlink packets and optionally uplink packets are:
 - for a non-MA PDU session or a MA PDU session where non-3GPP access is not available, discarded by modifying or removing any related dynamic PCC rule(s) or by deactivating any related predefined PCC rule(s);
 - for a MA PDU session where non-3GPP access is available, forwarded only via non-3GPP access, if it is ensured by the policy for ATSSS Control as specified in clause 4.2.6.2.17.
- NOTE 2: In order for the UPF to prevent the services that do not belong to the list of 3GPP PS Data Off Exempt Services, if such services are controlled by dynamic PCC rules, the PCF can either close gates for the downlink and optionally the uplink directions via the "flowStatus" attribute in the related dynamic PCC rules or remove those dynamic PCC rules. If the services are controlled by predefined PCC rules, the PCF needs to deactivate those PCC rules. PCC rule(s) with wild-carded service data flow filters can be among the PCC rules that are modified, removed or disabled in that manner. It can then be necessary that the PCF at the same time installs or activates PCC rules for PS Data Off Exempt Services. The network configuration can ensure that at least one PCC rule is bound to the default QoS flow when PS Data Off is activated in order to avoid the deletion of an existing PDU session or to not fail a PDU session establishment.

If the PCF determines that the 3GPP PS Data Off handling functionality becomes inactive, the PCF shall make the necessary policy control decisions and perform PCC rule operations to make sure that services are allowed according to the user's subscription and operator policy (irrespective of whether they belong to the list of 3GPP PS Data Off Exempt Services or not).

NOTE 3: The PCF can then open gates via the "flowStatus" attribute for active PCC rules associated to services not contained in the list of 3GPP PS Data Off Exempt Services. The PCF can also install PCC rules or activate predefined PCC rules for some services not belonging to the list of 3GPP PS Data Off Exempt Services. If the PCF activates or installs a PCC rule with wildcarded filters, it can remove or de-activate PCC rules for 3GPP PS Data Off Exempt Services that are redundant with this PCC rule.

4.2.4.9 Request and Report of Access Network Information

If the NetLoc as defined in clause 5.8 is supported, the PCF may request the SMF to report the access network information as defined in clause 4.2.6.5.4.

If the AN_INFO policy control request trigger is set, upon receiving the "lastReqRuleData" attribute with the "reqData" attribute with the value(s) MS_TIME_ZONE and/or USER_LOC_INFO and the "refPccRuleIds" attribute containing the PCC rule identifier(s) corresponding to the PCC rule(s) which is being installed, modified or removed together, the SMF shall apply the Namf_EventExposure service for Time-Zone-Report and/or Location-Report event with One-Time Report type as defined in clause 5.3.1 and 5.3.2.2.2 of 3GPP TS 29.518 [36] if the related information is not available to obtain this information. When the SMF then receives access network information from the AMF, the SMF shall provide the required access network information to the PCF by as defined in clause 4.2.4.2 and set the corresponding attributes as follows:

- If the user location(s) information was requested by the PCF and was provided to the SMF, the SMF shall provide the user location information within the "userLocationInfo" attribute and the time when it was last known within "userLocationInfoTime" attribute (if available).
- NOTE 1: The SMF derives the value of the "userLocationInfoTime" attribute from the age of location information received in the Location-Report (defined in clause 5.3.1 of 3GPP TS 29.518 [36]) from the AMF. Whether the "userLocationInfo" attribute also encodes the age of location is implementation specific.
- NOTE 2: The SMF encodes both 3GPP and non-3GPP access UE location in the "userLocationInfo" attribute when they are both received from the AMF.
- If the user location information was requested by the PCF and was not provided to the SMF, the SMF shall provide the serving PLMN Identifier or the SNPN Identifier (the PLMN Identifier and the NID) within the "servingNetwork" attribute.
- If the time zone was requested by the PCF, the SMF shall provide it within the "ueTimeZone" attribute.
- NOTE 3: If the SMF receives the access network information but receives the rejection of the QoS flow creation or modification, the SMF reports the the enforcement error of the PCC rule to the PCF as defined in clause 4.2.4.15.

In addition, the SMF shall provide the AN_INFO policy control request trigger within the "repPolicyCtrlReqTriggers" attribute.

The SMF shall not report any subsequent access network information updates received from the RAN without any further provisioning or removal of related PCC rules requesting the access network information unless the associated QoS flow or PDU session has been released.

4.2.4.10 Request Usage Monitoring Control and Reporting Accumulated Usage

4.2.4.10.1 General

If the UMC feature, as defined in clause 5.8 is supported, the PCF may provision the usage monitoring control policy to the SMF, as defined in clause 4.2.6.5.3, to request the usage monitoring control.

The SMF shall report the accumulated usage to the PCF in the following conditions:

- when a usage threshold is reached, as described in this clause;
- when all PCC rules for which usage monitoring is enabled for a particular usage monitoring key are removed or deactivated, as specified in clause 4.2.4.10.2;
- when usage monitoring is explicitly disabled by the PCF, as specified in clause 4.2.6.5.3.2;
- when a PDU session is terminated, as specified in clause 4.2.5.3;
- when requested by the PCF, as specified in clause 4.2.6.5.3.3.

The UPF measures the volume and/or the time of usage of all traffic of a PDU session or the corresponding service data flows. When the SMF receives the accumulated usage report from the UPF as defined in clauses 7.5.5.2, 7.5.7.2 or

7.5.8.3 of 3GPP TS 29.244 [13], the SMF shall send an HTTP POST message as defined in clause 4.2.4.2, including one or more accumulated usage reports within the "accuUsageReports" attribute and the "US_RE" value within the "repPolicyCtrlReqTriggers" attribute. Each AccuUsageReport data structure shall contain the accumulated usage report within one or two Usage Report information element, i.e. the accumulated usage before the monitoring time or the accumulated usage both before and after the monitoring time, corresponding to one usage monitoring control instance as requested by the PCF.

If the monitoring time is provided by the PCF for a usage monitoring control instance and:

- if the SMF receives only one Usage Report information elements corresponding to the usage monitoring control instance from the UPF, within the AccuUsageReport data structure, the SMF shall include the accumulated usage before the monitoring time within the "timeUsage" attribute, "volUsageUplink" attribute and/or "volUsageDownlink" attribute, if applicable; otherwise,
- if the SMF receives two Usage Report information elements corresponding to the usage monitoring control instance from the UPF, within the AccuUsageReport data structure, the SMF includes the accumulated usage before the monitoring time within the "timeUsage" attribute, "volUsage" attribute, "volUsageUplink" attribute and/or "volUsageDownlink" attribute, if applicable, and the accumulated usage after the monitoring time within the "nextTimeUsage" attribute, "nextVolUsage" attribute, "nextVolUsageUplink" attribute and/or "nextVolUsageDownlink" attribute, if applicable.

When the PCF receives the accumulated usage report in the HTTP POST message, the PCF shall indicate to the SMF if usage monitoring shall continue for this usage monitoring control instance as follows:

- if the PCF wishes to continue monitoring for the usage monitoring control instance and:
 - if monitoring shall continue for specific level(s), the PCF shall provide in the response to the received HTTP POST message the new threshold(s) corresponding to these level(s) using the same attributes as before (i.e. "volumeThreshold", "volumeThresholdUplink", "volumeThresholdDownlink" and/or "timeThreshold"; "nextVolThreshold", "nextVolThresholdUplink", "nextVolThresholdDownlink", and/or "nextTimeThreshold" if the "monitoringTime" attribute is provided within an entry of the "umDecs" attribute); or
 - if the PCF wishes to stop monitoring for specific level(s) the PCF shall not include in the response to the received HTTP POST message updated threshold(s) for these specific level(s), i.e. the corresponding "volumeThreshold" attribute, "volumeThresholdUplink" attribute, "volumeThresholdDownlink" attribute, "timeThreshold" attribute, "nextVolThreshold" attribute, "nextVolThresholdDownlink" attribute, and/or "nextTimeThreshold" attribute shall not be included within an entry of the "umDecs" attribute.
- otherwise, if the PCF wishes to stop monitoring for the usage monitoring control instance, the PCF shall not
 include any thresholds of this usage monitoring control instance in the response to the HTTP POST message or
 remove the reference to the usage monitoring control instance from the concerned dynamic PCC rule or session
 rule.

If both volume and time thresholds were provided by the PCF and only one of these two thresholds is reached, the SMF shall report this event to the PCF and the accumulated usage since last report shall be reported for both measurements.

Upon reception of the reported usage from the SMF, the PCF shall deduct the value of the usage report from the total allowed usage for that PDU session, usage monitoring key, or both as applicable, and the PCF may also derive and update the PCC rules based on the remaining allowed usage or reported usage and provision them to the SMF. If the remaining allowed usage reaches a value zero (or below zero), the PCF may apply other policy decisions and interact with the SMF accordingly.

NOTE: The PCF can also update the related usage monitoring information in the UDR as defined in 3GPP TS 29.519 [15] according to the received usage report(s).

4.2.4.10.2 PCC Rule Removal

When the PCF removes or deactivates the last PCC rule associated with a usage monitoring key in an Npcf_SMPolicyControl_UpdateNotify request as described in clause 4.2.3.2 or in an Npcf_SMPolicyControl_Update response as described in clause 4.2.3.4 whose request was not related to reporting usage for the same monitoring key, the SMF shall send a new Npcf_SMPolicyControl_Update request including the "US_RE" value within the "repPolicyCtrlReqTriggers" attribute and one or more accumulated usage reports within the "accuUsageReports"

attribute within the SmPolicyUpdateContextData data type of the HTTP POST request using the procedures to report accumulated usage defined in clause 4.2.4.10.

When the SMF reports that the last PCC rule associated with a usage monitoring key is inactive, the SMF shall report the accumulated usage for that monitoring key within the same HTTP POST request if the "ruleReports" attribute was included in the SmPolicyUpdateContextData data type; otherwise, if the "ruleReports" attribute was included in the HTTP POST response of an Npcf_SMPolicyControl_UpdateNotify request, the SMF shall invoke the Npcf_SMPolicyControl_Update service operation by sending a new HTTP POST request to report accumulated usage for the usage monitoring key.

4.2.4.11 Ipv6 Multi-homing support

The SMF may insert an additional PDU Session Anchor to an existing PDU session by using Ipv6 multi-homing mechanism. In this case, the SMF shall inform the PCF when one or more new Ipv6 prefix is allocated to the new PDU Session Anchor as defined in clause 4.2.4.2. The SMF shall, within the SmPolicyUpdateContextData data structure, include the "UE_IP_CH" within the "repPolicyCtrlReqTriggers" attribute and include the new Ipv6 prefix within the "ipv6AddressPrefix" attribute, and may include an additional new Ipv6 prefix within the "addIpv6AddrPrefixes" attribute, if the "MultiIpv6AddrPrefix" feature is supported, or multiple new Ipv6 prefixes within the "multiIpv6Prefixes" attribute, if the "UnlimitedMultiIpv6Prefix" feature is supported.

When the PCF receives the request from the SMF indicating the addition of one or more new Ipv6 prefixes, the PCF shall determine the impacted PCC rules and/or session rules associated with each new Ipv6 prefix and provision them to the SMF as defined in clauses 5.6.2.6 and 5.6.2.7. The SMF shall derive the appropriate policies based on the policies provisioned by the PCF and provision them to the appropriate UPF, if applicable, access network, if applicable, and UE, if applicable. The PCF shall additionally consider the new Ipv6 prefix, or the new Ipv6 prefixes if the "MultiIpv6AddrPrefix" feature is supported or the "UnlimitedMultiIpv6Prefix" feature, during subsequent PCC rules and/or session rules updates.

When the SMF removes a PDU Session anchor from the Multi-homing PDU session, the SMF shall inform the PCF of the released Ipv6 prefix related to the PDU Session anchor as defined in clause 4.2.5.2. The SMF shall, within the SmPolicyUpdateContextData data structure, include the "UE_IP_CH" within the "repPolicyCtrlReqTriggers" attribute and include the released Ipv6 prefix within the "relIpv6AddressPrefix" attribute, and may include an additional released UE Ipv6 prefixes within the "addRelIpv6AddrPrefixes" attribute, if the "MultiIpv6AddrPrefix feature" is supported, or multiple released UE Ipv6 prefixes within the "multiRelIpv6Prefixes" attribute, if the "UnlimitedMultiIpv6Prefix feature" is supported.

When the PCF receives the request from the SMF indicating the release of one or more Ipv6 prefixes, the PCF shall determine the previously provisioned PCC rules and/or session rules associated with each released Ipv6 prefix and shall remove and/or update them from the SMF as applicable. The PCF shall remove the released Ipv6 prefix, or the multiple released Ipv6 prefixes if the "MultiIpv6AddrPrefix" or the "UnlimitedMultiIpv6Prefix" feature is supported.

4.2.4.12 Request and report for the result of PCC rule removal

If the RAN-NAS-Cause feature is supported, the PCF may request the SMF to inform it of the result of the PCC rule removal when the PCF removes the PCC rule as defined in clause 4.2.6.5.2.

When the SMF receives the request, the SMF shall maintain locally the removed PCC rules until it receives of the resource release outcome from the network.

The SMF shall notify the PCF by include the "RES_RELEASE" within the "repPolicyCtrlReqTriggers" attribute and the affected rules indicated within one instance of the "ruleReports" attribute with the "ruleStatus" attribute set to the value INACTIVE.

If the QoS flow is terminated as a consequence of the removal of one or more PCC rules, the SMF shall inform the PCF about the completion of the QoS flow procedure related to the removal of PCC rules that indicated resource release notification by including the RequestedRuleData instance containing the "reqData" attribute with the RES_RELEASE referring to the PCC rule. If the SMF received from the access network some RAN/NAS release cause(s), the SMF shall also provide the received cause(s) in the "ruleReports" attribute. The SMF shall also provide the available access network information within the "userLocationInfo" attribute (if available), "userLocationInfoTime" attribute (if available) and "ueTimezone" attribute (if available).

4.2.4.13 Access Network Charging Identifier request and report

If the "policyCtrlReqTriggers" attribute with the value "AN_CH_COR" has been provided to the SMF, the SMF shall notify to the PCF the Access Network Charging Identifier that the SMF has assigned to the PDU session for the dynamic PCC Rules which referred from the RequestedRuleData data structure containing the CH_ID within the "reqData" attribute by including an "accNetChIds" attribute within the SmPolicyUpdateContextData data structure in the HTTP POST message.

If the the Access Network Charging Identifier is within the Uint32 value range; the SMF shall include one AccNetChId instance within the "accNetChIds" attribute and include the Access Network Charging Identifier within the "accNetChaIdValue" attribute and the "sessionChScope" attribute set to true; otherwise, if the "AccNetChargId_String" feature is supported by the SMF and the PCF, and the Access Network Charging Identifier value is longer than Uint32, the SMF shall include one AccNetChId instance within the "accNetChIds" attribute and the Access Network Charging Identifier within the "accNetChargIdString" attribute and the "sessionChScope" attribute set to true.

NOTE: As specified in 3GPP TS 32.255 [35] clause 5.1.4, the SMF assigns a charging identifier per PDU session and is used through the PDU session's lifetime. The request of Access Network Charging Identifier(s) in 5GS and EPS interworking scenarios is described in clause B.3.4.11.

When the PCF does not have the access network charging identifier information for the PDU session, the PCF may request the SMF to provide the Access Network Charging Identifier associated to the new dynamic PCC rules as defined in clause 4.2.6.5.1 in the response message.

4.2.4.14 Request and report for the successful resource allocation notification

The PCF may request the SMF to confirm that the resources associated to a PCC rule are successfully allocated as defined in clause 4.2.6.5.5.

If the "policyCtrlReqTriggers" attribute with the value "SUCC_RES_ALLO" has been provided to the SMF, the SMF shall notify to the PCF that the resources associated to the PCC rules which were referred from an element of the "lastReqRuleData" attribute containing the "SUCC_RES_ALLO" within the "reqData" attribute are successfully allocated. When the SMF received successful resource allocation response from the access network, the SMF shall within the SmPolicyUpdateContextData data structure include the "SUCC_RES_ALLO" within the "repPolicyCtrlReqTriggers" attribute and "ruleReports" attribute. Within the RuleReport instance, the SMF shall include the corresponding PCC rule identifier(s) within the "pccRuleIds" attribute and the "ruleStatus" attribute set to value "ACTIVE".

If the "AuthorizationWithRequiredQoS" feature as defined in clause 5.8 is supported and if the SMF additionally receives the reference to the matching Alternative QoS Profile which the NG-RAN can guarantee, the SMF shall also include the reference to the QosData data structure for the Alternative QoS parameter set corresponding to the reference to the matching alternative QoS profile within the "altQosParamId" attribute.

If the "RuleVersioning" feature is supported and the PCF included the "contVer" attribute for a specific PCC rule instance, and the resource allocation was successful for this PCC rule, the SMF shall include the rule content version within the "contVers" attribute in the corresponding RuleReport instance.

4.2.4.15 PCC Rule Error Report

If the installation/activation of one or more PCC rules fails using the procedure as defined in clause 4.2.2.1 or 4.2.4.1 or the PCF installed, activated or modified one or more PCC rules as defined in clause 4.2.3.1 but resource allocation for the PCC rule was unsuccessful or the UE was found temporarily unavailable, the SMF shall include the "ruleReports" attribute for the affected PCC rules to report the failure within the SmPolicyUpdateContextData data structure. Within each RuleReport instance, the SMF shall identify the failed PCC rule(s) by including the affected PCC rules within the "pccRuleIds" attribute, identify the failed reason code by including a "failureCode" attribute, and shall include rule status within the "ruleStatus" attribute with the value as described below.

If the installation/activation of one or more new PCC rules (i.e., rules which were not previously successfully installed) fails, the SMF shall set the "ruleStatus" to INACTIVE.

The removal of a PCC rule shall not fail, even if the PDU session procedures with the UE fail. The SMF shall retain information on the removal and conduct the necessary PDU session procedures with the UE when it is possible.

If the modification of a currently active PCC rule fails, the SMF shall retain the existing PCC rule as active without any modification unless the reason for the failure has an impact also on the existing PCC rule. The SMF shall report the modification failure to the PCF.

If a PCC rule was successfully installed/activated, but can no longer be enforced by the SMF, the SMF shall set the "ruleStatus" attribute to INACTIVE.

NOTE: When the PCF receives "ruleStatus" set to INACTIVE, the PCF does not need request the SMF to remove the inactive PCC rule.

Depending on the value of the "failureCode" attribute, the PCF may decide whether retaining of the old PCC rule, reinstallation, modification, removal of the PCC rule or any other action applies.

If the feature "UEUnreachable" is supported, when the "failureCode" indicates "UE_TEMPORARILY_UNAVAILABLE" and the "retryAfter" attribute is received, the PCF should not reattempt the installation, re-installation or modification of PCC rules until the timer indicated in the received "retryAter" attribute expires or until the "UE_REACH_STATUS_CH" PCRT is received and includes the "ueReachStatus" attribute set to the value "REACHABLE".

If the RAN-NAS-Cause feature is supported and as part of any of the procedures described in this clause the SMF receives from the access network some RAN/NAS release cause(s), the SMF shall also provide the received cause(s) in the RuleReport instance. If RAN-NAS-Cause feature is supported the SMF shall provide the available access network information within the "userLocationInfo" attribute (if available), "userLocationInfoTime" attribute (if available) and "ueTimezone" attribute (if available).

If the "RuleVersioning" feature is supported and the PCF included the "contVer" attribute for a specific PCC rule instance, and the resource allocation was unsuccessful as for any of the procedures described in this clause the SMF shall include the rule content version within the "contVers" attribute for the corresponding RuleReport instance.

4.2.4.16 Presence Reporting Area Information Report

If the PRA or ePRA feature as defined in clause 5.8 is supported and when the SMF receives the presence reporting area information from the serving node as defined in 3GPP TS 29.518 [36] indicating that the UE is inside or outside of one or more presence reporting areas or any of the presence reporting areas is set to inactive, the SMF shall check if the reported presence reporting area identifier corresponds to a presence reporting area that is relevant for the PCF. In that case, the SMF shall within the SmPolicyUpdateContextData data structure include the "PRA_CH" within the "repPolicyCtrlReqTriggers" attribute and one or more Presence Reporting Area Information Report within the "repPraInfos" attribute. For each PresenceInfo data structure, the SMF shall also include the presence reporting area status within the "presenceState" attribute and the presence reporting area identifier within the "praId" attribute for each of the presence reporting areas reported by the serving node.

If the SMF receives presence reporting area information for a Set of Core Network predefined Presence Reporting Area encoded within the "praId" attribute together with the individual PRA Identifier encoded within the "additionalPraId" attribute as described in 3GPP TS 29.518 [36], the SMF shall only provide the PCF with the presence reporting area information corresponding to the additional PRA information (i.e. the individual PRA identifier) encoded within the "praId" attribute.

- NOTE 1: The SMF will receive additional presence reporting area information when the UE enters or leaves one or more presence reporting areas related to a PRA set. In that case, the additional presence reporting area information corresponds to the actual individual presence reporting area. The received presence reporting area identifier corresponds to the PRA set id and is used to identify the requester (PCF or CHF) of the notification information.
- NOTE 2: The PCF can acquire the necessary data for presence reporting from the UDR.
- NOTE 3: Homogeneous support of Presence Area reporting in a network is assumed.
- NOTE 4: The serving node can activate the reporting for the PRAs which are inactive as described in the 3GPP TS 23.501 [2].

4.2.4.17 UE initiates a resource modification support

In the case that the UE initiates a resource modification procedure as defined in clause 6.4.2.2 of 3GPP 3GPP TS 24.501 [20], the SMF shall within the SmPolicyUpdateContextData data structure include the "RES_MO_RE" within the "repPolicyCtrlReqTriggers" attribute and shall include the UE request of specific QoS handling for selected SDF within the "ueInitResReq" attribute. Within the UeInitiatedResourceRequest data structure, the SMF shall include the "ruleOp" attribute, "packFiltInfo" attribute and "reqQos" attribute if applicable as follows:

- When the UE requests to "Create new QoS rule", the SMF shall include the "ruleOp" attribute set to "CREATE_PCC_RULE", the "packFiltInfo" attribute and "reqQos" attribute containing the requested QoS for the new PCC rule. Each PacketFilterInfo instance shall contain one packet filters requested for creating the new QoS rule. If the PCF authorizes the request, the PCF shall create a new PCC rule by including the new packet filters within the service data flow template of the PCC rule. When the SMF received the PCC rule, the SMF shall derive the QoS rule based on the PCC rule, assign a new QoS rule identifier within the PDU session for the QoS rule. The SMF shall keep the mapping between the PCC rule identifier and the QoS rule identifier.
- When the UE requests to "Modify existing QoS rule and add packet filters" for the QoS rule created as a result of the UE-initiated resource modification, SMF shall include the "ruleOp" attribute set to "MODIFY_PCC_RULE_AND_ADD_PACKET_FILTERS", the "pccRuleId" attribute including the PCC rule identifier corresponding the QoS rule identifier and the "packFiltInfo" attribute. Each PacketFilterInfo instance shall contain one packet filters requested for addition to this QoS Rule. If the UE request includes the modified QoS information the SMF shall also include the "reqQos" attribute to indicate the updated QoS for the affected PCC rule(s). If the PCF authorizes the request, the PCF shall update the PCC rule by adding the new packet filters to the service data flow template of the PCC rule.
- When the UE requests to "Modify existing QoS rule and replace all packet filters" for the QoS rule created as a result of the UE-initiated resource modification, SMF shall include the "ruleOp" attribute set to "MODIFY_PCC_RULE_AND_REPLACE_PACKET_FILTERS", the "pccRuleId" attribute including the PCC rule identifier corresponding the QoS rule identifier and the "packFiltInfo" attribute. Each PacketFilterInfo instance shall contain one packet filters requested for addition to this QoS Rule. If the UE request includes the modified QoS information the SMF shall also include the "reqQos" attribute to indicate the updated QoS for the affected PCC rule. If the PCF authorizes the request, the PCF shall update PCC rule by replacing the all existing packet filters within the service data flow template of the PCC rule with the new packet filter(s).
- When the UE requests to "Modify existing QoS rule and delete packet filters" for the QoS rule created as a result of the UE-initiated resource modification, SMF shall include the "ruleOp" attribute set to "MODIFY_PCC_RULE_AND_DELETE_PACKET_FILTERS", the "pccRuleId" attribute including the PCC rule identifier corresponding the QoS rule identifier and the "packFiltInfo" attribute. Each PacketFilterInfo instance shall within the "packFiltId" attribute include the removed packet filter identifier assigned by the PCF corresponding to the packet filter identifier received from the UE. If the UE request includes modified QoS information the SMF shall also include the "reqQos" attribute to indicate the updated QoS for the affected PCC rule(s). If the PCF authorizes the request, the PCF shall update PCC rule by removing the corresponding packet filters from the service data flow template of the PCC rule.
- When the UE requests to "Modify existing QoS rule without modifying packet filters" for the QoS rule created as a result of the UE-initiated resource modification, SMF shall include the "ruleOp" attribute set to "MODIFY_PCC_RULE_WITHOUT_MODIFY_PACKET_FILTERS", the "pccRuleId" attribute including the PCC rule identifier corresponding the QoS rule identifier, the "packFiltInfo" attribute and the modified QoS information within the "reqQos" attribute. The "packFiltInfo" attribute shall include one PacketFilterInfo instance which includes any packet filter identifier assigned by the PCF for the PCC rule within the "packFiltId" attribute.
- When the UE requests to "Delete existing QoS rule" the SMF shall include the "ruleOp" attribute set to "DELETE_PCC_RULE" for the QoS rule created as a result of the UE-initiated resource modification, the "pccRuleId" attribute including the PCC rule identifier corresponding the QoS rule identifier and the "packFiltInfo" attribute. The "packFiltInfo" attribute shall include one PacketFilterInfo instance which includes any packet filter identifier assigned by the PCF for the PCC rule within the "packFiltId" attribute. The PCF shall remove the PCC rule when the PCF receives the request according to the PCC rule identifier.
- NOTE 1: The UE can only modify or delete the packet filters that the UE has introduced and associated resources. The packet filter identifiers contained in the FlowInformation data structure are only used for packet filters created by the UE.

The SMF shall calculate the requested GBR, for a GBR 5QI, as the sum of the previously authorized GBR for the affected PCC rule, corresponding to the QoS rule, adjusted with the difference between the requested GBR for the QoS flow and previously negotiated GBR for the QoS flow. For the UE request to create a new QoS Rule, the GBR as requested by the UE for the QoS rule shall be used.

If the request covers all the PCC rules with a QoS flow binding to the same QoS flow, then the SMF may request a change to the 5QI for existing PCC rules.

For the purpose of creating or modifying a QoS rule with adding, replacing and modifying packet filter, within the UeInitiatedResourceRequest instance, the SMF shall include the precedence information of the QoS rule within the "precedence" attribute, and within each PacketFilterInfo instance, the SMF shall include the "packFiltCont" attribute, "tosTrafficClass" attribute, "spi" attribute, "flowLabel" attribute and "flowDirection" attribute set to the value(s) describing the packet filter provided by the UE.

NOTE 2: The UE signalling with the network is governed by the applicable NAS signalling TS. The NAS 3GPP TS for a specific access may restrict the UE possibilities to make requests compared to what is stated above.

Upon receipt of the request from the SMF, the PCF shall check the set of services the user is allowed to access. If the user is not allowed to access AF session based services, the PCF shall check whether the user is allowed to request resources for services not known to the PCF and whether the requested QoS and/or packet filters can be authorized. If the user is not allowed to request resources for services not known to the PCF, the PCF shall reject the request with in an HTTP "403 Forbidden" response message including the "cause" attribute of the ProblemDetails data structure set to "POLICY_CONTEXT_DENIED".

If the PCF authorizes the request from the UE, the PCF shall construct a PCC rule(s) based on the UeInitiatedResourceRequest data structure. For the request to add the filter(s), the PCF shall within the FlowInformation data structure include the assigned packet filter identifier within the "packFiltId" attribute. When the SMF derives the QoS based on the PCC rule, the SMF shall assign a new packet filter identifier for each added packet filter within the QoS rule and keep the mapping between the packet filter identifier for the packet filter within the PCC rule and QoS rule.

The PCF shall perform the QoS authorization for the new created or modified PCC rules if requested by the UE as defined in clause 4.2.6.6.2.

If the PCF detects that the packet filters in the request for new PCC rules received from the SMF is covered by the packet filters of outstanding PCC rules that the PCF is provisioning to the SMF, the PCF may reject the request and indicate the cause for the rejection including the "cause" attribute of the ProblemDetails data structure set to "ERROR_CONFLICTING_REQUEST" in an HTTP "403 Forbidden" response message. If the SMF receives a response message with this code, the SMF shall ignore the PDU session modification that initiated the HTTP request as specified in 3GPP TS 24.501[20] clause 6.3.2.5.

If the PCF does not accept one or more of the traffic mapping filters provided by the SMF in an HTTP Request (e.g. because the PCF does not allow the UE to request enhanced QoS for services not known to the PCF), the PCF shall reject the request and indicate the cause for the rejection including the "cause" attribute of the ProblemDetails data structure set to "ERROR_TRAFFIC_MAPPING_INFO_REJECTED" in an HTTP "403 Forbidden" response message. If the SMF receives an HTTP response with this code, the SMF shall reject the PDU session modification that initiated the HTTP request.

The PCF shall not combine a rejection with provisioning of PCC rule operations in the same HTTP response.

4.2.4.18 Trace Control

When there is the requirement to activate tracing the SMF may provide trace control parameters within the "traceReq" attribute to the PCF via the Npcf_SMPolicyControl_Update service operation. The update service operation may also indicate the update or deactivation of the trace session to the PCF.

4.2.4.19 Negotiation of the QoS flow for IMS signalling

When UE initiates a resource modification request, if the SMF includes the "qosFlowUsage" attribute containing "IMS_SIG" within SmPolicyUpdateContextData data structure and the PCF accepts that a QoS flow dedicated to IMS signalling shall be used, the PCF shall return the "qosFlowUsage" containing "IMS_SIG" value within the SmPolicyDecision data structure. The provided PCC rules shall have the 5QI applicable for IMS signalling.

4.2.4.20 Notification about Service Data Flow QoS target enforcement

When the SMF gets the knowledge that for one or more QoS Flows:

- the GBR QoS targets cannot be guaranteed; or
- the GBR QoS targets can be guaranteed again;

the SMF shall inform the PCF that the GBR QoS targets cannot be guaranteed or can be guaranteed again for the PCC rules bound to the QoS flows.

The SMF gets the knowledge that the GBR QoS targets cannot be guaranteed or can be guaranteed again for the QoS flow(s) as follows:

- upon receiving a notification from the NG-RAN that the GFBR can no longer be guaranteed or can be guaranteed again as defined clause 5.2.2.3.1 of 3GPP TS 29.502 [22]; or
- during a handover, a QoS Flow which is listed as transferred QoS Flow received from the AMF as defined clause 5.2.2.3.1 of 3GPP TS 29.502 [22] can be interpreted as a notification that GFBR can be guaranteed again if the SMF has received a notification from the source NG-RAN that the GFBR can no longer be guaranteed but does not receive an explicit notification that the GFBR can no longer be guaranteed for that QoS Flow from the Target NG-RAN within a configured time as previous bullet.

The SMF shall send an HTTP POST request to the PCF with an SmPolicyUpdateContextData data structure, including the "QOS_NOTIF" within "repPolicyCtrlReqTriggers" attribute and the "qncReports" attribute. In each QosNotificationControlInfo data structure, the SMF shall include the indication that the GBR QoS targets cannot be guaranteed or the GBR QoS targets can be guaranteed again within the "notifType" attribute and affected PCC rule identifiers within the "refPccRuleIds" attribute.

If the "AuthorizationWithRequiredQoS" feature as defined in clause 5.8 is supported, the SMF shall also include the reference to the QosData data structure for the Alternative QoS parameter set corresponding to the reference to the matching alternative QoS profile within the "altQosParamId" attribute if the SMF additionally receives the reference to the matching Alternative QoS Profile which the NG-RAN can guarantee when the NG-RAN indicates the GBR QoS targets cannot be guaranteed. When the SMF additionally receives an indication that lowest priority Alternative QoS Profile cannot be fulfilled from the NG-RAN the SMF shall omit the "altQosParamId" attribute to indicate that that the lowest priority alternative QoS profile could not be fulfilled either. When the "DisableUENotification" feature is supported, if the corresponding PCC rule does not include the "disUeNotif" attribute set to true, the SMF shall also send the fulfilled QoS profile or Alternative QoS Profile to the UE as defined in clause 5.2.2.3.1.1 of 3GPP TS 29.518 [36], if applicable.

If the affected PCC rule was provisioned with a content version, the SMF shall include the "contVers" attribute defined in the QosNotificationControlInfo data structure for those corresponding PCC rules. The SMF may include more than one content version in the "contVers" attribute for the same PCC rule within the corresponding QosNotificationControlInfo instance included in the "qncReports" attribute (e.g. the SMF has combined multiple PCC rule versions enforcement into one QoS flow operation).

When the "AuthorizationWithRequiredQoS" and the "AltQoSProfilesSupportReport" features as defined in clause 5.8 are supported, and the PCF included during PCC rule provisioning the "refAltQosParams" attribute for the concerned PCC rule(s), if the SMF:

- receives the indication that the GBR QoS targets cannot be guaranteed, as specified in 3GPP TS 38.413 [54]; and
- does not receive a matching Alternative QoS Profile the NG-RAN can guarantee or the indication that the lowest priority Alternative QoS profile cannot be fulfilled, as specified in 3GPP TS 38.413 [54];

then the SMF may determine that Alternative QoS Profiles are not supported by the NG-RAN where the UE is currently located and include within the QosNotificationControlInfo data structure the "altQosNotSuppInd" attribute set to true. When Alternative QoS profiles are supported by the NG-RAN where the UE is currently located, the SMF may omit the "altQosNotSuppInd" attribute or set it to false.

When the PCF receives the HTTP POST request, it shall acknowledge the request by sending a "200 OK" response to the SMF and then notify the AF as defined in 3GPP TS 29.514 [17], clause 4.2.5.4.

4.2.4.21 Session Rule Error Report

If the "SessionRuleErrorHandling" feature is supported and if the installation of one or more session rules fails using the procedure as defined in clauses 4.2.2.1 or 4.2.4.1 or the PCF provisioned one or more session rules as defined in clause 4.2.3.1 but enforcement of the session Rule was unsuccessful (e.g. session-AMBR is rejected by the AMF in the roaming scenario, and the SMF determines that the PDU session is kept, the SMF shall include the "sessRuleReports" attribute for the affected session rules to report the failure within the SmPolicyUpdateContextData data structure. Within each SessionRuleReport instance, the SMF shall identify the failed session rule(s) by including the affected session rules within the "ruleIds" attribute, identify the failed reason code by including a "sessRuleFailureCode" attribute, and shall include rule status within the "ruleStatus" attribute with the value as described below.

If the installation of one or more new session rules fails, the SMF shall set the "ruleStatus" to INACTIVE.

The removal of a session rule shall not fail, even if the PDU session procedures with the UE fail. The SMF shall retain information on the removal and conduct the necessary PDU session procedures with the UE when it is possible.

If the modification of a currently provisioned session rule fails, the SMF shall retain the existing session rule as provisioned without any modification unless the reason for the failure has an impact also on the existing session rule. The SMF shall report the modification failure to the PCF.

If a session rule was successfully installed, but can no longer be enforced by the SMF:

- If the "ImmediateTermination" feature is supported, and based on operator's policy, the SMF shall evaluate whether the PDU session can be kept. If the SMF determines to terminate the PDU session immediately, the SMF shall trigger the deletion of the SM Policy Association as described in clauses 4.2.5, otherwise the SMF shall set the "ruleStatus" attribute to INACTIVE.
- If the the "ImmediateTermination" feature is not supported, the SMF shall set the "ruleStatus" attribute to INACTIVE.

NOTE: When the PCF receives "ruleStatus" set to INACTIVE, the PCF does not need to request the SMF to remove the inactive session rule.

Depending on the value of the "sessRuleFailureCode" attribute, the PCF may decide whether retaining the old session rule, re-installation, modification, removal of the session rule or any other action applies.

4.2.4.22 Request the termination of SM Policy association

If "RespBasedSessionRel" feature is supported, PCF may request the PDU session termination upon receiving a POST message from the SMF (e.g. when usage quota reached). In this case, the PCF shall include the "relCause" attribute within the SmPolicyDecision data structure of the response to the POST message.

After the receipt of a successful HTTP POST response from the PCF containing the "relCause" attribute within the SmPolicyDecision data structure, the SMF shall invoke the Npcf_SMPolicyControl_Delete Service Operation defined in clause 4.2.5 to terminate the policy association and initiate the procedure to terminate the PDU session as defined in 3GPP TS 29.502 [22].

4.2.4.23 Reporting of TSC user plane node management information and port management information

If the feature "TimeSensitiveNetworking" or "TimeSensitiveCommunication" is supported and the "TSN_BRIDGE_INFO" policy control request trigger is provisioned in the SMF, when new TSC user plane node information is available for TSC or Deterministic Networking PDU sessions, the SMF requests to update the SM Policy Association and provides to the PCF information on the conditions that have been met.

The Policy Control Request Trigger condition "TSN_BRIDGE_INFO" is met when:

- a. the SMF detects new TSC user plane node port (based on local configuration for the given DNN and S-NSSAI the SMF requests the UPF to provide Bridge or Router information and to allocate a port number). The SMF shall send to the PCF, if available:
 - the port number for the device side of the PDU session encoded in the "dsttPortNum" attribute allocated by the UPF;

- NOTE 1: The port number of the PDU session corresponds to the device side port of the 5GS bridge/router. When the device supports the DS-TT functionality, the port number represents the DS-TT port number corresponding to the given PDU Session.
- NOTE 2: Port number can refer either to Ethernet port or PTP port or a port of a DetNet router. In Ethernet type PDU Sessions, it is assumed that the PTP port number is the same as the associated Ethernet port number.
 - the TSC user plane node Id received from the UPF encoded in the "bridgeId" attribute;
 - when DS-TT functionality is used (i.e., the UE has indicated support of transferring Port Management Information Containers):
 - a. the MAC address of the DS-TT port received from the UE encoded in the "dsttAddr" attribute, if received: and
 - b. the UE-DS-TT residence time if received from the UE encoded in the "dsttResidTime" attribute,
 - in case of Deterministic Networking, for the device side port, and when the feature "MTU_Size" is supported, the MTU size (as specified in IETF RFC 8344 [56]) for IPv4 and/or IPv6 encoded in the "mtuIpv4" and/or "mtuIpv6" attributes respectively,

within the SmPolicyUpdateContextData structure encoded in the "tsnBridgeInfo" attribute of the TsnBridgeInfo data type; and/or

- b. the SMF receives a UMIC from the TSC user plane node functionality of the UPF/NW-TT and/or, when the DS-TT or the NW-TT functions are used, the SMF receives a PMIC from the DS-TT port and/or one or more PMIC(s) in the corresponding one or more NW-TT ports. The SMF shall transparently forward to the PCF the UMIC encoded within the "tsnBridgeManCont" attribute and/or the DS-TT PMIC encoded within the "tsnPortManContDstt" attribute and/or the one or more NW-TT PMIC(s) encoded within the "tsnPortManContNwtts" attribute within the SmPolicyUpdateContextData structure.
- NOTE 3: The 5GS Architecture to support IETF Deterministic Networking IETF RFC 8655 [55] does not require the DS-TT functionality to be supported in the device nor require the user plane NW-TT functionality to be supported in the UPF. For the reporting of information of network side ports, NW-TT control plane functionality is supported and PMIC(s) carry port management information of NW-TT port(s).

For IP type of PDU sessions, the UE IP address of the PDU session received within the "ipv4Address" or "ipv6AddressPrefix" attribute, as described in clause 4.2.2.2 and 4.2.4.2 (reported with trigger "UE_IP_CH") is used as identifier of the PDU session related to the reported TSC user plane node information.

For Ethernet type of PDU sessions (IEEE TSN and other time sensitive communications than TSN) the MAC address of the DS-TT port received within the "dsttAddr" attribute is used as identifier of the PDU session related to the reported TSC user plane node information.

4.2.4.24 Notification about Service Data Flow QoS Monitoring

When the SMF gets the information about real-time measurements of QoS monitoring parameters for one or more SDFs from the UPF and the "QOS_MONITORING" policy control request trigger was provisioned, then SMF shall inform the PCF for the impacted PCC rules

When the QoS monitoring applies for packet delay, the SMF shall inform the PCF when it gets information about any of the following items for one or more SDFs from the UPF:

- uplink packet delay(s);
- downlink packet delay(s); and/or
- round trip delay(s); or
- if the feature "PacketDelayFailureReport" is supported, indicator of packet delay measurement failure.

When the "EnQoSMon" feature is supported and the QoS monitoring applies for congestion information, the SMF shall inform the PCF when it gets information about any of the following items for one or more SDFs from the UPF:

- uplink congestion information; and/or

- downlink congestion information.

When the feature "EnQoSMon" is supported, and QoS monitoring applies for data rate measurements, the SMF shall inform about any of the following items for one or more SDFs from the UPF:

- uplink data rate; and/or
- downlink data rate.

The SMF shall send an HTTP POST request to the PCF with an SmPolicyUpdateContextData data structure, including the "QOS_MONITORING" within "repPolicyCtrlReqTriggers" attribute and the "qosMonReports" attribute, and/or if the feature "EnQoSMon" is supported, the "qosMonCongReps" and/or the "qosMonDatRateReps" attribute. In each QosMonitoringReport data structure, the PCF shall include:

- affected PCC rule identifiers within the "refPccRuleIds" attribute; and

if QoS monitoring report is for packet delay, the SMF shall also include within the "qosMonReports" attribute:

- the uplink packet delays within the "ulDelays" attribute; and/or
- the downlink packet delays within the "dlDelays" attribute; and/or
- the round trip packet delays within the "rtDelays" attribute; or
- if the feature "PacketDelayFailureReport" is supported, the packet delay measurement failure indicator within "pdmf" attribute;

NOTE: The UPF reports one UL, DL and/or round-trip packet delay measurement for each periodic and/or event-triggered report as described in 3GPP TS 29.244 [13]. I.e, the SMF can include only one element within the "ulDelays", "dlDelays", and/or "rtDelays" array(s), each one with the received report from the UPF for the UL, DL and/or round trip delay(s).

and/or, if the feature "EnQoSMon" is supported and QoS monitoring report is for data rate measurements, the SMF shall also include within the "qosMonDatRateReps" attribute:

- one data rate measurement for the UL within the "ulDataRate" attribute; and/or
- one data rate measurement for the DL within the "dlDataRate" attribute.

and/or, if the feature "EnQoSMon" is supported and QoS monitoring report is for congestion measurement, the SMF shall also include within the "qosMonCongReps" attribute:

- the uplink congestion information within the "ulCongInfo" attribute; and/or
- the downlink congestion information within the "dlCongInfo" attribute.

4.2.4.25 Access traffic steering, switching and splitting support

If "ATSSS" feature defined in clause 5.8 is supported and the PCF has previously provisioned the AC_TY_CH policy control request trigger, when the UE requests to:

- add an access to an already established MA PDU session (i.e. registers to another acess), the SMF shall, within
 the SmPolicyUpdateContextData data structure, include the "AC_TY_CH" within the
 "repPolicyCtrlReqTriggers" attribute and include the additional Access type and the additional RAT type if
 available within the "addAccessInfo" attribute.
- release an access from an already established MA PDU session (i.e. deregisters from one access but remains
 registered on the other access), the SMF shall, within the SmPolicyUpdateContextData data structure, include
 the "AC_TY_CH" within the "repPolicyCtrlReqTriggers" attribute and include the released access type and the
 released RAT type if available within the "relAccessInfo" attribute.

When the PCF receives the request from the SMF indicating the addition of Access Type or removal of Access Type, the PCF may provide PCC rules and/or session rules for the MA PDU session as defined in clause 4.2.6.2.17 and clause 4.2.6.3.4.

4.2.4.26 Policy decision error handling

4.2.4.26.1 Policy decision types and condition data error handling

If the "PolicyDecisionErrorHandling" feature is supported and the "ExtPolicyDecisionErrorHandling" feature is not supported, and one or more policy decision types (as defined in clause 4.1.4.4) and/or condition data (as defined in clause 4.1.8) which are not referred by any PCC rules or session rule is provisioned using the procedure as defined in clauses 4.2.2.1, 4.2.3.1 or 4.2.4.1 but the storage was unsuccessful (e.g. the policy decision could not be successfully stored due to a limitation of resources at the SMF), or because there are semantical inconsistencies in the provided data, the SMF shall include the "policyDecFailureReports" attribute to indicate the type(s) of the failed policy decisions and/or condition data within the SmPolicyUpdateContextData data structure. When the PCF receives the above report, the PCF shall consider all the instances of the policy decisions and/or condition data which are not referred by any PCC rule and/or session stored at the SMF and indicated by the PolicyDecisionFailureCode data type are removed from the SMF.

The removal of a policy decision type and/or condition data shall not fail.

4.2.4.26.2 Policy decision types, condition data and other policy decisions error handling

If the "ExtPolicyDecisionErrorHandling" feature is supported and one or more policy decision types (as defined in clause 4.1.4.4) and/or condition data (as defined in clause 4.1.8) which are not referred by any PCC rules or session rules is provisioned using the procedure as defined in clauses 4.2.2.1, 4.2.3.1 or 4.2.4.1, and/or other SM policy decisions (e.g. the SMF receives policy control request triggers and applicable additional information) but the SMF detects the received policy decision cannot be enforced (e.g. because semantical inconsistencies in the provided data), and the SMF determines that the PDU session can be kept, the SMF shall within the SmPolicyUpdateContextData data structure include the "policyDecFailureReports" attribute to indicate a failure in the provided policy decision types and/or condition data not referred by any PCC rules or session rules and/or in other SM policy decisions, and may include the "invalidPolicyDecs" attribute to indicate the failed policy decision types and/or condition data not referred by any PCC rules or session rules and/or other SM policy decisions.

When the PCF receives the above report, the PCF shall consider:

- all the instances of the policy decisions and/or condition data which are not referred by any PCC rule and/or session stored at the SMF and indicated by the PolicyDecisionFailureCode data type are removed from the SMF;
 and
- for the other policy decisions:
 - a. All the new failed policy decisions provisioned are not installed in the SMF.
 - b. All the modified policy decisions shall remain unmodified in the SMF.
 - c. All the removed policy decisions provided in the request message are deleted in the SMF.

NOTE: The removal of a policy decision does not fail. Even if there is an inconsistency e.g. between the deletion of a policy control request trigger and the deletion of the applicable additional information, the whole related policy decision is removed.

4.2.4.27 Policy Control for DDN Events

If the feature "DDNEventPolicyControl" or "DDNEventPolicyControl2" is supported, and if the PCF has previously provisioned "DDN_FAILURE" policy control request trigger, the SMF shall send the PCC rule request when it receives an event subscription for DDN Failure event including the traffic descriptors. The SMF shall send an HTTP POST request to the PCF with an SmPolicyUpdateContextData data structure, including the "DDN_FAILURE" within "repPolicyCtrlReqTriggers" attribute and include one or more traffic descriptor(s) in the "trafficDescriptors" attribute within the SmPolicyUpdateContextData structure for policy evaluation. Upon reception of the HTTP POST message:

- if the PCF determines that there is an existing PCC rule for the traffic detection of DDD Status event which has the same traffic descriptor(s) as the new request one, the PCF shall update the existing PCC rule for traffic detection of DDD Status event by including both the "DDN_FAILURE" and "DDD_STATUS" values within the "notifCtrlInds" attribute of the "ddNotifCtrl" attribute if the "DDNEventPolicyControl" feature is supported or of the "ddNotifCtrl2" attribute if the "DDNEventPolicyControl2" feature is supported to indicate both the DDN Failure and DDD Status event detection;

- if the PCF determines that there is an existing PCC rule for the policy and charging control which has the same traffic descriptor(s) as the new request one, the PCF shall update the existing PCC rule by including the downlink data notification control information within the "ddNotifCtrl" attribute if the "DDNEventPolicyControl" feature is supported or within the "ddNotifCtrl2" attribute if the "DDNEventPolicyControl2" feature is supported to indicate the DDN Failure event detection. Within the DownlinkDataNotificationControl or DownlinkDataNotificationControlRm data type, the PCF shall include the "DDN_FAILURE" value within the "notifCtrlInds" attribute;
- otherwise the PCF shall make a new PCC rule by including the reported traffic descriptors within the "flowInfos" attribute, setting a lower value to the "precedence" attribute and including the downlink data notification control information within the "ddNotifCtrl" attribute if the "DDNEventPolicyControl" feature is supported or within the "ddNotifCtrl2" attribute if the "DDNEventPolicyControl2" feature is supported and setting the other PCC rule information to the same values as in an existing PCC rule that previously matched the traffic. Within the DownlinkDataNotificationControl or DownlinkDataNotificationControlRm data type, the PCF shall include the "DDN_FAILURE" value within the "notifCtrlInds" attribute to indicate the DDN Failure event detection. When the new PCC rule has to be bound to the default QoS flow, the PCF shall include the "defQosFlowIndication" attribute set to true within the QosData data structure to which the PCC rule refers. From now on, the PCF needs to keep new PCC rule for event detection fully synchronized with the existing PCC rule that previously matched the traffic for all other policy and charging control settings to ensure the same user experience and traffic treatment according to the operator policy.

If the feature "DDNEventPolicyControl" or the "DDNEventPolicyControl2" is supported, and if the PCF has previously provisioned "DDN_DELIVERY_STATUS" policy control request trigger, the SMF shall send the PCC rule request when it receives an event subscription for DDD Status event including the traffic descriptors. The SMF shall send an HTTP POST request to the PCF with an SmPolicyUpdateContextData data structure, including the "DDN_DELIVERY_STATUS" within "repPolicyCtrlReqTriggers" attribute, include one or more traffic descriptor(s) in the "trafficDescriptors" attribute and the type(s) of notification in the "typesOfNotif" attribute within the SmPolicyUpdateContextData structure for policy evaluation. Upon reception of the HTTP POST message:

- if the PCF determines that there is an existing PCC rule for traffic detection of DDN Failure event which has the same traffic descriptor(s) as the new request one, the PCF shall update the existing PCC rule for traffic detection of DDN Failure event by including both the "DDN_FAILURE" and "DDD_STATUS" values within the "notifCtrlInds" attribute and the type(s) of notifications within the "typesOfNotif" attribute of the "ddNotifCtrl" attribute if the "DDNEventPolicyControl" feature is supported or of the "ddNotifCtrl2" attribute if the "DDNEventPolicyControl2" feature is supported to indicate both the DDN Failure and DDD Status event detection;
- if the PCF determines that there is an existing PCC rule for the policy and charging control which has the same traffic descriptor(s) as the new request one, the PCF shall update the existing PCC rule by including the downlink data notification control information within the "ddNotifCtrl" attribute if the "DDNEventPolicyControl" feature is supported or within the "ddNotifCtrl2" attribute if the "DDNEventPolicyControl2" feature is supported to indicate the DDD Status event detection. Within the DownlinkDataNotificationControl or DownlinkDataNotificationControlRm data type, the PCF shall include the "DDD_STATUS" value within the "notifCtrlInds" attribute and the type(s) of notifications within the "typesOfNotif" attribute; otherwise the PCF shall make a PCC rule by including the reported traffic descriptors within the "flowInfos" attribute, setting a lower value to the "precedence" attribute and including the downlink data notification control information within the "ddNotifCtrl" attribute if the "DDNEventPolicyControl" feature is supported or within the "ddNotifCtrl2" attribute if the "DDNEventPolicyControl2" feature is supported to indicate the DDD Status event detection and setting the other PCC rule information to the same values as in an existing PCC rule that previously matched the traffic. Within the DownlinkDataNotificationControl or DownlinkDataNotificationControlRm data type, the PCF shall include the "DDD_STATUS" value within the "notifCtrlInds" attribute and the type(s) of notifications within the "typesOfNotif" attribute to indicate that DDN Status event detection is required. When the new PCC rule has to be bound to the default QoS flow, the PCF shall include the "defOosFlowIndication" attribute set to true within the OosData data structure to which the PCC rule refers. From now on, the PCF needs to keep new PCC rule for event detection fully synchronized with the existing PCC rule that previously matched the traffic for all other policy and charging control settings to ensure the same user experience and traffic treatment according to the operator policy.

If the feature "DDNEventPolicyControl2" is supported, when the SMF receives a request to cancel a subscription of the DDN Failure or DDD status event and if the PCF has previously provisioned "DDN_FAILURE_CANCELLATION" and "DDN_DELIVERY_STATUS_CANCELLATION policy control request trigger, the SMF shall send an HTTP POST request to the PCF with an SmPolicyUpdateContextData data structure, including the "DDN FAILURE CANCELLATION" or "DDN DELIVERY STATUS CANCELLATION" within

"repPolicyCtrlReqTriggers" attribute respectively and include the rule identifier of the PCC rule which is used for traffic detection of event within the "pccRuleId" attribute. Upon reception of the HTTP POST message:

- If the PCC rule corresponding to the received PCC rule identifier is only used for the traffic detection of DDN failure or DDD Status respectively, the PCF shall remove the PCC rule locally and request the SMF to remove it too.
- If the PCC rule corresponding to the received PCC identifier is used for the traffic detection of both DDN failure and DDD status events, the PCF shall update the PCC rule by removing the downlink data notification control information for DDN failure or DDD status respectively from the PCC rule. In order to do that, within the DownlinkDataNotificationControlRm data type of the "ddNotifCtrl2" attribute, the PCF shall omit the "DDN_FAILURE" or "DDD_STATUS" within the "notifCtrlInds" attribute respectively. If the data notification control information for the DDD status is omitted, the PCF shall aslo include the "typesOfNotif" attribute set to NULL.
- If the PCC rule corresponding to the receied PCC rule identifier is also used for the policy and charging control to the service data flow besides the traffic detection of the DDN failure or DDD status event, the PCF shall update the PCC rule by removing the downlink data notification control information from the PCC rule. In order to do that, the PCF shall include the "ddNotifCtrl2" attribute set to NULL.

NOTE: The "ddNotifCtrl" attribute is used to contain the downlink data notification control information if the "DDNEventPolicyControl" feature is supported; while the "ddNotifCtrl2" attribute is used to contain the downlink data notification control information if the "DDNEventPolicyControl2" feature is supported.

When the SMF receives the new or updated PCC rule within the response message from the PCF, SMF shall perform the DDD Status and/or DDN Failure event based on the downlink data notification control information within the PCC rue as follows:

- If the downlink data notification control information indicates that the detection of DDD Status event and buffered notification type is required, the SMF shall derive a PDR and a related FAR as defined in clause 5.28 of 3GPP TS 29.244 [13] to request the UPF to report an event of the first buffered downlink data packet identified by the PDR. When the SMF receives the corresponding report, the SMF shall send the notification to the NEF as defined in clause 4.2.2.2 of 3GPP TS 29.508 [12].
- If the downlink data notification control information indicates that the detection of DDD Status event and transmitted notification type is required, the SMF shall detect event and send the notification as defined in clause 4.2.2.2 of 3GPP TS 29.508 [12].
- If the downlink data notification control information indicates that the detection of DDN Failure event and/or DDD Status event and discarded notification type is required, the SMF shall derive a PDR and a related FAR as defined in clause 5.28 of 3GPP TS 29.244 [13] to request the UPF to report an event of the first discarded downlink data packet identified by the PDR. When the SMF receives the corresponding report, the SMF shall send the notification to the AMF as defined in clause 5.2.2.5.1 of 3GPP TS 29.502 [22] and/or send the notification to the NEF as defined in clause 4.2.2.2 of 3GPP TS 29.508 [12] respectively.

4.2.4.28 Network slice related data rate policy control

When an Npcf_SMPolicyControl_Update request that requires a change of the authorized Session-AMBR and/or MBR update(s) for PCC Rule(s) corresponding to GBR service data flow(s) is received, the PCF may check if the S-NSSAI to which the received request relates is subject to network slice data rate policy control. If it is the case, the PCF shall apply network slice data rate control as described in clause 4.2.6.8.

4.2.4.29 Group related data rate policy control

When a Npcf_SMPolicyControl_Update request that requires a change of the authorized Session-AMBR and/or MBR update(s) for PCC Rule(s) corresponding to GBR service data flow(s) is received, the PCF may apply group data rate policy control as defined in clause 4.2.6.9.

4.2.4.30 Notification on network provided BAT Offset policy control trigger

When the BAT_OFFSET_INFO policy control request trigger is set, upon receiving the BAT offset and optionally an adjusted periodicity from the NG-RAN, the SMF shall send an HTTP POST request to the PCF with an SmPolicyUpdateContextData data structure, including:

- a. the "BAT_OFFSET_INFO" within the "repPolicyCtrlReqTriggers" attribute; and
- b. the BAT offset within the "batOffsetInfo" attribute, that shall contain:
 - i. the affected PCC rules within the "refPccRuleIds" attribute;
 - ii. "ranBatOffsetNotif" attribute; and
 - iii. optionally the adjusted periodicity within the "adjPeriod" attribute.

The SMF shall adjust the BAT offset value of "ranBatOffsetNotif" attribute received from NG-RAN based on the clock drifting report from UPF. Otherwise, the SMF shall notify the BAT offset value of "ranBatOffsetNotif" attribute to PCF without any adjustment.

When the BAT_OFFSET_INFO policy control request trigger is set and the QoS Notification Control is also enabled for the corresponding PCC rule, upon receiving the BAT offset along with the "GFBR can no longer be guaranteed" notification from the NG-RAN feedback, the SMF shall, in addition to the provisions of clause 4.2.4.20, include the "BAT_OFFSET_INFO" within the "repPolicyCtrlReqTriggers" attribute and the BAT offset within the "batOffsetInfo" attribute of the SmPolicyUpdateContextData data structure.

4.2.4.31 Network slice usage control

When the PCF receives a Npcf_SMPolicyControl_Update request and the "NetSliceUsageCtrl" feature is supported, the PCF may check whether the S-NSSAI f the targeted SM Policy Association is subject to network slice usage control. If it is the case, the PCF may provision/update/remove via the Npcf_SMPolicyControl_Update response the network slice usage control information (e.g., the slice PDU session inactivity timer value) within the "sliceUsgCtrlInfo" attribute of the SmPolicyDecision data structure.

NOTE: In this release of the specification, network slice usage control information provisioning/update/removal by the PCF is not supported in roaming scenarios.

4.2.4.32 VPLMN Specific Offloading Policy

For HR-SBO scenarios and if the "HR-SBO" feature is supported, if the H-PCF receives an Npcf_SMPolicyControl_Update Request including the "HR_SBO_IND_CHG" event trigger indicating a change in the HR-SBO support to value "true" or HR-SBO is supported and the "PLMN_CH" event trigger indicating a change of the VPLMN is received, the H-PCF shall analyze if there is a new or updated Specific Offloading Policy for the serving PLMN. If it is the case, the H-PCF may provision/update/remove the Specific Offloading Policy. If the HR-SBO support is changed to value "false", the H-PCF shall remove the existing Specific Offloading Policy, if any.

Additionally, if the "HR_SBO_IND_CHG" event trigger is received indicating HR-SBO support, the H-PCF shall subscribe to "PLMN_CH" event trigger if not previously done.

NOTE: VPLMN Specific Offloading Policy can be provisioned in HPLMN per each VPLMN based on the service level agreement between HPLMN and VPLMN.

4.2.5 Npcf_SMPolicyControl_Delete Service Operation

4.2.5.1 General

The delete service operation provides means for the NF service consumer to delete the policy context associated with a PDU Session.

The following procedures using the Npcf SMPolicyControl Delete service operation are supported:

- Deletion of the policy context associated with a PDU session.
- Report Accumulated Usage.
- Report Access Network Information.
- Network slice related data rate policy control.

- Group related data rate policy control.

4.2.5.2 SM Policy Association termination

Figure 4.2.5.2-1: SM Policy Association termination

When an individual resource of the SM Policy Association collection shall be deleted, the NF service consumer shall invoke the Npcf_SMPolicyControl_Delete service operation towards the PCF using an HTTP POST request, as shown in figure 4.2.5.2-1, step 1.

The NF service consumer shall set the request URI to "{apiRoot}/npcf-smpolicycontrol/v1/sm-policies/{smPolicyId}/delete". The {smPolicyId} in the URI identifies the "Individual SM Policy" to be deleted.

The HTTP POST request sent by the NF service consumer (e.g. SMF) shall contain (if available) the SM Policy Association related information within the SmPolicyDeleteData data structure in the request body:

- accumulated usage within the "accuUsageReports" attribute as defined in clause 4.2.5.3;
- the user location(s) information within the "userLocationInfo" attribute, the information on when the UE was last known to be in that location within the "userLocationInfoTime" attribute, the PLMN Identifier or the SNPN Identifier (the PLMN Identifier and the NID) within the "servingNetwork" attribute, the timezone information within the "ueTimeZone" attribute and the RAN and/or NAS release cause(s) within the "ranNasRelCauses" attribute as defined in clause 4.2.5.4;
- NOTE 1: The SMF derives the value of the "userLocationInfoTime" attribute from the age of location information received from the AMF at PDU session termination as described in 3GPP TS 29.502[22]. Whether the "userLocationInfo" attribute also encodes the age of location is implementation specific.
- NOTE 2: The SMF encodes both 3GPP and non-3GPP access UE location in the "userLocationInfo" attribute when they are both received from the AMF.
- the "PS_TO_CS_HO" value within the "pduSessRelCause" attribute, if the PDU session is released due to PS to CS handover and the "PDUSessionRelCause" feature defined in clause 5.8 is supported;
- the "RULE_ERROR" value within the "pduSessRelCause" attribute, if the PDU session is released due to a failed enforcement of the applied session rule as described in clause 4.2.4.21 and the "ImmediateTermination" feature defined in clause 5.8 is supported.

When the PCF receives the HTTP POST request from the NF service consumer and if the PCF successfully processed and accepted the received HTTP POST request from the NF service consumer, the PCF shall acknowledges the request by sending an HTTP response message with the corresponding status code. The PCF acknowledges the delete request by sending a "204 No Content" response to the NF service consumer, as shown in figure 4.2.5.2-1, step 2. Further, the PCF shall remove the individual resource linked to the delete request.

If errors occur when processing the HTTP POST request, the PCF shall send an HTTP error response as specified in clause 5.7.

If the feature "ES3XX" is supported, and the PCF determines the received HTTP POST request needs to be redirected, the PCF shall send an HTTP redirect response as specified in clause 6.10.9 of 3GPP TS 29.500 [4].

4.2.5.3 Report Accumulated Usage

If the UMC feature is supported, at PDU session termination, the SMF shall send the accumulated usage information for all the monitoring keys for which usage monitoring was previously enabled. When the SMF receives the accumulated usage report from the UPF as defined in clause 7.5.7.2 of 3GPP TS 29.244 [13], the SMF shall include one or more received accumulated usage reports in the "accuUsageReports" attribute of the SmPolicyDeleteData data structure.

If all PDU sessions related to the same DNN and S-NSSAI combination for a user are terminated, the PCF shall store the remaining allowed usage, i.e. the information about the remaining overall amount of resources, in the UDR as defined in 3GPP TS 29.519 [15].

4.2.5.4 Report Access Network Information

If the RAN-NAS-Cause feature is supported or the NetLoc feature is supported, within the SmPolicyDeleteData data structure, the SMF shall provide the available access network information within the "userLocationInfo" attribute (if available), the information on when the UE was last known to be in that location within the "userLocationInfoTime" attribute (if available), the "ueTimezone" attribute (if available). Additionally, for the NetLoc feature, if the user location information is not available, the SMF shall include the PLMN Identifier or the SNPN Identifier (the PLMN Identifier and the NID) within the "servingNetwork" attribute; for RAN-NAS-Cause feature, if the SMF received from the access network the RAN cause and/or the NAS cause due to PDU session termination, the SMF shall provide the received cause(s) in the "ranNasRelCauses" attribute.

- NOTE 1: The SMF derives the value of the "userLocationInfoTime" attribute from the age of location information received in the Location-Report (defined in clause 5.3.1 of 3GPP TS 29.518 [36]) from the AMF. Whether the "userLocationInfo" attribute also encodes the age of location is implementation specific.
- NOTE 2: The SMF encodes both 3GPP and non-3GPP access UE location in the "userLocationInfo" attribute when they are both received from the AMF.

4.2.5.5 Void

4.2.5.6 Network slice related data rate policy control

When an Npcf_SMPolicyControl_Delete request is received, the PCF may check if the S-NSSAI to which the received request relates is subject to network slice data rate policy control. If it is the case, the PCF shall apply network slice data rate control as described in clause 4.2.6.8.

4.2.5.7 Group related data rate policy control

When a Npcf_SMPolicyControl_Delete request is received, the PCF may apply group data rate policy control as defined in clause 4.2.6.9.

4.2.6 Provisioning and Enforcement of Policy Decisions

4.2.6.1 General

Policy Decisions are provided from the PCF to the NF service consumer (SMF) as part of the following service operations:

- the Npcf_SMPolicyControl_Create Service Operation described in clause 4.2.2;
- the SM Policy Association Notification request as part of the Npcf_SMPolicyControl_UpdateNotify Service Operation as described in clause 4.2.3.2; and
- the Npcf_SMPolicyControl_Update service operation as described in clause 4.2.4

Policy decisions shall be encoded within the SmPolicyDecision data structure defined in clause 5.6.2.4

Policy decisions may include:

- Session Rule(s), as described in clause 4.1.4.3, encoded within the "sessRules" attribute;

- PCC Rule(s), as described in clause 4.1.4.2, encoded within the "pccRules" attribute;
- QoS decision(s), as described in clause 4.1.4.4.3, which can be referenced from PCC rule(s), encoded within the "qosDecs" attribute;
- Charging decision(s), as described in clause 4.1.4.4.4, which can be referenced from PCC rule(s), encoded within the "chgDecs" attribute;
- Traffic control decision(s), as described in clause 4.1.4.4.2, which can be referenced from PCC rule(s), encoded within the "traffContDecs" attribute;
- Usage monitoring control decision(s), as described in clause 4.1.4.4.5, which can be referenced from PCC rule(s) and session rule(s), encoded within the "umDecs" attribute;
- QoS monitoring decision, as described in clause 4.1.4.4.6, which can be referenced from PCC rule(s), encoded within the "gosMonDecs" attribute;
- Condition(s) that can be referenced from PCC rule(s) and session rule(s), encoded within the "conds" attribute;
- QoS characteristics for non-standard 5QIs and non-preconfigured 5QIs provided within the "qosChars" attribute;
- A reflective QoS timer;
- Policy control request triggers and applicable additional information, e.g. Revalidation Time, PRA information;
- Last requested rule data;
- Last requested usage data;
- Default charging method of the PDU session;
- "PDU Session with offline charging only" indication;
- Charging information;
- P-CSCF Restoration Indication;
- IP index information;
- Presence Reporting Area information;
- TSC user plane node management information;
- port management information for the DS-TT port;
- port management information for the NW-TT port;
- The request of the PDU session termination;
- Usage of QoS flow;
- Redundant PDU session indication;
- VPLMN Specific Offloading Policy;
- the network slice usage control information (e.g., the slice PDU session inactivity timer value), if the "NetSliceUsageCtrl" feature is supported; and

NOTE: In this release of the specification, network slice usage control information provisioning/update/removal by the PCF is not supported in roaming scenarios.

- Policy provisioning for eXtended Reality (XR) and Interactive Media Services.

For the Npcf_SMPolicyControl_Create Service Operation, the SmPolicyDecision data structure shall contain a full description of all policy decision(s) provided by the PCF for the policy association.

For the Npcf_SMPolicyControl_UpdateNotify service operation for the SM Policy Association Notification request and for the Npcf_SMPolicyControl_Update service operation, the SmPolicyDecision data structure shall contain a

description of the changes to the policy decision(s) with respect to the last provided policy decision(s) for the corresponding policy association. The redundant PDU session indication, the default charging method of the PDU session, the "PDU Session with offline charging only" indication, the charging information, the Reflective QoS Timer and the IP index information shall not be updated by the PCF.

If no other rule is defined for specific data types within the SmPolicyDecision data structure, the encoding of changes of the policy decision(s) in the SmPolicyDecision data structure shall follow the following principles:

- 1) To modify an attribute with a value of type map (e.g. the "sessRules" attribute, the "pccRules" attribute, the "qosDecs" attribute, the "traffContDecs" attribute, the "umDecs" attribute, the "conds" attribute, etc.), this attribute shall be provided with a value containing a map with entries according to the following principles:
 - A new entry of the map shall be added by supplying a new identifier (e.g. rule / decision identifier) as the key and the corresponding structured data type instance (e.g. PCC rule) with the complete content as the value.
 - An existing entry of the map shall be modified by supplying the existing identifier as the key and the corresponding structured data type instance as the value, with the same existing identifier (e.g. set the "qosId" to the same existing QoS data decision identifier), which shall describe the modifications following bullets 1 to 6.
 - An existing entry of the map shall be deleted by supplying the existing identifier as the key and "NULL" as the value.
 - For an unmodified entry of the map, no entry needs to be provided within the map.
- 2) To modify an attribute with a structured data type instance as the value, the attribute shall be provided with a value containing a structured data type instance with entries according to bullets 1 to 6.
- 3) To modify an attribute with another type than map or structured data type as the value, the attribute shall be provided with a complete representation of its value, which shall replace the previous value.
- 4) To create an attribute of any type, the attribute shall be provided with a complete representation of its value.
- 5) To delete an attribute of any type, the attribute shall be provided with "NULL" as the value.
- NOTE 1: Attributes that are allowed to be deleted need to be marked as "nullable" within the OpenAPI file in Annex A.
- 6) Attributes that are not added, modified or deleted do not need to be provided.
- NOTE 2: In the related data structures, no attribute can be marked as mandatory except the attribute containing the identifier (e.g. rule / decision identifier).

The PCF shall not remove a provisioned policy decision data or condition data from the SMF when the associated reference(s) from the PCC rule(s) or session rule(s) are still valid except the usage montoring data referred by the predefined PCC rule(s) (see clause 4.2.6.5.3.2 for further information). If the PCF determines that the policy decision or condition data shall be used for future PCC or session rule(s), the PCF may keep a policy decision data or condition data valid when the PCF removes all the PCC rule or session rule(s) referring to that policy decision data or condition data; otherwise the PCF shall remove the provisioned policy decision data or condition data when the PCF removes all the PCC or session rule(s) referring to the policy decision data or condition data.

When the NF service consumer (SMF) accepts the notification of policy updates, and/or when after receiving the response to the request of policies the SM Policy association is retained in the NF service consumer (SMF), if the installation/activation of one or more new PCC rule(s) or the installation of one or more session rule(s) (i.e. rules which were not previously successfully installed) fails, although the failed PCC rule(s) or session rule(s) are removed, the policy decision and/or condition data which are referred by the failed PCC rule(s) or session rule(s) may remain applicable in the SMF until the PCF removes them. If the PCF determines that the policy decision or condition data that remain applicable shall be used for future PCC or session rule(s) (e.g. because the PCF reattempts to install the failed PCC rule) the PCF may keep these policy decision data or condition data valid; otherwise the PCF shall immediately remove these policy data or condition data from the SMF.

- NOTE 3: Due to internal policies, the SMF could decide to remove the policy decision and/or condition data not referred by any PCC and/or session rule(s) before the PCF decides to remove them. When the PCF decides to remove the policy decision and/or condition data that were silently removed by the SMF, the SMF accepts the removal indication, as specified in clauses 4.2.3.26 and 4.2.4.26. When the PCF decides to reuse the policy decision and/or condition data that were silently removed by the SMF, the SMF reports PCC and/or session rule error as specified in clauses 4.2.3.16, 4.2.4.15, 4.2.3.20 and 4.2.4.21.
- NOTE 4: When the PCF notification of policy updates is rejected as specified in clauses 4.2.3.16 and 4.2.3.20 with a HTTP "400 Bad Request" status code, the whole update is rejected, including the provided policy decision and/or condition data. When the SMF reports PCC and/or session rule(s) error as specified in clauses 4.2.4.15 and 4.2.4.21 for all the provisioned PCC rule and/or session rule(s), the valid policy decision and/or condition data provided in the corresponding update response can remain valid in the SMF until the PCF removes them.

The error handling for the policy decision and/or condition data which are not referred by any PCC rule and/or session rule stored at the SMF is defined in clause 4.2.3.26 and 4.2.4.26.

4.2.6.2 PCC Rules

4.2.6.2.1 Overview

The PCF may perform an operation on a single PCC rule or a group of PCC rules. The impacted PCC rule(s) shall be included in the "pccRules" map attribute within the SmPolicyDecision data structure with the associated "pccRuleId" as the key of the map. For activating a pre-defined PCC rule or installing or modifying a dynamic PCF-provisioned PCC rule, the corresponding PccRule data structure shall be provided as the map entry value. For deactivating or removing a PCC rule, the map entry value shall be set to "NULL".

