NOTE 1: Asymmetric operating band (UL + DL).

NOTE 2: DL operation in this band is restricted to 1526 – 1536 MHz and UL operation is restricted to 1627.5 – 1637.5 MHz and 1646.5 – 1656.5 MHz.

### 6.2.3.2 Test frequencies for CA signalling test

Test frequencies for CA signalling testing are specified in Table 6.2.3.2-1 for CA Intra-Band contiguous case; in Tables 6.2.3.2-2 for CA Inter-band case and in Table 6.2.3.2-4 for Intra-Band Non-Contiguous case.

NOTE 1: Alternative test frequencies for additional channel bandwidth combinations may need to be specified when new CA configurations or CA Bandwidth Combination Sets are introduced in TS 36.101 subclause 5.6A.

For CA Intra-Band contiguous scenarios then f1, f2 and f3 are used.

NOTE 2: f2 and f3 are not adjacent frequencies; hence those cannot be used simultaneously as Pcell and Scell for CA Intra-Band contiguous scenarios.

For CA Inter-Band scenarios then f1, f2, f5 and f6 are used.

NOTE 3: Table 6.2.3.2-2 specifies the test frequencies for operation with PCell in the frequency band mentioned first (= carrier 1) and SCell in the frequency band mentioned second (= carrier 2) in the E-UTRA CA Configuration name acc. to TS 36.101 subclause 5.6A (e.g. PCell in band 1 and SCell in band 5 for CA\_1A-5A configuration), for operation with switched allocation of PCell and SCell. SCell in the frequency band mentioned first (= carrier 1) and PCell in the frequency band mentioned second (= carrier 2) in the E-UTRA CA Configuration name (given that UL is supported in both frequency bands in question).

NOTE 4: For operation with switched allocation f1 is mapped to f5, f2 is mapped to f6, f5 is mapped to f1, f6 is mapped to f2

For CA Intra-Band non-contiguous scenarios then f1, f2 and f3 are used.

Table 6.2.3.2-1: Test frequencies for E-UTRA PCell and SCell for CA contiguous Intra-band operation

| E-UTRA CA Configuration | Width of Operating band [MHz] | CC Combination / N <sub>RB_agg</sub> | Test Frequency | CC N <sub>RB</sub> | N <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | Frequency of Downlink [MHz] |
|-------------------------|-------------------------------|--------------------------------------|----------------|--------------------|-----------------|---------------------------|-----------------|-----------------------------|

|         |                                                                                                                                                                                                                                                                       |  | f6 | CC 50 | 133422 | 693 | 68886 | 647 |
| Note 1: | Exceptionally the second band test frequencies of this CA combination shall be used for PCell and the first band test frequencies of this CA combination shall be used for the SCell respectively.                                                                    |  |    |       |        |     |       |     |
| Note 2: | Asymmetric operating band (UL + DL).                                                                                                                                                                                                                                  |  |    |       |        |     |       |     |
| Note 3: | Band 46 is restricted to E-UTRA operation when carrier aggregation is configured. In Rel-13 the downlink only operating band 46 is paired with the uplink operating band (external) of the carrier aggregation configuration that is supporting the configured Pcell. |  |    |       |        |     |       |     |

Table 6.2.3.2-3: Void

Table 6.2.3.2-4: Test frequencies for E-UTRA PCell and SCell for CA non-contiguous Intra-band operation

| E-UTRA CA Configuration | Width of Operating band [MHz] | CC Combination / N <sub>RB_agg</sub> | Test Frequency | CC N <sub>RB</sub> | N <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | Frequency of Downlink [MHz] |

NOTE 1: Asymmetric operating band (UL + DL)

### 6.2.3.3 Test frequencies for ProSe signalling test

Test frequencies for prose direct discovery and communication signalling testing are specified in Table 6.2.3.3-1 and Table 6.2.3.3-2, these are derived from section 4.3.1 using uplink mid range frequency (i.e. f1 in Table 6.2.3.1-1) for supported Prose Bands as specified in TS 36.101 table 5.6D.

**Table 6.2.3.3-1: Test frequencies for E-UTRA cells and Sidelink Discovery**

#### 6.2.3.4 Test frequencies for MFBI frequency band priority adjustment signalling test

Test frequencies for MFBI frequency band priority adjustment signalling testing are specified in Table 6.2.3.4-1, these are derived from section 4.3.1 using uplink mid range frequency.

**Table 6.2.3.4-1: MFBI frequency band priority adjustment test frequency/Inter-band CA**

| E-UTRA CA Configuration                                                                | Width of Operating bands [MHz+MHz] | CC Combination / N <sub>RB_agg</sub> | E-UTRA Operating Band | MFBI Operating Band | MFBI Overlapping Band | f1, f5     |
|----------------------------------------------------------------------------------------|------------------------------------|--------------------------------------|-----------------------|---------------------|-----------------------|------------|
| CA_39A-41A                                                                             | 40+194                             | 100+100                              | 39                    | 38                  | 41                    | Mid (Note) |
| Note: For f1, Mid refer to Table 4.3.1.2.7-1. For f5, Mid refer to Table 4.3.1.5.26-1. |                                    |                                      |                       |                     |                       |            |

#### 6.2.3.5 Test frequencies for V2X Communication

Test frequencies for V2X communication signalling testing are specified in Table 6.2.3.5-1, these are derived from section 4.3.1 using uplink mid, low and high range frequency for supported V2X communication Bands as specified in TS 36.101 table 5.6G.

**Table 6.2.3.5-1: Test frequencies for V2X Communication**

| E-UTRA V2X Communication Band | Bandwidth [MHz] | Default Operating BW | f5 | f6 | f7 |
|-------------------------------|-----------------|----------------------|----|----|----|
|-------------------------------|-----------------|----------------------|----|----|----|

|    |    | MHz | N <sub>UL</sub> | N <sub>DL</sub> | N <sub>UL</sub> | N <sub>DL</sub> | N <sub>UL</sub> | N <sub>DL</sub> |
|----|----|-----|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| 47 | 60 | 10  | Mid             | Mid             | High            | High            | Low             | Low             |
| 47 | 60 | 20  | Mid             | Mid             | High            | High            | Low             | Low             |

## 6.3 Reference system configurations

The reference system configurations specified in this subclause apply to all Signalling test cases defined in TS 36.523-1 [18] unless otherwise specified, in addition to the common reference system configurations specified in subclause 4.4 of this specification.

For Signalling testing, MIMO (Multiple Input Multiple Output) is not applied for all cell configurations regardless of UE MIMO functionality. Only one SS Tx antenna is used.

One or two UE antennas are used for all signalling test cases. (\*1)

(\*1) Two UE antennas configuration is possible for UE diversity case.

### 6.3.1 Default parameter specific for simulated cells

Default parameters specific for simulated cells are specified in this subclause.

#### 6.3.1.1 Intra-frequency neighbouring cell list in SIB4 for E-UTRA cells

Intra-frequency neighbouring cell list for signalling test cases is defined in table 6.3.1.1-1. This table is referred to in the default contents of IE *intraFreqNeighbouringCellList* in *SystemInformationBlockType4* defined in table 4.4.3.3-3.

**Table 6.3.1.1-1: Intra-frequency neighbouring cell lists for E-UTRA cells**

| cell ID | Test Frequency | intra-frequency neighbouring cell list |               |        |         |                  |     |     |
|---------|----------------|----------------------------------------|---------------|--------|---------|------------------|-----|-----|
|         |                | number of entries                      | physCellId[n] |        |         | q-OffsetCell [n] |     |     |
|         |                |                                        | 1             | 2      | 3       | 1                | 2   | 3   |
| Cell 1  | f1             | 3                                      | Cell 2        | Cell 4 | Cell 11 | dB0              | dB0 | dB0 |
| Cell 2  | f1             | 3                                      | Cell 1        | Cell 4 | Cell 11 | dB0              | dB0 | dB0 |
| Cell 4  | f1             | 3                                      | Cell 1        | Cell 2 | Cell 11 | dB0              | dB0 | dB0 |
| Cell 11 | f1             | 3                                      | Cell 1        | Cell 2 | Cell 4  | dB0              | dB0 | dB0 |
| Cell 3  | f2             | 1                                      | Cell 23       | -      | -       | dB0              | -   | -   |
| Cell 23 | f2             | 1                                      | Cell 3        | -      | -       | dB0              | -   | -   |

NOTE: The intra-frequency E-UTRA neighbouring cell list for signalling NAS test cases when cells are on same PLMN is defined in table 6.3.2.3.1-1.

#### 6.3.1.2 Inter-frequency carrier frequency list in SIB5 for E-UTRA cells

Inter-frequency E-UTRA carrier frequency list for signalling test cases is defined in table 6.3.1.2-1. This table is referred to in the default contents of IE *interFreqCarrierFreqList* in *SystemInformationBlockType5* defined in table 4.4.3.3-4.

**Table 6.3.1.2-1: Inter-frequency carrier frequency lists for E-UTRA cells**

| cell ID                               | Test Frequency | interFreqCarrierFreqList |                   |    |    |
|---------------------------------------|----------------|--------------------------|-------------------|----|----|
|                                       |                | number of entries        | dl-CarrierFreq[n] |    |    |
|                                       |                |                          | 1                 | 2  | 3  |
| Cell 1<br>Cell 2<br>Cell 4<br>Cell 11 | f1             | 3                        | f2                | f3 | f5 |
| Cell 3<br>Cell 23                     | f2             | 3                        | f1                | f3 | f5 |
| Cell 6                                | f3             | 3                        | f1                | f2 | f5 |
| Cell 10                               | f5             | 3                        | f1                | f2 | f3 |

|         |                                                                                                                                                |
|---------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Note 1: | The inter-frequency E-UTRA carrier frequency list for signalling NAS test cases when cells are on same PLMN is defined in table 6.3.2.3.2-1.   |
| Note 2: | Depending on the Band under test, f3 may not be applicable.                                                                                    |
| Note 3: | In case of Test frequency f1, f2 and f3, dl-CarrierFreq f5 as part of inter-frequency list is applicable only in case of multi-band scenarios. |
| Note 4: | In case of Test frequency f5, dl-CarrierFreq f1 as part of inter-frequency list is applicable only in case of multi-band scenarios.            |

In the case of dual mode multi-cell network scenarios as defined in subclause 4.4.1.3, inter-frequency E-UTRA carrier frequency list for signalling test cases is defined in table 6.3.1.2-2.

**Table 6.3.1.2-2: Inter-frequency carrier frequency lists for E-UTRA cells in dual mode scenario**

| cell ID                         | Test Frequency | interFreqCarrierFreqList |                   |    |    |
|---------------------------------|----------------|--------------------------|-------------------|----|----|
|                                 |                | number of entries        | dl-CarrierFreq[n] |    |    |
|                                 |                |                          | 1                 | 2  | 3  |
| Cell 1<br>Cell 2<br>Cell 4      | f1             | 3                        | f2                | f5 | f6 |
| Cell 3                          | f2             | 3                        | f1                | f5 | f6 |
| Cell 10,<br>Cell 30,<br>Cell 31 | f5             | 3                        | f1                | f2 | f6 |
| Cell 28,<br>Cell 29             | f6             | 3                        | f1                | f2 | f5 |

### 6.3.1.3 UTRA carrier frequency list in SIB6 for E-UTRA cells

UTRA carrier frequency list for signalling test cases is defined in table 6.3.1.3-1. This table is referred to in the default contents of IE *carrierFreqListUTRA-FDD* and *carrierFreqListUTRA-TDD* in *SystemInformationBlockType6* defined in table 4.4.3.3-5.

**Table 6.3.1.3-1: UTRA carrier frequency lists for E-UTRA cells**

| interFreqCarrierFreqList       |                |    |     |
|--------------------------------|----------------|----|-----|
| number of entries              | carrierFreq[n] |    |     |
|                                | 1              | 2  | 3   |
| 3                              | f8             | f9 | f10 |
| Note: Band VI has two entries. |                |    |     |

**Table 6.3.1.3-2: Mapping of UTRA cell with TS 34.108 [5]**

| UTRA cell                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Frequency | UTRA cell in TS 34.108, clause 6.1 | UTRA frequency in TS 34.108 |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|------------------------------------|-----------------------------|
| Cell 5                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | f8        | Cell 1                             | High (Note 2)               |

| Cell 8                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | f9        | Cell 4                             | Mid (Note 2)                |
| Cell 9                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | f10       | Cell 7                             | Low                         |
| Note 1: The following simultaneous co-existences in the test are not allowed:<br>- cells on f1 (eUTRA cell 1, cell 2, cell 4, cell 11) and f9 (UTRA cell 8);<br>- cells on f2 (eUTRA cell 3, cell 12, cell 23) and f8 (UTRA cell 5, cell 7);<br>- cells on f3 (eUTRA cell 6, Cell 13) and f10 (UTRA cell 9).<br>Note 2: On UTRA Band VI, the Low range test frequency is applied to f9 for Cell 8, and f8 for Cell 5 and Cell 7.<br>Note 3: The combinations of the referred TS 34.108 UTRA Cell index and frequency in this table override that specified in TS 34.108. |           |                                    |                             |

#### 6.3.1.4 GERAN carrier frequency group list in SIB7 for E-UTRA cells

GERAN carrier frequency group list for signalling test cases is defined in table 6.3.1.4-1. This table is referred to in the default contents of IE *carrierFreqsInfoList* in *SystemInformationBlockType7* defined in table 4.4.3.3-6.

**Table 6.3.1.4-1: GERAN carrier frequency group list for E-UTRA cells**

| carrierFreqsInfoList |           |                  |                         |                  |
|----------------------|-----------|------------------|-------------------------|------------------|
| number of entries    | index (n) | carrierFreqs[n]  |                         |                  |
|                      |           | startingARFCN[n] | explicitListOfARFCNs[n] |                  |
|                      |           |                  | number of entries       | ARFCN-ValueGERAN |
| 1                    | 1         | f11              | 2                       | f12, f13         |

**Table 6.3.1.4-2: Mapping of GERAN cells with TS 51.010-1 [25]**

| GERAN cell | Frequency | GERAN cell in TS 51.010-1, clause 40 |
|------------|-----------|--------------------------------------|
| Cell 24    | f11       | Cell A                               |
| Cell 25    | f12       | Cell D                               |
| Cell 26    | f13       | Cell B                               |

NOTE 2: Unless otherwise stated, GERAN cells 24/25/26 take the default values of GERAN cells A/B/D as defined in TS 51.010 clause 40.

#### 6.3.1.5 CDMA2000 HRPD carrier frequency list in SIB8 for E-UTRA cells

CDMA2000 HRPD carrier frequency list for signalling test cases is defined in table 6.3.1.5-1. This table is referred to in the default contents of IE *cellReselectionParametersHRPD* in *SystemInformationBlockType8* defined in table 4.4.3.3-7.

**Table 6.3.1.5-1: CDMA2000 HRPD carrier frequency list for E-UTRA cells**

| neighCellsPerFreqList |           |          |                   |       |                    |
|-----------------------|-----------|----------|-------------------|-------|--------------------|
| number of entries     | index (n) | arfcn[n] | physCellIdList[n] |       |                    |
|                       |           |          | number of entries | index | PhysCellIdCDMA2000 |
| 3                     | 1         | f14      | 2                 | 1     | Cell 15            |
|                       |           |          |                   | 2     | Cell 16            |
|                       | 2         | f15      | 1                 | 1     | Cell 17            |
|                       | 3         | f16      | 1                 | 1     | Cell 18            |

#### 6.3.1.6 CDMA2000 1xRTT carrier frequency list in SIB8 for E-UTRA cells

CDMA2000 1xRTT carrier frequency list for signalling test cases is defined in table 6.3.1.6-1. This table is referred to in the default contents of IE *cellReselectionParameters1XRTT* in *SystemInformationBlockType8* defined in table 4.4.3.3-7.

**Table 6.3.1.6-1: CDMA2000 1xRTT carrier frequency list for E-UTRA cells**

| neighCellsPerFreqList |           |          |                   |       |                    |
|-----------------------|-----------|----------|-------------------|-------|--------------------|
| number of entries     | index (n) | arfcn[n] | physCellIdList[n] |       |                    |
|                       |           |          | number of entries | index | PhysCellIdCDMA2000 |
| 3                     | 1         | f17      | 2                 | 1     | Cell 19            |
|                       |           |          |                   | 2     | Cell 20            |
|                       | 2         | f18      | 1                 | 1     | Cell 21            |
|                       | 3         | f19      | 1                 | 1     | Cell 22            |

### 6.3.1.7 E-UTRA carrier frequency list in SIB19 for UTRA cells

E-UTRA carrier frequency list for signalling test cases is defined in table 6.3.1.7-1. This table is referred to in the default contents of IE eutra-FrequencyAndPriorityInfoList in System Information Block type 19 defined in table 4.4.4.1-1.

**Table 6.3.1.7-1: E-UTRA carrier frequency list for UTRA cells**

| eutra-FrequencyAndPriorityInfoList                                           |           |    |    |    |   |
|------------------------------------------------------------------------------|-----------|----|----|----|---|
| number of entries                                                            | earfcn[n] |    |    |    |   |
|                                                                              | 1         | 2  | 3  | 4  | - |
| 4                                                                            | f1        | f2 | f3 | f4 | - |
| Note: Depending on the Band under test, f2, f3 and f4 may not be applicable. |           |    |    |    |   |

### 6.3.1.8 NR carrier frequency list in SIB24 for E-UTRA cells

NR carrier frequency list for signalling test cases is defined in table 6.3.1.8-1. This table is referred to in the default contents of IE carrierFreqListNR-r15 in System Information Block type 24 defined in Table 4.4.3.3-20.

**Table 6.3.1.8-1: NR carrier frequency list for E-UTRA cells**

| carrierFreqListNR-r15                                                                    |             |      |      |      |   |
|------------------------------------------------------------------------------------------|-------------|------|------|------|---|
| number of entries                                                                        | nr-arfcn[n] |      |      |      |   |
|                                                                                          | 1           | 2    | 3    | 4    | - |
| 4                                                                                        | NRf1        | NRf2 | NRf3 | NRf4 | - |
| Note 1: Depending on the NR Band under test, NRf2, NRf3 and NRf4 may not be applicable.  |             |      |      |      |   |
| Note 2: NRf1, NRf2, NRf3 and NRf4 are defined in TS 38.508-1[67] clause 4.4.2 and 6.2.3. |             |      |      |      |   |

## 6.3.2 Default configurations for NAS test cases

The default configurations specified in this subclause apply only to NAS test cases. They apply to all NAS test cases unless otherwise specified.

### 6.3.2.1 Simulated network scenarios for NAS test cases

Simulated network scenarios for NAS test cases to be tested are specified in the pre-test conditions of each individual test case.

**NOTE:** The number of cells specified does not necessarily correspond to the maximum number of resources to be configured simultaneously in test equipment. Please refer to Table 6.1-1 for such information.

Any combination is allowed with the following restrictions:

- Cell E should not be used if Cell G or Cell H is used, otherwise two different PLMNs will be operated on the same frequency
- a maximum 3 cells on the same frequency can be used, i.e. only 3 cells out of cells A, B, C, D and M may be used simultaneously in each individual test case when cells in the test case are in different PLMNs (refer to Table 6.3.2.2-3).

### 6.3.2.2 Simulated NAS cells

Simulated NAS cells and default parameters are specified in table 6.3.2.2-1.

Unless otherwise specified, the default parameters specified in section 4 also apply to all NAS cells.

**Table 6.3.2.2-1: Default parameters for simulated NAS cells**

| NAS cell | Tracking Area | TA# list | GUTI (Note 2) |
|----------|---------------|----------|---------------|
|----------|---------------|----------|---------------|

| ID      | TA#                                                                                                                                                                                                                                          | PLMN     |     | TAC | (Note 1) | MME Identifier |          | M-TMSI                                                         |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|-----|-----|----------|----------------|----------|----------------------------------------------------------------|
|         |                                                                                                                                                                                                                                              | MCC      | MNC |     |          | MME Group ID   | MME Code |                                                                |

| Note 1: The test frequency f3 or f4 is allocated to the cell if f1 and f2 are already allocated to the cells in the test. Otherwise, f1 or f2 is allocated, instead. |                             |             |                                |                 |    |     |    |

### 6.3.2.3 Broadcast system information

#### 6.3.2.3.1 Intra-frequency neighbouring cell list in SIB4 for E-UTRA NAS cells

Intra-frequency neighbouring cell list of the same PLMN for the NAS signalling test is defined in table 6.3.2.3.1-1 when SIB4 to be broadcast.

**Table 6.3.2.3.1-1: Intra-freq. lists in SIB4 for NAS test cases (same PLMN)**

| NAS cell ID | Test Frequency | Intra-frequency neighbouring cell list |               |        |
|-------------|----------------|----------------------------------------|---------------|--------|
|             |                | number of entries                      | physCellId[n] |        |
|             |                |                                        | 1             | 2      |
| Cell A      | f1             | 2                                      | Cell B        | Cell D |
| Cell B      | f1             | 2                                      | Cell A        | Cell D |
| Cell D      | f1             | 2                                      | Cell A        | Cell B |
| Cell C      | f2             | 1                                      | Cell M        | N/A    |
| Cell M      | f2             | 1                                      | Cell C        | N/A    |

#### 6.3.2.3.2 Inter-frequency carrier frequency list in SIB5 for E-UTRA NAS cells

Inter-frequency neighbouring carrier and cell lists for NAS signalling test cases are defined in table 6.3.2.3.2-1 for same PLMN and table 6.3.2.3.2-2 for different PLMN.

**Table 6.3.2.3.2-1: Inter-freq. lists in SIB5 for NAS test cases (same PLMN)**

| NAS cell ID                                        | Test Frequency | interFreqCarrierFreqList |                   |    |
|----------------------------------------------------|----------------|--------------------------|-------------------|----|
|                                                    |                | number of entries        | dl-CarrierFreq[n] |    |
|                                                    |                |                          | 1                 | 2  |
| Cell A<br>Cell B<br>Cell D                         | f1             | 1                        | f2                | NA |
| Cell C<br>Cell M                                   | f2             | 1                        | f1                | NA |
| NOTE: Operating on Band 13, SIB5 is not broadcast. |                |                          |                   |    |

**Table 6.3.2.3.2-2: Inter-freq. lists in SIB5 for NAS test cases (different PLMN)**

| NAS cell ID | Test Frequency | interFreqCarrierFreqList |                   |   | Condition |
|-------------|----------------|--------------------------|-------------------|---|-----------|
|             |                | number of entries        | dl-CarrierFreq[n] |   |           |
|             |                |                          | 1                 | 2 |           |

|                                                |    |   |    |    |            |
|------------------------------------------------|----|---|----|----|------------|
| Cell A<br>Cell B<br>Cell C<br>Cell D<br>Cell M | f1 | 0 | NA | NA |            |
| Cell G<br>Cell H                               | f2 | 0 | NA | NA |            |
| Cell I<br>Cell K<br>Cell L                     | f3 | 0 | NA | NA | E-NOT-CONF |
|                                                |    | 1 | f2 |    | E-CONF     |
| Cell J                                         | f4 | 0 | NA | NA |            |
| Cell E                                         | f2 | 1 | f3 | NA |            |

| Condition  | Explanation                          |
|------------|--------------------------------------|
| E-NOT-CONF | cell E is not configured in the test |
| E-CONF     | cell E is configured in the test     |

### 6.3.3 Cell configurations

For the purpose of test not involving Carrier Aggregation, three types of SS cell configurations are defined, full (Active) cell configuration, broadcast only cell configuration and minimum uplink cell configuration.

The abovementioned configurations can also be used in Carrier Aggregation test cases, either for PCells or SCells. However another configuration, the virtual cell configuration, can additionally be used for an SCell that is not active.

#### 6.3.3.1 Full cell configuration

Full cell configuration is also called active cell configuration. The cell configuration, in minimum, has all defined DL and UL physical channels configured, i.e.

in DL: PBCH, PCFICH, PDCCH, PDSCH, PHICH,

in UL: PRACH, PUCCH, PUSCH.

The DL and UL Reference and synchronization (both primary and secondary) signals are also configured.

#### 6.3.3.2 Minimum uplink cell configuration

In this cell configuration,

in DL: physical channels capable of transmission, i.e. PBCH, PCFICH, PDCCH, PDSCH are configured;

DL physical reference and synchronization (both primary and secondary) signals are also configured.

In UL: PRACH is configured. SS shall report any detection of PRACH preambles, in order to assign test verdicts. Decoding the preambles is not required.

#### 6.3.3.3 Broadcast only cell configuration

In this cell configuration,

in DL: physical channels capable of transmission, i.e. PBCH, PCFICH, PDCCH, PDSCH are configured;

DL physical reference and synchronization (both primary and secondary) signals are also configured.

in UL: no physical resources are configured, neither channels, nor signals.

#### 6.3.3.3A Virtual cell configuration

In this cell configuration,

- in DL: no physical resources are configured, neither channels, nor signals;
- in UL: no physical resources are configured, neither channels, nor signals.

#### 6.3.3.4 Application of different cell configurations

By default, the cells specified in 36.523-1 are defined with the full cell configuration, unless it is explicitly specified as either the broadcast only, minimum uplink, or virtual cell configuration. The full cell configuration is suitable for UE to start camping, establish RRC connection or hand over from another active cell.

The broadcast only cells identified as 'DL only' can be applied in some RRC measurement test cases to those neighbour cells which UE shall not camp on during the test case execution.

The capability of a minimum uplink cell is much weaker than a full cell, but stronger than a broadcast only cell in UL. This cell configuration identified as 'min UL' can be applied in the idle mode test cases to those neighbour cells which a conformant UE shall not camp on during the test case execution.

The virtual cell configuration can only be used in Carrier Aggregation test cases as an SCell which is not active, i.e. the UE has it configured via RRC signalling but does not need to send or receive anything in this SCell.

If a cell configuration is specified in a test case it shall remain unchanged throughout the test case specification. In addition, there shall not be any requirement in the test specification or test implementation for a cell reconfiguration from one of the above configurations to the other.

For the UE conformance test, the broadcast only cell configuration can be replaced and implemented with the minimum uplink or full cell configurations. The minimum uplink cell configuration can also be implemented with the full cell configuration. The replacements in the implementation have no impact on the test purposes and the test requirements. The implementation guidelines are referred to 36.523-3.

### 6.3.4 SCell configurations

For the purpose of System Simulator resource management for Carrier Aggregation testing the following types of SCell configurations are defined:

- Active SCell: A cell that becomes an SCell at any point of time during the test case and which, while being an SCell, is activated.
- Inactive SCell: A cell that becomes an SCell at any point of time during the test case but is never activated while being an SCell.

SCell activation is defined as sending an Activation/Deactivation MAC Control Element (ref. 36.321 cl. 6.1.3.8) to the UE to activate the SCell.

The SCell type does not depend on what the cell is used for in the test case while not being an SCell and does not directly relate to the cell type specified in section 6.3.3. In particular an Inactive SCell can still be used as full cell or broadcast only cell (e.g., for measurements to be performed on such a cell), and may be used for UE dedicated traffic while not acting as an SCell.

Also note that an Active SCell will not become an Inactive SCell if the SCell is deactivated via Activation/Deactivation MAC Control Element or after the *sCellDeactivationTimer* timer expires.

### 6.3.5 Satellite ephemeris information for NTN

#### 6.3.5.1 GSO scenario

The satellite ephemeris information of GSO is defined in Table 4.4.3.3-21 for eMTC NTN and Table 8.1.4.3.3-10 for NB-IoT NTN with below assumption:

- Inclination: 0
- Eccentricity: 0
- Latitude: 0

- Longitude: 121.56076999
- Altitude: 35786 km
- Speed: 0 km/s

In case of multi-cell NTN GSO scenario, a maximum of 3 NTN cells can be used. The satellite ephemeris information is defined in Table 6.3.5.1-1 unless otherwise specified in a test case.

**Table 6.3.5.1-1: Satellite ephemeris information in multi-cell NTN GSO scenario**

| Cell type<br>(Note 1)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | positionX | positionY | positionZ | velocityVX/Y/Z | nta-<br>Common | Koffset |

| Third                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | -14502736 | 29010891  | 0         | 0              | 8248322        | 550     |
| Note 1: First Cell is the cell defined as default serving cell in the test case at the end of the preamble. Second Cell and third Cell are used in multi-cell test cases with Second Cell being defined as the 1st neighbour cell and Third Cell being defined as the 2nd neighbour cell. For example, in TS 36.523-1 [18] TC 22.5.23 running in GSO scenario, Ncell 50 is the serving cell in the preamble so it uses the satellite ephemeris information of First Cell, while Ncell 62 uses the satellite ephemeris information of Second Cell. |           |           |           |                |                |         |

### 6.3.5.2 NGSO scenario

The satellite ephemeris information of NGSO is defined in Table 4.4.3.3-21 for eMTC NTN and Table 8.1.4.3.3-10 for NB-IoT NTN with below assumption:

- Inclination: 90
- Eccentricity: 0
- Longitude: 121.56076999
- Altitude: 600 km
- Speed: 7.56 km/s

The UE position defined in clause 4.13 is the projection position from one of the satellite information to the ground.

