|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains the URI of the newly created resource, according to the structure:<br>{apiRoot}/3gpp-mbs-session/v1/mbs-sessions/subscriptions/{subscriptionId} |

**5.20.2.4.4 Resource Custom Operations**

There are no resource custom operations defined for this resource in this release of the specification.

## 5.20.2.5 Resource: Individual MBS Session Subscription

### 5.20.2.5.1 Introduction

This resource represents an Individual MBS Session Subscription managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [3]).

### 5.20.2.5.2 Resource Definition

Resource URI: **{apiRoot}/3gpp-mbs-session/v1/mbs-sessions/subscriptions/{subscriptionId}**

This resource shall support the resource URI variables defined in table 5.20.2.5.2-1.

**Table 5.20.2.5.2-1: Resource URI variables for this resource**

| Name           | Data type | Definition                                                      |
|----------------|-----------|-----------------------------------------------------------------|
| apiRoot        | string    | See clause 5.20.1.                                              |
| subscriptionId | string    | Identifier of the Individual MBS Session Subscription resource. |

### 5.20.2.5.3 Resource Methods

#### 5.20.2.5.3.1 GET

This method enables an AF to request to retrieve an existing Individual MBS Session Subscription resource at the NEF.

This method shall support the URI query parameters specified in table 5.20.2.5.3.1-1.

**Table 5.20.2.5.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.20.2.5.3.1-2 and the response data structures and response codes specified in table 5.20.2.5.3.1-3.

**Table 5.20.2.5.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.20.2.5.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                               | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                    |
|-------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MbsSessionSubsc                                                                                                         | M | 1           | 200 OK                 | Successful case. The requested Individual MBS Session Subscription resource is returned.                                                                                                                                       |
| n/a                                                                                                                     |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                     |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status code for the GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                |

**Table 5.20.2.5.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                              |
|----------|-----------|---|-------------|--------------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative target URI of the resource located in an alternative NEF. |

**Table 5.20.2.5.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                              |
|----------|-----------|---|-------------|--------------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative target URI of the resource located in an alternative NEF. |

**5.20.2.5.3.2 DELETE**

This method enables an AF to request the deletion of an existing Individual MBS Session Subscription resource at the NEF.

This method shall support the URI query parameters specified in table 5.20.2.5.3.2-1.

**Table 5.20.2.5.3.2-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.20.2.5.3.2-2 and the response data structures and response codes specified in table 5.20.2.5.3.2-3.

**Table 5.20.2.5.3.2-2: Data structures supported by the DELETE Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.20.2.5.3.2-3: Data structures supported by the DELETE Response Body on this resource**

| Data type                                                                                                                  | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                    |
|----------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a                                                                                                                        |   |             | 204 No Content         | Successful case. The concerned Individual MBS Session Subscription resource is successfully deleted.                                                                                                                           |
| n/a                                                                                                                        |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                        |   |             | 308 Permanent Redirect | Permanent redirection. | Location | string    | M | 1           | An alternative target URI of the resource located in an alternative NEF. |

#### 5.20.2.5.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.20.2.6 Resource: MBS Parameters Provisionings

#### 5.20.2.6.1 Introduction

This resource represents the collection of MBS Parameters Provisionings managed by the NEF.

This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [3]).

#### 5.20.2.6.2 Resource Definition

Resource URI: **{apiRoot}/3gpp-mbs-session/v1/mbs-pp**

This resource shall support the resource URI variables defined in table 5.20.2.6.2-1.

**Table 5.20.2.6.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition         |
|---------|-----------|--------------------|
| apiRoot | string    | See clause 5.20.1. |

#### 5.20.2.6.3 Resource Methods

##### 5.20.2.6.3.1 GET

This method enables an AF to request to retrieve all the MBS Parameters Provisionings resources managed by the NEF.

This method shall support the URI query parameters specified in table 5.20.2.6.3.1-1.

**Table 5.20.2.6.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.20.2.6.3.1-2 and the response data structures and response codes specified in table 5.20.2.6.3.1-3.

**Table 5.20.2.6.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.20.2.6.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                               | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                    |
|-------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| array(MbsPpData)                                                                                                        | M | 1..N        | 200 OK                 | Successful case. All the Individual MBS Parameters Provisionings resources managed by the NEF are returned.                                                                                                                    |
| n/a                                                                                                                     |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                     |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status code for the GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                |

**Table 5.20.2.6.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                              |
|----------|-----------|---|-------------|--------------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative target URI of the resource located in an alternative NEF. |

**Table 5.20.2.6.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                              |
|----------|-----------|---|-------------|--------------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative target URI of the resource located in an alternative NEF. |

### 5.20.2.6.3.2 POST

This method enables an AF to request the creation of a new MBS Parameters Provisioning at the NEF.

This method shall support the URI query parameters specified in table 5.20.2.6.3.2-1.

**Table 5.20.2.6.3.2-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.20.2.6.3.2-2 and the response data structures and response codes specified in table 5.20.2.6.3.2-3.

**Table 5.20.2.6.3.2-2: Data structures supported by the POST Request Body on this resource**

| Data type | P | Cardinality | Description                                                                                 |
|-----------|---|-------------|---------------------------------------------------------------------------------------------|
| MbsPpData | M | 1           | Contain the representation of the new MBS Parameters Provisioning to be created at the NEF. |

**Table 5.20.2.6.3.2-3: Data structures supported by the POST Response Body on this resource**

| Data type | P | Cardinality | Response codes | Description |
|-----------|---|-------------|----------------|-------------|
|-----------|---|-------------|----------------|-------------|

|                                                                                                                          |   |   |             |                                                                                                                                                                                                      |
|--------------------------------------------------------------------------------------------------------------------------|---|---|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MbsPpData                                                                                                                | M | 1 | 201 Created | Successful case. A representation of the created Individual MBS Parameters Provisioning resource is returned.<br><br>The URI of the created resource shall be returned in an HTTP "Location" header. |
| NOTE: The mandatory HTTP error status code for the POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |   |             |                                                                                                                                                                                                      |

**Table 5.20.2.6.3.2-4: Headers supported by the 201 response code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                |
|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains the URI of the newly created resource, according to the structure: {apiRoot}/3gpp-mbs-session/v1/mbs-pp/{mbsPpId} |

#### 5.20.2.6.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.20.2.7 Resource: Individual MBS Parameters Provisioning

#### 5.20.2.7.1 Introduction

This resource represents an Individual MBS Parameters Provisioning resource managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [3]).

#### 5.20.2.7.2 Resource Definition

Resource URI: {apiRoot}/3gpp-mbs-session/v1/mbs-pp/{mbsPpId}

This resource shall support the resource URI variables defined in table 5.20.2.7.2-1.

**Table 5.20.2.7.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition                                                         |
|---------|-----------|--------------------------------------------------------------------|
| apiRoot | string    | See clause 5.20.1.                                                 |
| mbsPpId | string    | Identifier of the Individual MBS Parameters Provisioning resource. |

#### 5.20.2.7.3 Resource Methods

##### 5.20.2.7.3.1 GET

This method enables an AF to request to retrieve an existing Individual MBS Parameters Provisioning resource managed by the NEF.

This method shall support the URI query parameters specified in table 5.20.2.7.3.1-1.

**Table 5.20.2.7.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.20.2.7.3.1-2 and the response data structures and response codes specified in table 5.20.2.7.3.1-3.

**Table 5.20.2.7.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.20.2.7.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                               | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                |
|-------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MbsPpData                                                                                                               | M | 1           | 200 OK                 | Successful case. The requested Individual MBS Parameters Provisioning resource is successfully returned.                                                                                                                   |
| n/a                                                                                                                     |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                     |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status code for the GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                            |

**Table 5.20.2.7.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                              |
|----------|-----------|---|-------------|--------------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative target URI of the resource located in an alternative NEF. |

**Table 5.20.2.7.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                              |
|----------|-----------|---|-------------|--------------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative target URI of the resource located in an alternative NEF. |

### 5.20.2.7.3.2 PUT

This method enables an AF to request the update of an existing Individual MBS Parameters Provisioning resource at the NEF.

This method shall support the URI query parameters specified in table 5.20.2.7.3.2-1.

**Table 5.20.2.7.3.2-1: URI query parameters supported by the PUT method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.20.2.7.3.2-2 and the response data structures and response codes specified in table 5.20.2.7.3.2-3.

**Table 5.20.2.7.3.2-2: Data structures supported by the PUT Request Body on this resource**

| Data type | P | Cardinality | Description                                                                            |
|-----------|---|-------------|----------------------------------------------------------------------------------------|
| MbsPpData | M | 1           | Represents the updated Individual MBS Parameters Provisioning resource representation. |

**Table 5.20.2.7.3.2-3: Data structures supported by the PUT Response Body on this resource**

| Data type                                                                                                                 | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                    |
|---------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MbsPpData                                                                                                                 | M | 1           | 200 OK                 | Successful response. The Individual MBS Parameters Provisioning resource is successfully updated and a representation of the updated resource is returned in the response body.                                                |
| n/a                                                                                                                       |   |             | 204 No Content         | Successful response. The Individual MBS Parameters Provisioning resource is successfully updated and no content is to be returned in the response body.                                                                        |
| n/a                                                                                                                       |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                       |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE 1: The mandatory HTTP error status code for the PUT method listed in Table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                |

**Table 5.20.2.7.3.2-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**Table 5.20.2.7.3.2-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |

### 5.20.2.7.3.3 PATCH

This method enables an AF to request the modification of an existing Individual MBS Parameters Provisioning resource at the NEF.

This method shall support the URI query parameters specified in table 5.20.2.7.3.3-1.

**Table 5.20.2.7.3.3-1: URI query parameters supported by the PATCH method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.20.2.7.3.3-2 and the response data structures and response codes specified in table 5.20.2.7.3.3-3.

**Table 5.20.2.7.3.3-2: Data structures supported by the PATCH Request Body on this resource**

| Data type      | P | Cardinality | Description                                                                                    |
|----------------|---|-------------|------------------------------------------------------------------------------------------------|
| MbsPpDataPatch | M | 1           | Represents the requested modifications to the Individual MBS Parameters Provisioning resource. |

**Table 5.20.2.7.3.3-3: Data structures supported by the PATCH Response Body on this resource**

| Data type                                                                                                                   | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                    |
|-----------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MbsPpData                                                                                                                   | M | 1           | 200 OK                 | Successful response. The Individual MBS Parameters Provisioning resource is successfully modified and a representation of the updated resource is returned in the response body.                                               |
| n/a                                                                                                                         |   |             | 204 No Content         | Successful response. The Individual MBS Parameters Provisioning resource is successfully modified and no content is to be returned in the response body.                                                                       |
| n/a                                                                                                                         |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                         |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE 1: The mandatory HTTP error status code for the PATCH method listed in Table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                |

**Table 5.20.2.7.3.3-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**Table 5.20.2.7.3.3-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |

| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

#### 5.20.2.7.3.4 DELETE

This method enables an AF to request the deletion of an existing Individual MBS Parameters Provisioning resource at the NEF.

This method shall support the URI query parameters specified in table 5.20.2.7.3.4-1.

**Table 5.20.2.7.3.4-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.20.2.7.3.4-2 and the response data structures and response codes specified in table 5.20.2.7.3.4-3.

**Table 5.20.2.7.3.4-2: Data structures supported by the DELETE Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.20.2.7.3.4-3: Data structures supported by the DELETE Response Body on this resource**

| Data type                                                                                                                  | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                    |
|----------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a                                                                                                                        |   |             | 204 No Content         | Successful case. The concerned Individual MBS Parameters Provisioning resource is successfully deleted.                                                                                                                        |
| n/a                                                                                                                        |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                        |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status code for the DELETE method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                |

**Table 5.20.2.7.3.4-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                              |
|----------|-----------|---|-------------|--------------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative target URI of the resource located in an alternative NEF. |

| Name     | Data type | P | Cardinality | Description                                                              |
|----------|-----------|---|-------------|--------------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative target URI of the resource located in an alternative NEF. |

#### 5.20.2.7.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.20.3 Custom Operations without associated resources

There are no customoperations without associated resources defined for this API in this release of the specification.

## 5.20.4 Notifications

### 5.20.4.1 General

Notifications shall comply to clause 5.2.5 of 3GPP TS 29.122 [4].

**Table 5.20.4.1-1: Notifications overview**

| Notification                    | Callback URI      | HTTP method or custom operation | Description (service operation)                                                 |
|---------------------------------|-------------------|---------------------------------|---------------------------------------------------------------------------------|
| MBS Session Status Notification | {notificationUri} | POST                            | Enables to notify a previously subscribed AF on MBS session status information. |

## 5.20.4.2 MBS Session Status Notification

### 5.20.4.2.1 Description

The MBS Session Status Notification is used by the NEF to report MBS session status information to a subscribed AF.

### 5.20.4.2.2 Target URI

The Callback URI "{notificationUri}" shall be used with the callback URI variables defined in table 5.20.4.2.2-1.

**Table 5.20.4.2.2-1: Callback URI variables**

| Name            | Data type | Definition                                                                            |
|-----------------|-----------|---------------------------------------------------------------------------------------|
| notificationUri | Uri       | Callback URI provided by the AF during the creation/modification of the subscription. |

### 5.20.4.2.3 Operation Definition

#### 5.20.4.2.3.1 Notification via HTTP POST

This method shall support the request data structures specified in table 5.20.4.2.3.1-1 and the response data structures and response codes specified in table 5.20.4.2.3.1-2.

**Table 5.20.4.2.3.1-1: Data structures supported by the POST Request Body on this resource**

| Data type             | P | Cardinality | Description                                                             |
|-----------------------|---|-------------|-------------------------------------------------------------------------|
| MbsSessionStatusNotif | M | 1           | Represents the MBS Session Status information to be reported to the AF. |

**Table 5.20.4.2.3.1-2: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                 | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                                                     |
|---------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a                                                                                                                       |   |             | 204 No Content         | The MBS Session Status notification is successfully received.                                                                                                                                                                                                                   |
| n/a                                                                                                                       |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF where the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                       |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF where the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                                                                 |

**Table 5.20.4.2.3.1-3: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                             |
|----------|-----------|---|-------------|-------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

**Table 5.20.4.2.3.1-4: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                             |
|----------|-----------|---|-------------|-------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

## 5.20.5 Data Model

### 5.20.5.1 General

This clause specifies the application data model supported by the MBSSession API. Table 5.20.5.1-1 specifies the data types defined for the MBSSession API.

**Table 5.20.5.1-1: MBSSession specific Data Types**

| Data type             | Clause defined | Description                                                                         | Applicability      |
|-----------------------|----------------|-------------------------------------------------------------------------------------|--------------------|
| MbsPpData             | 5.20.5.2.6     | Represents MBS Parameters Provisioning data.                                        |                    |
| MbsPpDataPatch        | 5.20.5.2.8     | Represents the requested modification to existing MBS Parameters Provisioning data. |                    |
| MbsSessAuthData       | 5.20.5.2.7     | Represents the MBS Session Authorization data.                                      |                    |
| MbsSessAssistInfo     | 5.20.5.2.9     | Represents the MBS Session Assistance information data set(s).                      | 5MBS2              |
| MbsSessionCreateReq   | 5.20.5.2.2     | Represents the parameters to request MBS Session creation.                          |                    |
| MbsSessionCreateResp  | 5.20.5.2.3     | Represents the parameters to be returned in an MBS Session creation response.       |                    |
| MbsSessionSubsc       | 5.20.5.2.4     | Represents an MBS Session Subscription.                                             |                    |
| MbsSessionStatusNotif | 5.20.5.2.5     | Represents an MBS Session Status notification.                                      |                    |
| MbsSessionUpdateResp  | 5.20.5.2.10    | Represents MBS Session update related information.                                  | ReducedMbsServArea |

Table 5.20.5.1-2 specifies data types re-used by the MBSSession API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the MBSSession API.

**Table 5.20.5.1-2: Re-used Data Types**

| Data type                 | Reference           | Comments                                                                   | Applicability |
|---------------------------|---------------------|----------------------------------------------------------------------------|---------------|
| 5MbsAuthorizationInfo     | 3GPP TS 29.503 [17] | Contains the MBS Session authorization information.                        |               |
| DateTime                  | 3GPP TS 29.122 [4]  | Represents a date and a time                                               |               |
| ExternalGroupId           | 3GPP TS 29.122 [4]  | Represents the External Group Identifier for a user group.                 |               |
| ExternalMbsServiceArea    | 3GPP TS 29.571 [8]  | Represents an external MBS service area.                                   |               |
| Gpsi                      | 3GPP TS 29.571 [8]  | Represents a GPSI.                                                         |               |
| MbsServiceArea            | 3GPP TS 29.571 [8]  | Represents an MBS service area.                                            |               |
| MbsAssistanceInfo         | 3GPP TS 29.503 [17] | Represents the MBS Session Assistance information.                         | 5MBS2         |
| MbsSession                | 3GPP TS 29.571 [8]  | Represents MBS session information.                                        |               |
| MbsSessionId              | 3GPP TS 29.571 [8]  | Represents the identifier of an MBS Session.                               |               |
| MbsSessionEventReportList | 3GPP TS 29.571 [8]  | Represents the list of MBS Session Event Report(a).                        |               |
| MbsSessionSubscription    | 3GPP TS 29.571 [8]  | Represents an MBS Session Subscription                                     |               |
| MtcProviderInformation    | 3GPP TS 29.571 [8]  | Represents the MTC provider information.                                   | enNB1         |
| PatchItem                 | 3GPP TS 29.571 [8]  | Represents the requested modifications to a resource via the PATCH method. |               |
| ProblemDetails            | 3GPP TS 29.122 [4]  | Represents error related information.                                      |               |

|                         |                    |                                                                                                               |  |
|-------------------------|--------------------|---------------------------------------------------------------------------------------------------------------|--|
| ProblemDetailsTmgiAlloc | 5.19.5.4.1         | Represents an extension to the ProblemDetails data structure with additional information.                     |  |
| SupportedFeatures       | 3GPP TS 29.571 [8] | Represents the list of supported feature(s) and used to negotiate the applicability of the optional features. |  |
| Tmgi                    | 3GPP TS 29.571 [8] | Represents a TMGI.                                                                                            |  |
| TunnelAddress           | 3GPP TS 29.571 [8] | Represents a Tunnel Address (UDP/IP).                                                                         |  |
| Uri                     | 3GPP TS 29.122 [4] | Represents a URI.                                                                                             |  |

## 5.20.5.2 Structured data types

### 5.20.5.2.1 Introduction

This clause defines the structures to be used in resource representations.

### 5.20.5.2.2 Type: MbsSessionCreateReq

**Table 5.20.5.2.2-1: Definition of type MbsSessionCreateReq**

| Attribute name | Data type         | P | Cardinality | Description                                                                                                                                                                        | Applicability |
|----------------|-------------------|---|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| afId           | string            | M | 1           | Contains the identifier of the AF that is sending the request.                                                                                                                     |               |
| mbsSession     | MbsSession        | M | 1           | MBS session to be created.                                                                                                                                                         |               |
| suppFeat       | SupportedFeatures | C | 0..1        | Contains the list of supported features.<br><br>This attribute shall be provided in the HTTP POST request to create a new MBS session, if feature negotiation needs to take place. |               |

### 5.20.5.2.3 Type: MbsSessionCreateRsp

**Table 5.20.5.2.3-1: Definition of type MbsSessionCreateRsp**

| Attribute name | Data type                 | P | Cardinality | Description                                                                                                                                                                                                    | Applicability |
|----------------|---------------------------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| mbsSession     | MbsSession                | M | 1           | Represents the created MBS session.                                                                                                                                                                            |               |
| eventList      | MbsSessionEventReportList | C | 0..1        | Contains a list of MBS Session Status Event(s) report(s), if available.                                                                                                                                        |               |
| suppFeat       | SupportedFeatures         | C | 0..1        | Contains the list of supported features.<br><br>This attribute shall be provided in the HTTP POST response to a request to create a new MBS session, if it was present in the corresponding HTTP POST request. |               |

### 5.20.5.2.4 Type: MbsSessionSubsc

**Table 5.20.5.2.4-1: Definition of type MbsSessionSubsc**

| Attribute name | Data type              | P | Cardinality | Description                                                                          | Applicability |
|----------------|------------------------|---|-------------|--------------------------------------------------------------------------------------|---------------|
| afId           | string                 | M | 1           | Contains the identifier of the AF that is sending the request.                       |               |
| subscription   | MbsSessionSubscription | M | 1           | Represents the parameters of the MBS Session Status subscription to be created       |               |
| subscriptionId | string                 | C | 0..1        | Contains the identifier of the created Individual MBS Session Subscription resource. |               |

|  |  |  |  |                                                                                                    |  |
|--|--|--|--|----------------------------------------------------------------------------------------------------|--|
|  |  |  |  | This attribute shall only be present in the HTTP POST response to an MBS session creation request. |  |
|--|--|--|--|----------------------------------------------------------------------------------------------------|--|

## 5.20.5.2.5 Type: MbsSessionStatusNotif

Table 5.20.5.2.5-1: Definition of type MbsSessionStatusNotif

| Attribute name | Data type                 | P | Cardinality | Description                                                             | Applicability |
|----------------|---------------------------|---|-------------|-------------------------------------------------------------------------|---------------|
| eventList      | MbsSessionEventReportList | M | 1           | Contains the reported MBS session event(s) and the related information. |               |

## 5.20.5.2.6 Type: MbsPpData

Table 5.20.5.2.6-1: Definition of type MbsPpData

| Attribute name    | Data type              | P | Cardinality | Description                                                                                                                                                                                                                            | Applicability |
|-------------------|------------------------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| afId              | string                 | M | 1           | Contains the identifier of the AF that is sending the request.                                                                                                                                                                         |               |
| mtcProviderId     | MtcProviderInformation | O | 0..1        | Identifies the MTC Service Provider and/or MTC Application.                                                                                                                                                                            | enNB1         |
| mbsSessAuthData   | MbsSessAuthData        | C | 0..1        | Contains the MBS Session Authorization data that the AF requests to provision.<br><br>This attribute shall be present when the AF requests to provision MBS Session Authorization data.                                                |               |
| mbsSessAssistInfo | MbsSessAssistInfo      | C | 0..1        | Contains the MBS Session Assistance information data set(s) that the AF requests to provision.<br><br>This attribute shall be present when the AF requests to provision one or several MBS Session Assistance information data set(s). | 5MBS2         |
| suppFeat          | SupportedFeatures      | C | 0..1        | Contains the list of supported features among the ones defined in clause 5.20.6.<br><br>This attribute shall be present only when feature negotiation needs to take place.                                                             |               |

## 5.20.5.2.7 Type: MbsSessAuthData

Table 5.20.5.2.7-1: Definition of type MbsSessAuthData

| Attribute name   | Data type             | P | Cardinality | Description                                                                                                                                                                                                                                                                                                     | Applicability |
|------------------|-----------------------|---|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| extGroupId       | ExternalGroupId       | M | 1           | Represents the external group identifier of the targeted multicast MBS Group.                                                                                                                                                                                                                                   |               |
| gpsiList         | map(Gpsi)             | C | 1..N        | Represents the list of the GPSI(s) of the member UE(s) constituting the multicast MBS group.<br><br>Any value of type string can be used as a key of the map.<br><br>This attribute shall be present only if the multicast MBS group has not yet been created or the list of its member(s) needs to be updated. |               |
| mbsSessionIdList | 5MbsAuthorizationInfo | M | 1           | Contains the identifier(s) of the multicast MBS Session(s) that the                                                                                                                                                                                                                                             |               |

|  |  |  |  |                                            |  |
|--|--|--|--|--------------------------------------------|--|
|  |  |  |  | multicast MBS group is authorized to join. |  |
|--|--|--|--|--------------------------------------------|--|

#### 5.20.5.2.8 Type: MbsPpDataPatch

**Table 5.20.5.2.8-1: Definition of type MbsPpDataPatch**

| Attribute name    | Data type         | P | Cardinality | Description                                                                                            | Applicability |
|-------------------|-------------------|---|-------------|--------------------------------------------------------------------------------------------------------|---------------|
| mbsSessAuthData   | MbsSessAuthData   | O | 0..1        | Contains the updated MBS Session Authorization data that the AF requests to provision.                 |               |
| mbsSessAssistInfo | MbsSessAssistInfo | O | 0..1        | Contains the updated MBS Session Assistance information data set(s) that the AF requests to provision. | 5MBS2         |

#### 5.20.5.2.9 Type: MbsSessAssistInfo

**Table 5.20.5.2.9-1: Definition of type MbsSessAssistInfo**

| Attribute name    | Data type                | P | Cardinality | Description                                                                                               | Applicability |
|-------------------|--------------------------|---|-------------|-----------------------------------------------------------------------------------------------------------|---------------|
| mbsSessAssistData | array(MbsAssistanceInfo) | M | 1..N        | Contains one or several MBS Session Assistance information data set(s) for one or several MBS Session(s). |               |

#### 5.20.5.2.10 Type: MbsSessionUpdateResp

**Table 5.20.5.2.10-1: Definition of type MbsSessionUpdateResp**

| Attribute name        | Data type              | P | Cardinality | Description                                                                                                                                                                                                                                                                                                                                  | Applicability |
|-----------------------|------------------------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| reducedMbsServArea    | MbsServiceArea         | C | 0..1        | <p>This attribute shall be present only if the requested MBS Service Area cannot be covered by the MB-SMF Service Area of a single MB-SMF, and the MB-SMF reduced the MBS Service Area accordingly.</p> <p>When present, it shall contain the reduced MBS Service Area in which the MBS session has been updated.</p> <p>(NOTE)</p>          |               |
| reducedExtMbsServArea | ExternalMbsServiceArea | C | 0..1        | <p>This attribute shall be present only if the requested MBS Service Area cannot be covered by the MB-SMF Service Area of a single MB-SMF, and the MB-SMF reduced the MBS Service Area accordingly.</p> <p>When present, it shall contain the reduced external MBS Service Area in which the MBS session has been updated.</p> <p>(NOTE)</p> |               |

NOTE: These attributes are mutually exclusive. Either one of them may be present.

### 5.20.5.3 Simple data types and enumerations

#### 5.20.5.3.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

#### 5.20.5.3.2 Simple data types

The simple data types defined in table 5.20.5.3.2-1 shall be supported.

**Table 5.20.5.3.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

### 5.20.6 Used Features

The table below defines the features applicable to the MBSSession API. Those features are negotiated as described in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.20.6-1: Supported Features**

| Feature number | Feature Name        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1              | 5MBS2               | <p>This feature indicates the support of the Rel-18 enhancements to the 5G Multicast/Broadcast services.</p> <p>The following functionalities are supported:</p> <ul style="list-style-type: none"> <li>- MBS Session Assistance information provisioning.</li> <li>- Support the provisioning of the Associated Session Identifier to enable 5MBS MOCN Network Sharing scenarios (e.g., MOCN with multiple broadcast MBS sessions transmitting the same content via different Core Networks).</li> <li>- NR RedCap UE information provisioning during MBS Session creation/update.</li> </ul> |
| 2              | ReducedMbsServ Area | <p>This feature indicates the support of the MBS Service Area reduction functionality.</p> <p>The following sub-functionalities are supported:</p> <ul style="list-style-type: none"> <li>- Support to return the reduced MBS Service Area in an MBS Session creation/update response.</li> </ul>                                                                                                                                                                                                                                                                                              |
| 3              | enNB1               | <p>This feature indicates the support of Rel-18 enhancements to this northbound API.</p> <p>The following sub-functionalities are supported:</p> <ul style="list-style-type: none"> <li>- Support the provisioning of the MTC provider ID.</li> </ul>                                                                                                                                                                                                                                                                                                                                          |

### 5.20.7 Error handling

#### 5.20.7.1 General

HTTP error handling shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses shall apply.

#### 5.20.7.2 Protocol Errors

In this Release of the specification, there are no additional protocol errors applicable for the MBSSession API.

### 5.20.7.3 Application Errors

The application errors defined for the MBSSession API are listed in table 5.20.7.3-1.

**Table 5.20.7.3-1: Application errors**

| Application Error                | HTTP status code | Description                                                                                                                                                                                                                  |
|----------------------------------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| INVALID_MBS_SERVICE_INFO         | 400 Bad Request  | The provided MBS Service Information is invalid (e.g. invalid QoS reference), incorrect or insufficient to perform MBS policy authorization.                                                                                 |
| FILTER_RESTRICTIONS_NOT_OBSERVED | 400 Bad Request  | The MBS IP flow(s) description provided within the MBS Service Information cannot be handled due to the restrictions defined in clause 5.3.8 of 3GPP TS 29.214 [64] not being observed.                                      |
| MBS_SERVICE_AREA_TOO_LARGE       | 403 Forbidden    | Indicates that the MBS Session creation request is rejected because the provided MBS Service Area cannot be supported by the network as it is too large to be served by a single MB-SMF.                                     |
| MBS_SERVICE_AREA_NOT_SUPPORTED   | 403 Forbidden    | Indicates that the MBS Session Creation/Update is rejected because the requested MBS Service Area is not supported (e.g., the MBS Service Area received from the AF cannot be covered by the service area(s) of any MB-SMF). |
| MBS_SERVICE_INFO_NOT_AUTHORIZED  | 403 Forbidden    | The provided MBS Service Information is rejected.                                                                                                                                                                            |
| MBS_SESSION_ALREADY_CREATED      | 403 Forbidden    | The requested MBS session has already been created at the NEF/MB-SMF.                                                                                                                                                        |
| OVERLAPPING_MBS_SERVICE_AREA     | 403 Forbidden    | The provided MBS service area overlaps with the MBS service area of an existing MBS Session that shares the same MBS session Identifier.                                                                                     |
| UNKNOWN_TMGI                     | 404 Not Found    | The TMGI provided in the request does not exist.                                                                                                                                                                             |
| MBS_SESSION_CONTEXT_NOT_FOUND    | 404 Not Found    | The targeted Individual MBS Session does not exist.                                                                                                                                                                          |
| UNKNOWN_MBS_SERVICE_AREA         | 404 Not Found    | The requested MBS service area (e.g. identified by the Area Session ID) cannot be found.                                                                                                                                     |

## 5.21 EASDeployment API

### 5.21.0 Introduction

The Nnef\_EASDeployment service shall use the EASDeployment API.

The API URI of EASDeployment API shall be:

**{apiRoot}/3gpp-eas-deployment/v1**

with the following components:

- "apiRoot" is set as defined in clause 5.2.4 of 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-eas-deployment".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.

All resource URIs in the clauses below are defined relative to the above API URI.

## 5.21.1 Resources

### 5.21.1.1 Overview

This clause describes the structure for the Resource URIs as shown in figure 5.21.1.1-1 and the resources and HTTP methods used for AF provisioned EAS Deployment information management in the northbound EASDeployment API.

**Figure 5.21.1.1-1: Resource URI structure of the northbound EASDeployment API**

Table 5.21.1.1-1 provides an overview of the resources and HTTP methods applicable for the northbound EASDeployment API.

**Table 5.21.1.1-1: Resources and methods overview**

| Resource name                         | Resource URI                                 | HTTP method | Description                                                         |
|---------------------------------------|----------------------------------------------|-------------|---------------------------------------------------------------------|
| EAS Deployment Information            | /{afld}/eas-deployment-info                  | GET         | Read all EAS Deployment information for a given AF.                 |
|                                       |                                              | POST        | Create a new Individual EAS Deployment information resource.        |
| Individual EAS Deployment Information | /{afld}/eas-deployment-info/{easDeployInfld} | GET         | Reads an active Individual EAS Deployment Information resource.     |
|                                       |                                              | PUT         | Update an existing Individual EAS Deployment Information resource.  |
|                                       |                                              | DELETE      | Deletes an existing Individual EAS Deployment Information resource. |

### 5.21.1.2 Resource: EAS Deployment Information

#### 5.21.1.2.1 Introduction

This resource allows an AF to request the creation of a new Individual EAS Deployment Information resource.

#### 5.21.1.2.2 Resource Definition

Resource URI: {apiRoot}/3gpp-eas-deployment/v1/{afld}/eas-deployment-info

This resource shall support the resource URI variables defined in table 5.21.1.2.2-1.

**Table 5.21.1.2.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition                          |
|---------|-----------|-------------------------------------|
| apiRoot | string    | Clause 5.2.4 of 3GPP TS 29.122 [4]. |

|      |        |                       |
|------|--------|-----------------------|
| afld | string | Identifier of the AF. |
|------|--------|-----------------------|

### 5.21.1.2.3 Resource Methods

#### 5.21.1.2.3.1 General

The following clauses specify the resource methods supported by the resource as described in clause 5.21.1.2.2.

#### 5.21.1.2.3.2 GET

The GET method allows to read all active EAS Deployment information for a given AF and subscription. The AF shall initiate the HTTP GET request message and the NEF shall respond to the message.

This method shall support the URI query parameters specified in table 5.21.1.2.3.2-1.

**Table 5.21.1.2.3.2-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| N/A  |           |   |             |             |

This method shall support the request data structures specified in table 5.21.1.2.3.2-2, the response data structures and response codes specified in table 5.21.1.2.3.2-3, and the location headers specified in table 5.21.1.2.3.2-4 and table 5.21.1.2.3.2-5.

**Table 5.21.1.2.3.2-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| N/A       |   |             |             |

**Table 5.21.1.2.3.2-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                | P | Cardinality | Response codes               | Description                                                                                                                                                                                                                                                                   |
|--------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| array(EasDeployl<br>nfo)                                                                                                 | M | 0..N        | 200 OK                       | The configuration information for the AF in the request URI are returned.                                                                                                                                                                                                     |
| N/A                                                                                                                      |   |             | 307<br>Temporary<br>Redirect | Temporary redirection, during EAS deployment information retrieval. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF. Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| N/A                                                                                                                      |   |             | 308<br>Permanent<br>Redirect | Permanent redirection, during EAS deployment information retrieval. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF. Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                              |                                                                                                                                                                                                                                                                               |

**Table 5.21.1.2.3.2-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**Table 5.21.1.2.3.2-5: Headers supported by the 308 Response Code on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
|------|-----------|---|-------------|-------------|

|          |        |   |   |                                                                   |
|----------|--------|---|---|-------------------------------------------------------------------|
| Location | string | M | 1 | An alternative URI of the resource located in an alternative NEF. |
|----------|--------|---|---|-------------------------------------------------------------------|

#### 5.21.1.2.3.3 POST

The POST method creates a new resource of Individual EAS Deployment Information for a given AF. The AF shall initiate the HTTP POST request message and the NEF shall respond to the message. The NEF shall construct the URI of the created resource.

This method shall support the request data structures specified in table 5.21.1.2.3.3-1, the response data structures and response codes specified in table 5.21.1.2.3.3-2, and the Location Headers specified in table 5.21.1.2.3.3-3.

**Table 5.21.1.2.3.3-1: Data structures supported by the POST Request Body on this resource**

| Data type     | P | Cardinality | Description                                                                            |
|---------------|---|-------------|----------------------------------------------------------------------------------------|
| EasDeployInfo | M | 1           | EAS Deployment Information, indicates how edge services are deployed in each Local DN. |

**Table 5.21.1.2.3.3-2: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                 | P | Cardinality | Response codes | Description                                                                                                                                                      |
|---------------------------------------------------------------------------------------------------------------------------|---|-------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EasDeployInfo                                                                                                             | M | 1           | 201 Created    | The Individual EAS Deployment Information resource was created successfully.<br>The URI of the created resource shall be returned in the "Location" HTTP header. |
| NOTE: The mandatory HTTP error status codes for the POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                |                                                                                                                                                                  |

| Name     | Data type | P | Cardinality | Description                                                                                                                                               |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains the URI of the newly created resource, according to the structure: {apiRoot}/3gpp-eas-deployment/v1/{afId}/eas-deployment-info/{easDeployInfoId} |

### 5.21.1.3 Resource: Individual EAS Deployment Information

#### 5.21.1.3.1 Introduction

This resource allows an AF to read, update or delete an existing Individual EAS Deployment Information.

#### 5.21.1.3.2 Resource Definition

Resource URI: {apiRoot}/3gpp-eas-deployment/v1/{afId}/eas-deployment-info/{easDeployInfoId}

This resource shall support the resource URI variables defined in table 5.21.1.3.2-1.

**Table 5.21.1.3.2-1: Resource URI variables for this resource**

| Name            | Data type | Definition                                                                              |
|-----------------|-----------|-----------------------------------------------------------------------------------------|
| apiRoot         | string    | Clause 5.2.4 of 3GPP TS 29.122 [4].                                                     |
| afId            | string    | Identifier of the AF.                                                                   |
| easDeployInfoId | string    | Identifier of the EAS Deployment Information formatted according to IETF RFC 3986 [44]. |

### 5.21.1.3.3 Resource Methods

#### 5.21.1.3.3.1 General

The following clauses specify the resource methods supported by the resource as described in clause 5.21.1.3.2.

#### 5.21.1.3.3.2 GET

The GET method allows to read the existing EAS Deployment Information for a given AF and a given EAS Deployment Information Id. The AF shall initiate the HTTP GET request message and the NEF shall respond to the message.

This method shall support the URI query parameters specified in table 5.21.1.3.3.2-1.

**Table 5.21.1.3.3.2-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| N/A  |           |   |             |             |

This method shall support the request data structures specified in table 5.21.1.3.3.2-2, the response data structures and response codes specified in table 5.21.1.3.3.2-3, and the Location Headers specified in table 5.21.1.3.3.2-4 and table 5.21.1.3.3.2-5.

**Table 5.21.1.3.3.2-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| N/A       |   |             |             |

**Table 5.21.1.3.3.2-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                                                          |
|--------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EasDeployInfo                                                                                                            | M | 1           | 200 OK                 | Successful case.<br>The exposure information of an existing Individual EAS Deployment Information in the request URI is returned.                                                                                                                                                    |
| N/A                                                                                                                      |   |             | 307 Temporary Redirect | Temporary redirection, during the EAS Deployment Information retrieval. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF.<br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| N/A                                                                                                                      |   |             | 308 Permanent Redirect | Permanent redirection, during the EAS Deployment Information retrieval. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF.<br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                                                                      |

**Table 5.21.1.3.3.2-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**Table 5.21.1.3.3.2-5: Headers supported by the 308 Response Code on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
|------|-----------|---|-------------|-------------|

|          |        |   |   |                                                                   |
|----------|--------|---|---|-------------------------------------------------------------------|
| Location | string | M | 1 | An alternative URI of the resource located in an alternative NEF. |
|----------|--------|---|---|-------------------------------------------------------------------|

#### 5.21.1.3.3.3 PUT

The PUT method is used to modify an existing Individual EAS Deployment Information resource. The AF shall initiate the HTTP PUT request message and the NEF shall respond to the message.

This method shall support the URI query parameters specified in table 5.21.1.3.3.3-1.

**Table 5.21.1.3.3.3-1: URI query parameters supported by the PUT method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.21.1.3.3.3-2, the response data structures and response codes specified in table 5.21.1.3.3.3-3, and the Location Headers specified in table 5.21.1.3.3.3-4 and table 5.21.1.3.3.3-5.

**Table 5.21.1.3.3.3-2: Data structures supported by the PUT Request Body on this resource**

| Data type     | P | Cardinality | Description                                                |
|---------------|---|-------------|------------------------------------------------------------|
| EasDeployInfo | M | 1           | Modify the Individual EAS Deployment Information resource. |

**Table 5.21.1.3.3.3-3: Data structures supported by the PUT Response Body on this resource**

| Data type                                                                                                                | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                                                             |
|--------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EasDeployInfo                                                                                                            | M | 1           | 200 OK                 | Successful case.<br>The exposure information of the updated EAS Deployment Information.                                                                                                                                                                                                 |
| N/A                                                                                                                      |   |             | 204 No Content         | The EAS Deployment change was updated successfully.                                                                                                                                                                                                                                     |
| N/A                                                                                                                      |   |             | 307 Temporary Redirect | Temporary redirection, during the EAS Deployment Information modification. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF.<br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| N/A                                                                                                                      |   |             | 308 Permanent Redirect | Permanent redirection, during the EAS Deployment Information modification. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF.<br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the PUT method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                                                                         |

**Table 5.21.1.3.3.3-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**Table 5.21.1.3.3.3-5: Headers supported by the 308 Response Code on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
|------|-----------|---|-------------|-------------|

|          |        |   |   |                                                                   |
|----------|--------|---|---|-------------------------------------------------------------------|
| Location | string | M | 1 | An alternative URI of the resource located in an alternative NEF. |
|----------|--------|---|---|-------------------------------------------------------------------|

#### 5.21.1.3.3.4 DELETE

The DELETE method deletes an existing Individual EAS Deployment Information resource. The AF shall initiate the HTTP DELETE request message and the NEF shall respond to the message.

This method shall support the URI query parameters specified in table 5.21.1.3.3.4-1.

**Table 5.21.1.3.3.4-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| N/A  |           |   |             |             |

This method shall support the request data structures specified in table 5.21.1.3.3.4-2, the response data structures and response codes specified in table 5.21.1.3.3.4-3, and the Location Headers specified in table 5.21.1.3.3.4-4 and table 5.21.1.3.3.4-5.

**Table 5.21.1.3.3.4-2: Data structures supported by the DELETE Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| N/A       |   |             |             |

**Table 5.21.1.3.3.4-3: Data structures supported by the DELETE Response Body on this resource**

| Data type                                                                                                                   | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                              |
|-----------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| N/A                                                                                                                         |   |             | 204 No Content         | The Individual EAS Deployment Information resource was terminated successfully.                                                                                                                                                                          |
| N/A                                                                                                                         |   |             | 307 Temporary Redirect | Temporary redirection, during the termination. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF. Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| N/A                                                                                                                         |   |             | 308 Permanent Redirect | Permanent redirection, during the termination. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF. Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the DELETE method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                                          |

**Table 5.21.1.3.3.4-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**Table 5.21.1.3.3.4-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

# 5.21.2 Custom Operations without associated resources

## 5.21.2.1 Overview

The structure of the custom operation URIs of the Nnef\_EASDeployment service is shown in Figure 5.21.2.1-1.

**Figure 5.21.2.1-1: Custom operation URI structure of the Nnef\_EASDeployment API**

Table 5.21.2.1-1 provides an overview of the custom operations and applicable HTTP methods.

**Table 5.21.2.1-1: Custom operations without associated resources**

| Custom operation URI                                   | Mapped HTTP method | Description                                                                     |
|--------------------------------------------------------|--------------------|---------------------------------------------------------------------------------|
| {apiRoot}/3gpp-eas-deployment/<apiVersion>/remove-edis | POST               | Request the NEF to delete EAS Deployment Information based on given attributes. |

## 5.21.2.2 Operation: remove-edis

### 5.21.2.2.1 Description

The operation is used by the AF to delete EAS Deployment Information based on given attributes.

### 5.21.2.2.2 Operation Definition

This operation shall support the request data structures shown in Table 5.21.2.2.2-1 and the response data structures and error codes specified in Table 5.21.2.2.2-2.

**Table 5.21.2.2.2-1: Data structures supported by the POST Request Body on this resource**

| Data type         | P | Cardinality | Description                                                                        |
|-------------------|---|-------------|------------------------------------------------------------------------------------|
| EdiDeleteCriteria | M | 1           | Information about the criteria to be used for EAS Deployment Information deletion. |

**Table 5.21.2.2.2-2: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                 | P | Cardinality | Response codes | Description                                                                      |
|---------------------------------------------------------------------------------------------------------------------------|---|-------------|----------------|----------------------------------------------------------------------------------|
| n/a                                                                                                                       |   |             | 204 No Content | Successful request to remove EAS Deployment Information based on given criteria. |
| NOTE: The mandatory HTTP error status codes for the POST method listed in Table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                |                                                                                  |

# 5.21.3 Notifications

There are no notifications defined for this API in this release of the specification.

## 5.21.4 Data Model

### 5.21.4.1 General

This clause specifies the application data model supported by the EASDeployment API. Table 5.21.4.1-1 specifies the data types defined for the EASDeployment API.

**Table 5.21.4.1-1: EASDeployment API specific Data Types**

| Data type              | Clause defined | Description                                                                                 | Applicability      |
|------------------------|----------------|---------------------------------------------------------------------------------------------|--------------------|
| EasDeployInfo          | 5.21.4.3.2     | EAS Deployment Information, indicates how edge services are deployed in each Local DN.      |                    |
| EdiDeleteCriteria      | 5.21.4.3.5     | Contains criteria for deleting EAS Deployment Information.                                  |                    |
| DnaiInformation        | 5.21.4.3.3     | list of DNS server identifier and/or IP address(s) of the EAS in the local DN for the DNAI. |                    |
| DnsServerIdentifier    | 5.21.4.3.4     | DNS server identifier (consisting of IP address and port).                                  |                    |
| N6DelayMeasurementInfo | 5.21.4.3.7     | Represents N6 delay measurement assistance information.                                     | N6DelayMeasurement |
| N6DelayPerDnaiEas      | 5.21.4.3.6     | Represents N6 delay measurement assistance information per DNAI and/or EAS.                 | N6DelayMeasurement |

### 5.21.4.2 Reused data types

The data types reused by the EASDeployment API from other specifications are listed in table 5.21.4.2-1.

**Table 5.21.4.2-1: Re-used Data Types**

| Data type                | Reference          | Comments                                                                                                      |
|--------------------------|--------------------|---------------------------------------------------------------------------------------------------------------|
| Afid                     | 5.14.5.4.2         | Represents an AF identifier.                                                                                  |
| DelayMeasurementProtocol | 3GPP TS 29.571 [8] | Represents a delay measurement protocol.                                                                      |
| Dnai                     | 3GPP TS 29.571 [8] | Identifies a DNAI.                                                                                            |
| Dnn                      | 3GPP TS 29.571 [8] | Identifies a DNN.                                                                                             |
| DnnSnssaiInformation     | 5.18.3.3.5         | Contains DNN and S-NSSAI information.                                                                         |
| EasServerAddress         | 3GPP TS 29.571 [8] | Identifies an EAS server.                                                                                     |
| ExternalGroupId          | 3GPP TS 29.122 [4] | External Group Identifier for a user group.                                                                   |
| FqdnPatternMatchingRule  | 3GPP TS 29.571 [8] | Identifies the FQDN pattern matching rule.                                                                    |
| IpAddr                   | 3GPP TS 29.571 [8] | IP Address.                                                                                                   |
| Snssai                   | 3GPP TS 29.571 [8] | Identifies the S-NSSAI.                                                                                       |
| SupportedFeatures        | 3GPP TS 29.571 [8] | Represents the list of supported feature(s) and used to negotiate the applicability of the optional features. |
| UInteger                 | 3GPP TS 29.571 [8] | Unsigned integer.                                                                                             |
| Link                     | 3GPP TS 29.122 [4] | Identifies a referenced resource.                                                                             |

### 5.21.4.3 Structured data types

#### 5.21.4.3.1 Introduction

This clause defines the structured data types to be used in resource representations.

#### 5.21.4.3.2 Type: EasDeployInfo

**Table 5.21.4.3.2-1: Definition of type EasDeployInfo**

| Attribute name | Data type | P | Cardinality | Description | Applicability |
|----------------|-----------|---|-------------|-------------|---------------|
|----------------|-----------|---|-------------|-------------|---------------|

|                   |                                |   |      |                                                                                                                                                                              |                    |
|-------------------|--------------------------------|---|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|
| self              | Link                           | C | 0..1 | Identifies the individual EAS Deployment information resource.<br>Shall be present in the HTTP GET response when reading all the configurations for an AF.                   |                    |
| afServiceId       | string                         | O | 0..1 | Identifies a service on behalf of which the AF is issuing the request.                                                                                                       |                    |
| fqdnPatternList   | array(FqdnPatternMatchingRule) | M | 1..N | Contains the supported FQDN pattern(s) for application(s) deployed in the Local part of the DN where each FQDN pattern is described by a FQDN Pattern Matching Rule.         |                    |
| appld             | string                         | O | 0..1 | Identifies the application for which the EAS Deployment Information corresponds to.                                                                                          |                    |
| dnn               | Dnn                            | O | 0..1 | Contains the DNN for the EAS Deployment Information.                                                                                                                         |                    |
| snssai            | Snssai                         | O | 0..1 | Contains the S-NSSAI for the EAS Deployment Information.                                                                                                                     |                    |
| externalGroupId   | ExternalGroupId                | O | 0..1 | Contains the external Group ID for the EAS Deployment Information.                                                                                                           |                    |
| dnaiInfos         | map(DnaiInformation)           | O | 1..N | Contains the list of DNS server identifier (consisting of IP address and port) and/or IP address(s) of the EAS in the local DN for each DNAI. The key of map is the DNAI.    |                    |
| targetAfId        | string                         | O | 0..1 | Identifier of the AF that is responsible for the EAS associated with this EAS deployment information.                                                                        | EasRelocationEnh   |
| n6DelayPerDnaiEas | array(N6DelayPerDnaiEas)       | O | 1..N | Contains N6 delay measurement assistance information per DNAI and/or EAS.                                                                                                    | N6DelayMeasurement |
| suppFeat          | SupportedFeatures              | C | 0..1 | Contains the list of supported feature(s) among the ones defined in clause 5.21.5.<br><br>This attribute shall be present only when feature negotiation needs to take place. |                    |

#### 5.21.4.3.3 Type: DnaiInformation

**Table 5.21.4.3.3-1: Definition of type DnaiInformation**

| Attribute name                                                                      | Data type                  | P | Cardinality | Description                                                                      | Applicability |
|-------------------------------------------------------------------------------------|----------------------------|---|-------------|----------------------------------------------------------------------------------|---------------|
| dnai                                                                                | Dnai                       | M | 1           | Identify the DNAI.                                                               |               |
| dnsServIds                                                                          | array(DnsServerIdentifier) | C | 1..N        | list of DNS server identifier (consisting of IP address and port) for each DNAI. |               |
| easIpAddrs                                                                          | array(IpAddr)              | C | 1..N        | IP address(s) of the EASs in the local DN for each DNAI.                         |               |
| NOTE: At least one of the "dnsServIds" or "easIpAddrs" attribute shall be provided. |                            |   |             |                                                                                  |               |

## 5.21.4.3.4 Type: DnsServerIdentifier

**Table 5.21.4.3.4-1: Definition of type DnsServerIdentifier**

| Attribute name | Data type | P | Cardinality | Description            | Applicability |
|----------------|-----------|---|-------------|------------------------|---------------|
| dnsServIpAddr  | IpAddr    | M | 1           | DNS server IP address. |               |
| portNumber     | UInteger  | M | 1           | DNS port number.       |               |

## 5.21.4.3.5 Type: EdiDeleteCriteria

**Table 5.21.4.3.5-1: Definition of type EdiDeleteCriteria**

| Attribute name                                            | Data type           | P | Cardinality | Description                                                          | Applicability |
|-----------------------------------------------------------|---------------------|---|-------------|----------------------------------------------------------------------|---------------|
| afld                                                      | Afld                | C | 0..1        | AF identifier to be used as deletion criterion. (NOTE)               |               |
| dnnSnsai                                                  | DnnSnsaiInformation | C | 0..1        | DNN and S-NSSAI information to be used as deletion criterion. (NOTE) |               |
| NOTE: At least one of those attributes shall be provided. |                     |   |             |                                                                      |               |

## 5.21.4.3.6 Type: N6DelayPerDnaiEas

**Table 5.21.4.3.6-1: Definition of type N6DelayPerDnaiEas**

| Attribute name                                                              | Data type              | P | Cardinality | Description                                                                                                             | Applicability |
|-----------------------------------------------------------------------------|------------------------|---|-------------|-------------------------------------------------------------------------------------------------------------------------|---------------|
| dnai                                                                        | Dnai                   | C | 0..1        | Contains the DNAI to which this N6 delay measurement assistance information applies.<br>(NOTE)                          |               |
| eas                                                                         | EasServerAddress       | C | 0..1        | Contains addressing information of the EAS to which this N6 delay measurement assistance information applies.<br>(NOTE) |               |
| n6DelayMeasureInfo                                                          | N6DelayMeasurementInfo | M | 1           | Contains N6 delay measurement assistance information.                                                                   |               |
| NOTE: At least one of the "dnai" and/or "eas" attributes shall be provided. |                        |   |             |                                                                                                                         |               |

## 5.21.4.3.7 Type: N6DelayMeasurementInfo

**Table 5.21.4.3.7-1: Definition of type N6DelayMeasurementInfo**

| Attribute name         | Data type                       | P | Cardinality | Description                                                                                                    | Applicability |
|------------------------|---------------------------------|---|-------------|----------------------------------------------------------------------------------------------------------------|---------------|
| measureEndpointAddress | IpAddr                          | M | 1           | Contains the measurement endpoint address information.                                                         |               |
| measureEndpointPort    | UInteger                        | O | 0..1        | Contains the measurement endpoint port information.                                                            |               |
| suppMeasProtocs        | array(DelayMeasurementProtocol) | O | 1..N        | Contains the supported N6 delay measurement protocols.                                                         |               |
| configParams           | string                          | O | 0..1        | Contains protocol-specific configuration parameters. The contents and the format are up to the implementation. |               |

Editor's Note: The contents and format of configParams is FFS.

## 5.21.4.4 Simple data types and enumerations

### 5.21.4.4.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

### 5.21.4.4.2 Simple data types

The simple data types defined in table 5.21.4.4.2-1 shall be supported.

**Table 5.21.4.4.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

### 5.21.4.4.3 Void

## 5.21.5 Used Features

The table below defines the features applicable to the EASDeployment API. Those features are negotiated as described in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.21.5-1: Features used by EASDeployment API**

| Feature number | Feature Name       | Description                                                                                                                                         |
|----------------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| 1              | EasRelocationEnh   | This feature indicates enhanced support of EAS relocation procedures via additional information about the AFs that are responsible for certain EAS. |
| 2              | EasDnaiConsistency | This feature indicates support of consistency checking between AF-provisioned and operator-configured data related to EAS Deployment.               |
| 3              | N6DelayMeasurement | This feature indicates support of provisioning N6 delay measurement assistance information.                                                         |

## 5.21.6 Error handling

### 5.21.6.1 General

HTTP error handling shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses shall apply.

### 5.21.6.2 Protocol Errors

In this Release of the specification, there are no additional protocol errors applicable for the EASDeployment API.

### 5.21.6.3 Application Errors

The application errors defined for EASDeployment API are listed in table 5.21.6.3-1.

**Table 5.21.6.3-1: Application errors**

| Application Error    | HTTP status code | Description                                                                                 | Applicability      |
|----------------------|------------------|---------------------------------------------------------------------------------------------|--------------------|
| CONFLICT_CONFIG_DATA | 403 Forbidden    | The provided EAS Deployment Information is in conflict with the OAM-configured information. | EasDnaiConsistency |

## 5.22 ASTI API

### 5.22.0 Introduction

The Nnef\_ASTI service shall use the ASTI API.

The API URI of ASTI API shall be:

**{apiRoot}/3gpp-asti/v1**

with the following components:

- "apiRoot" is set as defined in clause 5.2.4 of 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-asti".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.

All resource URIs in the clauses below are defined relative to the above API URI.

### 5.22.1 Resources

#### 5.22.1.1 Overview

This clause describes the structure for the Resource URIs as shown in figure 5.22.1.1-1 and the resources and HTTP methods used for the ASTI API.

**Figure 5.22.1.1-1: Resource URI structure of the ASTI API**

Table 5.22.1.1-1 provides an overview of the resources and HTTP methods applicable for the ASTI API.

**Table 5.22.1.1-1: Resources and methods overview**

| Resource name       | Resource URI           | HTTP method | Description                                                                                     |
|---------------------|------------------------|-------------|-------------------------------------------------------------------------------------------------|
| ASTI Configurations | /{afId}/configurations | GET         | Read all configurations of 5G access stratum time distribution for a given AF and subscription. |
|                     |                        | POST        | Create a new configuration of 5G access stratum time distribution.                              |

|                               |                                       |                 |                                                                |
|-------------------------------|---------------------------------------|-----------------|----------------------------------------------------------------|
|                               | /{{afld}}/configurations/retrieve     | retrieve (POST) | Retrieval of the status of access stratum time distribution.   |
| Individual ASTI Configuration | /{{afld}}/configurations/{{configld}} | PUT             | Modify a configuration of 5G access stratum time distribution. |
|                               |                                       | DELETE          | Delete a configuration of 5G access stratum time distribution. |
|                               |                                       | GET             | Query the status of the access time distribution               |

## 5.22.1.2 Resource: ASTI Configurations

### 5.22.1.2.1 Introduction

This resource allows an AF to read all active configurations of 5G access stratum time distribution for a given AF, or allows an AF to create a new new configuration of 5G access stratum time distribution.

### 5.22.1.2.2 Resource Definition

Resource URI: **{apiRoot}/3gpp-asti/v1/{{afld}}/configurations**

This resource shall support the resource URI variables defined in table 5.22.1.2.2-1.

**Table 5.22.1.2.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition                          |
|---------|-----------|-------------------------------------|
| apiRoot | string    | Clause 5.2.4 of 3GPP TS 29.122 [4]. |
| afld    | string    | Identifier of the AF.               |

### 5.22.1.2.3 Resource Methods

#### 5.22.1.2.3.1 General

The following clauses specify the resource methods supported by the resource as described in clause 5.22.1.2.2.

#### 5.22.1.2.3.2 GET

The GET method allows to read all active configurations of 5G access stratum time distribution for a given AF and subscription. The AF shall initiate the HTTP GET request message and the NEF shall respond to the message.

This method shall support the URI query parameters specified in table 5.22.1.2.3.2-1.

**Table 5.22.1.2.3.2-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| N/A  |           |   |             |             |

This method shall support the request data structures specified in table 5.22.1.2.3.2-2 and the response data structures and response codes specified in table 5.22.1.2.3.2-3.

**Table 5.22.1.2.3.2-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| N/A       |   |             |             |

**Table 5.22.1.2.3.2-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                                      |
|--------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| array(AccessTimeDistributionData)                                                                                        | M | 0..N        | 200 OK                 | The configuration information for the AF are returned.                                                                                                                                                                                                           |
| N/A                                                                                                                      |   |             | 307 Temporary Redirect | Temporary redirection, during configuration retrieval. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF. Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| N/A                                                                                                                      |   |             | 308 Permanent Redirect | Permanent redirection, during configuration retrieval. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF. Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                                                  |

**Table 5.22.1.2.3.2-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**Table 5.22.1.2.3.2-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

### 5.22.1.2.3.3 POST

The POST method creates a new configuration of 5G access stratum time distribution for a given AF. The AF shall initiate the HTTP POST request message and the NEF shall respond to the message. The NEF shall construct the URI of the created resource.

This method shall support the request data structures specified in table 5.22.1.2.3.3-1 and the response data structures and response codes specified in table 5.22.1.2.3.3-2.

**Table 5.22.1.2.3.3-1: Data structures supported by the POST Request Body on this resource**

| Data type                  | P | Cardinality | Description                                                                  |
|----------------------------|---|-------------|------------------------------------------------------------------------------|
| AccessTimeDistributionData | M | 1           | Parameters to create a configuration of 5G access stratum time distribution. |

**Table 5.22.1.2.3.3-2: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                   | P | Cardinality | Response codes | Description                                                                                                                     |
|-----------------------------------------------------------------------------------------------------------------------------|---|-------------|----------------|---------------------------------------------------------------------------------------------------------------------------------|
| AccessTimeDistributionData                                                                                                  | M | 1           | 201 Created    | The configuration was created successfully.<br>The URI of the created resource shall be returned in the "Location" HTTP header. |
| ProblemDetails                                                                                                              | O | 0..1        | 403 Forbidden  | (NOTE 2)                                                                                                                        |
| NOTE 1: The mandatory HTTP error status codes for the POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                |                                                                                                                                 |
| NOTE 2: Failure causes are described in clause 5.22.6.                                                                      |   |             |                |                                                                                                                                 |

**Table 5.22.1.2.3.3-3: Headers supported by the 201 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                         |
|----------|-----------|---|-------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains the URI of the newly created resource, according to the structure: {apiRoot}/3gpp-asti/v1/{afId}/configurations/{configId} |

#### 5.22.1.2.4 Resource Custom Operations

##### 5.22.1.2.4.1 Overview

**Table 5.22.1.2.4.1-1: Custom operations**

| Operation Name | Custom operation URI     | Mapped HTTP method | Description                                                                      |
|----------------|--------------------------|--------------------|----------------------------------------------------------------------------------|
| retrieve       | /configurations/retrieve | retrieve (POST)    | Request the status of the 5G access stratum time distribution for a list of UEs. |

##### 5.22.1.2.4.2 Operation: retrieve

##### 5.22.1.2.4.2.1 Description

This custom operation retrieves the status of the access stratum time distribution for a list of UEs.

##### 5.22.1.2.4.2.2 Operation Definition

This operation shall support the request data structures specified in table 5.22.1.2.4.2.2-1 and the response data structure and response codes specified in table 5.22.1.2.4.2.2-2.

**Table 5.22.1.2.4.2.2-1: Data structures supported by the POST Request Body on this resource**

| Data type         | P | Cardinality | Description                                                                                                                |
|-------------------|---|-------------|----------------------------------------------------------------------------------------------------------------------------|
| StatusRequestData | M | 1           | Parameters to be sent by the AF when the status of the 5G access stratum time distribution for a list of UEs is requested. |

**Table 5.22.1.2.4.2.2-2: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                 | P | Cardinality | Response codes | Description                                                                      |
|---------------------------------------------------------------------------------------------------------------------------|---|-------------|----------------|----------------------------------------------------------------------------------|
| StatusResponseData                                                                                                        | M | 1           | 200 OK         | Status of the 5G access stratum time distribution for a list of UEs is returned. |
| NOTE: The mandatory HTTP error status codes for the POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                |                                                                                  |

#### 5.22.1.3 Resource: Individual ASTI Configuration

##### 5.22.1.3.1 Introduction

This resource allows an AF to read/modify/cancel a configuration of 5G access stratum time distribution with the NEF.

##### 5.22.1.3.2 Resource Definition

Resource URI: {apiRoot}/3gpp-asti/v1/{afId}/configurations/{configId}

This resource shall support the resource URI variables defined in table 5.22.1.3.2-1.

**Table 5.22.1.3.2-1: Resource URI variables for this resource**

| Name | Data type | Definition |
|------|-----------|------------|
|------|-----------|------------|

|          |        |                                           |
|----------|--------|-------------------------------------------|
| apiRoot  | string | Clause 5.2.4 of 3GPP TS 29.122 [4].       |
| afld     | string | Identifier of the AF.                     |
| configld | string | Identifier of the configuration resource. |

### 5.22.1.3.3 Resource Methods

#### 5.22.1.3.3.1 General

The following clauses specify the resource methods supported by the resource as described in clause 5.22.1.3.2.

#### 5.22.1.3.3.2 GET

The GET method allows to read the active configuration for a given AF and configuration Id. The AF shall initiate the HTTP GET request message and the NEF shall respond to the message.

This method shall support the URI query parameters specified in table 5.22.1.3.3.2-1.

**Table 5.22.1.3.3.2-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| N/A  |           |   |             |             |

This method shall support the request data structures specified in table 5.22.1.3.3.2-2 and the response data structures and response codes specified in table 5.22.1.3.3.2-3.

**Table 5.22.1.3.3.2-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| N/A       |   |             |             |

**Table 5.22.1.3.3.2-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                                      |
|--------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AccessTimeDistributionData                                                                                               | M | 1           | 200 OK                 | The configuration information for the AF in the request URI are returned.                                                                                                                                                                                        |
| N/A                                                                                                                      |   |             | 307 Temporary Redirect | Temporary redirection, during configuration retrieval. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF. Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| N/A                                                                                                                      |   |             | 308 Permanent Redirect | Permanent redirection, during configuration retrieval. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF. Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                                                  |

**Table 5.22.1.3.3.2-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**Table 5.22.1.3.3.2-5: Headers supported by the 308 Response Code on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
|------|-----------|---|-------------|-------------|

|          |        |   |   |                                                                   |
|----------|--------|---|---|-------------------------------------------------------------------|
| Location | string | M | 1 | An alternative URI of the resource located in an alternative NEF. |
|----------|--------|---|---|-------------------------------------------------------------------|

#### 5.22.1.3.3.3 PUT

The PUT method modifies an existing configuration resource to update a configuration. The AF shall initiate the HTTP PUT request message and the NEF shall respond to the message.

This method shall support the request data structures specified in table 5.22.1.3.3.3-1 and the response data structures and response codes specified in table 5.22.1.3.3.3-2.

**Table 5.22.1.3.3.3-1: Data structures supported by the PUT Request Body on this resource**

| Data type                  | P | Cardinality | Description                                                              |
|----------------------------|---|-------------|--------------------------------------------------------------------------|
| AccessTimeDistributionData | M | 1           | Modify an existing configuration of 5G access stratum time distribution. |

**Table 5.22.1.3.3.3-2: Data structures supported by the PUT Response Body on this resource**

| Data type                                                                                                                  | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                                         |
|----------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AccessTimeDistributionData                                                                                                 | M | 1           | 200 OK                 | The configuration was updated successfully.                                                                                                                                                                                                                         |
| N/A                                                                                                                        |   |             | 204 No Content         | The configuration was updated successfully.                                                                                                                                                                                                                         |
| N/A                                                                                                                        |   |             | 307 Temporary Redirect | Temporary redirection, during configuration modification. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF. Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| N/A                                                                                                                        |   |             | 308 Permanent Redirect | Permanent redirection, during configuration modification. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF. Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| ProblemDetails                                                                                                             | O | 0..1        | 403 Forbidden          | (NOTE 2)                                                                                                                                                                                                                                                            |
| NOTE 1: The mandatory HTTP error status codes for the PUT method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                                                     |
| NOTE 2: Failure causes are described in clause 5.22.6.                                                                     |   |             |                        |                                                                                                                                                                                                                                                                     |

**Table 5.22.1.3.3.3-3: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |

| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

## 5.22.1.3.3.4 DELETE

The DELETE method deletes the configuration of 5G access stratum time distribution for a given AF. The AF shall initiate the HTTP DELETE request message and the NEF shall respond to the message.

This method shall support the URI query parameters specified in table 5.22.1.3.3.4-1.

**Table 5.22.1.3.3.4-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| N/A  |           |   |             |             |

This method shall support the request data structures specified in table 5.22.1.3.3.4-2 and the response data structures and response codes specified in table 5.22.1.3.3.4-3.

**Table 5.22.1.3.3.4-2: Data structures supported by the DELETE Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| N/A       |   |             |             |

**Table 5.22.1.3.3.4-3: Data structures supported by the DELETE Response Body on this resource**

| Data type                                                                                                                   | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                                        |
|-----------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| N/A                                                                                                                         |   |             | 204 No Content         | The configuration was terminated successfully.                                                                                                                                                                                                                     |
| N/A                                                                                                                         |   |             | 307 Temporary Redirect | Temporary redirection, during configuration termination. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF. Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| N/A                                                                                                                         |   |             | 308 Permanent Redirect | Permanent redirection, during configuration termination. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF. Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the DELETE method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                                                    |

**Table 5.22.1.3.3.4-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**Table 5.22.1.3.3.4-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

## 5.22.2 Custom Operations without associated resources

There are no custom operations without associated resources defined for this API in this release of the specification.

## 5.22.3 Notifications

### 5.22.3.1 General

Notifications shall comply to clause 5.2.5 of 3GPP TS 29.122 [4].

**Table 5.22.3.1-1: Notifications overview**

| Notification      | Callback URI   | HTTP method or custom operation | Description (service operation) |
|-------------------|----------------|---------------------------------|---------------------------------|
| ASTI Notification | {astiNotifUri} | POST                            | ASTI notification.              |

### 5.22.3.2 ASTI Notification

#### 5.22.3.2.1 Description

The ASTI Notification is used by the NEF to report the changes on the ASTI service to a previously subscribed AF.

#### 5.22.3.2.2 Target URI

The Callback URI "{astiNotifUri}" shall be used with the callback URI variables defined in table 5.22.3.2.2-1.

**Table 5.22.3.2.2-1: Callback URI variables**

| Name         | Definition                                                                                                                        |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------|
| astiNotifUri | Callback reference provided by the AF during the creation/update/modification of the corresponding Individual ASTI Configuration. |

#### 5.22.3.2.3 Operation Definition

##### 5.22.3.2.3.1 Notification via HTTP POST

This method shall support the request data structures specified in table 5.22.3.2.3.1-1 and the response data structures and response codes specified in table 5.22.3.2.3.1-2.

**Table 5.22.3.2.3.1-1: Data structures supported by the POST Request Body on this resource**

| Data type              | P | Cardinality | Description                                                                                                                       |
|------------------------|---|-------------|-----------------------------------------------------------------------------------------------------------------------------------|
| AstiConfigNotification | M | 1           | Provides information about the change in the 5G Access Stratum Time Distribution configuration notification by the NEF to the AF. |

**Table 5.22.3.2.3.1-2: Data structures supported by the POST Response Body on this resource**

| Data type | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                                                     |
|-----------|---|-------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a       |   |             | 204 No Content         | The event notification is successfully received.                                                                                                                                                                                                                                |
| n/a       |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF where the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a       |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF where the notification should be sent.                                                                                  |

|                                                                                                                           |  |  |  |                                                                           |
|---------------------------------------------------------------------------------------------------------------------------|--|--|--|---------------------------------------------------------------------------|
|                                                                                                                           |  |  |  | Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |  |  |  |                                                                           |

5.22.3.2.3.2            Void

## 5.22.4 Data Model

### 5.22.4.1 General

This clause specifies the application data model supported by the ASTI API.

Table 5.22.4.1-1 specifies the data types defined for the ASTI API.

**Table 5.22.4.1-1: ASTI API specific Data Types**

| Data type                   | Clause defined | Description                                                                                                                                                           | Applicability    |
|-----------------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| AccessTimeDistributionData  | 5.22.4.3.2     | Contains the parameters for the creation of 5G access stratum time distribution configuration and for the subscription of 5G access stratum time distribution status. |                  |
| ActiveUe                    | 5.22.4.3.5     | Contains the UE identifier whose status of the access stratum time distribution is active and the optional requested time synchronization error budget.               |                  |
| AstiConfigNotification      | 5.22.4.3.6     | Contains the report of a change in the 5G Access Stratum Time Distribution parameters applied to the UE(s).                                                           | ASTIConfigReport |
| AstiConfigStateNotification | 5.22.4.3.7     | Contains the report about a change in the 5G Access Stratum Time Distribution parameters for a UE                                                                     | ASTIConfigReport |
| StatusRequestData           | 5.22.4.3.3     | Contains the parameters for retrieval of the status of the access stratum time distribution for a list of UEs.                                                        |                  |
| StatusResponseData          | 5.22.4.3.4     | Contains the parameters for the status of the access stratum time distribution for a list of UEs.                                                                     |                  |

### 5.22.4.2 Reused data types

The data types reused by the ASTI API from other specifications are listed in table 5.22.4.2-1.

