Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "*Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards*", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<https://ipr.etsi.org/>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under <http://webapp.etsi.org/key/queryform.asp>.

Modal verbs terminology

In the present document "**shall**", "**shall not**", "**should**", "**should not**", "**may**", "**need not**", "**will**", "**will not**", "**can**" and "**cannot**" are to be interpreted as described in clause 3.2 of the [ETSI Drafting Rules](#) (Verbal forms for the expression of provisions).

"**must**" and "**must not**" are **NOT** allowed in ETSI deliverables except when used in direct citation.

Foreword

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

x the first digit:

- 1 presented to TSG for information;
- 2 presented to TSG for approval;
- 3 or greater indicates TSG approved document under change control.

y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.

z the third digit is incremented when editorial only changes have been incorporated in the document.

Introduction

The present document is part 3 of a multi-part conformance test specification for UE. The specification contains a TTCN (TTCN -2 and TTCN-3) design frame work and the detailed test specifications in TTCN for UE at the Uu interface.

3GPP TS 34.123-1 [1]: "User Equipment (UE) conformance specification; Part 1: Protocol conformance specification".

3GPP TS 34.123-2 [2]: "User Equipment (UE) conformance specification; Part 2: Implementation Conformance Statement (ICS) proforma specification".

3GPP TS 34.123-3: "Abstract Test Suite (ATS)" (the present document).

1 Scope

The present document specifies the protocol conformance testing in TTCN for the 3GPP User Equipment (UE) at the Uu interface.

The present document is the 3rd part of a multi-part test specification, 3GPP TS 34.123. The following TTCN test specification and design considerations can be found in the present document:

- the overall test suite structure;
- the testing architecture;
- the test methods and PCO definitions;
- the test configurations;
- the design principles, assumptions, and used interfaces to the TTCN tester (System Simulator);
- TTCN styles and conventions;
- the partial PIXIT proforma;
- the TTCN.MP and TTCN.GR forms for the mentioned protocols tests.

The Abstract Test Suites designed in the document are based on the test cases specified in prose (3GPP TS 34.123-1 [1]).

The present document is valid for UE implemented according to 3GPP releases starting from Release 1999 up to the Release indicated on the cover page of the present document.

2 References

The following documents contain provisions, which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document in the same Release as the present document unless the context in which the reference is made suggests a different Release is relevant (information on the applicable release in a particular context can be found in e.g. test case title, description or applicability, message description or content).

3 Definitions and abbreviations

3.1 Definitions

For the purposes of the present document, the terms and definitions given in 3GPP TS 34.123-1 [1] apply.

3.2 Abbreviations

For the purposes of the present document, the abbreviations given in 3GPP TS 34.123-1 [1], 3GPP TS 24.008 [9], 3GPP TS 25.331 [21] and TR 101 666 [27] apply.

4 Requirements on the TTCN development

A number of requirements are identified for the development and production of TTCN specification for 3GPP UE at Uu interface.

1. Top-down design, following 3GPP TS 34.123-1 [1], 3GPP TS 34.108 [3] and 3GPP TS 34.109 [4].
2. A unique testing architecture and test method for testing all protocol layers of UE.
3. Uniform TTCN style and naming conventions.
4. Improve TTCN readability.
5. Using TTCN-2++ (TR 101 666 [27]) for R99, Release 4, Release 5, Release 6, Release 7, Release 8 and Release 9 and TTCN-3 (ETSI ES 201 873-1[65]) for Release 10 and later Releases.
6. TTCN specification feasible, implementable and compilable.
7. Test cases shall be designed in a way for easily adaptable, upwards compatible with the evolution of the 3GPP core specifications and the future Releases.

8. The test declarations, data structures and data values shall be largely reusable.
9. Modularity and modular working method.
10. NAS ATS should be designed being independent from the radio access technologies.
11. Minimizing the requirements of intelligence on the emulators of the lower testers. Especially the functionality of the RRC emulator in the TTCN tester should be reduced and simplified; the behaviours should be standardized as the TTCN RRC test steps in the TTCN modular library.
12. Giving enough design freedom to the test equipment manufacturers.
13. Maximizing reuse of ASN.1 definitions from the relevant core specifications.

In order to fulfil these requirements and to ensure the investment of the test equipment manufacturers having a stable testing architecture for a relatively long period, a unique testing architecture and test method are applied to the 3GPP UE protocol tests.

5 TTCN-2 ATS structure

The total TTCN specification for the UE testing is structured in a number of separate layered ATSs. The number of ATS being produced corresponds to the number of the 3GPP core specifications referred. The separation of ATSs reduces the size of ATSs. The layer-specific test preambles and test data can be confined to one test suite and parallel development of test suites can be facilitated. The separation of ATSs enables also easily to follow the evolution of the core specifications.

- NAS ATSs:
 - 1) GSM MAP L3 ATS including MM, CC, GMM, SM test groups;
 - 2) SMS ATS;
 - 3) A-GPS ATS
- AS ATSs:
 - 1) RRC ATS including Single cell and multicell test group;
 - 2) RLC ATS;
 - 3) MAC ATS;
 - 4) BMC ATS;
 - 5) PDCP ATS;
 - 6) RAB ATS;
 - 7) IR_U ATS;
 - 8) HSD_ENH ATS (Rel-5 or later);
 - 9) HSU_ENH ATS (Rel-6 or later);
 - 10) MBMS ATS (Rel-6 or later);
 - 11) HSPA7_ENH ATS (Rel-7 or later);
 - 12) HSPA8_ENH ATS (Rel-8 or later);
 - 13) HSPA9_ENH ATS (Rel-9 or later).

5.1 Modularity

The modular TTCN approach is used for the development of the 3GPP ATS specification work. Three modules, BasicM, RRC_M and L3M are installed.

5.1.1 Module structure

The module structure is shown in Figure 5.1.1.

Figure 5.1.1: Module structure

The BasicM (**Basic Module**) is a minimum module commonly for the layer 2 and layer 3 testing. The L3M (**Layer 3 Module**) contains all the items to be shared by the RRC, NAS, SMS, RAB, IR_U/G, A-GPS, HSD_ENH, HSU_ENH and MBMS ATSS. NAS is applied to the NAS, A-GPS, HSD_ENH, HSU_ENH, MBMS, HSPA7_ENH, HSPA8_ENH and HSPA9_ENH ATSS. The RRC_M is a module containing common object for RRC, RAB, IR_U/G, SMS, A-GPS, HSD_ENH, HSU_ENH, MBMS, HSPA7_ENH, HSPA8_ENH and HSPA9_ENH ATSS.

5.1.2 Contents of the modules

The BasicM module includes objects related to the RRC, the layer 2 and the physical layer. It includes also all test steps needed by the layer 2 and layer 3 test cases for configurations and all objects related to the definition of the steps:

- Common test steps and default test steps defined as generic procedures in 3GPP TS 34.108 [3];
- RRC declarations related to the steps: types, timers, PDU types, ASP type, PCOs, TSOs, constants;
- Related ICS and IXIT parameters needed for testing and respectively defined in 3GPP TS 34.123-2 [2] and the present document;
- Defaults constraints based on the default message contents defined in 3GPP TS 34.108 [3];
- MMI PCO and ASPs;
- All TTCN objects related to the SS configuration, e.g. PCOs, declaration of the components.

The L3M module includes the NAS configuration steps and all related TTCN objects:

- Common test steps and default test steps defined as generic procedures in 3GPP TS 34.108 [3];
- NAS declarations related to these steps: types, PDU, ASP, PCOs, TSOs, constants;
- Related ICS and IXIT parameters needed for testing and respectively defined in 3GPP TS 34.123-2 [2] and the present document;
- Default constraints based on the default message contents defined in 3GPP TS 34.108 [3].

The RRC_M module includes the RRC steps common to RRC and RAB test cases and all related TTCN objects.

5.1.3 Example of a working platform

Figure 5.1.3 shows the working platform for the user that is writing the SMS test cases.

Figure 5.1.3: An example of working platform for SMS

6 Test method and testing architecture

6.1 Test method

The distributed single party test method is used for the UE testing. The lower tester configures the emulator and communicates with the UE under test via the emulator. An upper tester interfaces UE as (E)MMI.

All common parts in 3GPP TS 34.108 [3], 3GPP TS 34.109 [4] and 3GPP TS 34.123-2 [2] are developed in a TTCN library including the declarations, default constraints, preambles and postambles. They have the following characteristics:

- Very complex;
- Worked in different layers;
- Including data representing the radio parameters for SS setting and the data representing the UE capabilities (PICS parameters);
- Including the generic procedures to bring the UE into certain test states or a test mode (C-plane);
- Setting RABs at U-plane and SRBs in C-plane;
- Being used by every test cases no matter which layer the test case belongs to;
- No affect on the test verdict of PASS or FAIL.

The layer-specific test cases have the characteristics:

- relatively simple and straight forward;
- having narrow test scope and test purposes;
- test scenarios in a single layer (one PCO);
- assigning the test verdict.

6.2 TTCN-2 Testing architecture

A unique testing architecture is shown in Figure 6.2.

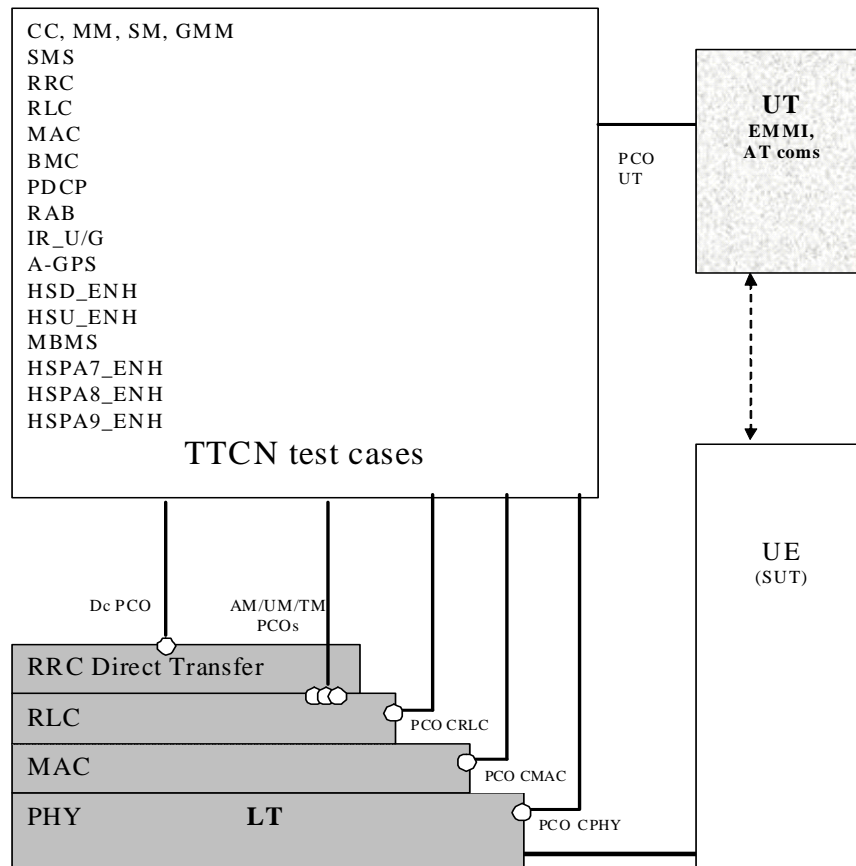

Figure 6.2: A unique testing architecture

6.2.1 Lower Tester (LT)

The Lower Tester (LT) provides the test means for the execution of the test cases for CC, SM, MM, GMM, SMS, RRC, RLC, MAC, PDCP, BMC, RAB, IR_U/G, A-GPS, HSD_ENH, HSU_ENH, MBMS, HSPA7_ENH, HSPA8_ENH and HSPA9_ENH. The LT provides also the RLC, MAC and PHY emulators to communicate with the UE. The configuration and initialization of the emulators are control by the TTCN via ASPs.

6.2.2 Configuration and initialization

A number of TTCN test steps are designed for the generic setting.

- 1) Configuration of L1 of the tester, such as the cells, Physical channels and common transport channels via CPHY-PCO, configuration of MAC via CMAC-PCO and configuration of RLC layer via CRLC-PCO.
- 2) Sending system information via TR-PCO.
- 3) Establishment RRC connection via AM or UM-PCO.
- 4) Assigning a radio bearer via AM-PCO.
- 5) MM /GMM registration via Dc-PCO.
- 6) Establishment of a CS call or a PDP context via Dc-PCO.
- 7) Setting security parameters and control of integrity via CRLC- and ciphering via CRLC- and CMAC-PCO.

6.2.3 Upper Tester (UT)

An Upper Tester (UT) exists in the test system. The UT interfaces toward UE with any optional EMMI (3GPP TS 34.109 [4], clause 7). TTCN communicates with the UT by passing coordination primitives via a Ut PCO. The primitives can either contain AT commands aiming at the automatic tests, or some informal commands as MMI, in order to request the UE for certain actions and to provide simple means for observations of UE.

6.2.4 TTCN-2

TTCN-2 is used as specification language based on TR 101 666 [27] (TTCN 2++). The importation of ASN.1 modules and modular TTCN-2 are two of the most important features used in the design of the ATSSs.

The TTCN test suites have been designed to maximize the portability from the language TTCN-2 to TTCN-3.

6.2.5 Model extension

If a test case needs to handle a concurrent situation two or more LTs can be configured at the same time. The following test scenarios identified may require multiple testers in the test configuration.

6.2.6 Multiplexing of RLC services

For the RRC and NAS testing, the TTCN RRC test steps (on RB1 and RB2) and the RRC emulator (on RB3 and RB4 for the NAS messages) share the same service access point (AM SAP). The RLC emulator shall provide separate message queues (buffers) for the TTCN RRC test steps and the RRC emulator for the TTCN NAS test cases, according to the signalling radio bearer identities.

6.3 NAS test method and architecture

6.3.1 Test configuration

The NAS test method is shown in Figure 6.3.1.

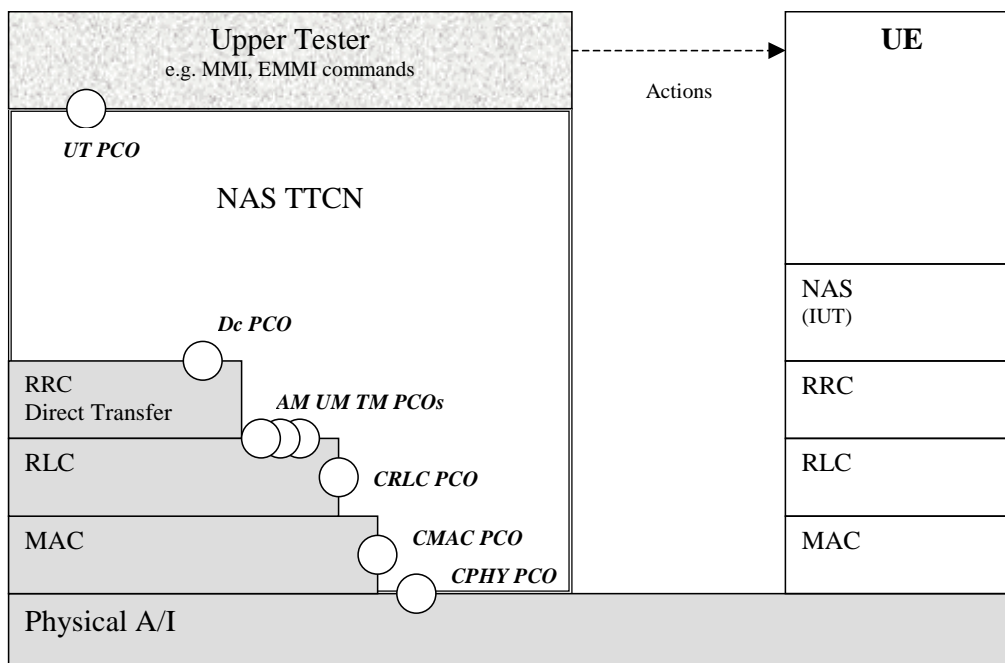

Figure 6.3.1: NAS testing architecture

The single layer distributed test method is used.

The Point of Control and Observation (PCO) are defined as the Dc (Dedicated control) SAP. The NAS test verdicts are assigned depending on the behaviours observed at the PCO.

The TTCN tester provides the NAS TTCN test cases and steps with a simple RRC direct transfer function which buffers the NAS PDU data, converts the data from the NAS TTCN table format into ASN.1, or in reverse way, and delivers all lower layer services of AM-SAP for RB3 and RB4.

The NAS TTCN test cases make also intensively use of the RRC TTCN test steps, in order to:

- Configure, initialize and control the L2 emulator;
- Initialize the UE for testing.

The RRC test steps, which are called by the NAS test cases or steps, interface with the RLC PCOs (UM, AM and TR), the control PCOs CRLC, CMAC and CPHY.

The General control (Gc) SAP and the Notification (Nt) SAP are not applied. Messages exchanged via these SAPs will be replaced with the corresponding RRC TTCN test steps.

The Ut PCO (so called logical interface [4]) is served as the interface to the UE EMMI to allow a remote control of operations, which have to be performed during execution of a test case such as to switch the UE on/off, initiate a call, etc.

6.3.2 Routing UL NAS messages in SS

The UL NAS messages are embedded in RRC messages INITIAL / UL DIRECT TRANSFER. In the UE test, the received UL NAS messages can either be routed to the Dc PCO and verified at the NAS message level, or routed to AM PCO and verified at the RRC message level.

- 1) RBid = 3 at the SS side indicates that the UL NAS high priority messages to be routed to Dc PCO. RB3 applies to RRC_DataInd/Req.
- 2) RBid = -16 at the SS side indicates the received messages to be routed to RLC AM PCO. RB-16 applies to RLC_DataInd/Req.

The RB3 and RB-16 do not coexist. The TTCN writer uses the MAC and RLC reconfigurations to re-map the RB and the corresponding logical channels. If RB3 has been configured, but a test case needs to re-map the logical channel from RB3 to RB-16 the following way is to replace RB3 with RB-16.

- CMAC_CONFIG_REQ (reconfiguration, RB-16).

Re-mapping on RB-16 which appears in the transport channel and logical channel mapping list.

- CRLC_CONFIG_REQ (reconfiguration, RB-16).

RB-16 appears in the routing info, in order to replace the original mapping on RB3.

Mapping from RB-16 to RB3 is done in the reverse way.

6.4 RRC and RAB test method and architecture

6.4.1 Test configuration

Figure 6.4.1: RRC testing architecture

The single layer distributed test method is used.

The PCOs are defined as the AM (Acknowledged Mode), UM (Unacknowledged Mode) and TM (Transparent Mode) SAPs. The RRC test verdicts are assigned depending on the behaviours observed at the PCO. The RRC TTCN interface also with the control PCOs CRLC, CMAC and CPHY, for the configuration, initialization and control of the System Simulator.

The RRC TTCN test cases also make use of the NAS TTCN test steps in order to:

- Bring UE to Idle state;
- Bring UE to state U10.

The NAS test steps, which are called by the RRC test cases or steps, interface with the Dc PCO.

The Ut PCO (so called logical interface [4]) is served as the interface to the UE EMMI to allow a remote control of operations, which have to be performed during execution of a test case such as to switch the UE on/off, initiate a call, etc.

According to 3GPP TS 25.331 [21], clause 12.1.1, the encoding of RRC PDUs is obtained by applying UNALIGNED PER to the abstract syntax value as specified in ITU-T Recommendation X.691 [28]. The two tables below show the declaration of the encoding rule and an example of the use in the definition of an RRC PDU.

6.4.2 RAB test method

6.4.2.1 Sending data on the same TTI

The RAB test requires a specific test method to send the test data on the same TTI. The TFC restriction method is used in this case. A specific TFC subset is allowed to ensure the test data are sent on different RBs on the same TTI. The downlink restriction can be used to ensure that the SS uses a specific TFC for transmission of data, by only allowing the "No data" TFC, and the "desired" TFC. It may also be necessary to include one or more "signalling only" TFCs to allow signalling to occur. The uplink restriction can be used to verify that the UE has used a specific TFC. Any data received by the SS using a forbidden TFCI shall be discarded.

6.4.2.2 Sending continuous data on consecutive TTIs

The RBS ATS is developed using the tabular TTCN notation. In order to test of multiple-RB combinations and simultaneous signalling, the SS shall be capable of sending continues test data in every TTI using the downlink transport format combination under test. A specific TSO is designed to request the SS sending continuous data. The information about the number of RLC SDUs and their sizes for each RAB will be provided to the system simulator through TSO.

6.5 RLC test method and architecture

6.5.1 Testing architecture

Figure 6.5.1 illustrates a typical realization of the RLC ATS.

Figure 6.5.1: RLC ATS single party test method

The single party test method is used for RLC testing.

Separation of TTCN test cases from the configuration of the tester and initialization of the UE is achieved by using test steps. For each RLC test case, common test steps will be used to perform the configuration of the tester and the appropriate generic setup procedures as described in 3GPP TS 34.108 [3]. These test steps will make use of PCOs AM, UM, TM, CRLC, CMAC, and CPHY.

Three PCOs are provided at the top of the RLC emulation in the tester, one corresponding to each of the available RLC modes: acknowledged, unacknowledged, and transparent. Routing information for different radio bearers used at these PCOs will be provided in ASP parameters.

The queues shown in the RLC emulation in Figure 6.5.1 indicate that normal RLC transmit and receive buffering will be used to isolate the TTCN test suite from the real time issues involved if messages are sent directly to the MAC layer.

The RLC TTCN test cases make also use of the NAS TTCN test steps in order to bring UE to Idle state. The NAS test steps, which are called by the RLC test cases or steps, interface with the Dc PCO.

6.5.2 Test method

Figure 6.5.2.1 illustrates an example configuration for downlink UM testing. Uplink and AM tests will use similar configurations. A Tr-Entity is established on the tester side using a CRLC-CONFIG-REQ. A corresponding UM-Entity is created in the UE by sending a Radio Bearer Setup PDU. RLC PDUs are specified in the TTCN test suite, and sent to TM PCO. These PDUs shall be carefully designed so that the Tr-Entity will not perform any segmentation. The system simulator is responsible for direct encoding the abstract representation of transmitted PDUs into a bitstring to be sent by the Transmitting Tr entity. Direct encoding is performed by concatenation of all of the present fields in the abstract representation. It is the TTCN author's responsibility to ensure that the PDU is valid. To test reassembly in the UE side, the segmentation must be explicitly coded in TTCN. To test various aspects of the RLC header (e.g. sequence numbering, length indications, etc.), the RLC header must be explicitly coded in TTCN. Ciphering will not be tested using this approach, and will be disabled in the UE UM Entity.

The segmentation block in the SS Tr-entity is shown in grey to indicate that the functionality is present in the SS, but the test cases shall be carefully designed to ensure that segmentation is not used in the SS Tr-entity for RLC testing.

The deciphering block in the UE UM-entity is shown in grey to indicate that the functionality may be present in the UE, but shall be disabled for RLC testing.

Figure 6.5.2.1: Example configuration for downlink RLC UM testing

The TFCS used for RLC testing must guarantee that Tr mode segmentation will not occur. This is to prevent transmission of more than one Tr PDU per TTI.

All RLC tests that require uplink data will make use of the UE test loop mode 1 defined in 3GPP TS 34.109 [4]. The UE test loop mode 1 function provides all Upper Tester (UT) functionality required, so an UT PCO is not required for RLC tests. Test Loop mode 1 is only available in the user plane, so all RLC tests will be performed in the user plane, using DTCH and DCCH logical channels mapped to DCH transport channels.

Ciphering will be disabled for all RLC test cases. Ciphering will be tested implicitly by other test cases that have ciphering enabled.

Figure 6.5.2.2 illustrates an example configuration for uplink UM testing, and reception of an example UMD PDU. Figure 6.5.2.3 illustrates an example configuration for uplink AM testing, reception of an example STATUS_PDU, and the use of the superFields and superFieldsRec fields.

The ciphering and deciphering blocks in the UE RLC entities are shown in grey to indicate that the functionality may be present in the UE, but shall be disabled for RLC testing.

The reassembly blocks in the SS Tr-entities are shown in grey to indicate that the functionality is present in the SS, but the test cases shall be carefully designed to ensure that reassembly is not used in the SS Tr-entity for RLC testing.

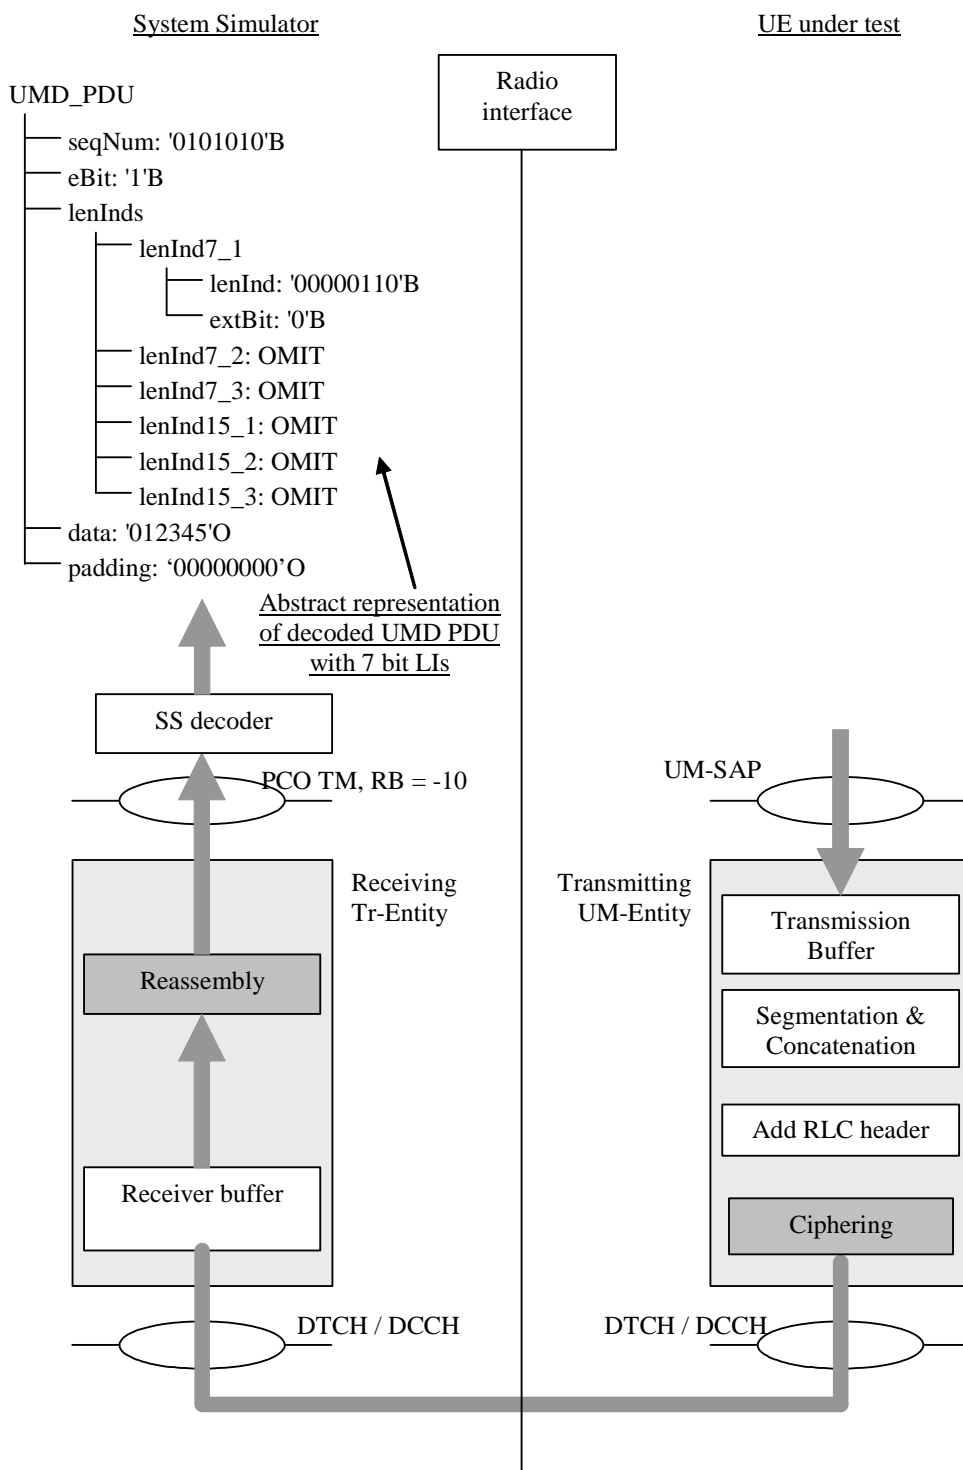

Figure 6.5.2.2: Example configuration for uplink RLC UM testing

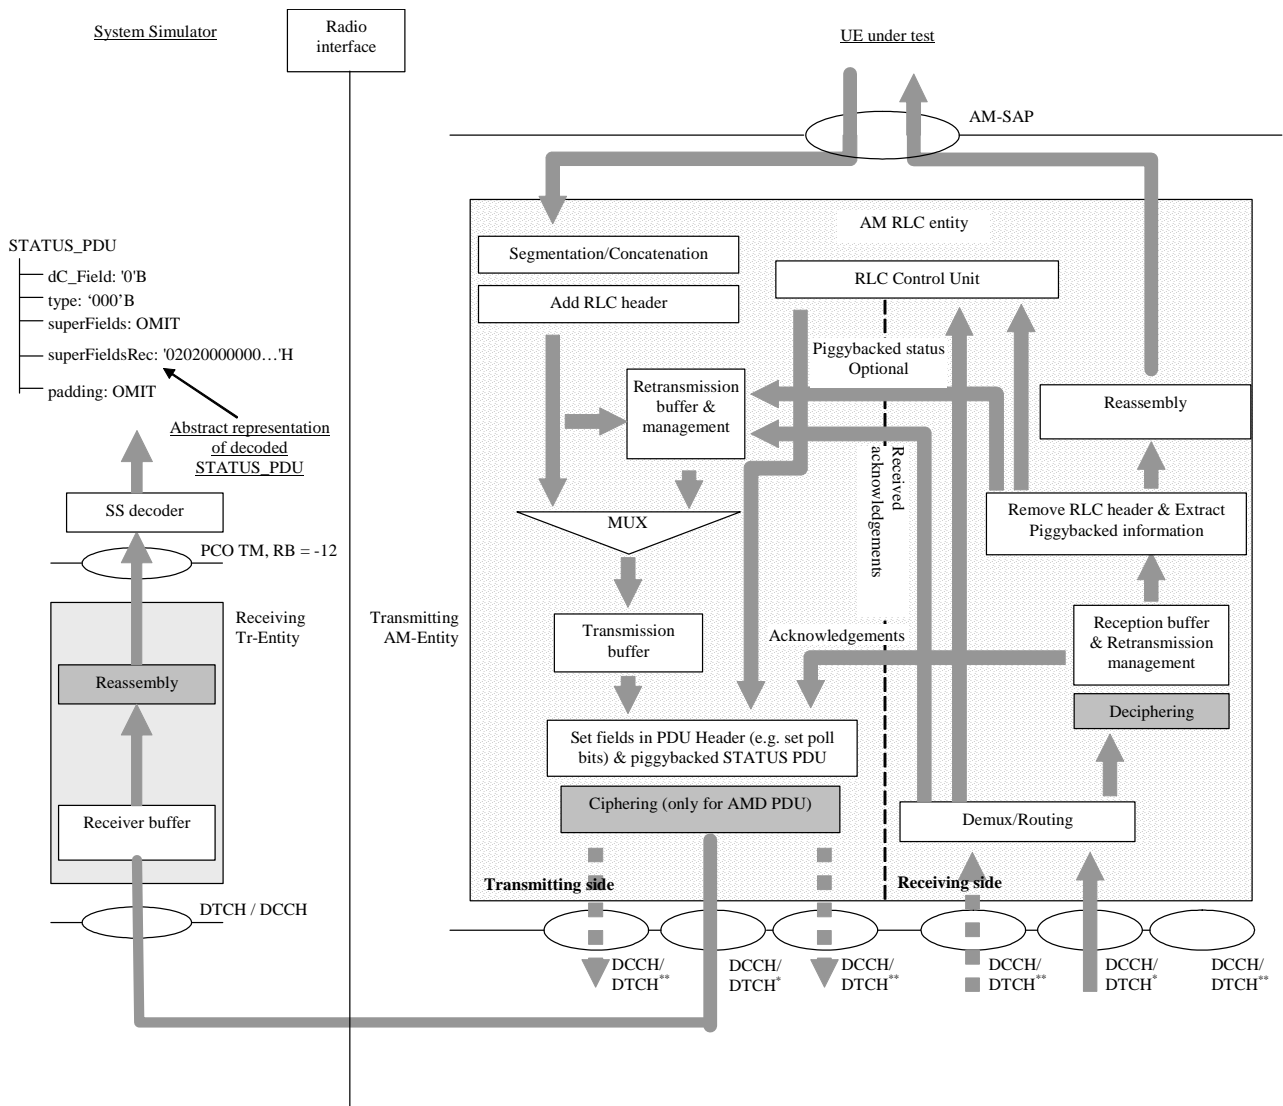

Figure 6.5.2.3: Example configuration for uplink RLC AM testing

Uplink data uses a similar approach to downlink, but the received data must be decoded in the correct way, depending on the current UE configuration. In the example in Figure 6.5.2.2, the SS must decode the data received at the TM PCO into an abstract representation of the structure defined in the TTCN for a UMD_PDU, using 7 bit length indicators. This structure is then compared with an abstract representation of the expected data to see if the receive event is successful. Refer to TR 101 666 [27], clause B.5.2.10 for more information.

For RLC testing, the following RB Ids are used within the system simulator, depending on the RLC mode, and length indicator size being simulated.

| RLC mode | LI Size | RB Id |
|-------------------------|---------|-------|
| UM | 7 | -10 |
| UM | 15 | -11 |
| AM | 7 | -12 |
| AM | 15 | -13 |
| UM/AM (Rel-7 or later) | 7/15 | -25 |

The SS decoder can use the RB Id to determine which abstract structure to create during the decode process. The SS decoder must also understand the RLC peer-to-peer protocol enough to determine which fields are present.

EXAMPLE 1: The semantics of LI extension bits must be known to determine how many LIs are present.

EXAMPLE 2: The contents of the LIs must be interpreted to determine how many octets of data, and how many octets of padding are present.

The SUFI list and any subsequent padding in a received STATUS_PDU or PiggyBackedSTATUS_PDU shall be decoded as a HEXSTRING, and put in the 'superFieldsRec' field of the abstract representation of the STATUS PDU. The "superFields" and "padding" fields shall be omitted for received STATUS PDUs. This is illustrated in Figure 6.5.2.3.

As in downlink testing, the TFCS must be defined to guarantee that the Tr entity does not perform any reassembly. This is to prevent reception of more than one Tr PDU per TTI so that the TTCN does not need to manage possible interleaving problems due to multiple PDUs received at the same time (i.e. they may be placed on the PCO queue in any order).

6.5.2.1 Handling SUFIs in TTCN

The SUFIs are a very flexible set of information elements contained in the RLC protocol. The order of the fields varies, the existence of a field may depend upon the presence of another one. A field can be present multiple times. For matching received SUFIs, it is convenient to define the SUFIs as a HEXSTRING which is treated by a TSO **o_SUFI_Handler**.

Depending upon which SUFIs and which aspects of SUFIs are to be checked, the TSO is provided with the information (**SUFI_Params**) on what checking it is expected to perform. If the check is successful the result TRUE will be returned, otherwise FALSE. Additionally the TSO will return an object which is structured as the SUFIs used in transmission (SuperFields). This will allow to make use of information received and needed to establish SUFIs to be transmitted.

The input parameters to **o_SUFI_Handler** to be used as checking criteria are collected in tabular data structure **SUFI_Params** which is filled each time before the TSO is called. These data are to allow the checking of the presence and the value of SUFIs. All entries shall be set to well-defined values if these are to be used by **o_SUFI_Handler**. As a principle values specifically set are used as criteria for checking, values omitted are used as AnyOrOmit values. The resulting SUFI list is established by **o_SUFI_Handler** and can be retrieved in the data structure returned by the TSO. Details have to be defined in the TSO itself.

Tasks **o_SUFI_Handler** has to perform:

- Transfer the SUFIs received into the structure of SuperFields; this is the SUFI list structure existing today.
- If multiple occurrences of SUFI are found then use the **last** one to fill the SuperFields structure. The LIST SUFI is an exception: multiple SUFIs may be used to transfer the complete LIST information.
- Check for all parameters in SUFI_Params set to a specific expected value that one of the SUFIs using this value is present and that the value received matches the specific expected value.
- Check that if SUFIs are received for which an expected value of Any is specified, the SUFI is consistent if that SUFI is received.
- Check that if SUFIs are received for the presence of which no entry is specified in SUFI_Params, the SUFI is consistent.
- Check that sequence numbers are in the range between LB and UB if specific values are set.

Entries in **SUFI_Params**.

| Element Name | Significance | Comment |
|---------------------|---|--|
| LB | Lower bound of sequence number range | Lowest SN for checking SNs acknowledged |
| UB | Upper bound of sequence number range | Highest SN for checking SNs acknowledged |
| WSN_presence | Window Size SUFI present | To check the presence of the Window Size SUFI |
| MRW_presence | Move Receive Window SUFI present | To check the presence of the MRW SUFI |
| Nack1 | SN of 1 st PDU negatively acknowledged | For the NackList to check SN to be negatively acknowledged |
| Nack2 | SN of 2 nd PDU negatively acknowledged | For the NackList to check SN to be negatively acknowledged |
| Nack3 | SN of 3 rd PDU negatively acknowledged | For the NackList to check SN to be negatively acknowledged |

More entries may be required in the future if specific SUFI field values are to be checked. The concept allows to add more fields easily.

6.6 SMS test method and architecture

6.6.1 SMS CS test method and architecture

The test method used for SMS CS tests is the same as the NAS test method, see clause 6.3, and the same ASPs, see clause 7.1.2.

6.6.2 SMS PS test method and architecture

The test method used for SMS PS tests is the same as the NAS test method, see clause 6.3, and the same ASPs, see clause 7.1.2.

6.6.3 SMS Cell broadcasting test method and architecture

The test method used for SMS CB tests is the same as the BMC test method, see clause 6.8, and the same ASPs, see clause 7.3.1.1.

6.7 MAC test method and architecture

6.7.1 Testing architecture

Figure 6.7.1 illustrates a typical realization of the MAC ATS.

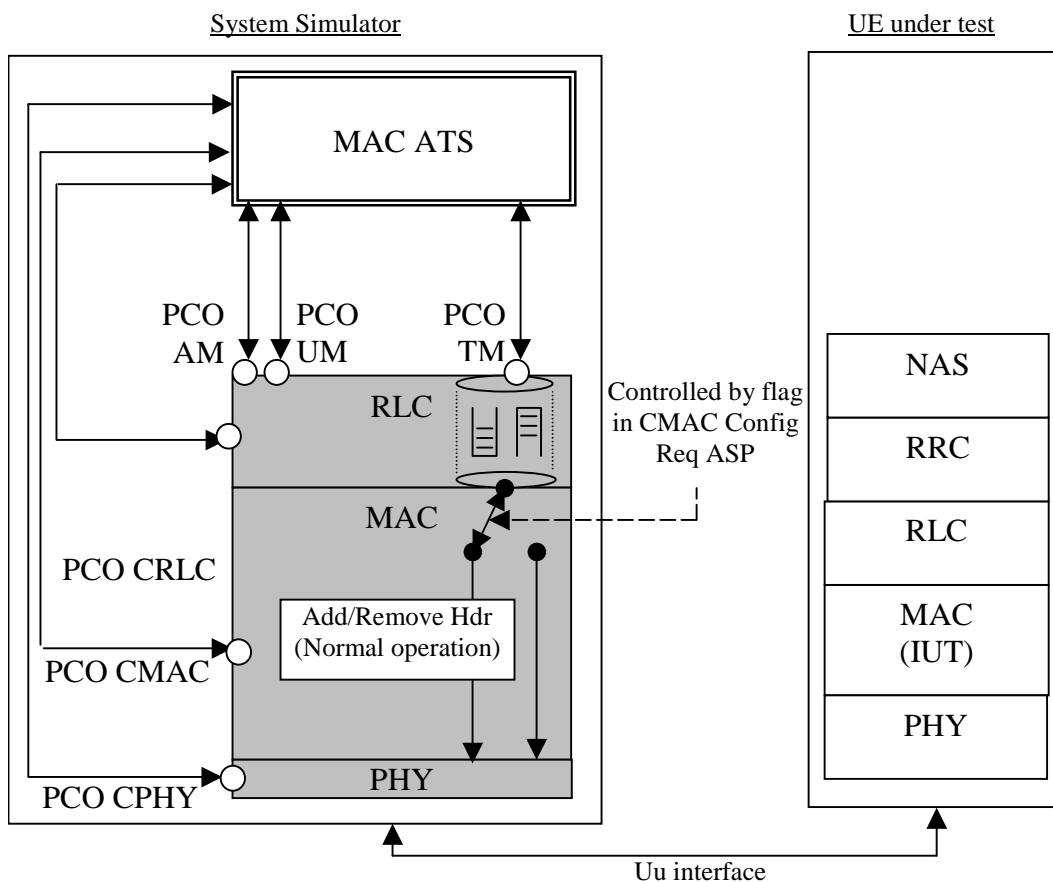

Figure 6.7.1: MAC ATS single party test method

6.7.2 Test method

The single party test method is used for MAC testing.

Separation of TTCN test cases from the configuration of the tester and initialization of the UE is achieved by using test steps. For each MAC test case, common test steps will be used to perform the configuration of the tester and the appropriate generic setup procedures as described in 3GPP TS 34.108 [3]. These test steps will make use of PCOs AM, UM, TM, CRLC, CMAC, and CPHY.

Three PCOs are provided at the top of the RLC emulation in the tester, one corresponding to each of the available RLC modes: acknowledged, unacknowledged, and transparent. Routing information for different radio bearers used at these PCOs will be provided in ASP parameters.

The queues shown in the RLC emulation in Figure 6.5.2.2 indicate that normal RLC transmit and receive buffering will be used to isolate the TTCN test suite from the real time issues involved if messages are sent directly to the MAC layer.

A flag is required within the CMAC Config Req to indicate that the SS MAC emulation must not add or remove any MAC header information, even if header fields should be present according to the configured channels. This flag shall allow control of the MAC header on a per logical channel basis. For example, it shall be possible to configure 4 DCCHs and a DTCH mapped to a DCH, such that the MAC will add / remove header information for the DCCHs, but not for the DTCH.

