**Important notice**

The present document can be downloaded from:

<https://www.etsi.org/standards-search>

The present document may be made available in electronic versions and/or in print. The content of any electronic and/or print versions of the present document shall not be modified without the prior written authorization of ETSI. In case of any existing or perceived difference in contents between such versions and/or in print, the prevailing version of an ETSI deliverable is the one made publicly available in PDF format at [www.etsi.org/deliver](http://www.etsi.org/deliver).

Users of the present document should be aware that the document may be subject to revision or change of status.

Information on the current status of this and other ETSI documents is available at

<https://portal.etsi.org/TB/ETSIDeliverableStatus.aspx>

If you find errors in the present document, please send your comment to one of the following services:

<https://portal.etsi.org/People/CommitteeSupportStaff.aspx>

If you find a security vulnerability in the present document, please report it through our  
Coordinated Vulnerability Disclosure Program:

<https://www.etsi.org/standards/coordinated-vulnerability-disclosure>

---

**Notice of disclaimer & limitation of liability**

The information provided in the present deliverable is directed solely to professionals who have the appropriate degree of experience to understand and interpret its content in accordance with generally accepted engineering or other professional standard and applicable regulations.

No recommendation as to products and services or vendors is made or should be implied.

No representation or warranty is made that this deliverable is technically accurate or sufficient or conforms to any law and/or governmental rule and/or regulation and further, no representation or warranty is made of merchantability or fitness for any particular purpose or against infringement of intellectual property rights.

In no event shall ETSI be held liable for loss of profits or any other incidental or consequential damages.

Any software contained in this deliverable is provided "AS IS" with no warranties, express or implied, including but not limited to, the warranties of merchantability, fitness for a particular purpose and non-infringement of intellectual property rights and ETSI shall not be held liable in any event for any damages whatsoever (including, without limitation, damages for loss of profits, business interruption, loss of information, or any other pecuniary loss) arising out of or related to the use of or inability to use the software.

# Intellectual Property Rights

## Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The declarations pertaining to these essential IPRs, if any, are publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "*Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards*", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<https://ipr.etsi.org/>).

Pursuant to the ETSI Directives including the ETSI IPR Policy, no investigation regarding the essentiality of IPRs, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

## Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

**DECT™**, **PLUGTESTS™**, **UMTS™** and the ETSI logo are trademarks of ETSI registered for the benefit of its Members. **3GPP™** and **LTE™** are trademarks of ETSI registered for the benefit of its Members and of the 3GPP Organizational Partners. **oneM2M™** logo is a trademark of ETSI registered for the benefit of its Members and of the oneM2M Partners. **GSM®** and the GSM logo are trademarks registered and owned by the GSM Association.

---

# Legal Notice

This Technical Specification (TS) has been produced by the ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities. These shall be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between 3GPP and ETSI identities can be found under <https://webapp.etsi.org/key/queryform.asp>.

---

# Modal verbs terminology

In the present document "**shall**", "**shall not**", "**should**", "**should not**", "**may**", "**need not**", "**will**", "**will not**", "**can**" and "**cannot**" are to be interpreted as described in clause 3.2 of the [ETSI Drafting Rules](#) (Verbal forms for the expression of provisions).

"**must**" and "**must not**" are **NOT** allowed in ETSI deliverables except when used in direct citation.

| 7.5       | Maximum Transmission Timing Difference .....                | 60 |
| 7.5.1     | Introduction .....  | 60 |
| 7.5.2     | Minimum Requirements for inter-band EN-DC .....             | 60 |
| 7.5.2.1   | Minimum Requirements for inter-band synchronous EN-DC ..... | 61 |
| 7.5.3     | Minimum Requirements for intra-band EN-DC .....             | 61 |
| 7.5.4     | Minimum Requirements for NR Carrier Aggregation .....       | 62 |
| 7.5.5     | Minimum Requirements for inter-band NE-DC .....             | 62 |
| 7.5.5.1   | Minimum Requirements for inter-band synchronous NE-DC ..... | 62 |

|           |  |    |
|-----------|--|----|
| 7.5.6     | Minimum Requirements for inter-band NR DC .....  | 63 |
| 7.6       | Maximum Receive Timing Difference .....  | 63 |
| 7.6.1     | Introduction .....   | 63 |
| 7.6.2     | Minimum Requirements for inter-band EN-DC .....  | 63 |
| 7.6.2.1   | Minimum Requirements for inter-band synchronous EN-DC .....  | 64 |
| 7.6.3     | Minimum Requirements for intra-band EN-DC .....  | 64 |
| 7.6.4     | Minimum Requirements for NR Carrier Aggregation .....  | 64 |
| 7.6.5     | Minimum Requirements for inter-band NE-DC .....  | 65 |
| 7.6.5.1   | Minimum Requirements for inter-band synchronous NE-DC .....  | 65 |
| 7.6.6     | Minimum Requirements for inter-band NR DC .....  | 66 |
| 7.7       | <i>deriveSSB-IndexFromCell</i> tolerance .....   | 66 |
| 7.7.1     | Minimum requirements .....   | 66 |
| 7.8       | Void .....   | 66 |
| 8         | Signalling characteristics .....   | 66 |
| 8.1       | Radio Link Monitoring .....  | 66 |
| 8.1.1     | Introduction .....   | 66 |
| 8.1.2     | Requirements for SSB based radio link monitoring .....   | 67 |
| 8.1.2.1   | Introduction .....   | 67 |
| 8.1.2.2   | Minimum requirement .....  | 68 |
| 8.1.2.3   | Measurement restrictions for SSB based RLM .....   | 69 |
| 8.1.3     | Requirements for CSI-RS based radio link monitoring .....  | 70 |
| 8.1.3.1   | Introduction .....   | 70 |
| 8.1.3.2   | Minimum requirement .....  | 71 |
| 8.1.3.3   | Measurement restrictions for CSI-RS based RLM .....  | 73 |
| 8.1.4     | Minimum requirement at transitions .....   | 73 |
| 8.1.5     | Minimum requirement for UE turning off the transmitter .....   | 74 |
| 8.1.6     | Minimum requirement for L1 indication .....  | 74 |
| 8.1.7     | Scheduling availability of UE during radio link monitoring .....   | 74 |
| 8.1.7.1   | Scheduling availability of UE performing radio link monitoring with a same subcarrier spacing as PDSCH/PDCCH on FR1 .....        | 74 |
| 8.1.7.2   | Scheduling availability of UE performing radio link monitoring with a different subcarrier spacing than PDSCH/PDCCH on FR1 ..... | 74 |
| 8.1.7.3   | Scheduling availability of UE performing radio link monitoring on FR2 .....  | 75 |
| 8.1.7.4   | Scheduling availability of UE performing radio link monitoring on FR1 or FR2 in case of FR1-FR2 inter-band CA and NR-DC .....    | 75 |
| 8.2       | Interruption .....   | 75 |
| 8.2.1     | EN-DC Interruption .....   | 75 |
| 8.2.1.1   | Introduction .....   | 75 |
| 8.2.1.2   | Requirements .....   | 76 |
| 8.2.1.2.1 | Interruptions at transitions between active and non-active during DRX .....  | 76 |
| 8.2.1.2.2 | Interruptions at transitions from non-DRX to DRX .....   | 76 |
| 8.2.1.2.3 | Interruptions at SCell addition/release .....  | 76 |
| 8.2.1.2.4 | Interruptions at SCell activation/deactivation .....   | 77 |
| 8.2.1.2.5 | Interruptions during measurements on SCC .....   | 78 |
| 8.2.1.2.6 | Interruptions at UL carrier RRC reconfiguration .....  | 79 |
| 8.2.1.2.7 | Interruptions due to Active BWP switching Requirement .....  | 79 |
| 8.2.2     | SA: Interruptions with Standalone NR Carrier Aggregation .....   | 80 |
| 8.2.2.1   | Introduction .....   | 80 |
| 8.2.2.2   | Requirements .....   | 81 |
| 8.2.2.2.1 | Interruptions at SCell addition/release .....  | 81 |
| 8.2.2.2.2 | Interruptions at SCell activation/deactivation .....   | 81 |
| 8.2.2.2.3 | Interruptions during measurements on deactivated SCC .....   | 82 |
| 8.2.2.2.4 | Interruptions at UL carrier RRC reconfiguration .....  | 83 |
| 8.2.2.2.5 | Interruptions due to Active BWP switching Requirement .....  | 83 |
| 8.2.2.2.6 | Interruptions at inter-frequency SFTD measurement .....  | 84 |
| 8.2.3     | NE-DC Interruptions .....  | 85 |
| 8.2.3.1   | Introduction .....   | 85 |
| 8.2.3.2   | Requirements .....   | 85 |
| 8.2.3.2.1 | Interruptions at transitions between active and non-active during DRX .....  | 85 |
| 8.2.3.2.2 | Interruptions at transitions from non-DRX to DRX .....   | 86 |
| 8.2.3.2.3 | Interruptions at PSCell/SCell addition/release .....   | 86 |

|           |  |     |
|-----------|--|-----|
| 8.2.3.2.4 | Interruptions at SCell activation/deactivation.....  | 87  |
| 8.2.3.2.5 | Interruptions during measurements on SCC.....  | 88  |
| 8.2.3.2.6 | Interruptions at UL carrier RRC reconfiguration .....  | 89  |
| 8.2.3.2.7 | Interruptions due to Active BWP switching Requirement .....  | 89  |
| 8.2.4     | NR-DC: Interruptions .....   | 89  |
| 8.2.4.1   | Introduction.....  | 89  |
| 8.2.4.2   | Requirements .....   | 90  |
| 8.2.4.2.1 | Interruptions at PSCell/SCell addition/release .....   | 90  |
| 8.2.4.2.2 | Interruptions at SCell activation/deactivation.....  | 90  |
| 8.2.4.2.3 | Interruptions during measurements on SCC.....  | 91  |
| 8.2.4.2.4 | Interruptions at UL carrier RRC reconfiguration .....  | 91  |
| 8.2.4.2.5 | Interruptions due to Active BWP switching Requirement .....  | 92  |
| 8.2.4.2.6 | Interruptions at transitions between active and non-active during DRX .....  | 92  |
| 8.2.4.2.7 | Interruptions at transitions from non-DRX to DRX .....   | 92  |
| 8.3       | SCell Activation and Deactivation Delay.....   | 92  |
| 8.3.1     | Introduction.....  | 92  |
| 8.3.2     | SCell Activation Delay Requirement for Deactivated SCell .....   | 93  |
| 8.3.3     | SCell Deactivation Delay Requirement for Activated SCell .....   | 96  |
| 8.4       | UE UL carrier RRC reconfiguration delay.....   | 97  |
| 8.4.1     | Introduction.....  | 97  |
| 8.4.2     | UE UL carrier configuration delay requirement .....  | 97  |
| 8.4.3     | UE UL carrier deconfiguration delay requirement .....  | 97  |
| 8.5       | Link Recovery Procedures .....   | 97  |
| 8.5.1     | Introduction.....  | 97  |
| 8.5.2     | Requirements for SSB based beam failure detection.....   | 98  |
| 8.5.2.1   | Introduction.....  | 98  |
| 8.5.2.2   | Minimum requirement .....  | 98  |
| 8.5.2.3   | Measurement restriction for SSB based beam failure detection.....  | 100 |
| 8.5.3     | Requirements for CSI-RS based beam failure detection.....  | 100 |
| 8.5.3.1   | Introduction.....  | 100 |
| 8.5.3.2   | Minimum requirement .....  | 101 |
| 8.5.3.3   | Measurement restrictions for CSI-RS beam failure detection.....  | 102 |
| 8.5.4     | Minimum requirement for L1 indication .....  | 103 |
| 8.5.5     | Requirements for SSB based candidate beam detection .....  | 104 |
| 8.5.5.1   | Introduction.....  | 104 |
| 8.5.5.2   | Minimum requirement .....  | 104 |
| 8.5.5.3   | Measurement restriction for SSB based candidate beam detection.....  | 105 |
| 8.5.6     | Requirements for CSI-RS based candidate beam detection.....  | 106 |
| 8.5.6.1   | Introduction.....  | 106 |
| 8.5.6.2   | Minimum requirement .....  | 106 |
| 8.5.6.3   | Measurement restriction for CSI-RS based candidate beam detection .....  | 108 |
| 8.5.7     | Scheduling availability of UE during beam failure detection .....  | 108 |
| 8.5.7.1   | Scheduling availability of UE performing beam failure detection with a same subcarrier spacing as PDSCH/PDCCH on FR1 .....       | 108 |
| 8.5.7.2   | Scheduling availability of UE performing beam failure detection with a different subcarrier spacing than PDSCH/PDCCH on FR1..... | 108 |
| 8.5.7.3   | Scheduling availability of UE performing beam failure detection on FR2 .....   | 109 |
| 8.5.7.4   | Scheduling availability of UE performing beam failure detection on FR1 or FR2 in case of FR1-FR2 inter-band CA and NR DC .....   | 109 |
| 8.5.8     | Scheduling availability of UE during candidate beam detection .....  | 109 |
| 8.5.8.1   | Scheduling availability of UE performing L1-RSRP measurement with a same subcarrier spacing as PDSCH/PDCCH on FR1 .....          | 109 |
| 8.5.8.2   | Scheduling availability of UE performing L1-RSRP measurement with a different subcarrier spacing than PDSCH/PDCCH on FR1.....    | 109 |
| 8.5.8.3   | Scheduling availability of UE performing L1-RSRP measurement on FR2 .....  | 110 |
| 8.5.8.4   | Scheduling availability of UE performing L1-RSRP measurement on FR1 or FR2 in case of FR1-FR2 inter-band CA and NR-DC.....       | 110 |
| 8.5.9     | Minimum requirement at transitions for beam failure detection.....   | 110 |
| 8.6       | Active BWP switch delay.....   | 111 |
| 8.6.1     | Introduction.....  | 111 |
| 8.6.2     | DCI and timer based BWP switch delay.....  | 111 |
| 8.6.3     | RRC based BWP switch delay.....  | 112 |

| <b>Annex A (normative): Test Cases .....</b> |  | <b>210</b> |
| A.1  | Purpose of annex .....   | 210        |
| A.2  | Requirement classification for statistical testing.....                                    | 210        |
| A.2.1  | Types of requirements in TS 38.133 .....   | 210        |
| A.2.1.1                                      | Time and delay requirements on UE higher layer actions .....                               | 210        |
| A.2.1.2                                      | Measurements of power levels, relative powers and time .....                               | 211        |
| A.2.1.3                                      | Implementation requirements .....  | 211        |
| A.2.1.4                                      | Physical layer timing requirements.....  | 211        |
| A.3  | RRM test configurations .....  | 211        |
| A.3.1  | Reference measurement channels.....  | 211        |
| A.3.1.1                                      | PDSCH .....  | 211        |
| A.3.1.1.1                                    | FDD.....   | 211        |
| A.3.1.1.2                                    | TDD .....  | 212        |
| A.3.1.2                                      | CORESET for RMSI scheduling .....  | 215        |
| A.3.1.2.1                                    | FDD.....   | 215        |
| A.3.1.2.2                                    | TDD .....  | 216        |
| A.3.1.3                                      | CORESET for RMC scheduling .....   | 218        |
| A.3.1.3.1                                    | FDD.....   | 218        |
| A.3.1.3.2                                    | TDD .....  | 219        |
| A.3.1.4                                      | TDD UL/DL configuration .....  | 221        |
| A.3.2  | OFDMA channel noise generator (OCNG).....  | 222        |
| A.3.2.1                                      | Generic OFDMA Channel Noise Generator (OCNG) .....   | 222        |
| A.3.2.1.1                                    | OCNG pattern 1: Generic OCNG pattern for all unused REs .....                              | 222        |
| A.3.2.1.2                                    | OCNG pattern 2: Generic OCNG pattern for all unused REs for 2AoA setup .....               | 222        |
| A.3.2.1.3                                    | OCNG pattern 3: Generic OCNG pattern for unused REs in the same bandwidth as CORESET ..... | 223        |
| A.3.2.1.4                                    | OCNG pattern 4: Generic OCNG pattern for all unused REs outside SSB slot(s).....           | 223        |
| A.3.2.2                                      | Void .....   | 225        |
| A.3.3  | Reference DRX configurations .....   | 225        |

|             |  |     |
|-------------|--|-----|
| A.3.3.1     | DRX Configuration 1: DRX cycle = 40 ms and TAT = 500 ms.....             | 225 |
| A.3.3.2     | DRX Configuration 2: DRX cycle = 640 ms and TAT = 500 ms.....            | 225 |
| A.3.3.3     | DRX Configuration 3: DRX cycle = 40 ms and TAT = Infinity .....          | 225 |
| A.3.3.4     | DRX Configuration 4: DRX cycle = 160 ms and TAT = Infinity .....         | 226 |
| A.3.3.5     | DRX Configuration 5: DRX cycle = 320 ms and TAT = Infinity .....         | 226 |
| A.3.3.6     | DRX Configuration 6: DRX cycle = 320 ms and TAT = 500 ms.....            | 226 |
| A.3.3.7     | DRX Configuration 7: DRX cycle = 640 ms and TAT = Infinity .....         | 227 |
| A.3.3.8     | DRX Configuration 8: DRX cycle = 320 ms and TAT = Infinity .....         | 227 |
| A.3.3.9     | DRX Configuration 9: DRX cycle = 40 ms and TAT = 500 ms.....             | 227 |
| A.3.3.10    | DRX Configuration 10: DRX cycle = 640 ms and TAT = 500 ms.....           | 228 |
| A.3.3.11    | DRX Configuration 11: DRX cycle = 20 ms and TAT = Infinity .....         | 228 |
| A.3.3.12    | DRX Configuration 12: DRX cycle = 640 ms and TAT = Infinity .....        | 228 |
| A.3.4       | Test Cases with Different Channel Bandwidths.....                        | 229 |
| A.3.4.1     | Test Cases with Different E-UTRA Channel Bandwidths.....                 | 229 |
| A.3.4.1.1   | Introduction.....  | 229 |
| A.3.4.1.2   | Principle of testing .....   | 229 |
| A.3.5       | Test Cases for Synchronous and Asynchronous DC Operations.....           | 229 |
| A.3.5.1     | EN-DC Test Cases for Synchronous and Asynchronous EN-DC Operations ..... | 229 |
| A.3.5.1.1   | Introduction.....  | 229 |
| A.3.5.1.2   | Principle of Testing.....  | 229 |
| A.3.6       | Antenna configurations .....   | 229 |
| A.3.6.1     | Antenna configurations for FR1 .....                                     | 229 |
| A.3.6.1.1   | Antenna connection for 4 Rx capable UEs .....                            | 230 |
| A.3.6.1.1.1 | Introduction .....   | 230 |
| A.3.6.1.1.2 | Principle of testing.....  | 230 |
| A.3.6.2     | Antenna configurations for FR2 .....                                     | 232 |
| A.3.7       | EN-DC test setup.....  | 232 |
| A.3.7.1     | Introduction.....  | 232 |
| A.3.7.2     | E-UTRAN Serving Cell Parameters .....                                    | 232 |
| A.3.7.2.1   | E-UTRAN Serving Cell Parameters for Tests with NR Cell(s) in FR1 .....   | 232 |
| A.3.7.2.2   | E-UTRAN Serving Cell Parameters for Tests with NR Cell(s) in FR2 .....   | 234 |
| A.3.7A      | NR FR1-FR2 test setup .....  | 235 |
| A.3.7B      | Void.....  | 235 |
| A.3.7C      | LTE-FR1/FR2 test setup .....   | 235 |
| A.3.7D      | NE-DC test setup.....  | 235 |
| A.3.7D.1    | Introduction.....  | 235 |
| A.3.7D.2    | E-UTRAN Serving Cell Parameters .....                                    | 235 |
| A.3.7D.2.1  | E-UTRAN Serving Cell Parameters for Tests with NR Cell(s) in FR1 .....   | 235 |
| A.3.7D.2.2  | E-UTRAN Serving Cell Parameters for Tests with NR Cell(s) in FR2 .....   | 235 |
| A.3.8       | PRACH configurations.....  | 235 |
| A.3.8.1     | Introduction.....  | 235 |
| A.3.8.2     | PRACH configurations in FR1 .....  | 236 |
| A.3.8.2.1   | FR1 PRACH configuration 1 .....  | 236 |
| A.3.8.2.2   | FR1 PRACH configuration 2 .....  | 236 |
| A.3.8.2.3   | FR1 PRACH configuration 3 .....  | 237 |
| A.3.8.2.4   | FR1 PRACH configuration 4 .....  | 238 |
| A.3.8.3     | PRACH configurations in FR2 .....  | 238 |
| A.3.8.3.1   | FR2 PRACH configuration 1 .....  | 238 |
| A.3.8.3.2   | FR2 PRACH configuration 2 .....  | 239 |
| A.3.8.3.3   | FR2 PRACH configuration 3 .....  | 240 |
| A.3.8.3.4   | FR2 PRACH configuration 4 .....  | 241 |
| A.3.9       | BWP configurations .....   | 241 |
| A.3.9.1     | Introduction.....  | 241 |
| A.3.9.2     | Downlink BWP configurations.....   | 241 |
| A.3.9.2.1   | Initial BWP .....  | 241 |
| A.3.9.2.2   | Dedicated BWP.....   | 242 |
| A.3.9.3     | Uplink BWP configurations.....   | 242 |
| A.3.9.3.1   | Initial BWP .....  | 242 |
| A.3.9.3.2   | Dedicated BWP.....   | 242 |
| A.3.10      | SSB Configurations .....   | 243 |
| A.3.10.1    | SSB Configurations for FR1 .....   | 243 |
| A.3.10.1.1  | SSB pattern 1 in FR1: SSB allocation for SSB SCS=15 kHz in 10 MHz.....   | 243 |

|             |  |     |
|-------------|--|-----|
| A.3.10.1.2  | SSB pattern 2 in FR1: SSB allocation for SSB SCS=30 kHz in 40 MHz .....                                    | 243 |
| A.3.10.1.3  | SSB pattern 3 in FR1: SSB allocation for SSB SCS=15 kHz in 10 MHz .....                                    | 244 |
| A.3.10.1.4  | SSB pattern 4 in FR1: SSB allocation for SSB SCS=30 kHz in 40 MHz .....                                    | 244 |
| A.3.10.1.5  | SSB pattern 5 in FR1: SSB allocation for SSB SCS=15 kHz starting from odd SFN in 10 MHz .....              | 245 |
| A.3.10.1.6  | SSB pattern 6 in FR1: SSB allocation for SSB SCS=30 kHz starting from odd SFN in 40 MHz .....              | 245 |
| A.3.10.2    | SSB Configurations for FR2 .....   | 245 |
| A.3.10.2.1  | SSB pattern 1 in FR2: SSB allocation for SSB SCS=120 kHz in 100 MHz .....                                  | 245 |
| A.3.10.2.2  | SSB pattern 2 in FR2: SSB allocation for SSB SCS=240 kHz in 100 MHz .....                                  | 246 |
| A.3.10.2.3  | SSB pattern 3 in FR2: SSB allocation for SSB SCS=120 kHz in 100 MHz .....                                  | 246 |
| A.3.10.2.4  | SSB pattern 4 in FR2: SSB allocation for SSB SCS=240 kHz in 100 MHz .....                                  | 247 |
| A.3.10.2.5  | SSB pattern 5 in FR2: SSB allocation for SSB SCS=120 kHz in 100 MHz .....                                  | 247 |
| A.3.10.2.6  | SSB pattern 6 in FR2: SSB allocation for SSB SCS=240 kHz in 100 MHz .....                                  | 247 |
| A.3.10.2.7  | SSB pattern 7 in FR2: SSB allocation for SSB SCS=120 kHz in 100 MHz .....                                  | 248 |
| A.3.10.2.8  | SSB pattern 8 in FR2: SSB allocation for SSB SCS=240 kHz in 100 MHz .....                                  | 248 |
| A.3.11      | SMTC Configurations .....  | 249 |
| A.3.11.1    | SMTC pattern 1: SMTC period = 20 ms with SMTC duration = 1 ms .....  | 249 |
| A.3.11.2    | SMTC pattern 2: SMTC period = 20 ms with SMTC duration = 5 ms .....  | 249 |
| A.3.11.3    | SMTC pattern 3: SMTC period = 160 ms with SMTC duration = 1 ms .....                                       | 249 |
| A.3.11.4    | SMTC pattern 4: SMTC period = 20 ms with SMTC duration = 1 ms .....  | 249 |
| A.3.11.5    | SMTC pattern 5: SMTC period = 20 ms with SMTC duration = 5 ms .....  | 250 |
| A.3.11.6    | SMTC pattern 6: SMTC period = 20 ms with SMTC duration = 5 ms .....  | 250 |
| A.3.12      | Test Cases with Different CC Configurations .....  | 250 |
| A.3.12.1    | EN-DC Test Cases with Different EN-DC Configurations .....   | 250 |
| A.3.12.1.1  | Introduction .....   | 250 |
| A.3.12.1.2  | Principle of testing .....   | 250 |
| A.3.12.2    | Carrier Aggregation Test Cases with Different CA Configurations .....                                      | 250 |
| A.3.12.2.1  | Introduction .....   | 250 |
| A.3.12.2.2  | Principle of testing .....   | 251 |
| A.3.13      | Test Cases in SA and EN-DC Operations .....  | 251 |
| A.3.13.1    | Introduction .....   | 251 |
| A.3.13.2    | Principle of Testing .....   | 251 |
| A.3.13A     | Test Cases involving E-UTRA/FR1 and FR2 carriers .....   | 251 |
| A.3.13A.1   | Introduction .....   | 251 |
| A.3.13A.2   | Principle of Testing in EN-DC .....  | 251 |
| A.3.13A.3   | Principle of Testing in SA .....   | 252 |
| A.3.13A.4   | Principle of Testing in E-UTRA .....   | 252 |
| A.3.13B     | Test Cases for EN-DC and NE-DC Operations .....  | 253 |
| A.3.13B.1   | Active BWP switch Test Cases for EN-DC and NE-DC Operations .....  | 253 |
| A.3.13B.1.1 | Introduction .....   | 253 |
| A.3.13B.1.2 | Principle of Testing .....   | 253 |
| A.3.13B.2   | SFTD accuracy Test Cases for EN-DC and NE-DC Operations .....  | 253 |
| A.3.13B.2.1 | Introduction .....   | 253 |
| A.3.13B.2.2 | Principle of Testing .....   | 253 |
| A.3.14      | CSI-RS configurations .....  | 254 |
| A.3.14.1    | FDD .....  | 254 |
| A.3.14.2    | TDD .....  | 254 |
| A.3.15      | Angle of Arrival (AoA) for FR2 RRM test cases .....  | 257 |
| A.3.15.1    | Setup 1: Single AoA in Rx beam peak direction .....  | 257 |
| A.3.15.2    | Setup 2: Single AoA in non Rx beam peak direction .....  | 257 |
| A.3.15.2.1  | Setup 2a: Single AoA in non Rx beam peak direction without change in direction .....                       | 257 |
| A.3.15.2.2  | Setup 2b: Single AoA in non Rx beam peak direction with change in direction .....                          | 257 |
| A.3.15.3    | Setup 3: 2 AoAs .....  | 257 |
| A.3.15.4    | Setup 4: 2 AoAs, 1 AoA in Rx beam peak direction, 1 in non Rx beam peak .....                              | 258 |
| A.3.15.4.1  | Setup 4a: 2 AoAs, 1 AoA in Rx beam peak direction, 1 in non Rx beam peak without change in direction ..... | 258 |
| A.3.15.4.2  | Setup 4b: 2 AoAs, 1 AoA in Rx beam peak direction, 1 in non Rx beam peak with change in direction .....    | 258 |
| A.3.16      | TCI State Configuration .....  | 258 |
| A.3.16.1    | Introduction .....   | 258 |
| A.3.16.2    | TCI states .....   | 259 |
| A.3.17      | Configurations of CSI-RS for tracking .....  | 259 |
| A.3.17.1    | Configuration of CSI-RS for tracking for FR1 .....   | 259 |

|---------------|---|-----|
| A.7.5.1.2.1   | Test Purpose and Environment.....   | 898 |
| A.7.5.1.2.2   | Test Requirements.....  | 901 |
| A.7.5.1.3     | Radio Link Monitoring Out-of-sync Test for FR2 PCell configured with SSB-based RLM RS in DRX mode.....  | 901 |
| A.7.5.1.3.1   | Test Purpose and Environment.....   | 901 |
| A.7.5.1.3.2   | Test Requirements.....  | 904 |
| A.7.5.1.4     | Radio Link Monitoring In-sync Test for FR2 PCell configured with SSB-based RLM RS in DRX mode.....  | 904 |
| A.7.5.1.4.1   | Test Purpose and Environment.....   | 904 |
| A.7.5.1.4.2   | Test Requirements.....  | 907 |
| A.7.5.1.5     | Radio Link Monitoring Out-of-sync Test for FR2 PCell configured with CSI-RS-based RLM in non-DRX mode.....  | 907 |
| A.7.5.1.5.1   | Test Purpose and Environment.....   | 907 |
| A.7.5.1.5.2   | Test Requirements.....  | 910 |
| A.7.5.1.6     | Radio Link Monitoring In-sync Test for FR2 PCell configured with CSI-RS-based RLM in non-DRX mode.....  | 910 |
| A.7.5.1.6.1   | Test Purpose and Environment.....   | 910 |
| A.7.5.1.6.2   | Test Requirements.....  | 913 |
| A.7.5.1.7     | Radio Link Monitoring Out-of-sync Test for FR2 PCell configured with CSI-RS-based RLM in DRX mode.....  | 914 |
| A.7.5.1.7.1   | Test Purpose and Environment.....   | 914 |
| A.7.5.1.7.2   | Test Requirements.....  | 916 |
| A.7.5.1.8     | Radio Link Monitoring In-sync Test for FR2 PCell configured with CSI-RS-based RLM in DRX mode.....  | 917 |
| A.7.5.1.8.1   | Test Purpose and Environment.....   | 917 |
| A.7.5.1.8.2   | Test Requirements.....  | 920 |
| A.7.5.1.9     | UE Radio Link Monitoring Scheduling Restrictions on FR2.....  | 920 |
| A.7.5.1.9.1   | Test Purpose and Environment.....   | 920 |
| A.7.5.1.9.2   | Test Requirements.....  | 922 |
| A.7.5.2.1     | Interruptions during measurements on deactivated NR SCC in FR2.....   | 922 |
| A.7.5.3.1     | SCell Activation and deactivation for SCell in FR2 intra-band in non-DRX.....   | 925 |
| A.7.5.3.1.1   | Test Purpose and Environment.....   | 925 |
| A.7.5.3.1.2   | Test Requirements.....  | 927 |
| A.7.5.3.2     | SCell Activation and deactivation for FR1+FR2 inter-band with target SCell in FR2.....  | 927 |
| A.7.5.3.2.1   | Test Purpose and Environment.....   | 927 |
| A.7.5.3.2.2   | Test Requirements.....  | 930 |
| A.7.5.5.1     | Beam Failure Detection and Link Recovery Test for FR2 PCell configured with SSB-based BFD and LR in non-DRX mode.....                                       | 931 |
| A.7.5.5.1.1   | Test Purpose and Environment.....   | 931 |
| A.7.5.5.1.2   | Test Requirements.....  | 934 |
| A.7.5.5.2     | Beam Failure Detection and Link Recovery Test for FR2 PCell configured with SSB-based BFD and LR in DRX mode.....   | 935 |
| A.7.5.5.2.1   | Test Purpose and Environment.....   | 935 |
| A.7.5.5.2.2   | Test Requirements.....  | 938 |
| A.7.5.5.3     | Beam Failure Detection and Link Recovery Test for FR2 PCell configured with CSI-RS-based BFD and LR in non-DRX mode.....                                    | 939 |
| A.7.5.5.3.1   | Test Purpose and Environment.....   | 939 |
| A.7.5.5.3.2   | Test Requirements.....  | 942 |
| A.7.5.5.4     | Beam Failure Detection and Link Recovery Test for FR2 PCell configured with CSI-RS-based BFD and LR in DRX mode.....  | 942 |
| A.7.5.5.4.1   | Test Purpose and Environment.....   | 942 |
| A.7.5.5.4.2   | Test Requirements.....  | 946 |
| A.7.5.5.5     | Scheduling availability restriction during Beam Failure Detection and Link Recovery for FR2 PCell configured with SSB-based BFD and LR in non-DRX mode..... | 946 |
| A.7.5.5.5.1   | Test Purpose and Environment.....   | 946 |
| A.7.5.5.5.2   | Test Requirements.....  | 950 |
| A.7.5.6.1     | DCI-based and Timer-based Active BWP Switch.....  | 950 |
| A.7.5.6.1.1   | NR FR2- NR FR2 DL active BWP switch of SCell with non-DRX in SA.....  | 950 |
| A.7.5.6.1.2   | NR FR1- NR FR2 DL active BWP switch of SCell with non-DRX in SA.....  | 954 |
| A.7.5.6.1.3   | NR FR2 DL active BWP switch with non-DRX in SA.....   | 958 |
| A.7.5.6.1.3.1 | Test Purpose and Environment.....   | 958 |
| A.7.5.6.1.3.2 | Test Requirements.....  | 960 |