NOTE 1: When deactivating a predefined PCC rule that is activated in more than one QoS flow, this predefined PCC rule is deactivated simultaneously in all the QoS flows where it was previously activated.

In order to activate a pre-defined PCC rule, the PCF shall include within the PccRule data structure the pre-defined PCC rule identifier within the "pccRuleId" attribute and the "refCondData" attribute, if applicable, i.e. the PccRule data structure is empty, except for the "pccRuleId" attribute and the "refCondData" attribute, if applicable. If the "refCondData" attribute is applicable, a "conds" attribute containing the corresponding ConditionData data structure referred by this PCC rule shall be included in the SmPolicyDecision data structure, if it has not been previously provided.

In order to install a new dynamic PCF-provisioned PCC rule, the PCF shall further set other attributes within the PccRule data structure as follows:

- It may include the precedence of a PCC rule among the other PCC rules of the PDU session, within the "precedence" attribute. Within a PDU session, the PCF shall authorize different precedence values for the PCC rules whose packet filters contained within the "flowDescription" attribute or the "ethFlowDescription" attribute include the "packetFilterUsage" attribute set to "true".
- NOTE 2: The SMF sets the precedence value of a QoS rule to the precedence value of the PCC rule for which the QoS rule is generated. The UE considers as an error when two or more QoS rules associated with a PDU session have identical precedence values.
- It shall include either the flow information within the "flowInfos" attribute or the application identifier within the "appId" attribute.
- It shall include one reference to the QosData data structure within the "refQosData" attribute. In this case, a "qosDecs" attribute containing the corresponding QoS data policy decision shall be included in the SmPolicyDecision data structure, if it has not been previously provided.
- It may include one or more reference(s) to the QosData structure within the "refAltQosParams" attribute to refer to the Alternative QoS parameter set(s) of the service data flow. In this case, a "qosDecs" attribute containing the corresponding alternative QoS data policy decision(s) shall be included in the SmPolicyDecision data structure, if it has not been previously provided,

- It shall include one reference to the TrafficControlData data structure within the "refTcData" attribute. In this case, a "traffContDecs" attribute containing the corresponding Traffic Control data policy decision shall be included in the SmPolicyDecision data structure, if it has not been previously provided.
- It may include one reference to the ChargingData data structure within the "refChgData" attribute. In this case, a "chgDecs" attribute containing the corresponding Charging Data policy decision shall be included in the SmPolicyDecision data structure, if it has not been previously provided.
- It may include one reference to the UsageMonitoringData data structure within the "refUmData" attribute. In this case, a "umDecs" attribute containing the corresponding Usage Monitoring data policy decision shall be included in the SmPolicyDecision data structure, if it has not been previously provided.
- It may include one, and when the "EnQoSMon" feature is supported, one or more reference(s) (up to three) to the QosMonitoringData data structure(s) within the "refQosMon" attribute. In this case, a "qosMonDecs" attribute containing the corresponding QoS Monitoring data policy decision(s) shall be included in the SmPolicyDecision data structure, if they have not been previously provided.
- It may include one reference to the ConditionData data type within the "refCondData" attribute. In this case, a "conds" attribute containing the corresponding Condition Data shall be included in the SmPolicyDecision data structure, if it has not been previously provided.
- If the "PowerSaving" feature is supported, it may include the traffic parameter data within the "traffParaData" attribute.

In order to modify an existing dynamic PCF-provisioned PCC rule, the PCF shall further set other attributes within the PccRule data structure as follows:

- If the PCF needs to modify attribute(s) within a PCC rule, the PCF shall include the modified attribute(s) with their new value(s) within the associated PccRule data instance in the SmPolicyDecision data structure. Previously supplied attribute(s) not supplied in the modified PCC rule instance shall remain valid.
- If the PCF only needs to modify the content of the referenced policy decision data (e.g. QosData, ChargingData, etc.) and/or condition data for one or more PCC rule(s), the PCF shall include, within the SmPolicyDecision data structure, the corresponding policy decision data and/or condition data within the corresponding map attribute(s) (e.g. include the QoS data decision(s) within the "qosDecs" attribute).
- In order to modify the content of the referenced condition data for one or more existing pre-defined PCC rule(s), the PCF shall include, within the SmPolicyDecision data structure, the corresponding condition data within the "conds" attribute.
- NOTE 3: To update a policy decision data and/or condition data instance, the PCF can provide only the modified attribute(s) with their new value(s) or could provide both, the modified attribute(s) with their new value(s) and the unmodified attributes. When only the modified attribute(s) are provided, the previously supplied attribute(s) not supplied in the modified policy decision data and/or condition data instance remain valid.
- PCF may also perform a full replacement of a policy decision data and/or condition data instance by including
 the new reference to the policy decision data and/or condition data instance within the associated PCC rule and
 the corresponding policy decision and/or condition data in the SmPolicyDecision data structure, if it has not been
 previously provided.

The PCF may combine multiple of the above PCC rule operations in a single message.

The SMF shall ensure that at least one PCC Rule bound to the default QoS flow is activated for the PDU Session. If the PCF does not provision any PCC rule, the SMF shall activate at least one pre-defined PCC rule which is not known by the PCF and bind it to the default QoS flow.

If the authorized default QoS is GBR type or delay critical GBR type as defined in clause 4.2.6.3.3, to ensure that one and only one of the authorized PCC rules is bound to the default QoS flow the PCF shall indicate that one and only one PCC rule is bound to the default QoS flow as defined in clause 4.2.6.2.10. The SMF shall not bind any other PCC rule to the default QoS flow with a GBR or delay critical GBR 5QI.

The SMF shall ensure that the packet fitlers signalled to UE reflects the QoS Flow binding of PCC rules, except for those extending the inspection beyond what can be signalled to the UE. The SMF shall explicitly signal the packet filters to the UE if the corresponding "packetFilterUsage" attribute is provided and set to true. If the

"packetFilterUsage" attribute is absent or set to false, it is an SMF decision whether to signal the packe filters that is redundant from a traffic mapping point of view.

The default QoS rules shall contain either a Packet Filter Set that allows all UL packets or a Packet Filter Set that is generated from the UL packet filters (and from the DL packet filters if they are available) with the "packetFilterUsage" attribute set to true.

- NOTE 4: If multiple PCC rules with the "packetFilterUsage" attribute set to true are bound to the QoS Flow associated with the default QoS rule, it is up to SMF implementation which one will be chosen to generate the default QoS rule. If the PCC rule that is chosen to generate the default QoS rule is removed/deactivated, another PCC rule bound to the QoS Flow associated with the default QoS rule will be used instead and the default QoS rule would be updated accordingly.
- NOTE 5: For IP type PDU Session or Ethernet type PDU Session, the default QoS rule is the only QoS rule of a PDU Session which may contain a Packet Filter Set that allows all UL packets, and in this case, the highest precedence value can be used for the QoS rule.

4.2.6.2.2 Gate Function

The Gate Function is a user plane function that permits to control, i.e. enabling or disabling, the forwarding of data packets belonging to a service data flow. A gate is provisioned by the PCF within a PCC rule, enforced by the SMF and ultimately applied by the UPF.

If a PCC rule contains the "flowInfos" attribute applicable for uplink service data flow(s), it shall describe a gate for the corresponding uplink service data flow(s). If a PCC rule contains the "flowInfos" attribute(s) applicable for downlink service data flow(s), it shall describe a gate for the corresponding downlink service data flow(s). If the PCC rule contains an "appId" attribute, it shall describe a gate for the corresponding detected application traffic. In order to do so, the "flowStatus" attribute within the TrafficControlData data structure to which the PCC rule refers shall describe if uplink and/or downlink gate(s) is/are open or closed.

The commands to open or close a gate shall lead to enabling or disabling the passage of the corresponding data packets. If a gate is closed, all data packets of the related service data flow(s) are dropped by the UPF. If a gate is open, the data packets of the related service data flow(s) are allowed to be forwarded by the UPF.

4.2.6.2.3 Policy enforcement for authorized QoS per PCC Rule

The PCF may provide the authorized QoS for a PCC rule to the SMF. The Provisioning of the authorized QoS per PCC Rule shall be performed using the PCC rule provisioning procedure defined in clause 4.2.6.2.1. For a PCF-provided PCC rule, the authorized QoS shall be encoded using the QosData data structure. The PCF shall include for this purpose a reference to this QosData data structure within the "refQosData" attribute of the PCC rule and a "qosDecs" attribute containing this QoS data decision within the SmPolicyDecision data structure.

If the authorized QoS is provided for a PCC rule, the SMF shall derive the associated QoS profile towards the access network, if applicable, the associated QoS rule towards the UE, if applicable, and the associated QoS information with the PDR(s) towards the UPF.

4.2.6.2.4 Redirect Function

When the ADC feature is supported, the PCF may provide the redirect instructions for one or several dynamic PCC rule(s) to the SMF. This Provisioning shall be performed using the policy provisioning procedure defined in clause 4.2.6.1.

The "traffContDecs" attribute within the SmPolicyDecision is used to provide traffic control decision(s). The redirect instructions shall be encoded using the "redirectInfo" attribute within the corresponding TrafficControlData data structure, and used to provide a RedirectInformation data structure with the following components:

- The "redirectEnabled" attribute to indicate whether redirect is enabled or not. It shall be included and set to true when the redirect instruction is initially provisioned and may be included in subsequent updates of the RedirectInformation to enable or disable the redirect instruction.
- The redirect address may be provided using the "redirectAddressType" and "redirectServerAddress" attributes or it may be preconfigured in the SMF/UPF. A redirect destination provided within the "redirectServerAddress" attribute for a dynamic PCC Rule shall override the redirect destination preconfigured in the SMF/UPF.

NOTE 1: The SMF/UPF uses the preconfigured redirection address only if it can be applied to the application traffic being detected, e.g. the redirection destination address could be preconfigured on a per application identifier basis.

If redirect action(s) need to be applied to a dynamic PCC rule, this PCC rule shall reference a traffic control decision with the relevant redirect instructions. If a dynamic PCC rule includes flow information for UE IPv4 address and IPv6 prefix address(es) related to the same application identifier and the ADCmultiRedirection feature is supported, the "addRedirectInfo" attribute including more than one RedirectInformation data structure may be provided simultaneously to the redirect instruction.

If the "redirectInfo" attribute is provided for a dynamic PCC rule, the SMF shall instruct the UPF to perform the requested redirection as defined in 3GPP TS 29.244 [13].

If the "redirectServerAddress" attribute is not provided in the dynamic PCC rule and the redirection address is not preconfigured in the SMF/UPF for this PCC rule, the SMF shall perform PCC Rule Error Report, as specified in clauses 4.2.3.16 and 4.2.4.15, and set the "failureCode" attribute to "MISS_REDI_SER_ADDR".

NOTE 2: When the redirect server address is not provided by the PCC rule, the SMF determines the "MISS_REDI_SER_ADDR" error, e.g. when the SMF determines the redirect destination is not preconfigured at both the SMF and the UPF.

To disable the redirect function for one or more already installed PCC Rule(s), the PCF shall:

- update the PCC rule to modify the reference to Traffic Control Data decision to point to another (existing or new) Traffic Control Data decision that does not have "redirectInfo" instructions; or
- update the Traffic Control Data decision that the PCC rule refers to with the "redirectEnabled" attribute set to
 false, if the PCF disables the redirect function for all the PCC rules that refer to this Traffic Control Data
 decision.

For a predefined PCC rule, the redirect information shall be included in the rule definition at the SMF/UPF. Redirect information shall be activated for predefined PCC rules while those rules are active.

4.2.6.2.5 Usage Monitoring Control

Usage monitoring may be performed for service data flows associated with one or more PCC rules.

The provisioning of usage monitoring control per PCC rule shall be performed using the PCC rule provisioning procedure as defined in clause 4.2.6.2.1. For a dynamic PCC rule, the reference to the UsageMonitoringData data structure of the usage monitoring control instance, which is related with the PCC rule, shall be included within the "refUmData" attribute of the PccRule data structure of the PCC rule(s). For a predefined PCC rule, the reference to a usage monitoring control instance shall be included in the rule definition at the SMF. Usage monitoring shall be activated for both service data flows associated with predefined PCC rules and dynamic PCC rules, including rules with deferred activation and/or deactivation times while those rules are active.

4.2.6.2.6 Traffic Steering Control support

If the TSC feature is supported, the PCF may instruct the SMF to apply a traffic steering control for the purpose of:

- steering the subscriber's traffic to an appropriate operator or 3rd party service functions (e.g. NAT, antimalware, parental control, DdoS protection) in the N6-LAN or 5G-LAN type of services according to operator policy or, if the SFC feature is supported, according to the information of AF influenced service function chaining, and/or
- enabling the routing of the user traffic to a local Data Network identified by a DNAI per AF request. When the
 "CommonEASDNAI" feature is supported, the procedure is also used by the PCF to request to select a common
 EAS or a common DNAI for a set of UE associated with the same traffic correlation Id accessing the application
 identified by the service data flow template as requested by the AF or to provide endpoint information for the
 NEF to be notified with information related to UE members of the set of UEs identified by traffic correlation ID.

If the SFC feature is supported, the PCF may instruct the SMF to apply both traffic steering controls above simultaneously.

4.2.6.2.6.1 Steering the traffic in the N6-LAN or steering the 5G-LAN type of services

This procedure is only applicable in non-roaming and home-routed scenarios.

For the purpose of steering the subscriber's traffic to an appropriate operator or 3rd party service functions in the N6-LAN or steering the 5G-LAN type of services based on network operator configured policies not related to an AF request to influence service function chaining, the PCF shall include within the PccRule data structure a reference to the relevant Traffic Control Data decision and:

- include within the PccRule data structure either the application to be detected identified by the "appId" attribute or the service data flow to be detected identified by the "flowInfos" attribute; and
- include a "traffContDecs" attribute containing the corresponding Traffic Control Data decision within the SmPolicyDecision, if it has not been previously provided. In this case, the PCF shall include directly within this Traffic Control Data decision a traffic steering policy identifier for downlink within the "trafficSteeringPolIdDl" attribute and/or a traffic steering policy identifier for uplink within the "trafficSteeringPolIdUl" attribute.

When the SFC feature is supported, for the purpose of steering the subscriber's traffic to an appropriate operator or 3rd party service functions in the N6-LAN or steering the 5G-LAN type of services related to an AF request to influence service function chaining, the PCF shall determine if the ongoing PDU Session is impacted by the steering of traffic to a Service Function Chain as follows:

- If the AF request includes the individual IP address/ prefix allocated to a UE or the UE MAC address, the PCF shall store the received traffic steering control information and perform session binding as defined in clause 6.2 of 3GPP TS 29.513 [7] to determine the impacted PDU session.
- Otherwise, the PCF fetches from the UDR, as defined in 3GPP TS 29.519 [15], the traffic steering control information applicable for a UE, any UE or an Internal Group Id (if received in the SMF request).

Then the PCF authorizes the request for influencing service function chaining. For the impacted PDU Session that corresponds to the AF request, the PCF shall take into account, if available, the service function chaining indication stored in the policy data subscription information in the UDR, as defined in 3GPP TS 29.519 [15], to determine whether it is allowed to generate PCC rules with traffic steering information based on AF request information. When allowed, the PCF shall generate PCC rules with traffic steering control information and provide the corresponding Traffic Control Data decision as described above. In this case the traffic steering policy identifier for downlink and/or uplink traffic may be derived from the SFC ID(s) provided by the AF. Additionally, the Traffic Control Data decision may include metadata if provided by the AF.

NOTE: In case there are both a network operator configured policy for N6-LAN Traffic Steering in PCF and an AF-provided SFC ID(s) mapping to traffic steering control information, the PCF decides based on local configuration which one takes precedence.

The PCF may also provision the traffic steering control information by activating pre-defined PCC rule(s) in the SMF.

If traffic steering policy provided in the "trafficSteeringPolIdUl" and/or "trafficSteeringPolIdDl" attribute are invalid or unknown, or the enforcement of the steering of the traffic failed, the SMF shall return a PCC Rule Error Report, as specified in clauses 4.2.3.16 and 4.2.4.15, and set the "failureCode" attribute to "TRAFFIC_STEERING_ERROR".

4.2.6.2.6.2 Steering the traffic to a local access of the data network

This procedure is only applicable in non-roaming and visited access (i.e. LBO) scenarios.

The PCF shall determine if the ongoing PDU Session is impacted by the routing of traffic to a local access to a data network as follows:

- If the AF request includes the individual IP address/ prefix allocated to a UE or the UE MAC address, the PCF shall store the received traffic routing information and perform session binding as defined in clause 6.2 of 3GPP TS 29.513 [7] to determine the impacted PDU session.
- Otherwise, the PCF fetches from the UDR, as defined in 3GPP TS 29.519 [15], the traffic routing data information applicable for a UE, any UE or one or more Internal Group Id(s) (if received in the SMF request) and/or subscriber category(ies).

NOTE 1: If the UDR provides as part of the traffic routing data information a list of Internal Group Id(s), this information applies to all the PDU sessions related to UEs that belong to every one of these groups, i.e. a single UE needs to be a member of every group in the list of Internal Group Id(s). If the list of subscriber category(ies) is part of the traffic routing data information, this information applies to all the PDU sessions related to the UEs that belong to every one of these Subscriber Categories.

Then the PCF authorizes the request for influencing SMF routing decisions. For the impacted PDU Session that corresponds to the AF request, the PCF shall take into account, if available, the local routing indication stored in the policy data subscription information in the UDR, as defined in 3GPP TS 29.519 [15], to determine whether it is allowed to generate PCC rules with traffic routing information. When allowed, the PCC rules are generated based on the AF request as follows:

- When the request is for influencing SMF routing decisions, based on traffic routing information, operator's policy, etc., the PCF determines the traffic steering policy. The traffic steering policy indicates, for each DNAI, a traffic steering policy identifier configured in the SMF and/or if the N6 routing information associated to the application is explicitly provided by the AF, the N6 routing information (as provided by the AF). The traffic steering policy identifier is derived by the PCF from the routing profile Id provided by the AF and is related to the mechanism enabling traffic steering to the DN. Then:
 - The PCF shall include within each PccRule data structure the necessary information to identify the concerned traffic within either the "flowInfos" attribute or the "appId" attribute, and include within the TrafficControlData data type that the PCC rule refers to a list of locations that the traffic shall be routed to in the "routeToLocs" attribute, and, if the "AF_latency" feature is supported, the PCF shall include the maximum allowed user plane latency within the "maxAllowedUpLat" attribute if available. If "EASIPreplacement" feature is supported, the PCF shall include the EAS IP replacement information within the "easIpReplaceInfos" attribute if available.
 - Within each RouteToLocation instance, the PCF shall include a DNAI in the "dnai" attribute to indicate the location of the application towards which the traffic routing is applied, and a traffic steering policy identifier in the "routeProfId" attribute, to indicate the traffic steering policy that applies to the indicated DNAI, and/or the explicit N6 traffic routing information in the "routeInfo" attribute.
 - If the AF provides both a routing profile Id and N6 routing information for a DNAI, the PCF may include a RouteToLocation instance with the required information or may include two RouteToLocation instances with the same DNAI within the "dnai" attribute and a traffic steering policy identifier within the "routeProfId" attribute in one instance and explicit routing information within the "routeInfo" attribute in the other instance.
- NOTE 2: The N6 traffic routing requirements are related to the mechanism enabling traffic steering in the local access to the DN. The routing profile ID refers to a pre-agreed policy between the AF and the 5GC. This policy may refer to different steering policy identifier(s) sent to the SMF and e.g. based on time of the day, etc.
- NOTE 3: When per DNAI both, the "routeProfId" and the "routeInfo" attributes are provided, if the pre-configured traffic steering policy referenced by the "routeProfId" attribute contains information that is overlapping with the N6 traffic routing information provided in the "routeInfo" attribute, the N6 traffic routing information takes precedence.
- NOTE 4: In this release of the specification, either a traffic steering policy identifier for UL or a traffic steering policy identifier for DL can be defined per DNAI.
- When the request is for subscribing to UP path change events of the PDU session, the PCF shall include the information on AF subscription to UP path change events within the PCC rule(s) to request the SMF to create a subscription to such notifications for the AF. In order to do so, the PCF shall include within each PccRule data structure the necessary information to identify the concerned traffic within either the "flowInfos" attribute or the "appId" attribute, and include within the Traffic Control Data decision that the PCC rule refers to the information on AF subscription to events within the "upPathChgEvent" attribute. Within this "upPathChgEvent" attribute, the PCF shall include the "dnaiChgType" attribute to indicate the type of notification (i.e. early notification, late notification or both), the notification URI within the "notificationUri" attribute, the notification correlation Id within the "notifCorreId" attribute, and if the URLLC feature is supported, an indication of AF acknowledgement to be expected within the "afAckInd" attribute. In order to enable the AF to identify the AF request to which the notification corresponds when the AF receives a UP path change notification from the SMF, as defined in clause 4.2.2.2 of 3GPP TS 29.508 [12], the PCF shall set the values of the "notificationUri" attribute and "notifCorreId" attribute respectively as follows:

- If the PCF fetches the traffic routing data information from the UDR, the PCF shall set the value of the "notificationUri" attribute to the value of the "upPathChgNotifUri" attribute of the TrafficInfluData data structure and set the value of the "notifCorreId" attribute to the value of the "upPathChgNotifCorreId" attribute of the TrafficInfluData data structure as defined in 3GPP TS 29.519 [15].
- If the PCF receives the traffic routing data information from the AF via N5 interface, the PCF shall set the values of the "notificationUri" attribute and the "notificorreId" attribute according to the "upPathChgSub" attribute within the AfRoutingRequirement data structure as defined in 3GPP TS 29.514 [17].

If the NEF/AF provided information about the feature support on Nsmf_EventExposure service as described in 3GPP TS 29.514 [17] (AF request applies an individual UE address) or 3GPP TS 29.519[15] (AF request applies to PDU sessions not identified by a UE address), the PCF may also include this information within the "nscSuppFeats" attribute included within the PccRule data type.

- If the AF request includes an indication that application relocation is not possible, the PCF shall include within the PccRule data instance(s) the necessary information to identify the traffic within either the "flowInfos" attribute or the "appId" attribute and the "appReloc" attribute set to true. In this case, the SMF shall ensure that for the traffic related with the concerned application, no DNAI change takes place once selected initially for this application.
- If the "EASDiscovery" feature is supported and the AF request includes an indication that EAS rediscovery is required, the PCF shall include within the PccRule data instance(s) the necessary information to identify the traffic within the "appId" attribute and the "easRedisInd" attribute set to true.
- If the URLLC feature is supported and the AF request includes an indication that the UE IP address preservation should be considered, the PCF shall include within the concerned PccRule data instance(s) the "addrPreserInd" attribute set to true.
- If the AF request includes an indication that the PDU session should be correlated via a common DNAI for a given traffic, the PCF shall include within the TrafficControlData data instance provisioned for one or more PCC rule(s), the "traffCorreInd" attribute set to true.

NOTE 5: The indication of traffic correlation can be provided together with the traffic routing information by the AF for all the members of the 5G VN group. Referred to clause 5.29.4 of 3GPP TS 23.501 [2].

- If the feature "SimultConnectivity" is supported and the AF request includes an indication that the simultaneous connectivity may be temporarily maintained for the target and the source PSA during the edge re-location procedure, the PCF may include within the TrafficControlData data instance provisioned for one or more PCC rule(s) the "simConnInd" attribute set to true, as indicated by the AF. If the feature "SimultConnectivity" is supported and the AF request includes the time interval to be considered for inactivity of the traffic routed through the source PSA after which the simultaneous connectivity can be terminated, the PCF may also include the received duration within the "simConnTerm" attribute.
- If the feature "CommonEASDNAI" is supported and AF includes a traffic correlation information within "tfcCorreInfo" attribute, and
 - if the AF request also includes an indication that the PDU session should be correlated via a common DNAI, the PCF shall include the TrafficControlData data instance provisioned for one or more PCC rule(s), "COMMON_DNAI" within the "corrType" attribute and the identification of a set of UEs accessing the application identified by the service data flow template within the "tfcCorrId" attribute. If the NEF has added its information in the AF request in order to be notified with information related to UE members of the set of UEs identified by traffic correlation ID, then the PCF shall include also the "notifUri" and "notifCorrId" attributes within the "tfcCorreInfo" attribute of the TrafficControlData; or
 - if the AF request also includes an indication that a common EAS for the application identified by the service data flow template should be selected, the PCF shall include the TrafficControlData data instance provisioned for one or more PCC rule(s), the "COMMON_EAS" within the "corrType" attribute, the identification of a set of UEs accessing the application identified by the service data flow template within the "tfcCorrId" attribute, the common EAS address(s) within the "comEasIpv4Addr" attribute and/or "comEasIpv6Addr" attribute and/or the FQDN range corresponding to the application within the "fqdnRange" attribute. If the NEF has added its information in the AF request in order to be notified with information related to UE members of the set of UEs identified by traffic correlation ID, then the PCF shall include also the "notifUri" and "notifCorrId" attributes within the "tfcCorreInfo" attribute of the TrafficControlData.

NOTE 6: Common EAS selection means the common DNAI is selected.

The PCF shall provide the PCC rule(s) as defined in clause 4.2.6.2.1.

If the temporal validity condition is received, the PCF shall evaluate the temporal validity condition of the AF request and inform the SMF to install or remove the corresponding PCC rule(s) according to the evaluation result. When policies specific to the PDU Session and policies general to multiple PDU Sessions exist, the PCF gives precedence to the PDU Session specific policies over the general policies.

If the spatial validity condition is received, the PCF considers the latest known UE location to determine the PCC rules provided to the SMF. In order to do that, the PCF shall request the SMF to report the notifications about change of UE location in an area of interest (i.e. Presence Reporting Area) as defined in clauses 4.2.2.13 or 4.2.3.19. The subscribed area of interest may be the same as the one provided in spatial validity condition, or may be a subset of the spatial validity condition (e.g. a list of TAs) based on the latest known UE location. When the SMF detects that the UE entered the area of interest subscribed by the PCF, the SMF notifies the PCF and the PCF provides to the SMF the PCC rule(s) described above. When the SMF becomes aware that the UE left the area subscribed by the PCF, the SMF notifies the PCF and the PCF may remove or provide updated PCC rule(s) to the SMF.

When the PCC rules are installed, the SMF may, based on local policies, take the information in the PCC rule(s) into account to:

- if the PDU Session is of IP type and the "addrPreserInd" attribute is included and set to true in the PCC rule(s), the SMF should preserve the UE IP address and, if necessary, not reselect the related PSA UPF for the traffic identified in the PCC rule once the PSA UPF is selected; otherwise, the SMF (re)selects UPF(s) as it might be required for PDU Sessions.
- activate mechanisms for traffic multi-homing or enforcement of an UL Classifier (UL CL).
- inform the AF of the (re)selection of the UP path (change of DNAI) and/or the candidate DNAI(s) for the PDU Session if the "CommonEASDNAI" feature is supported and the "candDnaiInd" attribute was set to "true".
- determine the target DNAI(s) for the current UE location, which may imply I-SMF selection or removal to be requested to the AMF as defined in 3GPP TS 29.502 [22].
- if the "traffCorreInd" attribute set to true is included in the TrafficControlData data type referenced by a set of PCC rules, based on SMF implementation and local configuration, the SMF should select a common DNAI from the list of DNAI included in the "routeToLocs" attribute for the identified traffic of the PDU session.
- if the "simConnInd" attribute set to true is included in the TrafficControlData data type referenced by a set of PCC rules, the SMF may temporarily maintain simultaneous connectivity for the source and target PSA at edge relocation procedure, and may influence the establishment of a temporary N9 forwarding tunnel between the source UL CL and target UL CL. If the "simConnTerm" attribute is also included, the SMF may consider the indicated time interval as the minimum one to be considered for inactivity for the described traffic before the connectivity over the source PSA may be removed.
- if the "maxAllowedUpLat" attribute is received, SMF may use this value to decide whether edge relocation is needed to ensure that the user plane latency does not exceed the value and whether to relocate the PSA UPF to satisfy the user plane latency.
- if the "easIpReplaceInfos" attribute is received, the SMF may instruct the local PSA UPF with the EAS IP replacement information using "Outer Header Creation" as defined in 3GPP TS 29.244 [13] clause 8.2.56 and "Outer Header Removal" as defined in 3GPP TS 29.244 [13] clause 8.2.64. The PSA UPF shall be configured by the SMF to perform one creation and one removal of the appropriate outer header(s) both in the uplink and in the downlink direction in a way that the address information indicated by the "source" attribute (within "easIpReplaceInfos") is used in the headers of the packets towards the UE and the address information indicated by the "target" attribute (within "easIpReplaceInfos") is used in the headers of the packets towards the DN.
- if the "easRedisInd" attribute set to true is included, the SMF may indicate the UE to refresh the cached EAS information as defined in clause 6.3.2 of 3GPP TS 24.501 [20].
- if the "tfcCorreInfo" attribute is received, and,
 - if the "COMMON_DNAI" is included within the "corrType" attribute in the TrafficControlData data type referenced by a set of PCC rules, based on SMF implementation and local configuration, the SMF should select a common DNAI from the list of DNAI included in the "routeToLocs" attribute for the traffic of the

PDU session which have the same traffic correlation Id within the "tfcCorrId" attribute as defined in clause 6.2.3.2.6 of TS 23.548 [62]. The SMF shall use the provided DNAI as the common DNAI when only one is included in the "routeToLocs" attribute; or

- if the "COMMON_EAS" is included within the "corrType" attribute in the TrafficControlData data type referenced by a set of PCC rules, the SMF should use the value within the "fqdnRange" if received to match the FQDN received from the EASDF via the Neasdf_DNSContext_Notify request. If they are matched, the SMF may indicate the UE the common EAS address(s) received within the "comEasIpv4Addr" attribute and/or "comEasIpv6Addr" attribute.
- NOTE 7: In order for the SMF to initiate the EASDF-based EAS discovery procedure, the SMF will use the FQDN information received within the "fqdnRange" attribute for setting traffic route and finding DNAI. The "flowInfos" attribute or the "appId" attribute will not be considered for that purpose.
 - if the "notifUri" attribute and "notifCorrId" attribute are included, the SMF shall notify the 5GC determined information for a set of UEs identified by Traffic Correlation ID.

NOTE 8: Common EAS selection means the common DNAI is selected.

If routing of traffic to a local access to a data network policy provided in the "routeToLocs" attribute is invalid, unknown or not applicable, or the enforcement of the steering of the traffic to the indicated DNAI failed, the SMF shall return a PCC Rule Error Report, as specified in clauses 4.2.3.16 and 4.2.4.15, and set the "failureCode" attribute to "DNAI_STEERING_ERROR".

4.2.6.2.7 Conditioned PCC rule

The PCF may control at what time the status of a PCC rule changes. In order to provision a PCC rule with conditional data, the PCF shall provision a PCC rule as defined in clause 4.2.6.2.1 and include within its "refCondData" attribute the value of the "condId" attribute of the targeted ConditionData instance. The PCF shall also ensure that this referenced ConditionData instance is included in the "conds" map attribute within the SmPolicyDecision data structure, following the procedures defined in clause 4.2.6.1.

Within the ConditionData instance, the PCF shall include the activation time within the "activationTime" attribute and/or the deactivation time within the "deactivationTime" attribute.

When the SMF receives a conditioned PCC rule, the SMF shall act as follows:

- 1) If only the "activationTime" attribute is provided by the PCF and the time specified in it is in the future, then the SMF shall set the PCC rule to inactive state and only change it to active state at the specified time. If this time specified in the "activationTime" attribute is in the past, then the SMF shall immediately set the PCC rule to active state.
- 2) If only the "deactivationTime" attribute is provided by the PCF and the time specified in it is in the future, then the SMF shall set the PCC rule to active state and only change it to inactive state at the specified time. If this time specified in the "deactivationTime" is in the past, then the SMF shall immediately set the PCC rule to inactive state.
- 3) If both the "activationTime" attribute and the "deactivationTime" attribute are provided by the PCF, and the value specified in the "activationTime" occurs before the value specified in the "deactivationTime" attribute, and also when the PCC rule is provided before or at the value specified in the "deactivationTime", the SMF shall handle the PCC rule first as defined in 1) and then as defined in 2).
- 4) If both the "activationTime" attribute and the "deactivationTime" attribute are provided by the PCF, and the value specified in the "deactivationTime" attribute occurs before the value specified in the "activationTime", and also when the PCC rule is provided before or at the value specified in the "activationTime" attribute, the SMF shall handle the PCC rule first as defined in 2) and then as defined in 1).
- 5) If both the "activationTime" attribute and the "deactivationTime" attribute are provided by the PCF and are both in the past, and the value specified in the "activationTime" occurs before the value specified in the "deactivationTime" attribute, then the SMF shall immediately set the PCC rule to inactive state.
- 6) If both the "activationTime" attribute and the "deactivationTime" attribute are provided by the PCF and are both in the past, and the value specified in the "deactivationTime" attribute occurs before the value specified in the "activationTime" attribute, then the SMF shall immediately set the PCC rule to active state.

7) If both "activationTime" attribute and "deactivationTime" attribute are specified with the same time, the SMF shall report a PCC rule error for the concerned PCC rule(s), as specified in clauses 4.2.3.16 and 4.2.4.15, and set the "failureCode" attribute to "INCORRECT_COND_DATA".

The PCF may modify a currently installed/activated PCC rule, including setting, modifying or deleting its deferred activation and/or deactivation time as follows:

- 1) When modifying a PCC rule by newly setting the deferred activation time and/or deactivation time, the PCF shall update the PCC rule by including the corresponding ConditionData instance 's "condId" attribute value within the "refCondData" attribute and including within the SmPolicyDecision data structure this ConditionData instance within the "conds" map attribute, if not previously provisioned.
- 2) When modifying a PCC rule by modifying the already provisioned deferred activation time and/or deactivation time:
 - the PCF may update the PCC rule by replacing the existing ConditionData instance's "condId" attribute value within the "refCondData" attribute with a another one pointing to another ConditionData instance and including within the SmPolicyDecision data structure this new ConditionData instance within the "conds" attribute, if not previously provisioned; or
 - the PCF may update the condition data decision to which the PCC rule refers by updating the corresponding ConditionData instance in the SmPolicyDecision data structure, as defined in clause 4.2.6.1. The PCF may add an activation time and/or a deactivation time, update the values of the existing activation time and/or deactivation time, or delete either the existing activation time or the existing deactivation time.
- 3) When modifying a PCC rule by deleting the previously provisioned deferred activation time and/or deactivation time:
 - the PCF shall delete the reference to the corresponding ConditionData instance within the PCC rule by updating the "refCondData" attribute of the PCC rule to "NULL" value; and
 - the PCF may also delete this condition data decision to which the PCC rule refers as defined in clause 4.2.6.1 (i.e. delete the corresponding ConditionData instance within the SmPolicyDecision data structure), if no other PCC rule is referring to this condition data decision.

To delete a conditioned PCC rule, the PCF shall run the procedures as defined in clause 4.2.6.2.1.

The UE timezone information, if available, may be used by the PCF to construct the values of the "activationTime" attribute and/or the "deactivationTime" attribute.

The PCC rule(s) including a reference to a Condition Data decision which includes an "activationTime" attribute and/or a "deactivationTime" attribute shall be bound to a QoS flow associated with a default QoS rule that allows all UL packets. If such PCC rule(s) are not bound to a QoS flow associated with a default QoS rule, the SMF shall report a failure to the PCF by including the "ruleReports" attribute with the "failureCode" attribute set to the value "NO_QOS_FLOW_BOUND" for the affected PCC rule(s). Changes of the QoS profile or QoS rule which will initiate signalling towards the access network and/or UE in such PCC rule(s) shall also not be applied.

NOTE: This limitation prevents dependencies on the signalling of changed traffic mapping information towards the UE.

4.2.6.2.8 PCC rule for resource sharing

If the ResShare feature is supported by both the SMF and PCF as described in clause 5.8, the PCF may indicate that the SMF should commonly reserve resources for a set of PCC rules. The SMF shall then, for PCC rules bound to the same QoS flow and the same sharing key value , use the highest GBR value among those PCC rules as input for calculating the common GBR value when reserving QoS flow resources. The GBR value for each direction shall be considered separately, so that the uplink and downlink GBR values may originate from different PCC rules.

The SMF may, based on internal logic, use the highest MBR value among the provided PCC rules indicated to share resources, when determining the MBR for the QoS flow. Each individual PCC rule is still subject to data rate policing based on its own MBR values.

The PCF shall provide the "sharingKeyDl" attribute and/or "sharingKeyUl" attribute within the QosData data structure which the PCC rules refers to in order to indicate that the related PCC rule may share resources with other PCC rules bound to the same QoS flow.

The SMF shall apply resource sharing if at least two PCC rules bound to the same QoS flow share the same value in the "sharingKeyDl" attribute and/or "sharingKeyUl" attribute.

When modifying the value of "sharingKeyDl" attribute and/or "sharingKeyUl" attribute of the QosData data structure, which a PCC rule refers to for the PCC rule that is subject to resource sharing the SMF may adjust the resource sharing of the remaining PCC rules.

- NOTE 1: A PCC rule that is deleted is also removed from the resource sharing, while the remaining PCC rules continue their sharing relationship.
- NOTE 2: The state of resource sharing ends when less than two of the PCC rules in the set remains.

4.2.6.2.9 Resource reservation for services sharing priority

When the PCF derives PCC Rules corresponding to a service related to an AF that has indicated that priority sharing is allowed for that service over Rx interface or within the Npcf_PolicyAuthorization service, it derives the corresponding PCC Rules according to current procedures as described in 3GPP TS 29.513 [7], clause 7.3. The PCF may additionally take the suggested pre-emption capability and vulnerability values into account if the AF provided them when the PCF determines the ARP pre-emption capability and vulnerability. The ARP derived at this point and the priority sharing indicator provided over Rx reference point (see 3GPP TS 29.214 [18] for further information) or over the Npcf_PolicyAuthorization service (see 3GPP TS 29.514 [17] for further information) related to these derived PCC Rules are stored for later use.

For PCC Rules related to the same PDU session with the same assigned 5QI and with the priority sharing indicator enabled (see 3GPP TS 29.214 [18], clause 4.4.8, or 3GPP TS 29.514 [17], clauses 4.2.2.21, 4.2.3.21 and 4.2.4.9), the PCF shall rederive the ARP into a shared ARP for these PCC Rules as follows:

- The Priority Level shall be set to the lowest value (i.e. highest priority) among the Priority Level values derived for the PCC rules that include the priority sharing indicator.
- The Pre-emption Capability shall be set to true if any of the original derived PCC Rules have the Pre-emption-Capability value set to true.
- The Pre-emption Vulnerability shall be set to true if all the original derived PCC Rules have the Pre-emption Vulnerability value set to true.

NOTE 1: Having the same setting for the ARP parameter in the PCC Rules with the priority sharing indicator set enables the usage of the same QoS flow. Furthermore, a combined modification of the ARP parameter in the PCC rules ensures that a QoS flow modification is triggered when a media flow with higher service priority starts.

If the 5QI and/or ARP related to any of the PCC Rules that share priority is changed (e.g. based on local policies), the PCF shall rederive the ARP for the impacted PCC Rules following the same procedure as defined in this clause.

The PCF shall provision the PCC Rules according to the rederived ARP information as described in clause 4.2.6.2.1.

If the PCF receives a report that a PCC rule provisioning or modification failed due to the resource reservation failure as defined in clauses 4.2.3.1.6 and 4.2.4.15 (PCC Rule Error Report) and if the PCF supports the MCPTT-Preemption feature as defined in clause 5.4.1 of 3GPP TS 29.214 [18] or in clause 5.8 of 3GPP TS 29.514 [17], the PCF shall check if pre-emption control based on the pre-emption control information provided by the AF as defined in clauses 4.4.1 or 4.4.2 of 3GPP TS 29.214 [18] or in clauses 4.2.2.21, 4.2.3.21 or 4.2.4.9 of 3GPP TS 29.514 [17] applies.

NOTE 2: The PCF determines that pre-emption control applies based on the presence of the Pre-emption-Control-Info AVP received over Rx reference point as defined in 3GPP TS 29.214 [18] or "preemptControlInfo" attribute received over N5 reference point as defined in 3GPP TS 29.514 [17] and operator policies.

If pre-emption control applies, the PCF shall check the corresponding derived PCC Rules (before applying priority sharing procedures). If the Pre-emption Capability of the derived PCC Rule is disabled the PCF shall notify that resource allocation has failed for this PCC rule to the AF as defined in clauses 4.4.1 or 4.4.2 of 3GPP TS 29.214 [18] or

in clauses 4.2.2.21, 4.2.3.21 or 4.2.4.9 of 3GPP TS 29.514 [17]. Otherwise, if the Pre-emption Capability of the derived PCC Rule is enabled, the PCF shall perform the pre-emption control as follows:

- For all the active PCC rule(s) that applied priority sharing mechanism, the PCF shall identify the PCC Rules that have the Pre-emption Vulnerability enabled. For those selected PCC Rule(s), the PCF shall check the Priority Level value.
- If there is only one PCC Rule with the Priority Level value higher (i.e. lower priority) than the derived Priority Level value of new or modified PCC Rule, the PCF shall remove this PCC rule. The PCF shall retry the PCC rule provisioning or modification procedure for the PCC rule that failed.
- Otherwise, if there are more than one PCC Rule with the Priority Level value higher (i.e. lower priority) than the derived Priority Level value of new or modified PCC Rule, the PCF shall remove the PCC Rule with the highest Priority Level from the SMF. The PCF shall retry the PCC rule provisioning or modification procedure for the PCC rule that failed; If more than one PCC Rule have the same highest Priority Level, the PCF shall check the Pre-Emption-Control-Info AVP received over Rx interface as defined in 3GPP TS 29.214 [18], or the "preemptControlInfo" attribute received over N5 interface as defined in 3GPP TS 29.514 [17] and remove the PCC Rule that matches the condition.
- Otherwise, if there is at least one PCC Rule with the same Priority Level value than the derived Priority Level value of new or modified PCC Rule, the PCF shall check the Pre-emption-Control-Info AVP received over Rx interface as defined in 3GPP TS 29.214 [18] or the "preemptControlInfo" attribute received over N5 interface as defined in 3GPP TS 29.514 [17] for these PCC Rules and remove the PCC Rule that matches the condition.
- Otherwise, the PCF shall notify that resource allocation has failed for this PCC rule to the AF as defined in clauses 4.4.1 or 4.4.2 of 3GPP TS 29.214 [18] or in clauses 4.2.2.21 or 4.2.3.21 of 3GPP TS 29.514 [17].

If there is no active PCC Rule with the Pre-emption Vulnerability enabled, the PCF shall notify that resource allocation has failed for this PCC rule to the AF as defined in clauses 4.4.1 or 4.4.2 of 3GPP TS 29.214 [18].

NOTE 3: If the PCF receives a report that a PCC rule provisioning or modification failed due to the resource reservation failure and the PCF does not support the MCPTT-Preemption feature as defined in clause 5.4.1 of 3GPP TS 29.214 [18] or clause 5.8 of 3GPP TS 29.514 [17], the PCF can apply preemption and remove active PCC rules from the SMF and then retry the PCC rule provisioning or modification procedure. Otherwise, the PCF will notify it to the AF as defined in clauses 4.4.1 or 4.4.2 of 3GPP TS 29.214 [18] or in clauses 4.2.2.21 or 4.2.3.21 of 3GPP TS 29.514 [17]. How the PCF applies the pre-emption depends on the implementation.

4.2.6.2.10 PCC rule bound to the default QoS flow

The PCF may indicate to the SMF that a PCC rule shall be bound to the default QoS flow and remain on the default QoS flow. The SMF shall then, for the indicated PCC rule, bind it to the default QoS flow until this PCC rule is removed or until the PCF modifies this PCC rule to set the "defQosFlowIndication" attribute to false. For this second case, Tthe SMF case shall evaluate the full QoS information within the QosData data structure to which the PCC rule refers and follow normal policy enforcement procedures for authorized QoS per service data flow as described in clause 4.2.6.2.3.

NOTE: 5QI, ARP, QNC (if available), Priority Level (if available), Averaging Window (if available) and Maximum Data Burst Volume (if available) within the QoS Data decision referred by the PCC rule are only used by the SMF for QoS flow binding purposes when the "defQosFlowIndication" attribute is not included in the QoS Data decision or it is included and set to false.

The PCF shall provide the "defQosFlowIndication" attribute set to true in order to indicate that the related PCC rule shall be bound to the default QoS flow.

If the "defQosFlowIndication" attribute is provided and set to true within the QosData data structure to which the PCC rule refers, the SMF shall bind the related PCC rule to the default QoS flow. This binding remains valid until the related PCC rule is removed or if the PCF indicates to the SMF that the binding to the default QoS flow for this PCC rule no longer applies.

The SMF shall ignore the values of the other attributes, including 5QI, ARP, QNC (if available), Priority Level (if available), Averaging Window (if available) and Maximum Data Burst Volume (if available), provided within the QosData data structure if the "defQosFlowIndication" attribute is provided by the PCF and set to true. If the PCF has previously indicated to the SMF that a PCC rule shall be bound to the default QoS flow, and desires to indicate that this

binding no longer applies the PCF shall update this PCC rule by including the "defQosFlowIndication" attribute set to false. The SMF shall in this case evaluate the full QoS information within the QosData data structure to which the PCC rule refers and follow normal policy enforcement procedures for authorized QoS per service data flow as described in clause 4.2.6.2.3.

If the PCF has not previously indicated to the SMF that a PCC rule shall be bound to the default QoS flow (i.e. it may be bound to another QoS flow), in order to indicate that the binding to the default QoS flow shall now apply for this PCC rule, the PCF shall update the PCC rule by including (or updating) the "defQosFlowIndication" attribute and set it to true. The SMF shall in this case follow the procedures described in this clause.

4.2.6.2.11 PCC rule for Application Detection and Control

If the ADC feature is supported, the user subscription indicates that application detection and control is enabled, and the PCF determines that application detection is required because of e.g. an internal/external trigger or the PCF has received from an NF service consumer (e.g. another PCF or an AF) a subscription to the event for application start/stop traffic detection (see TS 29.514 [17], clause 4.2.6.9 subscription to application detection control and TS 29.523 [61], clause 4.2.2 for AF subscription to application detection control), the PCF may instruct the SMF to detect application(s) by installing or activating PCC rule(s).

NOTE: When the NF service consumer is an AF, the PCF will identify all the affected PDU sessions based on the received information as specified in TS 29.523 [61] and generate the PCC Rules with instructions to detect application(s) for each affected PDU session.

An application to be detected is identified by an application identifier, which shall be provided within the "appId" attribute for dynamic PCC rules or pre-provisioned for predefined PCC rules. If the PCF requires to be notified when application start/stop is detected, it shall also provide the APP_STA and APP_STO policy control request triggers to the SMF as defined in clause 4.2.4.6. For dynamic PCC rules, the PCF may also mute such notifications for a specific detected application by including a "traffContDecs" attribute to contain a Traffic Control Data decision which contains the "muteNotif" attribute set to true and including a "refTcData" attribute referring to this Traffic Control Data decision within the concerned PCC rule.

If the application identifier provided in the "appId" attribute is invalid, unknown or not applicable, the SMF shall return a PCC Rule Error Report, as specified in clauses 4.2.3.16 and 4.2.4.15, and set the "failureCode" attribute to "APP_ID_ERR".

The SMF shall reject the update of the mute indication for a provisioned PCC rule as specified in clause 4.2.3.16 and 4.2.4.15, and set the "failureCode" attribute to "MUTE CHG NOT ALLOWED".

When the application detection control was initiated by an NF service consumer and it unsubscribes to receive these notifications, the PCF shall unsubscribe to the related policy control request triggers as described in clause 4.2.6.4 unless they are used for other purposes.

In this release of the specification Application Detection and Control applies only to the IP PDU session type.

4.2.6.2.12 Provisioning of PCC Rules for Multimedia Priority Services

4.2.6.2.12.1 General

The provision of PCC Rules corresponding to both MPS and non-MPS service shall be performed as described in clause 4.2.6.2.1 "Provisioning of PCC rules".

When the PCF derives PCC Rules corresponding to MPS service, the ARP and 5QI shall be set as appropriate for the prioritized service, e.g. an IMS Multimedia Priority Service. The PCF may authorize a standardized 5QI or a standardized 5QI with a specific 5QI priority level as defined in clause 4.2.6.6.2. The PCF may also authorize a non-standardized 5QI with explicitly signalled QoS characteristics as defined in clause 4.2.6.6.3.

When the PCF derives PCC Rules corresponding to non-MPS service, the PCF shall generate the PCC Rules as per normal procedures. At the time the Priority PDU connectivity services is invoked based on the subscription profile stored in the UDR (i.e. Indication for support of Priority PDU connectivity service and MPS Priority Level are set in the UDR) or by the AF (e.g., MPS for DTS is invoked as described in 3GPP TS 29.214 [18] and 3GPP TS 29.514 [17]), the PCF shall upgrade the ARP and/or change 5QI for the PCC Rules to appropriate values as needed for MPS. The PCF shall change the ARP and/or 5QI (also associated QoS characteristics if applicable) modified for the Priority PDU connectivity service to an appropriate value according to PCF decision.

When the PCF receives an HTTP POST message as defined in clause 4.2.2.1, the PCF shall check whether any of these parameters is stored in the UDR: indication for support of Priority PDU connectivity service, MPS Priority Level and/or indication of IMS priority service support. The PCF shall derive the applicable PCC rules and default QoS flow QoS based on that information. If the indication of IMS priority service support is set and the "dnn" attribute corresponds to a DNN dedicated for IMS, the PCF shall assign an ARP corresponding to MPS for the default QoS flow and for the PCC Rules corresponding to the IMS signalling QoS flow. If the "dnn" does not correspond to a DNN dedicated for IMS, the ARP shall be derived without considering IMS Signalling Priority.

NOTE 1: Subscription data for MPS is provided to PCF through the Nudr service.

Once the PCF receives a notification of a change in Priority PDU connectivity services support, MPS Priority Level and/or IMS priority service support from the UDR, the PCF shall make the corresponding policy decisions (i.e. ARP and/or 5QI (also associated QoS characteristics if applicable) change) and, if applicable, shall initiate an HTTP POST message as defined in clause 4.2.3.2 to provision the modified data.

NOTE 2: The details associated with the UDR service are specified in 3GPP TS 29.519 [15].

NOTE 3: The MPS Priority Level is one among other input data such as operator policy for the PCF to set the ARP.

Whenever one or more AF sessions of an MPS service are active within the same PDU session, the PCF shall ensure that the ARP priority level of the default QoS flow is at least as high as the highest ARP priority level used by any authorized PCC rules belonging to an MPS service. If the ARP pre-emption capability is enabled for any of the authorized PCC rules belonging to an MPS service, the PCF shall also enable the ARP pre-emption capability for the default QoS Flow.

NOTE 4: This ensures that services using dedicated QoS flows are not terminated because of a default QoS flow with a lower ARP priority level or disabled ARP pre-emption capability being dropped during mobility events.

NOTE 5: This PCF capability does not cover interactions with services other than MPS services.

4.2.6.2.12.2 Invocation/Revocation of Priority PDU connectivity services

When a Priority PDU connectivity services is invoked, the PCF shall:

- Derive the corresponding PCC Rules with the ARP and 5QI (also associated QoS characteristics if applicable) set as appropriate for a prioritized service.
- Set the ARP of the default QoS flow as appropriate for a Priority PDU connectivity services under consideration of the requirement described in clause 4.2.6.2.12.1.
- Set the 5QI (also associated QoS characteristics if applicable) of the default QoS flow as appropriate for the Priority PDU connectivity services.
- Set the ARP of PCC Rules installed before the activation of the Priority PDU connectivity services to the ARP as appropriate for the Priority PDU connectivity services under the consideration of the requirements described in clause 4.2.6.2.12.1.
- Set the 5QI of the PCC Rules installed before the activation of the Priority PDU connectivity services to the 5QI (also associated QoS characteristics if applicable) as appropriate for the Priority PDU connectivity services if modification of the 5QI of the PCC Rules is required.

When a Priority PDU connectivity services is revoked, the PCF shall:

- Delete the PCC Rules corresponding to the Priority PDU connectivity services if they were previously provided.
- Set the ARP of the default QoS flow to the normal ARP under the consideration of the requirements described in clause 4.2.6.2.12.1.
- Set the 5QI of the default QoS flow as appropriate for PCF decision.
- Set the ARP of all active PCC Rules as appropriate for the PCF under the consideration of the requirements described in clause 4.2.6.2.12.1.

- Set the 5QI to an appropriate value according to PCF decision if modification of the 5QI of PCC Rules is required.

NOTE: Priority PDU connectivity services can be explicitly invoked/revoked via UDR MPS user profile (Indication of Priority PDU connectivity services, MPS Priority Level). An AF for MPS Priority Service can also be used to provide Priority PDU connectivity services using network-initiated resource allocation procedures (via interaction with PCC) for originating accesses.

The PCF shall provision the SMF with the applicable PCC Rules upon Priority PDU connectivity services activation and deactivation as described above. The provision of the QoS information applicable for the PCC Rules shall be performed as described in clause 4.5.6.2. The provision of QoS information for the default QoS flow shall be performed as described in clause 4.2.6.3.

4.2.6.2.12.3 Invocation/Revocation of IMS Multimedia Priority Services

If the PCF receives service information including an MPS session indication and the service priority level from the P-CSCF or at reception of the indication that IMS priority service is active for the PDU session, the PCF shall under consideration of the requirements described in clause 4.2.6.2.12.1:

- if required, set the ARP and 5QI (also associated QoS characteristics if applicable) of the default QoS flow as appropriate for the prioritized service;
- if required, set the ARP and 5QI (also associated QoS characteristics if applicable) of all PCC rules assigned to the IMS signalling QoS flow as appropriate for IMS Multimedia Priority Services;
- derive the PCC Rules corresponding to the IMS Multimedia Priority Service and set the ARP and 5QI (also associated QoS characteristics if applicable) of these PCC Rules based on the information received over N5/Rx.

If the PCF detects that the P-CSCF released all the MPS session and the IMS priority service has been deactivated for the PDU session the PCF shall under consideration of the requirements described in clause 4.2.6.2.12.1:

- delete the PCC Rules corresponding to the IMS Multimedia Priority Service;
- if required, set the ARP and 5QI of the default QoS flow as appropriate for the IMS Multimedia Priority set to inactive;
- replace the ARP and 5QI of all PCC Rules assigned to the IMS signalling QoS flow as appropriate when the IMS Multimedia Priority is inactive.

4.2.6.2.12.4 Invocation/Revocation of MPS for DTS

When the PCF receives from the AF an indication of invocation/revocation of MPS for DTS as specified in 3GPP TS 29.514 [17] or 3GPP TS 29.214[10], and if the "MPSforDTS" feature is supported, the PCF shall make the corresponding policy decisions (i.e. ARP and/or 5QI change for the default QoS) and, if applicable, shall initiate an Npcf_SMPolicyControl_UpdateNotify to provision the modified data.

For the invocation of MPS for DTS, the PCF shall:

- Set the ARP of the default QoS flow as appropriate for MPS for DTS.
- Set the 5QI (also associated QoS characteristics if applicable) of the default QoS flow as appropriate for MPS for DTS.

NOTE 1: For PCC Rules that had the same ARP and 5QI as the original default QoS flow: the PCF indicates to the SMF that the PCC rule is to be bound to the default QoS flow by setting the "defQosFlowIndication" attribute within the QosData data structure to true; or sets the ARP as appropriate for MPS for DTS and the 5QI (also associated QoS characteristics if applicable) as appropriate for MPS for DTS.

For the revocation of MPS for DTS, to revert the MPS for DTS values of the default QoS flow and the PCC rules bound to the default QoS flow, the PCF shall set the ARP and the 5QI of the default QoS flow as appropriate for PCF decision.

NOTE 2: For PCC Rules that had the same ARP and 5QI as the default QoS flow, or had the "defQosFlowIndication" attribute set to true: the PCF sets the ARP; and the 5QI (also associated QoS characteristics if applicable) as appropriate for PCF decision. The provision of the QoS information applicable for the PCC Rules is performed as described in clause 4.2.6.6.

NOTE 3: Revocation may require more complex logic on the part of the PCF beyond simply restoring the prior ARP and 5QI values as set prior to invocation of MPS for DTS, if these values and/or the defQosFlowIndication were modified by another service during the time that MPS for DTS was enabled. The corresponding logic is dependent on the identification of particular services that may be deployed and the desired interactions between MPS for DTS and any such services. These aspects are not considered in the present specification.

The PCF shall provision the SMF upon MPS for DTS invocation and revocation as described above for the default QoS flow as described in clause 4.2.3.6.

On receipt from an AF of a request to report the successful outcome of the MPS for DTS invocation/revocation of priority handling for the default QoS flow (see 3GPP TS 29.214 [18] and 3GPP TS 29.514 [17]), the PCF shall request the SMF to confirm that the resources associated to the MPS for DTS invocation/revocation are successfully allocated. The PCF does this by setting the "policyCtrlReqTriggers" attribute in the "SmPolicyDecision" data structure to the value "SUCC_QOS_UPDATE". On receipt of the "repPolicyCtrlReqTriggers" attribute in the SmPolicyUpdateContextData data structure set to the value "SUCC_QOS_UPDATE" from the SMF, the PCF shall inform the AF that it successfully acted upon the "mpsAction" attribute as defined in 3GPP TS 29.514 [17] or the MPS-Action AVP as defined in 3GPP TS 29.214 [18].

The SMF shall report MPS for DTS invocation/revocation failure to the PCF according to clause 4.2.4.21 if requested to do so by the AF as described in 3GPP TS 29.214 [18], clause 4.4.11 or as described in 3GPP TS 29.514 [17], clause 4.2.2.12.2.

4.2.6.2.13 Sponsored Data Connectivity

Sponsored data connectivity may be performed for service data flows associated with one or more PCC rules if the information about the sponsor, the application service provider and optionally the threshold values are provided by the AF and if the AF has not indicated to disable/not enable sponsored data connectivity as described in 3GPP TS 29.214 [18] clauses 4.4.1 and 4.4.2 or 3GPP TS 29.514 [17] clauses 4.2.2.5 and 4.2.3.5.

The provisioning of sponsored data connectivity per PCC rule shall be performed using the PCC rule provisioning procedure as defined in clause 4.2.6.2.1. The sponsor identity shall be set using the "sponsorId" attribute within the ChargingData data type which the PCC rule refers to. The application service provider identity shall be set using the "appSvcProvId" attribute within the ChargingData data type which the PCC rule refers to. The "sponsorId" attribute and "appSvcProvId" shall be set if the "reportingLevel" attribute within the ChargingData data type which the PCC rule refers to is set to the value "SPON CON LEVEL".

When receiving the usage thresholds from the AF, the PCF shall use the sponsor identity to generate a value of "umId" attribute of the UsageMonitoringData data type which the PCC rule refers to and request usage monitoring control for the sponsored data connectivity by following the procedures specified in clauses 4.2.6.2.5.

When the AF disables sponsoring a service (See 3GPP TS 29.214 [18] clause 4.4.2 or 3GPP TS 29.514 [17] clause 4.2.3.5), the PCF

- may modify the PCC rules in order to set the "reportingLevel" attribute to "SER_ID_LEVEL" or "RAT_GR_LEVEL" within the ChargingData data type which the PCC rule refers to and not include the "sponsorId" attribute and "appSvcProvId" attribute if they were included previously.
- may modify the PCC rules to update the charging key by setting the new value of the "ratingGroup" attribute within the ChargingData data type which the PCC rule refers to.

NOTE: A specific charging key can be applied to the sponsored data connectivity for online charging.

- shall disable the usage monitoring for the sponsored data connectivity according to clause 4.2.6.2.5 if it was enabled previously. As a result, PCF gets the accumulated usage of the sponsored data connectivity.

4.2.6.2.14 Support for PCC rule versioning

The support of PCC rule versioning is optional. When the "RuleVersioning" feature is supported, the SMF and the PCF shall comply with the procedures specified in this clause.

If required by operator policies, the PCF shall assign a content version for each generated PCC rule and shall include the assigned version in the "contVer" attribute included within the PccRule data structure. Upon each PCC rule modification, if the content version was previously assigned to a PCC rule, the PCF shall assign a new content version.

In this case, all the content related to that PCC rule shall be included. If the PCF needs to modify the attribute(s) within the PCC rule, the PCF shall include the new content version within the "contVer" attribute together with all modified and unmodified applicable attribute(s) within the PccRule data structure. If the PCF only needs to modify the content of referenced policy decision data and/or condition data for one or more PCC rules, the PCF shall additionally provide the PCC rule(s) which is referring to the modified policy decision data and/or condition data. Within each PCC rule instance, the PCF shall include all unmodified applicable attribute(s) and the new assigned version in the "contVer" attribute. The content version is unique for the lifetime of the PCC rule.

- NOTE 1: The PCF will include all the content of the PCC rule in each modification of the PCC rule in order to ensure that the rule is installed with the proper information regardless of the outcome of the QoS flow procedure related to previous rule provisioning versions that are not reported yet.
- NOTE 2: The operation policies can take into account whether the AF provides the related content version information over Rx reference point (see clause 4.4.9 in 3GPP TS 29.214 [18]), or over Npcf_PolicyAuthorization service (see clauses 4.2.2.13 and 4.2.3.13 in 3GPP TS 29.514 [17]).

Whenever the SMF provides a PCC rule report for rules that were provisioned with a content version, the SMF shall include the "contVers" attribute defined in the RuleReport data structure for those corresponding PCC rules. In case it is required to report the content version of multiple PCC rules, the SMF shall use one instance of RuleReport data structure per PCC rule, and shall include in the "pccRuleIds" attribute only the identifier of the corresponding PCC rule. The SMF may include more than one content version in the "contVers" attribute for the same PCC rule within the corresponding RuleReport instance included in the "ruleReports" attribute (e.g. the SMF has combined multiple PCC rule versions enforcement into one QoS flow operation). In this case, the "ruleStatus" attribute shall indicate the final status of the PCC rule.

NOTE 3: The PCF will use the content version to identify the PCC rule version that failed or succeeded when multiple provisions of the same PCC rule occur in a short period of time. If required by the AF, the PCF will inform the AF according to 3GPP TS 29.214 [18], clause 4.4.9, or according to 3GPP TS 29.514 [17], clause 4.2.5.8 about the failure or success for the media component version associated to the PCC rule version.

4.2.6.2.15 Background data transfer support

If the PCF receives Reference Id within the service information from the AF as defined in 3GPP TS 29.514 [17] or 3GPP TS 29.214 [18] or if "EnhancedBackgroundDataTransfer" feature as defined in clause 5.8 is supported and the PCF receives the Reference Id(s) within the PDU session related subscription information from the UDR as defined in 3GPP TS 29.519 [15], the PCF shall retrieve the corresponding transfer policy from the UDR based on the Reference Id(s) as defined in 3GPP TS 29.519 [15]. The PCF shall use the retrieved transfer policy as input for policy decisions (e.g. setting the charging key equal to the charging key of the transfer policy, rule activation/deactivation time according to the time window).

During PDU session establishment, if "EnhancedBackgroundDataTransfer" feature as defined in clause 5.8 is supported and if validation conditions (i.e. Time Window and/or Location Criteria) of the transfer policy are not satisfied then the PCF may reject corresponding SM Policy Association as defined in clause 4.2.2.2 and include in an HTTP "403 Forbidden" response message the "cause" attribute of the ProblemDetails data structure set to "VALIDATION_CONDITION_NOT_MET". And based on this feedback, the SMF shall reject the PDU session setup.

After successful PDU session establishment, if "EnhancedBackgroundDataTransfer" feature as defined in clause 5.8 is supported, PCF may request the PDU session termination if the validation conditions become not satisfied as defined in clause 4.2.3.3. Within the TerminationNotification, the PCF shall include the "cause" attribute set to "VALIDATION_CONDITION_NOT_MET".

If "BDTPolicyRenegotiation" feature as defined in clause 5.8 is supported and if the PCF retrieves the BDT policy and corresponding related information (e.g. network area information, the volume of data to be transferred per UE, etc.) within the BdtData data type, and with the "bdtpStatus" attribute within the BdtData data type set to value "INVALID", the PCF may reject the SM Policy Association establishment or defer to make the policy decisions until the PCF is informed of the result of BDT policy re-negotiation finally. If the PCF determines to reject the SM Policy Association establishment based on the invalid BDT policy, the PCF shall include in an HTTP "403 Forbidden" response message the "cause" attribute of the ProblemDetails data structure set to "INVALID_BDT_POLICY". If the PCF defers to make the policy decisions, then based on the result of the BDT policy renegotiation, the PCF may make the policy decisions or terminate the SM Policy Association as defined in this clause.

4.2.6.2.16 Number of supported packet filter for signalled QoS rule limitation support

If the PCF includes the flow information within the "flowInfos" attribute and if the number of supported packet filter for signalled QoS rules within the "numOfPackFilter" attribute is received from the SMF during the PDU session establishment, the PCF shall ensure that for all the dynamic PCC rules of a PDU session, the number of packet filters contained within the "flowDescription" attribute or the "ethFlowDescription" attribute with the "packetFilterUsage" set to true does not exceed the value of the "numOfPackFilter" attribute.

NOTE: The maximum number of packet filters sent to the UE per QoS rule is additionally limited by the access type. When the UE is camping in 5GS the number of packet filters is limited as specified in 3GPP TS 24.501[20].

If the PCF determines that there is a possibility to run into a restriction regarding the number of TFT packet filters that can be allocated for the PDU Session, interworking with N26 deployment is supported and "PackFiltAllocPrecedence" feature is supported, the PCF may behave as described in Annex B.3.2.0, B.3.3.0 and B.3.4.0.

4.2.6.2.17 Access traffic steering, switching and splitting support

If both the SMF and the PCF support the "ATSSS" feature as defined in clause 5.8, the PCF may enable the control of traffic steering, switching and splitting for a detected service data flow by including MA PDU Session control information within the PCC rule. In order to do so, within the PccRule data structure the PCF:

- may include one reference to the Charging Data data structure within the "refChgN3gData" attribute if the PCF determines that the specific charging parameters used for packets carried via Non-3GPP access. In this case, a "chgDecs" attribute containing the corresponding Charging Data policy decisions shall be included in the SmPolicyDecision data structure if it has not been provided;
- may include one reference to the UsageMonitoringData data structure within the "refUmN3gData" attribute if the PCF determines that the specific usage monitoring parameters used for packets carried via Non-3GPP access. In this case, a "umDecs" attribute containing the corresponding Usage Monitoring Data policy decisions shall be included in the SmPolicyDecision data structure if it has not been provided;
- may include the ATSSS rule application descriptor within "appDescriptor" attribute if the SDF template included in the PCC rule contains an Application Identifier in the "appId" attribute (see clause 4.2.6.2.1). The PCF may retrieve the OS Id(s) from the "UEPolicySet" resource in the UDR as described in 3GPP TS 29.519 [15] to determine, by internal configuration, the OS Application Identifier supported by the OS Id that corresponds to the application identifier included in the SDF template. If no OS Id is available in the UDR, the PCF may use the PEI to determine the OS Id supported by the UE;
- NOTE 1: If the PCF does not take into account the received PEI and/or the retrieved OSid(s) to derive the application descriptor, then the PCF can include in the PCC rule multiple application descriptors associated to multiple operating systems.
- NOTE 2: If only one UE OSid is stored in the UDR and the PCF takes it into account to derive the application descriptor, then the PCF can omit the OS Id in the application descriptor included in the PCC rule.
- may include the ATSSS policies within the Traffic Control Data decision which the PCC rule refers to. Within the TrafficControlData data structure, based on the ATSSS capability supported for the MA PDU Session, the PCF shall include:
 - a. the applicable access traffic steering method, "ATSSS_LL", "MPTCP" or, if the EnATSSS_v2 feature is supported, "MPQUIC", for the UL and DL traffic, encoded in the "steerFun" attribute;
- NOTE 3: When the feature EnATSSS_v2 is supported, the ATSSS-LL functionality is not supported together with the "REDUNDANT" steering mode. When the UE indicates it supports the ATSSS-LL functionality with any steering mode, it is implied that the UE supports the ATSSS-LL functionality with any steering mode except the "REDUNDANT" steering mode.
 - b. the steering rule for access traffic distribution across the 3GPP and Non-3GPP accesses encoded in a "SteeringMode" data structure within the "steerModeDl" attribute for the DL traffic and within the "steerModeUl" attribute for the UL traffic; and
 - c. if the EnATSSS_v2 feature is supported and the steering functionality within the "steerFun" attribute is set to "MPQUIC", the transport mode for transmitting a UDP flow between the UE and UPF encoded in the

"transMode" attribute. Otherwise, if the steering functionality is not MPQUIC, the transport mode shall not be included.

The "SteeringMode" data structure shall include:

- the steering mode value determined by the PCF within the "steerModeValue" attribute as follows:
 - a. "ACTIVE_STANDBY" indicates the traffic of a SDF is steered on one access (the Active access), when this access is available, and switched to the other access (the Standby access), when Active access becomes unavailable. When the Active access becomes available again, the SDF is switched back to this access. If the Standby access is not defined, then the SDF is only allowed on the Active access and cannot be transferred on another access.
 - b. "LOAD_BALANCING" indicates that the traffic of an SDF is split percentually between the 3GPP and Non-3GPP accesses.
 - c. "SMALLEST_DELAY" indicates that the traffic of an SDF is steered and/or switched to the access that has the smallest delay (e.g. smallest RTT).
 - d. "PRIORITY_BASED" indicates that the traffic of an SDF is steered to the high priority access until the access is determined to be congested. In this case, the traffic of the SDF is also sent to the low priority access, i.e. the SDF traffic is split over the two accesses. When the high priority access becomes unavailable, all SDF traffic is switched to the low priority access. How UE and UPF determine when a congestion occurs on an access is implementation dependent.
 - e. If both the SMF and the PCF support the "EnATSSS_v2" feature, "REDUNDANT" indicates that the traffic of an SDF may be duplicated on the 3GPP and Non-3GPP accesses; and
- when the access traffic steering mode in the "steerModeValue" attribute is "ACTIVE_STANDBY", the active access encoded within the "active" attribute, and the standby access, if defined, in the "standby" attribute; or
- when the access traffic steering mode in the "steerModeValue" attribute is "LOAD_BALANCING", the traffic load distributed across 3GPP and Non-3GPP accesses encoded within the "3gLoad" attribute as the 3GPP access traffic weight percentage. The sum of the Non-3GPP access traffic weight percentage and the 3GPP access traffic weight percentage must be 100; or
- when the access traffic steering mode in the "steerModeValue" attribute is "PRIORITY_BASED", the high priority access type encoded within the "prioAcc" attribute.

If the EnATSSS_v2 feature is supported, when the access traffic steerning mode in the "steerModeValue" attribute is "REDUNDANT", the "SteeringMode" data structure may include the primary access encoded within the "primary" attribute.

If the EnATSSS feature is supported, the PCF may provide either the steering mode indicator or the authorized threshold values for RTT and/or Packet Loss Rate within the "SteeringMode" data structure as follows:

- a. when the access traffic steering mode within the "steerModeValue" attribute is "LOAD_BALANCING" with fixed split percentages or "PRIORITY_BASED" or, when the EnATSSS_v2 feature is supported, "REDUNDANT", the PCF may provide, within the "thresValue" attribute, the authorized threshold value of RTT encoded in the "rttThres" attribute and/or the authorized threshold value of Packet Loss Rate encoded in the "plrThres" attribute.
 - For "LOAD_BALANCING" steering mode with fixed split percentages (i.e., without the "AUTO_LOAD_BALANCE" or "UE_ASSISTANCE" steering mode indicator), the traffic load distributed across accesses indicated in "3gLoad" attribute shall only apply when the measurement of RTT and/or Packet Loss Rate on both accesses do not exceed the values for RTT and/or Packet Loss Rate provided respectively in the "rttThres" and/or "plrThres" attributes. When at least one measured parameter on one access exceeds the provided threshold value, the UE and UPF may stop sending traffic on this access, or may continue sending traffic on this access, but should reduce the traffic on this access and shall send the amount of reduced traffic on the other access. How UE and UPF adjust the traffic load distributed across accesses is implementation dependent.
 - For "PRIORITY_BASED" steering mode, when the measurement of RTT and/or Packet Loss Rate on the high priority access type exceeds the values for RTT and/or Packet Loss Rate provided respectively in the

"rttThres" and/or "plrThres" attributes, this access may be considered as congested by the UE and the UPF. In this case, the traffic of the SDF is also sent to the low priority access.