The MAC TTCN test cases make also use of the NAS TTCN test steps in order to bring UE to Idle state. The NAS test steps, which are called by the MAC test cases or steps, interface with the Dc PCO.

For MAC testing, the following RB Ids are used for the high priority NAS RB within the system simulator depending on the MAC configuration being simulated.

| RB Id | Simulated configuration |
|-------|-------------------------|
| -14 | DCCH mapped to FACH |
| -15 | DCCH mapped to DCH |
| -18 | CCCH mapped to FACH |

The SS decoder can use the RB Id to determine which MAC header fields are present, and create the appropriate abstract structure during the decode process. The SS decoder must understand enough of the MAC peer-to-peer protocol to determine which fields are present.

For example, the semantics of the UE Id Type field must be known to determine how many bits should be present in the UE Id field.

The MAC PDUs for MAC testing will always contain an AM RLC PDU (data or status) using 7 bit length indicators. See the RLC test method for further information on the SS decoder requirements for RLC PDUs.

Ciphering shall be disabled for all MAC tests.

6.7.2.1 Abnormal decoding situations

If the SS decoder cannot convert the received data into the supported structure, the SS shall terminate the test case immediately and indicate that a test case error has occurred.

6.7.2.2 MAC_es/e test method (Rel-6 or later)

MAC test method for MAC_es/e is depicted in the following figure. In the UE side the RLC entity is AM mode, in the SS the mode of RLC in downlink direction is TM, the AM mode functions are implemented in TTCN. In the uplink direction, the mapping between RB identity and logical channel identity is configured in the RLC entity, the RLC entity passes any data block received on the logical channel to the RB identified by `tsc_RB_DTCH_E_DCH_MAC`(value is -20), `tsc_RB_DTCH_E_DCH_MAC1`(-21), or `tsc_RB_DTCH_E_DCH_MAC2`(-22). Whenever a RLC pdu received through one of the specified RB identifiers, the TTCN shall generate a RLC ack for it and send it on the downlink direction.

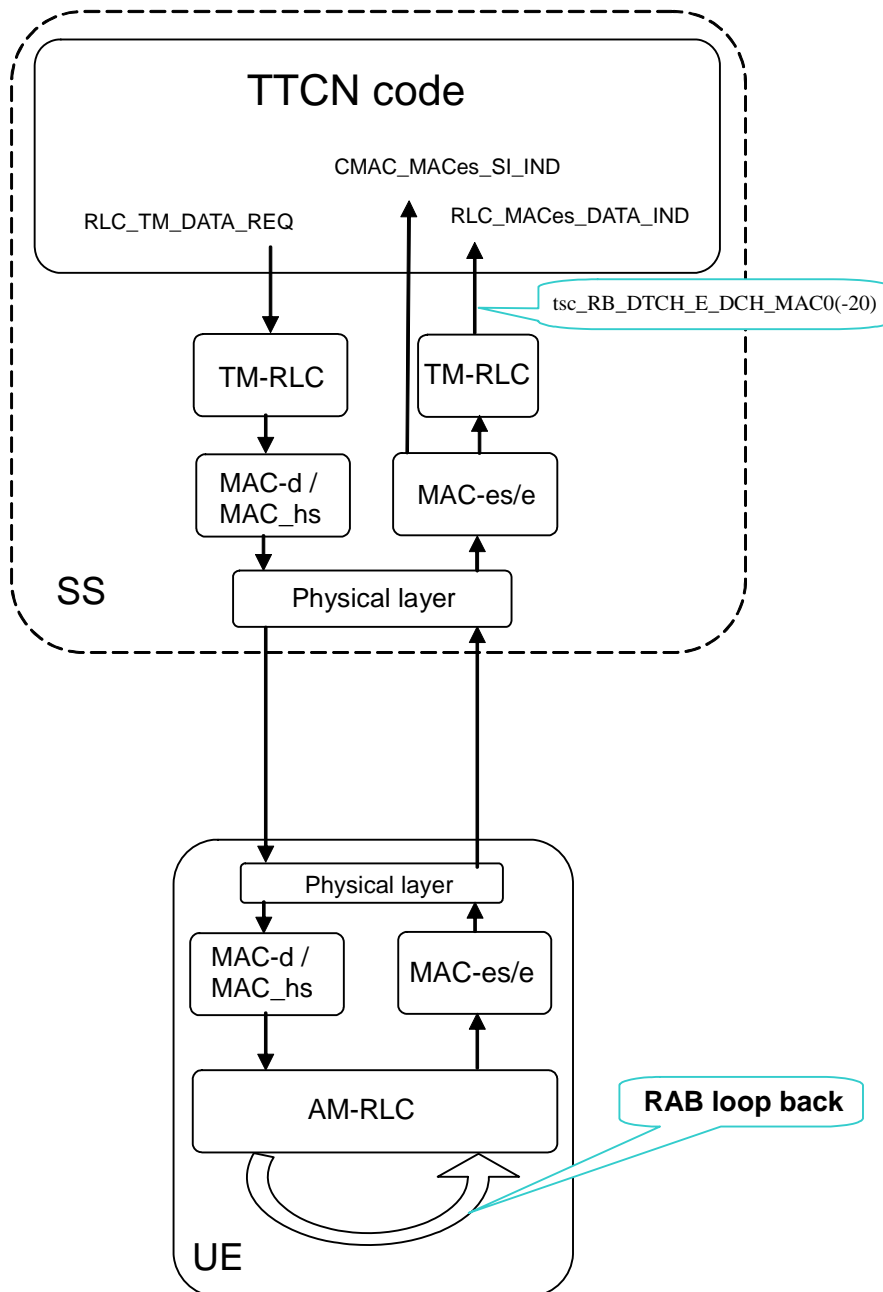

Figure 6.7.2.2: MAC_es/e testing model

6.7.2.3 MAC_is/i test method (Rel-8 or later)

MAC test method for MAC is/i is depicted in the following figure. In the UE side the RLC entity is AM or UM mode, in the SS the mode of RLC in downlink direction is TM, the AM or UM mode functions are implemented in TTCN. In the uplink direction, the mapping between RB identity and logical channel identity is configured in the RLC entity, the RLC entity passes any data block received on the logical channel to the RB identified by tsc_RB_DTCH_E_DCH_MAC(value is -20), tsc_RB_DTCH_E_DCH_MAC1(-21), or tsc_RB_DTCH_E_DCH_MAC2(-22). Whenever a RLC pdu received through one of the specified RB identifiers, the TTCN shall generate a RLC ack for it and send it on the downlink direction.

Figure 6.7.2.3: MAC_is/i testing model

6.8 BMC test method and architecture

Figure 6.8: BMC testing architecture single party method

6.8.1 BMC test architecture

The single party test method is used for BMC testing, i.e. it does not exist an Upper Tester. BMC emulation is used as shown in Figure 6.8. The BMC emulation makes use of two PCOs. The CBMC PCO is defined, to pass configuration information for a BMC entity. The BMC PCO is defined for BMC message data transfer.

Separation of TTCN test cases from the configuration of the tester and initialization of the UE is achieved by using test steps. For BMC test cases, common test steps and newly defined test steps for BMC configuration will be used to perform the configuration of the tester and on UE side. These test steps make use of PCOs, CRLC, CMAC, and CPHY.

The UE shall be able to activate and deactivate a certain CB MessageID according CB data to be sent while testing.

BMC messages are sent in BMC message blocks on the CTCH. For sending BMC messages (BMC Scheduling Message (Level 2, DRX) and BMC CBS Message) a configuration in downlink direction shall be performed to map the CTCH (RB#30) onto the FACH - S-CCPCH.

6.8.2 BMC test method

For BMC testing, only PS Cell Broadcast Service as distributed BMC service is applied. CBS Messages and BMC Schedule Messages are only sent in downlink direction. No uplink is used for BMC testing. The BMC test data with necessary CBS information shall be given by PIXIT parameter with a description of the indication on the display.

There are two level of BMC scheduling, Level 1 for CTCH configuration and Level 2 for DRX. The BMC scheduling information is conveyed to both BMC and MAC layer.

Level 1 scheduling is used to configure the CTCH on the S-CCPCH. For BMC testing (FDD), the Level 1 scheduling parameter M_{TTI} contains one radio frame in the TTI of the FACH used for CTCH. Therefore, only Level 1 scheduling information N (period of CTCH allocation on S-CCPCH) and K (CBS frame offset to synchronize to the SFN cycle (0 to 4 095 frames per cycle)) are necessary to configure the CTCH onto the S-CCPCH.

The Level 1 scheduling is done in the SS MAC layer, therefore this information is given by using the primitive "CMAC_BMCscheduling_REQ" to inform the MAC on SS side about K and N. The Level 1 scheduling information, K and N, is broadcast as system information in SIB 5 and SIB 6. After having performed the CTCH configuration as Level 1 scheduling, the SS is configured to send BMC messages and the UE has to listen to each CTCH for a BMC message.

Segmentation of BMC messages is performed by RLC in UM according to the payload size on RB#30 (152 bits).

If only one CB data as BMC CBS message is sent and repeated for a BMC test case, Level 1 scheduling is adequate, i.e. no BMC Scheduling Message (Level 2) is needed. Then, no level 2 scheduling information are included in the "CMAC_BMCscheduling_REQ" primitive. If more then one BMC CBS message are transmitted and repeated or if BMC Scheduling Messages are transmitted, BMC scheduling Level 2 message shall be performed. Level 2 scheduling is used to predict the sent event of the next BMC message blocks and the BS index contents.

BMC scheduling Level 2 predicts exactly, which information is contained on a certain CTCH block set with an aligned Block Set index number and how many CTCH blocks are given as offset, before the next BMC message block will be sent. Figure 6.8.2.1 shows an example, how the messages flow shall be done for BMC scheduling Level 2.

Figure 6.8.2.1: BMC Scheduling

The BMC test method makes use of the primitive: "BMC_Data_REQ" to transmit the BMC Messages to RLC. If BMC Scheduling Level 2 is used, it includes BMC CBS PDUs or BMC Schedule PDUs, created by the BMC TTCN and forwarded to the BMC emulation. The transmission of BMC PDU is confirmed through the primitive BMC_Data_CNF.

According to the K and N value, the MAC layer at SS side determines the CTCH blocks for the BMC use. The CTCH blocks are indexed (i = 1 ... 256).

If BMC DRX is needed, the BMC scheduling Level 2 information indicates the occupancy/spare of the available CTCH blocks by using a DRX_Selection_Bitmap and the list of CTCH BS index offsets. In the bitmap each bit, set to '1', corresponds to an actually available CTCH block belonging to the DRX period for the SS transmission. The all consecutive occupied CTCH blocks constitutes a BMC DRX period, whilst the consecutive spared blocks indicate the DRX offset as spare CTCH slot. Following the DRX_Selection_Bitmap, the segmented BMC messages are transmitted. Each BMC PDU is transmitted in a BMC_Data_REQ primitive in the order of expected transmission. The list of CTCH BS index offset indicating the offset start of the relative to the previous message transmitted is included in the CMAC_BMC_Scheduling_REQ. If any, the retransmission is handled by the BMC TTCN.

The figure 6.8.2.2 shows an example of DRX level2 scheduling when sending 4 BMC messages (either BMC schedule or CBS BMC data messages) with the CTCH BS Index Offset List={0,6,2,11} and the Bitmap='107002'0.

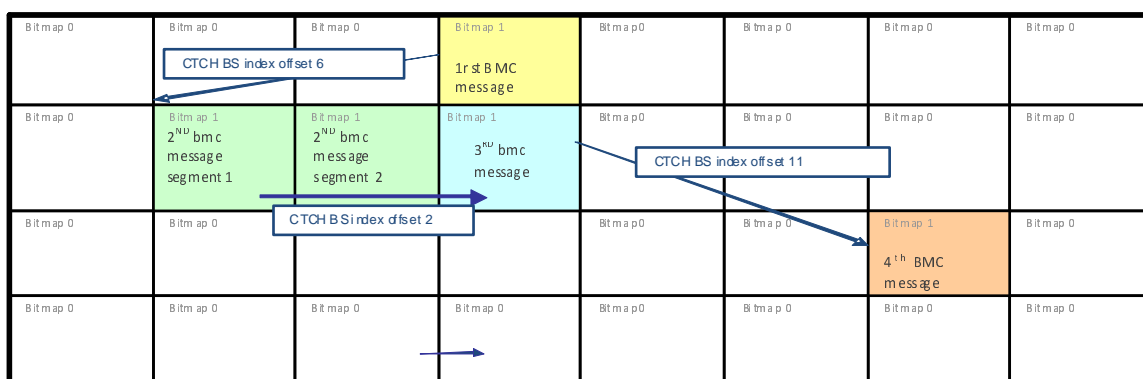

Figure 6.8.2.2: Example of BMC DRX scheduling: CTCH BS index offset list and Bitmap handling

6.9 PDCP test

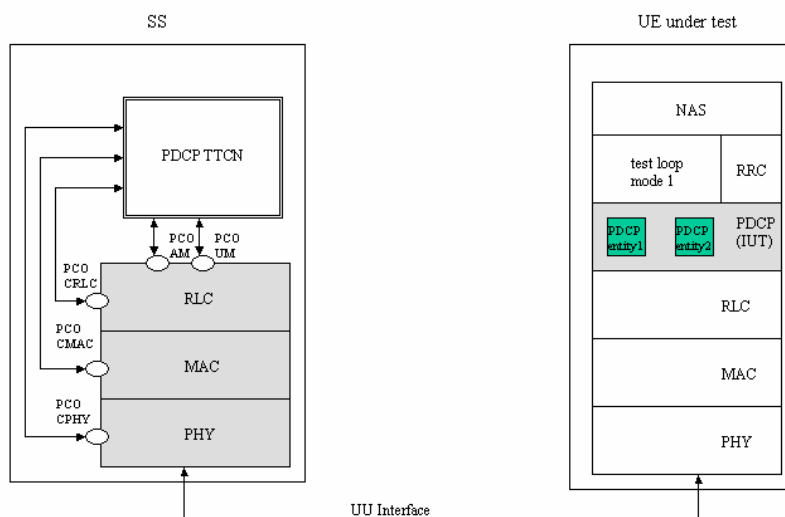

Figure 6.9: PDCP testing architecture 1: single party test method, with test loop mode 1

6.9.1 PDCP test architecture

The single party test method is used for PDCP testing. All PDCP tests that require uplink data will make use of the UE test loop mode 1 defined in 3GPP TS 34.109 [4]. Test Loop mode 1 is only available in the user plane, so all PDCP tests

will be performed in the user plane, using the same logical channels mapped to transport channels as defined in RLC test cases, except for test case, clause 7.3.2.2.4, where a configuration of combined radio bearers used only for this test case is defined.

Separation of TTCN test cases from the configuration of the tester and initialization of the UE is achieved by using test steps. For PDCP test cases, common test steps and newly defined test steps for PDCP configuration will be used to perform the configuration of the tester and the appropriate generic setup procedures as described in 3GPP TS 34.108 [3] and in clause 7.3 of 3GPP TS 34.123-1 [1]. These test steps will make use of PCOs RLC AM, RLC UM, CRLC, CMAC, and CPHY.

The PDCP TTCN test cases make also use of the NAS TTCN test steps in order to setup a PS session.

For PDCP testing, the IP Header Compression protocol as described in RFC 2507 [30] is used as optimization method. The IP header compression and decompression mechanisms as described in RFC 2507 [30] is not part of PDCP TTCN. PDCP testing make use of uncompressed, compressed and decompressed TCP/IP header packets of a certain packet stream and uncompressed, compressed and decompressed UDP/IP header packets of a certain generation. This parameters are given as test parameter (PIXIT information).

PDCP testing includes transmission/reception of compressed/decompressed IP header packets, PDCP sequence numbering while lossless SRNS relocation and PID assignment rules as well as PDCP configuration tests as described in 3GPP TS 25.323 [19]. It does not test optimization specific protocol behaviour as error recovery and packet reordering as described in RFC 2507 [30].

6.9.2 PDCP test method

For PDCP testing, the RB test mode is used with test loop mode 1. After establishing a PS session with RB in RLC UM or/and AM, the UE is configured to support a negotiated PDCP configuration. UDP/IP header packets are used as Non-TCP/IP header packets as PDCP test data.

There are different input parameter as PIXIT values necessary for PDCP testing.

For TCP/IP header packets, uncompressed TCP/IP header packets shall be defined as PIXIT input parameter. In addition, there are the corresponding RFC 2507 [30] FULL_HEADER packet, COMPRESSED_TCP packet and COMPRESSED_TCP_NONDELTA packet given for each TCP/IP header packet as PIXIT information.

For UDP/IP header packets, uncompressed UDP/IP header packets shall be defined as PIXIT input parameter. In addition, there are the corresponding RFC 2507 [30] FULL_HEADER packet and COMPRESSED_NON_TCP packet given for each UDP/IP header packet as PIXIT information.

To check the use of certain PID values assigned to IP compressed header types, a given IP header packet (PIXIT) will be sent to the UE. The UE shall return a appropriate valid IP header packet type, which corresponds to the previous sent IP header packet. The usage of valid compressed/uncompressed IP header packets shall be checked by comparing the given PIXIT IP header packet types for each IP header packet previously sent.

The IP header packet order as described in RFC 2507 [30] shall be applied within a test case.

If for example an TCP/IP header packet of type "COMPRESSED_TCP" shall be sent, the TTCN uses the given TCP/IP header packet (PIXIT) for transmission to the UE. The UE shall decompress the received packets appropriate, afterwards it will be returned by the loop back entity and it shall be sent by applying IP header compression rules as described in RFC 2507 [30] and as configured. Then, the SS receives returned IP header packets and compares it with all valid IP header packets given as PIXIT parameter corresponding to the previously sent IP header packet. It is checked, whether or not the IP header packet with assigned PID is valid and a configured PDCP PDU where used for transmission. In this way, it is checked, that the UE performs IP header compression as configured and is able to assign the correct PID values.

6.9.2.1 CS voice over HSPA

For PDCP CS voice over HSPA tests, the RB test mode used is test loop mode 1 with loopback of PDCP SDUs (as per 3GPP TS 34.109 [4], clause 5.3.2.6.1). The CS domain voice RAB is associated with one RB and one PDCP entity. The two RLC entities (DL/UL) are configured in UM with SN_delivery mode. The PDCP entity serving CS service does not use header compression, therefore no ROHC is configured.

6.9.2.2 Network initiated secondary PDP context

Figure 6.9.2.2: Network initiated secondary PDP testing architecture

For the network initiated secondary PDP context tests using data loopback, the UE test loop mode 4 is applied with loopback of IP PDUs (as per 3GPP TS 34.109 [4], clause 5.3.2.8.1). No header compression is tested, therefore no ROHC is configured.

6.10 Multi-RAT Handover Test Model

6.10.1 Overview

The test model is shown in Figure 6.10.2.9.6. The SS in the model consists of UTRAN emulation part and GERAN emulation part, GERAN emulation part includes protocol emulation modules for GSM CS services and protocol emulation modules for GPRS service. Protocol stack L1 (GERAN), L2 is for GSM CS service function emulation, protocol stack L1, RLC/MAC, LLC, SNDCP is for GPRS service function emulation. SNDCP emulation model and relevant PCO's can be removed if "traffic channel gets through" is not tested.

L1 (GERAN) provides necessary physical layer functionality for both GSM and GPRS. A control PCO and a set of ASP's are defined for configuring and controlling its protocol behaviour required in the test cases. L1 (GERAN) provides services to L2 and RLC/MAC emulation modules, the interfaces between them are not specified in this test model, it is implementation dependent and shall follow the relevant GSM and GPRS specifications.

L2 emulates necessary GSM L2 protocol functionality used in testing. A data PCO and a set of ASP's are defined for this module and used for transmitting and receiving layer 3 signalling messages and use data. The definition of the PCO and these ASP's are based on the logical channel concept of GSM specification. A control PCO and related ASP's are also defined for L2, they are used to introduce abnormal layer 2 behaviour required by the test purposes.

RLC/MAC is emulation module for GPRS Radio Link Control/Medium Access Control protocol. Two PCO's and related ASP's are defined for the module. Control PCO is used to set TBF and assign physical resources to it, actual physical resources (packet channels) are created by L1 (GERAN) ASP's beforehand. Data PCO is for transmitting and receiving RLC control messages (RLC control block). Before any RLC data or control block is sent (or received) a proper TBF shall be configured. In addition RLC/MAC module provides service to LLC emulation module, the interface between them is determined by implementation and shall be compliant with relevant core specification.

LLC performs GPRS Logical Link Control protocol emulation. Its data PCO and ASP's are used for exchange GMM signalling messages between TTCN and the UE under test. The current defined ASP's on control PCO are subset of the primitives defined in core specification, they are used to assign, un-assign TLLI and ciphering parameters, or get status report.

6.10.2 ASP function description

6.10.2.1 Identities

- Within the SS, a cell is identified by cell identifier (cellId), which is of TTCN type CellId (INTEGER).
- Within a cell, a basic physical channel is identified by physical channel identifier (physicalChId), which is of TTCN type PhysicalChId (INTEGER). In multislot configuration a basic physical channel is identified by physical channel identifier (physicalChId) and timeslot, which is of TTCN type TN (INTEGER).
- Within a physical channel, logical channel is identified by logical channel type (g_LogicChType), which is of TTCN type G_LogicChType (INTEGER). When multiple logical channels of same type are carried by (mapped to) the same basic physical channel, they are differentiated by sub-channel number (subChannel), which is of TTCN type SubChannelNumber (INTEGER).
- At the top boundary of L2 emulation module two service access points (SAP) are available, they are identified by SAPI. SAPI=3 is used for short message service; SAPI=0 is used for L3 signalling messages and user data.

EXAMPLE: If G_L2_DATA_REQ ASP has the following parameter setting:

- cellId = tsc_CellA;
- sAPI = tsc_SAPI_0;
- physicalChId = tsc_PhyCh0;
- g_LogicChType = tsc_SDCCH4; and
- subChannel = tsc_SubChannel1;

it sends PDU on the SDCCH4(1) logical channel which is carried by the physical channel tsc_PhyCh0 in cell A.

6.10.2.2 Cell configuration and control

In GSM each base station has a base station identity code BSIC, it consists of network colour code and base station colour code (NCC + BCC). BSIC is continuously broadcasted on the SCH channel, and it shall be used as the training sequence code for broadcast and common control channels.

In the test model the function of G_CL1_CreateCell_REQ ASP is to create a cell and pass parameter BSIC to it. This ASP establishes the cell identifier which shall be used in the ASP's related to this cell.

This is the first step to configure L1 (GERAN) emulation module of the SS.

6.10.2.3 L1 (GERAN) configuration and control

Configuration and control functions identified for L1 (GERAN) of a cell are:

- creation of basic physical channels;
- creation of multislot configuration;
- release of basic physical channel;
- modifications of channel mode, ciphering parameters and transmission power level;
- reporting of L1 header of SACCH channel;
- pickup a frame in near future, which can carry L3 message.

6.10.2.3.1 Basic physical channel configuration

A basic physical channel uses a combination of frequency and time domain resources, therefore, the definition of a particular basic physical channel consists of a description in the frequency domain and a description in the time domain. In time domain the resource is called Time Slot, there are 8 time slots in one frame, numbered from 0 to 7. In frequency domain a basic physical channel may use only one frequency or may use multiple frequencies in frequency hopping.

Basic physical channel carrying FCCH + SCH + BCCH + CCCH (PCH, AGCH, RACH) or FCCH + SCH + BCCH + CCCH + SDCCH4 logical channels shall be located in time slot 0, and uses single frequency (non-hopping). The basic physical channel carrying additional BCCH, CCCH (PCH, AGCH, RACH) logical channels shall be located in time slot 2, 4, 6 and uses the same single frequency as the frequency used by the physical channel carrying FCCH, SCH.

GSM specification defines 24 permitted combinations of different logical channels, which can be mapped on to a basic physical channel. The combination defines which logical channels are carried by a basic physical channel, and it is also an indication of which modulation (GMSK or 8PSK) is used for the basic physical channel.

Training Sequence Code (TSC) is another parameter needed by physical channel. Common control and broadcast channel have to use BCC as its TSC.

Dedicated control channel and dedicated traffic channel need more parameters to configure. Parameter "Channel Mode" is needed to specify channel coding (therefore the user data rate). Ciphering related parameters are required to define the ciphering behaviour of the channel.

Common control channels need parameters to configure where in the 51-multiframe paging and access grant blocks are located.

Transmission power level is provided as per physical channel parameter, power level of each physical channel can be controlled independently.

The function of ASP_G_CL1_CreateBasicPhyCh_REQ is to create a basic physical channel which has the required property defined by all the parameters mentioned above.

In the process of L1 (GERAN) configuration, calling the ASP is the next step after calling G_CL1_CreateCell_REQ.

6.10.2.3.2 Multislot configuration for circuit or packet switched channels

Multislot configuration for circuit switched connection consists of multiple circuit switched traffic channels, in L1 point of view these traffic channels are independent basic physical channels with the same frequency parameters (ARFCN or MA, MAIO, HSN) and the same training sequence code but located in different time slots, one of the basic physical channels is the main channel of the configuration carrying the main signalling (FACCH, SACCH, IACCH) for the configuration. The main channel shall be bi-directional channel and with channelCombination TCH/F+FACCH/F+SACCH/M or E-TCH/F+E-IACCH/F+E-FACCH/F+E-SACCH/M. When transmitting user data (not signalling message) stream is divided into substreams, each substream is transmitted independently on a channel in the configuration. At the receiving side all substreams are combined back to user stream.

According to the test model creation of a multislot configuration for circuit switched connection needs two ASP calls. Firstly, G_L1_CreatedBasicPhyCh_REQ is called to establish the main channel, then G_L1_CreateMultiSlotConfig_REQ is called to allocate more timeslots to the channel established by the previous ASP. A substream of a multislot configuration is identified with the physicalChId and timeslot.

Multislot configuration for packet switched connection consists of multiple PDCHs which can carry PDTCH/Us or PDTCH/Ds. All these PDCHs use the same frequency parameters (ARFCN or MA, MAIO, HSN) and the same training sequence code, but are located on different timeslots.

Similarly, a multislot configuration for packet switched connection is created with two ASP calls. First G_L1_CreatedBasicPhyCh_REQ is called to establish the first PDCH channel, then G_L1_CreateMultiSlotConfig_REQ is called to allocate more timeslots to the channel established by the previous ASP. All data ASP on packet data channel use physicalChId and timeslot to address the physical channels.

6.10.2.3.3 Frame in the near future

ASP `G_CL1_ComingFN_REQ` is defined to request L1 (GERAN) return the reduced frame number (FN modulo 42432) which is far enough in the future from current frame number and is able to carry L3 message on the specified channel. "far enough" means that there is enough time left for TTCN to prepare a L3 message to be sent on that frame. When calculating startingTime, this ASP could be useful. The starting time usually is set to a frame number in a time distance from current frame number. TTCN writer can use `G_CL1_ComingFN_REQ` to get a frame number in the future then add a certain number of frames as time distance to it and use the result as the value for startingTime.

6.10.2.3.4 L1 header

The layer 1 header of SACCH from UE to network carries information of timing advance and UE uplink transmission power level, verifying L1 header contents is required in some test cases, ASP `G_CL1_L1Header_REQ` and `G_CL1_L1Header_CNF` are defined for fulfilling this requirement.

6.10.2.4 L2 configuration and control

For normal operation there is no parameter configurable in L2. Some abnormal L2 behaviours are required in test cases. In the test model two ASP's are currently defined to introduce abnormal L2 behaviour. When creating a dedicated channel the initial SACCH header is set to the values in powerLevel and timingAdvance fields of `DedCH_Info`.

6.10.2.4.1 Don't response to some handover access bursts

In non-synchronized handover procedure UE/MS, having received handover command, sends handover access bursts on the target channel repeatedly till it receives PHYSICAL INFORMATION message from network or T3124 times out. Normally network replies PHYSICAL INFORMATION as soon as it receives handover access burst. Some test cases require that the SS ignores several incoming handover access bursts then responses to the one that follows. ASP `G_CL2_HoldPhyInfo_REQ` is defined for fulfilling this requirement. It is used together with and before a data ASP sending PHYSICAL INFORMATION message. When SS receives the `G_CL2_HoldPhyInfo_REQ`, it does not transmit the PHYSICAL INFORMATION message until n handover access bursts have been received.

6.10.2.4.2 No UA reply to SABM

GSM L2 protocol is adapted from LAPD (HDLC subset). The multiframe operation mode is established through exchange of supervisory frame SABM and unnumbered frame UA between peer entities, and SABM is always sent by UE/MS, UA is always sent by network. UE/MS will repeatedly transmit SABM till it receives UA or retransmission counter is reached. Some handover test cases require that the SS does not response to the incoming SABM, so handover fails. `G_CL2_NoUAforSABM_REQ` is used for such purpose, it commands the SS not to send UA response to the UE when SABM is received.

6.10.2.5 System Information sending

There are 17 different SYSTEM INFORMATION messages on BCCH and 4 different SYSTEM INFORMATION messages on SACCH defined for circuit switched services in GSM specification. In a particular test case not all of them are required. SYSTEM INFORMATION messages on BCCH shall be broadcasted periodically by the SS, SYSTEM INFORMATION TYPE 5, 6 and optionally 5bis and 5ter messages shall be sent on SACCH by the SS when nothing else has to be sent on that channel.

`G_L2_SYSINFO_REQ` is defined to deliver a SYSTEM INFORMATION message and its type `SysInfoType` to the SS, SS shall store the SYSTEM INFORMATION and transmit it periodically according to the scheduling rules specified in 3GPP TS 45.002 [31], clause 6.3.1.3. SYSTEM INFORMATION message newly delivered shall override the same type SYSTEM IFORMATION message previously stored in the SS.

SYSTEM INFORMATION message type 18, 19, 20 are scheduled by scheduling information in SYSTEM INFORMATION type 9. ASP for scheduling these messages has not been defined yet because these messages are not required in current test cases.

6.10.2.6 Paging

Paging message for a particular UE/MS shall be sent on the right CCCH_GROUP and PAGING_GROUP which are determined by IMSI of the UE/MS and other parameters. In the test model TTCN code is responsible to calculate the value of CCCH_GROUP and the value of PAGING_GROUP.

TTCN selects the right channel according to the value of CCCH_GROUP, then PAGING REQUEST message and the value of PAGING_GROUP are passed to the SS by using:

- ASP G_L2_Paging_REQ in case of UE/MS in idle mode or the UE/MS not supporting SPLIT_PG_CYCLE on CCCH when it is in GPRS attached mode.

The SS shall determine the position where the paging block is located using the value PAGING_GROUP and other CCCH parameters configured by G_CL1_CreateBasicPhyCH_REQ, then send the PAGING REQUEST message according the parameter pagingMode in the ASP:

- send the message on the paging block determined by PAGING_GROUP if pagingMode = "normal paging";
- send the message on the paging block determined by PAGING_GROUP and the "next but one" position on the PCH if pagingMode = "extended paging";
- send the message on all paging blocks if pagingMode ="paging reorganization".

6.10.2.7 Generic procedures for GPRS signalling

Two channel combinations are applied to configure a GERAN cell for the GPRS signalling:

- The channel combinations 5 + 13, (FCCH + SCH + BCCH + CCCH + SDCCH/4(0..3) + SACCH/C4(0..3)) + (PDTCH/F+PACCH/F+PTCCH/F), are considered as default at the interRAT tests and GERAN to UTRAN Inter-RAT test cases in clause 42.4.7 of TS 51.010-1.

The following generic procedures show the usages of GPRS ASP's for the GPRS generic attach procedures, the generic cell change order within a TBF and the GSM ciphering procedure.

6.10.2.9 L/H bits convention and bit padding in DL

6.10.2.9.1 GERAN DL RLC/MAC message bit padding

The length of a GPRS RLC/MAC control messages is an integer number of RLC/MAC control blocks. Padding bits are necessary to fill the message up to the desired length. The padding bits may be the 'null' string. Otherwise, the padding bits starts with bit '0', followed by "spare padding". The padding sequence used for "spare padding" in the present document, is a repetition of octet '00101011', starting on an octet boundary.

< padding bits > ::= { null | 0 < spare padding >

"<spare padding>" ::= <spare L> { null | < spare padding > }

In the TTCN a specific encoding variation - encoding rule 1 - is defined according to the rules described above. This shall be used in the definition of the message itself. No 'padding bits' field will be defined in the TTCN. The implementation shall ensure that after encoding the message contents defined in the TTCN, the remainder of the message shall be filled with 'padding bits'.

6.10.2.9.2 GSM DL message spare padding

A number of GPRS information elements are defined in the rest octets of certain GSM DL messages, for instance, IA Rest Octets, SI 2quater Rest Octets, SI 3 Rest Octets, SI 4 Rest Octets, SI 13 Rest Octets, etc. These rest octets were filled in a repetition of bit padding '00101011' or '2B'O, starting on an octet boundary to a certain length.

In the TTCN, a second encoding variation - encoding rule 2 - shall be used in the definition of the message itself, which shall be of a fixed length (always 23 octets). No "spare padding" field will be defined in the TTCN. The implementation shall ensure that after encoding the message contents defined in the TTCN, the remainder of the message, up to the defined fixed length, shall be filled with "spare padding".

6.10.2.9.3 L | H convention in rest octets of GSM DL messages

A number of GPRS information elements are defined in the rest octets of certain GSM DL messages. The special notations "L" and "H" are used to denote respectively the bit's logical value corresponding to the padding spare bit for that position, and the other value. The actual value of the bit transmitted by SS therefore depends upon its position within the octet - this involves counting bits.

In the TTCN a third encoding variation - encoding rule 3 - is defined for this purpose. This encoding variation is applied to those specific TTCN Rest Octets definitions which contain the L|H convention.

6.10.2.9.4 Spare Bits

Where the IE definition of RLC/MAC blocks contains bits defined to be 'spare bits', these bits shall set to the value '0' by the TTCN writers, according to the defined length indicator.

6.10.2.9.5 GSM System Information messages on SACCH

Certain GSM System Information messages, for instance, SI 5 and SI 6 are sent as a B4 frame on the SACCH. These messages are defined in 3GPP TS 44.006 [42], clause 8.8.3, to have a maximum of 19 octets.

In the TTCN a fourth encoding variation - encoding rule 4 - shall be used in the definition of the message itself. The implementation shall ensure that after encoding the message contents defined in the TTCN, the remainder of the message, up to the fixed length of 19 octets, shall be filled with "spare padding".

6.10.2.9.6 GSM Measurement Information messages on SACCH

The GSM Measurement Information message is sent as a Bter UI frame on the SACCH. This messages is defined in 3GPP TS 44.006 [42], clause 8.8.3 to have a maximum of 21 octets.

In the TTCN a fifth encoding variation - encoding rule 5 - shall be used in the definition of the message itself. The implementation shall ensure that after encoding the message contents defined in the TTCN, the remainder of the message, up to the fixed length of 21 octets, shall be filled with "spare padding".

Figure 6.10.2.9.6: The model of multi-RAT handover testing

6.11 DCH-DSCH model (R99 or Rel-4)

The model illustrates the relationship between various channels from logical channel to physical channels. DCH are associated with DSCH.

Figure 6.11: Associated DCH-DSCH model

The model associating DCH with DSCH enable in the SS:

- to define DSCH transport channel;
- to define TFCI(field2) for DSCH;
- to configure PDSCH;
- to define DSCH-RNTI value.

6.12 DCH with HS-DSCH (MAC-hs) model (FDD, Rel-5 or later)

The test model illustrates the relationship between various channels from logical channels to physical channels. All DCH are associated with a single HS-DSCH.

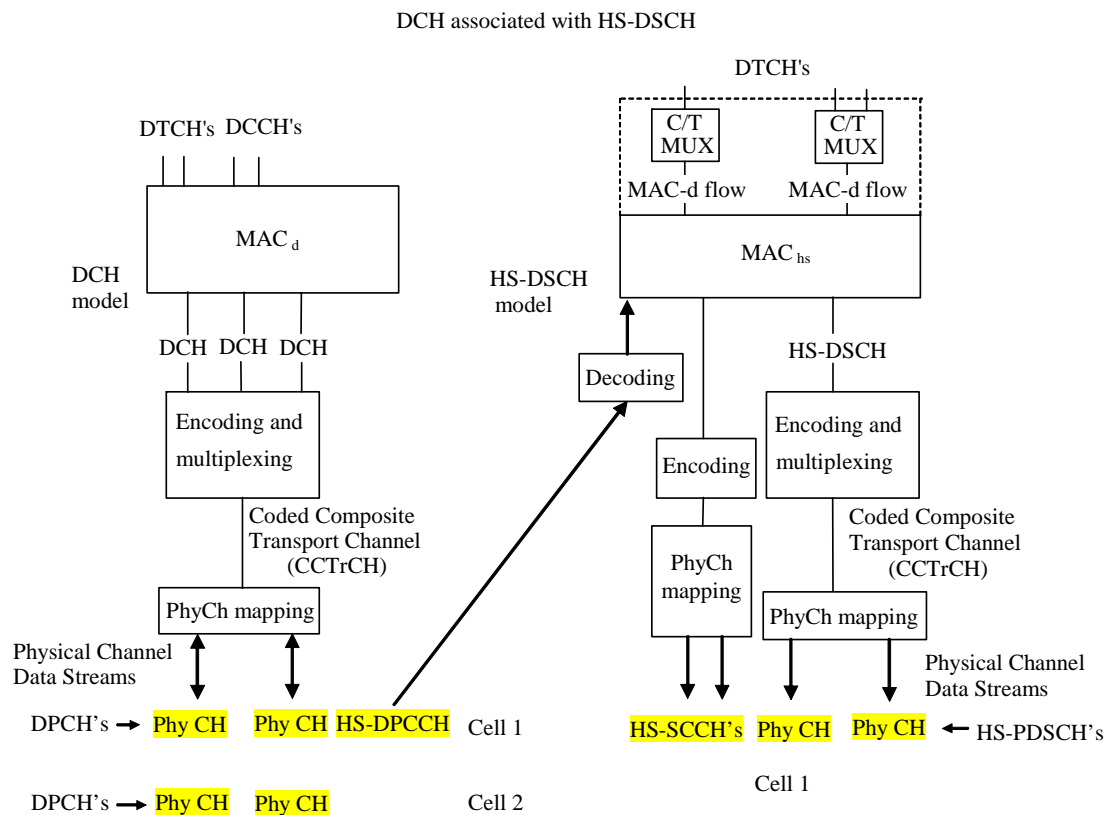

Figure 6.12: Associated DCH with HS-DSCH model

Associating DCH with HS-DSCH, the model enables in the SS:

- to define MAC-hs and multiplexing of logical channels DTCHs onto MAC-d flows;
- to configure HS-DSCH transport channel and MAC-d flows;
- to configure HS-PDSCHs and HS-SCCHs;
- to define the H-RNTI value.

6.12a DCH with HS-DSCH model for 1.28 Mcps TDD (Rel-5 or later)

Figure 6.12a: Associated DCH with HS-DSCH model for 1.28 Mcps TDD

Associating DCH with HS-DSCH, the model enables in the SS:

- to define MAC-hs and multiplexing of logical channels DTCHs onto MAC-d flows;
- to configure HS-DSCH transport channel and MAC-d flows;
- to configure HS-PDSCHs and HS-SCCHs;
- to define the H-RNTI value.

6.12b DCH with HS-DSCH (MAC-ehs) model (FDD, Rel-7 or later)

The test model illustrates the relationship between various channels from logical channels to physical channels. All DCH are associated with a single HS-DSCH.

Figure 6.12b: Associated DCH with HS-DSCH model

Associating DCH with HS-DSCH, the model enables in the SS:

- to define MAC-ehs and multiplexing of logical channels DTCHs & DCCHs onto MAC-d flows;
- to configure HS-DSCH transport channel and MAC-d flows;
- to configure HS-PDSCHs and HS-SCCHs;
- to define the H-RNTI value.
- to configure MIMO;

6.12c HS-DSCH (MAC-hs/ehs) model (FDD, Rel-7 or later)(No DCH Associated)

The test model illustrates the relationship between various channels from logical channels to physical channels.

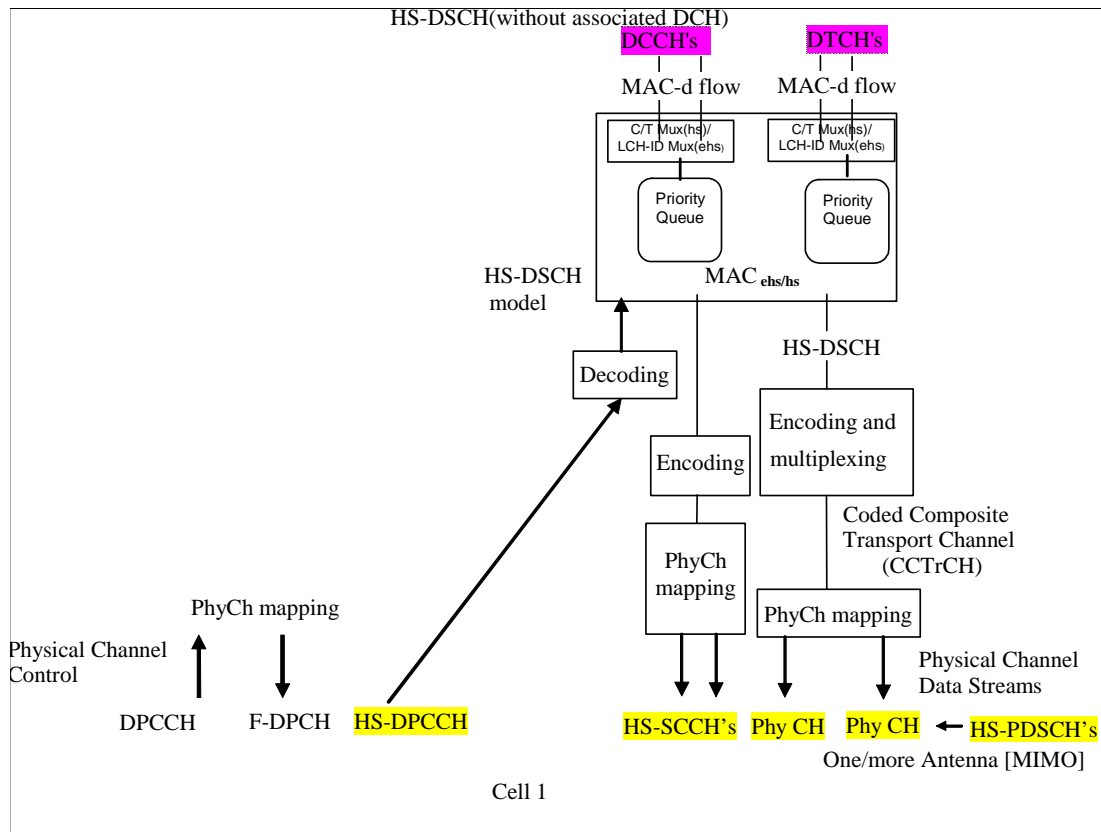

Figure 6.12c: HS-DSCH model without DCH associated

The model enables in the SS:

- to define MAC-ehs/hs and multiplexing of logical channels DTCHs & DCCHs onto MAC-d flows;
- to configure HS-DSCH transport channel and MAC-d flows/MAC-ehs Queues;
- to configure HS-PDSCHs and HS-SCCHs;
- to define the H-RNTI value(s);
- to configure MIMO.
- during the active set updating (soft handover), the test case configurations involves more than one cell; but one MAC-ehs entity is configured.