**Table 5.22.4.2-1: Re-used Data Types**

| Data type                 | Reference           | Comments                                                                                | Applicability    |
|---------------------------|---------------------|-----------------------------------------------------------------------------------------|------------------|
| AstiEvent                 | 3GPP TS 29.565 [50] | Contains the ASTI Event.                                                                | ASTIConfigReport |
| AfAsTimeDistributionParam | 3GPP TS 29.565 [50] | Contains the 5G AF requested access stratum time distribution parameters.               |                  |
| ExternalGroupId           | 3GPP TS 29.122 [4]  | External Group Identifier for a user group.                                             |                  |
| Gpsi                      | 3GPP TS 29.571 [8]  | Identifies a GPSI.                                                                      |                  |
| ProblemDetails            | 3GPP TS 29.122 [4]  | Represents error related information.                                                   |                  |
| SpatialValidityCond       | 3GPP TS 29.571 [8]  | Represents the Spatial Validity Condition.                                              | CoverageArea     |
| SupportedFeatures         | 3GPP TS 29.571 [8]  | Used to negotiate the applicability of the optional features defined in table 5.22.5-1. |                  |
| Uri                       | 3GPP TS 29.571 [8]  | Identifies a referenced resource.                                                       | ASTIConfigReport |

### 5.22.4.3 Structured data types

#### 5.22.4.3.1 Introduction

This clause defines the structured data types to be used in resource representations.

#### 5.22.4.3.2 Type: AccessTimeDistributionData

**Table 5.22.4.3.2-1: Definition of type AccessTimeDistributionData**

| Attribute name | Data type                 | P | Cardinality | Description                                                                                                                                                                                                                           | Applicability    |
|----------------|---------------------------|---|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| gpsis          | array(Gpsi)               | C | 1..N        | Identifies a list of UE(s).<br>(NOTE 1)                                                                                                                                                                                               |                  |
| exterGroupId   | ExternalGroupId           | C | 0..1        | Represents a group of users. (NOTE 1)                                                                                                                                                                                                 |                  |
| asTimeDisParam | AfAsTimeDistributionParam | M | 1           | 5G access stratum time distribution parameters.<br><br>(NOTE 3)                                                                                                                                                                       |                  |
| coverageArea   | SpatialValidityCondition  | O | 0..1        | Time Synchronization Coverage Area. (NOTE 2)                                                                                                                                                                                          | CoverageArea     |
| astiNotifUri   | Uri                       | C | 0..1        | Notification URI for reporting changes in 5G access stratum time distribution status, and/or reporting the 5G access stratum time distribution information.<br><br>It shall be provided if the feature ASTIConfigReport is supported. | ASTIConfigReport |
| astiNotifId    | string                    | C | 0..1        | Notification Correlation ID assigned by the AF. It shall be provided if the ASTIConfigReport feature is supported.                                                                                                                    | ASTIConfigReport |
| suppFeat       | SupportedFeatures         | C | 0..1        | Contains the list of supported feature(s) among the ones defined in clause 5.22.5.<br><br>This attribute shall be present only when feature negotiation needs to take place.                                                          |                  |

NOTE 1: One of "gpsis" or "exterGroupId" attribute shall be provided.

NOTE 2: The "trackingAreaList" attribute within the "coverageArea" attribute is not applicable for the untrusted AF.

NOTE 3: The "clkQltDetLvl" attribute and the "clkQltAcptCri" attribute (if applicable) within the "asTimeDisParam" attribute may be provided only if the "NetTimeSyncStatus" feature is supported.

## 5.22.4.3.3 Type: StatusRequestData

Table 5.22.4.3.3-1: Definition of type StatusRequestData

| Attribute name | Data type   | P | Cardinality | Description                 | Applicability |
|----------------|-------------|---|-------------|-----------------------------|---------------|
| gpsis          | array(Gpsi) | M | 1..N        | Identifies a list of UE(s). |               |

## 5.22.4.3.4 Type: StatusResponseData

Table 5.22.4.3.4-1: Definition of type StatusResponseData

| Attribute name | Data type       | P | Cardinality | Description                                                                                                                                                | Applicability |
|----------------|-----------------|---|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| inactiveUes    | array(Gpsi)     | O | 1..N        | Indicate the UE(s) whose status of the access stratum time distribution is inactive.                                                                       |               |
| activeUes      | array(ActiveUe) | O | 1..N        | Contains the UE identifier(s) whose status of the access stratum time distribution is active and the optional requested time synchronization error budget. |               |

## 5.22.4.3.5 Type: ActiveUe

Table 5.22.4.3.5-1: Definition of type ActiveUe

| Attribute name  | Data type | P | Cardinality | Description                                                                            | Applicability |
|-----------------|-----------|---|-------------|----------------------------------------------------------------------------------------|---------------|
| gpsi            | Gpsi      | M | 1           | Indicate the UE whose status of the access stratum time distribution is active.        |               |
| timeSyncErrBdgt | UInteger  | O | 0..1        | Indicates the time synchronization error budget in terms of time units of nanoseconds. |               |

## 5.22.4.3.6 Type: AstiConfigNotification

Table 5.22.4.3.6-1: Definition of type AstiConfigNotification

| Attribute name | Data type                          | P | Cardinality | Description                                                                                   | Applicability |
|----------------|------------------------------------|---|-------------|-----------------------------------------------------------------------------------------------|---------------|
| astiNotifId    | string                             | M | 1           | It is used to set the value of Notification Correlation ID in the corresponding notification. |               |
| stateConfigs   | array(AstiConfigStateNotification) | M | 1..N        | Contains change of state of 5G access stratum time distribution configuration.                |               |

## 5.22.4.3.7 Type: AstiConfigStateNotification

Table 5.22.4.3.7-1: Definition of type AstiConfigStateNotification

| Attribute name | Data type | P | Cardinality | Description                                        | Applicability |
|----------------|-----------|---|-------------|----------------------------------------------------|---------------|
| gpsi           | Gpsi      | M | 1           | Identifies the UE to which the status below apply. |               |
| event          | AstiEvent | M | 1           | Indicates the reported event.                      |               |

## 5.22.4.4 Simple data types and enumerations

### 5.22.4.4.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

### 5.22.4.4.2 Simple data types

The simple data types defined in table 5.22.4.4.2-1 shall be supported.

**Table 5.22.4.4.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

## 5.22.5 Used Features

The table below defines the features applicable to the ASTI API. Those features are negotiated as described in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.22.5-1: Features used by ASTI API**

| Feature number | Feature Name      | Description                                                                                                                                                            |
|----------------|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1              | CoverageArea      | Indicates support of the inclusion of the Time Synchronization Coverage Area in ASTI requests.                                                                         |
| 2              | ASTIConfigReport  | This feature indicates the support of the report of changes in 5G access stratum time distribution status.                                                             |
| 3              | NetTimeSyncStatus | This feature indicates the support of network timing synchronization status and reporting.<br><br>This feature requires the support of the "ASTIConfigReport" feature. |
| 4              | SupportReport     | This feature indicates the support of the report of whether the AF requested Time Synchronization is authorized for the requested UE's.                                |

## 5.22.6 Error handling

### 5.22.6.1 General

HTTP error handling shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses shall apply.

### 5.22.6.2 Protocol Errors

In this Release of the specification, there are no additional protocol errors applicable for the ASTI API.

### 5.22.6.3 Application Errors

The application errors defined for the ASTI API are listed in table 5.22.6.3-1.

**Table 5.22.6.3-1: Application errors**

| Application Error | HTTP status code | Description | Applicability |
|-------------------|------------------|-------------|---------------|
|                   |                  |             |               |

|                           |               |                                                                                                                                |               |
|---------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------|---------------|
| UE_SERVICE_NOT_AUTHORIZED | 403 Forbidden | The AF request is not authorized or the AF requested parameter(s) are not authorized by UE's Time Synchronization Data in UDM. | SupportReport |
|---------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------|---------------|

## 5.23 DataReporting API

### 5.23.1 Introduction

The Nnef\_DataReporting service shall use the DataReporting API.

The API URI of DataReporting API shall be:

**{apiRoot}/<apiName>/<apiVersion>**

The request URIs used in HTTP requests shall have the Resource URI structure defined in clause 5.2.4 of 3GPP TS 29.122 [4], i.e.:

**{apiRoot}/<apiName>/<apiVersion>/<apiSpecificSuffixes>**

with the following components:

- "apiRoot" is set as defined in clause 5.2.4 of 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-data-reporting".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.
- The <apiSpecificSuffixes> shall be set as described in clause 5.2.4 of 3GPP TS 29.122 [4].

All resource URIs in the clauses below are defined relative to the above API URI.

### 5.23.2 Resources

#### 5.23.2.1 Overview

This clause describes the structure for the Resource URIs as shown in Figure 5.23.2.1-1 and the resources and HTTP methods used for the DataReporting API.

The structure of the resource URIs of the DataReporting API is shown in Figure 5.23.2.1-1.

{apiRoot}/3gpp-data-reporting/<apiVersion>

Figure 5.23.2.1-1: Resource URI structure of the DataReporting API

Table 5.23.2.1-1 provides an overview of the resources and applicable HTTP methods applicable for the DataReporting API.

Table 5.23.2.1-1: Resources and methods overview

| Resource name                     | Resource URI (relative path under API URI) | HTTP method or custom operation | Description (service operation)                                  |
|-----------------------------------|--------------------------------------------|---------------------------------|------------------------------------------------------------------|
| Data Reporting Sessions           | /sessions                                  | POST                            | Create a Data Reporting Session                                  |
| Individual Data Reporting Session | /sessions/{sessionId}                      | GET                             | Retreive an existing Individual Data Reporting Session resource. |
|                                   |                                            | PUT                             | Update an Individual existing Data Reporting Session resource.   |
|                                   |                                            | DELETE                          | Delete an existing Individual Data Reporting Session resource.   |
|                                   |                                            | report (POST)                   | Report data.                                                     |

5.23.2.2 Resource: Data Reporting Sessions

5.23.2.2.1 Introduction

This resource represents the collection of Data Reporting Sessions managed by the NEF.

This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [3]).

## 5.23.2.2.2 Resource definition

Resource URI: {apiRoot}/3gpp-data-reporting/<apiVersion>/sessions

This resource shall support the resource URI variables defined in table 5.23.2.2.2-1.

**Table 5.23.2.2.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition         |
|---------|-----------|--------------------|
| apiRoot | string    | See clause 5.23.1. |

## 5.23.2.2.3 Resource Methods

## 5.23.2.2.3.1 POST

This method enables an AF to request the creation of a Data Reporting Session at the NEF.

This method shall support the URI query parameters specified in table 5.23.2.2.3.1-1.

**Table 5.23.2.2.3.1-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.23.2.2.3.1-2 and the response data structures and response codes specified in table 5.23.2.2.3.1-4.

**Table 5.23.2.2.3.1-2: Data structures supported by the POST request body on this resource**

| Data type                                                                                                            | P | Cardinality | Description                                                                          |
|----------------------------------------------------------------------------------------------------------------------|---|-------------|--------------------------------------------------------------------------------------|
| DataReportingSession                                                                                                 | M | 1           | Representation of the Data Reporting Session to be created in the NEF.<br><br>(NOTE) |
| NOTE: The "sessionId" attribute of the DataReportingSession data type shall not be provided as it is not applicable. |   |             |                                                                                      |

**Table 5.23.2.2.3.1-3: Data structures supported by the POST response body on this resource**

| Data type                                                                                                                        | P | Cardinality | Response codes | Description                                                                                                                                                                                                                                       |
|----------------------------------------------------------------------------------------------------------------------------------|---|-------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DataReportingSession                                                                                                             | M | 1           | 201 Created    | Successful case. A representation of the created "Individual Data Reporting Session" resource is returned.<br><br>An HTTP "Location" header that contains the URI of the created resource shall be returned in the response body.<br><br>(NOTE 2) |
| NOTE 1: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                |                                                                                                                                                                                                                                                   |
| NOTE 2: The "sessionId" attribute of the DataReportingSession data type shall not be provided as it is not applicable.           |   |             |                |                                                                                                                                                                                                                                                   |

**Table 5.23.2.2.3.1-4: Headers supported by the 201 response code on this resource**

| HTTP response header | Data type | P | Cardinality | Description                                                                                                                           |
|----------------------|-----------|---|-------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Location             | string    | M | 1           | The URI of the newly created resource, according to the structure:<br>{apiRoot}/3gpp-data-reporting/<apiVersion>/sessions/{sessionId} |

### 5.23.2.3 Resource: Individual Data Reporting Session

#### 5.23.2.3.1 Introduction

This resource represents an Individual Data Reporting Session managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [3]).

#### 5.23.2.3.2 Resource Definition

Resource URI: **{apiRoot}/3gpp-data-reporting/<apiVersion>/sessions/{sessionId}**

This resource shall support the resource URI variables defined in table 5.23.2.3.2-1.

**Table 5.23.2.3.2-1: Resource URI variables for this resource**

| Name      | Data type | Definition                                                                     |
|-----------|-----------|--------------------------------------------------------------------------------|
| apiRoot   | string    | See clause 5.23.1.                                                             |
| sessionId | string    | Represents the identifier of the "Individual Data Reporting Session" resource. |

#### 5.23.2.3.3 Resource standard methods

##### 5.23.2.3.3.1 GET

This method enables an AF to retrieve an existing "Individual Data Reporting Session" resource at the NEF.

This method shall support the URI query parameters specified in table 5.23.2.3.3.1-1.

**Table 5.23.2.3.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.23.2.3.3.1-2 and the response data structures and response codes specified in table 5.23.2.3.3.1-3.

**Table 5.23.2.3.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.23.2.3.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type            | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                |
|----------------------|---|-------------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DataReportingSession | M | 1           | 200 OK                 | Successful case. The requested "Individual Data Reporting Session" resource is returned to the AF.<br>(NOTE 2)                                                                                                             |
| n/a                  |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                  |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |

NOTE 1: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply.

NOTE 2: The "sessionId" attribute of the DataReportingSession data type shall not be provided as it is not applicable.

**Table 5.23.2.3.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI located in an alternative NEF. |

**Table 5.23.2.3.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.23.2.3.3.2 PUT

This method enables an AF to request the update of an existing "Individual Data Reporting Session" resource at the NEF.

This method shall support the URI query parameters specified in table 5.23.2.3.3.2-1.

**Table 5.23.2.3.3.2-1: URI query parameters supported by the PUT method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
|      |           |   |             |             |

This method shall support the request data structures specified in table 5.23.2.3.3.2-2 and the response data structures and response codes specified in table 5.23.2.3.3.2-3.

**Table 5.23.2.3.3.2-2: Data structures supported by the PUT request body on this resource**

| Data type                                                                                                            | P | Cardinality | Description                                                            |
|----------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------------------------------------------------------|
| DataReportingSession                                                                                                 | M | 1           | Parameters to update the "Individual Data Reporting Session" resource. |
| NOTE: The "sessionId" attribute of the DataReportingSession data type shall not be provided as it is not applicable. |   |             |                                                                        |

**Table 5.23.2.3.3.2-3: Data structures supported by the PUT response body on this resource**

| Data type            | P | Cardinality | Response codes         | Description                                                                                                                                                                                   |
|----------------------|---|-------------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DataReportingSession | M | 1           | 200 OK                 | Successful response. The "Individual Data Reporting Session" resource was updated successfully and a representation of the created resource is returned in the response body.<br><br>(NOTE 2) |
| n/a                  |   |             | 204 No Content         | Successful response. The "Individual Data Reporting Session" resource was successfully updated and no content is to be returned in the response body.                                         |
| n/a                  |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.                                                 |

|                                                                                                                                 |  |  |                        |                                                                                                                                                                                                                                |
|---------------------------------------------------------------------------------------------------------------------------------|--|--|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                 |  |  |                        | Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].                                                                                                                                                      |
| n/a                                                                                                                             |  |  | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE 1: The mandatory HTTP error status codes for the HTTP PUT method listed in Table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |  |  |                        |                                                                                                                                                                                                                                |
| NOTE 2: The "sessionId" attribute of the DataReportingSession data type shall not be provided as it is not applicable.          |  |  |                        |                                                                                                                                                                                                                                |

**Table 5.23.2.3.3.2-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**5.23.2.3.3.3 DELETE**

This method enables an AF to request the deletion of an existing "Individual Data Reporting Session" resource at the NEF.

This method shall support the URI query parameters specified in table 5.23.2.3.3.3-1.

**Table 5.23.2.3.3.3-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.23.2.3.3.3-2 and the response data structures and response codes specified in table 5.23.2.3.3.3-3.

**Table 5.23.2.3.3.3-2: Data structures supported by the DELETE request body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.23.2.3.3.3-3: Data structures supported by the DELETE response body on this resource**

| Data type | P | Cardinality | Response Codes         | Description                                                                                                                                                                                                                    |
|-----------|---|-------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a       |   |             | 204 No Content         | Successful response. The "Individual Data Reporting Session" resource is successfully deleted.                                                                                                                                 |
|           |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |

|                                                                                                                                  |  |  |                        |                                                                                                                                                                                                                                |

| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.23.2.3.4 Resource custom operations

##### 5.23.2.3.4.1 Overview

**Table 5.23.2.3.4.1-1: Custom operations**

| Operation name | Custom operation URI         | Mapped HTTP method | Description                                |
|----------------|------------------------------|--------------------|--------------------------------------------|
| Report         | /sessions/{sessionId}/report | POST               | Enables to send collected UE data reports. |

##### 5.23.2.3.4.2 Operation: Report

###### 5.23.2.3.4.2.1 Description

The custom operation enables an AF to send collected UE data reports to the NEF.

###### 5.23.2.3.4.2.2 Operation Definition

This operation shall support the request data structures specified in table 5.23.2.3.4.2.2-1 and the response data structures and response codes specified in table 5.23.2.3.4.2.2-2.

**Table 5.23.2.3.4.2.2-1: Data structures supported by the POST request body on this resource**

| Data type  | P | Cardinality | Description                                     |
|------------|---|-------------|-------------------------------------------------|
| DataReport | M | 1           | UE data reported by the data collection client. |

**Table 5.23.2.3.4.2.2-2: Data structures supported by the POST response body on this resource**

| Data type            | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                    |
|----------------------|---|-------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DataReportingSession | O | 0..1        | 200 OK                 | The UE data report was successfully received.                                                                                                                                                                                  |
| n/a                  |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |

|                                                                                                                            |  |  |                              |                                                                                                                                                                                                                               |
|----------------------------------------------------------------------------------------------------------------------------|--|--|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

### 5.23.3 Custom Operations without associated resources

There are no custom operations without associated resources defined for this API in this release of the specification.

### 5.23.4 Notifications

There are no notifications defined for this API in this release of the specification.

### 5.23.5 Data Model

#### 5.23.5.1 General

This clause specifies the application data model supported by the DataReporting API. Table 5.23.5.1-1 specifies the data types defined for the DataReporting API.

**Table 5.23.5.1-1: DataReporting specific Data Types**

| Data type | Clause defined | Description |
|-----------|----------------|-------------|
| n/a       |                |             |

Table 5.23.5.1-2 specifies data types re-used by the DataReporting API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the DataReporting API.

**Table 5.23.5.1-2: Re-used Data Types**

| Data type            | Reference           | Comments                                                    | Applicability |
|----------------------|---------------------|-------------------------------------------------------------|---------------|
| DataReport           | 3GPP TS 26.532 [60] | Reported data by the AF.                                    |               |
| DataReportingSession | 3GPP TS 26.532 [60] | Configuration by the AF specifying the data to be reported. |               |

### 5.23.6 Used Features

The table below defines the features applicable to the DataReporting API. Those features are negotiated as described in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.23.6-1: Features used by DataReporting API**

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|
|                |              |             |

## 5.23.7 Error handling

### 5.23.7.1 General

HTTP error handling shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses shall apply.

### 5.23.7.2 Protocol Errors

In this Release of the specification, there are no additional protocol errors applicable for the DataReporting API.

### 5.23.7.3 Application Errors

The application errors defined for the DataReporting API are listed in table 5.23.7.3-1.

**Table 5.23.7.3-1: Application errors**

| Application Error | HTTP status code | Description |
|-------------------|------------------|-------------|
|                   |                  |             |

## 5.24 DataReportingProvisioning API

### 5.24.1 Introduction

The Nnef\_DataReportingProvisioning service shall use the DataReportingProvisioning API.

The API URI of the DataReportingProvisioning API shall be:

**{apiRoot}/<apiName>/<apiVersion>**

The request URIs used in HTTP requests shall have the Resource URI structure defined in clause 5.2.4 of 3GPP TS 29.122 [4], i.e.:

**{apiRoot}/<apiName>/<apiVersion>/<apiSpecificSuffixes>**

with the following components:

- "apiRoot" is set as defined in clause 5.2.4 of 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-data-reporting-provisioning".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.
- The <apiSpecificSuffixes> shall be set as described in clause 5.2.4 of 3GPP TS 29.122 [4].

All resource URIs in the clauses below are defined relative to the above API URI.

5.24.2 Resources

5.24.2.1 Overview

This clause describes the structure for the Resource URIs as shown in Figure 5.24.2.1-1 and the resources and HTTP methods used for the DataReportingProvisioning API.

The structure of the resource URIs of the DataReportingProvisioning API is shown in Figure 5.24.2.1-1.

**Figure 5.24.2.1-1: Resource URI structure of the DataReportingProvisioning API**

Table 5.24.2.1-1 provides an overview of the resources and applicable HTTP methods applicable for the DataReportingProvisioning API.

**Table 5.24.2.1-1: Resources and methods overview**

| Resource name                                  | Resource URI (relative path under API URI) | HTTP method | Description (service operation)                                                 |
|------------------------------------------------|--------------------------------------------|-------------|---------------------------------------------------------------------------------|
| Data Reporting Provisioning Sessions           | /sessions                                  | POST        | Create a Data Reporting Provisioning Session.                                   |
| Individual Data Reporting Provisioning Session | /sessions/{sessionId}                      | GET         | Retreive an existing "Individual Data Reporting Provisioning Session" resource. |
|                                                |                                            | DELETE      | Delete an existing "Individual Data Reporting Provisioning Session" resource.   |

|                                         |                                                        |        |                                                                           |
|-----------------------------------------|--------------------------------------------------------|--------|---------------------------------------------------------------------------|
| Data Reporting Configurations           | /sessions/{sessionId}/configurations                   | POST   | Create a new Data Reporting Configuration.                                |
| Individual Data Reporting Configuration | /sessions/{sessionId}/configurations/{configurationId} | GET    | Retrieves an existing "Individual Data Reporting Configuration" resource. |
|                                         |                                                        | PUT    | Update an existing "Individual Data Reporting Configuration" resource.    |
|                                         |                                                        | PATCH  | Modify an existing "Individual Data Reporting Configuration" resource.    |
|                                         |                                                        | DELETE | Delete an existing "Individual Data Reporting Configuration" resource.    |

## 5.24.2.2 Resource: Data Reporting Provisioning Sessions

### 5.24.2.2.1 Introduction

This resource represents the collection of Data Reporting Provisioning Sessions managed by the NEF.

This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [3]).

### 5.24.2.2.2 Resource definition

Resource URL: {apiRoot}/3gpp-data-reporting-provisioning/v1/sessions

This resource shall support the resource URI variables defined in table 5.24.2.2.2-1.

**Table 5.24.2.2.2-1: Resource URL variables for this resource**

| Name    | Data type | Definition         |
|---------|-----------|--------------------|
| apiRoot | string    | See clause 5.24.1. |

### 5.24.2.2.3 Resource Methods

#### 5.24.2.2.3.1 POST

This method enables an AF to request the creation of a Data Reporting Provisioning Session at the NEF.

This method shall support the URI query parameters specified in table 5.24.2.2.3.1-1.

**Table 5.24.2.2.3.1-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.24.2.2.3.1-2 and the response data structures and response codes specified in table 5.24.2.2.3.1-4.

**Table 5.24.2.2.3.1-2: Data structures supported by the POST request body on this resource**

| Data type                                                                                                                                    | P | Cardinality | Description                                                                                   |
|----------------------------------------------------------------------------------------------------------------------------------------------|---|-------------|-----------------------------------------------------------------------------------------------|
| DataReportingProvisioningSession                                                                                                             | M | 1           | Representation of the Data Reporting Provisioning Session to be created in the NEF.<br>(NOTE) |
| NOTE: The "provisioningSessionId" attribute of the DataReportingProvisioningSession data type shall not be provided as it is not applicable. |   |             |                                                                                               |

**Table 5.24.2.2.3.1-3: Data structures supported by the POST response body on this resource**

| Data type                                                                                                                                      | P | Cardinality | Response codes | Description                                                                                                                                                                                                                                                                |
|------------------------------------------------------------------------------------------------------------------------------------------------|---|-------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DataReportingProvisioningSession (NOTE 2)                                                                                                      | M | 1           | 201 Created    | Successful case. A representation of the created "Individual Data Reporting Provisioning Session" resource is returned.<br><br>An HTTP "Location" header that contains the URI of the created "Individual Data Reporting Provisioning Session" resource shall be returned. |
| NOTE 1: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply.               |   |             |                |                                                                                                                                                                                                                                                                            |
| NOTE 2: The "provisioningSessionId" attribute of the DataReportingProvisioningSession data type shall not be provided as it is not applicable. |   |             |                |                                                                                                                                                                                                                                                                            |

**Table 5.24.2.2.3.1-4: Headers supported by the 201 response code on this resource**

| HTTP response header | Data type | P | Cardinality | Description                                                                                                                                     |
|----------------------|-----------|---|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| Location             | string    | M | 1           | The URI of the newly created resource, according to the structure: {apiRoot}/3gpp-data-reporting-provisioning/<apiVersion>/sessions/{sessionId} |

## 5.24.2.3 Resource: Individual Data Reporting Provisioning Session

### 5.24.2.3.1 Introduction

This resource represents an "Individual Data Reporting Provisioning Session" resource managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [3]).

### 5.24.2.3.2 Resource Definition

Resource URI: {apiRoot}/3gpp-data-reporting-provisioning/<apiVersion>/sessions/{sessionId}

This resource shall support the resource URI variables defined in table 5.24.2.3.2-1.

**Table 5.24.2.3.2-1: Resource URI variables for this resource**

| Name      | Data type | Definition                                                                                  |
|-----------|-----------|---------------------------------------------------------------------------------------------|
| apiRoot   | string    | See clause 5.24.1.                                                                          |
| sessionId | string    | Represents the identifier of the "Individual Data Reporting Provisioning Session" resource. |

### 5.24.2.3.3 Resource standard methods

#### 5.24.2.3.3.1 GET

This method enables an AF to retrieve an existing "Individual Data Reporting Provisioning Session" resource at the NEF.

This method shall support the URI query parameters specified in table 5.24.2.3.3.1-1.

**Table 5.24.2.3.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.24.2.3.3.1-2 and the response data structures and response codes specified in table 5.24.2.3.3.1-3.

**Table 5.24.2.3.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.24.2.3.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                                      | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                           |
|------------------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

5.24.2.3.3.2 Void

5.24.2.3.3.3 DELETE

This method enables an AF to request the deletion of an existing "Individual Data Reporting Provisioning Session" resource at the NEF.

This method shall support the URI query parameters specified in table 5.24.2.3.3.3-1.

**Table 5.24.2.3.3.3-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.24.2.3.3.3-2 and the response data structures and response codes specified in table 5.24.2.3.3.3-3.

**Table 5.24.2.3.3.3-2: Data structures supported by the DELETE request body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.24.2.3.3.3-3: Data structures supported by the DELETE response body on this resource**

| Data type                                                                                                                        | P | Cardinality | Response Codes         | Description                                                                                                                                                                                                                           |

## 5.24.2.4 Resource: Data Reporting Configurations

### 5.24.2.4.1 Introduction

This resource represents the collection of Data Reporting Configurations managed by the NEF.

This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [3]).

### 5.24.2.4.2 Resource definition

Resource URIL: **{apiRoot}/3gpp-data-reporting-provisioning/<apiVersion>/sessions/{sessionId}/configurations**

This resource shall support the resource URI variables defined in table 5.24.2.4.2-1.

**Table 5.24.2.4.2-1: Resource URI variables for this resource**

| Name      | Data type | Definition                                                                                           |
|-----------|-----------|------------------------------------------------------------------------------------------------------|
| apiRoot   | string    | See clause 5.24.1.                                                                                   |
| sessionId | string    | Represents the identifier of the existing "Individual Data Reporting Provisioning Session" resource. |

### 5.24.2.4.3 Resource Methods

#### 5.24.2.4.3.1 POST

This method enables an AF to request the creation of a Data Reporting Configuration at the NEF.

This method shall support the URI query parameters specified in table 5.24.2.4.3.1-1.

**Table 5.24.2.4.3.1-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.24.2.4.3.1-2 and the response data structures and response codes specified in table 5.24.2.4.3.1-4.

**Table 5.24.2.4.3.1-2: Data structures supported by the POST request body on this resource**

| Data type                                                                                                                                     | P | Cardinality | Description                                                                                |
|-----------------------------------------------------------------------------------------------------------------------------------------------|---|-------------|--------------------------------------------------------------------------------------------|
| DataReportingConfiguration                                                                                                                    | M | 1           | Representation of the Data Reporting Configuration to be created in the NEF.<br><br>(NOTE) |
| NOTE: The "dataReportingConfigurationId" attribute of the DataReportingConfiguration data type shall not be provided as it is not applicable. |   |             |                                                                                            |

**Table 5.24.2.4.3.1-3: Data structures supported by the POST response body on this resource**

| Data type                  | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                             |

| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

## 5.24.2.5 Resource: Individual Data Reporting Configuration

### 5.24.2.5.1 Introduction

This resource represents an Individual Data Reporting Configuration resource managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [3]).

### 5.24.2.5.2 Resource Definition

Resource URI: **{apiRoot}/3gpp-data-reporting-provisioning/<apiVersion>/sessions/{sessionId}/configurations/{configurationId}**

This resource shall support the resource URI variables defined in table 5.24.2.5.2-1.

**Table 5.24.2.5.2-1: Resource URI variables for this resource**

| Name            | Data type | Definition                                                                                  |
|-----------------|-----------|---------------------------------------------------------------------------------------------|
| apiRoot         | string    | See clause 5.24.1                                                                           |
| sessionId       | string    | Represents the identifier of the "Individual Data Reporting Provisioning Session" resource. |
| configurationId | string    | Represents the identifier of the "Individual Data Reporting Configuration" resource.        |

### 5.24.2.5.3 Resource standard methods

#### 5.24.2.5.3.2 GET

This method enables an AF to retrieve an existing "Individual Data Reporting Configuration" resource at the NEF.

This method shall support the URI query parameters specified in table 5.24.2.5.3.2-1.

**Table 5.24.2.5.3.2-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.24.2.5.3.2-2 and the response data structures and response codes specified in table 5.24.2.5.3.2-3.

**Table 5.24.2.5.3.2-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.24.2.5.3.2-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                                       | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DataReportingConfiguration                                                                                                                      | M | 1           | 200 OK                 | Successful case. The requested Individual Data Reporting Configuration resource is returned.<br>(NOTE 2)                                                                                                                              |
| n/a                                                                                                                                             |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                             |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE 1: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply.                 |   |             |                        |                                                                                                                                                                                                                                       |
| NOTE 2: The "dataReportingConfigurationId" attribute of the DataReportingConfiguration data type shall not be provided as it is not applicable. |   |             |                        |                                                                                                                                                                                                                                       |

**Table 5.24.2.5.3.2-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI located in an alternative NEF. |

**Table 5.24.2.5.3.2-5: Headers supported by the 308 Response Code on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
|------|-----------|---|-------------|-------------|

|          |        |   |   |                                                                                   |
|----------|--------|---|---|-----------------------------------------------------------------------------------|
| Location | string | M | 1 | Contains an alternative target URI of the resource located in an alternative NEF. |
|----------|--------|---|---|-----------------------------------------------------------------------------------|

#### 5.24.2.5.3.3 PUT

This method enables an AF to update an existing "Individual Data Reporting Configuration" resource at the NEF.

This method shall support the URI query parameters specified in table 5.24.2.5.3.3-1.

**Table 5.24.2.5.3.3-1: URI query parameters supported by the PUT method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
|      |           |   |             |             |

This method shall support the request data structures specified in table 5.24.2.5.3.3-2 and the response data structures and response codes specified in table 5.24.2.5.3.3-3.

**Table 5.24.2.5.3.3-2: Data structures supported by the PUT request body on this resource**

| Data type                                                                                                                                     | P | Cardinality | Description                                                                          |
|-----------------------------------------------------------------------------------------------------------------------------------------------|---|-------------|--------------------------------------------------------------------------------------|
| DataReportingConfiguration                                                                                                                    | M | 1           | Parameters to update the Individual Data Reporting Configuration resource.<br>(NOTE) |
| NOTE: The "dataReportingConfigurationId" attribute of the DataReportingConfiguration data type shall not be provided as it is not applicable. |   |             |                                                                                      |

**Table 5.24.2.5.3.3-3: Data structures supported by the PUT response body on this resource**

| Data type                                                                                                                                       | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DataReportingConfiguration                                                                                                                      | M | 1           | 200 OK                 | Successful case. The "Individual Data Reporting Configuration" resource was updated successfully and a representation of the updated resource is returned in the response body.<br>(NOTE 2)                                           |

#### 5.24.2.5.3.3A PATCH

The PATCH method is used to modify an existing "Individual Data Reporting Configuration" resource.

This method shall support the request data structures specified in table 5.24.2.5.3.3A-1, and the response data structures and response codes specified in table 5.24.2.5.3.3A-2.

**Table 5.24.2.5.3.3A-1: Data structures supported by the PATCH request body on this resource**

| Data type                       | P | Cardinality | Description                                                                                                    |
|---------------------------------|---|-------------|----------------------------------------------------------------------------------------------------------------|
| DataReportingConfigurationPatch | M | 1           | Contains the parameters to request the modification of the "Individual Data Reporting Configuration" resource. |

**Table 5.24.2.5.3.3A-2: Data structures supported by the PATCH response body on this resource**

| Data type                                                                                                                                       | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DataReportingConfiguration                                                                                                                      | M | 1           | 200 OK                 | Successful case. The "Individual Data Reporting Configuration" resource was updated successfully by configuration data provided.<br><br>(NOTE 2)                                                                                      |
| n/a                                                                                                                                             |   |             | 204 No Content         | Successful case. The "Individual Data Reporting Configuration" resource was successfully updated and no content is to be returned in the response body.                                                                               |
| n/a                                                                                                                                             |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |

#### 5.24.2.5.3.4 DELETE

This method enables an AF to request the deletion of an existing "Individual Data Reporting Configuration" resource at the NEF.

This method shall support the URI query parameters specified in table 5.24.2.5.3.4-1.

**Table 5.24.2.5.3.4-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.24.2.5.3.4-2 and the response data structures and response codes specified in table 5.24.2.5.3.4-3.

**Table 5.24.2.5.3.4-2: Data structures supported by the DELETE request body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.24.2.5.3.4-3: Data structures supported by the DELETE response body on this resource**

| Data type                                                                                                                        | P | Cardinality | Response Codes         | Description                                                                                                                                                                                                                           |

| Name     | Data type | P | Cardinality | Description                                                                |
|----------|-----------|---|-------------|----------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI of the resource located in an alternative NEF. |

### 5.24.3 Custom Operations without associated resources

There are no custom operations without associated resources defined for this API in this release of the specification.

### 5.24.4 Notifications

There are no notifications defined for this API in this release of the specification.

### 5.24.5 Data Model

#### 5.24.5.1 General

This clause specifies the application data model supported by the DataReportingProvisioning API. Table 5.24.5.1-1 specifies the data types defined for the DataReportingProvisioning API.

**Table 5.24.5.1-1: DataReportingProvisioning specific Data Types**

| Data type | Clause defined | Description |
|-----------|----------------|-------------|
| n/a       |                |             |

Table 5.24.5.1-2 specifies data types re-used by the DataReportingProvisioning API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the DataReportingProvisioning API.

**Table 5.24.5.1-2: DataReportingProvisioning re-used Data Types**

| Data type                        | Reference           | Comments                                                                                                   | Applicability |
|----------------------------------|---------------------|------------------------------------------------------------------------------------------------------------|---------------|
| DataReportingProvisioningSession | 3GPP TS 26.532 [60] | Configuration by the AF specifying the data to be collected, processed and reported.                       |               |
| DataReportingConfiguration       | 3GPP TS 26.532 [60] | Configuration data related to UE data collection and reporting.                                            |               |
| DataReportingConfigurationPatch  | 3GPP TS 26.532 [60] | Contains the requested modifications to the configuration data regarding UE data collection and reporting. |               |

### 5.24.6 Used Features

The table below defines the features applicable to the DataReportingProvisioning API. Those features are negotiated as described in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.24.6-1: Features used by DataReportingProvisioning API**

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|
|                |              |             |

## 5.24.7 Error handling

### 5.24.7.1 General

HTTP error handling shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses shall apply.

### 5.24.7.2 Protocol Errors

In this Release of the specification, there are no additional protocol errors applicable for the DataReportingProvisioning API.

### 5.24.7.3 Application Errors

The application errors defined for the DataReportingProvisioning API are listed in table 5.24.7.3-1.

**Table 5.24.7.3-1: Application errors**

| Application Error | HTTP status code | Description |
|-------------------|------------------|-------------|
|                   |                  |             |

## 5.25 UEId API

### 5.25.1 Introduction

The Nnef\_UEId service shall use the UEId API.

The API URI of UEId API shall be:

**{apiRoot}/3gpp-ueid/v1**

with the following components:

- "apiRoot" is set as described in clause 5.2.4 in 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-ueid".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.

All resource URIs in the clauses below are defined relative to the above API URI.

### 5.25.2 Resources

#### 5.25.2.1 Overview

This clause describes the structure for the Resource URIs as shown in figure 5.25.2.1-1 and the resources and HTTP methods used for the UEId API.

Figure 5.25.2.1-1: Resource URI structure of the UEId API

Table 5.25.2.1-1 provides an overview of the resources and applicable HTTP methods.

Table 5.25.2.1-1: Resources and methods overview

| Resource name                                     | Resource URI (relative path under API URI) | HTTP method or custom operation | Description (service operation)                                                              |
|---------------------------------------------------|--------------------------------------------|---------------------------------|----------------------------------------------------------------------------------------------|
| UE ID Mapping Information Provisionings           | /{afld}/pp                                 | GET                             | Retrieve all the active UE ID Mapping Information Provisionings managed by the NEF.          |
|                                                   |                                            | POST                            | Request the creation of a new UE ID Mapping Information Provisioning at the NEF.             |
| Individual UE ID Mapping Information Provisioning | /{afld}/pp/{ppld}                          | GET                             | Retrieve an existing "Individual UE ID Mapping Information Provisioning" managed by the NEF. |
|                                                   |                                            | PUT                             | Update an existing "Individual UE ID Mapping Information Provisioning" managed by the NEF.   |
|                                                   |                                            | PATCH                           | Modify an existing "Individual UE ID Mapping Information Provisioning" managed by the NEF.   |
|                                                   |                                            | DELETE                          | Delete an existing "Individual UE ID Mapping Information Provisioning" managed by the NEF.   |

5.25.2.2 Resource: UE ID Mapping Information Provisionings

5.25.2.2.1 Introduction

This resource represents the collection of UE ID Mapping Information Provisionings managed by the NEF.

This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [32]).

5.25.2.2.2 Resource Definition

Resource URI: {apiRoot}/3gpp-ueid/<apiVersion>/{afld}/pp

This resource shall support the resource URI variables defined in table 5.25.2.2.2-1.

**Table 5.25.2.2.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition                           |
|---------|-----------|--------------------------------------|
| apiRoot | string    | See clause 5.25.1.                   |
| afId    | string    | Represents the identifier of the AF. |

### 5.25.2.2.3 Resource Methods

#### 5.25.2.2.3.1 GET

This method enables to request to retrieve all the active UE ID Mapping Information Provisionings managed by the NEF.

This method shall support the URI query parameters specified in table 5.25.2.2.3.1-1.

**Table 5.25.2.2.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.25.2.2.3.1-2 and the response data structures and response codes specified in table 5.25.2.2.3.1-3.

**Table 5.25.2.2.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.25.2.2.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                                             |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### 5.25.2.2.3.2 POST

This method enables an AF to request the creation of a new UE ID Mapping Information Provisioning at the NEF.

This method shall support the URI query parameters specified in table 5.25.2.2.3.2-1.

**Table 5.25.2.2.3.2-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.25.2.2.3.2-2 and the response data structures and response codes specified in table 5.25.2.2.3.2-3.

**Table 5.25.2.2.3.2-2: Data structures supported by the POST Request Body on this resource**

| Data type       | P | Cardinality | Description                                                                                         |
|-----------------|---|-------------|-----------------------------------------------------------------------------------------------------|
| UeldMappingInfo | M | 1           | Contains the representation of the UE ID Mapping Information Provisioning to be created at the NEF. |

**Table 5.25.2.2.3.2-3: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                      | P | Cardinality | Response codes | Description                                                                                                                                                                                                                            |
|--------------------------------------------------------------------------------------------------------------------------------|---|-------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UeldMappingInfo                                                                                                                | M | 1           | 201 Created    | Successful case. A representation of the created "Individual UE ID Mapping Information Provisioning" resource is returned in the response body.<br><br>The URI of the created resource shall be returned in an HTTP "Location" header. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                |                                                                                                                                                                                                                                        |

**Table 5.25.2.2.3.2-4: Headers supported by the 201 response code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                      |
|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains the URI of the newly created resource, according to the structure:<br>{apiRoot}/3gpp-ueid/<apiVersion>/{afId}/pp/{ppId} |

#### 5.25.2.2.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.25.2.3 Resource: Individual UE ID Mapping Provisioning

#### 5.25.2.3.1 Introduction

This resource represents an "Individual UE ID Mapping Provisioning" resource managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [32]).

#### 5.25.2.3.2 Resource Definition

Resource URI: **{apiRoot}/3gpp-ueid/<apiVersion>/{afId}/pp/{ppId}**

This resource shall support the resource URI variables defined in table 5.25.2.3.2-1.

**Table 5.25.2.3.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition                                                                         |
|---------|-----------|------------------------------------------------------------------------------------|
| apiRoot | string    | See clause 5.25.1.                                                                 |
| afId    | string    | Represents the identifier of the AF.                                               |
| ppId    | string    | Represents the identifier of the "Individual UE ID Mapping Provisioning" resource. |

#### 5.25.2.3.3 Resource Methods

##### 5.25.2.3.3.1 GET

This method enables an AF to request to retrieve an existing "Individual UE ID Mapping Information Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.25.2.3.3.1-1.

**Table 5.25.2.3.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.25.2.3.3.1-2 and the response data structures and response codes specified in table 5.25.2.3.3.1-3.

**Table 5.25.2.3.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.25.2.3.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type       | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-----------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UeldMappingInfo | M | 1           | 200 OK                 | Successful case. The requested "Individual UE ID Mapping Information Provisioning" resource is returned in the response body.                                                                                                                         |
| n/a             |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |

|                                                                                                                                     |  |  |                        |                                                                                                                                                                                                                                                              |
|-------------------------------------------------------------------------------------------------------------------------------------|--|--|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a                                                                                                                                 |  |  | 308 Permanent Redirect | <p>Permanent redirection.</p> <p>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.</p> <p>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].</p> |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |  |  |                        |                                                                                                                                                                                                                                                              |

**Table 5.25.2.3.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.25.2.3.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.25.2.3.3.2 PUT

This method enables an AF to request the update of an existing "Individual UE ID Mapping Information Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.25.2.3.3.2-1.

**Table 5.25.2.3.3.2-1: URI query parameters supported by the PUT method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.25.2.3.3.2-2 and the response data structures and response codes specified in table 5.25.2.3.3.2-3.

**Table 5.25.2.3.3.2-2: Data structures supported by the PUT Request Body on this resource**

| Data type       | P | Cardinality | Description                                                                                         |
|-----------------|---|-------------|-----------------------------------------------------------------------------------------------------|
| UeldMappingInfo | M | 1           | Represents the updated "Individual UE ID Mapping Information Provisioning" resource representation. |

**Table 5.25.2.3.3.2-3: Data structures supported by the PUT Response Body on this resource**

| Data type       | P | Cardinality | Response codes         | Description                                                                                                                                                                                  |
|-----------------|---|-------------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UeldMappingInfo | M | 1           | 200 OK                 | Successful response. The "Individual UE ID Mapping Information Provisioning" resource is successfully updated and a representation of the updated resource is returned in the response body. |
| n/a             |   |             | 204 No Content         | Successful response. The "Individual UE ID Mapping Information Provisioning" resource is successfully updated and no content is returned in the response body.                               |
| n/a             |   |             | 307 Temporary Redirect | <p>Temporary redirection.</p> <p>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.</p>                  |

|                                                                                                                                     |  |  |                        |                                                                                                                                                                                                                                                       |
|-------------------------------------------------------------------------------------------------------------------------------------|--|--|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                     |  |  |                        | Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].                                                                                                                                                                             |

**5.25.2.3.3.3 PATCH**

This method enables an AF to request the modification of an existing "Individual UE ID Mapping Information Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.25.2.3.3.3-1.

**Table 5.25.2.3.3.3-1: URI query parameters supported by the PATCH method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.25.2.3.3.3-2 and the response data structures and response codes specified in table 5.25.2.3.3.3-3.

**Table 5.25.2.3.3.3-2: Data structures supported by the PATCH Request Body on this resource**

| Data type             | P | Cardinality | Description                                                                                                 |
|-----------------------|---|-------------|-------------------------------------------------------------------------------------------------------------|
| UeldMappingInfo Patch | M | 1           | Represents the requested modifications to the "Individual UE ID Mapping Information Provisioning" resource. |

**Table 5.25.2.3.3.3-3: Data structures supported by the PATCH Response Body on this resource**

| Data type       | P | Cardinality | Response codes         | Description                                                                                                                                                                                   |
|-----------------|---|-------------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UeldMappingInfo | M | 1           | 200 OK                 | Successful response. The "Individual UE ID Mapping Information Provisioning" resource is successfully modified and a representation of the updated resource is returned in the response body. |
| n/a             |   |             | 204 No Content         | Successful response. The "Individual UE ID Mapping Information Provisioning" resource is successfully modified and no content is returned in the response body.                               |
| n/a             |   |             | 307 Temporary Redirect | Temporary redirection.                                                                                                                                                                        |

|                                                                                                                                       |  |  |                        |                                                                                                                                                                                                                                                              |

| NOTE: The mandatory HTTP error status codes for the HTTP PATCH method listed in Table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |  |  |                        |                                                                                                                                                                                                                                                              |

**Table 5.25.2.3.3.3-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.25.2.3.3.3-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**5.25.2.3.3.4 DELETE**

This method enables an AF to request the deletion of an existing "Individual UE ID Mapping Information Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.25.2.3.3.4-1.

**Table 5.25.2.3.3.4-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.25.2.3.3.4-2 and the response data structures and response codes specified in table 5.25.2.3.3.4-3.

**Table 5.25.2.3.3.4-2: Data structures supported by the DELETE Request Body on this resource**

| Data type | P | Cardinality | Description |

### 5.25.3 Custom Operations without associated resources

#### 5.25.3.1 Overview

The structure of the custom operation URIs of the UEId API is shown in Figure 5.25.3.1-1.

Figure 5.25.3.1-1: Custom operation URI structure of the UEId API

Table 5.25.3.1-1 provides an overview of the custom operations and applicable HTTP methods.

Table 5.25.3.1-1: Custom operations without associated resources

| Operation name | Custom operation URI | Mapped HTTP method | Description                                               |
|----------------|----------------------|--------------------|-----------------------------------------------------------|
| Retrieve       | /retrieve            | POST               | Request to retrieve AF specific UE ID information.        |
| GetMsisdn      | /get-msisdn          | POST               | Request to get the UE ID in the form of MSISDN of the UE. |

|              |                |      |                                                                                                                              |
|--------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------|
| VerifyMsisdn | /verify-msisdn | POST | Request to verify whether the UE's MSISDN provided by the AF matches the UE ID in the form of MSISDN retrieved from the UDM. |
|--------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------|

### 5.25.3.2 Operation: Retrieve

#### 5.25.3.2.1 Description

The custom operation allows a service consumer to retrieve AF specific UE ID information via the NEF.

#### 5.25.3.2.2 Operation Definition

This operation shall support the request and response data structures and response codes specified in table 5.25.3.2.2-1 and table 5.25.3.2.2-2.

**Table 5.25.3.2.2-1: Data structures supported by the POST Request Body on this resource**

| Data type | P | Cardinality | Description                                                      |
|-----------|---|-------------|------------------------------------------------------------------|
| UeldReq   | M | 1           | Parameters to request to retrieve AF specific UE ID information. |

**Table 5.25.3.2.2-2: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                        | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |

5.25.3.2.3 Void

5.25.3.3 Operation: GetMsisdn

5.25.3.3.1 Description

The custom operation allows a service consumer to retrieve the UE ID in the form of MSISDN via the NEF.

5.25.3.3.2 Operation Definition

This operation shall support the request and response data structures and response codes specified in table 5.25.3.3.2-1 and table 5.25.3.3.2-2.

**Table 5.25.3.3.2-1: Data structures supported by the POST Request Body on this resource**

| Data type | P | Cardinality | Description                                                                               |
|-----------|---|-------------|-------------------------------------------------------------------------------------------|
| MsisdnReq | M | 1           | Contains the parameters to request to retrieve the UE ID in the form of MSISDN of the UE. |

**Table 5.25.3.3.2-2: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                              | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                    |

### 5.25.3.4 Operation: VerifyMsisdn

#### 5.25.3.4.1 Description

The custom operation allows a service consumer to request MSISDN verification to the NEF.

#### 5.25.3.4.2 Operation Definition

This operation shall support the request and response data structures and response codes specified in table 5.25.3.4.2-1 and table 5.25.3.4.2-2.

**Table 5.25.3.4.2-1: Data structures supported by the POST Request Body on this resource**

| Data type      | P | Cardinality | Description                                                           |
|----------------|---|-------------|-----------------------------------------------------------------------|
| MsisdnVerifReq | M | 1           | Contains the necessary parameters to request for MSISDN verification. |

**Table 5.25.3.4.2-2: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                              | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                    |
|----------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MsisdnVerifResp                                                                                                                        | M | 1           | 200 OK                 | Successful case. The MSISDN verification request is successfully received and processed, and the MSISDN verification outcome is returned in the response body.                                                                                 |

## 5.25.4 Notifications

There are no Notifications defined for this API in this release of the specification.

## 5.25.5 Data Model

### 5.25.5.1 General

This clause specifies the application data model supported by the UEId API. Table 5.25.5.1-1 specifies the data types defined for the UEId API.

**Table 5.25.5.1-1: UEId service specific Data Types**

| Data type            | Clause defined | Description                                                                                              | Applicability |
|----------------------|----------------|----------------------------------------------------------------------------------------------------------|---------------|
| MsisdnReq            | 5.25.5.2.4     | Represents the parameters to request to retrieve the UE ID in the form of MSISDN of the UE.              |               |
| MsisdnInfo           | 5.25.5.2.5     | Represents the UE ID in the form of MSISDN information.                                                  |               |
| MsisdnVerifReq       | 5.25.5.2.9     | Represents the MSISDN verification request.                                                              |               |
| MsisdnVerifResp      | 5.25.5.2.10    | Represents the MSISDN verification response.                                                             |               |
| UeldReq              | 5.25.5.2.2     | Represents the parameters to requestAF specific UE ID retrieval.                                         |               |
| UeldInfo             | 5.25.5.2.3     | Represents AF specific UE ID information.                                                                |               |
| UeldMappingInfo      | 5.25.5.2.6     | Represents the UE ID Mapping Information Provisioning.                                                   |               |
| UeldMappingInfoPatch | 5.25.5.2.8     | Represents the requested modifications to a UE ID Mapping Information Provisioning.                      |               |
| RangSIUeldMappInfo   | 5.25.5.2.7     | Represents the Ranging/Sidelink UE ID mapping information between the Application Layer ID and the GPSI. |               |

Table 5.25.5.1-2 specifies data types re-used by the UEId API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the UEId API.

**Table 5.25.5.1-2: Re-used Data Types**

| Data type              | Reference          | Comments                                                                                                      | Applicability |
|------------------------|--------------------|---------------------------------------------------------------------------------------------------------------|---------------|
| ApplicationlayerId     | 3GPP TS 29.571 [8] | Represents an Application Layer ID.                                                                           |               |
| Dnn                    | 3GPP TS 29.571 [8] | Identifies a DNN.                                                                                             |               |
| ExternalId             | 3GPP TS 29.122 [4] | Represents an External Identifier.                                                                            |               |
| Gpsi                   | 3GPP TS 29.571 [8] | Represents a GPSI.                                                                                            |               |
| IpAddr                 | 3GPP TS 29.571 [8] | Identifies an IP address.                                                                                     |               |
| MacAddr48              | 3GPP TS 29.571 [8] | Identifies a MAC address.                                                                                     |               |
| Msisdn                 | 3GPP TS 29.122 [4] | Represents the MSISDN.                                                                                        |               |
| MtcProviderInformation | 3GPP TS 29.571 [8] | Indicates MTC provider information.                                                                           |               |
| Port                   | 3GPP TS 29.122 [4] | Identifies a port, unsigned integer with valid values between 0 and 65535.                                    | PortNumber    |
| ProblemDetails         | 3GPP TS 29.122 [4] | Represents error related information.                                                                         |               |
| Snssai                 | 3GPP TS 29.571 [8] | Identifies the S-NSSAI.                                                                                       |               |
| SupportedFeatures      | 3GPP TS 29.571 [8] | Represents the list of supported feature(s) and used to negotiate the applicability of the optional features. |               |
| UInteger               | 3GPP TS 29.571 [8] | Represents a unsigned integer.                                                                                |               |

## 5.25.5.2 Structured data types

### 5.25.5.2.1 Introduction

This clause defines the structured data types to be used in resource representations.

### 5.25.5.2.2 Type: UeldReq

**Table 5.25.5.2.2-1: Definition of type UeldReq**

| Attribute name                                                                                                                                                                                              | Data type              | P | Cardinality | Description                                                                                                                                                        | Applicability (NOTE 1) |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|---|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|
| afId                                                                                                                                                                                                        | string                 | M | 1           | Represents the identifier of the AF that is sending the request.                                                                                                   |                        |
| appPortId                                                                                                                                                                                                   | Port                   | O | 0..1        | Identifies an application port ID. See clause 9.2.3.24.4 of 3GPP TS 23.040 [62] for further details.                                                               |                        |
| dnn                                                                                                                                                                                                         | Dnn                    | O | 0..1        | Identifies a DNN.                                                                                                                                                  |                        |
| ipDomain                                                                                                                                                                                                    | string                 | O | 0..1        | The IPv4 address domain identifier.<br><br>The attribute may only be present if the IPv4 address is provided in the "uelpAddr" attribute.                          |                        |
| mtcProviderId                                                                                                                                                                                               | MtcProviderInformation | O | 0..1        | Indicates MTC provider information.                                                                                                                                |                        |
| portNumber                                                                                                                                                                                                  | Port                   | O | 0..1        | Indicates the UDP or TCP port number associated with the UE IP address as provided in the "uelpAddr" attribute.                                                    | PortNumber             |
| snssai                                                                                                                                                                                                      | Snssai                 | O | 0..1        | Identifies an S-NSSAI.                                                                                                                                             |                        |

#### 5.25.5.2.10 Type: MsisdNVerifResp

**Table 5.25.5.2.4-1: Definition of type MsisdNVerifResp**

| Attribute name | Data type | P | Cardinality | Description                                                                                                                                                                                                                                                                                                                                                                                                              | Applicability |
|----------------|-----------|---|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| verifResult    | boolean   | M | 1           | Indicates the verification result on whether the UE's MSISDN provided by the AF matches the UE's MSISDN retrieved from the UDM or not.<br><ul style="list-style-type: none"> <li>- Set to "true" if the UE's MSISDN provided by the AF matches the UE's MSISDN retrieved from the UDM.</li> <li>- Set to "false" if the UE's MSISDN provided by the AF does not match the UE's MSISDN retrieved from the UDM.</li> </ul> |               |

### 5.25.5.3 Simple data types and enumerations

#### 5.25.5.3.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

#### 5.25.5.3.2 Simple data types

The simple data types defined in table 5.25.5.3.2-1 shall be supported.

**Table 5.25.5.3.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

## 5.25.6 Used Features

The table below defines the features applicable to the UEId API. Those features are negotiated as described in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.25.6-1: Features used by UEId API**

| Feature number | Feature Name       | Description                                                                                                  |
|----------------|--------------------|--------------------------------------------------------------------------------------------------------------|
| 1              | PortNumber         | This feature indicates supporting AF providing Port Number associated with the UE IP address in the request. |
| 2              | MsisdnVerification | This feature indicates the support of MSISDN verification.                                                   |

## 5.25.7 Error handling

### 5.25.7.1 General

HTTP error handling shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses shall apply.

### 5.25.7.2 Protocol Errors

In this Release of the specification, there are no additional protocol errors applicable for the UEId API.

### 5.25.7.3 Application Errors

The application errors defined for the UEId API are listed in table 5.25.7.3-1.

**Table 5.25.7.3-1: Application errors**

| Application Error        | HTTP status code | Description                                                                 | Applicability |
|--------------------------|------------------|-----------------------------------------------------------------------------|---------------|
| REQUEST_NOT_AUTHORIZED   | 403 Forbidden    | Indicates that the AF specific UE ID retrieval request is not authorized.   |               |
| UE_ID_NOT_AVAILABLE      | 404 Not Found    | Indicates that the requested AF specific UE ID is not available.            |               |
| UE_NOT_FOUND             | 404 Not Found    | Indicates that the requested UE address is not found.                       |               |
| USER_CONSENT_NOT_GRANTED | 403 Forbidden    | Indicates that the request is rejected because user consent is not granted. |               |

## 5.25.8 Security

The provisions of clause 6 and 7.2 of shall apply for the Nnef\_UeId API. In addition:

- For the "GetMsisdn" custom operation defined in clause 5.25.3.3, RNAA procedures specified in clause 5.6.2.3.2 of 3GPP TS 29.222 [12] may be supported and the "authorization code" grant type may be supported in addition to the "Client Credentials".

## 5.26 MBSUserService API

### 5.26.1 Introduction

The Nnef\_MBSUserService service shall use the MBSUserService API.

The API URI of MBSUserService API shall be:

**{apiRoot}/3gpp-mbs-us/v1**

with the following components:

- "apiRoot" is set as defined in clause 5.2.4 of 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-mbs-us".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.

All resource URIs in the clauses below are defined relative to the above API URI.

5.26.2 Resources

5.26.2.1 Overview

This clause describes the structure for the Resource URIs as shown in figure 5.26.2.1-1 and the resources and HTTP methods used for the MBSUserService API.

**Figure 5.26.2.1-1: Resource URI structure of the MBSUserService API**

Table 5.26.2.1-1 provides an overview of the resources and applicable HTTP methods.

**Table 5.26.2.1-1: Resources and methods overview**

| Resource name               | Resource URI (relative path under API URI) | HTTP method or custom operation | Description (service operation)                               |
|-----------------------------|--------------------------------------------|---------------------------------|---------------------------------------------------------------|
| MBS User Services           | /mbs-user-services                         | GET                             | Retrieve all the active MBS User Services managed by the NEF. |
|                             |                                            | POST                            | Request the creation of a new MBS User Service.               |
| Individual MBS User Service | /mbs-user-services/{mbsUserServId}         | GET                             | Retrieve an existng MBS User Service managed by the NEF.      |
|                             |                                            | PUT                             | Update an existng MBS User Service managed by the NEF.        |
|                             |                                            | PATCH                           | Modify an existng MBS User Service managed by the NEF.        |
|                             |                                            | DELETE                          | Delete an existng MBS User Service managed by the NEF.        |

## 5.26.2.2 Resource: MBS User Services

### 5.26.2.2.1 Introduction

This resource represents the collection of MBS User Services managed by the NEF.

This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [3]).

### 5.26.2.2.2 Resource Definition

Resource URI: {apiRoot}/3gpp-mbs-us/v1/mbs-user-services

This resource shall support the resource URI variables defined in table 5.26.2.2.2-1.

**Table 5.26.2.2.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition         |
|---------|-----------|--------------------|
| apiRoot | string    | See clause 5.26.1. |

### 5.26.2.2.3 Resource Standard Methods

#### 5.26.2.2.3.1 GET

This method allows an AF to retrieve all the active MBS User Service resources at the NEF.

This method shall support the URI query parameters specified in table 5.26.2.2.3.1-1.

**Table 5.26.2.2.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.26.2.2.3.1-2 and the response data structures and response codes specified in table 5.26.2.2.3.1-3.

**Table 5.26.2.2.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.26.2.2.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                               | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                    |
|-------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| array(MBSUserService)                                                                                                   | M | 0..N        | 200 OK                 | Successful case. All the active MBS User Services managed by the NEF are returned.                                                                                                                                             |
| n/a                                                                                                                     |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                     |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status code for the GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                |

**Table 5.26.2.2.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**Table 5.26.2.2.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

#### 5.26.2.2.3.2 POST

This method enables an AF to request the creation of an MBS User Service resource at the NEF.

This method shall support the URI query parameters specified in table 5.26.2.2.3.2-1.

**Table 5.26.2.2.3.2-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.26.2.2.3.2-2 and the response data structures and response codes specified in table 5.26.2.2.3.2-3.

**Table 5.26.2.2.3.2-2: Data structures supported by the POST Request Body on this resource**

| Data type      | P | Cardinality | Description                                                                           |
|----------------|---|-------------|---------------------------------------------------------------------------------------|
| MBSUserService | M | 1           | Contains the parameters to request the creation of a new MBS User Service at the NEF. |

**Table 5.26.2.2.3.2-3: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                | P | Cardinality | Response codes | Description                                                                                                                                                                                                                                                                                       |
|--------------------------------------------------------------------------------------------------------------------------|---|-------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MBSUserService                                                                                                           | M | 1           | 201 Created    | Successful case. A new MBS User Service is successfully created and a representation of the created Individual MBS User Service resource is returned.<br><br>An HTTP "Location" header that contains the resource URI of the created Individual MBS User Service resource shall also be included. |
| NOTE: The mandatory HTTP error status code for the POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                |                                                                                                                                                                                                                                                                                                   |

**Table 5.26.2.2.3.2-4: Headers supported by the 201 response code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                           |
|----------|-----------|---|-------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains the URI of the newly created resource, according to the structure:<br>{apiRoot}/3gpp-mbs-us/v1/mbs-user-services/{mbsUserId} |

#### 5.26.2.2.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.26.2.3 Resource: Individual MBS User Service

#### 5.26.2.3.1 Introduction

This resource represents an Individual MBS User Service managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [3]).

#### 5.26.2.3.2 Resource Definition

Resource URI: {apiRoot}/3gpp-mbs-us/v1/mbs-user-services/{mbsUserServId}

This resource shall support the resource URI variables defined in table 5.26.2.3.2-1.

**Table 5.26.2.3.2-1: Resource URI variables for this resource**

| Name          | Data type | Definition                                                                                      |
|---------------|-----------|-------------------------------------------------------------------------------------------------|
| apiRoot       | string    | See clause 5.26.1.                                                                              |
| mbsUserServId | string    | Contains the unique identifier of the Individual MBS User Service resource assigned by the NEF. |

#### 5.26.2.3.3 Resource Standard Methods

##### 5.26.2.3.3.1 GET

This method allows an AF to retrieve an existing Individual MBS User Service resource at the NEF.

This method shall support the URI query parameters specified in table 5.26.2.3.3.1-1.

**Table 5.26.2.3.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.26.2.3.3.1-2 and the response data structures and response codes specified in table 5.26.2.3.3.1-3.

**Table 5.26.2.3.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.26.2.3.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type      | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                    |
|----------------|---|-------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MBSUserService | M | 1           | 200 OK                 | Successful case. The requested Individual MBS User Service resource is successfully returned.                                                                                                                                  |
| n/a            |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a            |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |

NOTE: The mandatory HTTP error status code for the GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply.

**Table 5.26.2.3.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**Table 5.26.2.3.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

#### 5.26.2.3.3.2 PUT

This method enables an AF to request the update of an existing Individual MBS User Service resource at the NEF.

This method shall support the URI query parameters specified in table 5.26.2.3.3.2-1.

**Table 5.26.2.3.3.2-1: URI query parameters supported by the PUT method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.26.2.3.3.2-2 and the response data structures and response codes specified in table 5.26.2.3.3.2-3.

**Table 5.26.2.3.3.2-2: Data structures supported by the PUT Request Body on this resource**

| Data type      | P | Cardinality | Description                                                                                            |
|----------------|---|-------------|--------------------------------------------------------------------------------------------------------|
| MBSUserService | M | 1           | Contains the updated representation of the Individual MBS User Service resource that is to be updated. |

**Table 5.26.2.3.3.2-3: Data structures supported by the PUT Response Body on this resource**

| Data type      | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                    |
|----------------|---|-------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MBSUserService | M | 1           | 200 OK                 | Successful case. The concerned Individual MBS User Service resource is successfully updated and a representation of the updated resource is returned in the response body.                                                     |
| n/a            |   |             | 204 No Content         | Successful case. The concerned Individual MBS User Service resource is successfully updated and no content is returned in the response body.                                                                                   |
| n/a            |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a            |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |

NOTE: The mandatory HTTP error status code for the PUT method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply.

**Table 5.26.2.3.3.2-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**Table 5.26.2.3.3.2-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

### 5.26.2.3.3.3 PATCH

This method enables an AF to request the modification of an existing Individual MBS User Service resource at the NEF.

This method shall support the URI query parameters specified in table 5.26.2.3.3.3-1.

**Table 5.26.2.3.3.3-1: URI query parameters supported by the PATCH method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.26.2.3.3.3-2 and the response data structures and response codes specified in table 5.26.2.3.3.3-3.

**Table 5.26.2.3.3.3-2: Data structures supported by the PATCH Request Body on this resource**

| Data type           | P | Cardinality | Description                                                                                      |
|---------------------|---|-------------|--------------------------------------------------------------------------------------------------|
| MBSUserServicePatch | M | 1           | Contains the parameters to request the modification of the Individual MBS User Service resource. |

**Table 5.26.2.3.3.3-3: Data structures supported by the PATCH Response Body on this resource**

| Data type                                                                                                                 | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                    |
|---------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MBSUserService                                                                                                            | M | 1           | 200 OK                 | Successful case. The concerned Individual MBS User Service resource is successfully modified and a representation of the updated resource is returned in the response body.                                                    |
| n/a                                                                                                                       |   |             | 204 No Content         | Successful response. The Individual MBS User Service resource was successfully modified and no content is returned in the response body.                                                                                       |
| n/a                                                                                                                       |   |             | 307 Temporary Redirect | Temporary redirection. | n/a                                                                                                                       |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status code for the PATCH method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                |

**Table 5.26.2.3.3.3-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**Table 5.26.2.3.3.3-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

#### 5.26.2.3.3.4 DELETE

This method enables an AF to request the deletion of an existing Individual MBS User Service resource at the NEF.

This method shall support the URI query parameters specified in table 5.26.2.3.3.4-1.

**Table 5.26.2.3.3.4-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.26.2.3.3.4-2 and the response data structures and response codes specified in table 5.26.2.3.3.4-3.

**Table 5.26.2.3.3.4-2: Data structures supported by the DELETE Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.26.2.3.3.4-3: Data structures supported by the DELETE Response Body on this resource**

| Data type                                                                                                                  | P | Cardinality | Response Codes         | Description                                                                                                                                                                                                                    |
|----------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a                                                                                                                        |   |             | 204 No Content         | Successful response. The Individual MBS User Service resource is successfully deleted.                                                                                                                                         |
|                                                                                                                            |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
|                                                                                                                            |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status code for the DELETE method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                |

**Table 5.26.2.3.3.4-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**Table 5.26.2.3.3.4-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

#### 5.26.2.3.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.26.3 Custom Operations without associated resources

There are no custom operations without associated resources defined for this API in this release of the specification.

#### 5.26.4 Notifications

There are no notifications defined for this API in this release of the specification.

### 5.26.5 Data Model

#### 5.26.5.1 General

This clause specifies the application data model supported by the MBSUserService API. Table 5.26.5.1-1 specifies the data types defined for the MBSUserService API.

**Table 5.26.5.1-1: MBSUserService specific Data Types**

| Data type | Clause defined | Description | Applicability |
|-----------|----------------|-------------|---------------|
|           |                |             |               |

Table 5.26.5.1-2 specifies data types re-used by the MBSUserService API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the MBSUserService API.

**Table 5.26.5.1-2: Re-used Data Types**

| Data type           | Reference           | Comments                                                                               | Applicability |
|---------------------|---------------------|----------------------------------------------------------------------------------------|---------------|
| MBSUserService      | 3GPP TS 29.580 [66] | Represents MBS User Service parameters.                                                |               |
| MBSUserServicePatch | 3GPP TS 29.580 [66] | Represents the requested modifications to an MBS User Service resource representation. |               |

#### 5.26.5.2 Structured data types

##### 5.26.5.2.1 Introduction

This clause defines the structures to be used in resource representations.

There are no structured data types defined for this API in this release of the specification.

#### 5.26.5.3 Simple data types and enumerations

##### 5.26.5.3.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

### 5.26.5.3.2 Simple data types

The simple data types defined in table 5.26.5.3.2-1 shall be supported.

**Table 5.26.5.3.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

## 5.26.6 Used Features

The table below defines the features applicable to the MBSUserService API. Those features are negotiated as described in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.26.6-1: Features used by MBSUserService API**

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|
|                |              |             |
|                |              |             |

## 5.26.7 Error handling

### 5.26.7.1 General

HTTP error handling shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses shall apply.

### 5.26.7.2 Protocol Errors

In this Release of the specification, there are no additional protocol errors applicable for the MBSUserService API.

### 5.26.7.3 Application Errors

The application errors defined for the MBSUserService API are listed in table 5.26.7.3-1.

**Table 5.26.7.3-1: Application errors**

| Application Error | HTTP status code | Description |
|-------------------|------------------|-------------|
|                   |                  |             |

## 5.27 MBSUserDataIngestSession API

### 5.27.1 Introduction

The Nnef\_MBSUserDataIngestSession service shall use the MBSUserDataIngestSession API.

The API URI of MBSUserDataIngestSession API shall be:

**{apiRoot}/3gpp-mbs-ud-ingest/v1**

with the following components:

- "apiRoot" is set as defined in clause 5.2.4 of 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-mbs-ud-ingest".