|             |  |      |
|-------------|--|------|
| A.7.5.6.2   | RRC-based Active BWP Switch .....  | 961  |
| A.7.5.7.1   | Addition and Release Delay of known NR PSCell .....  | 964  |
| A.7.5.7.1.1 | Test Purpose and Environment.....  | 964  |
| A.7.5.7.2   | Addition and Release Delay of unknown NR PSCell .....  | 967  |
| A.7.5.7.2.1 | Test Purpose and Environment.....  | 967  |
| A.7.5.8.1   | MAC-CE based active TCI state switch.....  | 969  |
| A.7.5.8.2   | RRC based active TCI state switch .....  | 973  |
| A.7.6       | Measurement procedure .....  | 977  |
| A.7.6.1.1   | SA event triggered reporting test without gap under non-DRX .....  | 977  |
| A.7.6.1.1.1 | Test purpose and Environment .....   | 977  |
| A.7.6.1.1.2 | Test Requirements .....  | 980  |
| A.7.6.1.2   | SA event triggered reporting test without gap under DRX .....  | 980  |
| A.7.6.1.2.1 | Test purpose and Environment .....   | 980  |
| A.7.6.1.2.2 | Test Requirements .....  | 983  |
| A.7.6.1.3   | SA event triggered reporting test with per-UE gaps under non-DRX .....   | 983  |
| A.7.6.1.3.1 | Test purpose and Environment .....   | 983  |
| A.7.6.1.3.2 | Test Requirements .....  | 986  |
| A.7.6.1.4   | SA event triggered reporting test with per-UE gaps under DRX .....   | 987  |
| A.7.6.1.4.1 | Test purpose and Environment .....   | 987  |
| A.7.6.1.4.2 | Test Requirements .....  | 989  |
| A.7.6.2.1   | SA event triggered reporting tests For FR2 without SSB time index detection when DRX is not used (PCell in FR2)..... | 990  |
| A.7.6.2.1.1 | Test Purpose and Environment.....  | 990  |
| A.7.6.2.1.2 | Test Requirements .....  | 992  |
| A.7.6.2.2   | SA event triggered reporting tests For FR2 without SSB time index detection when DRX is used (PCell in FR2) .....    | 992  |
| A.7.6.2.2.1 | Test Purpose and Environment.....  | 992  |
| A.7.6.2.2.2 | Test Requirements .....  | 995  |
| A.7.6.2.3   | SA event triggered reporting tests For FR2 with SSB time index detection when DRX is not used (PCell in FR2) .....   | 995  |
| A.7.6.2.3.1 | Test Purpose and Environment.....  | 995  |
| A.7.6.2.3.2 | Test Requirements .....  | 998  |
| A.7.6.2.4   | SA event triggered reporting tests For FR2 with SSB time index detection when DRX is used (PCell in FR2) .....       | 998  |
| A.7.6.2.4.1 | Test Purpose and Environment.....  | 998  |
| A.7.6.2.4.2 | Test Requirements .....  | 1001 |
| A.7.6.2.5   | SA event triggered reporting tests for FR2 without SSB time index detection when DRX is not used (PCell in FR1)..... | 1001 |
| A.7.6.2.5.1 | Test Purpose and Environment.....  | 1001 |
| A.7.6.2.5.2 | Test Requirements .....  | 1004 |
| A.7.6.2.6   | SA event triggered reporting tests for FR2 without SSB time index detection when DRX is used (PCell in FR1) .....    | 1005 |
| A.7.6.2.6.1 | Test Purpose and Environment.....  | 1005 |
| A.7.6.2.6.2 | Test Requirements .....  | 1008 |
| A.7.6.2.7   | SA event triggered reporting tests for FR2 with SSB time index detection when DRX is not used (PCell in FR1) .....   | 1008 |
| A.7.6.2.7.1 | Test Purpose and Environment.....  | 1008 |
| A.7.6.2.7.2 | Test Requirements .....  | 1011 |
| A.7.6.2.8   | SA event triggered reporting tests for FR2 with SSB time index detection when DRX is used (PCell in FR1) .....       | 1012 |
| A.7.6.2.8.1 | Test Purpose and Environment.....  | 1012 |
| A.7.6.2.8.2 | Test Requirements .....  | 1015 |
| A.7.6.3     | L1-RSRP measurement for beam reporting.....  | 1015 |
| A.7.6.3.1   | SSB based L1-RSRP measurement when DRX is not used .....   | 1015 |
| A.7.6.3.1.1 | Test Purpose and Environment.....  | 1015 |
| A.7.6.3.1.2 | Test parameters.....   | 1016 |
| A.7.6.3.1.3 | Test Requirements .....  | 1017 |
| A.7.6.3.2   | SSB based L1-RSRP measurement when DRX is used .....   | 1018 |
| A.7.6.3.2.1 | Test Purpose and Environment.....  | 1018 |
| A.7.6.3.2.2 | Test parameters.....   | 1018 |
| A.7.6.3.2.3 | Test Requirements .....  | 1020 |
| A.7.6.3.3   | CSI-RS based L1-RSRP measurement when DRX is not used.....   | 1020 |

|             |   |      |
|-------------|---|------|
| A.7.6.3.3.1 | Test Purpose and Environment.....   | 1020 |

# Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

---

# 1 Scope

The present document specifies requirements for support of Radio Resource Management for the FDD and TDD modes of New Radio (NR). These requirements include requirements on measurements in NR and the UE as well as requirements on node dynamical behaviour and interaction, in terms of delay and response characteristics.

---

# 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

## 3 Definitions, symbols and abbreviations

### 3.1 Definitions

For the purposes of the present document, the terms and definitions given in TR 21.905 [11] and the following apply. A term defined in the present document takes precedence over the definition of the same term, if any, in TR 21.905 [11].

**Active DL BWP:** Active DL bandwidth part as defined in TS 38.213 [3].

**Blackbox Approach:** Testing methodology, in which the UE internal implementation of certain specific UE functionality involved in the test, is unknown.

**Control Resource Set:** As defined in TS 38.213 [3].

**DL BWP:** DL bandwidth part as defined in TS 38.213 [3].

**EN-DC:** E-UTRA-NR Dual Connectivity as defined in clause 4.1.2 of TS 37.340 [17].

**en-gNB:** As defined in TS 37.340 [17].

**FR1:** Frequency range 1 as defined in clause 5.1 of TS 38.104 [13].

**FR2:** Frequency range 2 as defined in clause 5.1 of TS 38.104 [13].

**gNB:** as defined in TS 38.300 [10].

**Master Cell Group:** As defined in TS 38.331 [2].

**Multi-Radio Dual Connectivity:** Dual Connectivity between E-UTRA and NR nodes, or between two NR nodes, as defined in TS 37.340 [17].

**ng-eNB:** As defined in TS 38.300 [10].

**NE-DC:** NR-E-UTRA Dual Connectivity as defined in clause 4.1.3.2 of TS 37.340 [17].

**NGEN-DC:** NG-RAN E-UTRA-NR Dual Connectivity as defined in clause 4.1.3.1 of TS 37.340 [17].

**NR-DC:** NR-NR Dual Connectivity as defined in clause 4.1.3.3 of TS 37.340 [17].

**Primary Cell:** As defined in TS 38.331 [2].

**Quasi Co-Location:** As defined in TS 38.214 [26].

**RLM-RS resource:** A resource out of the set of resources configured for RLM by higher layer parameter RLM-RS-List [2] as defined in TS 38.213 [3].

**SA operation mode:** Operation mode when the UE is configured with at least PCell and not any MR-DC.

**Secondary Cell:** As defined in TS 38.331 [2].

**Secondary Cell Group:** As defined in TS 38.331 [2].

**Serving Cell:** As defined in TS 38.331 [2].

**SMTC:** An SSB-based measurement timing configuration configured by *SSB-MeasurementTimingConfiguration* as specified in TS 38.331 [2].

**Special Cell:** As defined in TS 38.331 [2].

**SSB:** SS/PBCH block as defined in clause 7.8.3 of TS 38.211 [6].

**Timing Advance Group:** As defined in TS 38.331 [2].

## 3.2 Symbols

For the purposes of the present document, the following symbols apply:

|                        |  |
|------------------------|--|
| $BW_{\text{Channel}}$  | Channel bandwidth, defined in TS 38.101-1, 38.101-2 and 38.101-3 subclause 3.2   |
| $\hat{E}_s$            | Received energy per RE (power normalized to the subcarrier spacing) during the useful part of the symbol, i.e. excluding the cyclic prefix, at the UE antenna connector or radiated interface boundary   |
| $F_c$                  | <i>RF reference frequency</i> on the channel raster, given in table 5.4.2.2-1 in TS 38.101-1 and 38.101-2  |
| $F_{c,\text{low}}$     | The $F_c$ of the lowest carrier, expressed in MHz  |
| $I_o$                  | The total received power density, including signal and interference, as measured at the UE antenna connector or radiated interface boundary.   |
| $I_{oc}$               | The power spectral density (integrated in a noise bandwidth equal to the chip rate and normalized to the chip rate) of a band limited noise source (simulating interference from cells, which are not defined in a test procedure) as measured at the UE antenna connector or radiated interface boundary. |
| $I_{ot}$               | The received power spectral density of the total noise and interference for a certain RE (power integrated over the RE and normalized to the subcarrier spacing) as measured at the UE antenna connector or radiated interface boundary  |
| $N_{oc}$               | The power spectral density of a white noise source (average power per RE normalised to the subcarrier spacing), simulating interference from cells that are not defined in a test procedure, as measured at the UE antenna connector or radiated interface boundary  |
| $n_{PRB}$              | Physical Resource Block number as defined in clause 3.2 in TS 38.211.  |
| $N_{TA}$               | Timing offset between uplink and downlink radio frames at the UE, as defined in clause 4.2 in TS 38.213.   |
| $N_{TA\text{ offset}}$ | Fixed timing advance offset, as defined in clause 7.1.2 in TS 38.133.  |
| $P_{CMAX}$             | Configured UE transmitted power as defined in clause 6.2.4 in TS 38.101-1, 38.101-2 and 38.101-3.  |
| $P_{CMAX,c}$           | Configured UE transmitted power on a serving cell $c$ as defined in clause 6.2.4 in TS 38.101-1, 38.101-2 and 38.101-3   |
| $S$                    | Cell Selection Criterion defined in TS 38.304, subclause 5.2.3.2 for NR  |
| SSB_RP                 | Received (linear) average power of the resource elements that carry NR synchronisation burst, measured at the UE antenna connector or radiated interface boundary  |

|                                    |   |
|------------------------------------|---|
| Srxlev                             | Cell selection RX level, defined in TS 38.304, subclause 5.2.3.2  |
| Squal                              | Cell selection quality, defined in TS 38.304, subclause 5.2.3.2   |
| Sintrasearch                       | Defined in TS 38.304 , subclause 5.2.4.7 for E-UTRAN amd 38.304 subclause 5.2.4.7 for NR  |
| Snonintrasearch                    | Defined in TS 38.304 , subclause 5.2.4.7  |
| T <sub>c</sub>                     | Basic time unit, defined in clause 4.1 of TS 38.211 [6].  |
| T <sub>reselection</sub>           | Defined in TS 25.304, subclause 5.2.6.1.5   |
| T <sub>reselectionRAT</sub>        | Defined in TS 36.304 , subclause 5.2.4.7  |
| T <sub>reselectionEUTRA</sub>      | Defined in TS 36.304 , subclause 5.2.4.7  |
| T <sub>reselectionUTRA</sub>       | Defined in TS 36.304 , subclause 5.2.4.7  |
| T <sub>reselectionGERAN</sub>      | Defined in TS 36.304 , subclause 5.2.4.   |
| Thresh <sub>x, high</sub>          | Defined in TS 38.304 , subclause 5.2.4.7  |
| Thresh <sub>x, low</sub>           | Defined in TS 38.304 , subclause 5.2.4.7  |
| Thresh <sub>servng, low</sub>      | Defined in TS 38.304 , subclause 5.2.4.7  |
| T <sub>s</sub>                     | Reference time unit, defined in clause 4.1 of TS 38.211 [6].  |
| T <sub>UE_re-establish_delay</sub> | Time between the moments when any of the conditions requiring RRC re-establishment as defined in clause 5.3.7 in TS 38.331 [2] is detected by the UE and when the UE sends PRACH to the target PCell. |

### 3.3 Abbreviations

For the purposes of the present document, the abbreviations given in TR 21.905 [11] and the following apply. An abbreviation defined in the present document takes precedence over the definition of the same abbreviation, if any, in TR 21.905 [11].

|         |                                    |
|---------|------------------------------------|
| BFD     | Beam Failure Detection             |
| BFD-RS  | BFD Reference Signal               |
| BLER    | Block Error Rate                   |
| BM-RS   | Beam Management Reference Signal   |
| BWP     | Bandwidth Part                     |
| CA      | Carrier Aggregation                |
| CBD     | Candidate Beam Detection           |
| CC      | Component Carrier                  |
| CORESET | Control Resource Set               |
| CP      | Cyclic Prefix                      |
| CSI     | Channel-State Information          |
| CSI-RS  | CSI Reference Signal               |
| DC      | Dual Connectivity                  |
| DCI     | Downlink Control Information       |
| DL      | Downlink                           |
| DMRS    | Demodulation Reference Signal      |
| DRX     | Discontinuous Reception            |
| E-CID   | Enhanced Cell ID                   |
| E-UTRA  | Evolved UTRA                       |
| E-UTRAN | Evolved UTRAN                      |
| EN-DC   | E-UTRA-NR Dual Connectivity        |
| FDD     | Frequency Division Duplex          |
| FR      | Frequency Range                    |
| HARQ    | Hybrid Automatic Repeat Request    |
| HO      | Handover                           |
| L1-RSRP | Layer 1 RSRP                       |
| MAC     | Medium Access Control              |
| MCG     | Master Cell Group                  |
| MG      | Measurement Gap                    |
| MGL     | Measurement Gap Length             |
| MGRP    | Measurement Gap Repetition Period  |
| MIB     | Master Information Block           |
| MN      | Master Node                        |
| MR-DC   | Multi-Radio Dual Connectivity      |
| NE-DC   | NR-E-UTRA Dual Connectivity        |
| NGEN-DC | NG-RAN E-UTRA-NR Dual Connectivity |
| NR      | New Radio                          |

|                    |   |
|--------------------|---|
| NR-DC              | NR-NR Dual Connectivity   |
| OFDM               | Orthogonal Frequency Division Multiplexing  |
| OFDMA              | Orthogonal Frequency Division Multiple Access   |
| OTDOA              | Observed Time Difference Of Arrival   |
| PBCH               | Physical Broadcast Channel  |
| PCC                | Primary Component Carrier   |
| PCell              | Primary Cell  |
| PDCCH              | Physical Downlink Control Channel   |
| PDSCH              | Physical Downlink Shared Channel  |
| PLMN               | Public Land Mobile Network  |
| PRACH              | Physical RACH   |
| PSCell             | Primary SCell   |

## 3.4 Test tolerances

The requirements given in the present document make no allowance for measurement uncertainty. The test specification 38.533 [5] defines the test tolerances.

## 3.5 Frequency bands grouping

### 3.5.1 Introduction

The intention with the frequency band grouping below is to increase the readability of the specification.

The frequency bands grouping is derived based on UE REFSSENS requirements specified in [18, 19, 20] and assuming 0.5 dB step between the neighbour groups. The groups are defined in the order of increasing REFSSENS, i.e., the group A has the smallest REFSSENS among the groups. For the same SCS and a given bandwidth, the bands within the same group have the same  $I_o$  conditions in a corresponding requirement in this specification, provided the bands support this SCS. For different SCSs supported by a frequency band and the same bandwidth, different  $I_o$  conditions may apply for the frequency band in the requirements, while the band group is the same, based on the lowest REFSSENS requirement normalized by the number of subcarriers among its supported SCSs for this bandwidth. For the same SCS but different supported bandwidths, the group for a band is determined based on the lowest REFSSENS requirement normalized by the number of subcarriers among its supported bandwidths.

### 3.5.2 NR operating bands in FR1

NR frequency bands grouping for FR1 is specified in Table 3.5.2-1.

**Table 3.5.2-1: NR frequency band groups for FR1**

| Group | NR FDD              |                           | NR TDD              |                              | NR SDL              |                 |
|-------|---------------------|---------------------------|---------------------|------------------------------|---------------------|-----------------|
|       | Band group notation | Operating bands           | Band group notation | Operating bands              | Band group notation | Operating bands |
| A     | NR_FDD_FR1_A        | n1, n70, n74 <sup>4</sup> | NR_TDD_FR1_A        | n34, n38, n39, n40, n50, n51 | NR_SDL_FR1_A        | n75, n76        |
| B     | NR_FDD_FR1_B        | n66, n74 <sup>3</sup>     | NR_TDD_FR1_B        | -                            | NR_SDL_FR1_B        | -               |
| C     | NR_FDD_FR1_C        | -                         | NR_TDD_FR1_C        | n77 <sup>1</sup> , n78, n79  | NR_SDL_FR1_C        | -               |
| D     | NR_FDD_FR1_D        | n28                       | NR_TDD_FR1_D        | n77 <sup>2</sup>             | NR_SDL_FR1_D        | -               |
| E     | NR_FDD_FR1_E        | n2, n5, n7                | NR_TDD_FR1_E        | n41                          | NR_SDL_FR1_E        | -               |
| F     | NR_FDD_FR1_F        | -                         | NR_TDD_FR1_F        | -                            | NR_SDL_FR1_F        | -               |
| G     | NR_FDD_FR1_G        | n3, n8, n12, n20, n71     | NR_TDD_FR1_G        | -                            | NR_SDL_FR1_G        | -               |
| H     | NR_FDD_FR1_H        | n25                       | NR_TDD_FR1_H        | -                            | NR_SDL_FR1_H        | -               |

NOTE 1: Except 3.8 GHz to 4.2 GHz.  
NOTE 2: Only 3.8 GHz to 4.2 GHz.  
NOTE 3: Except 1475.9 MHz to 1510.9 MHz.  
NOTE 4: Only when the band is confined in 1475.9 MHz to 1510.9 MHz.  
NOTE 5: These bands are used only in NR carrier aggregation with other NR bands according to NR CA band combinations specified in TS 38.101-1 [18] and TS 38.101-3 [20].

### 3.5.3 NR operating bands in FR2

NR frequency bands grouping for FR2 is specified in Table 3.5.3-1.

**Table 3.5.3-1: NR frequency band groups for FR2**

| Group | Band group notation | Operating bands   |
|-------|---------------------|---|
| A     | NR_TDD_FR2_A        | n257 <sup>1</sup> , n258 <sup>1</sup> , n261 <sup>1</sup> |
| B     | NR_TDD_FR2_B        | n257 <sup>4</sup> , n258 <sup>4</sup> , n261 <sup>4</sup> |
| C     | NR_TDD_FR2_C        |   |
| D     | NR_TDD_FR2_D        |   |
| E     | NR_TDD_FR2_E        |   |
| F     | NR_TDD_FR2_F        | n260 <sup>4</sup>   |

|  |              |   |
|--|--------------|---|
| G  | NR_TDD_FR2_G | n260 <sup>1</sup>   |
| H  | NR_TDD_FR2_H |   |
| I  | NR_TDD_FR2_I |   |
| J  | NR_TDD_FR2_J |   |
| K  | NR_TDD_FR2_K |   |
| L  | NR_TDD_FR2_L | n257 <sup>2</sup> , n258 <sup>2</sup> , n261 <sup>2</sup> |
| M  | NR_TDD_FR2_M |   |
| N  | NR_TDD_FR2_N |   |
| O  | NR_TDD_FR2_O |   |
| P  | NR_TDD_FR2_P |   |
| Q  | NR_TDD_FR2_Q |   |
| R  | NR_TDD_FR2_R |   |
| S  | NR_TDD_FR2_S |   |
| T  | NR_TDD_FR2_T | n257 <sup>3</sup> , n258 <sup>3</sup> , n261 <sup>3</sup> |
| U  | NR_TDD_FR2_U |   |
| V  | NR_TDD_FR2_V |   |
| W  | NR_TDD_FR2_W |   |
| X  | NR_TDD_FR2_X |   |
| Y  | NR_TDD_FR2_Y | n260 <sup>3</sup>   |
| NOTE 1: UE power class 1.<br>NOTE 2: UE power class 2.<br>NOTE 3: UE power class 3.<br>NOTE 4: UE power class 4. |              |   |

## 3.6 Applicability of requirements in this specification version

In this specification,

- ‘cell’, ‘PCell’, ‘PSCell’ and ‘SCell’ refer to NR cell, NR PCell, NR PSCell, and NR SCell,
- E-UTRA cells are referred to as ‘E-UTRA cell’, ‘E-UTRA PCell’, ‘E-UTRA PSCell’, and ‘E-UTRA SCell’,
- E-UTRA-NR dual connectivity where E-UTRA is the master is referred to as ‘E-UTRA-NR dual connectivity’ or ‘EN-DC’.
- NR-NR dual connectivity which involves two gNB acting as Master gNB and Secondary gNB is referred to as “NR-NR dual connectivity” or “NR-DC”. NR-DC in Rel-15 only includes the scenarios where all serving cells in MCG in FR1 and all serving cells in SCG in FR2.
- ‘active serving cell’ refers to PCell, PSCell and activated SCells

For UE configured with supplementary UL, the requirements in clause 7.1 and 7.3 shall also apply to uplink transmissions on supplementary UL.

### 3.6.1 RRC connected state requirements in DRX

For the requirements in RRC connected state specified in this version of the specification, the UE shall assume that no DRX is used provided the following conditions are met:

- DRX parameters are not configured or
- DRX parameters are configured and
  - *drx-InactivityTimer* is running or
  - *drx-RetransmissionTimerDL* is running or
  - *drx-RetransmissionTimerUL* is running or
  - *ra-ContentionResolutionTimer* is running or
  - a Scheduling Request sent on PUCCH is pending or

- a PDCCH indicating a new transmission addressed to the C-RNTI of the MAC entity has not been received after successful reception of a Random Access Response for the preamble not selected by the MAC entity

Otherwise the UE shall assume that DRX is used.

## 3.6.2 Number of serving carriers

### 3.6.2.1 Number of serving carriers for SA

Requirements for standalone NR with NR PCell are applicable for the UE configured with the following number of serving NR CCs:

- up to 8 NR DL CCs in total, with 1 UL (or 2 UL if SUL is configured) in PCell and up to 7 UL (or 8 UL if SUL is configured) in SCell.
- SUL may be configured together with one of the UL

### 3.6.2.2 Number of serving carriers for EN-DC

Requirements for EN-DC operation of E-UTRA and NR with E-UTRA PCell and NR PSCell are applicable for the UE configured with the following number of serving NR CCs:

- up to 8 NR DL CCs in total, with 1 UL (or 2 UL if SUL is configured) in PSCell and up to 1 UL (or 2 UL if SUL is configured) in SCell in different FR with PSCell.
- SUL may be configured together with one of the UL

The applicable number of E-UTRA CC for EN-DC in the MCG for both UL and DL is specified in TS 36.133 [15].

### 3.6.2.3 Number of serving carriers for NE-DC

Requirements for NE-DC operation of NR and E-UTRA with NR PCell and E-UTRA PSCell are applicable for the UE configured with the following number of serving NR CCs:

- up to 7 NR DL CCs in total, with 1 UL (or 2 UL if SUL is configured) in PCell and up to 1 UL (or 2 UL if SUL is configured) in SCell.
- SUL may be configured together with one of the UL

The applicable number of E-UTRA CC for NE-DC in the SCG for both UL and DL is specified in TS 36.133 [15].

### 3.6.2.4 Number of serving carriers for NR-DC

Requirements for NR-DC are applicable for the UE configured with the following number of serving NR CCs:

- up to 2 NR DL CCs in total in FR1, up to 8 NR DL CCs in total in FR2, with 1 UL in PCell, 1 UL in PSCell.

## 3.6.3 Applicability for intra-band FR2

For the requirements in RRC connected state specified in this version of the specification, UE shall assume that the transmitted signals from the serving cells should have the same downlink spatial domain transmission filter on one OFDM symbol in the same band in FR2. Otherwise, the UE is not supposed to satisfy any requirements for SCell.

## 3.6.4 Applicability for FR2 UE power classes

For the requirements of each FR2 power class specified in this version of the specification, certain UE types with specific device architectures are assumed. The UE types can be found in TS 38.101-2 [19].

### 3.6.5 Applicability for SDL bands

The measurements accuracy requirements for SDL bands in this version of specification in clause 10.1 shall apply for NR intra-frequency measurements on SCC (SS-RSRP, SS-RSRQ, SS-SINR, and L1-RSRP) and inter-frequency measurements (SS-RSRP, SS-RSRQ, and SS-SINR).

### 3.6.6 Applicability of requirements for NGEN-DC operation

All the requirements in this specification applicable for EN-DC are also applicable for NGEN-DC.

### 3.6.7 Applicability of QCL

For the requirements specified in this version of the specification, a reference signal is considered to be QCLed to another reference signal if it is in the same TCI chain as the other reference signal, provided that the number of Reference Signals in the chain is no more than 4. It is assumed there is single QCL type per TCI chain.

A TCI chain consists of an SSB, and one or more CSI-RS resources, and the TCI state of each Reference Signal includes another Reference Signal in the same TCI chain.

DMRS of PDCCH or PDSCH is QCLed with the reference signal in its active TCI state and any other reference signal that is QCLed, based on above criteria, with the reference signal in the active TCI state.

---

## 4 SA: RRC\_IDLE state mobility

### 4.1 Cell Selection

After a UE has switched on and a PLMN has been selected, the cell selection process takes place, as described in TS 38.304 [1]. This process allows the UE to select a suitable cell where to camp on in order to access available services. In this process, the UE can use stored information (*Stored information cell selection*) or not (*Initial cell selection*).

### 4.2 Cell Re-selection

#### 4.2.1 Introduction

The cell reselection procedure allows the UE to select a more suitable cell and camp on it.

When the UE is in either *Camped Normally* state or *Camped on Any Cell* state on a cell, the UE shall attempt to detect, synchronise, and monitor intra-frequency, inter-frequency and inter-RAT cells indicated by the serving cell. For intra-frequency and inter-frequency cells the serving cell may not provide explicit neighbour list but carrier frequency information and bandwidth information only. UE measurement activity is also controlled by measurement rules defined in TS 38.304 [1], allowing the UE to limit its measurement activity.

In the requirements of clause 4.2, the exceptions for side conditions apply as follows:

- for the UE capable of CA, the applicable exceptions for side conditions are specified in Annex B, clause B.3.2.1, B.3.2.3, or B.3.2.5 for UE supporting CA in FR1, CA in FR2 and CA between FR1 and FR2, respectively;
- for the UE capable of SUL, the applicable exceptions for side conditions are specified in Annex B, clause B.3.4.1 for UE supporting SUL in FR1.

#### 4.2.2 Requirements

##### 4.2.2.1 UE measurement capability

For idle mode cell re-selection purposes, the UE shall be capable of monitoring at least:

- Intra-frequency carrier, and
- Depending on UE capability, 7 NR inter-frequency carriers, and
- Depending on UE capability, 7 FDD E-UTRA inter-RAT carriers, and
- Depending on UE capability, 7 TDD E-UTRA inter-RAT carriers.

In addition to the requirements defined above, a UE supporting E-UTRA measurements in RRC\_IDLE state shall be capable of monitoring a total of at least 14 carrier frequency layers, which includes serving layer, comprising of any above defined combination of E-UTRA FDD, E-UTRA TDD and NR layers.

#### 4.2.2.2 Measurement and evaluation of serving cell

The UE shall measure the SS-RSRP and SS-RSRQ level of the serving cell and evaluate the cell selection criterion S defined in TS 38.304 [1] for the serving cell at least once every  $M1 \cdot N1$  DRX cycle; where:

$M1=2$  if SMTC periodicity ( $T_{SMTC}$ ) > 20 ms and DRX cycle  $\leq$  0.64 second,  
otherwise  $M1=1$ .

The UE shall filter the SS-RSRP and SS-RSRQ measurements of the serving cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by, at least DRX cycle/2.

If the UE has evaluated according to Table 4.2.2.2-1 in  $N_{serv}$  consecutive DRX cycles that the serving cell does not fulfil the cell selection criterion S, the UE shall initiate the measurements of all neighbour cells indicated by the serving cell, regardless of the measurement rules currently limiting UE measurement activities.

If the UE in RRC\_IDLE has not found any new suitable cell based on searches and measurements using the intra-frequency, inter-frequency and inter-RAT information indicated in the system information for 10 s, the UE shall initiate cell selection procedures for the selected PLMN as defined in TS 38.304 [1].