- For "REDUNDANT" steering mode, and when the feature EnATSSS_v2 is supported:
 - i. When a threshold value is not provided (i.e., when RTT and Packet Loss Rate are not provided), the traffic of an SDF is duplicated on both accesses if both accesses are available. If a primary access is provided, the UE and the UPF send all data packets of the SDF on the primary access and may duplicate data packets of the SDF on the other access. If a primary access is not provided to the UE and UPF, the UE and UPF send all data packets of the SDF on both accesses.
 - ii. When a threshold value is provided, the duplication of the traffic of the SDF, by the UE and UPF, on both accesses shall only apply when the measurement of RTT or Packet Loss Rate on both accesses exceeds the values for RTT or Packet Loss Rate provided respectively in the "rttThres" or "plrThres" attributes. When the measured parameter (i.e., either RTT or Packet Loss Rate) exceeds the provided threshold value on one access only, the UE and UPF shall send the traffic of the SDF only over the other access. When the measured parameter (i.e., either RTT or Packet Loss Rate) does not exceed the provided threshold value on any access, the UE and UPF shall send the traffic of the SDF only over the primary access. If the primary access is not provided to the UE and UPF, UE and UPF select a primary access based on their own implementation (e.g., using the lowest RTT access or the lowest Packet Loss Rate acces). If measurement results on an access are not available for a parameter, it is considered that the measured parameter for this access has not exceeded the provided threshold value. When a threshold value is provided, the "REDUNDANT" steering mode is only used for Non-GBR SDF.
- b. when the access traffic steering mode in the "steerModeValue" attribute is "LOAD_BALANCING", the PCF may provide within the "steerModeInd" attribute:
 - "AUTO_LOAD_BALANCE", when the UE and UPF are allowed to autonomously determine the traffic load of an SDF distributed across accesses; or
 - "UE_ASSISTANCE", when the UE is allowed to decide how to distribute the UL traffic of an SDF and the UE may inform the UPF how it decided to distribute the UL traffic. In the normal cases, although with this indicator provided, the UE shall apply the Steering Mode provided by the network.

When the "steerModeInd" attribute is provided, the traffic load distributed across accesses indicated in "3gLoad" attribute may be ignored by the UE and UPF.

If the value of "atsssCapab" attribute received from the SMF is

"MPTCP_ATSSS_LL_WITH_EXSDMODE_DL_ASMODE_UL",

"MPQUIC_ATSSS_LL_WITH_EXSDMODE_DL_ASMODE_UL" or

"MPTCP_MPQUIC_ATSSS_LL_WITH_EXSDMODE_DL_ASMODE_UL", the PCF shall provide a PCC Rule for non-MPTCP/non-MPQUIC traffic. To enable non-MPTCP traffic/non-MPQUIC, the PCF shall include a "match all" packet filter within the "flowInfos" attribute, the highest value within the "precedence" attribute of the PCC rule, and within the TrafficControlData data structure referred by the PCC rule, set the "steerFun" attribute to the "ATSSS_LL", the "steerModeValue" attribute of the "steerModeUl" attribute to "ACTIVE_STANDBY", and the

"steerModeValue"attribute of the "steerModeDI" attribute to any supported steering mode except the

"SMALLEST_DELAY" and, when the EnATSSS_v2 feature is supported, "REDUNDANT" steering mode. How PCF assigns precedence value in packet filters for MPTCP and MPQUIC traffic, when both are supported, is implementation dependant.

If the value of "atsssCapab" received from the SMF is "MPTCP_ATSSS_LL_WITH_ASMODE_UL", "MPQUIC_ATSSS_LL_WITH_ASMODE_UL" or "MPTCP_MPQUIC_ATSSS_LL_WITH_ASMODE_UL", the PCF shall provide a PCC rule for non-MPTCP/non-MPQUIC traffic. To enable non-MPTCP/non-MPQUIC traffic, the PCF shall include a "match all" packet filter within the "flowInfos" attribute, the highest value within the "precedence" attribute of the PCC rule, and within the TrafficControlData data structure referred by the PCC rule, set the "steerFun" attribute to the "ATSSS_LL", the "steerModeValue"attribute of the "steerModeUl" attribute to "ACTIVE_STANDBY", and the "steerModeValue"attribute of the "steerModeDl" attribute to any supported steering mode except, when the feature EnATSSS_v2 is supported, the "REDUNDANT" steering mode. How PCF assigns precedence value in packet filters for MPTCP and MPQUIC traffic, when both are supported, is implementation dependant.

If the value of "atsssCapab" received from the SMF is "MPTCP_ATSSS_LL_WITH_ASMODE_DLUL", "MPQUIC_ATSSS_LL_WITH_ASMODE_DLUL" or "MPTCP_MPQUIC_ATSSS_LL_WITH_ASMODE_DLUL", the PCF shall provide a PCC rule for non-MPTCP/non-MPQUIC traffic. To enable non-MPTCP/non-MPQUIC traffic, the PCF shall include a "match all" packet filter within the "flowInfos" attribute, the highest value within the

"precedence" attribute of the PCC rule, and within the TrafficControlData data structure referred by the PCC rule, set the "steerFun" attribute to the "ATSSS_LL", the "steerModeValue"attribute of the "steerModeUl" attribute and the "steerModeDl" attribute to "ACTIVE_STANDBY. How PCF assigns precedence value in packet filters for MPTCP and MPQUIC traffic, when both are supported, is implementation dependant.

If the value of "atsssCapab" received from the SMF is "MPTCP_ATSSS_LL", "MPQUIC_ATSSS_LL" or "MPTCP_MPQUIC_ATSSS_LL", the PCF shall provide a PCC rule for non-MPTCP/non-MPQUIC traffic. To enable non-MPTCP/non-MPQUIC traffic, the PCF may include a "match all" packet filter within the "flowInfos" attribute, the highest value within the "precedence" attribute of the PCC rule, and within the TrafficControlData data structure referred by the PCC rule, set the "steerFun" attribute to the "ATSSS_LL", the "steerModeValue" attribute of the "steerModeUl" attribute and the "steerModeDl" attribute to any supported steering mode except, when the feature EnATSSS_v2 is supported, the "REDUNDANT" steering mode. How PCF assigns precedence value in packet filters for MPTCP and MPQUIC traffic, when both are supported, is implementation dependant.

Upon receipt of the PCC rule with the MA PDU Session control information, the SMF shall:

- derive the ATSSS rules to deliver to the UE for UL traffic steering as defined in 3GPP TS 29.502 [22]. When the EnATSSS feature is supported and the SMF received for UL traffic steering either the steering mode indicator within the "steerModeInd" attribute or the threshold value(s) within the "thresValue" attribute, the SMF includes the received steering mode indication or the received threshold value(s) in the derived ATSSS Rule sent to the UE as defined in 3GPP TS 29.502 [22]. When the EnATSSS_v2 feature is supported and the SMF received the primary access within the "primary" attribute and/or the transport mode within the "transMode" attribute, the SMF includes the received primary access and/or transport mode in the derived ATSSS Rule sent to the UE as defined in 3GPP TS 29.502 [22];
- NOTE 4: The Traffic Descriptor in the ATSSS rule is genereated by the SMF from the SDF template of the PCC rule. If the PccRule data structure contains the "flowInfos" attribute, the SMF uses the UL SDF filters for the generation of the IP descriptors or Non-IP descriptors. If the PccRule data structure contains the "appId" attribute, the SMF includes the application descriptors received from the PCF in the "appDescriptor" attribute of the PCC rule.
- derive the QoS profile and provide it to the access network(s) as follows:
 - for a Non-GBR QoS flow,
 - a) the SMF shall provide the QoS profile to both access networks if the UE is registered over both accesses during MA PDU Session Establishment procedure;
 - b) the SMF shall provide the QoS profile to the access networks over which the user plane resources are activated during MA PDU Session Modification procedure.
 - for a GBR QoS flow,
 - a) if the Multi Access policies of the PCC rule indicate the GBR SDF is handled only in one access (i.e., the SMF shall provide the QoS profile to the access network indicated by the PCC rule;
 - b) if the Multi Access policies of the PCC rule indicate the GBR SDF is handled in both accesses, the SMF shall decide to which access network to provide the QoS profile for the GBR SDF based on its local policy (e.g. the local policy is configured the access where the traffic is ongoing according to the Multi Access policies of the PCC rule).
 - c) for a GBR QoS flow, traffic splitting is not supported because the QoS profile is provided to a single access network at a given time, and the traffic can be steered or switched as indicated by the "ACTIVE_STANDBY" steering mode. If the SMF receives the report that the current active access is not available from the UPF, the SMF shall perform as follows:
 - if the corresponding PCC rule allows the GBR QoS flow only on this access or if the corresponding PCC rule allows the GBR QoS flow on both accesses but the other access is not available, the SMF shall release the resources for the GBR QoS flow and report to the PCF about the removal of the PCC rule as defined in clause 4.2.4.15.
 - if the corresponding PCC rule allows the GBR QoS flow on both accesses and the other access is
 available, the SMF shall try to move the GBR QoS flow to the other access. The SMF may trigger a
 PDU session modification procedure to provide the QoS profile to the other access and release the
 resources for the GBR QoS flow in the current access.

- if the QoS notification control is not enabled for the corresponding PCC rule and the other access does not accept the QoS profile, the SMF shall release the resources for the GBR QoS flow and report to the PCF about the removal of the PCC rule as defined in clause 4.2.4.15.
- if the QoS notification control is enabled for the corresponding PCC rule, the SMF shall notify the PCF within the "qncReports" attribute that the QoS targets of the SDFs are not guaranteed. After the other access accepts the QoS profile, the SMF shall notify the PCF within the "qncReports" attribute that the QoS targets of the SDFs are guaranteed again. If the other access does not accept the QoS profile, the SMF shall delete the GBR QoS flow and report to the PCF about the removal of the PCC rule as defined in clause 4.2.4.15.
- instruct the UPF for DL access traffic steering as defined in 3GPP TS 29.244 [13]. When the EnATSSS feature is supported and the SMF received for DL traffic steering either the steering mode indicator within the "steerModeInd" attribute or the threshold value(s) within the "thresValue" attribute, the SMF includes the received steering mode indication or the received threshold value(s) in the derived the multi-access rule sent to the UPF as defined in 3GPP TS 29.244 [13]. When the EnATSSS_v2 feature is supported and the SMF received the primary access within the "primary" attribute and/or the transport mode within the "transMode" attribute, the SMF includes the received primary access and/or transport mode in the derived multi-access rule sent to the UPF as defined in 3GPP TS 29.244 [13];
- apply charging information depending on the used access type if indicated in the PCC rule; and
- apply usage monitoring control depending on the used access type if indicated in the PCC rule.

If the EnATSSS_v2 feature is supported, when the SMF determines that for a PCC rule with Redundant Steering Mode the dedicated QoS flow over one of the redundant access could not be activated or has been terminated, the SMF, based on local policies, may determine to keep the affected PCC rule(s) and send an HTTP POST request to the PCF with an SmPolicyUpdateContextData data structure, including the "ruleReports" attribute containing the RuleReport data instance which specifies the affected PCC rules within the "pccRuleIds" attribute, "ACTIVE" as the value within the "ruleStatus" attribute, the "RES_ALLO_FAIL" as the value of the "failureCode". Additionally, the SMF shall provide the "relAccessInfo" attribute within SmPolicyUpdateContextData data structure with the access type which has the resource allocation failure for the PCC rule(s) with Redundant as Steering Mode. In this case, the PCF may decide on an implementation-specific course of action for handling a GBR SDF in which redundant traffic transmission is no longer feasible.

NOTE 4: For a MA PDU session, when all the resources allocated for a PCC rule failed or are terminated, the procedure specified in clause 4.2.4.7 applies. The PCF may update the steering rule for access traffic distribution across the 3GPP and Non-3GPP accesses for a PCC rule. In order to do so, the PCF may:

- within the corresponding PccRule data structure, include a new reference of a Traffic Control Data decision and provide the Traffic Control Data decision if not provided yet.
- update the Traffic Control Data decision by including the appropriate attribute value(s) within the "steerFun" attribute, "steerModeDl" attribute and/or "steerModeUl" attribute.

4.2.6.2.18 Void

4.2.6.2.19 Provisioning of PCC Rules for Mission Critical Services

4.2.6.2.19.1 General

The provision of PCC Rules corresponding to both MCS and non-MCS service shall be performed as described in clause 4.2.6.2.1 "Provisioning of PCC rules".

When the PCF derives PCC Rules corresponding to MCS service, the ARP and 5QI shall be set as appropriate for the prioritized service, e.g. an IMS Mission Critical Service. The PCF may authorize a standardized 5QI or a standardized 5QI with a specific 5QI priority level as defined in clause 4.2.6.6.2. The PCF may also authorize a non-standardized 5QI with explicitly signalled QoS characteristics as defined in clause 4.2.6.6.3.

At the time the Priority PDU connectivity services is invoked (i.e. Indication for support of priority PDU connectivity service and MCS Priority Level are set), the PCF shall upgrade the ARP and/or change 5QI for the PCC Rules to appropriate values as needed for MCS. The PCF shall change the ARP and/or 5QI (also associated QoS characteristics if applicable) modified for the priority PDU connectivity service to an appropriate value according to PCF decision.

When the PCF receives an HTTP POST message as defined in clause 4.2.2.1, the PCF shall check whether any of these parameters is stored in the UDR: indication for support of priority PDU connectivity service, indication for support of MCS Priority Level. The PCF shall derive the applicable PCC rules and default QoS flow QoS based on that information. If the indication of IMS priority service support is set and the "dnn" attribute corresponds to a DNN dedicated for IMS, the PCF shall assign an ARP corresponding to MCS for the default QoS flow and for the PCC Rules corresponding to the IMS signalling QoS flow. If the "dnn" does not correspond to a DNN dedicated for IMS, the ARP shall be derived without considering IMS Signalling Priority.

NOTE 1: Subscription data for MCS is provided to the PCF through the Nudr service.

Once the PCF receives a notification of a change in Priority PDU connectivity services support, MCS Priority Level and/or IMS priority service support from the UDR, the PCF shall make the corresponding policy decisions (i.e. ARP and/or 5QI (also associated QoS characteristics if applicable) change) and, if applicable, shall initiate an HTTP POST message as defined in clause 4.2.3.2 to provision the modified data.

NOTE 2: The details associated with the UDR service are specified in 3GPP TS 29.519 [15].

NOTE 3: The MCS Priority Level is one among other input data such as operator policy for the PCF to set the ARP.

Whenever one or more AF sessions of an MCS service are active within the same PDU session, the PCF shall ensure that the ARP priority level of the default QoS flow is at least as high as the highest ARP priority level used by any authorized PCC rules belonging to an MCS service. If the ARP pre-emption capability is enabled for any of the authorized PCC rules belonging to an MCS service, the PCF shall also enable the ARP pre-emption capability for the default QoS Flow.

NOTE 4: This ensures that services using dedicated QoS flows are not terminated because of a default QoS flow with a lower ARP priority level or disabled ARP pre-emption capability being dropped during mobility events.

NOTE 5: This PCF capability does not cover interactions with services other than MCS services.

4.2.6.2.19.2 Invocation/Revocation of Priority PDU connectivity services

When a Priority PDU connectivity services is invoked, the PCF shall:

- Derive the corresponding PCC Rules with the ARP and 5QI (also associated QoS characteristics if applicable) set as appropriate for a prioritized service.
- Set the ARP of the default QoS flow as appropriate for a Priority PDU connectivity services under consideration of the requirement described in clause 4.2.6.2.19.1.
- Set the 5QI (also associated QoS characteristics if applicable) of the default QoS flow as appropriate for the Priority PDU connectivity services.
- Set the ARP of PCC Rules installed before the activation of the Priority PDU connectivity services to the ARP as appropriate for the Priority PDU connectivity services under the consideration of the requirements described in clause 4.2.6.2.19.1.
- Set the 5QI of the PCC Rules installed before the activation of the Priority PDU connectivity services to the 5QI
 (also associated QoS characteristics if applicable) as appropriate for the Priority PDU connectivity services if
 modification of the 5QI of the PCC Rules is required.

When a Priority PDU connectivity services is revoked, the PCF shall:

- Delete the PCC Rules corresponding to the Priority PDU connectivity services if they were previously provided.
- Set the ARP of the default QoS flow to the normal ARP under the consideration of the requirements described in clause 4.2.6.2.19.1.
- Set the 5QI of the default QoS flow as appropriate for PCF decision.
- Set the ARP of all active PCC Rules as appropriate for the PCF under the consideration of the requirements described in clause 4.2.6.2.19.1.

- Set the 5QI to an appropriate value according to PCF decision if modification of the 5QI of PCC Rules is required.

NOTE: Priority PDU connectivity services can be explicitly invoked/revoked via UDR MCS user profile (Indication of Priority PDU connectivity services, MCS Priority Level). An AF for MCS Priority Service can also be used to provide Priority PDU connectivity services using network-initiated resource allocation procedures (via interaction with PCC) for originating accesses.

The PCF shall provision the SMF with the applicable PCC Rules upon Priority PDU connectivity services activation and deactivation as described above. The provision of the QoS information applicable for the PCC Rules shall be performed as described in clause 4.5.6.2. The provision of QoS information for the default QoS flow shall be performed as described in clause 4.2.6.3.

4.2.6.2.19.3 Invocation/Revocation of IMS Mission Critical Services

If the PCF receives service information including an MCS session indication and the service priority level from the P-CSCF or at reception of the indication that IMS priority service is active for the PDU session, the PCF shall under consideration of the requirements described in clause 4.2.6.2.19.1:

- if required, set the ARP and 5QI (also associated QoS characteristics if applicable) of the default QoS flow as appropriate for the prioritized service;
- if required, set the ARP and 5QI (also associated QoS characteristics if applicable) of all PCC rules assigned to the IMS signalling QoS flow as appropriate for IMS Mission Critical Services;
- derive the PCC Rules corresponding to the IMS Mission Critical Service and set the ARP and 5QI (also associated QoS characteristics if applicable) of these PCC Rules based on the information received over N5/Rx.

If the PCF detects that the P-CSCF released all the MCS session and the IMS priority service has been deactivated for the PDU session the PCF shall under consideration of the requirements described in clause 4.2.6.2.19.1:

- delete the PCC Rules corresponding to the IMS Mission Critical Service;
- if required, set the ARP and 5QI of the default QoS flow as appropriate for the IMS Mission Critical set to inactive;
- replace the ARP and 5QI of all PCC Rules assigned to the IMS signalling QoS flow as appropriate when the IMS Mission Critical Service is inactive.

4.2.6.2.20 PCC rules authorization with preliminary service information

If the PCF receives a request for PCC rules for a PDU session from the SMF, while no suitable authorized PCC rules are configured in the PCF or can be derived from service information provisioned by an AF, but the user is allowed to access AF session based services, the PCF may, depending e.g. on the user's subscription details or operator policy, authorise the requested QoS for a timer supervised grace period (the timer started by the PCF by the request from the SMF) to wait for AF service information. If an AF session bound to the same PDU session is ongoing and only preliminary service information was received within this AF session, the PCF shall base the authorization of the requested QoS on the preliminary service information.

- NOTE 1: This scenario can for instance be encountered for a UE terminated IMS session establishment or modification with UE initiated resource reservation, refer to 3GPP TS 29.214 [18] or 3GPP TS 29.514 [17]. If the PCF does not authorize a request for PCC rules in this scenario, the IMS session setup can fail.
- NOTE 2: During the grace period, the QoS and packet filters requested by the UE need to be authorized even if the user is not allowed to request for resources for services not known to the PCF or if the requested 5QI is not allowed for services not known to the PCF as it is not clear at this point in time whether the UE resource request belongs to an AF session or to a service not known to the PCF.

If the preliminary service information is insufficient to construct appropriate PCC rules or no preliminary service information is available, the PCF shall provide preliminary PCC rules to authorize the UE requested QoS and packet filters. Therefore, the preliminary PCC rules shall contain wildcarded flow description or flow description derived from possible packet filters received as part of the request for PCC rules. The PCF may apply a dedicated charging key value to indicate to the charging subsystem that the charging key is preliminary and may be corrected later on.

NOTE 3: With the dedicated charging key, the PCF instructs the charging subsystem to recalculate the applicable charge for the time when the dedicated charging key value was applied once the dedicated charging key value is replaced with some other value in a new provisioning of PCC rules. For example, if online charging applies, Session Charging with Unit Reservation (SCUR) can be used .When the charging key changes, the SMF will return initially reserved credit units and the CHF then can recalculate the consumed credit units applying the rate derived from the new other charging key value and update the user's credit accordingly.

NOTE 4: A preliminary PCC rule is a normal PCC rule containing preliminary information.

If the PCF receives AF service information while the timer-supervised grace period is running, the PCF shall stop the timer and may derive authorized PCC rules from this service information and update or replace the preliminary PCC rules that were previously provided for the UE requested QoS and packet filters, for instance by choosing service specific QoS parameters and charging keys.

NOTE 5: The dedicated preliminary charging key value that was previously provided by the PCF instructs the charging subsystem to recalculate the applicable charge when the new service specific charging key is provided. The recalculation covers the time when the previous dedicated charging key value was active. The new service specific charging key is applied from that time onwards.

If the timer expires and the PCF has not received any AF service information, the PCF should apply the policy for services not known to the PCF and may downgrade or revoke the authorization for the preliminary PCC rules (previously provided for the UE requested QoS and packet filters) in accordance with the policy for services not known to the PCF. The PCF should adjust the charging keys within the PCC rules and should downgrade the authorized QoS to the allowed value for the services not known to the PCF, if required.

4.2.6.2.21 Policy Control for L4S

When the "L4S" feature is supported, and the PCF is configured to provide an explicit indicator to the SMF to enable ECN marking for L4S, this procedure is used by the PCF to explicitly indicate that the UL and/or DL traffic identified by SDF template supports ECN marking for L4S support.

If the AF provides an explicit indication that the UL and/or DL service data flow supports ECN marking for L4S as defined in 3GPP TS 29.514 [17], or the PCF determines, based on locally configured policies, that the UL and/or DL traffic of the SDF template support ECN marking for L4S, then the PCF may explicitly or implicitly (based on local configuration), indicate to the SMF to enable ECN marking for L4S.

The PCF shall provide to the SMF the explicit indication of support of ECN marking for L4S by installing PCC rules and the implicit indication by installing or activating PCC rule(s).

The provisioning of the explicit indication of ECN marking for L4S support per PCC rule shall be performed using the PCC rule provisioning procedure as defined in clause 4.2.6.2.1 and shall be provided using the "l4sInd" attribute within the TrafficControlData the PCC rule refers to. The "l4sInd" attribute shall be set to "UL", "DL" or "UL_DL" to indicate respectively whether the UL, the DL, or both, UL and DL, service data flow(s) of the SDF template of the PCC rule support ECN marking for L4S.

When the SMF receives the indication that ECN marking for L4S is supported for the UL and/or DL traffic of the PCC rule, may decide, based on operator's network configuration and policies, to enable for the QoS flow the ECN marking for L4S in either the NG-RAN, as specified in 3GPP TS 29.502 [22], or in the PSA UPF as specified in 3GPP TS 29.244 [13].

NOTE: When the ECN marking for L4S is performed by UPF, the NG-RAN is instructed to perform congestion information monitoring, as specified in 3GPP TS 29.502 [22].

In case of inter NG-RAN UE mobility, if the ECN marking for L4S has been enabled on source NG-RAN, but the target NG-RAN does not support ECN marking for L4S, then the SMF may enable ECN marking for L4S in PSA UPF.

When serving PSA UPF or NG-RAN is changed e.g., due to inter-NG-RAN handover or PSA UPF relocation, target NG-RAN and PSA UPF should keep the current congestion exposure method. However, if not available (e.g., ECN marking for L4S is not used anymore in 5GS), the PCF provisioned the "L4S_SUPP" policy control request trigger, the SMF may notify the PCF about ECN marking not supported. At a subsequent PSA UPF or NG-RAN change, the SMF may determine the target NG-RAN and/or PSA UPF may support the congestion exposure method again and may notify the PCF about ECN marking is supported again. In these cases, the SMF shall invoke the Npcf_SMPolicyControl_Update procedure and shall include within the SmPolicyUpdateContextData, including the

"L4S_SUPP" within "repPolicyCtrlReqTriggers" attribute and the "l4sReports" attribute. In each L4sSupportInfo data structure, the SMF shall include the indication that ECN marking for L4S is not available or is available again within the "notifType" attribute and affected PCC rule identifiers within the "refPccRuleIds" attribute. The PCF may notify the affected AF(s) as specified 3GPP TS 29.514 [17].

4.2.6.2.22 UL/DL policy control based on Round-Trip latency requirements

If the "RTLatency" feature as defined in clause 5.8 of 3GPP TS 29.514 [17] is supported, the AF may provide the Round-Trip (RT) latency indication together with a single direction delay requirement for the UL and DL flow directions between UE and the PSA UPF (i.e. PDB) as specified in 3GPP TS 29.514 [17]:

- The Round-Trip (RT) latency indication indicates that the Round-Trip delay of a service data flow or two service data flows between UE and PSA UPF needs to meet the RT latency requirement provided by the AF.
- The RT latency requirement of a service data flow is twice the single direction delay requirement between the UE and the PSA UPF. The RT latency requirement of two service data flows is the sum of the UL and DL latency requirements between the UE and the PSA UPF. The AF indicates the delay requirements by the sent QoS reference parameter or the sent individual QoS parameter.

If the AF provided the RT latency indication and RT latency requirement as defined in 3GPP TS 29.514 [17], the PCF may split the RT latency requirement into two PDBs of two PCC rules, one for UL traffic and the other one for DL traffic. The two PDBs can be unequal, but their sum shall not exceed the RT latency requirement.

NOTE: RT latency indication and RT latency requirement can also be locally configured in the PCF.

To enable RT latency requirement tracking, the PCF shall generate associated UL and DL packet delay QoS monitoring policies in the PCC rules associated to the two correlated UL and DL QoS flows as described in clause 4.2.3.25. The UL and DL packet delay for the two PCC rules shall be tracked by PCF independently with same reporting period. When the QoS monitoring results are reported to PCF, the PCF may update one or both PCC rules to adjust the UL PDB and DL PDB to better fit the situation.

4.2.6.2.23 Policy Decision for AF requested QoS for a target UE or group of UE(s) not identified by UE address(es)

When the AF requested QoS for a UE or group UE(s), the requested QoS data may be either provisioned by the AF/NEF to the TSCTSCF, and later to the PCF for the related active PDU session(s), as specified in 3GPP TS 29.565 [53] and 3GPP TS 29.514 [17], or stored by the AF/NEF at the UDR and later retrieved by the PCF for the related active PDU session(s), as defined in 3GPP TS 29.519 [15].

When the PCF needs to make Policy Decision(s) and derive PCC Rule(s) for a PDU session corresponding to the concerned UE or group of UE(s), the PCF shall take into consideration the received AF requested QoS data, if applicable, and may provide to the SMF the policy control trigger(s) corresponding to the AF subscribed event(s) as defined in clause 4.2.6.4, or activate/modify/remove PCC rule(s) as defined in clause 4.2.3.2.

When the SMF notifies the PCF about the met policy control request trigger(s) corresponding to the AF subscribed event(s), the PCF may notify either the TSCTSF or the AF/NEF, as defined in 3GPP TS 29.514 [17], based on whether the requested QoS data was provisioned via the TSCTSF or the UDR.

4.2.6.3 Session Rules

4.2.6.3.1 Overview

The PCF may perform operations on session rules. The impacted rules shall be included in the "sessRules" map attribute within the SmPolicyDecision data structure with the "sessRuleId" as a key. For installing or modifying a session rule, the corresponding SessionRule data instance shall be provided as the map entry value. For removing a session rule, the map entry value shall be set to NULL.

In order to install a new session rule, the PCF shall further set other attributes within the SessionRule data structure as follows:

- if the "subsSessAmbr" has been previously received by the PCF, it shall include the authorized Session-AMBR within the "authSessAmbr" attribute;

- when the "subsDefQos" has been previously received by the PCF, it shall include the authorized default QoS within the "authDefQos" attribute using the procedure as defined in clause 4.2.6.3.3;
- it may include one reference to the UsageMonitoringData data structure within the "refUmData" attribute. In this case, a "umDecs" attribute containing the corresponding Usage Monitoring data policy decisions shall be included in SmPolicyDecision data structure if it has not been previously provided;
- if the "ATSSS" feature is supported, it may include one reference to the UsageMonitoringData data structure to apply for the Non-3GPP access within the "refUmN3gData" attribute. In this case, a "umDecs" attribute containing the corresponding Usage Monitoring data policy decisions shall be included in SmPolicyDecision data structure if it has not been previously provided; and
- it may include one reference to the ConditionData data structure within the "refCondData" attribute. In this case, a "conds" attribute containing the corresponding Condition Data decision shall be included in SmPolicyDecision data structure if it has not been previously provided.

In order to modify an existing session rule, the PCF shall further set other attributes within the SessionRule data structure as follows:

- If the PCF needs to modify the attribute(s) within a session rule, the PCF shall include the modified attribute(s) with the new value(s) within the SessionRule data instance. Previously supplied attributes not supplied in the modified PCC rule instance shall remain valid.
- If the PCF only needs to modify the content of referenced policy decision data (e.g. UsageMonitoringData, etc.) and/or condition data for one or more session rules, the PCF shall, within the SmPolicyDecision data structure, include the corresponding policy decision data and/or condition data within the corresponding map attributes (e.g. include the usage monitoring data decision within the "umDecs" attribute).

The PCF may combine multiple of the above session rule operations in a single message, but the PCF shall ensure that one and only one session rule is enforced in the SMF at a certain point in time.

NOTE: Either there is always an unconditional session rule provisioned in the NF service consumer (SMF), or there is always a conditioned session rule applicable in the NF service consumer (SMF).

4.2.6.3.2 Conditioned Session rule

4.2.6.3.2.1 General

Up to four conditioned session rules (i.e. authorized Session-AMBR and authorized default QoS) may be provisioned by the PCF. In order to provision a session rule with conditional data, the PCF shall provision a session rule as defined in clause 4.2.6.3.1 and include within its "refCondData" attribute the corresponding ConditionData's "condId" attribute value. The PCF shall also ensure that the referenced ConditionData instance is included in the "conds" map within the SmPolicyDecision data structure following the procedures defined in clause 4.2.6.1 and that the referenced usage monitoring data is the same for all the provisioned conditioned and non-conditioned session rule(s).

Within the ConditionData instance, the PCF shall include the activation time within the "activationTime" attribute for the time conditioned authorized Session-AMBR and authorized default QoS (deactivation time does not apply for a session rule). If the "AccessTypeCondition" feature as defined in clause 5.8 is supported, the PCF may include for the access type conditioned session rule the access type within the "accessType" attribute and RAT type within the "ratType" attribute if applicable for the access type conditioned authorized Session-AMBR.

NOTE 1: The SMF retains remaining time conditioned session rules that have an execution time in the future.

NOTE 2: Time condition and access type condition can both apply to authorize the Session-AMBR within a session rule.

The PCF shall ensure that a time conditioned session rule and a session rule without time condition for the same session differ only in the authorized session-AMBR and authorized default OoS properties.

When the SMF detects that the referenced usage monitoring data of the enforced session rule is not the same for all the provisioned session rule(s) the SMF shall report the session rule error for the not enforced session rule(s) as defined in clauses 4.2.3.20 and 4.2.4.21, and shall set the "failureCode" attribute to "INCORRECT_UM".

If the SMF receives the conditioned session rule, when the condition indicated in the related attribute(s) within the Condition Data decision (e.g. at the time indicated in the "activationTime" attribute) is met, the SMF shall perform the conditional policy without interaction with the PCF. If the Condition Data decision includes more than one type of conditions and all the types of conditions are met, the SMF shall perform the conditional policy.

If time conditioned session rule(s) to change the non-conditioned session rule are received by the SMF and the earliest Activation Time is in the past, then the SMF shall immediately enforce the most recent time conditioned instance that is not in the future.

The PCF may modify a currently installed session rule, including setting, modifying or deleting its condition(s) as follows:

- 1) When modifying a session rule by setting the condition(s), the PCF shall update the session rule by including the corresponding ConditionData's "condId" attribute value within the "refCondData" attribute and within the SmPolicyDecision data structure include the ConditionData instance within the "conds" attribute if not provisioned yet.
- 2) When modifying a session rule by modifying the condition(s):
 - the PCF may update the session rule by replacing the existing ConditionData instance's "condId" attribute value within the "refCondData" attribute with a new one and within the SmPolicyDecision data structure include the new ConditionData instance within the "conds" attribute if not provisioned yet; or
 - the PCF may update the condition data decision which the session rule refers to by updating the corresponding ConditionData instance as defined in clause 4.2.6.1. The PCF may update the value of the condition within the related attribute (e.g. the value of the existing deferred activation time within the "activationTime" attribute).
- 3) When modifying a session rule by deleting the condition(s):
 - the PCF shall delete the reference to the ConditionData instance within the session rule by updating session rule with the "refCondData" attribute set to NULL; and
 - the PCF may delete the condition data decision which the session rule refers to as defined in clause 4.2.6.1 if no other session rules are referring to the condition data decision.

To delete a conditioned session rule, the PCF shall perform the deletion of session rule as defined in clause 4.2.6.3.1. The "ueTimeZone" attribute, if available, may be used by the PCF to derive the value for the "activationTime" attribute.

- NOTE 3: Conditioned Session-AMBR and default QoS change helps reducing the signalling load over N7. However, the Session-AMBR and default QoS change needs to be communicated to the UE. Consequently a simultaneous change of the Session-AMBR and default QoS for many UE(s) may introduce a signalling storm in the 5GC (e.g. over N1/N2/N4/N11). The PCF can avoid this simultaneous change of the Session-AMBRSession-AMBR and default QoS (e.g. spread the time conditioned change over time for many UEs).
- NOTE 4: For services that depend on specific Session-AMBR and/or default QoS change (e.g. an MPS session), the PCF is responsible to ensure that no conditioned session rules interfere with the service (e.g., ensure proper MPS operation by removing time conditioned settings that would later impact MPS).

4.2.6.3.2.2 Time conditioned authorized Session-AMBR

The procedures in clause 4.2.6.3.2.1 apply with clarifications in the present clause.

Each instance of the session rule shall include authorized Session-AMBR within the "authSessAmbr" attribute.

If the "VPLMN-QoS-Control" feature is supported and the PCF receives the session AMBR constraints from the SMF, the PCF shall ensure that the authorized session AMBR value within each instance of the session rule does not exceed the session AMBR supported by the VPLMN, if applicable.

The SMF shall, after applying a time conditioned instruction to change the authorized AMBR, apply the corresponding procedures towards to the access network, the UE and the UPF for the enforcement of the AMBR per PDU session.

4.2.6.3.2.3 Time conditioned authorized default QoS

The procedures in clause 4.2.6.3.2.1 apply with clarifications in the present clause.

Each instance of the session rule shall include authorized default QoS within the "authDefQos" attribute.

If the "VPLMN-QoS-Control" feature is supported and the PCF receives the default QoS constraints from the SMF, the PCF shall ensure that the authorized default QoS containing 5QI, ARP and, if the feature "VPLMN-5QIPrioLevel" is supported, 5qiPriorityLevel (when the required 5QI Priority Level is different from the standardized Default Priority Level value in the QoS characteristics Table 5.7.4-1 in 3GPP TS 23.501 [2]), values within each instance of the session rule is supported by the VPLMN, if applicable.

The SMF shall, after applying a time conditioned instruction to change the authorized default QoS, apply the corresponding procedures towards to the access network, the UE and the UPF for the enforcement of the authorized default QoS. All PCC rule(s) with the "defQosFlowIndication" attribute set to true shall remain bound to the default QoS flow. For any other PCC rule previously bound to the default QoS flow, SMF shall then perform the QoS flow binding according to clause 6.4 in 3GPP TS 29.513 [7].

4.2.6.3.2.4 Access type conditioned authorized Session-AMBR

The SMF shall enforce the Session-AMBR values corresponding to the session rule whose referred ConditionData instance contains the "accessType" attribute and "ratType" attribute matching the current access type and RAT type of the UE for the given PDU session. If the "VPLMN-QoS-Control" feature is supported and the PCF receives the session AMBR constraints from the SMF, the PCF shall ensure that the authorized session AMBR value within each instance of the session rule does not exceed the session AMBR supported by the VPLMN, if applicable.

The PCF shall ensure that an access type conditioned session rule and a session rule without any access type condition for the same session differ only in the authorized session-AMBR property. If more than one access type conditioned session rules are provisioned, and if there is no session rule without any access type condition provisioned in the SMF, the PCF shall ensure that any two access type conditioned session rules for the same session differ only in the authorized session-AMBR property.

NOTE: Access type conditions are only applicable to the authorized session-AMBR.

If there is a session rule whose authorized Session-AMBR does not depend on any access type condition provided and there is also a session rule with an access type conditioned authorized Session-AMBR provided, then the access type conditioned session rule where the conditions specified within the Condition Data decision are met shall be enforced. Otherwise, the session rule with the authorized Session-AMBR without any access type condition shall be enforced.

If conditions from multiple access type conditioned the session rule with authorized Session-AMBR are met at the same time then the session rule related to the most strict matching condition is enforced, e.g. Policy1 specifies access type only and Policy2 specifies access type (with the value same as in Policy1) and an RAT Type, both, then the Policy2 shall be enforced when the UE's current access type and RAT type matches with the condition specified by Policy2.

If conditions from multiple access type conditioned the session rule with authorized Session-AMBR are met at the same time and all of these policies are equally applicable, e.g. Policy1 specifies access type only and Policy2 specifies RAT type only and if the UE's current access type matches with Policy1 and the UE's current RAT type matches with Policy2, then the SMF should apply the Session-AMBR with Policy2.

An access type conditioned session rule does not apply to a MA PDU session. When the "ATSSS" feature is supported, and the PDU session is a MA PDU session, the PCF shall not provide to the SMF access type conditioned session rules. If access type conditioned session rules are provisioned in the SMF for a MA PDU session (e.g. because of error in the PCF or EPS to 5GS handover) they shall be ignored.

4.2.6.3.3 Provisioning of authorized default QoS

The PCF can provide the authorized default QoS for a session rule to the SMF. The provisioning of authorized default QoS for a session rule shall be performed using the session rule provisioning procedure as defined in clause 4.2.6.3.1. The authorized default QoS shall be encoded using an AuthorizedDefaultQos data structure.

In order to provision authorized default QoS for a new session rule, the PCF shall include the assigned 5QI value within the "5qi" attribute and the assigned ARP value within the "arp" attribute in the AuthorizedDefaultQos data structure. The PCF may include the "priorityLevel" attribute in the AuthorizedDefaultQos data structure to authorize the particular 5QI priority level to override the default value for a standardized or pre-configured 5QI. The PCF may

include a "QosCharacteristics" entry in the "qosChars" attribute map to provide explicitly signalled QoS characteristics associated with a 5QI that is neither standardized nor pre-configured. When the authorized default QoS applies to explicitly signalled QoS Characteristics, it shall be provisioned as defined in clause 4.2.6.6.3. For 5QI of GBR type or delay critical GBR type, the PCF shall additionally include max bandwidth in uplink within the "maxbrUl" attribute and/or max bandwidth in downlink within the "maxbrDl" attribute, the guaranteed bandwidth in uplink within the "gbrUl" attribute and/or the guaranteed bandwidth in downlink within the "gbrDl" attribute and may include the particular averaging window within the "averWindow" attribute and/or particular maximum data burst volume within the "maxDataBurstVol" or "extMaxDataBurstVol" (if supported, see clause 4.2.2.1) attribute to override the default values for a standardized or pre-configured 5QI.

In order to modify authorized default QoS for an existing session rule, the PCF shall include the modified attribute(s) with the new value(s) within the AuthorizedDefaultQos data structure and provision a new QoS Characteristics if applicable. Previously supplied attributes not supplied in the AuthorizedDefaultQos data structure shall remain valid.

4.2.6.3.4 Access traffic steering, switching and splitting support

If both the SMF and the PCF support the "ATSSS" feature, the PCF may enable the control of the PDU session level Usage Monitoring information depending on what access type is used to carry service data flows.

When the PCF determines that at PDU session level different usage monitoring data shall be defined for the 3GPP and the Non-3GPP access, the PCF shall include within the SessionRule data structure one reference to the UsageMonitoringData policy decision to apply for the Non-3GPP access within the "refUmN3gData" attribute, and a "umDecs" attribute containing the corresponding Usage Monitoring Data policy decisions if it has not been previously provided. When the "refUmN3gData" is omitted, the attribute "refUmData" contains the reference to the UsageMonitoringData policy decision to apply for both, 3GPP and Non-3GPP, accesses.

NOTE: To ensure that the traffic of a set of service data flows is excluded for both, the 3GPP access and Non-3GPP access, from the PDU session level usage monitoring, the "exUsagePccRuleIds" attribute is set to the same value within the Usage Monitoring Control decision referred by the "refUmN3gData" attribute and within the Usage Monitoring Control decision referred by the "refUmData" attribute.

4.2.6.3.5 Usage Monitoring Control

Usage monitoring may be performed for all the traffic of a PDU session in the SMF or for all the traffic of a PDU session excluding the traffic of a service data flow or a group of service data flows.

The provisioning of usage monitoring control for the traffic of a PDU session shall be performed using the session rule provisioning procedure as defined in clause 4.2.6.3.1. When the traffic of a service data flow or a group of service data flows is excluded from the traffic of the PDU session, the UsageMonitoringData policy decision referred within the "refUmData" attribute, and/or the UsageMonitoringData policy decision referred within the "refUmN3gData" attribute when the "ATSSS" feature is supported, shall include the "exUsagePccRuleIds" attribute as defined in clause 4.2.6.5.3.1.

Usage monitoring for all the session rules (conditioned and non-conditioned) shall refer to the same UsageMonitoringData policy decision(s), i.e., the monitoring key that applies to all the traffic of a PDU session, or to all the traffic of a PDU session except certain service data flow(s), shall not change because of the activation of a conditioned session rule.

4.2.6.4 Policy control request triggers

The PCF may provide one or several policy control request trigger(s) to the SMF. In order to do so, the PCF shall include one or several policy control request trigger(s) within the "policyCtrlReqTriggers" attribute within the SmPolicyDecision data structure.

During the lifetime of the PDU session, the PCF may update or remove the policy control request triggers. In order to update the policy control request trigger, the PCF shall provide the new complete list of applicable policy control request triggers by including one or several policy control request trigger(s) within the "policyCtrlReqTriggers" attribute within the SmPolicyDecision data structure.

The PCF may remove all previously provided policy control request triggers by providing a "policyCtrlReqTriggers" attribute set to the value NULL. Upon reception of a policy control request trigger with this value, the SMF shall not

inform PCF of any trigger except for those triggers that are always reported and do not require provisioning from the PCF.

Whenever the PCF provisions one or several policy control request trigger(s) by using an HTTP POST message as defined in clause 4.2.3.2, unless otherwise specified in a policy control request trigger's value definition, the SMF shall send the corresponding currently applicable values (e.g. access type, RAT type, user location information, etc.) to the PCF within the UeCampingRep data structure in the response of the HTTP POST message, and in this case, the "repPolicyCtrlReqTriggers" attribute shall not be included.

4.2.6.5 Encoding of the request of information reporting

4.2.6.5.1 Request of Access Network Charging Identifier

When the Access Network Charging Identifier is unknown for an AF session to the PCF, the PCF may request the SMF to provide the Access Network Charging Identifier associated to the dynamic PCC rules. To do so, the PCF shall within SmPolicyDecision data structure provide the "policyCtrlReqTriggers" attribute with the value "AN_CH_COR" if the policy control request trigger is not previously set and the "lastReqRuleData" attribute. For the RequestedRuleData instance, the PCF shall include the CH_ID within the "reqData" attribute and reference of the PCC rule within the "refPccRuleIds" attribute.

The PCF shall interpret that the Access Network Charging Identifier is known when the PCF receives an "accNetChId" attribute with the "sessionChScope" attribute included and set to true as defined in clause 4.2.2.11 and 4.2.4.13.

4.2.6.5.2 RAN NAS Cause Support

When the RAN-NAS-Cause feature is supported, the PCF may request the SMF to inform it of the result of PCC rule(s) removal, when the PCF removes PCC rule(s). In order to do so, the PCF shall additionally include the "policyCtrlReqTriggers" attribute containing the "RES_RELEASE" value if this policy control request trigger was not previously set, and the "lastReqRuleData" attribute. Within the RequestedRuleData instance, the PCF shall include the "RES_RELEASE" value within the "reqData" attribute and reference the removed PCC rule within the "refPccRuleIds" attribute.

NOTE: This is done to allow the PCF to notify the AF when there is an abnormal termination of the QoS flow. The PCF does not have to retry the removal of these PCC Rules.

4.2.6.5.3 Provisioning of the Usage Monitoring Control Policy

4.2.6.5.3.1 General

The PCF may indicate the need to apply monitoring control of the accumulated usage of network resources on a per PDU session basis. Usage is defined as volume or time of user plane traffic. Monitoring for traffic volume and traffic time can be performed in parallel. The data collection for usage monitoring control shall be performed per monitoring key, which may apply to a single service data flow, a set of service data flows or all the traffic in a PDU session. If usage monitoring at PDU session level is enabled, the PCF may request the SMF to exclude a single service data flow or a set of service data flows from usage monitoring at PDU session level.

During PDU session establishment, the PCF may receive information from the UDR about total the allowed usage per DNN / S-NSSAI combination and UE, i.e. the overall amount of allowed traffic volume and/or time of usage that are to be monitored per DNN / S-NSSAI combination and UE and/or the total allowed usage for Monitoring key(s) per DNN / S-NSSAI combination and UE.

NOTE 1: It depends on the implementation of UDR whether to provide the total allowed usage per DNN / S-NSSAI combination and UE to different PCFs if these different PCFs are serving PDU sessions with the same value of DNN / S-NSSAI combination and UE.

If the SMF supports the UMC feature, the PCF may request usage monitoring control for a PDU session. If at that time the PCF has not provided "US_RE" policy control request trigger to the SMF, the PCF shall include the "policyCtrlReqTriggers" attribute with the value "US_RE" and provide it to the SMF as defined in clause 4.2.6.4. The PCF shall not remove the "US_RE" policy control request trigger while usage monitoring is still active in the SMF.

At PDU session establishment and modification, the PCF may provide to the SMF, for each usage monitoring control instance, the applicable threshold(s), i.e. volume threshold, time threshold or both volume threshold and time threshold.

To provide the initial threshold(s) for each usage monitoring control instance, the PCF shall include these threshold(s) within the "umDecs" attribute within the SmPolicyDecision data structure.

The PCF may provide a monitoring time to the SMF for the usage monitoring control instance(s) and optionally specify a subsequent threshold value for the usage after the monitoring time.

NOTE 2: The PCF can provide only one threshold or one threshold and one subsequent threshold in the case that monitoring time is provided. When only the threshold is provided, the UPF resets the usage threshold to the remaining value of the threshold at the monitoring time; when the threshold and subsequent threshold are provided, the UPF resets the usage threshold to the value of the subsequent threshold at the monitoring time as defined in 3GPP 29.244 [13].

Threshold levels may be defined for:

- the total volume only; or
- the uplink volume only; or
- the downlink volume only; or
- the uplink and downlink volume; and/or
- the time.

Threshold levels, monitoring time, if applicable, and inactive time, if applicable, for each usage monitoring control instance may be provisioned within an entry of the "umDecs" attribute as follows:

- the total volume threshold, if applicable, within the "volumeThreshold" attribute;
- the uplink volume threshold, if applicable, within the "volumeThresholdUplink" attribute;
- the downlink volume threshold, if applicable, within the "volumeThresholdDownlink" attribute;
- the time threshold, if applicable, within the "timeThreshold" attribute;
- the total volume threshold after the monitoring time, if applicable, within the "nextVolThreshold" attribute;
- the uplink volume threshold after the monitoring time, if applicable, within the "nextVolThresholdUplink" attribute;
- the downlink volume threshold after the monitoring time, if applicable, within the "nextVolThresholdDownlink" attribute:
- the time threshold after the monitoring time, if applicable, within the "nextTimeThreshold" attribute;
- the monitoring time, if applicable, within the "monitoringTime" attribute;
- the inactive time, if applicable, within the "inactivityTime" attribute.

If the SMF reports usage before the monitoring time is reached, the monitoring time is not retained by the SMF. Therefore, the PCF may again provide in the response a monitoring time and optionally the subsequent threshold value(s) for the usage after the monitoring time.

The "inactivityTime" attribute represents the time interval after which the time measurement shall stop for the Monitoring Key, if no packets belonging to the corresponding Monitoring Key are received. Time measurement shall resume again on receipt of a further packet belonging to the Monitoring Key. Time measurement for a Monitoring key shall also be stopped when time based usage monitoring is disabled, if this happens before the Inactivity Detection Time is reached. If an "inactivityTime" attribute with value of zero is provided, or if no "inactivityTime" attribute is present within the usage monitoring control instance provided by the PCF, the time measurement shall be performed continuously from the point the first packet is received matching the applicable Monitoring Key is received and until time based usage monitoring is disabled.

If the usage monitoring control instance applies to the PDU session level, the PCF shall include the reference to the Usage Monitoring Data decision within the "refUmData" attribute of the related session rule.

If the usage monitoring control instance applies to a service data flow or a group of service data flows, the PCF shall include the reference to the Usage Monitoring Data decision within the "refUmData" attribute of the related PCC rule(s).

The PCF may provide one usage monitoring control instance applicable at PDU session level and one or more usage monitoring control instances applicable at PCC Rule(s) level.

If the PDU session level usage monitoring is enabled and service data flow(s) need to be excluded from this PDU session level usage monitoring, the PCF shall include the corresponding PCC rule identifier(s) within the "exUsagePccRuleIds" attribute of the UsageMonitoringData instance of PDU session level usage monitoring. If the exclusion is enabled, the PCF may disable the exclusion again for service data flow(s) by removing the corresponding PCC rule identifier(s) from "exUsagePccRuleIds" attribute.

The PCF may provide new volume threshold(s) and/or a new time threshold to the SMF. The new threshold value(s) override the existing value(s) in the SMF.

When the SMF receives above the usage monitoring control request from the PCF, the SMF shall initiate the PFCP Session Establishment procedure as defined in clause 7.5.2, or the PFCP Session Modification procedure, as defined in clause 7.5.4 of 3GPP TS 29.244 [13], to request the UPF to perform the usage monitoring control.

If the reset time of the usage monitoring related information (see clause 5.4.2.7 of 3GPP TS 29.519 [15]) is reached, the PCF shall reset the remaining allowed usage to the value(s) indicated in the usage monitoring related information and shall then interact with the SMF to undo any previously applied policy decisions related to remaining allowed usage of zero (or below zero).

NOTE 2: The PCF can also update the related usage monitoring information in the UDR as defined in 3GPP TS 29.519 [15] according to the performed reset action.

4.2.6.5.3.2 Disabling Usage Monitoring

After usage monitoring is enabled, the PCF may explicitly disable usage monitoring as a result of receiving an SM Policy association update from the SMF which is not related to reporting usage, but to other external triggers (e.g., receiving an AF request, subscriber profile update), or a PCF internal trigger. When the PCF disables usage monitoring, the SMF shall report the accumulated usage which has occurred while usage monitoring was enabled since the last report.

To disable usage monitoring for a monitoring key, the PCF shall provide either the SMF with the corresponding applicable attributes of the usage monitoring control instance containing a NULL value (e.g. the previous provided "volumeThreshold" is set to NULL"), or:

- for dynamic PCC rule(s) or session rule(s), remove the reference to the corresponding usage monitoring control instance from all the dynamic PCC rule(s) or session rule(s) referencing it;

NOTE: The PCF could keep the UsageMonitoringData policy decision valid in the SMF.

- for predefined PCC rule(s), remove the UsageMonitoringData policy decision referred from all the activated predefined PCC rule(s).

When the PCF disables usage monitoring for usage monitoring key(s) via a Npcf_SMPolicyControl_UpdateNotify or a Npcf_SMPolicyControl_Update service operation, the SMF shall trigger a new Npcf_SMPolicyControl_Update service operation using the procedures specified in clause 4.2.4.10 to report accumulated usage for the disabled usage monitoring key(s).

4.2.6.5.3.3 PCF Requested Usage Report

When usage monitoring is enabled, the PCF may request the SMF to report the accumulated usage for one or more enabled usage monitoring control instance(s) regardless of whether associated usage threshold(s) have been reached or not. In order do so, the PCF shall include the "lastReqUsageData" attribute containing one or more reference(s) to usage monitoring data decision(s) within the "refUmIds" attribute or the "allUmIds" attribute set to true in an HTTP POST request or in the response of an HTTP POST request from the SMF. The PCF shall require the SMF to report accumulated usage for one or more enabled usage monitoring control instance(s) only in a response to received HTTP POST request from the SMF when the SMF has not provided accumulated usage in this HTTP POST request for the same usage monitoring control instance(s).

4.2.6.5.3.4 Usage Monitoring during Network Slice Replacement

When the "NetSliceRepl" fetaure is supported and the PCF receives the Alternative S-NSSAI in the Npcf_SMPolicyControl_Create, the PCF receives a change report from the initial S-NSSAI to the Alternative S-NSSAI, or the PCF receives a change report from the Alternative S-NSSAI back to the initial S-NSSAI in the Npcf_SMPolicy Control_Update request:

- the provisions of clause 4.2.6.5.3.1 shall apply with the following differences:
 - the PCF shall decide based on operator policies to perform usage monitoring based on either the initial S-NSSAI or the Alternative S-NSSAI, and may based on that retrieve information from the UDR about the total allowed usage for the initial S-NSSAI and DNN combination or Alternative S-NSSAI and DNN combination, respectively;
 - if the PCF decides to perform usage monitoring based on the Alternative S-NSSAI:
 - if Npcf_SMPolicyControl_Update request was received with the Alternative S-NSSAI to report a change from the initial S-NSSAI to the Alternative S-NSSAI:
 - the PCF shall disable the usage monitoring data for the initial S-NSSAI and DNN combination, if applicable, as defined in clause 4.2.6.5.3.2;
 - the PCF may enable the usage monitoring data for the monitoring key of the session rule(s) associated to the PDU session and for the monitoring key(s) for the PCC Rule(s) applicable for the Alternative S-NSSAI and DNN combination using the procedures defined in clauses 4.2.6.3.1 and 4.2.6.2.1 respectively;- if the Npcf_SMPolicyControl_Update request was received without the Alternative S-NSSAI to report a change from the Alternative S-NSSAI back to the initial S-NSSAI:
 - the PCF shall disable the usage monitoring data for the Alternative S-NSSAI and DNN combination, if applicable, as defined in clause 4.2.6.5.3.2; and
 - the PCF may enable the usage monitoring data for the monitoring key of the session rule(s) associated to the PDU session and for the monitoring key(s) for the PCC Rules applicable for the initial S-NSSAI and DNN combination using the procedures defined in clauses 4.2.6.3.1 and 4.2.6.2.1 respectively;

and

- if the PCF decides to perform usage monitoring for the initial S-NSSAI and DNN combination, the PCF shall continue the ongoing usage monitoring for that combination;

and

- the provisions of clause 4.2.6.5.3.2 shall apply with the following differences:
 - the PCF shall decide based on operator policies to perform usage monitoring based on either the initial S-NSSAI or the Alternative S-NSSAI;
 - if the PCF decides to perform usage monitoring based on the Alternative S-NSSAI:
 - if Npcf_SMPolicyControl_Update request was received with the Alternative S-NSSAI to report a change from the initial S-NSSAI to the Alternative S-NSSAI:
 - the PCF shall disable the usage monitoring data for the monitoring key of the session rule(s) associated to the PDU session and for the monitoring key(s) for the PCC rule(s) corresponding to the initial S-NSSAI and DNN combination, if applicable; and
 - the PCF shall update the usage monitoring information related to the initial S-NSSAI and DNN combination in the UDR as defined in 3GPP TS 29.519 [15];and
 - if the Npcf_SMPolicyControl_Update request was received without the Alternative S-NSSAI to report a change from the Alternative S-NSSAI back to the initial S-NSSAI:
 - the PCF shall disable the usage monitoring data for the Alternative S-NSSAI and DNN combination, if applicable, as defined in clause 4.2.6.5.3.2; and

- the PCF shall update the usage monitoring information related to the Alternative S-NSSAI in the UDR as defined in 3GPP TS 29.519 [15].

and

- if the PCF decides to perform usage monitoring for the initial S-NSSAI and DNN combination, the PCF shall continue the ongoing usage monitoring for that combination.

4.2.6.5.4 Request for Access Network Information

When the NetLoc feature is supported, if the AF requests the PCF to report the access network information as described in clauses 4.2.2, 4.2.3 or 4.2.4 of 3GPP TS 29.514 [17] or in clauses 4.1 and 4.2 of 3GPP TS 29.214 [18], the PCF shall perform the PCC rule provisioning procedure as defined in clause 4.2.6.2.1 and additionally provide the requested access network information indication (e.g. user location and/or user timezone information) to the SMF as follows:

- it shall include the "lastReqRuleData" attribute to contain the "reqData" attribute with the value(s) MS_TIME_ZONE and/or USER_LOC_INFO and the "refPccRuleIds" attribute to contain the related installed/modified/removed PCC rule identifier(s).
- it shall provide the AN_INFO policy control request rigger within the "policyCtrlReqTriggers" attribute (if not yet set).

For those PCC Rule(s) based on preliminary service information as described in 3GPP TS 29.514 [17] or in 3GPP TS 29.214 [18], the PCF may assign the 5QI and ARP of the default QoS flow to avoid signalling to the UE. These PCC Rules shall not include the "packetFilterUsage" attribute set to true within the "flowInfos" attribute.

For those PCC Rule(s) based on AF signalling as described in 3GPP TS 29.514 [17] or in 3GPP TS 29.214 [18], the PCF may use 5QI and ARP for AF signalling to avoid signalling to the UE. These PCC Rules shall not include the "packetFilterUsage" attribute set to true within the "flowInfos" attribute.

NOTE: Similarly, for predefined PCC rules based on AF signalling, these PCC Rule(s) could be defined with the 5QI and ARP for AF signalling, and cannot include packet filter usage information.

4.2.6.5.5 Request for the successful resource allocation notification

The PCF may request the SMF to confirm that the resources associated to a PCC rule are successfully allocated. To do so, the PCF shall provide within the "policyCtrlReqTriggers" attribute of the SmPolicyDecision data structure the value "SUCC_RES_ALLO", if this policy control request trigger was not previously set, and provide the "lastReqRuleData" attribute as well. For the associated RequestedRuleData instance, the PCF shall include the value "SUCC_RES_ALLO" within the "reqData" attribute and the reference to the PCC rule within the "refPccRuleIds" attribute.

4.2.6.5.6 Provisioning of Presence Reporting Area Information

When the PRA or ePRA feature is supported, the PCF may determine during the lifetime of the PDU session whether reports on the change of UE presence in Presence Reporting Area(s) are desired for this PDU session based on the subscriber's profile configuration. If such reporting is desired for a PDU session, the PCF shall provide the "praInfos" attribute within the SmPolicyDecision data structure. Within each associated PresenceInfoRm data structure, the PCF shall include the Presence Reporting Area Identifier within the "praId" attribute, and, for a UE-dedicated Presence Reporting Area, the list of elements composing the presence reporting area within the "trackingAreaList" attribute, the "ecgiList" attribute, the "globaleNbIdList" attribute and/or the "globalRanNodeIdList" attribute. The PCF shall also activate the reporting of the changes of UE presence in the provided Presence Reporting Area(s) by provisioning the "PRA_CH" policy control request trigger to the SMF, within the "policyCtrlReqTriggers" attribute.

NOTE 1: If this feature is not supported, the PCF can instead activate location change reporting that enables to receive reports of the actual location of the UE. Due to the potential increase in signalling load, careful consideration of the network load is necessary for such reporting, e.g. by limiting the number of subscribers subject to such reporting.

If the PCF is configured with a Presence Reporting Area identifier referring to a list of Presence Reporting Area Identifier(s) within a Set of Core Network predefined Presence Reporting Areas as defined in 3GPP TS 23.501 [2], the PCF shall include only the identifier of the Presence Reporting Area Set within the "praId" attribute.

NOTE 2: The Presence Reporting Area Identifier can correspond to a list of Presence Reporting Area Identifier(s) within a Set of Core Network predefined Presence Reporting Areas (PRA set identifier) as defined in 3GPP TS 23.501 [2].

The PCF may modify the list of PRA Identifier(s) by providing new Presence Reporting Area(s) or removing existing Presence Reporting Area(s), or modify the list of Presence Reporting Area element(s) by providing the updated Presence Reporting Area(s). In order to do that,

- when the PRA feature is supported, the PCF shall follow the general procedure defined in clause 4.2.6.1 and supply the Presence Reporting Area identifier(s) as key(s) of "praInfos" the map attribute; or
- when the ePRA feature is supported, the PCF shall follow the general procedure defined in clause 4.2.6.1 and supply the Presence Reporting Area identifier(s) as key(s) of "praInfos" map, with the exception that for the modification of the list of the Presence Reporting Area element(s) the PCF shall fully replace the Presence Reporting Areas(s) previously provided with the new complete list of Presence Reporting Area element(s).
- NOTE 3: When the PRA feature is supported, the PCF cannot indicate the SMF to remove an existing Presence Reporting Area element(s) from a Presence Reporting Area by providing the updated Presence Reporting Area as defined in clause 4.2.6.1. How to support it depends on implementation.

When PRA or ePRA feature is supported, the PCF may remove the associated policy control request trigger (i.e. "PRA CH") as defined in clause 4.2.6.4, if previously activated.

If the NF service consumer and the PCF support both PRA and ePRA features, the NF service consumer and PCF shall perform the behaviours as the ePRA feature defined.

If the "PRA_CH" policy control request trigger is provisioned, when the PCF provides a list of presence reporting areas as described above, the PCF shall ensure that the maximum number of provisioned Presence Reporting Area Identifiers is not exceeded. The maximum number of PRAs may be configured in the PCF. The PCF may have independent configuration of the maximum number for Core Network pre-configured PRAs and UE-dedicated PRAs.

- NOTE 4: For all the Presence Reporting Area(s) provided by the PCF, the SMF can store the Presence Reporting Area Identifier(s) together with an indication that states that it relates to PCF requested PRA status changes.
- NOTE 5: This information is needed so that if both the PCF and the CHF request the reporting of PRA status changes, the SMF is able to differentiate whether the reported PRA changes are relevant to the PCF or the CHF

The SMF shall invoke the Namf_EventExposure service in the AMF to handle the subscription to the presence state of a UE in an area of interest as specified in 3GPP TS 29.518 [36].

The PCF may be notified during the lifetime of a PDU session that the targeted UE is located in an access network where local configuration indicates that reporting changes of UE presence in Presence Reporting Area(s) is not supported. The PCF may then remove the associated policy control request trigger (i.e. "PRA_CH"), if previously activated. In this case, the PCF shall also remove the provisioned Presence Reporting Area(s) by including the "praInfos" attribute set to NULL within the SmPolicyDecision data structure.

The SMF shall remove the Namf_EventExposure service subscription with the AMF for the reporting of Changes of UE presence in Presence Reporting Area(s), when the PCF and CHF remove the associated request triggers.

4.2.6.5.7 Policy provisioning and enforcement of reflective QoS

If the PCF receives the "refQosIndication" attribute set to true as defined in clauses 4.2.2.2 or 4.2.4.2, and if the PCF determines that Reflective QoS Control will be enabled for the PDU session based on the operator's policy and user subscriptions, the PCF may provision the Reflective QoS Timer by including the "reflectiveQoSTimer" attribute within the SmPolicyDecision data structure in the response message.

The provisioning of reflective QoS may be performed for service data flows associated with one or more PCC rules, and shall be performed using the PCC rule provisioning procedure. The PCF may within a QoS data decision which a PCC rule refer to include the "reflectiveQos" attribute set to true to enable the Reflective QoS control to a non-GBR downlink service data flow when the PCF authorizes the QoS for the service data flow as defined in clause 4.2.6.6.2.

The PCF shall ensure that both, uplink and downlink traffic for such non-GBR service data flow are allowed.

NOTE 1: The PCF can allow both uplink and downlink traffic for the non-GBR service data flow in several ways, e.g. by installing a PCC rule with uplink and downlink flow information, or by installing separate PCC rules for the uplink flows and downlink flows, or by installing a PCC rule with only the application identifier.

The PCF shall activate the reporting changes of reflective QoS indication by provisioning the "REF_QOS_IND_CH" policy control request trigger to the SMF.

NOTE 2: While the UE applies a standardized value for the precedence of all UE derived QoS rules, PCC rules precedence values can vary and PCF configuration has to ensure that there is a large enough value range for the precedence of PCC rules corresponding to UE derived QoS rules. To avoid that the precedence of network provided QoS rules need to be changed when Reflective QoS is activated and filters are overlapping, the PCF will take the standardized value for the precedence of UE derived QoS rules into account and will setting the precedence value of PCC rules subject to Reflective QoS to a value in the range from 70 to 99 (decimal), as specified in 3GPP TS 24.501 [20], clause 6.2.5.1.1.3.

The SMF shall apply reflective QoS control for the downlink traffic of the service data flows of the PCC rules that reference a QosData decision that includes "reflectiveQos" attribute set to true.

The PCF shall not include the "reflectiveQos" attribute set to true within the QoS data decision which the PCC rule with match-all SDF template refers to. If a PCC rule with match-all SDF template has been provisioned to the SMF, the PCF shall not include the "reflectiveQos" attribute within the QoS data decision which contains the "defQosFlowIndication" attribute, either.

If the PCF receives the "refQosIndication" attribute set to false as defined in clause 4.2.4.2, the PCF shall disable the reflective QoS Control for the PDU session. In order to do so, the PCF shall within the QoS data decision which affected PCC rule refer to include the "reflectiveQos" attribute set to false and may update other QoS parameters within the QoS data decision and/or update the flow information of PCC rule by including the "packetFilterUsage" attribute set to true.

4.2.6.6 Authorized QoS

4.2.6.6.1 General

The PCF shall provision the authorized QoS. The authorized QoS may apply to a PCC rule or to a PDU session.

- When the authorized QoS applies to a PCC rule, it shall be provisioned within the corresponding PCC rule as defined in clause 4.2.6.6.2.
- When the authorized QoS for a PCC rule with a GBR QCI is candidate for resource sharing an instruction on the allowed sharing may be provisioned as defined in clause 4.2.6.2.8.
- When the authorized QoS applies to a PDU session, it shall be provisioned as defined in clause 4.2.6.3.1.
- When the authorized QoS applies to the default QoS flow, it shall be provisioned as defined in clause 4.2.6.3.1.
- When the authorized QoS applies to an explicitly signalled QoS Characteristics, it shall be provisioned as defined in clause 4.2.6.6.3.
- When the authorized QoS applies to the Reflective QoS, it shall be provisioned as defined in clause 4.2.6.5.7.

The authorized QoS provides appropriate values for the resources to be enforced. The authorized QoS for a PCC rule is a request for allocating the corresponding resources. The Provisioning of authorized QoS per PCC rule is a part of PCC rule provisioning procedure.

If the SMF cannot allocate any of the resources as authorized by the PCF, the SMF informs the PCF and acts as described in clauses 4.2.3.16 and 4.2.4.15.

The SMF shall interact with the (R)AN, UPF and UE for enforcing the policy based authorization.

QoS authorization information may be dynamically provisioned by the PCF or it may be a pre-defined PCC rule in the SMF. Moreover, all the parameters of the authorized QoS may be changed.

- NOTE 1: A change of 5QIs cannot be described as an upgrade or downgrade and also no 5QI can be referred to as the higher or lower. Whether the 5QI is permitted to be changed or not is subject to both operator policies and normal restrictions on changing from a non-GBR 5QI value to GBR 5QI value on an IP flow.
- NOTE 2: All attributes of the ARP QoS parameter can be changed but only the ARP priority level represents an ordered range of values. The ARP priority level attribute represents the actual priority for the service/user with the value 1 as the highest and can thus be upgraded and downgraded.

If the PCF is unable to make a decision for the response to the HTTP POST message by the SMF, the PCF may reject the request as described in clause 5.7.

4.2.6.6.2 Policy provisioning and enforcement of authorized QoS per service data flow

The Provisioning of authorized QoS per service data flow is a part of PCC rule provisioning procedure, as described in clause 4.2.6.2.1.

The authorized QoS per service data flow shall be provisioned within a QosData data structure. The PCF shall include a "qosDecs" attribute containing the corresponding QoS data decision within the SmPolicyDecision data structure and include the reference to this QoS data decision within the "refQosData" attribute of the PccRule data instance.

When network slice data rate policy control applies and the authorized QoS per service data flow refers to a 5QI of GBR type, the PCF shall derive the authorized QoS per service data flow as described in clause 4.2.6.8.

When group related data rate policy control applies for a 5G VN group and the authorized QoS per service data flow refers to a 5QI of GBR type, the PCF shall derive the authorized QoS per service data flow as described in clause 4.2.6.9.

Within the QoS data decision, for 5QI of GBR type or delay critical GBR type, the PCF shall include the authorized GBR 5QI or delay critical GBR 5QI respectively within the "5qi" attribute, the ARP within the "arp" attribute, and max bandwidth in uplink within the "maxbrUl" attribute and/or max bandwidth in downlink within the "maxbrDl" attribute, the guaranteed bandwidth in uplink within the "gbrUl" attribute and/or the guaranteed bandwidth in downlink within the "gbrDl" attribute. If the PCF determines that the application traffic can be adapted to the change in the QoS based on the configuration (e.g. if the AF is capable to trigger rate adaptation), the PCF may request a notification when authorized GBR or delay critical GBR cannot be guaranteed or can be guaranteed again by including the "qnc" attribute set to true.

Within the QoS data decision, for 5QI of non-GBR type, the PCF shall include the authorized non-GBR 5QI within the "5qi" attribute and the ARP within the "arp" attribute. The PCF may authorize the max bandwidth in uplink within the "maxbrUl" attribute and/or max bandwidth in downlink within the "maxbrDl" attribute.

When the PCF authorizes a standardized 5QI but a Priority Level, an Averaging Window and/or a Maximum Data Burst Volume which are different from the standardized value in the table 5.7.4-1 of 3GPP TS 23.501 [2] are required, the PCF shall include the Priority Level within the "priorityLevel" attribute, the Averaging Window within the "averWindow" attribute and/or the Maximum Data Burst Volume within the "maxDataBurstVol" attribute or the "extMaxDataBurstVol" attribute (if supported, see clause 4.2.2.1).

NOTE 1: For the non-standardized or non-configured 5QI, the PCF needs to authorize explicitly signalled QoS Characteristics associated with the 5QI if the PCF has not provisioned it.

If the configured policy allows at reception of the service information from the AF and the application of the rules of the QoS mapping procedures defined in 3GPP TS 29.513 [7] clause 7.3.2 for the received service information result in a 5QI of 1 associated with the corresponding flows, and the RAN-Support-Info feature as defined clause 5.8 is supported, the PCF shall determine the Maximum Packet Loss Rate for UL and DL for those flows associated within 5QI of 1. In this case, the PCF shall include the value of Maximum Packet Loss Rate for UL within the "maxPacketLossRateUl" attribute and/or the value of Maximum Packet Loss Rate for DL within the "maxPacketLossRateDl" attribute.

NOTE 2: If CHEM feature is supported, then PCF as described in clause 7.2.3 of 3GPP TS 29.513 [7] or based on local configuration, the PCF sets the downlink and uplink maximum packet loss rates corresponding to either the most robust codec mode or the least robust codec mode of the negotiated set in each direction.

If the PCF wants to ensure that a PCC Rule is always bound to the default QoS flow, the policy provisioning for the related authorized QoS shall be done as described in clause 4.2.6.2.10.

When the "PDUSetHandling" feature is supported, within the QoS data decision, for 5QI of GBR and non-GBR type, the PCF may include the authorized PDU Set QoS parameter(s) within the "pduSetQosDl" and/or "pduSetQosUl"

attribute(s) of the QosData policy decision referenced from the PCC rule. At least one of the following PDU Set QoS parameter(s) shall be provisioned within the "pduSetQosDl" and/or "pduSetQosUl" attribute(s) to enable PDU Set based handling: 1) the PSIHI within the "pduSetHandlingInfo" attribute and/or 2) both, the PSDB within the "pduSetDelayBudget" attribute and the PSER within the "pduSetErrRate" attribute.

The SMF shall perform a QoS flow binding based on the QoS information within the QoS data decision as defined in clause 6.4 of 3GPP TS 29.513 [7] after the SMF installs or activates the PCC rules.

The SMF shall reserve the resources necessary for the guaranteed bitrate for the PCC rule upon receipt of a PCC rule provisioning including QoS information. For GBR QoS flows the SMF should set the QoS flow's GBR to the sum of the GBRs of all PCC rules that are active/installed and bound to that GBR QoS flow. For GBR QoS flow the SMF should set the QoS flow's MBR to the sum of the MBRs of all PCC rules that are active/installed and bound to that GBR QoS flow.