- "apiVersion" shall be set to "v1" for the current version defined in the present document.

All resource URIs in the clauses below are defined relative to the above API URI.

## 5.27.2 Resources

### 5.27.2.1 Overview

This clause describes the structure for the Resource URIs as shown in figure 5.27.2.1-1 and the resources and HTTP methods used for the MBSUserDataIngestSession API.

**Figure 5.27.2.1-1: Resource URI structure of the MBSUserDataIngestSession API**

Table 5.27.2.1-1 provides an overview of the resources and applicable HTTP methods.

**Table 5.27.2.1-1: Resources and methods overview**

| Resource name                           | Resource URI (relative path under API URI) | HTTP method or custom operation | Description (service operation)                                                             |
|-----------------------------------------|--------------------------------------------|---------------------------------|---------------------------------------------------------------------------------------------|
| MBS User Data Ingest Sessions           | /sessions                                  | GET                             | Retrieve all the active MBS User Data Ingest Session(s) managed by the NEF.                 |
|                                         |                                            | POST                            | Request the creation of a new MBS User Data Ingest Session.                                 |
| Individual MBS User Data Ingest Session | /sessions/{sessionId}                      | GET                             | Retrieve an existing "Individual MBS User Data Ingest Session" resource managed by the NEF. |
|                                         |                                            | PUT                             | Update an existing "Individual MBS User Data Ingest Session" resource managed by the NEF.   |
|                                         |                                            | PATCH                           | Modify an existing "Individual MBS User Data Ingest Session" resource managed by the NEF.   |

|                                                             |                                        |        |                                                                                                                 |
|-------------------------------------------------------------|----------------------------------------|--------|-----------------------------------------------------------------------------------------------------------------|
|                                                             |                                        | DELETE | Delete an existing "Individual MBS User Data Ingest Session" resource managed by the NEF.                       |
| MBS User Data Ingest Session Status Subscriptions           | /status-subscriptions                  | GET    | Retrieve all the active MBS User Data Ingest Session Status Subscription(s) managed by the NEF.                 |
|                                                             |                                        | POST   | Request the creation of a new MBS User Data Ingest Session Status Subscription.                                 |
| Individual MBS User Data Ingest Session Status Subscription | /status-subscriptions/{subscriptionId} | GET    | Retrieve an existing "Individual MBS User Data Ingest Session Status Subscription" resource managed by the NEF. |
|                                                             |                                        | PUT    | Update an existing "Individual MBS User Data Ingest Session Status Subscription" resource managed by the NEF.   |
|                                                             |                                        | PATCH  | Modify an existing "Individual MBS User Data Ingest Session Status Subscription" resource managed by the NEF.   |
|                                                             |                                        | DELETE | Delete an existing "Individual MBS User Data Ingest Session Status Subscription" resource managed by the NEF.   |

## 5.27.2.2 Resource: MBS User Data Ingest Sessions

### 5.27.2.2.1 Introduction

This resource represents the collection of MBS User Data Ingest Sessions managed by the NEF.

This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [3]).

### 5.27.2.2.2 Resource Definition

Resource URI: **{apiRoot}/3gpp-mbs-ud-ingest/v1/sessions**

This resource shall support the resource URI variables defined in table 5.27.2.2.2-1.

**Table 5.27.2.2.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition         |
|---------|-----------|--------------------|
| apiRoot | string    | See clause 5.27.1. |

### 5.27.2.2.3 Resource Standard Methods

#### 5.27.2.2.3.1 GET

This method allows an AF to retrieve all the active MBS User Data Ingest Sessions managed by the NEF.

This method shall support the URI query parameters specified in table 5.27.2.2.3.1-1.

**Table 5.27.2.2.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.27.2.2.3.1-2 and the response data structures and response codes specified in table 5.27.2.2.3.1-3.

**Table 5.27.2.2.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.27.2.2.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                               | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                             |
|-------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| array(MBSUserDataIngestSession)                                                                                         | M | 0..N        | 200 OK                 | Successful case. All the active MBS User Data Ingest Sessions managed by the NEF are returned.                                                                                                                                          |
| n/a                                                                                                                     |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                     |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status code for the GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                         |

**Table 5.27.2.2.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**Table 5.27.2.2.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

### 5.27.2.2.3.2 POST

This method enables an AF to request the creation of an MBS User Data Ingest Session at the NEF.

This method shall support the URI query parameters specified in table 5.27.2.2.3.2-1.

**Table 5.27.2.2.3.2-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.27.2.2.3.2-2 and the response data structures and response codes specified in table 5.27.2.2.3.2-3.

**Table 5.27.2.2.3.2-2: Data structures supported by the POST Request Body on this resource**

| Data type             | P | Cardinality | Description                                                                                       |
|-----------------------|---|-------------|---------------------------------------------------------------------------------------------------|
| MBSUserDataIngSession | M | 1           | Contains the parameters to request the creation of a new MBS User Data Ingest Session at the NEF. |

**Table 5.27.2.2.3.2-3: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                  | P | Cardinality | Response Codes  | Description                                                                                                                                                                                                                                                                                                            |

| ProblemDetailsMBS                                                                                                          | O | 0..1        | 404 Not Found   | (NOTE 2)                                                                                                                                                                                                                                                                                                               |
| NOTE 1: The mandatory HTTP error status code for the POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                 |                                                                                                                                                                                                                                                                                                                        |
| NOTE 2: Failure cases are described in clause 5.27.7.                                                                      |   |             |                 |                                                                                                                                                                                                                                                                                                                        |

**Table 5.27.2.2.3.2-4: Headers supported by the 201 response code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                         |
|----------|-----------|---|-------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains the URI of the newly created resource, according to the structure:<br>{apiRoot}/3gpp-mbs-ud-ingest/v1/sessions/{sessionId} |

#### 5.27.2.2.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.27.2.3 Resource: Individual MBS User Data Ingest Session

#### 5.27.2.3.1 Introduction

This resource represents an Individual MBS User Data Ingest Session resource managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [3]).

#### 5.27.2.3.2 Resource Definition

Resource URI: {apiRoot}/3gpp-mbs-ud-ingest/v1/sessions/{sessionId}

This resource shall support the resource URI variables defined in table 5.27.2.3.2-1.

**Table 5.27.2.3.2-1: Resource URI variables for this resource**

| Name      | Data type | Definition                                                                                                  |
|-----------|-----------|-------------------------------------------------------------------------------------------------------------|
| apiRoot   | string    | See clause 5.27.1.                                                                                          |
| sessionId | string    | Contains the unique identifier of the Individual MBS User Data Ingest Session resource assigned by the NEF. |

## 5.27.2.3.3 Resource Standard Methods

## 5.27.2.3.3.1 GET

This method allows an AF to retrieve an existing "Individual MBS User Data Ingest Session" resource at the NEF.

This method shall support the URI query parameters specified in table 5.27.2.3.3.1-1.

**Table 5.27.2.3.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.27.2.3.3.1-2 and the response data structures and response codes specified in table 5.27.2.3.3.1-3.

**Table 5.27.2.3.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.27.2.3.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                               | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                    |
|-------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MBSUserDataIngestSession                                                                                                | M | 1           | 200 OK                 | Successful case. The requested Individual MBS User Data Ingest Session resource is successfully returned.                                                                                                                      |
| n/a                                                                                                                     |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                     |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status code for the GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                |

**Table 5.27.2.3.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**Table 5.27.2.3.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

## 5.27.2.3.3.2 PUT

This method enables an AF to request the update of an existing "Individual MBS User Data Ingest Session" resource at the NEF.

This method shall support the URI query parameters specified in table 5.27.2.3.3.2-1.

**Table 5.27.2.3.3.2-1: URI query parameters supported by the PUT method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.27.2.3.3.2-2 and the response data structures and response codes specified in table 5.27.2.3.3.2-3.

**Table 5.27.2.3.3.2-2: Data structures supported by the PUT Request Body on this resource**

| Data type             | P | Cardinality | Description                                                                                                        |
|-----------------------|---|-------------|--------------------------------------------------------------------------------------------------------------------|
| MBSUserDataIngSession | M | 1           | Contains the updated representation of the Individual MBS User Data Ingest Session resource that is to be updated. |

**Table 5.27.2.3.3.2-3: Data structures supported by the PUT Response Body on this resource**

| Data type                                                                                                                 | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                    |
|---------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MBSUserDataIngSession                                                                                                     | M | 1           | 200 OK                 | Successful case. The concerned Individual MBS User Data Ingest Session resource is successfully updated and a representation of the updated resource is returned in the response body.                                         |
| n/a                                                                                                                       |   |             | 204 No Content         | Successful case. The concerned Individual MBS User Data Ingest Session resource is successfully updated and no content is returned in the response body.                                                                       |
| n/a                                                                                                                       |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                       |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |

## 5.27.2.3.3.3 PATCH

This method enables an AF to request the modification of an existing "Individual MBS User Data Ingest Session" resource at the NEF.

This method shall support the URI query parameters specified in table 5.27.2.3.3.3-1.

**Table 5.27.2.3.3.3-1: URI query parameters supported by the PATCH method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.27.2.3.3.3-2 and the response data structures and response codes specified in table 5.27.2.3.3.3-3.

**Table 5.27.2.3.3.3-2: Data structures supported by the PATCH Request Body on this resource**

| Data type                  | P | Cardinality | Description                                                                                                  |
|----------------------------|---|-------------|--------------------------------------------------------------------------------------------------------------|
| MBSUserDataIngSessionPatch | M | 1           | Contains the parameters to request the modification of the Individual MBS User Data Ingest Session resource. |

**Table 5.27.2.3.3.3-3: Data structures supported by the PATCH Response Body on this resource**

| Data type                                                                                                                   | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                |
|-----------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MBSUserDataIngSession                                                                                                       | M | 1           | 200 OK                 | Successful case. The concerned Individual MBS User Data Ingest Session resource is successfully modified and a representation of the updated resource is returned in the response body.                                    |
| n/a                                                                                                                         |   |             | 204 No Content         | Successful response. The Individual MBS User Data Ingest Session resource is successfully modified and no content is returned in the response body.                                                                        |
| n/a                                                                                                                         |   |             | 307 Temporary Redirect | Temporary redirection. #### 5.27.2.3.3.4 DELETE

This method enables an AF to request the deletion of an existing "Individual MBS User Data Ingest Session" resource at the NEF.

This method shall support the URI query parameters specified in table 5.27.2.3.3.4-1.

**Table 5.27.2.3.3.4-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.27.2.3.3.4-2 and the response data structures and response codes specified in table 5.27.2.3.3.4-3.

**Table 5.27.2.3.3.4-2: Data structures supported by the DELETE Request Body on this resource**

| Data type | P | Cardinality | Description |

| n/a       |   |             | 204 No Content         | Successful response. The Individual MBS User Data Ingest Session resource is successfully deleted.                                                                                                                             |
|           |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
|           |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |

NOTE 1: The mandatory HTTP error status code for the DELETE method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply.

**Table 5.27.2.3.3.4-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**Table 5.27.2.3.3.4-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

#### 5.27.2.3.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.27.2.4 Resource: MBS User Data Ingest Session Status Subscriptions

#### 5.27.2.4.1 Introduction

This resource represents the collection of MBS User Data Ingest Session Status Subscriptions managed by the NEF.

This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [3]).

#### 5.27.2.4.2 Resource Definition

Resource URI: {apiRoot}/3gpp-mbs-ud-ingest/v1/status-subscriptions

This resource shall support the resource URI variables defined in table 5.27.2.4.2-1.

**Table 5.27.2.4.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition         |
|---------|-----------|--------------------|
| apiRoot | string    | See clause 5.27.1. |

#### 5.27.2.4.3 Resource Standard Methods

##### 5.27.2.4.3.1 GET

This method allows an AF to retrieve all the active MBS User Data Ingest Session Status Subscriptions managed by the NEF.

This method shall support the URI query parameters specified in table 5.27.2.4.3.1-1.

**Table 5.27.2.4.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.27.2.4.3.1-2 and the response data structures and response codes specified in table 5.27.2.4.3.1-3.

**Table 5.27.2.4.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.27.2.4.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type                      | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                      |
|--------------------------------|---|-------------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| array(MBSUserDataIngStatSubsc) | M | 0..N        | 200 OK                 | Successful case. All the active MBS User Data Ingest Session Status Subscriptions managed by the NEF are returned.                                                                                                               |
| n/a                            |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF. Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |

|                                                                                                                         |  |  |                              |                                                                                                                                                                                                                                         |
|-------------------------------------------------------------------------------------------------------------------------|--|--|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status code for the GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |  |  |                              |                                                                                                                                                                                                                                         |

**Table 5.27.2.4.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**Table 5.27.2.4.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**5.27.2.4.3.2 POST**

This method enables an AF to request the creation of a new MBS User Data Ingest Session Status Subscription at the NEF.

This method shall support the URI query parameters specified in table 5.27.2.4.3.2-1.

**Table 5.27.2.4.3.2-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.27.2.4.3.2-2 and the response data structures and response codes specified in table 5.27.2.4.3.2-3.

**Table 5.27.2.4.3.2-2: Data structures supported by the POST Request Body on this resource**

| Data type               | P | Cardinality | Description                                                                                                           |
|-------------------------|---|-------------|-----------------------------------------------------------------------------------------------------------------------|
| MBSUserDataIngStatSubsc | M | 1           | Contains the parameters to request the creation of a new MBS User Data Ingest Session Status Subscription at the NEF. |

**Table 5.27.2.4.3.2-3: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                | P | Cardinality | Response Codes | Description                                                                                                                                                                                                                                                                                                                                                                        |

A new MBS User Data Ingest Session Status Subscription is successfully created and a representation of the created Individual MBS User Data Ingest Session Status Subscription resource is returned.<br><br>An HTTP "Location" header that contains the URI of the created Individual MBS User Data Ingest Session Status Subscription resource is also included. |
| NOTE: The mandatory HTTP error status code for the POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                |                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 5.27.2.4.3.2-4: Headers supported by the 201 response code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                                          |
|----------|-----------|---|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains the URI of the newly created resource, according to the structure:<br>{apiRoot}/3gpp-mbs-ud-ingest/v1/status-subscriptions/{subscriptionId} |

#### 5.27.2.4.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.27.2.5 Resource: Individual MBS User Data Ingest Session Status Subscription

#### 5.27.2.5.1 Introduction

This resource represents an Individual MBS User Data Ingest Session Status Subscription managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [3]).

#### 5.27.2.5.2 Resource Definition

Resource URI: {apiRoot}/3gpp-mbs-ud-ingest/v1/status-subscriptions/{subscriptionId}

This resource shall support the resource URI variables defined in table 5.27.2.5.2-1.

**Table 5.27.2.5.2-1: Resource URI variables for this resource**

| Name      | Data type | Definition                                                                                                                      |
|-----------|-----------|---------------------------------------------------------------------------------------------------------------------------------|
| apiRoot   | string    | See clause 5.27.1.                                                                                                              |
| sessionId | string    | Contains the unique identifier of the Individual MBS User Data Ingest Session Status Subscription resource assigned by the NEF. |

#### 5.27.2.5.3 Resource Standard Methods

##### 5.27.2.5.3.1 GET

This method allows an AF to retrieve an existing "Individual MBS User Data Ingest Session Status Subscription" resource at the NEF.

This method shall support the URI query parameters specified in table 5.27.2.5.3.1-1.

**Table 5.27.2.5.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.27.2.5.3.1-2 and the response data structures and response codes specified in table 5.27.2.5.3.1-3.

**Table 5.27.2.5.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.27.2.5.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type | P | Cardinality | Response | Description |
|-----------|---|-------------|----------|-------------|
|-----------|---|-------------|----------|-------------|

|                                                                                                                         |   |   | codes                  |                                                                                                                                                                                                                            |
|-------------------------------------------------------------------------------------------------------------------------|---|---|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MBSUserDataIngStatSubsc                                                                                                 | M | 1 | 200 OK                 | Successful case. The requested Individual MBS User Data Ingest Session Status Subscription resource is successfully returned.                                                                                              |
| n/a                                                                                                                     |   |   | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                     |   |   | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status code for the GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |   |                        |                                                                                                                                                                                                                            |

**Table 5.27.2.5.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**Table 5.27.2.5.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

#### 5.27.2.5.3.2 PUT

The PATCH method allows an AF to update an existing "Individual MBS User Data Ingest Session Status Subscription" resource managed by the NEF.

This method shall support the URI query parameters specified in table 5.27.2.5.3.2-1.

**Table 5.27.2.5.3.2-1: URI query parameters supported by the PUT method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.27.2.5.3.2-2 and the response data structures and response codes specified in table 5.27.2.5.3.2-3.

**Table 5.27.2.5.3.2-2: Data structures supported by the PUT Request Body on this resource**

| Data type               | P | Cardinality | Description                                                                                                                                |
|-------------------------|---|-------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| MBSUserDataIngStatSubsc | M | 1           | Contains the parameters to request the modification of an existing "Individual MBS User Data Ingest Session Status Subscription" resource. |

**Table 5.27.2.5.3.2-3: Data structures supported by the PUT Response Body on this resource**

| Data type               | P | Cardinality | Response codes | Description                                                                                                                         |
|-------------------------|---|-------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------|
| MBSUserDataIngStatSubsc | M | 1           | 200 OK         | Successful case. The concerned "Individual MBS User Data Ingest Session Status Subscription" resource is successfully updated and a |

|                                                                                                                         |  |  |                        |                                                                                                                                                                                                                                         |
|-------------------------------------------------------------------------------------------------------------------------|--|--|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                         |  |  |                        | representation of the updated resource is returned in the response body.                                                                                                                                                                |
| n/a                                                                                                                     |  |  | 204 No Content         | Successful case. The concerned "Individual MBS User Data Ingest Session Status Subscription" resource is successfully updated, and no content is returned in the response body.                                                         |
| n/a                                                                                                                     |  |  | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                     |  |  | 308 Permanent Redirect | Permanent redirection. ### 5.27.2.5.3.3 PATCH

The PATCH method allows an AF to modify an existing "Individual MBS User Data Ingest Session Status Subscription" resource managed by the NEF.

This method shall support the URI query parameters specified in table 5.27.2.5.3.3-1.

**Table 5.27.2.5.3.3-1: URI query parameters supported by the PATCH method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.27.2.5.3.3-2 and the response data structures and response codes specified in table 5.27.2.5.3.3-3.

**Table 5.27.2.5.3.3-2: Data structures supported by the PATCH Request Body on this resource**

| Data type                       | P | Cardinality | Description                                                                                                                                |
|---------------------------------|---|-------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| MBSUserDataIngestStatSubscPatch | M | 1           | Contains the parameters to request the modification of an existing "Individual MBS User Data Ingest Session Status Subscription" resource. |

**Table 5.27.2.5.3.3-3: Data structures supported by the PATCH Response Body on this resource**

| Data type                  | P | Cardinality | Response codes | Description                                                                                              |
|----------------------------|---|-------------|----------------|----------------------------------------------------------------------------------------------------------|
| MBSUserDataIngestStatSubsc | M | 1           | 200 OK         | Successful case. The concerned "Individual MBS User Data Ingest Session Status Subscription" resource is |

|                                                                                                                           |  |  |                        |                                                                                                                                                                                                                                         |
|---------------------------------------------------------------------------------------------------------------------------|--|--|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                           |  |  |                        | successfully modified, and a representation of the updated resource is returned in the response body.                                                                                                                                   |
| n/a                                                                                                                       |  |  | 204 No Content         | Successful case. The concerned "Individual MBS User Data Ingest Session Status Subscription" resource is successfully modified and no content is returned in the response body.                                                         |
| n/a                                                                                                                       |  |  | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                       |  |  | 308 Permanent Redirect | Permanent redirection. | NOTE: The mandatory HTTP error status code for the PATCH method listed in Table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |  |  |                        |                                                                                                                                                                                                                                         |

**Table 5.27.2.5.3.3-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**Table 5.27.2.5.3.3-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

#### 5.27.2.5.3.4 DELETE

This method enables an AF to request the deletion of an existing Individual MBS User Data Ingest Session Status Subscription resource at the NEF.

This method shall support the URI query parameters specified in table 5.27.2.5.3.4-1.

**Table 5.27.2.5.3.4-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.27.2.5.3.4-2 and the response data structures and response codes specified in table 5.27.2.5.3.4-3.

**Table 5.27.2.5.3.4-2: Data structures supported by the DELETE Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.27.2.5.3.4-3: Data structures supported by the DELETE Response Body on this resource**

| Data type | P | Cardinality | Response Codes | Description                                                                                                            |
|-----------|---|-------------|----------------|------------------------------------------------------------------------------------------------------------------------|
| n/a       |   |             | 204 No Content | Successful response. The Individual MBS User Data Ingest Session Status Subscription resource is successfully deleted. |

|                                                                                                                              |  |  |                        |                                                                                                                                                                                                                                |
|------------------------------------------------------------------------------------------------------------------------------|--|--|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

#### 5.27.2.5.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.27.3 Custom Operations without associated resources

There are no custom operations without associated resources defined for this API in this release of the specification.

## 5.27.4 Notifications

### 5.27.4.1 General

Notifications shall comply to clause 5.2.5 of 3GPP TS 29.122 [4].

**Table 5.27.4.1-1: Notifications overview**

| Notification                                     | Callback URI | HTTP method or custom operation | Description (service operation)                                                                                           |
|--------------------------------------------------|--------------|---------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| MBS User Data Ingest Session Status Notification | {notifUri}   | POST                            | This operation enables the NEF to notify a previously subscribed AF on status changes of an MBS User Data Ingest Session. |

### 5.27.4.2 MBS User Data Ingest Session Status Change Notification

#### 5.27.4.2.1 Description

The MBS user data ingest session status change notification is used by the NEF to report one or several observed MBS user data ingest session status change events to a previously subscribed AF.

## 5.27.4.2.2 Target URI

The Callback URI "{notifUri}" shall be used with the callback URI variables defined in table 5.27.4.2.2-1.

**Table 5.27.4.2.2-1: Callback URI variables**

| Name     | Definition                                                                                                                                           |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| notifUri | Callback reference provided by the AF during the creation/update/modification of the corresponding MBS User Data Ingest Session Status Subscription. |

## 5.27.4.2.3 Operation Definition

## 5.27.4.2.3.1 Notification via HTTP POST

This method shall support the request data structures specified in table 5.27.4.2.3.1-1 and the response data structures and response codes specified in table 5.27.4.2.3.1-2.

**Table 5.27.4.2.3.1-1: Data structures supported by the POST Request Body on this resource**

| Data type                  | P | Cardinality | Description                                                                                                                 |
|----------------------------|---|-------------|-----------------------------------------------------------------------------------------------------------------------------|
| MBSUserDataIngestStatNotif | M | 1           | Provides information about the observed MBS user data ingest session status change event notification by the NEF to the AF. |

**Table 5.27.4.2.3.1-2: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                 | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                                                     |
|---------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 5.27.5 Data Model

### 5.27.5.1 General

This clause specifies the application data model supported by the MBSUserDataIngestSession API. Table 5.27.5.1-1 specifies the data types defined for the MBSUserDataIngestSession API.

**Table 5.27.5.1-1: MBSUserDataIngestSession specific Data Types**

| Data type | Clause defined | Description | Applicability |
|-----------|----------------|-------------|---------------|
|           |                |             |               |

Table 5.27.5.1-2 specifies data types re-used by the MBSUserDataIngestSession API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the MBSUserDataIngestSession API.

**Table 5.27.5.1-2: Re-used Data Types**

| Data type                    | Reference           | Comments                                                                                                                   | Applicability    |
|------------------------------|---------------------|----------------------------------------------------------------------------------------------------------------------------|------------------|
| MBSUserDataIngSession        | 3GPP TS 29.580 [66] | Represents MBS User Data Ingest Session parameters.                                                                        |                  |
| MBSUserDataIngSessionPatch   | 3GPP TS 29.580 [66] | Represents the requested modifications to an MBS User Data Ingest Session resource representation.                         |                  |
| MBSUserDataIngStatNotif      | 3GPP TS 29.580 [66] | Represents an MBS User Data Ingest Session Status Notification.                                                            |                  |
| MBSUserDataIngStatSubsc      | 3GPP TS 29.580 [66] | Represents an MBS User Data Ingest Session Status Subscription.                                                            |                  |
| MBSUserDataIngStatSubscPatch | 3GPP TS 29.580 [66] | Represents the requested modifications to an MBS User Data Ingest Session Status Subscription.                             |                  |
| ProblemDetailsMBS            | 3GPP TS 29.580 [66] | Represents an extension to the ProblemDetails data structure with potentially additional error information related to MBS. | MBSErrorHandling |

### 5.27.5.2 Structured data types

#### 5.27.5.2.1 Introduction

This clause defines the structures to be used in resource representations.

There are no structured data types defined for this API in this release of the specification.

### 5.27.5.3 Simple data types and enumerations

#### 5.27.5.3.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

#### 5.27.5.3.2 Simple data types

The simple data types defined in table 5.27.5.3.2-1 shall be supported.

**Table 5.27.5.3.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

## 5.27.6 Used Features

The table below defines the features applicable to the MBSUserDataIngestSession API. Those features are negotiated as described in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.27.6-1: Features used by MBSUserDataIngestSession API**

| Feature number | Feature Name     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1              | Void             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 2              | Void             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 3              | 5MBS2            | <p>This feature indicates the support of the Rel-18 enhancements to the 5G Multicast/Broadcast services.</p> <p>The following functionalities are supported:</p> <ul style="list-style-type: none"> <li>- Support the provisioning of the Associated Session Identifier to enable 5MBS MOCN Network Sharing scenarios (e.g., MOCN with multiple broadcast MBS sessions transmitting the same content via different Core Networks).</li> <li>- Support NR RedCap UE Information provisioning during MBS Distribution Session creation/update.</li> <li>- Support the possibility for the active periods of an MBS User Data Ingest Session to be expressed in the form of a repetition rule.</li> </ul> |
| 4              | MBSErrorHandling | <p>Represents the support of the MBS related error handling procedures.</p> <p>The following functionalities are supported:</p> <ul style="list-style-type: none"> <li>- Support of the missing MBS Session related error handling procedures to enable end-to-end relaying of errors.</li> <li>- Support MBS Data Ingest Session specific error handling.</li> <li>- Support partial MBS Distribution Session creation/update failure management.</li> </ul>                                                                                                                                                                                                                                          |

## 5.27.7 Error handling

### 5.27.7.1 General

HTTP error handling shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses shall apply.

### 5.27.7.2 Protocol Errors

In this Release of the specification, there are no additional protocol errors applicable for the MBSUserDataIngestSession API.

### 5.27.7.3 Application Errors

The application errors defined for the MBSUserDataIngestSession API are listed in table 5.27.7.3-1.

**Table 5.27.7.3-1: Application errors**

| Application Error | HTTP status code | Description | Applicability |
|-------------------|------------------|-------------|---------------|
|-------------------|------------------|-------------|---------------|

|                                  |                 |                                                                                                                                                                      |                  |
|----------------------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| INVALID_MBS_SERVICE_INFO         | 400 Bad Request | Indicates that the provided MBS Service Information is invalid (e.g. invalid QoS reference), incorrect or insufficient to perform MBS policy authorization.          | MBSErrorHandling |
| MBS_SERVICE_AREA_NOT_SUPPORTED   | 403 Forbidden   | Indicates that the requested MBS Service Area is not supported by the 3GPP Core Network.                                                                             | MBSErrorHandling |
| MBS_SERVICE_INFO_NOT_AUTHORIZED  | 403 Forbidden   | Indicates the provided MBS Service Information is rejected.                                                                                                          | MBSErrorHandling |
| MBS_DIST_SESSION_ALREADY_CREATED | 403 Forbidden   | Indicates that the requested MBS Distribution Session has already been created.                                                                                      | MBSErrorHandling |
| OVERLAPPING_MBS_SERVICE_AREA     | 403 Forbidden   | Indicates that the provided MBS service area overlaps with the MBS service area of an existing MBS Distribution Session that shares the same MBS session Identifier. | MBSErrorHandling |
| UNKNOWN_MBS_SERVICE_AREA         | 404 Not Found   | Indicates that the requested MBS service area (e.g., identified by the Area Session ID) cannot be found.                                                             | MBSErrorHandling |

## 5.28 MSEventExposure API

### 5.28.1 Introduction

The Nnef\_MSEventExposure service shall use the MSEventExposure API.

The API URI of MSEventExposure API shall be:

**{apiRoot}/3gpp-ms-event-exposure/v1**

with the following components:

- "apiRoot" is set as defined in clause 5.2.4 of 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-ms-event-exposure".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.

All resource URIs in the clauses below are defined relative to the above API URI.

5.28.2 Resources

5.28.2.1 Overview

This clause describes the structure for the Resource URIs as shown in figure 5.28.2.1-1 and the resources and HTTP methods used for the MSEventExposure API.

Figure 5.28.2.1-1: Resource URI structure of the MSEventExposure API

Table 5.28.2.1-1 provides an overview of the resources and applicable HTTP methods.

Table 5.28.2.1-1: Resources and methods overview

| Resource name                                          | Resource URI (relative path under API URI) | HTTP method or custom operation | Description (service operation)                                                   |
|--------------------------------------------------------|--------------------------------------------|---------------------------------|-----------------------------------------------------------------------------------|
| Media Streaming Event Exposure Subscriptions           | /subscriptions                             | GET                             | Reads all the existing Media Streaming Event Exposure Subscriptions.              |
|                                                        |                                            | POST                            | Request the creation of a Media Streaming Event Subscription.                     |
| Individual Media Streaming Event Exposure Subscription | /subscriptions/{subscriptionId}            | GET                             | Read an existing Individual Media Streaming Event Exposure Subscription resource. |
|                                                        |                                            | PUT                             | Update an existing Individual Media Streaming Event Exposure Subscription.        |
|                                                        |                                            | DELETE                          | Delete an existing Individual Media Streaming Event Exposure Subscription.        |

5.28.2.2 Resource: Media Streaming Event Exposure Subscriptions

5.28.2.2.1 Introduction

This resource represents the collection of Media Streaming Event Exposure Subscription resources managed by the NEF.

This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [3]).

## 5.28.2.2.2 Resource Definition

Resource URI: {apiRoot}/3gpp-ms-event-exposure/v1/subscriptions

This resource shall support the resource URI variables defined in table 5.28.2.2.2-1.

**Table 5.28.2.2.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition         |
|---------|-----------|--------------------|
| apiRoot | string    | See clause 5.28.1. |

## 5.28.2.2.3 Resource Standard Methods

## 5.28.2.2.3.1 GET

This method allows an AF to retrieve all the active Media Streaming Event Exposure Subscription resource at the NEF.

This method shall support the URI query parameters specified in table 5.28.2.2.3.1-1.

**Table 5.28.2.2.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.28.2.2.3.1-2 and the response data structures and response codes specified in table 5.28.2.2.3.1-3.

**Table 5.28.2.2.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.28.2.2.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                               | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                         |
|-------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| array(AfEventExposureSubsc)                                                                                             | M | 0..N        | 200 OK                 | Successful case. All the active Media Streaming Event Exposure Subscriptions managed by the NEF are returned.                                                                                                                       |
| n/a                                                                                                                     |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF.<br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                     |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF.<br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status code for the GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                     |

**Table 5.28.2.2.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**Table 5.28.2.2.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

#### 5.28.2.2.3.2 POST

This method enables an AF to request the creation of a new Media Streaming Event Exposure Subscription at the NEF.

This method shall support the URI query parameters specified in table 5.28.2.2.3.2-1.

**Table 5.28.2.2.3.2-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.28.2.2.3.2-2 and the response data structures and response codes specified in table 5.28.2.2.3.2-3.

**Table 5.28.2.2.3.2-2: Data structures supported by the POST Request Body on this resource**

| Data type            | P | Cardinality | Description                                                                                                      |
|----------------------|---|-------------|------------------------------------------------------------------------------------------------------------------|
| AfEventExposureSubsc | M | 1           | Contains the parameters to request the creation of a new Media Streaming Event Exposure Subscription at the NEF. |

**Table 5.28.2.2.3.2-3: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                | P | Cardinality | Response Codes | Description                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------------------------------------------------------------------------------------|---|-------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AfEventExposureSubsc                                                                                                     | M | 1           | 201 Created    | Successful case. A new Media Streaming Event Exposure Subscription is successfully created and a representation of the created Individual Media Streaming Event Exposure Subscription resource is returned.<br><br>An HTTP "Location" header that contains the resource URI of the created Individual Media Streaming Event Exposure Subscription resource shall also be included. |
| NOTE: The mandatory HTTP error status code for the POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                |                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 5.28.2.2.3.2-4: Headers supported by the 201 response code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                                       |
|----------|-----------|---|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains the URI of the newly created resource, according to the structure:<br>{apiRoot}/3gpp-ms-event-exposure/v1/subscriptions/{subscriptionId} |

#### 5.28.2.2.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.28.2.3 Resource: Individual Media Streaming Event Exposure Subscription

#### 5.28.2.3.1 Introduction

This resource represents an Individual Media Streaming Event Exposure Subscription managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [3]).

## 5.28.2.3.2 Resource Definition

Resource URI: {apiRoot}/3gpp-ms-event-exposure/v1/subscriptions/{subscriptionId}

This resource shall support the resource URI variables defined in table 5.28.2.3.2-1.

**Table 5.28.2.3.2-1: Resource URI variables for this resource**

| Name           | Data type | Definition                                                                                                                 |
|----------------|-----------|----------------------------------------------------------------------------------------------------------------------------|
| apiRoot        | string    | See clause 5.28.1.                                                                                                         |
| subscriptionId | string    | Contains the unique identifier of the Individual Media Streaming Event Exposure Subscription resource assigned by the NEF. |

## 5.28.2.3.3 Resource Standard Methods

## 5.28.2.3.3.1 GET

This method allows an AF to retrieve an existing Individual Media Streaming Event Exposure Subscription resource at the NEF.

This method shall support the URI query parameters specified in table 5.28.2.3.3.1-1.

**Table 5.28.2.3.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.28.2.3.3.1-2 and the response data structures and response codes specified in table 5.28.2.3.3.1-3.

**Table 5.28.2.3.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.28.2.3.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                               | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                    |
|-------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AfEventExposureSubsc                                                                                                    | M | 1           | 200 OK                 | Successful case. The requested Individual Media Streaming Event Exposure Subscription resource is successfully returned.                                                                                                       |
| n/a                                                                                                                     |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                     |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status code for the GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                |

**Table 5.28.2.3.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
|------|-----------|---|-------------|-------------|

|          |        |   |   |                                                                   |
|----------|--------|---|---|-------------------------------------------------------------------|
| Location | string | M | 1 | An alternative URI of the resource located in an alternative NEF. |
|----------|--------|---|---|-------------------------------------------------------------------|

**Table 5.28.2.3.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**5.28.2.3.3.2 PUT**

This method enables an AF to request the update of an existing Individual Media Streaming Event Exposure Subscription resource at the NEF.

This method shall support the URI query parameters specified in table 5.28.2.3.3.2-1.

**Table 5.28.2.3.3.2-1: URI query parameters supported by the PUT method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.28.2.3.3.2-2 and the response data structures and response codes specified in table 5.28.2.3.3.2-3.

**Table 5.28.2.3.3.2-2: Data structures supported by the PUT Request Body on this resource**

| Data type            | P | Cardinality | Description                                                                                                                       |
|----------------------|---|-------------|-----------------------------------------------------------------------------------------------------------------------------------|
| AfEventExposureSubsc | M | 1           | Contains the updated representation of the Individual Media Streaming Event Exposure Subscription resource that is to be updated. |

**Table 5.28.2.3.3.2-3: Data structures supported by the PUT Response Body on this resource**

| Data type                                                                                                               | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                    |
|-------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AfEventExposureSubsc                                                                                                    | M | 1           | 200 OK                 | Successful case. The concerned Individual Media Streaming Event Exposure Subscription resource is successfully updated and a representation of the updated resource is returned in the response body.                          |
| n/a                                                                                                                     |   |             | 204 No Content         | Successful case. The concerned Individual Media Streaming Event Exposure Subscription resource is successfully updated and no content is returned in the response body.                                                        |
| n/a                                                                                                                     |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                     |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status code for the PUT method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                |

**Table 5.28.2.3.3.2-4: Headers supported by the 307 Response Code on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
|------|-----------|---|-------------|-------------|

|          |        |   |   |                                                                   |
|----------|--------|---|---|-------------------------------------------------------------------|
| Location | string | M | 1 | An alternative URI of the resource located in an alternative NEF. |
|----------|--------|---|---|-------------------------------------------------------------------|

**Table 5.28.2.3.3.2-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**5.28.2.3.3.3 DELETE**

This method enables an AF to request the deletion of an existing Individual Media Streaming Event Exposure resource at the NEF.

This method shall support the URI query parameters specified in table 5.28.2.3.3.3-1.

**Table 5.28.2.3.3.3-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.28.2.3.3.3-2 and the response data structures and response codes specified in table 5.28.2.3.3.3-3.

**Table 5.28.2.3.3.3-2: Data structures supported by the DELETE Request Body on this resource**

|------|-----------|---|-------------|-------------|
|------|-----------|---|-------------|-------------|

|          |        |   |   |                                                                   |
|----------|--------|---|---|-------------------------------------------------------------------|
| Location | string | M | 1 | An alternative URI of the resource located in an alternative NEF. |
|----------|--------|---|---|-------------------------------------------------------------------|

#### 5.28.2.3.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.28.3 Custom Operations without associated resources

There are no custom operations without associated resources defined for this API in this release of the specification.

## 5.28.4 Notifications

### 5.28.4.1 General

Notifications shall comply to clause 5.2.5 of 3GPP TS 29.122 [4].

**Table 5.28.4.1-1: Notifications overview**

| Notification                                | Callback URI | HTTP method or custom operation | Description (service operation)                                                                               |
|---------------------------------------------|--------------|---------------------------------|---------------------------------------------------------------------------------------------------------------|
| Media Streaming Event Exposure Notification | {notifUri}   | POST                            | This operation enables the NEF to notify a previously subscribed AF on the Media Streaming Exposure Event(s). |

### 5.28.4.2 Media Streaming Event Exposure Notification

#### 5.28.4.2.1 Description

The Media Streaming Event Exposure notification is used by the NEF to report one or several observed Media Streaming event(s) to a previously subscribed AF.

#### 5.28.4.2.2 Target URI

The Callback URI "{**notifUri**}" shall be used with the callback URI variables defined in table 5.28.4.2.2-1.

**Table 5.28.4.2.2-1: Callback URI variables**

| Name     | Definition                                                                                                                         |
|----------|------------------------------------------------------------------------------------------------------------------------------------|
| notifUri | Callback reference provided by the AF during the creation/update of the corresponding Media Streaming Event Exposure Subscription. |

#### 5.28.4.2.3 Operation Definition

##### 5.28.4.2.3.1 Notification via HTTP POST

This method shall support the request data structures specified in table 5.28.4.2.3.1-1 and the response data structures and response codes specified in table 5.28.4.2.3.1-2.

**Table 5.28.4.2.3.1-1: Data structures supported by the POST Request Body on this resource**

| Data type             | P | Cardinality | Description                                               |
|-----------------------|---|-------------|-----------------------------------------------------------|
| AfEventExposure Notif | M | 1           | Contains the Media Streaming Event Exposure Notification. |

**Table 5.28.4.2.3.1-2: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                 | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                                                     |
|---------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| N/A                                                                                                                       |   |             | 204 No Content         | The Media Streaming Event Notification is successfully received.                                                                                                                                                                                                                |
| N/A                                                                                                                       |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF where the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| N/A                                                                                                                       |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF where the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                                                                 |

**Table 5.28.4.2.3.1-3: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                             |
|----------|-----------|---|-------------|-------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

**Table 5.28.4.2.3.1-4: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                             |
|----------|-----------|---|-------------|-------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

5.28.4.2.3.2            Void

## 5.28.5 Data Model

### 5.28.5.1 General

This clause specifies the application data model supported by the MSEventExposure API. Table 5.28.5.1-1 specifies the data types defined for the MSEventExposure API.

**Table 5.28.5.1-1: MSEventExposure specific Data Types**

| Data type | Clause defined | Description | Applicability |
|-----------|----------------|-------------|---------------|
|           |                |             |               |

Table 5.28.5.1-2 specifies data types re-used by the MSEventExposure API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the MSEventExposure API.

**Table 5.28.5.1-2: Re-used Data Types**

| Data type            | Reference           | Comments                                                                         | Applicability |
|----------------------|---------------------|----------------------------------------------------------------------------------|---------------|
| AfEventExposureNotif | 3GPP TS 29.517 [58] | Represents a Media Streaming event notification.                                 |               |
| AfEventExposureSubsc | 3GPP TS 29.517 [58] | Represents a Media Streaming event exposure subscription. Only applicable to the |               |

|  |  |                                                                                                         |  |
|--|--|---------------------------------------------------------------------------------------------------------|--|
|  |  | UE application events exposed via Data Collection AF as defined in clause 4.1.1 of 3GPP TS 29.517 [58]. |  |
|--|--|---------------------------------------------------------------------------------------------------------|--|

## 5.28.5.2 Structured data types

### 5.28.5.2.1 Introduction

This clause defines the structures to be used in resource representations.

There are no structured data types defined for this API in this release of the specification.

## 5.28.5.3 Simple data types and enumerations

### 5.28.5.3.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

### 5.28.5.3.2 Simple data types

The simple data types defined in table 5.28.5.3.2-1 shall be supported.

**Table 5.28.5.3.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

## 5.28.6 Used Features

The table below defines the features applicable to the MSEventExposure API. Those features are negotiated as described in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.28.6-1: Features used by MSEventExposure API**

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|
|                |              |             |

## 5.28.7 Error handling

### 5.28.7.1 General

HTTP error handling shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses shall apply.

### 5.28.7.2 Protocol Errors

In this Release of the specification, there are no additional protocol errors applicable for the MSEventExposure API.

### 5.28.7.3 Application Errors

The application errors defined for the MSEventExposure API are listed in table 5.28.7.3-1.

Table 5.28.7.3-1: Application errors

| Application Error | HTTP status code | Description |
|-------------------|------------------|-------------|
|                   |                  |             |

## 5.29 MBSGroupMsgDelivery API

### 5.29.1 Introduction

The Nnef\_MBSGroupMsgDelivery service shall use the MBSGroupMsgDelivery API.

The API URI of the MBSGroupMsgDelivery API shall be:

**{apiRoot}/<apiName>/<apiVersion>**

The request URIs used in HTTP requests shall have the Resource URI structure defined in clause 5.2.4 of 3GPP TS 29.122 [4], i.e.:

**{apiRoot}/<apiName>/<apiVersion>/<apiSpecificSuffixes>**

with the following components:

- "apiRoot" is set as defined in clause 5.2.4 of 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-mbs-group-msg".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.
- The <apiSpecificSuffixes> shall be set as described in clause 5.2.4 of 3GPP TS 29.122 [4].

All resource URIs in the clauses below are defined relative to the above root URI.

### 5.29.2 Resources

#### 5.29.2.1 Overview

This clause describes the structure for the Resource URIs as shown in figure 5.29.2.1-1 and HTTP methods used for the MBSGroupMsgDelivery API.

The structure of the resource URIs of the MBSGroupMsgDelivery API is shown in Figure 5.29.2.1-1.

Figure 5.29.2.1-1: Resource URI structure of the MBSGroupMsgDelivery API

Table 5.29.2.1-1 provides an overview of the resources and applicable HTTP methods.

**Table 5.29.2.1-1: Resources and methods overview**

| Resource name                         | Resource URI<br>(relative path under<br>API URI) | HTTP method or<br>custom operation | Description<br>(service operation)                                             |
|---------------------------------------|--------------------------------------------------|------------------------------------|--------------------------------------------------------------------------------|
| MBS Group Message Deliveries          | /deliveries                                      | GET                                | Retrieve the existing MBS Group Message Deliveries.                            |
|                                       |                                                  | POST                               | Request the creation of a new MBS Group Message Delivery.                      |
| Individual MBS Group Message Delivery | /deliveries/{delRef}                             | GET                                | Retrieve a previously submitted MBS Group Message Delivery.                    |
|                                       |                                                  | PATCH                              | Request the modification of a previously submitted MBS Group Message Delivery. |
|                                       |                                                  | DELETE                             | Request the deletion of a previously submitted MBS Group Message Delivery.     |

## 5.29.2.2 Resource: MBS Group Message Deliveries

### 5.29.2.2.1 Introduction

This resource represents the collection of MBS Group Message Deliveries managed by the NEF.

This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [3]).

### 5.29.2.2.2 Resource Definition

Resource URI: **{apiRoot}/3gpp-mbs-group-msg/v1/deliveries**

This resource shall support the resource URI variables defined in table 5.29.2.2.2-1.

**Table 5.29.2.2.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition         |
|---------|-----------|--------------------|
| apiRoot | string    | See clause 5.29.1. |

### 5.29.2.2.3 Resource Standard Methods

#### 5.29.2.2.3.1 GET

This method allows an AF to retrieve all the active MBS Group Message Deliveries managed by the NEF.

This method shall support the URI query parameters specified in table 5.29.2.2.3.1-1.

**Table 5.29.2.2.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.29.2.2.3.1-2 and the response data structures and response codes specified in table 5.29.2.2.3.1-3.

**Table 5.29.2.2.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.29.2.2.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| array(MbsGroupMsgDel)                                                                                                               | M | 0..N        | 200 OK                 | Successful case. All the active MBS Group Message Deliveries managed by the NEF shall be returned.<br><br>If there are no active MBS Group Message Delivery(ies) available at the NEF, an empty array shall be returned.              |
| n/a                                                                                                                                 |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                 |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                       |

**Table 5.29.2.2.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                |
|----------|-----------|---|-------------|----------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI of the resource located in an alternative NEF. |

**Table 5.29.2.2.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                |
|----------|-----------|---|-------------|----------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI of the resource located in an alternative NEF. |

### 5.29.2.2.3.2 POST

This method enables an AF to request the creation of an MBS Group Message Delivery at the NEF.

This method shall support the URI query parameters specified in table 5.29.2.2.3.2-1.

**Table 5.29.2.2.3.2-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This operation shall support the request and response data structures and response codes specified in table 5.29.2.2.3.2-2 and table 5.29.2.2.3.2-3.

**Table 5.29.2.2.3.2-2: Data structures supported by the POST Request Body on this resource**

| Data type      | P | Cardinality | Description                                                     |
|----------------|---|-------------|-----------------------------------------------------------------|
| MbsGroupMsgDel | M | 1           | Represents the Group Message Delivery to be created at the NEF. |

**Table 5.29.2.2.3.2-3: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                              | P | Cardinality | Response codes | Description                                                                                                                                                                                                                                                                        |
|----------------------------------------------------------------------------------------------------------------------------------------|---|-------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MbsGroupMsgDel                                                                                                                         | M | 1           | 201 Created    | Successful case: A representation of the created "Individual MBS Group Message Delivery" resource is returned in the response body.<br><br>An HTTP "Location" header that contains the URI of the created "Individual MBS Group Message Delivery" resource shall also be included. |
| ProblemDetails                                                                                                                         | O | 0..1        | 403 Forbidden  | (NOTE 2)                                                                                                                                                                                                                                                                           |
| NOTE 1: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                |                                                                                                                                                                                                                                                                                    |
| NOTE 2: Failure cases are described in clause 5.29.7.                                                                                  |   |             |                |                                                                                                                                                                                                                                                                                    |

**Table 5.29.2.2.3.2-4: Headers supported by the 201 response code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                        |
|----------|-----------|---|-------------|------------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains the URI of the newly created resource, according to the structure:<br>{apiRoot}/3gpp-mbs-group-msg/v1/deliveries/{delRef} |

#### 5.29.2.2.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.29.2.3 Resource: Individual MBS Group Message Delivery

#### 5.29.2.3.1 Introduction

This resource represents an "Individual MBS Group Message Delivery" resource managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [3]).

#### 5.29.2.3.2 Resource Definition

Resource URI: {apiRoot}/3gpp-mbs-group-msg/v1/deliveries/{delRef}

This resource shall support the resource URI variables defined in table 5.29.2.3.2-1.

**Table 5.29.2.3.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition                                                                                           |
|---------|-----------|------------------------------------------------------------------------------------------------------|
| apiRoot | string    | See clause 5.29.1.                                                                                   |
| delRef  | string    | Contains the identifier of the "Individual MBS Group Message Delivery" resource assigned by the NEF. |

#### 5.29.2.3.3 Resource Standard Methods

##### 5.29.2.3.3.1 GET

This method allows an AF to retrieve an existing "Individual MBS Group Message Delivery" resource at the NEF.

This method shall support the URI query parameters specified in table 5.29.2.3.3.1-1.

**Table 5.29.2.3.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.29.2.3.3.1-2 and the response data structures and response codes specified in table 5.29.2.3.3.1-3.

**Table 5.29.2.3.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.29.2.3.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MbsGroupMsgDel                                                                                                                      | M | 1           | 200 OK                 | Successful case. The requested "Individual MBS Group Message Delivery" resource is successfully returned.                                                                                                                             |
| n/a                                                                                                                                 |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                 |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                       |

**Table 5.29.2.3.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                |
|----------|-----------|---|-------------|----------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI of the resource located in an alternative NEF. |

**Table 5.29.2.3.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                |

#### 5.29.2.3.3.2 PATCH

This method enables an AF to request the modification of an existing "Individual MBS Group Message Delivery" resource at the NEF.

This method shall support the URI query parameters specified in table 5.29.2.3.3.2-1.

**Table 5.29.2.3.3.2-1: URI query parameters supported by the PATCH method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.29.2.3.3.2-2 and the response data structures and response codes specified in table 5.29.2.3.3.2-3.

**Table 5.29.2.3.3.2-2: Data structures supported by the PATCH Request Body on this resource**

| Data type            | P | Cardinality | Description                                                                                                  |
|----------------------|---|-------------|--------------------------------------------------------------------------------------------------------------|
| MbsGroupMsgDel Patch | M | 1           | Contains the parameters to request the modification of the "Individual MBS Group Message Delivery" resource. |

**Table 5.29.2.3.3.2-3: Data structures supported by the PATCH Response Body on this resource**

| Data type                                                                                                                               | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                           |
|-----------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MbsGroupMsgDel                                                                                                                          | M | 1           | 200 OK                 | Successful case. The concerned "Individual MBS Group Message Delivery" resource is successfully modified and a representation of the updated resource is returned in the response body.                                               |
| n/a                                                                                                                                     |   |             | 204 No Content         | Successful response. The "Individual MBS Group Message Delivery" resource is successfully modified and no content is returned in the response body.                                                                                   |
| n/a                                                                                                                                     |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |

### 5.29.2.3.3.3 DELETE

This method enables an AF to request the deletion of an existing "Individual MBS Group Message Delivery" resource at the NEF.

This method shall support the URI query parameters specified in table 5.29.2.3.3.3-1.

**Table 5.29.2.3.3.3-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.29.2.3.3.3-2 and the response data structures and response codes specified in table 5.29.2.3.3.3-3.

**Table 5.29.2.3.3.3-2: Data structures supported by the DELETE Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.29.2.3.3.3-3: Data structures supported by the DELETE Response Body on this resource**

| Data type                                                                                                                              | P | Cardinality | Response Codes         | Description                                                                                                                                                                                                                           |
|----------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The "Individual MBS Group Message Delivery" resource is successfully deleted.                                                                                                                                    |
|                                                                                                                                        |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
|                                                                                                                                        |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP DELETE method listed in Table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                       |

**Table 5.29.2.3.3.3-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                |
|----------|-----------|---|-------------|----------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI of the resource located in an alternative NEF. |

**Table 5.29.2.3.3.3-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                |
|----------|-----------|---|-------------|----------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI of the resource located in an alternative NEF. |

#### 5.29.2.3.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.29.3 Custom Operations without associated resources

There are no custom operations without associated resources defined for this API in this release of the specification.

## 5.29.4 Notifications

### 5.29.4.1 General

Notifications shall comply to clause 5.2.5 of 3GPP TS 29.122 [4].

**Table 5.29.4.1-1: Notifications overview**

| Notification                            | Callback URI | HTTP method or custom operation | Description (service operation)                                                                      |
|-----------------------------------------|--------------|---------------------------------|------------------------------------------------------------------------------------------------------|
| MBS Group Message Delivery Notification | {notifUri}   | POST                            | Enables the NEF to notify a previously subscribed AF of the status of an MBS Group Message Delivery. |

### 5.29.4.2 MBS Group Message Delivery Notification

#### 5.29.4.2.1 Description

This notification is used by the NEF to report the status of an MBS Group Message Delivery to a previously subscribed AF.

#### 5.29.4.2.2 Target URI

The Callback URI "{notifUri}" shall be used with the callback URI variables defined in table 5.29.4.2.2-1.

**Table 5.29.4.2.2-1: Callback URI variables**

| Name     | Definition                                                          |
|----------|---------------------------------------------------------------------|
| notifUri | Represents the callback URI encoded as a string formatted as a URI. |

#### 5.29.4.2.3 Operation Definition

This method shall support the request data structures specified in table 5.29.4.2.3-1 and the response data structures and response codes specified in table 5.29.4.2.3-2.

**Table 5.29.4.2.3-1: Data structures supported by the POST Request Body on this resource**

| Data type                 | P | Cardinality | Description                                             |
|---------------------------|---|-------------|---------------------------------------------------------|
| MbsGroupMsgDelStatusNotif | M | 1           | Represents the MBS Group Message Delivery Notification. |

**Table 5.29.4.2.3-2: Data structures supported by the POST Response Body on this resource**

| Data type | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                                                                    |
|-----------|---|-------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a       |   |             | 204 No Content         | Successful case. The notification is successfully received and acknowledged.                                                                                                                                                                                                                   |
| n/a       |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF towards which the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |

|                                                                                                                                      |  |  |                        |                                                                                                                                                                                                                                                                                                       |

|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

**Table 5.29.4.2.3-4: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                      |
|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

## 5.29.5 Data Model

### 5.29.5.1 General

This clause specifies the application data model supported by the MBSGroupMsgDelivery API. Table 5.29.5.1-1 specifies the data types defined for the MBSGroupMsgDelivery API.

**Table 5.29.5.1-1: MBSGroupMsgDelivery API specific Data Types**

| Data type                 | Clause defined | Description                                                                                      | Applicability |
|---------------------------|----------------|--------------------------------------------------------------------------------------------------|---------------|
| MbsGroupMsgDel            | 5.29.5.2.3     | Represents an MBS Group Message Delivery.                                                        |               |
| MbsGroupMsgDelPatch       | 5.29.5.2.5     | Represents the parameters to request the modification of an existing MBS Group Message Delivery. |               |
| MbsGroupMsgDelStatusNotif | 5.29.5.2.6     | Represents an MBS Group Message Delivery Notification.                                           |               |
| MbsServArea               | 5.29.5.4.1     | Represents an MBS Service Area.                                                                  |               |

Table 5.29.5.1-2 specifies data types re-used by the MBSGroupMsgDelivery API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the MBSGroupMsgDelivery API.

**Table 5.29.5.1-2: MBSGroupMsgDelivery API re-used Data Types**

| Data type              | Reference          | Comments                                 | Applicability |
|------------------------|--------------------|------------------------------------------|---------------|
| Bytes                  | 3GPP TS 29.122 [4] | Represents a sequence of bytes.          |               |
| DateTime               | 3GPP TS 29.122 [4] | Represents a date and a time.            |               |
| ExternalGroupId        | 3GPP TS 29.122 [4] | Represents an external Group Identifier. |               |
| ExternalMbsServiceArea | 3GPP TS 29.571 [8] | Represents an external MBS service area. |               |
| MbsServiceArea         | 3GPP TS 29.571 [8] | Represents an MBS service area.          |               |
| NrRedCapUeInfo         | 3GPP TS 29.571 [8] | Represents NR RedCap UE Information.     |               |
| ProblemDetails         | 3GPP TS 29.571 [8] | Represents error related information.    |               |

|                        |                     |                                                                                                                  |  |
|------------------------|---------------------|------------------------------------------------------------------------------------------------------------------|--|
| SupportedFeatures      | 3GPP TS 29.571 [8]  | Represents the list of supported feature(s) and is used to negotiate the applicability of the optional features. |  |
| Uri                    | 3GPP TS 29.122 [4]  | Represents a Uri.                                                                                                |  |
| UserServiceDescription | 3GPP TS 26.517 [71] | Represents MBS User Service Announcement information.                                                            |  |

## 5.29.5.2 Structured data types

### 5.29.5.2.1 Introduction

This clause defines the structured data types to be used in resource representations.

### 5.29.5.2.2 Void

### 5.29.5.2.3 Type: MbsGroupMsgDel

**Table 5.29.5.2.3-1: Definition of type MbsGroupMsgDel**

| Attribute name   | Data type              | P | Cardinality | Description                                                                                                                                                                                                                                                          | Applicability |
|------------------|------------------------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| afId             | string                 | C | 0..1        | Contains the identifier of the AF that is sending the request.<br><br>This attribute shall be present only in MBS Group Message Delivery creation requests.                                                                                                          |               |
| extGroupId       | ExternalGroupId        | M | 1           | Contains the identifier of the targeted group of UEs.                                                                                                                                                                                                                |               |
| payload          | Bytes                  | M | 1           | Contains the payload of the requested MBS Group Message Delivery.                                                                                                                                                                                                    |               |
| mbsServArea      | MbsServArea            | M | 1           | Contains the targeted MBS Service Area.                                                                                                                                                                                                                              |               |
| startTime        | DateTime               | M | 1           | Contains the start time of the MBS Group Message Delivery.                                                                                                                                                                                                           |               |
| endTime          | DateTime               | M | 1           | Contains the end time of the MBS Group Message Delivery.                                                                                                                                                                                                             |               |
| notifUri         | Uri                    | M | 1           | Contains the notification URI via which the AF desires to receive notifications on the status of this MBS Group Message Delivery.                                                                                                                                    |               |
| delStatus        | boolean                | C | 0..1        | Indicates the status of this MBS Group Message Delivery.<br>- "true": Successful delivery.<br>- "false": Failed delivery.<br><br>This attribute shall be present only in MBS Group Message Delivery creation/modification responses.                                 |               |

5.29.5.2.4 Void

5.29.5.2.5 Type: MbsGroupMsgDelPatch

**Table 5.29.5.2.5-1: Definition of type MbsGroupMsgDelPatch**

| Attribute name | Data type      | P | Cardinality | Description                                                                                                                               | Applicability |
|----------------|----------------|---|-------------|-------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| payload        | Bytes          | O | 0..1        | Contains the updated payload of the requested MBS Group Message Delivery.                                                                 |               |
| mbsServArea    | MbsServArea    | O | 0..1        | Contains the updated MBS Service Area.                                                                                                    |               |
| startTime      | DateTime       | O | 0..1        | Contains the updated start time of the MBS Group Message Delivery.                                                                        |               |
| endTime        | DateTime       | O | 0..1        | Contains the updated end time of the MBS Group Message Delivery.                                                                          |               |
| notifUri       | Uri            | O | 0..1        | Contains the updated notification URI via which the AF desires to receive notifications on the status of this MBS Group Message Delivery. |               |
| nrRedCapUeInfo | NrRedCapUeInfo | O | 0..1        | Contains the NR RedCap UE Information.                                                                                                    |               |

5.29.5.2.6 Type: MbsGroupMsgDelStatusNotif

**Table 5.29.5.2.6-1: Definition of type MbsGroupMsgDelStatusNotif**

| Attribute name | Data type | P | Cardinality | Description                                                                                                     | Applicability |
|----------------|-----------|---|-------------|-----------------------------------------------------------------------------------------------------------------|---------------|
| delStatus      | boolean   | M | 1           | Indicate the status of Group Message Delivery.<br>- "true": Successful delivery.<br>- "false": Failed delivery. |               |

### 5.29.5.3 Simple data types and enumerations

#### 5.29.5.3.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

#### 5.29.5.3.2 Simple data types

The simple data types defined in Table 5.29.5.3.2-1 shall be supported.

**Table 5.29.5.3.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

### 5.29.5.4 Data types describing alternative data types or combinations of data types

#### 5.29.5.4.1 Type: MbsServArea

**Table 5.29.5.4.1-1: Definition of type MbsServArea as a list of mutually exclusive alternatives**

| Data type              | Cardinality | Description                                                                                                 | Applicability |
|------------------------|-------------|-------------------------------------------------------------------------------------------------------------|---------------|
| MbsServiceArea         | 0..1        | Represents the internal MBS Service Area (i.e., in the form of a list of cell ID(s) and/or list of TAI(s)). |               |
| ExternalMbsServiceArea | 0..1        | Represents the external MBS Service Area (i.e., in the form of geographical area(s) or civic address(es)).  |               |

## 5.29.6 Used Features

The optional features listed in table 5.29.6-1 are defined for the MBSGroupMsgDelivery API. They shall be negotiated using the extensibility mechanism defined in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.29.6-1: Features used by the MBSGroupMsgDelivery API**

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|
|                |              |             |

## 5.29.7 Error handling

### 5.29.7.1 General

For the MBSGroupMsgDelivery API, HTTP error responses shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4]. Protocol errors and application errors specified in clause 5.2.6 of 3GPP TS 29.122 [4] shall be supported for the HTTP status codes specified in table 5.2.6-1 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses are applicable for the MBSGroupMsgDelivery API.

### 5.29.7.2 Protocol Errors

In this Release of the specification, there are no additional protocol errors applicable for the MBSGroupMsgDelivery API.

### 5.29.7.3 Application Errors

The application errors defined for the MBSGroupMsgDelivery API are listed in table 5.29.7.3-1.

Table 5.29.7.3-1: Application errors

| Application Error              | HTTP status code | Description                                                                                                                                          | Applicability |
|--------------------------------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| MBS_SERVICE_AREA_NOT_SUPPORTED | 403 Forbidden    | The MBS Group Message Delivery creation/update request is rejected because the requested MBS Service Area is not supported by the 3GPP Core Network. |               |

## 5.30 DNAMapping API

### 5.30.1 Introduction

The Nnef\_DNAMapping service shall use the DNAMapping API.

The API URI of the DNAMapping API shall be:

**{apiRoot}/<apiName>/<apiVersion>**

The request URIs used in HTTP requests shall have the Resource URI structure defined in clause 5.2.4 of 3GPP TS 29.122 [4], i.e.:

**{apiRoot}/<apiName>/<apiVersion>/<apiSpecificSuffixes>**

with the following components:

- "apiRoot" is set as defined in clause 5.2.4 of 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-dnai-mapping".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.
- The <apiSpecificSuffixes> shall be set as described in clause 5.2.4 of 3GPP TS 29.122 [4].

All resource URIs in the clauses below are defined relative to the above root URI.

### 5.30.2 Resources

#### 5.30.2.1 Overview

This clause describes the structure for the Resource URIs as shown in figure 5.30.2.1-1 and the resources and HTTP methods used for the DNAMapping API.

Figure 5.30.2.1-1: Resource URI structure of the DNAMapping API

Table 5.30.2.1-1 provides an overview of the resources and HTTP methods applicable for the DNAMapping API.

**Table 5.30.2.1-1: Resources and methods overview**

| Resource name                        | Resource URI                           | HTTP method | Description                                                    |
|--------------------------------------|----------------------------------------|-------------|----------------------------------------------------------------|
| DNAI Mapping Subscriptions           | /{afId}/subscriptions                  | GET         | Retrieve all the active DNAI Mapping Subscriptions at the NEF. |
|                                      |                                        | POST        | Create a new DNAI Mapping Subscription.                        |
| Individual DNAI Mapping Subscription | /{afId}/subscriptions/{subscriptionId} | GET         | Retrieve an existing DNAI Mapping Subscription.                |
|                                      |                                        | DELETE      | Delete an existing DNAI Mapping Subscription.                  |

## 5.30.2.2 Resource: DNAI Mapping Subscriptions

### 5.30.2.2.1 Introduction

This resource represents all the active DNAI Mapping Subscriptions managed by the NEF for a given AF.

This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [3]).

### 5.30.2.2.2 Resource Definition

Resource URI: **{apiRoot}/3gpp-dnai-mapping/<apiVersion>/{afId}/subscriptions**

This resource shall support the resource URI variables defined in table 5.30.2.2.2-1.

**Table 5.30.2.2.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition                           |
|---------|-----------|--------------------------------------|
| apiRoot | string    | See clause 5.30.1.                   |
| afId    | string    | Represents the identifier of the AF. |

### 5.30.2.2.3 Resource Standard Methods

#### 5.30.2.2.3.1 Void

#### 5.30.2.2.3.2 GET

The HTTP GET method allows to retrieve all the active DNAI Mapping Subscriptions managed by the NEF for a given AF.

This method shall support the URI query parameters specified in table 5.30.2.2.3.2-1.

**Table 5.30.2.2.3.2-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.30.2.2.3.2-2 and the response data structures and response codes specified in table 5.30.2.2.3.2-3.

**Table 5.30.2.2.3.2-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.30.2.2.3.2-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| array(DnaiMapSub)                                                                                                                   | M | 0..N        | 200 OK                 | Successful case. All the "Individual DNAI Mapping Subscription" resource(s) managed by the NEF are returned.<br><br>If there are no active "Individual DNAI Mapping Subscription" resources at the NEF, an empty array is returned.                   |
| n/a                                                                                                                                 |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                 |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.30.2.2.3.2-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.30.2.2.3.2-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

### 5.30.2.2.3.3 POST

The HTTP POST method allows to create a new DNAI Mapping Subscription at the NEF for a given AF.

This method shall support the URI query parameters specified in table 5.30.2.2.3.3-1.

**Table 5.30.2.2.3.3-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.30.2.2.3.3-1 and the response data structures and response codes specified in table 5.30.2.2.3.3-2.

**Table 5.30.2.2.3.3-1: Data structures supported by the POST Request Body on this resource**

| Data type  | P | Cardinality | Description                                                                                    |
|------------|---|-------------|------------------------------------------------------------------------------------------------|
| DnaiMapSub | M | 1           | Contains the parameters to request the creation of a new DNAI Mapping Subscription at the NEF. |

**Table 5.30.2.2.3.3-2: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                            | P | Cardinality | Response codes | Description                                                                                                                                                                                                               |
|--------------------------------------------------------------------------------------------------------------------------------------|---|-------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DnaiMapSub                                                                                                                           | M | 1           | 201<br>Created | Successful case. A representation of the created "Individual DNAI Mapping Subscription" resource is returned in the response body.<br><br>The URI of the created resource shall be returned in an HTTP "Location" header. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                |                                                                                                                                                                                                                           |

**Table 5.30.2.2.3.3-3: Headers supported by the 201 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                                                   |
|----------|-----------|---|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains the URI of the newly created resource, according to the structure:<br>{apiRoot}/3gpp-dnai-mapping/<apiVersion>/{afld}/subscriptions/{subscriptionId} |

#### 5.30.2.2.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.30.2.3 Resource: Individual DNAI Mapping Subscription

#### 5.30.2.3.1 Introduction

This resource represents an "Individual DNAI Mapping Subscription" resource managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [3]).

#### 5.30.2.3.2 Resource Definition

Resource URI: {apiRoot}/3gpp-dnai-mapping/<apiVersion>/{afld}/subscriptions/{subscriptionId}

This resource shall support the resource URI variables defined in table 5.30.2.3.2-1.

**Table 5.30.2.3.2-1: Resource URI variables for this resource**

| Name           | Data type | Definition                                                                        |
|----------------|-----------|-----------------------------------------------------------------------------------|
| apiRoot        | string    | See clause 5.30.1.                                                                |
| afld           | string    | Represents the identifier of the AF.                                              |
| subscriptionId | string    | Represents the identifier of the "Individual DNAI Mapping Subscription" resource. |

#### 5.30.2.3.3 Resource Standard Methods

##### 5.30.2.3.3.1 Void

##### 5.30.2.3.3.2 GET

The HTTP GET method allows to retrieve an existing "Individual DNAI Mapping Subscription" resource at the NEF.

This method shall support the URI query parameters specified in table 5.30.2.3.3.2-1.

**Table 5.30.2.3.3.2-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
|------|-----------|---|-------------|-------------|

|     |  |  |  |  |
|-----|--|--|--|--|
| n/a |  |  |  |  |
|-----|--|--|--|--|

This method shall support the request data structures specified in table 5.30.2.3.3.2-2 and the response data structures and response codes specified in table 5.30.2.3.3.2-3.

**Table 5.30.2.3.3.2-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.30.2.3.3.2-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DnaiMapSub                                                                                                                          | M | 1           | 200 OK                 | Successful case. The requested "Individual DNAI Mapping Subscription" resource is successfully returned in the response body.                                                                                                                         |
| n/a                                                                                                                                 |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                 |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.30.2.3.3.2-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.30.2.3.3.2-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

### 5.30.2.3.3.3 DELETE

The HTTP DELETE method allows to delete an existing "Individual DNAI Mapping Subscription" resource at the NEF.

This method shall support the URI query parameters specified in table 5.30.2.3.3.3-1.

**Table 5.30.2.3.3.3-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.30.2.3.3.3-2 and the response data structures and response codes specified in table 5.30.2.3.3.3-3.

**Table 5.30.2.3.3.3-2: Data structures supported by the DELETE Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.30.2.3.3.3-3: Data structures supported by the DELETE Response Body on this resource**

| Data type                                                                                                                              | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|----------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a                                                                                                                                    |   |             | 204 No Content         | Successful case. The "Individual DNAI Mapping Subscription" resource is successfully deleted.                                                                                                                                                         |
| n/a                                                                                                                                    |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                    |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP DELETE method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.30.2.3.3.3-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.30.2.3.3.3-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.30.2.3.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.30.3 Custom Operations without associated resources

There are no custom operations without associated resources defined for this API in this release of the specification.

## 5.30.4 Notifications

### 5.30.4.1 General

Notifications shall comply to clause 5.2.5 of 3GPP TS 29.122 [4].

**Table 5.30.4.1-1: Notifications overview**

| Notification                                 | Callback URI | HTTP method or custom operation | Description (service operation)                                                                              |
|----------------------------------------------|--------------|---------------------------------|--------------------------------------------------------------------------------------------------------------|
| DNAI Mapping Information Update Notification | {notifUri}   | POST                            | Enables the NEF to notify a previously subscribed AF on the updates of the DNAI-EAS address(es) information. |

## 5.30.4.2 DNAI Mapping Information Update Notification

### 5.30.4.2.1 Description

This notification is used by the NEF to report the updates of the DNAI Mapping information to a previously subscribed AF.

### 5.30.4.2.2 Target URI

The Callback URI "{**notifUri**}" shall be used with the callback URI variables defined in table 5.30.4.2.2-1.