**Table 4.2.2.2-1:  $N_{serv}$**

| DRX cycle length [s]   | Scaling Factor (N1) |                      | $N_{serv}$ [number of DRX cycles] |
|--|---------------------|----------------------|-----------------------------------|
|  | FR1                 | FR2 <sup>Note1</sup> |                                   |
| 0.32   | 1                   | 8                    | $M1 \cdot N1^4$                   |
| 0.64   |                     | 5                    | $M1 \cdot N1^4$                   |
| 1.28   |                     | 4                    | $N1^2$                            |
| 2.56   |                     | 3                    | $N1^2$                            |
| Note 1: Applies for UE supporting power class 2&3&4. For UE supporting power class 1, $N1 = 8$ for all DRX cycle length. |                     |                      |                                   |

#### 4.2.2.3 Measurements of intra-frequency NR cells

The UE shall be able to identify new intra-frequency cells and perform SS-RSRP and SS-RSRQ measurements of the identified intra-frequency cells without an explicit intra-frequency neighbour list containing physical layer cell identities.

The UE shall be able to evaluate whether a newly detectable intra-frequency cell meets the reselection criteria defined in TS38.304[1] within  $T_{detect,NR\_Intra}$  when that  $T_{reselection} = 0$ . An intra frequency cell is considered to be detectable according to the conditions defined in Annex B.1.2 for a corresponding Band.

The UE shall measure SS-RSRP and SS-RSRQ at least every  $T_{measure,NR\_Intra}$  (see table 4.2.2.3-1) for intra-frequency cells that are identified and measured according to the measurement rules.

The UE shall filter SS-RSRP and SS-RSRQ measurements of each measured intra-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least  $T_{measure,NR\_Intra}/2$ .

The UE shall not consider a NR neighbour cell in cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For an intra-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that the intra-frequency cell has met reselection criterion defined in TS38.304 [1] within  $T_{\text{evaluate,NR\_Intra}}$  when  $T_{\text{reselection}} = 0$  as specified in table 4.2.2.3-1 provided that:

when *rangeToBestCell* is not configured:

- the cell is at least 3 dB better ranked in FR1 or 4.5 dB better ranked in FR2.

when *rangeToBestCell* is configured:

- the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value in TS38.304 [1] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.
- if there are multiple such cells, the cell has the highest rank among them.
- the cell is at least 3dB better ranked in FR1 or 4.5dB better ranked in FR2 if the current serving cell is among them.

When evaluating cells for reselection, the SSB side conditions apply to both serving and non-serving intra-frequency cells.

If  $T_{\text{reselection}}$  timer has a non zero value and the intra-frequency cell is satisfied with the reselection criteria which are defined in TS38.304 [1], the UE shall evaluate this intra-frequency cell for the  $T_{\text{reselection}}$  time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect that cell.

**Table 4.2.2.3-1:  $T_{\text{detect,NR\_Intra}}$ ,  $T_{\text{measure,NR\_Intra}}$  and  $T_{\text{evaluate,NR\_Intra}}$**

| DRX cycle length [s]   | Scaling Factor (N1) |                      | $T_{\text{detect,NR\_Intra}}$ [s]<br>(number of DRX cycles) | $T_{\text{measure,NR\_Intra}}$ [s]<br>(number of DRX cycles) | $T_{\text{evaluate,NR\_Intra}}$ [s] (number of DRX cycles) |
|--|---------------------|----------------------|---|--|--|
|  | FR1                 | FR2 <sup>Note1</sup> |   |  |  |
| 0.32   | 1                   | 8                    | $11.52 \times N1 \times M2$ (36 x N1 x M2)                  | $1.28 \times N1 \times M2$ (4 x N1 x M2)                     | $5.12 \times N1 \times M2$ (16 x N1 x M2)                  |
| 0.64   |                     | 5                    | $17.92 \times N1$ (28 x N1)                                 | $1.28 \times N1$ (2 x N1)                                    | $5.12 \times N1$ (8 x N1)                                  |
| 1.28   |                     | 4                    | $32 \times N1$ (25 x N1)                                    | $1.28 \times N1$ (1 x N1)                                    | $6.4 \times N1$ (5 x N1)                                   |
| 2.56   |                     | 3                    | $58.88 \times N1$ (23 x N1)                                 | $2.56 \times N1$ (1 x N1)                                    | $7.68 \times N1$ (3 x N1)                                  |
| Note 1: Applies for UE supporting power class 2&3&4. For UE supporting power class 1, N1 = 8 for all DRX cycle length. |                     |                      |   |  |  |
| Note 2: M2 = 1.5 if SMTC periodicity of measured intra-frequency cell > 20 ms; otherwise M2=1.                         |                     |                      |   |  |  |

#### 4.2.2.4 Measurements of inter-frequency NR cells

The UE shall be able to identify new inter-frequency cells and perform SS-RSRP or SS-RSRQ measurements of identified inter-frequency cells if carrier frequency information is provided by the serving cell, even if no explicit neighbour list with physical layer cell identities is provided.

If  $S_{\text{rxlev}} > S_{\text{nonIntraSearchP}}$  and  $S_{\text{qual}} > S_{\text{nonIntraSearchQ}}$  then the UE shall search for inter-frequency layers of higher priority at least every  $T_{\text{higher\_priority\_search}}$  where  $T_{\text{higher\_priority\_search}}$  is described in clause 4.2.2.7.

If  $S_{\text{rxlev}} \leq S_{\text{nonIntraSearchP}}$  or  $S_{\text{qual}} \leq S_{\text{nonIntraSearchQ}}$  then the UE shall search for and measure inter-frequency layers of higher, equal or lower priority in preparation for possible reselection. In this scenario, the minimum rate at which the UE is required to search for and measure higher priority layers shall be the same as that defined below in this clause.

The UE shall be able to evaluate whether a newly detectable inter-frequency cell meets the reselection criteria defined in TS38.304 [1] within  $K_{\text{carrier}} * T_{\text{detect,NR\_Inter}}$  if at least carrier frequency information is provided for inter-frequency neighbour cells by the serving cells when  $T_{\text{reselection}} = 0$  provided that the reselection criteria is met by a margin of at least 5 dB in FR1 or 6.5 dB in FR2 for reselections based on ranking or 6 dB in FR1 or 7.5 dB in FR2 for SS-RSRP reselections based on absolute priorities or 4 dB in FR1 and 4 dB in FR2 for SS-RSRQ reselections based on absolute priorities. The parameter  $K_{\text{carrier}}$  is the number of NR inter-frequency carriers indicated by the serving cell. An inter-frequency cell is considered to be detectable according to the conditions defined in Annex B.1.3 for a corresponding Band.

When higher priority cells are found by the higher priority search, they shall be measured at least every  $T_{\text{measure,NR\_Inter}}$ . If, after detecting a cell in a higher priority search, it is determined that reselection has not occurred then the UE is not

required to continuously measure the detected cell to evaluate the ongoing possibility of reselection. However, the minimum measurement filtering requirements specified later in this clause shall still be met by the UE before it makes any determination that it may stop measuring the cell. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall measure SS-RSRP or SS-RSRQ at least every  $K_{\text{carrier}} * T_{\text{measure,NR\_Inter}}$  (see table 4.2.2.4-1) for identified lower or equal priority inter-frequency cells. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall filter SS-RSRP or SS-RSRQ measurements of each measured higher, lower and equal priority inter-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least  $T_{\text{measure,NR\_Inter}}/2$ .

The UE shall not consider a NR neighbour cell in cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For an inter-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that the inter-frequency cell has met reselection criterion defined TS 38.304 [1] within  $K_{\text{carrier}} * T_{\text{evaluate,NR\_Inter}}$  when  $T_{\text{reselection}} = 0$  as specified in table 4.2.2.4-1 provided that the reselection criteria is met by

- the condition when performing equal priority reselection and when *rangeToBestCell* is not configured:
  - the cell is at least 5dB better ranked in FR1 or 6.5dB better ranked in FR2 or.
- when *rangeToBestCell* is configured:
  - the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value in TS38.304 [1] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.
    - if there are multiple such cells, the cell has the highest rank among them
    - the cell is at least 5dB better ranked in FR1 or 6.5dB better ranked in FR2 if the current serving cell is among them. Or
  - 6dB in FR1 or 7.5dB in FR2 for SS-RSRP reselections based on absolute priorities or
  - 4dB in FR1 or 4dB in FR2 for SS-RSRQ reselections based on absolute priorities.

When evaluating cells for reselection, the SSB side conditions apply to both serving and inter-frequency cells.

If  $T_{\text{reselection}}$  timer has a non zero value and the inter-frequency cell is satisfied with the reselection criteria, the UE shall evaluate this inter-frequency cell for the  $T_{\text{reselection}}$  time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect that cell.

The UE is not expected to meet the measurement requirements for an inter-frequency carrier under DRX cycle=320 ms defined in Table 4.2.2.4-1 under the following conditions:

- $T_{\text{SMTC\_intra}} = T_{\text{SMTC\_inter}} = 160$  ms; where  $T_{\text{SMTC\_intra}}$  and  $T_{\text{SMTC\_inter}}$  are periodicities of the SMTC occasions configured for the intra-frequency carrier and the inter-frequency carrier respectively, and
- SMTC occasions configured for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the SMTC occasions configured for the intra-frequency carrier, and
- SMTC occasions configured for the intra-frequency carrier and for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the paging occasion in TS38.304 [1].

**Table 4.2.2.4-1:  $T_{\text{detect,NR\_Inter}}$ ,  $T_{\text{measure,NR\_Inter}}$  and  $T_{\text{evaluate,NR\_Inter}}$**

| 1.28   |     | 4                    | $32 \times N1$ (25 x N1)                                    | $1.28 \times N1$ (1 x N1)                                    | $6.4 \times N1$ (5 x N1)                                      |
| 2.56   |     | 3                    | $58.88 \times N1$ (23 x N1)                                 | $2.56 \times N1$ (1 x N1)                                    | $7.68 \times N1$ (3 x N1)                                     |
| Note 1: Applies for UE supporting power class 2&3&4. For UE supporting power class 1, N1 = 8 for all DRX cycle length. |     |                      |   |  |   |

#### 4.2.2.5 Measurements of inter-RAT E-UTRAN cells

If  $S_{\text{rxlev}} > S_{\text{nonIntraSearchP}}$  and  $S_{\text{qual}} > S_{\text{nonIntraSearchQ}}$  then the UE shall search for inter-RAT E-UTRAN layers of higher priority at least every  $T_{\text{higher\_priority\_search}}$  where  $T_{\text{higher\_priority\_search}}$  is described in clause 4.2.2

If  $S_{\text{rxlev}} \leq S_{\text{nonIntraSearchP}}$  or  $S_{\text{qual}} \leq S_{\text{nonIntraSearchQ}}$  then the UE shall search for and measure inter-RAT E-UTRAN layers of higher, lower priority in preparation for possible reselection. In this scenario, the minimum rate at which the UE is required to search for and measure higher priority inter-RAT E-UTRAN layers shall be the same as that defined below for lower priority RATs.

The requirements in this clause apply for inter-RAT E-UTRAN FDD measurements and E-UTRA TDD measurements. When the measurement rules indicate that inter-RAT E-UTRAN cells are to be measured, the UE shall measure RSRP and RSRQ of detected E-UTRA cells in the neighbour frequency list at the minimum measurement rate specified in this clause. The parameter  $N_{\text{EUTRA\_carrier}}$  is the total number of configured E-UTRA carriers in the neighbour frequency list. The UE shall filter RSRP and RSRQ measurements of each measured E-UTRA cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least  $T_{\text{measure,EUTRAN}}/2$ .

An inter-RAT E-UTRA cell is considered to be detectable provided the following conditions are fulfilled:

- the same conditions as for inter-frequency RSRP measurements specified in TS 36.133 [15, Annex B.1.2] are fulfilled for a corresponding Band, and
- the same conditions as for inter-frequency RSRQ measurements specified in TS 36.133 [15, Annex B.1.2] are fulfilled for a corresponding Band.
- SCH conditions specified in TS 36.133 [15, Annex B.1.2] are fulfilled for a corresponding Band

The UE shall be able to evaluate whether a newly detectable inter-RAT E-UTRAN cell meets the reselection criteria defined in TS38.304 [1] within  $(N_{\text{EUTRA\_carrier}}) * T_{\text{detect,EUTRAN}}$  when  $S_{\text{rxlev}} \leq S_{\text{nonIntraSearchP}}$  or  $S_{\text{qual}} \leq S_{\text{nonIntraSearchQ}}$  when  $T_{\text{reselection}} = 0$  provided that the reselection criteria is met by a margin of at least 6dB for RSRP reselections based on absolute priorities or 4dB for RSRQ reselections based on absolute priorities.

Cells which have been detected shall be measured at least every  $(N_{\text{EUTRA\_carrier}}) * T_{\text{measure,EUTRAN}}$  when  $S_{\text{rxlev}} \leq S_{\text{nonIntraSearchP}}$  or  $S_{\text{qual}} \leq S_{\text{nonIntraSearchQ}}$ .

When higher priority cells are found by the higher priority search, they shall be measured at least every  $T_{\text{measure,EUTRAN}}$ . If, after detecting a cell in a higher priority search, it is determined that reselection has not occurred then the UE is not required to continuously measure the detected cell to evaluate the ongoing possibility of reselection. However, the minimum measurement filtering requirements specified later in this clause shall still be met by the UE before it makes any determination that it may stop measuring the cell.

If the UE detects on an inter-RAT E-UTRAN carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall not consider an inter-RAT E-UTRA cell in cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For a cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that an already identified inter-RAT E-UTRA cell has met reselection criterion defined in TS 38.304 [1] within  $(N_{\text{EUTRA\_carrier}}) * T_{\text{evaluate,EUTRAN}}$  when  $T_{\text{reselection}} = 0$  as specified in table 4.2.2.5-1 provided that the

reselection criteria is met by a margin of at least 6dB for RSRP reselections based on absolute priorities or 4dB for RSRQ reselections based on absolute priorities.

If  $T_{\text{reselection}}$  timer has a non zero value and the inter-RAT E-UTRA cell is satisfied with the reselection criteria which are defined in TS 38.304 [1], the UE shall evaluate this E-UTRA cell for the  $T_{\text{reselection}}$  time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect that cell.

**Table 4.2.2.5-1:  $T_{\text{detect,EUTRAN}}$ ,  $T_{\text{measure,EUTRAN}}$ , and  $T_{\text{evaluate,EUTRAN}}$**

| DRX cycle length [s] | $T_{\text{detect,EUTRAN}}$ [s] (number of DRX cycles) | $T_{\text{measure,EUTRAN}}$ [s] (number of DRX cycles) | $T_{\text{evaluate,EUTRAN}}$ [s] (number of DRX cycles) |
|----------------------|---|--|---|
| 0.32                 | 11.52 (36)  | 1.28 (4)   | 5.12 (16)   |
| 0.64                 | 17.92 (28)  | 1.28 (2)   | 5.12 (8)  |
| 1.28                 | 32(25)  | 1.28 (1)   | 6.4 (5)   |
| 2.56                 | 58.88 (23)  | 2.56 (1)   | 7.68 (3)  |

#### 4.2.2.6 Maximum interruption in paging reception

UE shall perform the cell re-selection with minimum interruption in monitoring downlink channels for paging reception.

At intra-frequency and inter-frequency cell re-selection, the UE shall monitor the downlink of serving cell for paging reception until the UE is capable to start monitoring downlink channels of the target intra-frequency and inter-frequency cell for paging reception. The interruption time shall not exceed  $T_{\text{SI-NR}} + 2 * T_{\text{target\_cell\_SMTC\_period}}$  ms.

At inter-RAT cell re-selection, the UE shall monitor the downlink of serving cell for paging reception until the UE is capable to start monitoring downlink channels for paging reception of the target inter-RAT cell. For NR to E-UTRAN cell re-selection the interruption time must not exceed  $T_{\text{SI-EUTRA}} + 55$  ms.

$T_{\text{SI-NR}}$  is the time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks defined in TS 38.331 [2] for an NR cell.

$T_{\text{SI-EUTRA}}$  is the time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks defined in TS 36.331 [16] for an E-UTRAN cell.

These requirements assume sufficient radio conditions, so that decoding of system information can be made without errors and does not take into account cell re-selection failure.

#### 4.2.2.7 General requirements

The UE shall search every layer of higher priority at least every  $T_{\text{higher\_priority\_search}} = (60 * N_{\text{layers}})$  seconds, where  $N_{\text{layers}}$  is the total number of higher priority NR and E-UTRA carrier frequencies broadcasted in system information.

---

## 5 SA: RRC\_INACTIVE state mobility

### 5.1 Cell Re-selection

#### 5.1.1 Introduction

The cell reselection procedure allows the UE to select a more suitable cell and camp on it.

When the UE is in *Camped Normally* state on a cell, the UE shall attempt to detect, synchronise, and monitor intra-frequency, inter-frequency and inter-RAT cells indicated by the serving cell. For intra-frequency and inter-frequency cells the serving cell may not provide explicit neighbour list but carrier frequency information and bandwidth information only. UE measurement activity is also controlled by measurement rules defined in TS38.304 [1], allowing the UE to limit its measurement activity.

#### 5.1.2 Requirements

##### 5.1.2.1 UE measurement capability

The requirements in sub-clause 4.2.2.1 shall apply.

##### 5.1.2.2 Measurement and evaluation of serving cell

The requirements in sub-clause 4.2.2.2 shall apply.

##### 5.1.2.3 Measurements of intra-frequency NR cells

The requirements in sub-clause 4.2.2.3 shall apply.

##### 5.1.2.4 Measurements of inter-frequency NR cells

The requirements in sub-clause 4.2.2.4 shall apply.

##### 5.1.2.5 Measurements of inter-RAT E-UTRAN cells

The requirements in sub-clause 4.2.2.5 shall apply.

##### 5.1.2.6 Maximum interruption in paging reception

The requirements in sub-clause 4.2.2.6 shall apply.

##### 5.1.2.7 General requirements

The requirements in sub-clause 4.2.2.7 shall apply.

## 5.2 Void

# 6 RRC\_CONNECTED state mobility

## 6.1 Handover

### 6.1.1 NR Handover

#### 6.1.1.1 Introduction

The purpose of NR handover is to change the NR PCell to another NR cell. The requirements in this clause are applicable to SA NR, NE-DC and NR-DC.

#### 6.1.1.2 NR FR1 - NR FR1 Handover

The requirements in this clause are applicable to both intra-frequency and inter-frequency handovers from NR FR1 cell to NR FR1 cell.

##### 6.1.1.2.1 Handover delay

When the UE receives a RRC message implying handover the UE shall be ready to start the transmission of the new uplink PRACH channel within  $D_{\text{handover}}$  msec from the end of the last TTI containing the RRC command.

Where:

$D_{\text{handover}}$  equals the applicable RRC procedure delay defined in clause 12 in TS 38.331 [2] plus the interruption time stated in clause 6.1.1.2.2.

##### 6.1.1.2.2 Interruption time

The interruption time is the time between end of the last TTI containing the RRC command on the old PDSCH and the time the UE starts transmission of the new PRACH, excluding the RRC procedure delay.

When intra-frequency or inter-frequency handover is commanded, the interruption time shall be less than  $T_{\text{interrupt}}$

$$T_{\text{interrupt}} = T_{\text{search}} + T_{\text{IU}} + T_{\text{processing}} + T_{\Delta} + T_{\text{margin}} \text{ ms}$$

Where:

$T_{\text{search}}$  is the time required to search the target cell when the target cell is not already known when the handover command is received by the UE. If the target cell is known, then  $T_{\text{search}} = 0$  ms. If the target cell is an unknown intra-frequency cell and the target cell  $E_s/I_{ot} \geq -2$  dB, then  $T_{\text{search}} = T_{\text{rs}}$  ms. If the target cell is an unknown inter-frequency cell and the target cell  $E_s/I_{ot} \geq -2$  dB, then  $T_{\text{search}} = 3 * T_{\text{rs}}$  ms. Regardless of whether DRX is in use by the UE,  $T_{\text{search}}$  shall still be based on non-DRX target cell search times.

$T_{\text{processing}}$  is time for UE processing.  $T_{\text{processing}}$  can be up to 20ms.

$T_{\text{margin}}$  is time for SSB post-processing.  $T_{\text{margin}}$  can be up to 2ms.

$T_{\Delta}$  is time for fine time tracking and acquiring full timing information of the target cell.  $T_{\Delta} = T_{\text{rs}}$  for both known and unknown target cell.

$T_{\text{IU}}$  is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell.  $T_{\text{IU}}$  can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [3].

$T_{\text{rs}}$  is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cell in the handover command, otherwise  $T_{\text{rs}}$  is the SMTC configured in the `measObjectNR` having the

same SSB frequency and subcarrier spacing. If the measObjectNRs having the same SSB frequency and subcarrier spacing configured by MN and SN have different SMTC,  $T_{rs}$  is the periodicity of one of the SMTC which is up to UE implementation. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with  $T_{rs}=5\text{ms}$  assuming the SSB transmission periodicity is 5ms. There is no requirement if the SSB transmission periodicity is not 5ms. If the UE has been provided with higher layer in TS 38.331 [2] signaling of *smtc2* prior to the handover command,  $T_{rs}$  follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

In the interruption requirement a cell is known if it has been meeting the relevant cell identification requirement during the last 5 seconds otherwise it is unknown. Relevant cell identification requirements are described in Clause 9.2.5 for intra-frequency handover and Clause 9.3.4 for inter-frequency handover.

### 6.1.1.3 NR FR2- NR FR1 Handover

The requirements in this clause are applicable to inter-frequency handovers from NR FR2 cell to NR FR1 cell.

#### 6.1.1.3.1 Handover delay

When the UE receives a RRC message implying handover the UE shall be ready to start the transmission of the new uplink PRACH channel within  $D_{\text{handover}}$  ms from the end of the last TTI containing the RRC command.

Where:

$D_{\text{handover}}$  equals the applicable RRC procedure delay defined in clause 12 in TS 38.331 [2] plus the interruption time stated in clause 6.1.1.3.2.

#### 6.1.1.3.2 Interruption time

The interruption time is the time between the end of the last TTI containing the RRC command on the old PDSCH and the time the UE starts transmission of the new PRACH, excluding the RRC procedure delay.

When inter-frequency handover is commanded, the interruption time shall be less than  $T_{\text{interrupt}}$

$$T_{\text{interrupt}} = T_{\text{search}} + T_{\text{IU}} + T_{\text{processing}} + T_{\Delta} + T_{\text{margin}} \text{ ms}$$

Where:

$T_{\text{search}}$  is the time required to search the target cell when the target cell is not already known when the handover command is received by the UE. If the target cell is known, then  $T_{\text{search}} = 0$  ms. If the target cell is an unknown inter-frequency cell and the target cell  $E_s/I_{ot} \geq -2$  dB, then  $T_{\text{search}} = 3 * T_{rs}$  ms. Regardless of whether DRX is in use by the UE,  $T_{\text{search}}$  shall still be based on non-DRX target cell search times.

$T_{\Delta}$  is time for fine time tracking and acquiring full timing information of the target cell.  $T_{\Delta} = T_{rs}$  for both known and unknown target cell.

$T_{\text{processing}}$  is time for UE processing.  $T_{\text{processing}}$  can be up to 40ms.

$T_{\text{margin}}$  is time for SSB post-processing.  $T_{\text{margin}}$  can be up to 2ms.

$T_{\text{IU}}$  is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell.  $T_{\text{IU}}$  can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [3].

$T_{rs}$  is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cell in the handover command, otherwise  $T_{rs}$  is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If such measObjectNRs configured by MN and SN have different SMTC,  $T_{rs}$  is the periodicity of one of the SMTC which is up to UE implementation. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with  $T_{rs}=5\text{ms}$  assuming the SSB transmission periodicity is 5ms. There is no requirement if the SSB transmission periodicity is not 5ms.

In the interruption requirement a cell is known if it has been meeting the relevant cell identification requirement during the last 5 seconds otherwise it is unknown. Relevant cell identification requirements are described in Clause 9.2.5 for intra-frequency handover and Clause 9.3.4 for inter-frequency handover.

#### 6.1.1.4 NR FR2- NR FR2 Handover

The requirements in this clause are applicable to both intra-frequency and inter-frequency handovers from NR FR2 cell to NR FR2 cell.

##### 6.1.1.4.1 Handover delay

When the UE receives a RRC message implying handover the UE shall be ready to start the transmission of the new uplink PRACH channel within  $D_{\text{handover}}$  ms from the end of the last TTI containing the RRC command.

Where:

$D_{\text{handover}}$  equals the applicable RRC procedure delay defined in clause 12 in TS 38.331 [2] plus the interruption time stated in clause 6.1.1.4.2.

##### 6.1.1.4.2 Interruption time

The interruption time is the time between end of the last TTI containing the RRC command on the old PDSCH and the time the UE starts transmission of the new PRACH, excluding the RRC procedure delay.

When intra-frequency or inter-frequency handover is commanded, the interruption time shall be less than  $T_{\text{interrupt}}$

$$T_{\text{interrupt}} = T_{\text{search}} + T_{\text{IU}} + T_{\text{processing}} + T_{\Delta} + T_{\text{margin}} \text{ ms}$$

Where:

$T_{\text{search}}$  is the time required to search the target cell when the handover command is received by the UE. If the target cell is a known cell, then  $T_{\text{search}} = 0$  ms. If the target cell is an unknown intra-frequency cell and the target cell  $E_s/I_{ot} \geq -2$  dB, then  $T_{\text{search}} = 8 * T_{\text{rs}}$  ms. If the target cell is an unknown inter-frequency cell and the target cell  $E_s/I_{ot} \geq -2$  dB, then  $T_{\text{search}} = 8 * 3 * T_{\text{rs}}$  ms. Regardless of whether DRX is in use by the UE,  $T_{\text{search}}$  shall still be based on non-DRX target cell search times.

$T_{\text{processing}}$  is time for UE processing.  $T_{\text{processing}}$  can be up to 20ms.

$T_{\text{margin}}$  is time for SSB post-processing.  $T_{\text{margin}}$  can be up to 2ms.

$T_{\Delta}$  is time for fine time tracking and acquiring full timing information of the target cell.  $T_{\Delta} = T_{\text{rs}}$  for both known and unknown target cell.

$T_{\text{IU}}$  is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell.  $T_{\text{IU}}$  can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [3].

$T_{\text{rs}}$  is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cell in the handover command, otherwise  $T_{\text{rs}}$  is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If such measObjectNRs configured by MN and SN have different SMTC,  $T_{\text{rs}}$  is the periodicity of one of the SMTC which is up to UE implementation. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with  $T_{\text{rs}}=5$ ms assuming the SSB transmission periodicity is 5ms. There is no requirement if the SSB transmission periodicity is not 5ms. If the UE has been provided with higher layer in TS 38.331 [2] signaling of *smtc2* prior to the handover command,  $T_{\text{rs}}$  follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

In FR2, the target cell is known if it has been meeting the following conditions:

- During the last 5 seconds before the reception of the handover command:
  - the UE has sent a valid measurement report for the target cell and

- One of the SSBs measured from the NR target cell being configured remains detectable according to the cell identification conditions specified in clause 9.2 for intra-frequency cell and in clause 9.3 for inter-frequency cell,
- One of the SSBs measured from the target cell also remains detectable during the handover delay according to the cell identification conditions specified in clause 9.2 for intra-frequency cell and in clause 9.3 for inter-frequency cell.

otherwise it is unknown.

### 6.1.1.5 NR FR1- NR FR2 Handover

The requirements in this clause are applicable to inter-frequency handovers from NR FR1 cell to NR FR2 cell.

#### 6.1.1.5.1 Handover delay

When the UE receives a RRC message implying handover the UE shall be ready to start the transmission of the new uplink PRACH channel within  $D_{\text{handover}}$  ms from the end of the last TTI containing the RRC command.

Where:

$D_{\text{handover}}$  equals the applicable RRC procedure delay defined in clause 12 in TS 38.331 [2] plus the interruption time stated in clause 6.1.1.5.2.

#### 6.1.1.5.2 Interruption time

The interruption time is the time between end of the last TTI containing the RRC command on the old PDSCH and the time the UE starts transmission of the new PRACH, excluding the RRC procedure delay.

When inter-frequency handover is commanded, the interruption time shall be less than  $T_{\text{interrupt}}$

$$T_{\text{interrupt}} = T_{\text{search}} + T_{\text{IU}} + T_{\text{processing}} + T_{\Delta} + T_{\text{margin}} \text{ ms}$$

Where:

$T_{\text{search}}$  is the time required to search the target cell when the handover command is received by the UE. If the target cell is a known cell, then  $T_{\text{search}} = 0$  ms. . If the target cell is an unknown inter-frequency cell and the target cell  $E_s/I_{ot} \geq -2$  dB, then  $T_{\text{search}} = 8 \cdot 3 \cdot T_{\text{rs}}$  ms. Regardless of whether DRX is in use by the UE,  $T_{\text{search}}$  shall still be based on non-DRX target cell search times.

$T_{\text{processing}}$  is time for UE processing.  $T_{\text{processing}}$  can be up to 40ms.

$T_{\text{margin}}$  is time for SSB post-processing.  $T_{\text{margin}}$  can be up to 2ms.

$T_{\Delta}$  is time for fine time tracking and acquiring full timing information of the target cell.  $T_{\Delta} = T_{\text{rs}}$  for both known and unknown target cell.

$T_{\text{IU}}$  is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell.  $T_{\text{IU}}$  can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [3].

$T_{\text{rs}}$  is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cell in the handover command, otherwise  $T_{\text{rs}}$  is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If such measObjectNRs configured by MN and SN have different SMTC,  $T_{\text{rs}}$  is the periodicity of one of the SMTC which is up to UE implementation. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with  $T_{\text{rs}}=5$ ms assuming the SSB transmission periodicity is 5ms. There is no requirement if the SSB transmission periodicity is not 5ms.

In FR2, the target cell is known if it has been meeting the following conditions:

- During the last 5 seconds before the reception of the handover command:
  - the UE has sent a valid measurement report for the target cell and

- One of the SSBs measured from the NR target cell being configured remains detectable according to the cell identification conditions specified in clause 9.3,
- One of the SSBs measured from the target cell also remains detectable during the handover delay according to the cell identification conditions specified in clause 9.3.

otherwise it is unknown.

## 6.1.2 NR Handover to other RATs

### 6.1.2.1 NR – E-UTRAN Handover

#### 6.1.2.1.1 Introduction

The purpose of inter-RAT handover from NR to E-UTRAN is to change the radio access mode of PCell from NR to E-UTRAN. The handover procedure is initiated from NR with a RRC message that implies a handover as described in TS 38.331 [2]. The requirements in this clause are applicable to SA NR, NE-DC and NR-DC.

[If PRACH occasion is configured in radio frames with even SFN and the relative time difference between radio frame  $i$  in the current cell and the target cell is not less than  $153600 \cdot T_s$ , the longer handover delay is expected.]