All eMTC NTN and NB-IoT NTN test cases defined in TS 36.523-1 [18], unless otherwise stated, shall use the first row of Table 6.3.5.2-1 as the ephemeris configuration of the serving cell, corresponding to zero Doppler and constant delay for NGSO scenario, keeping such information constant throughout the duration of each measurement in the test.

In case of multi-cell NTN NGSO scenario, a maximum of 3 NTN cells can be used. The satellite ephemeris information is defined in Table 6.3.5.2-1 unless otherwise specified in a test case, keeping such information constant throughout the duration of each measurement in the test.

**Table 6.3.5.2-1: Satellite ephemeris information in multi-cell NTN NGSO scenario**

For example, in TS 36.523-1 [18] TC 22.5.23 running in NGSO scenario, Ncell 50 is the serving cell in the preamble so it uses the satellite ephemeris information of First Cell, while Ncell 62 uses the satellite ephemeris information of Second Cell. |         |         |       |        |        |   |   |        |
| Note 2: | Fd is the frequency Doppler in the service link, unit is ppm. The values are not broadcasted but resemble those                                                                                                                                                                                                                                                                                                                                                                                                                            |         |         |       |        |        |   |   |        |

## 6.3.6 Signalling test environment for Vertical UEs

### 6.3.6.1 eMTC NTN

This clause defines the signalling test environment which applies to all signalling test cases executed for eMTC NTN UEs, unless otherwise specified. This is in addition to the common test environment defined in clause 4.14.1.

- Test frequencies specified in Table 6.2.3.1-1d are used.
- For NGSO scenario, UE prediction of satellite trajectory shall be deactivated in the pre-test conditions by any preconfigured means.

**NOTE:** As constant ephemeris information in SIB31 is used for the NGSO scenario, the frequency Doppler and transmission delay values remain same during the test execution. Therefore, prediction of satellite trajectory needs to be deactivated in the UE, so that the UE will not update the Doppler and delay pre-compensation with the assumption that the satellite is moving before the expiry of timer T317 (ul-SyncValidityDuration-r17).

## 6.4 Generic procedures

This clause describes UE test states which can be used in the initial condition of many test cases defined in TS 36.523-1 [18] in addition to the states already specified in clause 4.5 of this specification.

### 6.4.1 Initial UE states and setup procedures

#### 6.4.1.1 Initial UE states and setup procedures

**Figure 6.4.1.1-1: Initial UE states**

In order that the UE can set up a call or session in E-UTRAN, there are a number of setup procedures to be undertaken in a hierarchical sequence to move between known states. The sequences are shown in figure 6.4.1.1-1 and the status of the relevant protocols in the UE in the different states are given in table 6.4.1.1-1. State 3 is defined in clause 4.5.1.

**Table 6.4.1.1-1: Protocol state for each initial UE state**

## 6.4.1.2 Dedicated Bearer Establishment (to state 5)

### 6.4.1.2.1 Initial conditions

System Simulator:

- Parameters are set to the default parameters for the basic single cell environment, as defined in subclause 4.4, unless otherwise specified in the test case.

User Equipment:

- The UE shall be in Generic RB established (State 3).

#### 6.4.1.2.2 Definition of system information messages

The default system information messages are used.

#### 6.4.1.2.3 Procedure

The establishment of dedicated radio bearer connection is assumed to always be mobile terminated.

**Table 6.4.1.2.3-1: Procedure for dedicated bearer establishment**

| Step | Procedure                                                                                                                                                                                                     | Message Sequence |                                                                                         |
|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|-----------------------------------------------------------------------------------------|
|      |                                                                                                                                                                                                               | U - S            | Message                                                                                 |
| 1    | The SS configures new data radio bearer(s) and the associated dedicated EPS bearer context(s).                                                                                                                | <--              | RRC: RRCConnectionReconfiguration<br>NAS: ACTIVATE DEDICATED EPS BEARER CONTEXT REQUEST |
| 2    | The UE transmits an <i>RRCConnectionReconfigurationComplete</i> message to confirm the establishment of the new data radio bearer(s), associated with the dedicated EPS bearer context(s) in the NAS message. | -->              | RRC: RRCConnectionReconfigurationComplete                                               |
| 3    | The UE transmits an ACTIVATE DEDICATED EPS BEARER CONTEXT ACCEPT message.                                                                                                                                     | -->              | NAS: ACTIVATE DEDICATED EPS BEARER CONTEXT ACCEPT                                       |

#### 6.4.1.2.4 Specific message contents

All specific message contents shall be referred to clause 4.6 and 4.7.

### 6.4.1.2A DC MCG/SCG Dedicated Bearer Establishment (to state 5A)

#### 6.4.1.2A.1 Initial conditions

System Simulator:

- Parameters are set to the default parameters for the basic single cell environment, as defined in subclause 4.4, unless otherwise specified in the test case.

User Equipment:

- The UE shall be in Generic RB established (State 3).

#### 6.4.1.2A.2 Definition of system information messages

The default system information messages are used.

#### 6.4.1.2A.3 Procedure

The establishment of MCG/SCG dedicated radio bearer connection is assumed to always be mobile terminated.

**Table 6.4.1.2A.3-1: Procedure for MCG/SCG dedicated bearer establishment**

| Step | Procedure                                                                                                                                         | Message Sequence |                                                                                         |
|------|---------------------------------------------------------------------------------------------------------------------------------------------------|------------------|-----------------------------------------------------------------------------------------|
|      |                                                                                                                                                   | U - S            | Message                                                                                 |
| 1    | The SS configures new MCG data radio bearer and the associated dedicated EPS bearer context.                                                      | <--              | RRC: RRCConnectionReconfiguration<br>NAS: ACTIVATE DEDICATED EPS BEARER CONTEXT REQUEST |

| 3    | The SS transmits a CLOSE UE TEST LOOP message to enter the UE test loop mode.                                                                                            | <--              | RRC: DLInformationTransfer<br>TC: CLOSE UE TEST LOOP             |
| 4    | The UE transmits a CLOSE UE TEST LOOP COMPLETE message to confirm that loopback entities for the radio bearer(s) have been created and loop back is activated (State 6). | -->              | RRC: ULInformationTransfer<br>TC: CLOSE UE TEST LOOP COMPLETE    |

#### 6.4.1.3.4 Specific message contents

All specific message contents shall be referred to clause 4.6, 4.7 and 4.7A.

### 6.4.1.3A DC MCG/SCG DRB Loopback Activation (to state 6A)

#### 6.4.1.3A.1 Initial conditions

System Simulator:

- Parameters are set to the default parameters for the basic single cell environment, as defined in subclause 4.4, unless otherwise specified in the test case.

User Equipment:

- The UE shall be in DC MCG/SCG Dedicated Radio Bearer Established (State 5A).

#### 6.4.1.3A.2 Definition of system information messages

The default system information messages are used.

#### 6.4.1.3A.3 Procedure

Same procedure as in sub-clause 6.4.1.3.3.

#### 6.4.1.3A.4 Specific message contents

All specific message contents shall be referred to clause 4.6, 4.7 and 4.7A.

### 6.4.1.3B DC Split DRB Loopback Activation (to state 6B)

#### 6.4.1.3B.1 Initial conditions

System Simulator:

- Parameters are set to the default parameters for the basic single cell environment, as defined in subclause 4.4, unless otherwise specified in the test case.

User Equipment:

- The UE shall be in DC Split Dedicated Radio Bearer Established (State 5B).

#### 6.4.1.3B.2 Definition of system information messages

The default system information messages are used.

#### 6.4.1.3B.3 Procedure

Same procedure as in sub-clause 6.4.1.3.3.

#### 6.4.1.3B.4 Specific message contents

All specific message contents shall be referred to clause 4.6, 4.7 and 4.7A.

## 6.4.2 Test procedures

### 6.4.2.1 Introduction

This section defines test procedures which can be used within test procedure sequences for test steps where checking the UE state is needed.

For each test procedure,

- at the start of the test procedure,
  - the System Simulator condition and the value of system information messages are the ones applicable in the test case referring to this test procedure, as they are after the execution of the test step immediately preceding the test step where the test procedure is used;
  - the initial UE condition is one indicated in the test case referring to this procedure, as it is after the execution of the test step immediately preceding the test step where the test procedure is used.
- at the end of the test procedure,
  - the System Simulator condition after the test procedure execution is complete is the same as before it is started (this should not be changed by the test procedure).

### 6.4.2.2 Test procedure to check RRC\_IDLE state

This procedure aims at checking whether the UE is in RRC\_IDLE on a certain cell of a test case or not.

**Table 6.4.2.2-1: Test procedure sequence**

| St    | Procedure                                                                                                                                                                                                                      | Message Sequence |                                                                 | TP | Verdict |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|-----------------------------------------------------------------|----|---------|
|       |                                                                                                                                                                                                                                | U - S            | Message/PDU/SDU                                                 |    |         |
| 0     | The SS waits 1 second.                                                                                                                                                                                                         | -                | -                                                               | -  | -       |
| 1     | The SS sends RRC <i>Paging</i> message with UE S-TMSI on the cell(s) specified in the test case.                                                                                                                               | <--              | RRC: <i>Paging</i> (PCCH)                                       | -  | -       |
| 2     | Check: Does the UE send an <i>RRCCConnectionRequest</i> message on the cell specified in the test case ?                                                                                                                       | -->              | RRC: <i>RRCCConnectionRequest</i>                               |    | P       |
| 3     | The SS transmits a <i>RRCCConnectionSetup</i> message                                                                                                                                                                          | <--              | RRC: <i>RRCCConnectionSetup</i>                                 | -  | -       |
| 4     | The UE transmits an <i>RRCCConnectionSetupComplete</i> message to confirm the successful completion of the connection establishment and to initiate the session management procedure by including the SERVICE REQUEST message. | -->              | RRC: <i>RRCCConnectionSetupComplete</i><br>NAS: SERVICE REQUEST | -  | -       |
| 5 - 6 | Void                                                                                                                                                                                                                           | -                | -                                                               | -  | -       |
| 7     | The SS transmits a <i>SecurityModeCommand</i> message to activate AS security.                                                                                                                                                 | <--              | RRC: <i>SecurityModeCommand</i>                                 | -  | -       |
| 8     | The UE transmits a <i>SecurityModeComplete</i> message.                                                                                                                                                                        | -->              | RRC: <i>SecurityModeComplete</i>                                | -  | -       |
| 9     | The SS transmits a <i>RRCCConnectionReconfiguration</i> message to establish the default bearer with condition SRB2-DRB(1, 0) according to 4.8.2.2.1.1,                                                                        | <--              | RRC: <i>RRCCConnectionReconfiguration</i>                       | -  | -       |
| 10    | The UE transmits an <i>RRCCConnectionReconfiguration complete</i> message.                                                                                                                                                     | -->              | RRC: <i>RRCCConnectionReconfigurationComplete</i>               | -  | -       |
| 11    | The SS release the RRC connection.                                                                                                                                                                                             | <--              | RRC: <i>RRCCConnectionRelease</i>                               | -  | -       |

### 6.4.2.3 Test procedure to check RRC\_CONNECTED state

**Table 6.4.2.3-1: Test procedure sequence**

| St | Procedure                                                         | Message Sequence |                                | TP | Verdict |
|----|-------------------------------------------------------------------|------------------|--------------------------------|----|---------|
|    |                                                                   | U - S            | Message/PDU/SDU                |    |         |
| 1  | The SS sends <i>UECapabilityEnquiry</i> message to the UE.        | <--              | <i>UECapabilityEnquiry</i>     | -  | -       |
| 2  | Check: Does the UE send a <i>UECapabilityInformation</i> message? | -->              | <i>UECapabilityInformation</i> |    | P       |

### 6.4.2.4 Test procedure Paging (for NAS testing)

This procedure aims at checking whether the UE is in registered with a certain S-TMSI.

For the PS domain this procedure is identical to the procedure in 6.4.2.2 except that the S-TMSI as indicated in step 1 is the one explicitly specified in the test step calling this procedure.

For the CS domain the test procedure is FFS (i.e. it shall be avoided to make use of CS paging in the test case design).

### 6.4.2.5 Test procedure for no response to paging (for NAS testing)

This procedure aims at checking that the UE ignores paging messages with a specified identity.

The procedure is defined in table 6.4.2.5-1.

**Table 6.4.2.5-1: Test procedure sequence**

| St | Procedure                                                                                                                                                                                     | Message Sequence |                             | TP | Verdict |
|----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|-----------------------------|----|---------|
|    |                                                                                                                                                                                               | U - S            | Message                     |    |         |
| 0  | The SS waits 1 second.                                                                                                                                                                        | -                | -                           | -  | -       |
| 1  | The SS transmits a paging message using the UE identity and the CN domain which are both specified in the referring test step, and on the cell which is specified in the referring test step. | <--              | Paging                      | -  | -       |
| 2  | Check: Does the UE send an <i>RRCConnectionRequest</i> message on the cell where the paging was transmitted within the next 3s?                                                               | -->              | <i>RRCConnectionRequest</i> |    | F       |

### 6.4.2.6 Test procedure to check that a dedicated EPS bearer context is active (for NAS testing)

This procedure aims at checking that a dedicated EPS bearer context is active.

The procedure is defined in table 6.4.2.6-1.

**Table 6.4.2.6-1: Test procedure sequence**

| St | Procedure                                                                                                                                                                                               | Message Sequence |                                                                                       | TP | Verdict |
|----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|---------------------------------------------------------------------------------------|----|---------|
|    |                                                                                                                                                                                                         | U - S            | Message                                                                               |    |         |
| 1  | The SS modifies existing data radio bearer(s) and the associated EPS bearer context(s) with Bearer QoS update.                                                                                          | <--              | RRC:<br><i>RRCConnectionReconfiguration</i><br>NAS: MODIFY EPS BEARER CONTEXT REQUEST | -  | -       |
| 2  | The UE transmits an <i>RRCConnectionReconfigurationComplete</i> message to confirm the modification of the existing data radio bearer(s), associated with the EPS bearer context(s) in the NAS message. | -->              | RRC:<br><i>RRCConnectionReconfigurationComplete</i>                                   | -  | -       |
| 3  | Check: Does the UE transmit a MODIFY EPS                                                                                                                                                                | -->              | RRC: <i>ULInformationTransfer</i>                                                     |    | P       |

|  |                                |  |                                       |  |  |
|--|--------------------------------|--|---------------------------------------|--|--|
|  | BEARER CONTEXT ACCEPT message? |  | NAS: MODIFY EPS BEARER CONTEXT ACCEPT |  |  |
|--|--------------------------------|--|---------------------------------------|--|--|

#### 6.4.2.7 Test procedure to check that UE is camped on a new E-UTRAN cell

This procedure aims at checking whether the UE is camping on a new E-UTRAN cell with different TAI of a test case or not.

The procedure is defined in table 6.4.2.7-1.

**Table 6.4.2.7-1: Test procedure sequence**

| St | Procedure                                                                                                                                                                                                                                    | Message Sequence |                                                                            | TP | Verdict |
|----|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|----------------------------------------------------------------------------|----|---------|
|    |                                                                                                                                                                                                                                              | U - S            | Message                                                                    |    |         |
| 1  | The UE transmits an <i>RRConnectionRequest</i> message on the cell specified in the test case.                                                                                                                                               | -->              | RRC: <i>RRConnectionRequest</i>                                            | -  | -       |
| 2  | SS transmit an <i>RRConnectionSetup</i> message.                                                                                                                                                                                             | <--              | RRC: <i>RRConnectionSetup</i>                                              | -  | -       |
| 3  | The UE transmits an <i>RRConnectionSetupComplete</i> message to confirm the successful completion of the connection establishment and a TRACKING AREA UPDATE REQUEST message is sent to update the registration of the actual tracking area. | -->              | RRC: <i>RRConnectionSetupComplete</i><br>NAS: TRACKING AREA UPDATE REQUEST | -  | -       |
| 4  | SS responds with TRACKING AREA UPDATE ACCEPT message.                                                                                                                                                                                        | <--              | RRC: <i>DLInformationTransfer</i><br>NAS: TRACKING AREA UPDATE ACCEPT      | -  | -       |
| 5  | Check: Does the UE send a TRACKING AREA UPDATE COMPLETE on the cell specified in the test case?                                                                                                                                              | -->              | RRC: <i>ULInformationTransfer</i><br>NAS: TRACKING AREA UPDATE COMPLETE    | -  | P       |
| 6  | The SS transmits an <i>RRConnectionRelease</i> message to release RRC connection and move to RRC_IDLE.                                                                                                                                       | <--              | RRC: <i>RRConnectionRelease</i>                                            | -  | -       |

NOTE 1: The periodic tracking area updating timer T3412 is deactivated by default during the attach procedure (TS 36.508 clause 4.7.2).

NOTE 2: The SS does not initiate authentication and NAS SECURITY MODE COMMAND are not performed (reuse of keys allocated during the attach procedure).

#### 6.4.2.7A Test procedure to check that UE is camped on E-UTRAN cell upon mobility from another RAT

This procedure aims at checking whether the UE is camping on a E-UTRAN cell upon mobility from another RAT after Inter RAT reselection.

The procedure if PDP context was established before inter RAT reselection, is defined in table 6.4.2.7A-1.

**Table 6.4.2.7A-1: Test procedure sequence**

| St | Procedure                                                                                                                                                                                                                             | Message Sequence |                                                                            | TP | Verdict |
|----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|----------------------------------------------------------------------------|----|---------|
|    |                                                                                                                                                                                                                                       | U - S            | Message                                                                    |    |         |
| 1  | The UE transmits a <i>RRConnectionRequest</i> message on the cell specified in the test case.                                                                                                                                         | -->              | RRC: <i>RRConnectionRequest</i>                                            | -  | -       |
| 2  | SS transmit an <i>RRConnectionSetup</i> message.                                                                                                                                                                                      | <--              | RRC: <i>RRConnectionSetup</i>                                              | -  | -       |

This message is sent integrity protected when a valid security context exists and without integrity protection otherwise.

### 6.4.2.7B Test procedure to check that UE is camped on a new E-UTRAN cell / UP Clot

This procedure aims at checking whether the UE is camping on a new E-UTRAN cell with different TAI of a test case or not.

The procedure is defined in table 6.4.2.7B-1.

**Table 6.4.2.7B-1: Test procedure sequence**

| St | Procedure                                                                                                                                                                                                                                      | Message Sequence |                                                                              | TP | Verdict |

### 6.4.2.8 Test procedure to check that UE is camped on a new UTRAN cell

This procedure aims at checking whether the UE is camping on a new UTRAN cell of a test case or not.

The procedure is defined in table 6.4.2.8-1.

**Table 6.4.2.8-1: Test procedure sequence**

| St | Procedure | Message Sequence | TP | Verdict |
|----|-----------|------------------|----|---------|
|----|-----------|------------------|----|---------|

|    |                                                                                                           | U - S | Message                                                          |   |   |
|----|-----------------------------------------------------------------------------------------------------------|-------|------------------------------------------------------------------|---|---|

|    | ACCEPT message.                                                                                          |     | ACCEPT                         |   |   |
| 10 | An uplink TBF is established in order to allow the UE to transmit a ROUTING AREA UPDATE COMPLETE message |     |                                | - | - |
| 11 | The UE transmits a ROUTING AREA UPDATE COMPLETE message.                                                 | --> | ROUTING AREA UPDATING COMPLETE | - | P |

NOTE: The TS 51.010-1 [25] uses Network Mode of Operation I as default, for this reason a combined MM/GMM procedure is performed.

#### 6.4.2.10 Test procedure to check that UE performs tracking area updating procedure without ISR and security reconfiguration after successful completion of handover from UTRA

This procedure aims at checking whether the UE performs tracking area updating procedure where ISR is not activated and security reconfiguration after successful completion of handover from UTRA.

The procedure is defined in table 6.4.2.10-1.

**Table 6.4.2.10-1: Test procedure sequence**

| St  | Procedure                                                                                                                                                                                                                                                              | Message Sequence |                                                                         | TP | Verdict |
|-----|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|-------------------------------------------------------------------------|----|---------|
|     |                                                                                                                                                                                                                                                                        | U - S            | Message                                                                 |    |         |
| 1   | The UE transmits an <i>ULInformationTransfer</i> message on the cell specified in the test case. This message includes a TRACKING AREA UPDATE REQUEST message.                                                                                                         | -->              | RRC: <i>ULInformationTransfer</i><br>NAS: TRACKING AREA UPDATE REQUEST  | -  | -       |

## 6.4.3.7 CS fallback to UTRAN procedures (LAI of UTRAN cell same as the LAI received in combined Attach procedure in EUTRA cell)

All procedures specified in this clause are referred to the UTRA target cell where the UE has been redirected or handed over from the EUTRA cell after a CS call requested. The default message contents are found in TS 34.108 [5], clause 9.

The procedures in 6.4.3.7.1 – 6.4.3.7.4 are applied if the UE supports (EUTRA) RRC connection release with redirection and Multi Cell System Information to UTRAN. The procedures in 6.4.3.7.5 - 6.4.3.7.7 are applied if the UE supports PS HO from EUTRA to UTRAN.

#### 6.4.3.7.1 CS fallback to UTRAN with redirection / MT call (PS bearers not established)

| Mobile identity                           | Not present  |         |           |

#### 6.4.3.8 CS fallback to GERAN procedures (LAI of GERAN cell same as the LAI received in combined Attach procedure in EUTRA cell)

All procedures specified in this clause are referred to the GERAN target cell where the UE has been redirected or handed over from the EUTRA cell after a CS call requested. The default message contents are found in TS 34.108 [5], clause 9.

The procedures in 6.4.3.8.1 – 6.4.3.8.4 are applied if the UE supports (EUTRA) RRC connection release with redirection or Cell Change order and Multi Cell System Information to GERAN.

#### 6.4.3.8.1 CS fallback to GERAN with redirection or CCO / MT call (DTM not supported)

### 6.4.3A Test case postambles

#### 6.4.3A.1 Introduction

In order to make test cases perfectly reproducible, the UE under test is switched off after the test procedure sequence of a test case is complete. In order to make it possible to run a number of test cases without any manual operation, it is important that the SS can properly handle any possible signalling from the UE between the end of the test procedure sequence and until the UE is off.

After the last verdict of a test procedure sequence is assigned, it is necessary to:

- terminate any ongoing signalling procedure,
- switch off the UE.

Usually, this can be performed by completing necessary TAU/LAU/RAU procedures, completing any ongoing voice call (CS or IMS), and switching off the UE with a detach procedure.

### 6.4.3A.2 Reference end states

Test procedures in TS 36.523-1 may only partially terminate ongoing signalling procedures, provided they indicate a reference end state at the end of the test procedure sequence, so that a matching procedure in TS 36.523-3 can be executed to switch off the UE.

Reference end states definitions include the necessary pieces of information to predict UE behaviour during the postambles.

If any extra information was stored in the UE or the USIM due to the test procedure sequence, it should be removed explicitly by the test procedure sequence, before the UE can be left in a reference end state.

**Table 6.4.3A.2-1: Reference end states**

| Name                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Optional information                                                                                                               |
|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>E-UTRA idle (E1)</b>                           | The UE:<br>- is camped on an E-UTRA cell, and RRC idle and<br>- registered for EPS services and EPS update status is "updated" and<br>- is registered for non-EPS services and update status is updated (if CS fallback or SMS over SGs is supported) and<br>- has one or more default EPS bearer context are active, zero or more dedicated EPS bearer contexts are active.                                                                                                                                                      | The test case may indicate that the UE is not registered for non-EPS services, though the UE supports CS fallback or SMS over SGs. |
| <b>E-UTRA connected (E2)</b>                      | Same as <b>E-UTRA idle</b> , except that:<br>- the UE is RRC connected and<br>- DRBs for all active EPS bearer contexts are established.                                                                                                                                                                                                                                                                                                                                                                                          | Same as for <b>E-UTRA idle</b> .                                                                                                   |
| <b>E-UTRA connected, T3440 started (E2_T3440)</b> | Same as <b>E-UTRA idle</b> , except that:<br>- the UE is RRC connected and<br>- Timer T3440 is started in UE.                                                                                                                                                                                                                                                                                                                                                                                                                     | Same as for <b>E-UTRA idle</b>                                                                                                     |
| <b>E-UTRA test mode (E3)</b>                      | Same as <b>E-UTRA connected</b> and<br>- test mode is active and<br>- test loop is closed.                                                                                                                                                                                                                                                                                                                                                                                                                                        | Same as for <b>E-UTRA idle</b>                                                                                                     |
| <b>E-UTRA deregistered (E4)</b>                   | The UE is:<br>- camped on an E-UTRA cell, and idle and<br>- not registered of EPS services and<br>- not registered for non-EPS services.                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                    |
| <b>E-UTRA manual selection (E5)</b>               | Same as <b>E-UTRA idle</b> , except that:<br>- the UE is in manual PLMN selection mode                                                                                                                                                                                                                                                                                                                                                                                                                                            | Same as for <b>E-UTRA idle</b>                                                                                                     |
| <b>UTRA idle (U1)</b>                             | The UE is:<br>- camped on a UTRA cell, RRC idle and<br>- IMSI attached and update status is "updated" (if the UE supports CS domain) and<br>- GPRS attached, GPRS update state is "updated", and zero or one or several PDP context(s) with interactive or background QoS are active.                                                                                                                                                                                                                                             | The test case may indicate that the UE is not IMSI attached though the UE supports CS domain                                       |
| <b>UTRA connected (U2)</b>                        | Same as <b>UTRA idle</b> , except that:<br>- the UE is in CELL_DCH state and<br>- a RAB associated with the active PDP context is established.                                                                                                                                                                                                                                                                                                                                                                                    | The test case may indicate that the UE is not IMSI attached though the UE supports CS domain.                                      |
| <b>UTRA handover (U3)</b>                         | The UE:<br>- was <b>E-UTRA connected</b> and<br>- has completed a handover to UMTS and<br>- hasn't yet sent or received any NAS signalling on the target UTRAN cell.                                                                                                                                                                                                                                                                                                                                                              | Same as for <b>UTRA connected</b>                                                                                                  |
| <b>UTRA CS fallback (U4)</b>                      | The UE:<br>- was <b>E-UTRA idle</b> or <b>E-UTRA connected</b> and<br>- has transmitted an EXTENDED SERVICE REQUEST message due to MO or MT CS fallback call and<br>- either the UE has completed a handover to UMTS or the UE has been redirected to UMTS and has established the RRC connection to a UTRA cell, and the target UTRA cell has activated security and RABs for all previously active EPS bearer contexts were established and<br>- the UE hasn't yet sent or received any NAS signalling on the target UTRAN cell |                                                                                                                                    |
| <b>UTRA CS call (U5)</b>                          | The UE was in <b>UTRAN CS fallback</b> and the UE has completed LAU/RAU procedure if necessary and has                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                    |

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                       |  |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
|                                | established a CS call <b>or</b> the UE was in <b>E-UTRAN connected</b> and the UE has completed LAU/RAU procedure if necessary and has performed a handover to UTRAN with SRVCC.                                                                                                                                                                                                                                                      |  |
| <b>UTRA deregistered (U6)</b>  | The UE is:<br>- camped on a UTRA cell, and idle and<br>- not registered GPRS/non-GPRS services                                                                                                                                                                                                                                                                                                                                        |  |
| <b>GERAN idle (G1)</b>         | The UE:<br>- is camped on an GERAN cell, in idle mode and GPRS idle state and<br>- is registered for PS services and GPRS update status is "updated" and zero or one or several PDP context(s) with interactive or background QoS are active.<br>- is IMSI attached (if CS domain is supported)                                                                                                                                       |  |
| <b>GERAN PS handover (G2)</b>  | The UE:<br>- was <b>E-UTRA connected</b> and<br>- has performed a PS handover procedure to a GERAN cell and<br>- hasn't yet sent or received any NAS signalling on the target GERAN cell.                                                                                                                                                                                                                                             |  |
| <b>GERAN CS fallback (G3)</b>  | The UE:<br>- was <b>E-UTRA idle or E-UTRA connected</b> and<br>- has transmitted an EXTENDED SERVICE REQUEST message due to MO or MT CS fallback call and<br>- either the UE has completed a PS handover to GERAN <b>or</b> a CCO to GERAN <b>or</b> the UE has been redirected to GERAN and has entered dedicated mode, and if DTM is supported,<br>- the UE hasn't yet sent or received any NAS signalling on the target GERAN cell |  |
| <b>GERAN CS call (G4)</b>      | The UE was in <b>GERAN CS fallback</b> and the UE has established a CS call <b>or</b> the UE was in <b>E-UTRAN connected</b> and has performed a handover to GERAN with SRVCC.                                                                                                                                                                                                                                                        |  |
| <b>GERAN deregistered (G5)</b> | The UE is:<br>- camped on a GERAN cell, and idle and<br>- not registered GPRS/non-GPRS services                                                                                                                                                                                                                                                                                                                                       |  |
| <b>1xRTT state 1 (1x1)</b>     | FFS                                                                                                                                                                                                                                                                                                                                                                                                                                   |  |
| ...                            | ...                                                                                                                                                                                                                                                                                                                                                                                                                                   |  |
| <b>HRPD state 1 (H1)</b>       | FFS                                                                                                                                                                                                                                                                                                                                                                                                                                   |  |
| ...                            | ...                                                                                                                                                                                                                                                                                                                                                                                                                                   |  |

## 6.5 Default RRC message and information element contents

The default RRC message and information element contents specified in this subclause apply to all Signalling test cases defined in TS 36.523-1 [18] unless otherwise specified, in addition to the default RRC message and information element contents specified in subclause 4.6 of this specification.