**Table 5.30.4.2.2-1: Callback URI variables**

| Name     | Definition                                                          |
|----------|---------------------------------------------------------------------|
| notifUri | Represents the callback URI encoded as a string formatted as a URI. |

### 5.30.4.2.3 Operation Definition

#### 5.30.4.2.3.1 Notification via HTTP POST

This method shall support the request data structures specified in table 5.30.4.2.3.1-1 and the response data structures and response codes specified in table 5.30.4.2.3.1-2.

**Table 5.30.4.2.3.1-1: Data structures supported by the POST Request Body on this resource**

| Data type                 | P | Cardinality | Description                                                  |
|---------------------------|---|-------------|--------------------------------------------------------------|
| DnaiMapUpdateNotification | M | 1           | Represents the DNAI Mapping Information Update Notification. |

**Table 5.30.4.2.3.1-2: Data structures supported by the POST Response Body on this resource**

| Data type | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                                                                    |
|-----------|---|-------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a       |   |             | 204 No Content         | Successful case. The notification is successfully received and acknowledged.                                                                                                                                                                                                                   |
| n/a       |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF towards which the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a       |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF towards which the notification should be sent.                                                                                  |

|                                                                                                                                      |  |  |  |                                                                           |
|--------------------------------------------------------------------------------------------------------------------------------------|--|--|--|---------------------------------------------------------------------------|
|                                                                                                                                      |  |  |  | Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |  |  |  |                                                                           |

**Table 5.30.4.2.3.1-3: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                      |
|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

**Table 5.30.4.2.3.1-4: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                      |
|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

5.30.4.2.3.2                  Void

## 5.30.5 Data Model

### 5.30.5.1 General

This clause specifies the application data model supported by the DNAIMapping API. Table 5.30.5.1-1 specifies the data types defined for the DNAIMapping API.

**Table 5.30.5.1-1: DNAIMapping API specific Data Types**

| Data type          | Clause defined | Description                                                | Applicability |
|--------------------|----------------|------------------------------------------------------------|---------------|
| DnaiMapSub         | 5.30.5.2.2     | Represents a DNAI Mapping Subscription.                    |               |
| DnaiMapUpdateNotif | 5.30.5.2.3     | Represents a DNAI Mapping Information Update Notification. |               |

Table 5.30.5.1-2 specifies data types re-used by the DNAIMapping API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the DNAIMapping API.

**Table 5.30.5.1-2: DNAIMapping API re-used Data Types**

| Data type            | Reference           | Comments                                                                                                         | Applicability |
|----------------------|---------------------|------------------------------------------------------------------------------------------------------------------|---------------|
| DnaiEasInfo          | 3GPP TS 29.519 [23] | Represents EAS information for a DNAI.                                                                           |               |
| Dnn                  | 3GPP TS 29.571 [8]  | Represents a DNN.                                                                                                |               |
| Fqdn                 | 3GPP TS 29.571 [8]  | Represents an FQDN.                                                                                              |               |
| IpAddr               | 3GPP TS 29.571 [8]  | Represents an IP address.                                                                                        |               |
| ReportingInformation | 3GPP TS 29.523 [22] | Represents the event reporting requirements.                                                                     |               |
| Snssai               | 3GPP TS 29.571 [8]  | Represents an S-NSSAI.                                                                                           |               |
| SupportedFeatures    | 3GPP TS 29.571 [8]  | Represents the list of supported feature(s) and is used to negotiate the applicability of the optional features. |               |
| Uri                  | 3GPP TS 29.122 [4]  | Represents a URI.                                                                                                |               |

## 5.30.5.2 Structured data types

### 5.30.5.2.1 Introduction

This clause defines the structures to be used in resource representations.

### 5.30.5.2.2 Type: DnaiMapSub

**Table 5.30.5.2.2-1: Definition of type DnaiMapSub**

| Attribute name                                                                      | Data type                 | P | Cardinality | Description                                                                                                                                                                                                                                                                  | Applicability |
|-------------------------------------------------------------------------------------|---------------------------|---|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| easIpAddrs                                                                          | array(IpAddr)             | C | 1..N        | Contains the IP address(es) of the EAS(s) in the Local part of the DN or the IP address range(s) (i.e., IPv4 subnetwork(s) and/or IPv6 prefix(es)) of the Local part of the DN where the EAS(s) is/are deployed.<br><br>(NOTE)                                               |               |
| fqdns                                                                               | array(Fqdn)               | C | 1..N        | Contains the FQDN(s) of the EAS(s) in the Local part of the DN where the EAS(s) is/are deployed.<br><br>(NOTE)                                                                                                                                                               |               |
| dnn                                                                                 | Dnn                       | O | 0..1        | Contains a DNN, a full DNN with both the Network Identifier and Operator Identifier, or a DNN with the Network Identifier only.                                                                                                                                              |               |

| mappingId      | string             | M | 1           | Identifies the mapping information provided in the "dnaiEasAddrMap" attribute.<br><br>For notifying deletion, this attribute shall be provided without the "dnaiEasAddrMap" attribute. |               |
| notifCorrId    | string             | M | 1           | Contains the notification correlation identifier.                                                                                                                                      |               |

## 5.30.5.2.4 Void

## 5.30.5.3 Simple data types and enumerations

## 5.30.5.3.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

## 5.30.5.3.2 Simple data types

The simple data types defined in table 5.30.5.3.2-1 shall be supported.

**Table 5.30.5.3.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

## 5.30.5.4 Data types describing alternative data types or combinations of data types

There are no data types describing alternative data types or combinations of data types defined for this API in this release of the specification.

## 5.30.6 Used Features

The optional features listed in table 5.30.6-1 are defined for the DNAMapping API. They shall be negotiated using the extensibility mechanism defined in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.30.6-1: Features used by DNAMapping API**

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|
| 1              | Void         |             |
| 2              | Void         |             |

## 5.30.7 Error handling

### 5.30.7.1 General

For the DNAMapping API, HTTP error responses shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4]. Protocol errors and application errors specified in clause 5.2.6 of 3GPP TS 29.122 [4] shall be supported for the HTTP status codes specified in table 5.2.6-1 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses are applicable for the DNAMapping API.

### 5.30.7.2 Protocol Errors

In this Release of the specification, there are no additional protocol errors applicable for the DNAMapping API.

### 5.30.7.3 Application Errors

The application errors defined for the DNAMapping API are listed in table 5.30.7.3-1.

**Table 5.30.7.3-1: Application errors**

| Application Error | HTTP status code | Description | Applicability |
|-------------------|------------------|-------------|---------------|
|                   |                  |             |               |

## 5.31 PdtqPolicyNegotiation API

### 5.31.0 Introduction

The Nnef\_PdtqPolicyNegotiation service shall use the PdtqPolicyNegotiation API.

The API URI of PdtqPolicyNegotiation API shall be:

**{apiRoot}/<apiName>/<apiVersion>**

The request URIs used in HTTP requests shall have the Resource URI structure defined in clause 5.2.4 of 3GPP TS 29.122 [4], i.e.:

**{apiRoot}/<apiName>/<apiVersion>/<apiSpecificSuffixes>**

with the following components:

- "apiRoot" is set as defined in clause 5.2.4 of 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-pdtq-policy-negotiation".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.
- The <apiSpecificSuffixes> shall be set as described in clause 5.2.4 of 3GPP TS 29.122 [4].

All resource URIs in the clauses below are defined relative to the above API URI.

### 5.31.1 Resources

#### 5.31.1.1 Overview

This clause describes the structure for the Resource URIs as shown in figure 5.29.2.1-1 and HTTP methods used for the PdtqPolicyNegotiation API.

The structure of the resource URIs of the PdtqPolicyNegotiation API is shown in Figure 5.31.1.1-1.

Figure 5.31.1.1-1: Resource URI structure of the PdtqPolicyNegotiation API

Table 5.31.1.1-1 provides an overview of the resources and applicable HTTP methods.

Table 5.31.1.1-1: Resources and methods overview

| Resource name                       | Resource URI                           | HTTP method or custom operation | Description                                                            |
|-------------------------------------|----------------------------------------|---------------------------------|------------------------------------------------------------------------|
| PDTQ Policy Subscriptions           | /{afId}/subscriptions                  | GET                             | Read all the active PDTQ Policy Subscription resources for a given AF. |
|                                     |                                        | POST                            | Create a new PDTQ Policy Subscription.                                 |
| Individual PDTQ Policy Subscription | /{afId}/subscriptions/{subscriptionId} | GET                             | Retrieve an existing "Individual PDTQ Policy Subscription" resource.   |
|                                     |                                        | PATCH                           | Modify an existing "Individual PDTQ Policy Subscription" resource.     |
|                                     |                                        | DELETE                          | Delete an existing "Individual PDTQ Policy Subscription" resource.     |

5.31.1.2 Resource: PDTQ Policy Subscriptions

5.31.1.2.1 Introduction

This resource represents all the active PDTQ Policy Subscriptions managed by the NEF for a given AF.  
This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [3]).

5.31.1.2.2 Resource Definition

Resource URI: {apiRoot}/3gpp-pdtq-policy-negotiation/<apiVersion>/{afId}/subscriptions

This resource shall support the resource URI variables defined in table 5.31.1.2.2-1.

Table 5.31.1.2.2-1: Resource URI variables for this resource

| Name    | Data type | Definition                           |
|---------|-----------|--------------------------------------|
| apiRoot | string    | See clause 5.31.0.                   |
| afId    | string    | Represents the identifier of the AF. |

## 5.31.1.2.3 Resource Standard Methods

## 5.31.1.2.3.1 Void

## 5.31.1.2.3.2 GET

The HTTP GET method allows to retrieve all the active PDTQ Policy Subscriptions managed by the NEF.

This method shall support the URI query parameters specified in table 5.31.1.2.3.2-1.

**Table 5.31.1.2.3.2-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.31.1.2.3.2-2 and the response data structures and response codes specified in table 5.31.1.2.3.2-3.

**Table 5.31.1.2.3.2-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.31.1.2.3.2-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| array(Pdtq)                                                                                                                         | M | 0..N        | 200 OK                 | Successful case. All the "Individual PDTQ Policy Subscription" resource(s) managed by the NEF are returned.<br><br>If there are no active "Individual PDTQ Policy Subscription" resources at the NEF, an empty array is returned.                     |
| n/a                                                                                                                                 |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                 |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.31.1.2.3.2-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
|------|-----------|---|-------------|-------------|

|          |        |   |   |                                                                                   |
|----------|--------|---|---|-----------------------------------------------------------------------------------|
| Location | string | M | 1 | Contains an alternative target URI of the resource located in an alternative NEF. |
|----------|--------|---|---|-----------------------------------------------------------------------------------|

#### 5.31.1.2.3.3 POST

The HTTP POST method allows to create a new PDTQ Policy Subscription at the NEF.

This method shall support the URI query parameters specified in table 5.31.1.2.3.3-1.

**Table 5.31.1.2.3.3-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.31.1.2.3.3-2 and the response data structures and response codes specified in table 5.31.1.2.3.3-3.

**Table 5.31.1.2.3.3-2: Data structures supported by the POST Request Body on this resource**

| Data type | P | Cardinality | Description                                                                                   |
|-----------|---|-------------|-----------------------------------------------------------------------------------------------|
| Pdtq      | M | 1           | Contains the parameters to request the creation of a new PDTQ Policy Subscription at the NEF. |

**Table 5.31.1.2.3.3-3: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                            | P | Cardinality | Response codes | Description                                                                                                                                                                                                              |
|--------------------------------------------------------------------------------------------------------------------------------------|---|-------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pdtq                                                                                                                                 | M | 1           | 201 Created    | Successful case. A representation of the created "Individual PDTQ Policy Subscription" resource is returned in the response body.<br><br>The URI of the created resource shall be returned in an HTTP "Location" header. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                |                                                                                                                                                                                                                          |

**Table 5.31.1.2.3.3-4: Headers supported by the 201 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                                                              |
|----------|-----------|---|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains the URI of the newly created resource, according to the structure:<br>{apiRoot}/3gpp-pdtq-policy-negotiation/<apiVersion>/{afId}/subscriptions/{subscriptionId} |

#### 5.31.1.2.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.31.1.3 Resource: Individual PDTQ Policy Subscription

#### 5.31.1.3.1 Introduction

This resource represents an "Individual PDTQ Policy Subscription" resource managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [3]).

#### 5.31.1.3.2 Resource Definition

Resource URI: {apiRoot}/3gpp-pdtq-policy-negotiation/<apiVersion>/{afId}/subscriptions/{subscriptionId}

This resource shall support the resource URI variables defined in table 5.31.1.3.2-1.

**Table 5.31.1.3.2-1: Resource URI variables for this resource**

| Name           | Data type | Definition                                                                       |
|----------------|-----------|----------------------------------------------------------------------------------|
| apiRoot        | string    | See clause 5.31.0.                                                               |
| afId           | string    | Represents the identifier of the AF.                                             |
| subscriptionId | string    | Represents the identifier of the "Individual PDTQ Policy Subscription" resource. |

### 5.31.1.3.3 Resource Standard Methods

#### 5.31.1.3.3.1 Void

#### 5.31.1.3.3.2 GET

The HTTP GET method allows to retrieve an existing "Individual PDTQ Policy Subscription" resource at the NEF.

This method shall support the URI query parameters specified in table 5.31.1.3.3.2-1.

**Table 5.31.1.3.3.2-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.31.1.3.3.2-2 and the response data structures and response codes specified in table 5.31.1.3.3.2-3.

**Table 5.31.1.3.3.2-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.31.1.3.3.2-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pdtq                                                                                                                                | M | 1           | 200 OK                 | Successful case. The requested "Individual PDTQ Policy Subscription" resource is successfully returned in the response body.                                                                                                                          |
| n/a                                                                                                                                 |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                 |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.31.1.3.3.2-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.31.1.3.3.2-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

### 5.31.1.3.3.3 PATCH

The HTTP PATCH method allows to modify an existing "Individual PDTQ Policy Subscription" resource at the NEF.

This method shall support the URI query parameters specified in table 5.31.1.3.3.3-1.

**Table 5.31.1.3.3.3-1: URI query parameters supported by the PATCH method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.31.1.3.3.3-2 and the response data structures and response codes specified in table 5.31.1.3.3.3-3.

**Table 5.31.1.3.3.3-2: Data structures supported by the PATCH Request Body on this resource**

| Data type | P | Cardinality | Description                                                                                   |
|-----------|---|-------------|-----------------------------------------------------------------------------------------------|
| PdtqPatch | M | 1           | Represents the requested modifications to the "Individual PDTQ Policy Subscription" resource. |

**Table 5.31.1.3.3.3-3: Data structures supported by the PATCH Response Body on this resource**

| Data type                                                                                                                             | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|---------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pdtq                                                                                                                                  | M | 1           | 200 OK                 | Successful response. The "Individual PDTQ Policy Subscription " resource is successfully modified and a representation of the updated resource is returned in the response body.                                                                      |
| n/a                                                                                                                                   |   |             | 204 No Content         | Successful response. The "Individual PDTQ Policy Subscription" resource is successfully modified and no content is returned in the response body.                                                                                                     |
| n/a                                                                                                                                   |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                   |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP PATCH method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.31.1.3.3.3-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.31.1.3.3.4 DELETE

The HTTP DELETE method allows to delete an existing "Individual PDTQ Policy Subscription" resource at the NEF.

This method shall support the URI query parameters specified in table 5.31.1.3.3.4.-1.

**Table 5.31.1.3.3.4-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.31.1.3.3.4-2 and the response data structures and response codes specified in table 5.31.1.3.3.4-3.

**Table 5.31.1.3.3.4-2: Data structures supported by the DELETE Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.31.1.3.3.4-3: Data structures supported by the DELETE Response Body on this resource**

| Data type | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-----------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a       |   |             | 204 No Content         | Successful case. The "Individual PDTQ Policy Subscription" resource is successfully deleted.                                                                                                                                                          |
| n/a       |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |

NOTE: The mandatory HTTP error status codes for the HTTP DELETE method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply.

**Table 5.31.1.3.3.4-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.31.1.3.3.4-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.31.1.3.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.31.1A Custom Operations without associated resources

There are no custom operations without associated resources defined for this API in this release of the specification.

## 5.31.2 Notifications

### 5.31.2.1 General

Notifications shall comply to clause 5.2.5 of 3GPP TS 29.122 [4].

**Table 5.31.2.1-1: Notifications overview**

| Notification              | Callback URI | HTTP method or custom operation | Description (service operation)                                                |
|---------------------------|--------------|---------------------------------|--------------------------------------------------------------------------------|
| PDTQ Warning Notification | {notifUri}   | POST                            | Enables the NEF to notify a previously subscribed AF on PDTQ warning event(s). |

### 5.31.2.2 PDTQ Warning Notification

#### 5.31.2.2.1 Description

This notification is used by the NEF to notify a previously subscribed AF on PDTQ warning event(s), i.e., the changed conditions for a planned data transfer with QoS requirements (e.g., a network performance or DN performance in the area of interest reaches the criteria set by the operator).

#### 5.31.2.2.2 Target URI

The Callback URI "{**notifUri**}" shall be used with the callback URI variables defined in table 5.31.2.2.2-1.

**Table 5.31.2.2.2-1: Callback URI variables**

| Name     | Definition                                                          |
|----------|---------------------------------------------------------------------|
| notifUri | Represents the callback URI encoded as a string formatted as a URI. |

### 5.31.2.2.3 Operation Definition

#### 5.31.2.2.3.1 Notification via HTTP POST

This method shall support the request data structures specified in table 5.31.2.2.3.1-1 and the response data structures and response codes specified in table 5.31.2.2.3.1-2.

**Table 5.31.2.2.3.1-1: Data structures supported by the POST Request Body**

| Data type        | P | Cardinality | Description                               |
|------------------|---|-------------|-------------------------------------------|
| PdtqNotification | M | 1           | Represents the PDTQ Warning Notification. |

**Table 5.31.2.2.3.1-2: Data structures supported by the POST Response Body**

| Data type                                                                                                                            | Cardinality | Response codes         | Description                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------------------------------------------------------------------------------------|-------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a                                                                                                                                  |             | 204 No Content         | Successful case. The notification is successfully received and acknowledged.                                                                                                                                                                                                                   |
| n/a                                                                                                                                  |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF towards which the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                  |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF towards which the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |             |                        |                                                                                                                                                                                                                                                                                                |

**Table 5.31.2.2.3.1-3: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                      |
|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

**Table 5.31.2.2.3.1-4: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                      |
|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

## 5.31.3 Data Model

### 5.31.3.1 General

This clause specifies the application data model supported by the PdtqPolicyNegotiation API. Table 5.31.3.1-1 specifies the data types defined for the PdtqPolicyNegotiation API.

**Table 5.31.3.1-1: PdtqPolicyNegotiation API specific Data Types**

| Data type        | Clause defined | Description                                                           | Applicability |
|------------------|----------------|-----------------------------------------------------------------------|---------------|
| Pdtq             | 5.31.3.3.2     | Represents a PDTQ Policy Subscription.                                |               |
| PdtqNotification | 5.31.3.3.4     | Represents a PDTQ Warning Notification.                               |               |
| PdtqPatch        | 5.31.3.3.3     | Represents the requested modifications to a PDTQ Policy Subscription. |               |

Table 5.31.3.1-2 specifies data types re-used by the PdtqPolicyNegotiation API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the PdtqPolicyNegotiation API.

**Table 5.31.3.1-2: PdtqPolicyNegotiation API re-used Data Types**

| Data type         | Reference           | Comments                                                                                                         |
|-------------------|---------------------|------------------------------------------------------------------------------------------------------------------|
| AltQosParamSet    | 3GPP TS 29.543 [68] | Represents the alternative QoS requirements expressed as a list of individual QoS parameters sets.               |
| ApplicationId     | 3GPP TS 29.571 [8]  | Represents the application identifier.                                                                           |
| LocationArea5G    | 3GPP TS 29.122 [4]  | Represents the user location area information.                                                                   |
| PdtqPolicy        | 3GPP TS 29.543 [68] | Represents a PDTQ policy.                                                                                        |
| PdtqReferenceId   | 3GPP TS 29.543 [68] | Represents a PDTQ Reference ID.                                                                                  |
| QosParameterSet   | 3GPP TS 29.543 [68] | Represents the QoS requirements expressed as one or more individual QoS parameters.                              |
| SupportedFeatures | 3GPP TS 29.571 [8]  | Represents the list of supported feature(s) and is used to negotiate the applicability of the optional features. |
| TimeWindow        | 3GPP TS 29.122 [4]  | Represents a time window.                                                                                        |
| Uri               | 3GPP TS 29.122 [4]  | Represents a URI.                                                                                                |

### 5.31.3.2 Void

### 5.31.3.3 Structured data types

#### 5.31.3.3.1 Introduction

This clause defines the structured data types to be used in resource representations.

#### 5.31.3.3.2 Type: Pdtq

**Table 5.31.3.3.2-1: Definition of type Pdtq**

| Attribute name  | Data type             | P | Cardinality | Description                                                                                                                                                                                                                 | Applicability |
|-----------------|-----------------------|---|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| altQosParamSets | array(AltQosParamSet) | O | 1..N        | Contains the alternative QoS requirements expressed as a list of individual QoS parameters sets in a prioritized order.<br><br>The lower the index of the array for a given entry, the higher the priority.<br><br>(NOTE 4) |               |
| altQosRefs      | array(string)         | O | 1..N        | Contains the alternative QoS requirements expressed as a list of QoS References in a prioritized order.<br><br>The lower the index of the array for a given entry, the higher the priority.<br><br>(NOTE 3)                 |               |
| appld           | ApplicationId         | O | 0..1        | Contains the identifier of the application.                                                                                                                                                                                 |               |
| aspld           | string                | M | 1           | Contains the identifier of the application service provider.                                                                                                                                                                |               |
| desTimeInts     | array(TimeWindow)     | M | 1..N        | Contains the time interval(s).                                                                                                                                                                                              |               |
| locationArea5G  | LocationArea5G        | O | 0..1        | Contains the area within which the AF request shall apply.                                                                                                                                                                  |               |

|                                                                                                                                                                                                                                                                                                                                                                                                             |                   |   |      |                                                                                                                                                                                                                                                                                      |  |

### 5.31.3.3.3 Type: PdtqPatch

**Table 5.31.3.3.3-1: Definition of type PdtqPatch**

| Attribute name   | Data type | P | Cardinality | Description                                                                                                                                 | Applicability |
|------------------|-----------|---|-------------|---------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| selectedPolicy   | integer   | O | 0..1        | Contains the identifier of the selected PDTQ policy.<br><br>(NOTE)                                                                          |               |
| warnNotifEnabled | boolean   | O | 0..1        | Indicates whether the PDTQ warning notification is enabled or not.<br><br>- "true" indicates that the PDTQ warning notification is enabled; |               |

|                                                                                                              |     |   |      |                                                                                        |  |
|--------------------------------------------------------------------------------------------------------------|-----|---|------|----------------------------------------------------------------------------------------|--|
|                                                                                                              |     |   |      | - "false" indicates that the PDTQ warning notification is not enabled.                 |  |
| notifUri                                                                                                     | Uri | O | 0..1 | Contains the updated URI via which the PDTQ warning notifications should be delivered. |  |
| NOTE: When this attribute is present and set to the value "0", it indicates that no PDTQ policy is selected. |     |   |      |                                                                                        |  |

#### 5.31.3.3.4 Type: PdtqNotification

**Table 5.31.3.3.4-1: Definition of type Notification**

| Attribute name | Data type         | P | Cardinality | Description                                                                                    | Applicability |
|----------------|-------------------|---|-------------|------------------------------------------------------------------------------------------------|---------------|
| pdtqRefId      | PdtqReferenceId   | M | 1           | Contains the identifier of the PDTQ policy to which the notification corresponds.              |               |
| candPolicies   | array(PdtqPolicy) | M | 1..N        | Contains a list of the candidate PDTQ policies from which the AF may select a new PDTQ policy. |               |

### 5.31.3.4 Simple data types and enumerations

#### 5.31.3.4.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

#### 5.31.3.4.2 Simple data types

The simple data types defined in table 5.31.3.4.2-1 shall be supported.

**Table 5.31.3.4.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

### 5.31.3.4 Data types describing alternative data types or combinations of data types

There are no data types describing alternative data types or combinations of data types defined for this API in this release of the specification.

## 5.31.4 Used Features

The optional features listed in table 5.31.4-1 are defined for the PdtqPolicyNegotiation API. They shall be negotiated using the extensibility mechanism defined in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.31.4-1: Features used by PdtqPolicyNegotiation API**

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|
|                |              |             |

## 5.31.5 Error handling

### 5.31.5.1 General

For the PdtqPolicyNegotiation API, HTTP error responses shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4]. Protocol errors and application errors specified in clause 5.2.6 of 3GPP TS 29.122 [4] shall be supported for the HTTP status codes specified in table 5.2.6-1 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses are applicable for the PdtqPolicyNegotiation API.

### 5.31.5.2 Protocol Errors

In this Release of the specification, there are no additional protocol errors applicable for the PdtqPolicyNegotiation API.

### 5.31.5.3 Application Errors

The application errors defined for PdtqPolicyNegotiation API are listed in table 5.31.5.3-1.

**Table 5.31.5.3-1: Application errors**

| Application Error | HTTP status code | Description | Applicability |
|-------------------|------------------|-------------|---------------|
|                   |                  |             |               |

## 5.32 MemberUESelectionAssistance API

### 5.32.1 Introduction

The Nnef\_MemberUESelectionAssistance service shall use the MemberUESelectionAssistance API.

The API URI of MemberUESelectionAssistance API shall be:

**{apiRoot}/<apiName>/<apiVersion>**

The request URIs used in HTTP requests shall have the Resource URI structure defined in clause 5.2.4 of 3GPP TS 29.122 [2], i.e.:

**{apiRoot}/<apiName>/<apiVersion>/<apiSpecificSuffixes>**

with the following components:

- "apiRoot" is set as defined in clause 5.2.4 of 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-musa".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.
- The <apiSpecificSuffixes> shall be set as described in clause 5.2.4 of 3GPP TS 29.122 [4].

All resource URIs in the clauses below are defined relative to the above API URI.

### 5.32.2 Resources

#### 5.32.2.1 Overview

This clause describes the structure for the Resource URIs as shown in Figure 5.32.2.1-1 and the resources and HTTP methods used for the MemberUESelectionAssistance API.

Figure 5.32.2.1-1: Resource URI structure of the MemberUESelectionAssistance API

Table 5.32.2.1-1 provides an overview of the resources and applicable HTTP methods applicable for the MemberUESelectionAssistance API.

Table 5.32.2.1-1: Resources and methods overview

| Resource name                                          | Resource URI (relative path under API URI) | HTTP method or custom operation | Description (service operation)                                                         |
|--------------------------------------------------------|--------------------------------------------|---------------------------------|-----------------------------------------------------------------------------------------|
| Member UE Selection Assistance Subscriptions           | /{afld}/subscriptions                      | POST                            | Create a new Member UE Selection Assistance Subscription.                               |
|                                                        |                                            | GET                             | Retreive all the active Member UE Selection Assistance Subscription resources.          |
| Individual Member UE Selection Assistance Subscription | /{afld}/subscriptions/{subscriptionId}     | GET                             | Retreive an existing "Individual Member UE Selection Assistance Subscription" resource. |
|                                                        |                                            | PUT                             | Update an existing "Individual Member UE Selection Assistance Subscription" resource.   |
|                                                        |                                            | PATCH                           | Modify an existing "Individual Member UE Selection Assistance Subscription" resource.   |
|                                                        |                                            | DELETE                          | Delete an existing "Individual Member UE Selection Assistance Subscription" resource.   |

5.32.2.2 Resource: Member UE Selection Assistance Subscriptions

5.32.2.2.1 Introduction

This resource represents all the active Member UE Selection Assistance Subscriptions managed by the NEF for a given AF.

This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [3]).

#### 5.32.2.2.2 Resource definition

Resource URL: **{apiRoot}/3gpp-musa/<apiVersion>/{afId}/subscriptions**

This resource shall support the resource URL variables defined in table 5.32.2.2.2-1.

**Table 5.32.2.2.2-1: Resource URL variables for this resource**

| Name    | Data type | Definition                           |
|---------|-----------|--------------------------------------|
| apiRoot | string    | See clause 5.32.1.                   |
| afId    | string    | Represents the identifier of the AF. |

#### 5.32.2.2.3 Resource Standard Methods

##### 5.32.2.2.3.1 POST

The HTTP POST method enables to request the creation of a new Member UE Selection Assistance Subscription at the NEF.

This method shall support the URI query parameters specified in table 5.32.2.2.3.1-1.

**Table 5.32.2.2.3.1-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.32.2.2.3.1-2 and the response data structures and response codes specified in table 5.32.2.2.3.1-3.

**Table 5.32.2.2.3.1-2: Data structures supported by the POST request body on this resource**

| Data type              | P | Cardinality | Description                                                                                                      |
|------------------------|---|-------------|------------------------------------------------------------------------------------------------------------------|
| MemUeSelectAssistSubsc | M | 1           | Contains the parameters to request the creation of a new Member UE Selection Assistance Subscription at the NEF. |

**Table 5.32.2.2.3.1-3: Data structures supported by the POST response body on this resource**

| Data type                                                                                                                            | P | Cardinality | Response codes | Description                                                                                                                                                                                                                                 |
|--------------------------------------------------------------------------------------------------------------------------------------|---|-------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MemUeSelectAssistSubsc                                                                                                               | M | 1           | 201 Created    | Successful case. A representation of the created "Individual Member UE Selection Assistance Subscription" resource is returned in the response body.<br><br>The URI of the created resource shall be returned in an HTTP "Location" header. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                |                                                                                                                                                                                                                                             |

**Table 5.32.2.2.3.1-4: Headers supported by the 201 response code on this resource**

| HTTP response header | Data type | P | Cardinality | Description                                                                                                                                  |
|----------------------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Location             | string    | M | 1           | The URI of the newly created resource, according to the structure:<br>{apiRoot}/3gpp-musa/<apiVersion>/{afId}/subscriptions/{subscriptionId} |

## 5.32.2.2.3.2 GET

The HTTP GET method enables to retrieve all the active Member UE Selection Assistance Subscriptions managed by the NEF.

This method shall support the URI query parameters specified in table 5.32.2.2.3.2-1.

**Table 5.32.2.2.3.2-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.32.2.2.3.2-2 and the response data structures and response codes specified in table 5.32.2.2.3.2-3.

**Table 5.32.2.2.3.2-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.32.2.2.3.2-3-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                                             |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| array(MemUeSelectAssistSubsc)                                                                                                       | M | 0..N        | 200 OK                 | Successful case. All the "Individual Member UE Selection Assistance Subscription" resource(s) managed by the NEF are returned.<br><br>If there are no active "Individual Member UE Selection Assistance Subscription" resources at the NEF, an empty array is returned. |
| n/a                                                                                                                                 |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].                   |
| n/a                                                                                                                                 |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].                   |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                                         |

**Table 5.32.2.2.3.2-3-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.32.2.2.3.2-3-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.32.2.2.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

#### 5.32.2.3 Resource: Individual Member UE Selection Assistance Subscription

##### 5.32.2.3.1 Introduction

This resource represents an "Individual Member UE Selection Assistance Subscription" resource managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [3]).

##### 5.32.2.3.2 Resource Definition

Resource URL: **{apiRoot}/3gpp-musa/<apiVersion>/{afId}/subscriptions/{subscriptionId}**

This resource shall support the resource URI variables defined in table 5.32.2.3.2-1.

**Table 5.32.2.3.2-1: Resource URL variables for this resource**

| Name           | Data type | Definition                                                                                          |
|----------------|-----------|-----------------------------------------------------------------------------------------------------|
| apiRoot        | string    | See clause 5.32.1.                                                                                  |
| afId           | string    | Represents the identifier of the AF.                                                                |
| subscriptionId | string    | Represents the identifier of the "Individual Member UE Selection Assistance Subscription" resource. |

##### 5.32.2.3.3 Resource Standard Methods

###### 5.32.2.3.3.1 GET

The HTTP GET method enables to retrieve an existing "Individual Member UE Selection Assistance Subscription" resource at the NEF.

This method shall support the URI query parameters specified in table 5.32.2.3.3.1-1.

**Table 5.32.2.3.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.32.2.3.3.1-2 and the response data structures and response codes specified in table 5.32.2.3.3.1-3.

**Table 5.32.2.3.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.32.2.3.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type              | P | Cardinality | Response codes         | Description                                                                                                                                                      |
|------------------------|---|-------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MemUeSelectAssistSubsc | M | 1           | 200 OK                 | Successful case. The requested "Individual Member UE Selection Assistance Subscription" resource is returned in the response body.                               |
| n/a                    |   |             | 307 Temporary Redirect | Temporary redirection.<br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF. |

|                                                                                                                                     |  |  |                              |                                                                                                                                                                                                                                                       |
|-------------------------------------------------------------------------------------------------------------------------------------|--|--|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                     |  |  |                              | Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].                                                                                                                                                                             |
| n/a                                                                                                                                 |  |  | 308<br>Permanent<br>Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |  |  |                              |                                                                                                                                                                                                                                                       |

**Table 5.32.2.3.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.32.2.3.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |

| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**5.32.2.3.3.2 PUT**

The HTTP PUT method enables to request the update of an existing "Individual Member UE Selection Assistance Subscription" resource at the NEF.

This method shall support the URI query parameters specified in table 5.32.2.3.3.2-1.

**Table 5.32.2.3.3.2-1: URI query parameters supported by the PUT method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.32.2.3.3.2-2 and the response data structures and response codes specified in table 5.32.2.3.3.2-4.

**Table 5.32.2.3.3.2-2: Data structures supported by the PUT request body on this resource**

| Data type              | P | Cardinality | Description                                                                                            |
|------------------------|---|-------------|--------------------------------------------------------------------------------------------------------|
| MemUeSelectAssistSubsc | M | 1           | Contains the updated "Individual Member UE Selection Assistance Subscription" resource representation. |

**Table 5.32.2.3.3.2-3: Data structures supported by the PUT response body on this resource**

| Data type              | P | Cardinality | Response codes | Description                                                                                                                                                                                       |
|------------------------|---|-------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MemUeSelectAssistSubsc | M | 1           | 200 OK         | Successful response. The "Individual Member UE Selection Assistance Subscription" resource is successfully updated and a representation of the updated resource is returned in the response body. |
| n/a                    |   |             | 204 No Content | Successful response. The "Individual Member UE Selection Assistance Subscription" resource is successfully                                                                                        |

|                                                                                                                                     |  |  |                        |                                                                                                                                                                                                                                                       |

### 5.32.2.3.3.3 PATCH

This method enables to request the modification of an existing "Individual Member UE Selection Assistance Subscription" resource at the NEF.

This method shall support the URI query parameters specified in table 5.32.2.3.3.3-1.

**Table 5.32.2.3.3.3-1: URI query parameters supported by the PATCH method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.32.2.3.3.3-2 and the response data structures and response codes specified in table 5.32.2.3.3.3-3.

**Table 5.32.2.3.3.3-2: Data structures supported by the PATCH Request Body on this resource**

| Data type                    | P | Cardinality | Description                                                                                                    |
|------------------------------|---|-------------|----------------------------------------------------------------------------------------------------------------|
| MemUeSelectAssistSubsc Patch | M | 1           | Contains the requested modifications to the "Individual Member UE Selection Assistance Subscription" resource. |

**Table 5.32.2.3.3.3-3: Data structures supported by the PATCH Response Body on this resource**

#### 5.32.2.3.3.4 DELETE

The HTTP DELETE method enables to request the deletion of an existing "Individual Member UE Selection Assistance Subscription" resource at the NEF.

This method shall support the URI query parameters specified in table 5.32.2.3.3.4-1.

**Table 5.32.2.3.3.4-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.32.2.3.3.4-2 and the response data structures and response codes specified in table 5.32.2.3.3.4-3.

**Table 5.32.2.3.3.4-2: Data structures supported by the DELETE request body on this resource**

| Data type | P | Cardinality | Description |

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.32.2.3.3.4-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.32.2.3.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.32.3 Custom Operations without associated resources

There are no custom operations without associated resources defined for this API in this release of the specification.

## 5.32.4 Notifications

### 5.32.4.1 General

Notifications shall comply to clause 5.2.5 of 3GPP TS 29.122 [4].

**Table 5.32.4.1-1: Notifications overview**

| Notification                                | Callback URI | HTTP method or custom operation | Description (service operation)                                                        |
|---------------------------------------------|--------------|---------------------------------|----------------------------------------------------------------------------------------|
| Member UE Selection Assistance Notification | {notifUri}   | POST                            | Enable the NEF to notify a previously subscribed AF on Member UE Selection Assistance. |

## 5.32.4.2 Member UE Selection Assistance Notification

### 5.32.4.2.1 Description

The Member UE Selection Assistance Notification is used by the NEF to report Member UE Selection Assistance related event(s) to a previously subscribed AF.

### 5.32.4.2.2 Target URI

The Callback URI "{notifUri}" shall be used with the callback URI variables defined in table 5.32.4.2.2-1.

**Table 5.32.4.2.2-1: Callback URI variables**

| Name     | Definition                                                          |
|----------|---------------------------------------------------------------------|
| notifUri | Represents the callback URI encoded as a string formatted as a URI. |

### 5.32.4.2.3 Operation Definition

This method shall support the request data structures specified in table 5.32.4.2.3-1 and the response data structures and response codes specified in table 5.32.4.2.3-2.

**Table 5.32.4.2.3-1: Data structures supported by the POST Request Body on this resource**

| Data type                     | P | Cardinality | Description                                                 |
|-------------------------------|---|-------------|-------------------------------------------------------------|
| array(MemUeSel etAssistNotif) | M | 1..N        | Represents the Member UE Selection Assistance Notification. |

**Table 5.32.4.2.3-2: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                            | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a                                                                                                                                  |   |             | 204 No Content         | Successful case. The notification is successfully received and acknowledged.                                                                                                                                                                                                                   |
| n/a                                                                                                                                  |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF towards which the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                  |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF towards which the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                                                                |

**Table 5.32.4.2.3-3: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                      |
|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

**Table 5.32.4.2.3-4: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                      |
|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

## 5.32.5 Data Model

### 5.32.5.1 General

This clause specifies the application data model supported by the MemberUESelectionAssistance API. Table 5.32.5.1-1 specifies the data types defined for the MemberUESelectionAssistance API.

**Table 5.32.5.1-1: MemberUESelectionAssistance API specific Data Types**

| Data type                   | Clause defined | Description                                                                                                 |
|-----------------------------|----------------|-------------------------------------------------------------------------------------------------------------|
| AccessRatTypeFilterCriteria | 5.32.5.2.5     | Represents the Access types and Rat types filtering criteria for Member UE selection.                       |
| CandUeInfo                  | 5.32.5.2.16    | Represents the candidate UE information.                                                                    |
| CandiUeListInfo             | 5.32.5.2.13    | Represents the lists of candidate UEs and recommended time window for performing the application operation. |
| DnnFilterCriteria           | 5.32.5.2.12    | Represents the DNN filtering criteria for Member UE selection.                                              |
| E2ETransTimeFilterCriteria  | 5.32.5.2.6     | Represents the End-to-end data volume transfer time filtering criteria for Member UE selection.             |
| FilterCriterionType         | 5.32.5.3.3     | Represents the filter criterion type.                                                                       |
| MemUeSeletAssistNotif       | 5.32.5.2.3     | Represents a Member UE Selection Assistance Notification.                                                   |
| MemUeSelectAssistSubsc      | 5.32.5.2.2     | Represents a Member UE Selection Assistance Subscription.                                                   |
| MemUeSelectAssistSubscPatch | 5.32.5.2.15    | Represents parameters to request the modification of a Member UE Selection Assistance Subscription.         |
| MemUeSeletReport            | 5.32.5.2.14    | Represents a Member UE selection report.                                                                    |
| UeDirectionFilterCriteria   | 5.32.5.2.9     | Represents the UE direction filtering criteria for Member UE selection.                                     |
| UeDistanceFilterCriteria    | 5.32.5.2.10    | Represents the UE distance filtering criteria for Member UE selection.                                      |
| UeHisLocFilterCriteria      | 5.32.5.2.8     | Represents the UE historical location filtering criteria for Member UE selection.                           |
| UeLocFilterCriteria         | 5.32.5.2.7     | Represents the UE location filtering criteria for Member UE selection.                                      |
| QoSFilterCriteria           | 5.32.5.2.4     | Represents the QoS filtering criteria for Member UE selection.                                              |
| ServiceExpFilterCriteria    | 5.32.5.2.11    | Represents the Service Experience filtering criteria for Member UE selection.                               |

Table 5.32.5.1-2 specifies data types re-used by the MemberUESelectionAssistance API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the MemberUESelectionAssistance API.

**Table 5.32.5.1-2: MemberUESelectionAssistance API re-used Data Types**

| Data type              | Reference           | Comments                                                             | Applicability |
|------------------------|---------------------|----------------------------------------------------------------------|---------------|
| AccessType             | 3GPP TS 29.571 [8]  | Represents the access type.                                          |               |
| AmfEventType           | 3GPP TS 29.518 [18] | Represents the events exposed by an AMF.                             |               |
| DataVolumeTransferTime | 3GPP TS 29.520 [27] | Represents the End-to-end data volume transfer time.                 |               |
| DateTime               | 3GPP TS 29.122 [4]  | Represents a date and a time.                                        |               |
| DurationSec            | 3GPP TS 29.122 [4]  | Represents the duration time in units of seconds.                    |               |
| DurationSecRm          | 3GPP TS 29.122 [4]  | Represents the time duration, same as the DurationSec data type, but |               |

|                       |                     |                                                                                                               |  |
|-----------------------|---------------------|---------------------------------------------------------------------------------------------------------------|--|
|                       |                     | with the OpenAPI "nullable: true" property.                                                                   |  |
| Direction             | 3GPP TS 29.520 [27] | Represents the UE direction.                                                                                  |  |
| Dnai                  | 3GPP TS 29.571 [8]  | Represents a user plane access to one or more DN(s).                                                          |  |
| Dnn                   | 3GPP TS 29.571 [8]  | Represents a DNN.                                                                                             |  |
| Gpsi                  | 3GPP TS 29.571 [8]  | Represents a GPSI.                                                                                            |  |
| GeoDistributionInfo   | 3GPP TS 29.520 [27] | Represents the geographical distribution of the UEs.                                                          |  |
| IpAddr                | 3GPP TS 29.571 [8]  | Represents an IP address.                                                                                     |  |
| LocationArea5G        | 3GPP TS 29.122 [4]  | Represents a user location area when the UE is attached to 5G.                                                |  |
| NwdafEvent            | 3GPP TS 29.520 [27] | Represents the events exposed by an NWDAF.                                                                    |  |
| RatType               | 3GPP TS 29.571 [8]  | Represents the RAT types.                                                                                     |  |
| ServiceExperienceType | 3GPP TS 29.520 [27] | Represents the type of Service Experience Analytics.                                                          |  |
| SmfEvent              | 3GPP TS 29.508 [26] | Represents the events exposed by an SMF.                                                                      |  |
| Snssai                | 3GPP TS 29.571 [8]  | Represents an S-NSSAI.                                                                                        |  |
| SupportedFeatures     | 3GPP TS 29.571 [8]  | Represents the list of supported feature(s) and used to negotiate the applicability of the optional features. |  |
| TimeWindow            | 3GPP TS 29.122 [4]  | Represents a time window.                                                                                     |  |
| UInteger              | 3GPP TS 29.571 [8]  | Represents an unsigned integer.                                                                               |  |
| Uri                   | 3GPP TS 29.122 [4]  | Represents a URI.                                                                                             |  |

### 5.32.5.2 Structured data types

#### 5.32.5.2.1 Introduction

This clause defines the structured data types to be used in resource representations.

#### 5.32.5.2.2 Type: MemUeSelectAssistSubsc

**Table 5.32.5.2.2-1: Definition of type MemUeSelectAssistSubsc**

| Attribute name | Data type                | P | Cardinality | Description                                                                                                                    | Applicability |
|----------------|--------------------------|---|-------------|--------------------------------------------------------------------------------------------------------------------------------|---------------|
| afld           | string                   | O | 0..1        | Contains the identifier of the AF.                                                                                             |               |
| tgtUelds       | array(Gpsi)              | C | 1..N        | Identifies the list of identifier(s) of the UE(s) for which Member UE Selection Assistance Reporting is requested.<br>(NOTE 2) |               |
| tgtUelps       | array(IpAddr)            | C | 1..N        | Contains the IP address(es) of the UE(s) for which Member UE Selection Assistance Reporting is requested.<br>(NOTE 2)          |               |
| notifUri       | Uri                      | M | 1           | Contains the URI via which Member UE Selection Assistance notifications shall be delivered.                                    |               |

## 5.32.5.2.3 Type: MemUeSeletAssistNotif

**Table 5.32.5.2.3-1: Definition of type MemUeSeletAssistNotif**

| Attribute name  | Data type               | P | Cardinality | Description                                                     | Applicability |
|-----------------|-------------------------|---|-------------|-----------------------------------------------------------------|---------------|
| notifId         | string                  | M | 1           | Contains the Notification Correlation ID.                       |               |
| candiUeInfos    | array(CandiUeListInfo)  | M | 1..N        | Contains the list of candidate UEs and the related information. |               |
| memUeSelectRpts | array(MemUeSeletReport) | O | 1..N        | Contains the Member UE Selection report(s).                     |               |

## 5.32.5.2.4 Type: QoSFilterCriteria

**Table 5.32.5.2.4-1: Definition of type QoSFilterCriteria**

| Attribute name | Data type | P | Cardinality | Description                                                                                                                                            | Applicability |
|----------------|-----------|---|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| event          | SmfEvent  | O | 0..1        | Contains the SMF event which may be used to retrieve the QoS monitoring information.<br><br>The only applicable value for this attribute is "QOS_MON". |               |
| applId         | string    | O | 0..1        | Contains the identifier of the targeted application.                                                                                                   |               |
| dnn            | Dnn       | O | 0..1        | Contains the DNN, a full DNN with both the Network Identifier and Operator Identifier, or a DNN with the Network Identifier only.                      |               |
| snssai         | Snssai    | O | 0..1        | Contains the network slice information.                                                                                                                |               |
| ulDelay        | UInteger  | O | 0..1        | Contains the uplink packet delay in units of milliseconds.                                                                                             |               |
| dlDelay        | UInteger  | O | 0..1        | Contains the downlink packet delay in units of milliseconds.                                                                                           |               |
| rtDelay        | UInteger  | O | 0..1        | Contains the round trip delay in units of milliseconds.                                                                                                |               |

## 5.32.5.2.5 Type: AccessRatTypeFilterCriteria

**Table 5.32.5.2.5-1: Definition of type AccessRatTypeFilterCriteria**

| Attribute name | Data type         | P | Cardinality | Description                                                                                                                                                                                                              | Applicability |
|----------------|-------------------|---|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| events         | array(SmfEvent)   | O | 1..N        | Contains the SMF event(s) which may be used to retrieve the Access Type and/or RAT Type of the selected UE.<br><br>The only applicable values within each array element of this attribute are "AC_TY_CH" or "RAT_TY_CH". |               |
| dnn            | Dnn               | O | 0..1        | Contains a DNN, a full DNN with both the Network Identifier and Operator Identifier, or a DNN with the Network Identifier only.                                                                                          |               |
| snssai         | Snssai            | O | 0..1        | Contains the network slice information.                                                                                                                                                                                  |               |
| accTypes       | array(AccessType) | O | 1..N        | Contains the Access Type of the selected UE.                                                                                                                                                                             |               |

|          |                |   |      |                                              |  |
|----------|----------------|---|------|----------------------------------------------|--|
| ratTypes | array(RatType) | O | 1..N | Contains the RAT Type(s) of the selected UE. |  |
|----------|----------------|---|------|----------------------------------------------|--|

#### 5.32.5.2.6 Type: E2ETransTimeFilterCriteria

**Table 5.32.5.2.6-1: Definition of type E2ETransTimeFilterCriteria**

| Attribute name   | Data type                  | P | Cardinality | Description                                                                                                                                                                        | Applicability |
|------------------|----------------------------|---|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| event            | NwdafEvent                 | O | 0..1        | Contains the NWDAF event which may be used to retrieve the End-to-end data volume transfer time.<br><br>The only applicable value for this attribute is "E2E_DATA_VOL_TRANS_TIME". |               |
| appld            | string                     | O | 0..1        | Contains the identifier of the targeted application.                                                                                                                               |               |
| dnn              | Dnn                        | O | 0..1        | Contains the DNN, a full DNN with both the Network Identifier and Operator Identifier, or a DNN with the Network Identifier only.                                                  |               |
| snssai           | Snssai                     | O | 0..1        | Contains the network slice information.                                                                                                                                            |               |
| dataVolTransTime | DataVolumeTransferTime     | O | 0..1        | Contains the E2E data volume transfer time and the data volume used to derive the transfer time.                                                                                   |               |
| geoDistrInfos    | array(GeoDistributionInfo) | O | 1..N        | Contains the request for geographical distribution of UEs.                                                                                                                         |               |
| locationArea     | LocationArea5G             | O | 0..1        | Contains the location area of the candidate UEs.                                                                                                                                   |               |
| numDataTrans     | UInteger                   | O | 0..1        | Contains the target number of data transmission repetitions.                                                                                                                       |               |
| timeInterval     | DurationSec                | O | 0..1        | Contains the target time interval (in units of seconds) between data transmissions.                                                                                                |               |

#### 5.32.5.2.7 Type: UeLocFilterCriteria

**Table 5.32.5.2.7-1: Definition of type UeLocFilterCriteria**

| Attribute name | Data type      | P | Cardinality | Description                                                                                                                                     | Applicability |
|----------------|----------------|---|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| event          | AmfEventType   | O | 0..1        | Contains the AMF event which may be used to retrieve the UE location.<br><br>The only applicable value for this attribute is "LOCATION_REPORT". |               |
| loc            | LocationArea5G | O | 0..1        | Contains the location area within which the selected UE is currently located.                                                                   |               |

## 5.32.5.2.8 Type: UeHisLocFilterCriteria

**Table 5.32.5.2.8-1: Definition of type UeHisLocFilterCriteria**

| Attribute name | Data type      | P | Cardinality | Description                                                                                                                                   | Applicability |
|----------------|----------------|---|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| event          | NwdafEvent     | O | 0..1        | Contains the NWDAF event which may be used to retrieve the UE Mobility.<br><br>The only applicable value for this attribute is "UE_MOBILITY". |               |
| loc            | LocationArea5G | O | 0..1        | Contains the historical location of the UEs.                                                                                                  |               |

## 5.32.5.2.9 Type: UeDirectionFilterCriteria

**Table 5.32.5.2.9-1: Definition of type UeDirectionFilterCriteria**

| Attribute name | Data type        | P | Cardinality | Description                                                                                                                                   | Applicability |
|----------------|------------------|---|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| event          | NwdafEvent       | O | 0..1        | Contains the NWDAF event which may be used to retrieve the UE Mobility.<br><br>The only applicable value for this attribute is "UE_MOBILITY". |               |
| directions     | array(Direction) | O | 1..N        | Contains the moving directions of the UEs.                                                                                                    |               |

## 5.32.5.2.10 Type: UeDistanceFilterCriteria

**Table 5.32.5.2.10-1: Definition of type UeDistanceFilterCriteria**

| Attribute name | Data type  | P | Cardinality | Description                                                                                                                                                 | Applicability |
|----------------|------------|---|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| event          | NwdafEvent | O | 0..1        | Contains the NWDAF event which may be used to retrieve the Relative Proximity.<br><br>The only applicable value for this attribute is "RELATIVE_PROXIMITY". |               |
| distance       | UInteger   | O | 0..1        | Contains the minimum UE to UE separating distance of the selected UEs.                                                                                      |               |

## 5.32.5.2.11 Type: ServiceExpFilterCriteria

**Table 5.32.5.2.11-1: Definition of type ServiceExpFilterCriteria**

| Attribute name | Data type  | P | Cardinality | Description                                                                                                                                                 | Applicability |
|----------------|------------|---|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| event          | NwdafEvent | O | 0..1        | Contains the NWDAF event which may be used to retrieve the Service Experience.<br><br>The only applicable value for this attribute is "SERVICE_EXPERIENCE". |               |
| snssai         | Snssai     | O | 0..1        | Contains the network slice information.                                                                                                                     |               |

|                  |                              |   |      |                                                                                                                                   |  |
|------------------|------------------------------|---|------|-----------------------------------------------------------------------------------------------------------------------------------|--|
| dnn              | Dnn                          | O | 0..1 | Contains the DNN, a full DNN with both the Network Identifier and Operator Identifier, or a DNN with the Network Identifier only. |  |
| appld            | string                       | O | 0..1 | Contains the identifier of the targeted application.                                                                              |  |
| dnai             | Dnai                         | O | 0..1 | Contains the DNAI indicating the user plane access to DN to which the subscription applies.                                       |  |
| loc              | LocationArea5G               | O | 0..1 | Contains the area of interest.                                                                                                    |  |
| contribWeightThr | UInteger                     | O | 0..1 | Contains the Service Experience Contribution weight reporting threshold.                                                          |  |
| expTypes         | array(ServiceExperienceType) | O | 1..N | Contains the Service Experience Type.                                                                                             |  |

## 5.32.5.2.12 Type: DnnFilterCriteria

Table 5.32.5.2.12-1: Definition of type DnnFilterCriteria

| Attribute name | Data type | P | Cardinality | Description                                                                                                                       | Applicability |
|----------------|-----------|---|-------------|-----------------------------------------------------------------------------------------------------------------------------------|---------------|
| event          | SmfEvent  | O | 0..1        | Contains the SMF event which may be used to retrieve the DNN.<br><br>The only applicable value for this attribute is "QFI_ALLOC". |               |
| dnn            | Dnn       | O | 0..1        | Contains the DNN of the selected UE for the PDU Session used by the application.                                                  |               |

## 5.32.5.2.13 Type: CandiUeListInfo

Table 5.32.5.2.13-1: Definition of type CandiUeListInfo

| Attribute name | Data type         | P | Cardinality | Description                                                                                                                                                                                                                                                                                  | Applicability |
|----------------|-------------------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| candUeInfos    | array(CandUeInfo) | M | 1..N        | Contains the list of the identifier(s) of the candidate UE(s).                                                                                                                                                                                                                               |               |
| remdTimeWin    | TimeWindow        | O | 0..1        | Contains the recommended time window for performing the application operation.<br><br>It shall be a subset of the time window specified by "timeWin" attribute of the MemUeSelectAssistSubsc or MemUeSelectAssistSubscPatch data types representing the corresponding subscription resource. |               |

## 5.32.5.2.14 Type: MemUeSeletReport

Table 5.32.5.2.14-1: Definition of type MemUeSeletReport

| Attribute name | Data type           | P | Cardinality | Description                         | Applicability |
|----------------|---------------------|---|-------------|-------------------------------------|---------------|
| criterionType  | FilterCriterionType | M | 1           | Contains the filter criterion type. |               |

|                 |          |   |   |                                                                   |  |
|-----------------|----------|---|---|-------------------------------------------------------------------|--|
| numForCriterion | UInteger | M | 1 | Contains the number of UEs that do not meet the filter criterion. |  |
|-----------------|----------|---|---|-------------------------------------------------------------------|--|

#### 5.32.5.2.15 Type: MemUeSelectAssistSubscPatch

**Table 5.32.5.2.15-1: Definition of type MemUeSelectAssistSubscPatch**

| Attribute name      | Data type                          | P | Cardinality | Description                                                                                           | Applicability |
|---------------------|------------------------------------|---|-------------|-------------------------------------------------------------------------------------------------------|---------------|
| notifUri            | Uri                                | O | 0..1        | Contains the updated URI via which Member UE Selection Assistance notifications shall be delivered.   |               |
| notifId             | string                             | O | 0..1        | Contains the updated Notification Correlation ID assigned by the AF.                                  |               |
| qosFilters          | array(QoSFilterCriteria)           | O | 1..N        | Contains the updated QoS filtering criteria for Member UE selection.                                  |               |
| accRatTypeFilters   | array(AccessRatTypeFilterCriteria) | O | 1..N        | Contains the updated Access types and Rat types filtering criteria for Member UE selection.           |               |
| e2eTransTimeFilters | array(E2ETransTimeFilterCriteria)  | O | 1..N        | Contains the updated End-to-end data volume transfer time filtering criteria for Member UE selection. |               |
| ueLocFilters        | array(UeLocFilterCriteria)         | O | 1..N        | Contains the updated UE location filtering criteria for Member UE selection.                          |               |
| ueHisLocFilters     | array(UeHisLocFilterCriteria)      | O | 1..N        | Contains the updated UE historical location filtering criteria for Member UE selection.               |               |
| ueDirFilters        | array(UeDirectionFilterCriteria)   | O | 1..N        | Contains the updated UE direction filtering criteria for Member UE selection.                         |               |
| ueDistanceFilters   | array(UeDistanceFilterCriteria)    | O | 1..N        | Contains the updated UE distance filtering criteria for Member UE selection.                          |               |
| serviceExpFilters   | array(ServiceExpFilterCriteria)    | O | 1..N        | Contains the updated Service Experience filtering criteria for Member UE selection.                   |               |
| dnnFilters          | array(DnnFilterCriteria)           | O | 1..N        | Contains the updated DNN filtering criteria for Member UE selection.                                  |               |
| expTime             | DateTime                           | O | 0..1        | Contains the updated expiry time of the subscription.                                                 |               |
| memUpdatePeriod     | DurationSecRm                      | O | 0..1        | Contains the updated periodicity information for updating the member UEs.                             |               |
| maxUeNum            | UIntegerRm                         | O | 0..1        | Contains the updated maximum number of candidate UEs.                                                 |               |
| timeWin             | TimeWindow                         | O | 0..1        | Contains the updated the start time and end time for selecting the candidate UEs.                     |               |

#### 5.32.5.2.16 Type: CandUeInfo

**Table 5.32.5.2.16-1: Definition of type CandUeInfo**

| Attribute name | Data type | P | Cardinality | Description | Applicability |

### 5.32.5.3 Simple data types and enumerations

#### 5.32.5.3.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

#### 5.32.5.3.2 Simple data types

The simple data types defined in table 5.32.5.3.2-1 shall be supported.

**Table 5.32.5.3.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

#### 5.32.5.3.3 Enumeration: FilterCriterionType

The enumeration FilterCriterionType represents the type of filter criterion event for which the AF requests to be notified. It shall comply with the provisions defined in table 5.32.5.3.3-1.

**Table 5.32.5.3.3-1: Enumeration FilterCriterionType**

| Enumeration value             | Description                                                                                    |
|-------------------------------|------------------------------------------------------------------------------------------------|
| QOS                           | Indicates that the type of filter criterion is QoS criterion.                                  |
| ACCESS_RAT_TYPE               | Indicates that the type of filter criterion is Access and Rat types criterion.                 |
| E2E_DATA_VOLUME_TRANSFER_TIME | Indicates that the type of filter criterion is End-to-end data volume transfer time criterion. |
| UE_LOCATION                   | Indicates that the type of filter criterion is UE location criterion.                          |
| UE_HISTORICAL_LOCATION        | Indicates that the type of filter criterion is UE historical location criterion.               |
| UE_DIRECTION                  | Indicates that the type of filter criterion is UE direction criterion.                         |
| UE_DISTANCE                   | Indicates that the type of filter criterion is UE distance criterion.                          |
| SERVICE_EXPERIENCE            | Indicates that the type of filter criterion is Service Experience criterion.                   |
| DNN                           | Indicates that the type of filter criterion is DNN criterion.                                  |

#### 5.32.5.4 Data types describing alternative data types or combinations of data types

There are no data types describing alternative data types or combinations of data types defined for this API in this release of the specification.

#### 5.32.6 Used Features

The optional features listed in table 5.32.6-1 are defined for the MemberUESelectionAssistance API. They shall be negotiated using the extensibility mechanism defined in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.32.6-1: Features used by MemberUESelectionAssistance API**

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|
|                |              |             |

#### 5.32.7 Error handling

##### 5.32.7.1 General

For the MemberUESelectionAssistance API, HTTP error responses shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4]. Protocol errors and application errors specified in clause 5.2.6 of 3GPP TS 29.122 [4] shall be supported for the HTTP status codes specified in table 5.2.6-1 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses are applicable for the MemberUESelectionAssistance API.

##### 5.32.7.2 Protocol Errors

In this Release of the specification, there are no additional protocol errors applicable for the MemberUESelectionAssistance API.

##### 5.32.7.3 Application Errors

The application errors defined for the MemberUESelectionAssistance API are listed in table 5.32.7.3-1.

**Table 5.32.7.3-1: Application errors**

| Application Error | HTTP status code | Description | Applicability |
|-------------------|------------------|-------------|---------------|
|                   |                  |             |               |

# 5.33 GroupParametersProvisioning API

## 5.33.1 Introduction

The Nnef\_ParameterProvision service shall use the GroupParametersProvisioning API for:

- DNN and S-NSSAI specific Group Parameters provisioning.

The API URI of the GroupParametersProvisioning API shall be:

**{apiRoot}/<apiName>/<apiVersion>**

The request URIs used in HTTP requests shall have the Resource URI structure defined in clause 5.2.4 of 3GPP TS 29.122 [4], i.e.:

**{apiRoot}/<apiName>/<apiVersion>/<apiSpecificSuffixes>**

with the following components:

- "apiRoot" is set as defined in clause 5.2.4 of 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-grp-pp".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.
- The <apiSpecificSuffixes> shall be set as described in clause 5.2.4 of 3GPP TS 29.122 [4].

All resource URIs in the clauses below are defined relative to the above API URI.

## 5.33.2 Resources

### 5.33.2.1 Overview

This clause describes the structure for the Resource URIs as shown in figure 5.33.2.1-1 and the resources and HTTP methods used for the GroupParametersProvisioning API.

**Figure 5.33.2.1-1: Resource URI structure of the GroupParametersProvisioning API**

Table 5.33.2.1-1 provides an overview of the resources and applicable HTTP methods.

**Table 5.33.2.1-1: Resources and methods overview**

| Resource name                  | Resource URI (relative path under API URI) | HTTP method or custom operation | Description (service operation)          |
|--------------------------------|--------------------------------------------|---------------------------------|------------------------------------------|
| Group Parameters Provisionings | /pp                                        | GET                             | Retrieve all the active Group Parameters |

|                                          |            |        |                                                                                     |
|------------------------------------------|------------|--------|-------------------------------------------------------------------------------------|
| Individual Group Parameters Provisioning | /pp/{ppId} |        | Provisionings managed by the NEF.                                                   |
|                                          |            | POST   | Request the creation of a new Group Parameters Provisioning at the NEF.             |
|                                          |            | GET    | Retrieve an existing "Individual Group Parameters Provisioning" managed by the NEF. |
|                                          |            | PUT    | Update an existing "Individual Group Parameters Provisioning" managed by the NEF.   |
|                                          |            | DELETE | Delete an existing "Individual Group Parameters Provisioning" managed by the NEF.   |

### 5.33.2.2 Resource: Group Parameters Provisionings

#### 5.33.2.2.1 Introduction

This resource represents the collection of Group Parameters Provisionings managed by the NEF.

This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [32]).

#### 5.33.2.2.2 Resource Definition

Resource URI: {apiRoot}/3gpp-grp-pp/<apiVersion>/pp

This resource shall support the resource URI variables defined in table 5.33.2.2.2-1.

**Table 5.33.2.2.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition         |
|---------|-----------|--------------------|
| apiRoot | string    | See clause 5.33.1. |

#### 5.33.2.2.3 Resource Methods

##### 5.33.2.2.3.1 GET

This method enables an AF to request to retrieve all the active "Group Parameters Provisionings" resources managed by the NEF.

This method shall support the URI query parameters specified in table 5.33.2.2.3.1-1.

**Table 5.33.2.2.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.33.2.2.3.1-2 and the response data structures and response codes specified in table 5.33.2.2.3.1-3.

**Table 5.33.2.2.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.33.2.2.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| array(GrpPpData)                                                                                                                    | M | 0..N        | 200 OK                 | Successful case. All the "Individual Group Parameters Provisioning" resources managed by the NEF are returned.<br><br>If there are no existing "Individual Group Parameters Provisioning" resources managed at the NEF, an empty array is returned.   |
| n/a                                                                                                                                 |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                 |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.33.2.2.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.33.2.2.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

### 5.33.2.2.3.2 POST

This method enables an AF to request the creation of a new Group Parameters Provisioning at the NEF.

This method shall support the URI query parameters specified in table 5.33.2.2.3.2-1.

**Table 5.33.2.2.3.2-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.33.2.2.3.2-2 and the response data structures and response codes specified in table 5.33.2.2.3.2-3.

**Table 5.33.2.2.3.2-2: Data structures supported by the POST Request Body on this resource**

| Data type | P | Cardinality | Description                                                                                |
|-----------|---|-------------|--------------------------------------------------------------------------------------------|
| GrpPpData | M | 1           | Contains the representation of the Group Parameters Provisioning to be created at the NEF. |

**Table 5.33.2.2.3.2-3: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                            | P | Cardinality | Response codes | Description                                                                                                                                                                                                                   |
|--------------------------------------------------------------------------------------------------------------------------------------|---|-------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GrpPpData                                                                                                                            | M | 1           | 201 Created    | Successful case. A representation of the created "Individual Group Parameters Provisioning" resource is returned in the response body.<br><br>The URI of the created resource shall be returned in an HTTP "Location" header. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                |                                                                                                                                                                                                                               |

**Table 5.33.2.2.3.2-4: Headers supported by the 201 response code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                 |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains the URI of the newly created resource, according to the structure:<br>{apiRoot}/3gpp-grp-pp/<apiVersion>/pp/{ppId} |

#### 5.33.2.2.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.33.2.3 Resource: Individual Group Parameters Provisioning

#### 5.33.2.3.1 Introduction

This resource represents an "Individual Group Parameters Provisioning" resource managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [32]).

#### 5.33.2.3.2 Resource Definition

Resource URI: {apiRoot}/3gpp-grp-pp/<apiVersion>/pp/{ppId}

This resource shall support the resource URI variables defined in table 5.33.2.3.2-1.

**Table 5.33.2.3.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition                                                                            |
|---------|-----------|---------------------------------------------------------------------------------------|
| apiRoot | string    | See clause 5.33.1.                                                                    |
| ppId    | string    | Represents the identifier of the "Individual Group Parameters Provisioning" resource. |

#### 5.33.2.3.3 Resource Methods

##### 5.33.2.3.3.1 GET

This method enables an AF to request to retrieve an existing "Individual Group Parameters Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.33.2.3.3.1-1.

**Table 5.33.2.3.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.33.2.3.3.1-2 and the response data structures and response codes specified in table 5.33.2.3.3.1-3.

**Table 5.33.2.3.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.33.2.3.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GrpPpData                                                                                                                           | M | 1           | 200 OK                 | Successful case. The requested "Individual Group Parameters Provisioning" resource is returned in the response body.                                                                                                                                  |
| n/a                                                                                                                                 |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                 |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.33.2.3.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.33.2.3.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.33.2.3.3.2 PUT

This method enables an AF to request the update of an existing "Individual Group Parameters Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.33.2.3.3.2-1.

**Table 5.33.2.3.3.2-1: URI query parameters supported by the PUT method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.33.2.3.3.2-2 and the response data structures and response codes specified in table 5.33.2.3.3.2-3.

**Table 5.33.2.3.3.2-2: Data structures supported by the PUT Request Body on this resource**

| Data type | P | Cardinality | Description                                                                                |
|-----------|---|-------------|--------------------------------------------------------------------------------------------|
| GrpPpData | M | 1           | Represents the updated "Individual Group Parameters Provisioning" resource representation. |

**Table 5.33.2.3.3.2-3: Data structures supported by the PUT Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GrpPpData                                                                                                                           | M | 1           | 200 OK                 | Successful response. The "Individual Group Parameters Provisioning" resource is successfully updated and a representation of the updated resource is returned in the response body.                                                                   |
| n/a                                                                                                                                 |   |             | 204 No Content         | Successful response. The "Individual Group Parameters Provisioning" resource is successfully updated and no content is returned in the response body.                                                                                                 |
| n/a                                                                                                                                 |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                 |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP PUT method listed in Table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

### 5.33.2.3.3.3 PATCH

This method enables an AF to request the modification of an existing "Individual Group Parameters Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.33.2.3.3.3-1.

**Table 5.33.2.3.3.3-1: URI query parameters supported by the PATCH method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.33.2.3.3.3-2 and the response data structures and response codes specified in table 5.33.2.3.3.3-3.

**Table 5.33.2.3.3.3-2: Data structures supported by the PATCH Request Body on this resource**

| Data type      | P | Cardinality | Description                                                                                        |
|----------------|---|-------------|----------------------------------------------------------------------------------------------------|
| GrpPpDataPatch | M | 1           | Represents the requested modifications to the "Individual Group Parameters Provisioning" resource. |

**Table 5.33.2.3.3.3-3: Data structures supported by the PATCH Response Body on this resource**

| Data type                                                                                                                             | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|---------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GrpPpData                                                                                                                             | M | 1           | 200 OK                 | Successful response. The "Individual Group Parameters Provisioning" resource is successfully modified and a representation of the updated resource is returned in the response body.                                                                  |
| n/a                                                                                                                                   |   |             | 204 No Content         | Successful response. The "Individual Group Parameters Provisioning" resource is successfully modified and no content is returned in the response body.                                                                                                |
| n/a                                                                                                                                   |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                   |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP PATCH method listed in Table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.33.2.3.3.3-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

## 5.33.2.3.3.4 DELETE

This method enables an AF to request the deletion of an existing "Individual Group Parameters Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.33.2.3.3.4-1.

**Table 5.33.2.3.3.4-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.33.2.3.3.4-2 and the response data structures and response codes specified in table 5.33.2.3.3.4-3.

**Table 5.33.2.3.3.4-2: Data structures supported by the DELETE Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.33.2.3.3.4-3: Data structures supported by the DELETE Response Body on this resource**

| Data type                                                                                                                              | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|----------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a                                                                                                                                    |   |             | 204 No Content         | Successful case. The "Individual Group Parameters Provisioning" resource is successfully deleted.                                                                                                                                                     |
| n/a                                                                                                                                    |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |

| NOTE: The mandatory HTTP error status codes for the HTTP DELETE method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.33.2.3.3.4-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.33.2.3.3.4-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

## 5.33.2.3.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.33.3 Custom Operations without associated resources

There are no custom operations without associated resources defined for this API in this release of the specification.

### 5.33.4 Notifications

There are no notifications defined for this API in this release of the specification.

### 5.33.5 Data Model

#### 5.33.5.1 General

This clause specifies the application data model supported by the GroupParametersProvisioning API. Table 5.33.5.1-1 specifies the data types defined for the GroupParametersProvisioning API.