NOTE 3: Since the PCF controls the GBR value in the PCC rule, the PCF can prevent that uplink GBR resources are reserved by providing an uplink GBR value of zero for that PCC rule. This may be useful e.g. for a PCC rule with application identifier as the uplink traffic can be received in other QoS flow than the one the PCC rule is bound to.

The SMF shall assign a QFI if a new QoS flow needs to be established and shall derive, if applicable, the QoS profile required towards the Access Network, the QoS rule required towards the UE and the QoS information with PDRs towards to the UPF. If multiple PCC rules with the Maximum Packet Loss Rate for UL and DL are bound to the same QoS flow, the SMF shall choose the lowest value per direction related to the PCC rules within the QoS profile towards to the access network.

If the PCC rule contains one or more PDU Set QoS parameter(s), the SMF adds these PDU Set QoS parameter(s) to the derived QoS Profile of the QoS Flow as described in 3GPP TS 29.502 [22].

For PIN scenarios (defined in 3GPP TS 23.501 [2], clause 5.44), the SMF may, for a (S-NSSAI, DNN) combination of the PDU Session, determine the CN PDB in the derived QoS profile corresponding to a GBR flow if the UE requested non-3GPP delay budget as part of a UE-initiated resource modification procedure based on operator policy and implementation.

NOTE 4: The non-3GPP delay budget does not impact the QoS flow binding as defined in clause 6.4 in 3GPP TS 29.513 [7].

If one or more of the 5QI, ARP, QNC, Priority level, Averaging Window and Maximum Data Burst Volume attributes of a PCC rule are modified to the same updated values for all the PCC rules bound to the same QoS flow, then the SMF should modify the corresponding attributes for that impacted QoS flow.

Upon deactivation or removal of a PCC rule, the SMF shall free the resources reserved for that PCC rule, and initiate the corresponding procedure with access network, UE and UPF to remove the resources.

4.2.6.6.3 Policy provisioning and enforcement of authorized explicitly signalled QoS Characteristics

The PCF may provision a dynamically assigned 5QI value (from the non-standardized and non-preconfigured value range) and the associated 5G QoS characteristics to the SMF. In order to do so, the PCF shall include within the SmPolicyDecision data structure the "qosChars" attribute to contain one or more authorized signalled QosCharacteristics instance(s). For each QosCharacteristics instance, the PCF shall include the assigned 5QI value within the "5qi" attribute, the resource type value within the "resourceType" attribute, the 5QI Priority Level value within the "priorityLevel" attribute, the Packet Delay Budget value within the "packetDelayBudget" attribute, the Packet Error Rate value within the "packetErrorRate" attribute, the Averaging Window value within the "averagingWindow" attribute, if applicable, and the Maximum Data Burst Volume value within the "maxDataBurstVol" attribute or the "extMaxDataBurstVol" attribute (if supported, see clause 4.2.2.1), if applicable. If the PCF has provisioned an authorized signalled QosCharacteristics instance to the SMF, the PCF shall not update nor remove it during the lifetime of the policy association.

Upon receiving the authorized explicitly signalled QoS characteristics, the SMF shall derive the QoS profile for the access network and provide it to the access network by invoking the corresponding procedure.

- NOTE 1: The SMF can adjust the Packet Delay Budget in the QoS profile in PIN scenarios in order to consider both the value of dynamic CN PDB corresponding to a GBR flow and the non-3GPP delay budget as a result of a UE-requested PDU session modification procedure for certain (S-NSSAI, DNN) combination and signal it to the access network (defined in 3GPP TS 23.501 [2], clause 5.44.3.4).
- NOTE 2: Operator configuration is assumed to ensure that the assigned dynamic 5QI value is unique and references the same set of QoS characteristics within the whole PLMN at a given time.

4.2.6.7 Monitoring the data rate per network slice for a UE

The PCF can support monitoring of data rate per S-NSSAI for a UE.

During PDU session establishment, if the PCF supports monitoring of the data rate per S-NSSAI for a UE, the PCF may retrieve for the UE and S-NSSAI to which the PDU session is allocated the Subscribed UE-Slice-MBR (i.e. the aggregate data rate that can be expected to be provided across all GBR and Non-GBR QoS Flows of a UE for a network slice identified by an S-NSSAI) from the UDR as defined in clause 5.4.2.14 of 3GPP TS 29.519 [15]. The PCF shall monitor the data rate for this S-NSSAI and UE by deriving the utilized data rate based on the authorized Session-AMBR and/or the authorized QoS per service data flow in all PDU session(s) established for the UE in the concerned S-NSSAI and checking the derived value against the UE-Slice-MBR set by the PCF based on the Subscribed UE-Slice-MBR value retrieved from the UDR and operator policies available at the PCF.

As part of the PDU session modification procedure(s) targeting the PDU session(s) established for the UE in the concerned S-NSSAI, whenever the PCF needs to provide the associated authorized Session-AMBR(s), install new or updated PCC Rule(s) and/or delete PCC Rule(s) related to GBR service data flow(s), the PCF shall calculate the utilized data rate as described in clause 4.2.6.8.2.

At the termination of a PDU session established for the UE in the concerned S-NSSAI, the PCF shall adjust the utilized data rate for the UE based on the release of the Session-AMBR and the removal of all the PCC Rule(s) related to GBR service data flow(s) associated to that PDU session.

To enable this monitoring, the SMF shall select the same PCF instance for all PDU sessions of the UE to the S-NSSAI that is subject to this monitoring as defined in clause 8.3 of 3GPP TS 29.513 [7].

When the calculated utilized data rate for the S-NSSAI and UE reaches a certain percentage of the Subscribed UE-Slice-MBR value, the PCF may apply a policy decision to strengthen the traffic restrictions for individual PDU session(s) or PCC rule(s) (e.g. change the authorized Session-AMBR as defined in clause 4.2.6.3.1, change the authorized QoS per service data flow as defined in clause 4.2.6.6.2, or change the charging keys) within individual PDU session(s) established for the UE in the concerned S-NSSAI. When the calculated utilized data rate per S-NSSAI for a UE falls below that percentage of the Subscribed UE-Slice-MBR value, the PCF may relax the traffic restrictions for individual PDU session(s) or PCC rule(s) within individual PDU session(s) established for the UE in the concerned S-NSSAI.

As part of the policy decision to strengthen the traffic restrictions for individual PDU session(s), the PCF may reject the establishment or SMF-initiated modification of the associated SM Policy Association(s) with an HTTP "403 Forbidden" response message including the "cause" attribute of the ProblemDetails data structure set to "EXCEEDED_UE_SLICE_DATA_RATE".

NOTE: It is recommended to avoid frequent policy decisions which trigger a signalling with the UE (like change of the authorized Session-AMBR or change of the authorized QoS per service data flow).

4.2.6.8 Network slice related data rate policy control

4.2.6.8.1 General

A PCF that supports network slice related data rate policy control shall be able to control and manage the network slice data rate.

A Maximum Slice Data Rate may be configured by the operator (e.g. based on an SLA related to the associated network slice identified by an S-NSSAI).

NOTE 1: The Maximum Slice Data Rate defines the maximum allowed aggregate data rate across all GBR and Non-GBR QoS Flows within the network slice identified by an S-NSSAI as defined in 3GPP TS 29.519 [15].

NOTE 2: The maximum data rate of Non-GBR QoS Flow(s) is controlled via the authorized Session-AMBR, while the maximum data rate of a GBR QoS Flow is controlled via the authorized MBR value of the associated PCC rule.

The PCF shall determine, based on local configuration, if the network slice data rate is controlled via PCF-based monitoring by using QoS parameters or with assistance of the NWDAF.

The PCF shall monitor the data rate of the network slice and ensure that it does not exceed the Maximum Slice Data Rate for that network slice by e.g. rejecting new SM Policy Associations, changing the authorized Session-AMBR values (if allowed by the HPLMN), changing the MBR values in PCC rules belonging to GBR service data flows or other actions depending on operator's policies.

- NOTE 3: Based on operator's policies, it is also possible for the PCF to accept that new PDU session(s) or PCC rule(s) belonging to GBR service data flow(s) lead to exceeding the Maximum Slice Data Rate and apply a different charging for them. Once the Maximum Slice Data Rate is no longer exceeded, the PCF can decide to go back to applying the previous charging.
- NOTE 4: Subject to operator policy and national/regional regulations, prioritised services and emergency services may be exempted from network slice data rate policy control.
- NOTE 5: A single PCF can be used for the monitoring and limitation of the network slice related data rate. To enable this, the SMF has to select the same PCF instance for all PDU Sessions of the UE to the S-NSSAI.

4.2.6.8.2 PCF-based network slice data rate policy control by using QoS parameters

If the NWDAF is not deployed or not used for network slice data rate policy control and PCF-based monitoring of network slice data rate by using QoS parameters applies, the UDR shall maintain the Remaining Maximum Slice Data Rate per S-NSSAI as part of the network slice specific policy control data as defined in 3GPP TS 29.519 [15].

Whenever the PCF needs to calculate the data rate related to authorized Session-AMBR and/or the MBR(s) of the GBR Service Data Flow(s), the PCF shall obtain the Remaining Maximum Slice Data Rate by interacting with the UDR as defined in 3GPP TS 29.519 [15]. When the PCF interacts with the UDR may be based on operator policies.

When the PCF needs to provide the authorized Session-AMBR and/or install new or updated PCC Rule(s) and/or delete PCC Rule(s) related to GBR service data flow(s), the PCF shall:

- calculate the difference between the previously authorized Session-AMBR, if applicable, and the new authorized Session-AMBR; and/or
- calculate the difference between the previously authorized MBR and the new authorized MBR(s) for the authorized PCC Rule(s) related to GBR service data flow(s);

And then:

- Calculate the utilized data rate, i.e. the sum of the previously calculated differences, which is to be substracted from the Remaining Maximum Slice Data rate.
- NOTE 1: For example, when the PCF modifies as part of the same operation the MBR of PCC Rule A from 100 to 150 and the MBR of PCC Rule B from 30 to 20, deletes PCC Rule C with an MBR of 50 and adds a PCC Rule D of MBR 75, the final calculated value will be +50-10-50+75, i.e. 65. If the authorized Session-AMBR is also updated from 1000 to 2000, the final derived value will be 1065.
- NOTE 2: The utilized data rate can be a negative value. In this case, the final Remaining Maximum Slice Data Rate is increased.

Therefore, the PCF shall behave as follows:

- At PDU session establishment, the PCF shall check whether the Remaining Maximum Slice Data Rate is higher than the calculated utilized data rate (e.g. based on the authorized Session-AMBR). If it is the case, the PCF shall deduct the value of the utilized data rate from the Remaining Maximum Slice Data Rate for the concerned S-NSSAI in the UDR. If however the Remaining Maximum Slice Data Rate is not sufficient, the PCF may reject the establishment of the SM Policy Association with an HTTP "403 Forbidden" response message including the "cause" attribute of the ProblemDetails data structure set to "EXCEEDED_SLICE_DATA_RATE".

- At PDU session modification initiated by the SMF, the PCF shall check whether the Remaining Maximum Slice Data Rate is higher than the calculated utilized data rate (e.g. based on the authorized Session-AMBR). If it is the case, the PCF shall deduct the value of the utilized data rate from the Remaining Maximum Slice Data Rate for the concerned S-NSSAI in the UDR. If however the Remaining Maximum Slice Data Rate is not sufficient, the PCF may reject the modification of the SM Policy Association with an HTTP "403 Forbidden" response message including the "cause" attribute of the ProblemDetails data structure set to "EXCEEDED_SLICE_DATA_RATE".
- When a PCC rule of a GBR service data flow is installed, modified, removed, activated or deactivated in the SMF.
 - the PCF shall derive the authorized QoS for the service data flow and the associated utilized data rate and update the Remaining Maximum Slice Data Rate for the concerned S-NSSAI in the UDR accordingly;
 - the PCF may request the SMF to confirm that the resources associated to that PCC rule are successfully allocated as defined in clause 4.2.6.5.5 or released as defined in clauses 4.2.3.13 and 4.2.4.12;
 - if the SMF reports that some of or all the resources cannot be successfully allocated, the PCF shall recalculate the authorized QoS for the service data flow and the associated utilized data rate and update the Remaining Maximum Slice Data Rate for the concerned S-NSSAI in the UDR accordingly.
- When the authorized Session-AMBR changes and/or one or several PCC Rule(s) of a GBR service data flow(s) are installed, removed or modified, the PCF shall calculate the new utilized data rate and update the Remaining Maximum Slice Data Rate for that S-NSSAI in the UDR accordingly.
- At PDU session termination, the PCF shall add the value of the related previously utilized data rate (i.e. based on the authorized Session-AMBR allocated to the PDU session and the previously utilized data rate by the removed PCC Rule(s) related to GBR service data flow(s)) to the Remaining Maximum Slice Data Rate for the concerned S-NSSAI in the UDR.
- If the Remaining Maximum Slice Data Rate for that S-NSSAI reaches a (operator defined) threshold that indicates that it is closer or equal to zero, the PCF may apply policy decision(s) to strengthen the traffic restrictions for the concerned PDU Session(s).
- If the Remaining Maximum Slice Data Rate for that S-NSSAI returns to a value below the (operator defined) threshold, the PCF may apply policy decision(s) to recover the initially derived value(s) for the concerned PDU Session(s).
- NOTE 3: While the Remaining Maximum Slice Data Rate is relatively high, the PCF can be configured to maintain a local Remaining Maximum Slice Data Rate and to only interact with the UDR to update the Remaining Maximum Slice Data Rate when a certain threshold is reached, or a certain time window has passed. The higher the configured values are the lower the chances for an accurate limitation of the slice data rate becomes. When multiple PCFs for the same S-NSSAI are deployed, each PCF can also subscribe to the change of the Network slice specific policy control data in the UDR. The UDR will then send a notification to each subscribed PCF when the Remaining Maximum Slice Data Rate per S-NSSAI changes.
- NOTE 4: Multiple PCFs responsible for PDU Sessions of UEs to the same S-NSSAI can read and update the Remaining Maximum Slice Data Rate for the S-NSSAI in the UDR using the conditional requests with preconditions for the update of the Remaining Maximum Slice Data Rate, this mechanism using Etags is defined in Table 5.2.2.2-2 of 3GPP TS 29.500 [4] to ensure a proper update of the UDR data in case of simultaneous access from different PCFs.

4.2.6.8.3 Network slice data rate policy control with assistance of the NWDAF

If the NWDAF is used for network slice data rate policy control, the PCF uses the Data Volume Dispersion Analytics provided by the NWDAF. For this purpose, the PCF subscribes to the NWDAF for periodic reporting of the Data Volume Dispersion Analytics statistics for all the UEs using the concerned network slice. The PCF subscribes to the NWDAF for Data Volume Dispersion Analytics reporting at the establishment of the first PDU session within the concerned S-NSSAI (subject to network slice data rate limitation) and cancels this subscription at the termination of the last PDU session within the concerned S-NSSAI as described in 3GPP TS 29.520 [51].

The PCF calculates the utilized data rate of the S-NSSAI by using the Data Volume Dispersion Analytics statistics reported by the NWDAF. When the utilized data rate of the S-NSSAI in UL and/or DL is getting close to or exceeding

respectively the value of the "mbrUl" attribute and/or the value of the "mbrDl" attribute of the SlicePolicyData data structure as defined in 3GPP TS 29.519 [15], based on operator policy, the PCF may apply policy decision(s) to strengthen the traffic restrictions for individual PDU sessions and/or PCC rules. For example:

- The PCF may reject the creation or modification of SM Policy Associations that require the increase of the utilized data rate for the S-NSSAI with an HTTP "403 Forbidden" response message including the "cause" attribute of the ProblemDetails data structure set to "EXCEEDED_SLICE_DATA_RATE".
- The PCF may refrain from sending new and/or updated PCC Rules that require the increase of the utilized data rate.

When the utilized data rate of the S-NSSAI in UL and/or DL falls below respectively the value of the "mbrUl" attribute and/or the value of the "mbrDl" attribute of the SlicePolicyData data structure, the PCF may relax the traffic restrictions for individual PDU sessions and/or PCC rules.

When multiple PCFs for the same S-NSSAI are deployed, each PCF subscribes to the analytics from the NWDAF separately.

NOTE: When multiple PCFs are used for the concerned S-NSSAI, the NWDAF triggers Data Volume Dispersion Analytics notifications towards all these PCFs, but their policy decisions can be different.4.2.7 Detection and handling of late arriving requests

4.2.6.9 Group related data rate policy control

4.2.6.9.1 General

A PCF that supports group related data rate policy control for 5G VN groups shall be able to control and manage the group data rate for the PDU session(s) of the UE(s) belonging to the 5G VN groups. In order to do so, the PCF shall perform the same procedures as the ones defined for network slice related data rate policy control defined in clauses 4.2.6.8 for the PDU session(s) of the UE(s) belonging to a 5G VN group, with the following differences:

- Only the PCF-based method shall be applicable for group related data rate policy control, i.e., the provisions of clause 4.2.6.8.3 shall not apply for group related data rate policy control for a 5G VN group.
- The provisions related to slice related data rate policy control for an S-NSSAI shall apply for group related data rate policy control for a 5G VN group.
- Instead of the operator configuring the Maximum Slice Date Rate per S-NSSAI at the UDR, the Maximum Group Data Rate per 5G VN group is either:
 - provisioned by the AF to the UDR (for "Subscription Data") via the NEF/UDM as part of the 5G VN group subscription data, using the procedures defined in 3GPP TS 29.522 [59] and 3GPP TS 29.503 [34]);
 - configured by the operator at the UDR (for "Policy Data") as part of the 5G VN group specific policy control data; or
 - based on both.
- When the Maximum Group Data Rate is provisioned by the AF, the PCF shall receive the Maximum Group Data Rate either:
 - by retrieving it directly from the UDR (for "Subscription Data"); or
 - by receiving a notification from the UDR (for "Subscription Data") on the update of the 5G VN group subscription data, if the PCF subscribed for such notifications.
- In all of the above cases, if the value(s) of the Maximum Group Data Rate information within the 5G VN group subscription data received from the UDR (for "Subscription Data") and the value(s) of the Maximum Group Data Rate information within the 5G VN group specific policy control data received from the UDR (for "Policy Data") are different, the PCF shall update in the UDR (for "Policy Data") the value(s) of the Maximum Group Data Rate information and adjust accordingly the value(s) of the Remaining Maximum Group Data Rate information for the 5G VN group as specified in 3GPP TS 29.519[15].

- Instead of handling the Remaining Maximum Slice Data Rate per S-NSSAI, the UDR and PCF shall handle the Remaining Maximum Group Data Rate per 5G VN group.
- Instead of calculating the utilized data rate based on the value(s) of the authorized Session-AMBR and the MBR of the GBR service data flow(s) for each PDU Session of a network slice identified by an S-NSSAI, the PCF shall calculate the utilized data rate based on the value(s) of the authorized Session-AMBR and the MBR of the GBR service data flow(s) for each PDU Session of the 5G VN group.
- Instead of returning the "EXCEEDED_SLICE_DATA_RATE" application error within the "403 Forbidden" error response (i.e., in case the Remaining Maximum Group Data Rate is not sufficient), the PCF shall return the "EXCEEDED_GROUP_DATA_RATE" application error within the "403 Forbidden" error response.

4.2.6.10 Policy Provisioning for eXtended Reality and Interactive Media Services

4.2.6.10.1 Support for delivery of multi-modal services

Multi-modal services consist of several data flows that relate to each other and may come from different sources. Each data flow (single-modal data flow) may transfer different types of data (for example audio, video, positioning, haptic data) associated with the same communication service.

The provision of PCC Rules corresponding to multi-modal services shall be performed as described in clause 4.2.6.2.1 "Provisioning of PCC rules".

For the delivery of multi-modal services, the PCF shall:

- derive the applicable PCC rule(s) and apply the required QoS as described in clause 4.2.3.22. The PCF may use the multi-modal Service Identifier received from the AF (either directly or via NEF), as specified in 3GPP TS 29.514 [17], to derive the correct PCC rules and apply QoS policies; and
- generate the authorized QoS Monitoring policy for each flow as described in clause 4.2.3.25 based on the QoS monitoring requirement received from the AF (either directly or via NEF), as specified in 3GPP TS 29.514 [17].

4.2.6.10.2 Traffic Parameter Information and N6 Traffic Parameter Measurement

If the "PowerSaving" feature is supported, the PCF may generate policies to monitor N6 Traffic Parameter Measurement and to enable the SMF provides assitance information to NG-RAN (traffic parameters) to configure UE power management for connected mode DRX as described in clause 4.2.3.29.

4.2.6.10.3 PDU Set handling

The PDU Set handling by NG-RAN is determined by PDU Set QoS parameter(s) in the QoS profile of the QoS flow as provided in the PCC rule and the PDU Set information provided by the PSA UPF. The UE may identify PDU Sets based on the Protocol Description associated with the QoS rule.

When the "PDUSetHandling" feature is supported, the PCF may, based on local configuration and/or information received from the AF as defined in 3GPP TS 29.514 [17], explicitly provide PDU Set QoS parameter(s) for the UL and/or DL as described in clause 4.2.6.6.2, or activate a pre-configured PCC rule with the related PDU Set QoS parameter(s).

The PCF may also include in the PCC rule, if received from the AF as defined in 3GPP TS 29.514 [17], Protocol Description information for the downlink direction within the "protoDescDl" attribute (to indicate the transport protocol (e.g. RTP, SRTP) and additional information used for identifying the PDU Set information by the PSA UPF) and/or for the uplink direction within the "protoDescUl" attribute (to indicate the transport portocol and additional information used for identifying the PDU Set information by the UE).

When the SMF obtains the UL and/or DL PDU Set QoS parameter(s) from the provided or activated PCC rule, the SMF provides them to NG-RAN as specified in 3GPP TS 29.502 [22]. If the PCC rule includes protocol description, the SMF provides the DL protocol description to the PSA UPF for PDU Set identification in the downlink as specified in 3GPP TS 29.244 [13], and the UL protocol description to the UE for PDU Set identification in the uplink as specified in 3GPP TS 24.501 [20].

4.2.6.10.4 End of Data Burst Handling

If the "PowerSaving" feature is supported, the PCF may generate policies to enable the provisioning to the NG-RAN of the indication of the last packet of the data burst of a service data flow, e.g. to configure UE power management for connected mode DRX.

The PCF, based on the AF provided DL protocol description (as described in 3GPP TS 29.514 [17]) and/or local configuration, may determine to indicate to the SMF the detection and marking of the last packet of a data burst by providing the "datEndMarkInd" attribute set to true within the TrafficControlData policy decision the PCC rule refers to, and the "protoDescDl" attribute with the End of Data Burst marking information.

The provisioning of the End of Data Burst Handling per PCC rule shall be performed using the PCC rule provisioning procedure as defined in clause 4.2.6.2.1

The SMF shall request to the UPF to detect the last PDU of the data burst and mark the End of Data burst by providing the received end of data burst handling information as described in 3GPP TS 29.244 [13].

4.2.7 Handling of requests which collide with an existing SM Policy Association

The PCF may receive an Originating Time Stamp parameter within the 3gpp-Sbi-Origination-Timestamp header, which is set by the AMF, by the Npcf_SMPolicyControl_Create service request.

NOTE 1: The SMF forwards the Origination Time Stamp to the PCF, when received from the AMF to allow the handling of colliding requests at the PCF based on network conditions.

Upon receipt of a Npcf_SMPolicyControl_Create service request which collides with an existing SM Policy Association for the same UE (i.e. same values of "supi" attribute) and the same PDU session Id (i.e. same values of "pduSessionId" attribute), the PCF shall accept the new request only if it contains a more recent timestamp within the 3gpp-Sbi-Origination-Timestamp header than the origination timestamp stored for the existing SM Policy Association. An incoming Npcf_SMPolicyControl_Create service request shall be considered as more recent than an existing SM Policy Association and be accepted if no 3gpp-Sbi-Origination-Timestamp header was provided for at least one of the two SM Policy Associations. The PCF shall reject an incoming request whose timestamp is less recent than the timestamp of the existing SM Policy Association with the HTTP status code "403 Forbidden" and the application error "LATE_OVERLAPPING_REQUEST".

NOTE 2: When the PCF accepts the new request that contains a more recent timestamp within the 3gpp-Sbi-Origination-Timestamp header than the timestamp stored for the SM Policy Association, the PCF performs implementation specific, e.g. locally deletes the existing Individual SM Policy Association.

4.2.8 UE IP address support

As specified in 3GPP TS 23.501 [2], the following types of UE IP addresses may be assigned to a PDU session and may be received by the PCF:

- IPv4 address; and/or
- /64 IPv6 Prefix; or
- IPv6 prefix shorter than the default /64 prefix when IPv6 Prefix Delegation applies.

More than one UE IP addresses may be assigned to a PDU session, as specified in clause 4.2.4.11.

5 Npcf_SMPolicyControl Service API

5.1 Introduction

The Npcf_SMPolicyControl Service shall use the Npcf_SMPolicyControl API.

The API URI of the Npcf_SMPolicyControl API shall be:

{apiRoot}/<apiName>/<apiVersion>

The request URIs used in HTTP request from the NF service consumer towards the PCF shall have the Resource URI structure defined in clause 4.4.1 of 3GPP TS 29.501 [5], i.e.:

{apiRoot}/<apiName>/<apiVersion>/<apiSpecificResourceUriPart>

with the following components:

- The {apiRoot} shall be set as described in 3GPP TS 29.501 [5].
- The <apiName> shall be "npcf-smpolicycontrol".
- The <apiVersion> shall be "v1".
- The <apiSpecificResourceUriPart> shall be set as described in clause 5.3.

5.2 Usage of HTTP

5.2.1 General

HTTP/2, IETF RFC 9113 [8], shall be used as specified in clause 5 of 3GPP TS 29.500 [4].

HTTP/2, shall be transported as specified in clause 5.3 of 3GPP TS 29.500 [4].

An OpenAPI [10] specification of HTTP messages and content bodies for the Npcf_SMPolicyControl is contained in Annex A.

5.2.2 HTTP standard headers

5.2.2.1 General

See clause 5.2.2 of 3GPP TS 29.500 [4] for the usage of HTTP standard headers.

5.2.2.2 Content type

JSON, IETF RFC 8259 [9], shall be used as content type of the HTTP bodies specified in the present specification as specified in clause 5.4 of 3GPP TS 29.500 [4]. The use of the JSON format shall be signalled by the content type "application/json".

"Problem Details" JSON object shall be used to indicate additional details of the error in a HTTP response body and shall be signalled by the content type "application/problem+json", as defined in IETF RFC 9457 [31].

5.2.3 HTTP custom headers

5.2.3.1 General

The Npcf_SMPolicyControl API shall support HTTP custom header fields specified in clause 5.2.3.2 of 3GPP TS 29.500 [4] and may support HTTP custom header fields specified in clause 5.2.3.3 of 3GPP TS 29.500 [4].

5.2.3.2 3gpp-Sbi-Origination-Timestamp

The header contains the date and time (with a millisecond granularity) when the originating entity initiated the request as specified in clause 6.1.2.3.2 of 3GPP TS 29.502 [22].

5.3 Resources

5.3.1 Resource Structure

Figure 5.3.1-1: Resource URI structure of the Npcf_SMPolicyControl API

Table 5.3.1-1 provides an overview of the resources and applicable HTTP methods.

Table 5.3.1-1: Resources and methods overview

Resource name	Resource URI	HTTP method or custom operation	Description
SM Policies	/sm-policies	POST	Create a new Individual SM Policies resource for a SUPI or a PEI and PDU Session ID supplied by the NF service consumer.
Individual SM Policy	/sm-policies/{smPolicyId}	GET	Read an Individual SM Policies resource.
	/sm-policies/{smPolicyId}/delete	delete (POST)	Delete an Individual SM Policies resource.
	/sm-policies/{smPolicyId}/update	update (POST)	Update an Individual SM Policies resource when a policy control request event is met or an error of policy enforcement occurs.

5.3.2 Resource: SM Policies

5.3.2.1 Description

This resource represents the collection of the individual SM Policies created in the PCF.

5.3.2.2 Resource definition

Resource URI: {apiRoot}/npcf-smpolicycontrol/v1/sm-policies

This resource shall support the resource URI variables defined in table 5.3.2.2-1.

Table 5.3.2.2-1: Resource URI variables for this resource

Name	Data type	Definition
apiRoot	string	See clause 5.1

5.3.2.3 Resource Standard Methods

5.3.2.3.1 POST

This method shall support the URI query parameters specified in table 5.3.2.3.1-1.

Table 5.3.2.3.1-1: URI query parameters supported by the POST method on this resource

Name	Data type	Р	Cardinality	Description
n/a				

This method shall support the request data structures specified in table 5.3.2.3.1-2 and the response data structures and response codes specified in table 5.3.2.3.1-3.

Table 5.3.2.3.1-2: Data structures supported by the POST Request Body on this resource

Data type	Р	Cardinality	Description
SmPolicyContextData	М	1	Parameters to create an individual SM policies resources.

Table 5.3.2.3.1-3: Data structures supported by the POST Response Body on this resource

Data type	P	Cardinality	Response codes	Description
SmPolicyDecision	М	1	201 Created	An individual SM Policy resources for the SUPI and PDU session id are created successfully.
ProblemDetails	0	01	400 Bad Request	(NOTE 2)
ProblemDetails	0	01	403 Forbidden	(NOTE 2)
n/a			308 Permanent Redirect	The URI of the PCF within the existing PCF binding information stored in the BSF for the indicated combination is returned in the non-roaming or homerouted scenario. (NOTE 3)

NOTE 1: The mandatory HTTP error status codes for the POST method listed in table 5.2.7.1-1 of

3GPP TS 29.500 [4] shall also apply.

NOTE 2: Failure cases are described in clause 5.7.

NOTE 3: Only applicable to the "SamePcf" feature as defined in clause 5.8.

Table 5.3.2.3.1-4: Headers supported by the 201 Response Code on this resource

Name	Data type	Р	Cardinality	Description
Location	string	М		Contains the URI of the newly created resource, according to the structure: {apiRoot}/npcf-smpolicycontrol/v1/smpolicies/{smPolicyId}

Table 5.3.2.3.1-5: Headers supported by the 308 Response Code on this resource

Name	Data type	P	Cardinality	Description
Location	string	М	1	Contains the URI of the PCF within the existing PCF binding
				information stored in the BSF for the indicated combination.

5.3.2.4 Resource Custom Operations

None.

5.3.3 Resource: Individual SM Policy

5.3.3.1 Description

The individual SM Policy resource represents an individual SM Policy created in the PCF and associated with the SUPI and PDU session ID.

5.3.3.2 Resource definition

Resource URI: {apiRoot}/npcf-smpolicycontrol/v1/sm-policies/{smPolicyId}

This resource shall support the resource URI variables defined in table 5.3.3.2-1.

Table 5.3.3.2-1: Resource URI variables for this resource

Name	Data type	Definition
apiRoot	string	See clause 5.1
smPolicyId	string	Unique identifier of the individual SM Policy resource.

5.3.3.3 Resource Standard Methods

5.3.3.3.1 GET

This method shall support the URI query parameters specified in table 5.3.3.3.1-1.

Table 5.3.3.3.1-1: URI query parameters supported by the GET method on this resource

Name	Data type	Р	Cardinality	Description
n/a				

This method shall support the request data structures specified in table 5.3.3.3.1-2 and the response data structures and response codes specified in table 5.3.3.3.1-3.

Table 5.3.3.3.1-2: Data structures supported by the GET Request Body on this resource

	Data type	Р	Cardinality	Description
n/a				

Table 5.3.3.3.1-3: Data structures supported by the GET Response Body on this resource

Data type	Р	Cardinality	Response codes	Description			
SmPolicyControl	М	1	200 OK	An individual SM Policy resources for the SUPI and PDU session id are returned successfully.			
RedirectResponse	0	01	307 Temporary Redirect	Temporary redirection, during Individual SM policy retrieval. Applicable if the feature "ES3XX" is supported. (NOTE 2)			
RedirectResponse O 01		01	308 Permanent Redirect	Permanent redirection, during Individual SM policy retrieval. Applicable if the feature "ES3XX" is supported. (NOTE 2)			
NOTE 1: The mandatory HTTP error status codes for the GET method listed in table 5.2.7.1-1 of 3GPP TS 29.500 [4] shall also apply.							
NOTE 2: The RedirectResponse data structure may be provided by an SCP (cf. clause 6.10.9.1 of							

Table 5.3.3.3.1-4: Headers supported by the 307 Response Code on this resource

Name	Data type	Р	Cardinality	Description
Location	string	M		Contains an alternative URI of the resource located in an alternative PCF (service) instance towards which the request is redirected. For the case where the request is redirected to the same target via a different SCP, refer to clause 6.10.9.1 of 3GPP TS 29.500 [4].
3gpp-Sbi-Target- Nf-Id	string	0	01	Identifier of the target PCF (service) instance towards which the request is redirected

Table 5.3.3.3.1-5: Headers supported by the 308 Response Code on this resource

Name	Data type	Р	Cardinality	Description
Location	string	M	1	Contains an alternative URI of the resource located in an alternative PCF (service) instance towards which the request is redirected. For the case where the request is redirected to the same target via a different SCP, refer to clause 6.10.9.1 of 3GPP TS 29.500 [4].
3gpp-Sbi-Target- Nf-Id	string	0	01	Identifier of the target NF (service) instance towards which the request is redirected

5.3.3.4 Resource Custom Operations

5.3.3.4.1 Overview

Table 5.3.3.4.1-1: Custom operations

Operation Name	Custom operation URI	Mapped HTTP method	Description
delete		delete (POST)	Delete an individual SM Policy resource.
	policies/{smPolicyId}/delete		
update	/sm-	update (POST)	Update an individual SM Policy
	policies/{smPolicyId}/update		resource.

5.3.3.4.2 Operation: delete

5.3.3.4.2.1 Description

5.3.3.4.2.2 Operation Definition

This custom operation deletes an individual SM Policy resource in the PCF.

This operation shall support the request data structures specified in table 5.3.3.4.2.2-1 and the response data structure and response codes specified in table 5.3.3.4.2.2-2.

Table 5.3.3.4.2.2-1: Data structures supported by the POST Request Body on this resource

Data type	Р	Cardinality	Description
SmPolicyDeleteData	0	01	Parameters to be sent by the NF service consumer when the individual
·			SM policy is deleted.

Table 5.3.3.4.2.2-2: Data structures supported by the POST Response Body on this resource

Data type	Р	Cardinality	Response codes	Description			
n/a			204 No Content	This case represents a successful deletion of the			
				individual SM policy resource.			
RedirectRespo	0	01	307 Temporary	Temporary redirection, during Individual SM policy			
nse			Redirect	deletion.			
				Applicable if the feature "ES3XX" is supported.			
				(NOTE 2)			
RedirectRespo	0	01	308 Permanent	Permanent redirection, during Individual SM policy			
nse			Redirect	deletion.			
				Applicable if the feature "ES3XX" is supported.			
				(NOTE 2)			
NOTE 1: The m	NOTE 1: The mandatory HTTP error status codes for the POST method listed in table 5.2.7.1-1 of						
3GPP TS 29.500 [4] shall also apply.							
NOTE 2: The Re	edired	tResponse da	ata structure may be pr	ovided by an SCP (cf. clause 6.10.9.1 of			
3GPP	TS 29	9.500 [41).		•			

Table 5.3.3.4.2.2-3: Headers supported by the 307 Response Code on this resource

Name	Data type	Р	Cardinality	Description
Location	string	M		Contains an alternative URI of the resource located in an alternative PCF (service) instance towards which the request is redirected. For the case where the request is redirected to the same target via a different SCP, refer to clause 6.10.9.1 of 3GPP TS 29.500 [4].
3gpp-Sbi-Target- Nf-Id	string	0	01	Identifier of the target PCF (service) instance towards which the request is redirected

Table 5.3.3.4.2.2-4: Headers supported by the 308 Response Code on this resource

Name	Data type	Р	Cardinality	Description
Location	string	M		Contains an alternative URI of the resource located in an alternative PCF (service) instance towards which the request is redirected. For the case where the request is redirected to the same target via a different SCP, refer to clause 6.10.9.1 of 3GPP TS 29.500 [4].
3gpp-Sbi-Target- Nf-Id	string	0		Identifier of the target PCF (service) instance towards which the request is redirected

5.3.3.4.3 Operation: update

5.3.3.4.3.1 Description

5.3.3.4.3.2 Operation Definition

This custom operation updates an individual SM Policy resource in the PCF.

This operation shall support the request data structures specified in table 5.3.3.4.3.2-1 and the response data structure and response codes specified in table 5.3.3.4.3.2-2.

Table 5.3.3.4.3.2-1: Data structures supported by the POST Request Body on this resource

Data type	Р	Cardinality	Description
SmPolicyUpdateContextData	М	1	Parameters to be sent by the NF service consumer when the
			individual SM policy is updated. It indicates the occurred changes.

Table 5.3.3.4.3.2-2: Data structures supported by the POST Response Body on this resource

Data type	Р	Cardinality	Response codes	Description
SmPolicyDecision	М	1	200 OK	An individual SM Policy resources is updated successfully. Response body includes the policy decision changes.
RedirectResponse	0	01	307 Temporary Redirect	Temporary redirection, during Individual SM policy modification. Applicable if the feature "ES3XX" is supported. (NOTE 3)
RedirectResponse	0	01	308 Permanent Redirect	Permanent redirection, during Individual SM policy modification. Applicable if the feature "ES3XX" is supported. (NOTE 3)
ProblemDetails	0	01	400 Bad Request	(NOTE 2)
ProblemDetails	0	01	403 Forbidden	(NOTE 2)
ProblemDetails	0	01	404 Not Found	(NOTE 2)

NOTE 1: The mandatory HTTP error status codes for the POST method listed in table 5.2.7.1-1 of 3GPP TS 29.500 [4] shall also apply.

NOTE 2: Failure cases are described in clause 5.7.

NOTE 3: The RedirectResponse data structure may be provided by an SCP (cf. clause 6.10.9.1 of 3GPP TS 29.500 [4]).

Table 5.3.3.4.3.2-3: Headers supported by the 307 Response Code on this resource

Name	Data type	Р	Cardinality	Description
Location	string	M		Contains an alternative URI of the resource located in an alternative PCF (service) instance towards which the request is redirected. For the case where the request is redirected to the same target via a different SCP, refer to clause 6.10.9.1 of 3GPP TS 29.500 [4].
3gpp-Sbi-Target- Nf-Id	string	0	01	Identifier of the target PCF (service) instance towards which the request is redirected

Table 5.3.3.4.3.2-4: Headers supported by the 308 Response Code on this resource

Name	Data type	Р	Cardinality	Description
Location	string	M		Contains an alternative URI of the resource located in an alternative PCF (service) instance towards which the request is redirected. For the case where the request is redirected to the same target via a different SCP, refer to clause 6.10.9.1 of 3GPP TS 29.500 [4].
3gpp-Sbi-Target- Nf-Id	string	0	01	Identifier of the target PCF (service) instance towards which the request is redirected

5.4 Custom Operations without associated resources

None.

5.5 Notifications

5.5.1 General

Table 5.5.1-1: Notifications

Notification	Callback URI	HTTP method or custom operation	Description (service operation)
Policy Update Notification	{notificationUri}/update	update (POST)	Policy Update Notification.
Request for termination of the policy association	{notificationUri}/terminate	· · ·	Request for termination of the policy association.

5.5.2 Policy Update Notification

5.5.2.1 Description

This notification is used by the PCF to update the policy.

5.5.2.2 Operation Definition

This operation shall support the request data structures specified in table 5.5.2.2-1 and the response data structure and response codes specified in table 5.5.2.2-2.

Table 5.5.2.2-1: Data structures supported by the POST Request Body on this resource

Data type	Р	Cardinality	Description
SmPolicyNotification	М	1	Update the SM policies provided by the PCF

Table 5.5.2.2-2: Data structures supported by the POST Response Body on this resource

Data type	Р	Cardinality	Response codes	Description
n/a			204 No Content	The SM policies are updated successfully.
UeCampingRep	0	01	200 OK	The current applicable values corresponding to the policy control request trigger is reported.
array(PartialSuccessRepo rt)	0	1N	200 OK	Some of the PCC rules and/or session rule provisioned by the PCF are not installed/activated successfully and/or the storage of some of the provisioned policy decisions and/or condition data has failed.
RedirectResponse	0	01	307 Temporary Redirect	Temporary redirection, during SM policy notification. Applicable if the feature "ES3XX" is supported. (NOTE 3)
RedirectResponse	0	01	308 Permanent Redirect	Permanent redirection, during SM policy notification. Applicable if the feature "ES3XX" is supported. (NOTE 3)
ErrorReport	M	1	400 Bad Request	The SM policies including all the PCC rules, session rules and policy decisions and condition data provisioned by the PCF are not installed/activated and stored successfully.
eCode)	0	1N	200 OK	Provisioning of some of the policy decision and/condition data which are not referred by any PCC rules or session rule has failed.

NOTE 1: The mandatory HTTP error status codes for the POST method listed in table 5.2.7.1-1 of

3GPP TS 29.500 [4] shall also apply.

NOTE 2: Failure cases are described in clause 5.7.

NOTE 3: The RedirectResponse data structure may be provided by an SCP (cf. clause 6.10.9.1 of

3GPP TS 29.500 [4]).

Table 5.5.2.2-3: Headers supported by the 307 Response Code on this resource

Name	Data type	Р	Cardinality	Description
Location	string	M		Contains an alternative URI representing the end point of an alternative NF consumer (service) instance towards which the notification should be redirected. For the case where the request is redirected to the same target via a different SCP, refer to clause 6.10.9.1 of 3GPP TS 29.500 [4].
3gpp-Sbi-Target- Nf-Id	string	0	01	Identifier of the target NF (service) instance towards which the notification request is redirected

Table 5.5.2.2-4: Headers supported by the 308 Response Code on this resource

Name	Data type	Р	Cardinality	Description
Location	string	M		Contains an alternative URI representing the end point of an alternative NF consumer (service) instance towards which the notification should be redirected. For the case where the request is redirected to the same target via a different SCP, refer to clause 6.10.9.1 of 3GPP TS 29.500 [4].
3gpp-Sbi-Target- Nf-Id	string	0		Identifier of the target NF (service) instance towards which the notification request is redirected

5.5.3 Request for termination of the policy association

5.5.3.1 Description

This notification is used by the PCF to request the termination of a policy association.

5.5.3.2 Operation Definition

This operation shall support the request data structures specified in table 5.5.3.2-1 and the response data structure and response codes specified in table 5.5.3.2-2.

Table 5.5.3.2-1: Data structures supported by the POST Request Body on this resource

Data type	Р	Cardinality	Description
TerminationNotification	М	1	Request to terminate the policy association.

Table 5.5.3.2-2: Data structures supported by the POST Response Body on this resource

Data type	Р	Cardinality	Response codes	Description		
n/a			204 No Content	The request for policy association termination was received.		
RedirectRespon se	0	01	307 Temporary Redirect	Temporary redirection, during SM policy termination notification.		
				Applicable if the feature "ES3XX" is supported. (NOTE 2)		
RedirectRespon se	0	01	308 Permanent Redirect	Permanent redirection, during SM policy termination notification. Applicable if the feature "ES3XX" is supported. (NOTE 2)		
NOTE: 1 The mandatory HTTP error status codes for the POST method listed in table 5.2.7.1-1 of 3GPP TS 29.500 [4] shall also apply. NOTE 2: The RedirectResponse data structure may be provided by an SCP (cf. clause 6.10.9.1 of 3GPP TS 29.500 [4]).						

Table 5.5.3.2-3: Headers supported by the 307 Response Code on this resource

Name	Data type	Р	Cardinality	Description
Location	string	M		Contains an alternative URI representing the end point of an alternative NF consumer (service) instance towards which the notification should be redirected. For the case where the request is redirected to the same target via a different SCP, refer to clause 6.10.9.1 of 3GPP TS 29.500 [4].
3gpp-Sbi-Target- Nf-Id	string	0		Identifier of the target NF (service) instance towards which the notification request is redirected

Table 5.5.3.2-4: Headers supported by the 308 Response Code on this resource

Name	Data type	Р	Cardinality	Description
Location	string	M		Contains an alternative URI representing the end point of an alternative NF consumer (service) instance towards which the notification should be redirected. For the case where the request is redirected to the same target via a different SCP, refer to clause 6.10.9.1 of 3GPP TS 29.500 [4].
3gpp-Sbi-Target- Nf-Id	string	0		Identifier of the target NF (service) instance towards which the notification request is redirected

5.6 Data Model

5.6.1 General

This clause specifies the application data model supported by the API.

The Npcf_SMPolicyControl API allows the NF service consumer to retrieve the session management related policy from the PCF as defined in 3GPP TS 23.503 [6].

Table 5.6.1-1 specifies the data types defined for the Npcf_SMPolicyControl service based interface protocol.

Table 5.6.1-1: Npcf_SMPolicyControl specific Data Types

Data type	Section defined	Description	Applicability
5GSmCause	5.6.3.2	Indicates the 5GSM cause code value.	RAN-NAS-
			Cause
AdditionalAccessInfo	5.6.2.43	Indicates the combination of additional Access	ATSSS
		Type and RAT Type for MA PDU session	
AccNetChargingAddress	5.6.2.35	Identifies the address of the network node	
		performing charging and used for charging	
		applications.	
AccNetChId	5.6.2.23	Contains the access network charging identifier	
=		for the PCC rule(s) or whole PDU session.	
AccuUsageReport	5.6.2.18	Contains the accumulated usage report	UMC
A(O: D.)	5.0.0.40	information.	D 4E : IEI
AfSigProtocol	5.6.3.10	Indicates the protocol used for signalling between	ProvAFsignalFl
AnnDatactionInfo	F 6 0 00	the UE and the AF.	ow ADC
AppDetectionInfo	5.6.2.22	Contains the detected application's traffic information.	ADC
ApplicationDescriptor	5.6.3.2	Defines the Application Descriptor for an ATSSS	ATSSS
ApplicationDescriptor	3.0.3.2	rule.	A1000
AtsssCapability	5.6.3.26	Contains the ATSSS capability supported for the	ATSSS
/ Kosocapability	0.0.0.20	MA PDU Session.	711000
AuthorizedDefaultQos	5.6.2.34	Authorized Default QoS.	
BatOffsetInfoPcc	5.6.2.60	Contains the offset of the BAT and the optionally	EnTSCAC
	0.0.2.00	adjusted periodicity for the corresponding PCC	
		rules(s).	
BridgeManagementContainer	5.6.2.47	Contains the UMIC.	TimeSensitive
			Networking
CalleeInfo	5.6.2.55	Identifies the callee information.	VBCforIMS
CallInfo	5.6.2.54	Identifies the caller and callee information.	VBCforIMS
ChargingData	5.6.2.11	Contains charging related parameters.	
ChargingInformation	5.6.2.17	Contains the addresses, and if available, the	
		instance ID and set ID, of the charging functions.	
ConditionData	5.6.2.9	Contains conditions for applicability of a rule.	
CreditManagementStatus	5.6.3.16	Indicates the reason of the credit management	
		session failure.	
DownlinkDataNotificationCont	5.6.2.48	Contains the downlink data notification control	DDNEventPolic
rol		information.	yControl
DownlinkDataNotificationCont	5.6.2.49	This data type is defined in the same way as the	DDNEventPolic
rolRm		"DownlinkDataNotificationControl" data type, but	yControl2
EnaDanNaaDalCausa	F C O O	with the OpenAPI "nullable: true" property.	RAN-NAS-
EpsRanNasRelCause	5.6.3.2	Indicates the RAN or NAS release cause code information in 3GPP-EPS access type or indicates	Cause
		the TWAN or untrusted WLAN release cause	Cause
		code information in Non-3GPP-EPS access type.	
ErrorReport	5.6.2.36	Contains the PCC rule and/or session rule and/or	
Enonteport	0.0.2.00	policy decision and/or condition data reports.	
FailureCause	5.6.3.14	Indicates the cause of the failure in a Partial	
	0.0.0	Success Report.	
FailureCode	5.6.3.9	Indicates the reason of the PCC rule failure.	
FlowDescription	5.6.3.2	Defines a packet filter for an IP flow.	
FlowDirection	5.6.3.3	Indicates the direction of the service data flow.	
FlowDirectionRm	5.6.3.15	This data type is defined in the same way as the	
		"FlowDirection" data type, but allows null value.	
FlowInformation	5.6.2.14	Contains the flow information.	
IpMulticastAddressInfo	5.6.2.46	Contains the IP multicast addressing information	WWC
L4sSupportInfo	5.6.2.57	Indicates whether the ECN marking for L4S is	L4S
		available in 5GS for the indicated PCC rules.	
MaPduIndication	5.6.3.25	Contains the MA PDU session indication, i.e., MA	ATSSS
		PDU Request or MA PDU Network-Upgrade	
		Allowed.	
MeteringMethod	5.6.3.5	Indicates the metering method.	
MulticastAccessControl	5.6.3.20	Indicates whether the service data flow,	WWC
		corresponding to the service data flow template, is	
		allowed or not allowed.	
NetLocAccessSupport	5.6.3.27	Indicates the access network support of the report	NetLoc
	<u> </u>	of the requested access network information.	

NotificationControlIndication	5.6.3.29	Indicates the notification of DDD Status is requested and/or notification of DDN Failure is requested.	DDNEventPolic yControl
NwdafData	5.6.2.53	Indicates the list of NWDAF instance IDs used for the PDU Session and their associated Analytics ID(s) consumed by the NF service consumer.	EneNA
PacketFilterContent	5.6.3.2	Defines a packet filter for an IP flow.	
PacketFilterInfo	5.6.2.30	Contains the information from a single packet filter	
		sent from the NF service consumer to the PCF.	
PartialSuccessReport	5.6.2.33	Includes the information reported by the NF service consumer when some of the PCC rules and/or session rules and/or policy decisions and/or condition data are not successfully installed/activated or stored.	
PccRule	5.6.2.6	Contains the PCC rule information.	
PduSessionRelCause	5.6.3.24	Contains the NF service consumer PDU Session release cause.	PDUSessionR elCause, ImmediateTer mination
PolicyControlRequestTrigger	5.6.3.6	Contains the policy control request trigger(s).	
PolicyDecisionFailureCode	5.6.3.28	Indicates the type of the failed policy decision and/or condition data.	PolicyDecision ErrorHandling
PortManagementContainer	5.6.2.45	Contains the port management information container for a port.	TimeSensitive Networking
QosCharacteristics	5.6.2.16	Contains QoS characteristics for a non- standardized or non-configured 5QI.	
QosData	5.6.2.8	Contains the QoS parameters.	
QosFlowUsage	5.6.3.13	Indicates a QoS flow usage information.	
QosMonitoringData	5.6.2.40	Contains QoS monitoring related control information.	QosMonitoring
QosMonitoringReport	5.6.2.42	Contains QoS monitoring reporting information.	QosMonitoring
QosNotificationControlInfo	5.6.2.32	Contains the QoS Notification Control Information.	
QosMonitoringParamType	5.6.3.32	Contains the QoS monitoring parameter to be monitored.	EnQoSMon
RanNasRelCause	5.6.2.28	Contains the RAN/NAS release cause.	RAN-NAS- Cause
RedirectAddressType	5.6.3.12	Indicates the redirect address type.	ADC
RedirectInformation	5.6.2.13	Contains the redirect information.	ADC
ReportingFrequency	5.6.3.22	Indicates the frequency for the reporting	QosMonitoring
ReportingLevel	5.6.3.4	Indicates the reporting level.	
RequestedQos	5.6.2.31	Contains the QoS information requested by the UE.	
RequestedQosMonitoringPar	5.6.3.21	Indicates the requested QoS monitoring	QosMonitoring
ameter Details Details	5.0.0.4	parameters to be measured.	
RequestedRuleData	5.6.2.24	Contains rule data requested by the PCF to receive information associated with PCC rules.	
RequestedRuleDataType	5.6.3.7	Contains the type of rule data requested by the PCF.	11110
RequestedUsageData	5.6.2.25	Contains usage data requested by the PCF requesting usage reports for the corresponding usage monitoring data instances.	UMC
RuleOperation	5.6.3.11	Indicates a UE initiated resource operation that causes a request for PCC rules.	
RuleReport	5.6.2.27	Reports the status of PCC rule(s).	
RuleStatus	5.6.3.8	Indicates the status of PCC or session rule.	
ServingNfldenty	5.6.2.38	Contains the serving Network Function identity.	
SessionRule SessionRuleFailureCode	5.6.2.7 5.6.3.17	Contains session level policy information. Indicates the reason of the session rule failure.	SessionRuleEr
SessionRuleReport	5.6.2.37	Reports the status of session rule.	rorHandling SessionRuleEr
			rorHandling
SgsnAddress SliceUsgCtrlInfo	5.6.2.50 5.6.2.59	Contains the serving SGSN address. Represents network slice usage control	2G3GIWK NetSliceUsage
SmPolicyAssociationRelease	5.6.3.23	information. Represents the cause why the PCF requests the	Ctrl
Cause		termination of the SM policy association.	

SmPolicyControl	5.6.2.2	Contains the parameters to request the SM	
,		policies and the SM policies authorized by the PCF.	
SmPolicyContextData 5.6.2.3		Contains the parameters to create individual SM policy resource.	
SmPolicyDecision	5.6.2.4	Contains the SM policies authorized by the PCF.	
SmPolicyNotification	5.6.2.5	Contains the update of the SM policies.	
SmPolicyDeleteData	5.6.2.15	Contains the parameters to be sent to the PCF when the individual SM policy is deleted.	
SmPolicyUpdateContextData	5.6.2.19	Contains the met policy control request trigger(s) and corresponding new value(s) or the error report of the policy enforcement.	
SteeringFunctionality	5.6.3.18	Indicates functionality to support traffic steering, switching and splitting determined by the PCF.	ATSSS
SteeringMode	5.6.2.39	Contains the steering mode value and parameters determined by the PCF.	ATSSS
SteerModeIndicator	5.6.3.31	Contains Autonomous load-balance indicator or UE-assistance indicator.	EnATSSS
SteerModeValue	teerModeValue 5.6.3.19 Indicates the steering mode value determined by the PCF.		ATSSS
TerminationNotification	5.6.2.21	Termination Notification.	
ThresholdValue	5.6.2.52	Contains the threshold value(s) for RTT and/or Packet Loss Rate.	EnATSSS
TrafficControlData	5.6.2.10	Contains parameters determining how flows associated with a PCCRule are treated (blocked, redirected, etc).	
TrafficParaData	5.6.2.56	Contains Traffic Parameter(s) related control information.	PowerSaving
TrafficParameterMeas	5.6.3.32	Indicates the traffic parameters to be measured.	PowerSaving
TransportMode	5.6.3.33	Indicates the transport mode for MPQUIC steering functionality	EnATSSS_v2
TsnBridgeInfo	5.6.2.41	Contains parameters that describe and identify the TSC user plane node.	TimeSensitive Networking
TsnPortNumber	5.6.3.2	Contains a port number.	TimeSensitive Networking
UeCampingRep	5.6.2.26	Contains the current applicable values corresponding to the policy control request triggers.	
UeInitiatedResourceRequest	5.6.2.29	Indicates a UE requests specific QoS handling for selected SDF.	
UePolicyContainer	5.6.3.2	Contains a UE policy container	EpsUrsp
UeReachabilityStatus	5.6.3.35	Contains the UE reachability status.	UEUnreachabl e
UpPathChgEvent	5.6.2.20	Contains the UP path change event subscription from the AF.	TSC
UrspEnforcementInfo	5.6.3.2	Contains the report of URSP rule(s) enforcement information as received from the UE.	URSPEnforce ment
UsageMonitoringData	5.6.2.12	Contains usage monitoring related control information.	UMC

Table 5.6.1-2 specifies data types re-used by the Npcf_SMPolicyControl service based interface protocol from other specifications, including a reference to their respective specifications and when needed, a short description of their use within the Npcf_SMPolicyControl service based interface.

Table 5.6.1-2: Npcf_SMPolicyControl re-used Data Types

Data type	Reference	Comments	Applicability
5GMmCause	3GPP TS 29.571 [11]	Contains the cause value of 5GMM protocol.	RAN-NAS-
50:	20DD T0 20 574 [44]	Uncirculation and internal representing a 50 Oct I doubting	Cause
5Qi	3GPP TS 29.571 [11]	Unsigned integer representing a 5G QoS Identifier (see clause 5.7.2.1 of 3GPP TS 23.501 [2]), within the range 0 to 255.	
5QiPriorityLevel	3GPP TS 29.571 [11]	Unsigned integer indicating the 5QI Priority Level (see clauses 5.7.3.3 and 5.7.4 of	
		3GPP TS 23.501 [2]), within the range 1 to 127. Values are ordered in decreasing order of priority, i.e. with 1 as the highest priority and 127 as the	
5QiPriorityLevelRm	3GPP TS 29.571 [11]	lowest priority. This data type is defined in the same way as the	
Joan HomyLeventin	3011 10 23.371 [11]	"5QiPriorityLevel" data type, but with the OpenAPI "nullable: true" property.	
AccessType	3GPP TS 29.571 [11]	The identification of the type of access network.	
AccessTypeRm	3GPP TS 29.571 [11]	This data type is defined in the same way as the "AccessType" data type, but with the OpenAPI "nullable: true" property.	ATSSS
Ambr	3GPP TS 29.571 [11]	Session-AMBR.	
AnGwAddress	3GPP TS 29.514 [17]	Carries the control plane address of the access network gateway.	
ApplicationChargingId	3GPP TS 29.571 [11]	Application provided charging identifier allowing correlation of charging information.	AF_Charging_ Identifier
ApplicationId	3GPP TS 29.571 [11]	Application Identifier	UPEAS
Arp	3GPP TS 29.571 [11]	ARP.	
AverWindow	3GPP TS 29.571 [11]	Averaging Window.	
AverWindowRm	3GPP TS 29.571 [11]	This data type is defined in the same way as the "AverWindow" data type, but with the OpenAPI "nullable: true" property.	
BitRate	3GPP TS 29.571 [11]	String representing a bit rate that shall be formatted as follows:	
		pattern: "^\d+(\.\d+)? (bps Kbps Mbps Gbps Tbps)\$" Examples: "125 Mbps", "0.125 Gbps", "125000 Kbps".	
BitRateRm	3GPP TS 29.571 [11]	This data type is defined in the same way as the "BitRate" data type, but with the OpenAPI "nullable: true" property.	
Bytes	3GPP TS 29.571 [11]	String with format "byte".	TimeSensitive Networking
ChargingId	3GPP TS 29.571 [11]	Charging identifier allowing correlation of charging information.	
ContentVersion	3GPP TS 29.514 [17]	Indicates the content version of a PCC rule. It uniquely identifies a version of the PCC rule as defined in clause 4.2.6.2.14.	RuleVersionin g
DateTime	3GPP TS 29.571 [11]	String with format "date-time" as defined in OpenAPI Specification [10].	
DateTimeRm	3GPP TS 29.571 [11]	This data type is defined in the same way as the "DateTime" data type, but with the OpenAPI "nullable: true" property.	
DddTrafficDescriptor	3GPP TS 29.571 [11]	Traffic Descriptor	DDNEventPoli cyControl
DIDataDeliveryStatus	3GPP TS 29.571 [11]	Downlink data delivery status.	DDNEventPoli cyControl
DnaiChangeType	3GPP TS 29.571 [11]	Describes the types of DNAI change.	
Dnn	3GPP TS 29.571 [11]	The DNN the user is connected to.	
DnnSelectionMode	3GPP TS 29.502 [22]	DNN selection mode.	DNNSelection Mode
DurationSec	3GPP TS 29.571 [11]	Identifies a period of time in units of seconds.	
DurationSecRm	3GPP TS 29.571 [11]	This data type is defined in the same way as the "DurationSec" data type, but with the OpenAPI "nullable: true" property.	
DurationMilliSec	3GPP TS 29.514 [17]	Indicates the time interval in units of milliseconds.	PowerSaving

DurationMilliSecRm 3GPP TS 29.514 [17]		This data type is defined in the same way as the "DurationMilliSec" data type, but with the OpenAPI "nullable: true" property.	PowerSaving
EasIpReplacementInfo	3GPP TS 29.571 [11]	Contains EAS IP replacement information for a Source and a Target EAS.	EASIPreplace ment
EthFlowDescription	3GPP TS 29.514 [17]	Defines a packet filter for an Ethernet flow. (NOTE 2)	
ExtMaxDataBurstVol	3GPP TS 29.571 [11]	Maximum Data Burst Volume.	EMDBV
ExtMaxDataBurstVolRm	3GPP TS 29.571 [11]	This data type is defined in the same way as the "ExtMaxDataBurstVol" data type, but with the OpenAPI "nullable: true" property.	EMDBV
Metadata	3GPP TS 29.571 [11]	This datatype contains opaque information for the service functions in the N6-LAN that is provided by AF and transparently sent to UPF.	SFC
FinalUnitAction	3GPP TS 32.291 [19]	Indicates the action to be taken when the user's account cannot cover the service cost.	
FlowStatus	3GPP TS 29.514 [17]	Describes whether the IP flow(s) are enabled or disabled. The value "REMOVED" is not applicable to Npcf_SMPolicyControl service.	
FqdnPatternMatchingRul e	3GPP TS 29.571 [11]	Identifies the FQDN pattern matching rule.	HR-SBO
Gpsi	3GPP TS 29.571 [11]	Identifies a GPSI.	
GroupId	3GPP TS 29.571 [11]	Identifies a group of internal globally unique ID.	
Guami	3GPP TS 29.571 [11]	Globally Unique AMF Identifier.	
InvalidParam	3GPP TS 29.571 [11]	Invalid Parameters for the reported failed policy decisions	ExtPolicyDecis ionErrorHandli ng
IpIndex	3GPP TS 29.519 [15]	Information that identifies which IP pool or external server is used to allocate the IP address.	
IpAddr	3GPP TS 29.571 [11]	Identifes an IP address.	HR-SBO
lpv4Addr	3GPP TS 29.571 [11]	Identifies an Ipv4 address.	
Ipv4AddrMask	3GPP TS 29.571 [11]	String identifying an IPv4 address mask.	
lpv6Addr	3GPP TS 29.571 [11]	Identifies an IPv6 address.	
Ipv6Prefix	3GPP TS 29.571 [11]	The Ipv6 prefix allocated for the user.	
L4sNotifType	3GPP TS 29.514 [17]	Indicates whether the ECN marking for L4S support for the indicated SDFs is "NOT_AVAILABLE" or "AVAILABLE" again.	L4S
MacAddr48	3GPP TS 29.571 [11]	MAC Address.	
MaxDataBurstVol	3GPP TS 29.571 [11]	Maximum Data Burst Volume.	
MaxDataBurstVolRm	3GPP TS 29.571 [11]	This data type is defined in the same way as the "MaxDataBurstVol" data type, but with the OpenAPI "nullable: true" property.	
NfInstanceId	3GPP TS 29.571 [11]	The NF instance identifier.	
NfSetId	3GPP TS 29.571 [11]	The NF set identifier.	
NgApCause	3GPP TS 29.571 [11]	Contains the cause value of NgAP protocol.	RAN-NAS- Cause
NullValue	3GPP TS 29.571 [11]	JSON's null value, used as an explicit value of an enumeration.	
NwdafEvent	3GPP TS 29.520 [51]	Analytics ID consumed by the NF service consumer.	EneNA
PacketDelBudget	3GPP TS 29.571 [11]	Packet Delay Budget.	
PacketErrRate	3GPP TS 29.571 [11]	Packet Error Rate.	
PacketLossRateRm	3GPP TS 29.571 [11]	This data type is defined in the same way as the "PacketLossRate" data type, but with the OpenAPI "nullable: true" property.	
PcfUeCallbackInfo	3GPP TS 29.571 [11]	Contains the PCF for the UE callback URI and SBA binding information, if available	AMInfluence
PduSessionId	3GPP TS 29.571 [11]	The identification of the PDU session.	
PduSessionType	3GPP TS 29.571 [11]	Indicate the type of a PDU session.	
PduSetQosParaRm	3GPP TS 29.571 [11]	Represents the PDU Set level QoS parameters to be modified.	PDUSetHandli ng
Pei	3GPP TS 29.571 [11]	The Identification of a Permanent Equipment.	

PlmnldNid	3GPP TS 29.571 [11]	The identification of the Network: The PLMN Identifier (the mobile country code and the mobile network code) or the SNPN Identifier (the PLMN Identifier and the NID).	
PresenceInfo	3GPP TS 29.571 [11]	Contains the information which describes a Presence Reporting Area.	PRA
PresenceInfoRm	3GPP TS 29.571 [11]	This data type is defined in the same way as the "PresenceInfo" data type, but with the OpenAPI "nullable: true" property.	PRA
ProblemDetails	3GPP TS 29.571 [11]	Contains a detailed information about an error.	
ProtocolDescription	3GPP TS 29.571 [11]	Represents Protocol description of the media flow	PDUSetHandli ng, PowerSaving
QosNotifType	3GPP TS 29.514 [17]	Indicates whether the GBR targets for the indicated SDFs are "NOT_GUARANTEED" or "GUARANTEED" again.	
QosResourceType	3GPP TS 29.571 [11]	Indicates whether the resource type is GBR, delay critical GBR, or non-GBR.	
RatingGroup	3GPP TS 29.571 [11]	Identifier of a rating group.	
RatType	3GPP TS 29.571 [11]	The identification of the RAT type.	
RedirectResponse	3GPP TS 29.571 [11]	Contains redirection related information.	ES3XX
RouteToLocation	3GPP TS 29.571 [11]	A traffic routes to applications location.	TSC
SatelliteBackhaulCatego ry	3GPP TS 29.571 [11]	Indicates the satellite backhaul category or non-satellite backhaul.	SatBackhaulC ategoryChg
ServerAddressingInfo	3GPP TS 29.571 [11]	Contains the Provisioning Server information that provisions the UE with credentials and other data to enable SNPN access.	PvsSupport
Serviceld	3GPP TS 29.571 [11]	Identifier of a service.	
Snssai	3GPP TS 29.571 [11]	Identifies the S-NSSAI.	
SscMode	3GPP TS 29.571 [11]	Represents the service and session continuity mode.	URSPEnforce ment
SubscribedDefaultQos	3GPP TS 29.571 [11]	Subscribed Default QoS.	
Supi	3GPP TS 29.571 [11]	The identification of the user (i.e. IMSI, NAI).	
SupportedFeatures	3GPP TS 29.571 [11]	Used to negotiate the applicability of the optional features defined in table 5.8-1.	
TraceData	3GPP TS 29.571 [11]		
TimeZone	3GPP TS 29.571 [11]	Contains the user time zone information.	
TscailnputContainer	3GPP TS 29.514 [17]	TSCAI Input information.	TimeSensitive Networking
TrafficCorrelationInfo	3GPP TS 29.519 [15]	Contains the information for traffic correlation.	CommonEAS DNAI
UePolicyTransferFailure Cause	3GPP TS 29.525 [57]	UE Policy Transfer Failure Cause.	EpsUrsp
Uinteger	3GPP TS 29.571 [11]	Unsigned Integer.	
UintegerRm	3GPP TS 29.571 [11]	This data type is defined in the same way as the "Uinteger" data type, but with the OpenAPI "nullable: true" property.	EnATSSS, AF_latency, EnQoSMon
Uint16	3GPP TS 29.571 [11]	Unsigned 16-bit integers.	MTU_Size
Uint32	3GPP TS 29.571 [11]	Unsigned 32-bit integers.	MTU_Size
Uint64	3GPP TS 29.571 [11]	Unsigned 64-bit integers.	TimeSensitive Networking
UplinkDownlinkSupport	3GPP TS 29.514 [17]	Represents whether a capability is supported for the UL, the DL or both UL and DL service data flows	L4S
Uri	3GPP TS 29.571 [11]	URI.	
UserLocation	3GPP TS 29.571 [11]	Contains the user location(s).	
Volume	3GPP TS 29.122 [32]	Unsigned integer identifying a volume in units of bytes.	
VolumeRm	3GPP TS 29.122 [32]	This data type is defined in the same way as the "Volume" data type, but with the OpenAPI "nullable: true" property.	
VplmnDlAmbr	3GPP TS 29.571 [11]	VPLMN Specific DL AMBR.	HR-SBO
VplmnOffloadingInfo	3GPP TS 29.571 [11]	VPLMN Specific Offloading Information.	HR-SBO

VplmnQo	S	3GPP TS 29.502 [22]	QoS constraints in the VPLMN.	VPLMN-QoS- Control			
NOTE 1:	Void						
NOTE 2:	In order to supp	oort a set of MAC address	ses with a specific range in the traffic filter, feature				
	MacAddressRa	MacAddressRange as specified in clause 5.8 shall be supported.					

5.6.2 Structured data types

5.6.2.1 Introduction

This clause defines the structures to be used in resource representations.

5.6.2.2 Type SmPolicyControl

Table 5.6.2.2-1: Definition of type SmPolicyControl

Attribute name	Data type	Р	Cardinality	Description	Applicability
context	SmPolicyContextData	М		Includes the parameters to request the SM policies by the NF service consumer.	
policy	SmPolicyDecision	М	1	Includes the SM policies authorized by the PCF.	