### 6.5.1 Measurement information elements

- MeasConfig-DEFAULT

**Table 6.5.1-1: MeasConfig-DEFAULT**

| Derivation Path: 36.331, clause 6.3.5 |                        |         |           |
|---------------------------------------|------------------------|---------|-----------|
| Information Element                   | Value/remark           | Comment | Condition |
| MeasConfig-DEFAULT ::= SEQUENCE {     |                        |         |           |
| measObjectToRemoveList                | Not present            |         |           |
| measObjectToAddModList                | Not present            |         |           |
| reportConfigToRemoveList              | Not present            |         |           |
| reportConfigToAddModList              | Not present            |         |           |
| measIdToRemoveList                    | Not present            |         |           |
| measIdToAddModList                    | Not present            |         |           |
| quantityConfig                        | QuantityConfig-DEFAULT |         |           |
| measGapConfig                         | Not present            |         |           |

|                         |                   |  |                          |
|-------------------------|-------------------|--|--------------------------|
|                         | MeasGapConfig-GP1 |  | INTER-FREQ, UTRAN        |
|                         | MeasGapConfig-GP2 |  | GERAN, INTER-RAT         |
|                         | MeasGapConfig-CE  |  | intraFreq-CE-NeedForGaps |
| s-Measure               | Not present       |  |                          |
| preRegistrationInfoHRPD | Not present       |  |                          |
| speedStatePars          | Not present       |  |                          |
| }                       |                   |  |                          |

| Condition                | Explanation                                            |
|--------------------------|--------------------------------------------------------|
| INTER-FREQ               | For E-UTRA inter-freq measurements                     |
| UTRAN                    | For inter-RAT measurements with UTRAN                  |
| GERAN                    | For inter-RAT measurements with GERAN                  |
| INTER-RAT                | For inter-RAT measurements with UTRAN and GERAN        |
| intraFreq-CE-NeedForGaps | For UE having set pc_intraFreq_CE_NeedForGaps to TRUE. |

- MeasGapConfig-GP1

**Table 6.5.1-2: MeasGapConfig-GP1**

| Derivation Path: 36.331, clause 6.3.5 |              |              |           |
|---------------------------------------|--------------|--------------|-----------|
| Information Element                   | Value/remark | Comment      | Condition |
| MeasGapConfig-GP1 ::= CHOICE {        |              |              |           |

## 6.6 Default NAS message and information element contents

The default NAS message and information element contents specified in this subclause apply to all Signalling test cases defined in TS 36.523-1 [18] unless otherwise specified, in addition to the default NAS message and information element contents specified in subclause 4.7 of this specification.

### 6.6.1 Reference default EPS bearer contexts

The following table defines Reference default EPS bearer contexts. Default EPS bearer context1 is the default "default EPS bearer context" which is used in the common procedures and test cases where no particular default EPS bearer context is specified.

**Table 6.6.1-1: Reference default EPS bearer contexts**

| Parameters                                                                                                                                                                                                                                                                                                                                                                                                                                         | Reference default EPS bearer context #1 | Reference default EPS bearer context #2 | Reference default EPS bearer context #3 |

| Note 1: For all non-GBR QCIs, the maximum and guaranteed bit rates shall be ignored.<br>Note 2: According to TS 24.301, the UE ignores these parameters for a non-GBR QCI.<br>Note 3: Parameters included for UEs capable of UTRAN according to TS 34.123-3 clause 8.10.<br>Note 4: Parameters included for UEs capable of GERAN according to TS 51.010 subclause 40.5.<br>Note 5: QCI 69 is used for Mission Critical delay sensitive signalling. |                                         |                                         |                                         |

### 6.6.2 Reference dedicated EPS bearer contexts

The following table defines Reference dedicated EPS bearer contexts. Dedicated EPS bearer context #1 is the default "dedicated EPS bearer context" which is used in the common procedures and test cases where no particular dedicated EPS bearer context is specified.

**Table 6.6.2-1: Reference dedicated EPS bearer contexts, first set**

| Parameters | Reference | Reference | Reference | Reference | Reference |
|------------|-----------|-----------|-----------|-----------|-----------|
|------------|-----------|-----------|-----------|-----------|-----------|

|                                                   | dedicated EPS<br>bearer context<br>#1 | dedicated EPS<br>bearer context<br>#2                                            | dedicated EPS<br>bearer context<br>#3 | dedicated EPS<br>bearer context<br>#4 | dedicated EPS<br>bearer context<br>#5 |

## 6.6A Default SMS over SGs message and information element contents

The default SMS over SGs message and information element contents specified in this subclause apply to all SMS over SGs Signalling test cases defined in TS 36.523-1 [18] unless otherwise specified. All the messages and information elements are listed in alphabetical order.

### 6.6A.1 CM-sublayer messages

#### - CP-ACK

This message is sent between the SS and the UE, in both directions.

Table 6.6A.1-1: Message CP-ACK

| Derivation Path: 24.011 clause 7.2.2 |                   |              |           |
|--------------------------------------|-------------------|--------------|-----------|
| Information Element                  | Value/remark      | Comment      | Condition |
| Protocol discriminator               | '1001'B           | SMS messages |           |
| Transaction identifier               | Any allowed value |              |           |

|              |             |        |  |
|--------------|-------------|--------|--|
| Message type | '00000100'B | CP-ACK |  |
|--------------|-------------|--------|--|

- CP-DATA

This message is sent between the SS and the UE, in both directions.

**Table 6.6A.1-2: Message CP-DATA**

| Derivation Path: 24.011 clause 7.2.1 |                                                             |              |           |
|--------------------------------------|-------------------------------------------------------------|--------------|-----------|
| Information Element                  | Value/remark                                                | Comment      | Condition |
| Protocol discriminator               | '1001'B                                                     | SMS messages |           |
| Transaction identifier               | Any allowed value                                           |              |           |
| Message type                         | '00000001'B                                                 | CP-DATA      |           |
| CP-User data                         | RP-ACK RPDU or RP-DATA RPDU (as specified in the test case) |              |           |

## 6.6A.2 Short Message Relay Layer (SM-RL) messages

- RP-ACK RPDU

This message is sent between the SS and the UE, in both directions.

**Table 6.6A.2-1: Message RP-ACK RPDU**

| Derivation Path: 24.011 clause 7.3.3 |                                                |                     |              |
|--------------------------------------|------------------------------------------------|---------------------|--------------|
| Information Element                  | Value/remark                                   | Comment             | Condition    |
| RP-Message Type                      | '010'B                                         | RP-ACK_PDU uplink   | Uplink_SMS   |
|                                      | '011'B                                         | RP-ACK_PDU downlink | Downlink_SMS |
| RP-Message Reference                 | Same as in associated (preceding) RP-DATA RPDU |                     |              |
| RP-User Data                         | Not present or any allowed value               |                     | Uplink_SMS   |
|                                      | Not present                                    |                     | Downlink_SMS |

| Condition    | Explanation                                                          |
|--------------|----------------------------------------------------------------------|
| Uplink_SMS   | This condition applies when the message is sent by the UE to the SS. |
| Downlink_SMS | This condition applies when the message is sent by the SS to the UE. |

- RP-DATA RPDU

This message is sent between the SS and the UE, in both directions.

**Table 6.6A.2-2: Message RP-DATA RPDU**

| Derivation Path: 24.301 clause 8.2.23 |                   |                                    |              |
|---------------------------------------|-------------------|------------------------------------|--------------|
| Information Element                   | Value/remark      | Comment                            | Condition    |

| CEmodeB     | CE mode B test environment                                                        |

## 6.7 Timer Tolerances

The timer tolerances specified for the test environment in this subclause apply to all Signalling test cases defined in TS 36.523-1 [18] unless otherwise specified

All the timers used during testing are within a tolerance margin given by the equation below. If for a specific test a different tolerance value is required then this should be specified in the relevant test document (i.e. the document where the test is described).

Timer tolerance = 10%, or  $5 \times \text{RTT}$ , whichever value is the greater.

Where  $\text{RTT} = 8 \text{ TTIs}$  for FDD, and  $\text{RTT} = \text{Maximum RTT}$  from Table 6.7-1 for TDD (see Note).

NOTE: Since the exact RTT for TDD varies depending on the UL/DL configurations and subframe number [29], the maximum RTT is defined in Table 6.7-1.

**Table 6.7-1: Maximum RTT for TDD UL/DL configurations**

| UL/DL Configuration                                                       | Maximum RTT (TTIs) |
|---------------------------------------------------------------------------|--------------------|
| 0                                                                         | 10                 |
| 1*                                                                        | 11                 |

| 3                                                                         | 15                 |
| 4                                                                         | 16                 |
| 5                                                                         | TBD                |
| 6                                                                         | 11                 |
| *Note: Default UL/DL configuration defined in Table 4.6.3-23 of TS 36.508 |                    |

## 6.8 SideLink reference configuration

The reference test configurations specified in 6.8.1 apply to all SideLink Signalling test cases defined in TS 36.523-1 [18].

The reference test configurations specified in 6.8.2 apply to all V2X SideLink Signalling test cases defined in TS 36.523-1 [18].

### 6.8.1 Reference configuration for Direct Communication

ROHC compression is not applied in the signalling test cases simulating in coverage and out-of-coverage scenarios.

Unless otherwise specified, ciphering is not configured on SLRB.

#### 6.8.1.1 ProSe Direct Communication *Preconfiguration* for out-of-network coverage operation

The IE *SL-Preconfiguration* contains the resource pool information for sidelink direct communication.

**Table 6.8.1.1-1: SL-Preconfiguration**

## 6.8.2 Reference configuration for V2X Sidelink Communication

ROHC compression is not applied in the signalling test cases simulating in coverage and out-of-coverage scenarios.

Ciphering is not configured on SLRB.

### 6.8.2.1 V2X Sidelink Communication *Preconfiguration* for out-of-network coverage operation

The V2X Sidelink communication preconfigurations for single V2X component carrier or V2X intra-band contiguous multi-carrier are defined in Table 4.10.1.1-1 and Table 4.10.1.1-2 respectively.

## 7 Test environment for RRM tests

This section contains all the exceptions of the common test parameters specified in clause 4 for specific needs of test cases defined in TS 36.521-3 [34], TS 34.121-1 [50] and TS 34.122 [51]. Exceptions specified in clause 7 overwrite the parameter settings of clause 4; exceptions defined within the test cases overwrite parameter settings of clause 4 and 7.

This clause describes UE test states which can be used in the initial condition for TS 36.521-3 [34], TS 34.121-1 [50] and TS 34.122 [51].

### 7.1 Requirements of *test* equipment

<void>

### 7.2 RRM Reference system configurations

#### 7.2.1 Common parameters for simulated E-UTRA cells

##### 7.2.1.1 Combinations of system information blocks

<void>

##### 7.2.1.2 Scheduling of system information blocks

<void>

##### 7.2.1.3 Common contents of system information messages

- SystemInformationBlockType2

As defined in Table 4.4.3.3-1 with the following exceptions:

**Table 7.2.1.3-1: SystemInformationBlockType2 exceptions**

| State 3A-RF-CE  | Generic Default RB Established, Cell supporting BL/CE UE, UE Test Mode Activated | Refer to Table 5.2A.2AA                         | Refer to Table 5.2A.2AA | Refer to Table 5.2A.2AA | Refer to Table 5.2A.2AA             | Refer to Table 5.2A.2AA |
| State 3A-RF-DC1 | DC MCG/SCG Dedicated RB established, UE Test Mode Activated                      | Refer to Table 5.2A.1-1                         | Refer to Table 5.2A.1-1 | Refer to Table 5.2A.1-1 | Refer to Table 5.2A.1-1             | Refer to Table 5.2A.1-1 |
| State 3A-RF-DC2 | DC Split Default RB established, UE Test Mode Activated                          | Refer to Table 5.2A.1-1                         | Refer to Table 5.2A.1-1 | Refer to Table 5.2A.1-1 | Refer to Table 5.2A.1-1             | Refer to Table 5.2A.1-1 |
| State 3B-RF     | Generic Default RB Established, UE Test Mode Activated, pre-registered on HRPD   | RRC_CONNECTED<br>1 data radio bearer configured | ECM-CONNECTED           | EMM-REGISTERED          | 1 default EPS bearer context active | Active                  |

## 7.2A.2 UE Registration, UE Test Mode Activated (State 2A-RF)

As described in clause 5.2A.1A.

### 7.2A.2A UE Registration, UE Test Mode Activated in cell supporting BL/CE UE (State 2A-RF-CE)

As described in clause 5.2A.1AA.

### 7.2A.3 Generic Default Radio Bearer Establishment, UE Test Mode Activated (State 3A-RF)

As described in clause 5.2A.2.

#### 7.2A.3A DC MCG/SCG Dedicated RB established, UE Test Mode Activated (State 3A-RF-DC1)

As described in clause 5.2A.2A.

#### 7.2A.3AA Generic Default Radio Bearer Establishment, UE Test Mode Activated in cell supporting BL/CE UE (State 3A-RF-CE)

As described in clause 5.2A.2AA.

#### 7.2A.3B DC Split Default RB established, UE Test Mode Activated (State 3A-RF-DC2)

As described in clause 5.2A.2B.

## 7.2A.3C Generic Default Radio Bearer Establishment, UE Test Mode Activated, V2X Setup (State 3A-RF-V2X)

As described in clause 5.2A.2C.

## 7.2A.4 Generic Default Radio Bearer Establishment, UE Test Mode Activated, pre-registration on HRPD (State 3B-RF)

**Editor's note:** This section is incomplete. The following aspects are either missing or not yet determined:  
Other than UATI Request message and UATI Assignment message are FFS

### 7.2A.4.1 Initial conditions

System Simulator:

- Cell 1
- Cell 1 is transmitting SystemInformationBlockType8

User Equipment:

- The Test USIM shall be inserted.

### 7.2A.4.2 Definition of system information messages

As described in clause 4.5.2B.2.

### 7.2A.4.3 Procedure

**Table 7.2A.4.3-1: UE registration with default EPS bearer establishment, test mode activation and HRPD pre-registration procedures (state 1 to state 3B-RF)**

| Step     | Procedure                                                                            | Message Sequence |         |
|----------|--------------------------------------------------------------------------------------|------------------|---------|
|          |                                                                                      | U - S            | Message |
| 1 to 18  | Steps 1 to 18 as specified in the procedure in clause 5.2A.1A.3 take place.          | -                | -       |
| 19 to 36 | Same procedure for steps 17 to 30D as specified in the procedure in clause 4.5.2B.3. |                  |         |

### 7.2A.4.4 Specific message contents

As described in clauses 4.5.2B.4 and 7.2A.2.

## 7.2A.5 Procedure to configure SCC

As described in clause 5.2A.4.

## 7.2A.6 Exceptions for felCIC tests

As described in clause 5.2A.5.

## 7.2B Other generic RRM procedures

### 7.2B.1 Tracking area updating procedure

The procedure is defined in table 7.2B.1-1.

Table 7.2B.1-1: Tracking area updating procedure

| Step                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Procedure                                                                                                                                                                                                                                                      | Message Sequence |                                                                              |

|--------------|-----------------------------------|
| SCell_AddMod | Addition or modification of SCell |
| UL CA        | This condition is used for UL CA. |

## 7.6 Test environment for NTN testing

This section defines the test environment which applies to all RRM test cases executed for IoT NTN UEs, unless otherwise specified.

### 7.6.1 UE location

Same as in section 5.6.1.

### 7.6.2 Ephemeris Information

Ephemeris information in this section has been generated as described in clause 5 in TR36.905 [77].

#### 7.6.2.0 Assumptions for Ephemeris generation

Same as in section 5.6.2.0.

#### 7.6.2.1 Ephemeris for elevation angle 30°

All eMTC NTN RRM test cases defined in section 14 in TS 36.521-3 [34], unless otherwise stated, shall use ephemeris configuration in tables 7.6.2.1-1a to 7.6.2.1-3b, corresponding to an elevation angle of 30° for the type of satellite under test, keeping such information constant throughout the duration of the test:

- In case UE supports only NGSO satellites or both GSO and NGSO satellites, ephemeris values in Table 7.6.2.1-3a or 7.6.2.1-3b shall be used.
- Tables 7.6.2-4a to 7.6.2-4d shall only be used if the test case under test is only applicable to GEO satellites.

## 7.6.3 eMTC NTN message contents for RRM tests

### 7.6.3.1 *ServingSatelliteInfo-r17* values in SIB31

The *ServingSatelliteInfo-r17* values including the EphemerisInfo-r17 values in SIB31 shall be periodically signalled to the UE during test based on the Ephemeris information in clause 7.6.2 (kept constant throughout the duration of the test).

**Table 7.6.3.1-1: ServingSatelliteInfo-r17 for RRM tests (Serving cell)**

## 8 NB-IoT test environment

### 8.1 NB-IoT Common test environment

#### 8.1.1 NB-IoT Environmental conditions

Same environmental conditions as the ones described in section 4.1 apply to NB-IoT UEs.

#### 8.1.2 NB-IoT Common requirements of test equipment

Same common requirements of test equipment as the ones described in section 4.2 apply to NB-IoT with the following exceptions:

- Only FDD Mode is required for Rel-13 and Rel-14 NB-IoT
- Both FDD and TDD Mode are required for Rel-15 and forward NB-IoT
- Only FDD Mode is required for Rel-17 and forward NB-IoT NTN
- Supported physical channels for NB-IoT are:

| Physical channel | Minimum number | Comments                                                                      |
|------------------|----------------|-------------------------------------------------------------------------------|
| NPBCH            | 1              | Narrowband Physical Broadcast Channel                                         |
| NPDCCH           | 1              | The Narrowband Physical Downlink Control channel carries control information. |
| NPDSCH           | 1              | Narrowband Physical Downlink Shared Channel                                   |
| NPUSCH           | 1              | Narrowband Physical Uplink Shared Channel                                     |
| NPRACH           | 1              | Narrowband Physical Random Access Channel                                     |

- Supported physical signals for NB-IoT are:

| Physical signal                             | Minimum number | Comments |
|---------------------------------------------|----------------|----------|
| Narrowband Reference Signal                 | NA             | DL       |
| Narrowband Primary Synchronization Signal   | NA             | DL       |
| Narrowband Secondary Synchronization Signal | NA             | DL       |
| Demodulation Reference Signal               | NA             | UL       |
| Wake-Up Signal                              | NA             | DL       |

#### 8.1.3 NB-IoT Reference test conditions

This clause contains the reference test conditions, which apply to all NB-IoT test cases unless otherwise specified.

##### 8.1.3.1 NB-IoT Test frequencies

NB-IoT is designed to operate in the E-UTRA operating bands 1, 2, 3, 4, 5, 7, 8, 11, 12, 13, 14, 17, 18, 19, 20, 21, 25, 26, 28, 31, 41, 42, 43, 65, 66, 70, 71, 72, 73, 74, 85, 87, 88, 103 and 106 which are defined in Table 5.5-1 in [21]. For satellite access (NTN), NB-IoT is designed to operate in the E-UTRA operating bands 252, 253, 254, 255 and 256 which are defined in Table 5.2-1 in [74]. NB-IoT system operates in HD-FDD and TDD duplex mode or in TDD mode.

The test frequencies are based on the E-UTRA frequency bands defined in the core specifications.

The raster spacing is 100 kHz.

E-UTRA/FDD is designed to operate in paired bands of 3GPP TS 36.101 [27] and TS 36.102 [74]. The reference test frequencies for the RF and Signalling test environment for each of the operating bands are defined in sub clause 8.1.3.1.1.

E-UTRA/TDD is designed to operate in unpaired bands of 3GPP TS 36.101 [27]. The reference test frequencies for the RF and Signalling test environment for each of the operating bands are defined in sub clause 8.1.3.1.2.

USA & Canada emission requirements for specific operating bands are indicated by network signalling value NS\_04 on indicated bands in clause 8.1.3.1.1. The normative reference for this requirement is TS 36.101 [27] clause 5.5F.

For operation in Band 255, only channels positions which guarantee at least 190 kHz guard band from RF channel edge to the lower limit of the band shall be used.

For operation in Band 255 in USA and Canada when NS\_02N is signalled, only channels positions which guarantee at least 90 kHz guard band from RF channel edge to the lower and upper limit of the band shall be used.

For operation in Band 254 in USA and Canada when NS\_03N is signalled, only channels positions which guarantee at least 90 kHz guard band from RF channel edge to the lower and upper limit of the band shall be used.

### 8.1.3.1.1 NB-IoT FDD Mode Test frequencies

#### 8.1.3.1.1.1 NB-IoT FDD reference test frequencies for operating band 1

**Table 8.1.3.1.1.1-1: NB-IoT standalone Test frequencies for operating band 1**

| Test Frequency ID | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|-------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range         | 18001           | 0               | 1920.1                    | 1               | -0.5            | 2110.1                      |
| Mid Range         | 18300           | 0               | 1950.0                    | 300             | -0.5            | 2140.0                      |
| High Range        | 18599           | 0               | 1979.9                    | 599             | -0.5            | 2169.9                      |

NOTE 1: Applicable to either 3.75 kHz or 15 kHz NB-IoT UL subcarrier spacing

**Table 8.1.3.1.1.1-2: NB-IoT in-band Test frequencies for operating band 1**

| Test Frequency ID       | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|-------------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range <sup>1</sup>  | 18007           | 0               | 1920.7000                 | 7               | -2              | 2110.6925                   |
| Low Range <sup>2</sup>  | 18060           | -2              | 1925.9900                 | 60              | -1              | 2115.9975                   |
| Low Range <sup>3</sup>  | 18069           | -2              | 1926.8900                 | 69              | -1              | 2116.8975                   |

## 8.1.3.1.1.71 NB-IoT FDD reference test frequencies for operating band 71

**Table 8.1.3.1.1.71-1: NB-IoT standalone Test frequencies for operating band 71**

| Test Frequency ID                                                                                            | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|--------------------------------------------------------------------------------------------------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range                                                                                                    | 133123          | 0               | 663.1000                  | 68587           | -0.5            | 617.1000                    |
| Mid Range                                                                                                    | 133297          | 0               | 680.5000                  | 68761           | -0.5            | 634.5000                    |
| High Range                                                                                                   | 133471          | 0               | 697.9000                  | 68935           | -0.5            | 651.9000                    |
| NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing |                 |                 |                           |                 |                 |                             |

**Table 8.1.3.1.1.71-1a: NB-IoT standalone Test frequencies for operating band 71 with NS\_04**

| Test Frequency ID                                                                                            | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|--------------------------------------------------------------------------------------------------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range                                                                                                    | 133124          | 0               | 663.2000                  | 68588           | -0.5            | 617.2000                    |
| Mid Range                                                                                                    | 133297          | 0               | 680.5000                  | 68761           | -0.5            | 634.5000                    |
| High Range                                                                                                   | 133470          | 0               | 697.8000                  | 68934           | -0.5            | 651.8000                    |
| NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing |                 |                 |                           |                 |                 |                             |

**Table 8.1.3.1.1.71-2: NB-IoT in-band Test frequencies for operating band 71**

| Test Frequency ID                                                                                            | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|--------------------------------------------------------------------------------------------------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range <sup>1</sup>                                                                                       | 133129          | 0               | 663.7000                  | 68593           | -2              | 617.6925                    |
| Low Range <sup>2</sup>                                                                                       | 133182          | -2              | 668.9900                  | 68646           | -1              | 622.9975                    |
| Low Range <sup>3</sup>                                                                                       | 133191          | -2              | 669.8900                  | 68655           | -1              | 623.8975                    |
| Mid Range <sup>1</sup>                                                                                       | 133288          | 0               | 679.6000                  | 68752           | -2              | 633.5925                    |
| Mid Range <sup>2</sup>                                                                                       | 133307          | -2              | 681.4900                  | 68771           | -1              | 635.4975                    |
| Mid Range <sup>3</sup>                                                                                       | 133316          | -2              | 682.3900                  | 68780           | -1              | 636.3975                    |
| High Range <sup>1</sup>                                                                                      | 133465          | 0               | 697.3000                  | 68929           | 1               | 651.3075                    |
| High Range <sup>2</sup>                                                                                      | 133432          | -2              | 693.9900                  | 68896           | -1              | 647.9975                    |
| High Range <sup>3</sup>                                                                                      | 133441          | -2              | 694.8900                  | 68905           | -1              | 648.8975                    |
| NOTE 1: Related to LTE channel BW 3 MHz                                                                      |                 |                 |                           |                 |                 |                             |
| NOTE 2: Related to LTE channel BW 10 MHz and NB-IoT PRB 30                                                   |                 |                 |                           |                 |                 |                             |
| NOTE 3: Related to LTE channel BW 10 MHz and NB-IoT PRB 35                                                   |                 |                 |                           |                 |                 |                             |
| NOTE 4: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing |                 |                 |                           |                 |                 |                             |

**Table 8.1.3.1.1.71-2a: NB-IoT in-band Test frequencies for operating band 71 with NS\_04**

| Test Frequency ID       | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|-------------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range <sup>1</sup>  | 133129          | 0               | 663.7000                  | 68593           | -2              | 617.6925                    |
| Low Range <sup>2</sup>  | 133182          | -2              | 668.9900                  | 68646           | -1              | 622.9975                    |
| Low Range <sup>3</sup>  | 133191          | -2              | 669.8900                  | 68655           | -1              | 623.8975                    |
| Mid Range <sup>1</sup>  | 133288          | 0               | 679.6000                  | 68752           | -2              | 633.5925                    |
| Mid Range <sup>2</sup>  | 133307          | -2              | 681.4900                  | 68771           | -1              | 635.4975                    |
| Mid Range <sup>3</sup>  | 133316          | -2              | 682.3900                  | 68780           | -1              | 636.3975                    |
| High Range <sup>1</sup> | 133465          | 0               | 697.3000                  | 68929           | 1               | 651.3075                    |
| High Range <sup>2</sup> | 133432          | -2              | 693.9900                  | 68896           | -1              | 647.9975                    |
| High Range <sup>3</sup> | 133441          | -2              | 694.8900                  | 68905           | -1              | 648.8975                    |

NOTE 1: Related to LTE channel BW 3 MHz  
NOTE 2: Related to LTE channel BW 10 MHz and NB-IoT PRB 30  
NOTE 3: Related to LTE channel BW 10 MHz and NB-IoT PRB 35  
NOTE 4: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing

8.1.3.1.1.73 NB-IoT FDD reference test frequencies for operating band 73

**Table 8.1.3.1.1.73-1: NB-IoT standalone Test frequencies for operating band 73**

| Test Frequency ID | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|-------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range         | 133523          | 0               | 450.1000                  | 68997           | -0.5            | 461.1000                    |
| Mid Range         | 133547          | 0               | 452.5000                  | 69011           | -0.5            | 462.5000                    |
| High Range        | 133571          | 0               | 454.9000                  | 69035           | -0.5            | 464.9000                    |

NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing

**Table 8.1.3.1.1.73-2: NB-IoT in-band Test frequencies for operating band 73**

| Test Frequency ID                                                                                            | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|--------------------------------------------------------------------------------------------------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range                                                                                                    | 133556          | 0               | 453.4000                  | 69020           | 1               | 463.4000                    |
| Mid Range                                                                                                    | 133556          | 0               | 453.4000                  | 69020           | 1               | 463.4000                    |
| High Range                                                                                                   | 133556          | 0               | 453.4000                  | 69020           | 1               | 463.4000                    |
| NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing |                 |                 |                           |                 |                 |                             |
| NOTE 2: Defined for 5 MHz LTE Cell Bandwidth.                                                                |                 |                 |                           |                 |                 |                             |

**Table 8.1.3.1.1.73-3: NB-IoT guard-band Test frequencies for operating band 73**

| Test Frequency ID                                                                                            | LTE Cell Bandwidth [MHz] | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|--------------------------------------------------------------------------------------------------------------|--------------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range                                                                                                    | Any                      | 133523          | 0               | 450.1000                  | 68997           | 1               | 461.1000                    |
| Mid Range                                                                                                    | 5                        | 133523          | 0               | 450.1000                  | 68997           | 1               | 461.1000                    |
| High Range                                                                                                   | Any                      | 133571          | 0               | 454.9000                  | 69035           | 1               | 464.9000                    |
| NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing |                          |                 |                 |                           |                 |                 |                             |

8.1.3.1.1.74 to 8.1.3.1.1.84 Void

8.1.3.1.1.85 NB-IoT FDD reference test frequencies for operating band 85

**Table 8.1.3.1.1.85-1: NB-IoT standalone Test frequencies for operating band 85**

| Test Frequency ID                                                                                            | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|--------------------------------------------------------------------------------------------------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range                                                                                                    | 134003          | 0               | 698,1000                  | 70367           | -0.5            | 728,1000                    |
| Mid Range                                                                                                    | 134082          | 0               | 706,0000                  | 70446           | -0.5            | 736,0000                    |
| High Range                                                                                                   | 134181          | 0               | 715,9000                  | 70545           | -0.5            | 745,9000                    |
| NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing |                 |                 |                           |                 |                 |                             |

**Table 8.1.3.1.1.85-1a: NB-IoT standalone Test frequencies for operating band 85 with NS\_04**

| Test Frequency ID                                                                                            | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|--------------------------------------------------------------------------------------------------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range                                                                                                    | 134004          | 0               | 698,2000                  | 70368           | -0.5            | 728,2000                    |
| Mid Range                                                                                                    | 134082          | 0               | 706,0000                  | 70446           | -0.5            | 736,0000                    |
| High Range                                                                                                   | 134180          | 0               | 715,8000                  | 70544           | -0.5            | 745,8000                    |
| NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing |                 |                 |                           |                 |                 |                             |

**Table 8.1.3.1.1.85-2: NB-IoT in-band Test frequencies for operating band 85**

| Test Frequency ID                                                                                            | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|--------------------------------------------------------------------------------------------------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range <sup>1</sup>                                                                                       | 134062          | -2              | 703,9900                  | 70426           | -1              | 733,9975                    |
| Low Range <sup>2</sup>                                                                                       | 134071          | -2              | 704,8900                  | 70435           | -1              | 734,8975                    |
| Mid Range <sup>1</sup>                                                                                       | 134102          | -2              | 707,9900                  | 70466           | -1              | 737,9975                    |
| Mid Range <sup>2</sup>                                                                                       | 134111          | -2              | 708,8900                  | 70475           | -1              | 738,8975                    |
| High Range <sup>1</sup>                                                                                      | 134142          | -2              | 711,9900                  | 70506           | -1              | 741,9975                    |

| Low Range         | 134266          | 0               | 415.4000                  | 70630           | 1               | 425.4000                    |
| Mid Range         | 134266          | 0               | 415.4000                  | 70630           | 1               | 425.4000                    |
| High Range        | 134266          | 0               | 415.4000                  | 70630           | 1               | 425.4000                    |

NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing  
NOTE 2: Defined for 5 MHz LTE Cell Bandwidth.