**Table 5.33.5.1-1: GroupParametersProvisioning API specific Data Types**

| Data type        | Clause defined | Description                                                                              | Applicability |
|------------------|----------------|------------------------------------------------------------------------------------------|---------------|
| AfReqDefaultQoS  | 5.33.5.2.5     | Represents the AF requested default QoS.                                                 |               |
| DnnSnssaiGrpData | 5.33.5.2.4     | Represents DNN and S-NSSAI specific Group Parameters data.                               |               |
| GrpPpData        | 5.33.5.2.2     | Represents Group Parameters Provisioning data.                                           |               |
| GrpPpDataPatch   | 5.33.5.2.3     | Represents the requested modification to an existing Group Parameters Provisioning data. |               |
| LadnServArea     | 5.33.5.2.6     | Represents an LADN Service Area.                                                         |               |

Table 5.33.5.1-2 specifies data types re-used by the GroupParametersProvisioning API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the GroupParametersProvisioning API.

**Table 5.33.5.1-2: GroupParametersProvisioning API re-used Data Types**

| Data type              | Reference           | Comments                                                                                                            | Applicability |
|------------------------|---------------------|---------------------------------------------------------------------------------------------------------------------|---------------|
| 5Qi                    | 3GPP TS 29.571 [8]  | Represents a 5G QoS Identifier.                                                                                     |               |
| 5QIPriorityLevelRm     | 3GPP TS 29.571 [8]  | Represents the 5QI Priority Level.                                                                                  |               |
| Arp                    | 3GPP TS 29.571 [8]  | Represents an ARP.                                                                                                  |               |
| BitRate                | 3GPP TS 29.571 [8]  | Represents a bit rate.                                                                                              |               |
| BitRateRm              | 3GPP TS 29.571 [8]  | This data type is defined in the same way as the BitRate data type, but with the OpenAPI "nullable: true" property. |               |
| CivicAddress           | 3GPP TS 29.572 [34] | Represents a civic address.                                                                                         |               |
| Dnn                    | 3GPP TS 29.571 [8]  | Represents a DNN.                                                                                                   |               |
| ExternalGroupId        | 3GPP TS 29.122 [4]  | Represents the External Group Identifier for a user group.                                                          |               |
| GeographicArea         | 3GPP TS 29.572 [34] | Represents a geographical area.                                                                                     |               |
| MtcProviderInformation | 3GPP TS 29.571 [8]  | Represents the MTC provider information.                                                                            |               |
| Snssai                 | 3GPP TS 29.571 [8]  | Represents an S-NSSAI.                                                                                              |               |
| SupportedFeatures      | 3GPP TS 29.571 [8]  | Represents the list of supported feature(s) and used to negotiate the applicability of the optional features.       |               |
| Tai                    | 3GPP TS 29.571 [8]  | Represents a Tracking Area Identifier.                                                                              |               |

#### 5.33.5.2 Structured data types

##### 5.33.5.2.1 Introduction

This clause defines the structures to be used in resource representations.

## 5.33.5.2.2 Type: GrpPpData

Table 5.33.5.2.2-1: Definition of type GrpPpData

| Attribute name   | Data type              | P | Cardinality | Description                                                                                                                                                                                                  | Applicability |
|------------------|------------------------|---|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| afId             | string                 | M | 1           | Contains the identifier of the AF that is sending the request.                                                                                                                                               |               |
| mtcProviderId    | MtcProviderInformation | O | 0..1        | Contains the identifier of the MTC Service Provider and/or MTC Application.                                                                                                                                  |               |
| dnnSnssaiGrpData | DnnSnssaiGrpData       | C | 0..1        | Contains the DNN and S-NSSAI specific Group data that the AF requests to provision.<br><br>This attribute shall be present only when the AF requests to provision DNN and S-NSSAI specific Group parameters. |               |
| suppFeat         | SupportedFeatures      | C | 0..1        | Contains the list of supported features among the ones defined in clause 5.33.6.<br><br>This attribute shall be present only when feature negotiation needs to take place.                                   |               |

## 5.33.5.2.3 Type: GrpPpDataPatch

Table 5.33.5.2.3-1: Definition of type GrpPpDataPatch

| Attribute name   | Data type        | P | Cardinality | Description                                                                                 | Applicability |
|------------------|------------------|---|-------------|---------------------------------------------------------------------------------------------|---------------|
| dnnSnssaiGrpData | DnnSnssaiGrpData | O | 0..1        | Contains the updated DNN and S-NSSAI specific Group data that the AF requests to provision. |               |

## 5.33.5.2.4 Type: DnnSnssaiGrpData

Table 5.33.5.2.4-1: Definition of type DnnSnssaiGrpData

| Attribute name | Data type       | P | Cardinality | Description                                                                                                          | Applicability |
|----------------|-----------------|---|-------------|----------------------------------------------------------------------------------------------------------------------|---------------|
| extGroupId     | ExternalGroupId | M | 1           | Represents the external group identifier of the targeted group.                                                      |               |
| dnn            | Dnn             | M | 1           | Represents the concerned DNN.                                                                                        |               |
| snssai         | Snssai          | M | 1           | Represents the concerned S-NSSAI.                                                                                    |               |
| defQos         | AfReqDefaultQoS | C | 0..1        | Represents the AF-requested default QoS parameters to be applied to each UE within the targeted group.<br><br>(NOTE) |               |
| ladnServArea   | LadnServArea    | C | 0..1        | Represents the AF-requested LADN Service Area to be applied to each UE within the targeted group.<br><br>(NOTE)      |               |

NOTE: At least one of these attributes shall be present.

## 5.33.5.2.5 Type: AfReqDefaultQoS

Table 5.33.5.2.5-1: Definition of type AfReqDefaultQoS

| Attribute name | Data type | P | Cardinality | Description                                            | Applicability |
|----------------|-----------|---|-------------|--------------------------------------------------------|---------------|
| 5qi            | 5Qi       | M | 1           | Represents the AF requested default 5G QoS Identifier. |               |

|               |                        |   |      |                                                                        |  |
|---------------|------------------------|---|------|------------------------------------------------------------------------|--|
| arp           | Arp                    | M | 1    | Represents the AF requested default Allocation and Retention Priority. |  |
| priorityLevel | 5QIPriorityLevel<br>Rm | O | 0..1 | Represents the AF requested 5QI Priority Level.                        |  |

### 5.33.5.2.6 Type: LdnServArea

**Table 5.33.5.2.6-1: Definition of type LdnServArea**

| Attribute name                                                                      | Data type              | P | Cardinality | Description                                                                                      | Applicability |
|-------------------------------------------------------------------------------------|------------------------|---|-------------|--------------------------------------------------------------------------------------------------|---------------|
| geographicAreas                                                                     | array(Geographic Area) | C | 1..N        | Represents the LADN Service Area in the form of a list of geographic area(s).<br>(NOTE)          |               |
| civicAddresses                                                                      | array(CivicAddresses)  | C | 1..N        | Represents the LADN Service Area in the form of a list of civic address(es).<br>(NOTE)           |               |
| tais                                                                                | array(Tai)             | C | 1..N        | Represents the LADN Service Area in the form of a list of Tracking Area Identifier(s).<br>(NOTE) |               |
| NOTE: These attributes are mutually exclusive. Either one of them shall be present. |                        |   |             |                                                                                                  |               |

## 5.33.5.3 Simple data types and enumerations

### 5.33.5.3.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

### 5.33.5.3.2 Simple data types

The simple data types defined in table 5.33.5.3.2-1 shall be supported.

**Table 5.33.5.3.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

### 5.33.5.4 Data types describing alternative data types or combinations of data types

There are no data types describing alternative data types or combinations of data types defined for this API in this release of the specification.

## 5.33.6 Used Features

The table below defines the features applicable to the GroupParametersProvisioning API. Those features are negotiated as described in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.33.6-1: Supported Features**

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|
|                |              |             |

## 5.33.7 Error handling

### 5.33.7.1 General

For the GroupParametersProvisioning API, HTTP error responses shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4]. Protocol errors and application errors specified in clause 5.2.6 of 3GPP TS 29.122 [4] shall be supported for the HTTP status codes specified in table 5.2.6-1 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses are applicable for the GroupParametersProvisioning API.

### 5.33.7.2 Protocol Errors

In this Release of the specification, there are no additional protocol errors applicable for the GroupParametersProvisioning API.

### 5.33.7.3 Application Errors

The application errors defined for the GroupParametersProvisioning API are listed in table 5.33.7.3-1.

**Table 5.33.7.3-1: Application errors**

| Application Error | HTTP status code | Description | Applicability |
|-------------------|------------------|-------------|---------------|
|                   |                  |             |               |

## 5.34 SliceParamProvision API

### 5.34.1 Introduction

The Nnef\_ParameterProvision service shall use the SliceParamProvision API for:

- Network Slice Parameters provisioning.

The API URI of the SliceParamProvision API shall be:

**{apiRoot}/<apiName>/<apiVersion>**

The request URIs used in HTTP requests shall have the Resource URI structure defined in clause 5.2.4 of 3GPP TS 29.122 [4], i.e.:

**{apiRoot}/<apiName>/<apiVersion>/<apiSpecificSuffixes>**

with the following components:

- "apiRoot" is set as defined in clause 5.2.4 of 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-slice-pp".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.
- The <apiSpecificSuffixes> shall be set as described in clause 5.2.4 of 3GPP TS 29.122 [4].

All resource URIs in the clauses below are defined relative to the above API URI.

### 5.34.2 Resources

#### 5.34.2.1 Overview

This clause describes the structure for the Resource URIs as shown in figure 5.34.2.1-1 and the resources and HTTP methods used for the SliceParamProvision API.

Figure 5.34.2.1-1: Resource URI structure of the SliceParamProvision API

Table 5.34.2.1-1 provides an overview of the resources and applicable HTTP methods.

Table 5.34.2.1-1: Resources and methods overview

| Resource name                            | Resource URI (relative path under API URI) | HTTP method or custom operation | Description (service operation)                                                              |
|------------------------------------------|--------------------------------------------|---------------------------------|----------------------------------------------------------------------------------------------|
| Slice Parameters Provisionings           | /pp                                        | GET                             | Retrieve all the active Slice Parameters Provisionings managed by the NEF.                   |
|                                          |                                            | POST                            | Request the creation of a new Slice Parameters Provisioning at the NEF.                      |
| Individual Slice Parameters Provisioning | /pp/{ppId}                                 | GET                             | Retrieve an existing "Individual Slice Parameters Provisioning" resource managed by the NEF. |
|                                          |                                            | PUT                             | Update an existing "Individual Slice Parameters Provisioning" resource managed by the NEF.   |
|                                          |                                            | PATCH                           | Modify an existing "Individual Slice Parameters Provisioning" resource managed by the NEF.   |
|                                          |                                            | DELETE                          | Delete an existing "Individual Slice Parameters Provisioning" resource managed by the NEF.   |

5.34.2.2 Resource: Slice Parameters Provisionings

5.34.2.2.1 Introduction

This resource represents the collection of Slice Parameters Provisionings managed by the NEF.

This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [32]).

5.34.2.2.2 Resource Definition

Resource URI: {apiRoot}/3gpp-slice-pp/<apiVersion>/pp

This resource shall support the resource URI variables defined in table 5.34.2.2.2-1.

**Table 5.34.2.2.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition         |
|---------|-----------|--------------------|
| apiRoot | string    | See clause 5.34.1. |

### 5.34.2.2.3 Resource Methods

#### 5.34.2.2.3.1 GET

This method enables an AF to request to retrieve all the active Slice Parameters Provisionings managed by the NEF.

This method shall support the URI query parameters specified in table 5.34.2.2.3.1-1.

**Table 5.34.2.2.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.34.2.2.3.1-2 and the response data structures and response codes specified in table 5.34.2.2.3.1-3.

**Table 5.34.2.2.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.34.2.2.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| array(SlicePpData)                                                                                                                  | M | 0..N        | 200 OK                 | Successful case. All the "Individual Slice Parameters Provisioning" resource(s) managed by the NEF are returned.<br><br>If there are no active "Individual Slice Parameters Provisioning" resources at the NEF, an empty array is returned.           |
| n/a                                                                                                                                 |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                 |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.34.2.2.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
|------|-----------|---|-------------|-------------|

|          |        |   |   |                                                                                   |
|----------|--------|---|---|-----------------------------------------------------------------------------------|
| Location | string | M | 1 | Contains an alternative target URI of the resource located in an alternative NEF. |
|----------|--------|---|---|-----------------------------------------------------------------------------------|

**Table 5.34.2.2.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**5.34.2.2.3.2 POST**

This method enables an AF to request the creation of a new Slice Parameters Provisioning at the NEF.

This method shall support the URI query parameters specified in table 5.34.2.2.3.2-1.

**Table 5.34.2.2.3.2-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.34.2.2.3.2-2 and the response data structures and response codes specified in table 5.34.2.2.3.2-3.

**Table 5.34.2.2.3.2-2: Data structures supported by the POST Request Body on this resource**

| Data type   | P | Cardinality | Description                                                                                |
|-------------|---|-------------|--------------------------------------------------------------------------------------------|
| SlicePpData | M | 1           | Contains the representation of the Slice Parameters Provisioning to be created at the NEF. |

**Table 5.34.2.2.3.2-3: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                            | P | Cardinality | Response codes | Description                                                                                                                                                                                                                   |
|--------------------------------------------------------------------------------------------------------------------------------------|---|-------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SlicePpData                                                                                                                          | M | 1           | 201 Created    | Successful case. A representation of the created "Individual Slice Parameters Provisioning" resource is returned in the response body.<br><br>The URI of the created resource shall be returned in an HTTP "Location" header. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                |                                                                                                                                                                                                                               |

**Table 5.34.2.2.3.2-4: Headers supported by the 201 response code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                   |
|----------|-----------|---|-------------|-------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains the URI of the newly created resource, according to the structure:<br>{apiRoot}/3gpp-slice-pp/<apiVersion>/pp/{ppId} |

**5.34.2.2.4 Resource Custom Operations**

There are no resource custom operations defined for this resource in this release of the specification.

### 5.34.2.3 Resource: Individual Slice Parameters Provisioning

#### 5.34.2.3.1 Introduction

This resource represents an "Individual Slice Parameters Provisioning" resource managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [32]).

#### 5.34.2.3.2 Resource Definition

Resource URI: **{apiRoot}/3gpp-slice-pp/<apiVersion>/pp/{ppId}**

This resource shall support the resource URI variables defined in table 5.34.2.3.2-1.

**Table 5.34.2.3.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition                                                                            |
|---------|-----------|---------------------------------------------------------------------------------------|
| apiRoot | string    | See clause 5.34.1.                                                                    |
| ppId    | string    | Represents the identifier of the "Individual Slice Parameters Provisioning" resource. |

#### 5.34.2.3.3 Resource Methods

##### 5.34.2.3.3.1 GET

This method enables an AF to request to retrieve an existing "Individual Slice Parameters Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.34.2.3.3.1-1.

**Table 5.34.2.3.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.34.2.3.3.1-2 and the response data structures and response codes specified in table 5.34.2.3.3.1-3.

**Table 5.34.2.3.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.34.2.3.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type   | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SlicePpData | M | 1           | 200 OK                 | Successful case. The requested "Individual Slice Parameters Provisioning" resource is successfully returned in the response body.                                                                                                                     |
| n/a         |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a         |   |             | 308 Permanent Redirect | Permanent redirection.                                                                                                                                                                                                                                |

|                                                                                                                                     |  |  |  |                                                                                                                                                                                                                                |

| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |  |  |  |                                                                                                                                                                                                                                |

**Table 5.34.2.3.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.34.2.3.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**5.34.2.3.3.2 PUT**

This method enables an AF to request the update of an existing "Individual Slice Parameters Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.34.2.3.3.2-1.

**Table 5.34.2.3.3.2-1: URI query parameters supported by the PUT method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.34.2.3.3.2-2 and the response data structures and response codes specified in table 5.34.2.3.3.2-3.

**Table 5.34.2.3.3.2-2: Data structures supported by the PUT Request Body on this resource**

| Data type   | P | Cardinality | Description                                                                                |
|-------------|---|-------------|--------------------------------------------------------------------------------------------|
| SlicePpData | M | 1           | Represents the updated "Individual Slice Parameters Provisioning" resource representation. |

**Table 5.34.2.3.3.2-3: Data structures supported by the PUT Response Body on this resource**

| Data type   | P | Cardinality | Response codes         | Description                                                                                                                                                                         |
|-------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SlicePpData | M | 1           | 200 OK                 | Successful response. The "Individual Slice Parameters Provisioning" resource is successfully updated and a representation of the updated resource is returned in the response body. |
| n/a         |   |             | 204 No Content         | Successful response. The "Individual Slice Parameters Provisioning" resource is successfully updated and no content is returned in the response body.                               |
| n/a         |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.                |

|                                                                                                                                     |  |  |                        |                                                                                                                                                                                                                                                       |
|-------------------------------------------------------------------------------------------------------------------------------------|--|--|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|----------|-----------|---|-------------|----------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI of the resource located in an alternative NEF. |

**Table 5.34.2.3.3.2-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                |
|----------|-----------|---|-------------|----------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI of the resource located in an alternative NEF. |

**5.34.2.3.3.3 PATCH**

This method enables an AF to request the modification of an existing "Individual Slice Parameters Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.34.2.3.3.3-1.

**Table 5.34.2.3.3.3-1: URI query parameters supported by the PATCH method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.34.2.3.3.3-2 and the response data structures and response codes specified in table 5.34.2.3.3.3-3.

**Table 5.34.2.3.3.3-2: Data structures supported by the PATCH Request Body on this resource**

| Data type        | P | Cardinality | Description                                                                                        |
|------------------|---|-------------|----------------------------------------------------------------------------------------------------|
| SlicePpDataPatch | M | 1           | Represents the requested modifications to the "Individual Slice Parameters Provisioning" resource. |

**Table 5.34.2.3.3.4-3: Data structures supported by the DELETE Response Body on this resource**

| Data type | P | Cardinality | Response codes         | Description                                                                                                                                                                 |
|-----------|---|-------------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a       |   |             | 204 No Content         | Successful case. The "Individual Slice Parameters Provisioning" resource is successfully deleted.                                                                           |
| n/a       |   |             | 307 Temporary Redirect | <p>Temporary redirection.</p> <p>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.</p> |

|                                                                                                                                        |  |  |                        |                                                                                                                                                                                                                                                       |
|----------------------------------------------------------------------------------------------------------------------------------------|--|--|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                        |  |  |                        | Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].                                                                                                                                                                             |
| n/a                                                                                                                                    |  |  | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP DELETE method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |  |  |                        |                                                                                                                                                                                                                                                       |

**Table 5.34.2.3.3.4-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.34.2.3.3.4-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.34.2.3.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.34.3 Custom Operations without associated resources

There are no custom operations without associated resources defined for this API in this release of the specification.

### 5.34.4 Notifications

There are no notifications defined for this API in this release of the specification.

### 5.34.5 Data Model

#### 5.34.5.1 General

This clause specifies the application data model supported by the SliceParamProvision API. Table 5.34.5.1-1 specifies the data types defined for the SliceParamProvision API.

**Table 5.34.5.1-1: SliceParamProvision API specific Data Types**

| Data type        | Clause defined | Description                                                                           | Applicability |
|------------------|----------------|---------------------------------------------------------------------------------------|---------------|
| SlicePpData      | 5.34.5.2.1     | Represents Slice Parameters Provisioning data.                                        |               |
| SlicePpDataPatch | 5.34.5.2.2     | Represents the requested modification to existing Slice Parameters Provisioning data. |               |

Table 5.34.5.1-2 specifies data types re-used by the SliceParamProvision API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the SliceParamProvision API.

**Table 5.34.5.1-2: SliceParamProvision API re-used Data Types**

| Data type              | Reference          | Comments                                                                                                         | Applicability |
|------------------------|--------------------|------------------------------------------------------------------------------------------------------------------|---------------|
| MtcProviderInformation | 3GPP TS 29.571 [8] | Represents the MTC provider information.                                                                         |               |
| SliceUsageControlInfo  | 3GPP TS 29.571 [8] | Represents the Network Slice Usage Control information.                                                          |               |
| SupportedFeatures      | 3GPP TS 29.571 [8] | Represents the list of supported feature(s) and is used to negotiate the applicability of the optional features. |               |

## 5.34.5.2 Structured data types

### 5.34.5.2.1 Introduction

This clause defines the structures to be used in resource representations.

### 5.34.5.2.2 Type: SlicePpData

**Table 5.34.5.2.2-1: Definition of type SlicePpData**

| Attribute name   | Data type                  | P | Cardinality | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Applicability |
|------------------|----------------------------|---|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| afId             | string                     | M | 1           | Represents the identifier of the AF that is sending the request.                                                                                                                                                                                                                                                                                                                                                                                                               |               |
| mtcProviderId    | MtcProviderInformation     | O | 0..1        | Contains the identifier of the MTC Service Provider and/or MTC Application.                                                                                                                                                                                                                                                                                                                                                                                                    |               |
| sliceUsgCtrlData | map(SliceUsageControlInfo) | C | 1..N        | Represents the Network Slice Usage Control information to be provisioned.<br><br>The key of the map shall be the AF-dedicated S-NSSAI (that is provided within the "snssai" attribute of the corresponding map value encoded via the SliceUsageControlInfo data structure) to which the provisioned Network Slice Usage Control information is related.<br><br>This attribute shall be present only when the AF requests to provision Network Slice Usage Control information. |               |
| suppFeat         | SupportedFeatures          | C | 0..1        | Represents the list of supported features among the ones defined in clause 5.34.6.<br><br>This attribute shall be present only when feature negotiation needs to take place.                                                                                                                                                                                                                                                                                                   |               |

### 5.34.5.2.3 Type: SlicePpDataPatch

**Table 5.34.5.2.3-1: Definition of type SlicePpDataPatch**

| Attribute name   | Data type                  | P | Cardinality | Description                                                                                                                                                                                                                                                                                                                                             | Applicability |
|------------------|----------------------------|---|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| sliceUsgCtrlData | map(SliceUsageControlInfo) | O | 1..N        | Represents the Network Slice Usage Control information to be provisioned.<br><br>The key of the map shall be the AF-dedicated S-NSSAI (that is provided within the "snssai" attribute of the corresponding map value encoded via the SliceUsageControlInfo data structure) to which the provisioned Network Slice Usage Control information is related. |               |

### 5.34.5.3 Simple data types and enumerations

#### 5.34.5.3.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

#### 5.34.5.3.2 Simple data types

The simple data types defined in table 5.34.5.3.2-1 shall be supported.

**Table 5.34.5.3.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

### 5.34.6 Used Features

The table below defines the features applicable to the SliceParamProvision API. Those features are negotiated as described in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.34.6-1: Supported Features**

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|
|                |              |             |

### 5.34.7 Error handling

#### 5.34.7.1 General

For the SliceParamProvision API, HTTP error responses shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4]. Protocol errors and application errors specified in clause 5.2.6 of 3GPP TS 29.122 [4] shall be supported for the HTTP status codes specified in table 5.2.6-1 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses are applicable for the SliceParamProvision API.

#### 5.34.7.2 Protocol Errors

In this Release of the specification, there are no additional protocol errors applicable for the SliceParamProvision API.

#### 5.34.7.3 Application Errors

The application errors defined for the SliceParamProvision API are listed in table 5.34.7.3-1.

**Table 5.34.7.3-1: Application errors**

| Application Error | HTTP status code | Description | Applicability |
|-------------------|------------------|-------------|---------------|
|                   |                  |             |               |

## 5.35 UeAddress API

### 5.35.1 Introduction

The Nnef\_UeAddress service shall use the UeAddress API.

The API URI of UeAddress API shall be:

{apiRoot}/<apiName>/<apiVersion>

The request URIs used in HTTP requests shall have the Resource URI structure defined in clause 5.2.4 of 3GPP TS 29.122 [4], i.e.:

{apiRoot}/<apiName>/<apiVersion>/<apiSpecificSuffixes>

with the following components:

- "apiRoot" is set as described in clause 5.2.4 in 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-ue-address".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.
- The <apiSpecificSuffixes> shall be set as described in clause 5.2.4 of 3GPP TS 29.122 [4].

All resource URIs in the clauses below are defined relative to the above API URI.

5.35.2 Resources

5.35.2.1 Overview

This clause describes the structure for the Resource URIs as shown in figure 5.35.1.1-1 and the resources and HTTP methods used for the UeAddress API.

**Figure 5.35.2.1-1: Resource URI structure of the UeAddress API**

Table 5.35.2.1-1 provides an overview of the resources and HTTP methods applicable for the UeAddress API.

**Table 5.35.2.1-1: Resources and methods overview**

| Resource name                      | Resource URI (relative path under API URI) | HTTP method or custom operation | Description (service operation)                                     |
|------------------------------------|--------------------------------------------|---------------------------------|---------------------------------------------------------------------|
| UE Address Subscriptions           | /subscriptions                             | GET                             | Retrieve all the UE Address Subscriptions.                          |
|                                    |                                            | POST                            | Create a new UE Address Subscription.                               |
| Individual UE Address Subscription | /subscriptions/{subscriptionId}            | GET                             | Retrieve an existing "Individual UE Address Subscription" resource. |
|                                    |                                            | DELETE                          | Delete an existing "Individual UE Address Subscription" resource.   |

## 5.35.2.2 Resource: UE Address Subscriptions

### 5.35.2.2.1 Introduction

This resource represents the collection of UE Address Subscriptions managed by the NEF.

This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [32]).

### 5.35.2.2.2 Resource Definition

Resource URI: **{apiRoot}/3gpp-ue-address/<apiVersion>/subscriptions**

This resource shall support the resource URI variables defined in table 5.35.2.2.2-1.

**Table 5.35.2.2.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition         |
|---------|-----------|--------------------|
| apiRoot | string    | See clause 5.35.1. |

### 5.35.2.2.3 Resource Standard Methods

#### 5.35.2.2.3.1 Void

#### 5.35.2.2.3.2 GET

The HTTP GET method enables an AF to request to retrieve all the active UE Address Subscriptions managed by the NEF.

This method shall support the URI query parameters specified in table 5.35.2.2.3.2-1.

**Table 5.35.2.2.3.2-1: URI query parameters supported by the GET method on this resource**

| Name      | Data type         | P | Cardinality | Description                                                                                                                                                                      |
|-----------|-------------------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| supp-feat | SupportedFeatures | O | 0..1        | Contains the list of supported features among the ones defined in clause 5.35.6.<br><br>This query parameter shall be present only when feature negotiation needs to take place. |

This method shall support the request data structures specified in table 5.35.2.2.3.2-2 and the response data structures and response codes specified in table 5.35.2.2.3.2-3.

**Table 5.35.2.2.3.2-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |

**Table 5.35.2.2.3.2-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.35.2.2.3.2-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

### 5.35.2.2.3.3 POST

The HTTP POST method enables an AF to request the creation of a new UE Address Subscription at the NEF.

This method shall support the URI query parameters specified in table 5.35.2.2.3.3-1.

**Table 5.35.2.2.3.3-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.35.2.2.3.3-2 and the response data structures and response codes specified in table 5.35.2.2.3.3-3.

**Table 5.35.2.2.3.3-2: Data structures supported by the POST Request Body on this resource**

| Data type   | P | Cardinality | Description                                                                          |
|-------------|---|-------------|--------------------------------------------------------------------------------------|
| UeAddrSubsc | M | 1           | Contains the representation of the UE Address Subscription to be created at the NEF. |

**Table 5.35.2.2.3.3-3: Data structures supported by the POST Response Body on this resource**

| Data type   | P | Cardinality | Response codes | Description                                                                                                                                                                                                                     |
|-------------|---|-------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UeAddrSubsc | M | 1           | 201 Created    | <p>Successful case. A representation of the created "Individual UE Address Subscription" resource is returned in the response body.</p> <p>The URI of the created resource shall be returned in the "Location" HTTP header.</p> |

NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply.

**Table 5.35.2.2.3.3-4: Headers supported by the 201 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                                          |
|----------|-----------|---|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains the URI of the newly created resource, according to the structure:<br>{apiRoot}/3gpp-ue-address/<apiVersion>/subscriptions/{subscriptionId} |

#### 5.35.2.2.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.35.2.3 Resource: Individual UE Address Subscription

#### 5.35.2.3.1 Introduction

This resource represents a UE Address Subscription managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [32]).

#### 5.35.2.3.2 Resource Definition

Resource URI: {apiRoot}/3gpp-ue-address/<apiVersion>/subscriptions/{subscriptionId}

This resource shall support the resource URI variables defined in table 5.35.2.3.2-1.

**Table 5.35.2.3.2-1: Resource URI variables for this resource**

| Name           | Data type | Definition                                                                      |
|----------------|-----------|---------------------------------------------------------------------------------|
| apiRoot        | string    | See clause 5.35.1.                                                              |
| subscriptionId | string    | Represents the identifier of the "Individual UE Address Subscription" resource. |

#### 5.35.2.3.3 Resource Standard Methods

##### 5.35.2.3.3.1 Void

##### 5.35.2.3.3.2 GET

The HTTP GET method enables an AF to request to retrieve an existing "Individual UE Address Subscription" resource at the NEF.

This method shall support the URI query parameters specified in table 5.35.2.3.3.2-1.

**Table 5.35.2.3.3.2-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
|      |           |   |             |             |

This method shall support the request data structures specified in table 5.35.1.3.3.2-2 and the response data structures and response codes specified in table 5.35.1.3.3.2-3.

**Table 5.35.2.3.3.2-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
|-----------|---|-------------|-------------|

**Table 5.35.2.3.3.2-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.35.2.3.3.2-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

### 5.35.2.3.3.3 DELETE

The HTTP DELETE method enables an AF to request the deletion of an existing "Individual UE Address Subscription" resource at the NEF.

This method shall support the URI query parameters specified in table 5.35.2.3.3.3-1.

**Table 5.35.2.3.3.3-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.35.2.3.3.3-2 and the response data structures and response codes specified in table 5.35.2.3.3.3-3.

**Table 5.35.2.3.3.3-2: Data structures supported by the DELETE Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

Table 5. 35.2.3.3.3-3: Data structures supported by the DELETE Response Body on this resource

| Data type                                                                                                                              | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |

| n/a                                                                                                                                    |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP DELETE method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

Table 5.35.2.3.3.3-4: Headers supported by the 307 Response Code on this resource

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

Table 5.35.2.3.3.3-5: Headers supported by the 308 Response Code on this resource

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

5.35.2.3.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

5.35.3 Custom Operations without associated resources

5.35.3.1 Overview

The structure of the custom operation URIs of the UeAddress API is shown in Figure 5.35.3.1-1.

Figure 5.35.3.1-1: Custom operation URI structure of the UeAddress API

Table 5.35.3.1-1 provides an overview of the custom operations and applicable HTTP methods defined for the UeAddress API.

**Table 5.35.3.1-1: Custom operations without associated resources**

| Custom operation name | Custom operation URI | Mapped HTTP method | Description                                                  |
|-----------------------|----------------------|--------------------|--------------------------------------------------------------|
| Retrieve              | /retrieve            | POST               | Enables an AF to request to retrieve UE Address information. |

The custom operations shall support the URI variables defined in table 5.35.3.1-2.

**Table 5.35.3.1-2: URI variables for this custom operation**

| Name    | Data type | Definition         |
|---------|-----------|--------------------|
| apiRoot | string    | See clause 5.35.1. |

### 5.35.3.2 Operation: Retrieve

#### 5.35.3.2.1 Description

The custom operation allows to retrieve UE Address information via the NEF.

#### 5.35.3.2.2 Operation Definition

This operation shall support the request and response data structures and response codes specified in table 5.35.3.2.2-1 and table 5.35.3.2.2-2.

**Table 5.35.3.2.2-1: Data structures supported by the POST Request Body on this resource**

| Data type    | P | Cardinality | Description                                                            |
|--------------|---|-------------|------------------------------------------------------------------------|
| UeAddressReq | M | 1           | Contains the parameters to request to retrieve UE Address information. |

**Table 5.35.3.2.2-2: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                            | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|--------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UeAddressInfo                                                                                                                        | M | 1           | 200 OK                 | Successful case. The UE Address information request is successfully processed, and UE address information is returned in the response body.                                                                                                           |
| n/a                                                                                                                                  |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                  |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.35.3.2.2-3: Headers supported by the 307 Response Code on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
|------|-----------|---|-------------|-------------|

|          |        |   |   |                                                                                   |
|----------|--------|---|---|-----------------------------------------------------------------------------------|
| Location | string | M | 1 | Contains an alternative target URI of the resource located in an alternative NEF. |
|----------|--------|---|---|-----------------------------------------------------------------------------------|

**Table 5.35.3.2.2-4: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

## 5.35.4 Notifications

### 5.35.4.1 General

Notifications shall comply to clause 5.2.5 of 3GPP TS 29.122 [4].

**Table 5.35.4.1-1: Notifications overview**

| Notification            | Callback URI | HTTP method or custom operation | Description (service operation)                                                                  |
|-------------------------|--------------|---------------------------------|--------------------------------------------------------------------------------------------------|
| UE Address Notification | {notifUri}   | POST                            | Enables the NEF to notify a previously subscribed AF on UE address information related event(s). |

### 5.35.4.2 UE Address Notification

#### 5.35.4.2.1 Description

The UE Address Notification is used by the NEF to notify a previously subscribed AF on UE address information related event(s).

#### 5.35.4.2.2 Target URI

The Callback URI "{notifUri}" shall be used with the callback URI variables defined in table 5.35.4.2.2-1.

**Table 5.35.4.2.2-1: Callback URI variables**

| Name     | Definition                                                          |
|----------|---------------------------------------------------------------------|
| notifUri | Represents the callback URI encoded as a string formatted as a URI. |

#### 5.35.4.2.3 Standard Methods

##### 5.35.4.2.3.1 POST

This method shall support the request data structures specified in table 5.35.4.2.3.1-1 and the response data structures and response codes specified in table 5.35.4.2.3.1-2.

**Table 5.35.4.2.3.1-1: Data structures supported by the POST Request Body on this resource**

| Data type   | P | Cardinality | Description                             |
|-------------|---|-------------|-----------------------------------------|
| UeAddrNotif | M | 1           | Represents the UE Address Notification. |

**Table 5.35.4.2.3.1-2: Data structures supported by the POST Response Body on this resource**

| Data type | P | Cardinality | Response | Description |
|-----------|---|-------------|----------|-------------|
|-----------|---|-------------|----------|-------------|

|                                                                                                                                      |  |  | codes                  |                                                                                                                                                                                                                                                                                                |
|--------------------------------------------------------------------------------------------------------------------------------------|--|--|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a                                                                                                                                  |  |  | 204 No Content         | Successful case. The UE Address Notification is successfully received and processed.                                                                                                                                                                                                           |
| n/a                                                                                                                                  |  |  | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF towards which the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                  |  |  | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF towards which the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |  |  |                        |                                                                                                                                                                                                                                                                                                |

**Table 5.35.4.2.3.1-3: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                      |
|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

**Table 5.35.4.2.3.1-4: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                      |
|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

## 5.35.5 Data Model

### 5.35.5.1 General

This clause specifies the application data model supported by the UeAddress API. Table 5.35.5.1-1 specifies the data types defined for the UeAddress API.

**Table 5.35.5.1-1: UeAddress service specific Data Types**

| Data type     | Clause defined | Description                                                  | Applicability |
|---------------|----------------|--------------------------------------------------------------|---------------|
| UeAddressInfo | 5.35.5.2.3     | Represents UE Address information.                           |               |
| UeAddressReq  | 5.35.5.2.2     | Represents the parameters to request UE Address information. |               |
| UeAddrInfo    | 5.35.5.2.5     | Represents the UE Public Address information.                |               |
| UeAddrNotif   | 5.35.5.2.6     | Represents the UE Address Notification.                      |               |
| UeAddrSubsc   | 5.35.5.2.4     | Represents the UE Address Subscription.                      |               |

Table 5.35.5.1-2 specifies data types re-used by the UeAddress API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the UeAddress API.

**Table 5.35.5.1-2: Re-used Data Types**

| Data type         | Reference           | Comments                                                                                                         |
|-------------------|---------------------|------------------------------------------------------------------------------------------------------------------|
| Gpsi              | 3GPP TS 29.571 [8]  | Represents a GPSI.                                                                                               |
| IpAddr            | 3GPP TS 29.571 [8]  | Represents UE IP address.                                                                                        |
| Ipv4Addr          | 3GPP TS 29.571 [8]  | Identifies an IPv4 address.                                                                                      |
| Ipv6Addr          | 3GPP TS 29.571 [8]  | Identifies an IPv6 address.                                                                                      |
| UeNatMappingInfo  | 3GPP TS 29.564 [61] | Represents UE NAT Mapping Information.                                                                           |
| SupportedFeatures | 3GPP TS 29.571 [8]  | Represents the list of supported feature(s) and is used to negotiate the applicability of the optional features. |
| Uint16            | 3GPP TS 29.571 [8]  | Represents an unsigned 16-bit integer.                                                                           |
| Uri               | 3GPP TS 29.122 [4]  | Represents a URI.                                                                                                |

## 5.35.5.2 Structured data types

### 5.35.5.2.1 Introduction

This clause defines the structured data types to be used in resource representations.

### 5.35.5.2.2 Type: UeAddressReq

**Table 5.35.5.2.2-1: Definition of type UeAddressReq**

| Attribute name | Data type         | P | Cardinality | Description                                                                                                                                                         | Applicability |
|----------------|-------------------|---|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| afId           | string            | M | 1           | Represents the identifier of the AF that is sending the request.                                                                                                    |               |
| gpsi           | Gpsi              | M | 1           | Contains the target GPSI for which UE address information is requested.                                                                                             |               |
| suppFeat       | SupportedFeatures | C | 0..1        | Contains the list of supported features used as defined in clause 5.35.6.<br><br>This attribute shall be present only when feature negotiation needs to take place. |               |

### 5.35.5.2.3 Type: UeAddressInfo

**Table 5.35.5.2.3-1: Definition of type UeAddressInfo**

| Attribute name | Data type         | P | Cardinality | Description                                                                                                                                                    | Applicability |
|----------------|-------------------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| ueIpAddrs      | array(IpAddr)     | M | 1..N        | Contains the UE Address(es) corresponding to the requested GPSI.                                                                                               |               |
| suppFeat       | SupportedFeatures | C | 0..1        | Contains the list of supported features used as defined in clause 5.35.6.<br><br>This attribute shall be present when feature negotiation needs to take place. |               |

### 5.35.5.2.4 Type: UeAddrSubsc

**Table 5.35.5.2.4-1: Definition of type UeAddrSubsc**

| Attribute name | Data type | P | Cardinality | Description                                                                 | Applicability |
|----------------|-----------|---|-------------|-----------------------------------------------------------------------------|---------------|
| notifUri       | Uri       | M | 1           | Contains the URI for via which UE Address notifications shall be delivered. |               |
| notifId        | string    | M | 1           | Notification Correlation ID assigned by the AF.                             |               |

|                                                                                                                                                                                                                                                                               |                   |   |      |                                                                                                                                                                                                                                                        |  |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|---|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| afId                                                                                                                                                                                                                                                                          | string            | M | 1    | Represents the identifier of the AF that is sending the request.                                                                                                                                                                                       |  |
| ueAddrInfo                                                                                                                                                                                                                                                                    | UeAddrInfo        | C | 0..1 | Contains the UE private address information and IP address information of the remote end.<br><br>This attribute shall be present only if the UE public address information is subscribed.                                                              |  |
| immRepInd                                                                                                                                                                                                                                                                     | boolean           | C | 0..1 | Indicates whether immediate reporting is requested.<br><br>- "true": immediate reporting is requested;<br>- "false"(default): immediate reporting is not requested.<br>It shall be present and set to "true" if the "ueAddrInfo" attribute is present. |  |
| immReport                                                                                                                                                                                                                                                                     | UeNatMappingInfo  | C | 0..1 | Contains the UE Address report.<br><br>This attribute shall be present only in the response to a UE Address Subscription creation request and when the information is available.<br><br>(NOTE).                                                        |  |
| supFeat                                                                                                                                                                                                                                                                       | SupportedFeatures | C | 0..1 | Indicates the list of Supported features used as described in clause 5.35.6.<br><br>It shall be present if feature negotiation needs to take place.                                                                                                    |  |
| NOTE: The UPF may report a list of NATed public IP and port information for the same private UE IP address and the same remote IP address, for different destination port numbers, if no remote port number was received in the subscription within the ueAddrInfo attribute. |                   |   |      |                                                                                                                                                                                                                                                        |  |

## 5.35.5.2.5 Type: UeAddrInfo

Table 5.35.5.2.5-1: Definition of type UeAddrInfo

| Attribute name                                                                                   | Data type | P | Cardinality | Description                                                                                                                                | Applicability |
|--------------------------------------------------------------------------------------------------|-----------|---|-------------|--------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| uePrivateIpAddr                                                                                  | IpAddr    | M | 1           | Contains the UE's private IP address.                                                                                                      |               |
| ipDomain                                                                                         | string    | O | 0..1        | Contains the IPv4 domain.<br><br>This attribute may be present only if an IPv4 address is provided within the "uePrivateIpAddr" attribute. |               |
| remoteIpv4Addr                                                                                   | Ipv4Addr  | C | 0..1        | Contains the IPv4 address of remote end for which the NAT mapping is requested.<br><br>(NOTE).                                             |               |
| remoteIpv6Addr                                                                                   | Ipv6Addr  | C | 0..1        | Contains the IPv6 address of remote end for which the NAT mapping is requested.<br><br>(NOTE)                                              |               |
| remotePortNumber                                                                                 | Uint16    | O | 0..1        | Contains the port number of the remote end for which the NAT mapping is requested.                                                         |               |
| NOTE: Either the "remoteIpv4Addr" attribute or the "remoteIpv6Addr" attribute shall be included. |           |   |             |                                                                                                                                            |               |

## 5.35.5.2.6 Type: UeAddrNotif

**Table 5.35.5.2.6-1: Definition of type UeAddrNotif**

| Attribute name                                                                                                                                                                                                                                | Data type        | P | Cardinality | Description                                                                                                                                                           | Applicability |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|---|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| notifId                                                                                                                                                                                                                                       | string           | M | 1           | Contains the identifier of the subscription to which the notification is related.                                                                                     |               |
| uePubAddrInfo                                                                                                                                                                                                                                 | UeNatMappingInfo | M | 1           | Contains the list of NATed public address and port information.<br><br>The NEF shall return an empty value when there is no UeNatMappingInfo available.<br><br>(NOTE) |               |
| NOTE: The UPF may return a list of NATed public IP and port information for the same private UE IP address and the same remote IP address, for different destination port numbers, if no remote port number was received in the subscription. |                  |   |             |                                                                                                                                                                       |               |

## 5.35.5.2.7 Void

## 5.35.5.3 Simple data types and enumerations

## 5.35.5.3.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

## 5.35.5.3.2 Simple data types

The simple data types defined in table 5.35.5.3.2-1 shall be supported.

**Table 5.35.5.3.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

## 5.35.5.4 Data types describing alternative data types or combinations of data types

There are no data types describing alternative data types or combinations of data types defined for this API in this release of the specification.

## 5.35.6 Used Features

The optional features listed in table 5.35.6-1 are defined for the UeAddress API. They shall be negotiated using the extensibility mechanism defined in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.35.6-1: Features used by UeAddress API**

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|
|                |              |             |

## 5.35.7 Error handling

### 5.35.7.1 General

For the UeAddress API, HTTP error responses shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4]. Protocol errors and application errors specified in clause 5.2.6 of 3GPP TS 29.122 [4] shall be supported for the HTTP status codes specified in table 5.2.6-1 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses are applicable for the UeAddress API.

### 5.35.7.2 Protocol Errors

In this Release of the specification, there are no additional protocol errors applicable for the UeAddress API.

### 5.35.7.3 Application Errors

The application errors defined for the UeAddress API are listed in table 5.35.7.3-1.

**Table 5.35.7.3-1: Application errors**

| Application Error | HTTP status code | Description | Applicability |
|-------------------|------------------|-------------|---------------|
|                   |                  |             |               |

## 5.36 ECSAddress API

### 5.36.1 Introduction

The Nnef\_ECSAddress service shall use the ECSAddress API.

The API URI of ECSAddress API shall be:

**{apiRoot}/<apiName>/<apiVersion>**

The request URIs used in HTTP requests shall have the Resource URI structure defined in clause 5.2.4 of 3GPP TS 29.122 [4], i.e.:

**{apiRoot}/<apiName>/<apiVersion>/<apiSpecificSuffixes>**

with the following components:

- "apiRoot" is set as defined in clause 5.2.4 of 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-ecs-address".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.
- The <apiSpecificSuffixes> shall be set as described in clause 5.2.4 of 3GPP TS 29.122 [4].

All resource URIs in the clauses below are defined relative to the above API URI.

### 5.36.2 Resources

#### 5.36.2.1 Overview

This clause describes the structure for the Resource URIs as shown in figure 5.36.2.1-1 and the resources and HTTP methods used for the ECSAddress API.

Figure 5.36.2.1-1: Resource URI structure of the northbound ECSAddress API

Table 5.36.2.1-1 provides an overview of the resources and HTTP methods applicable for the northbound ECSAddress API.

Table 5.36.2.1-1: Resources and methods overview

| Resource name                                        | Resource URI                      | HTTP method | Description                                                                           |
|------------------------------------------------------|-----------------------------------|-------------|---------------------------------------------------------------------------------------|
| ECS Address Configuration Information Sets           | /{afld}/configurations            | GET         | Retrieve all the active ECS Address Configuration Information Sets.                   |
|                                                      |                                   | POST        | Create a new ECS Address Configuration Information Set.                               |
| Individual ECS Address Configuration Information Set | /{afld}/configurations/{configId} | GET         | Retrieve an existing "Individual ECS Address Configuration Information Set" resource. |
|                                                      |                                   | PUT         | Update an existing "Individual ECS Address Configuration Information Set" resource.   |
|                                                      |                                   | PATCH       | Modify an existing "Individual ECS Address Configuration Information Set" resource.   |
|                                                      |                                   | DELETE      | Delete an existing "Individual ECS Address Configuration Information Set" resource.   |

5.36.2.2 Resource: ECS Address Configuration Information Sets

5.36.2.2.1 Introduction

This resource represents all the active ECS Address Configuration Information Sets managed by the NEF for a given AF.

This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [3]).

5.36.2.2.2 Resource Definition

Resource URI: **{apiRoot}/3gpp-ecs-address/<apiVersion>/{afld}/configurations**

This resource shall support the resource URI variables defined in table 5.36.2.2.2-1.

**Table 5.36.2.2.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition                           |
|---------|-----------|--------------------------------------|
| apiRoot | string    | See clause 5.36.1.                   |
| afId    | string    | Represents the identifier of the AF. |

### 5.36.2.2.3 Resource Standard Methods

#### 5.36.2.2.3.1 Void

#### 5.36.2.2.3.2 GET

The HTTP GET method allows to retrieve all the active ECS Address Configuration Information Sets at the NEF for a given AF.

This method shall support the URI query parameters specified in table 5.36.2.2.3.2-1.

**Table 5.36.2.2.3.2-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.36.2.2.3.2-2, the response data structures and response codes specified in table 5.36.2.2.3.2-3, and the location headers specified in table 5.36.2.2.3.2-4 and table 5.36.2.2.3.2-5.

**Table 5.36.2.2.3.2-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.36.2.2.3.2-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                             |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| array(EcsAddrInfo)                                                                                                                  | M | 0..N        | 200 OK                 | Successful case. All the active "Individual ECS Address Configuration Information Set" resource(s) are returned.<br><br>If there are no active "Individual ECS Address Configuration Information Set" resources at the NEF, an empty array is returned. |
| n/a                                                                                                                                 |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].   |
| n/a                                                                                                                                 |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].   |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                         |

**Table 5.36.2.2.3.2-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.36.2.2.3.2-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

### 5.36.2.2.3.3 POST

The HTTP POST method allows to create a new ECS Address Configuration Information Set at the NEF for a given AF.

This method shall support the URI query parameters specified in table 5.36.2.2.3.3-1.

**Table 5.36.2.2.3.3-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.36.2.2.3.3-1, the response data structures and response codes specified in table 5.36.2.2.3.3-2, and the Location Headers specified in table 5.36.2.2.3.3-3.

**Table 5.36.2.2.3.3-1: Data structures supported by the POST Request Body on this resource**

| Data type   | P | Cardinality | Description                                                                                      |
|-------------|---|-------------|--------------------------------------------------------------------------------------------------|
| EcsAddrInfo | M | 1           | Contains the parameters to request the creation of an ECS Address Configuration Information Set. |

**Table 5.36.2.2.3.3-2: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                            | P | Cardinality | Response codes | Description                                                                                                                                                                                                                                |
|--------------------------------------------------------------------------------------------------------------------------------------|---|-------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EcsAddrInfo                                                                                                                          | M | 1           | 201 Created    | Successful case. A representation of the created "Individual ECS Address Configuration Information Set" resource is returned in the response body.<br><br>The URI of the created resource shall be returned in the "Location" HTTP header. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                |                                                                                                                                                                                                                                            |

**Table 5.36.2.2.3.3-3: Headers supported by the 201 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                                             |
|----------|-----------|---|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains the URI of the newly created resource, according to the structure:<br>{apiRoot}/3gpp-ecs-address/<apiVersion>/{afId}/configurations/{configId} |

### 5.36.2.2.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.36.2.3 Resource: Individual ECS Address Configuration Information Set

#### 5.36.2.3.1 Introduction

This resource represents an "Individual ECS Address Configuration Information Set" resource managed by the NEF.

#### 5.36.2.3.2 Resource Definition

Resource URI: **{apiRoot}/3gpp-ecs-address/<apiVersion>/{afId}/configurations/{configId}**

This resource shall support the resource URI variables defined in table 5.36.2.3.2-1.

**Table 5.36.2.3.2-1: Resource URI variables for this resource**

| Name     | Data type | Definition                                                                                        |
|----------|-----------|---------------------------------------------------------------------------------------------------|
| apiRoot  | string    | See clause 5.36.1.                                                                                |
| afId     | string    | Represents the identifier of the AF.                                                              |
| configId | string    | Represents the identifier of the "Individual ECS Address Configuration Information Set" resource. |

#### 5.36.2.3.3 Resource Standard Methods

##### 5.36.2.3.3.1 Void

##### 5.36.2.3.3.2 GET

The HTTP GET method allows to retrieve an existing "Individual ECS Address Configuration Information Set" resource at the NEF.

This method shall support the URI query parameters specified in table 5.36.2.3.3.2-1.

**Table 5.36.2.3.3.2-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.36.2.3.3.2-2 and the response data structures and response codes specified in table 5.36.2.3.3.2-3.

**Table 5.36.2.3.3.2-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.36.2.3.3.2-3: Data structures supported by the GET Response Body on this resource**

| Data type   | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EcsAddrInfo | M | 1           | 200 OK                 | Successful case. The requested "Individual ECS Address Configuration Information Set" resource is successfully returned in the response body.                                                                                                         |
| n/a         |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |

|                                                                                                                                     |  |  |                        |                                                                                                                                                                                                                                                              |
|-------------------------------------------------------------------------------------------------------------------------------------|--|--|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a                                                                                                                                 |  |  | 308 Permanent Redirect | <p>Permanent redirection.</p> <p>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.</p> <p>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].</p> |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |  |  |                        |                                                                                                                                                                                                                                                              |

**Table 5.36.2.3.3.2-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.36.2.3.3.3 PUT

The HTTP PUT method allows to update an existing "Individual ECS Address Configuration Information Set" resource at the NEF.

This method shall support the URI query parameters specified in table 5.36.2.3.3.3-1.

**Table 5.36.2.3.3.3-1: URI query parameters supported by the PUT method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.36.2.3.3.3-2 and the response data structures and response codes specified in table 5.36.2.3.3.3-3.

**Table 5.36.2.3.3.3-2: Data structures supported by the PUT Request Body on this resource**

| Data type   | P | Cardinality | Description                                                                                                 |
|-------------|---|-------------|-------------------------------------------------------------------------------------------------------------|
| EcsAddrInfo | M | 1           | Contains the updated representation of the "Individual ECS Address Configuration Information Set" resource. |

**Table 5.36.2.3.3.3-3: Data structures supported by the PUT Response Body on this resource**

| Data type   | P | Cardinality | Response codes         | Description                                                                                                                                                                                 |
|-------------|---|-------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EcsAddrInfo | M | 1           | 200 OK                 | Successful case. The "Individual ECS Address Configuration Information Set" resource is successfully updated and a representation of the updated resource is returned in the response body. |
| n/a         |   |             | 204 No Content         | Successful case. The "Individual ECS Address Configuration Information Set" resource is successfully updated and no content is returned in the response body.                               |
| n/a         |   |             | 307 Temporary Redirect | <p>Temporary redirection.</p> <p>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.</p>                 |

|                                                                                                                                     |  |  |                        |                                                                                                                                                                                                                                                       |
|-------------------------------------------------------------------------------------------------------------------------------------|--|--|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                     |  |  |                        | Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].                                                                                                                                                                             |
| n/a                                                                                                                                 |  |  | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP PUT method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |  |  |                        |                                                                                                                                                                                                                                                       |

**Table 5.36.2.3.3.3-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.36.2.3.3.3-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**5.36.2.3.3.3A PATCH**

This method enables to request the modification of an existing "Individual ECS Address Configuration Information Set" resource at the NEF.

This method shall support the URI query parameters specified in table 5.36.2.3.3.3A-1.

**Table 5.36.2.3.3.3A-1: URI query parameters supported by the PATCH method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.36.2.3.3.3A-2 and the response data structures and response codes specified in table 5.36.2.3.3.3A-3.

**Table 5.36.2.3.3.3A-2: Data structures supported by the PATCH Request Body on this resource**

| Data type        | P | Cardinality | Description                                                                                                  |
|------------------|---|-------------|--------------------------------------------------------------------------------------------------------------|
| EcsAddrInfoPatch | M | 1           | Contains the requested modifications to the "Individual ECS Address Configuration Information Set" resource. |

**Table 5.36.2.3.3.3A-3: Data structures supported by the PATCH Response Body on this resource**

| Data type   | P | Cardinality | Response codes | Description                                                                                                                                                                                      |
|-------------|---|-------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EcsAddrInfo | M | 1           | 200 OK         | Successful response. The "Individual ECS Address Configuration Information Set" resource is successfully modified and a representation of the updated resource is returned in the response body. |
| n/a         |   |             | 204 No Content | Successful response. The "Individual ECS Address Configuration Information Set" resource is successfully modified and no content is returned in the response body.                               |

|                                                                                                                                       |  |  |                        |                                                                                                                                                                                                                                                              |

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.36.2.3.3.4 DELETE

The HTTP DELETE method allows to delete an existing "Individual ECS Address Configuration Information Set" resource at the NEF.

This method shall support the URI query parameters specified in table 5.36.2.3.3.4-1.

**Table 5.36.2.3.3.4-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.36.2.3.3.4-2 and the response data structures and response codes specified in table 5.36.2.3.3.4-3.

**Table 5.36.2.3.3.4-2: Data structures supported by the DELETE Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.36.2.3.3.4-3: Data structures supported by the DELETE Response Body on this resource**

| Data type | P | Cardinality | Response codes         | Description                                                                                                   |
|-----------|---|-------------|------------------------|---------------------------------------------------------------------------------------------------------------|
| N/A       |   |             | 204 No Content         | Successful case. The "Individual ECS Address Configuration Information Set" resource is successfully deleted. |
| N/A       |   |             | 307 Temporary Redirect | Temporary redirection.                                                                                        |

|                                                                                                                                        |  |  |                        |                                                                                                                                                                                                                                                                          |

|                                                                                                                                        |  |  |                        | <div>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.</div> <div>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].</div>                                   |
| N/A                                                                                                                                    |  |  | 308 Permanent Redirect | <div>Permanent redirection.</div> <div>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.</div> <div>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].</div> |
| NOTE: The mandatory HTTP error status codes for the HTTP DELETE method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |  |  |                        |                                                                                                                                                                                                                                                                          |

Table 5.36.2.3.3.4-4: Headers supported by the 307 Response Code on this resource

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

Table 5.36.2.3.3.4-5: Headers supported by the 308 Response Code on this resource

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

5.36.2.3.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

5.36.3 Custom Operations without associated resources

5.36.3.1 Overview

The structure of the custom operation URIs of the ECSAddress API is shown in Figure 5.36.3.1-1.

Figure 5.36.3.1-1: Custom operation URI structure of the ECSAddress API

Table 5.36.3.1-1 provides an overview of the custom operations and applicable HTTP methods defined for the ECSAddress API.

Table 5.36.3.1-1: Custom operations without associated resources

| Custom operation name | Custom operation URI | Mapped HTTP method | Description                                                                                           |
|-----------------------|----------------------|--------------------|-------------------------------------------------------------------------------------------------------|
| RemoveEcsAddr         | /remove-ecsaddr      | POST               | Enables to request the NEF to delete ECS Address Configuration information based on given attributes. |

The custom operations shall support the URI variables defined in table 5.36.3.1-2.

**Table 5.36.3.1-2: URI variables for this custom operation**

| Name    | Data type | Definition         |
|---------|-----------|--------------------|
| apiRoot | string    | See clause 5.36.1. |

### 5.36.3.2 Operation: RemoveEcsAddr

#### 5.36.3.2.1 Description

The custom operation enables to delete ECS Address Configuration information based on given attributes.

#### 5.36.3.2.2 Operation Definition

This operation shall support the request data structures shown in Table 5.36.3.2.2-1 and the response data structures and error codes specified in Table 5.36.3.2.2-2.

**Table 5.36.3.2.2-1: Data structures supported by the POST Request Body on this resource**

| Data type             | P | Cardinality | Description                                                                                                |
|-----------------------|---|-------------|------------------------------------------------------------------------------------------------------------|
| EcsAddrDeleteCriteria | M | 1           | Contains the information about the criteria to be used for ECS Address Configuration information deletion. |

**Table 5.36.3.2.2-2: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                            | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|--------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a                                                                                                                                  |   |             | 204 No Content         | Successful case. The request to remove ECS Address Configuration information based on given criteria is successfully received and processed.                                                                                                          |
| n/a                                                                                                                                  |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                  |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in Table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.36.3.2.2-3: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.36.3.2.2-4: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

## 5.36.4 Notifications

There are no notifications defined for this API in this release of the specification.

## 5.36.5 Data Model

### 5.36.5.1 General

This clause specifies the application data model supported by the ECSAddress API. Table 5.36.5.1-1 specifies the data types defined for the ECSAddress API.

**Table 5.36.5.1-1: ECSAddress API specific Data Types**

| Data type             | Clause defined | Description                                                                         | Applicability |
|-----------------------|----------------|-------------------------------------------------------------------------------------|---------------|
| EcsAddrDeleteCriteria | 5.36.5.3.3     | Contains criteria for deleting ECS Address Configuration information.               |               |
| EcsAddrInfo           | 5.36.5.3.2     | Represents an ECS Address Configuration Information.                                |               |
| EcsAddrInfoPatch      | 5.36.5.3.4     | Represents the requested modifications to an ECS Address Configuration Information. |               |

Table 5.36.5.1-2 specifies data types re-used by the ECSAddress API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the ECSAddress API.

**Table 5.36.5.1-2: ECSAddress API re-used Data Types**

| Data type         | Reference           | Comments                                                                                                         | Applicability |
|-------------------|---------------------|------------------------------------------------------------------------------------------------------------------|---------------|
| Dnn               | 3GPP TS 29.571 [8]  | Represents a DNN.                                                                                                |               |
| EcsAuthMethod     | 3GPP TS 29.503 [17] | Represents the ECS Authentication Methods.                                                                       |               |
| EcsServerAddr     | 3GPP TS 29.571 [8]  | Represents the Edge Configuration Server (ECS) address configuration information.                                |               |
| Link              | 3GPP TS 29.122 [4]  | Represents a link.                                                                                               |               |
| Snssai            | 3GPP TS 29.571 [8]  | Represents an S-NSSAI.                                                                                           |               |
| SupportedFeatures | 3GPP TS 29.571 [8]  | Represents the list of supported feature(s) and is used to negotiate the applicability of the optional features. |               |
| SupportedPlmn     | 3GPP TS 29.503 [17] | ID of the PLMN supported by the ECS along with the list of ECSPs associated with the PLMN.                       |               |
| TargetUeid        | 5.6.3.3.7           | Represents the target UE(s) information.                                                                         |               |

### 5.36.5.2 Void

### 5.36.5.3 Structured data types

#### 5.36.5.3.1 Introduction

This clause defines the structured data types to be used in resource representations.

## 5.36.5.3.2 Type: EcsAddrInfo

Table 5.36.5.3.2-1: Definition of type EcsAddrInfo

| Attribute name      | Data type            | P | Cardinality | Description                                                                                                                                                         | Applicability |
|---------------------|----------------------|---|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| self                | Link                 | C | 0..1        | Identifies the individual resource.<br><br>This attribute shall be present in the HTTP GET response when retrieving all the resources for an AF.                    |               |
| ecsServerAddr       | EcsServerAddr        | M | 1           | Contains the ECS address(es).                                                                                                                                       |               |
| spatialValidityCond | SpatialValidityCond  | O | 0..1        | Contains the spatial validity conditions.                                                                                                                           |               |
| dnn                 | Dnn                  | O | 0..1        | Contains an HPLMN DNN.                                                                                                                                              |               |
| snssai              | Snssai               | O | 0..1        | Contains an HPLMN S-NSSAI.                                                                                                                                          |               |
| ecsAuthMethods      | array(EcsAuthMethod) | O | 1..N        | Contains the Supported ECS Authentication Method(s).                                                                                                                |               |
| supportedPlmns      | array(SupportedPlmn) | O | 1..N        | The List of PLMNs and associated ECSPs for which EDN configuration information can be provided by the ECS.                                                          |               |
| suppFeat            | SupportedFeatures    | C | 0..1        | Contains the list of supported features used as defined in clause 5.36.6.<br><br>This attribute shall be present only when feature negotiation needs to take place. |               |

## 5.36.5.3.3 Type: EcsAddrDeleteCriteria

Table 5.36.5.3.3-1: Definition of type EcsAddrDeleteCriteria

| Attribute name                                             | Data type         | P | Cardinality | Description                                                                                                                                                                          | Applicability |
|------------------------------------------------------------|-------------------|---|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| aflds                                                      | array(string)     | C | 1..N        | Contains the targeted identifier(s) of the AF(s).<br><br>(NOTE 1)                                                                                                                    |               |
| dnn                                                        | Dnn               | C | 0..1        | Contains the DNN to be used as deletion criterion.<br><br>(NOTE 1)                                                                                                                   |               |
| snssai                                                     | Snssai            | C | 0..1        | Contains the S-NSSAI to be used as deletion criterion.<br><br>(NOTE 1)                                                                                                               |               |
| ecsAddrInfo                                                | EcsAddrInfo       | C | 0..1        | Contains the ECS Address Configuration information to be used as deletion criterion. Only entries that are exact matches of this attribute shall be deleted.<br><br>(NOTE 1, NOTE 2) |               |
| suppFeat                                                   | SupportedFeatures | C | 0..1        | Contains the list of supported features used as defined in clause 5.36.6.<br><br>This attribute shall be present only when feature negotiation needs to take place.                  |               |
| NOTE 1: At least one of these attributes shall be present. |                   |   |             |                                                                                                                                                                                      |               |

NOTE 2: The "self" and "suppFeat" attributes of the "ecsAddrInfo" attribute (encoded using the EcsAddrInfo data type) shall not be provided and shall not be considered when finding the matching entries.

#### 5.36.5.3.4 Type: EcsAddrInfoPatch

**Table 5.36.5.3.4-1: Definition of type EcsAddrInfoPatch**

| Attribute name      | Data type            | P | Cardinality | Description                                                                                                         | Applicability |
|---------------------|----------------------|---|-------------|---------------------------------------------------------------------------------------------------------------------|---------------|
| ecsServerAddr       | EcsServerAddr        | O | 0..1        | Represents the updated ECS address(es) information.                                                                 |               |
| ecsAuthMethods      | array(EcsAuthMethod) | O | 1..N        | Contains the Supported ECS Authentication Method(s).                                                                |               |
| supportedPlmns      | array(SupportedPlmn) | O | 1..N        | Contains the List of PLMNs and associated ECSPs for which EDN configuration information can be provided by the ECS. |               |
| spatialValidityCond | SpatialValidityCond  | O | 0..1        | Contains the updated spatial validity conditions.                                                                   |               |

### 5.36.5.4 Simple data types and enumerations

#### 5.36.5.4.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

#### 5.36.5.4.2 Simple data types

The simple data types defined in table 5.36.5.4.2-1 shall be supported.

**Table 5.36.5.4.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

### 5.36.5.4 Data types describing alternative data types or combinations of data types

There are no data types describing alternative data types or combinations of data types defined for this API in this release of the specification.

## 5.36.6 Used Features

The optional features listed in table 5.36.6-1 are defined for the ECSAddress API. They shall be negotiated using the extensibility mechanism defined in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.36.6-1: Features used by ECSAddress API**

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|
|                |              |             |

## 5.36.7 Error handling

### 5.36.7.1 General

For the ECSAddress API, HTTP error responses shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4]. Protocol errors and application errors specified in clause 5.2.6 of 3GPP TS 29.122 [4] shall be supported for the HTTP status codes specified in table 5.2.6-1 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses are applicable for the ECSAddress API.

### 5.36.7.2 Protocol Errors

In this Release of the specification, there are no additional protocol errors applicable for the ECSAddress API.

### 5.36.7.3 Application Errors

The application errors defined for ECSAddress API are listed in table 5.36.7.3-1.

**Table 5.36.7.3-1: Application errors**

| Application Error | HTTP status code | Description | Applicability |
|-------------------|------------------|-------------|---------------|
|                   |                  |             |               |

## 5.37 RSLPPIParametersProvisioning API

### 5.37.1 Introduction

The Nnef\_ParameterProvision service shall use the RSLPPIParametersProvisioning API for:

- RSLPPI Parameters provisioning.

The API URI of the RSLPPIParametersProvisioning API shall be:

**{apiRoot}/<apiName>/<apiVersion>**

The request URIs used in HTTP requests shall have the Resource URI structure defined in clause 5.2.4 of 3GPP TS 29.122 [4], i.e.:

**{apiRoot}/<apiName>/<apiVersion>/<apiSpecificSuffixes>**

with the following components:

- "apiRoot" is set as defined in clause 5.2.4 of 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-rslppi-pp".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.
- The <apiSpecificSuffixes> shall be set as described in clause 5.2.4 of 3GPP TS 29.122 [4].

All resource URIs in the clauses below are defined relative to the above API URI.

### 5.37.2 Resources

#### 5.37.2.1 Overview

This clause describes the structure for the Resource URIs as shown in figure 5.37.2.1-1 and the resources and HTTP methods used for the RSLPPIParametersProvisioning API.

Figure 5.37.2.1-1: Resource URI structure of the RSLPPIParametersProvisioning API

Table 5.37.2.1-1 provides an overview of the resources and applicable HTTP methods.

Table 5.37.2.1-1: Resources and methods overview

| Resource name                             | Resource URI (relative path under API URI) | HTTP method or custom operation | Description (service operation)                                                      |
|-------------------------------------------|--------------------------------------------|---------------------------------|--------------------------------------------------------------------------------------|
| RSLPPI Parameters Provisionings           | /pp                                        | GET                             | Retrieve all the active RSLPPI Parameters Provisionings managed by the NEF.          |
|                                           |                                            | POST                            | Request the creation of a new RSLPPI Parameters Provisioning at the NEF.             |
| Individual RSLPPI Parameters Provisioning | /pp/{ppId}                                 | GET                             | Retrieve an existing "Individual RSLPPI Parameters Provisioning" managed by the NEF. |
|                                           |                                            | PUT                             | Update an existing "Individual RSLPPI Parameters Provisioning" managed by the NEF.   |
|                                           |                                            | PATCH                           | Modify an existing "Individual RSLPPI Parameters Provisioning" managed by the NEF.   |
|                                           |                                            | DELETE                          | Delete an existing "Individual RSLPPI Parameters Provisioning" managed by the NEF.   |

5.37.2.2 Resource: RSLPPI Parameters Provisionings

5.37.2.2.1 Introduction

This resource represents the collection of RSLPPI Parameters Provisionings managed by the NEF.  
This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [32]).

5.37.2.2.2 Resource Definition

Resource URI: {apiRoot}/3gpp-rslppi-pp/<apiVersion>/pp

This resource shall support the resource URI variables defined in table 5.37.2.2.2-1.

**Table 5.37.2.2.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition         |
|---------|-----------|--------------------|
| apiRoot | string    | See clause 5.37.1. |

### 5.37.2.2.3 Resource Methods

#### 5.37.2.2.3.1 GET

This method enables an AF to request to retrieve all the active RSLPPI Parameters Provisionings managed by the NEF.

This method shall support the URI query parameters specified in table 5.37.2.2.3.1-1.

**Table 5.37.2.2.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.37.2.2.3.1-2 and the response data structures and response codes specified in table 5.37.2.2.3.1-3.

**Table 5.37.2.2.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.37.2.2.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| array(RslppiPpData)                                                                                                                 | M | 0..N        | 200 OK                 | Successful case. All the "Individual RSLPPI Parameters Provisioning" resources managed by the NEF are returned.<br><br>If there are no existing "Individual RSLPPI Parameters Provisioning" resources managed at the NEF, an empty array is returned. |
| n/a                                                                                                                                 |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                 |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.37.2.2.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.37.2.2.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.37.2.2.3.2 POST

This method enables an AF to request the creation of a new RSLPPI Parameters Provisioning at the NEF.

This method shall support the URI query parameters specified in table 5.37.2.2.3.2-1.

**Table 5.37.2.2.3.2-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.37.2.2.3.2-2 and the response data structures and response codes specified in table 5.37.2.2.3.2-3.

**Table 5.37.2.2.3.2-2: Data structures supported by the POST Request Body on this resource**

| Data type    | P | Cardinality | Description                                                                                 |
|--------------|---|-------------|---------------------------------------------------------------------------------------------|
| RslppiPpData | M | 1           | Contains the representation of the RSLPPI Parameters Provisioning to be created at the NEF. |

**Table 5.37.2.2.3.2-3: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                      | P | Cardinality | Response codes | Description                                                                                                                                                                                                                    |
|--------------------------------------------------------------------------------------------------------------------------------|---|-------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RslppiPpData                                                                                                                   | M | 1           | 201 Created    | Successful case. A representation of the created "Individual RSLPPI Parameters Provisioning" resource is returned in the response body.<br><br>The URI of the created resource shall be returned in an HTTP "Location" header. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                |                                                                                                                                                                                                                                |

**Table 5.37.2.2.3.2-4: Headers supported by the 201 response code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                    |
|----------|-----------|---|-------------|--------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains the URI of the newly created resource, according to the structure:<br>{apiRoot}/3gpp-rslppi-pp/<apiVersion>/pp/{ppId} |

#### 5.37.2.2.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.37.2.3 Resource: Individual RSLPPI Parameters Provisioning

#### 5.37.2.3.1 Introduction

This resource represents an "Individual RSLPPI Parameters Provisioning" resource managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [32]).