5.6.2.3 Type SmPolicyContextData

Table 5.6.2.3-1: Definition of type SmPolicyContextData

Attribute name	Data type	Р	Cardinality	Description	Applicability
accNetChId	AccNetChId	0	01	Indicates the access network charging identifier for the whole PDU session. For EPS interworking scenarios, it indicates the access network charging identifier for the default QoS flow / default EPS bearer or the whole PDU session.	
chargEntityAddr	AccNetChargingAddr ess	0	01	Address of the network entity performing charging.	
gpsi	Gpsi	0	01	Gpsi shall contain either an External Id or an MSISDN.	
supi	Supi	М	1	Subscription Permanent Identifier. (NOTE 2)	
invalidSupi	boolean	С	01	When this attribute is included and set to true, it indicates that the "supi" attribute contains an invalid value. This attribute shall be present if the SUPI is not available in the NF service consumer, or the SUPI is unauthenticated. When present it shall be set as follows: - true: invalid SUPI. - false (default): valid SUPI.	
pduSessionId	PduSessionId	М	1	PDU session Id.	
dnn	Dnn	М	1	The DNN of the PDU session, a full DNN with both the Network Identifier and Operator Identifier, or a DNN with the Network Identifier only. (NOTE 4)	
dnnSelMode	DnnSelectionMode	0	01	Indicates whether the requested DNN corresponds to an explicitly subscribed DNN.	DNNSelection Mode
interGrplds	array(GroupId)	0	1N	The internal Group Id(s).	
notificationUri	Uri	М	1	Identifies the recipient of SM policies update notifications sent by the PCF.	
pduSessionType	PduSessionType	М	1	Indicates the type of a PDU session.	
accessType	AccessType	0	01	The Access Type where the served UE is camping.	
ratType	RatType	0	01	The RAT Type where the served UE is camping.	
addAccessInfo	AdditionalAccessInfo	0	01	Indicates the combination of additional Access Type and RAT Type for MA PDU session.	ATSSS
servingNetwork	PlmnldNid	0	01	The serving network (a PLMN or an SNPN) where the served UE is camping. For the SNPN the NID together with the PLMN ID identifies the SNPN.	
userLocationInfo	UserLocation	0	01	The location where the served UE is camping. (NOTE 3)	
ueTimeZone	TimeZone	0	01	The time zone where the served UE is camping.	
pei	Pei	С	01	The Permanent Equipment Identifier of the served UE. Refer to Clause 4.2.2.9.	
ipv4Address	lpv4Addr	0	01	The IPv4 Address of the served UE.	
ipv6AddressPrefix	lpv6Prefix	0	01	The Ipv6 Address Prefix of the served UE.	
ipDomain	string	0	01	IPv4 address domain identifier. (NOTE 1)	
subsSessAmbr	Ambr	0	01	UDM subscribed or DN-AAA authorized Session-AMBR.	
authProfIndex	string	0	01	DN-AAA authorization profile index.	DN- Authorization

subsDefQos	SubscribedDefaultQ os	0	01	Subscribed Default QoS Information.	
vplmnQos	VplmnQos	0	01	QoS constraints in a VPLMN.	VPLMN-QoS- Control
numOfPackFilter	integer	0	01	Contains the number of supported packet filter for signalled QoS rules.	
online	boolean	0	01	If it is included and set to true, the online charging is applied to the PDU session.	
offline	boolean	0	01	If it is included and set to true, the offline charging is applied to the PDU session.	
chargingCharacteri stics	string	0	01	Contains the Charging Characteristics applied to the PDU session. Functional requirements for the Charging Characteristics are defined in 3GPP TS 32.255 [35] Annex A. The charging characteristics are encoded as specified in 3GPP TS 29.503 [34].	
3gppPsDataOffStat us	boolean	0	01	If it is included and set to true, the 3GPP PS Data Off is activated by the UE.	3GPP-PS- Data-Off
refQosIndication	boolean	0	01	If it is included and set to true, the reflective QoS is supported by the UE.	
sliceInfo	Snssai	М	1	Identifies the S-NSSAI.	
altSliceInfo	Snssai	0	01	Contains the Alternative S-NSSAI.	NetSliceRepl
qosFlowUsage	QosFlowUsage	0	01	Indicates the required usage for default QoS flow.	
servNfld	ServingNfldentity	0	01	Contains the serving network function identity.	
suppFeat	SupportedFeatures	С	01	Indicates the list of Supported features used as described in clause 5.8. This parameter shall be supplied by the NF service consumer in the POST request that requested the creation of an individual SM policy resource.	
traceReq	TraceData	0	01	Trace control and configuration parameters information defined in 3GPP TS 32.422 [24].	
smfld	NfInstanceId	0	01	SMF instance identifier.	
recoveryTime	DateTime	0	01	It includes the recovery time of the NF service consumer.	
maPduInd	MaPduIndication	0	01	Contains the MA PDU session indication, i.e., MA PDU Request or MA PDU Network-Upgrade Allowed.	
atsssCapab	AtsssCapability	0	01	Contains the ATSSS capability supported for the MA PDU Session.	ATSSS
ipv4FrameRouteLis t	array(Ipv4AddrMask)	0	1N	List of Framed Route information of IPv4.	
ipv6FrameRouteLis t	array(Ipv6Prefix)	0	1N	List of Framed Route information of IPv6.	
satBackhaulCatego ry	SatelliteBackhaulCat egory	0	01	Indicates satellite backhaul category or non-satellite backhaul used for the PDU session. When this attribute is not present, non-satellite backhaul applies. If the "EnSatBackhaulCatChg" feature is supported, the different dynamic satellite backhaul categories may also be provided.	SatBackhaulC ategoryChg
pcfUeInfo	PcfUeCallbackInfo	0	01	PCF for the UE callback URI and SBA binding information.	AMInfluence
pvsInfo	array(ServerAddress ingInfo)	0	1N	Provisioning Server(s) information that provision the UE with credentials and other data to enable SNPN access.	PvsSupport

onboardInd	boolean	0	01	If it is included and set to true, it indicates that the PDU session is used for UE Onboarding.	PvsSupport
nwdafDatas	array(NwdafData)	0	1N	List of NWDAF Instance IDs and their associated Analytics IDs consumed by the NF service consumer.	EneNA
urspEnfInfo	UrspEnforcementInf o	0	01	Contains the reporting of URSP rule enforcement information from the UE.	URSPEnforce ment
sscMode	SscMode	С	01	SSC Mode of the PDU session. It shall be present when the "urspEnfInfo" attribute is present.	URSPEnforce ment
ueReqDnn	Dnn	0	01	UE requested DNN. It shall be present, if available and different from the selected DNN, when the "urspEnfInfo" attribute is present.	URSPEnforce ment
ueReqPduSession Type	PduSessionType	0	01	UE requested PDU session Type. It shall be present, if available and different from the selected PDU session Type, when the "urspEnfInfo" attribute is present.	URSPEnforce ment
hrsbolnd	boolean	0	01	HR-SBO support indication. If present and set to "true", it indicates that the HR-SBO is supported. Default value is "false" if omitted.	HR-SBO
uePolFailReport	UePolicyTransferFail ureCause	0	01	Indicates a failure delivery reason for UE policy container. Only applicable to the 5GS and EPC interworking scenario as defined in Annex B. (NOTE 5)	EpsUrsp

- NOTE 1: The value provided in this attribute is implementation specific. The only constraint is that the NF service consumer shall supply a different identifier for each overlapping address domain (e.g. the SMF NF instance identifier).
- NOTE 2: For an emergency session, when the SUPI is not available in the NF service consumer, or if available, the SUPI is unauthenticated, the value provided in the "supi" attribute is implementation specific.
- NOTE 3: The SMF may encode both 3GPP and non-3GPP access UE location in the "userLocationInfo" attribute.
- NOTE 4: The PCF uses the DNN as received from the NF service consumer without applying any transformation (e.g. in subsequent requests to the UDR). To successfully perform DNN matching, in a specific deployment a DNN shall always be encoded either with the full DNN (e.g., because there are multiple Operator Identifiers for a Network Identifier) or the DNN Network Identifier only. The NF service consumer may include the DNN Operator Identifier based on local configuration.
- NOTE 5: When the "EpsUrsp" feature is supported, the "uePolCont" attribute within the SmPolicyDecision and "uePolFailReport" attribute are mutually exclusive.

5.6.2.4 Type SmPolicyDecision

Table 5.6.2.4-1: Definition of type SmPolicyDecision

Attribute name	Data type	Р	Cardinality	Description	Applicability
sessRules	map(SessionRule)	0	1N	A map of Sessionrules with the	
				content being the SessionRule as	
				described in clause 5.6.2.7. The key	
				used in this map for each entry is the	
				sessRuleId attribute of the	
				corresponding SessionRule. (NOTE 2)	
pccRules	map(PccRule)	0	1N	A map of PCC rules with the content	
P 00. 1000				being the PCCRule as described in	
				clause 5.6.2.6. The key used in this	
				map for each entry is the pccRuleId	
				attribute of the corresponding	
				PccRule.	
qosDecs	map(QosData)	0	1N	Map of QoS data policy decisions. The	
quadeca	map(QosData)		1IN		
				key used in this map for each entry is	
				the qosld attribute of the	
	(2)			corresponding QosData. (NOTE 2)	
chgDecs	map(ChargingData)	0	1N	Map of Charging data policy	
				decisions. The key used in this map	
				for each entry is the chgld attribute of	
				the corresponding ChargingData.	
chargingInfo	ChargingInformation	0	01	Contains the CHF addresses, and if	
				available, the associated CHF	
				instance ID(s) and CHF set ID(s) of	
				the PDU session. (NOTE 3)	
traffContDecs	map(TrafficControlDa	0	1N	Map of Traffic Control data policy	
	ta)			decisions. The key used in this map	
	,			for each entry is the told attribute of	
				the corresponding TrafficControlData.	
				(NOTE 2)	
umDecs	map(UsageMonitorin	0	1N	Map of Usage Monitoring data policy	UMC
umbees	gData)		1	decisions. The key used in this map	OWO
	gData)			for each entry is the umld attribute of	
				the corresponding	
				UsageMonitoringData.	
ano Chara	man/OcaCharacterist		1N		
qosChars	map(QosCharacterist	0	1N	Map of QoS characteristics for non-	
	ics)			standard 5Qls and non-preconfigured	
				5Qls. This map uses the 5Ql values	
	(2.14.1)		4	as keys. (NOTE 2)	
qosMonDecs	map(QosMonitoringD	0	1N	Map of QoS Monitoring data policy	QosMonitoring
	ata)			decision. The key used in this map for	
				each entry is the qmld attribute of the	
				corresponding QosMonitoringData.	
reflectiveQoSTimer	DurationSec	0	01	Defines the lifetime of a UE derived	
				QoS rule belonging to the PDU	
				Session for reflective QoS. (NOTE 2)	
offline	boolean	0	01	Indicates the offline charging is	
				applicable to the PDU session.	
				- Set to "true": the offline charging is	
				applicable to the PDU session.	
				- Set to "false": the offline charging	
				is not applicable to the PDU	
				session.	
				(NOTE 3) (NOTE 4) (NOTE 6)	
online	boolean	0	01	Indicates the online charging is	1
5.111110	Solidari		01	applicable to the PDU session.	
				- Set to "true": the online charging is	
				applicable to the PDU session.	
				- Set to "false": the online charging	
				is not applicable to the PDU	
				session.	
				(NOTE 3) (NOTE 4) (NOTE 6)	

offlineChOnly	boolean	0	01	Indicates that the online charging	OfflineChOnly
				method shall never be used for any PCC rule activated during the lifetime	
				of the PDU session, when this	
				attribute is present and set to "true".	
				Otherwise, the default value is "false" if omitted.	
				(NOTE 3) (NOTE 4) (NOTE 6)	
conds	map(ConditionData)	0	1N	A map of condition data with the	
Corido	map(conditionbata)		11	content being as described in	
				clause 5.6.2.9. The key used in this	
				map for each entry is the condld	
				attribute of the corresponding	
				ConditionData.	
revalidationTime	DateTime	0	01	Defines the time before which the NF	
				service consumer shall have to re-	
				request PCC rules.	
pcscfRestIndication	boolean	0	01	Indicates that P-CSCF Restoration is	PCSCF-
				requested or not.	Restoration-
				 Set to "true": the P-CSCF 	Enhancement
				Restoration is requested.	
				- Set to "false": the P-CSCF	
				Restoration is not requested.	
				- The default value "false" applies if	
				the attribute is not present and has not	
nolioyCtrlDogTrigg	array(PolicyControlR	0	1N	been supplied previously. Defines the policy control request	
policyCtrlReqTrigg ers	equestTrigger)		119	triggers subscribed by the PCF.	
lastReqRuleData	array(RequestedRule	0	1N	Defines the last list of rule control data	
lasiKeqKuleDala	Data)	U	1IN	requested by the PCF.	
lastReqUsageData	RequestedUsageDat	0	01	Indicates whether the last	UMC
	а			accumulated usage report is	
				requested by the PCF or not, and	
				includes references to the targeted	
n rate for	man/DraggersalafaD		1N	usage monitoring data instances.	DD A
praInfos	map(PresenceInfoR m)	0	1IN	Defines the PRA information provisioned by the PCF. The "prald"	PRA
	111)			attribute within the PresenceInfo data	
				type shall also be the key of the map.	
				The "presenceState" attribute within	
				the PresenceInfo data type shall not	
				be supplied.	
ipv4Index	IpIndex	С	01	Information that identifies the IP	
•				address allocation method for IPv4	
				address allocation. (NOTE 3)	
ipv6Index	IpIndex	С	01	Information that identifies the IP	
				address allocation method for IPv6	
				address allocation. (NOTE 3)	
qosFlowUsage	QosFlowUsage	0	01	Indicates the required usage for default QoS flow.	
relCause	SmPolicyAssociation	0	01	The cause for which the PCF requests	RespBasedSe
TOTOGUSE	ReleaseCause		01	the termination of the policy	ssionRel
	5.545554455			association.	00.0111.01
suppFeat	SupportedFeatures	С	01	Indicates the list of negotiated	
F F =	1111			supported features.	
				This parameter shall be supplied by	
				the PCF in the response to the POST	
				request that requested the creation of	
				an individual SM policy resource.	
tsnBridgeManCont	BridgeManagementC	0	01	Transports TSC user plane node	TimeSensitive
ton Double - C 15	ontainer		0.4	management information	Networking
tsnPortManContDs	PortManagementCon	0	01	Transports port management	TimeSensitive
tt topPortMonContNiv	tainer	0	4 N1	information for the DS-TT port.	Networking
tsnPortManContNw tts	array(PortManageme ntContainer)	0	1N	Transports port management information for one or more NW-TT	TimeSensitive Networking
llo	incomallier)			ports.	INGLWOIKING
l	1		I	ports.	1

tscNotifUri	Uri	0	01	For PMIC/UMIC UPF event, notification target address of the TSCTSF or TSN AF receiving the TSC management information.	ExposureToTS C
tscNotifCorreld	string	С	01	Correlation identifier for TSC management information notifications. It shall be provided if the "tscNotifUri" attribute is provided.	ExposureToTS C
redSessIndication	boolean	0	01	Indicates whether the PDU Session is a redundant PDU session: - Set to "true": the PDU Session is a end to end redundant PDU session; - Set to "false": the PDU Session is Not end to end redundant PDU session; - Default value is "false" if omitted. (NOTE 2) (NOTE 3)	Dual- Connectivity- redundant-UP- paths
uePolCont	UePolicyContainer	0	01	Indicates a UE policy container for the UE. Only applicable to the 5GS and EPC interworking scenario as defined in Annex B.	EpsUrsp
vplmnOffloadInfos	array(VplmnOffloadin gInfo)	0	1N	Indicates the VPLMN Specific Offloading Policy Information. (NOTE 7)	HR-SBO
vplmnDlAmbr	VplmnDlAmbr	Ο	01	Indicates the VPLMN Specific Authorized DL Session AMBR for Offloading, i.e. DL Aggregate Maximum Bit Rate for the Non-GBR QoS Flows of the PDU Session authorized for offloading to the local part of DN in VPLMN.	HR-SBO
sliceUsgCtrlInfo	SliceUsgCtrlInfo	0	01	Represents the network slice usage control information (e.g., slice PDU Session inactivity timer value) to be used to support and enforce network slice usage control.	NetSliceUsage Ctrl

- NOTE 1: For IPv4v6 PDU session, both the "ipv4Index" attribute and "ipv6Index" attribute may be provisioned by the PCF.
- NOTE 2: This attribute shall not be removed if it was provisioned.
- NOTE 3: This attribute may only be supplied by the PCF in the response to the initial POST request that requested the creation of an individual SM policy resource.
- NOTE 4: If both the "offline" attribute and the "online" attribute are omitted by the PCF, and when the "OfflineChOnly" feature is supported, if the "offlineChOnly" attribute is set to "false" or omitted by the PCF, the default charging method pre-configured at the SMF, if available, shall be applied to the PDU session. If both offline and online charging methods are pre-configured at the SMF, the SMF shall determine which one of them to be applied to the PDU session based on local policy. The "offline" attribute and the "online" attribute shall not be simultaneously present with the same value, i.e., both set to true or both set to false.
- NOTE 5: If the "chargingInfo" attribute is not supplied by the PCF, the charging information configured at the SMF shall be applied to the PDU session.
- NOTE 6: When the "OfflineChOnly" feature is supported and the "offlineChOnly" attribute is present and set to "true", the "online" attribute and the "offline" attribute shall not be present.
- NOTE 7: If the "vplmnId" attribute of the VplmnOffloadingInfo data type is provided, it shall correspond with the VPLMN that is currently set as the serving PLMN in this policy association.

5.6.2.5 Type SmPolicyNotification

Table 5.6.2.5-1: Definition of type SmPolicyNotification

Attribute name	Data type	Р	Cardinality	Description	Applicability
resourceUri	Uri	M	1	The resource URI of the individual SM policy resource related to the notification. (NOTE)	
smPolicyDecision	SmPolicyDecision	М	1	Session management policy decision (see clause 5.6.2.4).	
				esourceUri" attribute or the "apiSpecificRe	

OTE: Either the complete resource URI included in the "resourceUri" attribute or the "apiSpecificResourceUriPart" component (see clause 5.1) of the resource URI included in the "resourceUri" attribute can be used by the SMF for the identification of the individual SM policy resource related to the notification.

5.6.2.6 Type PccRule

Table 5.6.2.6-1: Definition of type PccRule

Attribute name	Data type	Р	Cardinalit y	Description
flowInfos	array(FlowInformation)	С	1N	An array of Ethernet or IP filter information. (NOTE 3
appld	string	С	01	A reference to the applicat detection filter configured (NOTE 3)
appDescriptor	ApplicationDescriptor	С	01	ATSSS rule application de shall be present when the session is a MA PDU sess SDF template contains an Identifier (i.e. when the "aş attribute is present).
contVer	ContentVersion	0	01	Indicates the content versi PCC rule.
pccRuleId	string	М	1	Univocally identifies the Powithin a PDU session.
precedence	Uinteger	0	01	Determines the order in w PCC rule is applied relativ PCC rules within the same session. It shall be include "flowInfos" attribute is inclumay be included if the "ap attribute is included when initially provisions the PCC (NOTE 2) (NOTE 4)
afSigProtocol	AfSigProtocol	0	01	Indicates the protocol user signalling between the UE AF. The default value "NO_INFORMATION" shathe attribute is not present not been supplied previou
appReloc	boolean	0	01	It indicates that the application possibility. Set to "true": the application is selected application is selected 5GC. Set to "false": the application is selected application is selected application is selected application is selected 5GC. The default value is "fauttribute is not present and been supplied previously.
easRedisInd	boolean	0	01	Indicates whether the EAS rediscovery is required for application or not. - Set to "true": the EAS is required for the appl - Set to "false": the EAS rediscovery is not required application. - the default value is "fal omitted. The indication shall be invivous applied unless it is preagain.
addrPreserInd	boolean	0	01	Indicates whether UE IP a should be preserved. - Set to "true": the UE IF should be preserved. - Set to "false": the UE I should not be preserve. - The default value "falsapply, if the attribute is present and has not be supplied previously.

refQosData	array(string)	0	1N	A reference to the QosDat type decision type. It is the described in clause 5.6.2.8 (NOTE 1)
refAltQosParam s	array(string)	0	1N	A Reference to the QoS D decisions for the Alternative parameter sets of the serve flow. Only the "qosld" attril "gbrUl" attribute, the "gbrE the "packetDelayBudget" and the "packetErrorRate" are applicable within the a QosData data types. This represents an ordered list, lower the index of the arragiven entry, the higher the
refTcData	array(string)	0	1N	A reference to the TrafficC policy decision type. It is to described in clause 5.6.2. (NOTE 1)
refChgData	array(string)	0	1N	A reference to the Chargir policy decision type. It is to described in clause 5.6.2. (NOTE 1) (NOTE 7)
refChgN3gData	array(string)	0	1N	A reference to the Chargir policy decision type only a Non-3GPP access. It is the described in clause 5.6.2. (NOTE 1) (NOTE 5) (NOT
refUmData	array(string)	0	1N	A reference to UsageMoni policy decision type. It is to described in clause 5.6.2. (NOTE 1)
refUmN3gData	array(string)	0	1N	A reference to UsageMoni policy decision type only a Non-3GPP access. It is the described in clause 5.6.2. (NOTE 1) (NOTE 6)
refCondData	string	0	01	A reference to the conditic the condld described in clause 5.6.2.9.
refQosMon	array(string)	0	1N	Reference(s) to QosMonit policy decision type. It is to described in clause 5.6.2.4 (NOTE 10)
protoDescDI	ProtocolDescription	0	01	Downlink protocol descript identification of the DL pace PDU Set and/or dectection packed of the data burst in
protoDescUI	ProtocolDescription	0	01	Uplink protocol description identification of the UL pace PDU Set in the UE.
tscailnputUl	TscailnputContainer	0	01	Transports TSCAI input pa for TSC traffic at the ingre- of the DS-TT/UE (uplink flu direction). (NOTE 9)
tscailnputDl	TscailnputContainer	0	01	Transports TSCAI input pa for TSC traffic at the ingre- NW-TT (downlink flow dire (NOTE 9)
tscaiTimeDom	Uinteger	0	01	Indicates the (g)PTP doma (TSN)AF is located in.

capBatAdaptati on	boolean	0	01	Indicates the capability for adjust the burst sending till - Set to "true": the AF is - Set to "false": the AF i capable. The default value is "false": the capable.
ddNotifCtrl	DownlinkDataNotificati onControl	0	01	The Downlink Data Notific Control applying to the cond DDD Status event notificat DDN Failure event notificat attribute shall not be presented DDNEventPolicyContris supported.
ddNotifCtrl2	DownlinkDataNotificati onControlRm	0	01	The Downlink Data Notific Control applying to the cond DDD Status event notificated DDN Failure event notificated including the removal of puthe downlink data notificated information.
disUeNotif	boolean	0	01	Indicates to disable QoS fl parameters signalling to the the SMF is notified by the changes in the fulfilled Qo when it is included and set The fulfilled situation is eit QoS profile or an Alternati Profile. Otherwise, the defulfalse" shall apply, if the all not present and has not be supplied previously.
packFiltAllPrec	Uinteger	С	01	Determines the order of Ti filter allocation for PCC rul (NOTE 8)
nscSuppFeats	map(SupportedFeatur es)	0	1N	A map of Network Functio Consumer features suppo service. The key used in the each entry is the ServiceN as defined in 3GPP TS 29 (e.g. for Nsmf_EventExporthe key shall be set to nsmexposure).
callInfo	CallInfo	0	01	Indicates the caller and the information.
traffParaData	TrafficParaData	0	01	Traffic Parameter measure

roduced for future compatibility. In this release of the specification the maximum number array is 1.

th the "appld" attribute, the precedence can be preconfigured in SMF or provided in the F. The precedence provided by the PCF shall take precedence.

os" attribute or "appId" attribute shall be supplied by the PCF when the PCC rule is initially "appId" attribute is supplied, the PCF shall not modify the application identifier supplied attribute later.

attribute is used to specify the precedence of the PCC rule among all PCC rules e PDU session. It includes an integer value in the range from 0 to 255 (decimal). The f the "precedence" attribute, the lower the precedence of that PCC rule is. The precedence 70 to 99 (decimal) shall be used for the PCC rules subject to Reflective QoS. ssion, Charging Data decision referred by the "refChgData" attribute applies to both s no "refChgN3gData" attribute included. If there is a "refChgN3gData" attribute included, a decision referred by the "refChgN3gData" attribute applies to non-3GPP access and the cision referred by the "refChgData" attribute applies to 3GPP access. The value(s) of the Charging Data decision except the "chgld" attribute referred by the "refChgN3gData" he same as the one(s) within the Charging Data decision referred by the "refChgData"

ssion, Usage Monitoring Data decision referred by the "refUmData" attribute applies to nere is no "refUmN3gData" attribute included. If there is a "refUmN3gData" attribute ge Monitoring Data decision referred by the "refUmN3gData" attribute applies to non-3GPP sage Monitoring Data decision referred by the "refUmData" attribute applies to 3GPP

'attribute and/or "refChgN3gData" attribute is/are provisioned for a PCC rule, then this be subject to charging accordingly. If the "refChgData" attribute and/or "refChgN3gData" to NULL for a PCC rule, then charging shall be deactivated accordingly for this PCC rule. Precedence feature is supported, the packFiltAllPrec attribute shall be present in every DU Session when the PCC rule is installed for the first time.

imeWnd" attribute, within the "tscailnputUl" and/or "tscailnputDl" attributes, and the attribute are mutually exclusive.

he specification, if the feature "EnQoSMon" is not supported, the maximum number of ray is 1, and if the feature "EnQoSMon" is supported, the maximum number of elements in

5.6.2.7 Type SessionRule

Table 5.6.2.7-1: Definition of type SessionRule

Attribute name	Data type	Р	Cardinality	Description	Applicability
authSessAmbr	Ambr	С	01	Authorized Session-AMBR. (NOTE 1)	
authDefQos	AuthorizedDefaultQos	С	01	Authorized default QoS information. (NOTE 1)	
sessRuleId	string	М	1	Univocally identifies the session rule within a PDU session.	
refUmData	string	0	01	A reference to UsageMonitoringData policy decision type. It is the umld described in clause 5.6.2.12. (NOTE 2)	UMC
refCondData	string	0	01	A reference to the condition data. It is the condld described in clause 5.6.2.9.	
refUmN3gData	string	0	01	A reference to UsageMonitoringData policy decision type to apply for Non-3GPP access. It is the umld described in clause 5.6.2.12. (NOTE 2)	UMC, ATSSS

NOTE 1: When the "subsDefQos" and "subsSessAmbr" are provided to the PCF, the PCF shall provide both "authSessAmbr" and the "authDefQos" attributes the first time the session rule is provisioned. In this case, the PCF shall ensure that a session rule enforced in the SMF contains the "authSessAmbr" and the "authDefQos" attributes.

NOTE 2: For a MA PDU session, if the "refUmN3gData" is omitted, the attribute "refUmData" contains the reference to the UsageMonitoringData policy decision to apply for both, 3GPP and Non-3GPP, accesses.

5.6.2.8 Type QosData

Table 5.6.2.8-1: Definition of type QosData

Attribute name	Data type	Р	Cardinality	Description	Applicability
qosld	string	М	1	Univocally identifies the QoS control	
Eai	5Qi	С	01	policy data within a PDU session. Identifier for the authorized QoS	
5qi	3QI		01	parameters for the service data flow. It	
				shall be included when the QoS data	
				decision is initially provisioned and	
				"defQosFlowIndication" is not included	
				or is included and set to false.	
maxbrUl	BitRateRm	0	01	Indicates the maximum bandwidth in	
maxbrDl	BitRateRm	0	01	luplink. Indicates the maximum bandwidth in	
Пахыы	Ditivaterviii		01	downlink.	
gbrUl	BitRateRm	0	01	Indicates the guaranteed bandwidth in	
				uplink. (NOTE 3)	
gbrDl	BitRateRm	0	01	Indicates the guaranteed bandwidth in downlink. (NOTE 3)	
arp	Arp	С	01	Indicates the allocation and retention	
агр	Aib	-	01	priority. It shall be included when the	
				QoS data decision is initially	
				provisioned and "defQosFlowIndication"	
				is not included or is included and set to	
	h l	_	0.4	false.	
qnc	boolean	0	01	Indicates whether notifications are requested from 3GPP NG-RAN when	
				the GFBR is no longer (or again) be	
				guaranteed for a QoS Flow during the	
				lifetime of the QoS Flow.	
				- Set to "true": the notifications are	
				requested.	
				- Set to "false": the notifications are	
				not requested.	
				- The default value "false" is used if this attribute is not present and has not	
				been supplied previously. (NOTE 3)	
reflectiveQos	boolean	0	01	Indicates whether the QoS information	
				is reflective for the corresponding non-	
				GBR service data flow.	
				- Set to "true": the QoS information is	
				reflective Set to "false": the QoS information	
				is not reflective.	
				- The default value "false" is used if	
				this attribute is not present and has not	
				been supplied previously.	
sharingKeyDl	string	0	01	Indicates, by containing the same	ResShare
				value, what PCC rules may share resources in the downlink direction.	
sharingKeyUl	string	0	01	Indicates, by containing the same	ResShare
Sharingiteyor	String		01	value, what PCC rules may share	Resonate
				resources in the uplink direction.	
priorityLevel	5QiPriorityLevelRm	0	01	Indicates a priority in scheduling	
				resources among QoS Flows.	
\A/'	A 14/: 1 D		0.4	(NOTE 1)	
averWindow	AverWindowRm	0	01	Represents the duration over which the	
				guaranteed and maximum bitrates shall be calculated. (NOTE 1) (NOTE 3)	
maxDataBurstVol	MaxDataBurstVoIR	0	01	Denotes the largest amount of data that	
2	m	1		is required to be transferred within a	
				period of 5G-AN PDB. (NOTE 1,	
				NOTE 2)	
maxPacketLossR	PacketLossRateRm	0	01	Indicates the maximum downlink packet	RAN-Support-
-4-DI	1			loss rate for that can be tolerated for the service data flow.	Info
ateDI					
	Packetl occPataPm	0	0.1		RAN-Support
maxPacketLossR ateUl	PacketLossRateRm	0	01	Indicates the maximum uplink packet loss rate that can be tolerated for the	RAN-Support- Info

defQosFlowIndic ation	boolean	0	01	Indicates that the dynamic PCC rule shall always have its binding with the QoS Flow associated with the default QoS rule. - Set to "true": binding with the QoS Flow associated with the default QoS rule applies. - Set to "false": binding with the QoS Flow associated with the default QoS rule does not apply. - The default value "false" is used if this attribute is not present and has not been supplied previously.	
extMaxDataBurst Vol	ExtMaxDataBurstVo IRm	0	01		EMDBV
packetDelayBudg et	PacketDelBudget	0	01	Unsigned integer. It indicates the Packet Delay Budget expressed in milliseconds.	Authorization WithRequired QoS
packetErrorRate	PacketErrRate	0	01	String indicating the packet error rate. Examples: Packet Error Rate 4x10 ⁻⁶ shall be encoded as "4E-6". Packet Error Rate 10 ⁻² shall be encoded as "1E-2".	Authorization WithRequired QoS
pduSetQosDI	PduSetQosParaRm	0	01	Contains the PDU Set QoS Parameters which are used to support PDU Set based QoS handling in the downlink direction.	PDUSetHandli ng
pduSetQosUI	PduSetQosParaRm	0	01	Contains the PDU Set QoS Parameters which are used to support PDU Set based QoS handling in the uplink direction.	PDUSetHandli ng

NOTE 1: Applicable only when a value different from the standardized value for this 5QI, provided in table 5.7.4-1 3GPP TS 23.501 [2], is required.

NOTE 2: Either the maxDataBurstVol attribute or the extMaxDataBurstVol attribute may be present for a Delay Critical GBR QoS flow. If the maximum data burst volume value to be transmitted is lower than or equal to 4095 Bytes, the maxDataBurst Vol attribute is used. If the EMDBV feature is supported by both the PCF and the SMF, the extMaxDataBurstVol attribute is used to transmit the maximum data burst volume values higher than 4095 Bytes (see clause 4.2.2.1).

NOTE 3: This attribute is only applicable to GBR type or delay critical GBR type 5QIs.

5.6.2.9 Type ConditionData

Table 5.6.2.9-1: Definition of type ConditionData

Attribute name	Data type	Р	Cardinality	Description	Applicability
condld	string	М	1	Uniquely identifies the condition data within a PDU session.	
activationTime	DateTimeRm	0	01	The time when the decision data shall be activated.	
deactivationTime	DateTimeRm	0	01	The time when the decision data shall be deactivated. (NOTE 1)	
accessType	AccessType	0	01	The condition of access type of the UE when the session AMBR shall be enforced. (NOTE 2)	AccessTypeCo ndition
ratType	RatType	0	01	The condition of RAT type of the UE when the session AMBR shall be enforced. (NOTE 2)	AccessTypeCo ndition

NOTE 1: It is only included in the ConditionData instance for conditioned PCC rule.

NOTE 2: At least one of the "accessType" or "ratType" attributes shall be present in an access type conditioned session rule.

5.6.2.10 Type TrafficControlData

Table 5.6.2.10-1: Definition of type TrafficControlData

Attribute name	Data type	Р	Cardinality	Description	Applicability
tcld	string	М	1	Univocally identifies the traffic control	
				policy data within a PDU session.	
I4sInd	UplinkDownlinkSupp	0	01	When provided, it represents an	L4S
	ort			explicit indication of whether ECN marking for L4S support is supported	
				for the UL, the DL or both, UL and DL.	
flowStatus	FlowStatus	0	01	Enum determining what action to	
				perform on traffic. Possible values	
				are: [enable, disable, enable_uplink, enable_downlink]. The default value	
				"ENABLED" shall apply, if the attribute	
				is not present and has not been	
				supplied previously. (NOTE 3)	
redirectInfo	RedirectInformation	0	01	It indicates whether the detected	ADC
	Trodin Gottinion mation		0	application traffic should be redirected	,.50
				to another controlled address.	
addRedirectInfo	array(RedirectInform	0	1N	Additional redirection information.	ADCmultiRedir
	ation)			Each element indicates whether the detected application traffic should be	ection
				redirected to another controlled	
				address.	
muteNotif	boolean	0	01	1.	ADC
				stop notifications are to be muted. It shall be set to true to indicate	
				application's start or stop notifications	
				are muted. When it is set to false, it	
				indicates application's start or stop	
				notifications are not muted. The default value false shall apply, if the	
				attribute is not present and has not	
				been supplied previously.	
trafficSteeringPolldDl	string	0	01	Reference to a pre-configured traffic	TSC
(NOTE 1)				steering policy for downlink traffic at the SMF.	
trafficSteeringPolldUl	string	0	01	Reference to a pre-configured traffic	TSC
(NOTE 1)				steering policy for uplink traffic at the	
	M-4-4-4-4-		0.4	SMF.	SFC
metadata	Metadata	0	01	This datatype contains opaque information for the service functions in	SFC
				the N6-LAN that is provided by AF	
				and transparently sent to UPF. May	
				be only provided when	
				"trafficSteeringPolldDl" and/or "trafficSteeringPolldUl" are provided	
				for the first time.	
routeToLocs	array(RouteToLocati	0	1N	A list of location(s) to which the traffic	TSC
(NOTE 1)	on)		0.4	shall be routed for the AF request.	A.E. Johanna
maxAllowedUpLat	UintegerRm	0	01	Indicates the target user plane latency in units of milliseconds. The SMF may	AF_latency
				use this value to decide whether edge	
				relocation is needed to ensure that the	
				user plane latency does not exceed	
easlpReplaceInfos	array(EaslpReplace	0	1N	the value. Contains EAS IP replacement	EASIPreplace
- Capitopiaconiioo	mentInfo)	Ĭ	1	information.	ment
traffCorreInd	boolean	0	01	Indication of traffic correlation. If it is	
				included and set to "true", traffic	
				should be correlated; The default value "false" applies, if the attribute is	
				not present and has not been supplied	
				previously. (NOTE 2)	
tfcCorreInfo	TrafficCorrelationInf	0	01	Contains the information for traffic	CommonEAS
	0			correlation.	DNAI

simConnInd	boolean	0	01	Indication of simultaneous	SimultConnect
SimCommin	boolean		01	connectivity temporarily maintained	ivity
				for the source and target PSA. If it is	ivity
İ				included and set to "true", temporary	
				simultaneous connectivity should be	
				kept. The default value "false" applies,	
				if the attribute is not present and has	
				not been supplied previously.	01 1:0
simConnTerm	DurationSec	С	01	Indication of the minimum time	SimultConnect
				interval to be considered for inactivity	ivity
1				of the traffic routed via the source	
				PSA during the edge re-location	
				procedure.	
I				It may be included when the	
				"simConnInd" attribute is set to true.	
upPathChgEvent	UpPathChgEvent	0	01	Contains the information about the AF	TSC
1				subscription to UP path change	
				events.	
steerFun	SteeringFunctionalit	0	01	Indicates the applicable traffic steering	ATSSS
	v			functionality.	
transMode	TransportMode	С	01	It identifies the transport mode for	EnATSSS_v2
	Transportivious		0	transmitting a UDP flow between the	21,, (1000_12
				UE and the UPF. The transport mode	
				shall be included if the steering	
				functionality indicated in the	
				"steerFun" attribute is MPQUIC.	
				Otherwise, if the steering functionality	
1				is not MPQUIC, the transport mode	
			- 1	shall not be included.	4 T 000
steerModeDI	SteeringMode	0	01	Determines the traffic distribution rule	ATSSS
I				across 3GPP and Non-3GPP	
				accesses to apply for downlink traffic.	
steerModeUI	SteeringMode	0	01	Determines the traffic distribution rule	ATSSS
				across 3GPP and Non-3GPP	
				accesses to apply for uplink traffic.	
mulAccCtrl	MulticastAccessCon	0	01	Indicates whether the service data	WWC
	trol			flow, corresponding to the service	
				data flow template, is allowed or not	
				allowed. The default value	
				"NOT_ALLOWED" applies, if the	
				attribute is not present and has not	
				been supplied previously.	
candDnaiInd	boolean	0	01	Indication of reporting candidate	CommonEAS
	200.00.1		0	DNAI(s). If it is included and set to	DNAI
				"true", the candidate DNAI(s) for the	DIVI
				PDU session need to be reported.	
				Otherwise set to "false" or omitted.	
datEndMarkInd	hooloon		0.4	The data burst end marking is	DowerCoving
uatEHUIVId[KIHU	boolean	0	01	enabled if it is set to "true". Default	PowerSaving
				value is "false" if omitted.	
	1	1 1		ivalue is Taise if Ommeo.	I

NOTE 1: If SFC feature is not supported, traffic steering policy identifier(s) (i.e. "trafficSteeringPolIdDl" attribute and/or "trafficSteeringPolIdUl" attribute) and N6 traffic routing requirements (i.e. "routeToLocs" attribute) are mutually exclusive; otherwise, they can be provided simultaneously.

NOTE 2: The TSC feature shall be supported in order to support this attribute. The Indication of traffic correlation shall be provided only when all the PDU sessions related to the 5G VN group member UEs should be correlated by a common DNAI in the user plane for the traffic as described in 3GPP TS 23.501 [2], clause 5.6.7.1 and clause 5.29.

NOTE 3: The "flowStatus" attribute and the "mulAccCtrl" attribute are mutually exclusive.

5.6.2.11 Type ChargingData

Table 5.6.2.11-1: Definition of type ChargingData

Attribute name	Data type	Р	Cardinalit y	Description	Applicability
chgld	string	М	1	Univocally identifies the charging control policy data within a PDU session.	
meteringMethod	MeteringMethod	0	01	Defines what parameters shall be metered for offline charging. If the attribute is not present but it has been supplied previously, the previous information remains valid. If the attribute is not present and it has not been supplied previously or the attribute has been supplied previously but the attribute is set to NULL, the metering method pre-configured at the SMF is applicable as default metering method.	
offline	boolean	0	01	Indicates the offline charging is applicable to the PCC rule. - Set to "true": the offline charging is applicable to the PCC rule. - Set to "false": the offline charging is not applicable to the PCC rule. (NOTE 1)	
online	boolean	0	01	Indicates the online charging is applicable to the PCC rule when it is included and set ot true. - Set to "true": the online charging is applicable to the PCC rule. - Set to "false": the online charging is not applicable to the PCC rule. (NOTE 1, NOTE 5)	
sdfHandl	boolean	0	01	Indicates whether the service data flow is allowed to start while the SMF is waiting for the response to the credit request. - Set to "true": the service data flow is allowed to start while the SMF is waiting for the response to the credit request. - Set to "false": the service data flow is not allowed to start while the SMF is waiting for the response to the credit request. - The default value "false" (blocking) shall apply, if the attribute is not present. (NOTE 2)	
ratingGroup	RatingGroup	С	01	The charging key for the PCC rule used for rating purposes. It shall be included when the ChargingData policy decision is initially provisioned.	
reportingLevel	ReportingLevel	0	01	Defines on what level the SMF reports the usage for the related PCC rule. If the attribute is not present but it has been supplied previously, the previous information remains valid. If the attribute is not present and it has not been supplied previously or the attribute has been supplied previously but it is set to NULL, the reporting level pre-configured at the SMF is applicable as default reporting level.	
serviceld	ServiceId	0	01	Indicates the identifier of the service or service component the service data flow in a PCC rule relates to.	
sponsorld	string	0	01	Indicates the sponsor identity.	SponsoredCo nnectivity

appSvcProvId	string	0	01	Indicates the application service provider identity.	SponsoredCo nnectivity
afChargingIdentifie r	ChargingId	С	01	An identifier, provided from the AF, correlating the measurement for the Charging key/Service identifier values in this PCC rule with application level reports. (NOTE 4)	
afChargld	ApplicationCharging Id	0	01	A character string identifier, provided from the AF, correlating the measurement for the Charging key/Service identifier values in this PCC rule with application level reports. (NOTE 3)	AF_Charging_ Identifier

- NOTE 1: The absence of both the "offline" attribute and "online" attribute or only one attribute is present and set to false within a Charging Data decision instance indicates that the default charging method of the PDU session is applicable to the PCC rule referring to the Charging Data decision. Either "offline" attribute or "online" attribute set to true shall be provisioned initially if there is no default charging method applied to the PDU session. The "offline" attribute and the "online" attribute shall not be simultaneously present with the same value, i.e. both set to "true" or both set to "false".
- NOTE 2: The "sdfHandl" attribute shall not be present when the online charging method does not apply for the PCC rule referring to the Charging Data decision (i.e., when the "online" attribute is present and set to false, or is absent and the online default charging method does not apply for the PDU session, or is absent and there is no online default charging method defined).
- NOTE 3: The "afChargId" attribute shall be used instead of the "afChargingIdentifier" attribute when the
- "AF_Charging_Identifier" feature is supported.

 The "afChargingIdentifier" attribute shall not be present when the "AF_Charging_Identifier" feature is supported. When the "AF_Charging_Identifier" feature is not supported it is out of the scope of the NOTE 4: specification what the behaviour of the PCF is when the AF provides charging identifier values that are out of ChargingId data type value range.
- NOTE 5: When the "OfflineChOnly" feature is supported and the "offlineChOnly" attribute is present and set to "true" within the SmPolicyDecision data structure, then the "online" attribute shall not be present.

5.6.2.12 Type UsageMonitoringData

Table 5.6.2.12-1: Definition of type UsageMonitoringData

Attribute name	Data type	Р	Cardinality	Description	Applicability
umld	string	М	1	Contains the Usage Monitoring ID, which univocally identifies the usage monitoring policy data instance within a PDU session. (NOTE)	
volumeThreshold	VolumeRm	0	01	Indicates the total volume threshold.	
volumeThresholdUp link	VolumeRm	0	01	Indicates a volume threshold in uplink.	
volumeThresholdDo wnlink	VolumeRm	0	01	Indicates a volume threshold in downlink.	
timeThreshold	DurationSecRm	0	01	Indicates a time threshold.	
monitoringTime	DateTimeRm	0	01	Indicates the time at which the UP function is expected to reapply the next thresholds (e.g. nextVoIThreshold).	
nextVolThreshold	VolumeRm	0	01	Indicates a volume threshold after the Monitoring Time.	
nextVolThresholdU plink	VolumeRm	0	01	Indicates a volume threshold in uplink after the Monitoring Time.	
nextVolThresholdD ownlink	VolumeRm	0	01	Indicates al volume threshold in downlink after the Monitoring Time.	
nextTimeThreshold	DurationSecRm	0	01	Indicates a time threshold after the Monitoring.	
inactivityTime	DurationSecRm	0	01	Defines the period of time after which the time measurement shall stop, if no packets are received.	
exUsagePccRuleIds	array(string)	С	1N	Contains the PCC rule identifier(s) corresponding to service data flow(s) that shall be excluded from PDU Session usage monitoring. It is only included in the UsageMonitoringData instance for session level usage monitoring.	

5.6.2.13 Type RedirectInformation

Table 5.6.2.13-1: Definition of type RedirectInformation

Attribute name	Data type	Р	Cardinality	Description	Applicability
redirectEnabled	boolean	С	01	This attribute indicates whether the redirect instruction is enabled. It shall be included and set to true when the redirect instruction is provisioned initially within a PCC rule. Subsequently: - It may be included to disable or re-enable the redirect instruction. - Otherwise, if the attribute is omitted, the previous value shall apply.	
redirectAddressType	RedirectAddressTy pe	0	01	Indicates the type of redirect address contained within the "redirectServerAddress" attribute.	
redirectServerAddress	string	0	01	Indicates the address of the redirect server. If the "redirectAddressType" attribute indicates "IPV4_ADDR", the encoding is the same as the Ipv4Addr data type defined in 3GPP TS 29.571 [11]. If the "redirectAddressType" attribute indicates "IPV6_ADDR", the encoding is the same as the Ipv6Addr data type defined in 3GPP TS 29.571 [11]. If the "redirectAddressType" attribute indicates "URL" or "SIP_URI", the encoding is the same as the Uri data type defined in 3GPP TS 29.571 [11].	

5.6.2.14 Type FlowInformation

Table 5.6.2.14-1: Definition of type FlowInformation

Attribute name	Data type	Р	Cardinality	Description	Applicability
flowDescription	FlowDescription	0	01	Contains the packet filters of the IP flow(s).	
ethFlowDescription	EthFlowDescription	0	01	Defines a packet filter for an Ethernet flow. If the "fDir" attribute is included, it shall be set to "DOWNLINK". If the "fDir" attribute is never provided, the address information within the "ethFlowDescription" attribute shall be encoded in downlink direction.	
packFiltId	string	0	01	An identifier of packet filter. (NOTE)	
packetFilterUsage	boolean	0	01	The packet shall be sent to the UE. The default value "FALSE" shall apply, if the attribute is not present and has not been supplied previously.	
tosTrafficClass	string	0	01	2-octet string. The first octet contains the lpv4 Type-of-Service or the lpv6 Traffic-Class field and the second octet contains the ToS/Traffic mask field in hexadecimal representation. Each character in the string shall take a value of "0" to "9" or "A" to "F" and shall represent 4 bits. One example is that of a TFT packet filter as defined in 3GPP TS 24.008 [41].	
spi	string	0	01	4 octet string, representing the security parameter index of the IPSec packet in hexadecimal representation. Each character in the string shall take a value of "0" to "9" or "A" to "F" and shall represent 4 bits. One example is that of a TFT packet filter as defined in 3GPP TS 24.008 [41].	
flowLabel	string	0	01	3-octet string, representing the Ipv6 flow label header field in hexadecimal representation. Each character in the string shall take a value of "0" to "9" or "A" to "F" and shall represent 4 bits. One example is that of a TFT packet filter as defined in 3GPP TS 24.008 [41].	
flowDirection NOTE: The PCF	FlowDirectionRm	0	01	Indicates the direction/directions that a filter is applicable, downlink only, uplink only or both down- and uplink (bidirectional). for PCC rules created as a result of UE-in	

NOTE: The PCF shall only assign the "packFiltId" attribute for PCC rules created as a result of UE-initiated resource allocation.

Type SmPolicyDeleteData 5.6.2.15

Table 5.6.2.15-1: Definition of type SmPolicyDeleteData

Attribute name	Data type	Р	Cardinality	Description	Applicability
userLocationInfo	UserLocation	0	01	The location(s) where the served UE is camping. (NOTE 2)	RAN-NAS- Cause, NetLoc
ueTimeZone	TimeZone	0	01	The time zone where the served UE is camping.	RAN-NAS- Cause, NetLoc
userLocationInfoTime	DateTime	0	01	Contains the NTP time at which the UE was last known to be in the location contained in the "userLocationInfo" attribute. (NOTE 1)	RAN-NAS- Cause, NetLoc
servingNetwork	PlmnldNid	0	01	The serving network (a PLMN or an SNPN) where the served UE is camping. For the SNPN, the NID together with the PLMN ID identifies the SNPN.	NetLoc
ranNasRelCauses	array(RanNasRel Cause)	0	1N	Indicates the RAN and/or NAS release cause(s) code information.	RAN-NAS- Cause
accuUsageReports	array(AccuUsage Report)	0	1N	Contains the accumulated usage reporting information.	UMC
pduSessRelCause	PduSessionRelCa use	0	01	Indicates PDU session release cause.	PDUSessionRel Cause, ImmediateTermi nation

NOTE 1: The age of UE location included within the "userLocationInfoTime" attribute is the age of the 3GPP access UE location received from the AMF and shall be included only when the reported "userLocationInfo" attribute includes the UE location in the 3GPP access.

NOTE 2: The SMF may encode both 3GPP and non-3GPP access UE location in the "userLocationInfo" attribute.

5.6.2.16 Type QosCharacteristics

Table 5.6.2.16-1: Definition of type QosCharacteristics

Attribute name	Data type	Р	Cardinality	Description	Applicability
5qi	5Qi	М	1	Identifier for the authorized QoS parameters for the service data flow. Applies to PCC rule and PDU session level.	
resourceType	QosResourceType	М	1	Indicates whether the resource type is GBR, delay critical GBR, or non-GBR.	
priorityLevel	5QiPriorityLevel	М	1	Unsigned integer indicating the 5Ql Priority Level, within a range of 1 to 127.	
packetDelayBudget	PacketDelBudget	М	1	Unsigned integer indicates the packet delay budget. Packet Delay Budget expressed in milliseconds.	
packetErrorRate	PacketErrRate	M	1	String indicating the packet error rate. Examples: Packer Error Rate 4x10 ⁻⁶ shall be encoded as "4E-6". Packer Error Rate 10 ⁻² shall be encoded as"1E-2".	
averagingWindow	AverWindow	С	01	Indicates the averaging window. This IE shall be present only for a GBR QoS flow or a Delay Critical GBR QoS flow.	
maxDataBurstVol	MaxDataBurstVol	С	01	Unsigned Integer. Indicates the maximum data burst volume. (NOTE)	
extMaxDataBurstVol	ExtMaxDataBurstV ol	С	01	Unsigned Integer. Indicates the maximum data burst volume. (NOTE)	EMDBV

NOTE: Either the maxDataBurstVol IE or the extMaxDataBurstVol IE may be present for a Delay Critical GBR QoS flow. If the maximum data burst volume value to be transmitted is lower than or equal to 4095 Bytes, the maxDataBurst Vol IE is used. If the EMDBV feature is supported by both the PCF and the SMF, the extMaxDataBurstVol IE is used to transmit maximum data burst volume values higher than 4095 Bytes (see clause 4.2.2.1).

5.6.2.17 Type ChargingInformation

Table 5.6.2.17-1: Definition of type ChargingInformation

Attribute name	Data type	Р	Cardinality	Description	Applicability
primaryChfAddress	Uri	M	1	Contains the {apiRoot} part, either in the form of an FQDN or IPAddress/Port Number, of the URI, of the primary CHF instance. (NOTE 1) (NOTE 2)	
secondaryChfAddress	Uri	С	01	Contains the {apiRoot} part, either in the form of an FQDN or IPAddress/Port Number, of the URI, of the secondary CHF instance. It shall be present if the feature "CHFsetSupport" is not supported. It may be omitted if the feature "CHFsetSupport" is supported (NOTE 1) (NOTE 2)	
primaryChfSetId	NfSetId	С	01	The CHF set ID that the primary CHF instance belongs to may complement the primary CHF address and shall be present, if available. (NOTE 2)	
primaryChfInstanceId	NfInstanceId	С	01	The CHF instance ID of the primary CHF instance may complement the primary CHF address and shall be present, if available. (NOTE 2)	
secondaryChfSetId	NfSetId	С	01	The CHF set ID that the secondary CHF instance belongs to may complement the secondary CHF address and shall be present, if available, and the feature "CHFsetSupport" is not supported. It may be omitted if available and the feature "CHFsetSupport" is supported.	
secondaryChfInstance Id	NfInstanceId	С	01	The CHF instance ID of the secondary CHF instance may complement the secondary CHF address and shall be present, if available, and the feature "CHFsetSupport" is not supported. It may be omitted if available and the feature "CHFsetSupport" is supported.	

NOTE 1: Based on the {apiRoot} of the CHF instance in the form of an FQDN, the consumer can derive the Nfinstance via NRF lookup. It is up to the consumer to determine which service to invoke from the CHF. The {apiRoot} shall apply to all CHF services.

NOTE 2: The NF Service Consumer of the CHF may use the "primaryChfAddress"/"secondaryChfAddress" attributes as primary/secondary redundancy mechanism, or alternatively, when CHF instance and CHF set are available, it may also rely on the availability of a CHF instance within the CHF Set for the same purpose.

5.6.2.18 Type AccuUsageReport

Table 5.6.2.18-1: Definition of type AccuUsageReport

Attribute name	Data type	P	Cardinality	Description	Applicability
refUmlds	string	М	1	An id referencing UsageMonitoringData objects associated with this usage report.	
volUsage	Volume	0	01	Indicates a total accumulated volume usage.	
volUsageUplink	Volume	0	01	Indicates an accumulated volume usage in uplink.	
volUsageDownlink	Volume	0	01	Indicates an accumulated volume usage in downlink.	
timeUsage	DurationSec	0	01	Indicates an accumulated time usage.	
nextVolUsage	Volume	0	01	Indicates an accumulated volume usage after the Monitoring Time.	
nextVolUsageUplink	Volume	0	01	Indicates an accumulated volume usage in uplink after the Monitoring Time.	
nextVolUsageDownli nk	Volume	0	01	Indicates an accumulated volume usage in downlink after the Monitoring Time.	
nextTimeUsage	DurationSec	0	01	Indicates an accumulated time usage after the Monitoring.	

5.6.2.19 Type SmPolicyUpdateContextData

Table 5.6.2.19-1: Definition of type SmPolicyUpdateContextData

Attribute name	Data type	Р	Cardinality	Description	Applicability
repPolicyCtrlReqTrig	array(PolicyContr	С	1N	The policy control request triggers	
gers	olRequestTrigger)			which are met. It is omitted if no	
				triggers are met such as in clauses 4.2.4.7 and 4.2.4.15.	
accNetChlds	array(AccNetChId	0	1N	Indicates the access network	
)			charging identifier for the whole PDU	
				session. For EPS interworking	
				scenarios, it indicates the access	
				network charging identifier for the PCC rule(s) or the whole PDU	
				session.	
accessType	AccessType	0	01	The Access Type where the served	
				UE is camping.	
ratType	RatType	0	01	The RAT Type where the served UE	
addAccessInfo	AdditionalAccessI	0	01	is camping. Indicates the combination of added	ATSSS
addAccessiiio	nfo		01	Access Type and RAT Type for MA	A1333
	1110			PDU session.	
relAccessInfo	AdditionalAccessI	0	01	Indicates the combination of released	ATSSS
	nfo			Access Type and RAT Type for MA	
	DI 1 1 1 1 1		2.4	PDU session.	
servingNetwork	PlmnldNid	0	01	The serving network (a PLMN or an SNPN) where the served UE is	
				camping. For the SNPN the NID	
				together with the PLMN ID identifies	
				the SNPN.	
userLocationInfo	UserLocation	0	01	The location(s) where the served UE	
T: 7	T. 7		2.4	is camping. (NOTE 4)	
ueTimeZone	TimeZone	0	01	The time zone where the served UE is camping.	
ipv4Address	lpv4Addr	0	01	The IPv4 Address of the served UE.	
ipDomain	string	Ō	01	IPv4 address domain identifier.	
•	3			(NOTE 2)	
rellpv4Address	Ipv4Addr	0	01	Indicates the released IPv4 Address	
	L 0D "		2.4	of the served UE.	
ipv6AddressPrefix	Ipv6Prefix	0	01	The Ipv6 Address Prefix of the served UE. (NOTE 6)	
rellpv6AddressPrefix	Ipv6Prefix	0	01	Indicates the released IPv6 Address	
				Prefix of the served UE in multi-	
				homing case. (NOTE 6)	
relUeMac	MacAddr48	0	01	Indicates the released MAC Address	
	NA A L L 40		0.4	of the served UE.	
ueMac subsSessAmbr	MacAddr48 Ambr	0	01 01	The MAC Address of the served UE. UDM subscribed or DN-AAA	
SubsoessAmbi	AIIIDI		01	authorized Session-AMBR.	
authProfIndex	string	0	01	DN-AAA authorization profile index.	DN-
				·	Authorization
subsDefQos	SubscribedDefault	0	01	Subscribed Default QoS Information.	
v volume vo O = =	Qos		0.4	Oo Cooperation to the or VPL MAN	V/DL MAN C. C.
vplmnQos	VplmnQos	0	01	QoS constraints in a VPLMN (NOTE 5)	VPLMN-QoS- Control
vplmnQosNotApp	boolean	0	01	If it is included and set to true,	VPLMN-QoS-
	33.33.1			indicates that the QoS constraints in	Control
				the VPLMN are not applicable.	
0/5 : =::				(NOTE 5)	ļ
numOfPackFilter	integer	0	01	Contains the number of supported	
				packet filter for signalled QoS rules. (NOTE 1)	
accuUsageReports	array(AccuUsage	0	1N	Contains the accumulated usage	UMC
	Report)	Ĺ		report(s).	
3gppPsDataOffStatus	boolean	0	01	If it is included and set to true, the	3GPP-PS-
				3GPP PS Data Off is activated by the	Data-Off
annDetectionInfo	array/AnnDotactic	0	1N	UE. Reports the start/stop of the	ADC
appDetectionInfos	array(AppDetectio	U	1IN		ADC
	nInfo)			application traffic and detected SDF	

ruleReports	array(RuleReport)	0	1N	Used to report the PCC rule failure.	
sessRuleReports	array(SessionRul eReport)	0	1N	Used to report the session rule failure.	SessionRuleEr rorHandling
qncReports	array(QosNotificat ionControlInfo)	0	1N	QoS Notification Control information.	
qosMonReports	array(QosMonitori ngReport)	0	1N	QoS Monitoring reporting information with packet delay. It shall be present when the notified event is "QOS_MONITORING" and packet delay measurements are available.	QosMonitoring
qosMonDatRateReps	array(QosMonitori ngReport)	0	1N	QoS Monitoring reporting information with data rate measurements. It shall be present when the notified event is "QOS_MONITORING" and data rate measurements are available.	EnQoSMon
qosMonCongReps	array(QosMonitori ngReport)	0	1N	QoS Monitoring reporting information with congestion measurements. It shall be present when the notified event is "QOS_MONITORING" and data rate measurements are available.	EnQoSMon
userLocationInfoTime	DateTime	0	01	Contains the NTP time at which the UE was last known to be in the location. (NOTE 3)	
repPraInfos	map(PresenceInfo	0	1N	Reports the changes of presence reporting area. The "prald" attribute within the PresenceInfo data type shall also be the key of the map. The "presenceState" attribute within the PresenceInfo data type shall be supplied. The "additionalPrald" attribute within the PresenceInfo data type shall not be supplied.	PRA
ueInitResReq	UeInitiatedResour ceRequest	0	01	Indicates a UE requests specific QoS handling for selected SDF.	
refQosIndication	boolean	0	01	If it is included and set to true, the reflective QoS is supported by the UE. If it is included and set to false, the reflective QoS is revoked by the UE.	
qosFlowUsage	QosFlowUsage	0	01	Indicates the required usage for default QoS flow.	
creditManageStatus	CreditManageme ntStatus	0	01	Indicates the reason of the credit management session failure.	
servNfld	ServingNfldentity	0	01	Contains the serving network function identity.	
traceReq	TraceData	С	01	It shall be included if trace is required to be activated, modified or deactivated (see 3GPP TS 32.422 [24]). For trace modification, it shall contain a complete replacement of trace data. For trace deactivation, it shall contain the Null value.	
addlpv6AddrPrefixes	Ipv6Prefix	0	01	An additional Ipv6 Address Prefix of the served UE. (NOTE 6)	Multilpv6AddrP refix
addRellpv6AddrPrefi xes	Ipv6Prefix	0	01	Indicates an additional released IPv6 Address Prefix of the served UE. (NOTE 6)	Multilpv6AddrP refix
multiIpv6Prefixes	array(Ipv6Prefix)	0	1N	The Ipv6 Address Prefixes of the served UE. (NOTE 6)	UnlimitedMultil pv6Prefix
multiRellpv6Prefixes	array(Ipv6Prefix)	0	1N	Indicates the released IPv6 Address Prefixes of the served UE. (NOTE 6)	UnlimitedMultil pv6Prefix
tsnBridgeInfo	TsnBridgeInfo	0	01	Transports TSC user plane node information.	TimeSensitive Networking
tsnBridgeManCont	BridgeManageme ntContainer	0	01	Transports TSC user plane node management information.	TimeSensitive Networking

tsnPortManContDstt	PortManagement Container	0	01	When DS-TT functionality is used, transports TSN port management information for the DS-TT port.	TimeSensitive Networking
tsnPortManContNwtt s	array(PortManage mentContainer)	0	1N	When NW-TT functionality is used, transports TSN port management information for one or more NW-TT ports.	TimeSensitive Networking
tscNotifUri	Uri	0	01	For PMIC/UMIC UPF event notification target address of the TSCTSF or TSN AF receiving the TSC management information.	ExposureToTS C
tscNotifCorreld	string	0	01	Correlation identifier for TSC management information notifications.	ExposureToTS C
maPduInd	MaPduIndication	0	01	Contains the MA PDU session indication, i.e., MA PDU Request or MA PDU Network-Upgrade Allowed. (NOTE 1)	ATSSS
atsssCapab	AtsssCapability	0	01	Contains the ATSSS capability supported for the MA PDU session. (NOTE 1)	ATSSS
mulAddrInfos	array(IpMulticastA ddressInfo)	0	1N	Contains the IP multicast address information.	WWC
policyDecFailureRep orts	array(PolicyDecisi onFailureCode)	0	1N	Indicates the type(s) of the failed policy decision and/or condition data.	PolicyDecision ErrorHandling
invalidPolicyDecs	array(InvalidPara m)	0	1N	Indicates the invalid parameters for the reported type(s) of the failed policy decision and/or condition data.	ExtPolicyDecis ionErrorHandli
trafficDescriptors	array(DddTrafficD escriptor)	0	1N	Contains the traffic descriptor(s)	DDNEventPoli cyControl
typesOfNotif	array(DIDataDeliv eryStatus)	0	1N	Contains the type of notification of DDD Status.	DDNEventPoli cyControl
pccRuleId	string	0	01	Contains the identifier of the PCC rule which is used for traffic detection of event (e.g. DDN failure).	DDNEventPoli cyControl2
interGrpIds	array(GroupId)	0	1N	Internal Group Identifier(s) of the served UE.	GroupIdListCh ange
satBackhaulCategory	SatelliteBackhaul Category	0	01	Indicates the satellite backhaul category or non-satellite backhaul used for the PDU session. If the "EnSatBackhaulCatChg" feature is supported, the dynamic satellite backhaul categories may also be provided.	SatBackhaulC ategoryChg
pcfUeInfo	PcfUeCallbackInf o	0	01	PCF for the UE callback URI and SBA binding information.	AMInfluence
nwdafDatas	array(NwdafData)	0	1N	List of NWDAF Instance IDs and their associated Analytics IDs consumed by the NF service consumer.	EneNA
anGwStatus	boolean	0	1N	When it is included and set to "true", it indicates that the AN-Gateway has failed and that the PCF should refrain from sending policy decisions to the SMF until it is informed that the AN-Gateway has been recovered. (NOTE 1)	SGWRest
uePolCont	UePolicyContaine r	С	01	Indicates a UE policy container received from the UE. (NOTE 1) (NOTE 7)	EpsUrsp
uePolFailReport	UePolicyTransfer FailureCause	С	01	Indicates a failure delivery result for UE policy container. (NOTE 1) (NOTE 7)	EpsUrsp
urspEnfInfo	UrspEnforcementI nfo	0	01	Contains the reporting of URSP rule enforcement information from the UE.	URSPEnforce ment

sscMode	SscMode	0	01	SSC Mode of the PDU session.	URSPEnforce ment
				It may be present when the "urspEnfInfo" attribute is present.	
ueReqDnn	Dnn	0	01	UE requested DNN. It may be present when the "urspEnfInfo" attribute is present.	URSPEnforce ment
				disperiinio attribute is present.	
ueReqPduSessionTy pe	PduSessionType	0	01	UE requested PDU session Type.	URSPEnforce ment
				It may be present when the "urspEnfInfo" attribute is present.	
I4sReports	array(L4sSupportInfo)	0	1N	ECN marking for L4S support report information.	L4S
altSliceInfo	Snssai	0	01	Contains the Alternative S-NSSAI.	NetSliceRepl
batOffsetInfo	BatOffsetInfoPcc	0	01	Contains the BAT offset and the optionally adjusted periodicity for the indicated PCC rule(s).	EnTSCAC
hrsbolnd	boolean	0	01	HR-SBO support indication. If present and set to "true", it indicates that the HR-SBO is supported. If present and set to "false", it indicates that the HR-SBO is not supported.	HR-SBO
ueReachStatus	UeReachabilitySt atus	0	01	Contains the UE reachability Status. This attribute shall be present only when the notified event is "UE_REACH_STATUS_CH".	UEUnreachabl e
retryAfter	Uinteger	0	01	Contains the estimated time duration (expressed in units of seconds) during which the UE is unreachable.	UEUnreachabl e
				This attribute may be present only when the "ueReachStatus" attribute is present and set to "UNREACHABLE".	

- NOTE 1: This attribute is only applicable to the 5GS and EPC/E-UTRAN interworking scenario as defined in Annex B.
- NOTE 2: The value provided in this attribute is implementation specific. The only constraint is that the NF service consumer shall supply a different identifier for each overlapping address domain (e.g. the SMF NF instance identifier).
- NOTE 3: The age of UE location included within the "userLocationInfoTime" attribute is the age of the 3GPP access UE location received from the AMF and shall be included only when the reported "userLocationInfo" attribute includes the UE location in the 3GPP access.
- NOTE 4: The SMF may encode both 3GPP and non-3GPP access UE location in the "userLocationInfo" attribute.
- NOTE 5: Only one of "vplmnQos" or "vplmnQosNotApp" attributes may be present.
- NOTE 6: When the "WWC" feature is supported, according to 3GPP TS 23.316 [42], clause 8.3.1 and 4.6.2, more than one IPv6 prefix shorter than /64 or more than one full IPv6 addres with a /128 prefix may be allocated to the RG. When feature Multilpv6AddrPrefix is supported, additional IPv6 prefix shorter than /64 or full IPv6 address with a /128 prefix may be reported encoded as the "addlpv6AddrPrefixes" and the "addRellpv6AddrPrefixes" attributes, if the "Multilpv6AddrPrefix" feature is supported, or as the "multilpv6Prefixes" and the "multiRellpv6Prefixes" attributes, if the "UnlimitedMultilpv6Prefix" feature is supported. If the attribute "multilpv6Prefixes" is provided, then attributes "ipv6AddressPrefix" and "addlpv6AddrPrefixes" shall be both absent. If the attribute "multiRellpv6Prefixes" is provided, then attributes "rellpv6AddressPrefix" and "addRellpv6AddrPrefixes" shall be both absent.
- NOTE 7: When the "EpsUrsp" feature is supported, the "uePolCont" attribute and "uePolFailReport" attribute are mutually exclusive.

5.6.2.20 Type UpPathChgEvent

Table 5.6.2.20-1: Definition of type UpPathChgEvent

Attribute name	Data type	Р	Cardinality	Description	Applicability
notificationUri	Uri	М	1	Notification address of AF receiving the event notification.	TSC
notifCorreld	string	М	1	It is used to set the value of Notification Correlation ID in the notification sent by the NF service consumer.	TSC
dnaiChgType	DnaiChangeType	М	1	Indicates the type of DNAI change.	TSC
afAckInd	boolean	0	01	Identifies whether the AF acknowledgement of UP path event notification is expected. Set to "true" if the AF acknowledge is expected; otherwise set to "false". Default value is "false" if omitted.	URLLC

5.6.2.21 Type TerminationNotification

Table 5.6.2.21-1: Definition of type TerminationNotification

Attribute name	Data type	Р	Cardinality	Description	Applicability		
resourceUri	Uri	M	1	The resource URI of the individual SM policy resource related to the notification. (NOTE)			
cause	SmPolicyAssociati	М	1	The cause why the PCF requests the			
	onReleaseCause			termination of the policy association.			
NOTE: Either the complete resource URI included in the "resourceUri" attribute or the "apiSpecificResourceUriPart" component (see clause 5.1) of the resource URI included in the "resourceUri" attribute can be used by the SMF for the identification of the individual SM policy resource related to the notification.							

5.6.2.22 Type AppDetectionInfo

Table 5.6.2.22-1: Definition of type AppDetectionInfo

Attribute name	Data type	Р	Cardinality	Description	Applicability
appld	string	М	1	A reference to the application detection filter configured at the UPF and reported to the NF service consume.	
instanceId	string	0	01	Identifier dynamically assigned by UPF and reported to the NF service consumer in order to allow correlation of application Start and Stop events to the specific service data flow description, if service data flow descriptions are deducible.	
sdfDescriptions	array(FlowInformation)	0	1N	Contains the detected service data flow descriptions if they are deducible. When present, it shall only include the "flowDescription" and the "flowDirection" attributes of the FlowInformation data type.	

5.6.2.23 Type AccNetChld

Table 5.6.2.23-1: Definition of type AccNetChld

Attribute name	Data type	Р	Cardinality	Description	Applicability
accNetChaldValue	ChargingId	С	01	Contains a charging identifier. (NOTE 1)	
accNetChargldString	string	С	01	A character string containing the charging identifier (see clause 5.1.9.1 of 3GPP TS 32.255 [35]). (NOTE 1)	AccNetChargId _String
refPccRuleIds	array(string)	0	1N	Applicable only to EPS interworking scenarios. Contains the identifier of the PCC rule(s) that are associated to the provided Access Network Charging Identifier.	
sessionChScope	boolean	0	01	When included and set to true, it indicates that the provided Access Network Charging Identifier applies to the whole PDU Session. Default value is false if omitted. Value false applies only to EPS interworking scenarios	

NOTE 1: The "accNetChaldValue" shall be used to encode the charging identifier when the charging identifier is within the Uint32 value range. The "accNetChargldString" attribute shall be used to encode the charging identifier when the "AccNetChargld_String" feature is supported by the SMF and the PCF and the charging identifier is out of the Uint32 range.

NOTE 2: When the "AccNetChargId_String" feature is not supported and the value of the charging identifier is out of the ChargingId data type value range (Uint32) it is not possible to ensure a proper charging correlation using value of the "accNetChaldValue" attribute.

5.6.2.24 Type RequestedRuleData

Table 5.6.2.24-1: Definition of type RequestedRuleData

Attribute name	Data type	Р	Cardinality	Description	Applicability
refPccRuleIds	array(string)	М	1N	An array of PCC rule id references to the PCC rules associated with the control data.	
reqData	array(Requested RuleDataType)	М	1N	Array of requested rule data type elements indicating what type of rule data is requested for the corresponding referenced PCC rules.	

5.6.2.25 Type RequestedUsageData

Table 5.6.2.25-1: Definition of type RequestedUsageData

Attribute name	Data type	Р	Cardinality	Description	Applicability
refUmlds	array(string)	С	1N	An array of usage monitoring data id references to the usage monitoring data instances for which the PCF is requesting an accumulated usage report. This attribute shall only be provided when allUmlds is not set to true.	
allUmlds	boolean	С	01	This boolean indicates whether the requested accumulated usage report applies to all usage monitoring data instances. When it is not included, it means that the requested accumulated usage report shall only apply to the usage monitoring data instances referenced in the refUmlds attribute.	

5.6.2.26 Type UeCampingRep

Table 5.6.2.26-1: Definition of type UeCampingRep

Attribute name	Data type	Р	Cardinality	Description	Applicability
accessType	AccessType	С	01	The Access Type where the served UE	
				is camping. It shall be provided for trigger	
				"AC_TY_CH".	
ratType	RatType	С	01	The RAT Type where the served UE is	
				camping. It shall be provided for triggers	
				"RAT_TY_CH" and/or "AC_TY_CH".	
servNfld	ServingNfldentity	С	01	Contains the serving network function identity.	
				It shall be provided for trigger	
				"SCNN_CH".	
servingNetwork	PlmnldNid	С	01	The serving network (a PLMN or an SNPN) where the served UE is	
				camping. For an SNPN the NID	
				together with the PLMN ID identifies the	
				SNPN. It shall be provided for trigger	
				"PLMN_CH".	
userLocationInfo	UserLocation	С	01	The location(s) of the served UE.	
				It shall be provided for trigger "SAREA_CH".	
				(NOTE)	
ueTimeZone	TimeZone	С	01	The time zone where the served UE is	
				camping. It shall be provided for trigger	
				"UE_TZ_CH"	
netLocAccSupp	NetLocAccessSu pport	0	01	Indicates that the access network does not support the reporting of the	NetLoc
	рроп			requested access network information.	
satBackhaulCateg	SatelliteBackhaul	С	01	Indicates satellite backhaul category or	SatBackhaulCat
ory	Category			non-satellite backhaul used for the PDU session.	egoryChg_v2
				If the "EnSatBackhaulCatChg" feature	
				is supported, the different dynamic satellite backhaul categories may also	
				be provided.	
				It shall be provided for trigger	
urspEnfInfo	UrspEnforcement	С	01	"SAT_CATEGORY_CHG". Contains the reporting of URSP rule	URSPEnforcem
ui Speriii ii o	Info		01	enforcement information received from	ent
				the UE.	
				It shall be provided for trigger "URSP_ENFORCEMENT_INFO".	
sscMode	SscMode	0	01	SSC Mode of the PDU session.	URSPEnforcem
				It may be present when the	ent
				"urspEnfInfo" attribute is present.	
ueReqDnn	Dnn	0	01	UE requested DNN.	URSPEnforcem
				It may be present when the	ent
				"urspEnfInfo" attribute is present.	
ueReqPduSession	PduSessionType	0	01	UE requested PDU session Type.	URSPEnforcem
Туре				It may be present when the	ent
				"urspEnfInfo" attribute is present.	
NOTE: The SMF	may encode both 3	GPP	and non-3GPF	access UE location in the "userLocation	nfo" attribute.