#### 6.1.2.1.2 Handover delay

When the UE receives a RRC message implying handover to E-UTRAN the UE shall be ready to start the transmission of the uplink PRACH channel in E-UTRA within  $D_{\text{handover}}$  ms from the end of the last TTI containing the RRC command.  $D_{\text{handover}}$  is defined as

$$D_{\text{handover}} = T_{\text{RRC\_procedure\_delay}} + T_{\text{interrupt}}$$

Where:

$T_{\text{RRC\_procedure\_delay}}$ : it is the RRC procedure delay, which is 50ms

$T_{\text{interrupt}}$ : it is the time between end of the last TTI containing the RRC command on the NR PDSCH and the time the UE starts transmission of the PRACH in E-UTRAN, excluding  $T_{\text{RRC\_procedure\_delay}}$ .  $T_{\text{interrupt}}$  is defined in clause 6.1.2.1.3.

#### 6.1.2.1.3 Interruption time

When the inter-RAT handover to E-UTRAN is commanded, the interruption time shall be less than  $T_{\text{interrupt}}$

$$T_{\text{interrupt}} = T_{\text{search}} + T_{\text{IU}} + 20 \text{ ms}$$

Where:

$T_{\text{search}}$  is the time required to search the target cell when the target cell is not already known when the handover command is received by the UE. If the target cell is known, then  $T_{\text{search}} = 0$  ms. If the target cell is unknown and signal quality is sufficient for successful cell detection on the first attempt, then  $T_{\text{search}} = 80$  ms. Regardless of whether DRX is in use by the UE,  $T_{\text{search}}$  shall still be based on non-DRX target cell search times.

$T_{\text{IU}}$  is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell.  $T_{\text{IU}}$  can be up to 30 ms.

NOTE: The actual value of  $T_{\text{IU}}$  shall depend upon the PRACH configuration used in the target cell.

In the interruption requirement a cell is known if it has been meeting the relevant cell identification requirement during the last 5 seconds otherwise it is unknown. Relevant E-UTRAN cell identification requirements are described in clause 9.4.1.

## 6.2 RRC Connection Mobility Control

### 6.2.1 SA: RRC Re-establishment

#### 6.2.1.1 Introduction

This clause contains requirements on the UE regarding RRC connection re-establishment procedure. RRC connection re-establishment is initiated when a UE in RRC\_CONNECTED state loses RRC connection due to any of failure cases, including radio link failure, handover failure, and RRC connection reconfiguration failure. The RRC connection re-establishment procedure is specified in clause 5.3.7 of TS 38.331 [2].

The requirements in this clause are applicable for RRC connection re-establishment to NR cell.

#### 6.2.1.2 Requirements

In RRC\_CONNECTED state the UE shall be capable of sending *RRCReestablishmentRequest* message within  $T_{re-establish\_delay}$  seconds from the moment it detects a loss in RRC connection. The total RRC connection delay ( $T_{re-establish\_delay}$ ) shall be less than:

$$T_{re-establish\_delay} = T_{UE\_re-establish\_delay} + T_{UL\_grant}$$

$T_{UL\_grant}$ : It is the time required to acquire and process uplink grant from the target PCell. The uplink grant is required to transmit *RRCReestablishmentRequest* message.

The UE re-establishment delay ( $T_{UE\_re-establish\_delay}$ ) is specified in clause 6.2.1.2.1.

##### 6.2.1.2.1 UE Re-establishment delay requirement

The UE re-establishment delay ( $T_{UE\_re-establish\_delay}$ ) is the time between the moments when any of the conditions requiring RRC re-establishment as defined in clause 5.3.7 in TS 38.331 [2] is detected by the UE and when the UE sends PRACH to the target PCell. The UE re-establishment delay ( $T_{UE\_re-establish\_delay}$ ) requirement shall be less than:

$$T_{UE\_re-establish\_delay} = 50 \text{ ms} + T_{identify\_intra\_NR} + \sum_{i=1}^{N_{freq}-1} T_{identify\_inter\_NR,i} + T_{SI-NR} + T_{PRACH}$$

The intra-frequency target NR cell shall be considered detectable if each relevant SSB can satisfy that:

- SS-RSRP related side conditions given in clause 10.1.2 and 10.1.3 are fulfilled for a corresponding NR Band for FR1 and FR2, respectively, and
- the conditions of SSB<sub>RP</sub> and SSB  $\hat{E}_s/I_{ot}$  according to Annex B.2.2 for a corresponding NR Band are fulfilled.

The inter-frequency target NR cell shall be considered detectable when for each relevant SSB:

- SS-RSRP related side conditions given in clause 10.1.4 and 10.1.5 are fulfilled for a corresponding NR Band for FR1 and FR2, respectively, and
- the conditions of SSB<sub>RP</sub> and SSB  $\hat{E}_s/I_{ot}$  according to Annex B.2.3 for a corresponding NR Band are fulfilled.

$T_{identify\_intra\_NR}$ : It is the time to identify the target intra-frequency NR cell and it depends on whether the target NR cell is known cell or unknown cell and on the FR of the target NR cell. If the UE is not configured with intra-frequency NR carrier for RRC re-establishment then  $T_{identify\_intra\_NR}=0$ ; otherwise  $T_{identify\_intra\_NR}$  shall not exceed the values defined in Table 6.2.1.2.1-1.

$T_{identify\_inter\_NR,i}$ : It is the time to identify the target inter-frequency NR cell on inter-frequency carrier  $i$  configured for RRC re-establishment and it depends on whether the target NR cell is known cell or unknown cell and on the FR of the target NR cell.  $T_{identify\_inter\_NR,i}$  shall not exceed the values defined in Table 6.2.1.2.1-2.

$T_{SMTC}$ : It is the periodicity of the SMTC occasion configured for the intra-frequency carrier. If the UE has been provided with higher layer in TS 38.331 [2] signaling of *smtc2*,  $T_{smtc}$  follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

$T_{\text{SMTC},i}$ : It is the periodicity of the SMTC occasion configured for the inter-frequency carrier  $i$ . If it is not configured, the UE may assume that the target SSB periodicity is no larger than 20 ms.

$T_{\text{SI-NR}}$ : It is the time required for receiving all the relevant system information according to the reception procedure and the RRC procedure delay of system information blocks defined in TS 38.331 [2] for the target NR cell.

$T_{\text{PRACH}}$ : It is the delay uncertainty in acquiring the first available PRACH occasion in the target NR cell.  $T_{\text{PRACH}}$  can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [3].

$N_{\text{freq}}$ : It is the total number of NR frequencies to be monitored for RRC re-establishment;  $N_{\text{freq}} = 1$  if the target intra-frequency NR cell is known, else  $N_{\text{freq}} = 2$  and  $T_{\text{identify\_intra\_NR}} = 0$  if the target inter-frequency NR cell is known.

There is no requirement if the target cell does not contain the UE context.

In the requirement defined in the below tables, the target FR1 cell is known if it has been meeting the relevant cell identification requirement during the last 5 seconds otherwise it is unknown.

**Table 6.2.1.2.1-1: Time to identify target NR cell for RRC connection re-establishment to NR intra-frequency cell**

| Serving cell SSB $\hat{E}_s/\text{lot}$ (dB) | FR of target NR cell | $T_{\text{identify\_intra\_NR}}$ [ms]     |   |
|--|----------------------|---|---|
|  |                      | Known NR cell                             | Unknown NR cell                             |
| $\geq -8$                                    | FR1                  | MAX (200 ms, $5 \times T_{\text{SMTC}}$ ) | MAX (800 ms, $10 \times T_{\text{SMTC}}$ )  |
| $\geq -8$                                    | FR2                  | N/A                                       | MAX (1000 ms, $80 \times T_{\text{SMTC}}$ ) |
| $< -8$                                       | FR1                  | N/A                                       | 800 <sup>Note1</sup>                        |
| $< -8$                                       | FR2                  | N/A                                       | 3520 <sup>Note1</sup>                       |

Note 1: The UE is not required to successfully identify a cell on any NR frequency layer when  $T_{\text{SMTC}} > 20$  ms and serving cell SSB  $\hat{E}_s/\text{lot} < -8$  dB.

**Table 6.2.1.2.1-2: Time to identify target NR cell for RRC connection re-establishment to NR inter-frequency cell**

| Serving cell SSB $\hat{E}_s/\text{lot}$ (dB) | FR of target NR cell | $T_{\text{identify\_inter\_NR},i}$ [ms]     |  |
|--|----------------------|---|--|
|  |                      | Known NR cell                               | Unknown NR cell                                |
| $\geq -8$                                    | FR1                  | MAX (200 ms, $6 \times T_{\text{SMTC},i}$ ) | MAX (800 ms, $13 \times T_{\text{SMTC},i}$ )   |
| $\geq -8$                                    | FR2                  | N/A   | MAX (1000 ms, $104 \times T_{\text{SMTC},i}$ ) |
| $< -8$                                       | FR1                  | N/A   | 800 <sup>Note1</sup>                           |
| $< -8$                                       | FR2                  | N/A   | 4000 <sup>Note1</sup>                          |

Note 1: The UE is not required to successfully identify a cell on any NR frequency layer when  $T_{\text{SMTC},i} > 20$  ms and serving cell SSB  $\hat{E}_s/\text{lot} < -8$  dB.

## 6.2.2 Random access

### 6.2.2.1 Introduction

This clause contains requirements on the UE regarding random access procedure. The random access procedure is initiated to establish uplink time synchronization for a UE which either has not acquired or has lost its uplink synchronization, or to convey UE's request Other SI, or for beam failure recovery. The random access is specified in clause 8 of TS 38.213 [3] and the control of the RACH transmission is specified in clause 5.1 of TS 38.321 [7].

### 6.2.2.2 Requirements

The UE shall have capability to calculate PRACH transmission power according to the PRACH power formula defined in TS 38.213 [3] and apply this power level at the first preamble or additional preambles. The absolute power applied to the first preamble shall have an accuracy as specified in Table 6.3.4.2-1 of TS 38.101-1 [18] for FR1 and in Table 6.3.4.2-1 of TS 38.101-2 [19] for FR2. The relative power applied to additional preambles shall have an accuracy as specified in Table 6.3.4.3-1 of TS 38.101-1 [18] for FR1 and clause 6.3.4.3 of TS 38.101-2 [19] for FR2.

The UE shall indicate a random access problem to upper layers if the maximum number of preamble transmission counter has been reached for the random access procedure on PCell or PSCell as specified in clause 5.1.4 in TS 38.321 [7].

The requirements in this clause apply for UE in SA operation mode or any MR-DC operation mode.

#### 6.2.2.2.1 Contention based random access

##### 6.2.2.2.1.1 Correct behaviour when transmitting Random Access Preamble

With the UE selected SSB with SS-RSRP above *rsrp-ThresholdSSB*, UE shall have the capability to select a Random Access Preamble randomly with equal probability from the Random Access Preambles associated with the selected SSB if the association between Random Access Preambles and SSB is configured, as specified in clause 5.1.2 in TS 38.321 [7].

With the UE selected SSB with SS-RSRP above *rsrp-ThresholdSSB*, UE shall have the capability to transmit Random Access Preamble on the next available PRACH occasion from the PRACH occasions corresponding to the selected SSB permitted by the restrictions given by the *ra-ssb-OccasionMaskIndex* if configured, if the association between PRACH occasions and SSBs is configured, and PRACH occasion shall be randomly selected with equal probability amongst the selected SSB associated PRACH occasions occurring simultaneously but on different subcarriers, as specified in clause 5.1.2 in TS 38.321 [7].

##### 6.2.2.2.1.2 Correct behaviour when receiving Random Access Response

The UE may stop monitoring for Random Access Response(s) and shall transmit the msg3 if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall again perform the Random Access Resource selection procedure defined in clause 5.1.2 in TS 38.321 [7], and transmit with the calculated PRACH transmission power when the backoff time expires if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

##### 6.2.2.2.1.3 Correct behaviour when not receiving Random Access Response

The UE shall again perform the Random Access Resource selection procedure defined in clause 5.1.2 in TS 38.321 [7], and transmit with the calculated PRACH transmission power when the backoff time expires if no Random Access Response is received within the RA Response window defined in clause 5.1.4 in TS 38.321 [7].

##### 6.2.2.2.1.4 Correct behaviour when receiving an UL grant for msg3 retransmission

The UE shall re-transmit the msg3 upon the reception of an UL grant for msg3 retransmission.

##### 6.2.2.2.1.5 SA: Correct behaviour when receiving a message over Temporary C-RNTI

The UE shall send ACK if the Contention Resolution is successful.

The UE shall again perform the Random Access Resource selection procedure defined in clause 5.1.2 in TS 38.321 [7], and transmit with the calculated PRACH transmission power when the backoff time expires unless the received message includes a UE Contention Resolution Identity MAC control element and the UE Contention Resolution Identity included in the MAC control element matches the CCCH SDU transmitted in the uplink message.

##### 6.2.2.2.1.6 Correct behaviour when contention Resolution timer expires

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if the Contention Resolution Timer expires.

## 6.2.2.2.2 Non-Contention based random access

### 6.2.2.2.2.1 Correct behaviour when transmitting Random Access Preamble

If the contention-free Random Access Resources and the contention-free PRACH occasions associated with SSBs is configured, with the UE selected SSB with  $SS\text{-RSRP}$  above  $rsrp\text{-ThresholdSSB}$  amongst the associated SSBs, UE shall have the capability to select the Random Access Preamble corresponding to the selected SSB, and to transmit Random Access Preamble on the next available PRACH occasion from the PRACH occasions corresponding to the selected SSB permitted by the restrictions given by the  $ra\text{-ssb}\text{-OccasionMaskIndex}$  if configured, and PRACH occasion shall be randomly selected with equal probability amongst the selected SSB associated PRACH occasions occurring simultaneously but on different subcarriers, as specified in clause 5.1.2 in TS 38.321 [7].

If the contention-free Random Access Resources and the contention-free PRACH occasions associated with CSI-RSs is configured, with the UE selected CSI-RS with  $CSI\text{-RSRP}$  above  $rsrp\text{-ThresholdCSI-RS}$  amongst the associated CSI-RSs, UE shall have the capability to select the Random Access Preamble corresponding to the selected CSI-RS, and to transmit Random Access Preamble on the next available PRACH occasion from the PRACH occasions in  $ra\text{-OccasionList}$  corresponding to the selected CSI-RS, and PRACH occasion shall be randomly selected with equal probability amongst the selected CSI-RS associated PRACH occasions occurring simultaneously but on different subcarriers, as specified in clause 5.1.2 in TS 38.321 [7].

If the random access procedure is initialized for beam failure recovery and if the contention-free Random Access Resources and the contention-free PRACH occasions for beam failure recovery request associated with any of the SSBs and/or CSI-RSs is configured, UE shall have the capability to select the Random Access Preamble corresponding to the selected SSB with  $SS\text{-RSRP}$  above  $rsrp\text{-ThresholdSSB}$  amongst the associated SSBs or the selected CSI-RS with  $CSI\text{-RSRP}$  above  $rsrp\text{-ThresholdCSI-RS}$  amongst the associated CSI-RSs, and to transmit Random Access Preamble on the next available PRACH occasion from the PRACH occasions corresponding to the selected SSB permitted by the restrictions given by the  $ra\text{-ssb}\text{-OccasionMaskIndex}$  if configured, or from the PRACH occasions in  $ra\text{-OccasionList}$  corresponding to the selected CSI-RS, and PRACH occasion shall be randomly selected with equal probability amongst the selected SSB associated PRACH occasions or the selected CSI-RS associated PRACH occasions occurring simultaneously but on different subcarriers, as specified in clause 5.1.2 in TS 38.321 [7].

### 6.2.2.2.2.2 Correct behaviour when receiving Random Access Response

The UE may stop monitoring for Random Access Response(s), if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble, unless the random access procedure is initialized for Other SI request from UE.

The UE may stop monitoring for Random Access Response(s) and shall monitor the Other SI transmission if the Random Access Response only contains a Random Access Preamble identifier which is corresponding to the transmitted Random Access Preamble and the random access procedure is initialized for SI request from UE, as specified in clause 5.1.4 in TS 38.321 [7].

The UE may stop monitoring for Random Access Response(s), if the contention-free Random Access Preamble for beam failure recovery request was transmitted and if the PDCCH addressed to UE's C-RNTI is received, as specified in clause 5.1.4 in TS 38.321 [7].

The UE shall again perform the Random Access Resource selection procedure defined in clause 5.1.2 in TS 38.321 [7] for the next available PRACH occasion, and transmit the preamble with the calculated PRACH transmission power if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

### 6.2.2.2.2.3 Correct behaviour when not receiving Random Access Response

The UE shall again perform the Random Access Resource selection procedure defined in clause 5.1.2 in TS 38.321 [7] for the next available PRACH occasion, and transmit the preamble with the calculated PRACH transmission power, if no Random Access Response is received within the RA Response window configured in  $RACH\text{-ConfigCommon}$  or if no PDCCH addressed to UE's C-RNTI is received within the RA Response window configured in  $BeamFailureRecoveryConfig$ , as defined in clause 5.1.4 in TS 38.321 [7].

### 6.2.2.2.3 UE behaviour when configured with supplementary UL

In addition to the requirements defined in clause 6.2.2.2.1 and 6.2.2.2.2, a UE configured with supplementary UL carrier shall use RACH configuration for the supplementary UL carrier contained in RMSI and RRC dedicated signalling. If the cell for the random access procedure is configured with supplementary UL, the UE shall transmit or re-transmit PRACH preamble on the supplementary UL carrier if the SS-RSRP measured by the UE on the DL carrier is lower than the *rsrp-ThresholdSSB-SUL* as defined in TS 38.331 [2].

## 6.2.3 SA: RRC Connection Release with Redirection

### 6.2.3.1 Introduction

This clause contains requirements on the UE regarding RRC connection release with redirection procedure. RRC connection release with redirection is initiated by the *RRCRelease* message with redirection to E-UTRAN or NR from NR specified in TS 38.331 [2]. The RRC connection release with redirection procedure is specified in clause 5.3.8 of TS 38.331 [2].

### 6.2.3.2 Requirements

#### 6.2.3.2.1 RRC connection release with redirection to NR

The UE shall be capable of performing the RRC connection release with redirection to the target NR cell within  $T_{\text{connection\_release\_redirect\_NR}}$ .

The time delay ( $T_{\text{connection\_release\_redirect\_NR}}$ ) is the time between the end of the last slot containing the RRC command, “*RRCRelease*” (TS 38.331 [2]) on the NR PDSCH and the time the UE starts to send random access to the target NR cell. The time delay ( $T_{\text{connection\_release\_redirect\_NR}}$ ) shall be less than:

$$T_{\text{connection\_release\_redirect\_NR}} = T_{\text{RRC\_procedure\_delay}} + T_{\text{identify-NR}} + T_{\text{SI-NR}} + T_{\text{RACH}}$$

The target NR cell shall be considered detectable when for each relevant SSB, the side conditions should be met that,

- the conditions of SSB<sub>RP</sub> and SSB  $\hat{E}_s/I_{ot}$  according to Annex B.2.5 for a corresponding NR Band are fulfilled.

$T_{\text{RRC\_procedure\_delay}}$ : It is the RRC procedure delay for processing the received message “*RRCRelease*” as defined in clause 6.2.2 of TS 38.331 [2].

$T_{\text{identify-NR}}$ : It is the time to identify the target NR cell and depends on the FR of the target NR cell. It is defined in Table 6.2.3.2.1-1. Note that  $T_{\text{identify-NR}} = T_{\text{PSS/SSS-sync}} + T_{\text{meas}}$ , in which  $T_{\text{PSS/SSS-sync}}$  is the cell search time and  $T_{\text{meas}}$  is the measurement time due to cell selection criteria evaluation.

$T_{\text{SI-NR}}$ : It is the time required for acquiring all the relevant system information of the target NR cell. This time depends upon whether the UE is provided with the relevant system information of the target NR cell or not by the old NR cell before the RRC connection is released.

$T_{\text{RACH}}$ : It is the delay uncertainty in acquiring the first available PRACH occasion in the target NR cell.  $T_{\text{RACH}}$  can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [3].

$T_{\text{rs}}$  is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cell in the redirection command, otherwise  $T_{\text{rs}}$  is the SMTC periodicity configured in the *measObjectNR* having the same SSB frequency and subcarrier spacing configured for the RRC connection release with redirection. If the *measObjectNRs* having the same SSB frequency and subcarrier spacing configured by MN and SN have different SMTC,  $T_{\text{rs}}$  is the periodicity of one of the SMTC which is up to UE implementation. If the UE is not provided with SMTC configuration or measurement object for the frequency which is also configured for the RRC connection release with redirection then:

- the requirement in this clause is applied with  $T_{\text{rs}} = 20$  ms if the SSB transmission periodicity is not larger than 20 ms; otherwise,
- there is no requirement if the SSB transmission periodicity is larger than 20ms.

**Table 6.2.3.2.1-1: Time to identify target NR cell for RRC connection release with redirection to NR**

| FR of target NR cell | $T_{\text{identify-NR}}$  |
|----------------------|---|
| FR1                  | MAX (680 ms, $11 \times T_{\text{rs}}$ )  |
| FR2                  | MAX (880 ms, $8 \times 11 \times T_{\text{rs}}$ )   |
| Note:                | If the UE has been provided with higher layer signaling of <i>smtc2</i> specified in TS 38.331 [2] prior to the redirection command, $T_{\text{rs}}$ follows <i>smtc1</i> or <i>smtc2</i> according to the physical cell ID of the target cell. |

### 6.2.3.2.2 RRC connection release with redirection to E-UTRAN

The UE shall be capable of performing the RRC connection release with redirection to the target E-UTRAN cell within  $T_{\text{connection\_release\_redirect\_E-UTRA}}$ .

The time delay ( $T_{\text{connection\_release\_redirect\_E-UTRA}}$ ) is the time between the end of the last slot containing the RRC command, “*RRCRelease*” (TS 38.331 [2]) on the PDSCH and the time the UE starts to send random access to the target E-UTRA cell. The time delay ( $T_{\text{connection\_release\_redirect\_E-UTRA}}$ ) shall be less than:

$$T_{\text{connection\_release\_redirect\_E-UTRA}} = T_{\text{RRC\_procedure\_delay}} + T_{\text{identify-E-UTRA}} + T_{\text{SI-E-UTRA}} + T_{\text{RACH}}$$

The target E-UTRA FDD or TDD cell shall be considered detectable provided the following conditions are fulfilled:

- the same conditions as for inter-frequency RSRP measurements specified in annex B.1.2 of TS 36.133 [15] are fulfilled for a corresponding Band, and
- the same conditions as for inter-frequency RSRQ measurements specified in annex B.1.2 of TS 36.133 [15] are fulfilled for a corresponding Band, and
- SCH conditions specified in annex B.1.2 of TS 36.133 [15] are fulfilled for a corresponding Band.

$T_{\text{RRC\_procedure\_delay}}$ : It is the RRC procedure delay for processing the received message “*RRCRelease*” as defined in clause 6.2.2 of TS 38.331 [2].

$T_{\text{identify-E-UTRA}}$ : It is the time to identify the target E-UTRA cell. It shall be less than 320 ms.

$T_{\text{SI-E-UTRA}}$ : It is the time required for acquiring all the relevant system information of the target E-UTRA cell. This time depends upon whether the UE is provided with the relevant system information (SI) of the target E-UTRA cell or not by the old NR cell before the RRC connection is released.

$T_{\text{RACH}}$ : It is the delay caused due to the random access procedure when sending random access to the target E-UTRA cell.

## 7 Timing

### 7.1 UE transmit timing

#### 7.1.1 Introduction

The UE shall have capability to follow the frame timing change of the reference cell in connected state. The uplink frame transmission takes place  $(N_{\text{TA}} + N_{\text{TA\_offset}}) \times T_c$  before the reception of the first detected path (in time) of the corresponding downlink frame from the reference cell. For serving cell(s) in pTAG, UE shall use the SpCell as the reference cell for deriving the UE transmit timing for cells in the pTAG. For serving cell(s) in sTAG, UE shall use any of the activated SCells as the reference cell for deriving the UE transmit timing for the cells in the sTAG. UE initial transmit timing accuracy and gradual timing adjustment requirements are defined in the following requirements.

#### 7.1.2 Requirements

The UE initial transmission timing error shall be less than or equal to  $\pm T_e$  where the timing error limit value  $T_e$  is specified in Table 7.1.2-1. This requirement applies:

- when it is the first transmission in a DRX cycle for PUCCH, PUSCH and SRS or it is the PRACH transmission.

The UE shall meet the  $T_e$  requirement for an initial transmission provided that at least one SSB is available at the UE during the last 160 ms. The reference point for the UE initial transmit timing control requirement shall be the downlink timing of the reference cell minus  $(N_{TA} + N_{TA\text{ offset}}) \times T_c$ . The downlink timing is defined as the time when the first detected path (in time) of the corresponding downlink frame is received from the reference cell.  $N_{TA}$  for PRACH is defined as 0.

$(N_{TA} + N_{TA\text{ offset}}) \times T_c$  (in  $T_c$  units) for other channels is the difference between UE transmission timing and the downlink timing immediately after when the last timing advance in clause 7.3 was applied.  $N_{TA}$  for other channels is not changed until next timing advance is received. The value of  $N_{TA\text{ offset}}$  depends on the duplex mode of the cell in which the uplink transmission takes place and the frequency range (FR).  $N_{TA\text{ offset}}$  is defined in Table 7.1.2-2.

**Table 7.1.2-1:  $T_e$  Timing Error Limit**

| Frequency Range | SCS of SSB signals (kHz) | SCS of uplink signals (kHz) | $T_e$                    |
|-----------------|--------------------------|-----------------------------|--------------------------|
| 1               | 15                       | 15                          | $12 \cdot 64 \cdot T_c$  |
|                 |                          | 30                          | $10 \cdot 64 \cdot T_c$  |
|                 |                          | 60                          | $10 \cdot 64 \cdot T_c$  |
|                 | 30                       | 15                          | $8 \cdot 64 \cdot T_c$   |
|                 |                          | 30                          | $8 \cdot 64 \cdot T_c$   |
|                 |                          | 60                          | $7 \cdot 64 \cdot T_c$   |
| 2               | 120                      | 60                          | $3.5 \cdot 64 \cdot T_c$ |
|                 |                          | 120                         | $3.5 \cdot 64 \cdot T_c$ |
|                 | 240                      | 60                          | $3 \cdot 64 \cdot T_c$   |
|                 |                          | 120                         | $3 \cdot 64 \cdot T_c$   |

Note 1:  $T_c$  is the basic timing unit defined in TS 38.211 [6]

**Table 7.1.2-2: The Value of  $N_{TA\text{ offset}}$**

| Frequency range and band of cell used for uplink transmission   | $N_{TA\text{ offset}}$ (Unit: $T_c$ ) |
|---|---------------------------------------|
| FR1 FDD band without LTE-NR coexistence case or FR1 TDD band without LTE-NR coexistence case  | 25600 (Note 1)                        |
| FR1 FDD band with LTE-NR coexistence case   | 0 (Note 1)                            |
| FR1 TDD band with LTE-NR coexistence case   | 39936 (Note 1)                        |
| FR2   | 13792                                 |
| <p>Note 1: The UE identifies <math>N_{TA\text{ offset}}</math> based on the information n-TimingAdvanceOffset as specified in TS 38.331 [2]. If UE is not provided with the information n-TimingAdvanceOffset, the default value of <math>N_{TA\text{ offset}}</math> is set as 25600 for FR1 band. In case of multiple UL carriers in the same TAG, UE expects that the same value of n-TimingAdvanceOffset is provided for all the UL carriers according to clause 4.2 in TS 38.213 [3] and the value 39936 of <math>N_{TA\text{ offset}}</math> can also be provided for a FDD serving cell.</p> <p>Note 2: Void</p> |                                       |

When it is not the first transmission in a DRX cycle or there is no DRX cycle, and when it is the transmission for PUCCH, PUSCH and SRS transmission, the UE shall be capable of changing the transmission timing according to the received downlink frame of the reference cell except when the timing advance in clause 7.3 is applied.

**Table 7.1.2-3: void**

### 7.1.2.1 Gradual timing adjustment

When the transmission timing error between the UE and the reference timing exceeds  $\pm T_e$  then the UE shall adjust the timing such that timing error is within  $\pm T_e$ . The reference timing shall be  $(N_{TA} + N_{TA\text{ offset}}) \times T_c$  before the downlink timing of the reference cell. All adjustments made to the UE uplink timing shall follow these rules:

- 1) The maximum amount of the magnitude of the timing change in one adjustment shall be  $T_q$ .

- 2) The minimum aggregate adjustment rate shall be  $T_p$  per second.
- 3) The maximum aggregate adjustment rate shall be  $T_q$  per 200 ms.

where the maximum autonomous time adjustment step  $T_q$  and the aggregate adjustment rate  $T_p$  are specified in Table 7.1.2.1-1.

**Table 7.1.2.1-1:  $T_q$  Maximum Autonomous Time Adjustment Step and  $T_p$  Minimum Aggregate Adjustment rate**

| Frequency Range   | SCS of uplink signals (kHz) | $T_q$                    | $T_p$                    |
|---|-----------------------------|--------------------------|--------------------------|
| 1   | 15                          | $5.5 \cdot 64 \cdot T_c$ | $5.5 \cdot 64 \cdot T_c$ |
|   | 30                          | $5.5 \cdot 64 \cdot T_c$ | $5.5 \cdot 64 \cdot T_c$ |
|   | 60                          | $5.5 \cdot 64 \cdot T_c$ | $5.5 \cdot 64 \cdot T_c$ |
| 2   | 60                          | $2.5 \cdot 64 \cdot T_c$ | $2.5 \cdot 64 \cdot T_c$ |
|   | 120                         | $2.5 \cdot 64 \cdot T_c$ | $2.5 \cdot 64 \cdot T_c$ |
| NOTE: $T_c$ is the basic timing unit defined in TS 38.211 [6] |                             |                          |                          |

### 7.1.2.2 Void

**Table 7.1.2.2-1: Void**

## 7.2 UE timer accuracy

### 7.2.1 Introduction

UE timers are used in different protocol entities to control the UE behaviour.

### 7.2.2 Requirements

For UE timers specified in TS 38.331 [2], the UE shall comply with the timer accuracies according to Table 7.2.2-1.

The requirements are only related to the actual timing measurements internally in the UE. They do not include the following:

- Inaccuracy in the start and stop conditions of a timer (e.g. UE reaction time to detect that start and stop conditions of a timer is fulfilled), or
- Inaccuracies due to restrictions in observability of start and stop conditions of a UE timer (e.g. slot alignment when UE sends messages at timer expiry).

**Table 7.2.2-1**

| Timer value [s]      | Accuracy    |
|----------------------|-------------|
| timer value < 4      | $\pm 0.1s$  |
| timer value $\geq 4$ | $\pm 2.5\%$ |

## 7.3 Timing advance

### 7.3.1 Introduction

The timing advance is initiated from gNB to UE in EN-DC, NR-DC, NE-DC and NR SA operation modes, with MAC message that implies the adjustment of the timing advance, as defined in clause 5.2 of TS 38.321 [7].

## 7.3.2 Requirements

### 7.3.2.1 Timing Advance adjustment delay

UE shall adjust the timing of its uplink transmission timing at time slot  $n+k+1$  for a timing advance command received in time slot  $n$ , and the value of  $k$  is defined in clause 4.2 in TS 38.213 [3]. The same requirement applies also when the UE is not able to transmit a configured uplink transmission due to the channel assessment procedure.