## 5.37.2.3.2 Resource Definition

Resource URI: {apiRoot}/3gpp-rslppi-pp/<apiVersion>/pp/{ppId}

This resource shall support the resource URI variables defined in table 5.37.2.3.2-1.

**Table 5.37.2.3.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition                                                                             |
|---------|-----------|----------------------------------------------------------------------------------------|
| apiRoot | string    | See clause 5.37.1.                                                                     |
| ppId    | string    | Represents the identifier of the "Individual RSLPPI Parameters Provisioning" resource. |

## 5.37.2.3.3 Resource Methods

## 5.37.2.3.3.1 GET

This method enables an AF to request to retrieve an existing "Individual RSLPPI Parameters Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.37.2.3.3.1-1.

**Table 5.37.2.3.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.37.2.3.3.1-2 and the response data structures and response codes specified in table 5.37.2.3.3.1-3.

**Table 5.37.2.3.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.37.2.3.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RslppiPpData                                                                                                                        | M | 1           | 200 OK                 | Successful case. The requested "Individual RSLPPI Parameters Provisioning" resource is returned in the response body.                                                                                                                                 |
| n/a                                                                                                                                 |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                 |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.37.2.3.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.37.2.3.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.37.2.3.3.2 PUT

This method enables an AF to request the update of an existing "Individual RSLPPI Parameters Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.37.2.3.3.2-1.

**Table 5.37.2.3.3.2-1: URI query parameters supported by the PUT method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.37.2.3.3.2-2 and the response data structures and response codes specified in table 5.37.2.3.3.2-3.

**Table 5.37.2.3.3.2-2: Data structures supported by the PUT Request Body on this resource**

| Data type    | P | Cardinality | Description                                                                                 |
|--------------|---|-------------|---------------------------------------------------------------------------------------------|
| RslppiPpData | M | 1           | Represents the updated "Individual RSLPPI Parameters Provisioning" resource representation. |

**Table 5.37.2.3.3.2-3: Data structures supported by the PUT Response Body on this resource**

| Data type    | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|--------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RslppiPpData | M | 1           | 200 OK                 | Successful response. The "Individual RSLPPI Parameters Provisioning" resource is successfully updated and a representation of the updated resource is returned in the response body.                                                                  |
| n/a          |   |             | 204 No Content         | Successful response. The "Individual RSLPPI Parameters Provisioning" resource is successfully updated and no content is returned in the response body.                                                                                                |
| n/a          |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a          |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |

NOTE: The mandatory HTTP error status codes for the HTTP PUT method listed in Table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply.

**Table 5.37.2.3.3.2-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                |
|----------|-----------|---|-------------|----------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI of the resource located in an alternative NEF. |

**Table 5.37.2.3.3.2-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                |
|----------|-----------|---|-------------|----------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI of the resource located in an alternative NEF. |

### 5.37.2.3.3.3 PATCH

This method enables an AF to request the modification of an existing "Individual RSLPPI Parameters Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.37.2.3.3.3-1.

**Table 5.37.2.3.3.3-1: URI query parameters supported by the PATCH method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.37.2.3.3.3-2 and the response data structures and response codes specified in table 5.37.2.3.3.3-3.

**Table 5.37.2.3.3.3-2: Data structures supported by the PATCH Request Body on this resource**

| Data type         | P | Cardinality | Description                                                                                         |
|-------------------|---|-------------|-----------------------------------------------------------------------------------------------------|
| RslppiPpDataPatch | M | 1           | Represents the requested modifications to the "Individual RSLPPI Parameters Provisioning" resource. |

**Table 5.37.2.3.3.3-3: Data structures supported by the PATCH Response Body on this resource**

| Data type    | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|--------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RslppiPpData | M | 1           | 200 OK                 | Successful response. The "Individual RSLPPI Parameters Provisioning" resource is successfully modified and a representation of the updated resource is returned in the response body.                                                                 |
| n/a          |   |             | 204 No Content         | Successful response. The "Individual RSLPPI Parameters Provisioning" resource is successfully modified and no content is returned in the response body.                                                                                               |
| n/a          |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a          |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.                                                                                  |

|                                                                                                                                       |  |  |  |                                                                           |
|---------------------------------------------------------------------------------------------------------------------------------------|--|--|--|---------------------------------------------------------------------------|
|                                                                                                                                       |  |  |  | Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP PATCH method listed in Table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |  |  |  |                                                                           |

**Table 5.37.2.3.3.3-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                |
|----------|-----------|---|-------------|----------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI of the resource located in an alternative NEF. |

**Table 5.37.2.3.3.3-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                |
|----------|-----------|---|-------------|----------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI of the resource located in an alternative NEF. |

**5.37.2.3.3.4 DELETE**

This method enables an AF to request the deletion of an existing "Individual RSLPPI Parameters Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.37.2.3.3.4-1.

**Table 5.37.2.3.3.4-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.37.2.3.3.4-2 and the response data structures and response codes specified in table 5.37.2.3.3.4-3.

**Table 5.37.2.3.3.4-2: Data structures supported by the DELETE Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.37.2.3.3.4-3: Data structures supported by the DELETE Response Body on this resource**

| Data type | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-----------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a       |   |             | 204 No Content         | Successful case. The "Individual RSLPPI Parameters Provisioning" resource is successfully deleted.                                                                                                                                                    |
| n/a       |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a       |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |

NOTE: The mandatory HTTP error status codes for the HTTP DELETE method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply.

**Table 5.37.2.3.3.4-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.37.2.3.3.4-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.37.2.3.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.37.3 Custom Operations without associated resources

There are no custom operations without associated resources defined for this API in this release of the specification.

### 5.37.4 Notifications

There are no notifications defined for this API in this release of the specification.

### 5.37.5 Data Model

#### 5.37.5.1 General

This clause specifies the application data model supported by the RSLPPIParametersProvisioning API. Table 5.37.5.1-1 specifies the data types defined for the RSLPPIParametersProvisioning API.

**Table 5.37.5.1-1: RSLPPIParametersProvisioning API specific Data Types**

| Data type         | Clause defined | Description                                                                               | Applicability |
|-------------------|----------------|-------------------------------------------------------------------------------------------|---------------|
| RslppiData        | 5.37.5.2.2     | Represents RSLPPI parameters data.                                                        |               |
| RslppiPpData      | 5.37.5.2.3     | Represents RSLPPI Parameters Provisioning data.                                           |               |
| RslppiPpDataPatch | 5.37.5.2.4     | Represents the requested modification to an existing RSLPPI Parameters Provisioning data. |               |

Table 5.37.5.1-2 specifies data types re-used by the RSLPPIParametersProvisioning API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the RSLPPIParametersProvisioning API.

**Table 5.37.5.1-2: RSLPPIParametersProvisioning API re-used Data Types**

| Data type         | Reference           | Comments                                                                                                      | Applicability |
|-------------------|---------------------|---------------------------------------------------------------------------------------------------------------|---------------|
| ExternalGroupId   | 3GPP TS 29.122 [4]  | Represents the External Group Identifier for a user group.                                                    |               |
| Gpsi              | 3GPP TS 29.571 [8]  | Represents a GPSI.                                                                                            |               |
| Rslppi            | 3GPP TS 29.503 [17] | Represents the RSLPPI information.                                                                            |               |
| SupportedFeatures | 3GPP TS 29.571 [8]  | Represents the list of supported feature(s) and used to negotiate the applicability of the optional features. |               |

## 5.37.5.2 Structured data types

### 5.37.5.2.1 Introduction

This clause defines the structures to be used in resource representations.

### 5.37.5.2.2 Type: RslppiData

**Table 5.37.5.2.2-1: Definition of type RslppiData**

| Attribute name                                                                      | Data type       | P | Cardinality | Description                                                               | Applicability |
|-------------------------------------------------------------------------------------|-----------------|---|-------------|---------------------------------------------------------------------------|---------------|
| extGroupld                                                                          | ExternalGroupld | C | 0..1        | Represents the external group identifier of the targeted group.<br>(NOTE) |               |
| gpsi                                                                                | Gpsi            | C | 0..1        | Represents the GPSI of the targeted UE.<br>(NOTE)                         |               |
| rslppi                                                                              | Rslppi          | M | 1           | Contains the RSLPPI parameters.                                           |               |
| NOTE: These attributes are mutually exclusive. Either one of them shall be present. |                 |   |             |                                                                           |               |

### 5.37.5.2.3 Type: RslppiPpData

**Table 5.37.5.2.3-1: Definition of type RslppiPpData**

| Attribute name | Data type         | P | Cardinality | Description                                                                                                                                                                | Applicability |
|----------------|-------------------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| afld           | string            | M | 1           | Contains the identifier of the AF that is sending the request.                                                                                                             |               |
| rslppiData     | RslppiData        | C | 0..1        | Contains the RSLPPI data that the AF requests to provision.<br><br>This attribute shall be present only when the AF requests to provision RSLPPI parameters.               |               |
| suppFeat       | SupportedFeatures | C | 0..1        | Contains the list of supported features among the ones defined in clause 5.37.6.<br><br>This attribute shall be present when only feature negotiation needs to take place. |               |
|                |                   |   |             |                                                                                                                                                                            |               |

### 5.37.5.2.4 Type: RslppiPpDataPatch

**Table 5.37.5.2.4-1: Definition of type RslppiPpDataPatch**

| Attribute name | Data type  | P | Cardinality | Description                                                          | Applicability |
|----------------|------------|---|-------------|----------------------------------------------------------------------|---------------|
| rslppiData     | RslppiData | O | 0..1        | Contains the modified RSLPPI data that the AF requests to provision. |               |

## 5.37.5.3 Simple data types and enumerations

### 5.37.5.3.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

### 5.37.5.3.2 Simple data types

The simple data types defined in table 5.37.5.3.2-1 shall be supported.

**Table 5.37.5.3.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

### 5.37.5.4 Data types describing alternative data types or combinations of data types

There are no custom operations without associated resources defined for this API in this release of the specification.

## 5.37.6 Used Features

The table below defines the features applicable to the RSLPPIParametersProvisioning API. Those features are negotiated as described in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.37.6-1: Supported Features**

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|
|                |              |             |

## 5.37.7 Error handling

### 5.37.7.1 General

For the RSLPPIParametersProvisioning API, HTTP error responses shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4]. Protocol errors and application errors specified in clause 5.2.6 of 3GPP TS 29.122 [4] shall be supported for the HTTP status codes specified in table 5.2.6-1 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses are applicable for the RSLPPIParametersProvisioning API.

### 5.37.7.2 Protocol Errors

In this Release of the specification, there are no additional protocol errors applicable for the RSLPPIParametersProvisioning API.

### 5.37.7.3 Application Errors

The application errors defined for the RSLPPIParametersProvisioning API are listed in table 5.37.7.3-1.

**Table 5.37.7.3-1: Application errors**

| Application Error | HTTP status code | Description | Applicability |
|-------------------|------------------|-------------|---------------|
|                   |                  |             |               |

## 5.38 AddressingParamProvision API

### 5.38.1 Introduction

The Nnef\_ParameterProvision service shall use the AddressingParamProvision API for:

- Static IP Address Parameters provisioning.

The API URI of the AddressingParamProvision API shall be:

**{apiRoot}/<apiName>/<apiVersion>**

The request URIs used in HTTP requests shall have the Resource URI structure defined in clause 5.2.4 of 3GPP TS 29.122 [4], i.e.:

**{apiRoot}/<apiName>/<apiVersion>/<apiSpecificSuffixes>**

with the following components:

- "apiRoot" is set as defined in clause 5.2.4 of 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-addr-pp".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.
- The <apiSpecificSuffixes> shall be set as described in clause 5.2.4 of 3GPP TS 29.122 [4].

All resource URIs in the clauses below are defined relative to the above API URI.

5.38.2 Resources

5.38.2.1 Overview

This clause describes the structure for the Resource URIs as shown in figure 5.38.2.1-1 and the resources and HTTP methods used for the AddressingParamProvision API.

**Figure 5.38.2.1-1: Resource URI structure of the AddressingParamProvision API**

Table 5.38.2.1-1 provides an overview of the resources and applicable HTTP methods.

**Table 5.38.2.1-1: Resources and methods overview**

| Resource name                                 | Resource URI (relative path under API URI) | HTTP method or custom operation | Description (service operation)                                                          |
|-----------------------------------------------|--------------------------------------------|---------------------------------|------------------------------------------------------------------------------------------|
| Addressing Parameters Provisionings           | /pp                                        | GET                             | Retrieve all the active Addressing Parameters Provisionings managed by the NEF.          |
|                                               |                                            | POST                            | Request the creation of a new Addressing Parameters Provisioning at the NEF.             |
| Individual Addressing Parameters Provisioning | /pp/{ppId}                                 | GET                             | Retrieve an existing "Individual Addressing Parameters Provisioning" managed by the NEF. |

|  |  |        |                                                                                        |
|--|--|--------|----------------------------------------------------------------------------------------|
|  |  | PUT    | Update an existing "Individual Addressing Parameters Provisioning" managed by the NEF. |
|  |  | PATCH  | Modify an existing "Individual Addressing Parameters Provisioning" managed by the NEF. |
|  |  | DELETE | Delete an existing "Individual Addressing Parameters Provisioning" managed by the NEF. |

## 5.38.2.2 Resource: Addressing Parameters Provisionings

### 5.38.2.2.1 Introduction

This resource represents the collection of Addressing Parameters Provisionings managed by the NEF.

This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [32]).

### 5.38.2.2.2 Resource Definition

Resource URI: **{apiRoot}/3gpp-addr-pp/<apiVersion>/pp**

This resource shall support the resource URI variables defined in table 5.38.2.2.2-1.

**Table 5.38.2.2.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition         |
|---------|-----------|--------------------|
| apiRoot | string    | See clause 5.38.1. |

### 5.38.2.2.3 Resource Standard Methods

#### 5.38.2.2.3.1 GET

This method enables an AF to request to retrieve all the active Addressing Parameters Provisionings managed by the NEF.

This method shall support the URI query parameters specified in table 5.38.2.2.3.1-1.

**Table 5.38.2.2.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.38.2.2.3.1-2 and the response data structures and response codes specified in table 5.38.2.2.3.1-3.

**Table 5.38.2.2.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.38.2.2.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type | P | Cardinality | Response codes | Description |
|-----------|---|-------------|----------------|-------------|
|-----------|---|-------------|----------------|-------------|

|                                                                                                                                     |   |      |                        |                                                                                                                                                                                                                                                                 |
|-------------------------------------------------------------------------------------------------------------------------------------|---|------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| array(AddrPpData)                                                                                                                   | M | 0..N | 200 OK                 | Successful case. All the "Individual Addressing Parameters Provisioning" resource(s) managed by the NEF are returned.<br><br>If there are no existing "Individual Addressing Parameters Provisioning" resources managed at the NEF, an empty array is returned. |
| n/a                                                                                                                                 |   |      | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].           |
| n/a                                                                                                                                 |   |      | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].           |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |      |                        |                                                                                                                                                                                                                                                                 |

**Table 5.38.2.2.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.38.2.2.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**5.38.2.2.3.2 POST**

This method enables an AF to request the creation of a new Addressing Parameters Provisioning at the NEF.

This method shall support the URI query parameters specified in table 5.38.2.2.3.2-1.

**Table 5.38.2.2.3.2-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.38.2.2.3.2-2 and the response data structures and response codes specified in table 5.38.2.2.3.2-3.

**Table 5.38.2.2.3.2-2: Data structures supported by the POST Request Body on this resource**

| Data type  | P | Cardinality | Description                                                                                     |
|------------|---|-------------|-------------------------------------------------------------------------------------------------|
| AddrPpData | M | 1           | Contains the representation of the Addressing Parameters Provisioning to be created at the NEF. |

**Table 5.38.2.2.3.2-3: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                              | P | Cardinality | Response codes | Description                                                                                                                                                                                                                        |
|----------------------------------------------------------------------------------------------------------------------------------------|---|-------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AddrPpData                                                                                                                             | M | 1           | 201 Created    | Successful case. A representation of the created "Individual Addressing Parameters Provisioning" resource is returned in the response body.<br><br>The URI of the created resource shall be returned in an HTTP "Location" header. |
| ProblemDetails                                                                                                                         | O | 0..1        | 403 Forbidden  | (NOTE 2)                                                                                                                                                                                                                           |
| NOTE 1: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                |                                                                                                                                                                                                                                    |
| NOTE 2: Failure causes are described in clause 5.38.7.                                                                                 |   |             |                |                                                                                                                                                                                                                                    |

**Table 5.38.2.2.3.2-4: Headers supported by the 201 response code on this resource**

|----------|-----------|---|-------------|------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains the URI of the newly created resource, according to the structure:<br>{apiRoot}/3gpp-addr-pp/<apiVersion>/pp/{ppId} |

#### 5.38.2.2.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.38.2.3 Resource: Individual Addressing Parameters Provisioning

#### 5.38.2.3.1 Introduction

This resource represents an "Individual Addressing Parameters Provisioning" resource managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [32]).

#### 5.38.2.3.2 Resource Definition

Resource URI: {apiRoot}/3gpp-addr-pp/<apiVersion>/pp/{ppId}

This resource shall support the resource URI variables defined in table 5.38.2.3.2-1.

**Table 5.38.2.3.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition                                                                                 |
|---------|-----------|--------------------------------------------------------------------------------------------|
| apiRoot | string    | See clause 5.38.1.                                                                         |
| ppId    | string    | Represents the identifier of the "Individual Addressing Parameters Provisioning" resource. |

#### 5.38.2.3.3 Resource Standard Methods

##### 5.38.2.3.3.1 GET

This method enables an AF to request to retrieve an existing "Individual Addressing Parameters Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.38.2.3.3.1-1.

**Table 5.38.2.3.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.38.2.3.3.1-2 and the response data structures and response codes specified in table 5.38.2.3.3.1-3.

**Table 5.38.2.3.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |

#### 5.38.2.3.3.2 PUT

This method enables an AF to request the update of an existing "Individual Addressing Parameters Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.38.2.3.3.2-1.

**Table 5.38.2.3.3.2-1: URI query parameters supported by the PUT method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.38.2.3.3.2-2 and the response data structures and response codes specified in table 5.38.2.3.3.2-3.

**Table 5.38.2.3.3.2-2: Data structures supported by the PUT Request Body on this resource**

| Data type  | P | Cardinality | Description                                                                                     |
|------------|---|-------------|-------------------------------------------------------------------------------------------------|
| AddrPpData | M | 1           | Represents the updated "Individual Addressing Parameters Provisioning" resource representation. |

**Table 5.38.2.3.3.2-3: Data structures supported by the PUT Response Body on this resource**

| Data type                                                                                                                             | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|---------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AddrPpData                                                                                                                            | M | 1           | 200 OK                 | Successful response. The "Individual Addressing Parameters Provisioning" resource is successfully updated and a representation of the updated resource is returned in the response body.                                                              |
| n/a                                                                                                                                   |   |             | 204 No Content         | Successful response. The "Individual Addressing Parameters Provisioning" resource is successfully updated and no content is returned in the response body.                                                                                            |
| n/a                                                                                                                                   |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |

#### 5.38.2.3.3.3 PATCH

This method enables an AF to request the modification of an existing "Individual Addressing Parameters Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.38.2.3.3.3-1.

**Table 5.38.2.3.3.3-1: URI query parameters supported by the PATCH method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.38.2.3.3.3-2 and the response data structures and response codes specified in table 5.38.2.3.3.3-3.

**Table 5.38.2.3.3.3-2: Data structures supported by the PATCH Request Body on this resource**

| Data type       | P | Cardinality | Description                                                                                             |
|-----------------|---|-------------|---------------------------------------------------------------------------------------------------------|
| AddrPpDataPatch | M | 1           | Represents the requested modifications to the "Individual Addressing Parameters Provisioning" resource. |

| Location | string    | M | 1           | Contains an alternative URI of the resource located in an alternative NEF. |

## 5.38.2.3.3.4 DELETE

This method enables an AF to request the deletion of an existing "Individual Addressing Parameters Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.38.2.3.3.4-1.

**Table 5.38.2.3.3.4-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.38.2.3.3.4-2 and the response data structures and response codes specified in table 5.38.2.3.3.4-3.

**Table 5.38.2.3.3.4-2: Data structures supported by the DELETE Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.38.2.3.3.4-3: Data structures supported by the DELETE Response Body on this resource**

| Data type                                                                                                                              | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|----------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a                                                                                                                                    |   |             | 204 No Content         | Successful case. The "Individual Addressing Parameters Provisioning" resource is successfully deleted.                                                                                                                                                |
| n/a                                                                                                                                    |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                    |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP DELETE method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.38.2.3.3.4-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

## 5.38.2.3.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.38.3 Custom Operations without associated resources

There are no custom operations without associated resources defined for this API in this release of the specification.

### 5.38.4 Notifications

There are no notifications defined for this API in this release of the specification.

### 5.38.5 Data Model

#### 5.38.5.1 General

This clause specifies the application data model supported by the AddressingParamProvision API. Table 5.38.5.1-1 specifies the data types defined for the AddressingParamProvision API.

**Table 5.38.5.1-1: AddressingParamProvision API specific Data Types**

| Data type          | Clause defined | Description                                                                              | Applicability |
|--------------------|----------------|------------------------------------------------------------------------------------------|---------------|
| AddrPpData         | 5.38.5.2.2     | Represents the Addressing Parameters data.                                               |               |
| StaticIpAddrParams | 5.38.5.2.3     | Represents Static IP Address Parameters data.                                            |               |
| AddrPpDataPatch    | 5.38.5.2.4     | Represents the requested modification to an existing Addressing Parameters Provisioning. |               |

Table 5.38.5.1-2 specifies data types re-used by the AddressingParamProvision API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the AddressingParamProvision API.

**Table 5.38.5.1-2: AddressingParamProvision API re-used Data Types**

| Data type         | Reference          | Comments                                                                                                      | Applicability |
|-------------------|--------------------|---------------------------------------------------------------------------------------------------------------|---------------|
| Dnn               | 3GPP TS 29.571 [8] | Represents a DNN.                                                                                             |               |
| Gpsi              | 3GPP TS 29.571 [8] | Represents a GPSI.                                                                                            |               |
| IpAddr            | 3GPP TS 29.571 [8] | Represents an IP address (IPv4, or IPv6, or IPv6 prefix).                                                     |               |
| ProblemDetails    | 3GPP TS 29.571 [8] | Represents error related information.                                                                         |               |
| Snsai             | 3GPP TS 29.571 [8] | Represents an S-NSSAI.                                                                                        |               |
| SupportedFeatures | 3GPP TS 29.571 [8] | Represents the list of supported feature(s) and used to negotiate the applicability of the optional features. |               |

#### 5.38.5.2 Structured data types

##### 5.38.5.2.1 Introduction

This clause defines the structures to be used in resource representations.

##### 5.38.5.2.2 Type: AddrPpData

**Table 5.38.5.2.2-1: Definition of type AddrPpData**

| Attribute name     | Data type                 | P | Cardinality | Description                                                                          | Applicability |
|--------------------|---------------------------|---|-------------|--------------------------------------------------------------------------------------|---------------|
| afId               | string                    | M | 1           | Contains the identifier of the AF that is sending the request.                       |               |
| staticIpaddrParams | array(StaticIpAddrParams) | C | 1..N        | Contains the Static IP Addressing Parameters data that the AF requests to provision. |               |

|          |                   |   |      |                                                                                                                                                                            |  |
|----------|-------------------|---|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
|          |                   |   |      | This attribute shall be present only when the AF requests to provision static IP addressing parameters.                                                                    |  |
| suppFeat | SupportedFeatures | C | 0..1 | Contains the list of supported features among the ones defined in clause 5.38.6.<br><br>This attribute shall be present only when feature negotiation needs to take place. |  |

### 5.38.5.2.3 Type: StaticIpAddrParams

**Table 5.38.5.2.3-1: Definition of type StaticIpAddrParams**

| Attribute name    | Data type     | P | Cardinality | Description                                                                                                 | Applicability |
|-------------------|---------------|---|-------------|-------------------------------------------------------------------------------------------------------------|---------------|
| dnn               | Dnn           | M | 1           | Contains the DNN to which the provisioned static IP addressing parameters data is related.                  |               |
| snssai            | Snssai        | M | 1           | Contains the S-NSSAI to which the provisioned static IP addressing parameters data is related.              |               |
| gpsi              | Gpsi          | O | 0..1        | Contains the identifier of the UE to which the provisioned static IP addressing parameters data is related. |               |
| staticIpAddresses | array(IpAddr) | M | 1..N        | Contains the provisioned static IP address(es) of the UE.                                                   |               |

### 5.38.5.2.4 Type: AddrPpDataPatch

**Table 5.38.5.2.4-1: Definition of type AddrPpDataPatch**

| Attribute name                                                                                                                         | Data type                 | P | Cardinality | Description                                                                                         | Applicability |
|----------------------------------------------------------------------------------------------------------------------------------------|---------------------------|---|-------------|-----------------------------------------------------------------------------------------------------|---------------|
| staticIpAddrParams                                                                                                                     | array(StaticIpAddrParams) | O | 1..N        | Contains the modified Static IP address parameters that the AF requests to provision.<br><br>(NOTE) |               |
| NOTE: The "dnn", "snssai" and "gpsi" attributes within each array element of the "staticIpAddrParams" attribute shall not be modified. |                           |   |             |                                                                                                     |               |

## 5.38.5.3 Simple data types and enumerations

### 5.38.5.3.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

### 5.38.5.3.2 Simple data types

The simple data types defined in table 5.38.5.3.2-1 shall be supported.

**Table 5.38.5.3.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

### 5.38.5.4 Data types describing alternative data types or combinations of data types

There are no custom operations without associated resources defined for this API in this release of the specification.

## 5.38.5.5 Binary data

### 5.38.5.5.1 Binary Data Types

**Table 5.38.5.5.1-1: Binary Data Types**

| Name | Clause defined | Content type |
|------|----------------|--------------|
|      |                |              |

## 5.38.6 Used Features

The optional features in table 5.38.6-1 are defined for the AddressingParamProvision API. They shall be negotiated using the extensibility mechanism defined in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.38.6-1: Supported Features**

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|
|                |              |             |

## 5.38.7 Error handling

### 5.38.7.1 General

For the AddressingParamProvision API, HTTP error responses shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4]. Protocol errors and application errors specified in clause 5.2.6 of 3GPP TS 29.122 [4] shall be supported for the HTTP status codes specified in table 5.2.6-1 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses are applicable for the AddressingParamProvision API.

### 5.38.7.2 Protocol Errors

No specific procedures for the AddressingParamProvision API are specified.

### 5.38.7.3 Application Errors

The application errors defined for the AddressingParamProvision API are listed in table 5.38.7.3-1.

**Table 5.38.7.3-1: Application errors**

| Application Error    | HTTP status code | Description                                                                                                                                                                                                                                             | Applicability |
|----------------------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| OUT_OF_ALLOWED_RANGE | 403 Forbidden    | Indicates that the Static IP Addressing Parameters Provisioning request is rejected because the provided static IP addressing parameters provisioning data is not within the IP address/prefix range allowed for the target DNN and S-NSSAI for the AF. |               |

## 5.39 UAVFlightAssistance API

### 5.39.1 Introduction

The UAVFlightAssistance service shall use the UAVFlightAssistance API.

The API URI of UAVFlightAssistance API shall be:

**{apiRoot}/<apiName>/<apiVersion>**

The request URIs used in HTTP requests shall have the Resource URI structure defined in clause 5.2.4 of 3GPP TS 29.122 [2], i.e.:

**{apiRoot}/<apiName>/<apiVersion>/<apiSpecificSuffixes>**

with the following components:

- "apiRoot" is set as defined in clause 5.2.4 of 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-uav-fa".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.
- The <apiSpecificSuffixes> shall be set as described in clause 5.2.4 of 3GPP TS 29.122 [4].

All resource URIs in the clauses below are defined relative to the above API URI.

5.39.2 Resources

5.39.2.1 Overview

This clause describes the structure for the Resource URIs as shown in Figure 5.39.2.1-1 and the resources and HTTP methods used for the UAVFlightAssistance API.

**Figure 5.39.2.1-1: Resource URI structure of the UAVFlightAssistance API**

Table 5.39.2.1-1 provides an overview of the resources and applicable HTTP methods.

**Table 5.39.2.1-1: Resources and methods overview**

| Resource name                        | Resource URI (relative path under API URI) | HTTP method or custom operation | Description (service operation)                                                    |
|--------------------------------------|--------------------------------------------|---------------------------------|------------------------------------------------------------------------------------|
| UAV Flight Assistance Configurations | /{afld}/configurations                     | GET                             | Retrieve all the active UAV Flight Assistance Configuration(s) managed by the NEF. |
|                                      |                                            | POST                            | Create a new UAV Flight Assistance Configuration.                                  |

|                                                |                                         |        |                                                                                 |
|------------------------------------------------|-----------------------------------------|--------|---------------------------------------------------------------------------------|
| Individual UAV Flight Assistance Configuration | {afld}/configurations/{configurationId} | GET    | Retrieve an existing "Individual UAV Flight Assistance Configuration" resource. |
|                                                |                                         | PUT    | Update an existing "Individual UAV Flight Assistance Configuration" resource.   |
|                                                |                                         | PATCH  | Modify an existing "Individual UAV Flight Assistance Configuration" resource.   |
|                                                |                                         | DELETE | Delete an existing "Individual UAV Flight Assistance Configuration" resource.   |

### 5.39.2.2 Resource: UAV Flight Assistance Configurations

#### 5.39.2.2.1 Introduction

This resource represents the collection of UAV Flight Assistance Configurations managed by the NEF for a given AF.

This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [32]).

#### 5.39.2.2.2 Resource definition

Resource URI: **{apiRoot}/3gpp-uav-fa/<apiVersion>/{afld}/configurations**

This resource shall support the resource URI variables defined in table 5.39.2.2.2-1.

**Table 5.39.2.2.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition                           |
|---------|-----------|--------------------------------------|
| apiRoot | string    | See clause 5.39.1.                   |
| afld    | string    | Represents the identifier of the AF. |

#### 5.39.2.2.3 Resource Standard Methods

##### 5.39.2.2.3.0 GET

This method enables an AF to request to retrieve all the active "UAV Flight Assistance Configurations" resources managed by the NEF.

This method shall support the URI query parameters specified in table 5.39.2.2.3.0-1.

**Table 5.39.2.2.3.0-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.39.2.2.3.0-2 and the response data structures and response codes specified in table 5.39.2.2.3.0-3.

**Table 5.39.2.2.3.0-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.39.2.2.3.0-3: Data structures supported by the GET Response Body on this resource**

| Data type | P | Cardinality | Response codes | Description |
|-----------|---|-------------|----------------|-------------|
|-----------|---|-------------|----------------|-------------|

|                                                                                                                                     |   |      |                        |                                                                                                                                                                                                                                                                   |
|-------------------------------------------------------------------------------------------------------------------------------------|---|------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| array(UavFlightAssistance)                                                                                                          | M | 0..N | 200 OK                 | Successful case. All the "Individual UAV Flight Assistance Configuration" resource(s) managed by the NEF are returned.<br><br>If there are no existing "Individual UAV Flight Assistance Configuration" resources managed at the NEF, an empty array is returned. |
| n/a                                                                                                                                 |   |      | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].             |
| n/a                                                                                                                                 |   |      | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].             |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |      |                        |                                                                                                                                                                                                                                                                   |

**Table 5.39.2.2.3.0-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.39.2.2.3.0-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**5.39.2.2.3.1 POST**

This method enables an AF to request the creation of a new UAV Flight Assistance Configuration at the NEF.

This method shall support the URI query parameters specified in table 5.39.2.2.3.1-1.

**Table 5.39.2.2.3.1-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.39.2.2.3.1-2 and the response data structures and response codes specified in table 5.39.2.2.3.1-3.

**Table 5.39.2.2.3.1-2: Data structures supported by the POST request body on this resource**

| Data type           | P | Cardinality | Description                                                                                  |
|---------------------|---|-------------|----------------------------------------------------------------------------------------------|
| UavFlightAssistance | M | 1           | Contains the representation of UAV Flight Assistance Configuration to be created at the NEF. |

**Table 5.39.2.2.3.1-3: Data structures supported by the POST response body on this resource**

| Data type                                                                                                                            | P | Cardinality | Response codes | Description                                                                                                                                                                                                                         |
|--------------------------------------------------------------------------------------------------------------------------------------|---|-------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UavFlightAssistance                                                                                                                  | M | 1           | 201 Created    | Successful case. A representation of the created "Individual UAV Flight Assistance Configuration" resource is returned in the response body.<br><br>The URI of the created resource shall be returned in an HTTP "Location" header. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                |                                                                                                                                                                                                                                     |

**Table 5.39.2.2.3.1-4: Headers supported by the 201 response code on this resource**

| HTTP response header | Data type | P | Cardinality | Description                                                                                                                                               |
|----------------------|-----------|---|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Location             | string    | M | 1           | Contains the URI of the newly created resource, according to the structure:<br>{apiRoot}/3gpp-uav-fa/<apiVersion>/{afId}/configurations/{configurationId} |

#### 5.39.2.2.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.39.2.3 Resource: Individual UAV Flight Assistance Configuration

#### 5.39.2.3.1 Introduction

This resource represents an "Individual UAV Flight Assistance Configuration" resource managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [32]).

#### 5.39.2.3.2 Resource Definition

Resource URI: {apiRoot}/3gpp-uav-fa/<apiVersion>/{afId}/configurations/{configurationId}

This resource shall support the resource URI variables defined in table 5.39.2.3.2-1.

**Table 5.39.2.3.2-1: Resource URI variables for this resource**

| Name            | Data type | Definition                                                                              |
|-----------------|-----------|-----------------------------------------------------------------------------------------|
| apiRoot         | string    | See clause 5.39.1 of 3GPP TS 29.122 [4].                                                |
| afId            | string    | Represents the identifier of the AF.                                                    |
| configurationId | string    | Represents identifier of the "Individual UAV Flight Assistance Configuration" resource. |

#### 5.39.2.3.3 Resource Standard Methods

##### 5.39.2.3.3.0 GET

This method enables an AF to request to retrieve an existing "Individual UAV Flight Assistance Configuration" resource at the NEF.

This method shall support the URI query parameters specified in table 5.39.2.3.3.0-1.

**Table 5.39.2.3.3.0-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.39.2.3.3.0-2 and the response data structures and response codes specified in table 5.39.2.3.3.0-3.

**Table 5.39.2.3.3.0-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.39.2.3.3.0-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UavFlightAssistance                                                                                                                 | M | 1           | 200 OK                 | Successful case. The requested "Individual UAV Flight Assistance Configuration" resource is returned in the response body.                                                                                                                            |
| n/a                                                                                                                                 |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                 |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |

#### 5.39.2.3.3.1 PUT

This method enables an AF to update an existing "Individual UAV Flight Assistance Configuration" resource at the NEF.

This method shall support the URI query parameters specified in table 5.39.2.3.3.1-1.

**Table 5.39.2.3.3.1-1: URI query parameters supported by the PUT method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.39.2.3.3.1-2 and the response data structures and response codes specified in table 5.39.2.3.3.1-3.

**Table 5.39.2.3.3.1-2: Data structures supported by the PUT request body on this resource**

| Data type           | P | Cardinality | Description                                                                                      |
|---------------------|---|-------------|--------------------------------------------------------------------------------------------------|
| UavFlightAssistance | M | 1           | Represents the updated "Individual UAV Flight Assistance Configuration" resource representation. |

**Table 5.39.2.3.3.1-3: Data structures supported by the PUT response body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UavFlightAssistance                                                                                                                 | M | 1           | 200 OK                 | Successful case. The "Individual UAV Flight Assistance Configuration" resource is successfully updated and a representation of the updated resource is returned in the response body.                                                                 |

| Name     | Data type | P | Cardinality | Description                                                                |
|----------|-----------|---|-------------|----------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI of the resource located in an alternative NEF. |

#### 5.39.2.3.3.1A PATCH

This method enables an AF to request the modification of an existing "Individual UAV Flight Assistance Configuration" resource at the NEF.

This method shall support the URI query parameters specified in table 5.39.2.3.3.1A-1.

**Table 5.39.2.3.3.1A-1: URI query parameters supported by the PATCH method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.39.2.3.3.1A-2 and the response data structures and response codes specified in table 5.39.2.3.3.1A-3.

**Table 5.39.2.3.3.1A-2: Data structures supported by the PATCH Request Body on this resource**

| Data type                | P | Cardinality | Description                                                                                              |
|--------------------------|---|-------------|----------------------------------------------------------------------------------------------------------|
| UavFlightAssistancePatch | M | 1           | Represents the requested modifications to the "Individual UAV Flight Assistance Configuration" resource. |

**Table 5.39.2.3.3.1A-3: Data structures supported by the PATCH Response Body on this resource**

| Data type                                                                                                                             | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|---------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UavFlightAssistance                                                                                                                   | M | 1           | 200 OK                 | Successful response. The "Individual UAV Flight Assistance Configuration" resource is successfully modified and a representation of the updated resource is returned in the response body.                                                            |
| n/a                                                                                                                                   |   |             | 204 No Content         | Successful response. The "Individual UAV Flight Assistance Configuration" resource is successfully modified and no content is returned in the response body.                                                                                          |

### 5.39.2.3.3.2 DELETE

This method enables an AF to request the deletion of an existing "Individual UAV Flight Assistance Configuration" resource at the NEF.

This method shall support the URI query parameters specified in table 5.39.2.3.3.2-1.

**Table 5.39.2.3.3.2-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
|------|-----------|---|-------------|-------------|

|     |  |  |  |  |
|-----|--|--|--|--|
| n/a |  |  |  |  |
|-----|--|--|--|--|

This method shall support the request data structures specified in table 5.39.2.3.3.2-2 and the response data structures and response codes specified in table 5.39.2.3.3.2-3.

**Table 5.39.2.3.3.2-2: Data structures supported by the DELETE request body on this resource**

| Data type | P | Cardinality | Description |

|                                                                                                                                        |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP DELETE method listed in Table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.39.2.3.3.2-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                |
|----------|-----------|---|-------------|----------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI of the resource located in an alternative NEF. |

**Table 5.39.2.3.3.2-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                |
|----------|-----------|---|-------------|----------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI of the resource located in an alternative NEF. |

#### 5.39.2.3.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.39.3 Custom Operations without associated resources

#### 5.39.3.1 Overview

The structure of the custom operation URIs of the UAVFlightAssistance API is shown in Figure 5.39.3.1-1.

**Figure 5.39.3.1-1: Custom operation URI structure of the UAVFlightAssistance API**

Table 5.39.3.1-1 provides an overview of the custom operations and applicable HTTP methods defined for the UAVFlightAssistance API.

**Table 5.39.3.1-1: Custom operations without associated resources**

| Custom operation name | Custom operation URI | Mapped HTTP method | Description                                 |
|-----------------------|----------------------|--------------------|---------------------------------------------|
| Retrieve              | /afld/retrieve       | POST               | Request to retrieve UAV Flight information. |

The custom operations shall support the URI variables defined in table 5.39.3.1-2.

**Table 5.39.3.1-2: URI variables for this custom operation**

| Name    | Data type | Definition                           |
|---------|-----------|--------------------------------------|
| apiRoot | string    | See clause 5.39.1.                   |
| afld    | string    | Represents the identifier of the AF. |

5.39.3.2      Operation: Retrieve

5.39.3.2.1      Description

The custom operation allows to retrieve UAV Flight information from the NEF.

5.39.3.2.2      Operation Definition

This operation shall support the request and response data structures and response codes specified in table 5.39.3.2.2-1 and table 5.39.3.2.2-2.

**Table 5.39.3.2.2-1: Data structures supported by the POST Request Body on this resource**

| Data type        | P | Cardinality | Description                                                            |
|------------------|---|-------------|------------------------------------------------------------------------|
| UAVFlightInfoReq | M | 1           | Contains the parameters to request to retrieve UAV Flight information. |

**Table 5.39.3.2.2-2: Data structures supported by the POST Response Body on this resource**

| Data type         | P | Cardinality | Response codes         | Description                                                                                                                                                         |
|-------------------|---|-------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UAVFlightInfoResp | M | 1           | 200 OK                 | Successful case. The UAV Flight information retrieval request is successfully processed, and the requested UAV Flight information is returned in the response body. |
| n/a               |   |             | 307 Temporary Redirect | Temporary redirection.                                                                                                                                              |

|                                                                                                                                             |  |  |                        |                                                                                                                                                                                                                                              |
|---------------------------------------------------------------------------------------------------------------------------------------------|--|--|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                             |  |  |                        | <p>The response shall include a Location header field containing an alternative target URI located in an alternative NEF.</p> <p>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].</p>                               |
| n/a                                                                                                                                         |  |  | 308 Permanent Redirect | <p>Permanent redirection.</p> <p>The response shall include a Location header field containing an alternative target URI located in an alternative NEF.</p> <p>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].</p> |
| <p>NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply.</p> |  |  |                        |                                                                                                                                                                                                                                              |

**Table 5.39.3.2.2-3: Headers supported by the 307 Response Code on this custom operation**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI located in an alternative NEF. |

**Table 5.39.3.2.2-4: Headers supported by the 308 Response Code on this custom operation**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI located in an alternative NEF. |

## 5.39.4 Notifications

### 5.39.4.1 General

Notifications shall comply to clause 5.2.5 of 3GPP TS 29.122 [4].

**Table 5.39.4.1-1: Notifications overview**

| Notification                       | Callback URI | HTTP method or custom operation | Description (service operation)                                                                 |
|------------------------------------|--------------|---------------------------------|-------------------------------------------------------------------------------------------------|
| UAV Flight Assistance Notification | {notifUri}   | POST                            | Enables the NEF to notify a previously subscribed AF on UAV Flight Assistance related event(s). |

### 5.39.4.2 UAV Flight Assistance Notification

#### 5.39.4.2.1 Description

The UAV Flight Assistance Notification is used by the NEF to report UAV Flight Assistance related event(s) to a previously subscribed AF.

#### 5.39.4.2.2 Target URI

The Callback URI "{notifUri}" shall be used with the callback URI variables defined in table 5.39.4.2.2-1.

**Table 5.39.4.2.2-1: Callback URI variables**

| Name     | Definition                                                          |
|----------|---------------------------------------------------------------------|
| notifUri | Represents the callback URI encoded as a string formatted as a URI. |

## 5.39.4.2.3 Operation Definition

This method shall support the request data structures specified in table 5.39.4.2.3-1 and the response data structures and response codes specified in table 5.39.4.2.3-2.

**Table 5.39.4.2.3-1: Data structures supported by the POST Request Body on this resource**

| Data type            | P | Cardinality | Description                                        |
|----------------------|---|-------------|----------------------------------------------------|
| UAVFlightAssistNotif | M | 1           | Represents the UAV Flight Assistance Notification. |

**Table 5.39.4.2.3-2: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                            | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UAVFlightAssistNotifResp                                                                                                             | M | 1           | 200 OK                 | Successful case. The notification is successfully received and acknowledged, and notification related information is returned in the response body.                                                                                                                                            |
| n/a                                                                                                                                  |   |             | 204 No Content         | Successful case. The notification is successfully received and acknowledged.                                                                                                                                                                                                                   |
| n/a                                                                                                                                  |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF towards which the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                  |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF towards which the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                                                                |

**Table 5.39.4.2.3-3: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                      |
|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

**Table 5.39.4.2.3-4: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                      |
|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

## 5.39.5 Data Model

### 5.39.5.1 General

This clause specifies the application data model supported by the UAVFlightAssistance API. Table 5.39.5.1-1 specifies the data types defined for the UAVFlightAssistance API.

**Table 5.39.5.1-1: UAVFlightAssistance API specific Data Types**

| Data type                | Clause defined | Description                                                                      | Applicability |
|--------------------------|----------------|----------------------------------------------------------------------------------|---------------|
| AltitudeReport           | 5.39.5.2.9     | Represents the UAV's altitude report.                                            |               |
| AltitudeRepEvent         | 5.39.5.3.5     | Represents the UAV's altitude reporting event.                                   |               |
| AltitudeRepReqs          | 5.39.5.2.8     | Represents the UAV's altitude reporting requirements.                            |               |
| AltThresholds            | 5.39.5.2.10    | Represents the UAV's altitude thresholds.                                        |               |
| CandidateFlightPathInfo  | 5.39.5.2.13    | Represents the candidate flight path information.                                |               |
| FlightPath               | 5.39.5.2.3     | Represents a flight path.                                                        |               |
| FlightPathSegInfo        | 5.39.5.2.4     | Represents a flight path segment.                                                |               |
| MonitoringMode           | 5.39.5.3.6     | Represents the UAV Flight Assistance monitoring mode.                            |               |
| RangSIUavData            | 5.39.5.2.11    | Represents the Ranging/Sidelink UAV data.                                        |               |
| RequestPurpose           | 5.39.5.3.4     | Represents the purpose of the request.                                           |               |
| RetrievePurpose          | 5.39.5.3.7     | Represents the purpose of the retrieved UAV Flight information.                  |               |
| UavFlightAssistance      | 5.39.5.2.2     | Represents the UAV Flight Assistance Configuration.                              |               |
| UavFlightAssistancePatch | 5.39.5.2.7     | Represents the requested modifications to a UAV Flight Assistance Configuration. |               |
| UAVFlightAssistNotif     | 5.39.5.2.5     | Represents the UAV Flight Assistance Notification.                               |               |
| UAVFlightAssistNotifResp | 5.39.5.2.6     | Represents the response to a UAV Flight Assistance Notification.                 |               |
| UAVFlightInfoReq         | 5.39.5.2.12    | Represents the UAV Flight information retrieval request.                         |               |
| UAVFlightInfoResp        | 5.39.5.2.14    | Represents the UAV Flight information retrieval response.                        |               |
| UavStatus                | 5.39.5.3.3     | Represents the status of the UAV.                                                |               |

Table 5.39.5.1-2 specifies data types re-used by the UAVFlightAssistance API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the UAVFlightAssistance API.

**Table 5.39.5.1-2: Re-used Data Types**

| Data type                 | Reference           | Comments                                                                                                      | Applicability |
|---------------------------|---------------------|---------------------------------------------------------------------------------------------------------------|---------------|
| Altitude                  | 3GPP TS 29.572 [34] | Represents an altitude.                                                                                       |               |
| AnalyticsEventFilter      | 5.6.3.3.13          | Represents analytics event filter information.                                                                |               |
| DateTime                  | 3GPP TS 29.122 [4]  | Represents a date and a time.                                                                                 |               |
| DurationSec               | 3GPP TS 29.122 [4]  | Represents a time duration expressed in seconds.                                                              |               |
| Float                     | 3GPP TS 29.571 [8]  | Represents a float.                                                                                           |               |
| Gpsi                      | 3GPP TS 29.571 [8]  | Represents a GPSI.                                                                                            |               |
| LinearDistance            | 3GPP TS 29.572 [34] | Represents a linear distance.                                                                                 |               |
| LocationArea5G            | 3GPP TS 29.122 [4]  | Represents location area information.                                                                         |               |
| QoSSustainabilityExposure | 5.6.3.3.18          | Represents a QoS sustainability information.                                                                  |               |
| SupportedFeatures         | 3GPP TS 29.571 [8]  | Represents the list of supported feature(s) and used to negotiate the applicability of the optional features. |               |
| TimeWindow                | 3GPP TS 29.122 [4]  | Represents a time window.                                                                                     |               |
| UInteger                  | 3GPP TS 29.571 [8]  | Represents an unsigned integer.                                                                               |               |
| Uri                       | 3GPP TS 29.122 [4]  | Represents a URI.                                                                                             |               |

## 5.39.5.2 Structured data types

### 5.39.5.2.1 Introduction

This clause defines the structured data types to be used in resource representations.

### 5.39.5.2.2 Type: UavFlightAssistance

**Table 5.39.5.2.2-1: Definition of type UavFlightAssistance**

| Attribute name | Data type             | P | Cardinality | Description                                                                                                                                                                                                                                                                                                                                              | Applicability |
|----------------|-----------------------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| uavId          | Gpsi                  | M | 1           | Identifies the UAV.                                                                                                                                                                                                                                                                                                                                      |               |
| reqPurpose     | RequestPurpose        | M | 1           | Contains the purpose of the request.                                                                                                                                                                                                                                                                                                                     |               |
| monitorMode    | MonitoringMode        | C | 0..1        | Contains the monitoring mode.<br><br>This attribute shall be present only when the "reqPurpose" attribute value is set to "IN_FLIGHT_MONITORING".                                                                                                                                                                                                        |               |
| notifUri       | Uri                   | M | 1           | Contains the URI via which UAV Flight Assistance notifications shall be delivered.                                                                                                                                                                                                                                                                       |               |
| enviromingUavs | array(Gpsi)           | O | 1..N        | Contains the identifier(s) of the enviroming UAV(s) to be monitored on whether they are present in the same area as the target UAV.<br><br>This attribute may be present only when the "monitorMode" attribute is present and set to "FLIGHT_ENVIRONMENT".                                                                                               |               |
| preSetDistance | LinearDistance        | O | 0..1        | Contains the preset distance value to be used to monitor the other UAV(s) distance to the target UAV, i.e., monitor whether the the other UAV(s) distance to the target UAV is smaller than this preset distance value.<br><br>This attribute may be present only when the "monitorMode" attribute is present and set to "RANGING_SIDELINK_POSITION".    |               |
| qosSustReq     | AnalyticsEventFilter  | O | 0..1        | Contains the QoS sustainability analytics related requirements (only the attributes applicable for the "QoS_Sustainability" feature defined in Table 5.6.4-1 may be present within the AnalyticsEventFilter data type).<br><br>This attribute may be present only when the "monitorMode" attribute is present and set to "QOS_SUSTAINABILITY_ANALYTICS". |               |
| flightPath     | FlightPath            | O | 0..1        | Contains the flight path.                                                                                                                                                                                                                                                                                                                                |               |
| altitudeRep    | array(AltitudeReport) | O | 1..N        | Contains the UAV's altitude report(s).                                                                                                                                                                                                                                                                                                                   |               |

|                 |                   |   |      |                                                                                                                                                                                                                                                                                                                                                                                   |  |
|-----------------|-------------------|---|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
|                 |                   |   |      | This attribute may be present only in a UAV Flight Assistance Configuration Update request.                                                                                                                                                                                                                                                                                       |  |
| altitudeRepReqs | AltitudeRepReqs   | O | 0..1 | Indicates the altitude reporting requirements.<br><br>This attribute shall not be present in a UAV Flight Assistance Configuration Creation request.                                                                                                                                                                                                                              |  |
| stopAltRepInd   | boolean           | O | 0..1 | Indicates whether to stop the altitude reporting for the UAV UE.<br><br>- "true" indicates to stop the altitude reporting for the UAV UE.<br><br>When present, this attribute shall be set to "true". The presence of this attribute set to the value "false" is forbidden.<br><br>This attribute shall not be present in a UAV Flight Assistance Configuration Creation request. |  |
| suppFeat        | SupportedFeatures | C | 0..1 | Contains the list of supported features among the ones defined in clause 5.39.6.<br><br>This attribute shall be present only when feature negotiation is required.                                                                                                                                                                                                                |  |

### 5.39.5.2.3 Type: FlightPath

**Table 5.39.5.2.3-1: Definition of type FlightPath**

| Attribute name | Data type                | P | Cardinality | Description                                   | Applicability |
|----------------|--------------------------|---|-------------|-----------------------------------------------|---------------|
| pathSegInfo    | array(FlightPathSegInfo) | M | 1..N        | Contains the flight path segment information. |               |

### 5.39.5.2.4 Type: FlightPathSegInfo

**Table 5.39.5.2.4-1: Definition of type FlightPathSegInfo**

| Attribute name  | Data type             | P | Cardinality | Description                                                                                                                                                               | Applicability |
|-----------------|-----------------------|---|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| flightSeg       | LocationArea5G        | M | 1           | Contains the location of the UAV's flight path segment.                                                                                                                   |               |
| ussId           | string                | M | 1           | Contains the identifier of the USS serving the flight path segment location area.                                                                                         |               |
| candBdCrsPoints | array(LocationArea5G) | O | 1..N        | Contains the candidate border-crossing point(s).                                                                                                                          |               |
| uavSpeed        | Float                 | O | 0..1        | Contains the speed of the UAV at the flight path segment, expressed in units of meters per second.                                                                        |               |
| altitude        | Altitude              | O | 0..1        | Contains the altitude of the UAV's flight at the flight path segment.<br><br>The altitude value within this attribute shall take precedence over any altitude information |               |

|                                                |             |   |      |                                                                                                                            |  |
|------------------------------------------------|-------------|---|------|----------------------------------------------------------------------------------------------------------------------------|--|
|                                                |             |   |      | provided within the "flightSeg" attribute.                                                                                 |  |
| timeSchedule                                   | TimeWindow  | O | 0..1 | Contains the time schedule for crossing the flight path segment located as defined in the "flightSeg" attribute.<br>(NOTE) |  |
| timeDuration                                   | DurationSec | O | 0..1 | Contains the time duration spent at the flight path segment located as defined in the "flightSeg" attribute.<br>(NOTE)     |  |
| NOTE: These attributes are mutually exclusive. |             |   |      |                                                                                                                            |  |

## 5.39.5.2.5 Type: UAVFlightAssistNotif

Table 5.39.5.2.5-1: Definition of type UAVFlightAssistNotif

| Attribute name | Data type      | P | Cardinality | Description                                                                                                                                                                                                                                                                                         | Applicability |
|----------------|----------------|---|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| subscriptionId | string         | M | 1           | Contains the identifier of the subscription to which the notification is related.                                                                                                                                                                                                                   |               |
| uavStatus      | UavStatus      | M | 1           | Contains the status of the UAV.                                                                                                                                                                                                                                                                     |               |
| bdCrsPoint     | LocationArea5G | O | 0..1        | Contains the location of the border-crossing point.                                                                                                                                                                                                                                                 |               |
| altitude       | Altitude       | O | 0..1        | Contains the altitude of the border-crossing point.<br><br>This attribute may be present only when the "bdCrsPoint" attribute is present.<br><br>The altitude value within this attribute shall take precedence over any altitude information provided within the "bdCrsPoint" attribute.<br>(NOTE) |               |
| altitudeRptInd | boolean        | O | 0..1        | Indicates whether the UAV's altitude reporting failed or not.<br><br>- "true" indicates that the UAV's altitude reporting failed.<br><br>When this attribute is present, it shall be set to "true". The presence of this attribute with the value "false" shall be prohibited.<br>(NOTE)            |               |
| uavLocation    | LocationArea5G | O | 0..1        | Contains the location information of the UAV.<br><br>This attribute may be present only when the request purpose is "IN_FLIGHT_MONITORING" and the monitoring mode is "UAV_LOCATION".                                                                                                               |               |

## 5.39.5.2.7 Type: UavFlightAssistancePatch

Table 5.39.5.2.7-1: Definition of type UavFlightAssistancePatch

| Attribute name | Data type | P | Cardinality | Description | Applicability |
|----------------|-----------|---|-------------|-------------|---------------|
|----------------|-----------|---|-------------|-------------|---------------|

|                 |                       |   |      |                                                                                                                                                                                                                                                                             |  |
|-----------------|-----------------------|---|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| notifUri        | Uri                   | O | 0..1 | Contains the updated URI via which UAV Flight Assistance notifications shall be delivered.                                                                                                                                                                                  |  |
| flightPath      | FlightPath            | O | 0..1 | Contains the updated flight path.                                                                                                                                                                                                                                           |  |
| altitudeRep     | array(AltitudeReport) | O | 1..N | Contains the UAV's altitude report(s).                                                                                                                                                                                                                                      |  |
| altitudeRepReqs | AltitudeRepReqs       | O | 0..1 | Indicates the altitude reporting requirements.                                                                                                                                                                                                                              |  |
| stopAltRepInd   | boolean               | O | 0..1 | Indicates whether to stop the altitude reporting for the UAV UE.<br><br>- "true" indicates to stop the altitude reporting for the UAV UE.<br><br>When present, this attribute shall be set to "true". The presence of this attribute set to the value "false" is forbidden. |  |

## 5.39.5.2.8 Type: AltitudeRepReqs

Table 5.39.5.2.8-1: Definition of type AltitudeRepReqs

| Attribute name                                                                       | Data type               | P | Cardinality | Description                                                                                                                                                          | Applicability |
|--------------------------------------------------------------------------------------|-------------------------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| repThresholds                                                                        | AltThresholds           | C | 0..1        | Contains the altitude threshold(s) for threshold-based reporting.                                                                                                    |               |
| repPeriodicity                                                                       | UInteger                | C | 0..1        | Contains the periodicity information for periodic reporting, i.e., the altitude reporting periodic interval in milliseconds.<br><br>Minimum: 120<br>Maximum: 1800000 |               |
| repEvents                                                                            | array(AltitudeRepEvent) | C | 1..N        | Contains the reporting event(s) for event-based reporting.                                                                                                           |               |
| NOTE: These attributes are mutually exclusive and only one of them shall be present. |                         |   |             |                                                                                                                                                                      |               |

## 5.39.5.2.9 Type: AltitudeReport

Table 5.39.5.2.9-1: Definition of type AltitudeReport

| Attribute name | Data type        | P | Cardinality | Description                                                                                                                                                                  | Applicability |
|----------------|------------------|---|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| altitude       | Altitude         | M | 1           | Contains the altitude of the UAV.                                                                                                                                            |               |
| event          | AltitudeRepEvent | C | 0..1        | Contains the reported altitude event.<br><br>This attribute shall be present only when event-based reporting was requested when subscribing to the UAV's altitude reporting. |               |
| timeStamp      | DateTime         | O | 0..1        | Contains the time at which the altitude of the UAV provided within the "altitude" attribute was measured.                                                                    |               |

## 5.39.5.2.10 Type: AltThresholds

Table 5.39.5.2.10-1: Definition of type AltThresholds

| Attribute name                                           | Data type | P | Cardinality | Description                                                                                                             | Applicability |
|----------------------------------------------------------|-----------|---|-------------|-------------------------------------------------------------------------------------------------------------------------|---------------|
| lowerBound                                               | Altitude  | C | 0..1        | Contains the threshold lower altitude, i.e., the threshold altitude below which reporting shall be triggered.<br>(NOTE) |               |
| upperBound                                               | Altitude  | C | 0..1        | Contains the threshold upper altitude, i.e., the threshold altitude above which reporting shall be triggered.<br>(NOTE) |               |
| NOTE: At least one of these attributes shall be present. |           |   |             |                                                                                                                         |               |

## 5.39.5.2.11 Type: RangSIUavData

Table 5.39.5.2.11-1: Definition of type RangSIUavData

| Attribute name                                           | Data type      | P | Cardinality | Description                                                                                                                                                                                                                                                                                                                                                                                             | Applicability |
|----------------------------------------------------------|----------------|---|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| uavId                                                    | Gpsi           | M | 1           | Contains the identifier of the UAV.                                                                                                                                                                                                                                                                                                                                                                     |               |
| presetDistInd                                            | boolean        | C | 0..1        | Indicates whether the Ranging/Sidelink distance to the target UAV is smaller than the preset distance value.<br>- "true" indicates that the distance to the target UAV is smaller than the preset distance value.<br>- "false" indicates that the distance to the target UAV is not smaller than the preset distance value.<br>- The default value is "false" when this attribute is omitted.<br>(NOTE) |               |
| rangSIdistance                                           | LinearDistance | C | 0..1        | Contains the Ranging/Sidelink distance to the target UAV.<br>(NOTE)                                                                                                                                                                                                                                                                                                                                     |               |
| NOTE: At least one of these attributes shall be present. |                |   |             |                                                                                                                                                                                                                                                                                                                                                                                                         |               |

## 5.39.5.2.12 Type: UAVFlightInfoReq

Table 5.39.5.2.12-1: Definition of type UAVFlightInfoReq

| Attribute name  | Data type                      | P | Cardinality | Description                                                                                                                                                        | Applicability |
|-----------------|--------------------------------|---|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| gpsi            | Gpsi                           | M | 1           | Contains the target GPSI.                                                                                                                                          |               |
| retrievePurpose | RetrievePurpose                | M | 1           | Contains the purpose of the retrieved UAV flight information.                                                                                                      |               |
| targetUssList   | array(string)                  | O | 1..N        | Contains the list of the identifier(s) of the suitable target USS(s).                                                                                              |               |
| canFltPathsInfo | array(CandidateFlightPathInfo) | O | 1..N        | Contains a list of candidate Flight Path(s) related information.                                                                                                   |               |
| suppFeat        | SupportedFeatures              | C | 0..1        | Contains the list of supported features among the ones defined in clause 5.39.6.<br><br>This attribute shall be present only when feature negotiation is required. |               |

## 5.39.5.2.13 CandidateFlightPathInfo

Table 5.39.5.2.13-1: Definition of type CandidateFlightPathInfo

| Attribute name  | Data type      | P | Cardinality | Description                                                                                   | Applicability |
|-----------------|----------------|---|-------------|-----------------------------------------------------------------------------------------------|---------------|
| borderCrssPnt   | LocationArea5G | O | 0..1        | Contains the candidate border-crossing point.                                                 |               |
| accptDeviatDist | UInteger       | O | 0..1        | Contains an acceptable deviation distance for the flight route, expressed in units of meters. |               |
| accptDeviatTime | DurationSec    | O | 0..1        | Contains an acceptable deviation time for the flight plan.                                    |               |
| canFlightPath   | FlightPath     | O | 0..1        | Contains a candidate flight path.                                                             |               |

## 5.39.5.2.14 Type: UAVFlightInfoResp

Table 5.39.5.2.14-1: Definition of type UAVFlightInfoResp

| Attribute name                                                                                                                                                                                              | Data type                   | P | Cardinality | Description                                                                                                                                                        | Applicability |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|---|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| retrievedResults                                                                                                                                                                                            | array(UAVFlightAssistNotif) | M | 1..N        | Contains the retrieved results of UAV Flight information.<br><br>(NOTE)                                                                                            |               |
| suppFeat                                                                                                                                                                                                    | SupportedFeatures           | C | 0..1        | Contains the list of supported features among the ones defined in clause 5.39.6.<br><br>This attribute shall be present only when feature negotiation is required. |               |
| NOTE: The "subscriptionId" attribute of the UAVFlightAssistNotif data structure is not applicable and shall not be present when this data structure is used to encode the array elements of this attribute. |                             |   |             |                                                                                                                                                                    |               |

## 5.39.5.3 Simple data types and enumerations

## 5.39.5.3.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

## 5.39.5.3.2 Simple data types

The simple data types defined in table 5.39.5.3.2-1 shall be supported.

Table 5.39.5.3.2-1: Simple data types

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
| n/a       |                 |             |               |

## 5.39.5.3.3 Enumeration: UavStatus

The enumeration UavStatus represents the status of the UAV. It shall comply with the provisions defined in table 5.39.5.3.3-1.

Table 5.39.5.3.3-1: Enumeration UavStatus

| Enumeration value | Description | Applicability |
|-------------------|-------------|---------------|
|-------------------|-------------|---------------|

|           |                                                                                             |  |
|-----------|---------------------------------------------------------------------------------------------|--|
| LEAVING   | Indicates that the UAV status is leaving an area which is part of the planned flight path.  |  |
| ENTERING  | Indicates that the UAV status is entering an area which is part of the planned flight path. |  |
| DEVIATING | Indicates that the UAV status is deviating from the planned flight path.                    |  |

#### 5.39.5.3.4 Enumeration: RequestPurpose

The enumeration RequestPurpose represents UAV Flight Assistance request purpose. It shall comply with the provisions defined in table 5.39.5.3.4-1.

**Table 5.39.5.3.4-1: Enumeration RequestPurpose**

| Enumeration value    | Description                                                        | Applicability |
|----------------------|--------------------------------------------------------------------|---------------|
| USS_CHANGEOVER       | Indicates that the purpose of the request is USS changeover.       |               |
| IN_FLIGHT_MONITORING | Indicates that the purpose of the request is in-flight monitoring. |               |

#### 5.39.5.3.5 Enumeration: AltitudeRepEvent

The enumeration AltitudeRepEvent represents the UAV's altitude reporting event. It shall comply with the provisions defined in table 5.39.5.3.5-1.

**Table 5.39.5.3.5-1: Enumeration AltitudeRepEvent**

| Enumeration value   | Description                                                                                           | Applicability |
|---------------------|-------------------------------------------------------------------------------------------------------|---------------|
| TA_CHANGE           | Indicates that the UAV's altitude reporting trigger is the change of the UAV's serving TA.            |               |
| RAN_NODE_CHANGE     | Indicates that the UAV's altitude reporting trigger is the change of the UAV's serving RAN node.      |               |
| GEO_LOCATION_CHANGE | Indicates that the UAV's altitude reporting trigger is the change of the UAV's geographical location. |               |
| ANY_ALTITUDE_CHANGE | Indicates that the UAV's altitude reporting trigger is any change of the UAV's altitude.              |               |

#### 5.39.5.3.6 Enumeration: MonitoringMode

The enumeration MonitoringMode represents the UAV Flight Assistance monitoring mode. It shall comply with the provisions defined in table 5.39.5.3.6-1.

**Table 5.39.5.3.6-1: Enumeration MonitoringMode**

| Enumeration value            | Description                                                                             |
|------------------------------|-----------------------------------------------------------------------------------------|
| UAV_LOCATION                 | Indicates that the monitoring mode is UAV location monitoring.                          |
| FLIGHT_TRAJECTORY            | Indicates that the monitoring mode is flight trajectory monitoring.                     |
| FLIGHT_ENVIRONMENT           | Indicates that the monitoring mode is flight environment monitoring.                    |
| RANGING_SIDELINK_POSITION    | Indicates that the monitoring mode is Ranging/Sidelink positioning location monitoring. |
| QOS_SUSTAINABILITY_ANALYTICS | Indicates that the monitoring mode is QoS sustainability analytics monitoring.          |

#### 5.39.5.3.7 Enumeration: RetrievePurpose

The enumeration RetrievePurpose represents the purpose of the retrieved UAV flight information. It shall comply with the provisions of table 5.39.5.3.7-1.

**Table 5.39.5.3.7-1: Enumeration RetrievePurpose**

| Enumeration value   | Description                                                                                | Applicability |
|---------------------|--------------------------------------------------------------------------------------------|---------------|
| USS_CHANGEOVER      | Indicates that the purpose of the UAV Flight information retrieval is USS changeover.      |               |
| PRE_FLIGHT_PLANNING | Indicates that the purpose of the UAV Flight information retrieval is pre-flight planning. |               |

## 5.39.6 Used Features

The optional features in table 5.39.6-1 are defined for the UAVFlightAssistance API. They shall be negotiated using the extensibility mechanism defined in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.39.6-1: Features used by UAVFlightAssistance API**

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|
|                |              |             |

## 5.39.7 Error handling

### 5.39.7.1 General

For the UAVFlightAssistance API, HTTP error responses shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4]. Protocol errors and application errors specified in clause 5.2.6 of 3GPP TS 29.122 [4] shall be supported for the HTTP status codes specified in table 5.2.6-1 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses are applicable for the UAVFlightAssistance API.

### 5.39.7.2 Protocol Errors

No specific procedures for the UAVFlightAssistance API are specified.

### 5.39.7.3 Application Errors

The application errors defined for the UAVFlightAssistance API are listed in table 5.39.7.3-1.

**Table 5.39.7.3-1: Application errors**

| Application Error | HTTP status code | Description | Applicability |
|-------------------|------------------|-------------|---------------|
|                   |                  |             |               |

## 5.40 CagInfoParamProvision API

### 5.40.1 Introduction

The Nnef\_ParameterProvision service shall use the CagInfoParamProvision API for:

- CAG Information Parameters provisioning.

The API URI of the CagInfoParamProvision API shall be:

**{apiRoot}/<apiName>/<apiVersion>**

The request URIs used in HTTP requests shall have the Resource URI structure defined in clause 5.2.4 of 3GPP TS 29.122 [4], i.e.:

**{apiRoot}/<apiName>/<apiVersion>/<apiSpecificSuffixes>**

with the following components:

- "apiRoot" is set as defined in clause 5.2.4 of 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-caginfo-pp".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.
- The <apiSpecificSuffixes> shall be set as described in clause 5.2.4 of 3GPP TS 29.122 [4].

All resource URIs in the clauses below are defined relative to the above API URI.

5.40.2 Resources

5.40.2.1 Overview

This clause describes the structure for the Resource URIs as shown in figure 5.40.2.1-1 and the resources and HTTP methods used for the CagInfoParamProvision API.

**Figure 5.40.2.1-1: Resource URI structure of the CagInfoParamProvision API**

Table 5.40.2.1-1 provides an overview of the resources and applicable HTTP methods.

**Table 5.40.2.1-1: Resources and methods overview**

| Resource name                                      | Resource URI (relative path under API URI) | HTTP method or custom operation | Description (service operation)                                                                        |
|----------------------------------------------------|--------------------------------------------|---------------------------------|--------------------------------------------------------------------------------------------------------|
| CAG Information Parameters Provisionings           | /pp                                        | GET                             | Retrieve all the active CAG Information Parameters Provisionings managed by the NEF.                   |
|                                                    |                                            | POST                            | Request the creation of a new CAG Information Parameters Provisioning at the NEF.                      |
| Individual CAG Information Parameters Provisioning | /pp/{ppId}                                 | GET                             | Retrieve an existing "Individual CAG Information Parameters Provisioning" resource managed by the NEF. |
|                                                    |                                            | PUT                             | Update an existing "Individual CAG Information Parameters Provisioning" resource managed by the NEF.   |
|                                                    |                                            | PATCH                           | Modify an existing "Individual CAG Information Parameters Provisioning" resource managed by the NEF.   |

|  |  |        |                                                                                                      |
|--|--|--------|------------------------------------------------------------------------------------------------------|
|  |  | DELETE | Delete an existing "Individual CAG Information Parameters Provisioning" resource managed by the NEF. |
|--|--|--------|------------------------------------------------------------------------------------------------------|

## 5.40.2.2 Resource: CAG Information Parameters Provisionings

### 5.40.2.2.1 Introduction

This resource represents the collection of CAG Information Parameters Provisionings managed by the NEF.