6.12d HS-DSCH (MAC-ehs) model for DC/4C -HSDPA (FDD, Rel-8 or later)

The test model illustrates the relationship between various channels from logical channels to physical channels.

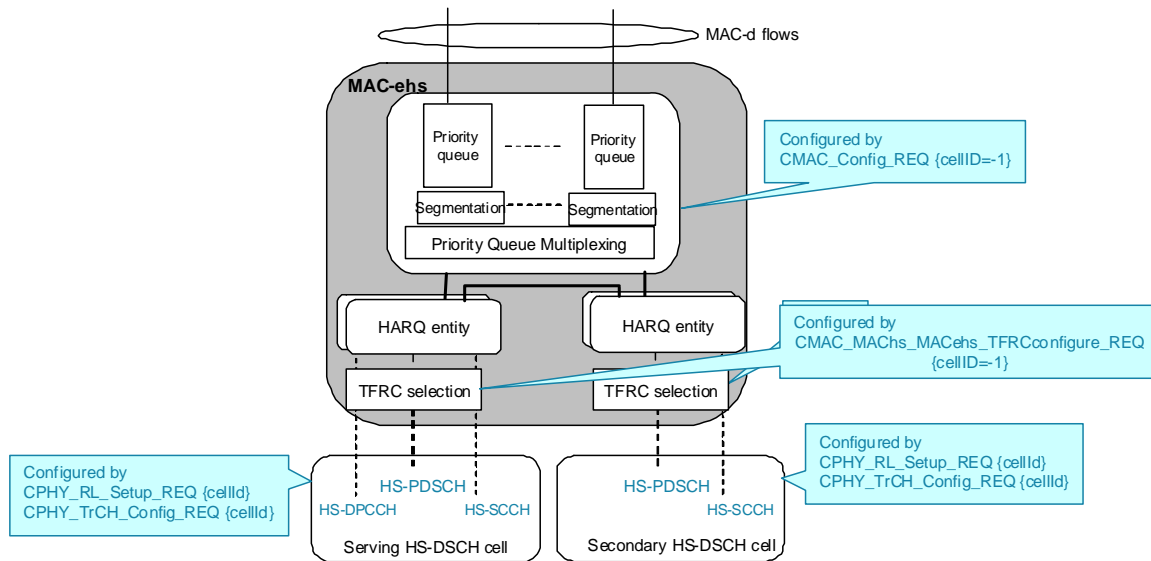

Figure 6.12d-1: HS-DSCH model with intra-NodeB DC-HSDPA

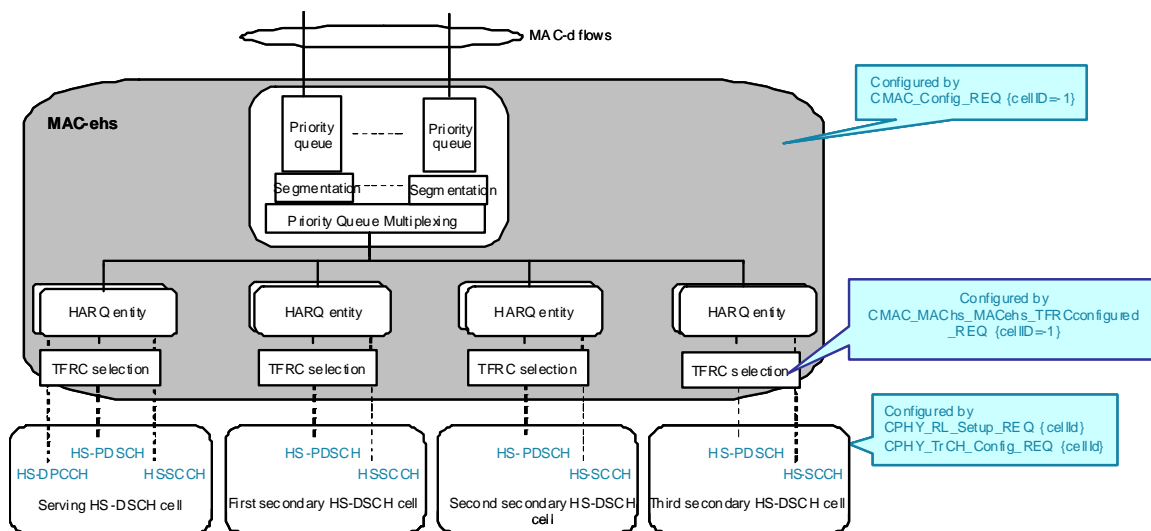

Figure 6.12d-2: HS-DSCH model for 4C-HSDPA with 3 secondary cells configured

The model enables in the SS to configure DC-HSDPA or 3C/4C-HSDPA:

- MAC-ehs and the served RLC are cell-independent and are configured by using the cell-id =-1. During reconfigurations, cell changes and state transitions, the relevant counters in the RLC are maintained
- to define MAC-ehs and multiplexing of logical channels DTCHs & DCCHs onto MAC-ehs queues;
- to configure HS-DSCH transport channel and MAC-ehs Queues;
- to configure HS-PDSCHs and HS-SCCHs on the serving cell and a secondary HS-DSCH cell for DC-HSDPA;
- to configure HS-DPCCH in the serving cell;

- to define the H-RNTI value(s);
- MIMO and DC-HSDPA do not co-exist in Rel-8;
- to configure combined DC-HSDPA and MIMO in Rel-9 or later Releases.
- to configure HS-PDSCHs and HS-SCCHs on the serving cell and two or three secondary HS-DSCH cells for 4C-HSDPA in Rel-10 or later Releases. MIMO can be configured in the serving and/or secondary cells. When DC-HSUPA is configured in uplink, the first secondary serving HS-DSCH cell is the cell associated with the secondary uplink frequency.

The secondary cells are configured with P-CPICH common channel only according to TS 25.214 [12] section 4.2.4.

6.12e HS-DSCH (MAC-ehs) model for Multiflow Operation (FDD, Rel-11 or later)

The test model illustrates the relationship between various channels from logical channels to physical channels.

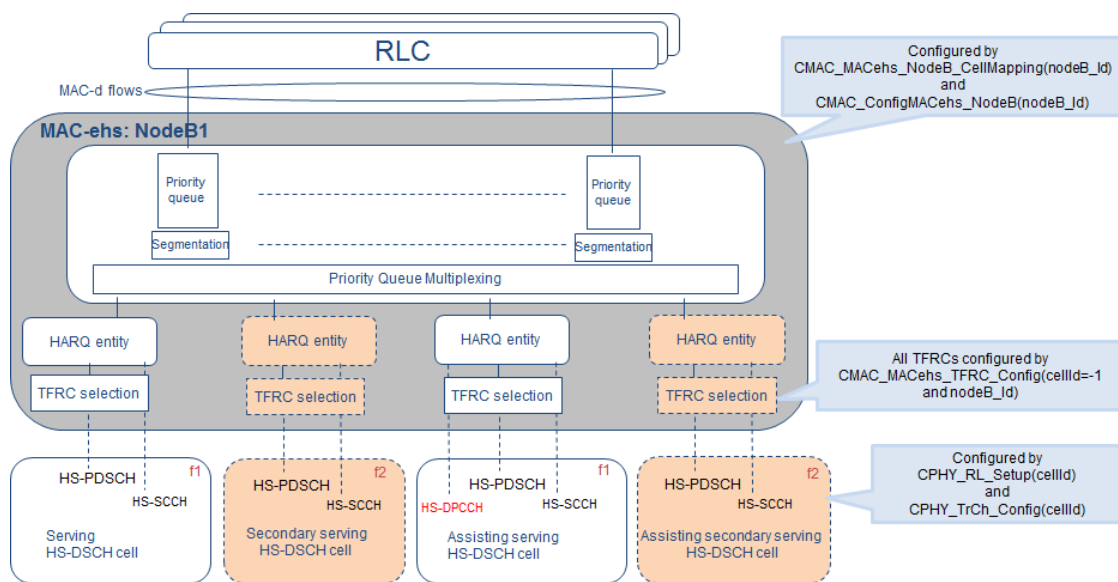

Figure 6.12e-1: Multiflow intra-NodeB HS-DSCH model

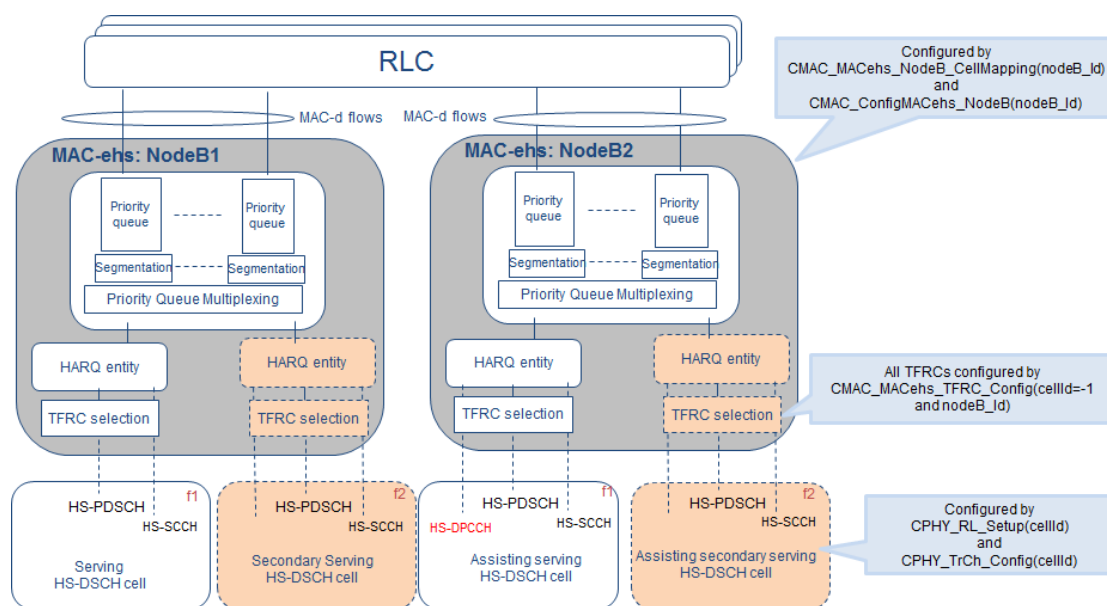

Figure 6.12e-2: Multiflow inter-NodeB HS-DSCH model

The model enables in the SS to configure Multiflow:

- to configure HS-PDSCHs and HS-SCCHs on the serving cell, assisting serving HS-DSCH cell, secondary serving HS-DSCH cell and assisting secondary serving HS-DSCH cell;
- to configure HS-DPCCH in the time reference cell only; either in the serving HS-DSCH cell or in the assisting serving HS-DSCH cell. For example in figures 6.12e-1 and 6.12e-2 the assisting serving HS-DSCH cell is the time reference cell;
- to configure one MAC-ehs entity for intra-NodeB configuration or two MAC-ehs entities for inter-NodeB configuration. The MAC-ehs entities are referred to a nodeB_Id;
- for each MAC-ehs entity, to configure HS-DSCH transport channel and MAC-ehs queues;
- to define the H-RNTI value(s);
- to define multiplexing of logical channels DTCHs & DCCHs onto MAC-ehs queues;
- to map cells on a MAC-ehs entity indicated by nodeB_Id. When a cell is mapped to the MAC-ehs entity then data can be transmitted on the HS-PDSCH of that cell. When a cell is unmapped then it is deactivated and no data can be sent on HS-PDSCH.
- the served RLC is nodeB and cell independent and is configured using cell-id=-1. During reconfigurations, cell changes and state transitions, the relevant counters in the RLC are maintained. In inter-NodeB configuration the RLC entity is connected to two MAC-ehs entities.

The assisting serving, secondary serving and assisting secondary serving HS-DSCH cells are configured with all common channels. The assisting serving cell is part of the UE active set. The serving and secondary serving HS-DSCH cells have the same downlink timing, and the same applies to the assisting serving and assisting secondary serving HS-DSCH cells. MIMO is not considered.

For RLC test cases, the test method specified in clause 6.5 is applied, the RAB is configured in TM mode on SS side. The following RB Ids are used within the system simulator, depending on the RLC mode, and length indicator size being simulated.

| UE RLC mode | LI Size | RB Id |
|-------------|---------|-----------------------|
| AM | 7 | tsc_RB_AM_7_RLC (-12) |

6.13 E-DCH model (Rel-6 or later)

6.13.1 MAC-e/MAC-es test model

The E-DCH model illustrates the relationship between various channels from logical channel to physical channels. In this model the TTCN writer can:

- define MAC-e/es and multiplexing of logical channels onto MAC-d flows;
- configure E-DCH transport channel and MAC-d flows;
- configure E-DPDCH, E-DPCCH, E-HICH, E-RGCH and E-AGCH.

MAC-es and the served RLC are cell-independent and are configured by using the cell-id = -1. During reconfigurations, cell changes and state transitions, the relevant counters in the RLC are maintained.

For the reason of simplicity, the E-DCH testing model does not shown the relation between E-DCH and related DCH and HS-DPCH, however the TTCN writer shall understand that the E-DCH active set is a subset of the DCH active set, when configuring E-DCH in the SS the TTCN writer shall keep this requirement respected.

During the active set updating (soft handover), the test case configurations may involve more than one cell. Those cells are under the control of the same Node B (intra-node) or under several Node B's (inter-node). For the signalling testing no macro diversity is required in the SS. In such test configurations only one E-DPDCH is necessary to be configured (together with corresponding E-DCH) for each Node B. Preferably, the E-DPDCH in the serving E-DCH cell controlled by the serving Node B is chosen for the configuration. In the inter-node soft handover cases, the E-DPDCH in a Non-serving RL cell of another Node B may require to be configured, instead of the one in the serving E-DCH cell. When the configuration involves several Node B's only one MAC-e (Node B) is necessary to be connected to the MAC-es. All possible connections are represented by dashed line and the preferable connection is the connection between MAC-es and the Node B controlling the serving E-DCH cell.

Since the UL-DPCCH is needed as reference channel for the E-DPCCH the UL-DPCH is configured in every cell where an E-DCH is configured (i.e. in serving and non-serving cell). In order to simplify the implementation and to avoid macro diversity in all non-serving cells the UL-DPCH is configured without the associated transport channel configuration, i.e. the physical channel is not connected to MAC-d.

Figure 6.13.1: The model of E-DCH testing with MAC-e/MAC-es

6.13.2 MAC-i/MAC-is test model (Rel-8 or later)

For channel configuration and activate set update, the same requirement apply as for MAC-e/Mac-es in clause 6.13.1.

The MAC-i/is E-DCH test model is provided in Figure 6.13.2.

Figure 6.13.2: The model of E-DCH testing with MAC-i/MAC-is

6.13.2.1 MAC-i/MAC-is test model for Enhanced UL in Cell_FACH (Rel-8 or later)

The MAC-i/is E-DCH test model for enhanced UL in cell_FACH and further enhanced cell_FACH (Rel-11 or later) is provided in Figure 6.13.2.1.

Figure 6.13.2.1: The model of E-DCH testing with MAC-i/MAC-is for enhanced uplink in CELL_FACH state

If the UE is in CELL_FACH state or Idle mode, the E-DCH active set consists of the serving E-DCH cell. When CCH is configured, MAC-is entity is configured per E-DCH cell basis, i.e. configured in the serving E-DCH cell, as well as in the neighbour E-DCH cells.

6.13.2.2 MAC-i/MAC-is test model for DC-HSUPA (Rel-9 or later)

The E-DCH model illustrates the relationship between various channels from logical channel to physical channels in DC-HSUPA configuration. In this model the TTCN can:

- define MAC-i/-is and multiplexing of logical channels onto MAC-d flows;
- configure E-DCH transport channel and MAC-d flows on all cells;
- configure E-DPDCH, E-DPCCH, E-HICH, E-RGCH and E-AGCH on primary and secondary uplink frequency.

MAC-is and the served RLC are cell-independent and are configured by using the cell-id = -1. During reconfigurations, cell changes and state transitions, the relevant counters in the RLC are maintained.

In DC-HSUPA, a single MAC-i entity is shared by the primary and the secondary serving radio link. The MAC-i entity is mapped to a NodeB id and is connected to the MAC-is entity.

During the active set updating (soft handover) involving cells under the control of several Node Bs (inter-node), two MAC-i entities are configured. Only one of the two MAC-i entities is connected to the MAC-is entity. The same design in clause 6.13.1 is applied.

For the reason of simplicity, the E-DCH testing model does not show the relation between E-DCH and related DCH and HS-DPCH, however, it is understood that the E-DCH active set is a subset of the DCH active set, when configuring E-DCH in the SS. The HS-DPCCH channel is configured only in the primary uplink frequency cell. Since the UL-DPCCH is needed as reference channel for the E-DPCCH the UL-DPCH is configured in every cell where ver an E-DCH is configured (i.e. in serving and secondary serving cell).

During the active set updating (soft handover), the added RL are configured in the same way as for MAC-e/es.

Figure 6.13.2.2: The model of E-DCH testing with MAC-i/MAC-is for DC-HSUPA

6.14 MBMS model (Rel-6 or later)

The MBMS test model illustrates the relationship between various channels, from logical channel to physical channels applied to the MBMS test. The MBMS-dedicated stand-alone SCCPCH, MICH, MAC-m, MCCH, MSCH and MTCH are configured by the TTCN.

During softcombining, MTCHs which have the same logical channel identity but in different cells are connected to the same UM RLC.

Figure 6.14: The model of MBMS testing

6.14.1 MBMS RLC test model

6.14.1.1 RLC test model for MTCH test

For RLC tests on MTCH a TR radio bearer is configured (tsc_RB_MTCH_RLC_TR). Similar to the UM mode, data scheduling is applied at the test.

When reconfiguring back from TR to UM mode, MAC is reconfigured and RLC is released/reconfigured again. It implies that UM will restart with sequence number 0; the corresponding RLC state variables are set to 0. Sequence numbers between the one used in the last PDU sent in TR mode and the sequence number 0 are considered by the UE as lost sequence numbers and shall have no impact on the test in the UM mode.

6.14.1.2 RLC test model for MCCH test

For RLC tests the MCCH critical messages can be sent as a DL sequence of PER encoded UM RLC PDUs in RLC TR mode. To achieve this, the normal UM radio bearer on MCCH is replaced with a TR radio bearer configured with a negative RB Id (tsc_RB_MCCH_RLC_TR). This is achieved by reconfiguring MAC and releasing the existing RLC UM entity /configuring a new TR RLC entity. It results in only one RLC entity being able to map on MCCH at the test.

It is assumed that the necessary MCCH data are completely sent out before the reconfiguration procedure mentioned above takes place.

When changing from UM to TR the care should be taken on the sequence numbers used in the RLC PDUs. That can be achieved by querying the SN from SS with CRLC_SequenceNumber_REQ. When changing back to UM the RLC may continue with the sequence number following the last sequence number used before changing to TR mode. That implies, the UM part of the RLC in SS does not need to take care of the UM PDUs sent in TR mode. The UE will regard it as PDU lost.

To support re-synchronization the 'specialLI' of the RLC_UM_CriticalMCCHMsg_REQ following TR mode can be set to TRUE.

6.15 IP signalling

In the TTCN-2 implementation, no IP signalling is handled because of the limitation of the test language. For IPv4 or IPv4IPv6 UE, only an IPv4 address is assigned in the NAS signalling in the ACTIVATE PDP CONTEXT ACCEPT message. For IPv6 only UE, a full IPv6 address is assigned in the NAS signalling in the ACTIVATE PDP CONTEXT ACCEPT message.

In the TTCN-3 implementation, IP signalling is referred to 3GPP TS 36.523-3 [62] clause 4.4.1.1. For IPv4 or IPv6 UE, an IPv4 or a full IPv6 address is respectively assigned in the ACTIVATE PDP CONTEXT ACCEPT message. For IPv4IPv6 UE the both IP addresses are assigned.

6.16 Supplementary Service test method and architecture

6.16.1 Test configuration

The SS test method is shown in Figure 6A.2.

The upper tester triggers the UE to perform the supplementary service task required by the test case.

The supplementary services are encoded in a TCAP [52] ROSE component [53] of the facility information element [51] conveyed in the NAS messages. The facility information element is encoded in BER in TTCN referred to 3GPP TS 24.080 [50], clause 3.6.1 and 3GPP TS 29.002 [51], clause 17.1.1.

6A TTCN-3 Test method and testing architecture

The following signalling conformance tests are specified in TTCN-3:

- Rel-10 or later;
- UE capability audit;
- Network Initiated Secondary PDP context;
- Supplementary Service.

The system architecture and the test model are based on 3GPP TS 36.523-3 [62].

NOTE: The TTCN-3 specification of A-GNSS test cases is defined in 37.571-4 [64].

6A.1 Test system architecture

6A.1.1 General system architecture

Refer to 3GPP TS 36.523-3 [62], clause 4.1.1.

6A.1.2 Component architecture

The component architecture as defined in 3GPP TS 36.523-3 [62], clause 4.1.2 is applied. The TTCN-3 master test component (MTC) and the UTRAN TTCN-3 parallel component (PTC) are configured.

6A.2 Test model

The test model defined in clause 6 of the present test specification is applied; the figure below shows how it is mapped on the TTCN-3 component architecture.

Figure 6A.2: UTRAN TTCN-3 Test Model

UTRAN PDCP, if necessary, is configured according to 3GPP TS 36.523-3 [62] clause 4.4.1.1.

7.1.2 Primitives used at Dc PCO

The Dc PCO is used to transmit and receive NAS (MM, CC, SM, SS) messages. Two categories of primitives are operated at the Dc PCO:

- RRC_DataReq for transmission of a NAS PDU;
- RRC_DataInd for reception of a NAS PDU.

These primitives are declared in TTCN tabular form, see Tables 7.1.2.1-1 and 7.1.2.1-2.

| cN_Domain | SS_CN_DomainIdentity | CN domain identity |
| start | START_Value | Mandatory in INITIAL DIRECT TRANSFER |
| msg | PDU | NAS PDU |
| Detailed Comments | | |

Table 7.1.2.1-2: Primitive RRC_DataReq used at the Dc PCO

| ASP Name | RRC_DataReq | |
|--------------------------|---|--|
| PCO Type | Dc_SAP | |
| Comments | The ASP is used to request the transmission of the NAS PDU message using acknowledged operation (NAS -> RRC). | |
| Parameter Name | Parameter Type | Comments |
| cellId | INTEGER | Cell Id |
| rB_Id | SS_RB_Identity | RB identity (RB3 or RB4) |
| ch | LogicChGERAN | Logical channel (used for interworking with GERAN) |
| sapId | SapId | RRC SAP identifier (SAP0) |
| cN_Domain | SS_CN_DomainIdentity | CN domain identity |
| msg | PDU | NAS PDU |
| Detailed Comments | | |

The RB Identity and CN domain parameters defined in the primitives are mandatory for UTRAN and not applicable for GERAN.

The START parameter is mandatory in INITIAL DIRECT TRANSFER; each time when it is received the new START shall be downloaded to the SS to reinitialize counters-C and counters-I.

The LogicChGSM and SapId parameters are mandatory for GERAN and not applicable for UTRAN. They are defined because they may be used for future TTCN test cases.

Except the initial, uplink and downlink direct transfer procedures, the NAS TTCN specification uses the TTCN test steps to realize all RRC functions for testing. The single layer test concept is kept for the NAS tests.

A simple RRC emulation shall be maintained for the NAS tests. It has four functions:

- Emulate the three direct transfer procedures.
- Convert the NAS downlink messages defined in 3GPP TS 24.008 [9] in table format to the NAS message in ASN.1 octet string specified in 3GPP TS 25.331 [21]. Convert the NAS uplink message in the reverse way.
- PER encoding and decoding.
- Have the integrity protection.

RB3 and RB4 are specifically used for the NAS signalling. When an uplink message entered the receiving buffer at AM-SAP from the RLC emulation, either an RRC test step if running will take it out; or the RRC emulation if running will pick the received message from the buffer. Activation of any RRC test steps and activation of any NAS test steps at the same time shall be excluded in TTCN (no concurrency between them).

7.2 Ut PCO and ASP definitions

7.2.1 Ut PCO Declarations

The Ut PCO is served as the interface to the UE EMMI for remote control of operations, which have to be performed during execution of a test case such as to switch the UE on/off, initiate a call, etc.

| PCO Declarations | |
|------------------|---|
| PCO Name | Ut |
| PCO Type | MMI |
| Role | UT |
| Comments | Carry transmission commands and reception of results for the upper tester |

7.2.2 Primitives used at Ut PCO

The Ut PCO is used to indicate to the upper tester actions and to receive the acknowledgement of these actions. The AT commands are used wherever the suitable commands exist within 3GPP TS 27.007 [23], 3GPP TS 27.005 [22] and 3GPP TS 27.060 [24]. An MMI command is used, when AT commands does not exit for the action to performed. The primitives used at the Ut PCO, are declared in TTCN tabular form, see Table 7.2.2.1.

Table 7.2.2.1: Primitives used at the Ut PCO

| Primitive | Parameters | Use |
|------------|--|---|
| AT_CmdReq | Command: IA5String SMS_BlockMode: HEXSTRING | Request an AT command to the upper tester. |
| AT_CmdInd | Command: IA5String SMS_BlockMode: HEXSTRING | Indication of a result from the upper tester. |
| AT_CmdCnf | Result: BOOLEAN ResultString: IA5String SMS_BlockMode: HEXSTRING | Return a positive or negative result from the command previously sent. Both the Boolean result and String parameter are optional. |
| MMI_CmdReq | Command: IA5String | Request a command to the upper tester. |
| MMI_CmdCnf | Result: BOOLEAN ResultString: IA5String | Return a positive or negative result from the command previously sent. The String parameter is optional. |

The AT_CmdReq primitive for sending AT commands is mostly used to trigger electronically an uplink access, such as initiating of a call, attaching or detaching, starting packet data transfer etc. The MMI_primitive is defined mainly for observation of some test events via a test operator, such as checking DTMF tone or checking called party number, etc.

The AT_CmdInd primitive for receiving AT commands is mostly used to transfer unsolicited result codes from the UE to the lower tester.

The SMS_BlockMode parameter is used to control and observe the Block mode procedure for SMS. This parameter is not yet used; it is defined for future development. The Command and SMS_BlockMode parameters are mutually exclusive

For the Command in the AT_CmdReq and AT_CmdInd primitives, the verbose format is used as defined in 3GPP TS 27.007 [23]. For the Command in MMI_CmdReq, just a descriptive IA5 string line, like "Check DTMF tone" is used.

Presence of hs_DPCCHInd means that the HS-DPCCH shall be configured in the uplink DPCH. If hs_DPCCHInd is absent no HS-DPCCH shall be configured in the uplink DPCH, or the configured HS-DPCCH shall be removed in the modify ASP. In the active set which has radio links from more than one cell the HS-DPCCH is configured only in the HS-DSCH serving cell. If mode = erroneous, the SS always generates any wrong CRC value which is different from the correct one on the specified MACdFlow/mac-ehs Queue. If mode = error1AndNormal, the SS generates wrong CRC for first transmission and correct CRC on first retransmission. Later SS operates in normal mode. If mode = error2AndNormal, the SS generates wrong CRC for first transmission, first retransmission and correct CRC second retransmission. The corrupted bits in first error transmission and second error transmission are different, so that when UE combines the data from three transmission, shall result in correct data. Later SS operates in normal mode. As default, the normal mode is applied. When the HS-DSCH first configured or reconfigured the SS enters the normal CRC calculation mode. |

| Comment | <p>Applied to the RLC entity carrying MTCH. MBMS serviceSchedulingInfo can contain a list of MBMS ServiceSchedulingInfo for multiple consecutive scheduling periods of discontinuous MBMS services. mSCH_REPconfiguration provides the timing of scheduling periods. serviceShedulingInfos provides a list of SS_ServiceSchedulingInfo corresponding to multiple scheduling periods. On or after the start and within the duration of a MBMS session, the RLC behaves as normal entity. Outside of these ranges the RLC regards the buffer occupancy as being zero, prohibiting the MAC from requesting PDU's. The same is valid for the service silence period (noServcieData). Each call of the ASP replaces the existing whole scheduling information list or creates a new scheduling information list if the list does not exist. The absence of IE mSCH_REPconfiguration and schedulingInfoInfos indicates continuous MBMS services. The SS shall delete the existing scheduling information list if it has existed. | Type Name | SS_RLC_Info |
| Comment | Applicable to Rel-4, Rel-5, Rel-6, Rel-7 for LCR TDD. UL and DL have been swapped intentionally in this type definition. This is to maximize re-use of the type definitions in 3GPP TS 25.331 [21] which are intended to configure a UE, where UL is transmission, and DL is reception. For the SS, UL is reception, and DL is transmission. For example, consider configuring a DL AM RLC entity (transmitter) in the SS. The transmission parameters to be configured include PollingInformation, Transmission-RLC-Discard etc. If the DL-AM-RLC-Mode type definition is used to configure this entity, it is only possible to configure reception parameters such as StatusInformation, and receiving window size. By swapping UL and DL, it is possible to configure the DL AM RLC entity using the existing type definition UL-AM-RLC-Info, which contains all of the required transmission parameters. When uM_SN_DeliveryMode is set to configured, the RLC entity does not concatenate nor segment RLC SDUs (see 3GPP TS 25.322 [18], subclause 8.2). If the IE useSpecialValueOfHEField is set to true, the last octet of the PDU is the last octet of an SDU and there is no SDU concatenation inside the PDU. sS_ul_PayloadSize is applied to RB0 RLC UL configuration; if it is omitted in the configuration the dl_PayloadSize is applied to UL RLC entity. |

| ASP Name | G_CL1_CreateBasicPhyCh_REQ | |
|--------------------------|---|--|
| PCO Type | G_CSAP | |
| Comments | The ASP is used to create a basic physical channel in GERAN | |
| Parameter Name | Parameter Type | Comments |
| cellId | CellId | The cell which the channel to be created belongs to |
| physicalChId | PhysicalChId | Identifier of the physical channel in the SS. |
| channelCombination | ChannelCombination | Logical channels combined onto the basic physical channel. |
| frqInfo | FrqInfo | Parameters for Description of the physical channel in frequency domain |
| timeSlot | TN | The timeslot number of the physical channel |
| tsc | TSC | Training sequence code. For common control and broadcast channels the value of tsc must be equal to BCC (base station colour code) |
| channelSpecificInfo | ChannelSpecificInfo | Specific parameters related to individual channel |
| txPower | TX_Power | The transmission power level in dB μ Vemf() |
| bandIndicator | BITSTRING[1] | Parameter for DCS or PCS frequency band selection. A value 0 for frqInfo.arfcn interpreted as DCS1800. A value 1 for frqInfo.arfcn interpreted as PCS1900. If omitted, the value in frqInfo.arfcn interpreted as DCS1800. |

| cipherMode | CipherModeSetting | | Definition see 3GPP TS 04.18 or 3GPP TS 44.018 [43], clause 10.5.2.9 |
| cipherKey | BITSTRING[64] | | (see note 1) |
| cipherKey128 | BITSTRING[128] | | (see note 1) |
| powerLevel | BITSTRING[5] | | Initial MS uplink transmission power level. This value is used in the L1 header of SACCH. |
| timingAdvance | BITSTRING[8] | | Initial timing advance. This value is used in the L1 header of SACCH. This field shall be set to the same value as in timingAdvance of G_CL1_CreateCell_REQ. |
| Detailed Comments | In addition to ciphering algorithm the cipherMode specifies the initial ciphering mode of the physical channel in both transmission and receiving direction by startingCiph bit. During ciphering mode setting procedure the ciphering mode of receiving direction can be changed by G_CL1_CipheringControl_REQ. NOTE 1: The value of cipherMode dictates which of cipherKey or cipherKey128 shall be used by the SS. | | |

| tN7 | BOOLEAN | | TRUE - time slot 7 is allocated; FALSE -- not allocated |
| channelCombination 7 | ChannelCombination | | Channel Combination for time slot 7; not applicable if tN7 = FALSE |
| Detailed Comments | Multislot configuration is referred to 3GPP TS 05.02 or 3GPP TS 45.002 [31], clause 6.4.2. The timeslot for which G_CL1_CreateBasicPhyCh_REQ has set the channel combination shall be set to FALSE. | | |

| | | |
|--------------------------|--|---|
| ASP Name | G_CL1_CipheringControl_REQ | |
| PCO Type | G_CSAP | |
| Comments | The ASP is used to set the ciphering mode of the physical channel in receiving direction, the kc and ciphering algorithm was set by the G_CL1_CreateBasicPhyCh_REQ for the physical channel before calling the ASP. | |
| Parameter Name | Parameter Type | Comments |
| cellId | CellId | |
| physicalChId | PhysicalChId | Channel identifier |
| rcvCipherMode | BITSTRING[1] | Ciphering Mode in SS receiving direction: 0→ not ciphered 1→ ciphered |
| Detailed Comments | For GSM dedicated physical channel, the ciphering mode of the SS shall be changed in three steps: (3GPP TS 44.018 [43], clause 3.4.7) Before the SS sending CIPHERING MODE COMMAND the SS is transmitting and receiving in old ciphering mode (for example, not ciphered), after the SS sending CIPHERING MODE COMMAND the SS changes its receiving ciphering mode to new ciphering mode (for example, ciphered) and keeps transmitting in old ciphering mode; then after receiving CIPHERING MODE COMPLETE or any correct L2 frame in new ciphering mode the SS changes the transmitting ciphering mode to the new mode. TTCN writer shall use this ASP before sending the CIPHERING MODE COMMAND to ensure the ciphering mode of the physical channel, in sufficient time, according to the 3 step procedure outlined above. | |

| | | |
|--------------------------|---|--------------------|
| ASP Name | G_CL1_CipheringControl_CNF | |
| PCO Type | G_CSAP | |
| Comments | The ASP is used to confirm that the G_CL1_CipheringControl_REQ is executed correctly. | |
| Parameter Name | Parameter Type | Comments |
| cellId | CellId | |
| physicalChId | PhysicalChId | Channel identifier |
| Detailed Comments | | |

| | | |
|--------------------------|--|---|
| ASP Name | G_CL1_ComingFN_REQ | |
| PCO Type | G_CSAP | |
| Comments | The ASP is used to request lower layer return the reduced frame number (FN modulo 42432) which is far enough in the future from current frame number and is able to carry L3 message on the specified channel. The requirement of "far enough" is that there is enough time left for TTCN to prepare a L3 message to send before that frame. The ASP could also be used in the calculation of a value for starting time | |
| Parameter Name | Parameter Type | Comments |
| cellId | CellId | |
| physicalChId | PhysicalChId | Channel identifier |
| g_LogicChType | G_LogicChType | |
| subChannel | SubChannelNumber | Valid only for logical channel types: TCH/H, FACCH/H, SACCH/TH, SDCCH/8, SACCH/C8, SDCCH/4, and SACCH/C4. For TCH/H, FACCH/H and SACCH/TH value is (0..1); For SDCCH/8 and SACCH/C8 value is (0..7); for SDCCH/4 and SACCH/C4 value is (0..3). This field is not applicable and the SS shall ignore it if this field is coded as 15. |

7.3.4.3.2.2 ASPs for configuration and control of GERAN L2

| | | |
|--------------------------|---|---|
| ASP Name | G_CL2_HoldPhyInfo_REQ | |
| PCO Type | G_CSAP | |
| Comments | The ASP commands the SS to hold the PHYSICAL INFORMATION message, which will be sent on PCO G_L2 following the current ASP. The PHYSICAL INFORMATION message shall be sent to the UE/MS within T3124 from the time when the SS has received n handover access bursts. | |
| Parameter Name | Parameter Type | Comments |
| cellId | CellId | |
| physicalChId | PhysicalChId | Channel identifier |
| g_LogicChType | G_LogicChType | |
| subChannel | SubChannelNumber | Valid only for logical channel types: FACCH/H, SDCCH/8 and SDCCH/4, This field is not applicable and the SS shall ignore it if this field is coded as 15. |
| n | INTEGER | The number of handover access bursts to be received |
| Detailed Comments | T3124 is defined in 3GPP TS 04.18 or 3GPP TS 44.018 [43], clauses 3.4.4.2.2 and 11.1.1 | |

| | | |
|--------------------------|---|--|

| Parameter Name | Parameter Type | Comments |
| cellId | CellId | |
| physicalChId | PhysicalChId | Channel identifier |
| g_LogicChType | G_LogicChType | Valid only for logical channel types: SACCH/TF, SACCH/TH, SACCH/C8 and SACCH/C4 |
| subChannel | SubChannelNumber | For SACCH/TH value is (0..1); for SACCH/C8 value is (0..7); for SACCH/C4 value is (0..3). |
| sendMeasRpts | BOOLEAN | Whether or not to report received Measurement Reports to the TTCN. |
| Detailed Comments | Per default, this will be set to FALSE | |

| | | |
|--------------------------|---|--------------------|
| ASP Name | G_CL2_MeasRptControl_CNF | |

7.3.4.3.2.3 ASPs for configuration and control of GERAN RLC/MAC

| | | |
|--------------------------|--|----------------------------|
| ASP Name | G_CRLC_CreateRLC_MAC_REQ | |
| PCO Type | G_CSAP | |
| Comments | The ASP is used to create a RLC/MAC entity in GERAN RLC/MAC emulation module. | |
| | Parameter Name | Parameter Type |
| | cellId | CellId |
| | | The identifier of the cell |
| Detailed Comments | One RLC/MAC entity per cell can exist, cellId will be used for coupling LLC layer module to the RLC/MAC emulation module.. The packet channel description given in the ChannelSpecificInfo of G_CL1_CreateBasicPhyCh_REQ shall be used to configure this layer. This ASP shall be called after the G_CL1_CreateBasicPhyCh_REQ ASP. | |

| | | |
|--------------------------|---|----------------------------|
| ASP Name | G_CRLC_CreateRLC_MAC_CNF | |
| PCO Type | G_CSAP | |
| Comments | The ASP is used to confirm the G_CRLC_CreateRLC_MAC_REQ | |
| | Parameter Name | Parameter Type |
| | cellId | CellId |
| | | The identifier of the cell |
| Detailed Comments | | |

| | | |
|--------------------------|---|----------------------------|
| ASP Name | G_CRLC_DeleteRLC_MAC_REQ | |
| PCO Type | G_CSAP | |
| Comments | The ASP is used to delete a RLC/MAC entity in GERAN emulation module. | |
| | Parameter Name | Parameter Type |
| | cellId | CellId |
| | | The identifier of the cell |
| Detailed Comments | This ASP is used to release any resource used for the RLC/MAC emulation entity in the SS. | |

| | | |
|--------------------------|---|----------------------------|
| ASP Name | G_CRLC_DeleteRLC_MAC_CNF | |
| PCO Type | G_CSAP | |
| Comments | The ASP is used to confirm the G_CRLC_CreateRLC_MAC_REQ | |
| | Parameter Name | Parameter Type |
| | cellId | CellId |
| | | The identifier of the cell |
| Detailed Comments | | |

| ASP Name | G_CRLC_UL_TBF_Config_REQ | |
|--------------------------|---|---|
| PCO Type | G_CSAP | |
| Comments | The ASP is used to configure a TBF used for uplink packet data transfer | |
| Parameter Name | Parameter Type | Comments |
| cellId | CellId | |
| tFI | TFI | |
| tBF_Mode | BITSTRING[1] | 0 - GPRS; 1 - EGPRS |
| channelCoding | ChannelCoding | |
| tLLI_BlockChannelCoding | BITSTRING[1] | 0 - CS-1 or MCS-1(EGPRS); 1 - same as channelCoding |
| rLC_Mode | BITSTRING[1] | 0 - acknowledged mode; 1 - unacknowledged mode |
| startingTime | RFN | This field is not applicable and the SS shall ignore it if the field t2 of rfn is coded as '11111'B. |
| uSF_Rate | INTEGER | This parameter controls the speed of the UL TBF transferring data blocks by controlling the USF rate: 1---> implementation dependent. TTCN does not specify the USF generating rate; 2---> 10 USF's per second; 3---> 5 USF's per second; 4---> 1 USF per second; 5---> 1 USF per 2 seconds; 6---> 1 USF per 3 seconds; 7---> 1 USF per 4 seconds. |
| dynamicAllocation | dynamicAllocation | dynamic allocation and other parameters. |
| Detailed Comments | For GPRS channel coding can be: CS-1, CS-2, CS-3 and CS-4; For EGPRS channel coding can be : MCS-1, MCS-2, MCS-3, MCS-4, MCS-5, MCS-6, MCS-7, MCS-8, MCS-9, MCS-5-7 and MCS-6-9. Due to one cell currently has only one RLC/MAC emulation module, this ASP does not contain RLC/MAC identity parameter to indicate which RLC/MAC emulation module this TBF is established for, instead, the parameter cellId implicitly indicates the RLC/MAC module, which is created by G_CRLC_CreateRLC_MAC_REQ in the cell. The higher layer (LLC emulation module) uses rLC/MAC_MappingInfo (with type of CellId) to address the RLC/MAC emulation module to which it connects | |

7.3.4.3.2.5 Void

7.3.5 A-GPS Upper tester, PCO and ASP definitions

This clause is for A-GPS test model in Release 99, the A-GNSS test model is referred to 3GPP TS 37.571-4 [64].

7.3.5.1 Upper tester

In order to perform A-GPS test, an Upper Tester is defined to have two basic functional unites:

- Satellite simulator generating and broadcasting satellite signals;
- Assistance data source storing the data simulating a number of pre-defined GPS test scenarios.

Under the TTCN command, the upper tester loads a pre-defined or re-loads another pre-defined GPS test scenario to the satellite simulator. The generated satellite signals shall simulate a sufficient number satellites. The signal shall be sufficiently strong, in order to enable the UE to do the positioning measurement.

The SS also sends the GPS assistance data to the UE through RRC signalling to facilitate the UE acquiring and tracking satellites. Such assistance data shall be consistent to within ± 2 seconds with the satellite signals generated.

The assistance data source shall provide the assistance data consistent to $\pm 1/0$ second with the GPS test scenario currently running in the satellite simulator (i.e. the data shall be up to 1 second in advance of the scenario); this allows for a further 2 seconds of latency in the SS.