**Table 8.1.3.1.1.88-3: NB-IoT guard-band Test frequencies for operating band 88**

| Test Frequency ID | LTE Cell Bandwidth [MHz] | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|-------------------|--------------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range         | Any                      | 134233          | 0               | 412.1000                  | 70597           | 1               | 422.1000                    |
| Mid Range         | 5                        | 134233          | 0               | 412.1000                  | 70597           | 1               | 422.1000                    |
| High Range        | Any                      | 134281          | 0               | 416.9000                  | 70645           | 1               | 426.9000                    |

NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing

## 8.1.3.1.1.89 to 8.1.3.1.1.102 Void

## 8.1.3.1.1.103

NB-IoT FDD reference test frequencies for operating band 103

**Table 8.1.3.1.1.103-1: NB-IoT standalone Test frequencies for operating band 103**

| Test Frequency ID | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|-------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range         | 134283          | 0               | 787.1                     | 70647           | -0.5            | 757.1                       |
| Mid Range         | 134287          | 0               | 787.5                     | 70651           | -0.5            | 757.5                       |
| High Range        | 134291          | 0               | 787.9                     | 70655           | -0.5            | 757.9                       |

NOTE 1: Applicable to either 3.75 kHz or 15 kHz NB-IoT UL subcarrier spacing

**Table 8.1.3.1.1.103-1a: NB-IoT standalone Test frequencies for operating band 103 with NS\_04**

| Test Frequency ID | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|-------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range         | 134284          | 0               | 787.2                     | 70648           | -0.5            | 757.2                       |
| Mid Range         | 134287          | 0               | 787.5                     | 70651           | -0.5            | 757.5                       |
| High Range        | 134290          | 0               | 787.8                     | 70654           | -0.5            | 757.8                       |

NOTE 1: Applicable to either 3.75 kHz or 15 kHz NB-IoT UL subcarrier spacing

8.1.3.1.1.104 to 8.1.3.1.1.105 FFS

8.1.3.1.1.106 NB-IoT FDD reference test frequencies for operating band 106

**Table 8.1.3.1.1.106-1: NB-IoT standalone Test frequencies for operating band 106**

| Test Frequency ID | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|-------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range         | 134293          | 0               | 896.1000                  | 70657           | -0.5            | 935.1000                    |
| Mid Range         | 134317          | 0               | 898.5000                  | 70681           | -0.5            | 937.5000                    |
| High Range        | 134341          | 0               | 900.9000                  | 70705           | -0.5            | 939.9000                    |

NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing

**Table 8.1.3.1.1.106-2: NB-IoT in-band Test frequencies for operating band 106**

| Test Frequency ID | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|-------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range         | 134322          | 0               | 899.0000                  | 70686           | 1               | 938.0075                    |
| Mid Range         | 134322          | 0               | 899.0000                  | 70686           | 1               | 938.0075                    |
| High Range        | 134322          | 0               | 899.0000                  | 70686           | 1               | 938.0075                    |

NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing  
NOTE 2: Defined for 3 MHz LTE Cell Bandwidth.

**Table 8.1.3.1.1.106-3: NB-IoT guard-band Test frequencies for operating band 106**

| Test Frequency ID | LTE Cell Bandwidth [MHz] | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|-------------------|--------------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range         | Any                      | 134293          | 0               | 896.1000                  | 70657           | 1               | 935.1075                    |
| Mid Range         | 3                        | 134293          | 0               | 896.1000                  | 70657           | 1               | 935.1075                    |
| High Range        | Any                      | 134341          | 0               | 900.9000                  | 70705           | 1               | 939.9075                    |

NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing

8.1.3.1.1.107 to 8.1.3.1.1.251 FFS

Note: Sub-clauses 8.1.3.1.1.104, 8.1.3.1.1.105 and 8.1.3.1.1.107 to 8.1.3.1.1.251 are marked as FFS as bands 104, 105 and 107 to 251 are not yet defined in TS 36.101 [27] or TS 36.102 [74].

8.1.3.1.1.252 NB-IoT FDD reference test frequencies for operating band 252

**Table 8.1.3.1.1.252-1: NB-IoT standalone Test frequencies for operating band 252**

| Test Frequency ID | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|-------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range         | 261070          | 0               | 2000.1                    | 228302          | 0               | 2180.1                      |
| Mid Range         | 261169          | 0               | 2010                      | 228401          | 0               | 2190                        |

|            |        |   |        |        |   |        |
|------------|--------|---|--------|--------|---|--------|
| High Range | 261268 | 0 | 2019.9 | 228500 | 0 | 2199.9 |
|------------|--------|---|--------|--------|---|--------|

NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing

**Table 8.1.3.1.1.252-2: standalone Test frequencies for operating band 252 with flexible Tx-Rx frequency separation**

| Test Frequency ID | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|-------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range         | 261268          | 0               | 2019.9                    | 228302          | 0               | 2180.1                      |
| Mid Range         | 261169          | 0               | 2010                      | 228401          | 0               | 2190                        |
| High Range        | 261070          | 0               | 2000.1                    | 228500          | 0               | 2199.9                      |

NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing.  
 NOTE 2: Low Range is based on the smallest Tx-Rx separation while High Range is based on the largest Tx-Rx separation.  
 NOTE 3: The Mid Range is based on Tx-Rx separation of -151 MHz and has been specified for signalling tests.

8.1.3.1.1.253 NB-IoT FDD reference test frequencies for operating band 253

**Table 8.1.3.1.1.253-1: NB-IoT standalone Test frequencies for operating band 253**

| Test Frequency ID | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|-------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range         | 261270          | 0               | 1668.1                    | 228502          | 0               | 1518.1                      |
| Mid Range         | 261304          | 0               | 1671.5                    | 228536          | 0               | 1521.5                      |
| High Range        | 261338          | 0               | 1674.9                    | 228570          | 0               | 1524.9                      |

NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing

**Table 8.1.3.1.1.253-2: NB-IoT standalone Test frequencies for operating band 253 with flexible Tx-Rx frequency separation**

| Test Frequency ID         | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|---------------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range <sup>1,2</sup>  | 261338          | 0               | 1674.9                    | 228502          | 0               | 1518.1                      |
| Mid Range <sup>1,3</sup>  | 261289          | 0               | 1670.0                    | 228511          | 0               | 1519.0                      |
| High Range <sup>1,2</sup> | 261270          | 0               | 1668.1                    | 228570          | 0               | 1524.9                      |

NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing  
 NOTE 2: Low Range is based on the smallest Tx-Rx separation while High Range is based on the largest Tx-Rx separation.  
 NOTE 3: The Mid Range is based on Tx-Rx separation of -151 MHz and has been specified for signalling tests.

8.1.3.1.1.254 NB-IoT FDD reference test frequencies for operating band 254

**Table 8.1.3.1.1.254-1: NB-IoT standalone Test frequencies for operating band 254**

| Test Frequency ID | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|-------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range         | 261340          | 0               | 1610.1                    | 228572          | 0               | 2483.6                      |
| Mid Range         | 261422          | 0               | 1618.3                    | 228654          | 0               | 2491.8                      |
| High Range        | 261503          | 0               | 1626.4                    | 228735          | 0               | 2499.9                      |

NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing

**Table 8.1.3.1.1.254-1a: NB-IoT standalone Test frequencies for operating band 254 with NS\_03N**

| Test Frequency ID                                                                                            | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |

| Low Range                                                                                                    | 261341          | 0               | 1610.2                    | 228573          | 0               | 2483.7                      |
| Mid Range                                                                                                    | 261422          | 0               | 1618.3                    | 228654          | 0               | 2491.8                      |
| High Range                                                                                                   | 261502          | 0               | 1626.3                    | 228734          | 0               | 2499.8                      |
| NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing |                 |                 |                           |                 |                 |                             |

**Table 8.1.3.1.1.254-2: NB-IoT standalone Test frequencies for operating band 254 with flexible Tx-Rx frequency separation**

| Test Frequency ID                                                                                                      | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|------------------------------------------------------------------------------------------------------------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range <sup>1,2</sup>                                                                                               | 261503          | 0               | 1626.4                    | 228572          | 0               | 2483.6                      |
| Mid Range <sup>1,3</sup>                                                                                               | 261389          | 0               | 1615.0                    | 228586          | 0               | 2485.0                      |
| High Range <sup>1,2</sup>                                                                                              | 261340          | 0               | 1610.1                    | 228735          | 0               | 2499.9                      |
| NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing           |                 |                 |                           |                 |                 |                             |
| NOTE 2: Low Range is based on the smallest Tx-Rx separation while High Range is based on the largest Tx-Rx separation. |                 |                 |                           |                 |                 |                             |
| NOTE 3: The Mid Range is based on Tx-Rx separation of 870 MHz and has been specified for signalling tests.             |                 |                 |                           |                 |                 |                             |

**Table 8.1.3.1.1.254-3: NB-IoT in-band operation in NR NTN test frequencies for operating band 254**

| Test Frequency ID                                                                                            | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|--------------------------------------------------------------------------------------------------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range <sup>1</sup>                                                                                       | 261384          | -4              | 1614.4800                 | 228578          | -2              | 2484.1925                   |
| Mid Range <sup>1,3</sup>                                                                                     | 261398          | 2               | 1615.9100                 | 228675          | 0               | 2493.9025                   |
| High Range <sup>1</sup>                                                                                      | 261501          | -8              | 1626.1600                 | 228693          | -2              | 2499.6925                   |
| NOTE 1: Related to NR channel BW 5 MHz                                                                       |                 |                 |                           |                 |                 |                             |
| NOTE 2: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing |                 |                 |                           |                 |                 |                             |
| NOTE 3: UL frequency is in the guardband of the NR NTN channel                                               |                 |                 |                           |                 |                 |                             |

### 8.1.3.1.1.255 NB-IoT FDD reference test frequencies for operating band 255

**Table 8.1.3.1.1.255-1: NB-IoT standalone Test frequencies for operating band 255**

| Test Frequency ID                                                                                            | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|--------------------------------------------------------------------------------------------------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range                                                                                                    | 261507          | 0               | 1626.8                    | 228739          | 0               | 1525.3                      |
| Mid Range                                                                                                    | 261674          | 0               | 1643.5                    | 228906          | 0               | 1542.0                      |
| High Range                                                                                                   | 261843          | 0               | 1660.4                    | 229075          | 0               | 1558.9                      |
| NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing |                 |                 |                           |                 |                 |                             |

**Table 8.1.3.1.1.255-1a: NB-IoT standalone Test frequencies for operating band 255 with NS\_02N**

| Test Frequency ID                                                                                            | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|--------------------------------------------------------------------------------------------------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range                                                                                                    | 261506          | 0               | 1626.7                    | 228738          | 0               | 1525.2                      |
| Mid Range                                                                                                    | 261674          | 0               | 1643.5                    | 228906          | 0               | 1542.0                      |
| High Range                                                                                                   | 261842          | 0               | 1660.3                    | 229074          | 0               | 1558.8                      |
| NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing |                 |                 |                           |                 |                 |                             |

**Table 8.1.3.1.1.255-2: NB-IoT standalone Test frequencies for operating band 255 with flexible Tx-Rx frequency separation**

| Test Frequency ID                                                                                                      | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|------------------------------------------------------------------------------------------------------------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range <sup>1,2</sup>                                                                                               | 261843          | 0               | 1660.4                    | 228737          | 0               | 1525.1                      |
| Mid Range <sup>1,3</sup>                                                                                               | 261529          | 0               | 1640                      | 228786          | 0               | 1530.0                      |
| High Range <sup>1,2</sup>                                                                                              | 261505          | 0               | 1626.6                    | 229075          | 0               | 1558.9                      |
| NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing           |                 |                 |                           |                 |                 |                             |
| NOTE 2: Low Range is based on the smallest Tx-Rx separation while High Range is based on the largest Tx-Rx separation. |                 |                 |                           |                 |                 |                             |
| NOTE 3: The Mid Range is based on Tx-Rx separation of -110 MHz and has been specified for signalling tests.            |                 |                 |                           |                 |                 |                             |

| High Range <sup>1</sup>                                                                                      | 261841          | -8              | 1660.1600                 | 229033          | -2              | 1554.6925                   |
| NOTE 1: Related to NR channel BW 5 MHz                                                                       |                 |                 |                           |                 |                 |                             |
| NOTE 2: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing |                 |                 |                           |                 |                 |                             |
| NOTE 3: UL frequency is in the guardband of the NR NTN channel                                               |                 |                 |                           |                 |                 |                             |

## 8.1.3.1.1.256 NB-IoT FDD reference test frequencies for operating band 256

**Table 8.1.3.1.1.256-1: NB-IoT standalone Test frequencies for operating band 256**

| Test Frequency ID                                                                                            | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|--------------------------------------------------------------------------------------------------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range                                                                                                    | 261845          | 0               | 1980.1                    | 229077          | 0               | 2170.1                      |
| Mid Range                                                                                                    | 261994          | 0               | 1995.0                    | 229226          | 0               | 2185.0                      |
| High Range                                                                                                   | 262143          | 0               | 2009.9                    | 229375          | 0               | 2199.9                      |
| NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing |                 |                 |                           |                 |                 |                             |

**Table 8.1.3.1.1.256-2: NB-IoT standalone Test frequencies for operating band 256 with flexible Tx-Rx frequency separation**

| Test Frequency ID                                                                                                      | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|------------------------------------------------------------------------------------------------------------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range <sup>1,2</sup>                                                                                               | 262143          | 0               | 2009.9                    | 229077          | 0               | 2170.1                      |
| Mid Range <sup>1,3</sup>                                                                                               | 262014          | 0               | 1997.0                    | 229226          | 0               | 2185.0                      |
| High Range <sup>1,2</sup>                                                                                              | 261845          | 0               | 1980.1                    | 229375          | 0               | 2199.9                      |
| NOTE 1: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing           |                 |                 |                           |                 |                 |                             |
| NOTE 2: Low Range is based on the smallest Tx-Rx separation while High Range is based on the largest Tx-Rx separation. |                 |                 |                           |                 |                 |                             |
| NOTE 3: The Mid Range is based on Tx-Rx separation of 188 MHz and has been specified for signalling tests.             |                 |                 |                           |                 |                 |                             |

**Table 8.1.3.1.1.256-3: NB-IoT in-band operation in NR NTN test frequencies for operating band 256**

| Test Frequency ID        | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|--------------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range <sup>1</sup>   | 261864          | -4              | 1981.9800                 | 229083          | -2              | 2170.6925                   |
| Mid Range <sup>1,3</sup> | 261971          | -8              | 1992.6600                 | 229208          | -2              | 2183.1925                   |
| High Range <sup>1</sup>  | 262141          | -8              | 2009.6600                 | 229369          | -2              | 2199.2925                   |

NOTE 1: Related to NR channel BW 5 MHz

NOTE 2: Defined for NB-IoT UL subcarrier spacing 15 kHz. Also applicable for 3.75 kHz UL sub-carrier spacing

NOTE 3: UL frequency is in the guardband of the NR NTN channel

## 8.1.3.1.2 NB-IoT TDD Mode Test frequencies

8.1.3.1.2.1 to 8.1.3.1.2.40 Void

8.1.3.1.2.41 NB-IoT TDD reference test frequencies for operating band 41

**Table 8.1.3.1.1.41-1: NB-IoT standalone Test frequencies for operating band 41**

| Test Frequency ID | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |
|-------------------|-----------------|-----------------|---------------------------|-----------------|-----------------|-----------------------------|
| Low Range         | 39651           | 0               | 2496.1                    | 39651           | -0.5            | 2496.1                      |
| Mid Range         | 40620           | 0               | 2593.0                    | 40620           | -0.5            | 2593.0                      |
| High Range        | 41589           | 0               | 2689.9                    | 41589           | -0.5            | 2689.9                      |

NOTE 1: Applicable to either 3.75 kHz or 15 kHz NB-IoT UL subcarrier spacing

**Table 8.1.3.1.1.41-2: NB-IoT in-band Test frequencies for operating band 41**

| Test Frequency ID       | N <sub>UL</sub> | M <sub>UL</sub> | Frequency of Uplink [MHz] | N <sub>DL</sub> | M <sub>DL</sub> | Frequency of Downlink [MHz] |

### 8.1.3.2 NB-IoT Radio conditions

#### 8.1.3.2.1 NB-IoT Normal propagation condition

Same normal propagation condition as defined in clause 4.3.2.1 apply.

#### 8.1.3.3 NB-IoT Physical channel allocations

##### 8.1.3.3.1 NB-IoT Antennas

As the UE has one Rx antenna, the downlink signal is applied to it.

##### 8.1.3.3.2 NB-IoT Downlink physical channels and physical signals

The Downlink Physical channels and Physical signals used and their relative powers are specified for either single or two SS Tx antenna in table 8.1.3.3.2-1. According to this table, no boosting needs to be signalled (as power ratios are fixed between NRS EPRE and all DL channels for a given number of DL antenna ports).

According to TS 36.213 [29] clause 16.2.2, if higher layer parameter *operationModeInfo* indicates '00' for a cell, the ratio of NRS EPRE to CRS EPRE is given by the parameter *nrs-CRS-PowerOffset* if the parameter *nrs-CRS-EPRE-Ratio* is provided by higher layers, and the ratio of NRS EPRE to CRS EPRE may be assumed to be 0 dB if the parameter *nrs-CRS-EPRE-Ratio* is not provided by higher layers.

**Table 8.1.3.3.2-1: NB-IoT Power allocation for OFDM symbols and reference signals (1 or 2 SS Tx antenna)**

| Physical Channel / Signal | EPRE Ratio                                                                                                                                                                                                                                                                |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NPBCH                     | According to TS 36.213 [29] clause 16.2.2, a UE may assume the ratio of NPBCH EPRE to NRS EPRE among NPBCH REs (not applicable to NPBCH REs with zero EPRE) is 0 dB for an NB-IoT cell with one NRS antenna port and -3 dB for an NB-IoT cell with two NRS antenna ports. |
| NPSS                      | Power allocation for NPSS is defined as equal to NRS EPRE = -85 dBm/15 kHz in order to have a constant EPRE (an absolute value is used as there is no NRS transmission when NPSS is transmitted).                                                                         |
| NSSS                      | Power allocation for NSSS is defined as equal to NRS EPRE = -85 dBm/15 kHz in order to have a constant EPRE (an absolute value is used as there is no NRS transmission when NPSS is transmitted).                                                                         |

|        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NPDCCH | According to TS 36.213 [29] clause 16.2.2, a UE may assume the ratio of NPDCCH EPRE to NRS EPRE among NPDCCH REs (not applicable to NPDCCH REs with zero EPRE) is 0 dB for an NB-IoT cell with one NRS antenna port and -3 dB for an NB-IoT cell with two NRS antenna ports.                                                                                                                                                                                                                                                                           |
| NPDSCH | According to TS 36.213 [29] clause 16.2.2, a UE may assume the ratio of NPDSCH EPRE to NRS EPRE among NPDSCH REs (not applicable to NPDSCH REs with zero EPRE) is 0 dB for an NB-IoT cell with one NRS antenna port and -3 dB for an NB-IoT cell with two NRS antenna ports.                                                                                                                                                                                                                                                                           |
| NRS    | <ul style="list-style-type: none"> <li>- If the number of NRS antenna ports is one, the EPRE of NRS and the EPRE of all NB-IoT DL channels is the same</li> <li>- If the number of NRS antenna ports is two, the EPRE per antenna port of NRS port is 3dB larger compared to the EPRE per antenna port of all NB-IoT DL channels</li> <li>- This means no signalling support of power offsets</li> <li>- The set of values for power offset between NRS and LTE CRS is {-6, -4.77, -3, -1.77, 0, 1, 1.23, 2, 3, 4, 4.23, 5, 6, 7, 8, 9} dB.</li> </ul> |
| NWUS   | According to TS 36.213 [29] clause 16.2.2, the ratio of NWUS EPRE to NRS EPRE is 0 dB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### 8.1.3.3.3 NB-IoT Mapping of downlink physical channels and signals to physical resources

Parameters for mapping of NB-IoT downlink physical channels and signals are specified as follows:

Normal Cyclic Prefix

$N_{ID}^{cell}$ , Physical layer cell identity = 0 is used as the default physical layer cell identity

For RF testing, the mapping of DL physical channels to resource element is defined TS 36.521-1 [21] Annex C.1.

**Table 8.1.3.3.3-1: NB-IoT Mapping of DL Physical Channels and Signals to Resource Elements (FDD)**

| Physical channel / signal | Time Domain Location                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Frequency Domain Location                                                             | Note                                                              |

#### 8.1.3.4 NB-IoT Signal levels

##### 8.1.3.4.1 NB-IoT Downlink signal levels

The downlink power settings in table 8.1.3.4.1-1 are used unless otherwise specified in a test case.

**Table 8.1.3.4.1-1: NB-IoT Default Downlink power levels**

|                                                                                                                                                                                         | Unit      | Channel bandwidth |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|-------------------|
|                                                                                                                                                                                         |           | 200 kHz           |
| Number of Tones                                                                                                                                                                         |           | 12                |
| Channel BW Power                                                                                                                                                                        | dBm       | -74               |
| NRS EPRE                                                                                                                                                                                | dBm/15kHz | -85               |
| Note 1: The channel bandwidth powers are informative, based on -85dBm/15kHz NRS_EPRES, then scaled according to the number of tones in DL and rounded to the nearest integer dBm value. |           |                   |

Note 2: The power level is specified at the UE Rx antenna

It is [FFS] whether there is a requirement to specify constant power throughout all OFDM symbols, and if so how unallocated Resource elements should be treated.

The default signal level uncertainty is +/-3dB at each test port, for any level specified. If the uncertainty value is critical for the test purpose a tighter uncertainty is specified for the related test case in TS 36.521-1 [21] Annex F or in TS 36.521-3 [34] Annex F

#### 8.1.3.6 NB-IoT Physical layer parameters

##### 8.1.3.6.1 NB-IoT Downlink physical layer parameters

##### 8.1.3.6.1.1 NB-IoT Physical layer parameters for DCI format N0

Default NB-IoT physical layer parameters for DCI format N0 are specified in table 8.1.3.6.1.1-1.

**Table 8.1.3.6.1.1-1: NB-IoT Physical layer parameters for DCI format N0**

| Parameter                                    | Value                                                                                                                                                                         | Value in binary                                             |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|
| Flag for format N0/format N1 differentiation | format N0                                                                                                                                                                     | "0"                                                         |
| Subcarrier indication                        | 0 if not specified otherwise depending on test case<br>(6 bits as defined in section 16.5.1.1 of 36.213 [29])                                                                 | -                                                           |
| Resource assignment                          | Depending on test parameters<br>(3 bits as defined in section 16.5.1.1 of 36.213 [29])                                                                                        | -                                                           |
| Scheduling delay                             | 0<br>(2 bits as defined in section 16.5.1 of 36.213 [29])                                                                                                                     | "00"                                                        |
| Modulation and coding scheme                 | Depending on test parameters<br>(4 bits as defined in section 16.5.1.2 of 36.213 [29])                                                                                        | -                                                           |
| Redundancy version                           | 0<br>(1 bit as defined in clause 16.5.1.2 of 36.213 [29])                                                                                                                     | "0"                                                         |
| Repetition number                            | NRep = 1<br>(3 bits as defined in clause 16.5.1.2 of 36.213 [29])                                                                                                             | "000"                                                       |
| New data indicator                           | Set for every data transmission/retransmission according to the rules specified in TS 36.321 [14]<br>(1 bit)                                                                  | -                                                           |
| DCI subframe repetition number               | R = 2 (according to NPDCCH configuration of Table 8.1.6.3-3) for normal coverage and 32 for RRM enhanced coverage (2 bits as defined in section 16.6 in 36.213 [29])          | "00" for normal coverage and "11" for RRM enhanced coverage |
| HARQ process number                          | Mandatory present if 2 HARQ processes are configured in the UE, default value (HARQ process) "0". Otherwise not present (1 bit as defined in section 16.5.1.2 of 36.213 [29]) | -                                                           |

**Table 8.1.3.6.1.1-1a: NB-IoT Physical layer parameters for DCI format N0 for PUR-RNTI**

| Parameter                                          | Value                                                                                                         | Value in binary |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------|-----------------|
| Flag for format N0/format N1 differentiation       | format N0                                                                                                     | "0"             |
| Modulation and coding scheme                       | (4 bits as defined in section 16.5.1.2 of 36.213 [29])                                                        | '1110'          |
| ACK or Fallback indicator                          | (1 bit where value 0 indicates ACK and value 1 indicates fallback as defined in clause 16.6.4 of [3])         | -               |
| NPUSCH repetition adjustment                       | 0 if not specified otherwise depending on test case (3 bits as defined in in Table 16.5.1.1-3 of 36.213 [29]) | "000"           |
| Timing advance adjustment                          | 0 if not specified otherwise depending on test case (6 bits as defined in clause 16.1.2 of 36.213 [29])       | "000000"        |
| All the remaining bits in format N0 are set to one |                                                                                                               |                 |

#### 8.1.3.6.1.2 NB-IoT Physical layer parameters for DCI format N1

Default NB-IoT physical layer parameters for DCI format N1 are specified in table 8.1.3.6.1.2-1 for random access procedure initiated by a NPDCCH order, in table 8.1.3.6.1.2-2 for the scheduling of one NPDSCH codeword in one cell scrambled by RA-RNTI/C-RNTI and in table 8.1.3.6.1.2-3 for the scheduling of one NPDSCH codeword in one cell scrambled by G-RNTI.