5.6.2.27 Type RuleReport

Table 5.6.2.27-1: Definition of type RuleReport

Attribute name	Data type	Р	Cardinality	Description	Applicability
pccRuleIds	array(string)	М	1N	Contains the identifier(s) of the affected PCC rule(s).	
ruleStatus	RuleStatus	М	1	Indicates the status of the PCC rule(s).	
contVers	array(ContentVers ion)	С	1N	Indicates the version(s) of the PCC rule(s). If the RuleVersioning feature is supported, the content version shall be included in this attribute if it was included when the corresponding PCC rule was installed or modified.	RuleVersioning
failureCode	FailureCode	С	01	Indicates the reason why the PCC Rule(s) are being reported. It shall be included when the NF service consumer reports the failure of the enforcement of the PCC rule(s).	
retryAfter	Uinteger	0	01	Indicates the estimate on how long it will take before it can be considered the UE is reachable. It may be provided when the failureCode attribute indicates UE_TEMPORARILY_UNAVAILABLE. The value shall be in seconds.	UEUnreachabl e
finUnitAct	FinalUnitAction	0	01	Contains the termination action that is applied, when the user's account cannot cover the service cost.	
ranNasRelCauses	array(RanNasRel Cause)	0	1N	Indicates the RAN or NAS release cause code information.	RAN-NAS- Cause
altQosParamId	string	0	01	Indicates the alternative QoS parameter set that the NG-RAN can guarantee. It is included during the report of success resource allocation and indicates that NG-RAN used an alternative QoS profile because the requested QoS could not be allocated.	AuthorizationW ithRequiredQo S

5.6.2.28 Type RanNasRelCause

Table 5.6.2.28-1: Definition of type RanNasRelCause

Attribute name	Data type	Р	Cardinality	Description	Applicability
ngApCause	NgApCause	0	01	Indicates the cause value of NGAP	RAN-NAS-
				protocol.	Cause
5gMmCause	5GMmCause	0	01	Indicates the cause value of 5GMM	RAN-NAS-
				protocol.	Cause
5gSmCause	5GSmCause	0	01	Indicates the cause value of 5GSM	RAN-NAS-
				protocol.	Cause
epsCause	EpsRanNasRelC	0	01	Indicates the RAN/NAS cause value for	RAN-NAS-
•	ause			EPS.	Cause

5.6.2.29 Type UeInitiatedResourceRequest

Table 5.6.2.29-1: Definition of type UelnitiatedResourceRequest

Attribute name	Data type	Р	Cardinality	Description	Applicability
pccRuleId	string	0	01	Indicates a PCC rule corresponding to a QoS rule which is requested to	
				be modified or deleted by the UE.	
ruleOp	RuleOperation	М	1	Indicates an operation for the PCC	
				rule.	
packFiltInfo	array(PacketFilterInfo)	M	1N	Contains the information from a single packet filter sent from the NF service consumer to the PCF.	
precedence	integer	0	01	The requested order for the PCC rule generated from the QoS rule requested by the UE.	
reqQos	RequestedQos	0	01	Contains the QoS information requested by the UE.	

5.6.2.30 Type PacketFilterInfo

Table 5.6.2.30-1: Definition of type PacketFilterInfo

Attribute name	Data type		Р	Cardinality	y	Description	Applicability
packFiltId packFiltCont	string PacketFilterConte	nt	0	01		An identifier of packet filter. For PCC rules created as a result of UE-initiated resource modification, the packet filter identifier is assigned by the PCF and is unique per UE and PCF instance. Contains the content of the packet filter as requested by the UE and required by the PCF to create the	
	string	0		01	2-o the Tra octified Eactako as o 4 o seca BIPS rep bits pacea	Ctet string. The first octet contains Ipv4 Type-of-Service or the Ipv6 ffic-Class field and the second et contains the ToS/Traffic mask d in hexadecimal representation. ch character in the string shall e a value of "0" to "9" or "A" to "F" d shall represent 4 bits. One ample is that of a TFT packet filter defined in 3GPP TS 24.008 [41]. ctet string, representing the curity parameter index of the fec packet in hexadecimal resentation. Each character in the fing shall take a value of "0" to "9" A" to "F" and shall represent 4 for the contains of the second of the find shall take a value of "0" to "9" A" to "F" and shall represent 4 for the contains of the second of the find shall take a value of "0" to "9" A" to "F" and shall represent 4 for the contains of the second of the find shall take a value of "0" to "9" A" to "F" and shall represent 4 for the contains of the second of the find shall take a value of "0" to "9" A" to "F" and shall represent 4 for the contains of the second of the find shall take a value of "0" to "9" A" to "F" and shall represent 4 for the contains of the second of the find shall take a value of "0" to "9" A" to "F" and shall represent 4 for the contains of the second of the find shall represent a the second of the secon	
flowLabel	string	0		01	3-o flov hex cha valu sha is tl	ctet string, representing the Ipv6 v label header field in cadecimal representation. Each tracter in the string shall take a ue of "0" to "9" or "A" to "F" and fill represent 4 bits. One example that of a TFT packet filter as ined in 3GPP TS 24.008 [41].	
flowDirection	FlowDirection	0		01 I	Ind a fil upli	icates the direction/directions that lter is applicable, downlink only, ink only or both down- and uplink directional).	

5.6.2.31 Type RequestedQos

Table 5.6.2.31-1: Definition of type RequestedQos

Attribute name	Data type	Р	Cardinality	Description	Applicability
5qi	5Qi	M	1	Identifier for the authorized QoS	
				parameters for the service data flow.	
gbrUl	BitRate	0	01	Indicates the guaranteed bandwidth in	
				uplink requested by the UE.	
gbrDl	BitRate	0	01	Indicates the max guaranteed in	
				downlink requested by the UE.	

5.6.2.32 Type QosNotificationControlInfo

Table 5.6.2.32-1: Definition of type QosNotificationControlInfo

Attribute name	Data type	Р	Cardinality	Description	Applicability
refPccRuleIds	array(string)	М	1N	An array of PCC rule id references to the PCC rules associated with the QosNotificationControlInfo.	
notifType	QosNotifType	M	1	Indicates whether the GBR targets for the indicated SDFs are "NOT_GUARANTEED" or "GUARANTEED" again.	
contVers	array(ContentV ersion)	С	1N	Indicates the version of the PCC rule. If rule versioning feature is supported, the content version shall be included if it was included when the corresponding PCC rule was installed or modified.	RuleVersioning
altQosParamId	string	0	01	Indicates the alternative QoS parameter set the NG-RAN can guarantee. When it is omitted and "notifType" attribute is NOT_GUARANTEED, it indicates that the lowest priority alternative QoS profile could not be fulfilled.	AuthorizationWit hRequiredQoS
altQosNotSuppInd	boolean	0	01	It may be set to true when the "notifType" attribute is NOT_GUARANTEED to indicate that the Alternative QoS profiles are not supported by NG-RAN. The default value false shall apply if the attribute is not present. It may be used when the AuthorizationWithRequiredQoS feature is supported.	AltQoSProfilesSu pportReport

5.6.2.33 Type PartialSuccessReport

Table 5.6.2.33-1: Definition of type PartialSuccessReport

Attribute name	Data type	Р	Cardinality	Description	Applicability		
failureCause	FailureCause	М	1	Application error cause specific to this report.			
ruleReports	array(RuleReport)	С	1N	Information about the PCC rules provisioned by the PCF not successfully installed/activated.			
sessRuleReports	array(SessionRule Report)	0	1N	Information about the session rules provisioned by the PCF not successfully installed.	SessionRuleEr rorHandling		
ueCampingRep	UeCampingRep	0	01	Includes the current applicable values corresponding to the provisioned policy control request triggers.			
policyDecFailure Reports	array(PolicyDecisio nFailureCode)	0	1N	Used to report the failure of the policy decision and/or condition data.	PolicyDecision ErrorHandling		
invalidPolicyDecs	array(InvalidParam)	0	1N	Indicates the invalid parameters for the reported type(s) of the failed policy decision and/or condition data.	ExtPolicyDecis ionErrorHandli ng		
NOTE: The "ruleReports" shall be included if the SessionRuleErrorHandling feature or the PolicyDecisionErrorHandling feature is not supported.							

5.6.2.34 Type AuthorizedDefaultQos

Table 5.6.2.34-1: Definition of type AuthorizedDefaultQos

Attribute name	Data type	Р	Cardinality	Description	Applicability
5qi	5Qi	С	01	5G QoS Identifier. It shall be included when the Authorized Default QoS is initially provisioned.	
arp	Arp	С	01	Indicates the allocation and retention priority. It shall be included when the Authorized Default QoS is initially provisioned.	
priorityLevel	5QiPriorityLevel Rm	0	01	Unsigned integer indicating the 5QI Priority Level, within a range of 1 to 127.	
averWindow	AverWindowRm	0	01	Indicates the averaging window. (NOTE 1)	
maxDataBurstVol	MaxDataBurstV olRm	0	01	Unsigned integer indicating the maximum data burst volume. (NOTE 2)	
gbrUl	BitRateRm	0	01	Indicates the guaranteed bandwidth in uplink. (NOTE 1)	
gbrDl	BitRateRm	0	01	Indicates the guaranteed bandwidth in downlink. (NOTE 1)	
maxbrUl	BitRateRm	0	01	Indicates the max bandwidth in uplink. (NOTE 1)	
maxbrDl	BitRateRm	0	01	Indicates the max bandwidth in downlink. (NOTE 1)	
extMaxDataBurstVol	ExtMaxDataBur stVolRm	0	01	Unsigned integer indicating the maximum data burst volume. (NOTE 2)	EMDBV

NOTE 1: This attribute is only applicable to GBR type or delay critical GBR type 5QI.

NOTE 2: Either the maxDataBurstVol IE or the extMaxDataBurstVol IE may be present for a Delay Critical GBR QoS flow. If the maximum data burst volume value to be transmitted is lower than or equal to 4095 Bytes, the maxDataBurst Vol IE is used. If the EMDBV feature is supported by both the PCF and the SMF, the extMaxDataBurstVol IE is used to transmit maximum data burst volume values higher than 4095 Bytes (see clause 4.2.2.1).

5.6.2.35 Type AccNetChargingAddress

Table 5.6.2.35-1: Definition of type AccNetChargingAddress

Attribute name	Data type	Р	Cardinality	Description	Applicability			
anCharglpv4Addr	lpv4Addr	0	01	Includes the IPv4 address of network				
				entity within the access network				
				performing charging.				
anCharglpv6Addr	lpv6Addr	0	01	Includes the IPv6 address of network				
				entity within the access network				
				performing charging.				
NOTE: At least one address of the access network entity (the IPv4 address or the IPv6 address or both if both								
addresse	addresses are available) shall be included.							

5.6.2.36 Type ErrorReport

Table 5.6.2.36-1: Definition of type ErrorReport

Attribute name	Data type	Р	Cardinality	Description	Applicability
error	ProblemDetails	М	1	More information on the error shall be provided in the "cause" attribute of the "ProblemDetails" structure.	
ruleReports	array(RuleReport)	0	1N	Used to report the PCC rule failure.	
sessRuleReports	array(SessionRule Report)	0	1N	Used to report the session rule failure.	SessionRuleEr rorHandling
policyDecFailureRe ports	array(PolicyDecisio nFailureCode)	0	1N	Used to report the failure of the policy decision and/or condition data.	PolicyDecision ErrorHandling
invalidPolicyDecs	array(InvalidParam)	0	1N	Indicates the invalid parameters for the reported type(s) of the failed policy decision and/or condition data.	ExtPolicyDecis ionErrorHandli ng

5.6.2.37 Type SessionRuleReport

Table 5.6.2.37-1: Definition of type SessionRuleReport

Attribute name	Data type	Р	Cardinality	Description	Applicability
rulelds	array(string)	М	1N	Contains the identifier of the affected session rule(s).	
ruleStatus	RuleStatus	М	1	Indicates the status of the session rule(s).	
sessRuleFailureCode	SessionRuleFailu reCode	С	01	Indicates the reason that the session rule(s) is being reported. It shall be included when the NF service consumer reports the enforcement failure of the session rule(s).	

5.6.2.38 Type ServingNfldentity

Table 5.6.2.38-1: Definition of type ServingNfldentity

Attribute name	Data type	Р	Cardinality	Description	Applicability
servNfInstId	NfInstanceId	0	01	Network Function Instance Identifier of	
				the 5G serving CN node. It represents	
				the AMF.	
guami	Guami	0	01	Globally Unique AMF Identifier.	
anGwAddr	AnGwAddress	0	01	Contains the access network control gateway address. It represents the S-GW or ePDG address. (NOTE 2)	
sgsnAddr	SgsnAddress	0	01	Contains the serving SGSN address. (NOTE 3)	2G3GIWK

NOTE 1: Void.

NOTE 2: The "anGwAddr" attribute is only applicable to the 5GS and EPC (E-UTRAN and non-3GPP access) interworking scenario as defined in Annex B.

NOTE 3: The "sgsnAddr" attribute is only applicable to the 5GS and EPC (GERAN and UTRAN access) interworking scenario as defined in Annex B.

Type SteeringMode 5.6.2.39

Table 5.6.2.39-1: Definition of type SteeringMode

Attribute name	Data type	Р	Cardinality	Description	Applicability
steerModeValue	SteerModeValue	М	1	Indicates the value of the steering mode.	
active	AccessType	С	01	Indicates the Active access. It shall be included when the "steerModeValue" attribute is set to "ACTIVE_STANDBY".	
standby	AccessTypeRm	0	01	Indicates the Standby access. It may be included when the "steerModeValue" attribute is set to "ACTIVE_STANDBY".	
3gLoad	Uinteger	С	01	Indicates the traffic load to steer to the 3GPP Access expressed in one percent. It shall be set to 0, 10, 20, 30, 40, 50, 60, 70, 80, 90 or 100. It shall be included when the "steerModeValue" attribute is set to "LOAD_BALANCING".	
prioAcc	AccessType	С	01	Indicates the high priority access. It shall be included when the "steerModeValue" attribute is set to "PRIORITY_BASED".	
thresValue	ThresholdValue	0	01	Indicates the threshold value(s) for RTT and/or Packet Loss Rate. If the EnATSSS feature is supported, it may be included when the "steerModeValue" attribute is set to "LOAD_BALANCING" with fixed split percentages or "PRIORITY_BASED" or, when the feature EnATSSS_v2 is supported, "REDUNDANT". (NOTE 1) (NOTE 2)	EnATSSS
steerModeInd	SteerModeIndicat or	0	01	Contains Autonomous load-balance indicator or UE-assistance indicator. If the EnATSSS feature is supported, it may be included when the "steerModeValue" attribute is set to "LOAD_BALANCING". (NOTE 1)	EnATSSS
primary	AccessTypeRm	0	01	Indicates the Primary access. It shall be included when the "steerModeValue" attribute is set to "REDUNDANT".	EnATSSS_v2

NOTE 1: The "thresValue" attribute and "steerModeInd" attribute are mutually exclusive.

NOTE 2: When the feature EnATSSS_v2 is supported, if the Steering Mode is "REDUNDANT", either a Maximum RTT or a Maximum Packet Loss Rate may be provided, but not both.

5.6.2.40 Type QosMonitoringData

Table 5.6.2.40-1: Definition of type QosMonitoringData

Attribute name	Data type	Р	Cardinality	Description	Applicability
qmld	string	М	1	Univocally identifies the QoS monitoring policy data within a PDU session.	
qosMonParamType	QosMonitoringP aramType	С	01	Indicates the type of QoS monitoring parameter included in the QosMonitoringData instance. It may be omitted when the QoS monitoring parameter is Packet Delay, otherwise it shall be provided when the "EnQoSMon" feature is supported.	EnQoSMon
reqQosMonParams	array(Requeste dQosMonitoring Parameter)	M	1N	Indicates QoS information to be monitored, (e.g.the UL packet delay, DL packet delay and/or round trip packet delay between the UE and the UPF is to be monitored) when the QoS Monitoring is enabled for the service data flow. If the "EnQoSMon" feature is supported, it indicates the QoS monitoring parameters for the QoS monitoring parameter type indicated in the "qosMonParamType" attribute (e.g., when the "qosMonParamType" attribute indicates that the congestion information is to be monitored, the "reqQosMonParams" attribute indicates whether the UL congestion information and/or the DL congestion information is to be monitored). (NOTE 2)	
repFreqs	array(Reporting Frequency)	М	1N	Indicates the frequency for the reporting for the indicated QoS monitoring parameter, such as event triggered and/or periodic. (NOTE 2)	
repThreshDl	integer	0	01	Indicates the threshold in units of milliseconds for DL packet delay. Only applicable when the "qosMonParamType" is omitted or includes the value "PACKET_DELAY", the "reqQosMonParams" attribute includes the "DOWNLINK" value and the "repFreqs" attribute includes the value "EVENT_TRIGGERED". Minimum = 0.	
repThreshUl	integer	0	01	Indicates the threshold in units of milliseconds for UL packet delay. Only applicable when the "qosMonParamType" is omitted or includes the value "PACKET_DELAY", the "reqQosMonParams" attribute includes the "UPLINK" value and the "repFreqs" attribute includes the value "EVENT_TRIGGERED". Minimum = 0.	
repThreshRp	integer	0	01	Indicates the threshold in units of milliseconds for round trip packet delay. Only applicable when the "qosMonParamType" is omitted or includes the value "PACKET_DELAY", the "reqQosMonParams" attribute includes the "ROUND_TRIP" value and the "repFreqs" attribute includes the value "EVENT_TRIGGERED". Minimum = 0.	

conThreshDl	LlintegorPm		0 1	Indicates the downlink threshold for	EnCoSMon
con i nresnDi	UintegerRm	0	01	congestion reporting. Only applicable when the "qosMonParamType" includes the value "CONGESTION", the "reqQosMonParams" attribute includes "DOWNLINK_CONGESTION" and the "repFreqs" attribute is set to	EnQoSMon
a a Thua a b L II	Linto manDro		0.4	"EVENT_TRIGGERED".	En Ca CMan
conThreshUI	UintegerRm	0	01	Indicates the downlink threshold for congestion reporting. Only applicable when the "qosMonParamType" includes the value "CONGESTION", the "reqQosMonParams" attribute includes "UPLINK_CONGESTION" and the "repFreqs" attribute is set to "EVENT_TRIGGERED".	EnQoSMon
waitTime	DurationSecRm	0	01	Indicates the minimum waiting time between subsequent reports. Only applicable when the "repFreqs" attribute includes the value "EVENT_TRIGGERED".	
repPeriod	DurationSecRm	0	01	Indicates the reporting period. Only applicable when the "repFreqs" attribute includes the value "PERIODIC". If the feature "PacketDelayFailureReport" is supported, it also indicates the time interval at which a packet delay measurement failure needs to be reported if no measurement result is provided (applicable when the "repFreqs" attribute includes the value "PERIODIC" and/or "EVENT_TRIGGERED").	
notifyUri	UriRm	0	01	Notification address of the AF or if the "ExposureToEAS" feature is supported, of the Local NEF or AF receiving the event notification. It shall be included if the PCF determines that the notification shall be sent to the AF directly from the NF service consumer or the PCF determines that the notification shall be sent to the Local NEF or AF directly from the UPF. (NOTE 1).	
notifyCorreld	string	0	01	It is used to set the value of Notification Correlation ID in the notification sent by the NF service consumer or, if the "ExposureToEAS" feature is supported, the UPF. It may be included if the PCF determines that the notification shall be sent to the AF directly from the NF service consumer or the PCF determines that the notification shall be sent to the Local NEF or AF directly from the UPF. (NOTE 1).	
directNotifInd	boolean	0	01	Indicates that the direct event notification sent to the Local NEF or AF by the UPF is requested if it is included and set to true.	ExposureToEA S EnQoSMon
avrgWndw	AverWindowRm	0	01	Averaging window for the calculation of the data rate for the service data flow. It may be present when the "repThreshDatRateDI" and/or "repThreshDatRateUI" attributes are present.	EnQoSMon
repThreshDatRateD	BitRateRm	0	01	Indicates the threshold for DL data rate. Only applicable when the "qosMonParamType" includes the value "DATA_RATE", the "reqQosMonParams" attribute includes "DOWNLINK_DATA_RATE" and the "repFreqs" attribute is set to "EVENT_TRIGGERED".	EnQoSMon

repThreshDatRateU	BitRateRm	0	Indicates the threshold for UL data rate. Only applicable when the "qosMonParamType" includes the value "DATA_RATE", the "reqQosMonParams" attribute includes "UPLINK_DATA_RATE" and the "repFreqs" attribute is set to "EVENT_TRIGGERED".	EnQoSMon
dataCollAppId	ApplicationId	0	Indicates the Data Collection Application Identifier used to identify the QoS monitoring event exposure subscription.	UPEAS

- NOTE 1: The attributes "notifyUri" and "notifyCorreld' shall not be set to NULL if the "ExposureToEAS" feature is not supported.
- NOTE 2: When the "DOWNLINK_CONGESTION" and/or "UPLINK_CONGESTION" are included in "reqQosMonParams" attribute, the reporting frequency within the "repFreqs" attribute shall only indicate "EVENT_TRIGGERED".

5.6.2.41 Type TsnBridgeInfo

Table 5.6.2.41-1: Definition of type TsnBridgeInfo

Attribute name	Data type	Р	Cardinality	Description	Applicability
bridgeld	Uint64	0	01	Contains a TSC user plane node Id. It may contain the unique TSN Bridge MAC address for IEEE TSN networks (as defined in IEEE Std 802.1Q-2018 [45] clause 14.2.5) or may contain a unique identifier assigned within 5GS (that identifies, e.g. a DetNet Router).	
dsttAddr	MacAddr48	0	01	When DS-TT functionality is used, contains the MAC address of DS-TT.	
dsttPortNum	TsnPortNumb er	0	01	Port allocated to a PDU session.	
dsttResidTime	Uinteger	0	01	When DS-TT functionality is used, the time taken within the UE and DS-TT to forward a packet between the UE/DS-TT port encoded as specified in clause 9.11.4.26 of 3GPP TS 24.501 [20] starting with octet 3 and ending with octet 10.	
mtulpv4	Uint16	0	01	MTU size, in octets, for the largest IPv4 packet that the interface will send and receive, as specified in IETF RFC 8344 [56]. Minimum = 68	MTU_Size
mtulpv6	Uint32	0	01	MTU size, in octets, of the largest IPv6 packet that the interface will send and receive, as specified in IETF RFC 8344 [55]. Minimum = 1280	MTU_Size

5.6.2.42 Type QosMonitoringReport

Table 5.6.2.42-1: Definition of type QosMonitoringReport

Attribute name	Data type	Р	Cardinality	Description	Applicability
refPccRuleIds	array(string)	М	1N	An array of PCC rule id references to the PCC rules associated with the QoS Monitoring report.	
ulDelays	array(integer)	0	1N	Uplink packet delay in units of milliseconds. (NOTE)	
dlDelays	array(integer)	0	1N	Downlink packet delay in units of milliseconds. (NOTE)	
rtDelays	array(integer)	0	1N	Round trip delay in units of milliseconds. (NOTE)	
ulCongInfo	Uinteger	0	01	Percentage of congestion information in uplink direction.	EnQoSMon
dlCongInfo	Uinteger	0	01	Percentage of congestion information in downlink direction.	EnQoSMon
pdmf	boolean	0	01	Packet delay measurement failure indicator. When set to true, it indicates that a packet delay failure has occurred. Default value is false if omitted.	PacketDelayFail ureReport
ulDataRate	BitRate	0	01	Average data throughput in uplink direction.	EnQoSMon
dlDataRate	BitRate	0	01	Average data throughput in downlink direction.	EnQoSMon

5.6.2.43 Type Additional AccessInfo

Table 5.6.2.43-1: Definition of type Additional AccessInfo

Attribute name	Data type	Р	Cardinality	Description	Applicability
accessType	AccessType	M	1	The Access Type where the served UE is	
				camping.	
ratType	RatType	0	01	The RAT Type where the served UE is	
				camping.	

5.6.2.44 Void

5.6.2.45 Type PortManagementContainer

Table 5.6.2.45-1: Definition of type PortManagementContainer

Attribute name	Data type	Р	Cardinality	Description	Applicability
portManCont	Bytes	M	1	Transports port management information for a DS-TT port or a NW-TT port encoded as specified in clause 9.11.4.27 of 3GPP TS 24.501 [20] starting with octet 4.	
portNum	TsnPortNumber	М	1	Provides port number for a DS-TT port or a NW-TT port.	

5.6.2.46 Type lpMulticastAddressInfo

Table 5.6.2.46-1: IpMulticastAddressInfo

Attribute name	Data type	P	Cardinality	Description	Applicability
srclpv4Addr	lpv4Addr	С	01	Indicates the source IPv4 address of the DL multicast flow. Maybe included if the "ipv4MulAddr" attribute is included.	
ipv4MulAddr	lpv4Addr	0	01	Indicates the destination IPv4 multicast address of the DL multicast flow.	
srclpv6Addr	lpv6Addr	С	01	Indicates the source IPv6 address of the DL multicast flow. Maybe included if the "ipv6MulAddr" attribute is included.	
ipv6MulAddr	lpv6Addr	0	01	Indicates the destination IPv6 multicast address of the DL multicast flow.	
				multicast address of the DL multicast	

5.6.2.47 Type BridgeManagementContainer

Table 5.6.2.47-1: Definition of type BridgeManagementContainer

Attribute name	Data type	Р	Cardinality	Description	Applicability
bridgeManCont	Bytes	М		Transports TSC user plane node management service message encoded as specified in clause 8.7 of 3GPP TS 24.539 [49].	

5.6.2.48 Type DownlinkDataNotificationControl

Table 5.6.2.48-1: Definition of type DownlinkDataNotificationControl

Attribute name	Data type	Р	Cardinality	Description	Applicability
notifCtrlInds	array(Notificatio nControlIndicati on)	М	1N	Indicates the event notification(s) is requested.	DDNEventPoli cyControl
typesOfNotif	array(DIDataDel iveryStatus)	0	1N	Contains the type of notification of DDD Status.	DDNEventPoli cyControl

5.6.2.49 Type DownlinkDataNotificationControlRm

This data type is defined in the same way as the "DownlinkDataNotificationControl" data type, but:

- with the OpenAPI "nullable: true" property;
- the removable attributes "notifCtrlInds", and " typesOfNotif " attribute are defined as nullable in the OpenAPI.

5.6.2.50 Type SgsnAddress

Table 5.6.2.50-1: Definition of type SgsnAddress

Attribute name	Data type	Р	Cardinality	Description	Applicability		
sgsnlpv4Addr	Ipv4Addr	0	01	Includes the IPv4 address of the access			
				network gateway control node.			
sgsnlpv6Addr	Ipv6Addr	0	01	Includes the IPv6 address of the access			
				network gateway control node.			
NOTE: At least one address of the SGSN (the IPv4 address or the IPv6 address or both if both addresses are available) shall be included.							

5.6.2.51 Void

5.6.2.52 Type ThresholdValue

Table 5.6.2.52 -1: Definition of type ThresholdValue

Attribute name	Data type	Р	Cardinality	Description	Applicability			
rttThres	UintegerRm	0	01	Unsigned integer identifying a threshold value of Maximum RTT in units of milliseconds.				
plrThres	PacketLossRate Rm	0	01	Indicates a threshold value of Maximum Packet Loss Rate.				
NOTE: At least o	NOTE: At least one of the attributes shall be included.							

5.6.2.53 Type NwdafData

Table 5.6.2.53-1: Definition of type NwdafData

Attribute name	Data type	Р	Cardinality	Description	Applicability
nwdafInstanceId	NfInstanceId	M	1	Uniquely identifies the NWDAF Instance ID	
				consumed by the NF service consumer.	
nwdafEvents	array(NwdafEv	0	1N	List of Analytics IDs consumed by the NF	
	ent)			service consumer.	

5.6.2.54 Type CallInfo

Table 5.6.2.54-1: Definition of type CallInfo

Attribute name	Data type	Р	Cardinality	Description	Applicability
callingPartyAddrs	array(string)	0		Identifies the address(es) (SIP URI or Tel URI) which identifies the party (Public User Identity or Public Service Identity) initiating a SIP transaction. The coding of each calling party address is the same as defined as clause 7.2.33 of 3GPP TS 32.299[60]	
calleeInfo	CalleeInfo	0	01	Identifies the callee information	

5.6.2.55 Type CalleeInfo

Table 5.6.2.55-1: Definition of type CalleeInfo

Attribute name	Data type	Р	Cardinality	Description	Applicability
calledPartyAddr	string	0	01	Holds the address of the party (Public User ID or Public Service ID) to whom the SIP transaction is posted in the context of an end-to-end SIP transaction as defined in clause 7.2.32 in 3GPP TS 32.299 [60].	
requestPartyAddr s	array(string)	0	1N	Holds the address(es) of the party (Public User ID or Public Service ID) to whom the SIP transaction was originally posted as defined in clause 7.2.176 in 3GPP TS 32.299 [60].	
calledAssertIds	array(string)	0	1N	Holds the address(es) (SIP URI and/or Tel URI) of the party (Public User ID or Public Service ID) of the finally asserted called party as defined in clause 7.2.31 of 3GPP TS 32.299 [60].	

5.6.2.56 Type TrafficParaData

Table 5.6.2.56-1: Definition of type TrafficParaData

Attribute name	Data type	Р	Cardinality	Description	Applicability
periodUl	DurationMilliSe cRm	0	01	Indicates the time period between the start of the two data bursts in units of milliseconds in Uplink direction.	
periodDl	DurationMilliSe cRm	0	01	Indicates the time period between the start of the two data bursts in units of milliseconds in Downlink direction.	
reqTrafficParas	array(TrafficPar ameterMeas)	0	1N	Indicates the traffic parameters to be measured. (NOTE)	
repFreqs	array(Reporting Frequency)	С	1N	Represents the notification method (periodic or on event detection). It shall be present if the "reqTrafficParas" attribute is present.	
dlN6JitterThr	Uinteger	0	01	Indicates threshold for the N6 Jitter Information associated with downlink Periodicity that triggers the report of the traffic parameters indicated in the "reqTrafficParas" attribute. Only applicable when the "repFreqs" attribute includes the value "EVENT_TRIGGERED".	
repPeriod	DurationSecRm	0	01	Indicates the time interval between successive event notifications. Only applicable when the "repFreqs" attribute includes the value "PERIODIC".	

NOTE: The DL_PERIOD and UL_PERIOD may be provided in the "reqTrafficParas" attribute only if the "periodUl" and "periodDl" attributes are not included.

5.6.2.57 Type L4sSupportInfo

Table 5.6.2.57-1: Definition of type L4sSupportInfo

Attribute name	Data type	Р	Cardinality	Description	Applicability
refPccRuleIds	array(string)	М		An array of PCC rule id references to the PCC rules associated with the ECN marking for L4S support information.	
notifType	L4sNotifType	M	1	Indicates whether the ECN marking for L4S for the indicated SDFs are "NOT_AVAILABLE" or "AVAILABLE" again.	

5.6.2.58 Void

5.6.2.59 Type SliceUsgCtrlInfo

Table 5.6.2.59-1: Definition of type SliceUsgCtrlInfo

Attribute name	Data type	Р	Cardinality	Description	Applicability		
pduSessInactivTimer	DurationSecRm	С		Represents the slice PDU Session inactivity timer value. (NOTE)			
NOTE: At least one of these attributes shall be present.							

5.6.2.60 Type BatOffsetInfoPcc

Table 5.6.2.60-1: Definition of type BatOffsetInfoPcc

Attribute name	Data type	Р	Cardinality	Description	Applicability
ranBatOffsetNotif	integer	М	1	Indicates the BAT offset of the arrival	
				time of the data burst in units of	
				milliseconds.	
adjPeriod	Uinteger	0	01	Contains the adjusted periodicity in	
				units of milliseconds of the data bursts	
				in reference to the external GM.	
refPccRuleIds	array(string)	M	1N	Identification of the PCC rules	
				associated with the BAT offset and the	
				optionally adjusted periodicity.	

5.6.3 Simple data types and enumerations

5.6.3.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

5.6.3.2 Simple data types

The simple data types defined in table 5.6.3.2-1 shall be supported. For additional simple data types see 3GPP TS 29.571 [11].

Table 5.6.3.2-1: Simple data types

Type Name	Type Definition	Description	Applicability
5GSmCause	Uinteger	Indicates the 5GSM cause code value as defined in clause 9.11.4.2 of 3GPP TS 24.501 [20].	RAN-NAS-Cause
EpsRanNasRelCau se	string	Indicates the RAN or NAS release cause code information in 3GPP-EPS access type or indicates the TWAN or untrusted WLAN release cause code information in Non-3GPP-EPS access type. It shall be coded as per the RAN/NAS Cause in clause 8.103 of 3GPP TS 29.274 [37], starting with Octet 5.	RAN-NAS-Cause
FlowDescription	string	Defines a packet filter for an IP flow. Refer to clause 5.4.2 of 3GPP TS 29.212 [23] for encoding.	
PacketFilterContent	string	Defines a packet filter for an IP flow. Refer to clause 5.3.54 of 3GPP TS 29.212 [23] for encoding.	
TsnPortNumber	Uinteger	Port number for the device side of the PDU session or for the NW-TT port.	TimeSensitiveNetwo rking
ApplicationDescript or	Bytes	Defines the OS Id and the OS application identifier for an ATSSS rule, where the OS Id is optional. It is a sequence of octets representing the traffic descriptor(s) of the ATSSS rule as Os Id, if applicable, and Os App Id as defined in table 6.1.3.2-1 of 3GPP TS 24.193 [43].	
UePolicyContainer	Bytes	Defines a UE policy delivery service message. Refer to Annex D.5 of 3GPP TS 24.501 [20] for encoding.	EpsUrsp
UrspEnforcementInf o	Bytes	Defines URSP rule Enforcement Information from the UE. Refer to URSP rule enforcement reports in 3GPP TS 24.501 [20], clause 9.11.4 for encoding.	URSPEnforcement

5.6.3.3 Enumeration: FlowDirection

Table 5.6.3.3-1: Enumeration FlowDirection

Enumeration value	Description	Applicability
DOWNLINK	The corresponding filter applies for traffic to the UE.	
UPLINK	The corresponding filter applies for traffic from the UE.	
BIDIRECTIONAL	The corresponding filter applies for traffic both to and from the UE.	
UNSPECIFIED	The corresponding filter applies for traffic to the UE (downlink), but has no specific direction declared. The service data flow detection shall apply the filter for uplink traffic as if the filter was bidirectional. The PCF shall not use the value UNSPECIFIED in filters created by the network in NW-initiated procedures. The PCF shall only include the value UNSPECIFIED in filters in UE-initiated procedures if the same value is received from the NF service consumer.	

5.6.3.4 Enumeration: ReportingLevel

Table 5.6.3.4-1: Enumeration ReportingLevel

Enumeration value	Description	Applicability
SER_ID_LEVEL	Indicates that the usage shall be reported on service id and rating group combination level.	
RAT_GR_LEVEL	Indicates that the usage shall be reported on rating group level.	
SPON_CON_LEVEL	Indicates that the usage shall be reported on sponsor identity and rating group combination level.	

5.6.3.5 Enumeration: MeteringMethod

Table 5.6.3.5-1: Enumeration MeteringMethod

Enumeration value	Description	Applicability
DURATION	Indicates that the duration of the service data flow traffic shall be metered.	
VOLUME	Indicates that volume of the service data flow traffic shall be metered.	
DURATION_VOLUME	Indicates that the duration and the volume of the service data flow traffic shall be metered.	
EVENT	Indicates that events of the service data flow traffic shall be metered.	

5.6.3.6 Enumeration: PolicyControlRequestTrigger

Table 5.6.3.6-1: Enumeration PolicyControlRequestTrigger

Enumeration value	Description	Applicability
PLMN_CH	PLMN Change.	Applicability
RES_MO_RE	A request for resource modification has been received by the NF	
	service consumer. (NOTE)	
AC_TY_CH	Access Type Change. It also indicates the addition or removal of	
	Access Type for MA PDU session.	
UE_IP_CH	UE IP address change. (NOTE)	
UE_MAC_CH	A new UE MAC address is detected or a used UE MAC address	
	is inactive for a specific period.	
AN_CH_COR	Access Network Charging Correlation Information.	
US_RE	The PDU Session or the Monitoring key specific resources	UMC
	consumed by a UE either reached the threshold or needs to be	
	reported for other reasons.	
APP_STA	The start of application traffic has been detected.	ADC
APP_STO	The stop of application traffic has been detected.	ADC
AN_INFO	Access Network Information report.	NetLoc
CM_SES_FAIL	Credit management session failure.	
PS_DA_OFF	The NF service consumer reports when the 3GPP PS Data Off	3GPP-PS-Data-Off
	status changes. (NOTE)	
DEF_QOS_CH	Default QoS Change. (NOTE)	
SE_AMBR_CH	Session-AMBR Change. (NOTE)	
QOS_NOTIF	The NF service consumer notify the PCF when receiving	
	notification from RAN that QoS targets of the QoS Flow cannot	
	be guaranteed or can be guaranteed.	
NO_CREDIT	Out of credit.	
REALLO_OF_CREDIT	Reallocation of credit	ReallocationOfCred
		it
PRA_CH	Change of UE presence in Presence Reporting Area.	PRA
SAREA_CH	Location Change with respect to the Serving Area.	
SCNN_CH	Location Change with respect to the Serving CN node.	
RE_TIMEOUT	Indicates the NF service consumer generated the request	
	because there has been a PCC revalidation timeout (i.e.	
	Enforced PCC rule request defined in table 6.1.3.51 of	
	3GPP TS 23.503 [6]).	
RES_RELEASE	Indicates that the NF service consumer can inform the PCF of	RAN-NAS-Cause
	the outcome of the release of resources for those rules that	
	require so.	
SUCC_RES_ALLO	Indicates that the NF service consumer shall inform the PCF of	
	the successful resource allocation for those rules that requires	
DAT TV OIL	SO.	
RAT_TY_CH	RAT type change.	
REF_QOS_IND_CH	Reflective QoS indication Change.	
NUM_OF_PACKET_FILTE	Indicates that the NF service consumer shall report the number	
R	of supported packet filter for signalled QoS rules. (NOTE) Only	
UE_STATUS_RESUME	applicable to the interworking scenario as defined in Annex B. Indicates that the UE's status is resumed. Only applicable to the	PolicyUpdateWhen
UE_STATUS_RESUME		
UE_TZ_CH	interworking scenario as defined in Annex B. UE Time Zone Change.	UESuspends
AUTH_PROF_CH	Indicates that the DN-AAA authorization profile index has	DN-Authorization
AUTI_FROF_CIT	changed. (NOTE)	DIN-Authorization
TSN_BRIDGE_INFO	Indicates the NF service consumer has detected information	TimeSensitiveNetw
TON_BRIDGE_INFO	about new TSC user plane node port(s), and/or new/updated	orking
	UMIC and/or PMIC(s).	onang
QOS_MONITORING	Indicates that the NF service consumer notifies the PCF of the	QosMonitoring
	QoS Monitoring information.	
SCELL_CH	Location Change with respect to the Serving Cell.	
USER_LOCATION_CH	Indicates that user location has changed, applicable to serving	AggregatedUELoc
	area change and serving cell change.	Changes
EPS_FALLBACK	EPS Fallback report is enabled in the NF service consumer. Only	EPSFallbackReport
	applicable to the interworking scenario as defined is Annex B.	
MA_PDU	Indicates that the NF service consumer notifies the PCF of the	ATSSS
	MA PDU session request. Only applicable to the interworking	
	scenario as defined in Annex B. (NOTE)	
5G_RG_JOIN	The 5G-RG has joined to an IP Multicast Group.	WWC
5G_RG_LEAVE	The 5G-RG has left an IP Multicast Group.	WWC

DDN_FAILURE	Indicates that the NF service consumer requests policies from PCF if it received an event subscription for DDN Failure event.	DDNEventPolicyControl
DDN_DELIVERY_STATUS	Indicates that the NF service consumer requests policies from PCF if it received an event subscription for DDN Delievery Status event.	DDNEventPolicyCo ntrol
GROUP_ID_LIST_CHG	UE Internal Group Identifier(s) has changed: the NF service consumer reports that UDM provided list of group Ids has changed. (NOTE)	GroupIdListChange
DDN_FAILURE_CANCELL ATION	Indicates that the event subscription for DDN Failure event is cancelled.	DDNEventPolicyCo ntrol2
DDN_DELIVERY_STATUS _CANCELLATION	Indicates that the event subscription for DDD STATUS is cancelled.	DDNEventPolicyCo ntrol2
VPLMN_QOS_CH	Indicates that the NF service consumer has detected the change of the QoS supported in the VPLMN, the change from the case where the QoS constraints are applicable to the case where the QoS constraints are not applicable (e.g. the UE moves back from the home routed to the non-roaming scenario) or vice versa. (NOTE)	VPLMN-QoS- Control
SUCC_QOS_UPDATE	Indicates that the NF service consumer notifies the PCF of the successful update of the QoS for MPS.	MPSforDTS
SAT_CATEGORY_CHG	Indicates that the SMF has detected a change between different satellite category, or non-satellite backhaul.	SatBackhaulCatego ryChg
PCF_UE_NOTIF_IND	Indicates the SMF has detected the AMF forwarded the PCF for the UE indication to receive/stop receiving notifications of SM Policy association established/terminated events and/or the UE binding information changes.	AMInfluence
	(NOTE)	
NWDAF_DATA_CHG	and/or associated Analytics IDs have changed. (NOTE)	EneNA
UE_POL_CONT_IND	Indicates that the NF service consumer has received a UE policy container from the UE or failure delivery report for UE policy container in EPC over a PDN connection. Only applicable to the interworking scenario as defined in Annex B. (NOTE)	EpsUrsp
URSP_ENFORCEMENT_IN FO	Indicates that the NF service consumer has detected a report of URSP rule enforcement information.	URSPEnforcement
HR_SBO_IND_CHG	Indicates the HR-SBO support indication has changed. (NOTE)	HR-SBO
L4S_SUPP	Indicates whether the ECN marking for L4S support is not available or available again in 5GS.	L4S
NET_SLICE_REPL	Indicates network slice replacement, i.e., a change between the initial S-NSSAI of the PDU Session and the Alternative S-NSSAI. (NOTE)	NetSliceRepl
BAT_OFFSET_INFO	Indicates that the NF service consumer has detected the information about the BAT offset and optionally adjusted periodicity.	EnTSCAC
UE_REACH_STATUS_CH		UEUnreachable
NOTE: The NF service cor	sumer always reports to the PCF.	

The PCF may provision the values of policy control request trigger which are not always reported by the NF service consumer as defined in clause 4.2.6.4.

When the NF service consumer detects the corresponding policy control request trigger(s), the NF service consumer shall report the detected trigger(s) to the PCF as defined in clause 4.2.4.1 with the additional information for different independent policy control request triggers as follows:

If the "PLMN_CH" is provisioned, when the NF service consumer detects a change of the serving network (a PLMN or an SNPN), the NF service consumer shall include the "PLMN_CH" within the "repPolicyCtrlReqTriggers" attribute and the current identifier of the serving network within the "servingNetwork" attribute.

NOTE 1: Handover between non-equivalent SNPNs, and between SNPN and PLMN is not supported. When the UE is operating in SNPN access mode, the trigger reports changes of equivalent SNPNs.

When the NF service consumer receives the resource modification request from the UE, the NF service consumer shall include the "RES_MO_RE" within the "repPolicyCtrlReqTriggers" attribute and the information for requesting the PCC rule as defined in clause 4.2.4.17.

If the "AC_TY_CH" is provisioned, when the NF service consumer detects a change of access type, the NF service consumer shall include the "AC_TY_CH" within the "repPolicyCtrlReqTriggers" attribute and the current access type within the "accessType" attribute. The RAT type encoded in the "ratType" attribute shall also be provided when applicable to the specific access type. Specific attributes for the EPC interworking case are described in Annex B. If the ATSSS feature is supported, when the NF service consumer detects an access is added or released for MA PDU session, the NF service consumer shall include the added Access Type or released Access type encoded as "accessType" attribute within the AdditionalAccessInfo data structure. The RAT type encoded in the "ratType" attribute shall also be provided within the AdditionalAccessInfo data structure when applicable to the added access type or released access type.

When the NF service consumer detects an IPv4 address and/or an IPv6 prefix is allocated or released, the NF service consumer shall include the "UE_IP_CH" within the "repPolicyCtrlReqTriggers" attribute and new allocated UE Ipv4 address within the "ipv4Address" attribute and/or the UE Ipv6 prefix within the "ipv6AddressPrefix" attribute or the released UE Ipv4 address within the "relIpv4Address" attribute and/or the UE Ipv6 prefix within the "relIpv6AddressPrefix" attribute. If the "MultiIpv6AddrPrefix" feature is supported, and if an additional allocated or released IPv6 prefix is detected, the NF service consumer shall include the new allocated UE Ipv6 prefix within the "addRelIpv6AddrPrefixes" attribute and the released UE Ipv6 prefix within the "addRelIpv6AddrPrefixes" attribute. If the "UnlimitedMultiIpv6Prefix" feature is supported, and if multiple allocated or released IPv6 prefixes are detected, the NF service consumer shall include the new allocated UE Ipv6 prefixes within the "multiIpv6Prefixes" attribute and the released UE Ipv6 prefixes within the "multiIpv6Prefixes" attribute and the released UE Ipv6 prefixes within the "multiIpv6Prefixes" attribute and the released UE Ipv6 prefixes within the "multiIpv6Prefixes" attribute.

When the NF service consumer detects a new UE MAC address or a used UE MAC address is not used any more, the NF service consumer shall include the "UE_MAC_CH" within the "repPolicyCtrlReqTriggers" attribute and new detected UE MAC address within the "ueMac" attribute or the not used UE MAC address within the "relUeMac" attribute.

If the "AN_CH_COR" is provisioned, when the NF service consumer is provisioned with the PCC rule as defined in clause 4.2.6.5.1, the NF service consumer shall notify the PCF of access network charging identifier associated with the PCC rules as defined in clause 4.2.4.13.

If the "US_RE" is provisioned, when the NF service consumer receives the usage report from the UPF, the NF service consumer shall notify the PCF of the accumulated usage as defined in clause 4.2.4.10. Applicable to functionality introduced with the UMC feature as described in clause 5.8.

If the "APP_STA" is provisioned, when the NF service consumer receives the application start report from the UPF, the NF service consumer shall notify the PCF of the application start report as defined in clause 4.2.4.6. Applicable to functionality introduced with the ADC feature as described in clause 5.8.

If the "APP_STO" is provisioned, when the NF service consumer receives the application stop report from the UPF, the NF service consumer shall notify the PCF of the application stop report as defined in clause 4.2.4.6. Applicable to functionality introduced with the ADC feature as described in clause 5.8.

If the "AN_INFO" is provisioned, when the NF service consumer receives the reported access network information from the access network, the NF service consumer shall notify the PCF of the access network information as defined in clause 4.2.4.9. Applicable to functionality introduced with the NetLoc feature as described in clause 5.8.

If the "CM_SES_FAIL" is provisioned, when the NF service consumer receives a detected transient/permanent failure from the CHF, the NF service consumer shall include the "CM_SES_FAIL" within the "repPolicyCtrlReqTriggers" attribute. If the failure does not apply to all PCC Rules, the affected PCC Rules are indicated within the "ruleReports" attribute, with the "ruleStatus" attribute set to value ACTIVE and the "failureCode" attribute set to the corresponding value as reported by the CHF; otherwise if the failure applies to the session, the "creditManageStatus" shall be set to the corresponding value as reported by the CHF.

If the "PS_DA_OFF" is provisioned, when the NF service consumer receives a change of 3GPP PS Data Off status from the UE, the NF service consumer shall notify the PCF as defined in clause 4.2.4.8. Applicable to functionality introduced with the 3GPP-PS-Data-Off feature as described in clause 5.8.

When the NF service consumer detects a change of subscribed default QoS, the NF service consumer shall include the "DEF_QOS_CH" within the "repPolicyCtrlReqTriggers" attribute and the new subscribed default QoS within the "subsDefQos" attribute.

When the NF service consumer detects a change of Session-AMBR, the NF service consumer shall include the "SE_AMBR_CH" within the "repPolicyCtrlReqTriggers" attribute and the new Session-AMBR within the "subsSessAmbr" attribute.

If the "QOS_NOTIF" is provisioned, when the NF service consumer receives a notification from access network that QoS targets of the QoS Flow cannot be guaranteed or can be guaranteed again, the NF service consumer shall send the notification as defined in clause 4.2.4.20.

If the "NO_CREDIT" is provisioned, when the NF service consumer detects the credit for the PCC rule(s) is no longer available, the NF service consumer shall include the "NO_CREDIT" within the "repPolicyCtrlReqTriggers" attribute, the termination action the NF service consumer applies to the PCC rules as instructed by the CHF within the "finUnitAct" attribute and the affected PCC rules within the "ruleReports" attribute.

When the "ReallocationOfCredit" feature is supported, if the "REALLO_OF_CREDIT" is provisioned, when the NF service consumer detects the credit for the PCC rule(s) is reallocated, the NF service consumer shall include the "REALLO_OF_CREDIT" within the "repPolicyCtrlReqTriggers" attribute and include the affected PCC rules for which credit has been reallocated after credit was no longer available and the "ruleStatus" attribute set to value ACTIVE within the "ruleReports" attribute.

If the "PRA_CH" is provisioned, to detect when the UE enters/leaves certain presence reporting areas, the NF service consumer is provisioned the presence reporting area information as defined in clause 4.2.6.5.6. When the NF service consumer receives the presence reporting area information from the serving node, the NF service consumer shall notify the PCF of the reported presence area information as defined in clause 4.2.4.16. This report includes reporting the initial status at the time the request for reports is initiated. Applicable to the functionality introduced by the PRA or ePRA feature as described in clause 5.8.

If the "SAREA_CH" is provisioned, when the NF service consumer detects a change of serving area (i.e. tracking area, or if the feature "2G3GIWK" is supported routing area), the NF service consumer shall include the "SAREA_CH" within the "repPolicyCtrlReqTriggers" attribute and the current TAI within the "userLocationInfo" attribute in either the "eutraLocation" or "nrLocation", or the current Routing Area within the "userLocationInfo" attribute in the "utraLocation" attribute when UTRAN access, or in the "geraLocation" attribute when GERAN access, as applicable. Non-3GPP access user location is reported in the "n3gaLocation" attribute when applicable. The attributes used in case of EPC interworking are described in Annex B.

If the "SCNN_CH" is provisioned, when the NF service consumer detects a change of serving Network Function (i.e. the AMF, ePDG, S-GW or if the feature "2G3GIWK" is supported SGSN), the NF service consumer shall include the "SCNN_CH" within the "repPolicyCtrlReqTriggers" attribute and the current serving Network Function in the "servNfId" attribute if available. When the serving Network Function is an AMF, the NF service consumer shall include the AMF Network Function Instance Identifier within the "servNfInstId" attribute and the Globally Unique AMF Identifier within the "guami" attribute. The attributes included in case of EPC interworking are described in Annex B.

NOTE 1: In the home-routed roaming case, if the AMF change is unknown to the H-SMF, then the AMF change is not reported.

If the "RE_TIMEOUT" is provisioned, when the NF service consumer is provisioned with the revalidation time by the PCF, the NF service consumer shall request the policy before the indicated revalidation time is reached as defined in clause 4.2.4.3.

If the "RES_RELEASE" is provisioned, when the NF service consumer receives the request of PCC rule removal as defined in clause 4.2.6.5.2, the NF service consumer shall report the outcome of resource release as defined in clause 4.2.4.12. Applicable to functionality introduced with the RAN-NAS-Cause feature as described in clause 5.8.

When "SUCC_RES_ALLO" is provisioned and PCC rules are provisioned according to clause 4.2.6.5.5, the NF service consumer shall inform the PCF of the successful resource allocation as defined in clause 4.2.4.14.

If the feature "2G3GIWK" is supported, and if the "RAI_CH" is provisioned, when the NF service consumer detects a change of routing area, the NF service consumer shall include the "RAI_CH" within the "repPolicyCtrlReqTriggers" attribute and the current RAI within the "userLocationInfo" attribute as described in Annex B.

If the "RAT_TY_CH" is provisioned, when the NF service consumer detects a change of the RAT type, the NF service consumer shall include the "RAT_TY_CH" within the "repPolicyCtrlReqTriggers" attribute and the current RAT type within the "ratType" attribute. For MA PDU session, the NF service consumer shall include the current RAT type at the SmPolicyUpdateContextData data type level or AdditionalAccessInfo data type level. If the RAT type is provided at the

SmPolicyUpdateContextData data type level, the NF service consumer shall also provide the associated access type within the SmPolicyUpdateContextData data structure.

If the "REF_QOS_IND_CH" is provisioned, when the NF service consumer receives a change of reflective QoS indication from the UE, the NF service consumer shall include the "REF_QOS_IND_CH" within the "repPolicyCtrlReqTriggers" attribute and the indication within the "refQosIndication" attribute.

When the NF service consumer receives the number of supported packet filter for signalled QoS rules for the PDU session from the UE during the PDU Session Modification procedure after the first inter-system change from EPS to 5GS for a PDU Session established in EPS and transferred from EPS with N26 interface, the NF service consumer shall include the "NUM_OF_PACKET_FILTER" within the "repPolicyCtrlReqTriggers" attribute and the number of supported packet filter for signalled QoS rules within the "numOfPackFilter" attribute. Only applicable to the interworking scenario as defined in Annex B.

If the "UE_STATUS_RESUME" is provisioned, when the NF service consumer detected the UE's status is resumed from suspend state, the NF service consumer shall inform the PCF of the UE status including the "UE_STATUS_RESUME" within "repPolicyCtrlReqTriggers" attribute. The PCF shall after this update the NF service consumer with PCC Rules or session rules if necessary. Applicable to functionality introduced with the PolicyUpdateWhenUESuspends feature as described in clause 5.8.

If the "UE_TZ_CH" is provisioned, when the NF service consumer detects a change of the UE Time Zone, the NF service consumer shall include the "UE_TZ_CH" within the "repPolicyCtrlReqTriggers" attribute and the current UE Time Zone within the "ueTimeZone" attribute.

If the "DN-Authorization" feature is supported, when the NF service consumer detects a change of DN-AAA authorization profile index, the NF service consumer shall include the "AUTH_PROF_CH" within the "repPolicyCtrlReqTriggers" attribute and the new DN-AAA authorization profile index within the "authProfIndex" attribute.

If the "TimeSensitiveNetworking" or "TimeSensitiveCommunication" feature is supported and "TSN_BRIDGE_INFO" is provisioned, when the NF service consumer detects:

- there is information about new TSC user plane node port(s), e.g. a new manageable Ethernet port, the NF service consumer shall include the "TSN_BRIDGE_INFO" within the "repPolicyCtrlReqTriggers" attribute and the updated TSC user plane node information within the "tsnBridgeInfo" attribute; and/or
- the NF service consumer detects a UMIC or PMIC, the NF service consumer shall include the
 "TSN_BRIDGE_INFO" within the "repPolicyCtrlReqTriggers" attribute and the UMIC, if available, within the
 "tsnBridgeManCont" attribute, and/or the PMIC(s), if available, within the "tsnPortManContDstt" and the
 "tsnPortManContNwtts" attributes.
- NOTE 2: When the NF service consumer detects updated Port Management Information of the NW-TT ports, the NF service consumer includes the PMIC within the "tsnPortManContNwtts" attribute of SmPolicyUpdateContextData data type.

If the "QoSMonitoring" feature and/or the "EnQoSMon" is supported and if the "QOS_MONITORING" is provisioned, upon receiving the QoS Monitoring report from the UPF, the NF service consumer shall send the QoS monitoring report(s) for the concerned PCC rules to the PCF as defined in clause 4.2.4.24.

If the "SCELL_CH" is provisioned, when the NF service consumer detects a change of serving cell, the NF service consumer shall include the "SCELL_CH" within the "repPolicyCtrlReqTriggers" attribute and the current cell Id within the "userLocationInfo" attribute either in the "eutraLocation" attribute when EPC/E-UTRAN access or "nrLocation" attribute when NR access or "geraLocation" attribute when GERAN access or "utraLocation" attribute when UTRAN access, as applicable.

NOTE 3: Location change of serving cell can increase signalling load on multiple interfaces. Hence, it is recommended that any such serving cell changes event trigger subscription is only applied for a limited number of subscribers.

If the "AggregatedUELocChanges" feature is supported and the "USER_LOCATION_CH" is provisioned, when the NF service consumer detects a change of serving cell and/or a change of serving area (i.e. tracking area), the NF service consumer shall include the "USER_LOCATION_CH" within the "repPolicyCtrlReqTriggers" attribute and the current serving area and/or cell Id within the "userLocationInfo" attribute in the "eutraLocation" attribute or "nrLocation" attribute or "geraLocation" attribute or "utraLocation" attribute, as applicable.

NOTE 4: The access network can be configured to report location changes only when transmission resources are established in the radio access network.

If the "EPSFallbackReport" feature is supported and the "EPS_FALLBACK" is provisioned and there is a PCC rule installed that required the reporting, when the NF service consumer receives a PDU session modification response indicating the rejection of the establishment of the QoS flow with 5QI=1, the NF service consumer shall notify the PCF of EPS fallback as defined in clause B.3.4.6.

When the NF service consumer receives the MA PDU Request Indication or MA PDU Network-Upgrade Allowed Indication and ATSSS Capability from the UE during the PDU Session Modification procedure after the first intersystem change from EPS to 5GS for a PDU Session established in EPS and transferred from EPS with N26 interface, the NF service consumer shall include the "MA_PDU" within the "repPolicyCtrlReqTriggers" attribute, the MA PDU session Indication in the "maPduInd" attribute, the ATSSS capability of the MA PDU session within the "atsssCapab" attribute. Only applicable to the interworking scenario as defined in Annex B.

If the "WWC" feature is supported and "5G_RG_JOIN" is provisioned and when the NF service consumer detects a 5G-RG has joined to an IP Multicast Group, the NF service consumer shall include the "5G_RG_JOIN" within the "repPolicyCtrlReqTriggers" attribute and the IP multicast addressing information within the "mulAddrInfos" attribute.

If the "WWC" feature is supported and "5G_RG_LEAVE" is provisioned and when the NF service consumer detects a 5G-RG has left an IP Multicast Group, the NF service consumer shall include the "5G_RG_LEAVE" within the "repPolicyCtrlReqTriggers" attribute and the IP multicast addressing information within the "mulAddrInfos" attribute.

If "DDNEventPolicyControl" feature is supported, and if "DDN_FAILURE" is provisioned, when the NF service consumer receives an event subscription for DDN Failure event including the traffic descriptors, the NF service consumer shall include the "DDN_FAILURE" within the "repPolicyCtrlReqTriggers" attribute and traffic descriptor(s) within the "trafficDescriptors" attribute.

If "DDNEventPolicyControl" feature is supported, and if "DDN_DELIVERY_STATUS" is provisioned, when the NF service consumer receives an event subscription for DDD Status event including the traffic descriptors, the NF service consumer shall include the "DDN_DELIVERY_STATUS" within the "repPolicyCtrlReqTriggers" attribute and traffic descriptor(s) within the "trafficDescriptors" attribute and the requested type(s) of notifications (notifications about downlink packets being buffered, and/or discarded).

If "GroupIdListChange" feature is supported, when the SMF receives the updated Internal Group Identifier(s) from the UDM, the SMF shall include the "GROUP_ID_LIST_CHG" within the "repPolicyCtrlReqTriggers" attribute and the Internal Group Identifier(s) of the served UE within the "interGrpIds" attribute.

If "DDNEventPolicyControl2" feature is supported, and if "DDN_FAILURE_CANCELLATION" is provisioned, when the SMF receives a cancellation of event subscription for DDN Failure event, the SMF shall include the "DDN_FAILURE_CANCELLATION" within the "repPolicyCtrlReqTriggers" attribute and the PCC rule identifier of the PCC rule which is used for traffic detection of DDN failure event within the "pccRuleId" attribute.

If "DDNEventPolicyControl2" feature is supported, and if "DDN_DELIVERY_STATUS_CANCELLATION" is provisioned, when the SMF receives a cancellation of event subscription for DDD Status event, the SMF shall include the "DDN_DELIVERY_STATUS_CANCELLATION" within the "repPolicyCtrlReqTriggers" attribute and the PCC rule identifier of the PCC rule which is used for traffic detection of DDD status event within the "pccRuleId" attribute.

When the "VPLMN-QoS-Control" feature is supported and if the NF service consumer receives a new QoS value supported in the VPLMN, the NF service consumer shall include the "VPLMN_QOS_CH" within the "repPolicyCtrlReqTriggers" attribute and the received QoS constraints within the "vplmnQos" attribute; if the NF service consumer detects that the UE moves from a VPLMN with QoS constraints to the HPLMN or to a VPLMN without QoS constraints, the NF service consumer shall include the "VPLMN_QOS_CH" within the "repPolicyCtrlReqTriggers" attribute and the "vplmnQosNotApp" attribute set to true.

If the "MPSforDTS" feature is supported, and if "SUCC_QOS_UPDATE" is provisioned, when the resources for the MPS for DTS invocation/revocation are successfully allocated for MPS for DTS, the NF service consumer shall include the "SUCC_QOS_UPDATE" within the "repPolicyCtrlReqTriggers" attribute.

If "SatBackhaulCategoryChg" is supported, and if "SAT_CATEGORY_CHG" is provisioned, the NF service consumer notifies the PCF when there is a change of the backhaul which is used for the PDU session between different satellite backhaul categories or between a satellite backhaul and a non-satellite backhaul. When the "EnSatBackhaulCatChg" feature is supported, the different dynamic satellite backhaul categories may also be reported. The NF service consumer shall include the satellite backhaul category or dynamic satellite backhaul category or non-satellite backhaul within the

"satBackhaulCategory" attribute together with the "SAT_CATEGORY_CHG" policy control request trigger within the "repPolicyCtrlReqTriggers" attribute.

NOTE 5: Only a single backhaul category can be indicated.

If the "AMInfluence" feature is supported, the NF service consumer notifies the PCF about

- the PCF for the UE request to be notified of PDU session established/terminated events by forwarding within the "pcfUeInfo" attribute, the received PCF for the UE callback URI within the "callbackUri" attribute and, if received, SBA binding information within the "bindingInfo" attribute, together with the "PCF_UE_NOTIF_IND" policy control request trigger within the "repPolicyCtrlReqTriggers" attribute;
- the PCF for the UE request to stop being notified about the PDU session established/terminated events by sending the "pcfUeInfo" attribute set to NULL together with the "PCF_UE_NOTIF_IND" policy control request trigger within the "repPolicyCtrlReqTriggers" attribute; or
- the PCF for the UE binding information changes, by forwarding within the "pcfUeInfo" attribute the received updated binding information together with the "PCF_UE_NOTIF_IND" policy control request trigger within the "repPolicyCtrlReqTriggers" attribute.

If "EneNA" feature is supported, the NF service consumer notifies the PCF when there is a change in the list of NWDAF Instance IDs used for the PDU Session and/or associated Analytics IDs. The NF service consumer shall include within the "nwdafDatas" attribute the list of NWDAF instance IDs used for the PDU Session within the "nwdafInstanceId" attribute and their associated Analytic ID(s) within the "nwdafEvents" attribute, and the "NWDAF_DATA_CHG" within the "repPolicyCtrlReqTriggers" attribute.

If the "EpsUrsp" feature is supported, when the NF service consumer receives a UE policy container from the UE in EPC over a PDN connection, the NF service consumer shall include the "UE_POL_CONT_IND" within the "repPolicyCtrlReqTriggers" attribute, and the received UE policy container within the "uePolCont" attribute or the received failure delivery report within the "uePolFailReport" attribute. Only applicable to the interworking scenario as defined in Annex B.

If the "URSPEnforcement" feature is supported and "URSP_ENFORCEMENT_INFO" is provisioned, when the NF service consumer detects the UE includes URSP rule enforcement information in the PDU session modification request, the NF service consumer shall include the "URSP_ENFORCEMENT_INFO" within the "repPolicyCtrlReqTriggers" attribute and shall forward the received information from the UE within the "urspEnfInfo" attribute. In this case, the NF service consumer shall also include, if they were not previously provided, the SSC mode within the "sscMode" attribute, the UE requested DNN (if available and different from the selected DNN) within the "ueReqDnn" attribute, and the UE requested PDU session Type (if available and different from the selected PDU session Type) within the "ueReqPduSessionType" attribute.

If "HR-SBO" feature is supported, the NF service consumer notifies the PCF when the HR-SBO support indication has changed. The NF service consumer shall include the "hrsboInd" attribute and set it to "true" if the HR-SBO is supported, otherwise set it to "false", and the "HR_SBO_IND_CHG" within the "repPolicyCtrlReqTriggers" attribute.

When the "L4S" feature is supported and the "L4S_SUPP" is provisioned, when the PCC rules are provisioned with the explicit indication of ECN marking for L4S according to clause 4.2.6.21.3, the NF service consumer shall inform the PCF of the unavailability or availability again in 5GS for ECN marking for L4S support as defined in clause 4.2.6.2.21.

If "NetSliceRepl" feature is supported, the NF service consumer notifies the PCF about network slice replacement, i.e., when there is a change between the initial S-NSSAI of the PDU Session and the Alternative S-NSSAI by including the "NET_SLICE_REPL" PCRT within the "repPolicyCtrlReqTriggers" attribute. When the NF service consumer reports a change from the initial S-NSSAI of the PDU Session to the Alternative S-NSSAI, it shall additionally include the Alternative S-NSSAI within the "altSliceInfo" attribute.

If "EnTSCAC" feature is supported, and if "BAT_OFFSET_INFO" is provisioned, when the SMF receives the notification on BAT offset and optionally adjusted periodicity, the SMF shall include the "BAT_OFFSET_INFO" within the "repPolicyCtrlReqTriggers" attribute and the BAT offset and optionally adjusted periodicity within the "batOffsetInfo" attribute.

If the "UEUnreachable" feature is supported and the "UE_REACH_STATUS_CH" PCRT is provisioned, when the AMF informs the SMF that the reachability status of the UE has changed (see 3GPP TS 29.518 [36]), the NF service consumer shall include the "UE_REACH_STATUS_CH" PCRT within the "repPolicyCtrlReqTriggers" attribute and the UE reachability status information within the "ueReachStatus" attribute. When the received "ueReachStatus" is set

to "UNREACHABLE", the SMF may also include the "retryAfter" attribute as received from the AMF. The PCF should not attempt the installation, re-installation or modification of PCC rules until the timer indicated in the "retryAfter" attribute expires or the "UE_REACH_STATUS_CH" PCRT is received together with the "ueReachStatus" attribute set to "REACHABLE".

5.6.3.7 Enumeration: RequestedRuleDataType

Table 5.6.3.7-1: Enumeration RequestedRuleDataType

Enumeration value	Description	Applicability
CH_ID	Indicates that the requested rule data is the charging identifier.	
MS_TIME_ZONE	Indicates that the requested access network info type is the UE's timezone. (NOTE)	
USER_LOC_INFO	Indicates that the requested access network info type is the UE's location. (NOTE)	
RES_RELEASE	Indicates that the requested rule data is the result of the release of resource.	
SUCC_RES_ALLO	Indicates that the requested rule data is the successful resource allocation.	
EPS_FALLBACK	Indicates that the requested rule data is the report of QoS flow rejection due to EPS fallback.	EPSFallbackReport
NOTE: The requested rule data sh	all also be reported at QoS flow termination and PDU s	ession termination.

5.6.3.8 Enumeration: RuleStatus

Table 5.6.3.8-1: Enumeration RuleStatus

Enumeration value	Description	Applicability
ACTIVE	Indicates that the PCC rule(s) are successfully installed (for those provisioned from the PCF) or activated (for those predefined in the SMF), or that the session rule(s) are successfully installed.	
INACTIVE	Indicates that the PCC rule(s) are removed (for those provisioned from the PCF) or inactive (for those pre-defined in the SMF) or that the session rule(s) are removed.	

5.6.3.9 Enumeration: FailureCode

Table 5.6.3.9-1: Enumeration FailureCode

UNK_RULE_ID Indicates that the pre-provisioned PCC rule could not be successfully activated because the provided PCC rule identifier is unknown to the NF service consumer. RA. GR. ERR Indicates that the PCC rule could not be successfully installed or enforced because the Rating Group specified within the Charging Data policy decision to which the PCC rule refers is unknown or invalid. SER_ID_ERR Indicates that the PCC rule could not be successfully installed or enforced because the Service Identifier specified within the Charging Data policy decision to which the PCC rule refers is invalid, unknown or not applicable to the service being charged. NF_MAL Indicates that the PCC rule could not be successfully installed for those provisioned from the PCF, activated (for those pre-defined in the SMF) or enforced (for those aready successfully installed) due to SMF/UPF malfunction. RES LIM Indicates that the PCC rule could not be successfully installed (for those provisioned from the PCF), activated (for those pre-defined in the SMF) or enforced (for those already successfully installed) due to a limitation of resources at the SMF/UPF. MAX_NR_Qos_FLOW (NOTE) MAX_NR_Qos_FLOW MISS_FLOW_INFO Indicates that the PCC rule could not be successfully installed (for those provisioned for the associated PDU session. MISS_FLOW_INFO Indicates that the PCC rule could not be successfully installed (for those provisioned from the PCF) or enforced (for those already successfully installed of these provisioned from the PCF) or enforced (for those already successfully installed of these provisioned from the PCF) or enforced (for those already successfully installed of these provisioned from the PCF) or enforced (for those already successfully installed or maintained since the associated QoS flow was released. UNSUCC_OOS_VAL Initiates that the PCC rule could not be successfully installed or maintained since the associated QoS flow was released. UNSUCC_OOS_VAL Initiates that the PCC rule could not be successfully insta	Enumeration value	Description	Applicability
Indicates that the PCC rule could not be successfully installed or enforced because the Rating Group specified within the Charging Data policy decision to which the PCC rule refers is unknown or invalid. SER_ID_ERR Indicates that the PCC rule could not be successfully installed or enforced because the Service Identifier specified within the Charging Data policy decision to which the PCC rule refers is invalid, unknown or not applicable to the service being charged. NF_MAL Indicates that the PCC rule could not be successfully installed for those provisioned from the PCD, activated (for those pre-defined in the SMF) or enforced (for those already successfully installed) due to SMF/IPF malfunction. RES_LIM Indicates that the PCC rule could not be successfully installed (for those provisioned from the PCD, activated (for those pre-defined in the SMF) or enforced (for those already successfully installed) due to a limitation of resources at the SMF/IPF. MAX_NR_QoS_FLOW Indicates that the PCC rule could not be successfully installed (for those provisioned from the PCD, activated (for those pre-defined in the SMF) or enforced (for those already successfully installed) due to a limitation of resources at the SMF/IPF. MISS_FLOW_INFO Indicates that the PCC rule could not be successfully installed (for those provisioned from the PCD, activated (for those pre-defined in the SMF) or enforced (for those already successfully installed) due to the fact that the maximum number of QoS flows has been reached for the associated PDU session. Indicates that the PCC rule could not be successfully installed (for those provisioned from the PCD or enforced (for those already successfully installed or maintained since the associated QoS flow associated PDU session). Indicates that the PCC rule could not be successfully installed or maintained since the associated QoS flow was related to the definition of the provided IP address(es) or Ipv6 prefixed or the network (e.g. the provided IP address(es) or Ipv6 prefixed or the netwo	UNK_RULE_ID		
RA_GR_ERR Indicates that the PCC rule could not be successfully installed or enforced because the Rating Group specified within the Charging Data policy decision to which the PCC rule refers is unknown or invalid. SER_ID_ERR Indicates that the PCC rule could not be successfully installed or enforced because the Service Identifier specified within the Charging Data policy decision to which the PCC rule refers is invalid, unknown or not applicable to the service being charged. NF_MAL Indicates that the PCC rule could not be successfully installed (for those provisioned from the PCF), activated (for those pre-defined in the SMF) or enforced (for those already successfully installed) due to SMF/UPF maffunction. RES_LIM Indicates that the PCC rule could not be successfully installed (for those provisioned from the PCF), activated (for those pre-defined in the SMF) or enforced (for those already successfully installed) due to a limitation of resources at the SMF/UPF. MAX_NR_Qos_FLOW Indicates that the PCC rule could not be successfully installed (for those provisioned from the PCF), activated (for those pre-defined in the SMF) or enforced (for those already successfully installed) due to the fact that the maximum unmber of Qos flows has been reached for the associated PDU session. MISS_FLOW_INFO Indicates that the PCC rule could not be successfully installed (for those provisioned from the PCF) activated (for those pre-defined in the SMF) or enforced (for those already successfully installed) due to the fact that the maximum unmber of Qos flows has been reached for the associated PDU session. MISS_FLOW_INFO Indicates that the PCC rule could not be successfully installed or maintained since the associated Qos flow was released. UNSUCC_QOS_VAL In its value is used to: - indicate that Qos validation has failed; or - indicates that the PCC rule could not be successfully installed or modified at the NF service consumer because the provided flow indicates that the PCC rule could not be successfully installed or en			
enforced because the Rating Group specified within the Charging Data policy decision to which the PCC rule refers is unknown or invalid. SER_ID_ERR Indicates that the PCC rule could not be successfully installed or enforced because the Service Identifier specified within the Charging Data policy decision to which the PCC rule refers is invalid, unknown or not applicable to the service being charged. NF_MAL Indicates that the PCC rule could not be successfully installed (for those provisioned from the PCF), activated (for those pre-defined in the SMF) or enforced (for those already successfully installed) due to a limitation of resources at the SMF/UPF. MAX_NR_QoS_FLOW (NOTE) MAX_NR_QoS_FLOW Indicates that the PCC rule could not be successfully installed (for those provisioned from the PCF), activated (for those pre-defined in the SMF) or enforced (for those already successfully installed) due to the fact that the maximum number of QoS flows has been reached for the associated PUS ession. MISS_FLOW_INFO Indicates that the PCC rule could not be successfully installed (for those provisioned from the PCF) or enforced (for those pready successfully installed) because neither the "fourthfors" attribute nor the "appld" attribute is specified by the PCF within the PCC rule entry of the "pocRules" attribute during the first PCC rule entry of the "pocRules" attribute during the first PCC rule entry of the "pocRules" attribute during the first PCC rule entry of the "pocRules" attribute during the first PCC rule entry of the "pocRules" attribute during the first PCC rule entry of the "pocRules" attribute or nordified at the NF service c			
Data policy decision to which the PCC rule refers is unknown or invalid. SER_ID_ERR Indicates that the PCC rule could not be successfully installed or enforced because the Service Identifier specified within the Charging Data policy decision to which the PCC rule refers is invalid, unknown or not applicable to the service being charged. NF_MAL Indicates that the PCC rule could not be successfully installed (for those provisioned from the PCF), activated (for those provisioned from the PCF) or enforced (for those already successfully installed) due to the fact that the maximum number of 20s flows have been reached for the associated PDU session. MISS_FLOW_INFO Indicates that the PCC rule could not be successfully installed (for those provisioned from the PCF) or enforced (for those already successfully installed) for the associated PDU session. RES_ALLO_FAIL Indicates that the PCC rule could not be successfully installed or maintained since the associated QoS flow establishment/modification failed or the associated QoS flow was released. UNSUCC QOS_VAL In Indicates that the PCC rule could not be successfully installed or modified at the NF service consumer because the provided flow information is not supported by the network (e.g., the provided flow	RA_GR_ERR		
SER_ID_ERR Invalid. Invalid. Indicates that the PCC rule could not be successfully installed or enforced because the Service Identifier specified within the Charging Data policy decision to which the PCC rule refers is invalid, unknown or not applicable to the service being charged. NF_MAL Indicates that the PCC rule could not be successfully installed (for those provisioned from the PCF), activated (for those provisioned from the PCF), activated (for those pre-defined in the SMF) or enforced (for those already successfully installed) due to SMF/UPF malfunction. RES_LIM Indicates that the PCC rule could not be successfully installed (for those provisioned from the PCF), activated (for those pre-defined in the SMF) or enforced (for those already successfully installed) due to a limitation of resources at the SMF/UPF. MAX_NR_QOS_FLOW MAX_NR_QOS_FLOW (NOTE) In the SMF) or enforced (for those already successfully installed (for those provisioned from the PCF), activated (for those pre-defined in the SMF) or enforced (for those already successfully installed) due to the fact that the maximum number of QoS flows has been reached for the associated PUS ession. MISS_FLOW_INFO Indicates that the PCC rule could not be successfully installed (for those provisioned from the PCF) or enforced (for those already successfully installed) because neither the "flowInfos" attribute nor the "appd" attribute is specified by the PCF within the PCC rule entry of the "pocRules" attribute during the first PCC rule entry of the "pocRules" attribute during the first PCC rule entry of the "pocRules" attribute during the first PCC rule entry of the "pocRules" attribute during the first PCC rule entry of the "pocRules" attribute during the first PCC rule entry of the "pocRules" attribute during the first PCC rule entry of the "pocRules" attribute during the first PCC rule entry of the "pocRules" attribute during the first PCC rule entry of the "pocRules" attribute or indicates that the PCC rule could not be successfully installe			
Indicates that the PCC rule could not be successfully installed or enforced because the Service Identifier specified within the Charging Data policy decision to which the PCC rule refers is invalid. Junknown or not applicable to the service being charged. was not reachable. CM_END_USER_SER_D Indicates that the charging system denied the service request due to service restrictions (e.g. terminate rating group) or limitations related to the end-user, e.g. the end-user's account could not			
CM_END_USER_SER_D ENIED Indicates that the charging system denied the service request due to service restrictions (e.g. terminate rating group) or limitations related to the end-user, e.g. the end-user's account could not			
ENIED to service restrictions (e.g. terminate rating group) or limitations related to the end-user, e.g. the end-user's account could not	CM_END_USER SER D		
related to the end-user, e.g. the end-user's account could not			
cover the requested service.			
l l		cover the requested service.	