7.3.5.2 SV PCO

The upper tester has an ASP interface through a PCO in type of SatS PCO defined in the table.

7.3.5.3 A-GPS Primitives

The primitives at SV PCO are used to

- load a pre-defined test scenario into the satellite simulator;
- start or stop generating and broadcasting satellite signals from the satellite simulator;
- retrieve the GPS assistance data from assistance data source, the table below is the summary of these primitives.

| Primitive | Parameters | Use |
|------------------------------|--|--|
| Satellite_StartStop_REQ | Mode: start or stop | Start or stop generating satellite signals in the satellite simulator. |
| Satellite_StartStop_CNF | Null | Confirm the Satellite_StartStop_Req. |
| Load_GPS_Scenario_REQ | GPS test scenario number | Requests to load a pre-defined test scenario into the satellite simulator |
| Load_GPS_Scenario_CNF | Null | Confirm the load_GPS_Scenario_Req |
| Retri_GPS_AssistanceData_REQ | Indication of which assistance data elements to be retrieved | Request the assistance data source to provide the next (in time) valid GPS assistance data elements. |

7.3.7 Handling RLP for CS non-transparent data

After the establishment of a CS non-transparent data call during the test, the UE may attempt to initiate a Radio Link Protocol (RLP) connection or start XID exchange before the RLP connection if the UE has an RLP installed. The RLP frames exchanges shall be handled by the SS, in order to carry on the test. Otherwise, the UE may disconnect the CS call.

For the purpose of handling UE originated RLP frames the SS has installed an RLC codec. The RLP codec supports RLP Version 0,1, and 2, detects the version number at the first XID exchange. Without any prior XID exchange, the default version 0 applies. According to the RLP version number, the codec decodes / encodes U, S, I+S frames including header, information and FCS (Frame Check Sequence) fields. The RLP has a fixed bit frame size that is set to 576 bits. The SS RLP codec calculates the FCS value and inserts it in the FCS fields in each DL RLP frames. The FCS values in the UL frames are irrelevant in the TTCN. The I frames are decoded and acknowledged in TTCN, and the other RLP frames are decoded and discarded in the default behaviour trees in TTCN.

7.3.7.1 UTRAN cell

In a UTRAN cell, an RLP codec can be activated on the top of the SS TM RLC entity if the RLP protocol is applied to the UE. In addition of PCO TM, two new PCOs are defined. The PCO CRLP is used for the control and configuration of the RLP codec and the PCO RLP is used for the transferring of the RLP frames. PCO TM is not applied if PCO RLP is used in the test.

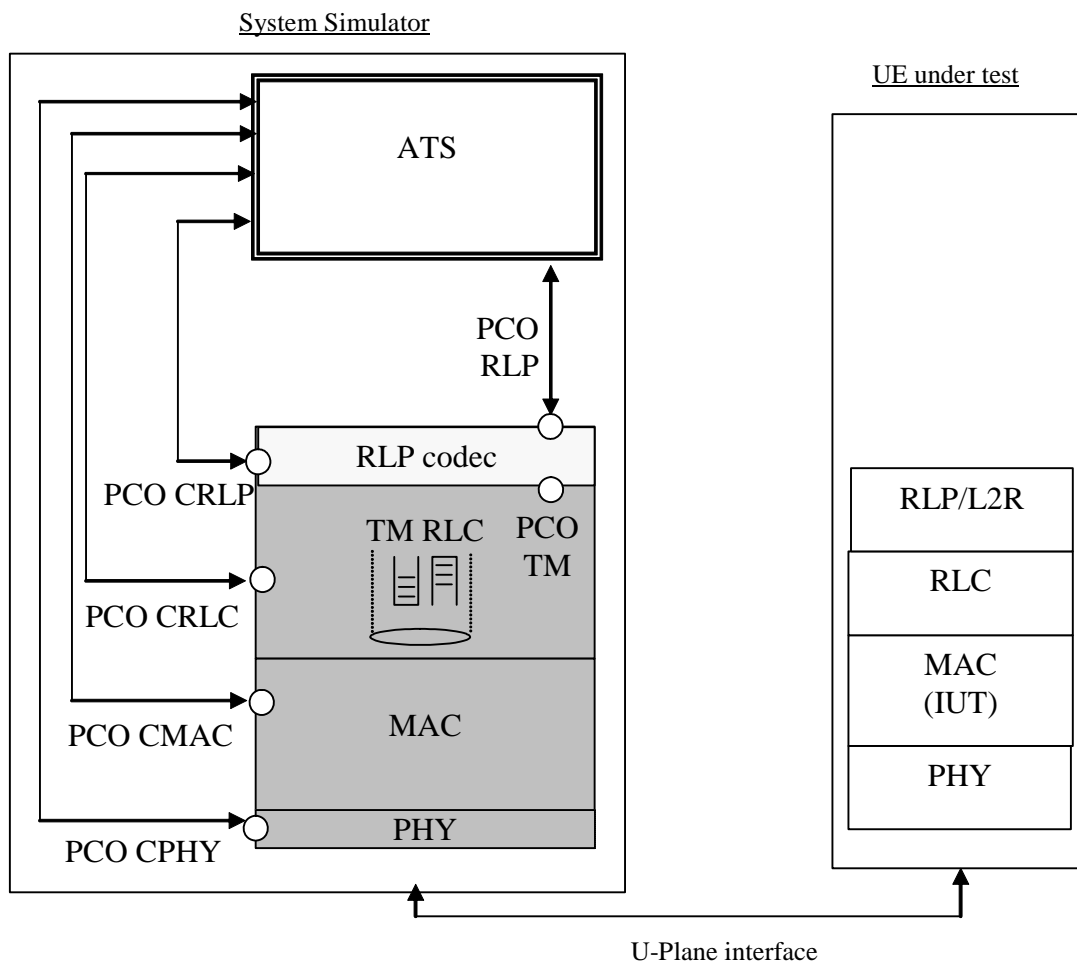

Figure 7.3.7.1: RLP codec model

An activate / deactivate command is required within the CRLP_Config_REQ to configure and activate the RLP codec and RLP PCO. The deactivate command switches off the RLP PCO and the SS discards all received RLP frames.

7.3.7.2 GERAN cell

Figure 7.3.7.2: GERAN RLP codec model

After the establishment of a CS non-transparent data call in a GERAN cell during the test, the UE may attempt to initiate a Radio Link Protocol (RLP) connection or start XID exchange before the RLP connection if the UE has an RLP installed. The RLP frame exchanges shall be handled by the SS, in order to carry on the test. Otherwise, the UE may disconnect the CS call.

In a GERAN cell, an RLP codec can be activated on the traffic channel if the RLP protocol is applied to the UE. Two new PCOs are defined: G_CRLP is used for the control and configuration of the RLP codec and G_RLP is used for the transferring of the RLP frames in the GERAN cell.

For the purposes of interRAT handover testing, only the frame length of 576 bits is required. The 240 bits frame length and the REMAP function are not required.

8 Design Considerations

8.1 Channel mapping

Figure 8.1 shows the channel type mapping that is used for the configuration of the SS.

Figure 8.1: Channel mapping in SS-

8.2 Channel and RB identity

The TTCN addresses the TTCN tester by using a channel identifier:

- Either Physical channel identifier (PhyCh id); or
- Transport channel identifier (TrCh id); or
- Radio bearer identifier (RB id).

The selected channel identifier identifies uniquely:

- a channel within a cell;
- a total path of the address in the lower layers concerned.

Having taken out the cell id and PCO id (AM, UM and TM), a complete address, as RoutingInfo in the RRC ASP definition, should have at least five fields, CN domain id, RB id, LogCH id, TrCH id and PhyCH id. For simplified application of CHOICE of the routing information, a TTCN writer must carefully follow a number of rules assigning the channel identifiers.

General requirements:

- a structured scheme of planning all channel identifiers assigned;
- the scheme shall meet the requirements for all test cases in 3GPP TS 34.123-1 [1] including TDD channels;
- the scheme can apply to all radio bearer configurations in 3GPP TS 34.108 [3], clause 6.10;
- a clear multiplex mapping between a PhyCH id to TrCH ids and a TrCH id to LogCH ids, RB ids is needed.

Requirements on identification of RB in a test case:

- unique identification of the individual SRBs;
- unique identification of the individual sub-flows of a RABs in CS and PS domain.;
- an assigned RB id can represent UL and DL.

Requirements on identification of Logical Channel in a test case:

- it is an instance number of the individual logical channel; and
- uniquely identifies among all the Logical Channel mapped onto a Transport Channel.

Requirements on identification of Transport Channel in a test case:

- unique identification of the individual Transport Channel;
- assign different identities for UL and DL of a same Transport Channel type;
- the order of the Transport Channel id assigned in a cell shall follow the TFCS definitions in the 3GPP TS 34.108 [3], clause 6.10.

EXAMPLE: Transport Channel ids are assigned in the ascending order for (RABsubflow#1, RABsubflow#2, RABsubflow#3, 64kRAB, DCCH).

Requirements on identification of Physical Channel in a test case:

- unique identification of the individual Physical Channel;
- assign different identities for UL and DL of a same Physical Channel type;
- each S-CCPCH or PRACH has a unique identifier;
- for 2 Mbps PS data radio link (in case of demux of a Transport Channel), three DPCH are needed for high-speed data. A single Physical Channel id is assigned to a bundle of the three physical channels.

Table 8.2 shows which type of channel identity is chosen for the individual primitives. In table 8.2, the ASN.1 primitives use a CHOICE type for channel identity, while TTCN primitives use an explicit channel identity.

8.2.2.1 Support of Default Configurations

In test cases using default configurations according to 3GPP TS 25.331 [21], clause 13.7, the configuration of the system simulator follows the same parameter values as defined for the UE side with the following exceptions:

- UL/DL transport channel ids;
- E-DCH MAC-d flow id / HS-DSCH MAC-d flow id.

As the transport channel identities and the MAC-d flow identities have the local significance, the TTCN implementations follow the test model.

8.2.3 Logical Channels

Table 8.2.3 shows the logical channels identities.

8.2.6 MAC-d

MAC-d and the served RLC are cell-independent and are configured by using the cell-id = -1. During reconfigurations, cell changes and state transitions, the relevant counters in the RLC and MAC-d are maintained.

For the active set updating, the DL DCH with the same channel Id in the different cells are implicitly connected to form the DL multiple paths.

8.2.6.1 MAC-d configuration examples

The following example shows how the MAC and RLC ASP are used to configure different configurations.

The 1st parameter in ASP represents the cell identity: p_CellId corresponds to the current cell identity, tsc_CellDedicated corresponds to the cell independent (-1). The 2nd parameter represents the channel Id, this parameter is not needed in the CRLC ASP).

8.2.7 Configuration of compressed mode

8.2.7.1 UE Side

Two IE are available for the configuration of the compressed mode for the UE.

- a) DPCH_CompressedModeInfo.
- b) DPCH_CompressedModeStatusInfo.

Compressed mode initiation at UE side can be divided into 2 steps:

- a) Downloading compressed mode parameters.
- b) Activating the compressed mode.

Both of them can be done in one shot.

8.2.7.2 SS Side

Compressed mode configuration at SS side shall be maintained the same status as that on the UE side. So there are 3 different types of compressed mode configuration states both on UE and SS side.

- Configuration of compressed mode parameters (Use of DPCH_CompressedModeInfo) without the activation.
- Configuration of compressed mode parameters and simultaneous activation (use of DPCH_CompressedModeInfo).
- Only activation (use of DPCH_CompressedModeStatusInfo).

If compressed mode parameters are to be downloaded to the UE without actually activation, it shall be configured on the SS side by any one of the following two procedures.

- If DPCH channel on which compressed mode is to be downloaded is not already configured, primitive "CPHY_RL_Setup_REQ", with "CphyRISetupReq. PhysicalChannelInfo" which is of choice, chosen to dPCHInfo shall be called. The procedure is used to pre-configure all compressed patterns necessary for test, but deactivate the all patterns configured at the beginning of the test. This procedure has not been implemented in the TTCN.
- If DPCH channel on which compressed mode is to be downloaded is already configured, the primitive "CPHY_RL_Modify_REQ" with "CphyRIModifyReq. PhysicalChannelInfo" which is of choice, chosen to dPCHInfo shall be called. This procedure is generally used in the TTCN.

If compressed mode parameters are to be configured and simultaneously activated, the same procedure as for the configuration of compressed mode without activation shall be used.

Activation of the compressed mode, whose parameters are already configured shall be achieved by the primitive "CPHY_RL_Modify_REQ" with "CphyRIModifyReq. PhysicalChannelInfo" which is of choice, chosen to dpch_CompressedModeStatusInfo.

8.2.8 Use of U-RNTI and C-RNTI

The uRNTI and cRNTI are optional when configuring the MAC (CMAC_Config_REQ). Table 8.2.8.1 gives indication on when uRNTI and cRNTI are needed.

Table 8.2.8.1: cRNTI and uRNTI in CMAC-Config_REQ

| | P-CCPCH | S-CCPCH with mapped DL-DCCH/DTCH (UE in cell_FACH) | S-CCPCH without mapped DL-DCCH/DTCH (UE in cell_DCH) | PRACH with mapped DL-DCCH/DTCH (UE in cell_FACH) | PRACH without mapped DL-DCCH/DTCH (UE in cell_DCH) | DPCH |
|------------------------|-----------|--|--|--|--|-----------|
| uRNTI | - | Included | - | Omit | - | - |
| cRNTI | - | Included | - | Included | - | - |
| CMAC-Config_REQ | OMIT both | Download cRNTI and uRNTI | OMIT both | Download cRNTI | OMIT both | OMIT both |

In the case of DL-DCCH/DTCH mapped on S-CCPCH, cRNTI and uRNTI are downloaded to the MAC layer. As default, SS MAC shall use cRNTI as UE id. At the CMAC configuration of the beginning of test cases, the RLC payload size is configured, as default on cRNTI for the MAC header calculation. If uRNTI is to be used the SS RLC payload size shall be reconfigured as cRNTI and uRNTI do not have the same length (16 bits and 32 bits respectively).

CELL UPDATE CONFIRM or URA UPDATE CONFIRM shall be sent on DCCH at the test for the ciphering reason except the periodic update without carrying the UE identity information. In this case the CELL UPDATE CONFIRM or URA UPDATE CONFIRM is sent on CCCH at the test.

Table 8.2.8.2: Relationship between cell update cause, UE state and RLC size reconfiguration

8.3 Channels configurations

8.3.1 Configuration of Cell_FACH

The configuration is based on 3GPP TS 34.108 [3], clause 6.10.2.4.3.2.1.2 for downlink and 3GPP TS 34.108 [3], clause 6.10.2.4.4.1.1.1 for uplink. The configuration is applied to the RRC tests related in the states CELL_FACH, CELL_PCH and URA_PCH. They need a minimum radio configuration for testing.

8.3.6 Configuration of Cell_RLC_DCH_RAB

The configuration is based on 3GPP TS 34.108 [3], clauses 6.11.1, 6.11.2, 6.11.3, and 6.11.4 for the RLC AM and UM tests with 7 and 15 bit length indicators. The RB0/UM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.3.2.1.2 and RB0/TM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.4.1.1.1.

The RB Ids used for the DTCH depend on the RLC mode and length indicator size being simulated (reference clause 6.5.2, RLC test method). Table 8.3.6.1 shows the test suite constants used for each RLC mode, and length indicator size.

The configuration is based on 3GPP TS 34.108 [3], clause 6.10.2.4.1.26. The RB0/UM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.3.2.1.2 and RB0/TM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.4.1.1.1. The configuration is applied to those RRC and NAS signalling tests in the DCH state where a PS RAB on DTCH is setup for the interactive or background service class. The configuration is applied to PDCP test cases in acknowledge mode.

8.3.26 Configuration of PS Cell_DCH_DSCH_PS_RAB

The configuration is based on 3GPP TS 34.108 [3], clause 6.10.2.4.2.1. The RB0/UM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.3.2.1.2 and RB0/TM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.4.1.1.1. The configuration is applied to those RAB signalling tests where a PS RAB on DTCH is setup for the interactive or background service class is mapped on to DSCH.

The uplink configuration is same in clause 8.3.8.

8.3.33a Configuration of cell_Three_DTCH_1Q_HS_DSCH_MAC (Rel-7 or later)

The configuration is based on 3GPP TS 34.108 [3], clause 6.11.4f. The RB0/UM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.3.2.1.2 and RB0/TM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.4.1.1.1. The configuration is applied to those MAC-ehs Signalling tests in the DCH state where a 3 PS RAB on DTCH mapped on HS-DSCH [1 MAC-ehs Queue] is setup for the interactive or background service class.

8.3.33b Configuration of cell_Three_DTCH_3Q_HS_DSCH_MAC (Rel-7 or later)

The configuration is based on 3GPP TS 34.108 [3], clause 6.11.4f. The RB0/UM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.3.2.1.2 and RB0/TM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.4.1.1.1. The configuration is applied to those MAC-ehs Signalling tests in the DCH state where a 3 PS RAB on DTCH mapped on HS-DSCH [1 MAC-ehs Queue] is setup for the interactive or background service class.

The uplink configuration of cell_Three_DTCH_3Q_HS_DSCH_MAC is the same as the uplink configuration of cell_Three_DTCH_1Q_HS_DSCH_MAC

8.3.33c Configuration of Cell_E_HS_SRB_MAC_TM_RAB (Rel-7 or later)

The configuration is based on 3GPP TS 34.108 [3], clause 6.10.2.4.6.3, with RAB configured in TM mode on SS side. The RB0/UM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.3.2.1.2 and RB0/TM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.4.1.1.1.

The configuration is applied to RRC signalling tests in the DCH state where a PS RAB is setup for the interactive or background service class (A14):

- PS RAB on DTCH is mapped on E-DCH in uplink and HS-DSCH in downlink.
- Uplink SRBs on DCCH are mapped on E-DCH.
- Downlink SRBs on DCCH are mapped on HS-DSCH.

The configuration is applied to RRC signalling tests in the DCH state where a PS RAB is setup for the interactive or background service class (A13):

- PS RAB on DTCH is mapped on E-DCH in uplink and HS-DSCH in downlink.
- Uplink SRBs on DCCH are mapped on E-DCH.
- Downlink SRBs on DCCH are mapped on DCH.

The downlink configuration is same in clause 8.3.32 Cell_DCH_HS_DSCH.

The configuration is applied to RRC signalling tests in the DCH state where a PS RAB is setup for the interactive or background service class (A14):

- PS RAB on DTCH is mapped on E-DCH in uplink and HS-DSCH in downlink.
- Uplink SRBs on DCCH are mapped on E-DCH.
- Downlink SRBs on DCCH are mapped on HS-DSCH.

The uplink configuration is same in clause 8.3.43 Cell_DCH_dISRB_E_HS. In the downlink F-DPCH is configured.

8.3.50 Configuration of Cell_3DCH_2AM_1UM_E_HS (Rel-6 or later)

The configuration is based on 3GPP TS 34.108 [3], clause 6.10.2.4.6.7. The RB0/UM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.3.2.1.2 and RB0/TM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.4.1.1.1.

The configuration is applied to RRC signalling tests in the DCH state where two PS RABs are setup for the streaming or interactive or background service class and another UM PS Bearer is setup for conversational / unknown or speech:

- 2 AM PS RABs and 1 UM PS RAB on DTCH are mapped on E-DCH in uplink and HS-DSCH in downlink.
- Uplink SRBs on DCCH are mapped on E-DCH.
- Downlink SRBs on DCCH are mapped on HS-DSCH.

In the downlink F-DPCH is configured.

The configuration is based on 3GPP TS 34.108 [3], clauses 6.10.2.4.6.8. The RB0/UM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.3.2.1.2 and RB0/TM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.4.1.1.1. The configuration is applied to RB tests.

The uplink configuration is same as in clause 8.3.45 Cell_Four_DTCH_E_HS_CS and Cell_Four_DTCH_CS_E_HS.

The downlink configuration is the same as in clause 8.3.52 Cell_Four_DTCH_HS_5SRB.

8.3.52 Configuration of Cell_Four_DTCH_HS_5SRB (Rel-5 or later)

The configuration is based on 3GPP TS 34.108 [3], clauses 6.10.2.4.5.8. The RB0/UM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.3.2.1.2 and RB0/TM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.4.1.1.1. The configuration is applied to RB tests.

The uplink configuration is same in clause 8.3.36 Cell_Four_DTCH_HS_CS and Cell_Four_DTCH_CS_HS.

8.3.53 Configuration of Cell_E_HS_StandAloneSRB/ Cell_E_HS_StandAloneSRB_NoConn (Rel-6 or later)

The configuration is based on 3GPP TS 34.108 [3], clause 6.10.2.4.6.1a. The RB0/UM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.3.2.1.2 and RB0/TM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.4.1.1.1.

The configuration is applied to stand-alone SRB RRC signalling tests in the DCH:

- Uplink SRBs on DCCH are mapped on E-DCH.
- Downlink SRBs on DCCH are mapped on HS-DSCH.

Additionally UL-DPCCH and HS-DPCCH are configured in UL as well as F-DPCH is configured in DL.

The configuration is based on 3GPP TS 34.108 [3], clause 6.10.2.4.4.3 for downlink and 3GPP TS 34.108 [3], clause 6.10.2.4.4.1.1.1 for uplink. The configuration is applied to the RRC tests related in the states CELL_PCH and URA_PCH. They need a minimum radio configuration for testing.

The configuration is applied to RRC signalling tests in the PCH states where a PS RAB is setup for the interactive or background service class (A):

- PS RAB on DTCH is mapped on S-CCPCH in uplink and HS-DSCH in downlink.
- Downlink SRBs on DCCH are mapped on HS-DSCH;

- Uplink SRBs on DCCH are mapped on PRACH.

8.3.62 Configuration of Cell_FACH_enhDL_PS (Rel-7 or later)

The configuration is based on 3GPP TS 34.108 [3], clause 6.10.2.4.4.3 for downlink and 3GPP TS 34.108 [3], clause 6.10.2.4.4.1.1.1 for uplink. The configuration is applied to the RRC tests related in the states CELL_FACH. They need a minimum radio configuration for testing.

The configuration is applied to RRC signalling tests in the FACH state where a PS RAB is setup for the interactive or background service class (A):

- PS RAB on DTCH is mapped on PRACH in uplink and HS-DSCH in downlink.
- Uplink SRBs on DCCH and CCCH are mapped on PRACH.
- Downlink SRBs on DCCH are mapped on HS-DSCH.

8.3.63 Configuration of Cell_E_HS_UM (Rel-7 or later)

The configuration is based on 3GPP TS 34.108 [3], clauses 6.10.2.4.6.9 and 6.10.2.4.6.10. The RB0/UM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.3.2.1.2 and RB0/TM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.4.1.1.1.

The configuration is applied to signalling tests in the DCH state where a PS RAB is setup for CS voice over HSPA(A23):

- UM PS RAB on DTCH is mapped on E-DCH in uplink and HS-DSCH in downlink.
- SRBs on DCCH are mapped on E-DCH in uplink and HS-DSCH in downlink.

8.3.68.4 Configuration of Cell_FACH_UL_NoDedicated (Rel-8 or later)

The configuration is based on 3GPP TS 34.108 [3], clause 6.10.2.4.7.1 for downlink and 3GPP TS 34.108 [3], clause 6.10.2.4.4.1.1.1 for uplink.

The configuration is applied to signalling tests in the enhanced FACH state for a non serving cell where:

- Uplink SRBs on CCCH are mapped on E-DCH.

The downlink configuration is same as in clause 8.3.1a Cell_FACH_NoDedicated

8.3.68.5 Configuration of Cell_FACH_UL_FallBack (Rel-11 or later)

The configuration is based on 3GPP TS 34.108[3], clause 6.10.2.4.7.1 for downlink and 3GPP TS 34.108 [3], clause 6.10.2.4.4.1.1.1 for uplink. The configuration is applied to the MAC tests related in the states further enhanced CELL_FACH. They need a minimum radio configuration for testing.

The configuration is applied to MAC signalling tests in the further enhanced FACH state where a PS RAB is setup:

- PS RAB on DTCH is mapped on PRACH in uplink and HS-DSCH in downlink
- Uplink SRBs on DCCH and CCCH are mapped on PRACH
- Downlink SRBs on DCCH are mapped on HS-DSCH

The downlink configuration is same as in clause 8.3.62 Cell_FACH_enhDL_PS.

The configuration is based on 3GPP TS 34.108 [3], clause 6.10.2.4.7.1 for downlink and 3GPP TS 34.108 [3], clause 6.10.2.4.4.1.1.1 for uplink. The configuration is applied to the RRC tests related in the states CELL_FACH. They need a minimum radio configuration for testing.

The configuration is applied to RRC signalling tests in the FACH state when UE is in idle mode:

- Uplink SRBs on DCCH and CCCH are mapped on E-DCH.
- Downlink SRBs on DCCH are mapped on S-CCPCH.

8.3.72 Configuration of Cell_E_HS_MAC_TM_dISRB (Rel-9 or later)

The configuration is based on 3GPP TS 34.108 [3], clause 6.11.4d. The RB0/UM-CCCH is referred to 3GPP TS 34.108 [33], clause 6.10.2.4.3.2.1.2 and RB0/TM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.4.1.1.1.

The configuration is applied to MAC(i/is) signalling tests in the DCH state where a PS RAB is setup for the interactive or background service class:

- 1 TM PS RAB on DTCH is mapped on E-DCH in uplink and HS-DSCH in downlink.
- Uplink SRBs on DCCH are mapped on E-DCH.
- Downlink SRBs on DCCH are mapped on DCH.

The configuration is based on 3GPP TS 34.108 [3], clause 6.10.2.4.6.9 and 6.10.2.4.6.10. The RB0/UM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.3.2.1.2 and RB0/TM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.4.1.1.1.

The configuration is applied to MAC(i/is) signalling tests in the DCH state where two PS RAB are setup for the interactive or background service class:

- 2 TM PS RAB on DTCH are mapped on E-DCH in uplink and HS-DSCH in downlink.
- SRBs on DCCH are mapped on E-DCH in uplink and HS-DSCH in downlink.

8.3.74 Configuration of Cell_DCH_E_HS_TM_RAB (Rel-11 or later)

The configuration is based on 3GPP TS 34.108 [3], clause 6.11.4c, with RAB configured in TM mode on SS side. The RB0/UM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.3.2.1.2 and RB0/TM-CCCH is referred to 3GPP TS 34.108 [3], clause 6.10.2.4.4.1.1.1.

The configuration is applied to RLC signalling tests in the DCH state where a PS RAB is setup for the interactive or background service class (A44 or A45):

- PS RAB on DTCH is mapped on E-DCH in uplink and HS-DSCH in downlink.
- Uplink SRBs on DCCH are mapped on DCH.
- Downlink SRBs on DCCH are mapped on DCH.

8.4 System information blocks scheduling

All SIBs specified in 3GPP TS 34.108 [3] are broadcast for all test cases in the present document. The repeat period of broadcasting of a complete SIB configuration is 64 frames (0,64 s) as the default configuration.

Except MIB and SB1, they have the highest scheduling rates, SIB7 has also a higher scheduling rate.

According to the default SIB contents in 3GPP TS 34.108 [3], SIB11 and SIB12 have 3 segments. SIB5/SIB5bis has 4 segments for FDD and 5 segments for 1.28 Mcps TDD. SIB 6 has 4 segments. MIB, SB1, SIB1, SIB2, SIB3, SIB4, SIB7 and SIB18 are not segmented, i.e. one segment for each. For the PDCP tests, SIB16 has 7 segments.

Use CMAC_SYSINFO_CONFIG_REQ, CMAC_SYSINFO_CONFIG_CNF and RLC_TR_DATA_REQ as interface to SS for broadcasting.

Two TSOs are defined, one for PER encoding function, the other for segmentation function. The TSOs shall be implemented in the tester.

8.4.1 Grouping SIBs for testing

The grouping of SIBs is defined in 3GPP TS 34.108 [3], clause 6.1.0a.1.

8.4.2 SIB configurations

SIB configurations are defined in 3GPP TS 34.108 [3], clause 6.1.0a.2.

8.4.3 Test SIB default schedule

The SIB default schedule is defined in 3GPP TS 34.108 [3], clause 6.1.0a.3.

8.4.3.1 Test SIB schedule for idle mode, measurement and Inter-RAT UTRAN to GERAN test cases

The SIB schedule is defined in 3GPP TS 34.108 [3], clause 6.1.0a.4.2.

8.4.4 Test SIB special schedule

8.4.4.1 Test SIB schedule for two S-CCPCH or two PRACH

The SIB schedule for two S-CCPCH or two PRACH is defined in 3GPP TS 34.108 [3], clause 6.1.0a.4.1.

8.4.4.2 Test SIB schedule for Inter-Rat Handover from GERAN to UTRAN Test

The SIB schedule for Inter-Rat Handover from GERAN to UTRAN Test is defined in 3GPP TS 34.108 [3], clause 6.1.0a.4.3.

8.4.5 Handling the transmission of SIB

According to the SIB repeat periods, SIBs need to be transmitted on a very regular basis during the operation of a test case. This transmission usually has no direct bearing on the operation of the test case, although the carried information ensures the correct configuration and operation of the UE during the test case.

To send this information repeatedly directly from each test case would make the test cases very complex to implement, difficult to understand and place real-time requirements upon them that are beyond the capabilities of most TTCN driven test engines.

Management of scheduling of System Information messages is performed by the system simulator. The SIB contents, usually determined in part by the individual tests, come from the TTCN test cases.

8.4.5.1 Delivery of System Information content

The content of the System Information messages is delivered as a fully encoded bit string to the TM-RLC SAP from the message content defined in the TTCN test case.

The IE 'SFNprime' in the SI messages is set to 0 by the TTCN, and the correct value of 'SFNprime' shall be inserted by the System Simulator prior to transmission of a SI message.

SI messages are ASN.1 packed encoded through a TTCN TSO and segmented another TTCN TSO into SIBs in the TTCN and sent only once to the TM-RLC SAP. Repetition of the SIB is the responsibility of the System Simulator lower layers.

SIBs are considered to be cached. That is, sending a SIB to the TM-RLC SAP will cause a previously sent copy of the SIB to be lost, and all future transmissions of the SIB will be the most recently sent version. This allows for the updating of System Information during the operation of a test case.

8.4.5.2 Scheduling of system Information blocks

The schedule for the transmission of SIBs is provided by the TTCN test case. It is sent using the CMAC_SYSINFO_CONFIG_REQ primitive sent to the CMAC SAP (CMAC_PCO).

Each CMAC_SYSINFO_CONFIG_REQ primitive carries scheduling information for the next SIB sent from the TTCN. Each primitive is followed by an associated SIB. Sending two CMAC_SYSINFO_CONFIG_REQ primitives in succession may cause an unspecified result.

8.4.5.3 Example of usage

The following example shows how the MIB, SB1 and all SIBs in subclause 8.4.3 are sent to the System Simulator lower layers for broadcasting. The 1st parameter in CMAC_SYSINFO_CONFIG_REQ represents the repeat period in power of 2. The 2nd parameter represents the repetition position. Two consecutive frames represent an available repetition position.

8.5 Security in testing

The security functions at the SS side are implemented in RLC and MAC layers. When the AM or UM RLC entities and a MAC(d) entity are created, the TTCN will download a security context for each CN domain used. The two ASPs CMAC_SecurityMode_Config_REQ and CRLC_SecurityMode_Config_REQ configure the SS security contexts and associate the contexts to the created entities. The SS shall support one activate security contexts and one context pending activation for each CN domain.

A security context at the SS consists of the security parameter START, 20 bits long and a pair of integrity key and a ciphering key, each 128 bits long. All these security parameters belong to a CS or a PS domain. The SS shall have the ability to store these values till the new values are downloaded and activated. $START_{cs}$ is used for initialization of all counters-C and counters-I (32 bits long each) of all DL and UL radio bearers for ciphering and integrity protection in the CS domain. The same is for $START_{ps}$ in the PS domain. The TTCN downloads the new START value whenever it is received from the UE. In the case of a succeeded authentication procedure, the START value is reset to zero by the TTCN.

Once the START is downloaded the SS will, according to the activation time, initialize the 20 most significant bits of the RRC HFN (for integrity protection), the RLC HFN (for ciphering) and the MAC-d HFN (for ciphering) to the START value of the corresponding service domain; the remaining bits are initialized to 0.

Upon the concerned RLC entities and the MAC(d) entity release in the SS, the associated security contexts are no longer used and shall be removed as well. The RLC and the MAC(d) entities are addressed by the TTCN with the cell id = -1.

8.5.1 Authentication

A GMM or MM authentication test step makes use of a number of TSOs to generate an authentication vector:

$$AV := \{RAND, XRES, CK, IK, AUTN\}$$

If the UE has valid authentication parameters (CKSN/KSI), for the respective domain, use of the Authentication procedure after an INITIAL DIRECT TRANSFER message is optional. Authentication in this case will be left to the test case implementation and need not be specified in the prose. However, in the case where the UE does not have valid authentication parameters the Authentication procedure shall be performed.

8.5.2 Ciphering

The ciphering in the SS is activated through the ASP CRLC_Ciphering_Activate_REQ for the AM or UM mode and through CMAC_Ciphering_Activate_REQ for the TM mode.

A PIXIT parameter px_CipheringOnOff indicates whether all the tests are performed under ciphering activated or not. If ciphering should be off at the test execution, the ciphering algorithm in IE ciphering ModeInfo is set to uea0 (no encryption). The UE under test is informed about the SS ciphering capability via IE cipheringAlgorithmCap set to uea0.

Unless specified otherwise in the test prose, px_CipheringOnOff shall be set to on in FDD mode and off in LCR TDD mode.

Table 8.5.2 gives the mapping of the RB id and the bearer value used in the ciphering calculation at the SS side.

8.5.3 Integrity

The integrity protection in the SS is activated through the ASP CRLC_Integrity_Activate_REQ for all SRB.

MAC-I (MessageAuthenticationCode) is calculated by the SS. If the integrity protection is not yet started, the "integrity protection info" IE is omitted in TTCN. If integrity protection is started the TTCN includes the "integrity protection info" IE with all bits set to "0". The SS takes care of all the necessary initialization and calculation on SRBs.

Once integrity is started, the SS initializes and calculates a correct Message Authentication Code, overrides the initial value all bits "0" and inserts a corresponding RRC message sequence number into the IntegrityCheckInfo for all DL DCCH messages. In UL, the SS shall check the received MessageAuthenticationCode. If it is wrong, the ASP CRLC_Integrity_Failure_IND will report having received an UL message with integrity error. If it is correct SS forwards the received messages to the TTCN.

In addition, CRLC_MAC_I_Mode_REQ can be used to force the SS generate wrong DL MAC-I on a specific SRB for the integrity error handling test.

8.5.4 Test security scenarios

Five basic test scenarios are presented in the present document. The corresponding core spec references are found in 3GPP TS 25.331 [21], clauses 8.1.12, 8.2.2.2, 8.5.10.1, 8.5.10.2, 8.6.3.4, 8.6.3.5, 8.6.4.3 and 8.6.4.8.

- Start security;
- RB setup;
- AM RB reconfiguration;
- Security modification;
- SRNS relocation;
- Modification of RLC size of AM RB during RB reconfiguration;
- Cell/URA update;
- InterRAAt HO to UTRAN.

As Default, the 1st three basic scenarios can be subdivided into:

- Start integrity without ciphering start;
- Start integrity and ciphering at the same time.

Regarding the simultaneous SRNS relocation, the security scenarios at the relocation are split into:

- No security configuration modification;
- Modification of integrity (FRESH) without ciphering configuration change;
- Modification integrity FRESH and ciphering algorithm;
- A security modification pending at the SRNS relocation.

This clause shows the procedures how the security ASP applied to the SS configurations at the different security test scenarios.

8.5.4.8 Hard handover

Ciphering is activated for any TM radio bearer;
 "Downlink DPCH info for all RL" in a message performing timing re-initialized hard handover or;
 "Downlink DPCH info for all RL" in a message other than RADIO BEARER SETUP transferring UE to
 Cell_DCH from non-Cell_DCH state.

1. Before sending the message

```

CMAC_SecurityMode_Config_REQ
  startValue = value most recently received
  cipheringKey = value maintained by TTCN
  cn_DomainIdentity = CS or PS
CMAC_Ciphering_Activate_REQ (CN domain concerned)
  incHFN = NotInc
  cipheringModeCommand = Start/Restart (existing algorithm)
  activationTimeForDPCH = now