**Table 8.1.3.6.1.2-1: NB-IoT Physical layer parameters for DCI format N1 (for random access procedure initiated by a NPDCCH order)**

| Parameter                                                  | Value                                                      | Value in binary |
|------------------------------------------------------------|------------------------------------------------------------|-----------------|
| Flag for format N0/format N1 differentiation               | format N1                                                  | "1"             |
| NPDCCH order indicator                                     | 1                                                          | "1"             |
| Starting number of NPRACH repetitions                      | n1<br>(2 bits as defined in section 16.3.1 of 36.213 [29]) | "00"            |
| Subcarrier indication of NPRACH                            | 12<br>(6 bits as defined in section 16.3.1 of 36.213 [29]) | "001100"        |
| NOTE 1: All the remaining bits in format N1 are set to one |                                                            |                 |

**Table 8.1.3.6.1.2-2: NB-IoT Physical layer parameters for DCI format N1 (for the scheduling of one NPDSCH codeword in one cell scrambled by RA-RNTI/C-RNTI)**

| Parameter                                    | Value                                                                                                                                                                 | Value in binary                                                 |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|
| Flag for format N0/format N1 differentiation | format N1                                                                                                                                                             | "1"                                                             |
| NPDCCH order indicator                       | 0                                                                                                                                                                     | "0"                                                             |
| Scheduling delay                             | 0<br>(3 bits as defined in clause 16.4.1 of 36.213 [29])                                                                                                              | "000"                                                           |
| Resource assignment                          | Depending on test parameters<br>(3 bits as defined in section 16.4.1.3 of 36.213 [29])                                                                                | -                                                               |
| Modulation and coding scheme                 | Depending on test parameters<br>(4 bits as defined in section 16.4.1.5 of 36.213 [29])                                                                                | -                                                               |
| Repetition number                            | NRep = 1 for normal coverage and 32 for enhanced coverage test cases (see RRM_NTN_Enh in table 8.1.4.3.2-3)<br>(4 bits as defined in section 16.4.1.3 of 36.213 [29]) | "0000" for normal coverage and<br>"0101" for enhanced coverage. |
| New data indicator                           | Set for every data transmission/retransmission according to the rules specified in TS 36.321 [14]<br>(1 bit)                                                          | -                                                               |

|                                |                                                                                                                                                                               |                                                             |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|
| HARQ-ACK resource              | 0 if not specified otherwise depending on test case<br>(4 bits as defined in section 16.4.2 of 36.213 [29])                                                                   | -                                                           |
| DCI subframe repetition number | R = 2 (according to NPRACH configuration of Table 8.1.6.3-5) for normal coverage and 32 for RRM enhanced coverage (2 bits as defined in section 16.6 in 36.213 [29])          | "00" for normal coverage and "11" for RRM enhanced coverage |
| HARQ process number            | Mandatory present if 2 HARQ processes are configured in the UE, default value (HARQ process) "0". Otherwise not present (1 bit as defined in section 16.4.1.5 of 36.213 [29]) | -                                                           |

**Table 8.1.3.6.1.2-3: NB-IoT Physical layer parameters for DCI format N1 (for the scheduling of one NPDSCH codeword in one cell scrambled by G-RNTI)**

8.1.3.6.1.3 (Void)

8.1.3.6.1.4 (Void)

8.1.3.6.1.5 NB-IoT Physical layer parameters for DCI format N2

Default NB-IoT physical layer parameters for DCI format N2 are specified in table 8.1.3.6.1.5-1 for paging, in table 8.1.3.6.1.5-2 for direct indication and in table 8.1.3.6.1.5-3 for scheduling of one NPDSCH codeword carrying SC-MCCH in one cell.

**Table 8.1.3.6.1.5-1: NB-IoT Physical layer parameters for DCI format N2 (for paging)**

| Parameter                                         | Value                                                                                  | Value in binary |
|---------------------------------------------------|----------------------------------------------------------------------------------------|-----------------|
| Flag for paging/direct indication differentiation | 1                                                                                      | "1"             |
| Resource assignment                               | Depending on test parameters<br>(3 bits as defined in section 16.4.1.3 of 36.213 [29]) | -               |

## 8.1.4 NB-IoT Reference system configurations

The reference system configurations specified in this sub clause apply to all NB-IoT test cases unless otherwise specified.

### 8.1.4.1 NB-IoT Simulated network scenarios

Simulated network scenarios to be tested are listed in this sub clause.

NOTE 1: The number of cells specified does not necessarily correspond to the maximum number of resources to be configured simultaneously in test equipment. Please refer to clause 8.3.1 for such information.

NOTE 2: Void.

#### 8.1.4.1.1 NB-IoT Single cell network scenarios

For NB-IoT basic single cell environment, Ncell 1 is used.

#### 8.1.4.1.2 NB-IoT single mode multi cell network scenarios

For NB-IoT basic intra-frequency multi cell environment, Ncell 1, Ncell 2 and Ncell 4 are used.

For NB-IoT basic inter-frequency multi cell environment, Ncell 1 Ncell 3 and Ncell 6 are used.

For NB-IoT basic inter-band cell environment, Ncell 1 and Ncell 10 are used.

For NB-IoT multi tracking area intra-frequency multi cell environment, Ncell 1 and Ncell 11 are used.

For NB-IoT multi tracking area inter-frequency multi cell environment, Ncell 1 and Ncell 23 are used.

For NB-IoT multi PLMN inter-frequency multi cell environment, Ncell 1, Ncell 12, Ncell 13 and Ncell 14 are used.

#### 8.1.4.2 NB-IoT Simulated cells

NOTE 1: Void

NOTE 2: Test frequency and range defined in table 8.1.4.2-1 do not apply to 36.521-1 test cases.

Test frequencies and simulated cells are defined in table 8.1.4.2-1. For NB-IoT cells, f1 is the default test frequency.

Default parameters for simulated cells are specified in table 8.1.4.2-1A and table 8.1.4.2-2.

Common parameters for simulated cells are specified in subclauses 8.1.4.3.

**Table 8.1.4.2-1: Definition of test frequencies and simulated NB-IoT cells – Batch1**

| Test frequency                                                                                      | RAT    | Operating band                      | Range            | Simulated cells                                                                       |
|-----------------------------------------------------------------------------------------------------|--------|-------------------------------------|------------------|---------------------------------------------------------------------------------------|
| f1                                                                                                  | NB-IoT | Operating band under test           | Mid<br>(Note 1)  | Ncell 1, Ncell 1a, Ncell 2, Ncell 4, Ncell5, Ncell 6a, Ncell 11<br>(Note 2), Ncell 18 |
| f2                                                                                                  | NB-IoT | Operating band under test           | High<br>(Note 1) | Ncell 3, Ncell 12, Ncell 23                                                           |
| f3                                                                                                  | NB-IoT | Operating band under test           | Low<br>(Note 1)  | Ncell 6, Ncell 13                                                                     |
| f4                                                                                                  | NB-IoT | Operating band under test           | (Note 1)         | Ncell 14                                                                              |
| f5                                                                                                  | NB-IoT | Operating band for inter-band cells | Mid<br>(Note 1)  | Ncell 10                                                                              |
| Note 1: For signalling test, see clause 8.3.2.3 (note that f4 is not defined for signalling tests). |        |                                     |                  |                                                                                       |
| Note 2: For signalling test, simultaneous co-existence of Ncell 2 with Ncell 11 is not allowed.     |        |                                     |                  |                                                                                       |

### 8.1.4.3 NB-IoT Common parameters for simulated cells

The parameters specified in this sub clause apply to all simulated cells unless otherwise specified.

#### 8.1.4.3.1 NB-IoT Common configurations of system information blocks

##### 8.1.4.3.1.1 NB-IoT Combinations of system information blocks

The combination of system information blocks required by a test case depends on the test case scenario. In this clause, the following combinations of system information blocks are defined.

Combination 1 is the default combination which applies to the following test case scenarios:

- single cell scenario

Combination 2 applies to the following test case scenarios:

- intra-frequency multi cell scenario
- intra-frequency multi cell scenario with neighbouring cell related information

Combination 3 applies to the following test case scenarios:

- inter-frequency multi cell scenario

Combination 4 applies to the following test case scenarios:

- access barring single cell scenario

Combination 5 applies to the following test case scenarios:

- SC-PTM single cell scenario (SC-PTM cell broadcasting SIB20-NB)

Combination 6 applies to the following test case scenarios:

- single cell on multi carriers scenario

Combination 7 applies to the following test case scenarios:

- single cell NPRACH resources using preamble format 2 on non-anchor carriers scenario

Combination 8 is the default combination which applies to the following test case scenarios:

- single NTN cell scenario

Combination 9 is the default combination which applies to the following test case scenarios:

- intra-frequency multi NTN cell scenario

Combination 10 is the default combination which applies to the following test case scenarios:

- intra-frequency multi NTN cell scenario with neighbouring NTN cell related information

Combination 11 is the default combination which applies to the following test case scenarios:

- inter-frequency multi NTN cell scenario

Combination 12 is the default combination which applies to the following test case scenarios:

- single NTN cell on multi NTN carriers scenario

Combination 13 applies to the following test case scenarios:

- access barring single NTN cell scenario

Combination 14 applies to the following test case scenarios:

- intra-frequency multi NTN cell on discontinuous coverage scenario with neighbouring NTN cell related information

Combination 15 applies to the following test case scenarios:

- intra-frequency multi NTN cell scenario with satellite assistance information for neighbour cells.
- intra-frequency multi NTN cell scenario for RRM with satellite assistance information for neighbour cells with Test equipment configuration (Rel-18).

**Table 8.1.4.3.1.1-1: Combinations of system information blocks**

| Combination No. | System information block type |         |         |         |          |          |          |          |          |          |          |          |
|-----------------|-------------------------------|---------|---------|---------|----------|----------|----------|----------|----------|----------|----------|----------|
|                 | SIB2-NB                       | SIB3-NB | SIB4-NB | SIB5-NB | SIB14-NB | SIB16-NB | SIB20-NB | SIB22-NB | SIB23-NB | SIB31-NB | SIB32-NB | SIB33-NB |

#### 8.1.4.3.1.2 NB-IoT Scheduling of system information blocks

The scheduling configurations for combinations of system information blocks are defined in the following tables.

**Table 8.1.4.3.1.2-1: Scheduling for combination 1**

| Scheduling Information No. | Periodicity [radio frames] | Repetition pattern [radio frames] | TB size [bits] | Mapping of system information blocks |
|----------------------------|----------------------------|-----------------------------------|----------------|--------------------------------------|
| 1                          | 64                         | every8thRF                        | 552            | SIB2-NB                              |

**Table 8.1.4.3.1.2-2: Scheduling for combination 2**

| Scheduling Information No. | Periodicity [radio frames] | Repetition pattern [radio frames] | TB size [bits] | Mapping of system information blocks |
|----------------------------|----------------------------|-----------------------------------|----------------|--------------------------------------|
| 1                          | 64                         | every8thRF                        | 552            | SIB2-NB                              |
| 2                          | 64                         | every16thRF                       | 256            | SIB3-NB                              |
| 3                          | 64                         | every16thRF                       | 256            | SIB4-NB                              |

**Table 8.1.4.3.1.2-3: Scheduling for combination 3**

| Scheduling Information No. | Periodicity [radio frames] | Repetition pattern [radio frames] | TB size [bits] | Mapping of system information blocks |
|----------------------------|----------------------------|-----------------------------------|----------------|--------------------------------------|
| 1                          | 64                         | every8thRF                        | 552            | SIB2-NB                              |
| 2                          | 64                         | every16thRF                       | 256            | SIB3-NB                              |
| 3                          | 64                         | every16thRF                       | 256            | SIB5-NB                              |

**Table 8.1.4.3.1.2-4: Scheduling for combination 4**

| Scheduling Information No. | Periodicity [radio frames] | Repetition pattern [radio frames] | TB size [bits] | Mapping of system information blocks |
|----------------------------|----------------------------|-----------------------------------|----------------|--------------------------------------|
| 1                          | 64                         | every8thRF                        | 552            | SIB2-NB                              |
| 2                          | 64                         | every16thRF                       | 256            | SIB3-NB                              |
| 3                          | 64                         | every16thRF                       | 256            | SIB14-NB                             |

**Table 8.1.4.3.1.2-5: Scheduling for combination 5**

| Scheduling Information No. | Periodicity [radio frames] | Repetition pattern [radio frames] | TB size [bits] | Mapping of system information blocks |
|----------------------------|----------------------------|-----------------------------------|----------------|--------------------------------------|
| 1                          | 64                         | every8thRF                        | 552            | SIB2-NB                              |
| 2                          | 64                         | every16thRF                       | 256            | SIB20-NB                             |

**Table 8.1.4.3.1.2-6: Scheduling for combination 6**

| Scheduling Information No. | Periodicity [radio frames] | Repetition pattern [radio frames] | TB size [bits] | Mapping of system information blocks |
|----------------------------|----------------------------|-----------------------------------|----------------|--------------------------------------|
| 1                          | 64                         | every8thRF                        | 552            | SIB2-NB                              |
| 2                          | 64                         | every16thRF                       | 256            | SIB22-NB                             |

**Table 8.1.4.3.1.2-7: Scheduling for combination 7**

| Scheduling Information No. | Periodicity [radio frames] | Repetition pattern [radio frames] | TB size [bits] | Mapping of system information blocks |
|----------------------------|----------------------------|-----------------------------------|----------------|--------------------------------------|
| 1                          | 64                         | every8thRF                        | 552            | SIB2-NB                              |
| 2                          | 64                         | every16thRF                       | 256            | SIB22-NB                             |
| 3                          | 64                         | every16thRF                       | 256            | SIB23-NB                             |

**Table 8.1.4.3.1.2-8: Scheduling for combination 8**

| Scheduling Information No. | Periodicity [radio frames] | Repetition pattern [radio frames] | TB size [bits] | Mapping of system information |
|----------------------------|----------------------------|-----------------------------------|----------------|-------------------------------|
|----------------------------|----------------------------|-----------------------------------|----------------|-------------------------------|

|   |    |             |     | <b>blocks</b> |
|---|----|-------------|-----|---------------|
| 1 | 64 | every8thRF  | 552 | SIB2-NB       |
| 2 | 64 | every16thRF | 256 | SIB31-NB      |

**Table 8.1.4.3.1.2-8a: Scheduling for combination 8 under RRM enh coverage**

| <b>Scheduling Information No.</b> | <b>Periodicity [radio frames]</b> | <b>Repetition pattern [radio frames]</b> | <b>TB size [bits]</b> | <b>Mapping of system information blocks</b> |
|-----------------------------------|-----------------------------------|------------------------------------------|-----------------------|---------------------------------------------|
| 1                                 | 256                               | every2thRF                               | 552                   | SIB2-NB                                     |
| 2                                 | 256                               | every2thRF                               | 256                   | SIB31-NB                                    |

- SystemInformationBlockType1-NB

*SystemInformationBlockType1-NB* contains information relevant when evaluating if a UE is allowed to access a cell and defines the scheduling of other system information.

**Table 8.1.4.3.2-3: SystemInformationBlockType1-NB**

| SibType>22              | When the system information combination in use (see clause 8.1.4.3.1) includes at least one SIB with index exceeding 22 (i.e. 23 or more) |
| Inband_nrNTN            | NB-IoT inband operation in NR Non-Terrestrial Networks test environment                                                                   |
| Standalone_flexibleTxRx | Standalone test environment with flexible Tx-Rx separation                                                                                |

#### 8.1.4.3.3 NB-IoT Common contents of system information blocks

- SystemInformationBlockType2-NB

The IE *SystemInformationBlockType2-NB* contains radio resource configuration information that is common for all UEs.

**Table 8.1.4.3.3-1: SystemInformationBlockType2-NB**

- SystemInformationBlockType3-NB

The IE *SystemInformationBlockType3-NB* contains cell re-selection information common for intra-frequency, inter-frequency as well as intra-frequency cell re-selection information other than neighbouring cell related.

**Table 8.1.4.3.3-2: SystemInformationBlockType3-NB**

- SystemInformationBlockType15-NB

The IE *SystemInformationBlockType15-NB* contains the MBMS Service Area Identities (SAI) of the current and/ or neighbouring carrier frequencies.

**Table 8.1.4.3.3-5A: SystemInformationBlockType15-NB**

FFS

- SystemInformationBlockType16-NB

The IE SystemInformationBlockType16-NB contains information related to GPS time and Coordinated Universal Time (UTC). The UE may use the parameters provided in this system information block to obtain the UTC, the GPS and the local time.

## 8.1.5 NB-IoT Generic procedures

### 8.1.5.0 General

This clause describes NB-IoT UE test states which can be used in the initial condition of many test cases defined in TS 36.521-1 [21], TS 36.523-1 [18] and TS 36.521-3 [34] or other procedures defined in this specification. This section also defines a set of procedures to bring the UE into these states.

#### 8.1.5.1 NB-IoT UE test states

NB-IoT UE test states defined in this section support Control Plane CIoT EPS Optimization (CP) and User Plane CIoT EPS Optimization (UP).

Figure 8.1.5.1-1: NB-IoT UE Test States for Basic Generic Procedures

Table 8.1.5.1-1: The NB-IoT UE states

NOTE 1: Refer to TS 24.301 [28] subclause 5.5.1.1 for more details on the ESM state.

NOTE 2: Refer to TS 36.509 [38] for details regarding UE test mode and UE Loopback.

### 8.1.5.2 NB-IoT UE Attach, Connected mode (State 2-NB)

#### 8.1.5.2.0 General

UE registration depends on the specific configuration of a UE, which is expressed by PICS according to TS 36.523-2 [19], and specific test case conditions.

The following UE configurations and test case conditions are used in this procedure.

| Configuration     | Condition                                                        | Explanation                                                                                                                                                                                                     | Default values                                                                                                         |
|-------------------|------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| S1_U_DataTransfer | UE_S1_U_CIoT_Optimisation<br>AND<br>TC_Require_S1_U_DataTransfer | User Plane ClIoT Optimisation or S1_U is supported by UE (UE capability), pc_NB_User_Plane_CIoT_Optimisation or pc_S1_U_DataTransfer, and both the Network and test case require Attach with S1_U Data Transfer | UE_S1_U_DataTransfer<br>=pc_NB_User_Plane_CIoT_O<br>or pc_S1_U_DataTransfer<br><br>TC_Require_S1_U_DataTran:<br>=FALSE |

#### 8.1.5.2.1 Initial conditions

System Simulator:

- 1 NB-IoT cell, default parameters.
- The procedure shall be performed under ideal radio conditions as defined in clause 8.2.

User Equipment:

- The Test UICC shall be inserted. This shall contain a USIM application on UICC.
- UE is in State 1-NB switched off.

#### 8.1.5.2.2 Definition of system information messages

The default system information messages are used with the exception(s) below.

**Table 8.1.5.2.2-1: SystemInformationBlockType1-NB**

|                                                                                                                                       |
|---------------------------------------------------------------------------------------------------------------------------------------|
| Derivation Path: Table 8.1.4.3.2-3, condition ATTACH_WITHOUT_PDN for NOT S1_U_DataTransfer and ATTACH_WITH_PDN for S1_U_DataTransfer. |
|---------------------------------------------------------------------------------------------------------------------------------------|

#### 8.1.5.2.3 Procedure

#### 8.1.5.2A NB-IoT UE Attach, Connected mode, UE Test Mode Activated (State 2A-NB)

##### 8.1.5.2A.0 General

UE registration depends on the specific configuration of a UE, which is expressed by PICS according to TS 36.523-2 [19], and specific test case conditions.

The UE configurations and test case conditions described in clause 8.1.5.2 are used in this procedure.

##### 8.1.5.2A.1 Initial conditions

System Simulator:

- 1 NB-IoT cell, default parameters.
- The procedure shall be performed under ideal radio conditions as defined in clause 8.2

User Equipment:

- The Test UICC shall be inserted. This shall contain a USIM application on UICC.
- UE is in State 1-NB switched off.

##### 8.1.5.2A.2 Definition of system information messages

The same default system information messages are used as in clause 8.1.5.2.2.

NOTE: Loopback mode A/B is applicable only IF S1\_U\_DataTransfer; loopback mode G/H/I is applicable only IF NOT S1\_U\_DataTransfer.

## 8.1.5.2A.3 Procedure

**Table 8.1.5.2A.3-1: NB-IoT UE Attach, connected mode and test mode activated procedure (state 2-NB to state 2A-NB)**

| Step        | Procedure                                                                               | U - S | Message Sequence Message                                                |
|-------------|-----------------------------------------------------------------------------------------|-------|-------------------------------------------------------------------------|
| 0           | Switch-on the UE                                                                        | -     | -                                                                       |
| 1-9a2       | Same procedure for steps 0 to 9a2 as specified in the procedure in clause 8.1.5.2.3     | -     | -                                                                       |
| 10          | The SS transmits an ACTIVATE TEST MODE message to activate test mode procedure.         | <--   | RRC: <i>DLInformationTransfer-NB</i><br>TC: ACTIVATE TEST MODE          |
| 11          | The UE transmits an ACTIVATE TEST MODE COMPLETE message.                                | -->   | RRC: <i>ULInformationTransfer-NB</i><br>TC: ACTIVATE TEST MODE COMPLETE |
| 12a1 - 16b1 | Same procedure for steps 10a1 to 14b1 as specified in the procedure in clause 8.1.5.2.3 | -     | -                                                                       |

## 8.1.5.2A.4 Specific message contents

All specific message contents shall be referred to clause 8.1.6 and 8.1.7 with the exceptions below.

**Table 8.1.5.2A.4-1: ACTIVATE TEST MODE (step 10, Table 8.1.5.2A.3-1)**

| Derivation Path: Table 4.7A-1                                                |              |         |                              |

| Information Element                                                          | Value/remark | Comment | Condition                    |
| UE test loop mode                                                            | '00000110'B  |         | UE TEST LOOP MODE G (NOTE 1) |
|                                                                              | '00000111'B  |         | UE TEST LOOP MODE H (NOTE 1) |
|                                                                              | '00001000'B  |         | UE TEST LOOP MODE I (NOTE 1) |
|                                                                              | '00000000'B  |         | UE TEST LOOP MODE A (NOTE 2) |
|                                                                              | '00000001'B  |         | UE TEST LOOP MODE B (NOTE 2) |
|                                                                              | '00000101'B  |         | UE TEST LOOP MODE F          |
| NOTE 1: UE TEST LOOP MODE G/H/I is applicable only IF NOT S1_U_DataTransfer. |              |         |                              |
| NOTE 2: UE TEST LOOP MODE A/B is applicable only IF S1_U_DataTransfer.       |              |         |                              |

## 8.1.5.2B NB-IoT UE Attach, Connected Mode, UE Test Loopback Activated (State 2B-NB)

## 8.1.5.2B.1 Initial conditions

System Simulator:

- Parameters are set to the default parameters for the basic single cell environment, as defined in subclause 8.1.4, unless otherwise specified in the test case.

- The procedure shall be performed under ideal radio conditions as defined in clause 8.2

User Equipment:

- The NB-IoT UE shall be in NB-IoT UE Connected mode, NB-IoT UE Test Mode Activated (State 2A-NB).

#### 8.1.5.2B.2 Definition of system information messages

The same default system information messages are used as in clause 8.1.5.2.2.

NOTE: Loopback mode A/B is applicable only IF S1\_U\_DataTransfer; loopback mode G/H/I is applicable only IF NOT S1\_U\_DataTransfer.

#### 8.1.5.2B.3 Procedure

**Table 8.1.5.2B.3-1: NB-IoT UE Attach, Connected Mode, UE Test Loopback Activated procedure (state 2A-NB to state 2B-NB)**

| Step | Procedure                                                                     | Direction | Message Sequence                                                        |
|------|-------------------------------------------------------------------------------|-----------|-------------------------------------------------------------------------|
|      |                                                                               | UE - SS   | Message                                                                 |
| 1    | The SS transmits a CLOSE UE TEST LOOP message to enter the UE test loop mode. | <--       | RRC: <i>DLInformationTransfer-NB</i><br>TC: CLOSE UE TEST LOOP          |

| return_via_EMM_SMC   | data is returned in uplink at the EMM entity for UE test loop mode G or the SMC SAP for UE test loop mode H |
| NBIOT_return_via_RLC | data is returned in uplink at the RLC AM-SAP of SRB1bis for NB-IoT UE used in MAC and RLC test cases        |

### 8.1.5.3 NB-IoT UE Registered, Idle Mode (State 3-NB)

#### 8.1.5.3.1 Initial conditions

System Simulator:

- Parameters are set to the default parameters for the basic single cell environment, as defined in subclause 8.1.4, unless otherwise specified in the test case.
- The procedure shall be performed under ideal radio conditions as defined in clause 8.2

User Equipment:

- The NB-IoT UE shall be in NB-IoT UE Attach, Connected mode (State 2-NB).

#### 8.1.5.3.2 Definition of system information messages

The same default system information messages are used as in clause 8.1.5.2.2.

#### 8.1.5.3.3 Procedure

**Table 8.1.5.3.3-1: NB-IoT Registered Idle Mode procedure (state 2-NB to state 3-NB)**

| Step | Procedure                                                                                                   | Direction<br>UE - SS | Message Sequence<br>Message          |
|------|-------------------------------------------------------------------------------------------------------------|----------------------|--------------------------------------|
| 1    | The SS transmits an <i>RRCCConnectionRelease-NB</i> message to release RRC connection and move to RRC_IDLE. | <--                  | RRC: <i>RRCCConnectionRelease-NB</i> |

#### 8.1.5.3.4 Specific message contents

None.

### 8.1.5.3A NB-IoT UE Registered, Idle Mode, UE Test Mode Activated (State 3A-NB)

#### 8.1.5.3A.1 Initial conditions

System Simulator:

- Parameters are set to the default parameters for the basic single cell environment, as defined in subclause 8.1.4, unless otherwise specified in the test case.
- The procedure shall be performed under ideal radio conditions as defined in clause 8.2

User Equipment:

- The NB-IoT UE shall be in NB-IoT UE Attach, Connected mode (State 2A-NB).

#### 8.1.5.3A.2 Definition of system information messages

The same default system information messages are used as in clause 8.1.5.2.2.

#### 8.1.5.3A.3 Procedure

**Table 8.1.5.3A.3-1: NB-IoT Registered, Idle Mode, NB-IoT UE Test Mode Activated (state 2A-NB to state 3A-NB)**

| Step | Procedure                                                                                                  | Direction | Message Sequence                    |
|------|------------------------------------------------------------------------------------------------------------|-----------|-------------------------------------|
|      |                                                                                                            | UE - SS   | Message                             |

#### 8.1.5.3A.4 Specific message contents

None.

#### 8.1.5.4 Void

### 8.1.5A Other generic procedures

#### 8.1.5A.1 Procedure for IP address allocation in the CP CIoT

The purpose of this procedure is to allow the successful completion of IP address allocation if it is initiated by the UE therefore the result from the execution of the Procedure for IP address allocation in the CP CIoT shall not lead to assignment of a verdict.

Depending on the UE configuration there may be unpredictable delay in the start of the procedure. A guarding time of 1.2 sec (for satellite access (NTN) 2.48 sec) is suggested within which the procedure is expected to start. If the timer expires then the test procedure, from which the Procedure for IP address allocation in the CP CIoT is called, shall advance to the next specified step.

The procedure only applies for IP data. The procedure is not applicable for Non IP type data and SMS.

**Table 8.1.5A.1-1: Procedure for IP address allocation in the CP CIoT**

| Step | Procedure                                                                                                                                                                                                                    | Message Sequence |                                                                 |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|-----------------------------------------------------------------|
|      |                                                                                                                                                                                                                              | U - S            | Message                                                         |
| -    | EXCEPTION: Steps 1 to 2 below describe behaviour that depends on the contents of the latest PDN CONNECTIVITY REQUEST message sent by the UE prior to this procedure.                                                         | -                | -                                                               |
| 1    | If the "PDN type" in the latest PDN CONNECTIVITY REQUEST message prior to this procedure was 'IPv6' or 'IPv4v6' then stateless address auto configuration may occurs over SRB1bis, UE may send an ICMPv6 Router Solicitation | -->              | RRC: <i>ULInformationTransfer-NB</i><br>NAS: ESM DATA TRANSPORT |
| 2    | The SS sends an ICMPv6 Router Advertisement containing the IPv6 prefix.                                                                                                                                                      | <--              | RRC: <i>DLInformationTransfer-NB</i><br>NAS: ESM DATA TRANSPORT |

## 8.1.5A.2 Test procedure to check UE response to Paging for Control Plane CIoT MT access

### 8.1.5A.2.1 Initial conditions

System Simulator:

- 1 NB-IoT cell, default parameters.
- The procedure shall be performed under ideal radio conditions as defined in clause 8.2.