### 7.3.2.2 Timing Advance adjustment accuracy

The UE shall adjust the timing of its transmissions with a relative accuracy better than or equal to the UE Timing Advance adjustment accuracy requirement in Table 7.3.2.2-1, to the signalled timing advance value compared to the timing of preceding uplink transmission. The timing advance command step is defined in TS 38.213 [3].

**Table 7.3.2.2-1: UE Timing Advance adjustment accuracy**

| UL Sub Carrier Spacing(kHz)           | 15            | 30            | 60            | 120          |
|---------------------------------------|---------------|---------------|---------------|--------------|
| UE Timing Advance adjustment accuracy | $\pm 256 T_c$ | $\pm 256 T_c$ | $\pm 128 T_c$ | $\pm 32 T_c$ |

## 7.4 Cell phase synchronization accuracy

### 7.4.1 Definition

Cell phase synchronization accuracy for TDD is defined as the maximum absolute deviation in frame start timing between any pair of cells on the same frequency that have overlapping coverage areas.

### 7.4.2 Minimum requirements

The cell phase synchronization accuracy measured at BS antenna connectors or radiated interface boundaries shall be better than 3  $\mu$ s.

## 7.5 Maximum Transmission Timing Difference

### 7.5.1 Introduction

A UE shall be capable of handling a relative transmission timing difference between subframe timing boundary of E-UTRA PCell and the closest slot timing boundary of PSCell to be aggregated for EN-DC operation.

A UE shall be capable of handling a relative transmission timing difference among the closest slot timing boundaries of different carriers to be aggregated in NR carrier aggregation.

A UE shall be capable of handling a relative transmission timing difference between slot timing boundary of PCell and subframe timing boundary of E-UTRA PSCell to be aggregated for NE-DC operation.

A UE shall be capable of handling a relative transmission timing difference between slot timing boundaries of PCell and the closest slot timing boundary of PSCell to be aggregated in NR DC operation.

### 7.5.2 Minimum Requirements for inter-band EN-DC

The UE shall be capable of handling a maximum uplink transmission timing difference between E-UTRA PCell and PSCell as shown in Table 7.5.2-1.

**Table 7.5.2-1 Maximum uplink transmission timing difference requirement for asynchronous EN-DC**

| Sub-carrier spacing in E-UTRA PCell (kHz)   | UL Sub-carrier spacing for data in PSCell (kHz) | Maximum uplink transmission timing difference ( $\mu$ s) |
|---|---|--|
| 15  | 15  | 500  |
| 15  | 30  | 250  |
| 15  | 60  | 125  |
| 15  | 120 <sup>Note1</sup>                            | 62.5   |
| NOTE 1: For E-UTRA FDD-NR FDD intra-band EN-DC, for which the requirement is defined in clause 7.5.3 and this Table 7.5.2-1 is also applicable, the scenario with 120kHz PSCell does not exist. |   |  |

**Table 7.5.2-2 Void**

### 7.5.2.1 Minimum Requirements for inter-band synchronous EN-DC

The requirements in this clause apply as a reference for inter-band synchronous EN-DC.

The UE shall be capable of handling a maximum uplink transmission timing difference between E-UTRA PCell and PSCell for inter-band synchronous EN-DC as shown in Table 7.5.2.1-1. The requirements for synchronous EN-DC are applicable for E-UTRA TDD-NR TDD, E-UTRA FDD-NR FDD, E-UTRA TDD-NR FDD and E-UTRA FDD-NR TDD inter-band EN-DC.

**Table 7.5.2.1-1 Maximum uplink transmission timing difference requirement for inter-band synchronous EN-DC**

| Sub-carrier spacing in E-UTRA PCell (kHz) | UL Sub-carrier spacing for data in PSCell (kHz) | Maximum uplink transmission timing difference ( $\mu$ s) |
|---|---|--|
| 15  | 15  | 35.21  |
| 15  | 30  | 35.21  |
| 15  | 60  | 35.21  |
| 15  | 120   | 35.21  |

### 7.5.3 Minimum Requirements for intra-band EN-DC

For intra-band EN-DC, only co-located deployment is applied.

The UE shall be capable of handling a maximum uplink transmission timing difference between E-UTRA PCell and PSCell as shown in Table 7.5.2-1 for E-UTRA FDD-NR FDD intra-band EN-DC provided the UE indicates that it is capable of asynchronous EN-DC operation [2].

The UE shall be capable of handling a maximum uplink transmission timing difference between E-UTRA PCell and PSCell as shown in Table 7.5.3-1 for E-UTRA TDD-NR TDD and E-UTRA FDD-NR FDD intra-band EN-DC provided the UE does not indicate that it is capable of asynchronous FDD-FDD EN-DC operation [16].

**Table 7.5.3-1: Maximum uplink transmission timing difference requirement for intra-band synchronous EN-DC**

| Sub-carrier spacing in E-UTRA PCell (kHz)   | UL Sub-carrier spacing for data in PSCell (kHz) | Maximum uplink transmission timing difference ( $\mu$ s) |
|---|---|--|
| 15  | 15  | 5.21 <sup>Note1, Note 2</sup>                            |
| 15  | 30  | 5.21 <sup>Note 2</sup>                                   |
| 15  | 60  | 5.21 <sup>Note 2</sup>                                   |
| NOTE 1: This is not applicable for a UE which indicates the capability of only supporting single UL timing ( <i>ul-TimingAlignmentEUTRA-NR</i> is signalled). Single UL timing for E-UTRA and NR cell is assumed for this UE. |   |  |

NOTE 2: If the transmission timing difference exceeds the cyclic prefix length of the UL Sub-carrier spacing for data in PSCell, NR UE Tx EVM degradation is expected for the symbol that is overlapping the LTE subframe boundary

## 7.5.4 Minimum Requirements for NR Carrier Aggregation

The UE shall be capable of handling at least a relative transmission timing difference between slot timing of all pairs of TAGs as shown in Table 7.5.4-1, provided that the UE is:

- configured with the pTAG and the sTAG for inter-band NR carrier aggregation in SA or NR-DC mode, or
- configured with more than one sTAG for inter-band NR carrier aggregation in EN-DC or NE-DC mode.

**Table 7.5.4-1: Maximum uplink transmission timing difference requirement for inter-band NR carrier aggregation**

| Frequency Range of the pair of TAGs | Maximum uplink transmission timing difference ( $\mu$ s) |
|-------------------------------------|--|
| FR1                                 | 34.6   |
| FR2                                 | 8.5  |
| Between FR1 and FR2                 | 26.1   |

## 7.5.5 Minimum Requirements for inter-band NE-DC

The UE shall be capable of handling a maximum uplink transmission timing difference between PCell and E-UTRA PSCell as shown in Table 7.5.5-1 for inter-band asynchronous NE-DC.

**Table 7.5.5-1: Maximum uplink transmission timing difference requirement for inter-band asynchronous NE-DC**

| Sub-carrier spacing in PCell (kHz) | UL Sub-carrier spacing for data in E-UTRA PSCell (kHz) | Maximum uplink transmission timing difference ( $\mu$ s) |
|------------------------------------|--|--|
| 15                                 | 15   | 500  |
| 30                                 | 15   | 250  |
| 60                                 | 15   | 125  |
| 120                                | 15   | 62.5   |
| NOTE 1: Void                       |  |  |

**Table 7.5.5-2: Void**

### 7.5.5.1 Minimum Requirements for inter-band synchronous NE-DC

The requirements in this clause apply as a reference for inter-band synchronous NE-DC.

The UE shall be capable of handling a maximum uplink transmission timing difference between PCell and E-UTRA PSCell for inter-band synchronous NE-DC as shown in Table 7.5.5.1-1. The requirements for synchronous NE-DC are applicable for NR TDD- E-UTRA TDD, NR FDD- E-UTRA FDD, NR TDD- E-UTRA FDD and NR FDD- E-UTRA TDD inter-band NE-DC.

**Table 7.5.5.1-1: Maximum uplink transmission timing difference requirement for inter-band synchronous NE-DC**

| Sub-carrier spacing in PCell (kHz) | UL Sub-carrier spacing for data in E-UTRA PSCell (kHz) | Maximum uplink transmission timing difference ( $\mu$ s) |
|------------------------------------|--|--|
| 15                                 | 15   | 35.21  |

|     |    |       |
|-----|----|-------|
| 30  | 15 | 35.21 |
| 60  | 15 | 35.21 |
| 120 | 15 | 35.21 |

## 7.5.6 Minimum Requirements for inter-band NR DC

The UE shall be capable of handling a maximum uplink transmission timing difference between PCell and PSCell as shown in Table 7.5.6-1 provided that the UE indicates that it is capable of synchronous NR DC [16].

**Table 7.5.6-1: Maximum uplink transmission timing difference requirement for inter-band synchronous NR DC**

| Frequency Range |        | Maximum uplink transmission timing difference ( $\mu\text{s}$ ) |
|-----------------|--------|---|
| PCell           | PSCell |   |
| FR1             | FR2    | 34.1  |

## 7.6 Maximum Receive Timing Difference

### 7.6.1 Introduction

A UE shall be capable of handling a relative receive timing difference between subframe timing boundary of an E-UTRA cell belonging to the MCG and the closest slot timing boundary of a cell belonging to SCG to be aggregated for EN-DC operation.

A UE shall be capable of handling a relative receive timing difference between subframe timing boundary of an E-UTRA cell belonging to the SCG to be aggregated for NE-DC operation and the closest slot timing boundary of a cell belonging to MCG.

A UE shall be capable of handling a relative receive timing difference between slot timing boundary of a cell belonging to MCG and the closest slot timing boundary of a cell belonging to the SCG to be aggregated for NR DC operation. A UE shall be capable of handling a relative receive timing difference among the closest slot timing boundaries of different carriers to be aggregated in NR carrier aggregation.

### 7.6.2 Minimum Requirements for inter-band EN-DC

The UE shall be capable of handling at least a relative receive timing difference between subframe timing of signal from a E-UTRA cell belonging to the MCG and slot timing of signal from a cell belonging to SCG at the UE receiver as shown in Table 7.6.2-1.

**Table 7.6.2-1: Maximum receive timing difference requirement for asynchronous EN-DC**

| Sub-carrier spacing of E-UTRA cell in MCG (kHz)  | DL Sub-carrier spacing of cell in SCG (kHz) (Note 1) | Maximum receive timing difference ( $\mu\text{s}$ ) |
|--|--|---|
| 15   | 15   | 500   |
| 15   | 30   | 250   |
| 15   | 60   | 125   |
| 15   | 120 <sup>Note2</sup>                                 | 62.5  |
| NOTE 1: DL Sub-carrier spacing is $\min\{\text{SCS}_{\text{SS}}, \text{SCS}_{\text{DATA}}\}$ .   |  |   |
| NOTE 2: For E-UTRA FDD-NR FDD intra-band EN-DC, for which the requirement is defined in clause 7.6.3 and this Table 7.6.2-1 is also applicable, the scenario with 120 kHz does not exit. |  |   |

**Table 7.6.2-2: Void**

**Table 7.6.2-3 Void****7.6.2.1 Minimum Requirements for inter-band synchronous EN-DC**

The requirements in this clause apply as a reference for inter-band synchronous EN-DC.

The UE shall be capable of handling at least a relative receive timing difference between subframe timing of signal from an E-UTRA cell belonging to the MCG and slot timing of signal from a cell belonging to SCG at the UE receiver for inter-band synchronous EN-DC as shown in Table 7.6.2.1-1. The requirements for synchronous EN-DC are applicable for E-UTRA TDD-NR TDD, E-UTRA FDD-NR FDD, E-UTRA TDD-NR FDD and E-UTRA FDD-NR TDD inter-band EN-DC.

**Table 7.6.2.1-1: Maximum receive timing difference requirement for inter-band synchronous EN-DC**

| Sub-carrier spacing of E-UTRA cell in MCG (kHz)                    | DL Sub-carrier spacing of cell in SCG (kHz) (Note1) | Maximum receive timing difference ( $\mu$ s) |
|--|---|--|
| 15   | 15  | 33   |
| 15   | 30  |  |
| 15   | 60  |  |
| 15   | 120   |  |
| Note 1: DL Sub-carrier spacing is $\min\{SCS_{SS}, SCS_{DATA}\}$ . |   |  |

**7.6.3 Minimum Requirements for intra-band EN-DC**

For intra-band EN-DC, only co-located deployment is applied.

The UE shall be capable of handling at least a relative receive timing difference between subframe timing of signal from a E-UTRA cell belonging to the MCG and slot timing of signal from a cell belonging to the SCG as shown in Table 7.6.2-1 for E-UTRA FDD-NR FDD intra-band EN-DC provided the UE indicates that it is capable of asynchronous EN-DC operation [2].

The UE shall be capable of handling at least a relative receive timing difference between subframe timing of signal from a E-UTRA cell belonging to the MCG and slot timing of signal from a cell belonging to the SCG as shown in Table 7.6.3-1 for E-UTRA FDD-NR FDD and E-UTRA TDD-NR TDD intra-band EN-DC provided the UE does not indicate that it is capable of asynchronous FDD-FDD EN-DC operation [16].

**Table 7.6.3-1 Maximum receive timing difference requirement for intra-band synchronous EN-DC**

| Sub-carrier spacing of E-UTRA cell in MCG (kHz)                    | DL Sub-carrier spacing of cell in SCG (kHz) <sup>Note1</sup> | Maximum receive timing difference ( $\mu$ s) |
|--|--|--|
| 15   | 15   | 3  |
| 15   | 30   | 3  |
| 15   | 60   | 3  |
| NOTE 1: DL Sub-carrier spacing is $\min\{SCS_{SS}, SCS_{DATA}\}$ . |  |  |

**Table 7.6.3-2 Void****7.6.4 Minimum Requirements for NR Carrier Aggregation**

For intra-band CA, only co-located deployment is applied. For intra-band non-contiguous NR carrier aggregation, the UE shall be capable of handling at least a relative receive timing difference between slot timing of different carriers to be aggregated at the UE receiver as shown in Table 7.6.4-1 below.

**Table 7.6.4-1: Maximum receive timing difference requirement for intra-band non-contiguous NR carrier aggregation**

| Frequency Range  | Maximum receive timing difference ( $\mu\text{s}$ ) |
|--|---|
| FR1  | 3 <sup>1</sup>                                      |
| FR2  | 0.26  |
| Note 1: In the case of different SCS on different CCs, if the receive time difference exceeds the cyclic prefix length of that SCS, demodulation performance degradation is expected for the first symbol of the slot. |   |

For inter-band NR carrier aggregation, the UE shall be capable of handling at least a relative receive timing difference between slot timing of all pairs of carriers to be aggregated at the UE receiver as shown in Table 7.6.4-2 below.

**Table 7.6.4-2: Maximum receive timing difference requirement for inter-band NR carrier aggregation**

| Frequency Range of the pair of carriers | Maximum receive timing difference ( $\mu\text{s}$ ) |
|---|---|
| FR1                                     | 33  |
| FR2                                     | 8   |
| Between FR1 and FR2                     | 25  |

## 7.6.5 Minimum Requirements for inter-band NE-DC

The UE shall be capable of handling at least a relative receive timing difference between slot timing of signal from a cell belonging to the MCG and subframe timing of signal from an E-UTRA cell belonging to the SCG at the UE receiver for asynchronous NE-DC as shown in Table 7.6.5-1.

**Table 7.6.5-1: Maximum receive timing difference requirement for asynchronous NE-DC**

| Sub-carrier spacing of cell in MCG (kHz)   | DL Sub-carrier spacing of EUTRA cell in SCG (kHz) (Note 1) | Maximum receive timing difference ( $\mu\text{s}$ ) |
|--|--|---|
| 15   | 15   | 500   |
| 30   | 15   | 250   |
| 60   | 15   | 125   |
| 120  | 15   | 62.5  |
| NOTE 1: DL Sub-carrier spacing is $\min\{\text{SCS}_{\text{SS}}, \text{SCS}_{\text{DATA}}\}$ . |  |   |
| NOTE 2: Void   |  |   |

**Table 7.6.5-2: Void**

### 7.6.5.1 Minimum Requirements for inter-band synchronous NE-DC

The requirements in this clause apply as a reference for inter-band synchronous NE-DC.

The UE shall be capable of handling at least a relative receive timing difference between slot timing of signal from a cell belonging to the MCG and subframe timing of signal from a E-UTRA cell belonging to the SCG at the UE receiver for inter-band synchronous NE-DC as shown in Table 7.6.5.1-1. The requirements for synchronous NE-DC are applicable for NR TDD- E-UTRA TDD, NR FDD- E-UTRA FDD, NR TDD- E-UTRA FDD and NR FDD- E-UTRA TDD inter-band NE-DC.

**Table 7.6.5.1-1: Maximum receive timing difference requirement for inter-band synchronous NE-DC**

| Sub-carrier spacing of cell in MCG (kHz) | DL Sub-carrier spacing of EUTRA cell in SCG (kHz) (Note1) | Maximum receive timing difference ( $\mu\text{s}$ ) |
|--|---|---|
|--|---|---|

|     |    |    |
|-----|----|----|
| 15  | 15 | 33 |
| 30  | 15 |    |
| 60  | 15 |    |
| 120 | 15 |    |

## 7.6.6 Minimum Requirements for inter-band NR DC

The UE shall be capable of handling at least a relative receive timing difference between slot timing of signal from a cell belonging to the MCG and slot timing of signal from a cell belonging to the SCG at the UE receiver as shown in Table 7.6.6-1 provided that the UE indicates that it is capable of synchronous NR DC [16].

**Table 7.6.6-1: Maximum receive timing difference requirement for inter-band synchronous NR DC**

| Frequency Range |             | Maximum receive timing difference ( $\mu\text{s}$ ) |
|-----------------|-------------|---|
| Cell in MCG     | Cell in SCG |   |
| FR1             | FR2         | 33  |

## 7.7 *deriveSSB-IndexFromCell* tolerance

### 7.7.1 Minimum requirements

When *deriveSSB-IndexFromCell* is enabled, the UE assumes frame boundary alignment (including half frame, subframe and slot boundary alignment) across cells on the same frequency carrier is within a tolerance not worse than  $\min(2 \text{ SSB symbols}, 1 \text{ PDSCH symbol})$  and the SFNs of all cells on the same frequency carrier are the same.

### 7.8 Void

## 8 Signalling characteristics

### 8.1 Radio Link Monitoring

#### 8.1.1 Introduction

The requirements in clause 8.1 apply for radio link monitoring on:

- PCell in SA NR, NR-DC and NE-DC operation mode,
- PSCell in NR-DC and EN-DC operation mode.

The UE shall monitor the downlink radio link quality based on the reference signal configured as RLM-RS resource(s) in order to detect the downlink radio link quality of the PCell and PSCell as specified in TS 38.213 [3]. The configured RLM-RS resources can be all SSBs, or all CSI-RSs, or a mix of SSBs and CSI-RSs. UE is not required to perform RLM outside the active DL BWP.

On each RLM-RS resource, the UE shall estimate the downlink radio link quality and compare it to the thresholds  $Q_{\text{out}}$  and  $Q_{\text{in}}$  for the purpose of monitoring downlink radio link quality of the cell.

The threshold  $Q_{\text{out}}$  is defined as the level at which the downlink radio link cannot be reliably received and shall correspond to the out-of-sync block error rate ( $\text{BLER}_{\text{out}}$ ) as defined in Table 8.1.1-1. For SSB based radio link monitoring,  $Q_{\text{out\_SSB}}$  is derived based on the hypothetical PDCCH transmission parameters listed in Table 8.1.2.1-1. For CSI-RS based radio link monitoring,  $Q_{\text{out\_CSI-RS}}$  is derived based on the hypothetical PDCCH transmission parameters listed in Table 8.1.3.1-1.

The threshold  $Q_{in}$  is defined as the level at which the downlink radio link quality can be received with significantly higher reliability than at  $Q_{out}$  and shall correspond to the in-sync block error rate ( $BLER_{in}$ ) as defined in Table 8.1.1-1. For SSB based radio link monitoring,  $Q_{in\_SSB}$  is derived based on the hypothetical PDCCH transmission parameters listed in Table 8.1.2.1-2. For CSI-RS based radio link monitoring,  $Q_{in\_CSI-RS}$  is derived based on the hypothetical PDCCH transmission parameters listed in Table 8.1.3.1-2.

The out-of-sync block error rate ( $BLER_{out}$ ) and in-sync block error rate ( $BLER_{in}$ ) are determined from the network configuration via parameter *rlmInSyncOutOfSyncThreshold* signalled by higher layers. When UE is not configured with *rlmInSyncOutOfSyncThreshold* from the network, UE determines out-of-sync and in-sync block error rates from Configuration #0 in Table 8.1.1-1 by default. All requirements in clause 8.1 are applicable for BLER Configuration #0 in Table 8.1.1-1.

**Table 8.1.1-1: Out-of-sync and in-sync block error rates**

| Configuration | $BLER_{out}$ | $BLER_{in}$ |
|---------------|--------------|-------------|
| 0             | 10%          | 2%          |

UE shall be able to monitor up to  $N_{RLM}$  RLM-RS resources of the same or different types in each corresponding carrier frequency range, depending on a maximum number  $L_{max}$  of SSBs per half frame according to TS 38.213 [3], where  $N_{RLM}$  is specified in Table 8.1.1-2 according to TS 38.213 [3], and meet the requirements as specified in clause 8.1. UE is not required to meet the requirements in clause 8.1 if RLM-RS is not configured and no TCI state for PDCCH is activated.

**Table 8.1.1-2: Maximum number of RLM-RS resources  $N_{RLM}$**

| Carrier frequency range of PCell/PSCell | $L_{max}$ | Maximum number of RLM-RS resources, $N_{RLM}$ |
|---|-----------|---|
| FR1, $\leq 3$ GHz <sup>Note</sup>       | 4         | 2   |
| FR1, $> 3$ GHz <sup>Note</sup>          | 8         | 4   |
| FR2                                     | 64        | 8   |

NOTE: For unpaired spectrum operation with Case C - 30 kHz SCS, 3GHz is replaced by 1.88GHz, as specified in clause 4.1 in TS 38.213 [3].

## 8.1.2 Requirements for SSB based radio link monitoring

### 8.1.2.1 Introduction

The requirements in this clause apply for each SSB based RLM-RS resource configured for PCell or PSCell, provided that the SSB configured for RLM is actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.1.2.2.

**Table 8.1.2.1-1: PDCCH transmission parameters for out-of-sync evaluation**

| Attribute  | Value for BLER Configuration #0 |
|--|---------------------------------|
| DCI format   | 1-0                             |
| Number of control OFDM symbols                                   | 2                               |
| Aggregation level (CCE)  | 8                               |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy   | 4dB                             |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 4dB                             |
| Bandwidth (PRBs)   | 24                              |
| Sub-carrier spacing (kHz)  | SCS of the active DL BWP        |
| DMRS precoder granularity  | REG bundle size                 |
| REG bundle size  | 6                               |
| CP length  | Normal                          |
| Mapping from REG to CCE  | Distributed                     |

**Table 8.1.2.1-2: PDCCH transmission parameters for in-sync evaluation**

| Attribute  | Value for BLER Configuration #0 |
|--|---------------------------------|
| DCI payload size   | 1-0                             |
| Number of control OFDM symbols                                   | 2                               |
| Aggregation level (CCE)  | 4                               |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy   | 0dB                             |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 0dB                             |
| Bandwidth (PRBs)   | 24                              |
| Sub-carrier spacing (kHz)  | SCS of the active DL BWP        |
| DMRS precoder granularity  | REG bundle size                 |
| REG bundle size  | 6                               |
| CP length  | Normal                          |
| Mapping from REG to CCE  | Distributed                     |

### 8.1.2.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last  $T_{\text{Evaluate\_out\_SSB}}$  ms period becomes worse than the threshold  $Q_{\text{out\_SSB}}$  within  $T_{\text{Evaluate\_out\_SSB}}$  [ms] evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last  $T_{\text{Evaluate\_in\_SSB}}$  ms period becomes better than the threshold  $Q_{\text{in\_SSB}}$  within  $T_{\text{Evaluate\_in\_SSB}}$  [ms] evaluation period.

$T_{\text{Evaluate\_out\_SSB}}$  and  $T_{\text{Evaluate\_in\_SSB}}$  are defined in Table 8.1.2.2-1 for FR1.

$T_{\text{Evaluate\_out\_SSB}}$  and  $T_{\text{Evaluate\_in\_SSB}}$  are defined in Table 8.1.2.2-2 for FR2 with scaling factor  $N=8$ .

For FR1,

- $P = \frac{1}{1 - \frac{T_{\text{SSB}}}{MGRP}}$ , when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, and these measurement gaps are overlapping with some but not all occasions of the SSB; and
- $P = 1$  when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

For FR2,

- $P = \frac{1}{1 - \frac{T_{\text{SSB}}}{T_{\text{SMTCperiod}}}}$ , when RLM-RS resource is not overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ( $T_{\text{SSB}} < T_{\text{SMTCperiod}}$ ).
- $P$  is  $P_{\text{sharing}}$  factor, when the RLM-RS resource is not overlapped with measurement gap and RLM-RS resource is fully overlapped with SMTC period ( $T_{\text{SSB}} = T_{\text{SMTCperiod}}$ ).
- $P = \frac{1}{1 - \frac{T_{\text{SSB}}}{MGRP} - \frac{T_{\text{SSB}}}{T_{\text{SMTCperiod}}}}$ , when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ( $T_{\text{SSB}} < T_{\text{SMTCperiod}}$ ) and SMTC occasion is not overlapped with measurement gap and
  - $T_{\text{SMTCperiod}} \neq MGRP$  or
  - $T_{\text{SMTCperiod}} = MGRP$  and  $T_{\text{SSB}} < 0.5 \times T_{\text{SMTCperiod}}$

- $P = \frac{P_{\text{sharing factor}}}{1 - \frac{T_{\text{SSB}}}{MGRP}}$ , when the RLM-RS is partially overlapped with measurement gap and the RLM-RS is partially overlapped with SMTC occasion ( $T_{\text{SSB}} < T_{\text{SMTCperiod}}$ ) and SMTC occasion is not overlapped with measurement gap and  $T_{\text{SMTCperiod}} = MGRP$  and  $T_{\text{SSB}} = 0.5 \times T_{\text{SMTCperiod}}$
- $P = \frac{1}{1 - \frac{T_{\text{SSB}}}{\text{Min}(MGRP, T_{\text{SMTCperiod}})}}$ , when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ( $T_{\text{SSB}} < T_{\text{SMTCperiod}}$ ) and SMTC occasion is partially or fully overlapped with measurement gap
- $P = \frac{P_{\text{sharing factor}}}{1 - \frac{T_{\text{SSB}}}{MGRP}}$ , when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is fully overlapped with SMTC occasion ( $T_{\text{SSB}} = T_{\text{SMTCperiod}}$ ) and SMTC occasion is partially overlapped with measurement gap ( $T_{\text{SMTCperiod}} < MGRP$ )
- $P_{\text{sharing factor}} = 1$ , if the RLM-RS resource outside measurement gap is
  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,
  - not overlapped by the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.
- $P_{\text{sharing factor}} = 3$ , otherwise.

where,

If the high layer in TS 38.331 [2] signaling of *smtc2* is present,  $T_{\text{SMTCperiod}}$  follows *smtc2*; Otherwise  $T_{\text{SMTCperiod}}$  follows *smtc1*.  $T_{\text{SMTCperiod}}$  is the shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

**Table 8.1.2.2-1: Evaluation period  $T_{\text{Evaluate\_out\_SSB}}$  and  $T_{\text{Evaluate\_in\_SSB}}$  for FR1**

| Configuration  | $T_{\text{Evaluate\_out\_SSB}}$ (ms)  | $T_{\text{Evaluate\_in\_SSB}}$ (ms)  |
|--|---|--|
| no DRX   | $\text{Max}(200, \text{Ceil}(10 \times P) \times T_{\text{SSB}})$                             | $\text{Max}(100, \text{Ceil}(5 \times P) \times T_{\text{SSB}})$                               |
| DRX cycle $\leq 320$ ms  | $\text{Max}(200, \text{Ceil}(15 \times P) \times \text{Max}(T_{\text{DRX}}, T_{\text{SSB}}))$ | $\text{Max}(100, \text{Ceil}(7.5 \times P) \times \text{Max}(T_{\text{DRX}}, T_{\text{SSB}}))$ |
| DRX cycle $> 320$ ms   | $\text{Ceil}(10 \times P) \times T_{\text{DRX}}$  | $\text{Ceil}(5 \times P) \times T_{\text{DRX}}$  |
| NOTE: $T_{\text{SSB}}$ is the periodicity of the SSB configured for RLM. $T_{\text{DRX}}$ is the DRX cycle length. |   |  |

**Table 8.1.2.2-2: Evaluation period  $T_{\text{Evaluate\_out\_SSB}}$  and  $T_{\text{Evaluate\_in\_SSB}}$  for FR2**

| Configuration  | $T_{\text{Evaluate\_out\_SSB}}$ (ms)   | $T_{\text{Evaluate\_in\_SSB}}$ (ms)   |
|--|--|---|
| no DRX   | $\text{Max}(200, \text{Ceil}(10 \times P \times N) \times T_{\text{SSB}})$                             | $\text{Max}(100, \text{Ceil}(5 \times P \times N) \times T_{\text{SSB}})$                               |
| DRX cycle $\leq 320$ ms  | $\text{Max}(200, \text{Ceil}(15 \times P \times N) \times \text{Max}(T_{\text{DRX}}, T_{\text{SSB}}))$ | $\text{Max}(100, \text{Ceil}(7.5 \times P \times N) \times \text{Max}(T_{\text{DRX}}, T_{\text{SSB}}))$ |
| DRX cycle $> 320$ ms   | $\text{Ceil}(10 \times P \times N) \times T_{\text{DRX}}$  | $\text{Ceil}(5 \times P \times N) \times T_{\text{DRX}}$  |
| NOTE: $T_{\text{SSB}}$ is the periodicity of the SSB configured for RLM. $T_{\text{DRX}}$ is the DRX cycle length. |  |   |

### 8.1.2.3 Measurement restrictions for SSB based RLM

The UE is required to be capable of measuring SSB for RLM without measurement gaps. The UE is required to perform the SSB measurements with measurement restrictions as described in the following clauses.

For FR1, when the SSB for RLM is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for RLM without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for RLM without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for RLM and CSI-RS. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

For FR2, when the SSB for RLM measurement on one CC is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSB for RLM and CSI-RS. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

## 8.1.3 Requirements for CSI-RS based radio link monitoring

### 8.1.3.1 Introduction

The requirements in this clause apply for each CSI-RS based RLM-RS resource configured for PCell or PSCell, provided that the CSI-RS configured for RLM is actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.1.3.2. UE is not expected to perform radio link monitoring measurements on the CSI-RS configured as RLM-RS if the CSI-RS is not in the active TCI state of any CORESET configured in the UE active BWP.