```

2. Send the message for hard HO

3. After receiving the response message

```

CMAC_SecurityMode_Config_REQ
  startValue = value received in the response message
  cipheringKey = value maintained by TTCN
  cn_DomainIdentity = CS or PS
CMAC_Ciphering_Activate_REQ (CN domain concerned)
  cipheringModeCommand = Start/Restart (existing algorithm)
  activationTimeForDPCH = value in "COUNT-C activation time"
  incHFN = IncByOne_IncPerCFN_Cycle

8.5.5 Test USIM configurations

The default test USIM is defined in 3GPP TS 34.108 [3]. This clause specifies a number of specific test USIM configurations which are used for the concerned test cases.

8.5.5.1 Test USIM for Idle mode tests

The PLMN 1-12 identities used below have been defined in 3GPP TS 34.123-1 [1], table 6.2. Clause numbers refer to 3GPP TS 34.123-1 [1].

Test USIM is configured as bellow for PLMN selection of RPLMN, HPLMN, UPLMN and OPLMN in tc_6_1_1_1, tc_6_1_1_4, and tc_6_1_1_14.

| o_AuthRspChk | <p>Type of the result: BOOLEAN</p> <p>Parameters: p_AuthRsp : AuthRsp p_AuthRspExt : AuthRspExt p_K : BITSTRING p_RAND : BITSTRING p_Ext : BOOLEAN</p> <p>Description Checks the input parameter p_AuthRsp and p_AuthRspExt, both received in an Authentication Response, according to the authentication algorithm defined in the following procedure. The extension, p_AuthRspExt, is optional. Its presence is indicated by p_Ext. Returns TRUE if the Authentication Response contained in parameters p_AuthRsp and eventually p_AuthRspExt is correct, FALSE otherwise. The value of tcv_Auth_n indicates whether the AuthRspExt has been provided by the UE or not (n=31, or 31 < n < 128). See 3GPP TS 34.108 [3], clause 8.1.2. If not the parameter p_AuthRspExt is not to be used.</p> <p>Algorithm (without the knowledge of tcv_Auth_n): ===== if NOT p_Ext EvaluateAuthRsp else EvaluateAuthRspAndAuthRspExt EvaluateAuthRsp: ===== resultbitstring = o_BitstringXOR(XRES, AuthRsp) if resultbitstring is all 0s then there is a match. | o_BitstringChange | <p>Type of the result: BITSTRING</p> <p>Parameters: P_Str: BITSTRING p_Len: INTEGER p_Offset: INTEGER</p> <p>Description Performs the manipulation of a bitstring by toggling the bit identified by p_Offset. The length of the string to be manipulated is specified in p_Len. This is only provided to help ensure that the p_Offset is less than p_Len. Returns a resulting bitstring of length p_Len. EXAMPLE 1: o_BitstringChange('010101'B, 6, 5) produces '010100'B. EXAMPLE 2: o_BitstringChange('010101'B, 6, 0) produces '110101'B.</p> |
| o_BitstringConcat | <p>Type of the result: BITSTRING</p> <p>Parameters: P_Str1: BITSTRING p_Str2: BITSTRING p_Len1: INTEGER p_Len2: INTEGER</p> <p>Description Performs the concatenation of 2 bitstrings of possibly different lengths. The bit significance is from left to right, i.e. the MSB is at the left-hand side. Returns a resulting bitstring p_Str1 p_Str2 of length p_Len1 + p_Len2. EXAMPLE: o_BitstringConcat('010101'B,'11'B) produces '01010111'B of length 6 + 2 = 8.</p> |
| o_BitstringXOR | <p>Type of the result: BITSTRING</p> <p>Parameters: p_Str1: BITSTRING p_Str2: BITSTRING p_Len: INTEGER</p> <p>Description Performs an XOR operation using 2 bitstrings of the same length (p_Len). Returns a resulting Bitstring of length p_Len. EXAMPLE: o_BitstringXOR('0011'B, '0101'B, 4) produces '0110'B.</p> |

|-------------------|--|
| o_BitstringXtract | <p>Type of the result: BITSTRING</p> <p>Parameters: P_Str: BITSTRING p_SrcLen: INTEGER p_TargetLen: INTEGER p_Offset: INTEGER</p> <p>Description Performs the wrap around extract of a bitstring. The length of the string from which extraction is to be made is specified in p_SrcLen. The length of the bitstring to be extracted is indicated as p_TargetLen, the offset in the original string is indicated in p_Offset. The bit position 0 is at the left side. Returns a resulting bitstring of length p_TargetLen.</p> <p>EXAMPLE 1: o_BitstringXtract('101010'B, 6, 2, 1) produces '01'B. EXAMPLE 2: o_BitstringXtract('101010'B, 6, 4, 3) produces '0101'B, wrapping around. EXAMPLE 3: o_BitstringXtract('111000'B, 6, 4, 3) produces '0111'B, wrapping around.</p> |
| o_BoolToBit | <p>Type of the result: B1</p> <p>Parameters: p_Boolean : BOOLEAN</p> <p>Description This TSO is used to convert the given BOOLEAN into a single bit. A boolean value of TRUE will give a result '1' and a boolean value of FALSE will give a result '0'.</p> |

| TSO Name | Description |

| o_BMC_DrxScheduling | <p>Type of the result: BMC_ResultOfSchedulingLevel2</p> <p>Parameters: p_BMC_CBS_Message1 : BMCCBSMESSAGE p_BMC_CBS_Message2 : BMCCBSMESSAGE p_BMC_CB_RepPeriod : INTEGER p_BMC_NoOfBroadcast_Req : INTEGER p_Offset : BMC_DRX_Offset</p> <p>Description This TSO shall calculate all BMC CBS schedule Messages for the CBS messages as described in 3GPP TS 34.123-1, clause 7.4.3.1. The TSO has to precalculate the CTCH Block SETs needed, i.e. it shall have all necessary knowledge (RLC segmentation, MAC handling, if needed) to predict the CTCH with BMC contents for the given input to be sent.</p> <p>The TSO shall consider the BMC CBS Scheduling Level2 as described in 3GPP TS 25.324 [20], 3GPP TR 25.925 [44] and the description of BMC test architecture and test method in the present document, clause 6.8.</p> <p>The TSO calculates the BMC CBS Schedule messages to predict its next BlockSet to be sent. In addition, a DRX scheduling Bitmap is created for each CTCH allocated TTI aligned to the pre-calculated offset in between 2 CTCH Block Sets.</p> <p>The principle of DRX shall be followed by this TSO. I.e. BMC Messages shall be sent blockwise (CTCH Block Set) with predicted offset in between 2 Block Sets.</p> <p>The TSO shall consider the following aspects to calculate the DRX Selection Bitmap and to create the BMC CBS Schedule messages:</p> <ol style="list-style-type: none"> 1. The first CTCH Block Set consists of the first BMC CBS Schedule message predicting the offset, length and content of the following Block Set where the BMC CBS Message1 shall be send as new message. 2. The BMC CBS Message1 shall be repeated for p_BMC_CB_RepPeriod multiplied by p_BMC_NoOfBroadcast_Req times before the BMC CBS Message2 is broadcasted. 3. The BMC CBS Schedule Messages shall be the last message of a CTCH Block Set, i.e. on the end of a Block Set. 4. If no further repetition of BMC CBS Messages is needed, no further BMC CBS Schedule message shall be created. <p>output parameter: DrxSelectionBitmap: The TSO creates a Bitmap as Octetstring for scheduled CTCH allocated TTI as described in 3GPP TS 34.123-3: clause 6.8.2 BMC test method and architecture.</p> <p>CBS_Schedule_Message01, CBS_Schedule_Message02, CBS_Schedule_Message03: Considering the given BMC PDUs BMC_DRX_Offset and BMCCBSMESSAGE to be sent, the BMC Schedule messages have to be created according the given parameter.</p> |
| o_CheckStringStartWith | <p>Type of the result: BOOLEAN</p> <p>Parameters: p_SourceString: IA5String p_StartString : IA5String</p> <p>Description o_CheckStringStartWith returns TRUE if the p_sourceString start with the p_StartString. Otherwise it returns FALSE.</p> <p>EXAMPLE: o_CheckStringStartWith ("+CLCC:1,0,0,2,0;", "+CLCC:1,0,0")=TRUE */.</p> |

| TSO Name | Description |

| o_ComputeSM_ContentsSpec | <p>Type of the result: OCTETSTRING</p> <p>Parameters: p_NumOfChars: INTEGER p_Text: IA5String</p> <p>Description This operation provides a short message's contents with a specified number of characters 'p_NumOfChars', each represented by 7 bits. 'p_Text' is used as contents of the short message. If 'p_Text' contains less than 'p_NumOfChars' characters, 'p_Text' is repeated until the short message reaches the 'p_NumOfChars' characters long. The bits are arranged acc. to 3GPP TS 23.038 [34], clause 6.1.2.1.1.</p> <p>max. 160 characters, i.e. 140 octets.</p> |
| o_ConcatStrg | <p>Type of the result: IA5String</p> <p>Parameters: P_String1: IA5String p_String2: IA5String</p> <p>Description o_ConcatString concatenates 'p_String1' and 'p_String2' and returns the resulting string.</p> <p>EXAMPLE: o_ConcatString ("AT+CBST=0", ";0") = "AT+CBST=0;0"</p> |
| o_ConvertIMSI | <p>Type of the result: IMSI_GSM_MAP</p> <p>Parameters: P_Imsi : HEXSTRING</p> <p>The input parameter 'p_Imsi' is a BCD string (subset of HEXSTRING), the result is of type IMSI_GSM_MAP.</p> |
| o_ConvertTMSI | <p>Type of the result: TMSI_GSM_MAP</p> <p>Parameters: p_Tmsi : OCTETSTRING</p> <p>Description The input parameter 'p_Tmsi' is an OCTETSTRING; the result is of type TMSI_GSM_MAP.</p> |
| o_ConvertPTMSI | <p>Type of the result: P_TMSI_GSM_MAP</p> <p>Parameters: p_PTMSI : OCTETSTRING</p> <p>Description The input parameter 'PTMSI' is a OCTETSTRING, the result is of type P_TMSI_GSM_MAP.</p> |
| o_ConvtPLMN | <p>Type of the result: TMSI_GSM_MAP</p> <p>Parameters: OCTETSTRING p_MCC, p_MNC : HEXSTRING</p> <p>Description the functions of o_ConvtPLMN are as following:</p> <ol style="list-style-type: none"> 1. The least significant HEX of p_MNC is removed from p_MNC and inserted into p_MCC in the position left to the third HEX to form a new p_MCC of 4 HEXs, then swap the first HEX (left most, most significant Hex) with the second HEX of the new p_MCC. 2. Swap the first Hex with the second HEX of the remaining part of p_MNC and append it to the new p_MCC formed in Step1 above. <p>EXAMPLE 1: o_ConvtPLMN('123'H, '456'H) = '216354'O. | o_FirstDigit | <p>Type of the result: B4</p> <p>Parameters: p_BCDDigits : HEXSTRING</p> <p>Description The input parameter p_BCDDigits shall be a BCD string (subset of HEXSTRING), the result is a BITSTRING[4] of a binary representation of one BCD digit. The function of the o_FirstDigit is to return the first (most significant) digit of the input parameter 'p_BCDDigits'.</p> <p>EXAMPLE 1: o_FirstDigit('12345') = '0001'B. EXAMPLE 2: o_FirstDigit('012345678') = '0000'B.</p> |
| o_GetBit | <p>Type of the result: BITSTRING</p> <p>Parameters: p_Source: BITSTRING p_DataLength: INTEGER</p> <p>Description o_GetBit returns the BITSTRING of length p_DataLength extracted from p_Source. The extraction shall start in the bit position 0 (at the left).</p> |
| o_GetLeastSignificantBits | <p>Type of the result: BITSTRING</p> <p>Parameters: bstring : BITSTRING lg : INTEGER</p> <p>Description o_GetLeastSignificantBits operation returns the `lg` least significant bits of the original `bstring`.</p> <p>for example:</p> <p>o_GetLeastSignificantBits('110011000101010'B, 3) = '010'B, o_GetLeastSignificantBits('110011000101010'B, 6) = '101010'B.</p> |
| o_GetMostSignificantBits | <p>Type of the result: BITSTRING</p> <p>Parameters: bstring : BITSTRING lg :INTEGER</p> <p>Description o_GetMostSignificantBits operation returns the `lg` most significant bits of the original `bstring`.</p> <p>for example:</p> <p>o_GetMostSignificantBits('110011000101010'B, 3) = '110'B, o_GetMostSignificantBits('110011000101010'B, 6) = '110011'B.</p> |
| o_GetMostSignificantBits_WrapAround | <p>Type of the result: BITSTRING</p> <p>Parameters: bstring : BITSTRING lg :INTEGER</p> <p>Description o_GetMostSignificantBits operation returns the `lg` most significant bits of the original `bstring`.</p> <p>for example:</p> <p>o_GetMostSignificantBits('110011000101010'B, 3) = '110'B, o_GetMostSignificantBits('110011000101010'B, 6) = '110011'B. If lg is greater than the length of bstring, then a bitsring of size greater than lg is created by concatenating bstring to itself (any number of times till it is size is greater than lg), and then 'lg' most significant bits of concatenated bstring are returned. example o_GetMostSignificantBits('1100'B, 9) = '110011001'B.</p> |

| o_GetN_OctetsFromPRBS | <p>Type of the result: OCTETSTRING</p> <p>Parameters: p_Start, p_N: INTEGER</p> <p>Description This operation returns N octets from a repeated pseudo random bit sequence, starting with octet position p_Start. The PRBS is the 2047 bit pseudo random test pattern defined in ITU-T Recommendation O.153 [45] for measurements at 64 kbit/s and N x 64 kbit/s o_GetN_OctetsFromPRBS(p_Start, p_N) generates an OCTETSTRING containing p_N octets starting from octet number p_Start in the PRBS.</p> <p>Requirements p_Start ≥ 0 p_N ≥ 1</p> <p>Definition Define the 2 047 bit PRBS sequence b(i) as an m-sequence produced by using the following primitive (over GF(2)) generator polynomial of degree 11: $X^{11} + X^9 + 1$</p> <p>This sequence is defined recursively as: b(i) = 1, i = 0,1,...,10 b(i) = b(i - 2) + b(i - 11) modulo 2, i = 11,16,...,2046</p> <p>The OCTETSTRING, o(j) generated by the present TSO is produced by extracting p_N octets from the repeated sequence b(i) as follows: o(j,k) = b((n_Start + j) * 8 + k) modulo 2047) where: j = 0,1,...,p_N - 1 k = 0,1,..7 o(j,k) is the kth bit of the jth octet in o(j), o(j,0) is the MSB of the jth octet in o(j), o(j,7) is the LSB of the jth octet in o(j),</p> <p>Example results: o_GetN_OctetsFromPRBS(0, 25) and o_GetN_OctetsFromPRBS(2047, 25) both return: 'FFE665A5C5CA3452085408ABEECE4B0B813FD337873F2CD1E2'O o_GetN_OctetsFromPRBS(255, 25) and o_GetN_OctetsFromPRBS(255 + 2047, 25) both return '01FFCCCB4B8B9468A410A81157DD9C9617027FA66F0E7E59A3'O</p> |
| o_GetPI | <p>Type of the result: BITSTRING</p> <p>Parameters: p_lmsi : HEXSTRING p_Np: INTEGER</p> <p>Description PI = drx_index mod np</p> <p>The drx_index is calculated as described hereafter: drx_index = (p_lmsi / 8192)) This calculation is defined in TS 25.304 clause 8.3.</p> <p>NOTE: the IMSI is passed as HEXSTRING, the relevant conversion shall be done.</p> |
| o_GetSC_TimeStamp | <p>Type of the result: TP_ServCentreTimeSt</p> <p>Parameters: p_timezone : TZONES</p> <p>This operation provides the hexstring containing the Service Centre Time Stamp (SCTS) according to 3GPP TS 23.040 [35], clauses 9.2.2.1 and 9.2.3.11. The TSO reads the current time of the test systems clock and transforms the time in combination with the input parameter 'timezone' into a service centre time stamp.</p> <p>Example: 2002 April 18, 15:32:46, timezone=4 o_GetSC_TimeStamp returns 20408151236440</p> <p>TPSCTS is HEXSTRING[14]</p> |

| o_HexToDigitsMCC | <p>Type of the result: MCC</p> <p>Parameters: p_BCDdigits : HEXSTRING</p> <p>Description The input parameter p_BCDdigits shall be a BCD string (subset of HEXSTRING), the result is a SEQUENCE (SIZE(3)) OF digit (MCC).</p> <p>NOTE: The length of p_BCDdigits shall be 3. User shall take the responsibility of fulfilling this requirement.</p> <p>EXAMPLE 1: o_HexToDigitsMCC('111'H) = {1, 1, 1}. EXAMPLE 2: o_HexToDigitsMCC('123'H) = {1, 2, 3}.</p> |
| o_HexToDigitsMNC | <p>Type of the result: MNC</p> <p>Parameters: p_BCDdigits : HEXSTRING</p> <p>Description The function of this operation is: 1. The least significant HEX is removed if it is 'F' and the operation returns SEQUENCE (SIZE(2)) OF Digit. 2. The operation returns SEQUENCE (SIZE(3)) OF Digit if all 3 HEX digits in p_BCDdigits are BCD Digit.</p> <p>EXAMPLE 1: o_HexToDigitsMNC('123'H) = {1, 2, 3}. EXAMPLE 2: o_HexToDigitsMNC('13F'H) = {1, 3}.</p> |
| o_HexToIA5 | <p>Type of the result: IA5String</p> <p>Parameters: p_String: HEXSTRING</p> <p>Description o_HEX_TO_IA5 converts hexadecimal string 'p_String' to an IA5 String</p> <p>EXAMPLE: o_HEX_TO_IA5 ('15A'H) = "15A".</p> |
| o_IA5_ToOct | <p>Type of the result: OCTETSTRING</p> <p>Parameters: p_String : IA5String</p> <p>Description o_IA5_ToOct converts the string p_String from IA5String type to OCTETSTRING. Each character is mapped onto an octet, and bit 8 is set to 0. This TSO shall be used to convert Access Point Numbers for example. See 3GPP TS 24008, clause 10.5.6.1</p> <p>EXAMPLE: o_IA5_ToOct ("15A") = '313541'O.</p> |
| o_IA5_BMC_ToOct | <p>Type of the result: OCTETSTRING</p> <p>Parameters: p_String :IA5String_BMC p_DCS: TP_DataCodingScheme</p> <p>Description o_IA5_BMC_ToOct converts the string p_String from IA5String_BMC type to OCTETSTRING. p_DCS determines how this is done (refer to 3GPP TS 23.038 [34] clause 5). If a 7 bit packing is to be applied then proceed as described in 3GPP TS 23.038 [34] clause 6.1.2.2.1 and clause 6.2.1. This is the default case. If 8bit data is to be used then proceed as described in 3GPP TS 23.038 [34] clause 6.2.2. If UCS2is to be used then proceed as described in 3GPP TS 23.038 [34] clause 6.2.3. The type IA5_BMC implies that the length of p_String is restricted to 1..1395 octets. (Refer to 3GPP TS 23.041 [36], 3GPP TS 23.038 [34], 3GPP TS 25.324 [20]) This TSO will always generate a BMC encoded message of 15 page of information. If the input message stream (p_String) is less than the size of required octet, then the input message will be concatenated to generate a string of required length based on p_DCS.</p> |

| o_IA5_IP_ToOct | <p>Type of the result: OCTETSTRING</p> <p>Parameters: p_String: IA5String p_IP_V4: BOOLEAN</p> <p>Description o_IA5_IP_ToOct converts the string p_String from IA5String type to OCTETSTRING. In case of IPv4, p_String represents an IP address consisting of a number of fields of digits, separated by dots. Each one of the numbers of which the IP address consists is converted into one octet. The dots separating the numbers are ignored. EXAMPLE 1: o_IA5_IP_ToOct ("200.1.1.80", TRUE) = 'C8010150'O. EXAMPLE 2: o_IA5_IP_ToOct ("200.1.1.80.100", TRUE) should result in an appropriate error message. EXAMPLE 3: o_IA5_IP_ToOct ("300.1.1.80", TRUE) should result in an appropriate error message.</p> <p>In case of IPv6, p_String represents an IP address consisting of a number of fields of hexadecimal digits, separated by ":". a) In case of uncompressed IPv6 format each value separated by ";" is converted to 2 octets. The ":" separating the numbers are ignored. EXAMPLE 1: o_IA5_IP_ToOct(FEDC:BA98:7654:3210:FEDC:BA98:7654:3210, FALSE) = 'FEDCBA9876543210FEDCBA9876543210'O EXAMPLE 2: o_IA5_IP_ToOct(FEDC:BA98:7654:3210:FEDC:BA98:7654, FALSE) should result in an appropriate error message. EXAMPLE 3: o_IA5_IP_ToOct(1080:0:0:0:8:800:200C:417A,FALSE) = '10800000000000000000000800200C417A'O EXAMPLE 4: o_IA5_IP_ToOct(1080:0:0:0:8:800:20H:417A,FALSE) should result in an appropriate error message. b) In case of compressed IPv6 format the use of "::" indicates multiple groups of 16-bits of zeros. The "::" can only appear once in an address. EXAMPLE 1: o_IA5_IP_ToOct(FF01::101,FALSE) = 'FF010000000000000000000000000000101'O EXAMPLE 2: o_IA5_IP_ToOct(FEDC::7654:3210:FEDC::BA98:7654:3210, FALSE) should result in an appropriate error message.</p> <p>p_IP_V4 is a BOOLEAN. When TRUE, an IP Version 4 address is to be converted, the maximum length of which is 4 octets, otherwise an IP Version 6 address is to be converted, the maximum length of which is 16 octets. See 3GPP TS 24.008 [9], clause 10.5.6.4.</p> |
| o_IA5_DigitsToOct | <p>Type of the result: OCTETSTRING</p> <p>Parameters: p_String: IA5String</p> <p>Description o_IA5_DigitsToOct converts the string p_String from IA5String type to OCTETSTRING. Each pair of characters is considered a pair of numbers to be mapped onto 1 octet. Each character of p_String shall represent a digit (0..9). In case the number of characters is odd, then a filler '1111'B is used to fill the last octet required to represent the digits. See 3GPP TS 24.008 [9], clause 10.5.4.7.</p> <p>EXAMPLE 1: o_IA5_DigitsToOct ("0613454120") = '6031541402'O. EXAMPLE 2: o_IA5_DigitsToOct ("06134541209") = '6031541402F9'O. EXAMPLE 3: o_IA5_DigitsToOct ("A6134541209") should result in an appropriate error message.</p> |
| o_IntToOct | <p>Type of the result: OCTETSTRING</p> <p>Parameters: p_N : INTEGER p_L: INTEGER</p> <p>Description o_IntToOct converts the INTEGER `p_N` into OCTETSTRING with length = `p_L`.</p> <p>EXAMPLE 1: o_IntToOct(14,1) = '0E'O. EXAMPLE 2: o_IntToOct(18,1) = '12'O. EXAMPLE 3: o_IntToOct(18,2) = '0012'O.</p> |

| o_IntToIA5 | <p>Type of the result: IA5String Parameters: p_N : INTEGER; p_L: INTEGER</p> <p>Description o_IntToIA5 converts the INTEGER `p_N` into IA5 String with length = 'p_L'. EXAMPLE 1: o_IntToIA5(160,3) = "160"; EXAMPLE 2: o_IntToIA5(160,4) = " 160"; EXAMPLE 3: o_IntToIA5(160,2) = "60".</p> |
| o_OctetstringConcat | <p>Type of the result: OCTETSTRING Parameters: p_Str1, p_Str2: OCTETSTRING</p> <p>Description o_OctetstringConcat Performs the concatenation of 2 octetstrings of possibly different lengths. The octet significance is from left to right, i.e. the MSB is at the lefthand side. Returns a resulting octetstring p_Str1 p_Str2. EXAMPLE: o_OctetstringConcat('135'O, '9A38'O) = '1359A38'O.</p> |
| o_OctToBit | <p>Type of the result: BITSTRING Parameters: p_OctetStr: OCTETSTRING</p> <p>Description Converts an OCTETSTRING into a BITSTRING. The size of the resulting BITSTRING is 8 times the size of the input OCTETSTRING.</p> |
| o_OctToIA5 | <p>Type of the result: IA5String Parameters: p_String : OCTETSTRING</p> <p>Description o_OctToIA5 converts the string p_String from OCTETSTRING type to IA5String. Each octet is mapped onto a pair of characters. Nibbles 0 - F are translated into "0" - "F". For example: o_OctToIA5 ('3BF541'O) = "3BF541"</p> |
| o_OctToInt | <p>Type of the result: INTEGER Parameters: p_oct : OCTETSTRING</p> <p>Description Transform an OCTETSTRING of length 1 to 4 into an unsigned 32 bits INTEGER value. If the input octet string is larger than 4, then only the first 4 octets shall be considered.</p> |
| o_OeBit | <p>Type of the result: BITSTRING Parameters: p_BCDdigits: HEXSTRING</p> <p>Description The input parameter 'p_BCDdigits' is a BCD string (subset of HEXSTRING), the result is BITSTRING[1]. The function of the o_OeBit is as the follows:</p> <ol style="list-style-type: none"> 1. It returns '1'B, if the length of the 'p_BCDdigits' is odd. 2. It returns '0'B, if the length of the 'p_BCDdigits' is even. <p>EXAMPLE 1: o_OeBit('12583') = '1'B. EXAMPLE 2: o_OeBit('87259957') = '0'B.</p> |

8.7.1.1.1 Pseudocode in a C like notation

The pseudocode defined below can be written in a more compact fashion. The code hereafter is to allow easy identification of the TSO's tasks. All situations leading to a FALSE result must produce a log. This is not shown in the code hereafter. Possible wrap arounds are not shown in this section. These have to be accounted for at the appropriate places.

| o_CalculateE_DCH_TBSize | <p>Type of the result: INTEGER</p> <p>Parameters: p_tti: E_DCH_TTI p_TableInd: E_TFCI_TableIndex p_TB_Index: INTEGER</p> <p>Description: TSO implements tables defined in 25.321 Annex B.1 (tti 2ms Index 0), Annex B.2 (tti 2ms Index 1), Annex B.3 (tti 10ms Index 0), Annex B.4 (tti 10ms Index 1). It accepts 3 input parameters: p_TTI: the TTI of E-DCH (2ms or 10ms) P_TableInd: the table index (0 or 1) p_TB_Index: the TB index in the table (0..127 for tti 2ms Index 0), (0..125 tti 2ms Index 1), (0..127 tti 10ms Index 0), (0..120 tti 10ms Index 1) The TSO then returns the corresponding TB Size from the appropriate Table and with given table index. The value returned is '0' for any erroneous conditions (e.g. p_TB_Index out of range). Example: p_tti:2ms, p_TableInd:0, p_TB_Index:13 produces the result 185</p> |

8.8.2 TTCN-2 AT Command Handling in TTCN

8.8.2.1 AT Command Interface

The AT Command Interface resides between the UE and the System Simulator (SS). The implementation of AT commands in the UE is optional[3]. It is agreed, however, that it is the responsibility of the SS - not the ATS - to map AT commands onto appropriate MMI commands. This means that the ATSSs issue AT commands which have to be mapped appropriately and forwarded to the UE, and vice versa.

The ATSSs have been implemented in such a way that AT commands are to be answered immediately. This means that the TTCN expects the answers right away and progresses only afterwards. As a consequence only positive AT responses are assumed.

There are two exceptions from the rule of immediate answering:

- the CGACT command: for this command the TTCN does not expect an immediate AT response. Once the CGACT command has been issued a subsequent UE behaviour is expected. The AT response is issued by the UE only after execution of the AT command, and it will only then be accounted for by the ATSSs;
- the CMSS command: the short message triggered from the UE and the response upon the AT command may arrive at the SS in any order. The signalling short message received from the UE is considered as implicit response upon the AT command. The actual response upon the AT command, a string starting with "CMSS", is consumed in the default behaviour.

8.8.2.2 AT Command Dialogues

In some cases AT commands trigger a dialogue between the AT command interface and the UE. An example used in the SMS ATS is the CMGW command.

```
EXAMPLE:  AT+CMGW="9501231234" (write message)
          > This is the message body^Z
          +CMGW: 7             (index number in storage returned)
          OK
```

A special character (^Z) marks the end of the dialogue.

The ATs generate information to be sent to the UE as one block. If the command mapping function cannot proceed with the dialogue that way, it has to divide the received block into the appropriate pieces prior to forwarding them.

8.8.2.3 AT Response Types

The term 'response type' shall allow a distinction between different types of contents to answer upon an AT command issued by the TTCN.

8.8.2.3.1 'OK' Response

Most AT commands are to be answered with 'OK'. All exceptions are according to 3GPP TS 27.007 [23], for example +CGDATA is to be answered with 'CONNECT'.

8.8.2.3.2 Name String

There are a number of AT commands which, in the positive case, trigger an answer string from UEs. Such strings start with the command which is being answered.

```
EXAMPLE:  AT+CPMS?             (check memory settings)
          +CPMS: "ME",4,10,"ME",4,10,"ME",4,10
          OK
```

The implementation of this type of AT commands is such that the TTCN expects and checks the beginning of the response string. This would (later) facilitate possible direct connections between SS and UE.

8.8.2.3.3 Error strings

There are situations when the UE cannot react positively upon an AT command. Different types of reactions are foreseen. The strings 'ERROR' or 'CMS ERROR: <err>' may be issued by UEs.

"...subparameter values of a command are not accepted by the TA (or command itself is invalid, or command cannot be performed for some reason), result code <CR><LF>ERROR<CR><LF> is sent to the TE and no subsequent commands in the command line are processed."

"Final result code +CMS ERROR: <err> indicates an error related to mobile equipment or network. The operation is similar to ERROR result code. None of the following commands in the same command line is executed. Neither ERROR nor OK result code shall be returned. ERROR is returned normally when error is related to syntax or invalid parameters."

The chosen way of realization prevents, in general, that error strings generated by the UE are passed to the SS. This holds for both intended and unintended errors (from the tester perspective).

8.8.2.4 AT Command Parameters And Options

Many AT commands take parameters some of which are optional. Thus, there is a degree of freedom left to the UEs. This freedom is widely used in the AT commands used in the SMS ATS. To allow flexible parameterization PIXIT items can be used to set the parameters as understood by the UEs.

Examples of such parameters are the preferred memories to be used when testing.

8.9 Bit padding

Three different kinds of bit padding at the RRC layer are defined in 3GPP TS 25.331 [21].

If a bit string is defined in ASN.1 and is an output from a (PER) encoder, it may need the segmentation and padding. One example is that each SIB message is PER-encoded and becomes a (PER) bit-string. A long bit-string is segmented in fixed length, for example with 222 bits. The (1 ... 7) padding bits shall be added at the last segment if its length is between 215 and 211.

No bit padding shall be generated by the PER encoder. Contrary to ITU-T Recommendation X.691 [28], the unaligned PER encoder shall not generate any padding bit to achieve octet alignment at the end of a PER bit string.

RRC padding: The RRC padding bits shall be generated after PER encoder. If the PER bit strings are exchanged via AM or UM SAP, the (1 ... 7) padding bits shall be added to ensure the octet alignment. If the PER bit strings are exchanged via TR SAP, before the exchanges, RRC shall select the smallest transport format that fits the RRC PDU and shall add the lowest number of padding bits required to fit the size specified for the selected transport format. The RRC padding bits shall be taken into account at the calculation of the integrity checksum.

8.9.1 Requirements for implementation

The different kinds of bit padding occur at the different places in the testing architecture. Care must be taken, in order to ensure the correct implementation.

The bit padding for the embedded bit string in ASN.1 shall be resolved in TTCN. It is under the responsibility of the TTCN writer. Several TSO defined can resolve the necessary bit padding in the downlink direction.

The unaligned PER encoder used for TTCN shall not implement the octet alignment at the end of a PER bit string in the downlink direction.

The RRC padding should be implemented at the SS in the downlink direction both for AM/UM and TR modes according to 3GPP TS 25.331 [21], clause 12.1.3.

The SS PER decoder has no need to distinguish the extension and padding parts in the UL direction, and shall match and accept RRC PDUs with any bit string in the extension and padding parts. The remaining part of the received bit string shall be discarded regardless of the RLC mode.

8.10 Test PDP contexts

Table 8.10.1 defines test PDP contexts used in the generic procedures for the PS establishment and other SM tests. The test PDP contextDch1 is the default Test PDP context used in the test cases where no particular Test PDP contexts are specified and UE is in DCH state. The test PDP contextFach is the default Test PDP context used in the test cases where no particular Test PDP contexts are specified and UE is in FACH state.

NOTE 1: Refer to 3GPP TS 25.306 [16a] Table 5.1a.

NOTE 2: The maximum number of single-sized MAC-d PDUs in a single MAC-hs PDU is calculated with the formula:

- **Max number MAC-d PDU = DIV ((MAX TB size - MAC-hs header fixed part), MAC-d PDU size)**
- where MAC-d PDU size = 640 + 16 = 656
- MAC-hs header fixed part = Length of MAC-hs fixed header (VF + Queue Id + TSN) + Length of MAC-hs flexible header (SID + N + F) = 21 bits

Example of calculation for category 1:

Max number MAC-d PDU = DIV((7298-21) , 656) = 11

NOTE 3: Example of calculation for MIMO or DC-HSDPA or Multiflow with 2 cells:

When MIMO or dual cell operation is configured, this parameter defines the maximum number of bits that the UE is capable of receiving per transport block per HS-DSCH.

The maximum number of single-sized MAC-d PDUs in a single MAC-ehs PDU is calculated with the formula:

- **Max number MAC-d PDU = DIV ((MAX TB size - MAC-ehs header fixed part), MAC-d PDU size) * 2**
- where MAC-d PDU size = 640 + 16 = 656
- MAC-ehs header fixed part = Length of one MAC-ehs fixed header (LCH-ID + L + TSN + SI + F) = 24 bits

Example of calculation for category 17:

Max number MAC-d PDU = DIV((23370-24) , 656)*2 = 70

NOTE 4: Example of calculation for combined DC-HSDPA and MIMO:

When DC-HSDPA and MIMO is configured, this parameter defines the maximum number of bits that the UE is capable of receiving per transport block per HS-DSCH.

The maximum number of single-sized MAC-d PDUs in a single MAC-ehs PDU is calculated with the formula:

- **Max number MAC-d PDU = DIV ((MAX TB size - MAC-ehs header fixed part), MAC-d PDU size) * 4**
- where MAC-d PDU size = 640 + 16 = 656
- MAC-ehs header fixed part = Length of one MAC-ehs fixed header (LCH-ID + L + extended TSN + SI + F) = 32 bits

Example of calculation for category 25:

Max number MAC-d PDU = DIV((23370-32) , 656)*4 = 140

NOTE 5: Example of calculation for 3C-HSDPA or Multiflow with 3 cells:

When 3C-HSDPA is configured, this parameter defines the maximum number of bits that the UE is capable of receiving per transport block per HS-DSCH.

The maximum number of single-sized MAC-d PDUs in a single MAC-ehs PDU is calculated with the formula:

- without MIMO configured: **Max number MAC-d PDU = DIV ((MAX TB size - MAC-ehs header fixed part), MAC-d PDU size) * 3**
- with MIMO configured: **Max number MAC-d PDU = DIV ((MAX TB size - MAC-ehs header fixed part), MAC-d PDU size) * 6**

- where MAC-d PDU size = 640 + 16 = 656

- MAC-ehs header fixed part = Length of one MAC-ehs fixed header (LCH-ID + L + TSN + SI + F) = 24 bits

Example of calculation for category 29:

Max number MAC-d PDU = DIV((42192-24) , 656)*3 = 192

NOTE 6: Example of calculation for 4C-HSDPA or Multiflow with 4 cells:
 When 4C-HSDPA is configured, this parameter defines the maximum number of bits that the UE is capable of receiving per transport block per HS-DSCH.
 The maximum number of single-sized MAC-d PDUs in a single MAC-ehs PDU is calculated with the formula:
 - without MIMO configured: **Max number MAC-d PDU = DIV ((MAX TB size - MAC-ehs header fixed part), MAC-d PDU size) * 4**
 - with MIMO configured: **Max number MAC-d PDU = DIV ((MAX TB size - MAC-ehs header fixed part), MAC-d PDU size) * 8**
 - where MAC-d PDU size = 640 + 16 = 656
 - MAC-ehs header fixed part = Length of one MAC-ehs fixed header (LCH-ID + L + TSN + SI + F) = 24 bits

Example of calculation for category 29:
 Max number MAC-d PDU = DIV((42192-24) , 656)*4 = 256

8.10.1a Mapping of Quality of service and AT command for LCR TDD HSPA DL testing

NOTE 1: Refer to 3GPP TS 25.306 [16a], Table 5.1c.

NOTE 2: The maximum number of single-sized MAC-d PDUs in a single MAC-hs PDU is calculated with the formula:
- **Max number MAC-d PDU = DIV ((MAX TB size - MAC-hs header fixed part), MAC-d PDU size),**
where
- MAC-d PDU size = 640 + 16 = 656 bits
- MAC-hs header fixed part = Length of MAC-hs fixed header (VF + Queue Id + TSN) + Length of MAC-hs flexible header (SID + N + F) = 21 bits.
Example of calculation for category 1: Max number MAC-d PDU = DIV((2788-21) , (640+16)) = 4.

NOTE 3: When MIMO operation is configured, the maximum number of single-sized MAC-d PDUs in a single MAC-ehs PDU is calculated with the formula:
- **Max number MAC-d PDU = DIV ((MAX TB size - MAC-ehs header fixed part), MAC-d PDU size) * 2**
where MAC-d PDU size = 640 + 16 = 656
MAC-ehs header fixed part = Length of one MAC-ehs fixed header (LCH-ID + L + TSN + SI + F) = 24 bits
Example calculation for category 30: Max number MAC-d PDU = DIV((21076-24) , 656)*2 = 64.

8.10.2 Mapping of Quality of service and AT command for HSPA UL testing

NOTE 1: Refer to 3GPP TS 25.306 [16a], Table 5.1g.

NOTE 2: The maximum number of MAC-d PDUs in a single MAC-e PDU containing a single MAC-es PDU is calculated with the formula:
 - **Max number MAC-d PDU = DIV ((MAX TB size - Length of MAC-e/es fixed header (DDI+N+TSN)), MAC-d PDU size)**
 The maximum number of MAC-d PDUs in a single MAC-i PDU containing a single MAC-is PDU is calculated with the formula:
 - **Max number MAC-d PDU = DIV ((MAX TB size - Length of MAC-i/is fixed header (LCH-ID, L, F, SS, TSN)), MAC-d PDU size)**

Example of calculation for category 1 with MAC-e/es:
 Max number MAC-d PDU = DIV((7110 - 18), (320+16)) = 21
 Example of calculation for category 1 with MAC-i/is:
 Max number MAC-d PDU = DIV((7110 - 24), (320+16)) = 21

NOTE 3: TTI=2ms is preferred for the test unless specified differently in 3GPP TS 34.123-1 [1].

NOTE 4: When DC-HSUPA apply the maximum number of MAC-d PDUs in a single MAC-i PDU containing a single MAC-is PDU is calculated with the formula:
 - **Max number MAC-d PDU = (DIV ((MAX TB size - Length of MAC-i/is fixed header (LCH-ID, L, F, SS, extended TSN)), MAC-d PDU size))*2**

Example of calculation for category 8:
 Max number MAC-d PDU = DIV((7110 - 32), (320+16)) *2= 68

8.10.2a Mapping of Quality of service and AT command for LCR TDD HSPA UL testing

Table 8.10.2a defines the encoding of the Maximum bit rate for uplink IE in QoS and the corresponding encoding in the AT command.

NOTE 1: See 3GPP TS 25.306 [16a], Table 5.1m.

NOTE 2: The maximum number of MAC-d PDUs in a single MAC-e PDU containing a single MAC-es PDU is calculated with the formula:
 - **Max number MAC-d PDU = DIV ((MAX TB size - Length of MAC-e/es fixed header), MAC-d PDU size)**
 where, MAC-d PDU size = 320 + 16 = 336 bits
 - Length of MAC-e/es fixed header = DDI+N+TSN = 18 bits
 Example of calculation for category 1: Max number MAC-d PDU = DIV((2754 - 18), (336)) = 8.

8.11 DCH-DSCH Configurations

1. Configure PDSCH physical channel

```
CPHY_RL_Setup_REQ(
    physicalChannelIdentity,
    pDSCHInfo)
```

-- set up the scrambling code and transmission power level for the PDSCH identified by PhysicalChannelIdentity, and establishes the mapping between the spreading factor (and channelization codes) used for the PDSCH and TFCI(field2) transmitted in associated PDCH

2. Configure DSCH transport channels

```
CPHY_TrCH_Config_REQ(
    physicalChannelIdentity,
    dlconnectedTrCHList,
    dlTFCS)
```

-- set up TFS for each of DSCH's carried by the PDSCH defined in step 1 and TFCS (will be presented in TFCI(field2) of PDCH configured in step 5) for the CCTrCH consisting of these DSCH's

3. Configure MAC entity for DSCH

```
CMAC_Config_REQ(
    physicalChannelIdentity,
    uE_Info,
    dlconnectedTrCHList,
    dlTFCS)
```

-- set up TFS, DSCH-RNTI and TFCS (which will be presented in TFCI(field2) of PDCH configured in step 5) for DSCH's, and map logical channel to DSCH transport channel

4. Configure RLC entity for DTCHs

```
CRLC_Config_REQ(
    physicalChannelIdentity,
    rBInfo)
```

-- set up RLC entity on top of DTCH logical channel which is mapped onto DSCH

5. Configure DPCH physical channel

```
CPHY_RL_Setup_REQ(
    physicalChannelIdentity,
    dPCHInfo)
```

6. Configure DCH transport channels

```
CPHY_TrCH_Config_REQ(
    physicalChannelIdentity,
```

```

    dlconnectedTrCHList,
    dlTFCS)
-- set up TFS for each DCH carried by the DPCH defined in step 5 and TFCS (TFCI(field1 and field2))
for the CCTrCH consisting of all DCH's mapped on the DPCH.

```

7. Configure MAC entity for DCH

```

CMAC_Config_REQ(
    physicalChannelIdentity,
    dlconnectedTrCHList,
    dlTFCS)
-- set up TFS and TFCS (TFCI(field1) for DCH's, and TFCI(field2) for associated DSCH), and map
logical channel to DCH transport channel.

```

8. Configure RLC for DTCH, DCCH

```

CRLC_Config_REQ(
    physicalChannelIdentity,
    rBInfo)
-- set up RLC entity on top of DTCH and DCCH logical channels which are mapped onto DCH

```

8.11a DCH with HS-DSCH Configurations (Rel-5 or later)

1. Configure DPCH physical channel

```

CPHY_RL_Setup_REQ(
    physicalChannelIdentity,
    dPCHInfo_r5 or dPCHInfo_r6 or dPCHInfo_r7 )
-- hs_DPCCHInd is present in the dPCHInfo ( only for HS-DSCH serving cell)
-- set up the DL-DPCH associated with HS-PDSCH
-- set up the HS-DPCCH which is associated with the HS-PDSCH (this is done only for HS-DSCH serving
-- cell).

```

2. Configure DCH transport channels

```

CPHY_TrCH_Config_REQ(
    physicalChannelIdentity,
    dlconnectedTrCHList,
    dlTFCS)
-- set up TFS for each DCH carried by the DPCH defined in step 5 and TFCS for the CCTrCH consisting
of all DCH's mapped on the DPCH.

```

3. Configure MAC entity for DCH

```

CMAC_Config_REQ(
    physicalChannelIdentity,
    dlconnectedTrCHList,
    dlTFCS)
-- set up TFS and TFCS for DCH's, and map logical channel to DCH transport channel.

```

4. Configure RLC for DCCH

```

CRLC_Config_REQ(
    rB_Identity,
    rBInfo)
-- set up RLC entity on top of DCCH logical channels which are mapped onto DCH

```

5. Configure HS-PDSCH physical channel

```

mac_hsPduSizeInfoList; reorderingReleaseTimer, discardTimer and the MAC-dFlow identity to which
this MAChsQueue belongs.
-- mimoStatus is set to TRUE if MIMO is configured.

```

6.b Associated with MAC-ehs [Rel-7 or later]

```

CPHY_TrCH_Config_REQ(
    physicalChannelIdentity,
    ehs_DSCH_Flows])
-- set up the HS-DSCH transport channel MAC-ehs Queues flows identified by mac_ehs_QueueId
in the EHS_DSCH_Flows.

As no data is sent on HS-DSCH, this implementation will not affect the signalling, as signalling is
transmitted through the associated DPCH channel.
-- mimoStatus is set to TRUE if MIMO is configured.
```

8. Configure RLC entity for DTCHs and/or DCCHs (if not already configured) which is mapped on HS-DSCH

```
CRLC_Config_REQ(
    rB_Identity,
    rBInfo)
-- set up RLC entity on top of DTCH/DCCH logical channel which is mapped onto MAC-d/mac-ehsQueue
```

9. MAC-hs/MAC-ehs reset, release of SS resources for HSDPA

```
MAC-hs/MAC-ehs reset:
    CMAC_MACHs_MACehs_Reset_REQ(
        cellId)

RL release:

        cellId, phyChId)
-- phyChId is the identity of HS-PDSCH physical channel
```

```

RLC release:
    CRLC_Config_REQ(
        cellId, rbId)
-- rbid is the identity of the radio bearer providing HSDPA service

```

8.11b HS-DSCH Configuration Verification

In most HSDPA test cases although the HSDPA channels (HS-SCCH, HS-PDSCH, HS-DSCH & HS-DPCCH) are set up and reconfigured using RRC peer messages, no data is sent on HS-DSCH and all the signalling is transmitted through the associated DPCH physical channel.

In order to ensure that the HS-DPCCH channel has been configured, the SS shall, upon request, forward one CQI report to the TTCN.

8.12 Pre- and postambles for GERAN to UTRAN tests

8.12.1 Preamble for GERAN to UTRAN tests

Before running inter-RAT test cases, radio conditions should be such that the mobile has to select the cell of the intended original RAT. The following steps should be used before running GERAN to UTRAN test cases.

1. UTRAN cell is powered OFF. The default radio conditions for a suitable GERAN cell are used for the serving cell, as defined in 3GPP TS 34.108 [3], clause 6.1.7. This step is performed while the UE is still switched OFF.
2. UE is switched ON and performs registration and attach.
3. The UTRAN cell is powered ON with an RF level such that the cell is a suitable neighbour cell, using the RF conditions defined in 3GPP TS 34.108 [3], clause 6.1.5, so that the UE will not re-select the UTRAN cell.

8.12.2 Postamble for GERAN to UTRAN tests

The following procedure is used after inter-RAT handover or cell change order test cases in case the test needs to be performed multiple times in a loop.

8.12.2.1 GERAN to UTRAN handover in CS

The test cases are defined in 3GPP TS 51.010-1 [26], clause 60.

8.12.2.2 GERAN to UTRAN cell change in PS (in PMM-CONNECTED)

These test cases are defined in 3GPP TS 51.010-1 [26], clause 42.4.7.

Expected sequence

| Step | Direction | | Message | Comments |
|------|-----------|----|------------------------------|---|
| | UE | SS | | |
| 1 | --> | | ROUTING AREA UPDATE REQUEST | GMM - Update type = 'Combined RA / LA updating' or 'combined RA/LA updating with ISMI Attach' for CS/PS mobiles, and 'RA updating' for PS only mobiles. Follow-on request is made. |
| 2 | <-- | | SECURITY MODE COMMAND | Integrity protection is activated, UTRAN security keys in PS domain derived from GERAN |
| 3 | --> | | SECURITY MODE COMPLETE | |
| 4 | <-- | | ROUTING AREA UPDATE ACCEPT | GMM - P-TMSI is included |
| 5 | --> | | ROUTING AREA UPDATE COMPLETE | |
| | | | | SS releases the RRC connection |
| | | | | UE is powered OFF. |

8.12.2.3 GERAN to UTRAN DTM test cases

These test cases are defined in 3GPP TS 51.010-1 [26], clauses 41.5.1.1.1.4 and 47.3.4.

Expected sequence

| Step | Direction | | Message | Comments |
|------|-----------|----|-------------------------------|---|
| | UE | SS | | |
| | | | | The SS releases the RR connection |
| 1 | --> | | RRC CONNECTION REQUEST | RRC - establishment cause = 'registration' |
| 2 | <-- | | RRC CONNECTION SETUP | RRC |
| 3 | --> | | RRC CONNECTION SETUP COMPLETE | RRC |
| A4 | --> | | ROUTING AREA UPDATE REQUEST | UE behaviour type A, if the UE is still attached: GMM - Update type = 'Combined RA / LA updating' or 'combined RA/LA updating with ISMI Attach |
| A5 | <-- | | SECURITY MODE COMMAND | Integrity protection is activated, UTRAN security keys in PS domain derived from GERAN |
| A6 | --> | | SECURITY MODE COMPLETE | |
| A7 | <-- | | ROUTING AREA UPDATE ACCEPT | GMM - P-TMSI is included |
| A8 | --> | | ROUTING AREA UPDATE COMPLETE | |
| B4 | --> | | LOCATION UPDATING REQUEST | UE behaviour type B, if the UE has already detached |
| B5 | | | AUTHENTICATION REQUEST | |
| B6 | | | AUTHENTICATION RESPONSE | |
| B7 | <-- | | SECURITY MODE COMMAND | Integrity protection is activated, UTRAN security keys in CS domain derived from GERAN |
| B8 | --> | | SECURITY MODE COMPLETE | |
| B8a | <-- | | LOCATION UPDATING ACCEPT | |
| B8b | --> | | TMSI REALLOCATION COMPLETE | |
| 9 | | | | SS releases the RRC connection |
| 10 | | | | UE is powered OFF. |

8.13 E-DCH configurations (Rel-6 or later)

8.13.1 DPCH (SRB) and E-DCH (RAB) configuration

8.13.1.1 Serving E-DCH cell

1. Configure DPCH physical channel

```
CPHY_RL_Setup_REQ
(
  cellId_1
  physicalChannelIdentity,
  dPCHInfo_r5OrLater
  r6 (
    ul_DPCH_Info6

8.13.2 DPCH/HS-DSCH/E-DCH setup and release order

When setting up an HSUPA RAB, the following order of channel configuration is applied:

DL-DPCH, HS-DSCH, UL-DPCH, E-DCH.