This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [32]).

### 5.40.2.2.2 Resource Definition

Resource URI: {apiRoot}/3gpp-caginfo-pp/<apiVersion>/pp

This resource shall support the resource URI variables defined in table 5.40.2.2.2-1.

**Table 5.40.2.2.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition         |
|---------|-----------|--------------------|
| apiRoot | string    | See clause 5.40.1. |

### 5.40.2.2.3 Resource Standard Methods

#### 5.40.2.2.3.1 GET

This method enables an AF to request to retrieve all the active CAG Information Parameters Provisionings managed by the NEF.

This method shall support the URI query parameters specified in table 5.40.2.2.3.1-1.

**Table 5.40.2.2.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.40.2.2.3.1-2 and the response data structures and response codes specified in table 5.40.2.2.3.1-3.

**Table 5.40.2.2.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.40.2.2.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type            | P | Cardinality | Response codes | Description                                                                                                                                                                                                                                                     |
|----------------------|---|-------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| array(CagInfoPpData) | M | 0..N        | 200 OK         | Successful case. All the "Individual CAG Information Parameters Provisioning" resource(s) managed by the NEF are returned.<br><br>If there are no active "Individual CAG Information Parameters Provisioning" resources at the NEF, an empty array is returned. |

|                                                                                                                                     |  |  |                        |                                                                                                                                                                                                                                                              |
|-------------------------------------------------------------------------------------------------------------------------------------|--|--|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a                                                                                                                                 |  |  | 307 Temporary Redirect | <p>Temporary redirection.</p> <p>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.</p> <p>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].</p> |
| n/a                                                                                                                                 |  |  | 308 Permanent Redirect | <p>Permanent redirection.</p> <p>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.</p> <p>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].</p> |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |  |  |                        |                                                                                                                                                                                                                                                              |

**Table 5.40.2.2.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.40.2.2.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**5.40.2.2.3.2 POST**

This method enables an AF to request the creation of a new CAG Information Parameters Provisioning at the NEF.

This method shall support the URI query parameters specified in table 5.40.2.2.3.2-1.

**Table 5.40.2.2.3.2-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.40.2.2.3.2-2 and the response data structures and response codes specified in table 5.40.2.2.3.2-3.

**Table 5.40.2.2.3.2-2: Data structures supported by the POST Request Body on this resource**

| Data type     | P | Cardinality | Description                                                                                          |
|---------------|---|-------------|------------------------------------------------------------------------------------------------------|
| CagInfoPpData | M | 1           | Contains the representation of the CAG Information Parameters Provisioning to be created at the NEF. |

**Table 5.40.2.2.3.2-3: Data structures supported by the POST Response Body on this resource**

| Data type     | P | Cardinality | Response codes | Description                                                                                                                                      |
|---------------|---|-------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| CagInfoPpData | M | 1           | 201 Created    | Successful case. A representation of the created "Individual CAG Information Parameters Provisioning" resource is returned in the response body. |

|                                                                                                                                      |  |  |  |                                                                                 |
|--------------------------------------------------------------------------------------------------------------------------------------|--|--|--|---------------------------------------------------------------------------------|
|                                                                                                                                      |  |  |  | The URI of the created resource shall be returned in an HTTP "Location" header. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |  |  |  |                                                                                 |

**Table 5.40.2.2.3.2-4: Headers supported by the 201 response code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                     |
|----------|-----------|---|-------------|---------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains the URI of the newly created resource, according to the structure:<br>{apiRoot}/3gpp-caginfo-pp/<apiVersion>/pp/{ppId} |

#### 5.40.2.2.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.40.2.3 Resource: Individual CAG Information Parameters Provisioning

#### 5.40.2.3.1 Introduction

This resource represents an "Individual CAG Information Parameters Provisioning" resource managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [32]).

#### 5.40.2.3.2 Resource Definition

Resource URI: {apiRoot}/3gpp-caginfo-pp/<apiVersion>/pp/{ppId}

This resource shall support the resource URI variables defined in table 5.40.2.3.2-1.

**Table 5.40.2.3.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition                                                                                      |
|---------|-----------|-------------------------------------------------------------------------------------------------|
| apiRoot | string    | See clause 5.40.1.                                                                              |
| ppId    | string    | Represents the identifier of the "Individual CAG Information Parameters Provisioning" resource. |

#### 5.40.2.3.3 Resource Standard Methods

##### 5.40.2.3.3.1 GET

This method enables an AF to request to retrieve an existing "Individual CAG Information Parameters Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.40.2.3.3.1-1.

**Table 5.40.2.3.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.40.2.3.3.1-2 and the response data structures and response codes specified in table 5.40.2.3.3.1-3.

**Table 5.40.2.3.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.40.2.3.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |

| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.40.2.3.3.2 PUT

This method enables an AF to request the update of an existing "Individual CAG Information Parameters Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.40.2.3.3.2-1.

**Table 5.40.2.3.3.2-1: URI query parameters supported by the PUT method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.40.2.3.3.2-2 and the response data structures and response codes specified in table 5.40.2.3.3.2-3.

**Table 5.40.2.3.3.2-2: Data structures supported by the PUT Request Body on this resource**

| Data type     | P | Cardinality | Description                                                                                          |
|---------------|---|-------------|------------------------------------------------------------------------------------------------------|
| CagInfoPpData | M | 1           | Represents the updated "Individual CAG Information Parameters Provisioning" resource representation. |

**Table 5.40.2.3.3.2-3: Data structures supported by the PUT Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CagInfoPpData                                                                                                                       | M | 1           | 200 OK                 | Successful response. The "Individual CAG Information Parameters Provisioning" resource is successfully updated and a representation of the updated resource is returned in the response body.                                                         |
| n/a                                                                                                                                 |   |             | 204 No Content         | Successful response. The "Individual CAG Information Parameters Provisioning" resource is successfully updated and no content is returned in the response body.                                                                                       |

| Name     | Data type | P | Cardinality | Description                                                                |
|----------|-----------|---|-------------|----------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI of the resource located in an alternative NEF. |

#### 5.40.2.3.3.3 PATCH

This method enables an AF to request the modification of an existing "Individual CAG Information Parameters Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.40.2.3.3.3-1.

**Table 5.40.2.3.3.3-1: URI query parameters supported by the PATCH method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.40.2.3.3.3-2 and the response data structures and response codes specified in table 5.40.2.3.3.3-3.

**Table 5.40.2.3.3.3-2: Data structures supported by the PATCH Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
|-----------|---|-------------|-------------|

|                    |   |   |                                                                                                              |
|--------------------|---|---|--------------------------------------------------------------------------------------------------------------|
| CagInfoPpDataPatch | M | 1 | Represents the requested modifications to the "Individual CAG Information Parameters Provisioning" resource. |
|--------------------|---|---|--------------------------------------------------------------------------------------------------------------|

**Table 5.40.2.3.3.3-3: Data structures supported by the PATCH Response Body on this resource**

| Data type                                                                                                                             | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |

| Location | string    | M | 1           | Contains an alternative URI of the resource located in an alternative NEF. |

#### 5.40.2.3.3.4 DELETE

This method enables an AF to request the deletion of an existing "Individual CAG Information Parameters Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.40.2.3.3.4-1.

**Table 5.40.2.3.3.4-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.40.2.3.3.4-2 and the response data structures and response codes specified in table 5.40.2.3.3.4-3.

**Table 5.40.2.3.3.4-2: Data structures supported by the DELETE Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.40.2.3.3.4-3: Data structures supported by the DELETE Response Body on this resource**

| Data type                                                                                                                              | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|----------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a                                                                                                                                    |   |             | 204 No Content         | Successful case. | Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.40.2.3.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.40.3 Custom Operations without associated resources

There are no custom operations without associated resources defined for this API in this release of the specification.

### 5.40.4 Notifications

There are no notifications defined for this API in this release of the specification.

## 5.40.5 Data Model

### 5.40.5.1 General

This clause specifies the application data model supported by the CagInfoParamProvision API. Table 5.40.5.1-1 specifies the data types defined for the CagInfoParamProvision API.

**Table 5.40.5.1-1: CagInfoParamProvision API specific Data Types**

| Data type          | Clause defined | Description                                                                         | Applicability |
|--------------------|----------------|-------------------------------------------------------------------------------------|---------------|
| CagInfoPpData      | 5.40.5.2.2     | Represents CAG Information Parameters Provisioning.                                 |               |
| CagInfoPpDataPatch | 5.40.5.2.3     | Represents the requested modification to a CAG Information Parameters Provisioning. |               |
| CagInformation     | 5.40.5.2.4     | Represents the CAG information.                                                     |               |

Table 5.40.5.1-2 specifies data types re-used by the CagInfoParamProvision API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the CagInfoParamProvision API.

**Table 5.40.5.1-2: CagInfoParamProvision API re-used Data Types**

| Data type               | Reference          | Comments                                                                                                         | Applicability |
|-------------------------|--------------------|------------------------------------------------------------------------------------------------------------------|---------------|
| CagProvisionInformation | 3GPP TS 29.571 [8] | Represents CAG provisioning information.                                                                         |               |
| Gpsi                    | 3GPP TS 29.571 [8] | Represents a GPSI.                                                                                               |               |
| SupportedFeatures       | 3GPP TS 29.571 [8] | Represents the list of supported feature(s) and is used to negotiate the applicability of the optional features. |               |

### 5.40.5.2 Structured data types

#### 5.40.5.2.1 Introduction

This clause defines the structures to be used in resource representations.

#### 5.40.5.2.2 Type: CagInfoPpData

**Table 5.40.5.2.2-1: Definition of type CagInfoPpData**

| Attribute name | Data type             | P | Cardinality | Description                                                                                                                                                                  | Applicability |
|----------------|-----------------------|---|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| afId           | string                | M | 1           | Represents the identifier of the AF that is sending the request.                                                                                                             |               |
| cagInfos       | array(CagInformation) | C | 1..N        | Represents the CAG information to be provisioned.<br><br>This attribute shall be present only when the AF requests to provision CAG information parameters.                  |               |
| suppFeat       | SupportedFeatures     | C | 0..1        | Represents the list of supported features among the ones defined in clause 5.40.6.<br><br>This attribute shall be present only when feature negotiation needs to take place. |               |

#### 5.40.5.2.3 Type: CagInfoPpDataPatch

**Table 5.40.5.2.3-1: Definition of type CagInfoPpDataPatch**

| Attribute name | Data type | P | Cardinality | Description | Applicability |
|----------------|-----------|---|-------------|-------------|---------------|
|----------------|-----------|---|-------------|-------------|---------------|

|          |                       |   |      |                                                                      |  |
|----------|-----------------------|---|------|----------------------------------------------------------------------|--|
| cagInfos | array(CagInformation) | C | 1..N | Represents the updated CAG Information Parameters to be provisioned. |  |
|----------|-----------------------|---|------|----------------------------------------------------------------------|--|

#### 5.40.5.2.4 Type: CagInformation

**Table 5.40.5.2.4-1: Definition of type CagInformation**

| Attribute name | Data type               | P | Cardinality | Description                                                                                  | Applicability |
|----------------|-------------------------|---|-------------|----------------------------------------------------------------------------------------------|---------------|
| ueList         | array(Gpsi)             | M | 1..N        | Contains the identifier(s) of the UE(s) to which the provisioned CAG information is related. |               |
| cagProvInfo    | CagProvisionInformation | M | 1           | Contains the CAG information to be provisioned.                                              |               |

### 5.40.5.3 Simple data types and enumerations

#### 5.40.5.3.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

#### 5.40.5.3.2 Simple data types

The simple data types defined in table 5.40.5.3.2-1 shall be supported.

**Table 5.40.5.3.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

### 5.40.5.5 Binary data

#### 5.40.5.5.1 Binary Data Types

**Table 5.40.5.5.1-1: Binary Data Types**

| Name | Clause defined | Content type |
|------|----------------|--------------|
|      |                |              |

### 5.40.6 Used Features

The optional features in table 6.1.8-1 are defined for the CagInfoParamProvision API. They shall be negotiated using the extensibility mechanism defined in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.40.6-1: Supported Features**

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|
|                |              |             |

## 5.40.7 Error handling

### 5.40.7.1 General

For the CagInfoParamProvision API, HTTP error responses shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4]. Protocol errors and application errors specified in clause 5.2.6 of 3GPP TS 29.122 [4] shall be supported for the HTTP status codes specified in table 5.2.6-1 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses are applicable for the CagInfoParamProvision API.

### 5.40.7.2 Protocol Errors

No specific procedures for the CagInfoParamProvision API are specified.

### 5.40.7.3 Application Errors

The application errors defined for the CagInfoParamProvision API are listed in table 5.40.7.3-1.

**Table 5.40.7.3-1: Application errors**

| Application Error | HTTP status code | Description | Applicability |
|-------------------|------------------|-------------|---------------|
|                   |                  |             |               |

## 5.41 Void

## 5.42 ImsSessionManagement API

### 5.42.1 Introduction

The Nnef\_ImsSessionManagement service shall use the ImsSessionManagement API.

The API URI of the ImsSessionManagement API shall be:

**{apiRoot}/<apiName>/<apiVersion>**

The request URIs used in HTTP requests shall have the Resource URI structure defined in clause 5.2.4 of 3GPP TS 29.122 [4], i.e.:

**{apiRoot}/<apiName>/<apiVersion>/<apiSpecificResourceUriPart>**

with the following components:

- The {apiRoot} shall be set as described in clause 5.2.4 of 3GPP TS 29.122 [4].
- The <apiName> shall be "3gpp-ims-sm".
- The <apiVersion> shall be "v1".
- The <apiSpecificResourceUriPart> shall be set as described in clause 5.2.4 of 3GPP TS 29.122 [4].

### 5.42.2 Resources

#### 5.42.2.1 Overview

This clause describes the structure for the Resource URIs as shown in figure 5.42.2.1-1 and the resources and HTTP methods used for the ImsSessionManagement API.

Figure 5.42.2.1-1: Resource URI structure of the ImsSessionManagement API

Table 5.42.2.1-1 provides an overview of the resources and applicable HTTP methods.

Table 5.42.2.1-1: Resources and methods overview

| Resource name          | Resource URI (relative path after API URI) | HTTP method or custom operation | Description (service operation)                         |
|------------------------|--------------------------------------------|---------------------------------|---------------------------------------------------------|
| IMS Sessions           | /ims-sessions                              | POST                            | Create a new IMS Session at the NEF.                    |
|                        |                                            | GET                             | Retrieve all the active IMS Session(s) at the NEF.      |
| Individual IMS Session | /ims-sessions/{sessionId}                  | GET                             | Retrieve an existing "Individual IMS Session" resource. |
|                        |                                            | PUT                             | Update an existing "Individual IMS Session" resource.   |
|                        |                                            | PATCH                           | Modify an existing "Individual IMS Session" resource.   |
|                        |                                            | DELETE                          | Delete an existing "Individual IMS Session" resource.   |

5.42.2.2 Resource: IMS Sessions

5.42.2.2.1 Description

This resource represents the collection of IMS Sessions managed by the NEF.

The resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [32]).

5.42.2.2.2 Resource Definition

Resource URI: {apiRoot}/3gpp-ims-sm/<apiVersion>/ims-sessions

This resource shall support the resource URI variables defined in table 5.42.2.2.2-1.

Table 5.42.2.2.2-1: Resource URI variables for this resource

| Name    | Data type | Definition         |
|---------|-----------|--------------------|
| apiRoot | string    | See clause 5.42.1. |

## 5.42.2.2.3 Resource Standard Methods

## 5.42.2.2.3.1 POST

The HTTP POST method enables an AF to request the creation of a new IMS Session at the NEF.

This method shall support the URI query parameters specified in table 5.42.2.2.3.1-1.

**Table 5.42.2.2.3.1-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.42.2.2.3.1-2 and the response data structures and response codes specified in table 5.42.2.2.3.1-3.

**Table 5.42.2.2.3.1-2: Data structures supported by the POST Request Body on this resource**

| Data type  | P | Cardinality | Description                                                           |
|------------|---|-------------|-----------------------------------------------------------------------|
| ImsSession | M | 1           | Contains the parameters to request the creation of a new IMS Session. |

**Table 5.42.2.2.3.1-3: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                              | P | Cardinality | Response codes | Description                                                                                                                                                                                                                                              |
|----------------------------------------------------------------------------------------------------------------------------------------|---|-------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ImsSession                                                                                                                             | M | 1           | 201 Created    | Successful response. The "Individual IMS Session" resource is successfully created and a representation of the created resource is returned in the response body.<br><br>The URI of the created resource shall be returned in an HTTP "Location" header. |
| ProblemDetails                                                                                                                         | O | 0..1        | 403 Forbidden  | (NOTE 2)                                                                                                                                                                                                                                                 |
| NOTE 1: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                |                                                                                                                                                                                                                                                          |
| NOTE 2: Failure cases are described in clause 5.42.7.                                                                                  |   |             |                |                                                                                                                                                                                                                                                          |

**Table 5.42.2.2.3.1-4: Headers supported by the 201 response code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                                |
|----------|-----------|---|-------------|--------------------------------------------------------------------------------------------------------------------------------------------|

## 5.42.2.2.3.2 GET

The HTTP GET method enables to retrieve all the active IMS Sessions managed by the NEF.

This method shall support the URI query parameters specified in table 5.42.2.2.3.2-1.

**Table 5.42.2.2.3.2-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.42.2.2.3.2-2 and the response data structures and response codes specified in table 5.42.2.2.3.2-3.

**Table 5.42.2.2.3.2-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.42.2.2.3.2-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.42.2.2.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

#### 5.42.2.3 Resource: Individual IMS Session

##### 5.42.2.3.1 Description

This resource represents an "Individual IMS Session" resource managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [32]).

##### 5.42.2.3.2 Resource Definition

Resource URI: {apiRoot}/3gpp-ims-sm/<apiVersion>/ims-sessions/{sessionId}

This resource shall support the resource URI variables defined in table 5.42.2.3.2-1.

**Table 5.42.2.3.2-1: Resource URI variables for this resource**

| Name      | Data type | Definition                                                          |
|-----------|-----------|---------------------------------------------------------------------|
| apiRoot   | string    | See clause 5.42.1.                                                  |
| sessionId | string    | Represents the identifier of the "Individual IMS Session" resource. |

### 5.42.2.3.3 Resource Standard Methods

#### 5.42.2.3.3.0A GET

The HTTP GET method enables an AF to request to retrieve an existing "Individual IMS Session" resource at the NEF.

This method shall support the URI query parameters specified in table 5.42.2.3.3.0A-1.

**Table 5.42.2.3.3.0A-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.42.2.3.3.0A-2 and the response data structures and response codes specified in table 5.42.2.3.3.0A-3.

**Table 5.42.2.3.3.0A-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.42.2.3.3.0A-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| imsSession                                                                                                                          | M | 1           | 200 OK                 | Successful case. The requested "Individual IMS Session" resource is returned in the response body.                                                                                                                                                    |
| n/a                                                                                                                                 |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                 |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.42.2.3.3.0A-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.42.2.3.3.0A-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**5.42.2.3.3.0B PUT**

The HTTP PUT method enables an AF to request the update of an existing "Individual IMS Session" resource at the NEF.

This method shall support the URI query parameters specified in table 5.42.2.3.3.0B-1.

**Table 5.42.2.3.3.0B-1: URI query parameters supported by the PUT method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.42.2.3.3.0B-2 and the response data structures and response codes specified in table 5.42.2.3.3.0B-3.

**Table 5.42.2.3.3.0B-2: Data structures supported by the PUT Request Body on this resource**

| Data type  | P | Cardinality | Description                                                              |
|------------|---|-------------|--------------------------------------------------------------------------|
| ImsSession | M | 1           | Represents the updated "Individual IMS Session" resource representation. |

**Table 5.42.2.3.3.0B-3: Data structures supported by the PUT Response Body on this resource**

| Data type      | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|----------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ImsSession     | M | 1           | 200 OK                 | Successful response. The "Individual IMS Session" resource is successfully updated and a representation of the updated resource is returned in the response body.                                                                                     |
| n/a            |   |             | 204 No Content         | Successful response. The "Individual IMS Session" resource is successfully updated and no content is returned in the response body.                                                                                                                   |

|----------|--------|---|---|-----------------------------------------------------------------------------------|

**Table 5.42.2.3.3.0B-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**5.42.2.3.3.1 PATCH**

The HTTP PATCH method enables an AF to request the modification of an existing "Individual IMS Session" resource at the NEF.

This method shall support the URI query parameters specified in table 5.42.2.3.3.1-1.

**Table 5.42.2.3.3.1-1: URI query parameters supported by the PATCH method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.42.2.3.3.1-2 and the response data structures and response codes specified in table 5.42.2.3.3.1-3.

**Table 5.42.2.3.3.1-2: Data structures supported by the PATCH Request Body on this resource**

| Data type       | P | Cardinality | Description                                                                      |
|-----------------|---|-------------|----------------------------------------------------------------------------------|
| ImsSessionPatch | M | 1           | Represents the requested modifications to the "Individual IMS Session" resource. |

**Table 5.42.2.3.3.1-3: Data structures supported by the PATCH Response Body on this resource**

| Data type      | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|----------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ImsSession     | M | 1           | 200 OK                 | Successful response. The "Individual IMS Session" resource is successfully modified and a representation of the updated resource is returned in the response body.                                                                                    |
| n/a            |   |             | 204 No Content         | Successful response. The "Individual IMS Session" resource is successfully modified and no content is returned in the response body.                                                                                                                  |
| n/a            |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a            |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| ProblemDetails | O | 0..1        | 403 Forbidden          | (NOTE 2)                                                                                                                                                                                                                                              |

NOTE 1: The mandatory HTTP error status codes for the HTTP PATCH method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply.

NOTE 2: Failure cases are described in clause 5.42.7.

**Table 5.42.2.3.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                |
|----------|-----------|---|-------------|----------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI of the resource located on an alternative NEF. |

**Table 5.42.2.3.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                |
|----------|-----------|---|-------------|----------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI of the resource located on an alternative NEF. |

#### 5.42.2.3.3.2 DELETE

The HTTP DELETE method enables an AF to request the deletion of an existing "Individual IMS Session" resource at the NEF.

This method shall support the URI query parameters specified in table 5.42.2.3.3.2-1.

**Table 5.42.2.3.3.2-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.42.2.3.3.2-2 and the response data structures and response codes specified in table 5.42.2.3.3.2-3.

**Table 5.42.2.3.3.2-2: Data structures supported by the DELETE Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.42.2.3.3.2-3: Data structures supported by the DELETE Response Body on this resource**

| Data type | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-----------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a       |   |             | 204 No content         | Successful response. The "Individual IMS Session" resource is successfully deleted.                                                                                                                                                                   |
| n/a       |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a       |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |

NOTE 1: The mandatory HTTP error status codes for the HTTP DELETE method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply.

**Table 5.42.2.3.3.2-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                |
|----------|-----------|---|-------------|----------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI of the resource located on an alternative NEF. |

**Table 5.42.2.3.3.2-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                |
|----------|-----------|---|-------------|----------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI of the resource located on an alternative NEF. |

#### 5.42.2.3.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.42.3 Custom Operations without associated resources

There are no resource custom operations defined for this resource in this release of the specification.

## 5.42.4 Notifications

### 5.42.4.1 General

Notifications shall comply to clause 5.2.5 of 3GPP TS 29.122 [4].

**Table 5.42.4.1-1: Notifications overview**

| Notification             | Callback URI | HTTP method or custom operation | Description (service operation)                                                      |
|--------------------------|--------------|---------------------------------|--------------------------------------------------------------------------------------|
| IMS Session Notification | {notifUri}   | POST                            | Enable the NEF to notify a previously subscribed AF on IMS Session related event(s). |

### 5.42.4.2 IMS Session Notification

#### 5.42.4.2.1 Description

The IMS Session Notification is used by the NEF to report IMS session related event(s) to a previously subscribed AF.

#### 5.42.4.2.2 Target URI

The Callback URI "{**notifUri**}" shall be used with the callback URI variables defined in table 5.43.4.2.2-1.

**Table 5.42.4.2.2-1: Callback URI variables**

| Name     | Definition                                                          |
|----------|---------------------------------------------------------------------|
| notifUri | Represents the callback URI encoded as a string formatted as a URI. |

#### 5.42.4.2.3 Operation Definition

This method shall support the request data structures specified in table 5.42.4.2.3-1 and the response data structures and response codes specified in table 5.42.4.2.3-2.

**Table 5.42.4.2.3-1: Data structures supported by the POST Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
|-----------|---|-------------|-------------|

|                              |   |   |                                        |
|------------------------------|---|---|----------------------------------------|
| ImsSessionEvent Notification | M | 1 | Contains the IMS Session Notification. |
|------------------------------|---|---|----------------------------------------|

**Table 5.42.4.2.3-2: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                            | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a                                                                                                                                  |   |             | 204 No Content         | Successful case. The IMS Session Notification is successfully received and acknowledged.                                                                                                                                                                                                       |
| n/a                                                                                                                                  |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF towards which the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                  |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF towards which the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                                                                |

**Table 5.42.4.2.3-3: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                      |
|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

**Table 5.42.4.2.3-4: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                      |
|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

## 5.42.5 Data Model

### 5.42.5.1 General

This clause specifies the application data model supported by the API.

Table 5.42.5.1-1 specifies the data types defined for the ImsSessionManagement service-based interface protocol.

**Table 5.42.5.1-1: ImsSessionManagement specific Data Types**

| Data type       | Clause defined | Description                                               | Applicability |
|-----------------|----------------|-----------------------------------------------------------|---------------|
| ImsSession      | 5.42.5.2.2     | Represent an IMS Session.                                 |               |
| ImsSessionPatch | 5.42.5.2.3     | Represents the requested modifications to an IMS Session. |               |

Table 5.42.5.1-2 specifies data types re-used by the ImsSessionManagement service based interface protocol from other specifications, including a reference to their respective specifications and when needed, a short description of their use within the ImsSessionManagement service based interface.

**Table 5.42.5.1-2: ImsSessionManagement re-used Data Types**

| Data type                   | Reference           | Comments                                                                                                         | Applicability |
|-----------------------------|---------------------|------------------------------------------------------------------------------------------------------------------|---------------|
| ImsSessionInfo              | 3GPP TS 29.175 [78] | Represents IMS Session related information.                                                                      |               |
| ImsSessionEventNotification | 3GPP TS 29.175 [78] | Represents the IMS Session Notification.                                                                         |               |
| SupportedFeatures           | 3GPP TS 29.571 [8]  | Represents the list of supported feature(s) and is used to negotiate the applicability of the optional features. |               |
| Uri                         | 3GPP TS 29.122 [4]  | Represents a URI.                                                                                                |               |

**Editor's Note:** The data model of ImsSessionManagement is FFS.

## 5.42.5.2 Structured data types

### 5.42.5.2.1 Introduction

This clause defines the structured data types to be used in resource representations.

### 5.42.5.2.2 Type: ImsSession

**Table 5.42.5.2.2-1: Definition of type ImsSession**

| Attribute name | Data type         | P | Cardinality | Description                                                                                                                                                        | Applicability |
|----------------|-------------------|---|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| afId           | string            | M | 1           | Contains the identifier of the AF that is sending the request.                                                                                                     |               |
| imsSessionInfo | ImsSessionInfo    | M | 1           | Contains the IMS session information.                                                                                                                              |               |
| notifUri       | Uri               | O | 0..1        | Contains the URI via which IMS Session notifications shall be delivered.                                                                                           |               |
| suppFeat       | SupportedFeatures | C | 0..1        | Contains the list of supported features among the ones defined in clause 5.42.6.<br><br>This attribute shall be present only when feature negotiation is required. |               |

## 5.42.5.3 Simple data types and enumerations

### 5.42.5.3.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

### 5.42.5.3.2 Simple data types

The simple data types defined in table 5.42.5.3.2-1 shall be supported.

**Table 5.42.5.3.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

#### 5.42.5.4 Data types describing alternative data types or combinations of data types

There are no custom operations without associated resources defined for this API in this release of the specification.

#### 5.42.5.5 Binary data

##### 5.42.5.5.1 Binary Data Types

**Table 5.42.5.5.1-1: Binary Data Types**

| Name | Clause defined | Content type |
|------|----------------|--------------|
|      |                |              |

#### 5.42.6 Used Features

The optional features in table 5.42.6-1 are defined for the ImsSessionManagement API. They shall be negotiated using the extensibility mechanism defined in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.42.6-1: Supported Features**

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|
|                |              |             |

#### 5.42.7 Error Handling

##### 5.42.7.1 General

For the ImsSessionManagement API, HTTP error responses shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4]. Protocol errors and application errors specified in clause 5.2.6 of 3GPP TS 29.122 [4] shall be supported for the HTTP status codes specified in table 5.2.6-1 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses are applicable for the ImsSessionManagement API.

##### 5.42.7.2 Protocol Errors

No specific procedures for the ImsSessionManagement API are specified.

##### 5.42.7.3 Application Errors

The application errors defined for the ImsSessionManagement service are listed in Table 5.42.7.3-1.

**Table 5.42.7.3-1: Application errors**

| Application Error | HTTP status code | Description                                                                                                   | Applicability |
|-------------------|------------------|---------------------------------------------------------------------------------------------------------------|---------------|
| AF_NOT_AUTHORIZED | 403 Forbidden    | The creation/update/modification request for IMS session is rejected because the AF is not authorized by NEF. |               |

### 5.43 ImsEventExposure API

#### 5.43.1 Introduction

The Nnef\_ImsEventExposure service shall use the ImsEventExposure API.

The API URI of ImsEventExposure API shall be:

{apiRoot}/<apiName>/<apiVersion>

The request URIs used in HTTP requests shall have the Resource URI structure defined in clause 5.2.4 of 3GPP TS 29.122 [4], i.e.:

{apiRoot}/<apiName>/<apiVersion>/<apiSpecificSuffixes>

with the following components:

- "apiRoot" is set as defined in clause 5.2.4 of 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-ims-ee".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.
- The <apiSpecificSuffixes> shall be set as described in clause 5.2.4 of 3GPP TS 29.122 [4].

5.43.2 Resources

5.43.2.1 Overview

This clause describes the structure for the Resource URIs as shown in Figure 5.43.2.1-1 and the resources and HTTP methods used for the ImsEventExposure API.

**Figure 5.43.2.1-1: Resource URI structure of the ImsEventExposure API**

Table 5.43.2.1-1 provides an overview of the resources and applicable HTTP methods applicable for the ImsEventExposure API.

**Table 5.43.2.1-1: Resources and methods overview**

| Resource name                  | Resource URI (relative path under API URI) | HTTP method or custom operation | Description (service operation)                                    |
|--------------------------------|--------------------------------------------|---------------------------------|--------------------------------------------------------------------|
| IMS EE Subscriptions           | /{afld}/subscriptions                      | POST                            | Create a new IMS EE Subscription.                                  |
|                                |                                            | GET                             | Retreive all the active IMS EE Subscription(s) managed by the NEF. |
| Individual IMS EE Subscription | /{afld}/subscriptions/{subscriptionId}     | GET                             | Retreive an existing "Individual IMS EE Subscription" resource.    |
|                                |                                            | PUT                             | Update an existing "Individual IMS EE Subscription" resource.      |
|                                |                                            | PATCH                           | Modify an existing "Individual IMS EE Subscription" resource.      |

|  |  |        |                                                               |
|--|--|--------|---------------------------------------------------------------|
|  |  | DELETE | Delete an existing "Individual IMS EE Subscription" resource. |
|--|--|--------|---------------------------------------------------------------|

## 5.43.2.2 Resource: IMS EE Subscriptions

### 5.43.2.2.1 Introduction

This resource represents all the active IMS Event Exposure Subscription(s) managed by the NEF for a given AF.

This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [3]).

### 5.43.2.2.2 Resource definition

Resource URI: **{apiRoot}/3gpp-ims-ee/<apiVersion>/{afId}/subscriptions**

This resource shall support the resource URI variables defined in table 5.43.2.2.2-1.

**Table 5.43.2.2.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition                           |
|---------|-----------|--------------------------------------|
| apiRoot | string    | See clause 5.43.1.                   |
| afId    | string    | Represents the identifier of the AF. |

### 5.43.2.2.3 Resource Standard Methods

#### 5.43.2.2.3.1 POST

The HTTP POST method enables to request the creation of a new IMS Event Exposure Subscription at the NEF.

This method shall support the URI query parameters specified in table 5.43.2.2.3.1-1.

**Table 5.43.2.2.3.1-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.43.2.2.3.1-2 and the response data structures and response codes specified in table 5.43.2.2.3.1-3.

**Table 5.43.2.2.3.1-2: Data structures supported by the POST request body on this resource**

| Data type   | P | Cardinality | Description                                                                                          |
|-------------|---|-------------|------------------------------------------------------------------------------------------------------|
| ImseEESubsc | M | 1           | Contains the parameters to request the creation of a new IMS Event Exposure Subscription at the NEF. |

**Table 5.43.2.2.3.1-3: Data structures supported by the POST response body on this resource**

| Data type                                                                                                                              | P | Cardinality | Response codes | Description                                                                                                                                                                                                         |
|----------------------------------------------------------------------------------------------------------------------------------------|---|-------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ImseEESubsc                                                                                                                            | M | 1           | 201 Created    | Successful case. A representation of the created "Individual IMS EE Subscription" resource is returned in the response body.<br><br>The URI of the created resource shall be returned in an HTTP "Location" header. |
| ProblemDetails                                                                                                                         | O | 0..1        | 403 Forbidden  | (NOTE 2)                                                                                                                                                                                                            |
| NOTE 1: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                |                                                                                                                                                                                                                     |
| NOTE 2: Failure cases are described in clause 5.43.7.                                                                                  |   |             |                |                                                                                                                                                                                                                     |

**Table 5.43.2.2.3.1-4: Headers supported by the 201 response code on this resource**

| HTTP response header | Data type | P | Cardinality | Description                                                                                                                                      |
|----------------------|-----------|---|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Location             | string    | M | 1           | The URI of the newly created resource, according to the structure:<br>{apiRoot}/3gpp-ims-<br>ee/<apiVersion>/afld/subscriptions/{subscriptionId} |

**5.43.2.2.3.2 GET**

The HTTP GET method enables to retrieve all the active IMS EE Subscriptions managed by the NEF.

This method shall support the URI query parameters specified in table 5.43.2.2.3.2-1.

**Table 5.43.2.2.3.2-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.43.2.2.3.2-2 and the response data structures and response codes specified in table 5.43.2.2.3.2-3.

**Table 5.43.2.2.3.2-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.43.2.2.3.2-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| array(ImsEESubsc)                                                                                                                   | M | 0..N        | 200 OK                 | Successful case. All the "Individual IMS EE Subscription" resource(s) managed by the NEF are returned.<br><br>If there are no active "Individual IMS EE Subscription" resources at the NEF, an empty array is returned.                               |
| n/a                                                                                                                                 |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                 |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.43.2.2.3.2-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.43.2.2.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.43.2.3 Resource: Individual IMS EE Subscription

#### 5.43.2.3.1 Introduction

This resource represents an "Individual IMS EE Subscription" resource managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [3]).

#### 5.43.2.3.2 Resource Definition

Resource URI: {apiRoot}/3gpp-ims-ee/<apiVersion>/{afId}/subscriptions/{subscriptionId}

This resource shall support the resource URI variables defined in table 5.43.2.3.2-1.

**Table 5.43.2.3.2-1: Resource URI variables for this resource**

| Name           | Data type | Definition                                                                  |
|----------------|-----------|-----------------------------------------------------------------------------|
| apiRoot        | string    | See clause 5.43.1.                                                          |
| afId           | string    | Represents the identifier of the AF.                                        |
| subscriptionId | string    | Represents the identifier of the "Individual IMS EE Subscription" resource. |

#### 5.43.2.3.3 Resource Standard Methods

##### 5.43.2.3.3.1 GET

The HTTP GET method enables to retrieve an existing "Individual IMS EE Subscription" resource at the NEF.

This method shall support the URI query parameters specified in table 5.43.2.3.3.1-1.

**Table 5.43.2.3.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.43.2.3.3.1-2 and the response data structures and response codes specified in table 5.43.2.3.3.1-3.

**Table 5.43.2.3.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.43.2.3.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type | P | Cardinality | Response | Description |
|-----------|---|-------------|----------|-------------|
|-----------|---|-------------|----------|-------------|

|                                                                                                                                     |   |   | codes                  |                                                                                                                                                                                                                                                       |

#### 5.43.2.3.3.2 PUT

The HTTP PUT method enables to request the update of an existing "Individual IMS EE Subscription" resource at the NEF.

This method shall support the URI query parameters specified in table 5.43.2.3.3.2-1.

**Table 5.43.2.3.3.2-1: URI query parameters supported by the PUT method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.43.2.3.3.2-2 and the response data structures and response codes specified in table 5.43.2.3.3.2-4.

**Table 5.43.2.3.3.2-2: Data structures supported by the PUT request body on this resource**

| Data type  | P | Cardinality | Description                                                                    |
|------------|---|-------------|--------------------------------------------------------------------------------|
| lmsEESubsc | M | 1           | Contains the updated "Individual IMS EE Subscription" resource representation. |

**Table 5.43.2.3.3.2-3: Data structures supported by the PUT response body on this resource**

| Data type | P | Cardinality | Response codes | Description |
|-----------|---|-------------|----------------|-------------|
|-----------|---|-------------|----------------|-------------|

|                                                                                                                                     |   |   |                        |                                                                                                                                                                                                                                                       |
|-------------------------------------------------------------------------------------------------------------------------------------|---|---|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ImseEESubsc                                                                                                                         | M | 1 | 200 OK                 | Successful response. The "Individual IMS EE Subscription" resource is successfully updated and a representation of the updated resource is returned in the response body.                                                                             |
| n/a                                                                                                                                 |   |   | 204 No Content         | Successful response. The "Individual IMS EE Subscription" resource is successfully updated and no content is returned in the response body.                                                                                                           |

**5.43.2.3.3.3 PATCH**

This method enables to request the modification of an existing "Individual IMS EE Subscription" resource at the NEF.

This method shall support the URI query parameters specified in table 5.43.2.3.3.3-1.

**Table 5.43.2.3.3.3-1: URI query parameters supported by the PATCH method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.43.2.3.3.3-2 and the response data structures and response codes specified in table 5.43.2.3.3.3-3.

**Table 5.43.2.3.3.3-2: Data structures supported by the PATCH Request Body on this resource**

| Data type        | P | Cardinality | Description                                                                            |
|------------------|---|-------------|----------------------------------------------------------------------------------------|
| ImseEESubscPatch | M | 1           | Contains the requested modifications to the "Individual IMS EE Subscription" resource. |

#### 5.43.2.3.3.4 DELETE

The HTTP DELETE method enables to request the deletion of an existing "Individual IMS EE Subscription" resource at the NEF.

This method shall support the URI query parameters specified in table 5.43.2.3.3.4-1.

**Table 5.43.2.3.3.4-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.43.2.3.3.4-2 and the response data structures and response codes specified in table 5.43.2.3.3.4-3.

**Table 5.43.2.3.3.4-2: Data structures supported by the DELETE request body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.43.2.3.3.4-3: Data structures supported by the DELETE response body on this resource**

| Data type                                                                                                                              | P | Cardinality | Response Codes         | Description                                                                                                                                                                                                                                           |
|----------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a                                                                                                                                    |   |             | 204 No Content         | Successful response. The "Individual IMS EE Subscription" resource is successfully deleted.                                                                                                                                                           |
| n/a                                                                                                                                    |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                    |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP DELETE method listed in Table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.43.2.3.3.4-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.43.2.3.3.4-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.43.2.3.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.43.3 Custom Operations without associated resources

There are no custom operations without associated resources defined for this API in this release of the specification.

## 5.43.4 Notifications

### 5.43.4.1 General

Notifications shall comply to clause 5.2.5 of 3GPP TS 29.122 [4].

**Table 5.43.4.1-1: Notifications overview**

| Notification        | Callback URI | HTTP method or custom operation | Description (service operation)                                                      |
|---------------------|--------------|---------------------------------|--------------------------------------------------------------------------------------|
| IMS EE Notification | {notifUri}   | POST                            | Enables to notify a previously subscribed AF on IMS Event Exposure related event(s). |

## 5.43.4.2 IMS Event Exposure Notification

### 5.43.4.2.1 Description

The IMS Event Exposure Notification is used by the NEF to report IMS Event Exposure related event(s) to a previously subscribed AF.

### 5.43.4.2.2 Target URI

The Callback URI "{notifUri}" shall be used with the callback URI variables defined in table 5.43.4.2.2-1.

**Table 5.43.4.2.2-1: Callback URI variables**

| Name     | Definition                                                          |
|----------|---------------------------------------------------------------------|
| notifUri | Represents the callback URI encoded as a string formatted as a URI. |

### 5.43.4.2.3 Operation Definition

This method shall support the request data structures specified in table 5.43.4.2.3-1 and the response data structures and response codes specified in table 5.43.4.2.3-2.

**Table 5.43.4.2.3-1: Data structures supported by the POST Request Body on this resource**

| Data type  | P | Cardinality | Description                                     |
|------------|---|-------------|-------------------------------------------------|
| ImsEENotif | M | 1           | Represents the IMS Event Exposure Notification. |

**Table 5.43.4.2.3-2: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                            | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a                                                                                                                                  |   |             | 204 No Content         | Successful case. The IMS Event Exposure Notification is successfully received and acknowledged.                                                                                                                                                                                                |
| n/a                                                                                                                                  |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF towards which the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                  |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF towards which the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                                                                |

**Table 5.43.4.2.3-3: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                      |
|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

**Table 5.43.4.2.3-4: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                      |
|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

## 5.43.5 Data Model

### 5.43.5.1 General

This clause specifies the application data model supported by the ImsEventExposure API. Table 5.43.5.1-1 specifies the data types defined for the ImsEventExposure API.

**Table 5.43.5.1-1: ImsEventExposure API specific Data Types**

| Data type           | Clause defined | Description                                                       | Applicability |
|---------------------|----------------|-------------------------------------------------------------------|---------------|
| ImsEENotif          | 5.43.5.2.3     | Represents the IMS Event Exposure Notification.                   |               |
| ImsEventReport      | 5.43.5.2.6     | Represents the IMS Event Report.                                  |               |
| ImsEventRequirement | 5.43.5.2.5     | Represents the IMS Event related requirements.                    |               |
| ImsEventType        | 5.43.5.3.3     | Represents the IMS Event Type.                                    |               |
| ImsEESubsc          | 5.43.5.2.2     | Represents the IMS Event Exposure Subscription.                   |               |
| ImsEESubscPatch     | 5.43.5.2.4     | Represents the requested modifications to an IMS EE Subscription. |               |

Table 5.43.5.1-2 specifies data types re-used by the ImsEventExposure API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the ImsEventExposure API.

**Table 5.43.5.1-2: ImsEventExposure API re-used Data Types**

| Data type             | Reference           | Comments                                                                                                      | Applicability |
|-----------------------|---------------------|---------------------------------------------------------------------------------------------------------------|---------------|
| DateTime              | 3GPP TS 29.122 [4]  | Represents a date and a time.                                                                                 |               |
| ImsEvent              | 3GPP TS 29.571 [8]  | Represents the IMS Event.                                                                                     |               |
| ImsEventConfiguration | 3GPP TS 29.571 [8]  | Represents the IMS event configuration requirements.                                                          |               |
| ImsEventReportInfo    | 3GPP TS 29.571 [8]  | Represents the IMS event report information.                                                                  |               |
| ImsReportingOptions   | 3GPP TS 29.571 [8]  | Represents the IMS reporting requirement options.                                                             |               |
| ImsPublicId           | 3GPP TS 29.562 [80] | Represents the IMS Public Identity.                                                                           |               |
| SessionId             | 3GPP TS 29.571 [8]  | The IMS session ID.                                                                                           |               |
| SupportedFeatures     | 3GPP TS 29.571 [8]  | Represents the list of supported feature(s) and used to negotiate the applicability of the optional features. |               |

### 5.43.5.2 Structured data types

#### 5.43.5.2.1 Introduction

This clause defines the structured data types to be used in resource representations.

#### 5.43.5.2.2 Type: ImsEESubsc

**Table 5.43.5.2.17-1: Definition of type ImsEESubsc**

| Attribute name | Data type                  | P | Cardinality | Description                                        | Applicability |
|----------------|----------------------------|---|-------------|----------------------------------------------------|---------------|
| eventReqs      | array(ImsEventRequirement) | M | 1..N        | Contains the subscribed IMS Event(s) requirements. |               |
| imsReptReq     | ImsReportingOptions        | M | 1           | Contains the IMS reporting requirements.           |               |

|                                                                                      |                       |   |      |                                                                                                                                                                                                                                                                                                                                |  |
|--------------------------------------------------------------------------------------|-----------------------|---|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| immReports                                                                           | array(ImsEventReport) | C | 1..N | Contains the current status related to the subscribed event(s).<br><br>This attribute shall be present only in subscription creation/update responses and only when immediate reporting was requested in the corresponding subscription creation/update request when the information is available for the subscribed event(s). |  |
| tgtUeIds                                                                             | array(ImsPublicId)    | C | 1..N | Contains the identifier(s) of the UE(s) to which the subscription is related.<br><br>(NOTE)                                                                                                                                                                                                                                    |  |
| anyUeInd                                                                             | boolean               | C | 0..1 | Indicates whether the subscription is for any UE.<br><br>- "true" indicates that the subscription is for any UE.<br><br>When present, this attribute shall be set to "true". The presence of this attribute set to the value "false" is forbidden.<br><br>(NOTE)                                                               |  |
| notifUri                                                                             | Uri                   | M | 1    | Contains the URI via which IMS EE notifications shall be delivered.                                                                                                                                                                                                                                                            |  |

## 5.43.5.2.3 Type: ImsEENotif

Table 5.43.5.2.3-1: Definition of type ImsEENotif

| Attribute name  | Data type             | P | Cardinality | Description                                                                       | Applicability |
|-----------------|-----------------------|---|-------------|-----------------------------------------------------------------------------------|---------------|
| subscriptionId  | string                | M | 1           | Contains the identifier of the subscription to which the notification is related. |               |
| sessionId       | SessionId             | O | 0..1        | Identifies the session ID.                                                        |               |
| reports         | array(ImsEventReport) | M | 1..N        | Contains the IMS event report(s).                                                 |               |
| imsFailureCause | string                | O | 0..1        | Contains the failure cause provided from the IMS AS.                              |               |

## 5.43.5.2.4 Type: ImsEESubscPatch

Table 5.43.5.2.4-1: Definition of type ImsEESubscPatch

| Attribute name | Data type                  | P | Cardinality | Description                                                                 | Applicability |
|----------------|----------------------------|---|-------------|-----------------------------------------------------------------------------|---------------|
| eventReqs      | array(ImsEventRequirement) | O | 1..N        | Contains the updated IMS Event(s) requirements.                             |               |
| notifUri       | Uri                        | O | 1           | Contains the updated URI via which IMS EE notifications shall be delivered. |               |

## 5.43.5.2.5 Type: ImsEventRequirement

**Table 5.43.5.2.5-1: Definition of type ImsEventRequirement**

| Attribute name | Data type             | P | Cardinality | Description                                        | Applicability |
|----------------|-----------------------|---|-------------|----------------------------------------------------|---------------|
| imsEventType   | ImsEventType          | M | 1           | Contains the IMS Event Type.                       |               |
| imsEventConfig | ImsEventConfiguration | M | 1           | Indicates the IMS event configuration requirement. |               |

**Editor's Note:** The encoding of the "eventFilter" attribute is FFS and pending stage 2 progress.

## 5.43.5.2.6 Type: ImsEventReport

**Table 5.43.5.2.6-1: Definition of type ImsEventReport**

| Attribute name | Data type          | P | Cardinality | Description                                        | Applicability |
|----------------|--------------------|---|-------------|----------------------------------------------------|---------------|
| imsEvent       | ImsEvent           | M | 1           | Contains the IMS event within the requested scope. |               |
| timeStamp      | DateTime           | M | 1           | Contains the timestamp of this IMS event report.   |               |
| eventRptInfo   | ImsEventReportInfo | O | 0..1        | Contains the IMS event report information.         |               |

## 5.43.5.3 Simple data types and enumerations

## 5.43.5.3.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

## 5.43.5.3.2 Simple data types

The simple data types defined in table 5.43.5.3.2-1 shall be supported.

**Table 5.43.5.3.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

## 5.43.5.3.3 Enumeration: ImsEventType

The enumeration ImsEventType represents the IMS Event type. It shall comply with the provisions defined in table 5.43.5.3.3-1.

**Table 5.43.5.3.3-1: Enumeration ImsEventType**

| Enumeration value       | Description                                                                    | Applicability |
|-------------------------|--------------------------------------------------------------------------------|---------------|
| SUBSCRIBER_SPECIFIC     | Indicates that the IMS Event type is Subscriber Specific for data channel.     |               |
| NON_SUBSCRIBER_SPECIFIC | Indicates that the IMS Event type is Non-Subscriber Specific for data channel. |               |

#### 5.43.5.4 Data types describing alternative data types or combinations of data types

There are no data types describing alternative data types or combinations of data types defined for this API in this release of the specification.

#### 5.43.5.5 Binary data

##### 5.43.5.5.1 Binary Data Types

**Table 5.43.5.5.1-1: Binary Data Types**

| Name | Clause defined | Content type |
|------|----------------|--------------|
|      |                |              |

#### 5.43.6 Used Features

The optional features listed in table 5.43.6-1 are defined for the ImsEventExposure API. They shall be negotiated using the extensibility mechanism defined in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.43.6-1: Features used by ImsEventExposure API**

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|
|                |              |             |

#### 5.43.7 Error handling

##### 5.43.7.1 General

For the ImsEventExposure API, HTTP error responses shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4]. Protocol errors and application errors specified in clause 5.2.6 of 3GPP TS 29.122 [4] shall be supported for the HTTP status codes specified in table 5.2.6-1 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses are applicable for the ImsEventExposure API.

##### 5.43.7.2 Protocol Errors

No specific procedures for the ImsEventExposure API are specified.

##### 5.43.7.3 Application Errors

The application errors defined for the ImsEventExposure API are listed in table 5.43.7.3-1.

**Table 5.43.7.3-1: Application errors**

| Application Error | HTTP status code | Description                                                                                                                 | Applicability |
|-------------------|------------------|-----------------------------------------------------------------------------------------------------------------------------|---------------|
| AF_NOT_AUTHORIZED | 403 Forbidden    | The subscribe request for subscriber/non-subscriber specific IMS event is rejected because the AF is not authorized by NEF. |               |

#### 5.44 ImsParamProvision API

##### 5.44.1 Introduction

The Nnef\_ImsParameterProvision service shall use the ImsParamProvision API for:

- IMS Parameters provisioning.

The API URI of the ImsParamProvision API shall be:

**{apiRoot}/<apiName>/<apiVersion>**

The request URIs used in HTTP requests shall have the Resource URI structure defined in clause 5.2.4 of 3GPP TS 29.122 [4], i.e.:

**{apiRoot}/<apiName>/<apiVersion>/<apiSpecificSuffixes>**

with the following components:

- "apiRoot" is set as defined in clause 5.2.4 of 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-ims-pp".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.
- The <apiSpecificSuffixes> shall be set as described in clause 5.2.4 of 3GPP TS 29.122 [4].

## 5.44.2 Resources

### 5.44.2.1 Overview

This clause describes the structure for the Resource URIs as shown in figure 5.44.2.1-1 and the resources and HTTP methods used for the ImsParamProvision API.

**Figure 5.44.2.1-1: Resource URI structure of the ImsParamProvision API**

Table 5.44.2.1-1 provides an overview of the resources and applicable HTTP methods.

**Table 5.44.2.1-1: Resources and methods overview**

| Resource name                          | Resource URI (relative path under API URI) | HTTP method or custom operation | Description (service operation)                                                   |
|----------------------------------------|--------------------------------------------|---------------------------------|-----------------------------------------------------------------------------------|
| IMS Parameters Provisionings           | /pp                                        | GET                             | Retrieve all the active IMS Parameters Provisionings managed by the NEF.          |
|                                        |                                            | POST                            | Request the creation of a new IMS Parameters Provisioning at the NEF.             |
| Individual IMS Parameters Provisioning | /pp/{ppId}                                 | GET                             | Retrieve an existing "Individual IMS Parameters Provisioning" managed by the NEF. |
|                                        |                                            | PUT                             | Update an existing "Individual IMS Parameters Provisioning" managed by the NEF.   |

|  |  |        |                                                                                 |
|--|--|--------|---------------------------------------------------------------------------------|
|  |  |        | Provisioning" managed by the NEF.                                               |
|  |  | DELETE | Delete an existing "Individual IMS Parameters Provisioning" managed by the NEF. |

## 5.44.2.2 Resource: IMS Parameters Provisionings

### 5.44.2.2.1 Introduction

This resource represents the collection of IMS Parameters Provisionings managed by the NEF.

This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [32]).

### 5.44.2.2.2 Resource Definition

Resource URI: {apiRoot}/3gpp-ims-pp/<apiVersion>/pp

This resource shall support the resource URI variables defined in table 5.44.2.2.2-1.

**Table 5.44.2.2.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition         |
|---------|-----------|--------------------|
| apiRoot | string    | See clause 5.44.1. |

### 5.44.2.2.3 Resource Methods

#### 5.44.2.2.3.1 GET

This method enables an AF to request to retrieve all the active "IMS Parameters Provisionings" resources managed by the NEF.

This method shall support the URI query parameters specified in table 5.44.2.2.3.1-1.

**Table 5.44.2.2.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.44.2.2.3.1-2 and the response data structures and response codes specified in table 5.44.2.2.3.1-3.

**Table 5.44.2.2.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.44.2.2.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type        | P | Cardinality | Response codes | Description                                                                                                                                                                                                                                     |
|------------------|---|-------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| array(ImsPpData) | M | 0..N        | 200 OK         | Successful case. All the "Individual IMS Parameters Provisioning" resources managed by the NEF are returned.<br><br>If there are no existing "Individual IMS Parameters Provisioning" resources managed at the NEF, an empty array is returned. |

|                                                                                                                                     |  |  |                        |                                                                                                                                                                                                                                                              |
|-------------------------------------------------------------------------------------------------------------------------------------|--|--|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a                                                                                                                                 |  |  | 307 Temporary Redirect | <p>Temporary redirection.</p> <p>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.</p> <p>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].</p> |
| n/a                                                                                                                                 |  |  | 308 Permanent Redirect | <p>Permanent redirection.</p> <p>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.</p> <p>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4].</p> |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |  |  |                        |                                                                                                                                                                                                                                                              |

**Table 5.44.2.2.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.44.2.2.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**5.44.2.2.3.2 POST**

This method enables an AF to request the creation of a new IMS Parameters Provisioning at the NEF.

This method shall support the URI query parameters specified in table 5.44.2.2.3.2-1.

**Table 5.44.2.2.3.2-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.44.2.2.3.2-2 and the response data structures and response codes specified in table 5.44.2.2.3.2-3.

**Table 5.44.2.2.3.2-2: Data structures supported by the POST Request Body on this resource**

| Data type | P | Cardinality | Description                                                                              |
|-----------|---|-------------|------------------------------------------------------------------------------------------|
| ImsPpData | M | 1           | Contains the representation of the IMS Parameters Provisioning to be created at the NEF. |

**Table 5.44.2.2.3.2-3: Data structures supported by the POST Response Body on this resource**

| Data type | P | Cardinality | Response codes | Description                                                                                                                          |
|-----------|---|-------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------|
| ImsPpData | M | 1           | 201 Created    | Successful case. A representation of the created "Individual IMS Parameters Provisioning" resource is returned in the response body. |

|                                                                                                                                      |  |  |  |                                                                                 |
|--------------------------------------------------------------------------------------------------------------------------------------|--|--|--|---------------------------------------------------------------------------------|
|                                                                                                                                      |  |  |  | The URI of the created resource shall be returned in an HTTP "Location" header. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |  |  |  |                                                                                 |

**Table 5.44.2.2.3.2-4: Headers supported by the 201 response code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                 |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains the URI of the newly created resource, according to the structure:<br>{apiRoot}/3gpp-ims-pp/<apiVersion>/pp/{ppId} |

#### 5.44.2.2.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.44.2.3 Resource: Individual IMS Parameters Provisioning

#### 5.44.2.3.1 Introduction

This resource represents an "Individual IMS Parameters Provisioning" resource managed by the NEF.

This resource is modelled with the Document resource archetype (see clause C.1 of 3GPP TS 29.501 [32]).

#### 5.44.2.3.2 Resource Definition

Resource URI: **{apiRoot}/3gpp-ims-pp/<apiVersion>/pp/{ppId}**

This resource shall support the resource URI variables defined in table 5.44.2.3.2-1.

**Table 5.44.2.3.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition                                                                          |
|---------|-----------|-------------------------------------------------------------------------------------|
| apiRoot | string    | See clause 5.44.1.                                                                  |
| ppId    | string    | Represents the identifier of the "Individual IMS Parameters Provisioning" resource. |

#### 5.44.2.3.3 Resource Methods

##### 5.44.2.3.3.1 GET

This method enables an AF to request to retrieve an existing "Individual IMS Parameters Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.44.2.3.3.1-1.

**Table 5.44.2.3.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.44.2.3.3.1-2 and the response data structures and response codes specified in table 5.44.2.3.3.1-3.

**Table 5.44.2.3.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.44.2.3.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ImsPpData                                                                                                                           | M | 1           | 200 OK                 | Successful case. The requested "Individual IMS Parameters Provisioning" resource is returned in the response body.                                                                                                                                    |
| n/a                                                                                                                                 |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                 |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.44.2.3.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.44.2.3.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.44.2.3.3.2 PUT

This method enables an AF to request the update of an existing "Individual IMS Parameters Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.44.2.3.3.2-1.

**Table 5.44.2.3.3.2-1: URI query parameters supported by the PUT method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.44.2.3.3.2-2 and the response data structures and response codes specified in table 5.44.2.3.3.2-3.

**Table 5.44.2.3.3.2-2: Data structures supported by the PUT Request Body on this resource**

| Data type | P | Cardinality | Description                                                                              |
|-----------|---|-------------|------------------------------------------------------------------------------------------|
| ImsPpData | M | 1           | Represents the updated "Individual IMS Parameters Provisioning" resource representation. |

**Table 5.44.2.3.3.2-3: Data structures supported by the PUT Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ImsPpData                                                                                                                           | M | 1           | 200 OK                 | Successful response. The "Individual IMS Parameters Provisioning" resource is successfully updated and a representation of the updated resource is returned in the response body.                                                                     |
| n/a                                                                                                                                 |   |             | 204 No Content         | Successful response. The "Individual IMS Parameters Provisioning" resource is successfully updated and no content is returned in the response body.                                                                                                   |
| n/a                                                                                                                                 |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                 |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP PUT method listed in Table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.44.2.3.3.2-4: Headers supported by the 307 Response Code on this resource**

|----------|-----------|---|-------------|----------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI of the resource located in an alternative NEF. |

5.44.2.3.3.3           Void

5.44.2.3.3.4           DELETE

This method enables an AF to request the deletion of an existing "Individual IMS Parameters Provisioning" resource at the NEF.

This method shall support the URI query parameters specified in table 5.44.2.3.3.4-1.

**Table 5.44.2.3.3.4-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.44.2.3.3.4-2 and the response data structures and response codes specified in table 5.44.2.3.3.4-3.

**Table 5.44.2.3.3.4-2: Data structures supported by the DELETE Request Body on this resource**

| Data type | P | Cardinality | Description |

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.44.2.3.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.44.3 Custom Operations without associated resources

There are no custom operations without associated resources defined for this API in this release of the specification.

### 5.44.4 Notifications

There are no notifications defined for this API in this release of the specification.

## 5.44.5 Data Model

### 5.44.5.1 General

This clause specifies the application data model supported by the ImsParamProvision API. Table 5.44.5.1-1 specifies the data types defined for the ImsParamProvision API.

**Table 5.44.5.1-1: ImsParamProvision API specific Data Types**

| Data type | Clause defined | Description                                  | Applicability |
|-----------|----------------|----------------------------------------------|---------------|
| ImsData   | 5.44.5.2.2     | Represents IMS Parameters data.              |               |
| ImsPpData | 5.44.5.2.3     | Represents IMS Parameters Provisioning data. |               |

Table 5.44.5.1-2 specifies data types re-used by the ImsParamProvision API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the ImsParamProvision API.

**Table 5.44.5.1-2: ImsParamProvision API re-used Data Types**

| Data type         | Reference           | Comments                                                                                                      | Applicability |
|-------------------|---------------------|---------------------------------------------------------------------------------------------------------------|---------------|
| ImsPublicId       | 3GPP TS 29.562 [80] | Represents the IMS public Identity.                                                                           |               |
| RcdProperties     | 3GPP TS 29.571 [8]  | Represents the RCD properties data.                                                                           |               |
| SupportedFeatures | 3GPP TS 29.571 [8]  | Represents the list of supported feature(s) and used to negotiate the applicability of the optional features. |               |

### 5.44.5.2 Structured data types

#### 5.44.5.2.1 Introduction

This clause defines the structures to be used in resource representations.

#### 5.44.5.2.2 Type: ImsData

**Table 5.44.5.2.2-1: Definition of type ImsData**

| Attribute name | Data type     | P | Cardinality | Description                                                            | Applicability |
|----------------|---------------|---|-------------|------------------------------------------------------------------------|---------------|
| tgtUeId        | ImsPublicId   | M | 1           | Contains the identifier of the IMS public subscriber of the target UE. |               |
| rcdPropData    | RcdProperties | O | 0..1        | Contains the RCD properties related data.                              |               |

#### 5.44.5.2.3 Type: ImsPpData

**Table 5.44.5.2.3-1: Definition of type ImsPpData**

| Attribute name | Data type         | P | Cardinality | Description                                                                                                                                                        | Applicability |
|----------------|-------------------|---|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| afId           | string            | M | 1           | Contains the identifier of the AF that is sending the request.                                                                                                     |               |
| imsData        | ImsData           | C | 0..1        | Contains the IMS data that the AF requests to provision.<br><br>This attribute shall be present only when the AF requests to provision IMS parameters.             |               |
| suppFeat       | SupportedFeatures | C | 0..1        | Contains the list of supported features among the ones defined in clause 5.44.6.<br><br>This attribute shall be present when only feature negotiation is required. |               |

#### 5.44.5.2.4 Void

### 5.44.5.3 Simple data types and enumerations

#### 5.44.5.3.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

#### 5.44.5.3.2 Simple data types

The simple data types defined in table 5.44.5.3.2-1 shall be supported.

**Table 5.44.5.3.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

#### 5.44.5.4 Data types describing alternative data types or combinations of data types

There are no custom operations without associated resources defined for this API in this release of the specification.

### 5.44.5.5 Binary data

#### 5.44.5.5.1 Binary Data Types

**Table 5.44.5.5.1-1: Binary Data Types**

| Name | Clause defined | Content type |
|------|----------------|--------------|
|      |                |              |

### 5.44.6 Used Features

The optional features in table 5.44.6-1 are defined for the ImsParamProvision API. They shall be negotiated using the extensibility mechanism defined in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.44.6-1: Supported Features**

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|
|                |              |             |

### 5.44.7 Error handling

#### 5.44.7.1 General

For the ImsParamProvision API, HTTP error responses shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4]. Protocol errors and application errors specified in clause 5.2.6 of 3GPP TS 29.122 [4] shall be supported for the HTTP status codes specified in table 5.2.6-1 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses are applicable for the ImsParamProvision API.

#### 5.44.7.2 Protocol Errors

No specific procedures for the ImsParamProvision API are specified.

5.44.7.3      Application Errors

The application errors defined for the ImsParamProvision API are listed in table 5.44.7.3-1.

Table 5.44.7.3-1: Application errors

| Application Error | HTTP status code | Description | Applicability |
|-------------------|------------------|-------------|---------------|
|                   |                  |             |               |

5.45      AIoT API

5.45.1      Introduction

The Nnef\_AIoT service shall use the AIoT API.

The API URI of AIoT API shall be:

**{apiRoot}/<apiName>/<apiVersion>**

The request URIs used in HTTP requests shall have the Resource URI structure defined in clause 5.2.4 of 3GPP TS 29.122 [4], i.e.:

**{apiRoot}/<apiName>/<apiVersion>/<apiSpecificSuffixes>**

with the following components:

- "apiRoot" is set as described in clause 5.2.4 in 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-aiot".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.
- The <apiSpecificSuffixes> shall be set as described in clause 5.2.4 of 3GPP TS 29.122 [4].

5.45.2 Resources

There are no resources defined for this API in this release of the specification.

5.45.3      Custom Operations without associated resources

5.45.3.1      Overview

The structure of the custom operation URIs of the AIoT API is shown in Figure 5.45.3.1-1.

Figure 5.45.3.1-1: Custom operation URI structure of the AIoT API

Table 5.45.3.1-1 provides an overview of the custom operations and applicable HTTP methods defined for the AIoT API.

**Table 5.45.3.1-1: Custom operations without associated resources**

| Custom operation name | Custom operation URI | Mapped HTTP method | Description                                                |
|-----------------------|----------------------|--------------------|------------------------------------------------------------|
| InventoryRequest      | /request-inv         | POST               | Enables to request to perform an AIoT Inventory operation. |
| CommandRequest        | /request-cmd         | POST               | Enables to request to perform an AIoT Command operation.   |

The custom operations shall support the URI variables defined in table 5.45.3.1-2.

**Table 5.45.3.1-2: URI variables for this custom operation**

| Name    | Data type | Definition         |
|---------|-----------|--------------------|
| apiRoot | string    | See clause 5.45.1. |

## 5.45.3.2 Operation: InventoryRequest

### 5.45.3.2.1 Description

The custom operation enables to request to perform an AIoT Inventory operation at the NEF.

### 5.45.3.2.2 Operation Definition

This operation shall support the request and response data structures and response codes specified in table 5.45.3.2.2-1 and table 5.45.3.2.2-2.

**Table 5.45.3.2.2-1: Data structures supported by the POST Request Body on this resource**

| Data type    | P | Cardinality | Description                                                                |
|--------------|---|-------------|----------------------------------------------------------------------------|
| InventoryReq | M | 1           | Contains the parameters to request to perform an AIoT Inventory operation. |

**Table 5.45.3.2.2-2: Data structures supported by the POST Response Body on this resource**

| Data type      | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                           |
|----------------|---|-------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| InventoryResp  | M | 1           | 200 OK                 | Successful case. The AIoT Inventory request is successfully received and processed, and AIoT Inventory related information is returned in the response body.                                                                          |
| n/a            |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a            |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]  |
| ProblemDetails | O | 0..1        | 403 Forbidden          | (NOTE 2)                                                                                                                                                                                                                              |

NOTE 1: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply.  
 NOTE 2: Failure cases are described in clause 5.45.7.

**Table 5.45.3.2.2-3: Headers supported by the 307 Response Code on this custom operation**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI located in an alternative NEF. |

**Table 5.45.3.2.2-4: Headers supported by the 308 Response Code on this custom operation**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI located in an alternative NEF. |

### 5.45.3.3 Operation: CommandRequest

#### 5.45.3.3.1 Description

The custom operation enables to request to perform an AIoT Command operation at the NEF.

#### 5.45.3.3.2 Operation Definition

This operation shall support the request and response data structures and response codes specified in table 5.45.3.3.2-1 and table 5.45.3.3.2-2.

**Table 5.45.3.3.2-1: Data structures supported by the POST Request Body on this resource**

| Data type  | P | Cardinality | Description                                                              |
|------------|---|-------------|--------------------------------------------------------------------------|
| CommandReq | M | 1           | Contains the parameters to request to perform an AIoT Command operation. |

**Table 5.45.3.3.2-2: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                              | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                           |
|----------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CommandResp                                                                                                                            | M | 1           | 200 OK                 | Successful case. The AIoT Command request is successfully received and processed, and AIoT Command related information is returned in the response body.                                                                              |
| n/a                                                                                                                                    |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                    |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]  |
| ProblemDetails                                                                                                                         | O | 0..1        | 403 Forbidden          | (NOTE 2)                                                                                                                                                                                                                              |
| NOTE 1: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                       |

NOTE 2: Failure cases are described in clause 5.45.7.

**Table 5.45.3.3.2-3: Headers supported by the 307 Response Code on this custom operation**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI located in an alternative NEF. |

**Table 5.45.3.3.2-4: Headers supported by the 308 Response Code on this custom operation**

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI located in an alternative NEF. |

## 5.45.4 Notifications

### 5.45.4.1 General

Notifications shall comply to clause 5.2.5 of 3GPP TS 29.122 [4].

**Table 5.45.4.1-1: Notifications overview**

| Notification                 | Callback URI | HTTP method or custom operation | Description (service operation)                                                          |
|------------------------------|--------------|---------------------------------|------------------------------------------------------------------------------------------|
| AIoT Operations Notification | {notifUri}   | POST                            | Enable the NEF to notify a previously subscribed AF on AIoT operations related event(s). |

### 5.45.4.2 AIoT Operations Notification

#### 5.45.4.2.1 Description

The AIoT Operations Notification is used by the NEF to report AIoT operations related event(s) to a previously subscribed AF.

#### 5.45.4.2.2 Target URI

The Callback URI "{**notifUri**}" shall be used with the callback URI variables defined in table 5.45.4.2.2-1.

**Table 5.45.4.2.2-1: Callback URI variables**

| Name     | Definition                                                          |
|----------|---------------------------------------------------------------------|
| notifUri | Represents the callback URI encoded as a string formatted as a URI. |

#### 5.45.4.2.3 Standard Methods

##### 5.45.4.2.3.1 POST

This method shall support the request data structures specified in table 5.45.4.2.3.1-1 and the response data structures and response codes specified in table 5.45.4.2.3.1-2.

**Table 5.45.4.2.3.1-1: Data structures supported by the POST Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
|-----------|---|-------------|-------------|

|           |   |   |                                              |
|-----------|---|---|----------------------------------------------|
| AloTNotif | M | 1 | Represents the AloT Operations Notification. |
|-----------|---|---|----------------------------------------------|

**Table 5.45.4.2.3.1-2: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                            | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a                                                                                                                                  |   |             | 204 No Content         | Successful case. The AloT Operations Notification is successfully received and acknowledged.                                                                                                                                                                                                   |
| n/a                                                                                                                                  |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF towards which the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                  |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF towards which the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                                                                |

**Table 5.45.4.2.3.1-3: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                      |
|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

**Table 5.45.4.2.3.1-4: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                      |
|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

## 5.45.5 Data Model

### 5.45.5.1 General

This clause specifies the application data model supported by the AIoT API. Table 5.45.5.1-1 specifies the data types defined for the AIoT API.