**Table 8.1.3.1-1: PDCCH transmission parameters for out-of-sync evaluation**

| Attribute   | Value for BLER Configuration #0 |
|---|---------------------------------|
| DCI format  | 1-0                             |
| Number of control OFDM symbols                                      | 2                               |
| Aggregation level (CCE)   | 8                               |
| Ratio of hypothetical PDCCH RE energy to average CSI-RS RE energy   | 4dB                             |
| Ratio of hypothetical PDCCH DMRS energy to average CSI-RS RE energy | 4dB                             |
| Bandwidth (PRBs)  | 48                              |
| Sub-carrier spacing (kHz)   | SCS of the active DL BWP        |
| DMRS precoder granularity   | REG bundle size                 |
| REG bundle size   | 6                               |
| CP length   | Normal                          |
| Mapping from REG to CCE   | Distributed                     |

**Table 8.1.3.1-2: PDCCH transmission parameters for in-sync evaluation**

| Attribute   | Value for BLER Configuration #0 |
|---|---------------------------------|
| DCI payload size  | 1-0                             |
| Number of control OFDM symbols                                      | 2                               |
| Aggregation level (CCE)   | 4                               |
| Ratio of hypothetical PDCCH RE energy to average CSI-RS RE energy   | 0dB                             |
| Ratio of hypothetical PDCCH DMRS energy to average CSI-RS RE energy | 0dB                             |
| Bandwidth (PRBs)  | 48                              |

|                           |                          |
|---------------------------|--------------------------|
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size          |
| REG bundle size           | 6                        |
| CP length                 | Normal                   |
| Mapping from REG to CCE   | Distributed              |

### 8.1.3.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last  $T_{\text{Evaluate\_out\_CSI-RS}}$  ms period becomes worse than the threshold  $Q_{\text{out\_CSI-RS}}$  within  $T_{\text{Evaluate\_out\_CSI-RS}}$  [ms] evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last  $T_{\text{Evaluate\_in\_CSI-RS}}$  ms period becomes better than the threshold  $Q_{\text{in\_CSI-RS}}$  within  $T_{\text{Evaluate\_in\_CSI-RS}}$  [ms] evaluation period.

- $T_{\text{Evaluate\_out\_CSI-RS}}$  and  $T_{\text{Evaluate\_in\_CSI-RS}}$  are defined in Table 8.1.3.2-1 for FR1.
- $T_{\text{Evaluate\_out\_CSI-RS}}$  and  $T_{\text{Evaluate\_in\_CSI-RS}}$  are defined in Table 8.1.3.2-2 for FR2 with scaling factor  $N=1$ .

The requirements of  $T_{\text{Evaluate\_out\_CSI-RS}}$  and  $T_{\text{Evaluate\_in\_CSI-RS}}$  apply provided that the CSI-RS for RLM is not in a resource set configured with repetition ON. The requirements do not apply when the CSI-RS resource in the active TCI state of CORESET is the same CSI-RS resource for RLM and the TCI state information of the CSI-RS resource is not given, wherein the TCI state information means QCL Type-D to SSB for L1-RSRP or CSI-RS with repetition ON.

For FR1,

- $P = \frac{1}{1 - \frac{T_{\text{CSI-RS}}}{\text{MGRP}}}$ , when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, and these measurement gaps are overlapping with some but not all occasions of the CSI-RS; and
- $P = 1$ , when in the monitored cell there are no measurement gaps overlapping with any occasion of the CSI-RS.

For FR2,

- $P = 1$ , when the RLM-RS resource is not overlapped with measurement gap and also not overlapped with SMTC occasion.
- $P = \frac{1}{1 - \frac{T_{\text{CSI-RS}}}{\text{MGRP}}}$ , when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is not overlapped with SMTC occasion ( $T_{\text{CSI-RS}} < \text{MGRP}$ )
- $P = \frac{1}{1 - \frac{T_{\text{CSI-RS}}}{T_{\text{SMTCperiod}}}}$ , when the RLM-RS resource is not overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ( $T_{\text{CSI-RS}} < T_{\text{SMTCperiod}}$ ).
- $P = P_{\text{sharing factor}}$ , when the RLM-RS resource is not overlapped with measurement gap and RLM-RS resource is fully overlapped with SMTC occasion ( $T_{\text{CSI-RS}} = T_{\text{SMTCperiod}}$ ).
- $P = \frac{1}{1 - \frac{T_{\text{CSI-RS}}}{\text{MGRP}} - \frac{T_{\text{CSI-RS}}}{T_{\text{SMTCperiod}}}}$ , when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ( $T_{\text{CSI-RS}} < T_{\text{SMTCperiod}}$ ) and SMTC occasion is not overlapped with measurement gap and
  - $T_{\text{SMTCperiod}} \neq \text{MGRP}$  or
  - $T_{\text{SMTCperiod}} = \text{MGRP}$  and  $T_{\text{CSI-RS}} < 0.5 \times T_{\text{SMTCperiod}}$
- $P = \frac{P_{\text{sharing factor}}}{1 - \frac{T_{\text{CSI-RS}}}{\text{MGRP}}}$ , when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ( $T_{\text{CSI-RS}} < T_{\text{SMTCperiod}}$ ) and SMTC occasion is not overlapped with measurement gap and  $T_{\text{SMTCperiod}} = \text{MGRP}$  and  $T_{\text{CSI-RS}} = 0.5 \times T_{\text{SMTCperiod}}$

- $P = \frac{1}{1 - \frac{T_{CSI-RS}}{\min(MGRP, T_{SMTCperiod})}}$ , when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ( $T_{CSI-RS} < T_{SMTCperiod}$ ) and SMTC occasion is partially or fully overlapped with measurement gap
- $P = \frac{P_{\text{sharing factor}}}{1 - \frac{T_{CSI-RS}}{MGRP}}$ , when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is fully overlapped with SMTC occasion ( $T_{CSI-RS} = T_{SMTCperiod}$ ) and SMTC occasion is partially overlapped with measurement gap ( $T_{SMTCperiod} < MGRP$ )
- $P_{\text{sharing factor}} = 1$ , if the RLM-RS resource outside measurement gap is
  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,
  - not overlapped by the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.
- $P_{\text{sharing factor}} = 3$ , otherwise.

where,

If the high layer in TS 38.331 [2] signaling of *smtc2* is present,  $T_{SMTCperiod}$  follows *smtc2*; Otherwise  $T_{SMTCperiod}$  follows *smtc1*.  $T_{SMTCperiod}$  is the shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.

Note: The overlap between CSI-RS for RLM and SMTC means that CSI-RS based RLM is within the SMTC window duration.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

The values of  $M_{out}$  and  $M_{in}$  used in Table 8.1.3.2-1 and Table 8.1.3.2-2 are defined as:

- $M_{out} = 20$  and  $M_{in} = 10$ , if the CSI-RS resource configured for RLM is transmitted with higher layer CSI-RS parameter *density* [6, clause 7.4.1] set to 3 and over the bandwidth  $\geq 24$  PRBs.

**Table 8.1.3.2-1: Evaluation period  $T_{Evaluate\_out\_CSI-RS}$  and  $T_{Evaluate\_in\_CSI-RS}$  for FR1**

| Configuration           | $T_{Evaluate\_out\_CSI-RS}$ (ms)   | $T_{Evaluate\_in\_CSI-RS}$ (ms)   |
|-------------------------|--|---|
| no DRX                  | $\text{Max}(200, \text{Ceil}(M_{out} \times P) \times T_{CSI-RS})$                                 | $\text{Max}(100, \text{Ceil}(M_{in} \times P) \times T_{CSI-RS})$                                 |
| $DRX \leq 320\text{ms}$ | $\text{Max}(200, \text{Ceil}(1.5 \times M_{out} \times P) \times \text{Max}(T_{DRX}, T_{CSI-RS}))$ | $\text{Max}(100, \text{Ceil}(1.5 \times M_{in} \times P) \times \text{Max}(T_{DRX}, T_{CSI-RS}))$ |
| $DRX > 320\text{ms}$    | $\text{Ceil}(M_{out} \times P) \times T_{DRX}$   | $\text{Ceil}(M_{in} \times P) \times T_{DRX}$   |

NOTE:  $T_{CSI-RS}$  is the periodicity of the CSI-RS resource configured for RLM. The requirements in this table apply for  $T_{CSI-RS}$  equal to 5 ms, 10ms, 20 ms or 40 ms.  $T_{DRX}$  is the DRX cycle length.

**Table 8.1.3.2-2: Evaluation period  $T_{Evaluate\_out\_CSI-RS}$  and  $T_{Evaluate\_in\_CSI-RS}$  for FR2**

| Configuration           | $T_{Evaluate\_out\_CSI-RS}$ (ms)  | $T_{Evaluate\_in\_CSI-RS}$ (ms)  |
|-------------------------|---|--|
| no DRX                  | $\text{Max}(200, \text{Ceil}(M_{out} \times P \times N) \times T_{CSI-RS})$                                 | $\text{Max}(100, \text{Ceil}(M_{in} \times P \times N) \times T_{CSI-RS})$                                 |
| $DRX \leq 320\text{ms}$ | $\text{Max}(200, \text{Ceil}(1.5 \times M_{out} \times P \times N) \times \text{Max}(T_{DRX}, T_{CSI-RS}))$ | $\text{Max}(100, \text{Ceil}(1.5 \times M_{in} \times P \times N) \times \text{Max}(T_{DRX}, T_{CSI-RS}))$ |
| $DRX > 320\text{ms}$    | $\text{Ceil}(M_{out} \times P \times N) \times T_{DRX}$   | $\text{Ceil}(M_{in} \times P \times N) \times T_{DRX}$   |

NOTE:  $T_{CSI-RS}$  is the periodicity of the CSI-RS resource configured for RLM. The requirements in this table apply for  $T_{CSI-RS}$  equal to 5 ms, 10 ms, 20 ms or 40 ms.  $T_{DRX}$  is the DRX cycle length.

### 8.1.3.3 Measurement restrictions for CSI-RS based RLM

The UE is required to be capable of measuring CSI-RS for RLM without measurement gaps. The UE is required to perform the CSI-RS measurements with measurement restrictions as described in the following clauses.

For both FR1 and FR2, when the CSI-RS for RLM is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for RLM in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD, or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for RLM, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for RLM, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS for RLM measurement without restrictions.
- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for RLM and SSB. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

For FR1, when the CSI-RS for RLM is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for RLM without any restriction.

For FR2, when the CSI-RS for RLM measurement on one CC is in the same OFDM symbol as SSB for RLM, BFD, or L1-RSRP measurement on the same CC or different CCs in the same band, or in the same symbol as SSB for CBD measurement on the same CC or different CCs in the same band when beam failure is detected, UE is required to measure one of but not both CSI-RS for RLM and SSB. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

For FR2, when the CSI-RS for RLM measurement on one CC is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band,

- In the following cases, UE is required to measure one of but not both CSI-RS for RLM and the other CSI-RS. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.
  - The CSI-RS for RLM or the other CSI-RS in a resource set configured with repetition ON, or
  - The other CSI-RS is configured in q1 and beam failure is detected, or
  - The two CSI-RS-es are not QCL-ed w.r.t. QCL-TypeD, or the QCL information is not known to UE,
- Otherwise, UE shall be able to measure the CSI-RS for RLM without any restriction.

### 8.1.4 Minimum requirement at transitions

When the UE transitions between DRX and no DRX or when DRX cycle periodicity changes, for each RLM-RS resource, for a duration of time equal to the evaluation period corresponding to the second mode after the transition occurs, the UE shall use an evaluation period that is no less than the minimum of evaluation period corresponding to the first mode and the second mode. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second mode for each RLM-RS resource. This requirement shall be applied to both out-of-sync evaluation and in-sync evaluation of the monitored cell.

When the UE transitions from a first configuration of RLM resources to a second configuration of RLM resources that is different from the first configuration, for each RLM resource present in the second configuration, for a duration of time equal to the evaluation period corresponding to the second configuration after the transition occurs, the UE shall use an evaluation period that is no less than the minimum of evaluation periods corresponding to the first configuration and the second configuration. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second configuration for each RLM resource present in the second configuration. This requirement shall be applied to both out-of-sync evaluation and in-sync evaluation of the monitored cell.

When the UE transitions from a first configuration of active TCI state of the CORESET to a second configuration of active TCI state of the CORESET, for each CSI-RS for RLM present in the second configuration, the UE shall use an

evaluation period corresponding to the second configuration from the time of transition. This requirement shall be applied to both out-of-sync evaluation and in-sync evaluation of the monitored cell.

### 8.1.5 Minimum requirement for UE turning off the transmitter

The transmitter power of the UE in the monitored cell shall be turned off within 40ms after expiry of T310 timer as specified in TS 38.331 [2].

### 8.1.6 Minimum requirement for L1 indication

When the downlink radio link quality on all the configured RLM-RS resources is worse than  $Q_{out}$ , layer 1 of the UE shall send an out-of-sync indication for the cell to the higher layers. A layer 3 filter shall be applied to the out-of-sync indications as specified in TS 38.331 [2].

When the downlink radio link quality on at least one of the configured RLM-RS resources is better than  $Q_{in}$ , layer 1 of the UE shall send an in-sync indication for the cell to the higher layers. A layer 3 filter shall be applied to the in-sync indications as specified in TS 38.331 [2].

The out-of-sync and in-sync evaluations for the configured RLM-RS resources shall be performed as specified in clause 5 in TS 38.213 [3]. Two successive indications from layer 1 shall be separated by at least  $T_{Indication\_interval}$ .

When DRX is not used  $T_{Indication\_interval}$  is  $\max(10\text{ms}, T_{RLM-RS,M})$ , where  $T_{RLM,M}$  is the shortest periodicity of all configured RLM-RS resources for the monitored cell, which corresponds to  $T_{SSB}$  specified in clause 8.1.2 if the RLM-RS resource is SSB, or  $T_{CSI-RS}$  specified in clause 8.1.3 if the RLM-RS resource is CSI-RS.

In case DRX is used,  $T_{Indication\_interval}$  is  $\text{Max}(10\text{ms}, 1.5 \times \text{DRX\_cycle\_length}, 1.5 \times T_{RLM-RS,M})$  if DRX cycle\_length is less than or equal to 320ms, and  $T_{Indication\_interval}$  is DRX cycle\_length if DRX cycle\_length is greater than 320ms. Upon start of T310 timer as specified in TS 38.331 [2], the UE shall monitor the configured RLM-RS resources for recovery using the evaluation period and layer 1 indication interval corresponding to the no DRX mode until the expiry or stop of T310 timer.

### 8.1.7 Scheduling availability of UE during radio link monitoring

When the reference signal to be measured for RLM has different subcarrier spacing than PDSCH/PDCCH or is on frequency range 2, there are restrictions on the scheduling availability as described in the following clauses.

#### 8.1.7.1 Scheduling availability of UE performing radio link monitoring with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to radio link monitoring performed with a same subcarrier spacing as PDSCH/PDCCH on FR1.

#### 8.1.7.2 Scheduling availability of UE performing radio link monitoring with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to radio link monitoring based on SSB as RLM-RS. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to radio link monitoring based on SSB as RLM-RS.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for radio link monitoring.

When intra-band carrier aggregation in FR1 is performed, the scheduling restrictions on FR1 serving PCell or PSCell applies to all serving cells in the same band on the symbols that fully or partially overlap with the restricted symbols. When inter-band carrier aggregation within FR1 is performed, there are no scheduling restrictions on FR1 serving cell(s) in the bands due to radio link monitoring performed on FR1 serving PCell or PSCell in different bands.

### 8.1.7.3 Scheduling availability of UE performing radio link monitoring on FR2

The following scheduling restriction applies due to radio link monitoring on an FR2 serving PCell and/or PSCell.

- If the RLM-RS is CSI-RS which is type-D QCLed with active TCI state for PDCCH or PDSCH, and the CSI-RS is not in a CSI-RS resource set with repetition ON,
  - There are no scheduling restrictions due to radio link monitoring based on the CSI-RS.
- Otherwise
  - The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on RLM-RS symbols to be measured for radio link monitoring.

When intra-band carrier aggregation in FR2 is performed, the scheduling restrictions on FR2 serving PCell or PSCell applies to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

For FR2, if following conditions are met,

- UE has been notified about system information update through paging,
- The gap between UE's reception of PDCCH that UE monitors in the Type2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB for RLM and CORESET for RMSI scheduling multiplexing patterns 3, UE is expected to receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for RLM; and

For the SSB for RLM and CORESET for RMSI scheduling multiplexing patterns 2, UE is expected to receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for RLM.

### 8.1.7.4 Scheduling availability of UE performing radio link monitoring on FR1 or FR2 in case of FR1-FR2 inter-band CA and NR-DC

There are no scheduling restrictions on FR1 serving cell(s) due to radio link monitoring performed on FR2 serving PCell and/or PSCell.

There are no scheduling restrictions on FR2 serving cell(s) due to radio link monitoring performed on FR1 serving PCell and/or PSCell.

NR-DC in Rel-15 only includes the scenarios where all serving cells in MCG are in FR1 and all serving cells in SCG are in FR2.

## 8.2 Interruption

### 8.2.1 EN-DC Interruption

#### 8.2.1.1 Introduction

This clause contains the requirements related to the interruptions on PSCell, and SCell, when

- E-UTRA PCell transitions between active and non-active during DRX, or
- E-UTRA PCell transitions from non-DRX to DRX, or
- E-UTRA SCell in MCG or SCell in SCG is added or released, or
- E-UTRA SCell in MCG or SCell in SCG is activated or deactivated, or
- measurements on SCC with deactivated SCell in either E-UTRA MCG or NR SCG, or

a supplementary UL carrier or an UL carrier is configured or de-configured, or  
UL/DL BWP is switched on PSCell or SCell in SCG.

The requirements shall apply for E-UTRA-NR DC with an E-UTRA PCell.

This clause contains interruptions where victim cell is PSCell or SCell belonging to SCG. Requirements for interruptions requirements when the victim cell is E-UTRA PCell or E-UTRA SCell belonging to MCG are specified in TS 36.133 [15].

For a UE which does not support per-FR measurement gaps, interruptions to the PSCell or activated SCG SCells may be caused by EUTRA PCell, EUTRA SCells or SCells on any frequency range. For UE which support per-FR gaps, interruptions to the PSCell or activated SCG SCells may be caused by EUTRA PCell, EUTRA SCells or SCells on the same frequency range as the victim cell.

## 8.2.1.2 Requirements

### 8.2.1.2.1 Interruptions at transitions between active and non-active during DRX

Interruption on PSCell and the activated SCell if configured due to E-UTRA PCell transitions between active and non-active during DRX when PSCell or SCell is in non-DRX are allowed with up to 1% probability of missed ACK/NACK when the configured E-UTRA PCell DRX cycle is less than 640 ms, and 0.625% probability of missed ACK/NACK is allowed when the configured E-UTRA PCell DRX cycle is 640 ms or longer. Each interruption shall not exceed X slot as defined in table 8.2.1.2.1-1.

**Table 8.2.1.2.1-1: Interruption length X at transition between active and non-active during DRX**

| $\mu$ | NR Slot length (ms) | Interruption length X (slots) |       |
|-------|---------------------|-------------------------------|-------|
|       |                     | Sync                          | Async |
| 0     | 1                   | 1                             | 2     |
| 1     | 0.5                 | 1                             | 2     |
| 2     | 0.25                | 3                             |       |
| 3     | 0.125               | 5                             |       |

When both E-UTRA PCell and PSCell are in DRX, no interruption is allowed.

### 8.2.1.2.2 Interruptions at transitions from non-DRX to DRX

Interruption on PSCell and the activated SCell if configured due to E-UTRA PCell transitions from non-DRX to DRX when PSCell or SCell is in non-DRX shall not exceed X slot as defined in table 8.2.1.2.1-1.

When PSCell and the activated SCell are in DRX, no interruption due to E-UTRA PCell transitions from non-DRX to DRX is allowed.

### 8.2.1.2.3 Interruptions at SCell addition/release

The requirements in this clause shall apply for the UE configured with PSCell.

When one E-UTRA SCell in MCG is added or released:

- the UE is allowed an interruption on any active serving cell in SCG:
- of up to X1 slot, if the active serving cell is not in the same band as the E-UTRA SCell being added or released, or
- of up to  $\max\{Y1 \text{ slot} + T_{\text{SMTC\_duration}}, 5\text{ms}\}$  if the active serving cells are in the same band as the E-UTRA SCell being added or released, provided the cell specific reference signals from the active serving cells and the E-UTRA SCell being added or released are available in the same slot, where  $T_{\text{SMTC\_duration}}$  is the longest SMTC duration among all above active serving cells in SCG;

Where X1 and Y1 are specified in Table 8.2.1.2.3-1.

When one SCell in SCG is added or released:

- the UE is allowed an interruption on any active serving cell in SCG:
  - of up to X1 slot, if the active serving cell is not in the same band as any of the SCells being added or released, or
  - of up to Y1 slot + T<sub>SMTC\_duration</sub> if the active serving cells are in the same band as any of the SCells being added or released, provided the cell specific reference signals from the active serving cells and the SCells being added or released are available in the same slot, where, T<sub>SMTC\_duration</sub> is
    - the longest SMTC duration among all above active serving cells in SCG and the SCell being added when one SCell is added. If SSB configuration (*absoluteFrequencySSB*) but no SMTC configuration is provided for the SCell being added, the SSB transmission periodicity is assumed to be 5ms and T<sub>SMTC\_duration</sub> for the SCell being added is x ms, where x = the number of consecutive subframes containing all SSBs in one SSB burst transmitted by the SCell being added. If no SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration is provided for the SCell being added, T<sub>SMTC\_duration</sub> for the SCell being added is 0 ms;
    - the longest SMTC duration among all above active serving cells in SCG when one SCell is released.

Where X1 and Y1 are specified in Table 8.2.1.2.3-2.

**Table 8.2.1.2.3-1: Interruption length X1 and Y1 at E-UTRA SCell addition/Release**

| $\mu$ | NR Slot length (ms) | Interruption length X1 (slots) |       | Interruption length Y1 (slots) |       |
|-------|---------------------|--------------------------------|-------|--------------------------------|-------|
|       |                     | Sync                           | Async | Sync                           | Async |
| 0     | 1                   | 1                              | 2     | 1                              | 2     |
| 1     | 0.5                 | 2                              | 3     | 2                              | 3     |
| 2     | 0.25                | 5                              |       | 4                              | 5     |
| 3     | 0.125               | 9                              |       | N/A                            | N/A   |

**Table 8.2.1.2.3-2: Interruption length X1 and Y1 at SCell addition/Release**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X1 (slots)                 |   | Interruption length Y1 (slots) |
|-------|------------------------------------|--|---|--------------------------------|
|       |                                    |  |   |                                |
| 0     | 1                                  | 1  |   | 1                              |
| 1     | 0.5                                | 2  |   | 2                              |
| 2     | 0.25                               | Both aggressor cell and victim cell are on FR2 | 4 | 4                              |
|       |                                    | Either aggressor cell or victim cell is on FR1 | 5 |                                |
| 3     | 0.125                              | Aggressor cell is on FR2                       | 8 | 8                              |
|       |                                    | Aggressor cell is on FR1                       | 9 |                                |

**8.2.1.2.4 Interruptions at SCell activation/deactivation**

The requirements in this clause shall apply for the UE configured with PSCell and one SCell.

When one E-UTRA SCell in MCG is activated or deactivated:

- the UE is allowed an interruption on any active serving cell in SCG:
  - of up to X2 slot, if the active serving cell is not in the same band as the E-UTRA SCell being activated or deactivated, or
  - of up to max{Y2 slot + T<sub>SMTC\_duration</sub>, 5ms} if the active serving cells are in the same band as the E-UTRA SCell being activated or deactivated, provided the cell specific reference signals from the active serving cells and the E-UTRA SCell being activated or deactivated are available in the same slot, where T<sub>SMTC\_duration</sub> is the longest SMTC duration among all above active serving cells in SCG.

Where X2 and Y2 are specified in Table 8.2.1.2.4-1.

When one SCell in SCG is activated or deactivated:

- an interruption on any active serving cell in SCG:
  - of up to X2 slot, if the active serving cell is not in the same band as the SCell being activated or deactivated, or
  - of up to Y2 slot +  $T_{SMTC\_duration}$  if the active serving cells are in the same band as the SCell being activated or deactivated, provided the cell specific reference signals from the active serving cells and the SCell being activated or deactivated are available in the same slot, where,  $T_{SMTC\_duration}$  is
    - the longest SMTC duration among all above active serving cells in SCG and the SCell being activated when one SCell is activated. If SSB configuration (*absoluteFrequencySSB*) but no SMTC configuration is provided for the SCell being activated, the SSB transmission periodicity is assumed to be 5ms and  $T_{SMTC\_duration}$  for the SCell being activated is x ms, where x = the number of consecutive subframes containing all SSBs in one SSB burst transmitted by the SCell being activated. If no SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration is provided for the SCell being activated,  $T_{SMTC\_duration}$  for the SCell being activated is 0ms;
    - the longest SMTC duration among all above active serving cells in SCG when one SCell is deactivated.

Where X2 and Y2 are specified in Table 8.2.1.2.4-2.

**Table 8.2.1.2.4-1: Interruption length X2 and Y2 at E-UTRA SCell activation/deactivation**

| $\mu$ | NR Slot length (ms) | Interruption length X2 (slots) |       | Interruption length Y2 (slots) |       |
|-------|---------------------|--------------------------------|-------|--------------------------------|-------|
|       |                     | Sync                           | Async | Sync                           | Async |
| 0     | 1                   | 1                              | 2     | 1                              | 2     |
| 1     | 0.5                 | 1                              | 2     | 1                              | 2     |
| 2     | 0.25                | 3                              |       | 2                              | 3     |
| 3     | 0.125               | 5                              |       | N/A                            | N/A   |

**Table 8.2.1.2.4-2: Interruption length X2 and Y2 at SCell activation/deactivation**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X2 (slots)                 |   | Interruption length Y2 (slots) |
|-------|------------------------------------|--|---|--------------------------------|
| 0     | 1                                  | 1  |   | 1                              |
| 1     | 0.5                                | 1  |   | 1                              |
| 2     | 0.25                               | Both aggressor cell and victim cell are on FR2 | 2 | 2                              |
|       |                                    | Either aggressor cell or victim cell is on FR1 | 3 |                                |
| 3     | 0.125                              | Aggressor cell is on FR2                       | 4 | 4                              |
|       |                                    | Aggressor cell is on FR1                       | 5 |                                |

**8.2.1.2.5 Interruptions during measurements on SCC**

**8.2.1.2.5.1 Interruptions during measurements on deactivated NR SCC**

Interruption on PSCell and other activated NR SCell(s) during measurement on the deactivated NR SCC shall meet requirements in clause 8.2.2.2.3, where the term PCell in clause 8.2.2.2.3 shall be deemed to be replaced with PSCell.

**8.2.1.2.5.2 Interruptions during measurements on deactivated E-UTRAN SCC**

When one E-UTRA SCell in MCG is deactivated, the UE is allowed due to measurements on the E-UTRA SCC with the deactivated E-UTRA SCell:

- an interruption on PSCell or any activated SCell with up to 0.5% probability of missed ACK/NACK when any of the configured *measCycleSCell* [15] for the deactivated E-UTRA SCells is 640 ms or longer.
- an interruption on PSCell or any activated SCell with up to 0.5% probability of missed ACK/NACK regardless of the configured *measCycleSCell* [15] for the deactivated E-UTRA SCells if indicated by the network using IE *allowInterruptions* [15].

Each interruption shall not exceed

- X3 slot, if the PSCell or activated SCell is not in the same band as the E-UTRA deactivated SCC being measured, or
- Y3 slot + SMTC duration, if the PSCell or activated SCell is in the same band as the E-UTRA deactivated SCC being measured, provided the cell specific reference signals from the PSCell or activated SCell and the E-UTRA deactivated SCC being measured are available in the same slot.

**Table 8.2.1.2.5.2-1: Interruption length X3 and Y3 at measurements on deactivated E-UTRA SCC**

| $\mu$ | NR Slot length (ms) | Interruption length X3 (slots) |       | Interruption length Y3 (slots) |       |
|-------|---------------------|--------------------------------|-------|--------------------------------|-------|
|       |                     | Sync                           | Async | Sync                           | Async |
| 0     | 1                   | 1                              | 2     | 1                              | 2     |
| 1     | 0.5                 | 1                              | 2     | 1                              | 2     |
| 2     | 0.25                | 3                              |       | 2                              | 3     |
| 3     | 0.125               | 5                              |       | N/A                            | N/A   |

#### 8.2.1.2.6 Interruptions at UL carrier RRC reconfiguration

The requirements in this clause shall apply when a supplementary UL carrier or an UL carrier is configured or de-configured in NR non-standalone operation as defined in TS 38.331 [2].

When an UL carrier or supplementary UL carrier is configured or de-configured, an interruption of up to X4 slot, is allowed during the RRC reconfiguration procedure [2] on E-UTRA PCell, all activated E-UTRA SCells, PSCell and all activated SCells within the same FR as the reconfigured uplink carrier. The interruption is for both uplink and downlink of E-UTRA PCell, all activated E-UTRA SCells, PSCell and all activated SCells within the same FR as the configured or de-configured UL.

**Table 8.2.1.2.6-1: Interruption length X4 at UL carrier RRC reconfiguration**

| $\mu$ | NR Slot length (ms) | Interruption length X4 (slots) |       |
|-------|---------------------|--------------------------------|-------|
|       |                     | Sync                           | Async |
| 0     | 1                   | 1                              | 2     |
| 1     | 0.5                 | 2                              | 3     |
| 2     | 0.25                | 5                              |       |
| 3     | 0.125               | 9                              |       |

#### 8.2.1.2.7 Interruptions due to Active BWP switching Requirement

The requirements for DCI-based and timer-based BWP switches in this clause only apply to the case that the BWP switch is performed on a single CC.

When UE receives a DCI indicating UE to switch its active BWP involving changes in any of the parameters listed in Table 8.2.1.2.7-2, the UE is allowed to cause interruption of up to X slot to other active serving cells if the UE is not capable of per-FR gap, or if the BWP switching involves SCS changing. When the BWP switch imposes changes in any of the parameters listed in Table 8.2.1.2.7-2 and the UE is capable of per-FR gap, the UE is allowed to cause interruption of up to X slot to other active serving cells in the same frequency range wherein the UE is performing BWP switching. X is defined in Table 8.2.1.2.7-1. The starting time of interruption is only allowed within the BWP switching delay  $T_{\text{BWPswitchDelay}}$  as defined in clause 8.6.2. Interruptions are not allowed during BWP switch involving any other parameter change.

When a BWP timer *bwp-InactivityTimer* defined in TS 38.331 [2] expires, UE is allowed to cause interruption of up to X slot to other active serving cells due to switching its active BWP involving changes in any of the parameters listed in Table 8.2.1.2.7-2 if the UE is not capable of per-FR gap, or if the BWP switching involves SCS changing. When the BWP switch imposes changes in any of the parameters listed in Table 8.2.1.2.7-2 and the UE is capable of per-FR gap, the UE is allowed to cause interruption of up to X slot to other active serving cells in the same frequency range wherein the UE is performing BWP switching. X is defined in Table 8.2.1.2.7-1. The starting time of interruption is only allowed within the BWP switching delay  $T_{\text{BWPswitchDelay}}$  as defined in clause 8.6.2. Interruptions are not allowed during BWP switch involving any other parameter change.