When releasing an HSUPA RAB, the following order of channel release/ modification is applied:

E-DCH, HS-DSCH, UL-DPCH, DL-DPCH.

8.14 Guidelines of MBMS implementations

8.14.1 MCCH scheduling implementation

The rules for the transmission of MCCH messages are specified in 3GPP TS 34.108 [3], clause 11.1.2. The current clause provides the implementation guidelines.

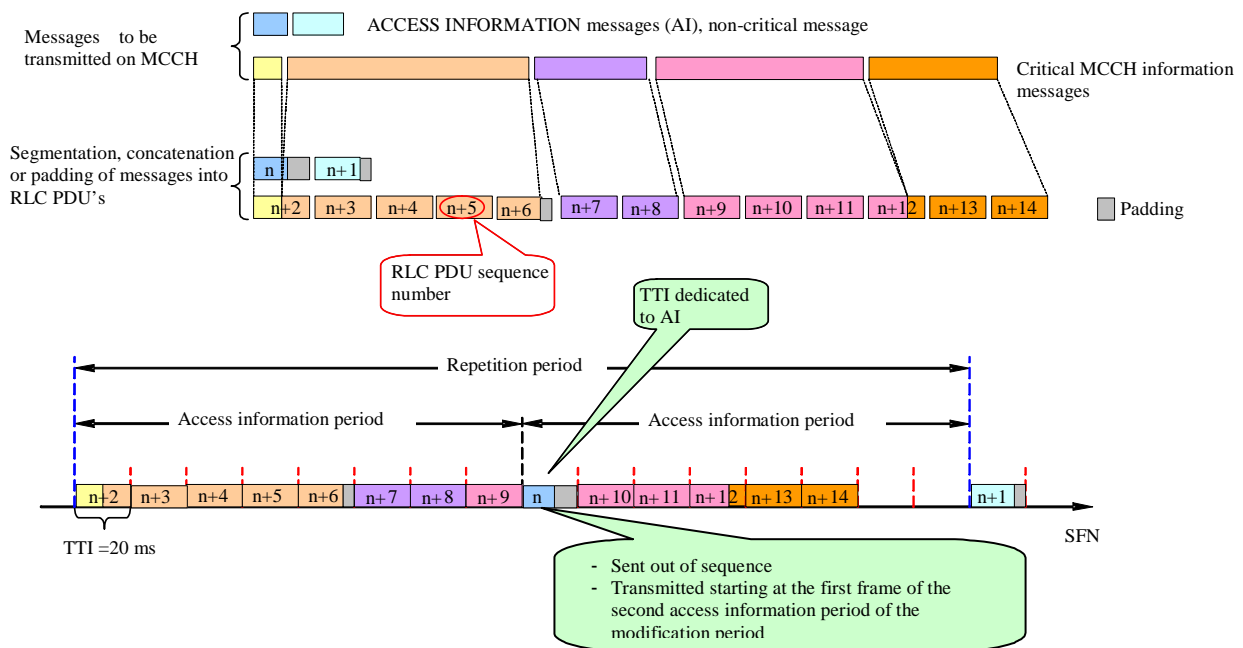

Figure 8.14.1.1: Segmentation and concatenation of MCCH messages into RLC PDU's

If required in the test, all ACCESS INFORMATION messages of a modification period are sent via RLC_UM_ACCESSInfo_REQ. Each ACCESS INFORMATION message corresponds to an access information period in an ordered way. The ACCESS INFORMATION is transmitted on the 1st TTI of the second access information period of the modification period.

All critical MCCH messages of a modification period are sent via RLC_UM_CriticalMCCHMsg_REQ. The sequence of the critical MCCH messages is segmented and concatenated without padding by a UM RLC entity configured specifically for MCCH. RLC_UM_ACCESSInfo_REQ precedes RLC_UM_CriticalMCCHMsg_REQ, or RLC_UM_CriticalMCCHMsg_REQ can be used alone. The scenarios of RLC_UM_ACCESSInfo_REQ used alone or RLC_UM_CriticalMCCHMsg_REQ preceding RLC_UM_ACCESSInfo_REQ are not applied.

The first RLC SN are always allocated consecutively to ACCESS INFORMATION messages, i.e. from $n + 0$ onwards as necessary. Then an RLC SN block is consecutively allocated to the critical MCCH messages, saying the last used SN = $(n + m) \text{MOD } 128$ in the current modification period. Renew n to $(n + m + 1) \text{MOD } 128$ for the next modification period.

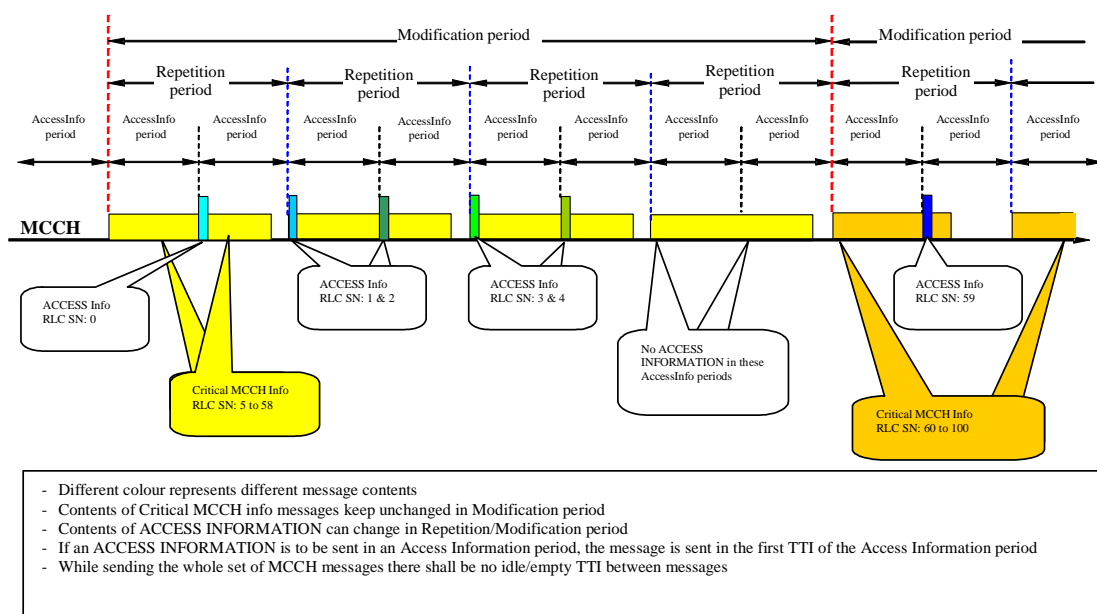

Figure 8.14.1.2: RLC SN allocation in MCCH scheduling

ACCESS INFORMATION messages within a modification period have different RLC SN. The SN = $n + 0$ is allocated to the 1st ACCESS INFORMATION message. The critical MCCH messages to be transmitted in the different repetition periods within a modification period have the same RLC SN. RLC SN are incremented across the boundary of two consecutive modification periods without RLC reestablishment. The different RLC SN are allocated to the two consecutive modification periods.

In order to ensure UE can read the first ACCESS INFORMATION message, the message is sent by the TTCN in the second access information period.

8.14.2 MSCH scheduling and service data on MTCH

Multiple ordered SCHEDULING INFORMATION messages are sent by using RLC_UM_MSCH_Msg_REQ. Each SCHEDULING INFORMATION corresponds to a scheduling period, a 'noSend' MSCH_Message indicates that no MBMS services are scheduled in that scheduling period for all MTCH. The first SCHEDULING INFORMATION message is sent on the scheduledSFN and successively the remaining messages are sent in every scheduling period.

The MBMS service data are fed by RLC_UM_TestDataReq. However the real MBMS service transmissions for multiple scheduling periods on each MTCH are controlled by CRLC_MTCH_Scheduling_REQ. Within each scheduling period the information on the discontinuous service transmissions are conveyed through a list of pairs of (start, duration). The IE noServiceData as NULL being provided for a scheduling period indicates no service transmission on that MTCH.

The simulation of the continuous MBMS services is provided if an empty CRLC_MTCH_Scheduling_REQ is sent without scheduling configuration parameter and scheduling information.

RLC_UM_MSCH_Msg_REQ precedes CRLC_MTCH_Scheduling_REQ and RLC_UM_TestDataReq.

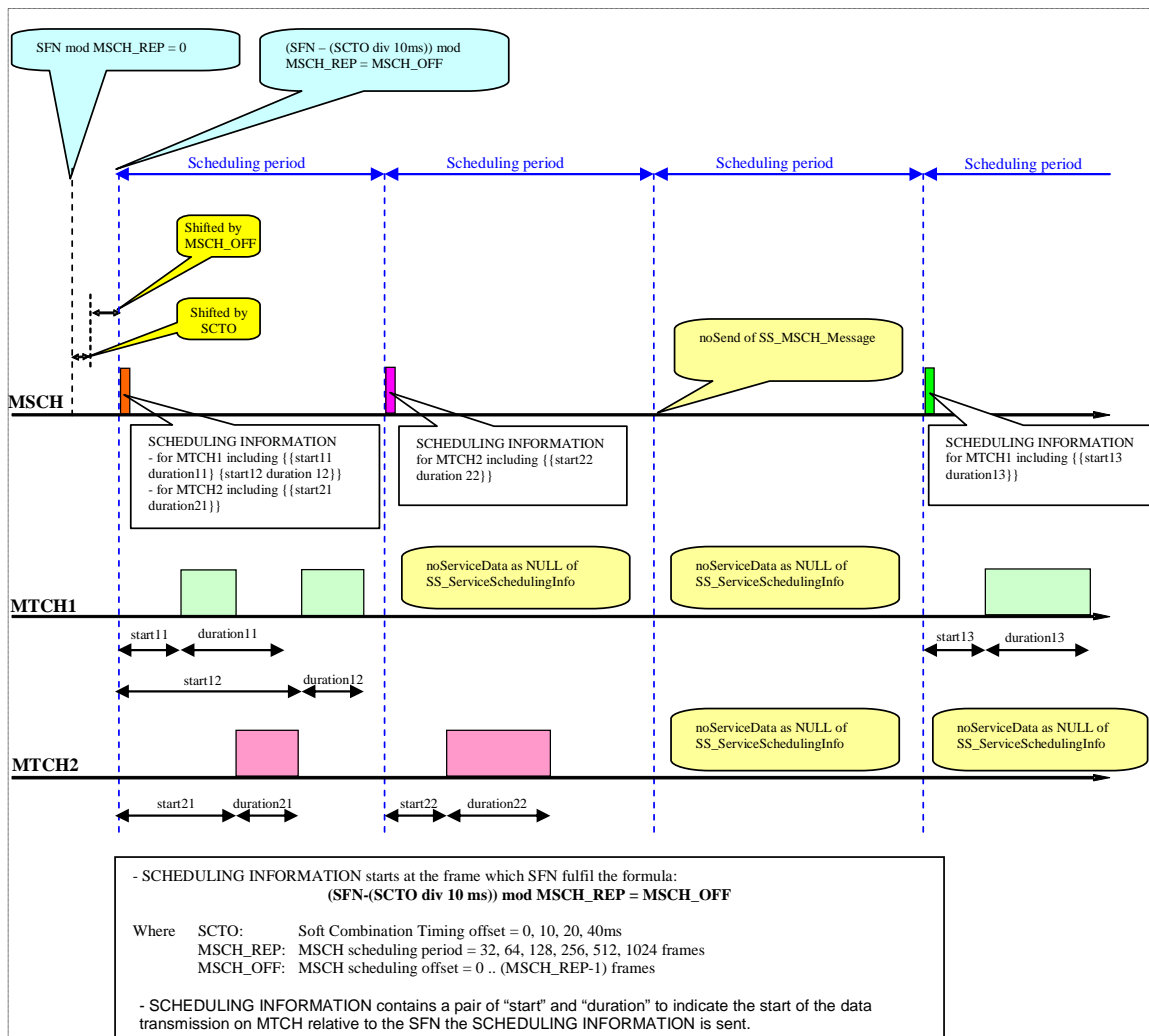

Figure 8.14.2: MSCH scheduling and MTCH data transfer

8.14.2.1 Scheduled service data on MTCH without MSCH configured

The scheduled service is a mechanism for synchronization of the initialization of the MBMS services announced on MCCH and the start of transmission the service data on MTCH. The mechanism can also be used at the SS side when MSCH is not configured.

In a PTM test session two separate sequences of critical MCCH messages are transmitted in an order of C4 - C2 or C5 - C3 in two consecutive modification periods. The MBMS MODIFIED SERVICES INFORMATION message in C4/C5 generally does not contain MBMS p-t-m activation time for the UE immediate reception of MBMS services. However, the SS shall not start test data transmission until on the 1st TTI of the next modification period to ensure that the UE can have a nearly full modification period to obtain critical MCCH messages and to apply the configuration required by the test.

Figure 8.14.2.1 illustrates the relationship of the service scheduling on MTCH and the default1 MCCH information scheduling. The SS waits until the 2nd half of the last repetition period in the modification period when the C4 messages are sent before closing test loop. The test data are transmitted on the 1st TTI of the modification period when the C2 messages are sent. The whole test sequence is:

CPHY_SF_N_REQ, calculating next MICH CFN,

MP n: next MICH CFN set MICH and transmit NI,

MP n+1: next MICH CFN+1 mp set modified services list (C4 or C5), set PTM activation time if necessary,

MP n+2: next MICH CFN+2 mp set unmodified service list and transmit data (C2 or C3).

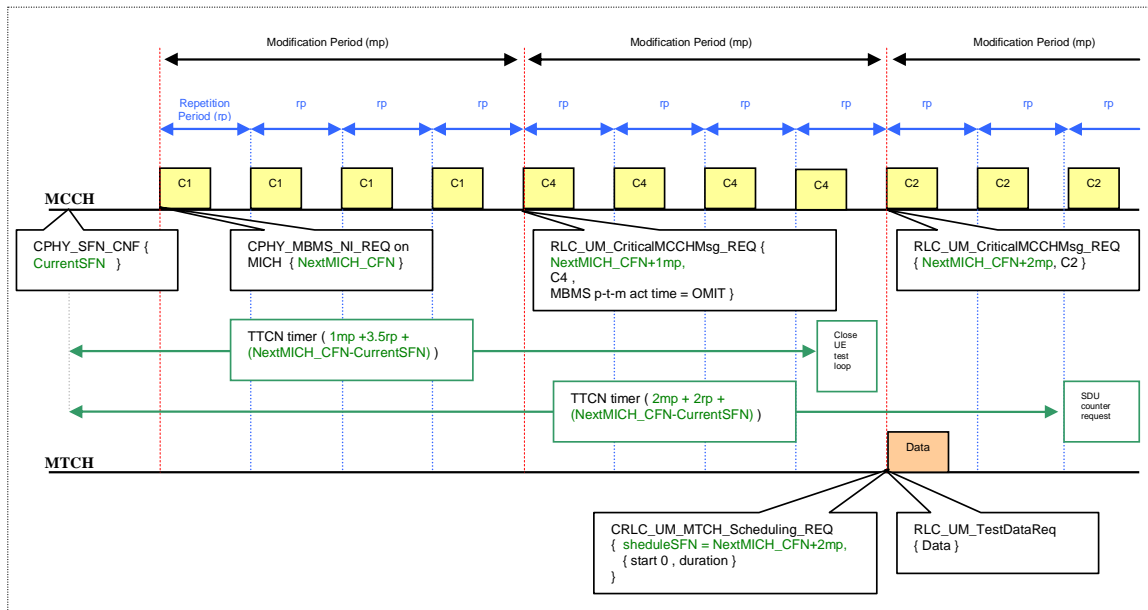

Figure 8.14.2.1: Synchronized MTCH data sending, no MSCH configured

If the test loop is already closed and the service data is to be sent the ASPs follow the order:

CPHY_SF_N_REQ, CRLC_MTCH_Scheduling_REQ and RLC_UM_TestDataReq.

8.15 Cell mapping

Table 8.15 defines the cell identities mapping between 3GPP TS 34.108 [3] and the ATS implementation.

8.16 Guidelines for CS voice over HSPA implementation

For PDCP CS voice over HSPA tests, data are scheduled to ensure consistency between CFN and CS counter in downlink and to check CS counter value in uplink. Figure 8.16 provides the ASP sequence, CFN and CS counter handling.

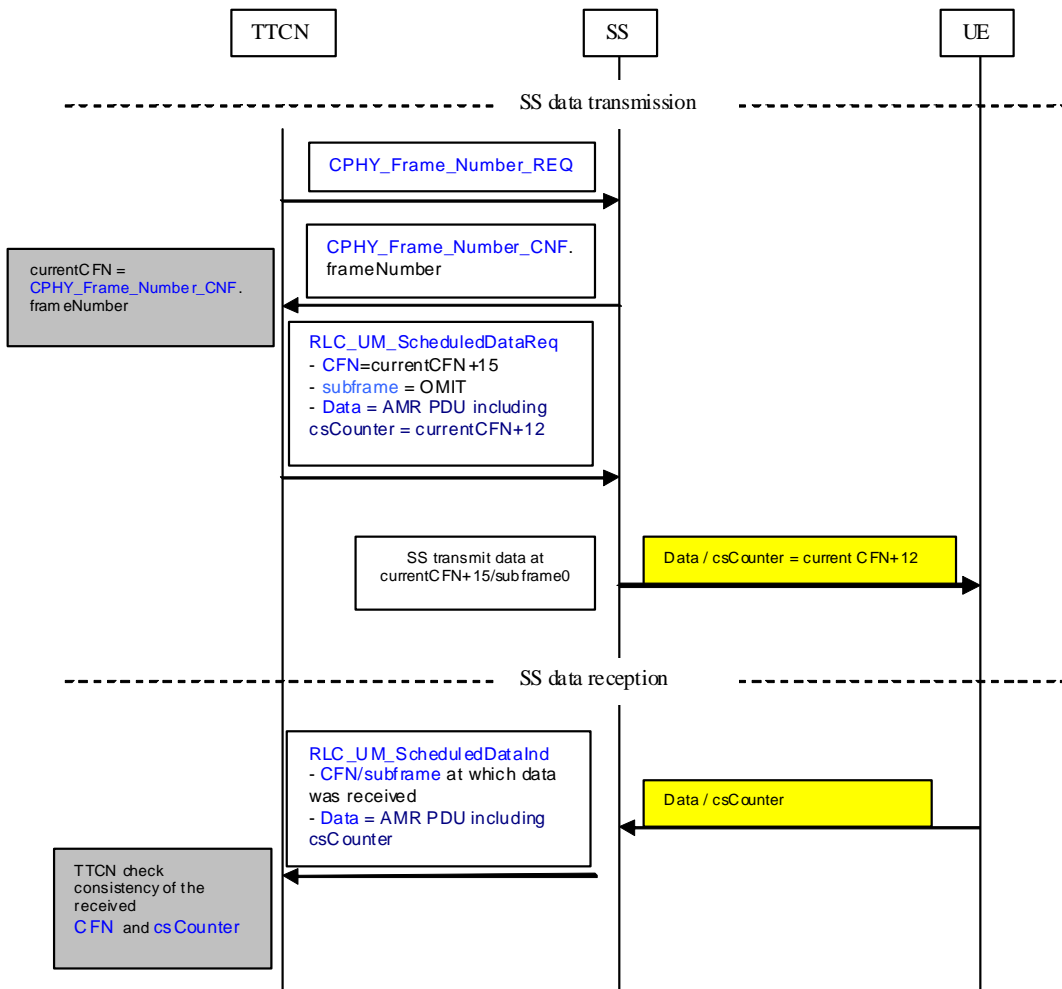

Figure 8.16: ASP sequence for data scheduling in PDCP CS Voice over HSPA tests

Upon reception of data, the ASP RLC_UM_ScheduledDataInd includes:

- the CFN on which the data has been received by SS,
- the AMR PDU, including the csCounter in the header

In terms of the CFN and csCounter, the TTCN can check the delay between the received CFN and the csCounter.

8.17 Cell Timing

The timing parameters of the cells are defined in Tables 8.17-1 and 8.17-2.

Table 8.17-1: Cell timing parameters for UTRAN test cases

| UTRAN cells | SFN offset | Tcell value |
|-------------|------------|-------------|
| 1 or A | 0 | px_TcellA |
| 2 or B | 0 | px_TcellB |
| 3 or C | 0 | px_TcellC |
| 4 or D | 3000 | px_TcellD |

Annex A (normative): Abstract Test Suites (ATS)

This annex contains the approved ATSs.

The ATSs have been produced using the Tree and Tabular Combined Notation version 2 (TTCN-2) according to TR 101 666 [27] and using the Testing and Test Control Notation version 3 (TTCN-3) according to ES 201 873-1 [65].

The ATSs were developed on a separate TTCN software tool and therefore the TTCN tables are not completely referenced in the table of contents. Each ATS contains a test suite overview part which provides additional information and references.

A.1 Version of specifications

Table A.1 shows the version of the test specifications which the delivered ATSs are referred to.

Table A.1: Versions of the test and Core specifications

A.2 NAS TTCN-2 ATS

The approved NAS test cases are listed. An "X" in columns FDD or LCR TDD indicates the test case approved for the relevant ATS.

| 8.2.2.17 | RRC / Radio Bearer Reconfiguration from CELL_FACH to CELL_FACH: Success | X | X |
| 8.2.2.18 | RRC / Radio Bearer Reconfiguration from CELL_FACH to CELL_FACH: Success (Cell re-selection) | X | |

| Test case | Description | FDD | LCR TDD |
|-----------|--|-----|---------|
| 8.2.2.19 | RRC / Radio Bearer Reconfiguration from CELL_DCH to CELL_DCH: Success (Subsequently received) | X | X |
| 8.2.2.23 | RRC / Radio Bearer Reconfiguration from CELL_FACH to CELL_PCH: Success | X | X |
| 8.2.2.31 | Radio Bearer Reconfiguration for transition from CELL_FACH to CELL_DCH (Frequency band modification): Success | X | |
| 8.2.2.35 | Radio Bearer Reconfiguration from CELL_DCH to CELL_FACH: Successful channel switching with multiple PS RABs established | X | |
| 8.2.2.43 | Radio Bearer Reconfiguration for transition from CELL_DCH to CELL_DCH: Success (Seamless SRNS relocation, without pending of ciphering, frequency band modification) | X | |
| 8.2.3.1 | Radio Bearer Release for transition from CELL_DCH to CELL_DCH: Success | X | X |
| 8.2.3.7 | RRC / Radio Bearer Release for transition from CELL_DCH to CELL_FACH: Success | X | X |
| 8.2.3.8 | RRC / Radio Bearer Release for transition from CELL_DCH to CELL_FACH: Success (Cell re-selection) | X | |
| 8.2.3.9 | RRC / Radio Bearer Release for transition from CELL_FACH to CELL_DCH: Success | X | X |
| 8.2.3.11 | RRC / Radio Bearer Release for transition from CELL_FACH to CELL_DCH: Failure (Physical channel failure and successful reversion to old configuration) | X | X |
| 8.2.3.15 | RRC / Radio Bearer Release for transition from CELL_FACH to CELL_FACH: Success | X | X |
| 8.2.3.18 | RRC / Radio Bearer Release from CELL_DCH to CELL_PCH: Success | X | X |
| 8.2.3.19 | RRC / Radio Bearer Release from CELL_DCH to URA_PCH: Success | X | X |
| 8.2.3.29 | Radio Bearer Release for transition from CELL_DCH to CELL_DCH: Associated with signalling connection release during multi call for PS and CS services | X | X |
| 8.2.4.1 | Transport channel reconfiguration (Timing re- initialised hard handover with transmission rate modification) from CELL_DCH to CELL_DCH: Success | X | |
| 8.2.4.1a | Transport channel reconfiguration (Transmission Rate Modification) from CELL_DCH to CELL_DCH of the same cell: Success | X | |

Annex B (normative): Partial IXIT proforma

Notwithstanding the provisions of the copyright related to the text of the present document, The Organizational Partners of 3GPP grant that users of the present document may freely reproduce the partial IXIT proforma in this annex so that it can be used for its intended purposes and may further publish the completed partial IXIT.

B.0 Introduction

This partial IXIT proforma contained in the present document is provided for completion, when the related Abstract Test Suite is to be used against the Implementation Under Test (IUT).

Text in *italics* is comments for guidance for the production of an IXIT, and is not to be included in the actual IXIT.

The completed partial IXIT will normally be used in conjunction with the completed ICS, as it adds precision to the information provided by the ICS.

B.1 Parameter values

B.1.1 BasicM test suite parameter declarations

The following parameters are common to all ATSS.

Table B.1.1: BasicM PIXIT

| Parameter name | Description | Type | Default value | Supported value |
|----------------------------|--|------------------------------|---|---|
| px_AuthAMF | Authentication Management Field (16 bits). The value shall be different from '1111 1111 1111 1111'B (AMFresynch). | B16 | See note 2 | |
| px_AuthK | Authentication Key (128 bits) | B128 | '01011110010010101010011001101101011101001010101110111010000001001011100110011111000011000010011010011001'B | |
| px_AuthN | Value of n to initialize tcv_Auth_n (length of extended response) min 31, max 127 (3GPP TS 34.108 [3], clause 8.1.2) | INTEGER | 127 | |
| px_AuthRAND | Random Challenge (128 bits) | BITSTRING | '01010101...01'B | |
| px_GPRS_CipheringAlgorithm | Cipher algorithm | GPRS_CipheringAlgorithm_Type | '010'B | Allowed values gea0 '000'B, gea2 '010'B, gea3 '011'B, gea4 '100'B |
| px_CipheringOnOff | Security mode - TRUE if ciphering is applicable | BOOLEAN | TRUE | |
| px_CN_DomainTested | CN domain to be tested. This parameter is used in test cases that handle both PS and CS domains. | CN_DomainIdentity | ps_domain | |
| px_DL_MaxCC_TB_bits | Maximum sum of number of bits of all convolutionally coded transport blocks | MaxNoBits | b163840 | |

| Parameter name | Description | Type | Default value | Supported value |
|-------------------------------|---|--------------------------------|--------------------|---|
| | being received at an arbitrary time instant. | | | |
| px_DL_MaxCCTrCH | Maximum number of Simultaneous CCTrCH for downlink | MaxSimultaneousCCTrCH_Count | 8 | |
| px_DL_MaxTB_bits | Maximum sum of number of bits of all transport blocks being received at an arbitrary time instant. | MaxNoBits | b163840 | |
| px_DL_MaxTF | Maximum number of TF for downlink | MaxNumberOfTF | tf1024 | |
| px_DL_MaxTFS | Maximum number of TFC in the TFCS for downlink | MaxNumberOfTFC_DL | ffc1024 | |
| px_DL_MaxTrCHs | Maximum number of simultaneous transport channels for downlink. | MaxSimultaneousTransChannelsDL | e32 | |
| px_DL_MaxTTI_TB | Maximum total number of transport blocks received within TTIs that end within the same 10 ms interval. | MaxTransportBlocksDL | tb512 | |
| px_FRESH | Value for FRESH | Fresh | See note 1 | |
| px_FDD_OperationBand | Applicable for FDD The operation band under test as defined in 34.108 clause 5.1.1. | INTEGER | 1, see note 3 | px_UARFCN_D_Mid, px_UARFCN_D_Low and px_UARFCN_D_High shall take the values according to the value of px_FDD_OperationBand. |
| px_GuardTimerExtension | Guard timer extension value (in seconds). A reasonable value shall be used. | INTEGER | 0 | |
| px_IMSI_Def | Default IMSI value | HEXSTRING | '001010123456063'H | |
| px_JapanMCC | Japan MCC to be used for Band VI | HEXSTRING | '442'H | |
| px_PriScrmCode | Applicable for FDD Primary scrambling code | PrimaryScramblingCode | 100 | |
| px_MaxAM_EntityNumberRLC_Cap | Maximum AM Entity Number for RLC. | MaximumAM_EntityNumberRLC_Cap | am30 | |
| px_MaxNoDPDCH_BitsTransmitted | Part of UL_PhysChCapabilityFDD | MaxNoDPDCH_BitsTransmitted | b57600 | |
| px_MaxNoDPCH_PDSCH_Codes | Part of DL_PhysChCapabilityFDD. INTEGER (1..8). | INTEGER | 8 | |
| px_MaxNoPhysChBitsReceived | Part of DL_PhysChCapabilityFDD. | MaxNoPhysChBitsReceived | b76800 | |
| px_MaxRLC_WindowSize | Maximum RLC window size. | MaximumRLC_WindowSize | mws4095 | |
| px_MS_ClsmkESIND | default Early Sending Indication | B1 | '0'B | |
| px_MS_ClsmkRevLvl | default Revision Level | B2 | '10'B | |
| px_PTMSI_Def | default PTMSI | OCTETSTRING | 'C2345678'O | |
| px_PTMSI_SigDef | default PTMSI signature (3 octets, 3GPP TS 24.008 [9], clause 10.5.5.8). | OCTETSTRING | 'AB1234'O | |
| px_RAT | Applicable for FDD This parameter is used to specify which radio access technology is being used for the current test execution. Valid values: fdd and tdd | RatType | fdd | |
| px_RRC_CS_ServTested | CS service to be tested for RRC test cases. | RRC_ServTested | Speech | |
| px_RRC_PS_ServTested | PS service to be tested for RRC test cases. | RRC_ServTested | ps_Interactive | |

| px_TCellH | TCell value for cell H or 8. Except the first created cell, the value 0 applied in ts_SS_CellCfg. | Tcell | 4351 | |
| px_TimerDequeuePCO | Additional time for dequeuing PCO | INTEGER | 5000 (ms) | |
| px_TMSI_Def | Default TMSI | OCTETSTRING | '12345678'O | |
| px_TotalRLC_AM_BufferSize | Total RLC AM buffer size for R99. The values are according to TotalRLC-AM-BufferSize defined in 3GPP TS 25.331. | TotalRLC_AM_BufferSize | NA | |
| px_UARFCN_D_Mid | Applicable for FDD Mid Range downlink UARFCN value | INTEGER | 10700 | |
| px_UARFCN_D_Low | Applicable for FDD Low Range downlink UARFCN value | INTEGER | 10563 | |
| px_UARFCN_D_High | Applicable for FDD High Range downlink UARFCN value | INTEGER | 10837 | |
| px_UE_OpModeDef | Default UE operation mode (either opModeA or opModeC). (For most UEs this corresponds class-A or class-C, and can not be changed by the user) | UE_OperationMode | opModeA | |
| px_UE_PositioningNetworkAssistedGPS_Sup | UE positioning capability: supports the network assisted GPS | NetworkAssistedGPS_Supported | networkBased | |
| px_UE_PowerClass | UE_PowerClass value of the band under test (px_FDD_OperationBand or px_TDD_OperationBand). | UE_PowerClass | 1 | |
| px_UL_MaxCC_TB_bits | Maximum sum of number of bits of all convolutionally coded transport blocks being transmitted at an arbitrary time instant. | MaxNoBits | b163840 | |
| px_UL_MaxTB_bits | Maximum sum of number of bits of all transport blocks being transmitted at an arbitrary time instant. | MaxNoBits | b163840 | |
| px_UL_MaxTF | Maximum number of TF for uplink. | MaxNumberOfTF | tf1024 | |

| px_UL_ScramblingCode | Applicable for FDD UL scrambling code value to be used by UE. | UL_ScramblingCode | 0 | |
| px_TDD_OperationBand | Applicable for TDD The operation band under test as defined in 34.108 clause 5.1.2. | INTEGER | 1 | px_UARFCN_Mid, px_UARFCN_Low and px_UARFCN_High shall take the values according to the value of px_TDD_OperationBand. |
| px_UARFCN_Mid | Applicable for TDD Mid Range UARFCN value | INTEGER | 9550 | |
| px_UARFCN_Low | Applicable for TDD Low Range UARFCN value | INTEGER | 9504 | |
| px_UARFCN_High | Applicable for TDD High Range UARFCN value | INTEGER | 9596 | |
| px_UARFCN_Mid_S1 | Applicable for TDD Mid Range UARFCN value | INTEGER | 9545 | |
| px_UARFCN_Mid_S2 | Applicable for TDD Mid Range UARFCN value | INTEGER | 9555 | |
| px_UARFCN_High_S1 | Applicable for TDD High Range UARFCN value | INTEGER | 9591 | |
| px_UARFCN_High_S2 | Applicable for TDD High Range UARFCN value | INTEGER | 9586 | |
| NOTE 1: No default value can be proposed (Manufacturer defined value). | | | | |
| NOTE 2: No default value can be proposed, because not enough information is available in 3GPP TS 34.109 [4], clause 8.1.2. | | | | |
| NOTE 3: This value shall be set in synchronization with the values that are being set for the 3 other pixits with: px_UARFCN_D_High, px_UARFCN_D_Mid, px_UARFCN_D_Low | | | | |

B.1.2 L3M test suite parameters declarations

The following parameters are commonly used in the RRC and NAS ATSSs.

Table B.1.2: L3M PIXIT

| Parameter name | Description | Type | Default value | Supported value |
|------------------------|--|---------|---------------|-----------------|
| px_3G324M_MmediaEnable | For a Multimedia UE: set to TRUE if a multimedia call is enabled; set to FALSE if a speech call is enabled. | BOOLEAN | TRUE | |
| px_BcapDataCompression | Data compression supported (used in the Bearer Capability) | B1 | '0'B | |
| px_BcapFNUR | Fixed Network User rate supported: '0000'B: Fixed network user rate not applicable '00001'B: FNUR 9.6 kbit/s '00010'B: FNUR 14.4 kbit/s '00011'B: FNUR 19.2 kbit/s '00100'B: FNUR 28.8 kbit/s '00101'B: FNUR 38.4 kbit/s '00110'B: FNUR 48.0 kbit/s '00111'B: FNUR 56.0 kbit/s '01000'B: FNUR 64.0 kbit/s '01001'B: FNUR 33.6 kbit/s '01010'B: FNUR 32.0 kbit/s | B5 | '00001'B | |
| px_BcapITC | Information transfer capability supported (used for the generation of the Bearer Capability) 0 - UDI | Itclnt | 2 | |

| Parameter name | Description | Type | Default value | Supported value |
|--------------------------|--|-------------|--------------------|-----------------|
| | 1 - RDI 2 - 31 kHz Audio 3 - Other | | | |
| px_BcapModemType | Modem type supported (used in the Bearer Capability) | B5 | '00110'B | |
| px_BcapNumberDataBits | Number of data bits supported (used in the Bearer Capability) | B1 | '1'B | |
| px_BcapNumberStopBits | Number of Stops bits supported (used in the Bearer Capability) | B1 | '1'B | |
| px_BcapOtherModemType | Other modem type supported (used in the Bearer Capability) | B2 | '10'B | |
| px_BcapParity | Parity supported (used in the Bearer Capability) | B3 | '011'B | |
| px_BcapSACP | Signalling access protocol supported (used in the Bearer Capability) | B3 | '001'B | |
| px_BcapSyncAsync | Synchronous '0'B or Asynchronous '1'B mode supported by IUT | B1 | '1'B | |
| px_BcapUeFlowControl | UE flow control. 0-outband, 1-inband, 2-no flow control. 3- X.25 4- X.75 Default: 0, outband flow control | FlowControl | 0 | |
| px_CC_CallDiallingDigits | Dialling digits used to initiate a CC MO call (used with the AT dial D command). | IA5String | "0123456902" | |
| px_CC_Serv | Service selected for Mobile Originated calls and Mobile Terminated calls. The possible values are ("Telephony", "EmergencyCall", "31kHz", "V110", "V120", "PIAFS", "FTM", "X31", "BTM", "3G324M_Call", "Alternate Speech/Facsimile", "3G324M_SpeechPreferred") | Services | "31 kHz" | |
| px_DeltaSS_DelayTime | Tdelta value (refer to 3GPP TS 34.108 [3], clause 4.2.3) in ms. | INTEGER | 55 ms | |
| px_EmergencyCallNumber | Emergency Number used by UE to initiate an emergency call | IA5String | "112" | |
| px_IMEI_Def | Default IMEI value transmitted by UE. Digit 15 shall be set as a Spare Digit, i.e. shall be set to '0' (see TS 23.003[6]). | HEXSTRING | See note | |
| px_IMEISV_Def | Default IMEISV value | HEXSTRING | See note | |
| px_IMSI_Diff | Different IMSI from the IMSI stored in the USIM | HEXSTRING | '001010654321063'H | |
| px_SupportOpModeC | TRUE if UE supports operation mode C, i.e. UE offers PS services only (see 3GPP TS 23.060 [60], clause 4.1 and 3GPP TS 24.008 [9]) | BOOLEAN | TRUE | |
| px_NwOrgPDP_Support | This indicates if the UE implementation supports network originated PDP Context. TRUE indicates, supported FALSE indicate, not supported | BOOLEAN | FALSE | |
| px_PDP_IP_AddrInfoDCH | A string parameter that identifies the MT in the address space applicable to the PDP for DCH. | IA5String | "200.1.1.80" | |
| px_PDP_IP_AddrInfoFACH | A string parameter that identifies the MT in the address space applicable to the PDP for FACH. | IA5String | "200.1.1.90" | |
| px_PTMSI_2 | Second PTMSI used for testing. | OCTETSTRING | 'C9876543'O | |
| px_PTMSI_Sig2 | Second PTMSI signature used for testing. | OCTETSTRING | 'AB1234'O | |

| Parameter name | Description | Type | Default value | Supported value |
|--|--|-------------|---------------|-----------------|
| px_TMSI_2 | Second TMSI value for testing | OCTETSTRING | '09876543'O | |
| px_SMS_IndexOffset | SMS index offset for the numbering of short messages, value range: (0,1) | INTEGER | 0 | |
| NOTE: No default value can be proposed (Manufacturer defined value). | | | | |

B.1.3 NAS test suite parameters declarations

The following parameters are commonly used in the NAS ATS.

Table B.1.3: NAS PIXIT

| Parameter name | Description | Type | Default value | Supported value |
|----------------|---|-------------|-----------------|-----------------|
| px_AuthRAND_2 | A second Random Challenge (128 bits) | BITSTRING | '1010101...10'B | |
| px_PTMSI_Sig3 | Second PTMSI signature used for testing | OCTETSTRING | 'AB1239'O | |

B.1.4 SMS test suite parameters declarations

These parameters are used in the SMS ATS.

Table B.1.4: SMS PIXIT

| Parameter name | Description | Type | Default value | Supported value |
|-----------------------|--|--------------|---------------------------------|-----------------|
| px_BMC_CB_RepPeriod01 | CB repetition period for CB message 1 | INTEGER | 2 | |
| px_BMC_CB_RepPeriod02 | CB repetition period for CB message 2 | INTEGER | 2 | |
| px_BMC_NoOfBC_Req01 | No of broadcasts requested for CB message 1 | INTEGER | 2 | |
| px_BMC_NoOfBC_Req02 | No of broadcasts requested for CB message 2 | INTEGER | 2 | |
| px_MaxCP_DataRetx | max. number of CP data retransmissions for SMS | INTEGER | 3 | |
| px_SMS_CB_Data01 | Contents of the first Cell Broadcast Message sent will be converted to an OCTETSTRING | IA5String | "First Cell Broadcast Message" | |
| px_SMS_CB_Data02 | Contents of the second Cell Broadcast Message sent will be converted to an OCTETSTRING | IA5String | "Second Cell Broadcast Message" | |
| px_SMS_CB_Msgld02 | Message Id to be used for the second Cell Broadcast Message sent | HEXSTRING[4] | '0002'H | |
| px_SMS_PrefMem1 | SMS Preferred Memory 1 <mem1> of 3GPP TS 27.005 [22], clause 3.1 | IA5String | "SM" | |
| px_SMS_PrefMem2 | SMS Preferred Memory 2 <mem2> of 3GPP TS 27.005 [22], clause 3.1 | IA5String | "SM" | |
| px_SMS_PrefMem3 | SMS Preferred Memory 3 <mem3> of 3GPP TS 27.005 [22], clause 3.1 | IA5String | "MT" | |
| px_TC1M | Value for timer TC1M, to be declared by the manufacturer | INTEGER | 10000 | |

B.1.5 RRC_M test suite parameters declarations

These parameters are used in the RRC and RAB ATS.