CM_CREDIT_CON_NOT_ APP	Indicates that the charging system determined that the service can be granted to the end user but no further credit control is needed for the service (e.g. service is free of charge or is treated via offline charging).	
CM_AUTH_REJ	Indicates that the charging system denied the service request in order to terminate the service for which credit is requested.	
CM_USER_UNK	Indicates that the specified end user could not be found in the charging system.	
CM_RAT_FAILED	Indicates that the charging system cannot rate the service request due to insufficient rating inputs, incorrect combination of inputs or due to an attribute or an attribute value that is not recognized or supported in the rating.	
UE_STA_SUSP	Indicates that the UE is in suspend state. Only applicable to the interworking scenario, as defined in Annex B.	PolicyUpdateWhen UESuspends
UNKNOWN_REF_ID	Indicates that the PCC rule could not be successfully installed/modified because the referenced identifier to a Policy Decision Data or to a Condition Data is unknown to the NF service consumer.	
INCORRECT_COND_DAT A	Indicates that the PCC rule could not be successfully installed/modified because the referenced Condition data are incorrect (e.g. the "deactivationTime" and the "activationTime" included in the referenced ConditionData contain the same time value).	
REF_ID_COLLISION	Indicates that the PCC rule could not be successfully installed/modified because a Policy Decision referenced within the PCC rule is also referenced by a session rule (e.g. a session rule and this PCC rule refer to the same Usage Monitoring decision data).	
TRAFFIC_STEERING_ER ROR	This value is used to indicate that: - the enforcement of the steering of traffic to the N6-LAN or 5G-LAN failed; or - the dynamic PCC rule could not be successfully installed/modified at the NF service consumer because e.g. there are invalid traffic steering policy identifier(s) within the provided Traffic Control Data policy decision to which the PCC rule refers. Applicable when the functionality introduced with the TSC feature	
DNAI_STEERING_ERRO	described in clause 5.8 applies. This value is used to indicate that: the enforcement of the steering of traffic to the indicated DNAI failed; or the dynamic PCC rule could not be successfully installed/modified at the NF service consumer because there is invalid route information for a DNAI(s) (e.g. routing profile id is not configured) within the provided Traffic Control Data policy decision to which the PCC rule refers. Applicable when the functionality introduced with the TSC feature described in clause 5.8 applies.	
AN_GW_FAILED	Indicates that the AN-Gateway has failed and that the PCF should refrain from sending policy decisions to the SMF until it is informed that the S-GW has been recovered. This value shall not be used if the SM Policy association modification procedure is initiated for session rule removal only.	SGWRest
MAX_NR_PACKET_FILTE RS_EXCEEDED	This value is used to indicate that the PCC rule could not be successfully installed, modified or enforced at the NF service consumer because the number of supported packet filters for signalled QoS rules for the PDU session has been reached.	
PACKET_FILTER_TFT_A LLOCATION_EXCEEDED	Indicates that the PCC rule is removed at 5GS to EPS mobility because TFT allocation was not possible since the number of active packet filters in the EPC bearer is exceeded.	PackFiltAllocPreced ence
MUTE_CHG_NOT_ALLO WED	Indicates that the PCC rule could not be successfully modified because the mute condition for application detection report cannot be changed. Applicable when the functionality introduced with the ADC feature described in clause 5.8 applies.	
"UPPER_WITH_U	value does not follow the related naming convention (i.e. JNDERSCORE") defined in clause 5.1.4 of 3GPP TS 29.501 [6]. This s currently defined in this specification for backward compatibility contributions.	

5.6.3.10 Enumeration: AfSigProtocol

Table 5.6.3.10-1: Enumeration AfSigProtocol

Enumeration value	Description	Applicability
NO_INFORMATION	Indicate that no information about the AF signalling protocol is being provided. This is the default value.	ProvAFsignalFlow
SIP	Indicate that the signalling protocol is Session Initiation Protocol.	ProvAFsignalFlow

5.6.3.11 Enumeration: RuleOperation

Table 5.6.3.11-1: Enumeration RuleOperation

Enumeration value	Description	Applicability
CREATE_PCC_RULE	Indicates to create a new PCC rule to reserve the resource requested by the UE.	
DELETE_PCC_RULE	Indicates to delete a PCC rule corresponding to reserve the resource requested by the UE.	
MODIFY_PCC_RULE_AND_ADD_PACKET _FILTERS	Indicates to modify the PCC rule by adding new packet filter(s).	
MODIFY_ PCC_RULE_AND_REPLACE_PACKET_FIL TERS (NOTE)	Indicates to modify the PCC rule by replacing the existing packet filter(s).	
MODIFY_ PCC_RULE_AND_DELETE_PACKET_FILT ERS (NOTE)	Indicates to modify the PCC rule by deleting the existing packet filter(s).	
MODIFY_PCC_RULE_WITHOUT_MODIFY _PACKET_FILTERS	Indicates to modify the PCC rule by modifying the QoS of the PCC rule.	
NOTE: The enumeration value does not follow the related naming convention (i.e. "UPPER_WITH_UNDERSCORE") defined in clause 5.1.4 of 3GPP TS 29.501 [5]. There is a space between the "MODIFY_" part and the "PCC" part. This enumeration value is however kept as currently defined in this specification for backward compatibility considerations.		

5.6.3.12 Enumeration: RedirectAddressType

Table 5.6.3.12-1: Enumeration RedirectAddressType

Enumeration value	Description	Applicability
IPV4_ADDR	Indicates that the address type is in the form of "dotted-decimal" IPv4 address.	
IPV6_ADDR	Indicates that the address type is in the form of IPv6 address.	
URL	Indicates that the address type is in the form of Uniform Resource Locator.	
SIP_URI	Indicates that the address type is in the form of SIP Uniform Resource Identifier.	

5.6.3.13 Enumeration: QosFlowUsage

Table 5.6.3.13-1: Enumeration QosFlowUsage

Enumeration value	Description	Applicability
GENERAL	Indicates no specific QoS flow usage information is available.	
IMS SIG	Indicates that the QoS flow is used for IMS signalling only.	

5.6.3.14 Enumeration: FailureCause

Table 5.6.3.14-1: Enumeration FailureCause

Enumeration value	Description	Applicability
PCC_RULE_EVENT	Some of the PCC rules provisioned by the PCF in the request cannot be installed/activated. It is used to inform the PCF that the request failed and should not be attempted again.	
PCC_QOS_FLOW_EVENT	For some reason some of the PCC rules provisioned by the PCF in the request cannot be enforced or modified successfully in a network initiated procedure. It is used to inform the PCF that the request could not be satisfied at the time it was received, but may be able to satisfy the request in the future.	
RULE_PERMANENT_ERR OR	The HTTP request is rejected because some of the PCC and/or session rules provisioned by the PCF in the request cannot be installed/activated. It is used to inform the PCF that the request failed, and should not be attempted again.	SessionRuleError Handling
RULE_TEMPORARY_ERR OR	The HTTP request is rejected because for some reason some of the PCC and/or session rules provisioned by the PCF in the request cannot be enforced or modified successfully in a network initiated procedure. It is used to inform the PCF that the request could not be satisfied at the time it was received, but may be able to satisfy the request in the future.	SessionRuleError Handling
POL_DEC_ERROR	Some of the policy decisions (including data that is different than PCC/session rule related data) provided by the PCF in the request cannot be provisioned in the NF service consumer.	PolicyDecisionErr orHandling

5.6.3.15 Enumeration: FlowDirectionRm

This data type is defined in the same way as the "FlowDirection" data type, but also allows null value (specified as "NullValue" data type).

5.6.3.16 Enumeration: CreditManagementStatus

Table 5.6.3.16-1: Enumeration CreditManagementStatus

Enumeration value	Description	Applicability
END_USER_SER_DENIED	Indicates that the charging system denied the service request due	
	to service restrictions (e.g. terminate rating group) or limitations	
	related to the end-user, for example the end-user's account could	
	not cover the requested service.	
CREDIT_CTRL_NOT_APP	Indicates that the charging system determined that the service can	
	be granted to the end user but no further credit control is needed	
	for the service (e.g. service is free of charge or is treated for offline	
	charging).	
AUTH_REJECTED	Indicates that the charging system denied the service request in	
	order to terminate the service for which credit is requested.	
USER_UNKNOWN	Indicates that the specified end user could not be found in the	
	charging system.	
RATING_FAILED	Indicates that the charging system cannot rate the service request	
	due to insufficient rating input, incorrect attribute combination or	
	an attribute value that is not recognized or supported in rating.	

5.6.3.17 Enumeration: SessionRuleFailureCode

Table 5.6.3.17-1: Enumeration SessionRuleFailureCode

Enumeration value	Description	Applicability
NF_MAL	Indicates that the session rule could not be successfully installed)	
	or enforced (for those already successfully installed) due to	
DEC 1114	SMF/UPF malfunction.	
RES_LIM	Indicates that the session rule could not be successfully installed	
	or enforced (for those already successfully installed) due to a limitation of resources at the SMF/UPF.	
SESSION_RESOURCE_A	Indicates the session rule could not be successfully enforced due	
LLOCATION_FAILURE	to failure during the allocation of resources for the PDU session in	
LEGO/(HOIV_I / NEOKE	the UE, RAN or AMF.	
UNSUCC_QOS_VAL	Indicates that the QoS validation has failed.	
INCORRECT_UM	The usage monitoring data of the enforced session rule is not the	(NOTE)
	same for all the provisioned session rule(s), i.e., the reference	
	identifier to a UsageMonitoringData policy decision is not	
	homogeneously provisioned in all session rules (e.g., some, but	
	not all, session rules contain usage monitoring data, or all session	
	rules contain usage monitoring data, but with different monitoring key).	
UE_STA_SUSP	Indicates that the UE is in suspend state. Only applicable to the	PolicyUpdateWhen
02_0.7_000.	interworking scenario as defined in Annex B.	UESuspends
UNKNOWN_REF_ID	Indicates that the session rule could not be successfully	
	installed/modified because the reference identifier to a Policy	
	Decision Data or to a Condition Data is unknown to the NF service	
	consumer.	
INCORRECT_COND_DA	Indicates that the session rule could not be successfully	
TA	installed/modified because the referenced Condition data are	
	incorrect (e.g. the ConditionData instance contains a	
	"deactivationTime" attribute, or the "ratType" attribute value in a ConditionData instance indicates a RAT type (e.g. "NR") that is not	
	specified for the the "accessType" attribute indicated value (e.g.	
	"NON_3GPP_ACCESS").	
REF_ID_COLLISION	Indicates that the session rule could not be successfully	
	installed/modified because the same Policy Decision is referenced	
	by a PCC rule (e.g. the session rule and the PCC rule refer to the	
DEEALUT COO MODIE	same Usage Monitoring decision data).	0 0 014 15 (
DEFAULT_QOS_MODIFI	Indicates that the enforcement of the default QoS modification failed.	SessQoSModEnforc ementFailure
CATION_FAILURE	The SMF shall use this value during the session rule error report	ementraliure
	specified in clause 4.2.4.21 to indicate to the PCF that the PDU	
	session modification failed because the default QoS modification	
	procedure as specified in clauses 4.2.3.6 and 4.2.4.5 has failed.	
SESSION_AMBR_MODIF	Indicates that the enforcement of the session-AMBR modification	SessQoSModEnforc
ICATION_FAILURE	failed.	ementFailure
	The SMF shall use this value during the session rule error report	
	specified in clause 4.2.4.21 to indicate to the PCF that the PDU	
	session modification failed because the session-AMBR	
	modification procedure as specified in clauses 4.2.3.5 and 4.2.4.4 has failed.	
NOTE: The "INCORREC	T_UM" value shall only be used when the feature "UMC" is supported	<u> </u>
INOTE. THE INCOMME	1_OW value shall only be used when the leature of the is supported	

5.6.3.18 Enumeration: SteeringFunctionality

Table 5.6.3.18-1: Enumeration SteeringFunctionality

Enumeration value	Description	Applicability
MPTCP	Indicates that PCF authorizes the MPTCP functionality to support traffic steering, switching and splitting.	
MPQUIC	Indicates that PCF authorizes the MPQUIC functionality to support traffic steering, switching and splitting.	EnATSSS_v2
ATSSS_LL	Indicates that PCF authorizes the ATSSS-LL functionality to support traffic steering, switching and splitting.	

5.6.3.19 Enumeration: SteerModeValue

Table 5.6.3.19-1: Enumeration SteerModeValue

Enumeration value	Description	Applicability
ACTIVE_STANDBY	Indicates the steering mode is Active-Standy. It is used to steer a SDF on one access (the Active access), when this access is available, and to switch the SDF to the other access (the Standby access), when Active access becomes unavailable.	ATSSS
LOAD_BALANCING	Indicates the traffic of an SDF is split percentually across accesses.	ATSSS
SMALLEST_DELAY	Indicates the traffic of a SDF is steered and/or switch to the access with the smallest delay.	ATSSS
PRIORITY_BASED	Indicates all the traffic of an SDF is steered to the high priority access, until this access is determined to be congested.	ATSSS
REDUNDANT	Indicates that the traffic of an SDF may be duplicated on the 3GPP and Non-3GPP accesses.	EnATSSS_v2
NOTE: When the steering mode provided.	"REDUNDANT" is provided, the steering functionality "ATSSS	_LL" shall not be

5.6.3.20 Enumeration: MulticastAccessControl

Table 5.6.3.20-1: Enumeration MulticastAccessControl

Enumeration value	Description	Applicability
ALLOWED	Indicates the service data flow, corresponding to the	WWC
	service data flow template, is allowed.	
NOT_ALLOWED	Indicates the service data flow, corresponding to the service data flow template, is not allowed. This is default value.	WWC

5.6.3.21 Enumeration RequestedQosMonitoringParameter

Table 5.6.3.21-1: Enumeration RequestedQosMonitoringParameter

Enumeration value	Description	Applicability
DOWNLINK	Indicates the DL packet delay between the UE and the UPF is to be monitored.	
UPLINK	Indicates the UL packet delay between the UE and the UPF is to be monitored.	
ROUND_TRIP	Indicates the round trip packet delay between the UE and the UPF is to be monitored.	
DOWNLINK_DATA_RATE	Indicates the DL data rate is to be monitored.	EnQoSMon
UPLINK_DATA_RATE	Indicates the UL data rate is to be monitored.	EnQoSMon
DOWNLINK_CONGESTION	Indicates that the percentage of DL packets to be marked as congested is to be monitored for the DL flow.	EnQoSMon
UPLINK_CONGESTION	Indicates that the percentage of UL packets to be marked as congested is to be monitored for the UL flow.	EnQoSMon

5.6.3.22 Enumeration: ReportingFrequency

Table 5.6.3.22-1: Enumeration ReportingFrequency

Enumeration value	Description	Applicability
EVENT_TRIGGERED	Indicates the delay is reported when the delay exceeds the threshold.	
PERIODIC	Indicates the delay is reported periodically.	

5.6.3.23 Enumeration: SmPolicyAssociationReleaseCause

The enumeration SmPolicyAssociationReleaseCause represents the cause why the PCF requests the termination of the policy association. It shall comply with the provisions defined in table 5.6.3.23-1.

Table 5.6.3.23-1: Enumeration SmPolicyAssociationReleaseCause

Enumeration value	Description	Applicability
UNSPECIFIED	This value is used for unspecified reasons.	
UE_SUBSCRIPTION	This value is used to indicate that the policy association needs to be terminated because the subscription of UE has changed (e.g. was removed).	
INSUFFICIENT_RES	This value is used to indicate that the server is overloaded and needs to abort the policy association.	
VALIDATION_CONDITION_ NOT_MET		EnhancedBackgrou ndDataTransfer
REACTIVATION_REQUEST ED	This value is used to indicate that policy association needs to be terminated because the PCF is not able to maintain the existing PDU session and requests that the PDU session is reactivated.	ReleaseToReactivat e

5.6.3.24 Enumeration: PduSessionRelCause

Table 5.6.3.24-1: Enumeration PduSessionRelCause

Enumeration value	Description	Applicability
PS_TO_CS_HO	Indicates that the PDU session is terminated due to PS	PDUSessionRelCau
	to CS handover.	se
RULE_ERROR	Indicates that the PDU session is terminated due to a	ImmediateTerminati
	session rule modification error.	on

5.6.3.25 Enumeration: MaPduIndication

Table 5.6.3.25-1: Enumeration MaPduIndication

Enumeration value	Description	Applicability
MA_PDU_REQUEST	UE requested MA PDU session and the request is authorized by subscription.	
MA_PDU_NETWORK_UPG RADE_ALLOWED	UE requested single access PDU session with indication of network upgrade to MA PDU session supported and the upgrade is authorized by subscription.	

5.6.3.26 Enumeration: AtsssCapability

Table 5.6.3.26-1: Enumeration AtsssCapability

Enumeration value	Description	Applicability
ATSSS_LL	Indicates that the MA PDU Session supports the	
	ATSSS-LL capability with any steering mode in the	
MPTCP_ATSSS_LL	uplink and in the downlink. Indicates that the MA PDU Session supports both the	
WII TOT _ATOOO_LL	MPTCP and ATSSS-LL capability with any steering	
	mode in the uplink and in the downlink.	
MPTCP_ATSSS_LL_WITH_ASMODE_U	Indicates that the MA PDU Session supports the	
L	MPTCP capability with any steering mode in uplink	
	and downlink, and ATSSS-LL capability with any steering mode in the downlink and Active-Standby	
	mode in the uplink.	
MPTCP_ATSSS_LL_WITH_EXSDMODE	Indicates that the MA PDU Session supports the	
_DL_ASMODE_UL	MPTCP capability with any steering mode in uplink	
	and downlink, and ATSSS-LL capability with any	
	steering mode except Smallest Delay mode in the	
MPTCP_ATSSS_LL_WITH_ASMODE_D	downlink and Active-Standby mode in the uplink. Indicates that the MA PDU Session supports the	
LUL	MPTCP capability with any steering mode and	
	ATSSS-LL capability with Active-Standby mode in	
	uplink and downlink.	
MPQUIC_ATSSS_LL	Indicates that the MA PDU Session supports the	EnATSSS_v2
	MPQUIC and ATSSS-LL capability with any steering mode in the uplink and in the downlink.	
MPQUIC ATSSS LL WITH ASMODE	Indicates that the MA PDU Session supports the	EnATSSS_v2
UL	MPQUIC capability with any steering mode in uplink	
	and downlink, and ATSSS-LL capability with any	
	steering mode in the downlink and Active-Standby	
MPQUIC_ATSSS_LL_WITH_EXSDMOD	mode in the uplink. Indicates that the MA PDU Session supports the	EnATSSS_v2
E_DL_ASMODE_UL	MPQUIC capability with any steering mode in uplink	L11/(1000_V2
	and downlink, and ATSSS-LL capability with any	
	steering mode except Smallest Delay mode in the	
MPQUIC_ATSSS_LL_WITH_ASMODE_	downlink and Active-Standby mode in the uplink. Indicates that the MA PDU Session supports the	EnATSSS_v2
MPQOIC_ATSSS_LL_WITH_ASMODE_ DLUL	MPQUIC capability with any steering mode and	EIIA1333_VZ
	ATSSS-LL capability with Active-Standby mode in	
	uplink and downlink.	
MPTCP_MPQUIC_ATSSS_LL	Indicates that the MA PDU Session supports the	EnATSSS_v2
	MPTCP, MPQUIC and ATSSS-LL capability with any steering mode in the uplink and in the downlink.	
MPTCP MPQUIC ATSSS LL WITH AS	Indicates that the MA PDU Session supports the	EnATSSS v2
MODE_UL	MPTCP and MPQUIC capability with any steering	L11/(1000_v2
_	mode in uplink and downlink, and ATSSS-LL	
	capability with any steering mode in the downlink and	
MDTCD MDOLLIC ATSSS LL WITH EV	Active-Standby mode in the uplink.	EnATSSS_v2
MPTCP_MPQUIC_ATSSS_LL_WITH_EX SDMODE_DL_ASMODE_UL	Indicates that the MA PDU Session supports the MPTCP and MPQUIC capability with any steering	EHATOOO_VZ
51552_52_/\text{\tin}\text{\tinte\text{\tin\tinit\text{\text{\text{\text{\text{\text{\text{\text{\tin\text{\tert{\text{\text{\texi}\tint{\text{\text{\texict{\tinte\tintet{\text{\tin\tinte\text{\text{\text{\texit{\texi}\tintet{\texititt{\tin\tintet{\text{\text{\text{\texi}\tintet{\texitit}}\ti	mode in uplink and downlink, and ATSSS-LL	
	capability with any steering mode except Smallest	
	Delay mode in the downlink and Active-Standby	
MPTCP_MPQUIC_ATSSS_LL_WITH_AS	mode in the uplink. Indicates that the MA PDU Session supports the	EnATSSS_v2
MPTCP_MPQUIC_ATSSS_LL_WITH_AS MODE_DLUL	MPTCP and MPQUIC capability with any steering	LIIA 1000_VZ
	mode and ATSSS-LL capability with Active-Standby	
	mode in uplink and downlink.	

5.6.3.27 Enumeration: NetLocAccessSupport

Table 5.6.3.27-1: Enumeration NetLocAccessSupport

Enumeration value	Description	Applicability
ANR_NOT_SUPPORTED	Indicates that the access network does not support the report of access network information.	
TZR_NOT_SUPPORTED	Indicates that the access network does not support the report of UE time zone. (NOTE 1)	
LOC_NOT_SUPPORTED	Indicates that the access network does not support the report of UE Location. (NOTE 2)	
NOTE 1: The UE time zone is not available in EPC untrusted WLAN. NOTE 2: The SMF+PGW determines the UE Location is not available as described in clause B.3.6.3.		

5.6.3.28 Enumeration: PolicyDecisionFailureCode

Table 5.6.3.28-1: PolicyDecisionFailureCode

Enumeration value	Description	Applicability
TRA_CTRL_DECS_ER	Indicates failure in the provisioning of traffic control decision	
R	data.	
QOS_DECS_ERR	Indicates failure in the provisioning of QoS decision data.	
CHG_DECS_ERR	Indicates failure in the provisioning of charging decision data.	
USA_MON_DECS_ERR	Indicates failure in the provisioning of usage monitoring decision	UMC
	data.	
QOS_MON_DECS_ERR	Indicates failure in the provisioning of QoS monitoring decision	
	data.	
CON_DATA_ERR	Indicates failure in the provisioning of condition data.	
POLICY_PARAM_ERR	Indicates the information related to the provisioned policy	ExtPolicyDecisionError
	parameter(s) is incorrect, incomplete or inconsistent.	Handling

5.6.3.29 Enumeration: NotificationControlIndication

Table 5.6.3.29-1: Enumeration NotificationControlIndication

Enumeration value	Description	Applicability
DDN_FAILURE	·	DDNEventPolicyControl
DDD_STATUS	•	DDNEventPolicyControl

5.6.3.30 Void

5.6.3.31 Enumeration: SteerModeIndicator

Table 5.6.3.31-1: Enumeration SteerModeIndicator

Enumeration value	Description	Applicability
AUTO_LOAD_BALANCE	Allows the UE and UPF to autonomously determine the traffic	
	load of an SDF distributed across accesses.	
UE_ASSISTANCE	Allows the UE to decide how to distribute the UL traffic of an	
	SDF and the UE may inform the UPF how it decided to	
	distribute the UL traffic.	

5.6.3.32 Enumeration TrafficParameterMeas

Table 5.6.3.32-1: Enumeration TrafficParameterMeas

Enumeration value	Description	Applicability
DL_N6_JITTER	The downlink N6 Jitter Information associated with DL	
	Periodicity.	
DL_PERIOD	The Downlink periodicity.	
UL_PERIOD	The Uplink periodicity.	

5.6.3.33 Enumeration: QosMonitoringParamType

Table 5.6.3.33-1: Enumeration QosMonitoringParamType

Enumeration value	Description	Applicability
PACKET_DELAY	Indicates that the QoS monitoring parameter to be measured is	
	Packet Delay.	
CONGESTION	Indicates that the QoS monitoring parameter to be measured is	
	Congestion.	
DATA_RATE	Indicates that the QoS monitoring parameter to be measured is	
	Data Rate.	

5.6.3.34 Enumeration TransportMode

Table 5.6.3.34-1: Enumeration TransportMode

Enumeration value	Description	Applicability
DATAGRAM_MODE_1	Datagram mode 1. This transport mode is an extension of the mode defined in RFC 9298 [64]. It encapsulates UDP packets within QUIC Datagram frames and provides unreliable transport but with sequence numbering and with packet reordering / deduplication (as defined in 3GPP TS 24.501 [20]), clause 5.32.6.2.2.1.	
DATAGRAM_MODE_2	Datagram mode 2: This transport mode is the mode defined in RFC 9298 [64]. It encapsulates UDP packets within QUIC Datagram frames and provides unreliable transport with no sequence numbering and no packet reordering / deduplication.	
STREAM_MODE	Stream mode: This mode encapsulates UDP packets within QUIC Stream frames and provides reliable transport with sequence numbering and with packet reordering / deduplication.	

5.6.3.35 Enumeration: UeReachabilityStatus Type

Table 5.6.3.35-1: Enumeration UeReachabilityStatusType

Enumeration value	Description Applicability Appl	
REACHABLE	Indicates that the UE is reachable.	
UNREACHABLE	Indicates that the UE is unreachable.	

5.7 Error handling

5.7.1 General

HTTP error handling shall be supported as specified in clause 5.2.4 of 3GPP TS 29.500 [4].

For the Npcf_SMPolicyControl API, HTTP error responses shall be supported as specified in clause 4.8 of 3GPP TS 29.501 [5].

Protocol errors and application errors specified in table 5.2.7.2-1 of 3GPP TS 29.500 [4] shall be supported for an HTTP method if the corresponding HTTP status codes are specified as mandatory for that HTTP method in table 5.2.7.1-1 of 3GPP TS 29.500 [4].

In addition, the requirements in the following clauses shall apply.

5.7.2 Protocol Errors

In this Release of the specification, there are no additional protocol errors applicable for the Npcf_SMPolicyControl API.

5.7.3 Application Errors

The application errors defined for the Npcf_SMPolicyControl API are listed in table 5.7.3-1 and 5.7.3-2.

Table 5.7.3-1: Application errors when PCF acts as a server

Application Error	HTTP status code	Description
USER_UNKNOWN	400 Bad Request	The HTTP request is rejected because the end user specified in the request is unknown to the PCF. (NOTE 1) (NOTE 3)
ERROR_INITIAL_PARAMETERS	400 Bad Request	The HTTP request is rejected because the set of session or subscriber information needed by the PCF for rule selection is incomplete or erroneous or not available for the decision to be made. (E.g. QoS, RAT type, subscriber information) (NOTE 1) (NOTE 2) (NOTE 3)
ERROR_TRIGGER_EVENT	400 Bad Request	The HTTP request is rejected because the set of session information sent the message originated due to a trigger been met is incoherent with the previous set of session information for the same session. (E.g. trigger met was RAT changed, and the RAT notified is the same as before) (NOTE 2) (NOTE 3)
PENDING_TRANSACTION	400 Bad Request	This error shall be used when the PendingTransaction feature is supported and the PCF receives an incoming request on a policy association while it has an ongoing transaction on the same policy association and cannot handle the request as described in clause 9.2 of 3GPP TS 29.513 [7]. (NOTE 2)
ERROR_TRAFFIC_MAPPING_INFO_ REJECTED	403 Forbidden	The HTTP request is rejected because the PCF does not accept one or more of the traffic mapping filters provided by the NF service consumer in a PCC Request. (NOTE 2) (NOTE 3)
ERROR_CONFLICTING_REQUEST	403 Forbidden	The HTTP request is rejected because the PCF cannot accept the UE-initiated resource request as a network-initiated resource allocation is already in progress that has packet filters that cover the packet filters in the received UE-initiated resource request. The NF service consumer shall reject the attempt for UE-initiated resource request. (NOTE 2) (NOTE 3)
LATE_OVERLAPPING_REQUEST	403 Forbidden	The request is rejected because it collides with and exiting Policy Association with a more recent originating timestamp. (NOTE 1)
POLICY_CONTEXT_DENIED	403 Forbidden	The HTTP request is rejected because the PCF does not accept the NF service consumer request due to operator policies and/or local configuration. (NOTE 1) (NOTE 2) (NOTE 3)
VALIDATION_CONDITION_NOT_MET	403 Forbidden	The HTTP request is rejected because the PCF does not accept the NF service consumer request because the validation condition of background data transfer policy is not met. (NOTE 1) (NOTE 3)
INVALID_BDT_POLICY	403 Forbidden	The HTTP request is rejected because the PCF does not accept the NF service consumer request because the background data transfer policy is invalid. (NOTE 1)
EXCEEDED_UE_SLICE_DATA_RATE	403 Forbidden	The HTTP request is rejected because the PCF does not accept the NF service consumer request because the authorized data rate exceeds the consumed data rate for that UE and network slice. (NOTE 1) (NOTE 2)
EXCEEDED_SLICE_DATA_RATE	403 Forbidden	The HTTP request is rejected because the PCF does not accept the NF service consumer request because the authorized data rate exceeds the consumed data rate for that slice. (NOTE 1) (NOTE 2)

EXCEEDED_GROUP_DATA_RATE	403 Forbidden	The HTTP request is rejected because the PCF does not accept the NF service consumer request because the authorized group data rate exceeds the consumed data rate for the concerned group. (NOTE 1) (NOTE 2)
POLICY_ASSOCIATION_NOT_FOUN D	404 Not Found	The HTTP request is rejected because no policy association corresponding to the request exists in the PCF.

- NOTE 1: These application errors are used by the create service operation (see clause 4.2.2.2) and included in the responses to the POST request.
- NOTE 2: These application errors are used by the update service operation (see clause 4.2.4.2) and included in the responses to the POST request.
- NOTE 3: The Cause codes mapping performed by NF service consumer between this Application Error and the 5GSM related value is specified in clause 5.2.2.2 of 3GPP TS 29.524 [40].

 NOTE 4: Including a "ProblemDetails" data structure with the "cause" attribute in the HTTP response is optional
- unless explicitly mandated in the service operation clauses.

Table 5.7.3-2: Application errors when NF service consumer acts as a server to receive a notification

Application Error	HTTP status code	Description
PCC_RULE_EVENT	400 Bad Request	The HTTP request is rejected because all the PCC rules provisioned by the PCF in the request cannot be installed/activated. It is used to inform the PCF that the request failed, and should not be attempted again. (NOTE 1)
PCC_QOS_FLOW_EVENT	400 Bad Request	The HTTP request is rejected because for some reason all the PCC rules provisioned by the PCF in the request cannot be enforced or modified successfully in a network initiated procedure. It is used to inform the PCF that the request could not be satisfied at the time it was received, but may be able to satisfy the request in the future. (NOTE 1)
UE_STATUS_SUSPEND	400 Bad Request	The HTTP request is rejected because the UE's status is suspended and the policy decisions received from the PCF cannot be enforced by the NF service consumer. Applicable only to functionality introduced with the PolicyUpdateWhenUESuspends feature as described in clause 5.8. (NOTE 1)
RULE_PERMANENT_ERROR	400 Bad Request	The HTTP request is rejected because all the PCC rules and/or session rules provisioned by the PCF in the request cannot be installed/activated. It is used to inform the PCF that the request failed, and should not be attempted again. Applicable only to functionality introduced with the SessionRuleErrorHandling feature as described in clause 5.8. (NOTE 1)
RULE_TEMPORARY_ERROR	400 Bad Request	The HTTP request is rejected because for some reason all the PCC rules and/or session rules provisioned by the PCF in the request cannot be enforced or modified successfully in a network initiated procedure. It is used to inform the PCF that the request could not be satisfied at the time it was received, but may be able to satisfy the request in the future. Applicable only to functionality introduced with the SessionRuleErrorHandling feature as described in clause 5.8. (NOTE 1)
PENDING_TRANSACTION	400 Bad Request	This error shall be used when the PendingTransaction feature is supported and the NF service consumer receives an incoming request on a policy association while it has an ongoing transaction on the same policy association and cannot handle the request as described in clause 9.2 of 3GPP TS 29.513 [7]. (NOTE 1)
AN_GW_FAILED	400 Bad Request	This error shall be used when SGWRest feature is supported and the received policy decisions (i.e. installation/modification of PCC rules or session rules) cannot be enforced by the SMF because the AN-Gateway has failed. (NOTE 1)
POL_DEC_ERROR	400 Bad Request	This error shall be used when Ext2PolicyDecisionErrorHandling feature is supported, the PCF provides only SM policy decisions and/or condition data and all the policy decisions and/or conditions in the request cannot be stored in the NF service consumer.

NOTE 1: These application errors are used by the UpdateNotify service operation (see clause 4.2.3.2) and included in the responses to the POST request.

NOTE 2: Including a "ProblemDetails" data structure with the "cause" attribute in the HTTP response is optional

unless explicitly mandated in the service operation clauses.

5.8 Feature negotiation

The optional features in table 5.8-1 are defined for the Npcf_SMPolicyControl API. They shall be negotiated using the extensibility mechanism defined in clause 6.6 of 3GPP TS 29.500 [4].

Table 5.8-1: Supported Features

Feature number	Feature Name	Description
1	TSC	This feature indicates support for traffic steering control in the (S)Gi-LAN, steering the 5G-LAN type of services or routing of the user traffic to a local Data Network identified by the DNAI per AF request. If the NF service consumer supports this feature, the PCF shall behave as described in clause 4.2.6.2.6.
2	ResShare	This feature indicates the support of service data flows that share resources. If the NF service consumer supports this feature, the PCF shall behave as described in clause 4.2.6.2.8.
3	3GPP-PS-Data-Off	This feature indicates the support of 3GPP PS Data off status change reporting.
4	ADC	This feature indicates the support of application detection and control.
5	UMC	Indicates that the usage monitoring control is supported.
6	NetLoc	This feature indicates the support of the Access Network Information Reporting for 5GS.
7	RAN-NAS-Cause	This feature indicates the support for the detailed release cause code information from the access network. (NOTE)
8	ProvAFsignalFlow	This feature indicates support for the feature of IMS Restoration as described in clause 4.2.3.17. If NF service consumer supports this feature the PCF may provision AF signalling IP flow information.
9	PCSCF-Restoration-Enhancement	This feature indicates support of P-CSCF Restoration Enhancement. It is used for the NF service consumer to indicate if it supports P-CSCF Restoration Enhancement.
10	PRA	This feature indicates the support of presence reporting area change reporting. The support of the update of a UE Dedicated Presence Reporting Area is unspecified.
11	RuleVersioning	This feature indicates the support of PCC rule versioning as defined in clause 4.2.6.2.14.
12	SponsoredConnectivity	This feature indicates support for sponsored data connectivity feature. If the NF service consumer supports this feature, the PCF may authorize sponsored data connectivity to the subscriber.
13	RAN-Support-Info	This feature indicates the support of maximum packet loss rate value(s) for uplink and/or downlink voice service data flow(s).
14	PolicyUpdateWhenUESuspends	This feature indicates the support of report when the UE is suspended and then resumed from suspend state. Only applicable to the interworking scenario as defined in Annex B.
15	AccessTypeCondition	This feature indicates the support of access type conditioned authorized Session-AMBR as defined in clause 4.2.6.3.2.4.
16	Multilpv6AddrPrefix	This feature indicates the support of additional new/removed (up to two) Ipv6 address prefixes reporting.
17	SessionRuleErrorHandling	This feature indicates the support of session rule error handling.
18	AF_Charging_Identifier	This feature indicates the support of long character strings as charging identifiers.
19	ATSSS	This feature indicates the support of the access traffic switching, steering and splitting functionality as defined in clauses 4.2.6.2.17 and 4.2.6.3.4.
20	PendingTransaction	This feature indicates support for the race condition handling as defined in 3GPP TS 29.513 [7].
21	URLLC	This feature indicates support of Ultra-Reliable Low-Latency Communication (URLLC) requirements, i.e. AF application relocation acknowledgement requirement and UE address(es) preservation. The TSC feature shall be supported in order to support this feature.
22	MacAddressRange	Indicates the support of a set of MAC addresses with a specific range in the traffic filter.
23	WWC	Indicates support of wireless and wireline convergence access as defined in annex C.

24	OceMonitoring	Indicates support of QoS monitoring as defined in
4	QosMonitoring	clause 4.2.3.25 and 4.2.4.24. Reporting of monitoring data
		applies to packet delay information when only this feature is
		supported.
25	AuthorizationWithRequiredQoS	Indicates support of policy authorization for the AF session with required QoS as defined in clause 4.2.3.22.
26	EnhancedBackgroundDataTransfer	Indicates the support of applying the Background Data
	_	Transfer Policy to a future PDU session.
27	DN-Authorization	This feature indicates the support of DN-AAA authorization
28	PDUSessionRelCause	data for policy control. Indicates the support of "PS_TO_CS_HO" PDU session
20	r DOSessionNeiCause	release cause.
29	SamePcf	This feature indicates the support of same PCF selection for
20	A DO see thi De dise ati a s	the parameter's combination.
30	ADCmultiRedirection	This feature indicates support for multiple redirection information in application detection and control. It requires
		the support of ADC feature.
31	RespBasedSessionRel	Indicates support of handling PDU session termination
22	Time of Committies Not to contain a	functionality as defined in clause 4.2.4.22.
32	TimeSensitiveNetworking	Indicates that the 5G System is integrated within the external network as a TSN bridge.
33	EMDBV	This feature indicates the support of the
		ExtMaxDataBurstVol data type defined in
		3GPP TS 29.571 [11]. The use of this data type is specified in clause 4.2.2.1.
34	DNNSelectionMode	This feature indicates the support of DNN selection mode.
35	EPSFallbackReport	This feature indicates the support of the report of EPS
		Fallback as defined in clauses B.3.3.2 and B.3.4.6.
36	PolicyDecisionErrorHandling	This feature indicates the support of the error report of the policy decision and/or condition data which is not referred
		by any PCC rule or session rule as defined in
		clause 4.2.3.26 and 4.2.4.26.
37	DDNEventPolicyControl	This feature indicates the support for policy control in the
		case of DDN Failure and Delivery Status events as defined in clause 4.2.4.27.
38	ReallocationOfCredit	This feature indicates the support of notifications of
		reallocation of credit.
39	BDTPolicyRenegotiation	This feature indicates the support of the BDT policy re-
40	ExtPolicyDecisionErrorHandling	negotiation. This feature indicates the support of the error report of a
		faulty SM policy decision parameter as defined in
		clause 4.2.3.26 and 4.2.4.26. It requires the support of
41	ImmediateTermination	PolicyDecisionErrorHandling feature. This feature indicates the support of the termination the
71	ininediate remination	PDU session when the NF service consumer cannot ensure
		the UE, RAN, AMF, or UPF can revert to the status before
		the PDU session modification occurred, as defined in
42	AggregatedUELocChanges	clause 4.2.4.21. This feature indicates the support of notifications of serving
		area (i.e. tracking area) and/or serving cell changes.
43	ES3XX	Extended Support for 3xx redirections. This feature
		indicates the support of redirection for any service operation, according to Stateless NF procedures as
		specified in clauses 6.5.3.2 and 6.5.3.3 of
		3GPP TS 29.500 [4] and according to HTTP redirection
		principles for indirect communication, as specified in
44	GroupIdListChange	clause 6.10.9 of 3GPP TS 29.500 [4]. This feature indicates the support for the notification of
		changes in the list of internal group identifiers.
45	DisableUENotification	Indicates the support of disabling QoS flow parameters
		signalling to the UE when the SMF is notified by the NG- RAN of changes in the fulfilled QoS situation. This feature
		requires that the AuthorizationWithRequiredQoS featute is
		also supported.
46	OfflineChOnly	

47	Dual-Connectivity-redundant-UP-paths	Indicates the support of policy authorization of end to end redundant user plane path using dual connectivity as described in clause 4.2.2.20.
48	DDNEventPolicyControl2	This feature indicates the support for the policy control removal in the case of DDN Failure and/or Delivery Status event(s) is cancelled as defined in clause 4.2.4.27. The DDNEventPolicyControl feature shall be supported in order to support this feature.
49	VPLMN-QoS-Control	Indicates the support of QoS constraints from the VPLMN for the derivation of the authorized Session-AMBR and authorized default QoS.
50	2G3GIWK	This feature indicates the support of GERAN and UTRAN access over N7 interface.
51	TimeSensitiveCommunication	Indicates that the 5G System is integrated within the external network as a TSC user plane node to enable the Time Sensitive Communications and Time Synchronization. This feature requires that the TimeSensitiveNetworking feature is also supported.
52	AF_latency	This feature indicates the support of Edge relocation considering user plane latency. This feature requires that the TSC feature is also supported.
53	SatBackhaulCategoryChg	This feature indicates the support of notification of a change between different satellite backhaul categories, or between satellite backhaul and non-satellite backhaul.
54	CHFsetSupport	Indicates the support of CHF redundancy and failover mechanisms based on CHF instance availability within a CHF Set, as described in clause 4.2.2.3.1.
55	EnATSSS	Indicates the support of ATSSS enhancement. It requires the support of ATSSS feature.
56	MPSforDTS	Indicates support of the MPSfor DTS feature as described in clause 4.2.6.2.12.4.
57	RoutingInfoRemoval	Indicates the support of the removal of the "routeToLocs" attribute from the TrafficControlData instance.
58	ePRA	This feature indicates the support of presence reporting area change reporting. It additionally supports the update of the elements of a UE Dedicated Presence Reporting Area by the full replacement of the previously provided one comparing with the PRA feature.
59	AMInfluence	Indicates the support of the delivery of the PCF for the UE request to be notified by the PCF for the PDU session about PDU session established/terminated events.
60	PvsSupport	This feature indicates the support of SNPN UE Remote Provisioning via User Plane as described in clause 4.2.2.21.
61	EneNA	This feature indicates the support of NWDAF data reporting.
62	BIUMR	This feature bit indicates whether the NF Service Consumer (e.g. SMF) and PCF supports Binding Indication Update for multiple resource contexts specified in clauses 6.12.1 and 5.2.3.2.6 of 3GPP TS 29.500 [4].
63	EASIPreplacement	This feature indicates the support of EAS IP replacement. This feature requires that the TSC feature is also supported.
64	ExposureToEAS	This feature indicates the support of exposure of QoS monitoring results to local AF. This feature requires that QosMonitoring feature is also supported.
65	SimultConnectivity	This feature indicates the support of temporary simultaneously connectivity at edge relocation. This feature requires that the TSC feature is also supported.
66	SGWRest	This feature indicates the support of SGW Restoration procedures. Only applicable to the interworking scenario as defined in Annex B.
67	ReleaseToReactivate	This feature indicates that the PCF can request the SMF for reactivation of a PDU session based on an SM Policy Association release cause.
68	EASDiscovery	This feature indicates the support of EAS (re)discovery.
69	AccNetChargId_String	This feature indicates the support of long character strings as access network charging identifier.

70	WLAN_Location	This feature indicates the support of the report of the WLAN location information received from the ePDG/EPC, if available. It is only applicable to EPS interworking scenarios as specified in Annex B.
71	PackFiltAllocPrecedence	This feature indicates the support of the control of the maximum number of packet filters in the EPS network in the EPS interworking scenarios as described in Annex B.
72	SatBackhaulCategoryChg_v2	This feature indicates the support of the indication of satellite backhaul categories, or the indication of non-satellite backhaul during the response to the update notify request.
73	PacketDelayFailureReport	Indicates the support of packet delay failure report as part of QoS Monitoring procedures. This feature requires that QosMonitoring feature is supported.
74	AltQoSProfilesSupportReport	This feature indicates the support of the report of whether Alternative QoS parameters are supported by NG-RAN. This feature requires that AuthorizationWithRequiredQoS feature is also supported.
75	Ext2PolicyDecisionErrorHandling	This feature indicates the support of the error report of the policy decision and/or condition data which is not referred by any PCC rule or session rule when no PCC rules and no session rules are provided and the handling of partial errors. It requires the support of ExtPolicyDecisionErrorHandling feature.
76	UEUnreachable	This feature indicates the support for the reporting of UE temporarily unavailable.
77	EnTSCAC	Indicates the support of extensions to TSCAC and the RAN feedback for BAT offset and adjusted periodicity. This feature requires that TimeSensitiveCommunication feature is also supported.
78	MTU_Size	This feature indicates the support of the report of the MTU size of the device side port. This feature requires that the TimeSensitiveCommunication feature is also supported.
79	EnSatBackhaulCatChg	This feature indicates the support of notification of dynamic satellite backhaul categories. It requires the support of SatBackhaulCategoryChg and SatBackhaulCategoryChg_v2 features.
80	SFC	This feature indicates support for application function influence on service function chaining(s). It requires the support of TSC feature.
81	EpsUrsp	This feature indicates the support of URSP provisioning in EPS. Only applicable to the interworking scenario as defined in Annex B.
82	CommonEASDNAI	This feature controls the support of the common EAS/DNAI selection. It requires the support of TSC feature.
83	UnlimitedMultiIpv6Prefix	This feature indicates the support of multiple Ipv6 address prefixes reporting.
84	NscSupportedFeatures	This feature indicates the support of provisioning of the Network Function Service Consumer features supported in Nsmf_EventExposure service as described in 3GPP TS 29.508 [12].
85	URSPEnforcement	This feature indicates the support of awareness of URSP rule enforcement
86	VBCforIMS	This feature indicates the support of provisioning of the caller and callee informations in volume based charging for IMS as defined in clause A.16 of 3GPP TS 29.214 [18] (replacing PCRF with PCF).
87	ExposureToTSC	This feature indicates the support of the direct event notification of TSC management information from the UPF to the TSCTSF or TSN AF in 5GC. This feature requires that TimeSensitiveCommunication feature is also supported.

88	NetSliceRepl	This feature indicates the support of the network slice replacement functionality introduced in this specification as part of the end-to-end network slicing functionality.
		The following functionalities are supported: Support the reporting of the network slice replacement information to the PCF.
89	SessQoSModEnforcementFailure	This feature indicates the support of the report PDU session modification failure because the enforcement of the default QoS modification or session-AMBR modification of the active session rule failed.
90	HR-SBO	This feature indicates the support of VPLMN specific Offloading policy in Home Routed deployments with Session Breakout (HR-SBO).
91	EnATSSS_v2	Indicates the support of ATSSS enhancements which includes REDUNDANT steering mode, MPQUIC steering functionality and MA PDU session interworking enhancements. It requires the support of the EnATSSS features.
92	NetSliceUsageCtrl	This feature indicates the support of the network slice usage control functionality introduced in this specification as part of the end-to-end network slicing functionality. The following functionalities are supported:
		 Support the provisioning by the PCF of the network slice usage control information (e.g., slice PDU session inactivity timer value).
93	VPLMN-5QIPrioLevel	Indicates the support of the indication of the VPLMN supported 5QI priority level when the required 5QI Priority Level is different from the standardized Default Priority Level value in the QoS characteristics Table 5.7.4-1 in 3GPP TS 23.501 [2]. This feature requires that VPLMN-QoS-Control feature is
94	PDUSetHandling	also supported. This feature indicates the support of PDU Set handling. This feature may be used for eXtended Reality (XR) and interactive media services.
95	EnQoSMon	This feature indicates the support of enhanced QoS monitoring functionality, i.e. the report of the congestion information, and/or, the data rate information monitoring. This feature requires that QosMonitoring feature is supported.
96	PowerSaving	This feature indicates the PCC support for UE Power Saving management. The following functionalities are supported: - Policy provisioning of Periodicity and N6 Traffic Parameters to be measured End of Data Burst Handling.
97	L4S	This feature indicates the support of the PCF indication of ECN marking for L4S support.
98	UPEAS	This feature indicates the support of UPF enhancements for exposure related to the identification of QoS monitoring event exposure subscription.
		n is supported. The EPS release cause code information from interworking scenarios as specified in Annex B.

5.9 Security

As indicated in 3GPP TS 33.501 [27], the access to the Npcf_SMPolicyControl API shall be authorized by means of the OAuth2 protocol (see IETF RFC 6749 [28]), using the "Client Credentials" authorization grant, where the NRF (see 3GPP TS 29.510 [29]) plays the role of the authorization server.

An NF service consumer, prior to consuming services offered by the Npcf_SMPolicyControl API, shall obtain a "token" from the authorization server, by invoking the Access Token Request service, as described in 3GPP TS 29.510 [29], clause 5.4.2.2.

NOTE: When multiple NRFs are deployed in a network, the NRF used as authorization server is the same NRF that the NF service consumer used for discovering the Npcf_SMPolicyControl service.

The Npcf_SMPolicyControl API defines a single scope "npcf-smpolicycontrol" for OAuth2 authorization (as specified in 3GPP TS 33.501 [27]) for the entire API, and it does not define any additional scopes at resource or operation level.

Annex A (normative): OpenAPI specification

A.1 General

The present Annex contains an OpenAPI [10] specification of HTTP messages and content bodies used by the Npcf_SMPolicyControl API.

This Annex shall take precedence when being discrepant to other parts of the specification with respect to the encoding of information elements and methods within the API.

NOTE 1: The semantics and procedures, as well as conditions, e.g. for the applicability and allowed combinations of attributes or values, not expressed in the OpenAPI definitions but defined in other parts of the specification also apply.

Informative copies of the OpenAPI specification file contained in this 3GPP Technical Specification are available on a Git-based repository, that uses the GitLab software version control system (see clause 5B of the 3GPP TR 21.900 [38] and clause 5.3.1 of the 3GPP TS 29.501 [5] for further information).

description: |

Indicates the policy control request trigger(s).

Possible values are:

- PLMN_CH: PLMN Change
- RES_MO_RE: A request for resource modification has been received by the SMF. The SMF always reports to the PCF.
- AC_TY_CH: Access Type Change.
- UE_IP_CH: UE IP address change. The SMF always reports to the PCF.
- UE_MAC_CH: A new UE MAC address is detected or a used UE MAC address is inactive for a specific period.
- AN_CH_COR: Access Network Charging Correlation Information
- US_RE: The PDU Session or the Monitoring key specific resources consumed by a UE either reached the threshold or needs to be reported for other reasons.
- APP_STA: The start of application traffic has been detected.
- APP_STO: The stop of application traffic has been detected.
- AN_INFO: Access Network Information report.
- CM_SES_FAIL: Credit management session failure.
- PS_DA_OFF: The SMF reports when the 3GPP PS Data Off status changes. The SMF always reports to the PCF.
- DEF_QOS_CH: Default QoS Change. The SMF always reports to the PCF.
- SE_AMBR_CH: Session-AMBR Change. The SMF always reports to the PCF.
- QOS_NOTIF: The SMF notify the PCF when receiving notification from RAN that QoS targets of the QoS Flow cannot be guranteed or gurateed again.
- NO_CREDIT: Out of credit.
- REALLO_OF_CREDIT: Reallocation of credit.
- PRA_CH: Change of UE presence in Presence Reporting Area.
- SAREA_CH: Location Change with respect to the Serving Area.
- SCNN_CH: Location Change with respect to the Serving CN node.
- RE_TIMEOUT: Indicates the SMF generated the request because there has been a PCC revalidation timeout.
- RES_RELEASE: Indicate that the SMF can inform the PCF of the outcome of the release of resources for those rules that require so.
- SUCC_RES_ALLO: Indicates that the requested rule data is the successful resource allocation.
- RAI_CH: Location Change with respect to the RAI of GERAN and UTRAN.
- RAT TY CH: RAT Type Change.
- REF_QOS_IND_CH: Reflective QoS indication Change
- NUM_OF_PACKET_FILTER: Indicates that the SMF shall report the number of supported packet filter for signalled QoS rules.
- UE_STATUS_RESUME: Indicates that the UE's status is resumed.
- UE_TZ_CH: UE Time Zone Change.
- AUTH_PROF_CH: The DN-AAA authorization profile index has changed.
- QOS_MONITORING: Indicate that the SMF notifies the PCF of the QoS Monitoring information.
- SCELL_CH: Location Change with respect to the Serving Cell.
- USER_LOCATION_CH: Indicate that user location has been changed, applicable to serving area change and serving cell change.
- EPS_FALLBACK: EPS Fallback report is enabled in the SMF.
- MA_PDU: UE Indicates that the SMF notifies the PCF of the MA PDU session request.
- TSN_BRIDGE_INFO: TSC user plane node information available.
- 5G_RG_JOIN: The 5G-RG has joined to an IP Multicast Group.
- 5G_RG_LEAVE: The 5G-RG has left an IP Multicast Group.
- DDN_FAILURE: Event subscription for DDN Failure event received. - DDN_DELIVERY_STATUS: Event subscription for DDN Delivery Status received.
- GROUP_ID_LIST_CHG: UE Internal Group Identifier(s) has changed: the SMF reports that UDM provided list of group Ids has changed.
- DDN_FAILURE_CANCELLATION: The event subscription for DDN Failure event is cancelled.
- DDN_DELIVERY_STATUS_CANCELLATION: The event subscription for DDD STATUS is cancelled.
- VPLMN_QOS_CH: Change of the QoS supported in the VPLMN.
- ${\tt SUCC_QOS_UPDATE}\colon$ Indicates that the requested MPS Action is successful.
- SAT_CATEGORY_CHG: Indicates that the SMF has detected a change between different satellite backhaul categories, or between a satellite backhaul and a non-satellite backhaul.
- PCF_UE_NOTIF_IND: Indicates the SMF has detected the AMF forwarded the PCF for the UE indication to receive/stop receiving notifications of SM Policy association

- PS_TO_CS_HAN

```
established/terminated events.
    - NWDAF_DATA_CHG: Indicates that the NWDAF instance IDs used for the PDU session and/or
    associated Analytics IDs used for the PDU session and available in the SMF have changed.
    - UE_POL_CONT_IND: Indicates that a UE policy container or failure delivery report is
    received from the UE in EPC over a PDN connection.
    - URSP_ENFORCEMENT_INFO: Indicates a report of URSP rule enforcement information.
    - HR_SBO_IND_CHG: Indicates the HR-SBO support indication has changed.
    - L4S\_SUPP: Indicates whether ECN marking for L4S is not available or available again
    in 5GS.
    - NET_SLICE_REPL: Indicates network slice replacement, i.e., a change between the initial
    S-NSSAI of the PDU Session and the Alternative S-NSSAI
    - BAT_OFFSET_INFO: Indicates that the SMF has detected the BAT offset and optionally
    adjusted periodicity.
    - UE_REACH_STATUS_CH: Indicates that there is a change in the UE reachability status.
RequestedRuleDataType:

This string provides forward-compatibility with future extensions to the enumeration and is not used to encode content defined in the present version of this API.

description:

Indicates the reason of the PCC rule failure.

Possible values are

- UNK_RULE_ID: Indicates that the pre-provisioned PCC rule could not be successfully activated because the PCC rule identifier is unknown to the SMF.
- RA_GR_ERR: Indicate that the PCC rule could not be successfully installed or enforced because the Rating Group specified within the Charging Data policy decision which the PCC rule refers to is unknown or, invalid.
- SER_ID_ERR: Indicate that the PCC rule could not be successfully installed or enforced because the Service Identifier specified within the Charging Data policy decision which the PCC rule refers to is invalid, unknown, or not applicable to the service being charged.
- NF_MAL: Indicate that the PCC rule could not be successfully installed (for those provisioned from the PCF) or activated (for those pre-defined in SMF) or enforced (for those already successfully installed) due to SMF/UPF malfunction.
- RES_LIM: Indicate that the PCC rule could not be successfully installed (for those provisioned from PCF) or activated (for those pre-defined in SMF) or enforced (for those already successfully installed) due to a limitation of resources at the SMF/UPF.
- MAX_NR_QoS_FLOW: Indicate that the PCC rule could not be successfully installed (for those provisioned from PCF) or activated (for those pre-defined in SMF) or enforced (for those already successfully installed) due to the fact that the maximum number of QoS flows has been reached for the PDU session.
- MISS_FLOW_INFO: Indicate that the PCC rule could not be successfully installed or enforced because neither the "flowInfos" attribute nor the "appId" attribute is specified within the PccRule data structure by the PCF during the first install request of the PCC rule.
- RES_ALLO_FAIL: Indicate that the PCC rule could not be successfully installed or maintained since the QoS flow establishment/modification failed, or the QoS flow was released.
- UNSUCC_QOS_VAL: indicate that the QoS validation has failed or when Guaranteed Bandwidth > Max-Requested-Bandwidth.
- INCOR_FLOW_INFO: Indicate that the PCC rule could not be successfully installed or modified at the SMF because the provided flow information is not supported by the network (e.g. the provided IP address(es) or Ipv6 prefix(es) do not correspond to an IP version applicable for the PDU session).
- ${\tt -PS_TO_CS_HAN}\colon$ Indicate that the PCC rule could not be maintained because of PS to CS handover.
- APP_ID_ERR: Indicate that the rule could not be successfully installed or enforced because the Application Identifier is invalid, unknown, or not applicable to the application required for detection.
- NO_QOS_FLOW_BOUND: Indicate that there is no QoS flow which the SMF can bind the PCC ${\tt rule}(s)$ to.
- FILTER_RES: Indicate that the Flow Information within the "flowInfos" attribute cannot be handled by the SMF because any of the restrictions defined in clause 5.4.2 of 3GPP TS 29.212 was not met.
- MISS_REDI_SER_ADDR: Indicate that the PCC rule could not be successfully installed or enforced at the SMF because there is no valid Redirect Server Address within the Traffic Control Data policy decision which the PCC rule refers to provided by the PCF and no preconfigured redirection address for this PCC rule at the SMF.
- CM_END_USER_SER_DENIED: Indicate that the charging system denied the service request due to service restrictions (e.g. terminate rating group) or limitations related to the end-user, for example the end-user's account could not cover the requested service.

 CM_CREDIT_CON_NOT_APP: Indicate that the charging system determined that the service can be granted to the end user but no further credit control is needed for the service (e.g.

- CM_AUTH_REJ: Indicate that the charging system denied the service request in order to terminate the service for which credit is requested.
- CM_USER_UNK : Indicate that the specified end user could not be found in the charging system.
- CM_RAT_FAILED: Indicate that the charging system cannot rate the service request due to insufficient rating input, incorrect AVP combination or due to an attribute or an attribute value that is not recognized or supported in the rating.
- UE_STA_SUSP: Indicates that the UE is in suspend state.
- UNKNOWN_REF_ID: Indicates that the PCC rule could not be successfully installed/modified because the referenced identifier to a Policy Decision Data or to a Condition Data is unknown to the SMF.
- INCORRECT_COND_DATA: Indicates that the PCC rule could not be successfully installed/modified because the referenced Condition data are incorrect.
- REF_ID_COLLISION: Indicates that PCC rule could not be successfully installed/modified because the same Policy Decision is referenced by a session rule (e.g. the session rule and the PCC rule refer to the same Usage Monitoring decision data).
- TRAFFIC_STEERING_ERROR: Indicates that enforcement of the steering of traffic to the N6-LAN or 5G-LAN failed; or the dynamic PCC rule could not be successfully installed or modified at the NF service consumer because there are invalid traffic steering policy identifier(s) within the provided Traffic Control Data policy decision to which the PCC rule refers.
- DNAI_STEERING_ERROR: Indicates that the enforcement of the steering of traffic to the indicated DNAI failed; or the dynamic PCC rule could not be successfully installed or modified at the NF service consumer because there is invalid route information for a DNAI(s) (e.g. routing profile id is not configured) within the provided Traffic Control Data policy decision to which the PCC rule refers.
- AN_GW_FAILED: This value is used to indicate that the AN-Gateway has failed and that the PCF should refrain from sending policy decisions to the SMF until it is informed that the S-GW has been recovered. This value shall not be used if the SM Policy association modification procedure is initiated for PCC rule removal only.
- MAX_NR_PACKET_FILTERS_EXCEEDED: This value is used to indicate that the PCC rule could not be successfully installed, modified or enforced at the NF service consumer because the number of supported packet filters for signalled QoS rules for the PDU session has been reached.
- PACKET_FILTER_TFT_ALLOCATION_EXCEEDED: This value is used to indicate that the PCC rule is removed at 5GS to EPS mobility because TFT allocation was not possible since the number of active packet filters in the EPC bearer is exceeded.
- MUTE_CHG_NOT_ALLOWED: Indicates that the PCC rule could not be successfully modified because the mute condition for application detection report cannot be changed. Applicable when the functionality introduced with the ADC feature applies.
- UE_TEMPORARILY_UNAVAILABLE: Indicates that the PCC rule could not be successfully installed or modified because the SMF was informed that the UE was not reachable.

AfSigProtocol:

```

      content defined in the present version of this API.
  description: |
    Indicates the reason of the session rule failure.
    Possible values are
    - NF_MAL: Indicates that the PCC rule could not be successfully installed (for those
    provisioned from the PCF) or activated (for those pre-defined in SMF) or enforced (for those
    already successfully installed) due to SMF/UPF malfunction.
    - RES_LIM: Indicates that the PCC rule could not be successfully installed (for those
    provisioned from PCF) or activated (for those pre-defined in SMF) or enforced (for those
    already successfully installed) due to a limitation of resources at the SMF/UPF.
    - SESSION RESOURCE ALLOCATION FAILURE: Indicates the session rule could not be successfully
    enforced due to failure during the allocation of resources for the PDU session in the UE,
   RAN or AMF.
    - UNSUCC_QOS_VAL: indicates that the QoS validation has failed.
     INCORRECT_UM: The usage monitoring data of the enforced session rule is not the same for
   all the provisioned session rule(s).
    - UE_STA_SUSP: Indicates that the UE is in suspend state.
    - UNKNOWN_REF_ID: Indicates that the session rule could not be successfully
    installed/modified because the referenced identifier to a Policy Decision Data or to a
    Condition Data is unknown to the SMF.
     · INCORRECT_COND_DATA: Indicates that the session rule could not be successfully
    installed/{\tt modified}\ because\ the\ referenced\ {\tt Condition}\ data\ are\ incorrect.
    - REF_ID_COLLISION: Indicates that the session rule could not be successfully
    installed/modified because the same Policy Decision is referenced by a PCC rule (e.g. the
    session rule and the PCC rule refer to the same Usage Monitoring decision data).
    - AN_GW_FAILED: Indicates that the AN-Gateway has failed and that the PCF should refrain
    from sending policy decisions to the SMF until it is informed that the S-GW has been
    recovered. This value shall not be used if the SM Policy association modification procedure
    is initiated for session rule removal only.
    - DEFAULT_QOS_MODIFICATION_FAILURE: Indicates that the enforcement of the default QoS
    modification failed. The SMF shall use this value to indicate to the PCF that the default
    QoS modification has failed.
     - SESSION_AMBR_MODIFICATION_FAILURE: Indicates that the enforcement of the session-AMBR
    modification failed. The SMF shall use this value to indicate to the PCF that the
    session-AMBR modification has failed.