**Table 5.45.5.1-1: AIoT service specific Data Types**

| Data type    | Clause defined | Description                                  | Applicability |
|--------------|----------------|----------------------------------------------|---------------|
| AloTNotif    | 5.45.5.2.6     | Represents the AloT Operations Notification. |               |
| CommandReq   | 5.45.5.2.4     | Represents the AloT Command request.         |               |
| CommandResp  | 5.45.5.2.5     | Represents the AloT Command response.        |               |
| CommandType  | 5.45.5.3.3     | Represents the type of AloT Command.         |               |
| ExtAloTArea  | 5.45.5.2.7     | Represents the External AloT Service Area.   |               |
| InventoryReq | 5.45.5.2.2     | Represents the AloT Inventory request.       |               |

|               |            |                                         |  |
|---------------|------------|-----------------------------------------|--|
| InventoryResp | 5.45.5.2.3 | Represents the AIoT Inventory response. |  |
|---------------|------------|-----------------------------------------|--|

Table 5.45.5.1-2 specifies data types re-used by the AIoT API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the AIoT API.

**Table 5.45.5.1-2: Re-used Data Types**

| Data type         | Reference           | Comments                                                                                                         | Applicability |
|-------------------|---------------------|------------------------------------------------------------------------------------------------------------------|---------------|
| AIoTDevices       | 3GPP TS 29.569 [83] | Represents the AIoT device(s) related information.                                                               |               |
| AiotDevPermlId    | 3GPP TS 29.571 [8]  | Represents the permanent identifier of the AIoT Device.                                                          |               |
| Bytes             | 3GPP TS 29.571 [16] | Represents a sequence of bytes.                                                                                  |               |
| CivicAddress      | 3GPP TS 29.572 [34] | Represents a civic address.                                                                                      |               |
| DevicesRepInfo    | 3GPP TS 29.569 [83] | Represents the AIoT device(s) related reporting information.                                                     |               |
| DurationSec       | 3GPP TS 29.122 [4]  | Represents a time duration in units of seconds.                                                                  |               |
| GeographicArea    | 3GPP TS 29.572 [34] | Represents a geographical area.                                                                                  |               |
| ProblemDetails    | 3GPP TS 29.571 [8]  | Represents error related information.                                                                            |               |
| SupportedFeatures | 3GPP TS 29.571 [8]  | Represents the list of supported feature(s) and is used to negotiate the applicability of the optional features. |               |
| UInteger          | 3GPP TS 29.571 [8]  | Represents an unsigned integer.                                                                                  |               |
| Uri               | 3GPP TS 29.122 [4]  | Represents a URI.                                                                                                |               |

## 5.45.5.2 Structured data types

### 5.45.5.2.1 Introduction

This clause defines the structured data types to be used in resource representations.

### 5.45.5.2.2 Type: InventoryReq

**Table 5.45.5.2.2-1: Definition of type InventoryReq**

| Attribute name                                           | Data type         | P | Cardinality | Description                                                                                                                                                        | Applicability |
|----------------------------------------------------------|-------------------|---|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| afId                                                     | string            | M | 1           | Contains the identifier of the AF that is sending the request.                                                                                                     |               |
| targetArea                                               | ExtAloTArea       | C | 0..1        | Contains the target AIoT Service Area within which the requested Inventory operation shall apply.<br><br>(NOTE)                                                    |               |
| targetDevices                                            | AIoTDevices       | C | 0..1        | Contains the target AIoT device(s) related information.<br><br>(NOTE)                                                                                              |               |
| numDevices                                               | UInteger          | O | 0..1        | Contains the approximative number of the targeted AIoT device(s).                                                                                                  |               |
| timeInterval                                             | DurationSec       | O | 0..1        | Contains the time interval to be used for results aggregation.                                                                                                     |               |
| notifUri                                                 | Uri               | M | 1           | Contains the URI via which the AIoT Inventory operation related notifications shall be delivered.                                                                  |               |
| suppFeat                                                 | SupportedFeatures | C | 0..1        | Contains the list of supported features among the ones defined in clause 5.45.6.<br><br>This attribute shall be present only when feature negotiation is required. |               |
| NOTE: At least one of these attributes shall be present. |                   |   |             |                                                                                                                                                                    |               |

## 5.45.5.2.3 Type: InventoryResp

Table 5.45.5.2.3-1: Definition of type InventoryResp

| Attribute name | Data type         | P | Cardinality | Description                                                                                                                                                        | Applicability |
|----------------|-------------------|---|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| afTransId      | string            | M | 1           | Contains the identifier of the AF transaction that is created for the inventory request.                                                                           |               |

#### 5.45.5.2.7 Type: ExtAloTArea

**Table 5.45.5.2.7-1: Definition of type ExtAloTArea**

| Attribute name                                                                       | Data type             | P | Cardinality | Description                                                                                              | Applicability |
|--------------------------------------------------------------------------------------|-----------------------|---|-------------|----------------------------------------------------------------------------------------------------------|---------------|
| extArealds                                                                           | array(ExtAiotAreald)  | C | 1..N        | Contains the target external AIoT Area identifier(s).<br>(NOTE)                                          |               |
| geographicAreas                                                                      | array(GeographicArea) | C | 1..N        | Contains the target AIoT Service Area, expressed in the form of a set of geographical area(s).<br>(NOTE) |               |
| civicAddresses                                                                       | array(CivicAddress)   | C | 1..N        | Contains the target AIoT Service Area, expressed in the form of a set of civic address(es).<br>(NOTE)    |               |
| NOTE: These attributes are mutually exclusive and only one of them shall be present. |                       |   |             |                                                                                                          |               |

### 5.45.5.3 Simple data types and enumerations

#### 5.45.5.3.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

#### 5.45.5.3.2 Simple data types

The simple data types defined in table 5.45.5.3.2-1 shall be supported.

**Table 5.45.5.3.2-1: Simple data types**

| Type Name     | Type Definition | Description                                   | Applicability |
|---------------|-----------------|-----------------------------------------------|---------------|
| ExtAiotAreald | string          | Represents the External AIoT Area identifier. |               |

#### 5.45.5.3.3 Enumeration: CommandType

The enumeration CommandType represents the type of AIoT Command. It shall comply with the provisions defined in table 5.45.5.3.3-1.

**Table 5.45.5.3.3-1: Enumeration CommandType**

| Enumeration value | Description                                                                                                  | Applicability |
|-------------------|--------------------------------------------------------------------------------------------------------------|---------------|
| READ              | Indicates that the AIoT Command is Read (i.e., retrieve information).                                        |               |
| WRITE             | Indicates that the AIoT Command is Write (i.e., provision information).                                      |               |
| PERMANENT_DISABLE | Indicates that the AIoT Command is Permanent Disable (i.e., disable the capability to transmit information). |               |

#### 5.45.5.4 Data types describing alternative data types or combinations of data types

There are no data types describing alternative data types or combinations of data types defined for this API in this release of the specification.

#### 5.45.5.5 Binary data

##### 5.45.5.1 Binary Data Types

**Table 5.45.5.1-1: Binary Data Types**

| Name | Clause defined | Content type |
|------|----------------|--------------|
|      |                |              |

#### 5.45.6 Used Features

The optional features listed in table 5.45.6-1 are defined for the AIoT API. They shall be negotiated using the extensibility mechanism defined in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.45.6-1: Features used by AIoT API**

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|
|                |              |             |

#### 5.45.7 Error handling

##### 5.45.7.1 General

For the AIoT API, HTTP error responses shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4]. Protocol errors and application errors specified in clause 5.2.6 of 3GPP TS 29.122 [4] shall be supported for the HTTP status codes specified in table 5.2.6-1 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses are applicable for the AIoT API.

##### 5.45.7.2 Protocol Errors

No specific procedures for the AIoT API are specified.

##### 5.45.7.3 Application Errors

The application errors defined for the AIoT API are listed in table 5.45.7.3-1.

**Table 5.45.7.3-1: Application errors**

| Application Error   | HTTP status code          | Description                                                                                                 | Applicability |
|---------------------|---------------------------|-------------------------------------------------------------------------------------------------------------|---------------|
| AF_NOT_AUTHORIZED   | 403 Forbidden             | The request for AIoT services is rejected because the AF is not authorized for the requested AIoT Services. |               |
| UNSPECIFIED_FAILURE | 500 Internal Server Error | The request for AIoT services is rejected because the NEF failed to process it.                             |               |

## 5.46 VFLTraining API

### 5.46.1 Introduction

The Nnef\_VFLTraining service shall use the VFLTraining API.

The API URI of the VFLTraining API shall be:

**{apiRoot}/<apiName>/<apiVersion>**

The request URIs used in HTTP requests shall have the Resource URI structure defined in clause 5.2.4 of 3GPP TS 29.122 [4], i.e.:

**{apiRoot}/<apiName>/<apiVersion>/<apiSpecificSuffixes>**

with the following components:

- "apiRoot" is set as defined in clause 5.2.4 of 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-vfl-training".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.
- The <apiSpecificSuffixes> shall be set as described in clause 5.2.4 of 3GPP TS 29.122 [4].

All resource URIs in the clauses below are defined relative to the above API URI.

### 5.46.2 Resources

#### 5.46.2.1 Overview

This clause describes the structure for the Resource URIs as shown in figure 5.46.2.1-1 and the resources and HTTP methods used for the VFLTraining API.

**Figure 5.46.2.1-1: Resource URI structure of the northbound VFLTraining API**

Table 5.46.2.1-1 provides an overview of the resources and HTTP methods applicable for the northbound VFLTraining API.

**Table 5.46.2.1-1: Resources and methods overview**

| Resource name | Resource URI | HTTP method | Description |
|---------------|--------------|-------------|-------------|
|---------------|--------------|-------------|-------------|

|                                      |                               |        |                                                                             |
|--------------------------------------|-------------------------------|--------|-----------------------------------------------------------------------------|
| VFL Training Subscriptions           | /{afld}/subscriptions         | GET    | Retrieve all the active VFL Training Subscriptions.                         |
|                                      |                               | POST   | Create a new Individual VFL Training Subscription resource.                 |
| Individual VFL Training Subscription | /{afld}/subscriptions/{subld} | GET    | Retrieve an existing Individual VFL Training Subscription resource.         |
|                                      |                               | PUT    | Update an existing Individual VFL Training Subscription resource.           |
|                                      |                               | PATCH  | Partially modify an existing Individual VFL Training Subscription resource. |
|                                      |                               | DELETE | Delete an existing Individual VFL Training Subscription resource.           |

## 5.46.2.2 Resource: VFL Training Subscriptions

### 5.46.2.2.1 Introduction

This resource represents all the active VFL Training Subscriptions managed by the NEF for a given AF.

This resource is modelled with the Collection resource archetype (see clause C.2 of 3GPP TS 29.501 [3]).

### 5.46.2.2.2 Resource Definition

Resource URI: {apiRoot}/3gpp-vfl-training/<apiVersion>/{afld}/subscriptions

This resource shall support the resource URI variables defined in table 5.46.2.2.2-1.

**Table 5.46.2.2.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition                           |
|---------|-----------|--------------------------------------|
| apiRoot | string    | See clause 5.46.1.                   |
| afld    | string    | Represents the identifier of the AF. |

### 5.46.2.2.3 Resource Standard Methods

#### 5.46.2.2.3.1 GET

The HTTP GET method allows to retrieve all the active VFL Training Subscriptions at the NEF for a given AF.

This method shall support the URI query parameters specified in table 5.46.2.2.3.1-1.

**Table 5.46.2.2.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.46.2.2.3.1-2, the response data structures and response codes specified in table 5.46.2.2.3.1-3, and the location headers specified in table 5.46.2.2.3.1-4 and table 5.46.2.2.3.1-5.

**Table 5.46.2.2.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.46.2.2.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| array(VflTrainingSubs)                                                                                                              | M | 0..N        | 200 OK                 | Successful case. All the active "Individual VFL Training Subscription" resource(s) are returned.<br><br>If there are no active "Individual VFL Training Subscription" resources at the NEF, an empty array is returned.                               |
| n/a                                                                                                                                 |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                 |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.46.2.2.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.46.2.2.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.46.2.2.3.2 POST

The HTTP POST method allows to create a new Individual VFL Training Subscription at the NEF for a given AF.

This method shall support the URI query parameters specified in table 5.46.2.2.3.2-1.

**Table 5.46.2.2.3.2-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.46.2.2.3.2-1, the response data structures and response codes specified in table 5.46.2.2.3.2-2, and the Location Headers specified in table 5.46.2.2.3.2-3.

**Table 5.46.2.2.3.2-1: Data structures supported by the POST Request Body on this resource**

| Data type       | P | Cardinality | Description                                                                                 |
|-----------------|---|-------------|---------------------------------------------------------------------------------------------|
| VflTrainingSubs | M | 1           | Contains the parameters to request the creation of an Individual VFL Training Subscription. |

**Table 5.46.2.2.3.2-2: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                            | P | Cardinality | Response codes | Description                                                                                                                                                                                                                |
|--------------------------------------------------------------------------------------------------------------------------------------|---|-------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VflTrainingSubs                                                                                                                      | M | 1           | 201 Created    | Successful case. A representation of the created "Individual VFL Training Subscription" resource is returned in the response body.<br><br>The URI of the created resource shall be returned in the "Location" HTTP header. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                |                                                                                                                                                                                                                            |

**Table 5.46.2.2.3.2-3: Headers supported by the 201 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                                          |
|----------|-----------|---|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains the URI of the newly created resource, according to the structure:<br>{apiRoot}/3gpp-vfl-training/<apiVersion>/{afId}/subscriptions/{subId} |

#### 5.46.2.2.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.46.2.3 Resource: Individual VFL Training Subscription

#### 5.46.2.3.1 Introduction

This resource represents an "Individual VFL Training Subscription" resource managed by the NEF.

#### 5.46.2.3.2 Resource Definition

Resource URI: {apiRoot}/3gpp-vfl-training/<apiVersion>/{afId}/subscriptions/{subId}

This resource shall support the resource URI variables defined in table 5.46.2.3.2-1.

**Table 5.46.2.3.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition                                                                        |
|---------|-----------|-----------------------------------------------------------------------------------|
| apiRoot | string    | See clause 5.46.1.                                                                |
| afId    | string    | Represents the identifier of the AF.                                              |
| subId   | string    | Represents the identifier of the "Individual VFL Training Subscription" resource. |

#### 5.46.2.3.3 Resource Standard Methods

##### 5.46.2.3.3.1 GET

The HTTP GET method allows to retrieve an existing "Individual VFL Training Subscription" resource at the NEF.

This method shall support the URI query parameters specified in table 5.46.2.3.3.1-1.

**Table 5.46.2.3.3.1-1: URI query parameters supported by the GET method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.46.2.3.3.1-2 and the response data structures and response codes specified in table 5.46.2.3.3.1-3.

**Table 5.46.2.3.3.1-2: Data structures supported by the GET Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.46.2.3.3.1-3: Data structures supported by the GET Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VflTrainingSubs                                                                                                                     | M | 1           | 200 OK                 | Successful case. The requested "Individual VFL Training Subscription" resource is successfully returned in the response body.                                                                                                                         |
| n/a                                                                                                                                 |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                 |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP GET method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.46.2.3.3.1-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.46.2.3.3.1-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.46.2.3.3.2 PUT

The HTTP PUT method allows to update an existing "Individual VFL Training Subscription" resource at the NEF.

This method shall support the URI query parameters specified in table 5.46.2.3.3.2-1.

**Table 5.46.2.3.3.2-1: URI query parameters supported by the PUT method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.46.2.3.3.2-2 and the response data structures and response codes specified in table 5.46.2.3.3.2-3.

**Table 5.46.2.3.3.2-2: Data structures supported by the PUT Request Body on this resource**

| Data type       | P | Cardinality | Description                                                                                 |
|-----------------|---|-------------|---------------------------------------------------------------------------------------------|
| VflTrainingSubs | M | 1           | Contains the updated representation of the "Individual VFL Training Subscription" resource. |

**Table 5.46.2.3.3.2-3: Data structures supported by the PUT Response Body on this resource**

| Data type                                                                                                                           | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VflTrainingSubs                                                                                                                     | M | 1           | 200 OK                 | Successful case. The "Individual VFL Training Subscription" resource is successfully updated and a representation of the updated resource is returned in the response body.                                                                           |
| n/a                                                                                                                                 |   |             | 204 No Content         | Successful case. The "Individual VFL Training Subscription" resource is successfully updated and no content is returned in the response body.                                                                                                         |
| n/a                                                                                                                                 |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                 |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

### 5.46.2.3.3.3 PATCH

This method enables to request the modification of an existing "Individual VFL Training Subscription" resource at the NEF.

This method shall support the URI query parameters specified in table 5.46.2.3.3.3-1.

**Table 5.46.2.3.3.3-1: URI query parameters supported by the PATCH method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.46.2.3.3.3-2 and the response data structures and response codes specified in table 5.46.2.3.3.3-3.

**Table 5.46.2.3.3.3-2: Data structures supported by the PATCH Request Body on this resource**

| Data type            | P | Cardinality | Description                                                                                  |
|----------------------|---|-------------|----------------------------------------------------------------------------------------------|
| VflTrainingSubsPatch | M | 1           | Contains the requested modifications to the "Individual VFL Training Subscription" resource. |

**Table 5.46.2.3.3.3-3: Data structures supported by the PATCH Response Body on this resource**

| Data type                                                                                                                             | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|---------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VflTrainingSubs                                                                                                                       | M | 1           | 200 OK                 | Successful response. The "Individual VFL Training Subscription" resource is successfully modified and a representation of the updated resource is returned in the response body.                                                                      |
| n/a                                                                                                                                   |   |             | 204 No Content         | Successful response. The "Individual VFL Training Subscription" resource is successfully modified and no content is returned in the response body.                                                                                                    |
| n/a                                                                                                                                   |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                   |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP PATCH method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.46.2.3.3.4 DELETE

The HTTP DELETE method allows to delete an existing "Individual VFL Training Subscription" resource at the NEF.

This method shall support the URI query parameters specified in table 5.46.2.3.3.4-1.

**Table 5.46.2.3.3.4-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.46.2.3.3.4-2 and the response data structures and response codes specified in table 5.46.2.3.3.4-3.

**Table 5.46.2.3.3.4-2: Data structures supported by the DELETE Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| n/a       |   |             |             |

**Table 5.46.2.3.3.4-3: Data structures supported by the DELETE Response Body on this resource**

| Data type                                                                                                                              | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                           |
|----------------------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a                                                                                                                                    |   |             | 204 No Content         | Successful case. The "Individual VFL Training Subscription" resource is successfully deleted.                                                                                                                                                         |
| n/a                                                                                                                                    |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                                    |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative target URI of the resource located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP DELETE method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                        |                                                                                                                                                                                                                                                       |

**Table 5.46.2.3.3.4-4: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

**Table 5.46.2.3.3.4-5: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                       |
|----------|-----------|---|-------------|-----------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative target URI of the resource located in an alternative NEF. |

#### 5.46.2.3.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.46.3 Custom Operations without associated resources

There are no custom operations without associated resources defined for this API in this release of the specification.

## 5.46.4 Notifications

### 5.46.4.1 General

Notifications shall comply to clause 5.2.5 of 3GPP TS 29.122 [4].

**Table 5.46.4.1-1: Notifications overview**

| Notification              | Callback URI | HTTP method or custom operation | Description (service operation)                                                        |
|---------------------------|--------------|---------------------------------|----------------------------------------------------------------------------------------|
| VFL Training Notification | {notifUri}   | POST                            | Enables the NEF to notify a previously subscribed AF on VFL Training related event(s). |

### 5.46.4.2 VFL Training Notification

#### 5.46.4.2.1 Description

The VFL Training Notification is used by the NEF to report VFL Training related event(s) to a previously subscribed AF.

#### 5.46.4.2.2 Target URI

The Callback URI "{notifUri}" shall be used with the callback URI variables defined in table 5.46.4.2.2-1.

**Table 5.46.4.2.2-1: Callback URI variables**

| Name     | Definition                                                          |
|----------|---------------------------------------------------------------------|
| notifUri | Represents the callback URI encoded as a string formatted as a URI. |

#### 5.46.4.2.3 Operation Definition

This method shall support the request data structures specified in table 5.46.4.2.3-1 and the response data structures and response codes specified in table 5.46.4.2.3-2.

**Table 5.46.4.2.3-1: Data structures supported by the POST Request Body on this resource**

| Data type         | P | Cardinality | Description                                           |
|-------------------|---|-------------|-------------------------------------------------------|
| VflTrainingNotify | M | 1..N        | Represents the VFL Training Notification information. |

**Table 5.46.4.2.3-2: Data structures supported by the POST Response Body on this resource**

| Data type | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                                                                    |
|-----------|---|-------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a       |   |             | 204 No Content         | Successful case. The notification is successfully received and acknowledged.                                                                                                                                                                                                                   |
| n/a       |   |             | 307 Temporary Redirect | Temporary redirection.<br><br>The response shall include a Location header field containing an alternative URI representing the end point of an alternative AF towards which the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a       |   |             | 308 Permanent Redirect | Permanent redirection.<br><br>The response shall include a Location header field containing an alternative URI                                                                                                                                                                                 |

|                                                                                                                                      |  |  |  |                                                                                                                                                                                 |
|--------------------------------------------------------------------------------------------------------------------------------------|--|--|--|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                      |  |  |  | representing the end point of an alternative AF towards which the notification should be sent.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| NOTE: The mandatory HTTP error status codes for the HTTP POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |  |  |  |                                                                                                                                                                                 |

**Table 5.46.4.2.3-3: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                      |
|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

**Table 5.46.4.2.3-4: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                      |
|----------|-----------|---|-------------|----------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains an alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

## 5.46.5 Data Model

### 5.46.5.1 General

This clause specifies the application data model supported by the VFLTraining API. Table 5.46.5.1-1 specifies the data types defined for the VFLTraining API.

**Table 5.46.5.1-1: VFLTraining API specific Data Types**

| Data type            | Clause defined | Description                                                        | Applicability |
|----------------------|----------------|--------------------------------------------------------------------|---------------|
| VflTrainingSubs      | 5.46.5.3.2     | Represents VFL training subscription information.                  |               |
| VflTrainingSubsPatch | 5.46.5.3.3     | Represents modifications to VFL training subscription information. |               |

Table 5.46.5.1-2 specifies data types re-used by the VFLTraining API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the VFLTraining API.

**Table 5.46.5.1-2: VFLTraining API re-used Data Types**

| Data type            | Reference           | Comments                                                                                                         | Applicability |
|----------------------|---------------------|------------------------------------------------------------------------------------------------------------------|---------------|
| ReportingInformation | 3GPP TS 29.523 [22] | Describes reporting requirements.                                                                                |               |
| SupportedFeatures    | 3GPP TS 29.571 [8]  | Represents the list of supported feature(s) and is used to negotiate the applicability of the optional features. |               |
| Uri                  | 3GPP TS 29.571 [8]  | Represents a URI.                                                                                                |               |
| VflTrainingNotify    | 3GPP TS 29.520 [27] | Represents VFL training notification information.                                                                |               |
| VflTrainingSub       | 3GPP TS 29.520 [27] | Represents VFL training subscription information for a specific analytics ID.                                    |               |

### 5.46.5.3 Structured data types

#### 5.46.5.3.1 Introduction

This clause defines the structured data types to be used in resource representations.

## 5.46.5.3.2 Type: VflTrainingSubs

Table 5.46.5.3.2-1: Definition of type VflTrainingSubs

| Attribute name | Data type                | P | Cardinality | Description                                                                                                                                                            | Applicability |
|----------------|--------------------------|---|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| notifUri       | Uri                      | M | 1           | Notification target address.                                                                                                                                           |               |
| notifCorrId    | string                   | M | 1           | Notification correlation identifier.                                                                                                                                   |               |
| vflTrainSubs   | array(VflTrainingSub)    | M | 1..N        | Each entry contains VFL training subscription request for a specific analytics ID.                                                                                     |               |
| reportingReqs  | ReportingInformation     | O | 0..1        | Reporting requirement information of the subscription. If omitted, the default values within the ReportingInformation data type apply.                                 |               |
| extNwdafId     | string                   | M | 1           | Contains the external identifier of the NWDAF which is being requested to act as a VFL client.                                                                         |               |
| trainReports   | array(VflTrainingNotify) | O | 1..N        | Contains the VFL Training related even(s) report(s).<br><br>This attribute may be present only if immediate reporting was requested via the "reportingReqs" attribute. |               |
| suppFeat       | SupportedFeatures        | C | 0..1        | List of supported features used as described in clause 5.46.6. This attribute shall be included when feature negotiation needs to take place.                          |               |

## 5.46.5.3.3 Type: VflTrainingSubsPatch

Table 5.46.5.3.3-1: Definition of type VflTrainingSubsPatch

| Attribute name | Data type             | P | Cardinality | Description                                                                                             | Applicability |
|----------------|-----------------------|---|-------------|---------------------------------------------------------------------------------------------------------|---------------|
| vflTrainSubs   | array(VflTrainingSub) | O | 1..N        | Contains modified information related to VFL training subscription request for a specific analytics ID. |               |
| notifUri       | Uri                   | O | 0..1        | Contains the updated URI via which VFL Training related notifications shall be delivered.               |               |
| notifCorrId    | string                | O | 0..1        | Contains the updated Notification Correlation Identifier.                                               |               |
| reportingReqs  | ReportingInformation  | O | 0..1        | Contains the reporting requirements applicable for VFL Training related reporting.                      |               |

## 5.46.5.4 Simple data types and enumerations

## 5.46.5.4.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

## 5.46.5.4.2 Simple data types

The simple data types defined in table 5.46.5.4.2-1 shall be supported.

**Table 5.46.5.4.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

#### 5.46.5.4 Data types describing alternative data types or combinations of data types

There are no data types describing alternative data types or combinations of data types defined for this API in this release of the specification.

### 5.46.6 Used Features

The optional features listed in table 5.46.6-1 are defined for the VFLTraining API. They shall be negotiated using the extensibility mechanism defined in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.46.6-1: Features used by VFLTraining API**

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|

### 5.46.7 Error handling

#### 5.46.7.1 General

For the VFLTraining API, HTTP error responses shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4]. Protocol errors and application errors specified in clause 5.2.6 of 3GPP TS 29.122 [4] shall be supported for the HTTP status codes specified in table 5.2.6-1 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses are applicable for the VFLTraining API.

#### 5.46.7.2 Protocol Errors

In this Release of the specification, there are no additional protocol errors applicable for the VFLTraining API.

#### 5.46.7.3 Application Errors

The application errors defined for VFLTraining API are listed in table 5.46.7.3-1.

**Table 5.46.7.3-1: Application errors**

| Application Error | HTTP status code | Description                                                               | Applicability |
|-------------------|------------------|---------------------------------------------------------------------------|---------------|
| OVERLOAD          | 403 Forbidden    | Indicates that the request cannot be served due to an overload situation. |               |

## 5.47 VFLInference API

### 5.47.1 Introduction

The Nnef\_VFLInference service shall use the VFLInference API.

The API URI of VFLInference API shall be:

**{apiRoot}/<apiName>/<apiVersion>**

The request URIs used in HTTP requests shall have the Resource URI structure defined in clause 5.2.4 of 3GPP TS 29.122 [4], i.e.:

{apiRoot}/<apiName>/<apiVersion>/<apiSpecificSuffixes>

with the following components:

- "apiRoot" is set as described in clause 5.2.4 in 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-vfl-inference".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.
- The <apiSpecificSuffixes> shall be set as described in clause 5.2.4 of 3GPP TS 29.122 [4].

All resource URIs in the clauses below are defined relative to the above API URI.

5.47.2 Resources

5.47.2.1 Overview

This clause describes the structure for the Resource URIs as shown in figure 5.47.2.1-1 and the resources and HTTP methods used for the VFLInference API.

This clause describes the structure for the Resource URIs and the resources and methods used for the service.

Figure 5.47.2.1-1 depicts the resource URIs structure for the VFLInference API.

**Figure 5.47.2.1-1: Resource URI structure of the VFLInference API**

Table 5.47.2.1-1 provides an overview of the resources and HTTP methods applicable for the VFLInference API.

**Table 5.47.2.1-1: Resources and methods overview**

| Resource name                         | Resource URI                         | HTTP method | Description                                                      |
|---------------------------------------|--------------------------------------|-------------|------------------------------------------------------------------|
| VFL Inference subscriptions           | /afld/subscriptions                  | POST        | Create a new Individual VFL Inference subscription resource.     |
| Individual VFL Inference subscription | /afld/subscriptions/{subscriptionId} | PUT         | Update an existing subscription identified by {subscriptionId}.. |
|                                       |                                      | PATCH       | Modify an existing subscription identified by {subscriptionId}.  |
|                                       |                                      | DELETE      | Delete an existing subscription identified by {subscriptionId}.  |

## 5.47.2.2 Resource: VFL Inference subscriptions

### 5.47.2.2.1 Description

This resource allows an VFL server to request the creation of a new Individual VFL Inference subscription resource.

### 5.47.2.2.2 Resource Definition

Resource URI: **{apiRoot}/3gpp-vfl-inference/v1/{afId}/subscriptions**

This resource shall support the resource URI variables defined in table 5.47.2.2.2-1.

**Table 5.47.2.2.2-1: Resource URI variables for this resource**

| Name    | Data type | Definition                          |
|---------|-----------|-------------------------------------|
| apiRoot | string    | Clause 5.2.4 of 3GPP TS 29.122 [4]. |
| afId    | string    | Identifier of the AF.               |

### 5.47.2.2.3 Resource Standard Methods

The following clauses specify the resource methods supported by the resource as described in clause 5.47.2.1.

#### 5.47.2.2.3.1 POST

The POST method creates a new resource to Individual VFL Inference subscription for a given untrusted AF acting as VFL server. The AF shall initiate the HTTP POST request message and the NEF shall respond to the message. The NEF shall construct the URI of the created resource.

This method shall support the URI query parameters specified in table 5.47.2.2.3.1-1.

**Table 5.47.2.2.3.1-1: URI query parameters supported by the POST method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.47.2.2.3.1-2 and shall support the response data structures and response codes specified in table 5.47.2.2.3.1-3 and the Location Headers specified in table 5.47.2.2.3.1-4.

**Table 5.47.2.2.3.1-2: Data structures supported by the POST Request Body on this resource**

| Data type   | P | Cardinality | Description                                                   |
|-------------|---|-------------|---------------------------------------------------------------|
| VflInferSub | M | 1           | Creates a new Individual VFL Inference Subscription resource. |

**Table 5.47.2.2.3.1-3: Data structures supported by the POST Response Body on this resource**

| Data type                                                                                                                   | P | Cardinality | Response codes            | Description                                                                                                                                                                          |
|-----------------------------------------------------------------------------------------------------------------------------|---|-------------|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VflInferSub                                                                                                                 | M | 1           | 201 Created               | Successful case.<br>The Individual VFL Inference subscription resource was created successfully.<br>The URI of the created resource shall be returned in the "Location" HTTP header. |
| ProblemDetails                                                                                                              | O | 0..1        | 403 Forbidden             | (NOTE 2)                                                                                                                                                                             |
| ProblemDetails                                                                                                              | O | 0..1        | 500 Internal Server Error | (NOTE 2)                                                                                                                                                                             |
| NOTE 1: The mandatory HTTP error status codes for the POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                           |                                                                                                                                                                                      |

NOTE 2: Failure causes are described in clause 5.47.7.

**Table 5.47.2.2.3.1-4: Headers supported by the 201 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                                       |
|----------|-----------|---|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | Contains the URI of the newly created resource, according to the structure: {apiRoot}/3gpp-vfl-inference/v1/{afId}/subscriptions/{subscriptionId} |

#### 5.42.2.2.4 Resource Custom Operations

There are no resource custom operations defined for this resource in this release of the specification.

### 5.47.2.3 Resource: Individual VFL Inference subscription

#### 5.47.2.3.1 Description

This resource allows an VFL server to update, partial modify or delete an existing Individual VFL Inference subscription.

#### 5.47.2.3.2 Resource Definition

Resource URI: {apiRoot}/3gpp-vfl-inference/v1/{afId}/subscriptions/{subscriptionId}

This resource shall support the resource URI variables defined in table 5.47.2.3.2-1.

**Table 5.47.2.3.2-1: Resource URI variables for this resource**

| Name           | Data type | Definition                                                                              |
|----------------|-----------|-----------------------------------------------------------------------------------------|
| apiRoot        | string    | Clause 5.2.4 of 3GPP TS 29.122 [4].                                                     |
| afId           | string    | Identifier of the AF.                                                                   |
| subscriptionId | string    | Identifier of the VFL Inference subscription formatted according to IETF RFC 3986 [44]. |

#### 5.47.2.3.3 Resource Standard Methods

The following clauses specify the resource methods supported by the resource as described in clause 5.47.2.1.

##### 5.47.2.3.3.1 PUT

The PUT method allows to create a new VFL Inference Events subscription. The VFL server shall initiate the HTTP PUT request message and the NEF shall respond to the message.

This method shall support the URI query parameters specified in table 5.47.2.3.3.1-1.

**Table 5.47.2.3.3.1-1: URI query parameters supported by the PUT method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| n/a  |           |   |             |             |

This method shall support the request data structures specified in table 5.47.2.3.3.1-2, the response data structures and response codes specified in table 5.47.2.3.3.1-3 and the Location Headers specified in table 5.47.2.3.3.1-4, table 5.47.2.3.3.1-5 and table 5.47.2.3.3.1-6.

**Table 5.47.2.3.3.1-2: Data structures supported by the PUT Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
|-----------|---|-------------|-------------|

|             |   |   |                                                                                         |
|-------------|---|---|-----------------------------------------------------------------------------------------|
| VflInferSub | M | 1 | Contains the information for the modification of the VFL Inference Events Subscription. |
|-------------|---|---|-----------------------------------------------------------------------------------------|

**Table 5.47.2.3.3.1-3: Data structures supported by the PUT Response Body on this resource**

| Data type                                                                                                                             | P | Cardinality | Response codes            | Description                                                                                                                                                                                                                                                                                    |
|---------------------------------------------------------------------------------------------------------------------------------------|---|-------------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VflInferSub                                                                                                                           | M | 1           | 200 OK                    | Successful case.<br>The VFL Inference Events Subscription was modified and a representation of it is returned. The representation of the VFL Inference Events Subscription is included within the properties of the VflInferSub data type.                                                     |
| N/A                                                                                                                                   |   |             | 204 No Content            | Successful case.<br>The VFL Inference Events Subscription was modified successfully, with no content to be sent in the response message body.                                                                                                                                                  |
| N/A                                                                                                                                   |   |             | 307 Temporary Redirect    | Temporary redirection, during the VFL Inference Events subscription modification. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF.<br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| N/A                                                                                                                                   |   |             | 308 Permanent Redirect    | Permanent redirection, during the VFL Inference Events subscription modification. The response shall include a Location header field containing an alternative URI of the resource located in an alternative NEF.<br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| ProblemDetails                                                                                                                        | O | 0..1        | 403 Forbidden             | (NOTE 2)                                                                                                                                                                                                                                                                                       |
| ProblemDetails                                                                                                                        | O | 0..1        | 404 Not Found             | (NOTE 2)                                                                                                                                                                                                                                                                                       |
| ProblemDetails                                                                                                                        | O | 0..1        | 500 Internal Server Error | (NOTE 2)                                                                                                                                                                                                                                                                                       |
| NOTE 1: The mandatory HTTP error status codes for the HTTP PUT method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] shall also apply. |   |             |                           |                                                                                                                                                                                                                                                                                                |

| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

## 5.47.2.3.3.2 PATCH

The PATCH method is used to modify an existing Individual VFL Inference subscription. The VFL server shall initiate the HTTP PATCH request message and the NEF shall respond to the message.

This method shall support the URI query parameters specified in table 5.47.2.3.3.2-1.

**Table 5.47.2.3.3.2-1: URI query parameters supported by the PATCH method on this resource**

| Name | Data type | P | Cardinality | Description | Applicability |
|------|-----------|---|-------------|-------------|---------------|
| n/a  |           |   |             |             |               |

This method shall support the request data structures specified in table 5.47.2.3.3.2-2, the response data structures and response codes specified in table 5.47.2.3.3.2-3 and the Location Headers specified in table 5.47.2.3.3.2-4 and table 5.47.2.3.3.2-5.

**Table 5.47.2.3.3.2-2: Data structures supported by the PATCH Request Body on this resource**

| Data type        | P | Cardinality | Description                                                                              |
|------------------|---|-------------|------------------------------------------------------------------------------------------|
| VflInferSubPatch | M | 1           | Contains the modification(s) to be applied to the Individual VFL Inference subscription. |

**Table 5.47.2.3.3.2-3: Data structures supported by the PATCH Response Body on this resource**

| Data type                                                                                                                               | P | Cardinality | Response codes            | Description                                                                                                                                                                                                                                                                             |

| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

**5.47.2.3.3.3 DELETE**

The DELETE method deletes an existing Individual VFL Inference subscription. The AF acting as VFL server shall initiate the HTTP DELETE request message and the NEF shall respond to the message.

This method shall support the URI query parameters specified in table 5.47.2.3.3.3-1.

**Table 5.47.2.3.3.3-1: URI query parameters supported by the DELETE method on this resource**

| Name | Data type | P | Cardinality | Description |
|------|-----------|---|-------------|-------------|
| N/A  |           |   |             |             |

This method shall support the request data structures specified in table 5.47.2.3.3.4-2 and the response data structures and response codes specified in table 5.47.2.3.3.3-3, and the Location Headers specified in table 5.47.2.3.3.3-4 and table 5.47.2.3.3.3-5.

**Table 5.47.2.3.3.3-2: Data structures supported by the DELETE Request Body on this resource**

| Data type | P | Cardinality | Description |
|-----------|---|-------------|-------------|
| N/A       |   |             |             |

| Name     | Data type | P | Cardinality | Description                                                       |
|----------|-----------|---|-------------|-------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI of the resource located in an alternative NEF. |

#### 6.1.3.2.4 Resource Custom Operations

There are no resource operations defined for this API in this release of the specification.

### 5.47.3 Custom Operations without associated resources

There are no custom operations without associated resources defined for this API in this release of the specification.

### 5.47.4 Notifications

#### 5.47.4.1 General

Upon receipt of VFL Inference Notification from the VFL client indicating the subscribed VFL inference event is detected, the NEF shall send an HTTP POST message including the notified VFL inference event to the VFL server.

Notifications shall comply to clause 5.2.5 of 3GPP TS 29.122 [4].

**Table 5.47.4.1-1: Notifications overview**

| Notification                     | Callback URI | HTTP method or custom operation | Description (service operation)                                                                     |
|----------------------------------|--------------|---------------------------------|-----------------------------------------------------------------------------------------------------|
| VFL Inference Event Notification | {notifUri}   | POST                            | The VFL inference changes event notification is provided by the NEF to the AF acting as VFL server. |

#### 5.47.4.2 VFL Inference Event Notification

##### 5.47.4.2.1 Description

The VFL Inference Notification is used by the NEF to report one or several observed VFL Inference events to VFL server that has subscribed to such Notifications.

##### 5.47.4.2.2 Target URI

The Callback URI "{**notifUri**}" shall be used with the callback URI variables defined in table 5.47.2.2-1.

**Table 5.47.4.2.2-1: Callback URI variables**

| Name     | Definition                                                                                                                                                                                                                                                                           |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| notifUri | Callback reference provided by the VFL server during creation/modification of the subscription within the VFL Inference Events subscription as defined in VflInferSub data type in Table 5.47.5.2.2-1 or in VflInferSubPatch data type in Table 5.10.6.2.3-1 of 3GPP TS 29.520 [27]. |

##### 5.47.4.2.3 Operation Definition

This method shall support the request data structures specified in table 5.47.4.2.3.1-1 and the response data structures and response codes specified in table 5.47.4.2.3.1-2 and the Location Headers specified in table 5.47.4.2.3.1-3 and table 5.47.4.2.3.1-4.

**Table 5.47.4.2.3.1-1: Data structures supported by the POST Request Body on this resource**

| Data type     | P | Cardinality | Description                                                                       |
|---------------|---|-------------|-----------------------------------------------------------------------------------|
| VflInferNotif | M | 1           | Provides information about the VFL inference events by the NEF to the VFL server. |

**Table 5.47.4.2.3.1-2: Data structures supported by the POST Response Body on this resource**

| Data type | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                                                                                                 |
|-----------|---|-------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| N/A       |   |             | 204 No Content         | The event notification is received successfully.                                                                                                                                                                                                                                                            |
| N/A       |   |             | 307 Temporary Redirect | Temporary redirection, during event notification. The response shall include a Location header field containing an alternative URI representing the end point of an alternative VFL server where the notification should be sent. Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| N/A       |   |             | 308 Permanent Redirect | Permanent redirection, during event notification. The response shall include a Location header field containing an alternative URI representing the end point of an alternative VFL server where the notification should be sent. Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |

NOTE: The mandatory HTTP error status codes for the POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply.

**Table 5.47.4.2.3.1-3: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                             |
|----------|-----------|---|-------------|-------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI representing the end point of an alternative AF towards which the notification should be redirected. |

**Table 5.47.4.2.3.1-4: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                                                                                     |
|----------|-----------|---|-------------|---------------------------------------------------------------------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative URI representing the end point of an alternative VFL server towards which the notification should be redirected. |

## 5.47.5 Data Model

### 5.47.5.1 General

This clause specifies the application data model supported by the VFLInference API.

Table 5.47.5.1-1 specifies the data types defined for the VFLInference API.

**Table 5.47.5.1-1: VFLInference API specific Data Types**

| Data type        | Clause defined | Description                                                                        | Applicability |
|------------------|----------------|------------------------------------------------------------------------------------|---------------|
| VflInferSub      | 5.8.6.2.2      | Represents an Individual VLF Inference Subscription resource.                      |               |
| VflInferSubPatch | 5.8.6.2.3      | Represents parameters to request the modification of a VFL inference subscription. |               |

Table 5.47.5.1-2 specifies data types re-used by the VFLInference API from other specifications, including a reference to their respective specifications, and when needed, a short description of their use within the VFLInference API.

**Table 5.47.5.1-2: Re-used Data Types**

| Data type            | Reference           | Comments                                                                           | Applicability |
|----------------------|---------------------|------------------------------------------------------------------------------------|---------------|
| RedirectResponse     | 3GPP TS 29.571 [16] | Contains redirection related information.                                          |               |
| ReportingInformation | 3GPP TS 29.523 [20] | Represents the type of reporting the subscription requires.                        |               |
| SupportedFeatures    | 3GPP TS 29.571 [8]  | Used to negotiate the applicability of the optional features.                      |               |
| Uri                  | 3GPP TS 29.571 [8]  | Represents a URI.                                                                  |               |
| VflInferAnaSub       | 3GPP TS 29.520 [17] | Represents an Individual NEF VFL Inference Subscription resource per analytics id. |               |
| VflInferNotif        | 3GPP TS 29.520 [17] | Represents notification of a VFL inference subscription.                           |               |
| VflInferReq          | 3GPP TS 29.520 [17] | Represents requirements for VFL inference                                          |               |
| VflInferResult       | 3GPP TS 29.520 [17] | Represents intermediate VFL inference result per target.                           |               |

## 5.47.5.2 Structured data types

### 5.47.5.2.1 Introduction

This clause defines the structured data types to be used in resource representations.

### 5.47.5.2.2 Type VflInferSub

**Table 5.47.5.2.2-1: Definition of type VflInferSub**

| Attribute name  | Data type             | P | Cardinality | Description                                                                                                                                                                                                                                                            | Applicability |
|-----------------|-----------------------|---|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| notifCorrelId   | string                | M | 1           | The value of Notification Correlation ID in the corresponding notification.                                                                                                                                                                                            |               |
| notifUri        | Uri                   | M | 1           | URI at which the NF service consumer requests to receive notifications.                                                                                                                                                                                                |               |
| suppFeats       | SupportedFeatures     | C | 0..1        | List of Supported features used as described in clause 5.10.8. It shall be supplied by NF service consumer in the POST requests that request the creation of an NEF VFL Subscriptions resource and shall be supplied by the NEF in the reply of corresponding request. |               |
| vflClientId     | string                | O | 0..1        | Target VFL Client identity.                                                                                                                                                                                                                                            |               |
| vflInferAnaSubs | array(VflInferAnaSub) | M | 1..N        | Identifies the VFL inference subscription information for the subscribed analytics ID(s).                                                                                                                                                                              |               |
| vflInferResults | array(VflInferResult) | O | 1..N        | Represents intermediate VFL inference results.                                                                                                                                                                                                                         |               |
| vflReportInfo   | ReportingInformation  | O | 0..1        | Reporting requirement information of the VFL inference subscription. If omitted, the default values within the ReportingInformation data type apply.                                                                                                                   |               |

## 5.47.5.2.3 Type VflInferSubPatch

Table 5.47.5.2.3-1: Definition of type VflInferSubPatch

| Attribute name | Data type            | P | Cardinality | Description                                                                 | Applicability |
|----------------|----------------------|---|-------------|-----------------------------------------------------------------------------|---------------|
| notifUri       | Uri                  | O | 0..1        | URI at which the NF service consumer requests to receive notifications.     |               |
| notifCorrelId  | string               | O | 0..1        | The value of Notification Correlation ID in the corresponding notification. |               |
| vflInferReq    | VflInferReq          | O | 0..1        | Represents required conditions to apply VFL inference.                      |               |
| vflReportInfo  | ReportingInformation | O | 0..1        | Reporting requirement information of the VFL inference subscription.        |               |

## 5.47.5.3 Simple data types and enumerations

## 5.47.5.3.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

## 5.47.5.3.2 Simple data types

The simple data types defined in table 5.47.5.3.2-1 shall be supported.

Table 5.47.5.3.2-1: Simple data types

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

## 5.47.6 Used Features

The optional features in table 5.47.6-1 are defined for the VFLInference API. They shall be negotiated using the extensibility mechanism defined in clause 5.2.7 of 3GPP TS 29.122 [4].

Table 5.47.6-1: Supported Features

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|
|                |              |             |

## 5.47.7 Error handling

## 5.47.7.1 General

For the VFLInference API, HTTP error responses shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4]. Protocol errors and application errors specified in clause 5.2.6 of 3GPP TS 29.122 [4] shall be supported for the HTTP status codes specified in table 5.2.6-1 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses are applicable for the VFLInference API.

## 5.47.7.2 Protocol Errors

No specific procedures for the VFLInference API are specified.

### 5.47.7.3 Application Errors

The application errors defined for the VFLInference API are listed in table 5.47.7.3-1.

**Table 5.47.7.3-1: Application errors**

| Application Error                                                                                                                                                          | HTTP status code | Description                     |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|---------------------------------|
| OVERLOAD                                                                                                                                                                   | 403 Forbidden    | Indicates the NF is overloaded. |
| NOTE: Including a "ProblemDetails" data structure with the "cause" attribute in the HTTP response is optional unless explicitly mandated in the service operation clauses. |                  |                                 |

## 5.48 VFLNFDDiscovery API

### 5.48.1 Introduction

The Nnef\_VFLNFDDiscovery service shall use the VFLNFDDiscovery API.

The API URI of VFLNFDDiscovery API shall be:

**{apiRoot}/<apiName>/<apiVersion>**

The request URIs used in HTTP requests shall have the Resource URI structure defined in clause 5.2.4 of 3GPP TS 29.122 [4], i.e.:

**{apiRoot}/<apiName>/<apiVersion>/<apiSpecificSuffixes>**

with the following components:

- "apiRoot" is set as described in clause 5.2.4 in 3GPP TS 29.122 [4].
- "apiName" shall be set to "3gpp-vfl-nf-discovery".
- "apiVersion" shall be set to "v1" for the current version defined in the present document.
- The <apiSpecificSuffixes> shall be set as described in clause 5.2.4 of 3GPP TS 29.122 [4].

All resource URIs in the clauses below are defined relative to the above API URI.

### 5.48.2 Resources

There are no resources defined for this API in this release of the specification.

### 5.48.3 Custom Operations without associated resources

#### 5.48.3.1 Overview

The structure of the custom operation URIs of the VFLNFDDiscovery API is shown in Figure 5.48.3.1-1.

{apiRoot}/3gpp-nf-vfl-discovery/<apiVersion>

Figure 5.48.3.1-1: Custom operation URI structure of the VFLNFDISCOVERY API

Table 5.48.3.1-1 provides an overview of the custom operations and applicable HTTP methods.

Table 5.48.3.1-1: Custom operations without associated resources

| Operation name | Custom operation URI | Mapped HTTP method | Description                                                      |
|----------------|----------------------|--------------------|------------------------------------------------------------------|
| DiscoverNwdaf  | /discover-nwdaf      | POST               | Request the discovery of NWDAF that are to act as VFL client(s). |
| ReleaseNwdaf   | /release-nwdaf       | POST               | Request to inform the external NWDAF ID(s) are not used anymore  |

5.48.3.2      Operation: DiscoverNwdaf

5.48.3.2.1      Description

The custom operation enables an AF to discover an NWDAF that are to act as VFL client(s).

5.48.3.2.2      Operation Definition

This operation shall support the request and response data structures and response codes specified in table 5.48.3.2.2-1 and table 5.48.3.2.2-2.

Table 5.48.3.2.2-1: Data structures supported by the POST Request Body on this resource

| Data type             | P | Cardinality | Description                                                                         |
|-----------------------|---|-------------|-------------------------------------------------------------------------------------|
| NwdafDiscoveryRequest | M | 1           | Represents the parameters to request the NWDAF(s) that are to act as VFL client(s). |

Table 5.48.3.2.2-2: Data structures supported by the POST Response Body on this resource

| Data type                                                                                                                 | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                    |
|---------------------------------------------------------------------------------------------------------------------------|---|-------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NwdafDiscoveryResponse                                                                                                    | M | 1           | 200 OK                 | Successful case: The external NWDAF ID(s) to act as the VFL client(s) are returned.                                                                                                                                            |
| n/a                                                                                                                       |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a                                                                                                                       |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]  |
| NOTE: The mandatory HTTP error status codes for the POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply. |   |             |                        |                                                                                                                                                                                                                                |

**Table 5.48.3.2.2-3: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                              |
|----------|-----------|---|-------------|--------------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative target URI of the resource located in an alternative NEF. |

**Table 5.48.3.2.2-4: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                              |
|----------|-----------|---|-------------|--------------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative target URI of the resource located in an alternative NEF. |

### 5.48.3.3 Operation: ReleaseNwdaf

#### 5.48.3.3.1 Description

The custom operation enables an AF to inform the external NWDAF ID(s) are not used anymore.

#### 5.48.3.3.2 Operation Definition

This operation shall support the request and response data structures and response codes specified in table 5.48.3.3.2-1 and table 5.48.3.3.2-2.

**Table 5.48.3.3.2-1: Data structures supported by the POST Request Body on this resource**

| Data type           | P | Cardinality | Description                                                                        |
|---------------------|---|-------------|------------------------------------------------------------------------------------|
| NwdafReleaseRequest | M | 1           | Represents the parameters to inform the external NWDAF ID(s) are not used anymore. |

**Table 5.48.3.3.2-2: Data structures supported by the POST Response Body on this resource**

| Data type | P | Cardinality | Response codes         | Description                                                                                                                                                                                                                    |
|-----------|---|-------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n/a       |   |             | 204 No Content         | Successful case: The requested NWDAF ID(s) are released for the NF.                                                                                                                                                            |
| n/a       |   |             | 307 Temporary Redirect | Temporary redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]. |
| n/a       |   |             | 308 Permanent Redirect | Permanent redirection. The response shall include a Location header field containing an alternative target URI located in an alternative NEF.<br><br>Redirection handling is described in clause 5.2.10 of 3GPP TS 29.122 [4]  |

NOTE: The mandatory HTTP error status codes for the POST method listed in table 5.2.6-1 of 3GPP TS 29.122 [4] also apply.

**Table 5.48.3.3.2-3: Headers supported by the 307 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                              |
|----------|-----------|---|-------------|--------------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative target URI of the resource located in an alternative NEF. |

**Table 5.48.3.3.2-4: Headers supported by the 308 Response Code on this resource**

| Name     | Data type | P | Cardinality | Description                                                              |
|----------|-----------|---|-------------|--------------------------------------------------------------------------|
| Location | string    | M | 1           | An alternative target URI of the resource located in an alternative NEF. |

## 5.48.4 Notifications

There are no Notifications defined for this API in this release of the specification.

## 5.48.5 Data Model

### 5.48.5.1 General

This clause specifies the application data model supported by the VFLNFDDiscovery API. Table 5.48.5.1-1 specifies the data types defined for the VFLNFDDiscovery API.

**Table 5.48.5.1-1: VFLNFDDiscovery specific Data Types**

| Data type              | Clause defined | Description                                                                         | Applicability |
|------------------------|----------------|-------------------------------------------------------------------------------------|---------------|
| NwdafDiscoveryRequest  | 5.48.5.2.2     | Represents the parameters to request the NWDAF(s) that are to act as VFL client(s). |               |
| NwdafDiscoveryResponse | 5.48.5.2.3     | Represents the external NWDAF ID(s).                                                |               |
| NwdafReleaseRequest    | 5.48.5.2.4     | Represents the external NWDAF ID(s) are not used anymore.                           |               |
| VFLCapabilityType      | 5.48.5.3.3     | Represents the requested VFL capability type.                                       |               |

Table 5.48.5.1-2 specifies data types re-used by the VFLNFDDiscovery API from other specifications, including a reference to their respective specifications and when needed, a short description of their use within the VFLNFDDiscovery API.

**Table 5.48.5.1-2: Re-used Data Types**

| Data type      | Reference           | Comments                                    |
|----------------|---------------------|---------------------------------------------|
| NwdafEvent     | 3GPP TS 29.520 [27] | Represents analytics ID(s).                 |
| TimeWindow     | 3GPP TS 29.122 [4]  | Represents the time period of interest.     |
| GeographicArea | 3GPP TS 29.572 [34] | Represents the service area of the request. |

### 5.48.5.2 Structured data types

#### 5.48.5.2.1 Introduction

This clause defines the structured data types to be used in resource representations.

#### 5.48.5.2.2 Type: NwdafDiscoveryRequest

**Table 5.48.5.2.2-1: Definition of type NwdafDiscoveryRequest**

| Attribute name | Data type         | P | Cardinality | Description                               | Applicability |
|----------------|-------------------|---|-------------|-------------------------------------------|---------------|
| analyticsIds   | array(NwdafEvent) | M | 1..N        | Contains the analytics ID(s).             |               |
| vflCapType     | VFLCapabilityType | M | 1           | Contains the type of VFL capability.      |               |
| vflInterInfo   | string            | O | 0..1        | Contains a VFL interoperability indicator |               |

|               |                       |   |      |                                              |  |
|---------------|-----------------------|---|------|----------------------------------------------|--|
| reqFeatureIds | array(string)         | O | 1..N | Contains the requested feature ID(s).        |  |
| timePeriod    | TimeWindow            | O | 0..1 | Contains the time period of interest.        |  |
| serviceAreas  | array(GeographicArea) | O | 1..N | Contains the service area(s) of the request. |  |

#### 5.48.5.2.3 Type: NwdafDiscoveryResponse

**Table 5.48.5.2.3-1: Definition of type NwdafDiscoveryResponse**

| Attribute name | Data type     | P | Cardinality | Description                                        | Applicability |
|----------------|---------------|---|-------------|----------------------------------------------------|---------------|

### 5.48.5.3 Simple data types and enumerations

#### 5.48.5.3.1 Introduction

This clause defines simple data types and enumerations that can be referenced from data structures defined in the previous clauses.

#### 5.48.5.3.2 Simple data types

The simple data types defined in table 5.48.5.3.2-1 shall be supported.

**Table 5.48.5.3.2-1: Simple data types**

| Type Name | Type Definition | Description | Applicability |
|-----------|-----------------|-------------|---------------|
|           |                 |             |               |

#### 5.48.5.3.3 VFLCapabilityType

**Table 5.48.5.3.3-1: Enumeration VFLCapabilityType**

| Enumeration value | Description              | Applicability |
|-------------------|--------------------------|---------------|
| VFL_CLIENT        | VFL client is requested. |               |

### 5.48.6 Used Features

The optional features listed in table 5.48.6-1 are defined for the VFLNFDISCOVERY API. They shall be negotiated using the extensibility mechanism defined in clause 5.2.7 of 3GPP TS 29.122 [4].

**Table 5.48.6-1: Features used by VFLNFDISCOVERY API**

| Feature number | Feature Name | Description |
|----------------|--------------|-------------|
|----------------|--------------|-------------|

|  |  |  |
|--|--|--|
|  |  |  |
|--|--|--|

## 5.48.7 Error handling

### 5.48.7.1 General

For the VFLNFDISCOVERY API, HTTP error responses shall be supported as specified in clause 5.2.6 of 3GPP TS 29.122 [4]. Protocol errors and application errors specified in clause 5.2.6 of 3GPP TS 29.122 [4] shall be supported for the HTTP status codes specified in table 5.2.6-1 of 3GPP TS 29.122 [4].

In addition, the requirements in the following clauses are applicable for the VFLNFDISCOVERY API.

### 5.48.7.2 Protocol Errors

No specific procedures for the VFLNFDISCOVERY API are specified.

### 5.48.7.3 Application Errors

The application errors defined for the VFLNFDISCOVERY API are listed in table 5.48.7.3-1.

**Table 5.48.7.3-1: Application errors**

| Application Error | HTTP status code | Description | Applicability |
|-------------------|------------------|-------------|---------------|
|                   |                  |             |               |

## 6 Security

TLS shall be used to support secure communications between the NEF and the AF over the NEF Northbound interface as defined in clause 12.3 of 3GPP TS 33.501 [6].

When CAPIF is not supported and/or not used, the access to the NEF Northbound APIs shall be authorized by means of OAuth2 protocol (see IETF RFC 6749 [13]), based on local configuration, using the "Client Credentials" authorization grant as defined in clause 12.4 of 3GPP TS 33.501 [6]. When OAuth2 is used, a client shall obtain a "token" from the authorization server prior to consuming services offered by any NEF Northbound API.

When the NEF supports CAPIF for external exposure and CAPIF is used, the provisions of clause 7.2 shall apply for authorizing the access to the NEF Northbound APIs.

## 7 Using Common API Framework

### 7.1 General

When CAPIF is used with an NEF that is used for external exposure, the NEF shall support the following as defined in 3GPP TS 29.222 [12]:

- the API exposing function and related APIs over CAPIF-2/2e and CAPIF-3/3e reference points;
- the API publishing function and related APIs over CAPIF-4/4e reference point;
- the API management function and related APIs over CAPIF-5/5e reference point; and
- at least one of the security methods for authentication and authorization, and related security mechanisms.

In a centralized deployment as defined in 3GPP TS 23.222 [11], where the CAPIF core function and API provider domain functions are co-located, the interactions between the CAPIF core function and API provider domain functions may be independent of CAPIF-3/3e, CAPIF-4/4e and CAPIF-5/5e reference points.

## 7.2 Security

When CAPIF is used for external exposure, before invoking the API exposed by the NEF, the AF as API invoker shall negotiate the security method (PKI, TLS-PSK or OAuth2) with CAPIF core function and ensure the NEF has enough credential to authenticate the AF (see 3GPP TS 29.222 [12], clause 5.6.2.2 and clause 6.2.2.2).

If PKI or TLS-PSK is used as the selected security method between the AF and the NEF, upon API invocation, the NEF shall retrieve the authorization information from the CAPIF core function as described in 3GPP TS 29.222 [12], clause 5.6.2.4.

As indicated in 3GPP TS 33.122 [14], the access to the NEF northbound APIs may be authorized by means of the OAuth2 protocol (see IETF RFC 6749 [13]), using the "Client Credentials" authorization grant, where the CAPIF core function (see 3GPP TS 29.222 [12]) plays the role of the authorization server.

NOTE 1: In this release, only "Client Credentials" authorization grant is supported.

If OAuth2 is used as the selected security method between the AF and the NEF, the AF, prior to consuming services offered by the NEF northbound APIs, shall obtain a "token" from the authorization server, by invoking the Obtain\_Authorization service, as described in 3GPP TS 29.222 [12], clause 5.6.2.3.2.

The NEF northbound APIs do not define any scopes for OAuth2 authorization. It is the NEF responsibility to check whether the AF is authorized to use an API based on the "token". Once the NEF verifies the "token", it shall check whether the NEF identifier in the "token" matches its own published identifier, and whether the API name in the "token" matches its own published API name. If those checks are passed, the AF has full authority to access any resource or operation for the invoked API.

NOTE 2: For aforementioned security methods, the NEF needs to apply admission control according to access control policies after performing the authorization checks.

NOTE 3: The security requirement in the current clause does not apply for the NiddConfigurationTrigger and the MsisdnLessMoSms APIs since they are the NEF initiated interaction with the AF. How the security scheme works for the NiddConfigurationTrigger and MsisdnLessMoSms APIs is left to configuration.

---

# Annex A (normative): OpenAPI representation for NEF Northbound APIs

## A.1 General

This Annex is based on the OpenAPI Specification [5] and provides corresponding representations of all APIs defined in the present specification.

NOTE 1: An OpenAPIs representation embeds JSON Schema representations of HTTP message bodies.

This Annex shall take precedence when being discrepant to other parts of the specification with respect to the encoding of information elements and methods within the API(s).

NOTE 2: The semantics and procedures, as well as conditions, e.g. for the applicability and allowed combinations of attributes or values, not expressed in the OpenAPI definitions but defined in other parts of the specification also apply.

Informative copies of the OpenAPI specification files contained in this 3GPP Technical Specification are available on a Git-based repository that uses the GitLab software version control system (see clause 5B of the 3GPP TR 21.900 [21] and clause 5.3.1 of the 3GPP TS 29.501 [32] for further information).

```

```
description: |
  Represents the analytics event that is subscribed or notified.
  Possible values are:
  - UE_MOBILITY: The AF requests to be notified about analytics information of UE mobility.
  - UE_COMM: The AF requests to be notified about analytics information of UE communication.
  - ABNORMAL_BEHAVIOR: The AF requests to be notified about analytics information of UE's
    abnormal behavior.
  - CONGESTION: The AF requests to be notified about analytics information of user data
    congestion information.
  - NETWORK_PERFORMANCE: The AF requests to be notified about analytics information
    of network performance.
  - QOS_SUSTAINABILITY: The AF requests to be notified about analytics information
    of QoS sustainability.
  - DISPERSION: The AF requests to be notified about analytics information of Dispersion
    analytics.
  - DN_PERFORMANCE: The AF requests to be notified about analytics information of DN
    performance.
  - SERVICE_EXPERIENCE: The AF requests to be notified about analytics information of service
    experience.
  - E2E_DATA_VOL_TRANS_TIME: The AF requests to be notified about analytics information of
    E2E data volume transfer time.
  - MOVEMENT_BEHAVIOUR: The AF requests to be notified about analytics information of
    Movement Behaviour.
  - RELATIVE_PROXIMITY: The AF requests to be notified about analytics information of
    Relative Proximity.
  - WLAN_PERFORMANCE: Indicates that the event subscribed is the Wlan Performance
    information.
  - NS_LOAD_LEVEL: Indicates that the event subscribed is load level information of Network
    Slice.
  - SIGNALLING_STORM: The AF requests to be notified about analytics information of Signalling
    Storm.
```

AnalyticsFailureCode:

```
anyOf:
```

```

- type: string
  enum:
    - UNAVAILABLE_DATA
    - BOTH_STAT_PRED_NOT_ALLOWED
    - UNSATISFIED_REQUESTED_ANALYTICS_TIME
    - NO_ROAMING_SUPPORT
    - PREDICTION_NOT_ALLOWED
    - OTHER
- type: string
  description: >
    This string provides forward-compatibility with future
    extensions to the enumeration but is not used to encode
    content defined in the present version of this API.
  description: |
    Identifies the failure reason.
    Possible values are:
    - UNAVAILABLE_DATA: The event is rejected since necessary data to perform the service
      is unavailable.
    - BOTH_STAT_PRED_NOT_ALLOWED: The event is rejected since the start time is in the past
      and the end time is in the future, which means the AF requested both
      statistics and prediction for the analytics.
    - UNSATISFIED_REQUESTED_ANALYTICS_TIME: Indicates that the requested event is rejected
      since the analytics information is not ready when the time indicated by the timeAnaNeeded
      attribute (as provided during the creation or modification of subscription) is reached.
    - NO_ROAMING_SUPPORT: Indicates that the request shall be rejected because roaming analytics
      or data are required and the NWDAF that was invoked by the NEF neither supported roaming
      exchange capability nor could it forward the request to another NWDAF.
    - PREDICTION_NOT_ALLOWED: Indicates that the request for the prediction of the analytics
      event is not allowed.
    - OTHER: The event is rejected due to other reasons.

- type: string  
description: >  
This string provides forward-compatibility with future extensions to the enumeration and is not used to encode content defined in the present version of this API.

description: |

Represents the failure reason for the unsuccessful result.

Possible values are:

- UNSPECIFIED: Indicates the PCF received the UE sent UE policy delivery service cause #111 (Protocol error, unspecified) or that the PCF does not authorize the service information for unspecified reasons.
- UE\_NOT\_REACHABLE: Indicates the PCF received the notification from the AMF that the UE is not reachable.
- UNKNOWN: Indicates unknown reasons upon no response from the UE, e.g. UPDS message type is not defined or not implemented by the UE, or not compatible with the UPDS state, in which the UE shall ignore the UPDS message.
- UE\_TEMP\_UNREACHABLE: Indicates the PCF received the notification from the AMF that the UE is not reachable but the PCF will retry again.
- DNN\_NOT\_ALLOWED: Indicates that the DNN is not authorized for the user.
- SNSSAI\_NOT\_ALLOWED: Indicates that the SNSSAI is not authorized for the user.

ConnectionCapabilities:

- TIME\_CRITICAL  
- LOW\_LAT\_LOSS\_TOL\_UNACK

- type: string

description: >  
This string provides forward-compatibility with future extensions to the enumeration and is not used to encode content defined in the present version of this API.

description: |

Represents the information provided by a UE application when it requests a network connection with certain capabilities.

Possible values are:

- IMS: Indicates the connection capability to support IMS service.
- MMS: Indicates the connection capability to support MMS service.
- SUPL: Indicates the connection capability to support SUPL service.
- INTERNET: Indicates the connection capability to support Internet service.
- IOT\_DELAY\_TOLERANT: Indicates the connection capability to support IoT delay-tolerant services.
- IOT\_NON\_DELAY\_TOLERANT: Indicates the connection capability to support IoT non-delay-tolerant services.
- DL\_STREAMING: Indicates the connection capability to support downlink streaming services.
- UL\_STREAMING: Indicates the connection capability to support uplink streaming services.
- VEHIC\_COMM: Indicates the connection capability to support vehicular communication services.
- REAL\_TIME\_INTERACTIVE: Indicates the connection capability to support real time interactive services.
- UNIFIED\_COMM: Indicates the connection capability to support unified communication services.

- BACKGROUND: Indicates the connection capability to support background services.
- MISS\_CRITICAL: Indicates the connection capability to support mission critical services.
- TIME\_CRITICAL: Indicates the connection capability to support time critical services.
- LOW\_LAT\_LOSS\_TOL\_UNACK: Indicates the connection capability to support low latency loss tolerant communications in un-acknowledged mode.

**SubscribedEvent:****anyOf:**

- type: string

**enum:**

- AVAILABILITY\_FOR\_TIME\_SYNC\_SERVICE

- type: string

**description: >**

This string provides forward-compatibility with future extensions to the enumeration and is not used to encode content defined in the present version of this API.

**description: |**

Identifies the supported event.

Possible values are:

- AVAILABILITY\_FOR\_TIME\_SYNC\_SERVICE: 5GS and/or UE availability and capability for time synchronization service.

**AsTimeResource:****anyOf:**

- type: string

**enum:**

- ATOMIC\_CLOCK

- GNSS

- TERRESTRIAL\_RADIO

- SERIAL\_TIME\_CODE

- PTP

- NTP

- HAND\_SET

- INTERNAL\_OSCILLATOR

- OTHER

- type: string

**description: >**

This string provides forward-compatibility with future extensions to the enumeration and is not used to encode content defined in the present version of this API.

**description: |**

Identifies the supported 5G clock quality.

Possible values are:

- ATOMIC\_CLOCK: Indicates atomic clock is supported.

- GNSS: Indicates Global Navigation Satellite System is supported.

- TERRESTRIAL\_RADIO: Indicates terrestrial radio is supported.

- SERIAL\_TIME\_CODE: Indicates serial time code is supported.

- PTP: Indicates PTP is supported.

- NTP: Indicates NTP is supported.

- HAND\_SET: Indicates hand set is supported.

- INTERNAL\_OSCILLATOR: Indicates internal oscillator is supported.

- OTHER: Indicates other source of time is supported.

**AcceptanceCriteriaResultIndication:****anyOf:**

- type: string

**enum:**

- ACCEPTABLE

- NON\_ACCEPTABLE

- type: string

**description: >**

This string provides forward-compatibility with future extensions to the enumeration and is not used to encode content defined in the present version of this API.

**description: |**

Identifies the supported acceptable / not acceptable indication.

Possible values are:

- ACCEPTABLE: PTP port in (g)PTP service meets the clock quality acceptance criteria.

- NON\_ACCEPTABLE: PTP port in (g)PTP service does not meet the clock quality acceptance criteria.

**AvailStatus:****anyOf:**

- type: string

**enum:**

- PDU\_SESSION\_TERMINATION

- type: string

**description: >**

This string provides forward-compatibility with future extensions to the enumeration and is not used to encode content defined in the present version of this API.

**description: |**

Identifies the availability status.

Possible values are:

- PDU\_SESSION\_TERMINATION: The UE is not available for (g)PTP services because the PDU session is terminated.

      is not used to encode content defined in the present version of this API.
  description: |
    Represents the filter criterion event.
```

Possible values are:

- QoS: Indicates QoS criterion.
- ACCESS\_RAT\_TYPE: Indicates that the type of filter criterion is Access and Rat types criterion.
- E2E\_DATA\_VOLUME\_TRANSFER\_TIME: Indicates that the type of filter criterion is End-to-end data volume transfer time criterion.
- UE\_LOCATION: Indicates that the type of filter criterion is UE location criterion.
- UE\_HISTORICAL\_LOCATION: Indicates that the type of filter criterion is UE historical location criterion.
- UE\_DIRECTION: Indicates that the type of filter criterion is UE direction criterion.
- UE\_DISTANCE: Indicates that the type of filter criterion is UE distance criterion.
- SERVICE\_EXPERIENCE: Indicates that the type of filter criterion is Service Experience criterion.
- DNN: Indicates that the type of filter criterion is DNN criterion.