When UE receives an RRC reconfiguration that only requests UE to switch its active BWP on one single CC, the UE is allowed to cause interruption of up to X slot to other active serving cells due to switching its active BWP involving changes in any of the parameters listed in Table 8.2.1.2.7-2 if the UE is not capable of per-FR gap, or if the BWP switching involves SCS changing. When the BWP switch imposes changes in any of the parameters listed in Table 8.2.1.2.7-2 and the UE is capable of per-FR gap, the UE is allowed to cause interruption of up to X slot to other active serving cells in the same frequency range wherein the UE is performing BWP switching. X is defined in Table 8.2.1.2.7-1. The interruption is only allowed within the delay  $T_{\text{RRCprocessingDelay}} + T_{\text{BWPswitchDelayRRC}}$  defined in clause 8.6.3.

**Table 8.2.1.2.7-1: interruption length X**

| $\mu$  | NR Slot length (ms) | Interruption length X (slots) |
|--------|---------------------|-------------------------------|
| 0      | 1                   | 1                             |
| 1      | 0.5                 | 1                             |
| 2      | 0.25                | 3                             |
| 3      | 0.125               | 5                             |
| Note1: | void                |                               |

**Table 8.2.1.2.7-2: Parameters which cause interruption other than SCS**

| Parameters                  | Comment            |
|-----------------------------|--------------------|

| <i>nrofSRS-Ports</i>        |                    |

## 8.2.2 SA: Interruptions with Standalone NR Carrier Aggregation

### 8.2.2.1 Introduction

This clause contains the requirements related to the interruptions on PCell and activated SCell if configured, when up to 7 SCells are configured, de-configured, activated or deactivated, or a supplementary UL carrier or an UL carrier is configured or de-configured, or measurements on SCC with deactivated SCell in NR SCG, or UL/DL BWP is switched on PCell or SCell.

Note: interruptions at SCell addition/release, activation/deactivation and during measurements on SCC may not be required by all UEs.

The interruptions shall not interrupt RRC signalling or ACK/NACKs related to RRC reconfiguration procedure [2] for SCell addition/release or MAC control signalling [17] for SCell activation/deactivation command.

This clause additionally contains requirements related to interruptions at inter-frequency SFTD between PCell in FR1 and neighbour cell in FR2.

For a UE which does not support per-FR measurement gap, interruptions to the PCell and activated SCell may be caused by SCells on any frequency range. For a UE which supports per-FR gap, interruptions to PCell and activated SCell may be caused by SCells on the same frequency range as the victim cell.

## 8.2.2.2 Requirements

### 8.2.2.2.1 Interruptions at SCell addition/release

When any number of SCells between one and 7 is added or released using the same *RRCConnectionReconfiguration* message as defined in TS 38.331 [2], the UE is allowed an interruption on any active serving cell during the RRC reconfiguration procedure as follows:

- an interruption on any active serving cell:
  - of up to the duration shown in table 8.2.2.2.1-1, if the active serving cell is not in the same band as the SCell being added or released, or
  - of up to the duration shown in table 8.2.2.2.1-2, if the active serving cells are in the same band as the SCell being added or released, provided the cell specific reference signals from the active serving cells and the SCell being added or released are available in the same slot.

**Table 8.2.2.2.1-1: Interruption duration for SCell addition/release for inter-band CA**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length (slots)                    |   |
|-------|------------------------------------|--|---|
| 0     | 1                                  | 1  |   |
| 1     | 0.5                                | 2  |   |
| 2     | 0.25                               | Both aggressor cell and victim cell are on FR2 | 4 |
|       |                                    | Either aggressor cell or victim cell is on FR1 | 5 |
| 3     | 0.125                              | Aggressor cell is on FR2                       | 8 |
|       |                                    | Aggressor cell is on FR1                       | 9 |

**Table 8.2.2.2.1-2: Interruption duration for SCell addition/release for intra-band CA**

| $\mu$ | NR Slot length (ms) | Interruption length (slot)  |
|-------|---------------------|---|
| 0     | 1                   | $1 + T_{\text{SMTC\_duration}} * N_{\text{slot}}^{\text{subframe},\mu}$ |
| 1     | 0.5                 | $2 + T_{\text{SMTC\_duration}} * N_{\text{slot}}^{\text{subframe},\mu}$ |
| 2     | 0.25                | $4 + T_{\text{SMTC\_duration}} * N_{\text{slot}}^{\text{subframe},\mu}$ |
| 3     | 0.125               | $8 + T_{\text{SMTC\_duration}} * N_{\text{slot}}^{\text{subframe},\mu}$ |

NOTE 1:  $T_{\text{SMTC\_duration}}$  measured in subframes is

- the longest SMTC duration among all above active serving cells and the SCell being added when one SCell is added. If SSB configuration (*absoluteFrequencySSB*) but no SMTC configuration is provided for the SCell being added, the SSB transmission periodicity is assumed to be 5ms and  $T_{\text{SMTC\_duration}}$  for the SCell being added is x ms, where x = the number of consecutive subframes containing all SSBs in one SSB burst transmitted by the SCell being added. If no SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration is provided for the SCell being added,  $T_{\text{SMTC\_duration}}$  for the SCell being added is 0ms;
- the longest SMTC duration among all active serving cells in the same band when one SCell is released.

NOTE 2:  $N_{\text{slot}}^{\text{subframe},\mu}$  is as defined in TS 38.211 [6].

### 8.2.2.2.2 Interruptions at SCell activation/deactivation

When an SCell is activated or deactivated as defined in TS 37.340 [17], the UE is allowed

- an interruption on any active serving cell:
  - of up to the duration shown in table 8.2.2.2.2-1, if the active serving cell is not in the same band as the SCell being activated or deactivated, or

- of up to the duration shown in table 8.2.2.2.2-2, if the active serving cells are in the same band as the SCell being activated or deactivated provided the cell specific reference signals from the active serving cells and the SCell being activated or deactivated are available in the same slot.

**Table 8.2.2.2.2-1: Interruption duration for SCell activation/deactivation for inter-band CA**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length (slots)                    |   |
|-------|------------------------------------|--|---|
| 0     | 1                                  |  | 1 |
| 1     | 0.5                                |  | 1 |
| 2     | 0.25                               | Both aggressor cell and victim cell are on FR2 | 2 |
|       |                                    | Either aggressor cell or victim cell is on FR1 | 3 |
| 3     | 0.125                              | Aggressor cell is on FR2                       | 4 |
|       |                                    | Aggressor cell is on FR1                       | 5 |

**Table 8.2.2.2.2-2: Interruption duration for SCell activation/deactivation for intra-band CA**

| $\mu$ | NR Slot length (ms) | Interruption length (slots)   |
|-------|---------------------|---|
| 0     | 1                   | $1 + T_{\text{SMTC\_duration}} * N_{\text{slot}}^{\text{subframe},\mu}$ |
| 1     | 0.5                 | $1 + T_{\text{SMTC\_duration}} * N_{\text{slot}}^{\text{subframe},\mu}$ |
| 2     | 0.25                | $2 + T_{\text{SMTC\_duration}} * N_{\text{slot}}^{\text{subframe},\mu}$ |
| 3     | 0.125               | $4 + T_{\text{SMTC\_duration}} * N_{\text{slot}}^{\text{subframe},\mu}$ |

NOTE 1:  $T_{\text{SMTC\_duration}}$  measured in subframes is  
 - the longest SMTC duration among all above active serving cells and the SCell being activated when one SCell is activated. If SSB configuration (*absoluteFrequencySSB*) but no SMTC configuration is provided for the SCell being activated, the SSB transmission periodicity is assumed to be 5ms and  $T_{\text{SMTC\_duration}}$  for the SCell being activated is x ms, where x = the number of consecutive subframes containing all SSBs in one SSB burst transmitted by the SCell being activated. If no SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration is provided for the SCell being activated,  $T_{\text{SMTC\_duration}}$  for the SCell being activated is 0ms;  
 - the longest SMTC duration among all active servingNOTE 2:  $N_{\text{slot}}^{\text{subframe},\mu}$  is as defined in TS 38.211 [6].

**8.2.2.2.3 Interruptions during measurements on deactivated SCC**

Interruptions on PCell or activated SCell(s) due to measurements when an SCell is deactivated are allowed with up to 0.5% probability of missed ACK/NACK when the configured *measCycleSCell* [2] is 640 ms or longer.

- If the PCell or activated SCell(s) is not in the same band as the deactivated SCell, the UE is only allowed to cause interruptions on PCell or activated SCell(s) immediately before and immediately after an SMTC. Each interruption shall not exceed requirement in Table 8.2.2.2.2-1.
- If the PCell or activated SCell(s) is in the same band as the deactivated SCell, the UE is only allowed to cause an interruption on PCell or activated SCell(s) no earlier than X slots before  $T_{\text{SMTC\_duration}}$  and no later than X slots after  $T_{\text{SMTC\_duration}}$ , provided the cell specific reference signals from the active serving cells and the deactivated SCell are available in the same slot, where X and  $T_{\text{SMTC\_duration}}$  are given by Table 8.2.2.2.3-1. The interruption shall not exceed requirements in Table 8.2.2.2.3-1.

**Table 8.2.2.2.3-1: Interruption duration for measurement on deactivated SCell for intra-band CA**

| $\mu$ | NR Slot length (ms) | X (slots) | Interruption length (slots)   |
|-------|---------------------|-----------|---|
| 0     | 1                   | 1         | $2 + T_{\text{SMTC\_duration}} * N_{\text{slot}}^{\text{subframe},\mu}$ |
| 1     | 0.5                 | 1         | $2 + T_{\text{SMTC\_duration}} * N_{\text{slot}}^{\text{subframe},\mu}$ |

|   |       |   |   |
|---|-------|---|---|
| 2   | 0.25  | 2 | $4 + T_{\text{SMTC\_duration}} * N_{\text{slot}}^{\text{subframe},\mu}$ |
| 3   | 0.125 | 4 | $8 + T_{\text{SMTC\_duration}} * N_{\text{slot}}^{\text{subframe},\mu}$ |
| NOTE 1: $T_{\text{SMTC\_duration}}$ measured in subframes is the longest SMTC duration among all above active serving cells and the deactivated SCell to be measured; |       |   |   |
| NOTE 2: $N_{\text{slot}}^{\text{subframe},\mu}$ is as defined in TS 38.211 [6].   |       |   |   |

#### 8.2.2.2.4 Interruptions at UL carrier RRC reconfiguration

The requirements in this clause shall apply when a supplementary UL carrier or an UL carrier is configured or de-configured in NR standalone carrier aggregation as defined in TS 38.331 [2].

When an UL carrier or supplementary UL carrier is configured or de-configured, an interruption of up to the duration shown in table 8.2.2.2.4-1, is allowed during the RRC reconfiguration procedure [2] on PCell and all activated SCells within the same FR as the reconfigured uplink carrier. The interruption is for both uplink and downlink of PCell and all the activated SCells within the same FR as the configured or de-configured UL.

**Table 8.2.2.2.4-1: Interruption duration for UL carrier RRC reconfiguration**

| $\mu$ | NR Slot length (ms) | Interruption length (slots) |
|-------|---------------------|-----------------------------|
| 0     | 1                   | 1                           |
| 1     | 0.5                 | 2                           |
| 2     | 0.25                | 4                           |
| 3     | 0.125               | 8                           |

#### 8.2.2.2.5 Interruptions due to Active BWP switching Requirement

The requirements for DCI-based and timer-based BWP switches in this clause only apply to the case that the BWP switch is performed on a single CC.

When UE receives a DCI indicating UE to switch its active BWP involving changes in any of the parameters listed in Table 8.2.2.2.5-2, the UE is allowed to cause interruption of up to X slot to other active serving cells if the UE is not capable of per-FR gap, or if the BWP switching involves SCS changing. When the BWP switch imposes changes in any of the parameters listed in Table 8.2.2.2.5-2 and the UE is capable of per-FR gap the UE is allowed to cause interruption of up to X slot to other active serving cells in the same frequency range wherein the UE is performing BWP switching. X is defined in Table 8.2.2.2.5-1. The starting time of interruption is only allowed within the BWP switching delay  $T_{\text{BWPswitchDelay}}$  as defined in clause 8.6.2. Interruptions are not allowed during BWP switch involving any other parameter change.

When a BWP timer *bwp-InactivityTimer* defined in TS 38.331 [2] expires, UE is allowed to cause interruption of up to X slot to other active serving cells due to switching its active BWP involving changes in any of the parameters listed in Table 8.2.2.2.5-2 if the UE is not capable of per-FR gap, or if the BWP switching involves SCS changing. When the BWP switch imposes changes in any of the parameters listed in Table 8.2.2.2.5-2 and the UE is capable of per-FR gap, the UE is allowed to cause interruption of up to X slot to other active serving cells in the same frequency range wherein the UE is performing BWP switching. X is defined in Table 8.2.2.2.5-1. The starting time of interruption is only allowed within the BWP switching delay  $T_{\text{BWPswitchDelay}}$  as defined in clause 8.6.2. Interruptions are not allowed during BWP switch involving any other parameter change.

When UE receives an RRC reconfiguration that only requests UE to switch its active BWP on one single CC, the UE is allowed to cause interruption of up to X slot to other active serving cells due to switching its active BWP involving changes in any of the parameters listed in Table 8.2.2.2.5-2 if the UE is not capable of per-FR gap, or if the BWP switching involves SCS changing. When the BWP switch imposes changes in any of the parameters listed in Table 8.2.2.2.5-2 and the UE is capable of per-FR gap, the UE is allowed to cause interruption of up to X slot to other active serving cells in the same frequency range wherein the UE is performing BWP switching. X is defined in Table 8.2.2.2.5-1. The interruption is only allowed within the delay  $T_{\text{RRCprocessingDelay}} + T_{\text{BWPswitchDelayRRC}}$  defined in clause 8.6.3.

**Table 8.2.2.2.5-1: Interruption length X**

| $\mu$       | NR Slot length (ms) | Interruption length X (slots) |
|-------------|---------------------|-------------------------------|
| 0           | 1                   | 1                             |
| 1           | 0.5                 | 1                             |
| 2           | 0.25                | 3                             |
| 3           | 0.125               | 5                             |
| Note1: void |                     |                               |

**Table 8.2.2.2.5-2: Parameters which cause interruption other than SCS**

| Parameters                  | Comment            |
|-----------------------------|--------------------|
| <i>locationAndBandwidth</i> | From TS 38.331 [2] |
| <i>nrofSRS-Ports</i>        |                    |

### 8.2.2.2.6 Interruptions at inter-frequency SFTD measurement

The requirements in this clause concern interruptions on PCell, as well as on activated SCells in MCG, when the UE is performing SFTD measurements on inter-frequency neighbour cell(s). The following requirements apply when no PSCell is configured.

For a UE with per-FR gap capability:

- for neighbour cell in FR1:
  - the percentage of interrupted slots on uplink and downlink on FR1 serving cells during the SFTD measurement period  $T_{\text{measure\_SFTD1}}$  specified in Clause 9.3.8 shall not exceed the percentages specified in Table 8.2.2.2.6-1. No interruption is allowed on FR2 serving cells.
  - the length of each interruption on FR1 serving cells shall not exceed the number of slots specified in Table 8.2.2.2.6-2.
- for neighbour cell in FR2:
  - the percentage of interrupted slots on uplink and downlink on FR2 serving cells during the SFTD measurement period  $T_{\text{measure\_SFTD1}}$  specified in Clause 9.3.8 shall not exceed the percentages specified in Table 8.2.2.2.6-1. No interruption is allowed on FR1 serving cells.
  - the length of each interruption on FR2 serving cells shall not exceed the number of slots specified in Table 8.2.2.2.6-2.

For a UE with per-UE gap capability:

- for neighbour cell in FR1 or FR2:
  - the percentage of interrupted slots on uplink and downlink on FR1 and FR2 serving cells during the SFTD measurement period  $T_{\text{measure\_SFTD1}}$  specified in Clause 9.3.8 shall not exceed the percentages specified in Table 8.2.2.2.6-1.
  - the length of each interruption on FR1 and FR2 serving cells shall not exceed the number of slots specified in Table 8.2.2.2.6-2.

**Table 8.2.2.2.6-1: Requirements on maximum percentage of interrupted slots in serving cell in inter-frequency SFTD**

| SFTD configuration | Serving cell $\mu$ | Neighbour cell SMTC periodicity |      |      |      |      |       |
|--------------------|--------------------|---------------------------------|------|------|------|------|-------|
|                    |                    | 5ms                             | 10ms | 20ms | 40ms | 80ms | 160ms |
| With RSRP report   | 0                  | 8.4%                            | 6.3% | 8.4% | 6.3% | 5.3% | 4.7%  |
|                    | 1                  |                                 |      |      |      |      |       |
|                    | 2                  |                                 |      |      |      |      |       |
|                    | 3                  |                                 |      |      |      |      |       |

|                     |   |       |      |      |      |      |      |
|---------------------|---|-------|------|------|------|------|------|
| Without RSRP report | 0 | 11.4% | 8.6% | 7.9% | 6.8% | 6.3% | 6.0% |
|                     | 1 |       |      |      |      |      |      |
|                     | 2 |       |      |      |      |      |      |
|                     | 3 |       |      |      |      |      |      |

**Table 8.2.2.2.6-2: Interruption duration for FR1 serving cell in inter-frequency SFTD with neighbour cell in FR1**

| $\mu$ | NR Slot length (ms) | Interruption length (slots) |

**Table 8.2.2.2.6-4: Void**

## 8.2.3 NE-DC Interruptions

### 8.2.3.1 Introduction

This clause contains the requirements related to the interruptions on PCell and SCell, when

- E-UTRA PSCell transitions between active and non-active during DRX, or
- E-UTRA PSCell transitions from non-DRX to DRX, or
- E-UTRA PSCell/SCell in SCG or SCell in MCG is added or released, or
- E-UTRA PSCell/SCell in SCG or SCell in MCG is activated or deactivated, or
- measurements on SCC with deactivated SCell in either E-UTRA SCG or NR MCG or
- PUSCH/PUCCH carrier configuration and deconfiguration in NR MCG, or
- UL/DL BWP is switched on PCell or SCell in MCG.

The requirements shall apply for NE-DC with an NR PCell.

This clause contains interruptions where victim cell is PCell or SCell belonging to MCG. Requirements for interruptions requirements when the victim cell is E-UTRA PSCell or E-UTRA SCell belonging to SCG are specified in TS 36.133 [15].

For a UE which does not support per-FR measurement gap, interruptions to the PCell, E-UTRA PSCell or activated MCG SCells may be caused by EUTRA PSCell, EUTRA SCells or SCells on any frequency range. For UE which support per-FR gap, interruptions to the PCell, E-UTRA PSCell or activated MCG SCells may be caused by EUTRA PSCell, EUTRA SCells or SCells on the same frequency range as the victim cell.

### 8.2.3.2 Requirements

#### 8.2.3.2.1 Interruptions at transitions between active and non-active during DRX

Interruption on PCell and the activated SCell if configured due to E-UTRA PSCell transitions between active and non-active during DRX when PCell or SCell is in non-DRX are allowed with up to 1% probability of missed ACK/NACK when the configured E-UTRA PSCell DRX cycle is less than 640 ms, and 0.625% probability of missed ACK/NACK is allowed when the configured E-UTRA PCell DRX cycle is 640 ms or longer. Each interruption shall not exceed X slot as defined in table 8.2.3.2.1-1.

**Table 8.2.3.2.1-1: Interruption length X at transition between active and non-active during DRX**

| $\mu$ | NR slot length (ms) | Interruption length X (slots) |       |
|-------|---------------------|-------------------------------|-------|
|       |                     | Sync                          | Async |
| 0     | 1                   | 1                             | 2     |
| 1     | 0.5                 | 1                             | 2     |
| 2     | 0.25                | 3                             |       |
| 3     | 0.125               | 5                             |       |

When both PCell and E-UTRA PSCell are in DRX, no interruption is allowed.

### 8.2.3.2.2 Interruptions at transitions from non-DRX to DRX

Interruption on PCell and the activated SCell if configured due to E-UTRA PSCell transitions from non-DRX to DRX when PCell or SCell is in non-DRX shall not exceed X slot as defined in table 8.2.3.2.1-1.

### 8.2.3.2.3 Interruptions at PSCell/SCell addition/release

The requirements in this clause shall apply for the UE configured with E-UTRA PSCell.

When one E-UTRA PSCell/SCell in SCG is added or released:

- the UE is allowed an interruption on any active serving cell in MCG:
  - of up to X1 slots, if the active serving cell is not in the same band as the E-UTRA PSCell/SCell being added or released, or
  - of up to  $\max\{Y1 \text{ slots} + T_{\text{SMTC\_duration}}, 5\text{ms}\}$  if the active serving cells are in the same band as the E-UTRA PSCell/SCell being added or released, provided the cell specific reference signals from the active serving cells and the E-UTRA PSCell/SCell being added or released are available in the same slot, where  $T_{\text{SMTC\_duration}}$  is the longest SMTC duration among all above activated serving cells in MCG;

Where X1 and Y1 are specified in Table 8.2.3.2.3-1.

When one SCell in MCG is added or released:

- the UE is allowed an interruption on any activated serving cell in MCG:
  - of up to X1 slots, if the active serving cell is not in the same band as the SCell being added or released, or
  - of up to  $Y1 \text{ slots} + T_{\text{SMTC\_duration}}$  if the active serving cells are in the same band as the SCell being added or released, provided the cell specific reference signals from the active serving cells and the SCell being added or released are available in the same slot, where,  $T_{\text{SMTC\_duration}}$  is
    - the longest SMTC duration among all above active serving cells in MCG and the SCell being added when one SCell is added. If SSB configuration (*absoluteFrequencySSB*) but no SMTC configuration is provided for the SCell being added, the SSB transmission periodicity is assumed to be 5ms and  $T_{\text{SMTC\_duration}}$  for the SCell being added is x ms, where x = the number of consecutive subframes containing all SSBs in one SSB burst transmitted by the SCell being added. If no SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration is provided for the SCell being added,  $T_{\text{SMTC\_duration}}$  for the SCell being added is 0ms;
    - the longest SMTC duration among all above active serving cells in MCG when one SCell is released.

Where X1 and Y1 are specified in Table 8.2.3.2.3-2.

**Table 8.2.3.2.3-1: Interruption length X1 and Y1 at E-UTRA PSCell/SCell addition/release**

| $\mu$ | NR Slot length (ms) | Interruption length X1 (slots) |       | Interruption length Y1 (slots) |       |
|-------|---------------------|--------------------------------|-------|--------------------------------|-------|
|       |                     | Sync                           | Async | Sync                           | Async |
| 0     | 1                   | 1                              | 2     | 1                              | 2     |
| 1     | 0.5                 | 2                              | 3     | 2                              | 3     |

|   |       |   |     |     |
|---|-------|---|-----|-----|
| 2 | 0.25  | 5 | 4   | 5   |
| 3 | 0.125 | 9 | N/A | N/A |

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X1 (slots)                 |   | Interruption length Y1 (slots) |
|-------|------------------------------------|--|---|--------------------------------|
| 0     | 1                                  | 1  |   | 1                              |
| 1     | 0.5                                | 2  |   | 2                              |
| 2     | 0.25                               | Both aggressor cell and victim cell are on FR2 | 4 | 4                              |
|       |                                    | Either aggressor cell or victim cell is on FR1 | 5 |                                |
| 3     | 0.125                              | Aggressor cell is on FR2                       | 8 | 8                              |
|       |                                    | Aggressor cell is on FR1                       | 9 |                                |

**8.2.3.2.4 Interruptions at SCell activation/deactivation**

The requirements in this clause shall apply for the UE configured with E-UTRA PSCell and one SCell.

When one E-UTRA SCell in SCG is activated or deactivated:

- the UE is allowed an interruption on any active serving cell in MCG:
  - of up to X2 slots, if the active serving cell is not in the same band as the E-UTRA SCell being activated or deactivated, or
  - of up to  $\max\{Y2 \text{ slots} + T_{\text{SMTC\_duration}}, 5\text{ms}\}$  if the active serving cells are in the same band as the E-UTRA SCell being activated or deactivated, provided the cell specific reference signals from the active serving cells and the E-UTRA SCell being activated or deactivated are available in the same slot, where  $T_{\text{SMTC\_duration}}$  is the longest SMTC duration among all above active serving cells in MCG.

Where X2 and Y2 are specified in Table 8.2.3.2.4-1.

When one SCell in MCG is activated or deactivated:

- the UE is allowed an interruption on any serving cell in MCG:
  - of up to X2 slots, if the active serving cell is not in the same band as the SCell being activated or deactivated, or
  - of up to  $Y2 \text{ slots} + T_{\text{SMTC\_duration}}$  if the active serving cells are in the same band as the SCell being activated or deactivated, provided the cell specific reference signals from the active serving cells and the SCell being activated or deactivated are available in the same slot, where,  $T_{\text{SMTC\_duration}}$  is
    - the longest SMTC duration among all above active serving cells in MCG and the SCell being activated when one SCell is activated, If SSB configuration (*absoluteFrequencySSB*) but no SMTC configuration is provided for the SCell being activated, the SSB transmission periodicity is assumed to be 5ms and  $T_{\text{SMTC\_duration}}$  for the SCell being activated is x ms, where x = the number of consecutive subframes containing all SSBs in one SSB burst transmitted by the SCell being activated. If no SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration is provided for the SCell being activated,  $T_{\text{SMTC\_duration}}$  for the SCell being activated is 0ms;
    - the longest SMTC duration among all above active serving cells in MCG when one SCell is deactivated.

Where X2 and Y2 are specified in Table 8.2.3.2.4-2.

**Table 8.2.3.2.4-1: Interruption length X2 and Y2 at E-UTRA SCell activation/deactivation**

| $\mu$ |  | Interruption length X2 (slots) | Interruption length Y2 (slots) |
|-------|--|--------------------------------|--------------------------------|
|-------|--|--------------------------------|--------------------------------|

|   | NR Slot length (ms) | Sync | Async | Sync | Async |
|---|---------------------|------|-------|------|-------|
| 0 | 1                   | 1    | 2     | 1    | 2     |
| 1 | 0.5                 | 1    | 2     | 1    | 2     |
| 2 | 0.25                | 3    |       | 2    | 3     |
| 3 | 0.125               | 5    |       | N/A  | N/A   |

**Table 8.2.3.2.4-2: Interruption length X2 and Y2 at SCell activation/deactivation**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X2 (slots)                 |   | Interruption length Y2 (slots) |
|-------|------------------------------------|--|---|--------------------------------|
| 0     | 1                                  | 1  |   | 1                              |
| 1     | 0.5                                | 1  |   | 1                              |
| 2     | 0.25                               | Both aggressor cell and victim cell are on FR2 | 2 | 2                              |
|       |                                    | Either aggressor cell or victim cell is on FR1 | 3 |                                |
| 3     | 0.125                              | Aggressor cell is on FR2                       | 4 | 4                              |
|       |                                    | Aggressor cell is on FR1                       | 5 |                                |

8.2.3.2.5 Interruptions during measurements on SCC

8.2.3.2.5.1 Interruptions during measurements on deactivated NR SCC

Interruption on PCell and other activated SCell(s) during measurement on the deactivated NR SCC shall meet requirements in clause 8.2.2.2.3.

8.2.3.2.5.2 Interruptions during measurements on deactivated E-UTRAN SCC

When one E-UTRA SCell in SCG is deactivated, the UE is allowed due to measurements on the E-UTRA SCC with the deactivated E-UTRA SCell:

- an interruption on PCell or any activated SCell with up to 0.5% probability of missed ACK/NACK when any of the configured *measCycleSCell* [15] for the deactivated E-UTRA SCCells is 640 ms or longer.
- an interruption on PCell or any activated SCell with up to 0.5% probability of missed ACK/NACK regardless of the configured *measCycleSCell* [15] for the deactivated E-UTRA SCCells if indicated by the network using IE *allowInterruptions* [15].

Each interruption shall not exceed

- X3 slots, if the PCell or activated SCell is not in the same band as the E-UTRA deactivated SCC being measured, or
- Y3 slots + SMTC duration, if the PCell or activated SCell is in the same band as the E-UTRA deactivated SCC being measured, provided the cell specific reference signals from the PCell or activated SCell and the E-UTRA deactivated SCC being measured are available in the same slot.

Where X3 and Y3 are specified in Table 8.2.3.2.5-1

**Table 8.2.3.2.5-1: Interruption length X3 and Y3 at measurements on deactivated E-UTRA SCC**

| $\mu$ | NR Slot length (ms) | Interruption length X3 (slots) |       | Interruption length Y3 (slot) |       |
|-------|---------------------|--------------------------------|-------|-------------------------------|-------|
|       |                     | Sync                           | Async | Sync                          | Async |
| 0     | 1                   | 1                              | 2     | 1                             | 2     |
| 1     | 0.5                 | 1                              | 2     | 1                             | 2     |
| 2     | 0.25                | 3                              |       | 2                             | 3     |

|   |       |   |     |     |

| 3 | 0.125 | 5 | N/A | N/A |
|---|-------|---|-----|-----|

### 8.2.3.2.6 Interruptions at UL carrier RRC reconfiguration

The requirements in this clause shall apply when a supplementary UL carrier or an UL carrier is configured or de-configured in NE-DC.

When an UL carrier or supplementary UL carrier is configured or deconfigured, an interruption of up to X4 slot as specified in Table 8.2.3.2.6-1, is allowed during the RRC reconfiguration procedure in TS 38.331 [2] on PCell, all activated SCells within the same FR as the reconfigured uplink carrier. The interruption is for both uplink and downlink of PCell, all activated E-UTRA SCells, E-UTRA PSCell and all activated SCells within the same FR as the configured or de-configured UL.

**Table 8.2.3.2.6-1: Interruption length X4 at UL carrier RRC reconfiguration**

| $\mu$ | NR Slot length (ms) | Interruption length X4 (slots) |       |
|-------|---------------------|--------------------------------|-------|
|       |                     | Sync                           | Async |
| 0     | 1                   | 1                              | 2     |
| 1     | 0.5                 | 2                              | 3     |
| 2     | 0.25                | 5                              |       |
| 3     | 0.125               | 9                              |       |

### 8.2.3.2.7 Interruptions due to Active BWP switching Requirement

The requirements for DCI-based and timer-based BWP switches in this clause only apply to the case that the BWP switch is performed on a single CC.

When UE receives a DCI indicating the UE to switch its active BWP, or when a BWP timer *bwp-InactivityTimer* defined in TS 38.331 [2] expires, or when the UE receives an RRC command indicating the UE to switch its active BWP, the UE is allowed an interruption on PCell and any activated SCells as defined in clause 8.2.2.2.5.