User Equipment:

- The UE is in RRC-IDLE.

### 8.1.5A.2.2 Definition of system information messages

The default system information messages are used with the exception(s) below.

**Table 8.1.5A.2.2-1: SystemInformationBlockType1-NB**

Derivation Path: Table 8.1.4.3.2-3, Condition ATTACH WITHOUT PDN.

### 8.1.5A.2.3 Procedure

**Table 8.1.5A.2.3-1: UE response to Paging for Control Plane CIoT MT access**

| St    | Procedure                                                                                                                                                                                                                                                                                                               | Message Sequence |                                                                                                             | TP | Verdict |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|-------------------------------------------------------------------------------------------------------------|----|---------|
|       |                                                                                                                                                                                                                                                                                                                         | U - S            | Message/PDU/SDU                                                                                             |    |         |
| 1     | SS sends a <i>Paging</i> message to the UE on the appropriate paging block, and including the UE identity in one entry of the IE <i>pagingRecordLists</i> .                                                                                                                                                             | <--              | RRC: <i>Paging-NB</i>                                                                                       | -  | -       |
| 2     | Check: Does the UE transmit an <i>RRCCConnectionRequest-NB</i> message "mt-access"?                                                                                                                                                                                                                                     | -->              | RRC: <i>RRCCConnectionRequest-NB</i>                                                                        | -  | P       |
| 3     | SS transmits an <i>RRCCConnectionSetup-NB</i> message.                                                                                                                                                                                                                                                                  | <--              | RRC: <i>RRCCConnectionSetup-NB</i>                                                                          | -  | -       |

### 8.1.5A.3 Test procedure to check UE initiation of Control Plane Clot MO user data transfer non-SMS transport

#### 8.1.5A.3.1 Initial conditions

System Simulator:

- 1 NB-IoT cell, default parameters.
- The procedure shall be performed under ideal radio conditions as defined in clause 8.2.

User Equipment:

- The UE is in RRC-IDLE.

#### 8.1.5A.3.2 Definition of system information messages

The default system information messages are used with the exception(s) below.

**Table 8.1.5A.3.2-1: SystemInformationBlockType1-NB**

### 8.1.5A.3A Test procedure to check UE initiation of Control Plane CIoT MO user data transfer SMS transport

#### 8.1.5A.3A.1 Initial conditions

System Simulator:

- 1 NB-IoT cell, default parameters.
- The procedure shall be performed under ideal radio conditions as defined in clause 8.2.

User Equipment:

- The UE is in RRC-IDLE.

#### 8.1.5A.3A.2 Definition of system information messages

The default system information messages are used with the exception(s) below.

**Table 8.1.5A.3A.2-1: SystemInformationBlockType1-NB**

|                                                                   |
|-------------------------------------------------------------------|
| Derivation Path: Table 8.1.4.3.2-3, condition ATTACH_WITHOUT_PDN. |

#### 8.1.5A.4 Test procedure to check release of PDN connectivity before leaving RRC-CONNECTED for attach without PDN

##### 8.1.5A.4.1 Initial conditions

- 1 NB-IoT cell, default parameters.
- The procedure shall be performed under ideal radio conditions as defined in clause 8.2.

User Equipment:

- The UE is in RRC-CONNECTED.
- px\_DoAttachWithoutPDN=TRUE

#### 8.1.5A.4.2 Definition of system information messages

The default system information messages are used with the exception(s) below.

**Table 8.1.5A.4.2-1: SystemInformationBlockType1-NB**

Derivation Path: Table 8.1.4.3.2-3, condition ATTACH\_WITHOUT\_PD.

#### 8.1.5A.4.3 Procedure

|----|----------------------------------------------------------------------|------------------|-----------------------------------|----|---------|
|    |                                                                      | U - S            | Message/PDU/SDU                   |    |         |
| 1  | The SS sends <i>UECapabilityEnquiry-NB</i> message to the UE.        | <--              | <i>UECapabilityEnquiry-NB</i>     | -  | -       |
| 2  | Check: Does the UE send a <i>UECapabilityInformation-NB</i> message? | -->              | <i>UECapabilityInformation-NB</i> | -  | P       |

## 8.1.5A.9 Test Procedure to establish radio bearers in User Plane

## 8.1.5A.9.1 Initial conditions

System Simulator:

- Parameters are set to the default parameters for the NB-IoT single cell environment, as defined in subclause 8.1.4.1.1, unless otherwise specified in the test case.
- The procedure shall be performed under ideal radio conditions as defined in clause 8.2

User Equipment:

- The NB-IoT UE shall be in NB-IoT Registered, Idle mode (State 3-NB) for condition S1\_U\_DataTransfer.

## 8.1.5A.9.2 Definition of system information messages

The default system information messages are used with the exception(s) below.

Table 8.1.5A.9.2-1: *SystemInformationBlockType1-NB*

|                                                                |
|----------------------------------------------------------------|
| Derivation Path: Table 8.1.4.3.2-3, condition ATTACH WITH PDN. |
|----------------------------------------------------------------|

## 8.1.5A.9.3 Procedure

The establishment of generic radio bearer connection is assumed to always be mobile terminated.

Table 8.1.5A.9.3-1: Generic Radio Bearer establishment procedure

| Step | Procedure                                                                                                                                                   | Message Sequence |                                      |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|--------------------------------------|
|      |                                                                                                                                                             | U - S            | Message                              |
| 1    | SS sends a <i>Paging</i> message to the UE on the appropriate paging block, and including the UE identity in one entry of the IE <i>pagingRecordLists</i> . | <--              | RRC: <i>Paging-NB</i>                |
| 2    | UE transmits an <i>RRCCConnectionRequest-NB</i> message.                                                                                                    | -->              | RRC: <i>RRCCConnectionRequest-NB</i> |
| 3    | SS transmit an <i>RRCCConnectionSetup-NB</i>                                                                                                                | <--              | RRC: <i>RRCCConnectionSetup-NB</i>   |

|   |                                                                                                                                                                                                                                                 |     |                                                                                  |
|---|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|----------------------------------------------------------------------------------|
|   | message.                                                                                                                                                                                                                                        |     |                                                                                  |
| 4 | The UE transmits an <i>RRCCConnectionSetupComplete-NB</i> message to confirm the successful completion of the connection establishment and to initiate the session management procedure by including the CONTROL PLANE SERVICE REQUEST message. | --> | RRC: <i>RRCCConnectionSetupComplete-NB</i><br>NAS: CONTROL PLANE SERVICE REQUEST |
| 5 | The SS transmits a <i>SecurityModeCommand</i> message to activate AS security.                                                                                                                                                                  | <-- | RRC: <i>SecurityModeCommand</i>                                                  |
| 6 | The UE transmits a <i>SecurityModeComplete</i> message and establishes the initial security configuration.                                                                                                                                      | --> | RRC: <i>SecurityModeComplete</i>                                                 |

| 8 | The UE transmits an <i>RRCCConnectionReconfigurationComplete-NB</i> message to confirm the establishment of the new data radio bearer, associated with the default EPS bearer context.                                                          | --> | RRC: <i>RRCCConnectionReconfigurationComplete-NB</i>                             |

#### 8.1.5A.9.4 Specific message contents

All specific message contents shall be referred to clause 4.6, 4.7 and 8.1.6.

### 8.1.5B Common test environment for Vertical UEs

#### 8.1.5B.1 NB-IoT NTN

This clause defines the common test environment which applies to all test cases executed for NB-IoT NTN UEs, unless otherwise specified.

- Test configures following IEs with condition NTN of *MasterInformationBlock-NB* in Table 8.1.4.3.2-1, *SystemInformationBlockType1-NB* in Table 8.1.4.3.2-3, *SystemInformationBlockType31-NB* in Table 8.1.4.3.3-10 and *RadioResourceConfigCommonSIB-NB-DEFAULT* in Table 8.1.6.3-9.
- Test uses system information combinations 8 to 15.

### 8.1.6 NB-IoT Default RRC message and information elements contents

This clause contains the default values of common RRC messages and information elements, which unless indicated otherwise in specific clauses of TS 36.521-1 [21], TS 36.521-3 [34], TS 36.523-1 [18] and other clauses in this specification. All the messages and information elements are listed in alphabetical order.

## 8.1.9 NB-IoT Common test USIM parameters

### 8.1.9.1 General

As defined in clause 4.9; i.e. there are no specific NB-IoT requirements in addition to the default test USIM parameters, unless specified otherwise in a test case defined in TS 36.523-1 [18].

For PLMN (re-)selection, the UE will decide on the PLMN to select based on 'E-UTRA' as Access Technology in the PLMN selector of USIM Elementary Files PLMNwAcT, OPLMNwAcT and HPLMNwAcT and then use its device category (= NB-IoT) to properly access the NB-IoT network.

## 8.2 NB-IoT Test environment for RF test

This section contains all the exceptions of the NB-IoT common test parameters specified in clause 8.1 for specific needs of test cases defined in TS 36.521-1 [21]. Exceptions specified in clause 8.2 overwrite the parameter settings of clause 8.1; exceptions defined within the test cases overwrite parameter settings of clause 8.1 and 8.2.

### 8.2.1 NB-IoT Requirements of test equipment

No NB-IoT common RF test environment requirements are specified in addition to the NB-IoT common requirements described in clause 8.1.2. Specific RF requirements are indicated within the test cases defined in TS 36.521-1 [21].

### 8.2.2 NB-IoT RF Reference system configurations

#### 8.2.2.1 NB-IoT Common parameters for simulated E-UTRA cells

##### 8.2.2.1.1 NB-IoT Combinations of system information blocks

The NB-IoT combination of system information blocks required by a test case depends on the test case scenario. In clause 8.1.4 of this document, the NB-IoT combinations of system information blocks are defined.

Combination 1, defined in clause 8.1.4, is used by default in test cases defined in TS 36.521-1 [21].

##### 8.2.2.1.2 NB-IoT Scheduling of system information blocks

Same NB-IoT scheduling of system information blocks as defined in clause 8.1.4.3.1.2.

##### 8.2.2.1.3 NB-IoT Common contents of system information messages

###### MasterInformationBlock-NB

As defined in Table 8.1.4.3.2-1.

###### SystemInformation-NB

As defined in Table 8.1.4.3.2-2 without exceptions.

###### SystemInformationBlockType1-NB

As defined in Table 8.1.4.3.2-3 without exceptions.

###### SystemInformationBlockType2-NB

As defined in Table 8.1.4.3.3-1 without exceptions.

## 8.2.2A NB-IoT Generic RF procedures

The NB-IoT UE test state used for testing is specified in the individual test cases in the corresponding test specification TS 36.521-1 [21] or TS 36.521-3 [34].

RF NB-IoT UE test states are covered by common NB-IoT UE test states defined in clause 8.1.5 of this document.

## 8.2.3 NB-IoT Default RRC message and information elements contents

## 8.2.3.1 NB-IoT Radio resource control information elements

As defined in clause 8.1.6.3 with the following exceptions.

## 8.2.4 NB-IoT Default NAS message and information elements contents

As defined in clause 8.1.7 without exceptions.

## 8.2.5 NB-IoT Reference radio bearer configurations

### 8.2.5.1 NB-IoT SRB and DRB parameters

As defined in clause 8.1.8.2.1 without exception.

## 8.2.6 Test environment for NB-IoT NTN RF/Demod testing

This section defines the test environment which applies to all RF and DEMOD test cases executed for NB-IoT NTN UEs, unless otherwise specified.

### 8.2.6.1 UE location

Same as in section 5.6.1.

### 8.2.6.2 Ephemeris Information

Ephemeris information in this section has been generated as described in clause 5 in TR36.905 [77].

#### 8.2.6.2.0 Assumptions for Ephemeris generation

Same as 5.6.2.0.

#### 8.2.6.2.1 Ephemeris for zero Doppler conditions

All NB-IoT NTN test cases defined in sections 6, 7 and 8 in TS 36.521-4 [73], unless otherwise stated, shall use the ephemeris configuration in tables 8.2.6.2.1-1 to 8.2.6.2.1-3, corresponding to zero Doppler and constant delay for the type of satellite under test, keeping such information constant throughout the duration of each measurement in the test:

- In case UE supports only NGSO satellites, ephemeris values in Table 8.2.6.2.1-3 shall be used except for test cases 8.2.1.1.1 and 8.3.1.1.1, where ephemeris values in Table 8.2.6.2.1-2 shall be used.
- In case UE supports both GSO and NGSO satellites, ephemeris values in Table 8.2.6.2.1-1 shall be used except for test cases 8.2.1.1.1 and 8.3.1.1.1, where ephemeris values in Table 8.2.6.2.1-2 shall be used.

### 8.2.6.3 NB-IoT NTN message contents for RF Tx/Rx, Demodulation tests

#### 8.2.6.3.1 ServingSatelliteInfo-r17 values in SIB31-NB

The *ServingSatelliteInfo-r17* values including the *EphemerisInfo-r17* values in SIB31-NB shall be periodically signalled to the UE during test based on the Ephemeris information in clause 8.2.6.1 (kept constant throughout the duration of each measurement in the test).

## 8.3 NB-IoT Test environment for Signalling test

### 8.3.1 NB-IoT Requirements of test equipment

The requirements of test equipment specified in this subclause apply to NB-IoT Signalling test cases defined in TS 36.523-1 [18], in addition to the common NB-IoT requirements of test equipment specified in clause 8.1.2 and 8.1.3 of this specification. Test equipment shall be able to simulate NB-IoT cells, based on the E-UTRA platform as Radio Access Technology (RAT), in the following deployment scenarios:

- In-band operation with E-UTRA
- Guard-band operation with E-UTRA
- Standalone operation
- In-band operation in the DL with NR NTN and guard-band operation in the UL with NR NTN

Depending on the respective deployment scenario, the overall number and configuration of cells to be simulated simultaneously by test equipment shall not exceed the resources specified in the following Table 8.3.1-1:

**Table 8.3.1-1: Maximum resources in terms of number / configuration of Ncells to be simulated simultaneously in a test setup**

| Simulation of                                                                                                                                 | Max. number / configuration of cells (SISO) |
|-----------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------|
| NB-IoT network in standalone operation                                                                                                        | 4x cells                                    |
| NB-IoT network in E-UTRA guard-band operation (Note 1)                                                                                        | 4x cells                                    |
| NB-IoT network in E-UTRA in-band operation (Note 1)                                                                                           | 4x cells                                    |
| NB-IoT network in NR NTN in-band operation (Note 2, Note 3)                                                                                   | 4x cells                                    |
| Note 1: E-UTRA cells are not configured.<br>Note 2: NR NTN cells are not configured.<br>Note 3: UL is in the guardband of the NR NTN channel. |                                             |

Exceptions to the requirements outlined above are possible but need special evidence to be provided explicitly in the test case prose and should be allowed only if the test case purpose cannot be met otherwise.

### 8.3.2 NB-IoT Reference test conditions

#### 8.3.2.1 NB-IoT Physical channel allocations

As defined in clause 8.1.3.3.

#### 8.3.2.2 NB-IoT Signal levels

##### 8.3.2.2.1 NB-IoT Downlink signal levels

The default settings of suitable cells and non-suitable cells for NB-IoT are specified in table 8.3.2.2.1-1. Cells which are expected to be undetectable for UE under test shall fulfil the condition of non-suitable "Off" cell.

**Table 8.3.2.2.1-1: Default settings of suitable / non-suitable cells**

| Power level type                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | NB-IoT<br>(Note 1-3) |               |

| Note 1: The power level is specified in terms of cell-specific NRS EPRE.<br>Note 2: Power levels are specified based on the precondition that q-Hyst, a3-Offset and hysteresis are 0 dB.<br>Note 3: The power level is specified at the UE Rx antenna (assumption = single UE Rx antenna).<br>Note 4: Calculation of non-suitable cell power level is based on the reference sensitivity (without repetitions) for UE category NB1 as per the minimum requirements specified in TS 36.101 [27] clause 7.3.1F.1. |                      |               |

The default signal level uncertainty is specified in table 8.3.2.2.1-2 for any level specified, unless a tighter uncertainty is specified by a test case in TS 36.523-1 [18].

**Table 8.3.2.2.1-2: SS signal level uncertainty**

|                                                                                                                                                                                                     | Absolute signal level<br>uncertainty for each cell | Relative signal level<br>uncertainty between<br>multiple cells |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|----------------------------------------------------------------|
| Intra-frequency                                                                                                                                                                                     | +/-3 dB at each test port                          | +/-3 dB                                                        |
| Inter-frequency                                                                                                                                                                                     | +/-3 dB at each test port                          | See Note 1                                                     |
| Note 1: For Inter-frequency cells the relative signal level uncertainty between multiple cells is determined by the absolute uncertainty of each cell, and does not have any additional constraint. |                                                    |                                                                |

### 8.3.2.3 NB-IoT Default test frequencies

The default channel bandwidth of 200 kHz is applied to the signalling test. The test frequencies are defined so that no frequency overlapping takes place, in order to avoid unnecessary inter-frequency interference.

All operating bands can accommodate at least three test frequencies f1, f2 and f3 ( $f3 < f1 < f2$ ).

For NB-IoT in-band and guard-band signalling testing, the NB-IoT frequency to be tested are low/mid/high range and are associated to the LTE frequency low/mid/high range as specified in tables 4.3.1.1.x. The E-UTRA channel bandwidth to be tested is 10 MHz and NB-IoT PRB 30 for in-band and 5 MHz for guard-band for all operating bands for all test cases; unless the specific channel bandwidth is specified for the operating band below:

For Band 106 in-band testing, the E-UTRA channel bandwidth to be tested is 3 MHz.

For Band 31 in-band testing, the E-UTRA channel bandwidth to be tested is 5 MHz.

For NB-IoT NTN in-band signalling testing, the NB-IoT frequency to be tested are low/mid/high range and are associated to the NR NTN frequency low/mid/high range as specified in tables 4.3.1.9.1.x-1 of TS 38.508-1 [67]. The NR NTN channel bandwidth to be tested is 5 MHz channel.

#### 8.3.2.3.1 NB-IoT FDD Mode Test frequencies for signalling test

Test frequencies for signalling test are specified in table 8.3.2.3.1-1 for FDD in terms of Low, Mid and High which are referred to the Low Range, Mid Range and High Range in clause 8.1.3.1.1.

**Table 8.3.2.3.1-1: Test frequencies for NB-IoT FDD (200 kHz)**

| NB-IoT<br>Operating<br>Band | Bandwidth<br>[MHz] | f1, f5          |                 | f2              |                 | f3              |                 |
|-----------------------------|--------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
|                             |                    | N <sub>UL</sub> | N <sub>DL</sub> | N <sub>UL</sub> | N <sub>DL</sub> | N <sub>UL</sub> | N <sub>DL</sub> |
| 1                           | 60                 | Mid             | Mid             | High            | High            | Low             | Low             |

|     |                    |     |     |      |      |     |     |
|-----|--------------------|-----|-----|------|------|-----|-----|
| 2   | 60                 | Mid | Mid | High | High | Low | Low |
| 3   | 75                 | Mid | Mid | High | High | Low | Low |

| 253 | 7                  | Mid | Mid | High | High | Low | Low |
| 254 | 16.5               | Mid | Mid | High | High | Low | Low |
| 255 | 34                 | Mid | Mid | High | High | Low | Low |
| 256 | 30                 | Mid | Mid | High | High | Low | Low |

NOTE 1: Asymmetric operating band (UL + DL).

Table 8.3.2.3.1-2: Test frequencies for NB-IoT FDD (200 kHz) for flexible Tx-Rx frequency separation

| NB-IoT<br>Operating<br>Band | Bandwidth<br>[MHz] | f1, f5           |                  | f2                |                   | f3               |                  |
|-----------------------------|--------------------|------------------|------------------|-------------------|-------------------|------------------|------------------|
|                             |                    | N <sub>UL</sub>  | N <sub>DL</sub>  | N <sub>UL</sub>   | N <sub>DL</sub>   | N <sub>UL</sub>  | N <sub>DL</sub>  |
| 252                         | 20                 | Mid <sup>5</sup> | Mid <sup>5</sup> | High <sup>5</sup> | High <sup>5</sup> | Low <sup>5</sup> | Low <sup>5</sup> |
| 253                         | 7                  | Mid <sup>4</sup> | Mid <sup>4</sup> | High <sup>4</sup> | High <sup>4</sup> | Low <sup>4</sup> | Low <sup>4</sup> |
| 254                         | 16.5               | Mid <sup>3</sup> | Mid <sup>3</sup> | High <sup>3</sup> | High <sup>3</sup> | Low <sup>3</sup> | Low <sup>3</sup> |
| 255                         | 34                 | Mid <sup>2</sup> | Mid <sup>2</sup> | High <sup>2</sup> | High <sup>2</sup> | Low <sup>2</sup> | Low <sup>2</sup> |
| 256                         | 30                 | Mid <sup>1</sup> | Mid <sup>1</sup> | High <sup>1</sup> | High <sup>1</sup> | Low <sup>1</sup> | Low <sup>1</sup> |

NOTE 1: Test frequencies are specified in Table 8.1.3.1.1.256-2  
NOTE 2: Test frequencies are specified in Table 8.1.3.1.1.255-2  
NOTE 3: Test frequencies are specified in Table 8.1.3.1.1.254-2  
NOTE 4: Test frequencies are specified in Table 8.1.3.1.1.253-2  
NOTE 5: Test frequencies are specified in Table 8.1.3.1.1.252-2

Test frequencies for signalling test of MFBI are specified in Table 8.3.2.3.1-1a for FDD in terms of Low, Mid and High which are referred to as Low Range, Mid Range and High range in clause 8.1.3.1.1.

**Table 8.3.2.3.1-1a: Test frequencies for NB-IoT FDD MFBI (200 kHz)**

| NB-IoT Operating Band | MFBI Overlapping Band | Bandwidth [MHz] | f1, f5          |                 | f2              |                 | f3              |                 |
|-----------------------|-----------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
|                       |                       |                 | N <sub>UL</sub> | N <sub>DL</sub> | N <sub>UL</sub> | N <sub>DL</sub> | N <sub>UL</sub> | N <sub>DL</sub> |
| 2                     | 25                    | 60              | Mid             | Mid             | High            | High            | Low             | Low             |
| 4                     | 10                    | 45              | Mid             | Mid             | High            | High            | Low             | Low             |
| 4                     | 66                    | 45              | Mid             | Mid             | High            | High            | Low             | Low             |
| 5                     | 18                    | 15              | Mid             | Mid             | 23999           | 5999            | Low             | Low             |
| 5                     | 19                    | 15              | Mid             | Mid             | 20609           | 2609            | Low             | Low             |
| 5                     | 26                    | 25              | Mid             | Mid             | High            | High            | Low             | Low             |
| 8                     | 106                   | 5               | Mid             | Mid             | High            | High            | Low             | Low             |
| 12                    | 17                    | 12              | Mid             | Mid             | High            | High            | Low             | Low             |
| 17                    | 12                    | 12              | Mid             | Mid             | High            | High            | Low             | Low             |
| 17                    | 85                    | 12              | Mid             | Mid             | High            | High            | Low             | Low             |
| 19                    | 5                     | 15              | Mid             | Mid             | High            | High            | Low             | Low             |
| 19                    | 26                    | 15              | Mid             | Mid             | High            | High            | Low             | Low             |
| 25                    | 2                     | 60              | Mid             | Mid             | 26638           | 8638            | Low             | Low             |
| 26                    | 5                     | 25              | Mid             | Mid             | High            | High            | Low             | Low             |
| 26                    | 18                    | 15              | Mid             | Mid             | High            | High            | Low             | Low             |
| 26                    | 19                    | 15              | Mid             | Mid             | High            | High            | Low             | Low             |
| 66                    | 4                     | 45              | Mid             | Mid             | 132421          | 66885           | Low             | Low             |
| 66                    | 10                    | 60              | Mid             | Mid             | 132571          | 67035           | Low             | Low             |
| 85                    | 17                    | 12              | Mid             | Mid             | High            | High            | 134072          | 70436           |
| 106                   | 8                     | 5               | Mid             | Mid             | High            | High            | Low             | Low             |

Test frequencies for signalling test are specified in table 8.3.2.3.1-2 for TDD in terms of Low, Mid and High which are referred to the Low Range, Mid Range and High Range in clause 8.1.3.1.

**Table 8.3.2.3.1-2: Test frequencies for NB-IoT TDD (200 kHz)**

| NB-IoT Operating Band | Bandwidth [MHz] | f1, f5 |     | f2   |      | f3  |     |
|-----------------------|-----------------|--------|-----|------|------|-----|-----|
| 41                    | 60              | Mid    | Mid | High | High | Low | Low |

### 8.3.2.3.2 NB-IoT TDD Mode Test frequencies for signalling test

Test frequencies for signalling test are specified in table 8.3.2.3.2-1 in terms of Low, Mid and High which are referred to the Low Range, Mid Range and High Range in clause 8.1.3.1.2

**Table 8.3.2.3.2-1: Test frequencies for NB-IoT TDD (200 kHz)**

| NB-IoT Operating Band | Bandwidth [MHz] | f1, f5          |                 | f2              |                 | f3              |                 |
|-----------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
|                       |                 | N <sub>UL</sub> | N <sub>DL</sub> | N <sub>UL</sub> | N <sub>DL</sub> | N <sub>UL</sub> | N <sub>DL</sub> |
| 41                    | 194             | Mid             | Mid             | High            | High            | Low             | Low             |
| 42                    | 200             | Mid             | Mid             | High            | High            | Low             | Low             |
| 43                    | 200             | Mid             | Mid             | High            | High            | Low             | Low             |

Test frequencies for signalling test of MFBI are specified in Table 8.3.2.3.2-1a for TDD in terms of Low, Mid and High which are referred to as Low Range, Mid Range and High range in clause 8.1.3.1.2.

**Table 8.3.2.3.2-1a: Test frequencies for NB-IoT TDD MFBI (200 kHz)**

| NB-IoT Operating Band | MFBI Overlapping Band | Bandwidth [MHz] | f1, f5          |                 | f2              |                 | f3              |                 |
|-----------------------|-----------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
|                       |                       |                 | N <sub>UL</sub> | N <sub>DL</sub> | N <sub>UL</sub> | N <sub>DL</sub> | N <sub>UL</sub> | N <sub>DL</sub> |
| 41                    | 38                    | 50              | Mid             | Mid             | High            | High            | Low             | Low             |

### 8.3.3 NB-IoT Reference system configurations

The reference system configurations specified in this subclause apply to all Signalling test cases defined in TS 36.523-1 [18] unless otherwise specified, in addition to the common reference system configurations specified in subclause 8.1.4 of this specification.

Only one SS Tx antenna is used.

One UE antenna is used for all signalling test cases.

#### 8.3.3.1 NB-IoT Default parameters specific for simulated cells

Default parameters specific for simulated cells are specified in this subclause.

##### 8.3.3.1.1 Intra-frequency neighbouring cell list in SIB4-NB for NB-IoT cells

Intra-frequency neighbouring cell list for signalling test cases is defined in table 8.3.3.1.1-1. This table is referred to in the default contents of IE *intraFreqNeighbouringCellList* in *SystemInformationBlockType4-NB* defined in table 8.1.4.3.3-3.

**Table 8.3.3.1.1-1: Intra-frequency neighbouring cell lists for NB-IoT cells**

| cell ID  | Test Frequency | intra-frequency neighbouring cell list |               |         |          |                 |     |     |
|----------|----------------|----------------------------------------|---------------|---------|----------|-----------------|-----|-----|
|          |                | number of entries                      | physCellId[n] |         |          | q-OffsetCell[n] |     |     |
|          |                |                                        | 1             | 2       | 3        | 1               | 2   | 3   |
| Ncell 1  | f1             | 3                                      | Ncell 2       | Ncell 4 | Ncell 11 | dB0             | dB0 | dB0 |
| Ncell 2  | f1             | 3                                      | Ncell 1       | Ncell 4 | Ncell 11 | dB0             | dB0 | dB0 |
| Ncell 4  | f1             | 3                                      | Ncell 1       | Ncell 2 | Ncell 11 | dB0             | dB0 | dB0 |
| Ncell 11 | f1             | 3                                      | Ncell 1       | Ncell 2 | Ncell 4  | dB0             | dB0 | dB0 |
| Ncell 3  | f2             | 1                                      | Ncell 23      | -       | -        | dB0             | -   | -   |
| Ncell 23 | f2             | 1                                      | Ncell 3       | -       | -        | dB0             | -   | -   |

Intra-frequency neighbouring cell list of the same PLMN for the NAS signalling test is defined in table 8.3.3.1.1-2 when SIB4-NB is broadcast.