Table B.1.5: RRC and RAB PIXIT

| Parameter name | Description | Type | Default value | Supported value |
|----------------------|--|-------------------|---------------|---|
| px_DL_MaxTC_TB_bits | Maximum sum of number of bits of all turbo coded transport blocks being received at an arbitrary time instant. | MaxNoBits | b163840 | |
| px_ExecutePS_Class | Service to be executed in RAB test cases. The allowed values are: 1: Interactive 2: BackGround 3: Streaming 0: All supported classes. Any other value is not defined. | INTEGER | 1 | |
| px_MaxHcContextSpace | MaxHcContextSpace if RFC 2507 [30] is supported. | MaxHcContextSpace | by1024 | |
| px_MaxNoSCCPCH_RL | Part of SimultaneousSCCPCH_DPCH_Reception. | MaxNoSCCPCH_RL | r1 | |
| px_PrimaryBand | The primary operation band under test, as defined in 34.108 clause 5.1.1. Value 1 means Band 1, 2 means Band 2, 3 means Band 3, 6 means Band 6. | INTEGER | 1 | This pixit shall be set in synchronization with the values that are being set to other Pixit: px_UARFCN_D_Mid |
| px_SecondaryBand | The secondary operation band under test, as defined in 34.108 clause 5.1.1. Value 1 means Band 1, 2 means Band 2, 3 means Band 3, 6 means Band 6. | INTEGER | 8 | |
| px_SMS_CB_MsgId01 | the operator shall define the CB Message ID for the CB data1 used for transmitting this CB data, different to CB-Data 2 IXIT | HEXSTRING[4] | '0001'H | |
| px_SMS_CB_Store | TRUE if Broadcast Messages are kept in BM storage | BOOLEAN | TRUE | |
| px_SMS_MsgFrmt | SMS Message Format <mode> of TS 27.005 cl. 3.2.3 | IA5String | "1" | Default "Text mode" |
| px_SMS_PrefMemCB1 | SMS Preferred CB Memory 1 <mem1> of 3GPP TS 27.005 [22], clause 3.1 | IA5String | "BM" | |
| px_SMS_PrefMemCB2 | SMS Preferred CB Memory 2 <mem2> of 3GPP TS 27.005 [22], clause 3.1 | IA5String | "BM" | |
| px_SMS_PrefMemCB3 | SMS Preferred CB Memory 3 <mem3> of 3GPP TS 27.005 [22], clause 3.1 | IA5String | "BM" | |
| px_SMS_Service | SMS Service <service> of 3GPP TS 27.005 [22], clause 3.2.1 | IA5String | "0" | |
| px_UL_MaxTC_TB_bits | Maximum sum of number of bits of all turbo coded transport blocks being transmitted at an arbitrary time instant. | MaxNoBits | b163840 | |

The px_ExecutePS_Class allows the option 0 to be selected. This has been allowed in order to preserve the changes implemented in TTCN for handling all traffic classes in RAB testcase execution. System simulators are not required to support this execution and also TTCN maintenance of this path should be limited.

B.1.6 PDCP test suite parameters declarations

These parameters are used in the PDCP ATS.

Table B.1.6: PDCP PIXIT

| Parameter name | Description | Type | Default value | Supported value |
|--|--|-----------|--|-----------------|
| px_PDCP_TcplpCompressedTcpNonDeltaPacket01 | IP header compressed packet type (PID=3) of <u>px_PDCP_TcplpUncompressedPacket01</u> | IP_Packet | 0000 0000 0000 0a00 0000 0050 1000 0026 3400 006a 6e6e 206a 6e6e 206a 6e6e | |

| px_PDCP_UdpIpUncompressedPacket02 | uncompressed UDP/IP Packet02 | IP_Packet | "Test_PDCP_U DPIP_Packet2" | |

B.1.7 BMC test suite parameters declarations

These parameters are used in the BMC ATS.

Table B.1.7: BMC PIXIT

| Parameter name | Description | Type | Default value | Supported value |
|-------------------|--|---------------------|-----------------------|-----------------|
| px_CB_Data1 | Data to be sent for each PDCP test, except TC 7.4.1.4, 7.4.1.5 and 7.4.1.6 | IA5String [1..1246] | "CB Data1" | |
| px_CB_Data2 | Data to be sent in TC 7.4.2.1 | IA5String [1..1246] | "CB Data2" | |
| px_SMS_CB_MsgId01 | Data to be sent for each PDCP test, except TC 7.4.1.4, 7.4.1.5 and 7.4.1.6 | HEXSTRING[4] | '0000'H | |
| px_SMS_CB_MsgId02 | Data to be sent in TC 7.4.2.1 | HEXSTRING[4] | '0000'H | |

| px_MsgCode02 | Data to be sent in TC 7.4.2.1 | BITSTRING[10] | "Test_msgCode02" | |
| px_UpdateNumber01 | Data to be sent for each PDCP test, except TC 7.4.1.4, 7.4.1.5 and 7.4.1.6 | BITSTRING[4] | "Test_updateNumber01" | |
| px_UpdateNumber02 | Data to be sent in TC 7.4.2.1 | BITSTRING[4] | "Test_updateNumber02" | |

B.1.8 RRC test suite parameters declarations

These parameters are used in the RRC ATS.

Table B.1.8: RRC PIXIT

| Parameter name | Description | Type | Default value | Supported value |
|----------------|-------------|------|---------------|-----------------|
| - | - | - | - | - |

B.1.9 RAB test suite parameters declarations

These parameters are used in the RAB ATS.

Table B.1.9: RAB PIXIT

| Parameter Name | Description | Type | Default Value | Supported Value |
|----------------------------|--|---------------|------------------------|--|
| px_CB_Data1 | the operator shall define CBS data as IA5String together with the CB message ID used for transmitting this CB data, which is indicated by the UE after reception in a clear way according to the capabilities stored on the SIM. Furthermore, the operator shall describe the indication on the UE side (e.g. certain CBS traffic information) | IA5String_BMC | | the CB data range is 1..1246 Octets which refers to a IA5String of 1..1246 |
| px_DSCH_RNTI | DSCH RNTI | DSCH_RNTI | '0000 0000 0000 0010'B | |
| px_gS01 | used in the Serial No. of the CB_Data01 given as PIXIT, which differentiates between CBS messages from the same source and type | B2 | '00'B | |
| px_MsgCode01 | used in the Serial No. of the CB_Data01 given as PIXIT, which is the Geographical Scope indicates the area over which the msg code is unique | MsgCodeType | '0000000000'B | |
| px_UpdateNumber01 | used in the Serial No. of the CB_Data01 given as PIXIT, which indicates a change of the message content of the same CBS message | B4 | '0000'B | |
| px_PowerDSCH | transmission power level of DSCH | DL_TxPower | | |
| px_RAB_ExecImplctTeste dTC | TRUE enforces execution of optional lower bit rate R99 RAB combination test cases that are implicitly tested in higher bit rate RAB combination test cases | BOOLEAN | FALSE | |

B.1.10 RLC and MAC test suite parameters declarations

These parameters are used in the MAC ATS.

Table B.1.10: RLC & MAC PIXIT

| Parameter Name | Description | Type | Default Value | Supported Value |
|-------------------------------|--|--|---------------|-----------------|
| px_NumOfSegInPagResOrServ Req | This Pixit is used in MAC test cases 7.1.1.2, 7.1.1.3, 7.1.1.4, 7.1.1.5 and 7.1.1.8 This indicates the number of RLC segments the Paging Response (CS Domain) or Service Request (PS domain) will be segmented in. | INTEGER | 2 | |
| px_RLC_SDU_buffering | Is used in RLC TC 7.2.3.13, indicating the way to handle RLC SDU data for UL transmission when the transmission window is full | BOOLEAN(TRUE for buffering, FALSE for discard) | | |

B.1.11 Multi RAT test suite parameters declarations

These parameters are used in the MultiRAT ATS.

Table B.1.11: MultiRAT PIXIT

| Parameter name | Description | Type | Default value | Supported value |
|--------------------------------|--|--------------|---|--|
| px_ExtDTM_EGPRS_MultiSlotClass | Extended DTM GPRS Multi Slot Class. Used in Classmark 3 | B2 | | |
| px_GSM_BandUnderTest | indicates which band is under test | INTEGER | | 1 -> GSM450; 2 -> GSM480; 3 -> GSM750; 4 -> GSM850; 5 -> GSM-P-900; 6-> GSM-E-900; 7-> DCS1800; 8 -> PCS1900; 9 -> 450 & 900 MultiBand test; 10 -> 450 & 1800 MultiBand test; 11 -> 480 & 900 MultiBand test; 12 -> 480 & 1800 MultiBand test; 13 -> 900 & 1800 MultiBand test; 14-> GSM710; 15->T-GSM810; |
| px_GSM_CipheringOnOff | GSM Ciphering to be started or not | B1 | 1 | |
| px_GSM_CipherAlg | GSM Cipher algorithm. | B3_CipherAlg | '000'B | Allowed values: '000'B(A5/1), '010'B(A5/3), '011'B(A5/4) |
| px_HighMultiSlotCap | High Multislot Capability. Used in Classmark 3 | B2 | | |
| px_CipherKey | Cipher key (64 bits) | B64 | '0101111001001010101100110101100010010001001101110101110100101010'B | Any |
| px_CipherKey128 | Cipher key (128 bits) to be used e.g. for A5/4 and GEA/4 | B128 | '01011110010010101011001101011000100100010011010010101001011100100101010110011010110101101001001101110101110100101010'B | Any |
| px_MS_TXPWR_MAX_CCH | MS_TXPWR_MAX_CCH | B5 | '01010'B | |
| px_RXLEV_ACCESS_MIN | minimum received signal level at MS | B6 | '000000'B | |
| px_SplitOnCCCH | split paging cycle on CCCH supported indication | B1 | '0'B not supported | |
| px_TSC | Training sequence code for traffic channels | B3 | '011'B | |
| px_PowerLevel | power level value for L1 header | B5 | | |
| px_TimingAdvance | Timing advance value for L1 header | B1 | '0000000'B | |

B.1.12 MMI questions

Table B.1.12 requests additional information needed for the execution of the MMI commands used in the ATs, the column 'ATS' indicates in which ATs the question is used.

Table B.1.12: MMI questions

| Required information for MMI question | ATS |
|--|---|
| Please switch the PLMN selection mode of the UE to automatic selection | RRC, SMS, NAS, RAB, HSD_ENH, IR_U, AGPS, HSU_ENH, HS_ENH |
| Please switch the PLMN selection mode of the UE to manual selection | RRC, SMS, NAS, RAB, HSD_ENH, IR_U, AGPS, HSU_ENH, HS_ENH |
| Please select the following PLMN manually: MCC = <p_MCC>, MNC = <p_MNC> | RRC, SMS, NAS, RAB, HSD_ENH, IR_U, AGPS, HSU_ENH, HS_ENH |
| Please power off the UE | All ATs |
| Please power on the UE | All ATs |
| Please switch off the UE | All ATs |
| Please switch on the UE | All ATs |
| Please insert the USIM card into the UE | All ATs |
| Please remove the USIM card into the UE | All ATs |
| Please check that the DTCH is through connected by generating a noise | RRC, SMS, NAS, RAB, HSD_ENH, IR_U, AGPS, HSU_ENH |
| Configure UE for an MO Telephony call | RRC, SMS, NAS, RAB, HSD_ENH, IR_U, AGPS, HSU_ENH, HS_ENH |
| Configure UE for an Emergency call | RRC, SMS, NAS, RAB, HSD_ENH, IR_U, AGPS, HSU_ENH, HS_ENH |
| Configure UE for an MT telephony call | RRC, SMS, NAS, RAB, HSD_ENH, IR_U, AGPS, HSU_ENH, HS_ENH |
| Please set UE in operation mode C (PS services only) | RRC, SMS, NAS, RAB, HSD_ENH, IR_U, AGPS, HSU_ENH, HS_ENH |
| Please set UE in operation mode A (to support simultaneous CS and PS services) | RRC, SMS, NAS, RAB, HSD_ENH, IR_U, AGPS, HSU_ENH, HS_ENH |
| Please configure UE to use the following emergency number <p_EmergencyNumber> | RRC, SMS, NAS, RAB, HSD_ENH, IR_U, A-GPS, HSU_ENH, HS_ENH |
| Please initiate a non call related supplementary service which is supported by the UE | NAS |
| Please insert Test USIM programmed with Access Class: <p_AccessClass> | NAS |
| Please insert 2nd SIM card with short IMSI | NAS, SMS, AGPS |
| Please initiate an autocalling call with the number: <p_AutocallingNumber> | NAS |
| Please initiate an autocalling call with a number that will be put in the blacklisted list. The following number shall not be used: <p_AutocallingNumber> | NAS |
| Please reset the autocalling list of blacklisted numbers | NAS |
| Please initiate a DTMF tone with the character <p_Character> and the tone duration <p_ToneDuration> | NAS |
| Please enable call refusal on the UE | NAS |
| Please check that the DTMF tone indication has been generated | NAS |
| Please insert another USIM card as required for test case tc_9_4_5_4_6. The PLMN selector on the USIM card shall contain entries for PLMNs MCC='022'H, MNC='01F'H resp. MCC='022'H , MNC='03F'H. The latter PLMN shall be ranked better than the first one | NAS |

| Required information for MMI question | ATS |
|---|------------------------------------|
| Please trigger UE to initiate a Detach procedure for non-PS services only | NAS |
| Please check that the mobile indicates the reception of a message with message id: <p_MessageId > and message code: <p_MessageCode> | SMS |
| Please check the length of the received Short Message: <p_LengthMessage> and the contents of the received Short Message: <p_Message> | SMS |
| Please send an SMS COMMAND message containing a request to delete the previously submitted Short Message | SMS |
| Please send an SMS COMMAND message containing an enquiry about the previously submitted Short Message | SMS |
| Please check that NO recalled Short Message is displayed | SMS |
| Please check that the reception of a received Short Message is indicated | SMS |
| Please check that the Mobile does not indicate the reception of a new message with message id: <p_MessageId> and message code: <p_MessageCode> | SMS |
| Please check that NO reception of a received Short Message of type 0 is indicated | SMS |
| Please insert the USIM card of type B into the UE | MAC |
| Please insert the USIM card, with information given in <p_TestCase> | RRC, NAS, IR_U, HSU_ENH, HS_ENH |
| Please check that the UE display the registered PLMN as PLMN <p_PLMN> | RRC, HSU_ENH, HS_ENH |
| Please insert the USIM card, with Type A EFACC | RRC |
| Please insert the USIM card, with Type B EFACC | RRC |
| Please trigger UE to send three SNDCP PDUs of 500 bytes each on SAPI 11 | IR_G |
| Please trigger PDP Context Activation Type 2 in UE | IR_G |
| Please trigger MO-LR for position estimate | AGPS |
| Please trigger MO-LR for assistance data | AGPS |
| Please trigger MO-LR for transfer to 3rd party | AGPS |
| Please check that the UE displays the correct information about the LCS client | AGPS |
| Please accept the location request within 20 s | AGPS |
| Please deny the location request within 20 s | AGPS |
| Please do not reply to the location request | AGPS |
| Please check that the UE notifies the user of the location request | AGPS |
| If the UE does not support the RESET command defined in 34.109, please ensure that the UE has no assistance data stored before running this test case | AGPS |
| Please trigger UE to send 10 kbytes of data on SAPI 3 | IR_G |
| Please trigger UE to send 1 kbyte of data on SAPI 3 | IR_G |
| Please check that in the manual PLMN list the UE display: <p_PLMN_List> | HSU_ENH |
| Please check that UE displays no service or no network available | HSU_ENH, HSPA8_ENH |
| Please check that in the manual PLMN list the UE displays the PLMN with the following information: - <p_PLMN_List1> offers voice call, SMS and PS data services - <p_PLMN_List2> offers voice call services - <p_PLMN_List3> offers PS data services | HS_ENH |
| Please check that in the manual PLMN list the UE indicates that: - <p_PLMN1> is present on the the User Controlled PLMN List - <p_PLMN2> is present on the Forbidden list - <p_PLMN3> is present on the Operator Controlled PLMN List | HS_ENH |
| Please insert the USIM card with an empty CSG allowed list | HSPA8_ENH |
| Please switch the PLMN selection mode of the UE to manual CSG selection | HSPA8_ENH |
| Please switch the PLMN selection mode of the UE to automatic CSG selection | HSPA8_ENH |
| Please select the following CSG manually: MCC = <p_MCC>, MNC = <p_MNC>, CSG = <p_CSG> | HSPA8_ENH |
| Please check that in the manual CSG list the UE display: <p_CSG1> accessible, <p_CSG2> not accessible | HSPA8_ENH |
| Please check that the Mobile UE indicates the reception of ETWS data <p_ETWS_Data> and alerts or activate alerting the user. | HSPA8_ENH |
| Please check that the Mobile UE does NOT indicate the reception of ETWS data <p_ETWS_Data> and not alert, nor activate alerting the user | HSPA8_ENH |
| Please set the PLMN selection operation mode at switch on in the UE to automatic network selection | HSPA7_ENH |
| Please set the PLMN selection operation mode at switch on in the UE to manual network selection | HSPA7_ENH |

B.1.13 A-GPS test suite parameters declarations

These parameters are used in the A-GPS ATS.

Table B.1.13: A-GPS PIXIT

| Parameter Name | Description | Type | Default Value | Supported Value |
|---------------------------|---|------------------------------|------------------------------|-----------------|
| px_GpsScenario | Pre-defined GPS scenario to be loaded by the upper tester in the Satellite Simulator. See 3GPP TS 34.108 [3], clause 10.7. Minimum value:0, Maximum value: 31 | GpsScenarioType | 0 | |
| px_GeoInfo | Geographical information to be sent as Location Estimate in FACILITY message from the System Simulator. | Ext_Geographical Information | 9032B9D66360B600323C3C006544 | |
| px_LcsClientName | LCS Client name | IA5String | OPERATOR | |
| px_LcsClientAddressTOA | LCS Client external address TOA | B4 | '1001'B | |
| px_LcsClientAddressNPI | LCS Client external address NPI | B4 | '0001'B | |
| px_LcsClientAddressDigits | LCS Client external address Digits | IA5String | 0123456 | |
| px_ResetStoredInfo | Support of RESETUEPOSITIONINGSTORE DIFORMATION command as defined in 3GPP TS 34.109 [4], clause 6.10 | BOOLEAN | TRUE | |
| px_UeLcsNotification | Value for UE LCS Notification timeout timer (in seconds) | INTEGER | 20 | |

B.1.14 HSD_ENH test suite parameters declarations

These parameters are used in the HSD_ENH ATS.

Table B.1.14: HSD_ENH PIXIT

| Parameter Name | Description | Type | Default Value | Supported Value |
|----------------|-------------|------|---------------|-----------------|

| px_RAB_HS_Exec64_384Supp | TRUE enforces execution of optional UL 64 Kbps RAB HSDPA test cases, when UE supports UL 384 kbps | BOOLEAN | FALSE | |
| px_RAB_HS_Exec64_128Supp | TRUE enforces execution of optional UL 64 Kbps RAB HSDPA test cases, when UE supports UL128 kbps | BOOLEAN | FALSE | |
| px_CMAS_CB_Data01 | Contents of the first CMAS Cell Broadcast Message of 90 characters. | IA5String | "First CMAS message: CMAS Presidential Alert. ABCDEFGHIJKL MNOPQRSTUVWXYZ12345689 0abcdefghijklmnopqrst" | |
| px_CMAS_CB_Data02 | Contents of the second CMAS Cell Broadcast Message of 90 characters. | IA5String | "Second CMAS message: CMAS Imminent Threat Alert – Severity: Extreme, Urgency: Immediate. ABCDEFGHIJ" | |
| px_CMAS_CB_Data03 | Contents of the third CMAS Cell Broadcast Message of 90 characters. | IA5String | "Third CMAS message: CMAS Child Abduction Emergency. ABCDEFGHIJKL MNOPQRSTUVWXYZ12345689 0abcdefghijklmnopqrst" | |

B.1.15 HSU_ENH test suite parameters declarations

These parameters are used in the HSU_ENH ATS.

Table B.1.15: HSU_ENH PIXIT

| Parameter Name | Description | Type | Default Value | Supported Value |
|-------------------------------------|--|---------|---------------|-----------------|
| px_ExecNon_FDPCH_When_FD PCHSupp | To execute Non-FDPCH test case when fully FDPCH is supported | BOOLEAN | TRUE | |

B.1.16 HS_ENH test suite parameters declarations

These parameters are used in the HS_ENH ATS.

Table B.1.16: HS_ENH PIXIT

| Parameter Name | Description | Type | Default Value | Supported Value |

B.1.17 Audit capabilities test suite parameters declarations

These parameters are used in the audit capabilities test case.

Table B.1.17.1: UTRA audit capabilities PIXIT

| Parameter Name | Description | Type | Default Value | Supported Value |
|----------------------------------|--|----------------------------|---------------|-----------------|
| px_MaxNumberROHC_ContextSessions | Maximum number of ROHC context sessions, see 3GPP TS 25.331 [21], clause 10.3.3.24 | MaxROHC_ContextSessions_r4 | | |
| px_ReverseDecompressionDepth | Reverse decompression depth, see 3GPP TS 25.331 [21], clause 10.3.3.24 | INTEGER | | |

Table B.1.17.2: GERAN audit capabilities PIXIT

| Parameter Name | Description | Type | Default Value | Supported Value |
|---|--|---------|---------------|-----------------|
| px_8PSK_PowerCap | Radio Capability used for 8PSK modulation, see 3GPP TS 24.008 [9], clause 10.5.5.12a | B2 | | |
| px_Alt_EFTA_MultislotClass | Alternative Enhanced Flexible Timeslot Assignment Multislot Class, see 3GPP TS 24.008 [9], clause 10.5.5.12a | B4 | | |
| px_EGPRS_MultislotClass | Integer representation of the multislot class, see 3GPP TS 24.008 [9], clause 10.5.5.12a | INTEGER | | |
| px_GERAN_to_EUTRA_Support | GERAN to E-UTRA support in GERAN packet transfer mode, see 3GPP TS 24.008 [9], clause 10.5.5.12a | B2 | | |
| px_GMSK_PowerCap | Power Class used for GMSK with the indicated Access Technology, see 3GPP TS 24.008 [9], clause 10.5.5.12a | B3 | | |
| px_GPRS_MultislotClass | Integer representation of the multislot class, see 3GPP TS 24.008 [9], clause 10.5.5.12a | INTEGER | | |
| px_Max_RLC_AM_Entries | Maximum number of RLC entries operating in acknowledged mode, see 3GPP TS 44.118 [61], clause 9.3.46 | B3 | | |
| px_Max_RLC_UM_Entries | Maximum number of RLC entries operating in unacknowledged mode, see 3GPP TS 44.118 [61], clause 9.3.46 | B3 | | |
| px_Max_RLC_T_Entries | Maximum Number of RLC entries operating in transparent mode, see 3GPP TS 44.118 [61], clause 9.3.46 | B3 | | |
| px_Multislot_Capability_Reduction_for_Downlink_Dual_Carrier | Multislot Capability Reduction for Downlink Dual Carrier, see 3GPP TS 24.008 [9], clause 10.5.5.12a | B3 | | |

Table B.1.17.3: E-UTRA audit capabilities PIXIT

B.1.18 eCall and HSPA8 test suite parameters declarations

These parameters are used in the eCall and HSPA8 ATS.

Table B.1.18: eCall and HSPA8 PIXIT

| Parameter Name | Description | Type | Default Value | Supported Value |
|--------------------------|---|---------------|--------------------------------------|-----------------|
| px_eCall_TestNumber | Number digits of the test number used in eCall Test Call. Numbers are in the order: Digit 1, Digit 2, Digit 3, etc (see 3GPP TS 24.008 [9], clause 10.5.4.7) | IA5String | "123456" | |
| px_eCall_ReconfNumber | Number digits of the reconfiguration number used in eCall Reconfiguration Call. Numbers are in the order: Digit 1, Digit 2, Digit 3, etc (see 3GPP TS 24.008 [9], clause 10.5.4.7) | IA5String | "987654" | |
| px_ETWS_BMC_CB_RepPeriod | CB repetition period for ETWS CB message | INTEGER | 2 | |
| px_ETWS_BMC_NoOfBC_Req | No of broadcasts requested for ETWS CB message | INTEGER | 2 | |
| px_ETWS_DigitalSignature | ETWS Digital Signature | OCTETSTRING | | |
| px_ETWS_SMS_CB_Data01 | Contents of the first ETWS Cell Broadcast Message sent will be converted to an OCTETSTRING | IA5String_BMC | "First ETWS Cell Broadcast Message" | |
| px_ETWS_SMS_CB_Data02 | Contents of the second ETWS Cell Broadcast Message sent will be converted to an OCTETSTRING | IA5String_BMC | "Second ETWS Cell Broadcast Message" | |
| px_ETWS_SMS_CB_Data03 | Contents of the third ETWS Cell Broadcast Message sent will be converted to an OCTETSTRING | IA5String_BMC | "Third ETWS Cell Broadcast Message" | |
| px_ETWS_SMS_CB_Data04 | Contents of the fourth ETWS Cell Broadcast Message sent will be converted to an OCTETSTRING | IA5String_BMC | "Fourth ETWS Cell Broadcast Message" | |
| px_ETWS_SMS_CB_Data05 | Contents of the fifth ETWS Cell Broadcast Message sent will be converted to an OCTETSTRING | IA5String_BMC | "Fifth ETWS Cell Broadcast Message" | |
| px_ETWS_SMS_CB_Data06 | Contents of the sixth ETWS Cell Broadcast Message sent will be converted to an OCTETSTRING | IA5String_BMC | "Sixth ETWS Cell Broadcast Message" | |
| px_ETWS_TimeZone | Value of the Time Zone in ETWS cell broadcast message | TZONES | 0 | |

B.1.19 IR_U test suite parameters declarations

These parameters are used in the IR_U ATS.

Table B.1.19: IR_U PIXIT

| Parameter Name | Description | Type | Default Value | Supported Value |
|----------------------------------|--|-------------------------------|---------------|-----------------|
| px_ITURegion1_GSM_BandsUnderTest | Indicates the GSM band under test for ITU region 1 | ITURegion1_GSM_BandsUnderTest | | |
| px_ITURegion2_GSM_BandsUnderTest | Indicates the GSM band under test for ITU region 2 | ITURegion2_GSM_BandsUnderTest | | |
| px_ITURegion1_SecondaryFDD_Band | Indicates the secondary FDD band under test for ITU region 1 | ITURegion1_FD D_Band | | |
| px_ITURegion2_SecondaryFDD_Band | Indicates the secondary FDD band under test for ITU region 2 | ITURegion2_FD D_Band | | |

B.1.20 TTCN-3 test suite parameters declarations

These parameters are used in the TTCN-3 test suites.

Table B.1.20: TTCN-3 PIXIT

| Parameter Name | Description | Type | Default Value | Supported Value |

Annex E (informative): TTCN style guide for 3GPP ATS

E.1 Introduction

This annex provides a set of coding standards and development guidelines for use in the development of TTCN abstract test suites for ensuring that user equipment for the 3GPP standard conforms to the relevant core specifications.

The following items are assumed to exist, but their specification is outside the scope of this annex.

- A complete unambiguous prose detailing all test cases to be implemented.
- A complete unambiguous set of core specifications.
- A complete unambiguous detailed description of all the messages that are to be sent.
- A tool or human process that can convert Test Suite Operation Definitions to physical processes within the test system or unit under test.
- An abstracted or generic application programmers interface to all hardware components in the system.
- A tool for the translation and/or compilation of ISO/IEC 9646 [41] series TTCN to run on a test platform.

It is recognized within the context of the 3GPP User Terminal that some of these items are not yet stabilized.

The structure of the present annex maps directly to the guidelines provided in ETR 141 [37]. Rules are repeated in the present annex for convenience, with additional information specific to 3GPP test suite development provided where relevant. For more detailed information or examples about the rules, see ETR 141 [37].

In the present annex, the terms 'should' and 'shall' are frequently used. For the purpose of this annex, the following definitions apply:

- **Shall** means that the rule must be adhered to for all ATS development. If a rule expressed in terms of 'shall' is not followed, either the ATS must be updated so that the rule is followed, or the rule in the coding conventions must be updated to resolve the difference.
- **Should** means that the rule is a guideline. If a rule expressed in terms of 'should' is broken, a brief comment should be provided describing why the guideline does not apply.

E.2 ETR 141 rules and applicability

| RULE 1: Statement of naming conventions |
|--|
|--|

| |
|--|
| Naming conventions should be explicitly stated. Naming conventions should not exist only for a single ATS, and the reader of an ATS should not be forced to "derive" the rules implicitly. The naming conventions should be part of the ATS conventions contained in the ATS specification document. |
|--|

Names used in the present annex are comprised of a prefix part and a name body part. Conventions for deriving prefixes and name bodies are described after Rule 3 in the present annex.

RULE 2: Coverage of naming conventions

Naming conventions stated should, as a minimum, cover the following TTCN objects:

- test suite parameters/constants/variables;
- test case variables;
- formal parameters;
- timers;
- PDU/ASP/structured types;
- PDU/ASP/structured types constraints;
- test suite operations;
- aliases;
- test case/test step identifiers.

RULE 3: General properties of naming conventions

a) Protocol standard aligned

When there is a relationship between objects defined in the ATS and objects defined in the protocol standard, e.g. PDU types, the same names should be used in the ATS if this does not conflict with the character set for TTCN identifiers or with other rules. In case of a conflict, similar names should be used.

b) Distinguishing

The naming conventions should be defined in such a way, that objects of different types appearing in the same context, e.g. as constraint values, can be easily distinguished.

c) Structured

When objects of a given type allow a grouping or structuring into different classes, the names of these objects should reflect the structuring, i.e. the names should be composed of 2 or more parts, indicating the particular structure elements.

d) Self-explaining

The names should be such that the reader can understand the meaning (type/value/contents) of an object in a given context. When suffixes composed of digits are used, it is normally useful to have some rule expressed explaining the meaning of the digits.

e) Consistent

The rules stated should be used consistently throughout the document, there should be no exceptions.

f) Appropriate name length

Following the above rules extensively may occasionally lead to very long names, especially when structuring is used. The names should still be easily readable. When TTCN graphical form (TTCN.GR) is used, very long names are very inconvenient.

NOTE: Also, test tools may not be able to implement very long identifier names, which is an important aspect in this context.

E.2.1 Multiple words are separated by upper case letters at the start of each word

Many names consist of more words, and it shall be easy to distinguish the different words building up the same name. For all TTCN Object classes this is done using the case of the letters.

This rule is mandatory for all names appearing in the body of a dynamic behaviour table, and is recommended for all other TTCN object classes.

Generally every word a name consists of shall start with an upper case letter and the rest of this word shall be in lower case letters.

- E.g.: "channel" + "description" -> "ChannelDescription".

This rule also applies if a word starts after another upper case letter.

- E.g.: "px" + "Cell" + "A" + "Cell" + "Id" -> px_CellACellId.

This rule also applies if the name has a prefix, which is always lower case.

- E.g.: A test case variable "sequence" + "number" -> tcv_SequenceNumber.

This rule does not apply if the word is a unit, in which case the word retains it's original case.

- E.g.: Power level 1.5 dBm ->PowerLvl1_5dBm.

This rule does not apply if the word in the name is an acronym, in which case the word retains it's normal case.

- If an acronym is followed by another word, an underscore shall be used to separate the acronym from the following word. If an acronym is followed by a number in order to represent an identity (e.g. channel or radio bearer identity) then this acronym is not followed by an underscore.
E.g.: "this" + "Is" + "SIM" + "Message" + "With" + "CC" + "And" + "RR" + "Things" + "In" + "It" -> "thisIsSIM_MessageWithCC_AndRR_ThingsInIt".
- An exception to acronyms retaining their case is if the name is a field / element / parameter in a structured type / PDU / ASP, in which case it must start with a lower case letter.
E.g.: "SCH" + "info" + "element" -> "sCH_InfoElement".
- A further exception to acronyms retaining their case is if the name is an ASN.1 constraint, in which case, in which case the first letter is upper case, and the remaining letters are lower case.

For all objects used in the body of dynamic behaviour tables, use of underscores is forbidden, except for the following situations:

- As a replacement for a '!'. E.g. Test case that maps to prose clause 7.2.3.1 -> tc_7_2_3_1.
- To separate prefixes from names.
- To separate acronyms from the following word.
- To separate a number from the following word.
- To replace hyphens when types are re-used / imported from core specifications. This applies to types imported from ASN.1 definitions, and to names derived from table definitions in core specifications.
- To separate an ASP name from the embedded PDU name when the metatype PDU is not used.
E.g. RRC_DataInd_ConnAck for an RRC data indication ASP with an embedded CONNECT ACKNOWLEDGE PDU.

E.2.2 Identifiers shall be protocol standard aligned

To support rule 3(a), the mapping guidelines in table E.2.2 shall be used. This mapping table also supports rule 6.

Table E.2.2: Mapping guidelines between protocol standards and identifiers

| Type | Naming rule |
|-----------------------------|---|
| Objects of Structured Type | Shall be derived from the name of the Information Element in the standard, if it corresponds to this (use standard acronyms where appropriate). E.g.: "Window Size super-field" -> "WindowSizeSUF1" |
| Fields in a Structured Type | Shall be derived from the name of the same field in the corresponding Information Element in the standard. (Acronyms for the entire field name shall not be used) E.g.: "Header Extension Type" -> "headerExtensionType" (not "HE") |
| Objects of ASP type | Shall be derived from the name of the corresponding Service Primitive in the Standard, using any relevant abbreviations from the present annex. The full name as it appears in the core specification shall be included in parentheses after the name. E.g.: "CRLC-SUSPEND-Conf" -> "CRLC_SuspendCnf (CRLC-SUSPEND-Conf)" If the metatype PDU is not used, the ASP name shall reflect both the ASP, and the embedded PDU name, using an underscore to separate the ASP part from the PDU part. E.g.: DataReq_StartDTMF_Ack for an RRC-DATA-Req with an embedded START DTMF ACKNOWLEDGE PDU |
| Objects of PDU type | Shall have exactly the same name as the Message it corresponds to in the standard. If this Message is named by more words, they shall be joined, leaving the blanks out E.g.: "AMD PDU" -> "AMDPDU". |

E.2.3 Identifiers shall be distinguishing (use of prefixes)

To support rules 2, 3(b), 4, and 5, the prefixes shown in table E.2.3.1 shall be used for TTCN objects. Prefixes are separated from the name by an underscore to improve readability by clearly separating the prefix from the name. This convention will also support searching operations. For example, a search for all uses of PIXIT parameters in the test suite is possible by searching for 'px_'.

The optional *<protocol>* part shall be included in the name when the object is closely related to the protocol (e.g. PICS, some PIXIT parameters), it is necessary to be unambiguous or improves comprehension significantly (e.g. no need to think about protocol stacks on all used interfaces during reading). The optional *<protocol>* part shall be used for types defined in common modules.

Table E.2.3.1: Prefixes used for TTCN objects

| <p>NOTE 1: Coding rules are not specified for test suite operation procedural definitions at this stage. These rules will be defined when the need arises</p> <p>NOTE 2: A prefix is not used for PCO declarations, but is used for CP declarations. This is because PCOs and CPs will only be used in send and receive statements, and PCOs will be used more frequently than CPs. Since a PCO name or a CP name will be used on most behaviour lines, PCO names should be as short as possible - E.g. 2 to 3 characters.</p> <p>NOTE 3: The prefix is mtc if the component role is MTC, or ptc if the component role is PTC. If multiple PTCs are used, the rest of the identifier will clarify which PTC is being referred to. E.g. ptc_Cell1, ptc_Cell2.</p> <p>NOTE 4: This applies for both tabular and ASN.1 definitions.</p> <p>NOTE 5: Constraint prefixes are built up from the following regular expression. c[a][b d][s r w].</p> <ul style="list-style-type: none"> - 'c' shall always be present to indicate that the object is a constraint. - 'a' shall be present for ASP constraints to distinguish them from PDU constraints. - 'b' shall be present if and only if the constraint is used as a base constraint. (i.e. included in the derivation path of any other constraint). - 'd' shall be present if the constraint is derived from another constraint.(i.e. has an entry in it's derivation path field) - 'b' and 'd' cannot both be used in the same constraint, thereby limiting the derivation path to 1. - For the purpose of the present note, the following definitions are required (see TR 101 666 [27] clause 12.6.2): <ul style="list-style-type: none"> - The term 'field' is used to represent a structured type element, an ASP parameter, or a PDU field. - A 'bound field' is a field that either contains a SpecificValue, or is Omitted (-). - An 'unbound field' is a field that contains any of the following matching mechanisms: Complement, AnyValue (?), AnyOrOmit (*), ValueList, Range, SuperSet, SubSet, AnyOne (?), AnyOrNone (*), Permutation, Length, or IfPresent. - 's' may optionally be present if the constraint is only used in send statements. 's' shall not be present if the constraint contains any unbound fields, or any fields chained to a constraint whose prefix includes 'w' or 'r'. - 'r' may optionally be present if the constraint is only used in receive statements. - 'w' may optionally be present to indicate that the constraint contains fields that are unbound. Before these constraints are used in SEND events, all unbound fields must either be bound by using a derived constraint, or explicitly assigned a value in the SEND event behaviour line. - Either 'w' or 'r' shall be used if any fields in the constraint are unbound or are chained to a constraint whose prefix includes 'w' or 'r'. <p>NOTE 6: Test case names will correspond to the clause in the prose that specifies the test purpose. E.g. tc_7_2_23_2. An additional digit may be specified if more than one test case is used to achieve the test purpose. If an additional digit is required, this probably means that the test prose are not well defined.</p> <p>NOTE 7: Test steps may optionally use the prefixes pr_ or po_ to indicate that the test step is a preamble or postamble respectively.</p> | | | |

| TTCN object | Case of first character | Prefix | Comment |
|-------------|-------------------------|--------|--|
| NOTE 8: | | | Protocol abbreviations are provided in table E.2.3.2. Protocol abbreviations may optionally be used to clarify the scope of TTCN objects, or to resolve conflicts when the same name is required by multiple protocols within the ATS. The protocol abbreviation indicates that the object is related to a particular procedure (e.g. an MM procedure). This does not prevent the object from being used by an ATS testing a different protocol. If an object is specific to one ATS, this should be indicated in comments, rather than using a protocol abbreviation (e.g. if a timer is only used in RLC tests this should be stated in the comments, rather than using the abbreviation RLC in the timer name). If two different types exist in the ATS that represent the same information (e.g. IMSI) conversion operations shall be used to ensure consistency between the types. Also, conversion operations shall be used to avoid asking the same PIXIT question twice. For example, if a type is defined as an OCTETSTRING[4] for a NAS protocol, and the same type is represented as a BITSTRING[32] for RRC, a single PIXIT question shall be asked, and conversion operations shall be used to ensure that the same value is used for both types. |
| NOTE 9: | | | The prefixes CS and PS may optionally be used to indicate that a test step is specific to circuit switched, or packet switched signalling respectively. For test steps specific to the Upper Tester, the prefixes AT or MMI or UT shall be used to indicate that, respectively, AT or MMI or both types of commands are used. |
| NOTE 10: | | | The prefix AA shall be used for RRC PDU constraints to indicate that it is defined in 3GPP TS 34.123-1 [1] annex A. The prefix 108 shall be used for RRC PDU constraints to indicate that it is defined in 3GPP TS 34.108 [3] clause 9. |

E.2.4 Identifiers should not be too long (use standard abbreviations)

To assist in keeping TTCN identifiers shorter, table E.2.4 provides a non-exhaustive set of standard abbreviations that shall be used when naming objects that are used in the body of dynamic behaviour tables. Consistent use of abbreviations will improve test suite readability, and assist maintenance.

RULE 4: Specific naming rules for test suite parameters/constants/variables test case variables and formal parameters

- a) The name should reflect the purpose/objective the object is used for.
- b) If the type is not a predefined one, it is useful that the name reflects the type, too.
- c) It could be useful, that the individual naming conventions are not the same for all object classes this rule applies to. e.g. use upper case letters for test suite parameters/constants, and use one of the other possibilities presented in ETR 141 [37] example 1 for other object classes.

See also ETR 141 [37], clauses 5.1 to 5.4 for further discussion on naming test suite parameters.

RULE 5: Specific naming rule for timers

If the timer is not defined in the protocol to be tested, the name should reflect the objective of the timer used for testing.
NOTE: There is no need to indicate the object type "timer" in the name, since timers only occur together with timer operations

RULE 6: Specific naming rule for PDU/ASP/structured types

As far as applicable, derivation rules or mapping tables should be used to relate the names of the types to the corresponding objects in the protocol or service definition.
NOTE: There may be types, e.g. erroneous PDU types, that do not relate to an object in the protocol or service definition.

Whenever names of types are derived from ASN.1 type definitions provided in the core specifications, the names shall remain the same as the ASN.1 specifications, and references shall be provided in the comment fields.

RULE 7: Specific naming rule for PDU/ASP/structured types constraints

Rules should be stated to derive the names from the names of the corresponding type definitions. It is often possible to use the type name plus an appropriate suffix reflecting the specific constraint value. In case of lengthy names, useful abbreviations or a defined numbering scheme can be chosen.

Constraint names begin with the appropriate prefix, followed by the first letter of each word in the type, followed by words describing the peculiarity of the constraint. E.g. Type = RadioBearerSetupPDU, constraint name could be cb_RBSP_GenericUM_DTCH.

RULE 8: Specific naming rule for test suite operations

The name should reflect the operation being performed.
i.e. the name should indicate an activity, not a status. This can be achieved e.g. by using appropriate prefixes like "check", "verify", etc.

RULE 9: Specific naming rule for aliases

The name should reflect that aspect of its expansion, that is important in the situation where the alias is used. Derivation rules should be provided to derive the alias name from its macro expansion or from the name of an embedded ASP / PDU.

See also ETR 141 [37], clauses 6.3.6 and 9 for further guidelines on naming aliases.

RULE 10: Specific naming rule for test steps

The name should reflect the objective of the test step.

RULE 11: Selecting the ASN.1 format for type definitions

- a) If the protocol standard uses ASN.1 to specify the PDUs, the ATS specifier should also use ASN.1.
- b) If the protocol standard does not use ASN.1, check carefully whether features of ASN.1 that the tabular format of type definition does not present are necessary in the ATS, or could ease the design and understanding of the definitions as a whole. Check especially whether fields or parameters have to be specified, the order of appearance of which, in a received ASP/PDU, cannot be predicted. If any of these conditions apply, use ASN.1 for type and ASP/PDU type declarations.
- c) Use the option of "ASN.1 ASP/PDU type Definitions by Reference" whenever applicable.
- d) Example 14 shows a compatibility problem that could occur, when ASN.1 type declarations as well as tabular type declarations are used in an ATS. Use the ATS Conventions to describe how this compatibility problem is handled in the ATS, i.e. whether in expressions and assignments entities defined in ASN.1 are only related to entities defined in ASN.1 or not.

Names of ASN.1 objects shall be kept the same as the core specifications in this case, even where the names are at odds with the naming conventions adopted for other TTCN objects.

RULE 12: Further guidelines on type definitions

- a) Use simple type or ASN.1 type definitions whenever an object of a base type with given characteristics (length, range, etc.) will be referenced more often than once.
- b) Use the optional length indication in the field type or parameter type column of structured type and ASP/PDU type definitions whenever the base standard/profile restricts the length.
NOTE 1: This can often be achieved by references to simple types.
- c) Map the applicable ASPs/PDUs from the service/protocol standard to corresponding ASP/PDU type definitions in the ATS.
NOTE 2: It may happen that not all ASPs/PDUs of a service/protocol standard are applicable to a particular ATS for the related protocol. It may also happen that additional ASP/PDU type declarations are necessary, e.g. to create syntactical errors.
- d) Map the structure of ASPs/PDUs in the service/protocol standard to a corresponding structure in the ATS.
NOTE 3: This mapping is not always one-to-one, e.g. because a field in the PDU definition of the protocol standard is always absent under the specific conditions of an ATS. But it should normally not happen, that a structured element in the protocol standard is expanded using the "<" macro expansion, so that the individual fields are still referenced, but the structure is lost in the ATS.