      - MPOUIC ATSSS LL
      - MPTCP_MPQUIC_ATSSS_LL_WITH_ASMODE_UL
      - MPTCP_MPQUIC_ATSSS_LL_WITH_EXSDMODE_DL_ASMODE_UL
      - MPTCP_MPQUIC_ATSSS_LL_WITH_ASMODE_DLUL
      - MPTCP_MPQUIC_ATSSS_LL
  - type: string
    description: >
      This string provides forward-compatibility with future extensions to the enumeration
      and is not used to encode content defined in the present version of this API.
NetLocAccessSupport:
  anyOf:
  - type: string
    enum:
      - ANR_NOT_SUPPORTED
      - TZR_NOT_SUPPORTED
      - LOC_NOT_SUPPORTED
  - type: string
    description: >
      This string provides forward-compatibility with future
      extensions to the enumeration and is not used to encode
      content defined in the present version of this API.
  description: |
```

#

```
Indicates the access network support of the report of the requested access network
    information.
   Possible values are
    - ANR_NOT_SUPPORTED: Indicates that the access network does not support the report of access
   network information.
    - TZR_NOT_SUPPORTED: Indicates that the access network does not support the report of UE
    time zone.
    - LOC_NOT_SUPPORTED: Indicates that the access network does not support the report of UE
   Location (or PLMN Id).
PolicyDecisionFailureCode:
  description: Indicates the type of the failed policy decision and/or condition data.
  anvOf:
  - type: string
   enum:
     - TRA_CTRL_DECS_ERR
     - QOS_DECS_ERR
     - CHG DECS ERR
     - USA_MON_DECS_ERR
      - QOS_MON_DECS_ERR
     - CON_DATA_ERR
      - POLICY_PARAM_ERR
  - type: string
    description: >
      This string provides forward-compatibility with future extensions to the enumeration
      and is not used to encode content defined in the present version of this API.
NotificationControlIndication:
  description: >
    Indicates that the notification of DDD Status is requested and/or that the notification of
   DDN Failure is requested.
 anyOf:
  - type: string
   enum:
      - DDN FAILURE
      - DDD_STATUS
  - type: string
    description: >
     This string provides forward-compatibility with future extensions to the enumeration
      and is not used to encode content defined in the present version of this API.
SteerModeIndicator:
  description: Contains Autonomous load-balance indicator or UE-assistance indicator.
  anyOf:
  - type: string
   enum:
     - AUTO LOAD BALANCE
      - UE_ASSISTANCE
  - type: string
    description: >
     This string provides forward-compatibility with future extensions to the enumeration
      and is not used to encode content defined in the present version of this API.
TrafficParameterMeas:
 description: Indicates the traffic parameters to be measured.
  anyOf:
  - type: string
    enum:
      - DL_N6_JITTER
      - DL PERIOD
      - UL_PERIOD
  - type: string
   description: >
      This string provides forward-compatibility with future extensions to the enumeration
      and is not used to encode content defined in the present version of this API.
QosMonitoringParamType:
  anyOf:
  - type: string
    enum:
      - PACKET_DELAY
      - CONGESTION
      - DATA_RATE
  - type: string
    description: >
      This string provides forward-compatibility with future extensions to the enumeration
      and is not used to encode content defined in the present version of this API.
  description:
```

```
Indicates the QoS monitoring parameter type.
    Possible values are:
    - PACKET_DELAY: Indicates that the QoS monitoring parameter to be measured is packet delay.
    - CONGESTION: Indicates that the QoS monitoring parameter to be measured is congestion.
    - DATA_RATE: Indicates that the QoS monitoring parameter to be measured is data rate.
TransportMode:
  description: >
    Indicates the Transport Mode when the steering functionality is MPQUIC functionality.
  anyOf:
  - type: string
   enum:
     - DATAGRAM_MODE_1
     - DATAGRAM_MODE_2
      - STREAM_MODE
  - type: string
   description: >
     This string provides forward-compatibility with future extensions to the enumeration
     and is not used to encode content defined in the present version of this API.
UeReachabilityStatus:
  anyOf:
  - type: string
   enum:
     - REACHABLE
     - UNREACHABLE
  - type: string
   description: >
     This string provides forward-compatibility with future extensions to the enumeration
     and is not used to encode content defined in the present version of this API.
  description: |
   Indicates the UE rechability status.
   Possible values are:
    - REACHABLE: Indicates that the UE is reachable.
    - UNREACHABLE: Indicates that the UE is unreachable.
```

Annex B (normative): 5GC and EPC interworking scenario support

B.1 Scope

This annex defines procedures for 5GC and EPC interworking, which contains the following scenarios:

- EPS and 5GS interworking (i.e. 3GPP access connected to EPC and 3GPP access connected to 5GC).
- EPC/ePDG and 5GS interworking (i.e. ePDG connected to EPC and 3GPP access connected to 5GC).
- EPS and 5GC/N3IWF interworking (i.e. 3GPP access connected to EPC and N3IWF connected to 5GC).
- EPS and 5GC/TNAN/TWAN interworking (i.e. 3GPP access connected to EPC and TNAN/TWAN connected to 5GC).

NOTE: In this Release 5GC and EPC interworking is not supported for SNPN.

B.2 Npcf_SMPolicyControl Service

B.2.1 Service Description

B.2.1.1 Overview

Session Management Policy Control Service applies to the cases where the SMF+PGW-C interacts with the PCF in the non-roaming scenario, the SMF+PGW-C interacts with the V-PCF in the local breakout roaming scenario and the H-SMF+H-PGW-C interacts with the H-PCF in the home-routed scenario.

B.2.1.2 Service Architecture

The Session Management Policy Control Service is provided by the PCF as shown in the SBI representation model in figure B.2.1.2-1 and in the reference point representation model in figure B.2.1.2.2.

In this scenario the NF Service Consumer is a combined SMF and PGW-C.

Figure B.2.1.2-1: Reference Architecture for the Npcf_SMPolicyControl Service for 5GC and EPC interworking scenario; SBI representation

Figure B.2.1.2-2: Reference Architecture for the Npcf_SMPolicyControl Service or 5GC and EPC interworking scenario; reference point representation

NOTE: The PCF represents the V-PCF in the local breakout scenario. The SMF+PGW-C represents the H-SMF+H-PGW-C and the PCF represents the H-PCF in the home routed scenario.

B.3 Service Operation

B.3.1 Introduction

This clause defines the specific service operations for the 5GC and EPC interworking scenario. In addition, the service operations defined in clause 4.2 shall be applicable.

NOTE: For brevity reason, the combined SMF and PGW-C is denoted as SMF in what follows.

B.3.2 Npcf_SMPolicyControl_Create Service Operation

B.3.2.0 General

When the UE establishes the PDN connection through the EPC network and the SMF+PGW-C receives the Create Session Request message as defined in 3GPP TS 29.274 [37], the SMF+PGW-C shall behave as defined in clause 4.2.2.2 with the differences that the SMF+PGW-C shall include (if available) in SmPolicyContextData data structure:

- the IMSI of the user within the "supi" attribute;
- the MSISDN of the user within the "gpsi" attribute;
- APN within the "dnn" attribute:
- PDU Session Id determined by the SMF+PGW-C within "pduSessionId" attribute for a UE that has an EPS subscription that allows 5GC interworking but does not support 5GC NAS.

NOTE 1: For a PDN connection established via the MME or ePDG, the PDU Session ID value is assigned from a reserved range as specified in Table 5.4.2-1 of 3GPP TS 29.571 [11]. The PDU session ID value assigned at PDN connection establishment remains unchanged along the PDN connection, i.e., it does not change when the UE handovers between EPS and EPC/ePDG. In the scenarios where UE handover between EPS and EPC/ePDG is enabled, to ensure uniqueness of the assigned PDU Session ID value, the SMF+PGW-C can retrieve from UDM the already assigned PDU Session ID values, allocate a non-colliding PDU Session ID value, and register in UDM the allocated PDU session ID;

- PDN Type within the "pduSessionType" attribute;
- IMEI-SV within the "pei" attribute;
- IP-CAN type within the "accessType" attribute;
- RAT type within the "ratType" attribute;

NOTE 2: See Annex B.3.2.2 for further information.

- subscribed APN-AMBR within "subsSessAmbr" attribute;

- subscribed Default EPS bearer QoS within "subsDefQos" attribute;

NOTE 3: Subscribed APN-AMBR and the QCI within the subscribed default EPS bearer QoS are mapped to subscribed Session-AMBR and 5QI as defined in Annex B.3.6.1 respectively.

- user location information within the "userLocationInfo" attribute;

NOTE 4: See Annex B.3.2.1 for further information.

- the S-NSSAI determined by the SMF+PGW-C within the "sliceInfo" attribute;
- the bearer usage required of the default bearer within the "qosFlowUsage" attribute;
- the UE time zone information within "ueTimeZone" attribute, if available.

NOTE 5: The UE time zone is not available in EPC untrusted WLAN.

When the UE establishes the PDN connection in an 5GS-EPC interworking deployment, the SMF+PGW-C shall behave as defined in clause 4.2.2.2 (access through 5GS network) or this clause (access through the EPC network) and additionally, if the feature "PackFiltAllocPrecedence" is supported and there is a possibility to run into a restriction regarding the number of TFT packet filters that can be allocated when interworking with EPS with N26 is supported (see clause 4.11.1 of TS 23.502 [3]), the PCF may provide, as part of the PccRule data type(s) for the PCC Rules to be installed, the "packFiltAllPrec" attribute to indicate the order of the PCC Rules in the allocation of TFT packet filter(s) by the SMF+PGW-C.

NOTE 6: PCF can know that interworking with EPS with N26 is supported based on the received DNN and S-NSSAI of the PDU Session.

When the UE establishes a PDU session in a 5GS-EPC interworking deployment, and the feature "EpsUrsp" defined in clause 5.8 is supported by both, the PCF and the SMF+PGW-C:

- 1. to identify the 5GS to EPS mobility scenario, the PCF shall subscribe to RAT Type changes with the SMF+PGW-C in the SM Policy Association establishment response, if not previously subscribed, using an existing PDU session with "EpsUrsp" feature support; and
- 2. to enable the UE to determine (when attached in EPC) whether UE STATE INDICATION message may need to be sent to the network using the UE requested bearer resource modification procedure, the SMF+PGW-C, if the UE included the URSP provisioning in EPS support indication in the PDU Session Establishment Request, shall provide to the UE the indication of URSP Provisioning Support in EPS in the PDU Session Establishment Accept message as defined in 3GPP TS 24.501 [20].

B.3.2.1 UE Location related information

When the UE establishes the PDN connection through the EPC/E-UTRAN network, the SMF+PGW-C shall include, if available, the following user location information:

- user location information within the "eutraLocation" attribute included in the "userLocationInfo" attribute; and
- S-GW address, if available, within the "anGwAddr" attribute included in the "servNfId" attribute.

When the UE establishes the PDN connection through the EPC/UTRAN network and the feature "2G3GIWK" is supported, the SMF+PGW-C shall include, if available, the following user location information:

- user location information within the "utraLocationInfo" attribute included in the "userLocationInfo" attribute; and
- SGSN address, if available, within the "sgsnAddr" attribute included in the "servNfId" attribute.

When the UE establishes the PDN connection through the EPC/GERAN network and the feature "2G3GIWK" is supported, the SMF+PGW-C shall include, if available, the following user location information:

- user location information within the "geraLocationInfo" attribute included in the "userLocationInfo" attribute;
 and
- SGSN address, if available, within the "sgsnAddr" attribute included in the "servNfId" attribute.

When the UE establishes the PDN connection through the EPC/ePDG network, the SMF+PGW-C shall include, if available, the following user location information:

- user location information within the "n3gaLocation" attribute included in the "userLocationInfo" attribute. The "n3gaLocation" attribute includes the "ueIpv4Addr" or "ueIpv6Addr" attributes, and, if available the "portNumber" and "protocol" attributes and, if the feature "WLAN_Location" is supported, the "twapId" attribute encoding the WLAN location information, if available; and
- ePDG identification within the "anGwAddr" attribute included in the "servNfId" attribute.

NOTE: The "n3gaLocation" attribute does not include the "n3gppTai" and "n3IwfId" attributes in EPC interworking scenarios.

B.3.2.2 Access Type related information

When the UE establishes the PDN connection through the EPC/E-UTRAN network, the SMF+PGW shall include, if available, the following access type information:

- the "3GPP_ACCESS" value within the "accessType" attribute; and
- the "EUTRA" value within the "ratType" attribute.

When the UE establishes the PDN connection through the EPC/UTRAN network and the feature "2G3GIWK" is supported, the SMF+PGW shall include, if available, the following access type information:

- the "3GPP_ACCESS" value within the "accessType" attribute; and
- the "UTRA" value within the "ratType" attribute.

When the UE establishes the PDN connection through the EPC/GERAN network and the feature "2G3GIWK" is supported, the SMF+PGW shall include, if available, the following access type information:

- the "3GPP_ACCESS" value within the "accessType" attribute; and
- the "GERA" value within the "ratType" attribute.

When the UE establishes the PDN connection through the EPC/ePDG network, the SMF+PGW shall include, if available, the following access type information:

- the "NON 3GPP ACCESS" value within the "accessType" attribute;
- the "WLAN" or "VIRTUAL" value within the "ratType" attribute, as applicable; and
- the ePDG address in the "servNfId" attribute within the "anGwAddr" attribute.

B.3.2.3 Access Network Charging Identifier report

During PDU session establishment procedure, the SMF+PGW-C may provide the Access Network Charging Identifier for the PDU session (i.e., for the default QoS flow or the default EPS bearer) as specified in clause 4.2.2.11, or may provide the Access Network Charging Identifier for the default EPS bearer and indicate that there is a separate access network charging identifier for each EPS bearer/QoS flow by omitting or setting to false the "sessionChScope" attribute.

In both cases above, the Access Network Charging Identifier value and the address of the network entity performing the charging are provided as specified in clause 4.2.2.11.

NOTE: During the PDU Session Establishment procedure, when there are different charging identifiers for each EPS bearer (or QoS flow), the "refPccRuleIds" attribute is not provided within the AccNetChId data structure, since the PCC Rules are not yet authorized at this stage.

B.3.3 Npcf_SMPolicyControl_UpdateNotify Service Operation

B.3.3.0 General

When the UE has an established PDN connection through the EPC/E-UTRAN network and the PCF provisions the policy to the SMF+PGW-C as defined in clause 4.2.3. The SMF+ PGW-C shall behave as defined in clause 4.2.3 with the differences that the SMF+PGW-C shall map the QoS information within the PCC rule and/or session rule into EPS QoS information as defined in Annex B.3.6.1.

When the UE has an established PDN connection in an 5GS-EPC interworking deployment, the SMF+PGW-C shall behave as defined in clause 4.2.3 (access through the 5GS network) or this clause (access through the EPC network) and additionally, if the feature "PackFiltAllocPrecedence" is supported and there is a possibility to run into a restriction regarding the number of TFT packet filters that can be allocated when interworking with EPS with N26 is supported as described in Annex B.3.2.0, the PCF may provide, as part of the PccRule data type for the new PCC Rules to be installed, the "packFiltAllPrec" attribute to indicate the order of the PCC Rules in the allocation of TFT packet filter(s) by the SMF+PGW-C.

B.3.3.1 Policy Update When UE suspends

If the PolicyUpdateWhenUESuspends feature as defined in clause 5.8 is supported the PCF and the SMF shall comply with the procedures specified in this clause. During PDU session/PDN connection establishment or modification procedure, the PCF shall subscribe to the "UE_STATUS_RESUME" policy control request trigger if not subscribed yet, as described in clause 4.2.6.4. When the SMF receives the policy decision from the PCF as defined in clause 4.2.3.1 for a PDN connection maintained when the UE's status is suspend state, the SMF shall reject the request and include an HTTP "400 Bad Request" status code together with an ErrorReport structure. Within the ErrorReport data structure, the SMF shall include the "error" attribute containing the "cause" attribute of the ProblemDetails data structure set to "UE_STATUS_SUSPEND" which indicates the failure to enforce the corresponding policy decision, except if the policy decision is for the PCC rule removal only and/or session rule removal only, and further include the information as follows:

- If the policy decision includes the installation of one or more PCC rules, the SMF shall invoke the procedure as defined in clause 4.2.3.16 with the "failureCode" attribute set to "UE_STA_SUSP" and "ruleStatus" attribute set to INACTIVE to indicate the failure to enforce those PCC rules.
- If the policy decision includes the modification of one or more PCC rules, the SMF shall invoke the procedure as defined in clause 4.2.3.16 with the "failureCode" attribute set to "UE_STA_SUSP" and "ruleStatus" attribute set to ACTIVE to indicate the failure to enforce those PCC rules.
- If the policy decision includes the modification of one or more session rules, the SMF shall within a RuleReport data structure include the "sessRuleReports" attribute. Within each SessionRuleReport data structure, the SMF shall include the affected session rules within the "ruleIds" attribute(s), the "sessRuleFailureCode" attribute set to "UE_STA_SUSP" and "ruleStatus" attribute set to ACTIVE to indicate the failure to enforce those session rules.

Upon reception of the "failureCode" attribute and/or "sessRuleFailureCode" attribute set to "UE_STA_SUSP" or the ProblemDetails data structure set to "UE_STATUS_SUSPEND", the PCF shall not initiate any PDU Session Modification procedure, except if it is initiated for the PCC rule removal only or the session rule removal only, for the given PDU session over N7 until the UE's status is resumed. When the SMF detected the UE's status is resumed from suspend state, the SMF shall inform the PCF of the UE status as defined in Annex B.3.4.2.

B.3.3.2 Request report of EPS Fallback

When the "EPSFallbackReport" feature is supported, if the AF requests the PCF to report the EPS fallback for voice media type as described in clauses 4.2.2.30 or 4.2.3.29 of 3GPP TS 29.514 [17] or in clause E.3 of 3GPP TS 29.214 [18], the PCF shall perform the PCC rule provisioning procedure as defined in clause 4.2.6.2.1 and additionally provide the request of EPS fallback report to the SMF as follows:

- it shall include the "lastReqRuleData" attribute to contain the "reqData" attribute with the value "EPS_FALLBACK" and the "refPccRuleIds" attribute to contain the related installed/modified PCC rule identifier(s) with 5QI=1.

- it shall provide the "EPS_FALLBACK" policy control request rigger within the "policyCtrlReqTriggers" attribute, if not provided before.

B.3.3.3 S-GW Restoration Support

If the SGWRest feature as defined in clause 5.8 is supported, the PCF and the SMF shall comply with the procedures specified in this clause. During PDU session/PDN connection establishment or modification procedure, the PCF shall subscribe to the "SCNN_CH" policy control request trigger if not subscribed yet, as described in clause 4.2.6.4.

When the SMF+PGW receives the policy decision from the PCF as defined in clause 4.2.3.1 for a PDN connection maintained during a S-GW failure, the SMF+PGW shall act as follows:

- For MME/S4-SGSN triggered S-GW Restoration scenarios:
 - the SMF+PGW shall reject the request and include an HTTP "400 Bad Request" status code together with an ErrorReport structure. Within the ErrorReport data structure, the SMF shall include the "error" attribute containing the "cause" attribute of the ProblemDetails data structure set to "AN_GW_FAILED" which indicates the failure to enforce the corresponding policy decision, except if the policy decision is for the PCC rule removal only and/or session rule removal only, and further include the information as follows:
 - If the policy decision is related to one or more PCC rules, the SMF+PGW shall behave as defined in clause 4.2.3.16 with the "failureCode" attribute set to "AN GW FAILED".
 - If the policy decision is related to one or more session rules, the SMF+PGW shall behave as defined in clause 4.2.3.20 with the "sessRuleFailureCode" attribute set to "AN_GW_FAILED".
- For SMF+PGW triggered S-GW Restoration scenarios, the SMF+PGW shall accept the procedure as per normal procedures. In the case, the PDN connection is not restored during an operator configured time period, the SMF+PGW shall behave as follows as defined in annex B.3.4.9.

Upon reception of the "cause" attribute of the ProblemDetails data structure set to "AN_GW_FAILED" or the "failureCode" attribute set to "AN_GW_FAILED" and/or the "sessRuleFailureCode" attribute set to "AN_GW_FAILED", the PCF shall not initiate any SM Policy association modification procedure, except if the I SM Policy association modification procedure is initiated for the PCC rule removal only, for the given SM Policy association over N7 until the S-GW has recovered.

The SMF+PGW shall maintain the PDN connections affected by the S-GW failure and eligible for restoration for an operator configurable time period. Upon expiry of that time period, the SMF+PGW shall release the PDN connection and inform the PCF about the SM Policy association termination as specified in clause 4.2.5.2.

The SMF+PGW should maintain the GBR bearers of the PDN connections eligible for restoration for an operator configurable time period. Upon expiry of that time period, the SMF+PGW shall release GBR bearers that have not yet been restored and inform the PCF about the PCC rule removal as specified in clause 4.2.4.7.

The SMF+PGW shall discard downlink packets received for a PDN connection maintained during a S-GW failure that has not yet been restored.

The SMF+PGW shall delete the PDN connection locally when it receives an SM Policy association termination from the PCF as described in clause 4.2.4.3.

B.3.3.4 Request of Access Network Charging Identifier

When the PCF received from the SMF+PGW-C the indication that the Access Network Charging Identifier is different per EPS bearer/QoS flow (see clause B.3.2.3), or the Access Network Charging identifier is unknown for an AF session to the PCF, and the PCF received from the AF the request of access network information as specified in 3GPP TS 29.514 [17] or 3GPP TS 29.214 [18], the PCF shall request the access network charging identifier associated to the dynamic PCC rulesas specified in clause 4.2.6.5.1.

B.3.3.5 Forwarding of UE policy container and/or PCRT(s) for URSP provisioning in EPS

The PCF may receive a UE policy container and/or policy control request trigger(s) from the PCF for the UE during the lifetime of the PDU session and forward it to the SMF+PGW-C by invoking the procedure defined in clause 4.2.3.2.

If the feature "EpsUrsp" is supported, the PCF selects the SM Policy association of the PDN connection used for the delivery of UE policy container(s) and policy control request trigger(s) as described in 3GPP TS 29.525 [57] and invokes the Npcf_SMPolicyControl_UpdateNotify request to provide to the SMF+PGW-C via the SmPolicyDecision structure:

- the updated policy control request trigger(s), if available. and, if not previously provided, the RAT Type change policy control request trigger (to identify EPS to 5GS mobility); and
- transparently, the received UE policy container within the "uePolCont" attribute.

B.3.4 Npcf_SMPolicyControl_Update Service Operation

B.3.4.0 General

When the established PDN connection through the EPC/E-UTRAN network is modified and SMF+PGW-C receives Modify Bearer Request, Modify Bearer or Delete Bearer Command message and if the SMF detects the policy control request trigger(s) is met or the error(s) needs to be reported or when the UE handed over from the 5GS to the EPS and the SMF detects the policy control request trigger(s) is met, the SMF+PGW-C shall behave as defined in clause 4.2.4.2 with the differences that the SMF+PGW-C shall include (if available) in the SmPolicyUpdateContextData data structure:

- IP-CAN type within the "accessType" attribute;
- RAT type within the "ratType" attribute;

NOTE 1: See Annex B.3.4.5 for further information.

- subscribed APN-AMBR within the "subsSessAmbr" attribute;
- subscribed Default EPS bearer QoS Information within the "subsDefQos" attribute;

NOTE 2: Subscribed APN-AMBR and the QCI within the subscribed default EPS bearer QoS are mapped to subscribed Session-AMBR and 5QI as defined in Annex B.3.6.1 respectively.

- the bearer usage required for the dedicated bearer within the "qosFlowUsage" attribute if the UE initiates a resource modification request procedure and the bearer usage request was present in the Bearer Resource Command;
- user location information of EPC within the "userLocationInfo" attribute; and

NOTE 3: See Annex B.3.4.3 for further information.

- UE policy container within "uePolCont" attribute, if available.

The policy control request trigger "RES_MO_RE" is not supported when the PDN connection is established through the EPC/E-UTRAN network. The SMF+PGW shall reject the PDU session modification that initiated the UE's resource modification.

During interworking from 5GS to EPS, if the feature "PackFiltAllocPrecedence" is supported, for QoS Flows without EPS bearer ID(s) assigned or for QoS Flows related to PCC Rules that do not have allocated TFT packet filters, the SMF+PGW-C shall delete those PCC Rules and inform the PCF. The SMF+PGW-C shall include the "ruleReports" attribute containing the RuleReport data instance which specifies the affected PCC rules within the "pccRuleIds" attribute, set to "INACTIVE" the value within the "ruleStatus" attribute and the

"PACKET FILTER TFT ALLOCATION EXCEEDED" as the value of the "failureCode" attribute.

If the feature "PackFiltAllocPrecedence" is supported, the PCF may provide, as part of the PccRule data type for the new PCC Rules to be installed the "packFiltAllPrec" attribute to indicate the order of the PCC Rules in the allocation of

TFT packet filter(s) by the SMF+PGW-C. The PCF may include this parameter if the feature "PackFiltAllocPrecedence" is supported and there is a possibility to run into a restriction regarding the number of TFT packet filters that can be allocated for the PDU Session and interworking with EPS with N26 deployment is supported as described in Annex B.3.2.0.

B.3.4.1 Number of Supported Packet Filters Report

When the UE handed over from the EPC/E-UTRAN to the 5GS and the number of supported packet filters for signalled QoS rules is received from the UE, the SMF shall include the "NUM_OF_PACKET_FILTER" within the "repPolicyCtrlReqTriggers" attribute and the number of supported packet filters for signalled QoS rules within the "numOfPackFilter". In this case, the PCF shall behave as defined in clause 4.2.6.2.16.

NOTE: The maximum number of packet filters sent to the UE per QoS rule is additionally limited as specified in 3GPP TS 24.501 [20] when the UE is camping in 5GS.

B.3.4.2 Policy Update When UE suspends

B.3.4.2.1 Policy Update Error Report

If the PolicyUpdateWhenUESuspends feature as defined in clause 5.8 is supported, the PCF and the SMF shall comply with the procedures specified in this clause. During PDU session/PDN connection establishment or modification procedure, the PCF shall subscribe to the "UE_STATUS_RESUME" policy control request trigger if not subscribed yet, as described in clause 4.2.6.4. When the SMF receives the policy decision from the PCF as defined in clause 4.2.4.1 for a PDN connection maintained when the UE's status is suspend state, the SMF shall include the "ruleReports" attribute for the affected PCC rules and/or session rules to report the failure within the SmPolicyUpdateContextData data structure. Within the ErrorReport data structure, the SMF shall include the "error" attribute containing the "cause" attribute of the ProblemDetails data structure set to "UE_STATUS_SUSPEND" which indicates the failure to enforce the corresponding policy decision, except if the policy decision is for the PCC rule removal only and/or session rule removal only, and further include the information as follows:

- if the policy decision includes the modification of one or more session rules, within an RuleReport instance, the SMF shall include the "sessRuleReports" attribute. Within each SessionRuleReport data structure, the SMF shall include the affected session rules within the "ruleIds" attribute, the "sessRuleFailureCode" attribute set to "UE_STA_SUSP" and the "ruleStatus" attribute set to ACTIVE to indicate the failure to enforce those session rules.
- if the policy decision includes the installation of one or more PCC rules, the SMF shall invoke the procedure as defined in clause 4.2.4.15 with the "failureCode" attribute set to "UE_STA_SUSP" and "ruleStatus" attribute set to INACTIVE to indicate the failure to enforce those PCC rules.
- if the policy decision includes the modification of one or more PCC rules, the SMF shall invoke the procedure as defined in clause 4.2.4.15 with the "failureCode" attribute set to "UE_STA_SUSP" and "ruleStatus" attribute set to ACTIVE to indicate the failure to enforce those PCC rules.

Upon reception of the "failureCode" attribute and/or "sessRuleFailureCode" attribute set to "UE_STA_SUSP", the PCF shall not initiate any PDU Session Modification procedure, except if it is initiated for the PCC rule removal only and/or session rule removal only, for the given PDU session over N7 until the UE's status is resumed.

B.3.4.2.2 UE State Change Report

If the SMF detected the UE's status is resumed from suspend state, the SMF shall inform the PCF of the UE status including the "UE_STATUS_RESUME" within "repPolicyCtrlReqTriggers" attribute. The PCF shall after this update the SMF with PCC Rules or session rules if necessary.

B.3.4.3 UE Location related information

When the UE handed over from the EPC/GERAN or EPC/UTRAN and the feature "2G3GIWK" is supported, or 5GS to EPC/E-UTRAN the SMF+PGW-C shall include, together with the policy control request triggers met, the following user location information:

- If the "SAREA_CH" or "SCELL_CH" policy control request trigger is provisioned and met, the user location information within the "eutraLocation" attribute included in the "userLocationInfo" attribute.
- If the "SCNN_CH" policy control request trigger is provisioned and met, the "servNfId" attribute including the S-GW identification within the "anGwAddr" attribute.
- If the "AN_INFO" policy control request trigger is met, the user location was requested by the PCF and provided to the SMF+PGW-C, the SMF shall provide the user location information within the "eutraLocation" attribute included in the "userLocationInfo" attribute and the time when it was last known in the 3GPP access within "userLocationInfoTime" attribute (if available).

When the UE handed over from the EPC/E-UTRAN to the EPC/GERAN or EPC/UTRAN and the feature "2G3GIWK" is supported the SMF+PGW-C shall include, together with the policy control request triggers met, the following user location information:

- If the "SAREA_CH" or "SCELL_CH" policy control request trigger is provisioned and met, the user location information within the "geraLocation" attribute or "utraLocation" attribute included in the "userLocationInfo" attribute.
- If the "SCNN_CH" policy control request trigger is provisioned and met, the "servNfId" attribute including the SGSN identification within the "sgsnAddr" attribute.

When the UE handed over from the 5GS to EPC non-3GPP access, the SMF+PGW-C shall include, together with the applicable provisioned policy control request triggers, the following user location information:

- If the "SAREA_CH" policy control request trigger is provisioned and met, and the hand over is to EPC untrusted non-3GPP access, the user location information within the "n3gaLocation" attribute included in the "userLocationInfo" attribute as specified in clause B.3.2.1.
- If the "SCNN_CH" policy control request trigger is provisioned and met, the ePDG identification within the "anGwAddr" attribute included in the "servNfId" attribute.
- If the "AN_INFO" policy control request trigger is met, the user location was requested by the PCF and provided to the SMF+PGW-C, the SMF shall provide the user location information within the "n3gaLocation" attribute included in the "userLocationInfo" attribute and the time when it was last known in the non-3GPP access within "userLocationInfoTime" attribute (if available). The "n3gaLocation" attribute includes the "ueIpv4Addr" or "ueIpv6Addr" attributes, and, if available the "portNumber" and "protocol" attributes and, if the feature "WLAN Location" is supported, the "twapId" attribute encoding the WLAN location information, if available.
- NOTE 1: The "n3gaLocation" attribute does not include the "n3gppTai" and "n3IwfId" attributes in EPC interworking scenarios.
- NOTE 2: SCELL_CH policy control request trigger is not supported in EPC Non-3GPP access. The PCF will not receive user location information related to this trigger in this case.

B.3.4.4 Presence Reporting Area Information Report

When the UE is connected through the EPC/E-UTRAN network, the SMF+PGW-C receives the presence reporting area information as defined in 3GPP TS 29.274 [37]. When the PRA or ePRA feature is supported, the SMF+PGW-C provides presence reporting area to the PCF as specified in clause 4.2.4.16.

If the SMF+PGW-C receives from the MME presence reporting information corresponding to the Set of Core Network predefined Presence Reporting Areas, and the individual presence reporting area as specified in 3GPP TS 29.274 [37], the SMF+PGW shall only provide the PCF with the individual presence reporting area within the "praId" attribute of the PresenceInfo data type.

B.3.4.5 Access Type related information

The SMF+PGW shall include, when the policy control request trigger "AC_TY_CH" is met, the following access type information:

- If after handover the new access type is EPC/E-UTRAN:
 - a) the "3GPP_ACCESS" value within the "accessType" attribute; and

- b) the "EUTRA" value within the "ratType" attribute.
- If after handover the new access type is EPC/UTRAN and the feature "2G3GIWK" is supported:
 - a) the "3GPP_ACCESS" value within the "accessType" attribute; and
 - b) the "UTRA" value within the "ratType" attribute.
- If after handover the new access type is EPC/GERAN and the feature "2G3GIWK" is supported:
 - a) the "3GPP_ACCESS" value within the "accessType" attribute; and
 - b) the "GERA" value within the "ratType" attribute.
- If after handover the new access type is EPC/ePDG:
 - a) the "NON_3GPP_ACCESS" value within the "accessType" attribute;
 - b) the "WLAN" or "VIRTUAL" value within the "ratType" attribute, as applicable; and
 - c) the ePDG address in the "servNfId" attribute within the "anGwAddr" attribute.
- NOTE 1: In the interworking scenario, "AC_TY_CH" is met when the UE handed over from the 5GC/N3IWF or 5GC/TNAN/TWAN to the EPC/E-UTRAN, or when the UE handed over from the 5GS to the EPC/ePDG.

The SMF+PGW shall include, when the policy control request trigger "RAT_TY_CH" is met, the following RAT type information:

- If after handover the new RAT type is the E-UTRA, the "EUTRA" value within the "ratType" attribute.
- If after handover the new RAT type is the WLAN, the "WLAN" or "VIRTUAL" value within the "ratType" attribute, as applicable.

NOTE 2: In the interworking scenario, "RAT_TY_CH" is met when the UE handed over from the NR to the E-UTRA or when the UE handed over from the NR to the WLAN (untrusted) and from E-UTRA to WLAN (trusted/untrusted) or from E-UTRA to N3GA.

B.3.4.6 Report of EPS Fallback

When the "EPSFallbackReport" feature is supported, if the "policyCtrlReqTriggers" attribute with the value "EPS_FALLBACK" has been provided to the SMF, the SMF shall notify to the PCF of EPS fallback when a PCC rule referred from the "lastReqRuleData" attribute required the EPS fallback report within the "reqData" attribute.

When the SMF received a PDU session modification response from the access network indicating the establishment of the QoS flow with 5QI=1 is rejected due to EPS fallback, the SMF shall within the SmPolicyUpdateContextData data structure include:

- the "EPS_FALLBACK" value within the "repPolicyCtrlReqTriggers" attribute; and
- the affected PCC rules within the "pccRuleIds" attribute included in the "ruleReports" attribute, where the "ruleStatus" attribute is set to ACTIVE.

The PCF shall identify the AF session that requested the voice media type that triggered the EPS fallback and shall notify the AF as described in clauses 4.2.5.15 of 3GPP TS 29.514 [17] or in clause E.3 of 3GPP TS 29.214 [18].

B.3.4.7 MA PDU Session

If the UE or the network does not support MA PDU Session with 3GPP access connected to EPC, when the UE handed over from the EPC/E-UTRAN to the 5GS and the MA PDU Request Indication or MA PDU Network-Upgrade Allowed Indication and ATSSS Capability are received from the UE, if the "ATSSS" feature defined in clause 5.8 is supported, the SMF shall include the "MA_PDU" within the "repPolicyCtrlReqTriggers" attribute, and, as defined in clause 4.2.2.17, the SMF shall include the MA PDU session Indication within the "maPduInd" attribute and the ATSSS capability of the MA PDU session within the "atsssCapab" attribute. In this case, the PCF shall behave as defined in clause 4.2.2.17.

NOTE: If the UE and the network support MA PDU Sessions with 3GPP access connected to EPC, the MA PDU Session can be simultaneously associated with user-plane resources on 3GPP access network connected to EPC and with non-3GPP access network connected to 5GC as specified in clause B.3.6.4.

B.3.4.8 EPS RAN NAS Cause Support

If the RAN-NAS-Cause feature as defined in clause 5.8 is supported, and the PDN connection is established through the EPC network, the SMF shall report the RAN/NAS release cause(s) as specified in clauses 4.2.4.7, 4.2.4.12 and 4.2.4.15, with the exception that the received EPS RAN/NAS cause(s) are encoded within the "epsCause" attribute included in the RanNasRelCause data type. In this Release of the specification, the EPS release cause code information may include RAN/NAS release cause(s), a TWAN release cause or an untrusted WLAN release cause.

B.3.4.9 S-GW Restoration Support

If the SGWRest feature as defined in clause 5.8 is supported, the PCF and the SMF shall comply with the procedures specified in this clause. During PDU session/PDN connection establishment or modification procedure, the PCF shall subscribe to the "SCNN_CH" policy control request trigger if not subscribed yet, as described in clause 4.2.6.4.

When the SMF+PGW receives the policy decision from the PCF as defined in clause 4.2.4.1 or for a PDN connection maintained during a S-GW failure for a policy decision received as defined in clause 4.2.3.1 or 4.2.4.1, the SMF+PGW shall act as follows:

- For MME/S4-SGSN triggered S-GW Restoration scenarios:
 - When the SMF receives the policy decision from the PCF as defined in clause 4.2.4.1 for a PDN connection maintained during a S-GW failure, the SMF shall include the "ruleReports" attribute for the affected PCC rules and/or the "sessRuleReports" attribute for the affected session rules to report the failure within the SmPolicyUpdateContextData data structure and further include the information as follows.
 - if the policy decision is related to one or more PCC rules, the SMF+PGW shall behave as defined in clause 4.2.4.15 with the "failureCode" attribute set to set to "AN_GW_FAILED".
 - if the policy decision is related to one or more session rules the SMF+PGW shall behave as defined in clause 4.2.4.21 with the "sessRuleFailureCode" attribute set to "AN_GW_FAILED".
- For SMF+PGW triggered S-GW Restoration scenarios, if the SMF+PGW has accepted the procedure as per normal procedures but the PDN connection is not restored during an operator configured time period, the SMF+PGW shall behave as follows when the related timer expires:
 - if the policy decision is related to the PCC rule(s), the SMF+PGW shall behave as defined in clause 4.2.4.15 with the "failureCode" attribute set to "RESOURCE_ALLOCATION_FAILURE"
 - if the policy decision is related to the session rule(s), and the "SessQoSModEnforcementFailure" feature is not supported the SMF+PGW shall behave as defined in clause 4.2.4.21 with the "sessRuleFailureCode" attribute set to "SESSION_RESOURCE_ALLOCATION_FAILURE". If the "SessQoSModEnforcementFailure" feature is supported, the "sessRuleFailureCode" attribute shall be set to "DEFAULT_QOS_MODIFICATION_FAILURE" or "SESSION_AMBR_MODIFICATION_FAILURE" based on the failure to enforce the corresponding policy decision.

For MME/S4-SGSN triggered S-GW Restoration scenarios, while the S-GW restoration is in progress, if the SMF+PGW sends a request towards the PCF that is triggered by a different event (e.g. internal event at SMF+PGW), the SMF+PGW shall include the "anGwStatus" attribute set to "AN_GW_FAILED".

Upon reception of the "failureCode" attribute set to "AN_GW_FAILED" and/or the "sessRuleFailureCode" attribute set to "AN_GW_FAILED" or the "anGwStatus" attribute set to "AN_GW_FAILED", the PCF shall not initiate any SM Policy association modification procedure, except if the SM Policy association modification procedure is initiated for the PCC rule removal only, for the given SM Policy association over N7 until the S-GW has recovered.

If the SMF+PGW indicated AN_GW_FAILED previously according to the procedures described above or in annex B.3.3.3, the SMF+PGW shall inform the PCF when the S-GW has recovered by including "repPolicyCtrlReqTriggers" attribute set to the "SCNN_CH" and the "servNfId" attribute including the S-GW identification within the "anGwAddr" attribute related to the restored or new S-GW. The PCF may after this update the SMF+PGW if necessary.

NOTE 1: The PCF could reject requests from the AF and UDR when the "cause" attribute of the ProblemDetails data structure set to "AN_GW_FAILED", the "failureCode" attribute set to "AN_GW_FAILED" and/or the "sessRuleFailureCode" attribute set to "AN_GW_FAILED" or the "anGwStatus" attribute set to "AN_GW_FAILED" is received until the "repPolicyCtrlReqTriggers" attribute set to the "SCNN_CH" is received.

The SMF+PGW shall maintain the PDN connections affected by the S-GW failure and eligible for restoration for an operator configurable time period. Upon expiry of that time period, the SMF+PGW shall release the PDN connection and inform the PCF about the SM Policy association termination as specified in clause 4.2.5.2.

NOTE 2: The PCF is not aware of which PDN connections are eligible for restoration. When the SMF+PGW detects a S-GW failure, the SMF+PGW requests the PCF to terminate SM Policy associations associated to PDN connections affected by the S-GW failure and not eligible for restoration.

The SMF+PGW should maintain the GBR bearers of the PDN connections eligible for restoration for an operator configurable time period. Upon expiry of that time period, the SMF+PGW shall release GBR bearers that have not yet been restored and inform the PCF about the PCC rule removal as specified in clause 4.2.4.7.

The SMF+PGW shall discard downlink packets received for a PDN connection maintained during a S-GW failure that has not yet been restored.

The SMF+PGW shall delete the PDN connection locally when it receives an SM Policy association termination from the PCF as described in clause 4.2.4.3.

B.3.4.10 UE initiates a resource modification support

In the case that the UE initiates a resource allocation procedure as defined in clause 6.5.3 or UE initiates a resource modification procedure as defined in clause 6.5.4 of 3GPP 3GPP TS 24.301 [52], the SMF+PGW shall within the SmPolicyUpdateContextData data structure include the "RES_MO_RE" within the "repPolicyCtrlReqTriggers" attribute and shall include the UE request of specific QoS handling for selected SDF within the "ueInitResReq" attribute. Within the UeInitiatedResourceRequest data structure, the SMF+PGW shall include the "ruleOp" attribute, "packFiltInfo" attribute and "reqQos" attribute if applicable as follows:

- When the UE requests to "Create new TFT", the SMF+PGW shall include the "ruleOp" attribute set to "CREATE_PCC_RULE", the "packFiltInfo" attribute and "reqQos" attribute containing the requested QoS for the new PCC rule. Each PacketFilterInfo instance shall contain one packet filter provided by the UE. If the PCF authorizes the request, the PCF shall create a new PCC rule by including the new packet filters within the service data flow template of the PCC rule.
- When the UE requests to "Add packet filters to existing TFT", SMF+PGW shall include the "ruleOp" attribute set to "MODIFY_PCC_RULE_AND_ADD_PACKET_FILTERS", the "pccRuleId" attribute including the PCC rule identifier corresponding the packet filter identifier provided by the UE and the "packFiltInfo" attribute. Each PacketFilterInfo instance shall contain one packet filter requested for addition. If the UE request includes the modified QoS information the SMF+PGW shall also include the "reqQos" attribute to indicate the updated QoS for the affected PCC rule(s). If the PCF authorizes the request, the PCF shall update the PCC rule by adding the new packet filters to the service data flow template of the PCC rule.
- When the UE requests to "Replace packet filters in existing TFT", SMF+PGW shall include the "ruleOp" attribute set to "MODIFY_PCC_RULE_AND_REPLACE_PACKET_FILTERS", the "pccRuleId" attribute including the PCC rule identifier corresponding the packet filter identifier provided by the UE and the "packFiltInfo" attribute. Each PacketFilterInfo instance shall within the "packFiltId" attribute include the replaced packet filter identifier assigned by the PCF corresponding to the packet filter identifier received from the UE and one packet filter requested for addition. If the UE request includes the modified QoS information the SMF+PGW shall also include the "reqQos" attribute to indicate the updated QoS for the affected PCC rule. If the PCF authorizes the request, the PCF shall update PCC rule by replacing the existing packet filter with the new packet filter within the service data flow template of the PCC rule.
- When the UE requests to "Delete packet filters from existing TFT", SMF+PGW shall include the "ruleOp" attribute set to "MODIFY_PCC_RULE_AND_DELETE_PACKET_FILTERS", the "pccRuleId" attribute including the PCC rule identifier corresponding the paceket filter identifier provided by the UE and the "packFiltInfo" attribute. Each PacketFilterInfo instance shall within the "packFiltId" attribute include the removed packet filter identifier assigned by the PCF corresponding to the packet filter identifier received from the UE. If the UE request includes modified QoS information the SMF+PGW shall also include the "reqQos"

attribute to indicate the updated QoS for the affected PCC rule(s). If the PCF authorizes the request, the PCF shall update PCC rule by removing the corresponding packet filters from the service data flow template of the PCC rule.

- When the UE requests to "No TFT operation", SMF+PGW shall include the "ruleOp" attribute set to "MODIFY_PCC_RULE_WITHOUT_MODIFY_PACKET_FILTERS", the "pccRuleId" attribute including the PCC rule identifier corresponding the paceket filter identifier provided by the UE and the modified QoS information within the "reqQos" attribute.
- When the UE requests to "Delete existing TFT", the SMF+PGW shall include the "ruleOp" attribute set to "DELETE_PCC_RULE", the "pccRuleId" attribute including the PCC rule identifier corresponding the packet filter identifier provided by the UE and the "packFiltInfo" attribute. The PCF shall remove the PCC rule when the PCF receives the request according to the PCC rule identifier.

NOTE 1: The UE can only modify or delete packet filters that the UE has introduced and associated resources. The packet filter identifiers contained in the FlowInformation data structure are only used for packet filters created by the UE.

The SMF+PGW shall calculate the requested GBR, for a GBR QCI, as the sum of the previously authorized GBR for the affected PCC rule, adjusted with the difference between the requested GBR for the EPS bearer and previously negotiated GBR for the EPS bearer. For the UE request to "Create new TFT", the GBR as requested by the UE for those filters shall be used.

If the request covers all the PCC rules with a bearer binding to the same bearer, then the SMF+PGW may request a change to the QCI for existing packet filters.

For the purpose of creating or modifying a packet filter, replacing and modifying packet filter, within the UeInitiatedResourceRequest instance, the SMF+PGW shall include the precedence information of the packet filter within the "precedence" attribute, and within each PacketFilterInfo instance, the SMF+PGW shall include the "packFiltCont" attribute, "tosTrafficClass" attribute, "spi" attribute, "flowLabel" attribute and "flowDirection" attribute set to the value(s) describing the packet filter provided by the UE.

NOTE 2: The UE signalling with the network is governed by the applicable NAS signalling TS. The NAS 3GPP TS for a specific access may restrict the UE possibilities to make requests compared to what is stated above.

If the PCF authorizes the request from the UE, the PCF shall construct a PCC rule(s) based on the UeInitiatedResourceRequest data structure. For "CREATE_PCC_RULE" or

"MODIFY_PCC_RULE_AND_ADD_PACKET_FILTERS" operation, the PCF shall within the FlowInformation data structure include the assigned packet filter identifier within the "packFiltId" attribute. When the SMF+PGW derives the TFT based on the PCC rule, the SMF+PGW shall assign a new packet filter identifier for each added packet filter and keep the mapping between the packet filter identifier for the packet filter within the PCC rule and TFT sento the UE.

B.3.4.11 Report of Access Charging Network Identifier

The report of the Access Network Charging Identifier(s) is as specified in clause 4.2.4.13, with the difference that when the SMF assigns an Access Network Charging Identifier per EPS bearer/QoS flow, the SMF shall additionally include, within each AccNetChId instance, all the PCC rule identifier(s) associated to the provided Access Network Charging Identifier within the "refPccRuleIds" attribute.

B.3.4.11a Detection of the SM Policy Association enabling URSP provisioning in EPS

During UE Initial Attach with default PDN connection establishment in EPS, the UE and the SMF+PGW-C perform ePCO capability negotiation as defined in 3GPP TS 24.301 [52] to ensure that both, the network and the UE support URSP provisioning in EPS PCO. The SMF+PGW-C, when receives from the UE the Indication of URSP Provisioning Support in EPS PCO in the PDN connectivity request, and supports the feature "EpsUrsp" as defined in clause 5.8, the SMF+PGW-C shall select a PCF that supports the feature "EpsUrsp", shall create the SM Policy Association as described in clause B.3.2 and shall provide to the UE the Indication of URSP Provisioning Support in EPS PCO in the PDN Connectivity Accept message as defined in 3GPP TS 24.301 [52].

When the UE determines the URSP provisioning in EPS PCO is supported by the network, then the UE intiates the UE requested bearer modification procedure and includes the UE Policy Container ePCO, which will be further forwarded by the MME to the SMF+PGW-C. When the feature "EpsUrsp" is supported and the SMF+PGW-C receives the UE Policy Container ePCO, the SMF+PGW-C shall include the "UE_POL_CONT_IND" within the "repPolicyCtrlReqTriggers" attribute and shall forward transparently the UE Policy Container to the PCF for the PDU session within the "uePolCont" attribute. When the feature "EpsUrsp" is supported and the SMF+PGW-C receives the failure result for UE Policy Container delivery, the SMF+PGW-C shall include the "UE_POL_CONT_IND" within the "repPolicyCtrlReqTriggers" attribute and shall forward transparently the appropriate failure delivery report to the PCF for the PDU session within the "uePolFailReport" attribute.

The PCF for the PDU session then detects that the SM Policy Association enables the URSP provisioning in EPS and establishes a UE Policy Association with the PCF for the UE as described in 3GPP TS 29.525 [57] to transparently forward the received UE policy container. The PCF for the PDU session shall subscribe to RAT Type and/or Access-Type changes if not previously subscribed.

To detect the 5GS to EPS handover or 5GS to EPS Idle Mode mobility (both referred as 5GS to EPS mobility with N26 in the present document) and if the "EpsUrsp" feature described in clause 5.8 is supported, the PCF for the PDU session shall subscribe to RAT Type and/or Access Type changes, if not previously subscribed. During 5GS to EPS mobility with N26, and if the "EpsUrsp" feature described in clause 5.8 is supported, the PCF for the PDU session associated with the SMF+PGW-C serving the PDN connection(s) determines whether 5GS to EPS mobility applies based on the received RAT and/or Access-Type change event. When the reported RAT and Access-Type change event indicates the UE is moving from 5GS to EPS, the PCF for the PDU session then determines that the SM Policy Association(s) enables the URSP provisioning in EPS and establishes a UE Policy Association with the PCF for the UE, if applicable, as described in 3GPP TS 29.525 [57].

B.3.4.12 Reporting of UE Policy container for URSP provisioning in EPS

When the feature "EpsUrsp" is supported and a UE policy container is received from the UE in EPC over a PDN connection, the SMF+PGW-C requests to update the SM Policy Association and provides to the PCF the received UE policy container.

The Policy Control Request Trigger condition "UE_POL_CONT_IND" is met when the SMF+PGW-C receives a UE policy container from the UE or a failure delivery report. The SMF+PGW-C shall include the "UE_POL_CONT_IND" within the "repPolicyCtrlReqTriggers" attribute and shall transparently forward to the PCF the UE policy container encoded within the "uePolCont" attribute or the failure delivery report encoded within the "uePolFailReport" attribute. The PCF shall transparently forward the UE policy container to the PCF for the UE in Npcf_UEPolicyControl_Update/Create Request as described in 3GPP TS 29.525 [57].

B.3.4.13 Reporting of the PCC rule(s) removal in EPS

If the SMF+PGW-C releases dedicated QoS Flows established in 5GS, and remove the PCC rule(s) associated with these QoS Flows when the UE is handed over from 5GC to EPC/GERAN or EPC/UTRAN as described in clause 5.17.2.4, 3GPP TS 23.502 [3], then the SMF shall inform the PCF about the removal of the affected PCC rule(s) as defined in clause 4.2.4.12, and may provide the "RES_ALLO_FAIL" as the value of the "failureCode" attribute.

B.3.5 Npcf_SMPolicyControl_Delete Service Operation

B.3.5.1 General

When the UE deletes the PDN connection through the EPC network and the SMF+PGW-C shall behave as defined in clause 4.2.5.2 with the difference that the SMF+PGW-C shall include the information elements contained in the Delete Session Request message within the SmPolicyDeleteData data structure.

NOTE: See Annex B.3.2.1 for location information.

B.3.5.2 EPS RAN NAS Cause Support

If the RAN-NAS-Cause feature as defined in clause 5.8 is supported, and the PDN connection is established through the EPC network, the SMF shall report the RAN/NAS release cause(s) as specified in clause 4.2.5.4.7, with the exception

that the received EPS RAN/NAS cause(s) are encoded within the "epsCause" attribute included in the RanNasRelCause data type. In this Release of the specification, the EPS release cause code information may include RAN/NAS release cause(s), a TWAN release cause or an untrusted WLAN release cause.

B.3.6 Provisioning and Enforcement of Policy Decisions

B.3.6.1 QoS mapping perfored by the SMF+PGW-C

When the UE is served by the 5GC, during PDU Session establishment and GBR QoS flow establishment, SMF+ PGW-C performs EPS QoS mappings, from the 5G QoS parameters obtained from the PCF, and allocates TFT with the PCC rules obtained from the PCF. If a TFT is to be allocated for a downlink unidirectional EPS bearer mapped from a downlink only QoS Flow, the SMF+ PGW-C shall allocate a TFT packet filter that effectively disallows any useful uplink packet as described in clause 15.3.3.4 of 3GPP TS 23.060 [26]. The SMF+PGW-C sends the mapped QoS parameters and TFT to the UE via PCO.

When the UE is served by the EPC, during PDN Connection establishment and dedicated bearer establishment/modification, SMF+ PGW-C performs EPS QoS mappings, from the 5G QoS parameters obtained from the PCF, and allocates TFT with the PCC rules obtained from the PCF. Other 5G QoS parameters corresponding to the PDN connection, e.g. Session-AMBR, and QoS rules and QoS Flow level QoS parameters if needed for the QoS Flow(s) associated with the QoS rule(s), are sent to UE in PCO.

The SMF+PGW-C shall perform EPS QoS mappings as defined in clause 4.11.1.1 and Annex C in 3GPP TS 23.502 [3] as follows:

- ignore the QNC and reflective QoS indication if received;
- for standardized 5QIs, the authorized 5QI is one to one mapped to the QCI;

NOTE: The delay critical 5QI mapping to QCI is unspecified in the present specification.

- for non-standardized 5QI, derive the authorized QCI based on the authorized 5QI and operator policy;
- one to one map the subscribed default QCI to the subscribed default 5QI;
- set the subscribed Session-AMBR according to operator policy (e.g. taking the value of subscribed APN-AMBR into account); and
- set the authorized APN-AMBR according to operator policy (e.g. taking the value of authorized Session-AMBR into account).

When SMF+PGW-C is used for GERAN/UTRAN access during PDN Connection establishment, dedicated bearer establishment/modification and the feature "2G3GIWK" is supported, SMF+ PGW-C maps R99 QoS to/from EPS parameters as defined in Annex E of TS 23.401 [58]. The EPS and 5G QoS mapping is performed as defined in this clause.

B.3.6.2 Provisioning of Presence Reporting Area Information

When the PRA or ePRA feature is supported, the PCF provides the SMF with Presence Reporting Area(s) information as specified in clause 4.2.6.5.6. When the UE is connected through the EPC/E-UTRAN network, the SMF+PGW-C initiates the appropriate PDN connection specific procedures specified in 3GPP TS 29.274 [37] to obtain or to deactivate the report of the presence state of a UE in a presence reporting area.

NOTE: Homogeneous support of Presence Area reporting in EPC and 5GC networks is assumed.

B.3.6.3 Request and Report of Access Network information

If the NetLoc feature as defined in clause 5.8 is supported, the PCF may request the SMF+PGW-C to report the access network information as defined in clause 4.2.6.5.4.

If the AN_INFO policy control request trigger is set, upon receiving the "lastReqRuleData" attribute with the "reqData" attribute with the value(s) MS_TIME_ZONE and/or USER_LOC_INFO and the "refPccRuleIds" attribute containing the PCC rule identifier(s) corresponding to the PCC rule(s) being installed, modified or removed:

- If the "reqData" attribute indicates MS_TIME_ZONE and USER_LOC_INFO and the SMF+PGW-C determines that the access network does not support the access network information reporting, the SMF+PGW-C shall immediately inform the PCF by including the "netLocAccSupp" attribute set to "ANR_NOT_SUPPORTED" value in the "UeCampingRep" data structure returned in the "200 OK" response to the policy update notification request.
- If the "reqData" attribute only includes the MS_TIME_ZONE value and the SMF+PGW-C determines that the access network does not support the report of the UE time zone, the SMF+PGW-C shall immediately inform the PCF by including the "netLocAccSupp" attribute set to "TZR_NOT_SUPPORTED" value in the "UeCampingRep" data structure returned in the "200 OK" response to the policy update notification request.
- If the "reqData" attribute only includes the USER_LOC_INFO value and the SMF+PGW-C determines that the access network does not support the report of the UE location, the SMF+PGW-C shall immediately inform the PCF by including the "netLocAccSupp" attribute set to "LOC_NOT_SUPPORTED" value in the "UeCampingRep" data structure returned in the "200 OK" response to the policy update notification request.
- If the "reqData" attribute includes the USER_LOC_INFO value and the MS_TIME_ZONE value, and the SMF+PGW-C determines the access network supports the report of UE location and/or UE time zone, the SMF+PGW-C shall apply appropriate procedures to the EPC access network to obtain the requested and supported access network information and shall report the available information as specified in clause 4.2.4.9.

NOTE: The SMF+PGW determines whether the access network supports access network information reporting based on access type, RAT type and trusted/untrusted type of the access network.

When the request to report access network information occurs within an EPS Fallback for IMS voice procedure, the SMF shall delay the report of access network information till the handover to EPS has been completed, as specified in 3GPP TS 23.502 [3], clause 4.13.6.1.

B.3.6.4 MA PDU sessions with connectivity over E-UTRAN/EPC and non-3GPP access to 5GC

If the "EnATSSS" feature defined in clause 5.8 is supported by both the SMF and the PCF, this scenario uses the Access Traffic Steering, Switching and Splitting functionality as described in clauses 4.2.2.17, 4.2.3.21, and 4.2.4.2 with the following specifics:

- Multi access connectivity is provided using EUTRAN/EPC as 3GPP access and non-3GPP/5GC system as non-3GPP access.
- The ATSSS rules are derived from PCC rules and provided from the PGW-C+SMF to the UE over the non-3GPP access in 5GC system.
- When the UE requests a PDN connection in EPC indicating the association with a MA PDU session, the PDN connection may be handed over to 3GPP access in 5GC without affecting the ATSSS control.

B.3.6.5 MA PDU sessions with connectivity over 5GC and non-3GPP access to EPC

If the "EnATSSS_v2" feature defined in clause 5.8 is supported by both the SMF and the PCF, this scenario uses the Access Traffic Steering, Switching and Splitting functionality as described in clauses 4.2.2.17, 4.2.3.21, and 4.2.4.2 with the following specifics:

- Multi access connectivity is provided using 5GS as 3GPP access and ePDG/EPC system as non-3GPP access.
- The ATSSS rules are derived from PCC rules and provided from the PGW-C+SMF to the UE over the 3GPP access in 5GC system. ATSSS rules may be provided to the UE via ePDG/EPC.
- When the UE requests a PDU session in 5GS indicating the association with a MA PDU session, the PDU session may be handed over to 3GPP access in EPC without affecting the ATSSS control.

B.3.7 Detection and handling of late arriving requests for interworking scenario

B.3.7.1 Handling of requests which collide with an existing SM Policy Association

When the UE is served by the EPC and the SMF+PGW-C receives the origination time stamp from the originating entity (see clause 13.2 of 3GPP TS 29.274 [37]) during the PDN connection establishment, the SMF+PGW-C shall include the origination time stamp parameter within 3gpp-Sbi-Origination-Timestamp header in the HTTP POST request sent to the PCF, the PCF shall perform the behaviour as defined in clause 4.2.7.1.

B.3.7.2 Detection and handling of requests which have timed out at the originating entity

When the UE is served by the EPC and the SMF+PGW-C receives the origination time stamp and the maximum wait time from the originating entity (see clause 13.3 of 3GPP TS 29.274 [37]), the SMF+PGW-C shall behave as defined in annex B.3.2 with the differences that the SMF+PGW-C:

- shall include a 3gpp-Sbi-Sender-Timestamp header set to the value of the received origination time stamp;
- shall include a 3gpp-Sbi-Max-Rsp-Time header set to the value of the received maximum wait time.

When the PCF receives the request from the SMF+PGW-C, the PCF shall behave as defined in clause 6.11.2 of 3GPP TS 29.500 [4].

Annex C (normative): Wireless and wireline convergence access support

C.1 Scope

This annex defines procedures for wireless and wireline convergence access support for 5GS. The specific stage 2 definition and related procedures are contained in 3GPP TS 23.316 [42]. The System Architecture for wireless and wireline convergence access is defined in 3GPP TS 23.501 [2].

C.2 Npcf_SMPolicyControl Service

C.2.1 Service Description

C.2.1.1 Overview

Clause 4.1.1 applies with the exception that the UE is replaced by the 5G-RG and the W-AGF, which is acting as a UE towards the 5GC on behalf of the FN-RG.

C.2.1.2 Service Architecture

Clause 4.1.2 applies with the exception that roaming functionality does not apply for session policy control in this Release of the specification for 5G-RG users connecting to the 5GC via W-5GAN and FN-RG users. Roaming architecture is only applicable to a 5G-RG connecting to the 5GC via NG RAN.

The 5G-RG may support LTE access connected to EPC and EPC interworking as defined in Annex B.

C.2.1.3 Network Functions

C.2.1.3.1 Policy Control Function (PCF)

The PCF functionality defined in clause 4.1.3.1 shall apply with the exceptions described in this Annex.

C.2.1.3.2 NF Service Consumers

The functionality defined in clause 4.1.3.2 shall apply.

The enforcement of the policy decisions applies for a single access PDU session over wireline access and multiaccess PDU sessions over wireline access and 3GPP with the exceptions described in this Annex.

C.2.1.4 Rules

C.2.1.4.1 PCC Rules

Functionality as described in clause 4.1.4.2 applies with the following exceptions for the traffic of a PDU session over wireline access:

- UL/DL Maximum Packet Loss Rate information does not apply.
- QoS Notification Control Information does not apply.

C.2.1.4.2 Gate Function

Functionality as described in clause 4.2.6.2.2 applies with the following exceptions for the traffic of a PDU session over wireline access:

- for the IPTV service, the "mulAccCtrl" attribute within the TrafficControlData data structure to which the PCC rule refers shall be used to describe if the gate is open or closed instead of the "flowStatus" attribute.

C.2.1.5 Policy control request trigger

The Policy Control Request Triggers defined in clause 5.6.3.6 and related procedures are supported for a 5G-RG connecting to the 5GC via NG-RAN.

The Policy Control Request Triggers defined in clause 5.6.3.6 are supported for a 5G-RG or FN-RG connecting to the 5GC via W-5GAN with the following not supporting ones:

- PLMN CH
- SAREA_CH
- SCNN_CH
- PRA_CH
- PS_DA_OFF
- QOS_NOTIF
- RES_RELEASE
- UE_STATUS_RESUME
- TSN_BRIDGE_INFO
- QOS_MONITORING
- SCELL_CH
- EPS_FALLBACK
- DDN_FAILURE
- DDN_DELIVERY_STATUS
- DDN_FAILURE_CANCELLATION
- DDN_DELIVERY_STATUS_CANCELLATION
- USER_LOCATION_CH
- UE_POL_CONT_IND
- URSP_ENFORCEMENT_INFO

Consequently, the procedures related to above policy control request triggers are not supported in the corresponding service operations.

The PS_DA_OFF Policy Control Request Trigger may apply for the 5G-RG connecting to the 5GC via W-5GAN (see clause 4.2.2.8 and 4.2.4.8) in an hybrid access scenario (see clause C.3.6.2).

The RES_MO_RE Policy Control Request trigger is not supported for a FN-RG as described in BBF TR-456 [47] and CableLabs WR-TR-5WWC-ARCH [48] specification.

C.2.1.6 UE IP address support

The UE IP address support defined in clause 4.2.8 applies with the following additions, as specified in 3GPP TS 23.316 [57]:

- IPv6 prefix other than default /64, including individual /128 IPv6 address, for IPv6 address allocation using DHCPv6;
- More than one UE IP addresses may be assigned to a PDU session and may be received by the PCF, where the UE IP addresses may correspond, to:
 - a. multiple /128 IPv6 addresses; or
 - b. an /64 default prefix used for IPv6 stateless autoconfiguration and IPv6 prefix(es) shorter than the default /64 prefix for IPv6 Prefix Delegation not including the /64 IPv6 Prefix (i.e. when the total IPv6 address space available for the PDU session cannot be aggregated into one single IPv6 prefix).

C.3 Service Operation

C.3.1 Introduction

Clause 4.2.1 applies.

C.3.2 Npcf_SMPolicyControl_Create Service Operation

C.3.2.1 General

Clause 4.2.2.2 is applied with the following differences:

- The allocated /128 IPv6 address or IPv6 /64 prefix or IPv6 prefix shorter than /64 is included within the "ipv6AddressPrefix" attribute.
- Request of Presence Reporting Area Change Report is not applicable when the 5G-RG or FN-RG connects to the 5GC via W-5GAN.
- Global Line ID including the line Id and either PLMN Id or operator Id is encoded within the "gli" attribute of the "n3gaLocation" attribute included in the "userLoc" attribute within the PolicyAssociationRequest data structure when the 5G-RG or FN-RG registers via W-5GBAN.
- The HFC Node Identifier is encoded in the "hfcNodeId" attribute of the "n3gaLocation" attribute included in the "userLocationInfo" attribute within the SmPolicyContextData data structure when the 5G-CRG or FN-CRG connects to the 5GC via W-5GCAN.
- The PEI that may be included within the "pei" attribute shall have one of the following representations:
 - i. When the UE supports only wireline access, the PEI shall be a MAC address.

NOTE: When the PEI includes an indication that the MAC address cannot be used as Equipment identifier, the PEI cannot be trusted for regulatory purposes and cannot be used for equipment based policy evaluation.

- ii. When the UE supports at least one 3GPP access technology, the PEI shall be the allocated IMEI or IMEISV.
- To support of Hybrid Access for a 5G-RG with a single PDU session as described in clause C.3.6.2.2, EPC interworking specific attributes and procedures apply as described in clause B.3.2;
- Access Traffic Steering, Switching and Splitting as defined in clause 4.2.2.17 is only applicable to the case that the 5G-RG establishes:
 - a) Hybrid Access with a multi-access PDU Session connectivity via NG-RAN and W-5GAN, as described in clause C.3.6.2.3; or

- b) Hybrid Access with a multi-access PDU Session connectivity via EPC/E-UTRAN and W-5GAN, as described in clause C.3.6.2.4.
- The access network transmission technology for the wireline access may be encoded:
 - i. within the "ratType" attribute of the SmPolicyContextData type; or
 - ii. when Access Traffic Steering, Switching and Splitting is supported, within the "ratType" attribute of the SmPolicyContextData type, or within the "ratType" attribute of the AdditionalAccessInfo type.
- The onboarding mechanism defined in 3GPP TS 23.501 [2], clause 5.30.2.10, is not applicable for an RG and thus the functionality related to the "PvsSupport" feature defined in this specification does not apply.

C.3.2.2 IPTV service support

If the PCF fetches the Multicast Access Control information from the UDR as defined in 3GPP TS 29.519 [15], the PCF shall authorize a PCC rule as defined in Annex C.3.6.1 and provision it to the SMF in the HTTP response message.

C.3.2.3 SNPN services support

Access to SNPN applies following the same specification as for accessing a PLMN with the exception that User Plane Remote Provisioning of UEs SNPN Credentials when in Onboarding Network (ONN) is not applicable, i.e. clause 4.2.2.21 does not apply.

NOTE: In this Release of the specification, the RG will not access to an ON-SNPN to initiate the onboarding procedure and thus the SMF will never provide the "onboardInd" attribute set to true.

C.3.3 Npcf_SMPolicyControl_UpdateNotify Service Operation

C.3.3.1 General

The descriptions in clause 4.2.3.1 are applied with the following differences:

- To support Hybrid Access for a 5G-RG with a single PDU session as described in clause C.3.6.2.2, EPC interworking specific attributes and procedures apply as described in B.3.3;
- Access traffic steering, switching and splitting support as described in clause 4.2.3.21 is only applicable to the case that 5G-RG establishes:
 - a) Hybrid Access with a multi-access PDU Session connectivity via NG-RAN and W-5GAN, as described in clause C.3.6.2.3; or
 - b) Hybrid Access with a multi-access PDU Session connectivity via EPC/E-UTRAN and W-5GAN, as described in clause C.3.6.2.4.
- Request for the result of PCC rule removal is not applicable when the 5G-RG or FN-RG connects to the 5GC via W-5GAN.

C.3.3.2 IPTV service support

If the PCF fetches the Multicast Access Control information from the UDR as defined in 3GPP TS 29.519 [15], for each impacted PDU session, the PCF shall authorize a PCC rule as defined in Annex C.3.6.1 and provision it to the SMF in the HTTP POST message.

C.3.4 Npcf SMPolicyControl Update Service Operation

C.3.4.1 General

Clause 4.2.4.2 is applied with the following differences:

- The released /128 IPv6 address or IPv6 /64 prefix or IPv6 prefix shorter than /64 is included within the "relIpv6AddressPrefix" attribute.
- If the feature "MultiIpv6AddrPrefix" is supported, the additionally allocated IPv6 prefix may be included within the "addIpv6AddrPrefixes" attribute and the additional released IPv6 prefix may be included within the "addRelIpv6AddrPrefixes" attribute. If the "UnlimitedMultiIpv6Prefix" feature is supported, and if multiple allocated or released IPv6 prefixes are detected, the NF service consumer shall include the new allocated UE Ipv6 prefixes within the "multiIpv6Prefixes" attribute and the released UE Ipv6 prefixes within the "mutliRelIpv6Prefixes" attribute.
- RAN cause and/or the NAS cause information is not applicable when the 5G-RG or FN-RG connects the 5GC via W-5GAN.
- To support Hybrid Access for a 5G-RG with a single PDU session as described in clause C.3.6.2.2, EPC interworking specific attributes and procedures apply as described in B.3.4;
- When the report of access network information described in clause 4.2.4.9 includes the user location information, the "n3gaLocation" attribute shall be included in the "userLocationInfo" attribute and:
 - a) if the UE connects via W-5GBAN access:
 - Global Line Identifier shall be encoded in the "gli" attribute; and
 - the "w5gbanLineType" attribute to indicate whether the W-5GBAN access is DSL or PON may be included; or
 - b) if the UE connects via W-5GCAN access, the HFC Node Identifier shall be encoded in the "hfcNodeId" attribute.
- Access traffic steering, switching and splitting support as described in clause 4.2.4.25 is only applicable to the case that 5G-RG establishes:
 - a) Hybrid Access with a multi-access PDU Session connectivity via NG-RAN and W-5GAN, as described in clause C.3.6.2.3; or
 - b) Hybrid Access with a multi-access PDU Session connectivity via EPC/E-UTRAN and W-5GAN, as described in clause C.3.6.2.4.
- The access network transmission technology for the wireline access may be encoded:
 - $i. \quad within the \ "ratType" \ attribute \ of the \ SmPolicyUpdateContextData \ type; \ or \ attribute \ or$
 - ii. when Access Traffic Steering, Switching and Splitting is supported, within the "ratType" attribute of the SmPolicyContextUpdateData type, or within the "ratType" attribute of the AdditionalAccessInfo type.

C.3.4.2 IPTV service support

If the "WWC" feature is supported and "5G_RG_JOIN" and/or "5G_RG_LEAVE" are provisioned and when the SMF detects a 5G-RG has joined or left to an IP Multicast Group, the SMF shall send an HTTP POST message as defined in clause 4.2.4.2 and include the "5G_RG_JOIN" or "5G_RG_LEAVE" within the "repPolicyCtrlReqTriggers" attribute respectively and the received one or more IP multicast addressing information within the "mulAddrInfos" attribute. Within each IpMulticastAddressInfo data structure, the SMF shall include the destination IPv4 multicast address of the DL multicast flow within the "ipv4MulAddr" attribute and the source IPv4 address of the DL multicast flow within the "srcIpv4Addr" attribute if available or the destination IPv6 multicast flow within the "srcIpv6Addr" attribute and the source IPv6 address of the DL multicast flow within the "srcIpv6Addr" attribute if available.

NOTE: The corresponding notification can be used by the PCF to manage Preview Rights related with an IP multicast flow corresponding to an IPTV channel by provisioning the corresponding PCC rule. In this case the PCF is responsible to remove the provisioned PCC rule when the preview duration has elapsed.

C.3.5 Npcf_SMPolicyControl_Delete Service Operation

C.3.5.1 General

Clause 4.2.5.1 is applied with the following differences and limitations:

- the "n3gaLocation" attribute shall be included in the "userLocationInfo" attribute and:
 - a) if the UE connects via W-5GBAN access:
 - Global Line Identifier shall be encoded in the "gli" attribute; and
 - the "w5gbanLineType" attribute to indicate whether the W-5GBAN access is DSL or PON may be included; or
 - b) if the UE connects via W-5GCAN access,
 - the HFC Node Identifier shall be encoded in the "hfcNodeId" attribute; and
 - the Global Cable Identifier may be encoded within the "gci" attribute.
- RAN cause and/or the NAS cause information is not applicable when the 5G-RG or FN-RG connects the 5GC via W-5GAN.

C.3.6 Provisioning and Enforcement of Policy Decisions

C.3.6.0 General

Clause 4.2.6 applies with the following exceptions for the traffic of a PDU session over wireline access:

- Policy provisioning and enforcement of authorized QoS per service data flow as described in clause 4.2.6.6.2 applies with the following differences:
 - a) Determination of Maximum Packet Loss Rate for UL/DL does not apply.
 - b) PCF does not request a notification when authorized GBR or delay critical GBR cannot be guaranteed or can be guaranteed again, i.e. "qnc" attribute does not apply.
- Provisioning of PCC Rules for Multimedia Priority Services is not supported. Clause 4.2.6.2.12 does not apply.
- Provisioning of PCC Rules for Mission Critical Services is not supported. Clause 4.2.6.2.19 does not apply.

C.3.6.1 IPTV service support

If the "WWC" feature is supported by the SMF and PCF as defined in clause 5.8, when the PCF fetches the Multicast Access Control information from the UDR as defined in 3GPP TS 29.519 [15] applicable for a SUPI or Internal Group Id during the PDU session establishment or receives the notification of the Multicast Access Control information from the UDR as defined in 3GPP TS 29.519 [15] applicable for a SUPI(s) and/or Internal Group Id(s) and/or DNN/S-NSSAI combination(s) during the PDU session modification, the PCF authorizes the Multicast Access Control information. For each impacted PDU Session that corresponds to the Multicast Access Control information, the PCF shall determine the PCC rule(s) that are generated based on the Multicast Access Control information as follows:

- for the multicast channel(s) which is allowed indicated in the Multicast Access Control information, the PCF shall include the corresponding multicast address(es) within the "flowInfos" attribute of the PCC rule and include the "mulAccCtrl" attribute set to "ALLOWED" within a Traffic Control Data instance which the PCC rule refers to.
- for the multicast channel(s) which is not allowed indicated in the Multicast Access Control information, the PCF shall include the corresponding multicast address(es) within the "flowInfos" attribute of the PCC rule and include the "mulAccCtrl" attribute set to "NOT_ALLOWED" within a Traffic Control Data instance which the PCC rule refers to.

- NOTE 1: The "flowStatus" attribute is not included in this Traffic Control Data instance. The gate fuction is not applicable to IPTV service, and the control is done with the "mulAccCtrl" attribute.
- NOTE 2: Separate PCC Rules are used to convey the information related to allowed and not allowed multicast channel(s).

C.3.6.2 Hybrid Access support

C.3.6.2.1 General

This clause specifies the support of policy control for Hybrid Access considering both, the support of single access PDU sessions and MA PDU sessions.

Hybrid Access applies to a 5G-RG capable of connecting to:

- both, NG-RAN and wireline access; and/or
- both, wireline access and EPC/E-UTRAN using EPC interworking as described in Annex B.

Hybrid Access does not apply to FN-RG.

C.3.6.2.2 Hybrid Access with single PDU session

Hybrid Access scenarios with single PDU sessions shall only use one of the two accesses, but the PDU session can be handover over between the two accesses.

When the "WWC" feature is supported by the SMF and the PCF as defined in clause 5.8:

- for a 5G-RG capable of connecting to the NG-RAN and the wireline access, the procedures specified in the main body of this specification apply, except:
 - i. the UE is replaced by the 5G-RG; and
 - ii. the non-3GPP access is replaced by the wireline access, as specified in this annex;
- for a 5G-RG capable of connecting to the wireline access and the EPC/E-UTRAN access, the procedures specified in the Annex B of this specification apply, except:
 - i. the UE is replaced by the 5G-RG; and
 - ii. the non-3GPP access is replaced by the wireline access.

C.3.6.2.3 Hybrid Access with MA PDU session connectivity over NG-RAN and wireline

If the "WWC" and the "ATSSS" features are supported by the SMF and the PCF as defined in clause 5.8, this scenario uses the Access Traffic Steering, Switching and Splitting functionality as described in clauses 4.2.2.17, 4.2.3.21, and 4.2.4.25.8 with the following differences:

- UE is replaced by 5G-RG.
- Non-3GPP access(es) is replaced by wireline access.

C.3.6.2.4 Hybrid Access with MA PDU session connectivity over EPC/E-UTRAN and wireline using EPC interworking scenarios

If the "WWC" and the "ATSSS" features are supported by the SMF and the PCF as defined in clause 5.8, this scenario uses the Access Traffic Steering, Switching and Splitting functionality as described in clauses 4.2.2.17, 4.2.3.21, and 4.2.4.2 with the following specifics:

- UE is replaced by 5G-RG.
- Non-3GPP access(es) is replaced by wireline access.

- Multi access connectivity is provided using ATSSS using both, EPC (as 3GPP access) and wireline access/5GC system (as non-3GPP access), where:
 - i. the ATSSS rules are derived from PCC rules and provided from the PGW-C+SMF to the 5G-RG over wireline access/5GC system;
 - ii. when the 5G-RG requests a PDN connection in EPC indicating the association with a MA PDU session, the PDN connection may be handed over to 3GPP access in 5GC without affecting the ATSSS control.
- MA PDU Sessions of Ethernet PDU Session type where the 3GPP access corresponds to EPC/E-UTRAN are not applicable for 5G-RG.

C.3.6.3 Location Dependent Policies for trusted non-3GPP access

To support location dependent policies when a UE connects using trusted non-3GPP access procedures via TNAP collocated with a 5G-RG, the PCF may retrieve/be notified by the UDR of the AF provided list of TNAP(s) in Service Parameter Data and/or the list of TNAP(s) provided within Session Management Policy Data as defined in 3GPP TS 29.519 [15]. In this case, the PCF may compare the TNAP ID(s) received from the UDR with the TNAP ID received in the user location information (if available) and may apply different policies depending on whether the UE is at a TNAP ID obtained from UDR or not. In case the PCF receives from the UDR TNAP ID(s) both in the Policy Data and in the Service Parameter Data, the PCF decides based on configuration whether to apply both or one of them.

Annex D(informative): Change history

Date	Meeting	TDoc	CR	Rev	Cat	Change history Subject/Comment	New
2017.10							version 0.0.0