**Table 8.3.3.1.1-2: Intra-freq. lists in SIB4 for NAS test cases (same PLMN)**

| NAS cell ID | Test Frequency | Intra-frequency neighbouring cell list |               |          |
|-------------|----------------|----------------------------------------|---------------|----------|
|             |                | number of entries                      | physCellId[n] |          |
|             |                |                                        | 1             | 2        |
| Ncell 50    | f1             | 2                                      | Ncell 51      | Ncell 53 |
| Ncell 51    | f1             | 2                                      | Ncell 50      | Ncell 53 |
| Ncell 53    | f1             | 2                                      | Ncell 50      | Ncell 51 |
| Ncell 52    | f2             | 1                                      | Ncell 61      | N/A      |
| Ncell 61    | f2             | 1                                      | Ncell 52      | N/A      |

##### 8.3.3.1.2 Inter-frequency carrier frequency list in SIB5-NB for NB-IoT cells

Inter-frequency E-UTRA carrier frequency list for signalling test cases is defined in table 8.3.3.1.2-1. This table is referred to in the default contents of IE *interFreqCarrierFreqList* in *SystemInformationBlockType5-NB* defined in table 8.1.4.3.3-4.

**Table 8.3.3.1.2-1: Inter-frequency carrier frequency lists for NB-IoT cells**

| cell ID            | Test Frequency | interFreqCarrierFreqList |                   |    |    |
|--------------------|----------------|--------------------------|-------------------|----|----|
|                    |                | number of entries        | dl-CarrierFreq[n] |    |    |
|                    |                |                          | 1                 | 2  | 3  |
| Ncell 1<br>Ncell 2 | f1             | 3                        | f2                | f3 | f5 |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                        |    |   |    |    |    |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|---|----|----|----|
| Ncell 4<br>Ncell 11                                                                                                                                                                                                                                                                                                                                                                                                                                    |    |   |    |    |    |
| Ncell 3<br>Ncell 23                                                                                                                                                                                                                                                                                                                                                                                                                                    | f2 | 3 | f1 | f3 | f5 |
| Ncell 6                                                                                                                                                                                                                                                                                                                                                                                                                                                | f3 | 3 | f1 | f2 | f5 |
| Ncell 10                                                                                                                                                                                                                                                                                                                                                                                                                                               | f5 | 3 | f1 | f2 | f3 |
| Note 1: The inter-frequency carrier frequency list for signalling NAS test cases when cells are on same PLMN is defined in table 8.3.3.1.2-2.<br>Note 2: In case of Test frequency f1, f2 and f3, dl-CarrierFreq f5 as part of inter-frequency list is applicable only in case of multi-band scenarios.<br>Note 3: In case of Test frequency f5, dl-CarrierFreq f1 as part of inter-frequency list is applicable only in case of multi-band scenarios. |    |   |    |    |    |

Inter-frequency neighbouring carrier and cell lists for NAS signalling test cases are defined in table 8.3.3.1.2-2 for same PLMN and table 8.3.3.1.2-3 for different PLMN.

**Table 8.3.3.1.2-2: Inter-freq. lists in SIB5-NB for NAS test cases (same PLMN)**

| NAS cell ID                      | Test Frequency | interFreqCarrierFreqList |                   |    |
|----------------------------------|----------------|--------------------------|-------------------|----|
|                                  |                | number of entries        | dl-CarrierFreq[n] |    |
|                                  |                |                          | 1                 | 2  |
| Ncell 50<br>Ncell 51<br>Ncell 53 | f1             | 1                        | f2                | NA |

|                                                          |                | 1                        | f2                |    | 54-CONF     |
| Ncell 54                                                 | f2             | 1                        | f3                | NA |             |

| Condition   | Explanation                            |
|-------------|----------------------------------------|
| 54-NOT-CONF | Ncell 54 is not configured in the test |
| 54-CONF     | Ncell 54 is configured in the test     |

### 8.3.3.2 NB-IoT Default configurations for NAS test cases

As defined in clause 8.1.4.

### 8.3.3.3 NB-IoT Cell configurations

All Ncells are assumed to be full cells unless specified otherwise in a test case defined in TS 36.523-1 [18].

## 8.3.4 NB-IoT Generic signalling procedures

### 8.3.4.1 NB-IoT Initial UE states and setup procedures

As defined in clause 8.1.5.

### 8.3.4.2 NB-IoT Reference procedures and test procedures for TTCN development

As defined in clause 8.1.5A.

### 8.3.4.3 NB-IoT Test case postambles for TTCN development

As defined in clause 10.5 of TS 36.523-3 [20].

## 8.3.5 NB-IoT Default RRC message and information element contents

As defined in clause 8.1.6.

## 8.3.6 NB-IoT Default NAS message and information element contents

As defined in clause 8.1.7.

## 8.3.7 NB-IoT Timer tolerances

The timer tolerances specified for the test environment in this subclause apply to all Signalling test cases defined in TS 36.523-1 [18] unless otherwise specified.

All the timers used during testing are within a tolerance margin given in Table 8.3.7.-1 below. For NB-IoT and its typically longer timer values across all protocol layers, common timer tolerances are applicable independently from protocol layer resp. test case group. If for a specific test a different tolerance value is required then this should be specified in the relevant test document (i.e. the document where the test is described).

**Table 8.3.7-1: Timer tolerances for protocol timers**

|  |                        |            |                         |
|--|------------------------|------------|-------------------------|
|  | timer value            | < 500 ms   | not applicable          |
|  | 500 ms ≤ timer value   | < 10000 ms | timer tolerance = 10 %  |
|  | 10000 ms ≤ timer value | < 40000 ms | timer tolerance = 5 %   |
|  | 40000 ms ≤ timer value |            | timer tolerance = 2.5 % |

## 8.3.8 Signalling test environment for Vertical UEs

### 8.3.8.1 NB-IoT NTN

This clause defines the signalling test environment which applies to all signalling test cases executed for NB-IoT NTN UEs, unless otherwise specified. This is in addition to the common test environment defined in clause 8.1.5B.1.

- Test frequencies specified in Table 8.3.2.3.1-1 are used.
- For NGSO scenario, UE prediction of satellite trajectory shall be deactivated in the pre-test conditions by any preconfigured means.

**NOTE:** As constant ephemeris information in SIB31-NB is used for the NGSO scenario, the frequency Doppler and transmission delay values remain same during the test execution. Therefore, prediction of satellite trajectory needs to be deactivated in the UE, so that the UE will not update the Doppler and delay pre-compensation with the assumption that the satellite is moving before the expiry of timer T317 (ul-SyncValidityDuration-r17).

- For Rel-13 to Rel-15 NB-IoT test cases applicable to a UE supporting NTN only access in NB-IoT (pc\_NB\_ntn\_only\_Connectivity\_EPC):
- UE is pre-configured with the UE position defined in clause 4.13.
- The mapping of the system information combination in terrestrial networks (TN) to a corresponding system information combination in non-terrestrial networks (NTN) is defined in Table 8.3.8.1-1:

**Table 8.3.8.1-1: Mapping of the TN to NTN system information combinations**

| System Information Combination in TN environment | System Information Combination in NTN environment |
|--------------------------------------------------|---------------------------------------------------|
| c1                                               | c8                                                |
| c2                                               | c10                                               |
| c3                                               | c11                                               |
| c4                                               | c13                                               |

## 8.4 NB-IOT Test environment for RRM tests

This section contains all the exceptions of the common test parameters specified in clause 8.1 for specific needs of NB-IoT test cases defined in TS 36.521-3 [34]. Exceptions specified in clause 8.4 overwrite the parameter settings of clause 8.1; exceptions defined within the test cases overwrite parameter settings of clause 8.1 and 8.4.

### 8.4.1 NB-IoT Requirements of test equipment

No NB-IoT common RRM test environment requirements are specified in addition to the NB-IoT common requirements described in clause 8.1.2. Specific RRM requirements are indicated within the test cases defined in TS 36.521-3 [34].

### 8.4.2 NB-IoT RRM Reference system configurations

#### 8.4.2.1 NB-IoT Common parameters for simulated NB-IoT cells

##### 8.4.2.1.1 NB-IoT Combinations of system information blocks

The NB-IoT combination of system information blocks required by a test case depends on the test case scenario. In clause 8.1.4 of this document, the NB-IoT combinations of system information blocks are defined.

##### 8.4.2.1.2 NB-IoT Scheduling of system information blocks

Same NB-IoT scheduling of system information blocks as defined in clause 8.1.4.3.1.2.

##### 8.4.2.1.3 NB-IoT Common contents of system information messages

- MasterInformationBlock-NB

As defined in Table 8.1.4.3.2-1 with the following exceptions.

**Table 8.4.2.1.3-1: MasterInformationBlock-NB**

## 8.4.2A NB-IoT Generic RRM procedures

The NB-IoT UE test state used for testing is specified in the individual test cases in the corresponding test specification TS 36.521-3 [34].

RRM NB-IoT UE test states are covered by common NB-IoT UE test states defined in clause 8.1.5 of this document.

## 8.4.3 NB-IoT Default RRC message and information elements contents

### 8.4.3.1 NB-IoT Radio resource control information elements

As defined in clause 8.1.6.3 without exceptions.

## 8.4.4 NB-IoT Default NAS message and information elements contents

As defined in clause 8.1.7 without exceptions.

## 8.4.5 NB-IoT Reference radio bearer configurations

### 8.4.5.1 NB-IoT SRB and DRB parameters

As defined in clause 8.1.8.2.1 without exception.

## 8.4.6 Test environment for NB-IoT NTN RRM testing

This section defines the test environment which applies to all RRM test cases executed for NB-IoT NTN UEs, unless otherwise specified.

#### 8.4.6.1 UE location

Same as in section 7.6.1.

#### 8.4.6.2 Ephemeris Information

Ephemeris information in this section has been generated as described in clause 5 in TR36.905 [77].

##### 8.4.6.2.0 Assumptions for Ephemeris generation

Same as in section 7.6.2.0.

##### 8.4.6.2.1 Ephemeris for elevation angle 30°

All NB-IoT NTN RRM test cases defined in in section 13 in TS 36.521-3 [34], unless otherwise stated, shall use ephemeris configuration in tables 8.4.6.2.1-1a to 8.4.6.2.1-3b, corresponding to an elevation angle of 30° for the type of satellite under test, keeping such information constant throughout the duration of the test:

- In case UE supports only NGSO satellites or both GSO and NGSO satellites, ephemeris values in Table 8.4.6.2.1-3a or 8.4.6.2.1-3d shall be used.
- Tables 8.4.6.2-4a to 8.4.6.2-4d shall only be used if the test case under test is only applicable to GEO satellites.

### 8.4.6.3 NB-IoT NTN message contents for RRM tests

#### 8.4.6.3.1 ServingSatelliteInfo-r17 values in SIB31-NB

The *ServingSatelliteInfo-r17* values including the *EphemerisInfo-r17* values in SIB31-NB shall be periodically signalled to the UE during test based on the *Ephemeris* information in clause 8.4.6.2 (kept constant throughout the duration of the test).

#### 8.4.6.3.2 *SystemInformationBlockType33-NB*

## Annex A (informative): Connection Diagrams

### Definition of Terms

**System Simulator or SS** – A device or system, that is capable of generating simulated Node B signalling and analysing UE signalling responses on one or more RF channels, in order to create the required test environment for the UE under test. It will also include the following capabilities:

1. Measurement and control of the UE Tx output power through TPC commands
2. Measurement of Throughput
3. Measurement of signalling timing and delays
4. Ability to simulate UTRAN and/or E-UTRAN and/or GERAN signalling

**GNSS System Simulator or GSS:** A device or system, that is capable of generating simulated GNSS satellite transmissions in order to create the required test environment for the UE under test. It will also include the following capabilities:

1. Control of the output power of individual satellites and the simulation of atmospheric delays.
2. Ability to synchronize with E-UTRAN timing in the SS.

**Test System** – A combination of devices brought together into a system for the purpose of making one or more measurements on a UE in accordance with the test case requirements. A test system may include one or more System Simulators if additional signalling is required for the test case. The following diagrams are all examples of Test Systems.

NOTE 1: The above terms are logical definitions to be used to describe the test methods used in the documents TS36.521-1, TS 36.523-1 and TS36.521-3 in practice, real devices called 'System Simulators' may also include additional measurement capabilities or may only support those features required for the test cases they are designed to perform.

NOTE 2: Components in the connection diagrams:  
The components in the connection diagrams represent ideal components. They are intended to display the wanted signal flow. They don't mandate real implementations. An alternative to Figure A3 is shown below as an example: It is nearer to real implementations. The signal levels are the same as in Figure A3. The signal flow cannot be displayed as detailed as in Figure A.3.

Alternative to Figure A.3

**Connection:** Each connection is displayed as a one or two sided arrow, showing the intended signal flow. In some cases, for some tests, some connections shown may not be necessary (for example UL RX connection for a second cell).

**Circulator:** The signal, entering one port, is conducted to the adjacent port, indicated by the arrow. The attenuation among the above mentioned ports is ideally 0 and the isolation among the other ports is ideally  $\infty$ .

**Splitter:** a splitter has one input and 2 or more outputs. The signal at the input is equally divided to the outputs. The attenuation from input to the outputs is ideally 0 and the isolation between the outputs is ideally  $\infty$ .

**Combiner:** a combiner has one output and 2 or more inputs. The signals at the inputs are conducted to the output, all with the same, ideally 0 attenuation. The isolation between the inputs is ideally  $\infty$ .

**Switch:** contacts a sink (or source) alternatively to two or more sources (or sinks).

**Fader:** The fader has one input and one output. The MIMO fading channel is represented by several single faders (e.g. 8 in case of a MIMO antenna configuration 4x2) The correlation among the faders is described in TS 36.521-1 clause B.2.2. In some cases, for some tests, diagrams with fader(s) are referenced when no fading is required; in this case the fader(s) is omitted.

Attenuator: TBD

### General considerations on connections for CA testing

Figures A.32<x> to A.37<x> and A.41<x> to A.46<x> contain connection diagrams for CA testing with 2 CCs. Different options (<x> = a, b, c) have been defined for each connection, to consider different UE employments with respect to UE antenna connectors and signal mapping:

- a: Separate antenna connectors for each CC. An optional *Combiner* may be used in case the UE employs one common wide band antenna only for the receive diversity for both CC-s.
- b: Common antenna connectors for both CC-s with same UL transmit antenna connector.
- c: Common antenna connectors for both CC-s with different UL transmit antenna connectors.

The connections are referred in tests as *Figure group* which imply figures with the same Arabic numeral in the number, but different Latin letter extension (e.g. Figure A.32a, A.32b etc.). The selection of the connection option for testing is done according to the UE employment as appropriate.

Connection diagrams for CA testing with  $\geq 3$ CCs have been defined in other figures.

- The connections represent the case of a DUT with separate antenna connectors per CC. For other DUT antenna connector configurations, the necessary signal combining is done accordingly.
- The number of secondary CC is  $n$  with  $n = 2, 3, \dots$  as applicable to the individual test case for  $n+1$  CCs testing.

Following symbolic is used in the connection diagrams to distinguish CC-s and paths:

- $p$ : primary CC
- $s$ : secondary CC (in case of CA with 2CCs)
- $s1$ : first secondary CC (in case of CA with >2CCs)
- $sn$ :  $n$ -th secondary CC with  $n = 2, 3, \dots$  (in case of CA with >2CCs)
- $\langle j \rangle$ : (integer) defines the receive antenna and the path to it  $\langle j \rangle$  for a given CC
- $\langle i \rangle \langle j \rangle$ : (integer) defines the path between transmit antenna  $\langle i \rangle$  and receive antenna  $\langle j \rangle$  for a given CC

The connections are general and support CA both in DL and UL. According to the test conditions, if the UL CA is not used, the "secondary CCs of UL" in the connections may be ignored.

For contiguous CA, single AWGN<sub>k</sub> sources with  $k = \{p, s, s1, s2, \dots\}$  affecting the same UE antenna connector can be unified to AWGN sources with higher bandwidth.

### Connections for UE category 0 and category M1 testing

For UE category 0 and category M1, if the connection is referred with the additional clarification “using only main UE Tx/Rx antenna”, then all the links and blocks in the connection serving to supply other UE Rx antennas with signal, are not used.

The example below in Figure A.0 shows the resulting connection to be used, after removing the unnecessary parts (red coloured) to connection of Figure A.10, assuming it is referred in a UE category 0 or a category M1 test as mentioned above.

### Connections for ProSe testing

TBD

### Connections for 4 Rx antenna ports in transmitter tests

For UE supporting 4 Rx antenna ports on at least one of the bands under test, in transmitter tests the connection is referred to connection diagrams showing only 2 UE Rx antenna ports. For such cases, the SS fed only two of the four antennas from the UE, which are connected depending on UE capability. The remaining two antenna ports of the UE are not connected to the SS.

### Considerations for CA testing on 4Rx capable UEs

Figures A.80, A.82, A.85 to A.87, A.90, A.91, A.94 and A.95 contain connection diagrams that shall be used to enable CA testing on 4Rx capable UEs. Such connection diagrams are only applicable to UEs that support 4Rx on at least one of the bands under test. In such cases, the following rules apply to the connection diagram:

- 1 For nDL CA with x CCs on a 4Rx supported band and (n-x) CCs on a 2Rx supported band, the 4Rx Module shall be replicated x times and 2Rx Module shall be replicated (n-x) times. These modules are specified on the connection diagrams.
- 2 UE is assumed to support 2Rx in {Rx1, Rx3} and 4Rx in {Rx1, Rx2, Rx3, Rx4}. Depending on UE capability these ports can be interchanged.
- 3 For all 2Rx supported band the 2-Rx CCs are fed only on two ports and the remaining two ports have zero-input in this band.
- 4 SS shall configure Rx1, Rx2, Rx3, Rx4 based on UE capability.
- 5 UE Tx will be placed in one of the 4 UE antenna ports and shall feed either SS\_4Rx or SS\_2Rx depending on UE capability. SS\_4Rx and SS\_2Rx are specified on the connection diagrams.

The connections represent the case of a DUT with common antenna connectors for both CC-s with same UL transmit antenna connector. For other DUT antenna connector configurations, the necessary signal combining is done accordingly.

Figure A.89: Connection for CA with Fading and additional intra-frequency cell for 4Rx antenna ports

**Figure A.89a: Connection for V2X Communication / Intra-band contiguous multi-carrier operation (common connectors, same UL antenna)**

Figure A.90: Connection for CA with Fading and additional Static intra-frequency cell with phase rotators for 4Rx antenna ports

**Figure A.91: Connection for CA SDR tests on a 4Rx-capable UE with CCs on both 4Rx-supported RF bands and 2Rx-supported RF bands**

Figure A.92: Connection for basic Tx/Rx testing of V2X sidelink transmissions non-concurrent with E-UTRAN uplink transmissions

Figure A.92a: Connection for basic Tx/Rx testing of V2X sidelink transmissions non-concurrent with E-UTRAN uplink transmission with E-UTRA-Interference

Figure A.92b: Connection for basic Tx/Rx testing of V2X sidelink transmissions non-concurrent with E-UTRAN uplink transmission with CW Interference

Figure A.92c: Connection for basic Tx/Rx testing of V2X sidelink transmissions non-concurrent with E-UTRAN uplink transmission with both E-UTRA Interference and additional CW signal

Figure A.93: Void

Figure A.92d: Connection for V2X Communication / Intra-band contiguous multi-carrier operation with additional Interferer / CW (common connectors, same UL antenna)

Figure A.93: Connection for RRM tests with antenna configuration 2x1 and 2 Cells

Figure A.93a: Connection for basic Tx/Rx testing of simultaneous E-UTRA V2X sidelink and E-UTRA uplink transmission

Figure A.93b: Connection for V2X testing of simultaneous E-UTRA V2X sidelink and E-UTRA uplink transmission with additional CW and Spectrum Analyzer

**Figure A.93c: Connection for V2X testing of simultaneous E-UTRA V2X sidelink and E-UTRA uplink transmission with additional Interferer / CW**

Figure A.93d: Connection for V2X Tx testing of simultaneous E-UTRA V2X sidelink and E-UTRA uplink transmission with additional Spectrum Analyzer

Figure A.93e: Connection for V2X Rx testing of simultaneous E-UTRA V2X sidelink and E-UTRA uplink transmission with additional Spectrum Analyzer

**Figure A.94: Connection Diagram to enable Carrier Aggregation tests (with 2x4 channel) on a 4Rx-capable UE with CCs on both 4Rx-supported RF bands and 2Rx-supported bands**

Figure A.95: Connection Diagram to enable Carrier Aggregation tests (with 4x4 channel) on a 4Rx-capable UE with CCs on both 4Rx-supported RF bands and 2Rx-supported bands

**Figure A.96: Connection for performance testing of V2V/V2X sidelink communications in 1x2 faded channel and non-concurrent with E-UTRAN uplink transmission**

**Figure A.97: Connection for performance decoding capability testing of V2V/V2X sidelink communications in 1x2 static channel and non-concurrent with E-UTRAN uplink transmission**

**Figure A.98: Connection for power imbalance performance testing of V2V sidelink communications with two links in 1x2 AWGN channel and non-concurrent with E-UTRAN uplink transmission**

**Figure A.99: Connection for more than 1 Cell with multipath fading propagation for 4Rx Capable UE**

Figure A.100: Connection for RX performance tests with antenna configuration 12x2

Figure A.101: Connection for RX performance tests with antenna configuration 12x2 for 4Rx capable UEs without any 2Rx RF bands

**Figure A.102: Connection for RX performance tests with antenna configuration 16x2**

**Figure A.103: Connection for RX performance tests with antenna configuration 16x2 for 4Rx capable UEs without any 2Rx RF bands**

---

| RAN5 #45          | RP-091121     | 0069 | -   | Correction CR to 36.508: Set the default parameter for offsetFreq in MeasObjectGERAN Information Element | F   | 8.3.0           | 8.4.0       | R5-095514     |
| RAN5 #45          | RP-091470     | 0070 | -   | Addition of HSPA UTRA reference radio bearer parameters for E-UTRA Inter-RAT testing                     | F   | 8.3.0           | 8.4.0       | R5-095555     |
| RAN5 #45          | RP-091122     | 0071 | -   | Introduction of RS power boosting to reduce interference                                                 | F   | 8.3.0           | 8.4.0       | R5-095594     |
| RAN5 #45          | RP-091122     | 0072 | -   | Corrections to default RRC message contents                                                              | F   | 8.3.0           | 8.4.0       | R5-095651     |
| RAN5 #45          | RP-091122     | 0073 | -   | Clarification for Cell Configuration Identifiers in 36.508                                               | F   | 8.3.0           | 8.4.0       | R5-096005     |
| RAN5 #45          | RP-091122     | 0074 | -   | Correction to the generic procedure for IP allocation and more                                           | F   | 8.3.0           | 8.4.0       | R5-096114     |
| RAN5 #45          | RP-091122     | 0075 | -   | Addition of new generic procedure for TAU after inter-RAT HO from UTRA                                   | F   | 8.3.0           | 8.4.0       | R5-096115     |
| RAN5 #45          | RP-091122     | 0076 | -   | Update of header chapter 5.2 in 36.508                                                                   | F   | 8.3.0           | 8.4.0       | R5-096202     |
| RAN5 #45          | RP-091122     | 0077 | -   | Correction to the default NAS message contents                                                           | F   | 8.3.0           | 8.4.0       | R5-096403     |
| RAN5 #45          | RP-091122     | 0078 | -   | cell frequency allocation                                                                                | F   | 8.3.0           | 8.4.0       | R5-096440     |
| RAN5 #45          | RP-091122     | 0079 | -   | Correction for IP address allocation                                                                     | F   | 8.3.0           | 8.4.0       | R5-096447     |
| RAN5 #45          | RP-091122     | 0080 | -   | LAI and TMSI in ATTACH ACCEPT and TAU ACCEPT messages                                                    | F   | 8.3.0           | 8.4.0       | R5-096449     |
| RAN5 #45          | RP-091122     | 0081 | -   | Addition of generic procedure for IP address allocation / configuration in U-plane                       | F   | 8.3.0           | 8.4.0       | R5-096455     |
| RAN5 #45          | RP-091122     | 0082 | -   | Correction of test procedures in TS 36.508                                                               | F   | 8.3.0           | 8.4.0       | R5-096456     |
| RAN5 #45          | RP-091122     | 0083 | -   | Update of MAC configuration for disabling PHR and BSR for L2 test cases                                  | F   | 8.3.0           | 8.4.0       | R5-096458     |
| RAN5 #45          | RP-091122     | 0084 | -   | Addition of default UTRA message contents to TS 36.508                                                   | F   | 8.3.0           | 8.4.0       | R5-096461     |
| RAN5 #45          | RP-091122     | 0085 | -   | Clarification to the mapping of GERAN cells and the default parameter values                             | F   | 8.3.0           | 8.4.0       | R5-096462     |
| RAN5 #45          | RP-091122     | 0086 | -   | Correction of TFTs for reference dedicated EPS bearer contexts                                           | F   | 8.3.0           | 8.4.0       | R5-096464     |
| RAN5 #45          | RP-091122     | 0087 | -   | Cleanup of default NAS message contents                                                                  | F   | 8.3.0           | 8.4.0       | R5-096465     |
| RAN5 #45          | RP-091122     | 0088 | -   | LTE-Sig: Assignment of different rootSequenceIndex for cells at the same frequency                       | F   | 8.3.0           | 8.4.0       | R5-096641     |
| RAN5 #46          | RP-100143     | 0089 | -   | Correction of SIB19 scheduling position in the neighbouring UTRA cell                                    | F   | 8.4.0           | 8.5.0       | R5-100086     |
| RAN5 #46          | RP-100143     | 0091 | -   | Correction of Quantity Configuration for EUTRA                                                           | F   | 8.4.0           | 8.5.0       | R5-100110     |
| RAN5 #46          | RP-100143     | 0092 | -   | Correction for the offset value of RSRP in EUTRA                                                         | F   | 8.4.0           | 8.5.0       | R5-100111     |
| RAN5 #46          | RP-100143     | 0093 | -   | SIB10 and SIB11 periodicity                                                                              | F   | 8.4.0           | 8.5.0       | R5-100112     |
| RAN5 #46          | RP-100143     | 0094 | -   | Assignment of rootSequenceIndex for simulated NAS cells in different PLMNs                               | F   | 8.4.0           | 8.5.0       | R5-100260     |
| RAN5 #46          | RP-100143     | 0095 | -   | Editorial correction to the default value of 'p-a'                                                       | F   | 8.4.0           | 8.5.0       | R5-100261     |
| RAN5 #46          | RP-100142     | 0096 | -   | New chapter: Test environment for RRM tests                                                              | F   | 8.4.0           | 8.5.0       | R5-100396     |
| RAN5 #46          | RP-100143     | 0097 | -   | Remove UM in DRB reconfiguration                                                                         | F   | 8.4.0           | 8.5.0       | R5-100487     |
| RAN5 #46          | RP-100143     | 0098 | -   | Addition of default power allocation for two TX antennas                                                 | F   | 8.4.0           | 8.5.0       | R5-100518     |
| RAN5 #46          | RP-100143     | 0099 | -   | Correction to TFT parameters used in ACTIVATE DEDICATED EPS BEARER CONTEXT REQUEST message               | F   | 8.4.0           | 8.5.0       | R5-100771     |