RULE 13: Specification of test suite operations

- a) Use a test suite operation only if it cannot be substituted by other TTCN constructs.
- b) Write down the rationale/objective of the test suite operation.
Reference standards if applicable.
- c) Classify and simplify algorithm.
Split test suite operation if too complex.
- d) Choose an appropriate specification language depending on the rationale/objective:
 - predicates for Boolean tests;
 - abstract data types for manipulation of ASN.1 objects;
 - programming languages for simple calculation.
- e) Check/proof the test suite operation:
 - is the notation used known/explained;
 - are all alternative paths fully specified;
 - is the test suite operation returning a value in all circumstances;
 - are error situations covered (empty input variables, etc.).
- f) State some evident examples.

E.2.5 Test suite operations must not use global data

All information required by test suite operations must be passed as formal parameters. This includes test suite variables, test case variables, test suite parameters, and constraints.

RULE 14: General aspects of specifying constraints

- a) Develop a design concept for the complete constraints part, particularly with respect to the "conflicting" features as indicated in items i) to iv) and including naming conventions (see ETR 141 [37] clause 6).
- b) Make extensive use of the different optional "Comment" fields in the constraint declaration tables to highlight the peculiarity of each constraint.

RULE 15: Relation between base constraints and modified constraints

- a) Define different base constraints for the send- and receive direction of a PDU (when applicable).
 - b) Use modified constraints preferably when only a small number of fields or parameter values are altered with respect to a given base.
- NOTE 1: For SEND events the creation of a further modified constraint can sometimes be avoided, if an assignment is made in the SEND statement line, thus overwriting a particular constraint value.
- c) Design the relation between base constraints and modified constraints always in connection with parameterization of constraints (see the two subsequent subclauses).
- NOTE 2: Additional parameters in a constraint, introduced to avoid the declaration of further base/modified constraints can reduce the amount of constraints needed in an ATS, but then the constraint reference is getting more and more unreadable.
- d) When modified constraints are used, keep the length of the derivation path small. The length of the derivation path (resulting from the number of dots in it) is a kind of nesting level, and it is known from experience that a length greater than 2 is normally difficult to overview and maintain.

Modified constraints should not have a derivation path longer than 1. A modified constraint should not alter more than 5 values with respect to a given base constraint. If a constraint is used as a base constraint, it must have the prefix 'cb', to warn test suite maintainers / developers that any changes to this constraint may cause side effects.

Note that if an existing constraint without the 'cb' prefix is to be used as a base constraint, either a new, identical constraint with an 'cb' prefix must be created, or the existing constraint must be renamed to include the 'cb' prefix in all places it is referenced in the test suite.

RULE 16: Static and dynamic chaining

- a) Make a careful evaluation of which embedded PDUs are needed in ASPs/PDUs, in which (profile) environment the ATS may operate and which kind of parameterization for other parameters/fields is needed, to find an appropriate balance between the use of static and/or dynamic chaining in a particular ATS.
- b) When the ATS is used in different profile environments and the types and values of embedded PDUs cannot be predicted, dynamic chaining is normally the better choice.
- c) When static chaining is used, chose the name of the ASP/PDU constraint such that it reflects the peculiar value of the embedded PDU (see also the clause on naming conventions in ETR 141 [37]).

RULE 17: Parameterization of constraints

- a) Make a careful overall evaluation of which field/parameter values are needed in ASPs and PDUs to find an appropriate balance between the aim of a comparably small number of constraint declarations and readable and understandable constraint references.
- b) Keep the number of formal parameters small.
Keep in mind, that the number of formal parameters in structured/ASN.1 types Constraints will add up to the total number of ASP/PDU constraints.
A clear border for the number of formal parameters cannot be stated, but it is known from experience that a number bigger than 5 normally cannot be handled very well.

Constraints should not be passed more than five parameters. Instead, more constraints should be defined. Related parameters can be grouped in new structured types to reduce the number of parameters that must be passed to constraints.

NOTE 1: The value five has been selected based on the recommendation in ETR 141 [37] rule 17. If more parameters are required, we can update this rule, or use more than 5 parameters, and provide documentation indicating why more parameters are required.

A constraint should not be passed parameters to that are not processed in that constraint. If for example a parameter is to be passed from a PDU constraint to a structured type constraint then the PDU constraint should be made specific and not have that parameter passed. The reason for this is that no editors as yet can trace through this mechanism and it becomes very difficult in a complex suite to see exactly what is being passed.

For example:

```
PduA ::= SEQUENCE {
  infoElement1 InformationElementType1,
  infoElement2 INTEGER
}

InformationElementType1 ::= SEQUENCE {
  field1 INTEGER,
  field2 INTEGER
}

cb_PATypical( p_Field1: INTEGER; p_Field2: INTEGER ) ::= {
  infoElement1 c_IET1Typical( p_Field1 ),
  infoElement2 pField2
}

c_IET1Typical( p_Field1: INTEGER ) ::= {
  field1 p_Field1,
  field2 5
}
```

In the example constraint cb_PATypical, passing p_Field1 through to a nested constraint is not allowed, but the use of p_Field2 is acceptable.

RULE 18: Constraint values

- Use comments to highlight the peculiarity of the value, especially when the value is a literal, whose meaning is not apparent.
- Use test suite constants instead of literals, when appropriate.
Normally not all literals can be defined as Test Suite Constants, but a rule by thumb is: if a literal value of a given type occurs more than once (as a constraint value or more generally in an expression), then it is useful to define it as a Test Suite Constant, letting the name reflect the value.
- Use the length attribute when possible and when the length is not implicit in the value itself or given by the type definition (e.g. for strings containing "**").

RULE 19: Verdict assignment in relation to the test body

Make sure that verdict assignment within a default tree is in relation to the test body. If an unsuccessful event arising in the test body is handled by the default tree, then assign a preliminary result "(FAIL)" within the corresponding behaviour line of the default tree. If the position of the unsuccessful event is not in the test body, assign a preliminary result "(INCONCLUSIVE)". If the behaviour line handling the unsuccessful event is a leaf of the default tree, assign a final verdict instead.

RULE 20: Test body entry marker

The entry of the test body should be marked.

RULE 21: State variable

For realizing test purposes dependent on protocol states, use a variable to reflect the current state of the IUT.

RULE 22: State checking event sequences

Combine event sequences used for checking a state of the IUT within test steps.

RULE 23: Easy adaptation of test steps to test cases

For easy adaptation of a test step to test case needs, parameterize the constraints used within a test step.

Test steps may be parameterized, but with no more than five parameters. See also ETR 141 [37] clause 12.2 and rule 28. Related parameters can be grouped in new structured types to reduce the number of parameters that must be passed to constraints.

NOTE 2: Again, the value five has been selected based on the recommendation in ETR 141 [37] rule 17. If more parameters are required, we can update this rule, or use more than 5 parameters, and provide documentation indicating why more parameters are required.

RULE 24: Minimizing complexity of test steps

Minimize the complexity of test steps either by restricting the objective of a test step to atomic confirmed service primitives or by separating event sequences, which build different "logical" units into different test steps.

RULE 25: Nesting level of test steps

Keep the nesting level of test steps to a minimum.

RULE 26: Recursive tree attachment

Avoid recursive tree attachment. Where possible, use loops instead of recursive tree attachments.

RULE 27: Verdict assignment within test steps

If verdicts are assigned within a test step, guarantee at least the partial (i.e. not general) re-use of the test step.

RULE 28: Parameterized test steps

Use parameterized test steps to ensure re-use of test steps within test cases for different needs.

RULE 29: Combining statements in a sequence of alternatives

If there is no Boolean expression included in an alternative sequence, a statement of type UCS (unconditional statement) should never be followed by a statement of type UCS or CS (conditional statement) within a sequence of alternatives.

RULE 30: Using relational expressions as alternatives

- A relational expression should never restrict the value range of a preceding relational expression in the same alternative sequence using the same variable.
- The value range of a relational expression should be different from the whole value range of all preceding relational expressions in the same alternative sequence using the same variable.

RULE 31: Loop termination

Do not use conditions for terminating loops, which depend only on the behaviour of the IUT.

RULE 32: Avoiding deadlocks

- Make sure that each alternative sequence of receive events contains an OTHERWISE statement (without any qualifier) for each PCO.
- Make sure that each alternative sequence of receive events contains at least one TIMEOUT event (implying that a corresponding timer was started).

A set of alternatives using qualifiers shall always include an alternative containing the qualifier [TRUE], to provide a default behaviour if none of the qualifiers match.

For example:

```
[ tcv_Value = 1 ]
  AM ! ASP_ForValue1
  ...
[ tcv_Value = 2 ]
  AM ! ASP_ForValue2
  ...
[ TRUE ]
  AM ! ASP_ForOtherValues
  ...
```

RULE 33: Straightforward specification of test cases

- Use only event sequences leading to the test body within a preamble.
- Handle all event sequences not leading to the test body within the default tree of the test case/step.
- If the very same event sequence can be used to transfer the IUT from each possible state to the idle state, then realize this event sequence as a postamble.

RULE 34: Test component configuration declaration

Avoid recursive test component configuration declarations.

RULE 35: Default trees with RETURN statement

Special care should be taken by using a RETURN statement within a default tree in order to avoid an endless loop resulting from the expansion of the default tree.

E.3 3GPP ATS implementation guidelines

This clause provides a set of guidelines that must be followed during ATS development. In general, these guidelines are intended to prevent developers from making common errors, or discuss considerations that must be taken into account before using specific features of the TTCN language.

E.3.1 Test case groups shall reflect the TSS&TP document

Test groups shall be used to organize the test cases in the same way as the test purposes are structured in the prose specification.

The general structure of the test groups should be in the following format.

<protocol>/<group>/<subgroup>

E.g. RLC/UM/Segmentation/LengthIndicator7bit/

E.3.2 Test case names correspond to the clause number in the prose

Test case names are derived directly from the clause number in the prose specification. Decimal points between digits in the clause number are replaced with underscores. E.g. the test case name for the test purpose specified in clause 7.2.3.2 of 3GPP TS 34.123-1 [1] is tc_7_2_3_2. If more than one test case is required to achieve a test purpose, an additional digit may be added. See also ETR 141 [37], clause 6.3.7.

E.3.3 Use standard template for test case and test step header

Table E.3.3.1 illustrates how the Test Case dynamic behaviour header fields should be used.

Table E.3.3.1: Template for TTCN test case table header

| Field | | Contents | | | |
|--|-------|---|-----------------|---------|----------|
| Test Case Name: | | tc_NUMBER_OF_TESTCASE The number of the test case, which is used in the name of the test case, is the number it has in the prose specification. e.g.: "tc_26_13_1_3_1" | | | |
| Group: | | Is automatically filled and cannot be changed | | | |
| Purpose: | | This is taken directly from the prose specifications. | | | |
| Configuration: | | As required if concurrent TTCN is being used. | | | |
| Default | | The appropriate default | | | |
| Comments: | | <p>First line contains: Specification: The names and clauses of relevant core specifications.</p> <p>Next line contains: Status: OK / NOT OK (+explanation if not ok) / Version number / Validated / Reviewed, etc. E.g.: Status: OK</p> <p>Rest of lines give comments as: What has to be done before running this test? E.g.: 1. Generic setup procedure must be completed before running this test. Any special information about what might be needed for the testing system, like specific requirements for the testing system, specific hacks, certain settings, etc. This field should be short (if long description is needed it must be put into Detailed Comments)</p> | | | |
| Selection Ref: | | The appropriate test case selection expression. | | | |
| Description: | | Optional. Max 4 lines. If available, this should be the title of the prose clause. Note 1 | | | |
| Nr | Label | Behaviour Description | Constraints Ref | Verdict | Comments |
| 1 | | Note 3 | Note 3 | | Note 2 |
| Detailed Comments | | Contains detailed information about test steps + additional information Note 2 | | | |
| NOTE 1: The description field in the test case / step header is used to generate the test suite overview, and should only include a brief overview of the test case / step with a maximum of 4 lines. For a more detailed description of the test case / step algorithm / parameters etc, the comments or detailed comments fields should be used. | | | | | |
| NOTE 2: The comments field for each behaviour line should usually consist of a number that is a reference to a specific numbered comment in the detailed comments field. If this extra level of indirection reduces readability, brief comments can be used in the comments field for each behaviour line. | | | | | |
| NOTE 3: If entries in the behaviour description or constraints reference column contain lists with more than one element, carriage returns should be used between list elements to prevent the line from becoming too long. | | | | | |

Table E.3.3.2 illustrates how the Test Case dynamic behaviour header fields should be used.

E.3.4 Do not use identical tags in nested CHOICE constructions

A nested CHOICE requires tags in the different alternative type lists to differ (see ISO/IEC 8824 [29], clause 24.4, example 3, INCORRECT). "The tag shall be considered to be variable, ... becomes equal to the tag of the "Type" ... from which the value was taken".

EXAMPLE: components are defined in a nested CHOICE construction, but no distinguishing tags are used to make the difference between component types, i.e. tags for different types turn out to be identical.

```

Component ::= CHOICE {
  GSMLocationRegistration_Components    GSMLocationRegistration_Components,
  GSMLocationCancellation_Components    GSMLoactionCancellation_Components,
  ...
}

GSMLocationRegistration_Components ::= CHOICE {
  GSMLocationRegistration_InvokeCpt    [1] IMPLICIT GSMLocationRegistration_InvokeCpt,
  GSMLocationRegistration_RRCpt       [2] IMPLICIT GSMLocationRegistration_RRCpt,
  GSMLocationRegistration_RECpt       [3] IMPLICIT GSMLocationRegistration_RECpt,
  GSMLocationRegistration_RejectCpt   [4] IMPLICIT RejectComponent
}

```

```

GSMLocationCancellation_Components ::= CHOICE {
  gSMLocationCancellation_InvokeCpt [1] IMPLICIT GSMLocationCancellation_InvokeCpt,
  gSMLocationCancellation_RejectCpt [4] IMPLICIT RejectComponent
}

```

gSMLocationRegistrationInvokeCpt and gSMLocationCancellation_InvokeCpt have the same tag and can therefore not distinguished anymore. Note that ITEX 3.5 does not report this error.

E.3.5 Incorrect usage of enumerations

Enumerations may contain distinct integers only (see ISO/IEC 8824 [29], clause 15.1).

EXAMPLE: TypeOfNumber containing a NamedValueList in which there are non-distinct values.

```

TypeOfNumber ::= ENUMERATED {
  .....,
  internationalNumber (1),
  level2RegionalNumber (1),
  nationalNumber (2),
  level1RegionalNumber (2),
  .....,
}

```

E.3.6 Structured type as OCTETSTRING should not be used

"It is required to declare all fields of the PDUs that are defined in the relevant protocol standard, ..." TR 101 101 [38] TTCN specification clause 11.15.1.

EXAMPLE 1: The ISDN Bearer Capability Information Element (BCAP) contents is defined as OCTETSTRING.

EXAMPLE 2: Usage of data type BITSTRING [7..15] as data type of the Call Reference (= 7 bits or =15 bits, but not 8 bits for example) does not correspond to the specification !!).

E.3.7 Wildcards in PDU constraints for structured types should not be used

Contrary to popular belief, TR 101 666 [27] does not support the use of wildcards for TTCN ASP parameters, or TTCN PDU fields whose type is structured. It is not clearly stated if wildcards are permitted for TTCN structured type elements whose type is structured but it is assumed that they are not permitted because the semantics for this are not clearly specified.

Note that this does not apply to ASN.1 Type definitions, ASPs, or PDUs.

Most tools do support wildcards for TTCN ASP parameters / TTCN PDU fields / TTCN structured type elements whose type is structured, but there is ambiguity between implementations since the semantics are not clearly specified in the core specification.

This feature is commonly used by TTCN developers, and is present in many existing test suites, including the 3GPP test suite, and in constraints that are being re-used from GERAN tests.

One problem with values '?' and '*' in constraints where they are used to indicate values of structured types, is that they would allow any combinations of values - even incorrect ones - which is not admissible according to the specifications. It is to be kept in mind that in tabular form each field is optional! It would be better to create and use an "any"-constraint which would deal with all the fields in detail (mandatory, IF PRESENT, etc.).

For the purpose of the present annex, the following rules shall apply:

1. '?' shall not be used to indicate values of TTCN ASP parameters / TTCN PDU fields / TTCN structured type elements whose type is structured. Known TTCN implementations differ significantly in their implementation of this feature.

2. '*' shall not be used for TTCN PDU fields, or TTCN ASP parameters whose type is structured (i.e. at the top level).
 - 2.1 Usage of wildcards should be avoided in structured type identifiers. Only simple type fields should use * or ?
3. '*' is permitted but discouraged for structured type elements whose type is structured. Note that this may result in ambiguous behaviour between TTCN implementations because the semantics are not specified in TR 101 666 [27].
4. One of the following two options shall be used as an alternative to using a '?' for a TTCN ASP parameter / TTCN PDU field / TTCN structured type element whose type is structured.

4.1 Option 1: Use '*' instead (only applicable to structured type elements due to rules 2 and 3 above).

WARNING: This may result in the situation where a UE omits a mandatory field, but passes the test anyway, and / or different behaviour depending on the TTCN tool used.

4.2 Option 2 (preferred option; supported by TR 101 666 [27]): Use an 'any' constraint, in conjunction with IF PRESENT if appropriate (whole TTCN ASP parameters / TTCN PDU fields / TTCN structured type elements may be omitted according to TR 101 666 [27]). This means that the constraint value specified for the parameter / field / element shall be a reference to another constraint of the appropriate structured type, which may in turn use wildcards for each of its elements according to the rules specified in the present annex.

5. A structured type formal parameter should not be used together with the IF_PRESENT indication inside a structured type constraint. If this is required, then this shall be clearly commented.

E.3.8 TSOs should be passed as many parameters as meaningful to facilitate their implementation

Parameters should be passed to TSOs to facilitate the TSO realization. If a TSO is used in various contexts, this should be reflected in the parameters passed to the TSO. Specifically, TSOs operating on well-defined (parameterized) constraints should take these constraints (including relevant parameters) as parameters if required.

BAD EXAMPLE: In this example, the TSO may be used in many contexts, but no information is passed to the TSO, which makes TSO realization difficult.

| | | | | | |
|--|--|--|---|--|--|
| | | L?SETUPr (... tcv_invokeId := TSO_GET_INVOKEID (), ...) | Sr (SU_GR3(GSM_IncomingCallMMInfo_In voke(...))) | | |
|--|--|--|---|--|--|

GOOD EXAMPLE: In this case, the TSO is provided with information about the data object from which the invoke Id is to be extracted, and the type of component from which the invoke Id is to be extracted is identified by passing the component constraint.

| | | | | | |
|--|--|---|---|--|--|
| | | L?SETUPr (... tcv_invokeId := TSO_GET_INVOKEID (DL_DataInd_Setup.msg, GSM_IncomingCallMMInfo_Invoke(...), ...) | Sr (SU_GR3(GSM_IncomingCallMMInfo_In voke(...))) | | |
|--|--|---|---|--|--|

To calculate the invocation identification and store the result in variable tcv_invokeId the TSO has to be provided with information about the data object from which the invoke Id is to be extracted. PDU constraint SU_GR3 may contain several components. In the specific situation only one of these components is relevant.

Depending on the nature of the TSO, passing the received value, or a subcomponent of the received value may be more appropriate than passing the constraint.

E.3.9 Specification of Encoding rules and variation should be indicated

TTCN does not mandate encoding rules, although TTCN foresees that applicable encoding rules and encoding variations can be indicated for the data structures used in a test suite.

There are standards defining encoding rules, e.g. the ITU-T Recommendation X.680 [39] series. However, the type of encoding called "Direct Encoding" - a bit-by-bit-mapping from the data definitions onto the data stream to be transmitted - is not defined anywhere. It therefore needs a "home".

TTCN should therefore define which encoding rules may legally be used by TTCN test suite specifiers. All the encoding rules defined in the ITU-T Recommendation X.680 [39] series should be contained in this repertoire. Additionally an encoding rule called Direct Encoding is needed in particular for tabular TTCN.

ITU-T Recommendation X.680 [39] allows to encode data objects using different length forms (short, long, indefinite). These could be used alternatively as encoding variations. Another encoding variation could be the "minimum encoding", accepting any of the length forms in reception, and using the shortest of the available forms in sending. The variation actually used has to be described somewhere (in the ATS).

E.3.10 Use of global data should be limited

The Phase 2 ATS became extremely complex due to the global definition of data. Data should be defined locally where possible if the language allows, alternatively the names of global constraints could be given prefixes to indicate their use.

E.3.11 Limit ATS scope to a single layer / sub-layer

Separate ATSs should be produced to test each Layer and perhaps sub Layer. By doing this preambles and common areas particular to one sub Layer can be confined to one test suite and parallel development of test suites can be facilitated.

E.3.12 Place system information in specially designed data structures

System Information data could be stored in specially defined data structures, use of these structures to build PDUs may help to ensure that a consistent set of data is transmitted in all the channels in a cell.

E.3.13 Place channel configuration in specially designed data structures

Likewise the configuration of a 'channel' could be stored in similar structures. This data can then be used to configure the test system and to build Assignment messages to the UE under test. This may help avoid the situation where the TTCN creates one channel and unintentionally commands the mobile to a different, non-existent, channel.

E.3.14 PICS / PIXIT parameters

It is desirable to limit the scope of PICS / PIXIT parameters.

A default value shall be provided in the PIXIT document for all PIXIT parameters.

PICS / PIXIT parameters shall not include structured types. If a structured parameter is required, several parameters shall be used, one for each simple element within the type, and a constraint shall be created to combine the simple parameters into a structured type.

For example, to use the following structured type as a parameter.

| | | | |
|---------------------------|---|-----------------------|-----------------|
| Type Name | LocAreald_v | | |
| Encoding Variation | | | |
| Comments | Location Area Identification Value 3GPP TS 24.008 [9] clause 10.5.1.3 | | |
| Element Name | Type Definition | Field Encoding | Comments |
| mcc | HEXSTRING[3] | | MCC 3 digits |
| mnc | HEXSTRING[3] | | MNC 3 digits |
| lac | OCTETSTRING[2] | | LAC |
| Detailed Comments | | | |

| The following three PIXIT parameters should be defined: Parameter Name | Type | PICS/PIXIT Ref | Comments |
|--|-------------|----------------|-------------|
| px_LACDef | OCTETSTRING | PIXIT TC | default LAC |
| px_MCCDef | HEXSTRING | PIXIT TC | default MCC |
| px_MNCDef | HEXSTRING | PIXIT TC | default MNC |

And then the following constraint can be used to combine the simple parameters into a structured parameter.

| | | | |
|---------------------------|----------------------|-------------------------|-----------------|
| Constraint Name | cb_LocArealdDef_v | | |
| Structured Type | LocAreald_v | | |
| Derivation Path | | | |
| Encoding Variation | | | |
| Comments | | | |
| | | | |
| Element Name | Element Value | Element Encoding | Comments |
| mcc | px_MCCDef | | |
| mnc | px_MNCDef | | |
| lac | px_LACDef | | |
| Detailed Comments | | | |

E.3.15 Dynamic vs. static choices

Don't use wildcards for static choice constraints. For example, a type that is similar for FDD and TDD should have 2 type definitions, rather than a single type that uses an ASN.1 choice. Then in the TTCN, the correct type should be selected based on test suite parameters.

E.g.:

```
[ pxUseTddMode ] AM ! TddSpecificAsp
AM ?
...
[ pxUseFddMode ] AM ! FddSpecificAsp
AM ? ...
...
```

E.3.16 Definition of Pre-Ambles and Post Ambles

Test cases should, as far as possible, use one of a set of standard pre-ambles to place the user equipment in its initial conditions. These pre-ambles should align with the generic setup procedures in the conformance specification. All non-standard pre-ambles should be identified and added to the pre-amble library.

With pre-ambles readability is very important so they should not use other test steps to send message sequences, and they should be passed as few parameters as possible. This also makes the results log easier to read.

The prose message sequence charts should be analysed, and a catalogue of common ways in which the test cases can terminate (correctly or incorrectly) created. This catalogue should be used to create a set of post-ambles. All final verdicts should be assigned in the post-ambles.

Wherever possible, a post-amble should return the test system and the User Equipment under test to a known idle state.

E.3.17 Use test steps to encapsulate AT and MMI commands

When the same AT or MMI command is to be used more than once within a test suite, the command should be placed within a test step, to ensure that the same information is provided consistently. The main intention of this guideline is to ensure that MMI commands provided to the user are consistent, and can be changed easily if required.

For example, a test step similar to the one illustrated in table E.3.17 should be created and attached so that the same information is provided to the user each time the test step is used, and the string to be sent only exists in one place within the test suite.

Table E.3.17: Example test step to encapsulate AT / MMI commandsDefault behaviour

Defaults are test steps that are executed when ever a receive event occurs that is not expected. Not expected means that it does not match any of the defined ASP constraints at that point in the test case. The default behaviour used in test case is defined in the test case declaration. They can be defined to stop the test case by calling a standard post-amble or receive the event as OTHERWISE and RETURN back to step where the unexpected event occurred.

A strategy for dealing with unexpected behaviour involving consistent use of defaults should be developed, and applied to test cases wherever possible.

If during a test case or test step it is necessary to change the default behaviour, the ACTIVATE statement may be used.

E.3.18 Use system failure guard timers

A timer should be set at the beginning of each test case to guard against system failure. Behaviour on expiry of this timer should be consistent for all test cases.

E.3.19 Mapping between prose specification and individual test cases

The ATS should map one-to-one between test cases and tests as described in 3GPP TS 34.123-1 [1]. A method for ensuring that the two specifications track each other needs to be defined.

E.3.20 Verdict assignment

E.3.20.1 General

Final verdicts shall only be used to indicate test case errors, or when unexpected UE behaviour occurs such that it not sensible to continue the test. When a test case reaches a leaf node, the test case ends, and the current preliminary verdict is assigned. At least one preliminary verdict shall be assigned for every test case. If a test case terminates and no final or preliminary verdicts have been assigned, the current value of the predefined variable R will be 'none', and a test case error is recorded instead of a final verdict.

Labels shall be used for every line in which a verdict is posted to improve the traceability of the conformance log produced when the test case is executed. These labels should be kept short, since they appear in the dynamic behaviour tables.

All test suites shall make use of a global boolean variable, defined in the common module, called `tcv_TestBody`. `tcv_TestBody` is updated within each test case to indicate if the test body is currently being executed. `tcv_TestBody` is referenced in defaults and test steps to assign a preliminary inconclusive verdict when unexpected events occur outside of the test body, or a preliminary failure verdict when unexpected events occur within the test body.

The initial value in the declaration of the test case variable `tcv_TestBody` shall be `FALSE`. The variable will be bound to this value when the ATS is initialized, and will be re-bound to this value after termination of each test case, ready for execution of the next test case.

E.3.20.2 Test cases

A line similar to line 3 in table E.3.20.2 shall be used in all test cases to set `tcv_TestBody` to `TRUE`. This line shall have the label TBS to indicate the Test Body Start point.

A line similar to line 6 in table E.3.20.2 shall be used in all test cases to set `tcv_TestBody` to `FALSE`. This line shall have the label TBE[N] to indicate the Test Body End point. A number N (with one or more digits) may optionally be appended to the label to distinguish between multiple test body end points. If the number of possible test sequences makes management of the `tcv_TestBody` variable too difficult, the variable can be set to `TRUE` at the beginning of the test. In this case, a comment shall be added to the test case noting that `tcv_TestBody` is not updated, so verdicts assigned within preambles and postambles will be treated as if they are part of the test body.

Within the test body, preliminary verdicts shall be used to indicate the result of the test purpose. Each behaviour line within the test body containing a preliminary verdict shall have a label of the form TBXN, where X is one of P, F, I for pass, fail, and inconclusive respectively, and N is a number (with one or more digits) used to distinguish multiple TBPs, TBFs, or TBIs in the same test case.

If an unexpected event occurs corresponding to a test case error, a final inconclusive verdict shall be assigned, and the behaviour line shall have a label ERRN, where N is a number used to distinguish multiple ERRs, and ERR indicates that a test case error has occurred. An example of this is provided in the test step clause.

Table E.3.20.2 contains an example test case illustrating these concepts.

In case of a failure event of a time consumed test case (longer than 30 minutes), the test case can be stopped by using a final verdict after the execution of the postamble.

Table E.3.20.2: Example test case illustrating use of verdicts, labels and tcv_TestBody test case variable

The label TBPn is used to indicate that the test purpose has been achieved via the Nth possible valid UE behaviour. 4. The label TBFn is used to indicate that the test purpose has not been achieved, due to the Nth possible failure cause. 5. The label TBIn is used to indicate that the test result is inconclusive for the Nth possible unexpected / unknown event. | | | |

E.3.20.3 Test steps

To promote re-use, test steps shall only assign preliminary verdicts (I) and (F). (P) verdicts shall be managed at the test case level in general, but may be used sparingly within test steps. ETR 141 [37] clause 12.4 recommends that a preliminary pass verdict should be assigned at the leaf of each passing event sequence of the test step. If a test step includes an alternative for unexpected / invalid behaviour, then either a preliminary inconclusive verdict shall be assigned if tcv_TestBody is FALSE, or a preliminary failure verdict shall be assigned if tcv_TestBody is TRUE.

Each behaviour line within the test step containing a preliminary verdict shall have a label of the form TSXN, where X is one of P, F or I for pass, fail, and inconclusive respectively, and N is a number (with one or more digits) used to distinguish multiple TSPs, TSFs, or TSIs in the same test step.

If an unexpected event occurs corresponding to a test case error, a final inconclusive verdict shall be assigned, and the behaviour line shall have a label ERRN, where N is a number used to distinguish multiple ERRs, and ERR indicates that a test case error has occurred.

Table E.3.20.3 contains an example test step illustrating these concepts.

If unexpected / invalid behaviour occurs, and the current test step is being used as a preamble or postamble (tcv_TestBody = FALSE) then a preliminary inconclusive verdict is assigned. 4. E.3.20.4 Defaults

Each behaviour line within a default behaviour table containing a preliminary verdict shall have a label of the form DFXN, where X is one of F or I for fail, and inconclusive respectively, and N is a number (with one or more digits) used to distinguish multiple DFFs, or DFIs in the same test step.

tcv_TestBody shall be referenced from within default behaviour tables to assign the appropriate verdict when unexpected events occur.

Table E.3.20.4 contains an example default behaviour table illustrating these concepts.

E.3.21 Test suite and test case variables

A default value shall be provided for all test suite and test case variables.

E.3.22 Use of macros is forbidden

The use of macros is forbidden, to support migration to TTCN3.

E.3.23 Support for future Radio Access Technologies

To allow existing test cases to be updated in future to support other radio access technologies, test suites shall make use of a PIXIT parameter `px_RAT` of type `RatType` as shown in the following example.

| Test Case Name | | tc_RAT_Example1 | | | |
|-------------------|-------|------------------------|-----------------|---------|--|
| Nr | Label | Behaviour Description | Constraints Ref | Verdict | Comments |
| 1 | | START t_Guard(300) | | | |

| 8 | | [px_RAT = other_rat] | | I | Tests for this RAT not implemented yet |
| 9 | TCE1 | [TRUE] | | I | Unexpected px_RAT value |
| Detailed Comments | | | | | |

In general, alternatives should be used to separate behaviour specific for each RAT, and common behaviour should be re-used as much as possible. A final inconclusive verdict shall be used for any alternatives that have not been implemented yet.

Local trees may be used as shown in the following example to improve re-use of common behaviour.

E.3.24 Managing multiple representations of the same information

When the same information is represented using multiple types within the same test suite, it is necessary to manage conversions between the types, and ensure that the information remains consistent across all of the representations.

For example, IMSI is represented as 'SEQUENCE (SIZE (6..15)) OF Digit' in the RRC ASN.1 definitions, as a HEXSTRING for input as a PIXIT parameter, and as an information element defined in TTCN tabular format for MM.

E.3.24.1 Predefined types

Conversion operations are not required to convert the following TTCN predefined types to their counterparts in ASN.1.

- a) INTEGER predefined type.
- b) BOOLEAN predefined type.

- c) BITSTRING predefined type.
- d) HEXSTRING predefined type.
- e) OCTETSTRING predefined type.
- f) OBJECTIDENTIFIER predefined type.
- g) R_TYPE predefined type.
- h) CharacterString predefined types.

Therefore it is valid to pass a value of type BIT STRING (ASN.1) as a formal parameter of type BITSTRING (TTCN predefined).

E.3.24.2 Simple types

TR 101 666 [27], clause 11.2.1 states:

- "TTCN is a weakly typed language, in that values of any two types which have the same base type are considered to be type compatible (e.g. for the purposes of performing assignments or parameter passing)".

When simple types have restrictions, it is the TTCN author's responsibility to ensure that the restrictions are compatible. The TTCN compiler provides some assistance with this, but the extent of the checking is compiler specific.

E.3.24.3 Structured types

For conversion between more complex representations, test suite operations will generally be required. If the mapping is simple enough, it may be possible to perform the conversion using a test step, which takes the common representation as a parameter, and stores the required representation in a test case variable. This may avoid the need for an extra test suite operation.

In TTCN-2 the NAS UL PDU types are frozen from Rel-11 onward, a generic extension field is used to match any received extension sent by UE. For example, the field “extensionFields” is added as the last field of PAGINGRESPONSE.

E.3.24.4 Conversion responsibility

Two design approaches are possible for deciding where the responsibility of conversion lies: Calling party conversion and called party conversion.

The appropriate option should be selected on a case-by-case basis with the following restrictions:

- If one representation of the information is a PIXIT parameter, and this information must be passed to a test step, the called party conversion option shall be used, and the formal parameter to the test step shall always have the same type as the PIXIT parameter.
- If a test step provides multiple alternatives for different radio access technologies, which require different representations of the same information, the called party conversion convention shall be used. In this case a technology independent representation of the information shall be passed as a parameter, and the test step shall perform the conversion to the appropriate type depending on which RAT is being used.

E.3.24.5 Option 1: Calling party conversions

For this approach, each test step provides an interface based on its internal representation. It is the responsibility of the test case / step attaching the test step to perform the conversion before the attachment.

E.3.24.5.1 Advantages

- The number of calls to conversion operations is minimized.
- The complexity of the attached test steps is reduced because fewer conversions are required than for the called party conversion approach.

E.3.24.5.2 Disadvantages

- Different types are used to transfer the same information across the test step interfaces.
- The complexity of the attaching test steps / cases may be increased because conversions are required before attaching a test step.
- The attaching test steps / cases are responsible for ensuring that multiple representations contain consistent information.

E.3.24.6 Option 2: Called party conversions

In this case, the same representation is used wherever the information must be used as a formal parameter value to a test step, and it is the responsibility of the test step to perform any conversions required.

E.3.24.6.1 Advantages

- The complexity in the attaching test case / step is reduced, which will often improve readability.
- The test step interfaces are cleaner, because the same representation is always passed as a formal parameter.
- Internal representations may be hidden within test steps so that calling parties do not need to have any knowledge of them.

E.3.24.6.2 Disadvantages

- Conversion operations may be called more times than necessary, for example if the same test step is attached twice within one test case.

E.3.25 Assignment using constraint

According to TR 101 666 [27], the Right Hand Side (RHS) of an assignment shall not contain any unbound variables. The matching symbols, AnyValue or AnyOrOmit, in both tabular and ASN.1 constraints shall not be assigned to a test case variable, independent of the type of the test case variable.

E.3.26 Guidelines for use of timers when tolerances are applicable

Timed events within the test suite should implement the timer tolerances specified in 3GPP TS 34.108 [3], clause 4.2.3. It is the TTCN author's responsibility to ensure that appropriate tolerance checks and tolerance values are being used.

NOTE: Tolerances are not applicable to guard timers as described in clause E.3.18 of the present document.

E.3.26.1 Specific situations

The present clause provides recommendations for how to implement timers with tolerances for the following situations:

- a) The timed event must occur before a given time.

- b) The timed event must occur after a given time.
- c) The timed event must occur between two given times.

NOTE: A specific case of this situation is when the desired event occurs at a specific time, plus or minus a tolerance.

E.3.26.2 Example situations

The examples below assume:

- a) The test case variable `tcv_Duration` contains the timer duration (in terms of the units used in the timer declaration).
- b) The test case variable `tcv_Tolerance` has been initialized using one of the following assignments (it is the TTCN author's responsibility to select the calculation resulting in the greatest value of `tcv_Tolerance`. Reference 3GPP TS 34.108 [3], clause 4.2.3):
 - 1) (`tcv_Tolerance := tcv_Duration / 10`)
 - 2) (`tcv_Tolerance := 2 * tcv_TTI + tsc_T_Delta`)
Where `tcv_TTI` contains the applicable TTI (in ms), and `tsc_T_Delta` is 55 ms.

NOTE: The timer value parameters used when starting the timers in the examples are recommendations only. Other timer value parameter expressions may be used if appropriate.

Annex F (informative): Void

Void.

Annex G (informative): Recommendation of an unique ICS/IXIT electronic exchange format

With standardization of ICS/IXIT file format, same Test Suite Parameter (TSP) files can be used across different System Simulators. The ICS/PIXIT will be simple ASCII text files. The assumption is that the test suite parameters are of simple type definitions only and do not include structured types (clause E.3.14).

G.1 Syntax

The proposed format of the ICS/IXIT file is as follows:

[<Parameter Name> <Parameter Type> <Value>] [<#Comment>]

- At the most one TSP value can be defined in a line.
- The comment starts with # and ends with new line.
- [...] represent OPTIONAL field(s).
- <..> represent MANDATORY field(s).
- Fields will be separated by one or more space characters.

The syntax for different Parameter Types will be as follows:

- **INTEGER**

<Parameter Name> INTEGER <Integer Value>

- **BOOLEAN**

<Parameter Name> BOOLEAN <Value>

NOTE 1: Here Value will be either 'TRUE' or 'FALSE'.

- **BITSTRING**

<Parameter Name> BITSTRING <Value>

- **HEXSTRING**

<Parameter Name> HEXSTRING <Value>

- **OCTETSTRING**

<Parameter Name> OCTETSTRING <Value>

- **ENUMERATED**

<Parameter Name> ENUMERATED <Integer Value>

- **IA5String**

<Parameter Name> IA5String "<Value>"

NOTE 2: Here Value will be string and is mandatory to put the actual value in double quotes.

G.2 Examples

This clause gives an example of ICS/IXIT file format.

```
# TSP file version 1.0.0
px_CS    BOOLEAN    TRUE # TRUE if Circuit Switched is applicable
px_PTMSI_Def  OCTETSTRING 12345678 #Default PTMSI
px_RAT    ENUMERATED  0    #px_RAT is of Type RatType and is of Type of ENUMERATED
           {fdd(0), tdd(1)}.
px_Region  IA5String "Europe" #px_Region is of Type Region and is of Type IA5String ("Europe", "Japan").
px_PriScrmCodeA  INTEGER 100    #px_PriScrmCodeA is of Type PrimaryScramblingCode and is of Type

H.2 SS and A-GNSS ASN.1 modules

These asn.1 modules are used in both the TTCN-3 Positioning and Supplementary Services tests.

Figure H.2 shows the dependencies between the asn.1 modules.

Figure H.2: ASN.1 Dependencies

H.2.1 Encoding information

Even though the codec is out of scope of the present document there are aspects with impact on TTCN-3 implementation. SS ASN.1 types are grouped by applicable encoding rules in different modules to avoid circular references. Encoding rules are applied per module when the SS ASN.1 is imported by other modules.

Table H.2.1: Encoding rules applied to the SS ASN.1 modules

| ASN.1 modules | Encoding Rule |
|--|--|
| TCAP-Definitions-Para | DIRECT: no additional encoding rules required |
| TCAP-Definitions, LCS-Definitions-Arguments, SS-Definitions-Arguments, Common-Definitions | BER_Definite: Basic Encoding Rule referred to 3GPP TS 24.080 [13], clause 3.6.1 and 3GPP TS 29.002 [14], clause 17.1.1: - The definite short form is used for length encoding, if data length is less than 128 octets. - The definite long form is used for length encoding, if data length is greater than 127 octets, the minimum number of octets shall be used to code the length field. |

Annex I (informative): Guidance on test execution

This clause provides the guidance on test execution of the different ATSSs.

I.1 Void

I.2 FDD test execution on different frequency bands

I.2.1 FDD Band VI, XIII, IX, XIV

A test case requires more than two radio frequencies shall avoid to execute on FDD Band VI, XIII and XIV. A list is given below.

6.1.1.4, 6.1.1.5, 6.1.1.7, 6.1.1.8, 6.1.1.9, 6.1.1.10, 6.1.1.11, 6.1.1.12, 6.1.1.13, 6.1.1.15, 6.1.2.3, 6.1.2.4, 6.1.2.6, 6.1.2.8, 6.1.2.11, 8.2.6.38, 8.3.1.21, 8.3.2.11, 8.4.1.42, 9.4.2.5, 9.4.5.4.1, 9.4.5.4.6, 9.4.8, 12.4.1.4b, 12.4.2.4, 12.4.2.5e.

For interBand test case execution on Band VI and IX, the Mobile Country Code of the two cells is set to the same value according to TS 34.108 clause 5.1.1.6 and 5.1.1.9. The used test USIM follows TS 34.108 clause 8.3.2.2. This is applied to the test cases:

6.1.2.1a, 6.1.2.10a, 8.1.2.10a, 8.2.1.24a, 8.2.1.34a, 8.2.6.37b, 8.3.1.1a, 8.3.2.1a, 8.4.1.2B, 8.4.1.24A, 8.4.1.25A.

I.2.2 FDD Band XII, XIX, XX, XXI

A test case requires more than three radio frequencies shall avoid to execute on FDD Band XII. A list is given below.

6.1.1.4, 6.1.1.8, 6.1.1.9, 6.1.1.10, 6.1.1.12, 6.1.1.13, 6.1.1.15, 9.4.5.4.1.

I.2.3 FDD Band XXXII

FDD Band XXXII is only applicable as a downlink only secondary band in dual band test cases:

DB-DC-HSDPA or

DB-DF-3C or

DB-DF-4C.

In the TTCN line 6 of TC_8_1_2_1, replace +ts_SendDefSysInfo(tsc_CellA) with +ts_SendSysInfoWithSpecialSIB11(tsc_CellA, tcv_SIB11IntraFreqRepQuantityRACH). Otherwise, a good UE would be failed at the regression test. | F | 3.0.0 | 3.1.0 | T1-030248 |