| 2018-03 | RAN#79 | R5-181607 | 1102 | 1 | F | Include AdditionalSpectrumEmission for V2X as per RAN2 spec                                   | 15.1.0 |
| 2018-03 | RAN#79 | R5-181616 | 1114 | 1 | F | Test frequencies for Rel-13 LTE CA configurations                                             | 15.1.0 |
| 2018-03 | RAN#79 | R5-181357 | 1115 | 1 | F | Test frequencies for Rel-14 LTE CA configurations                                             | 15.1.0 |
| 2018-03 | RAN#79 | R5-181666 | 1112 | 1 | F | Addition of Connection Diagrams for V2X and V2V Sidelink Communication Performance Test Cases | 15.1.0 |
| 2018-06 | RAN#80 | R5-182376 | 1142 | - | F | Removal of square brackets for GNSS for V2X setups                                            | 15.2.0 |
| 2018-06 | RAN#80 | R5-182415 | 1144 | - | F | Addition of GNSS information for MCS tests                                                    | 15.2.0 |
| 2018-06 | RAN#80 | R5-182425 | 1145 | - | F | Update of default NAS messages to add ENDC IEs                                                | 15.2.0 |
| 2018-06 | RAN#80 | R5-182460 | 1146 | - | F | Correction to Attach request and Tracking Area Update request message                         | 15.2.0 |
| 2018-06 | RAN#80 | R5-182608 | 1154 | - | F | Addition of connection diagrams for power imbalance performance V2V test                      | 15.2.0 |
| 2018-06 | RAN#80 | R5-182636 | 1155 | - | F | Update SIB2 message for NR                                                                    | 15.2.0 |
| 2018-06 | RAN#80 | R5-182654 | 1156 | - | F | Addition of SIB22-NB definition                                                               | 15.2.0 |
| 2018-06 | RAN#80 | R5-182660 | 1157 | - | F | Update of V2X USIM configuration to add service ID                                            | 15.2.0 |
| 2018-06 | RAN#80 | R5-182666 | 1158 | - | F | Addition of test frequency of CA_40E                                                          | 15.2.0 |
| 2018-06 | RAN#80 | R5-182668 | 1159 | - | F | Addition of test frequency of CA_41F                                                          | 15.2.0 |
| 2018-06 | RAN#80 | R5-182811 | 1163 | - | F | Addition of test frequencies for CA signalling test                                           | 15.2.0 |
| 2018-06 | RAN#80 | R5-182878 | 1167 | - | F | Exceptions for DL Control Channel Interference Mitigation (Type A and Type B) Tests           | 15.2.0 |
| 2018-06 | RAN#80 | R5-183038 | 1173 | - | F | Addition of test frequency of CA_66A-66A-66A                                                  | 15.2.0 |
| 2018-06 | RAN#80 | R5-183055 | 1174 | - | F | Corrections to 4.5A.24                                                                        | 15.2.0 |
| 2018-06 | RAN#80 | R5-183056 | 1139 | 1 | F | Update to UECapabilityInformation-NB message                                                  | 15.2.0 |
| 2018-06 | RAN#80 | R5-183057 | 1150 | 1 | F | Correction to t-PollRetransmit value in Table 4.6.3-19A                                       | 15.2.0 |
| 2018-06 | RAN#80 | R5-183058 | 1170 | 1 | F | Correction to PRACH Config for CAT-M1 UEs                                                     | 15.2.0 |
| 2018-06 | RAN#80 | R5-183076 | 1172 | 1 | F | Correction to Band 66 CA band combinations                                                    | 15.2.0 |
| 2018-06 | RAN#80 | R5-183091 | 1166 | 1 | F | Addition of NR and MRDC details for UECapabilityEnquiry RRC message                           | 15.2.0 |
| 2018-06 | RAN#80 | R5-183092 | 1169 | 1 | F | Add ULInformationTransferMRDC message contents                                                | 15.2.0 |
| 2018-06 | RAN#80 | R5-183125 | 1136 | 1 | F | Addition of MeasObject and MeasReport for NR                                                  | 15.2.0 |
| 2018-06 | RAN#80 | R5-183170 | 1161 | 1 | F | Introduction of DCI0A/0B for eLAA                                                             | 15.2.0 |
| 2018-06 | RAN#80 | R5-183171 | 1162 | 1 | F | Introduction of DCI4A/4B for eLAA                                                             | 15.2.0 |
| 2018-06 | RAN#80 | R5-183182 | 1149 | 1 | F | Addition of V2XoverLTEUu in V2X management data object configuration                          | 15.2.0 |
| 2018-06 | RAN#80 | R5-183238 | 1138 | 1 | F | Update RRCConnectionReconfiguration message for EN-DC                                         | 15.2.0 |
| 2018-06 | RAN#80 | R5-183239 | 1147 | 1 | F | Update TFT configuration in Dedicated Bearer to Allow IP Ping Operation                       | 15.2.0 |
| 2018-06 | RAN#80 | R5-183247 | 1140 | 1 | F | Update to the generic registration procedure for Multi-PDNs UEs                               | 15.2.0 |
| 2018-06 | RAN#80 | R5-183786 | 1153 | 1 | F | Update on AT commands for V2V/X Sidelink communications                                       | 15.2.0 |
| 2018-06 | RAN#80 | R5-183864 | 1151 | 1 | F | Definition of additional simulated cells for IncMon RRM Test Cases                            | 15.2.0 |
| 2018-06 | RAN#80 | R5-183867 | 1141 | 1 | F | Addition of Rel-15 NB-IoT test frequencies                                                    | 15.2.0 |
| 2018-06 | RAN#80 | R5-183894 | 1143 | 1 | F | Addition of WLAN and BLE to test frequencies                                                  | 15.2.0 |
| 2018-09 | RAN#81 | R5-184054 | 1177 | - | F | Add SRB with NR PDCCP                                                                         | 15.3.0 |
| 2018-09 | RAN#81 | R5-184075 | 1178 | - | F | NB-IoT timer tolerances: extension of timer value range                                       | 15.3.0 |
| 2018-09 | RAN#81 | R5-184110 | 1180 | - | F | Correction to NB-IOT In-Band Test Frequencies                                                 | 15.3.0 |
| 2018-09 | RAN#81 | R5-184234 | 1182 | - | F | Correction to message contents for UL64QAM                                                    | 15.3.0 |
| 2018-09 | RAN#81 | R5-184235 | 1183 | - | F | Correction to default message for UL CA tests                                                 | 15.3.0 |
| 2018-09 | RAN#81 | R5-184236 | 1184 | - | F | Editorial correction to FDD Mode test frequencies                                             | 15.3.0 |
| 2018-09 | RAN#81 | R5-184268 | 1186 | - | F | Cleaning up the default message contents and test states of V2X                               | 15.3.0 |
| 2018-09 | RAN#81 | R5-184282 | 1187 | - | F | Update of test frequencies for CA_42A-42A                                                     | 15.3.0 |
| 2018-09 | RAN#81 | R5-184569 | 1193 | - | F | Add Band 31 Test Frequencies for NB-IoT Inter-frequency Test cases                            | 15.3.0 |
| 2018-09 | RAN#81 | R5-184668 | 1195 | - | F | Editorial correction of reference document                                                    | 15.3.0 |
| 2018-09 | RAN#81 | R5-184771 | 1197 | - | F | Addition of test frequencies for CA_66A-71A, CA_66C-71A, CA_70A-71A, CA_70C-71A to 36.508     | 15.3.0 |
| 2018-09 | RAN#81 | R5-184820 | 1199 | - | F | Addition of default lla-SCellConfiguration setting for eLAA                                   | 15.3.0 |
| 2018-09 | RAN#81 | R5-184884 | 1200 | - | F | Update to NB-IoT test conditions for in-band / guard band                                     | 15.3.0 |
| 2018-09 | RAN#81 | R5-185002 | 1179 | 1 | F | Correction to ATTACH ACCEPT message for SMS only                                              | 15.3.0 |
| 2018-09 | RAN#81 | R5-185003 | 1190 | 1 | F | Correction of 6.2.3.2 Test Frequency for CA_3A-27A                                            | 15.3.0 |
| 2018-09 | RAN#81 | R5-185023 | 1189 | 1 | F | Updates of 6.2.3.2 Test Frequency for CA_8A-27A                                               | 15.3.0 |

|         |        |           |      |   |   |                                                                                           |        |
|---------|--------|-----------|------|---|---|-------------------------------------------------------------------------------------------|--------|
| 2018-09 | RAN#81 | R5-185103 | 1196 | 1 | F | Specifying content for SCGFailureInformationNR                                            | 15.3.0 |
| 2018-09 | RAN#81 | R5-185104 | 1201 | 1 | F | Addition of reference dedicated EPS bearer context #7 for V2X testing                     | 15.3.0 |
| 2018-09 | RAN#81 | R5-185113 | 1198 | 1 | F | Addition of NB_IOTenh-UEConTest test case scenarios and default SIB content               | 15.3.0 |
| 2018-09 | RAN#81 | R5-185158 | 1176 | 1 | F | Update Reference Table 6.6.2-1A dedicated EPS bearer contexts                             | 15.3.0 |
| 2018-09 | RAN#81 | R5-185164 | 1175 | 1 | F | Update RRCConnectionReconfiguration message for EN-DC                                     | 15.3.0 |
| 2018-09 | RAN#81 | R5-185166 | 1188 | 1 | F | Modification of EPS & Data Radio Bearer ID mapping for EN-DC Test cases                   | 15.3.0 |
| 2018-09 | RAN#81 | R5-185409 | 1181 | 1 | F | Addition of NB-IOT Guardband Test Frequencies for 10 MHz                                  | 15.3.0 |
| 2018-09 | RAN#81 | R5-185449 | 1185 | 1 | F | Correction to Figure A.64 to cater for CC >= 3                                            | 15.3.0 |
| 2018-09 | RAN#81 | R5-185454 | 1191 | 1 | F | Addition of antenna diagrams for IncMon RRM test cases                                    | 15.3.0 |
| 2018-09 | RAN#81 | R5-185455 | 1192 | 1 | F | Addition of message content for RRM IncMon test cases                                     | 15.3.0 |
| 2018-12 | RAN#82 | R5-186472 | 1203 | - | F | NB-IoT Band70 In-band frequency for 10Mhz Mid range                                       | 15.4.0 |
| 2018-12 | RAN#82 | R5-186473 | 1204 | - | F | New NCell for NB-IOT RRM Intra-Freq Cell reselection                                      | 15.4.0 |
| 2018-12 | RAN#82 | R5-186631 | 1207 | - | F | Correction to GNSS scenario #3 for V2X test cases                                         | 15.4.0 |
| 2018-12 | RAN#82 | R5-186768 | 1212 | - | F | Modify the values of IEs in sps-AssistanceInformation-r14                                 | 15.4.0 |
| 2018-12 | RAN#82 | R5-187002 | 1214 | - | F | Correction to Table 8.1.6.1-15a SCPTMConfiguration-NB                                     | 15.4.0 |
| 2018-12 | RAN#82 | R5-187005 | 1215 | - | F | Adding connection diagram for eNB-IoT RRM test case 6.2.18                                | 15.4.0 |
| 2018-12 | RAN#82 | R5-187058 | 1216 | - | F | Addition of test frequency for CA_48C and CA_48A-48A                                      | 15.4.0 |
| 2018-12 | RAN#82 | R5-187059 | 1217 | - | F | Addition of test frequency for CA_40A-40A and CA_40A-40C                                  | 15.4.0 |
| 2018-12 | RAN#82 | R5-187114 | 1218 | - | F | Correction to RRCConnectionReconfiguration                                                | 15.4.0 |
| 2018-12 | RAN#82 | R5-187447 | 1222 | - | F | Addition of Rel-13 CA configurations                                                      | 15.4.0 |
| 2018-12 | RAN#82 | R5-187612 | 1225 | - | F | Addition of the message content of PDCP-config for UDC                                    | 15.4.0 |
| 2018-12 | RAN#82 | R5-187639 | 1213 | 1 | F | Update NB-IoT Rel-14 DCI format N0/N1 with HARQ process number                            | 15.4.0 |
| 2018-12 | RAN#82 | R5-187640 | 1226 | - | F | Clarification to inband testing for signalling test cases                                 | 15.4.0 |
| 2018-12 | RAN#82 | R5-187643 | 1219 | 1 | F | New feMTC IEs                                                                             | 15.4.0 |
| 2018-12 | RAN#82 | R5-187646 | 1220 | 1 | F | Addition of support for LWA/LWIP Test Cases in generic procedures                         | 15.4.0 |
| 2018-12 | RAN#82 | R5-187719 | 1224 | 1 | F | Correction to Table 6.6.2-1 in 36.508                                                     | 15.4.0 |
| 2018-12 | RAN#82 | R5-187729 | 1221 | 1 | F | Addition of ReportConfigInterRAT for NR                                                   | 15.4.0 |
| 2018-12 | RAN#82 | R5-187730 | 1227 | 1 | F | Updating UE registration procedure to handle UE capability in 2 steps                     | 15.4.0 |
| 2018-12 | RAN#82 | R5-187739 | 1210 | 1 | F | Addition of SRB4 configuration to RRC connection                                          | 15.4.0 |
| 2018-12 | RAN#82 | R5-187740 | 1211 | 1 | F | Addition of Condition QMC for LTE QMC test                                                | 15.4.0 |
| 2018-12 | RAN#82 | R5-187923 | 1205 | 1 | F | Definition of additional cells for IncMon RRM Test Cases                                  | 15.4.0 |
| 2018-12 | RAN#82 | R5-187924 | 1206 | 1 | F | Message content for IncMon RRM Test Cases                                                 | 15.4.0 |
| 2018-12 | RAN#82 | R5-187976 | 1208 | 1 | F | Introduction of the support of ProSe for B72                                              | 15.4.0 |
| 2018-12 | RAN#82 | R5-187978 | 1209 | 1 | F | Introduction of B68 in ProSe test frequencies table                                       | 15.4.0 |
| 2019-03 | RAN#83 | R5-191522 | 1232 | - | F | Update RRCConnectionReconfiguration message with table references                         | 15.5.0 |
| 2019-03 | RAN#83 | R5-191553 | 1234 | - | F | Correction to 36.508 Table 8.3.2.3.1-1a                                                   | 15.5.0 |
| 2019-03 | RAN#83 | R5-191645 | 1235 | - | F | Updating p-MaxEUTRA-r15 IE part of RRCConnectionReconfiguration                           | 15.5.0 |
| 2019-03 | RAN#83 | R5-191735 | 1236 | - | F | Addition of CA_21A_42A                                                                    | 15.5.0 |
| 2019-03 | RAN#83 | R5-191768 | 1241 | - | F | Correction to CA_42E channel definition                                                   | 15.5.0 |
| 2019-03 | RAN#83 | R5-191769 | 1242 | - | F | Addition of test frequency for CA_40C-40C                                                 | 15.5.0 |
| 2019-03 | RAN#83 | R5-191770 | 1243 | - | F | Addition of test frequency for CA_48D                                                     | 15.5.0 |
| 2019-03 | RAN#83 | R5-192268 | 1247 | - | F | Addition of NB-IoT DCI Physical layer parameters for SC-PTM                               | 15.5.0 |
| 2019-03 | RAN#83 | R5-192344 | 1231 | 1 | F | Addition of support for LWA/LWIP Test Cases in generic procedures                         | 15.5.0 |
| 2019-03 | RAN#83 | R5-192713 | 1244 | 1 | F | Correction to SIB2                                                                        | 15.5.0 |

| 2019-06 | RAN#84 | R5-194641 | 1268 | - | F | Addition of test frequencies for signalling testing of CA_5A-40A and CA_5A-40C                                                | 16.1.0 |
| 2019-06 | RAN#84 | R5-194736 | 1269 | - | F | Resubmission of Addition of default IE contents for MeasGapConfig-CE                                                          | 16.1.0 |
| 2019-06 | RAN#84 | R5-194770 | 1260 | 1 | F | Introduction of GNSS requirements for aerial testing                                                                          | 16.1.0 |
| 2019-06 | RAN#84 | R5-194820 | 1272 | - | F | Introducing conditions for EN-DC PSCell handover in RRCConnectionReconfiguration                                              | 16.1.0 |
| 2019-06 | RAN#84 | R5-194875 | 1252 | 1 | F | Update LTE MeasObjectNR                                                                                                       | 16.1.0 |
| 2019-06 | RAN#84 | R5-194876 | 1266 | 1 | F | Correction to SMTC periodicity                                                                                                | 16.1.0 |
| 2019-06 | RAN#84 | R5-194877 | 1267 | 1 | F | Update of EMM messages for NR                                                                                                 | 16.1.0 |
| 2019-06 | RAN#84 | R5-194880 | 1251 | 1 | F | Introduction of test frequencies for LTE Band 85                                                                              | 16.1.0 |
| 2019-06 | RAN#84 | R5-194960 | 1271 | 1 | F | Common test frequencies for Band 73                                                                                           | 16.1.0 |
| 2019-06 | RAN#84 | R5-195069 | 1270 | 1 | F | Addition of connection diagrams for FD-MIMO                                                                                   | 16.1.0 |
| 2019-06 | RAN#84 | R5-195308 | 1257 | 1 | F | Correction to 4.5A.16.3 procedure for UEs supporting Multi-PDN and Internet configured as secondary PDN                       | 16.1.0 |
| 2019-06 | RAN#84 | R5-195321 | 1263 | 2 | F | Update of Aerial vehicle specific default message                                                                             | 16.1.0 |
| 2019-09 | RAN#85 | R5-195800 | 1273 | - | F | Addition of test frequencies for signalling testing of CA_11A_41A, CA_11A_41C, CA_11A_42A and CA_11A_42C                      | 16.2.0 |
| 2019-09 | RAN#85 | R5-196004 | 1276 | - | F | Update to 4.5A.16 generic procedure for UEs supporting Multi-PDN and Internet configured as secondary PDN with MobileData off | 16.2.0 |
| 2019-09 | RAN#85 | R5-196599 | 1284 | - | F | Correction SIB5-NB for RRM inter-frequency tests                                                                              | 16.2.0 |
| 2019-09 | RAN#85 | R5-196647 | 1285 | - | F | Update of default messages in regard to NR relevant content                                                                   | 16.2.0 |
| 2019-09 | RAN#85 | R5-196697 | 1287 | - | F | Update of RRC message SCGFailureInformationNR                                                                                 | 16.2.0 |
| 2019-09 | RAN#85 | R5-196725 | 1288 | - | F | Signalling Test environment for Band 73                                                                                       | 16.2.0 |
| 2019-09 | RAN#85 | R5-196760 | 1289 | - | F | Addition of TDD reference test frequencies for CA in operating band 41                                                        | 16.2.0 |
| 2019-09 | RAN#85 | R5-196777 | 1290 | - | F | Correction to NOTE on MCC/MNC setting for operation in EUTRA band 6                                                           | 16.2.0 |
| 2019-09 | RAN#85 | R5-196838 | 1291 | - | F | Typo corrections on NB-IoT test frequencies                                                                                   | 16.2.0 |
| 2019-09 | RAN#85 | R5-196971 | 1274 | 1 | F | Update to dataCodingScheme in SystemInformationBlockType11, required for ETWS test case                                       | 16.2.0 |
| 2019-09 | RAN#85 | R5-196977 | 1280 | 1 | F | Correction of USIM file format for V2X                                                                                        | 16.2.0 |
| 2019-09 | RAN#85 | R5-197178 | 1277 | 1 | F | Update of ReportConfigEUTRA default message                                                                                   | 16.2.0 |
| 2019-09 | RAN#85 | R5-197251 | 1278 | 1 | F | Update to Bluetooth and WLAN cells configuration                                                                              | 16.2.0 |
| 2019-09 | RAN#85 | R5-197257 | 1293 | 1 | F | Title: Update EN-DC PSCell handover condition in RRCConnectionReconfiguration                                                 | 16.2.0 |
| 2019-09 | RAN#85 | R5-197453 | 1283 | 1 | F | Addition of test freq for CA_1A-1A to 36.508                                                                                  | 16.2.0 |
| 2019-09 | RAN#85 | R5-197474 | 1281 | 1 | F | Addition of NB-IOT test frequencies for band FDD85                                                                            | 16.2.0 |
| 2019-09 | RAN#85 | R5-197488 | 1292 | 1 | F | Removing duplicate Table 4.3.1.2.9A-10: Test frequencies for CA_41F                                                           | 16.2.0 |
| 2019-12 | RAN#86 | R5-198034 | 1294 | - | F | Modification of GNSS Scenarios for aerial testing                                                                             | 16.3.0 |
| 2019-12 | RAN#86 | R5-198066 | 1296 | - | F | Correction to GNSS Scenario for aerial testing                                                                                | 16.3.0 |
| 2019-12 | RAN#86 | R5-198514 | 1302 | - | F | Update uplinkPowerControlDedicatedSCell-v1530                                                                                 | 16.3.0 |
| 2019-12 | RAN#86 | R5-198995 | 1298 | 1 | F | Update upperLayerIndication-r15 in SystemInformationBlockType2                                                                | 16.3.0 |
| 2019-12 | RAN#86 | R5-198996 | 1301 | 1 | F | Addition of N1 interworking to ACTIVATE DEFAULT EPS BEARER CONTEXT REQUEST messages                                           | 16.3.0 |
| 2019-12 | RAN#86 | R5-199411 | 1300 | 1 | F | Addition of new SIB combination for RRM EN-DC tests                                                                           | 16.3.0 |
| 2019-12 | RAN#86 | R5-199469 | 1297 | 1 | F | Addition of TDD reference test frequencies for CA_48C                                                                         | 16.3.0 |
| 2020-03 | RAN#87 | R5-200648 | 1308 |   | F | Updates to PDN Connectivity Request message                                                                                   | 16.4.0 |
| 2020-03 | RAN#87 | R5-200649 | 1309 |   | F | Updates to ESM Information Response message                                                                                   | 16.4.0 |
| 2020-03 | RAN#87 | R5-200704 | 1310 |   | F | Correction to QuantityConfig-DEFAULT                                                                                          | 16.4.0 |
| 2020-03 | RAN#87 | R5-200917 | 1306 | 1 | F | Adding missing R15 IEs into RRCConnectionReconfiguration                                                                      | 16.4.0 |
| 2020-03 | RAN#87 | R5-200989 | 1305 | 1 | F | Configuring dualConnectivityPHR IE for EN-DC scenarios                                                                        | 16.4.0 |
| 2020-03 | RAN#87 | R5-201008 | 1304 | 1 | F | Updates to condition for UEs indicating support of N1                                                                         | 16.4.0 |
| 2020-03 | RAN#87 | R5-201110 | 1307 | 1 | F | Addition of new Generic Test Procedure for IMS Re-registration in E-UTRAN and updates to clause 4.5A.3                        | 16.4.0 |
| 2020-06 | RAN#88 | R5-201426 | 1311 | - | F | Correction to Table 4.4.3.3-20-SIB24 of LTE                                                                                   | 16.5.0 |
| 2020-06 | RAN#88 | R5-201485 | 1312 | - | F | Update table 4.6.6-8A                                                                                                         | 16.5.0 |
| 2020-06 | RAN#88 | R5-201497 | 1313 | - | F | Updates to RRCConnectionReconfiguration for NR SCell                                                                          | 16.5.0 |

| 2025-06 | RAN#108 | R5-252632 | 1531 | - | F | Corrections to EMM Message CONTROL PLANE SERVICE REQUEST                                                                   | 18.9.0  |
| 2025-06 | RAN#108 | R5-252812 | 1533 | - | F | Correction to NB-IoT Defatul RRC message and information elements for RRM enhanced coverage                                | 18.9.0  |
| 2025-06 | RAN#108 | R5-252828 | 1534 | - | F | Editorial correction of typo for Ephemeris NB-IoT NTN RRM UL timing accuracy test cases                                    | 18.9.0  |
| 2025-06 | RAN#108 | R5-253045 | 1518 | 1 | F | Add generic test procedure for IMS MO add RTT                                                                              | 18.9.0  |
| 2025-06 | RAN#108 | R5-253046 | 1519 | 1 | F | Add generic test procedure for IMS MT add RTT                                                                              | 18.9.0  |
| 2025-06 | RAN#108 | R5-253047 | 1521 | 1 | F | Addition of support for EPS QoS signalling for Real-time text                                                              | 18.9.0  |
| 2025-06 | RAN#108 | R5-253048 | 1522 | 1 | F | Add generic test procedure for Emergency call add RTT                                                                      | 18.9.0  |
| 2025-06 | RAN#108 | R5-253049 | 1532 | 1 | F | Update to default message contents of Attach Accept                                                                        | 18.9.0  |
| 2025-06 | RAN#108 | R5-253131 | 1525 | 1 | F | Add EPS bearer configuration for IMS data channel                                                                          | 18.9.0  |
| 2025-06 | RAN#108 | R5-253132 | 1526 | 1 | F | Add test procedure for IMS bootstrap data channel establishment in E-UTRA                                                  | 18.9.0  |
| 2025-06 | RAN#108 | R5-253148 | 1513 | 1 | F | Addition of signalling parameters for spectrum less than 5MHz                                                              | 18.9.0  |
| 2025-06 | RAN#108 | R5-253185 | 1535 | 1 | F | Addition of NB-IoT DCI configuration for PUR                                                                               | 18.9.0  |
| 2025-06 | RAN#108 | R5-253189 | 1524 | 1 | F | Addition of signalling test frequencies and conditions for variable Tx-Rx spacing for NB-IoT for NTN band 256              | 18.9.0  |
| 2025-06 | RAN#108 | R5-253481 | 1515 | 1 | F | Correction of reference in Ephemeris Information clauses                                                                   | 18.9.0  |
| 2025-06 | RAN#108 | R5-253596 | 1517 | 1 | F | Correction of wrong DCI binary value of IoT NTN                                                                            | 18.9.0  |
| 2025-06 | RAN#108 | R5-253647 | 1516 | 1 | F | Update SIB33 for IoT NTN new RRM TCs                                                                                       | 18.9.0  |
| 2025-09 | RAN#109 | R5-253762 | 1539 |   | F | Correction to NB-IoT Generic procedure 8.1.5.2                                                                             | 18.10.0 |
| 2025-09 | RAN#109 | R5-253993 | 1541 |   | F | Correction of reference packet filters in clause 6.6.2                                                                     | 18.10.0 |
| 2025-09 | RAN#109 | R5-253994 | 1542 |   | F | Correction to RRCEarlyDataComplete-NB message                                                                              | 18.10.0 |
| 2025-09 | RAN#109 | R5-253995 | 1543 |   | F | Corrections for SIP registration                                                                                           | 18.10.0 |
| 2025-09 | RAN#109 | R5-254880 | 1550 |   | F | Test frequency and BW addition for LTE based 5G broadcast bands                                                            | 18.10.0 |
| 2025-09 | RAN#109 | R5-254917 | 1545 | 1 | F | Add generic test procedure for Emergency call and RTT                                                                      | 18.10.0 |
| 2025-09 | RAN#109 | R5-254918 | 1547 | 1 | F | Addition of signalling test frequencies and conditions for variable Tx-Rx spacing for NB-IoT for NTN band 253, 254 and 255 | 18.10.0 |
| 2025-09 | RAN#109 | R5-254919 | 1548 | 1 | F | Addition of test frequencies and updates to support protocol test coverage for NB-IoT inband in NTN NR                     | 18.10.0 |
| 2025-09 | RAN#109 | R5-254920 | 1549 | 1 | F | Correction to USIM configuration for eCall over EPS capable UEs                                                            | 18.10.0 |
| 2025-09 | RAN#109 | R5-254995 | 1538 | 1 | F | Update to default SIB24 message for NR channel BW less than 5MHz for FR1                                                   | 18.10.0 |
| 2025-09 | RAN#109 | R5-255281 | 1540 | 1 | F | Update description of Common test environment and NB-IoT Common contents of system information                             | 18.10.0 |
| 2025-09 | RAN#109 | R5-255282 | 1544 | 1 | F | IoT NTN - Test frequencies definition update for bands 254 and bands 255                                                   | 18.10.0 |
| 2025-09 | RAN#109 | R5-255283 | 1546 | 1 | F | Addition of RF test frequencies and conditions for variable Tx-Rx spacing for NB-IoT for NTN bands 253, 254 and 255        | 18.10.0 |

|         |         |           |      |   |   |                                                                                                                           |         |
|---------|---------|-----------|------|---|---|---------------------------------------------------------------------------------------------------------------------------|---------|
| 2025-12 | RAN#110 | R5-255785 | 1551 | - | F | Corrections to SysInfo contents for NB-IoT NTN operating with flexible Tx-Rx frequency separation and with in-band NR NTN | 18.11.0 |
| 2025-12 | RAN#110 | R5-255786 | 1552 | - | F | Removal of deprecated signalling GNSS scenarios                                                                           | 18.11.0 |
| 2025-12 | RAN#110 | R5-256125 | 1556 | - | F | Addition of USIM configuration for MPS when access to EPC/5GC is WLAN                                                     | 18.11.0 |
| 2025-12 | RAN#110 | R5-256406 | 1557 | - | F | Correction to references of 34.229-1                                                                                      | 18.11.0 |
| 2025-12 | RAN#110 | R5-256652 | 1555 | 1 | F | Update NAS IE for IoT NTN TCs                                                                                             | 18.11.0 |
| 2025-12 | RAN#110 | R5-255811 | 1554 | - | F | Addition of IoT NTN band 252 for SIG part                                                                                 | 19.0.0  |
| 2025-12 | RAN#110 | R5-256858 | 1553 | 1 | F | Addition of IoT NTN band 252 for RF part                                                                                  | 19.0.0  |