## 8.2.4 NR-DC: Interruptions

### 8.2.4.1 Introduction

This clause contains the requirements related to the interruptions on PCell, PSCell and activated SCell if configured, when

SCells are configured, de-configured, activated or deactivated or,

a supplementary UL carrier or an UL carrier is configured or de-configured, or

measurements on SCC with deactivated SCell in NR SCG, or

UL/DL BWP is switched on PCell, PSCell or SCell. transitions between active and non-active during DRX, or transitions from non-DRX to DRX.

Note: interruptions at SCell addition/release, activation/deactivation and during measurements on SCC may not be required by all UEs.

The interruptions shall not interrupt RRC signalling or ACK/NACKs related to RRC reconfiguration procedure [2] for SCell addition/release or MAC control signalling [17] for SCell activation/deactivation command. How to specify this is FFS.

The requirements shall apply for NR-DC with an NR PCell, PSCell or SCell.

For a UE which does not support per-FR measurement gap, interruptions to the PCell and activated SCell may be caused by SCells on any frequency range. For a UE which supports per-FR gaps, interruptions to PCell, PSCell and activated SCell may be caused by SCells on the same frequency range as the victim cell.

## 8.2.4.2 Requirements

### 8.2.4.2.1 Interruptions at PSCell/SCell addition/release

When PSCell or one or more SCells is added or released using the same *RRCConnectionReconfiguration* message as defined in TS 38.331 [2], the UE is allowed an interruption on any activated serving cell during the RRC reconfiguration procedure as follows:

- an interruption on any active serving cell:
  - of up to the duration shown in table 8.2.4.2.1-1, if the active serving cell is not in the same band as the SCell being added or released, or
  - of up to the duration shown in table 8.2.4.2.1-2, if the active serving cells are in the same band as the SCell being added or released, provided the cell specific reference signals from the active serving cells and the SCell being added or released are available in the same slot.

**Table 8.2.4.2.1-1: Interruption duration for PSCell/SCell addition/release for inter-band DC/CA**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length (slots)                    |   |
|-------|------------------------------------|--|---|
| 0     | 1                                  | 1  |   |
| 1     | 0.5                                | 2  |   |
| 2     | 0.25                               | Both aggressor cell and victim cell are on FR2 | 4 |
|       |                                    | Either aggressor cell or victim cell is on FR1 | 5 |
| 3     | 0.125                              | Aggressor cell is on FR2                       | 8 |
|       |                                    | Aggressor cell is on FR1                       | 9 |

**Table 8.2.4.2.1-2: Interruption duration for SCell addition/release for intra-band DC/CA**

| $\mu$ | NR Slot length (ms) | Interruption length (slots)   |
|-------|---------------------|---|
| 0     | 1                   | $1 + T_{\text{SMTC\_duration}} * N_{\text{slot}}^{\text{subframe},\mu}$ |
| 1     | 0.5                 | $2 + T_{\text{SMTC\_duration}} * N_{\text{slot}}^{\text{subframe},\mu}$ |
| 2     | 0.25                | $4 + T_{\text{SMTC\_duration}} * N_{\text{slot}}^{\text{subframe},\mu}$ |
| 3     | 0.125               | $8 + T_{\text{SMTC\_duration}} * N_{\text{slot}}^{\text{subframe},\mu}$ |

NOTE 1:  $T_{\text{SMTC\_duration}}$  measured in subframes is

- the longest SMTC duration among all above activeserving cells and the SCell being added when one SCell is added. If SSB configuration (*absoluteFrequencySSB*) but no SMTC configuration is provided for the SCell being added, the SSB transmission periodicity is assumed to be 5ms and  $T_{\text{SMTC\_duration}}$  for the SCell being added is x ms, where x = the number of consecutive subframes containing all SSBs in one SSB burst transmitted by the SCell being added. If no SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration is provided for the SCell being added,  $T_{\text{SMTC\_duration}}$  for the SCell being added is 0ms;
- the longest SMTC duration among all active serving cells in the same band when one SCell is released.

NOTE 2:  $N_{\text{slot}}^{\text{subframe},\mu}$  is as defined in TS 38.211 [6].

### 8.2.4.2.2 Interruptions at SCell activation/deactivation

When a SCell is activated or deactivated as defined in TS 37.340 [17], the UE is allowed

- an interruption on any active serving cell:
  - of up to the duration shown in table 8.2.4.2.2-1, if the active serving cell is not in the same band as the SCell being activated or deactivated, or

- of up to the duration shown in table 8.2.4.2.2-2, if the active serving cells are in the same band as the SCell being activated or deactivated provided the cell specific reference signals from the active serving cells and the SCell being activated or deactivated are available in the same slot.

**Table 8.2.4.2.2-1: Interruption duration for SCell activation/deactivation for inter-band DC/CA**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length (slots)                    |   |
|-------|------------------------------------|--|---|
| 0     | 1                                  | 1  |   |
| 1     | 0.5                                | 1  |   |
| 2     | 0.25                               | Both aggressor cell and victim cell are on FR2 | 2 |
|       |                                    | Either aggressor cell or victim cell is on FR1 | 3 |
| 3     | 0.125                              | Aggressor cell is on FR2                       | 4 |
|       |                                    | Aggressor cell is on FR1                       | 5 |

**Table 8.2.4.2.2-2: Interruption duration for SCell activation/deactivation for intra-band DC/CA**

| $\mu$ | NR Slot length (ms) | Interruption length (slots)  |
|-------|---------------------|--|
| 0     | 1                   | $1 + T_{\text{SMTC\_duration}} * N_{\text{slot}}^{\text{subframe}, \mu}$ |
| 1     | 0.5                 | $1 + T_{\text{SMTC\_duration}} * N_{\text{slot}}^{\text{subframe}, \mu}$ |
| 2     | 0.25                | $2 + T_{\text{SMTC\_duration}} * N_{\text{slot}}^{\text{subframe}, \mu}$ |
| 3     | 0.125               | $4 + T_{\text{SMTC\_duration}} * N_{\text{slot}}^{\text{subframe}, \mu}$ |

NOTE 1:  $T_{\text{SMTC\_duration}}$  measured in subframes is

- the longest SMTC duration among all above active serving cells and the SCell being activated when one SCell is activated. If SSB configuration (*absoluteFrequencySSB*) but no SMTC configuration is provided for the SCell being activated, the SSB transmission periodicity is assumed to be 5ms and  $T_{\text{SMTC\_duration}}$  for the SCell being activated is x ms, where x = the number of consecutive subframes containing all SSBs in one SSB burst transmitted by the SCell being activated. If no SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration is provided for the SCell being activated,  $T_{\text{SMTC\_duration}}$  for the SCell being activated is 0ms;
- the longest SMTC duration among all active serving cells in the same band when one SCell is deactivated.

NOTE 2:  $N_{\text{slot}}^{\text{subframe}, \mu}$  is as defined in TS 38.211 [6].

**8.2.4.2.3 Interruptions during measurements on SCC**

Interruption on PCell, PSCell and other activated SCell(s) during measurement on the deactivated NR SCC shall meet requirements in clause 8.2.2.2.3, where the term PCell in clause 8.2.2.2.3 shall be deemed to be replaced with SpCell.

**8.2.4.2.4 Interruptions at UL carrier RRC reconfiguration**

The requirements in this clause shall apply when a supplementary UL carrier or an UL carrier is configured or de-configured in NR-DC as defined in TS 38.331 [2].

When an UL carrier or supplementary UL carrier is configured or de-configured, an interruption of up to the duration shown in table 8.2.4.2.4-1, is allowed during the RRC reconfiguration procedure in TS 38.331 [2] on all the other activated serving cells within the same FR as the reconfigured uplink carrier. The interruption is for both uplink and downlink of all the other serving cells within the same FR as the configured or de-configured UL.

**Table 8.2.4.2.4-1: Interruption duration for UL carrier RRC reconfiguration**

| $\mu$ | NR Slot length (ms) | Interruption length (slots) |
|-------|---------------------|-----------------------------|
| 0     | 1                   | 1                           |

|   |       |   |
|---|-------|---|
| 1 | 0.5   | 2 |
| 2 | 0.25  | 4 |
| 3 | 0.125 | 8 |

#### 8.2.4.2.5 Interruptions due to Active BWP switching Requirement

The requirements for DCI-based and timer-based BWP switches in this clause only apply to the case that the BWP switch is performed on a single CC.

When UE receives a DCI indicating the UE to switch its active BWP, or when a BWP timer `bwp-InactivityTimer` defined in TS 38.331 [2] expires, or when the UE receives an RRC command indicating the UE to switch its active BWP, the UE is allowed to cause an interruption on any other serving cells as defined in clause 8.2.2.2.5.

#### 8.2.4.2.6 Interruptions at transitions between active and non-active during DRX

When PCell is in non-DRX and PSCell is in DRX, interruptions on PCell and the activated SCell in MCG if configured due to transitions from active to non-active and from non-active to active during PSCell DRX are allowed with up to 1% probability of missed ACK/NACK when the configured PSCell DRX cycle is less than 640 ms, and 0.625% probability of missed ACK/NACK is allowed when the configured PSCell DRX cycle is 640 ms or longer. Each interruption shall not exceed X slot as defined in table 8.2.4.2.6-1.

When PSCell is in non-DRX and PCell is in DRX, interruptions on PSCell on the activated SCell in SCG if configured due to transitions from active to non-active and from non-active to active during PCell DRX are allowed with up to 1% probability of missed ACK/NACK when the configured PCell DRX cycle is less than 640 ms, and 0.625% probability of missed ACK/NACK is allowed when the configured PCell DRX cycle is 640 ms or longer. Each interruption shall not exceed X slot as defined in table 8.2.4.2.6-1.

**Table 8.2.4.2.6-1: Interruption length X at transition between active and non-active during DRX**

| $\mu$ | NR Slot length (ms) | Interruption length X (slots) |       |
|-------|---------------------|-------------------------------|-------|
|       |                     | Sync                          | Async |
| 0     | 1                   | 1                             | 2     |
| 1     | 0.5                 | 1                             | 2     |
| 2     | 0.25                | 3                             |       |
| 3     | 0.125               | 5                             |       |

When both PCell and PSCell are in DRX, no interruption is allowed.

#### 8.2.4.2.7 Interruptions at transitions from non-DRX to DRX

Interruption on PCell and the activated SCell in MCG if configured due to PSCell transitions from non-DRX to DRX when PCell is in non-DRX shall not exceed X slots as defined in table 8.2.4.2.6-1.

Interruption on PSCell and the activated SCell in SCG if configured due to PCell transitions from non-DRX to DRX when PSCell is in non-DRX shall not exceed X slots as defined in table 8.2.4.2.6-1.

## 8.3 SCell Activation and Deactivation Delay

### 8.3.1 Introduction

This clause defines requirements for the delay within which the UE shall be able to activate a deactivated SCell and deactivate an activated SCell in EN-DC, or in standalone NR carrier aggregation, or in NE-DC, or in NR-DC.

The requirements shall apply for EN-DC, standalone NR carrier aggregation, NE-DC, and NR-DC.

### 8.3.2 SCell Activation Delay Requirement for Deactivated SCell

The requirements in this clause shall apply for the UE configured with one downlink SCell in EN-DC, or in standalone NR carrier aggregation or in NE-DC or in NR-DC and when one SCell is being activated.

The delay within which the UE shall be able to activate the deactivated SCell depends upon the specified conditions.

Upon receiving SCell activation command in slot  $n$ , the UE shall be capable to transmit valid CSI report and apply actions related to the activation command for the SCell being activated no later than in slot  $n +$

$\frac{T_{\text{HARQ}} + T_{\text{activation\_time}} + T_{\text{CSI\_Reporting}}}{\text{NR slot length}}$ , where:

$T_{\text{HARQ}}$  (in ms) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3]

$T_{\text{activation\_time}}$  is the SCell activation delay in millisecond.

If the SCell is known and belongs to FR1,  $T_{\text{activation\_time}}$  is:

- $T_{\text{FirstSSB}} + 5\text{ms}$ , if the measurement period of the SCell being activated is equal to or smaller than 2400ms.
- $T_{\text{FirstSSB\_MAX}} + T_{\text{rs}} + 5\text{ms}$ , if the measurement period of the SCell being activated is larger than 2400ms.

If the SCell being activated belongs to FR1 and if there is at least one active serving cell contiguous to the SCell on that FR1 band, if the UE is not provided with SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration for the target SCell,  $T_{\text{activation\_time}}$  is 3 ms for UE supporting *scellWithoutSSB*, provided

- The RTD between the target SCell and the contiguous active serving cell is within  $\pm 260\text{ns}$ , and
- The difference of the reception power with the contiguous active serving cell is  $\leq 6\text{dB}$ , and
- The RS(s) of SCell being activated is (are) QCL-TypeA with TRS(s) of the SCell being activated, and the TRS(s) of the SCell being activated is (are) further QCL-TypeC with SSB(s) of any active serving cell that is contiguous to the SCell being activated on that FR1 band.

If the SCell is unknown and belongs to FR1, provided that the side condition  $\hat{E}_s/I_{\text{ot}} \geq -2\text{dB}$  is fulfilled, then  $T_{\text{activation\_time}}$  is:

- $T_{\text{FirstSSB\_MAX}} + T_{\text{SMTC\_MAX}} + 2 * T_{\text{rs}} + 5\text{ms}$

If the SCell being activated belongs to FR2 and if there is at least one active serving cell on that FR2 band, then  $T_{\text{activation\_time}}$  is  $T_{\text{FirstSSB}} + 5\text{ms}$  provided:

- The UE is provided with SMTC for the target SCell, and
- The SSBs in the serving cell(s) and the SSBs in the SCell fulfil the condition defined in clause 3.6.3, and
- The parameter *ssb-PositionsInBurst* is same for the serving cell(s) and the SCell, and
- SSB is in the same half-frame on the SCell and the contiguous FR2 active serving cell.

If the SCell being activated belongs to FR2 and if there is at least one active serving cell on that FR2 band, if the UE supporting *scellWithoutSSB* is not provided with any SMTC for the target SCell,  $T_{\text{activation\_time}}$  is 3 ms, provided

- the RS (s) of SCell being activated is (are) QCL-TypeD with RS (s) of one active serving cell on that FR2 band.

If the SCell being activated belongs to FR2 and if there is no active serving cell on that FR2 band provided that PCell or PSCell is FR1:

If the target SCell is known to UE and semi-persistent CSI-RS is used for CSI reporting, then  $T_{\text{activation\_time}}$  is:

- $3\text{ms} + \max(T_{\text{uncertainty\_MAC}} + T_{\text{FineTiming}} + 2\text{ms}, T_{\text{uncertainty\_SP}})$ , where  $T_{\text{uncertainty\_MAC}}=0$  and  $T_{\text{uncertainty\_SP}}=0$  if UE receives the SCell activation command, semi-persistent CSI-RS activation command and TCI state activation command at the same time.

If the target SCell is known to UE and periodic CSI-RS is used for CSI reporting, then  $T_{\text{activation\_time}}$  is:

- $\max(T_{\text{uncertainty\_MAC}} + 5\text{ms} + T_{\text{FineTiming}}, T_{\text{uncertainty\_RRC}} + T_{\text{RRC\_delay}} - T_{\text{HARQ}})$ , where  $T_{\text{uncertainty\_MAC}}=0$  if UE receives the SCell activation command and TCI state activation commands at the same time.

If the target SCell is unknown to UE and semi-persistent CSI-RS is used for CSI reporting, provided that the side condition  $\hat{E}_s/I_{ot} \geq -2\text{dB}$  is fulfilled, then  $T_{\text{activation\_time}}$  is:

- $6\text{ms} + T_{\text{FirstSSB\_MAX}} + 15 * T_{\text{SMTC\_MAX}} + 8 * T_{\text{rs}} + T_{\text{L1-RSRP, measure}} + T_{\text{L1-RSRP, report}} + T_{\text{HARQ}} + \max(T_{\text{uncertainty\_MAC}} + T_{\text{FineTiming}} + 2\text{ms}, T_{\text{uncertainty\_SP}})$ .

If the target SCell is unknown to UE and periodic CSI-RS is used for CSI reporting, provided that the side condition  $\hat{E}_s/I_{ot} \geq -2\text{dB}$  is fulfilled, then  $T_{\text{activation\_time}}$  is:

- $3\text{ms} + T_{\text{FirstSSB\_MAX}} + 15 * T_{\text{SMTC\_MAX}} + 8 * T_{\text{rs}} + T_{\text{L1-RSRP, measure}} + T_{\text{L1-RSRP, report}} + \max\{(T_{\text{HARQ}} + T_{\text{uncertainty\_MAC}} + 5\text{ms} + T_{\text{FineTiming}}), (T_{\text{uncertainty\_RRC}} + T_{\text{RRC\_delay}})\}$ .

where,

$T_{\text{SMTC\_MAX}}$ :

- In FR1, in case of intra-band SCell activation,  $T_{\text{SMTC\_MAX}}$  is the longer SMTC periodicity between active serving cells and SCell being activated provided the cell specific reference signals from the active serving cells and the SCells being activated or released are available in the same slot; in case of inter-band SCell activation,  $T_{\text{SMTC\_MAX}}$  is the SMTC periodicity of SCell being activated.
- In FR2,  $T_{\text{SMTC\_MAX}}$  is the longer SMTC periodicity between active serving cells and SCell being activated provided that in Rel-15 only support FR2 intra-band CA.
- $T_{\text{SMTC\_MAX}}$  is bounded to a minimum value of 10ms.

$T_{\text{rs}}$  is the SMTC periodicity of the SCell being activated if the UE has been provided with an SMTC configuration for the SCell in SCell addition message, otherwise  $T_{\text{rs}}$  is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If the measObjectNRs having the same SSB frequency and subcarrier spacing configured by MN and SN have different SMTC,  $T_{\text{rs}}$  is the periodicity of one of the SMTC which is up to UE implementation. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement which involves  $T_{\text{rs}}$  is applied with  $T_{\text{rs}} = 5\text{ms}$  assuming the SSB transmission periodicity is 5ms. There are no requirements if the SSB transmission periodicity is not 5ms.

$T_{\text{FirstSSB}}$ : is the time to the end of the first complete SSB burst indicated by the SMTC, or within 5ms if SMTC is not configured, after slot  $n + \frac{T_{\text{HARQ}} + 3\text{ms}}{\text{NR slot length}}$ .

$T_{\text{FirstSSB\_MAX}}$ : Is the time to the end of the first complete SSB burst indicated by the SMTC, or within 5ms if SMTC is not configured, after slot  $n + \frac{T_{\text{HARQ}} + 3\text{ms}}{\text{NR slot length}}$ , further fulfilling:

- In FR1, in case of intra-band SCell activation, the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot; in case of inter-band SCell activation, the first occasion when the SCell being activated is transmitting SSB burst.
- In FR2, the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot.

$T_{\text{FineTiming}}$  is the time period between UE finish processing the last activation command for PDCCH TCI, PDSCH TCI (when applicable) and the timing of first complete available SSB corresponding to the TCI state.

$T_{\text{L1-RSRP, measure}}$  is L1-RSRP measurement delay  $T_{\text{L1-RSRP\_Measurement\_Period\_SSB}}$  ms or  $T_{\text{L1-RSRP\_Measurement\_Period\_CSI-RS}}$  based on applicability as defined in clause 9.5 assuming  $M=1$  and  $T_{\text{Report}}=0$ .

$T_{\text{L1-RSRP, report}}$  is delay of acquiring CSI reporting resources.

$T_{\text{uncertainty\_MAC}}$  is the time period between reception of the last activation command for PDCCH TCI, PDSCH TCI (when applicable) relative to

- SCell activation command for known case;
- First valid L1-RSRP reporting for unknown case.

$T_{\text{uncertainty\_SP}}$  is the time period between reception of the activation command for semi-persistent CSI-RS resource set for CQI reporting relative to

- SCell activation command for known case;
- First valid L1-RSRP reporting for unknown case.

$T_{\text{uncertainty\_RRC}}$  is the time period between reception of the RRC configuration message for TCI of periodic CSI-RS for CQI reporting (when applicable) relative to

- SCell activation command for known case;
- First valid L1-RSRP reporting for unknown case.

$T_{\text{RRC\_delay}}$  is the RRC procedure delay as specified in TS 38.331 [2].

Longer delays for RRM measurement requirements, and in case of FR2 also SSB based RLM/BFD/CBD/L1-RSRP measurement requirements, can be expected during the cell detection time for unknown SCell activation.

When *absoluteFrequencySSB* is not configured in *DownlinkConfigCommon* for target SCell but SMTTC for target SCell is configured, no requirement would be applied.

$T_{\text{CSI\_reporting}}$  is the delay (in ms) including uncertainty in acquiring the first available downlink CSI reference resource, UE processing time for CSI reporting and uncertainty in acquiring the first available CSI reporting resources as specified in TS 38.331 [2].

SCell in FR1 is known if it has been meeting the following conditions:

- During the period equal to  $\max(5 \cdot \text{measCycleSCell}, 5 \cdot \text{DRX cycles})$  for FR1 before the reception of the SCell activation command:
  - the UE has sent a valid measurement report for the SCell being activated and
  - the SSB measured remains detectable according to the cell identification conditions specified in clause 9.2 and 9.3.
- the SSB measured during the period equal to  $\max(5 \cdot \text{measCycleSCell}, 5 \cdot \text{DRX cycles})$  also remains detectable during the SCell activation delay according to the cell identification conditions specified in clause 9.2 and 9.3.

Otherwise SCell in FR1 is unknown.

The requirements for FR1 unknown SCell activation specified in this clause apply when one of the following conditions is met

- 'ssb-PositionInBurst' indicates only one SSB is being actually transmitted, or
- 'ssb-PositionInBurst' indicates multiple SSBs and TCI indication is provided in same MAC PDU with SCell activation.

For the first SCell activation in FR2 bands, the SCell is known if it has been meeting the following conditions:

- During the period equal to 4s for UE supporting power class1 and 3s for UE supporting power class 2/3/4 before UE receives the last activation command for PDCCH TCI, PDSCH TCI (when applicable) and semi-persistent CSI-RS for CQI reporting (when applicable):
  - the UE has sent a valid L3-RSRP measurement report with SSB index, and
  - SCell activation command is received after L3-RSRP reporting and no later than the time when UE receives MAC-CE command for TCI activation

- During the period from L3-RSRP reporting to the valid CQI reporting, the reported SSBs with indexes remain detectable according to the cell identification conditions specified in clauses 9.2 and 9.3, and the TCI state is selected based on one of the latest reported SSB indexes.

Otherwise, the first SCell in FR2 band is unknown. The requirement for unknown SCell applies provided that the activation commands for PDCCH TCI, PDSCH TCI (when applicable), semi-persistent CSI-RS for CQI reporting (when applicable), and configuration message for TCI of periodic CSI-RS for CQI reporting (when applicable) are based on the latest valid L1-RSRP reporting.

If the UE has been provided with higher layer in TS 38.331 [2] signaling of *smtc2* prior to the activation command,  $T_{\text{SMTc\_Scell}}$  follows *smtc1* or *smtc2* according to the physical cell ID of the target cell being activated.  $T_{\text{SMTc\_MAX}}$  follows *smtc1* or *smtc2* according to the physical cell IDs of the target cells being activated and the active serving cells.

In addition to CSI reporting defined above, UE shall also apply other actions related to the activation command specified in TS 38.331 [2] for a SCell at the first opportunities for the corresponding actions once the SCell is activated.

The starting point of an interruption window on spCell or any activated SCell, as specified in clause 8.2, shall not occur before slot  $n+1+\frac{T_{\text{HARQ}}}{\text{NR slot length}}$  and not occur after slot  $n+1+\frac{T_{\text{HARQ}}+3\text{ms}+T_{\text{X}}}{\text{NR slot length}}$ , where NR slot length is with respect to the numerology used in the SCell being activated, and  $T_{\text{X}}$  is:

- 0, if  $T_{\text{activation\_time}}$  is 3ms
- $T_{\text{FirstSSB}}$ , for any scenario where  $T_{\text{activation\_time}}$  includes  $T_{\text{FirstSSB}}$ ;
- $T_{\text{FirstSSB\_MAX}}$ , for any scenario where  $T_{\text{activation\_time}}$  includes  $T_{\text{FirstSSB\_MAX}}$ ;
- $T_{\text{uncertainty\_MAC}} + T_{\text{FineTiming}}$ , for any scenario where  $T_{\text{activation\_time}}$  includes only  $T_{\text{FineTiming}}$ - and no  $T_{\text{FirstSSB\_MAX}}$ .

The length of the interruption window may be different for different victim cells, and depends on the applicable scenario and on the frequency band relation between the aggressor cell and the victim cell.

The requirements in this clause and requirements on interruption due to SCell activation in clause 8.2 apply provided that the SSB of the to-be-activated SCell is within the first active DL BWP of the SCell.

Starting from the slot specified in clause 4.3 of TS 38.213 [3] (timing for secondary Cell activation/deactivation) and until the UE has completed the SCell activation, the UE shall report out of range if the UE has available uplink resources to report CQI for the SCell.

Starting from the slot specified in clause 4.3 of TS 38.213 [3] (timing for secondary Cell activation/deactivation) and until the UE has completed a first L1-RSRP measurement, the UE shall report lowest valid L1 SS-RSRP range if the UE has available uplink resources to report L1-RSRP for the SCell.

### 8.3.3 SCell Deactivation Delay Requirement for Activated SCell

The requirements in this clause shall apply for the UE configured with one downlink SCell in EN-DC, or in standalone NR carrier aggregation, or in NE-DC, or in NR-DC.

Upon receiving SCell deactivation command in slot  $n$ , the UE shall accomplish the deactivation actions for the SCell being deactivated no later than in slot  $n + \frac{T_{\text{HARQ}}+3\text{ms}}{\text{NR slot length}}$ . The starting point of an interruption window on spCell or any activated SCell, as specified in clause 8.2, shall not occur before slot  $n+1 + \frac{T_{\text{HARQ}}}{\text{NR slot length}}$  and not occur after slot  $n+1 + \frac{T_{\text{HARQ}}+3\text{ms}}{\text{NR slot length}}$ , where NR slot length is with respect to the numerology used in the SCell being deactivated.

Upon expiry of the *sCellDeactivationTimer* in slot  $n$ , the UE shall accomplish the deactivation actions for the SCell being deactivated no later than in slot  $n + \frac{3\text{ms}}{\text{NR slot length}}$ . The starting point of an interruption window on spCell or any activated SCell, as specified in clause 8.2, shall not occur before slot  $n+1$  and not occur after slot  $n+1 + \frac{3\text{ms}}{\text{NR slot length}}$ , where NR slot length is with respect to the numerology used in the SCell being deactivated.

The length of the interruption window may be different for different victim cells, and depends on the applicable scenario and on the frequency band relation between the aggressor cell and the victim cell.

## 8.4 UE UL carrier RRC reconfiguration delay

### 8.4.1 Introduction

The requirements in this clause apply for a UE being configured or deconfigured with a supplementary UL carrier or NR UL carrier.

### 8.4.2 UE UL carrier configuration delay requirement

When the UE receives a RRC message implying NR UL or supplementary UL carrier configuration, the UE shall be ready to start transmission on the newly configured carrier within  $T_{UL\_carrier\_config}$  from the end of the slot  $n$ .

Where

- Slot  $n$  is the last slot overlapping with the PDSCH containing the RRC command.
- $T_{UL\_carrier\_config}$  equals the maximum RRC procedure delay defined in clause 11.2 in TS 36.331 [16] if the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it equals the maximum RRC procedure delay defined in clause 12 in TS 38.331 [2].

### 8.4.3 UE UL carrier deconfiguration delay requirement

When the UE receives a RRC message implying NR UL or supplementary UL carrier deconfiguration RRC signalling, the UE shall stop UL signalling on the deconfigured UL carrier within  $T_{UL\_carrier\_deconfig}$  from the end of the slot  $n$ .

Where

- Slot  $n$  is the last slot overlapping with the PDSCH containing the RRC command.
- $T_{UL\_carrier\_deconfig}$  equals the maximum RRC procedure delay defined in clause 11.2 in TS 36.331 [16] if the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it equals the maximum RRC procedure delay defined in clause 12 in TS 38.331 [2].

## 8.5 Link Recovery Procedures

### 8.5.1 Introduction

The UE shall assess the downlink radio link quality of a serving cell based on the reference signal in the set  $\bar{Q}_0$  as specified in TS 38.213 [3] in order to detect beam failure on:

- PCell in SA, NR-DC, or NE-DC operation mode,
- PSCell in NR-DC and EN-DC operation mode.

The RS resource configurations in the set  $\bar{Q}_0$  can be periodic CSI-RS resources and/or SSBs. UE is not required to perform beam failure detection outside the active DL BWP. UE is not required to meet the requirements in clause 8.5.2 and 8.5.3 if UE does not have set  $\bar{Q}_0$ .

On each RS resource configuration in the set  $\bar{Q}_0$ , the UE shall estimate the radio link quality and compare it to the threshold  $Q_{out\_LR}$  for the purpose of accessing downlink radio link quality of the serving cell beams.

The threshold  $Q_{out\_LR}$  is defined as the level at which the downlink radio level link of a given resource configuration on set  $\bar{Q}_0$  cannot be reliably received and shall correspond to the  $BLER_{out} = 10\%$  block error rate of a hypothetical PDCCH transmission. For SSB based beam failure detection,  $Q_{out\_LR\_SSB}$  is derived based on the hypothetical PDCCH transmission parameters listed in Table 8.5.2.1-1. For CSI-RS based beam failure detection,  $Q_{out\_LR\_CSI-RS}$  is derived based on the hypothetical PDCCH transmission parameters listed in Table 8.5.3.1-1.

Upon request the UE shall deliver configuration indexes from the set  $\bar{q}_1$  as specified in TS 38.213 [3], to higher layers, and the corresponding L1-RSRP measurement provided that the measured L1-RSRP is equal to or better than the threshold  $Q_{in\_LR}$ , which is indicated by higher layer parameter *rsrp-ThresholdSSB*. The UE applies the  $Q_{in\_LR}$  threshold to the L1-RSRP measurement obtained from an SSB. The UE applies the  $Q_{in\_LR}$  threshold to the L1-RSRP measurement obtained for a CSI-RS resource after scaling a respective CSI-RS reception power with a value provided by higher layer parameter *powerControlOffsetSS*. The RS resource configurations in the set  $\bar{q}_1$  can be periodic CSI-RS resources or SSBs or both SSB and CSI-RS resources. UE is not required to perform candidate beam detection outside the active DL BWP.

## 8.5.2 Requirements for SSB based beam failure detection

### 8.5.2.1 Introduction

The requirements in this clause apply for each SSB resource in the set  $\bar{q}_0$  configured for a serving cell, provided that the SSB configured for beam failure detection is actually transmitted within the UE active DL BWP during the entire evaluation period specified in clause 8.5.2.2.

**Table 8.5.2.1-1: PDCCH transmission parameters for beam failure instance**

| Attribute  | Value for BLER                  |
|--|---------------------------------|
| DCI format   | 1-0                             |
| Number of control OFDM symbols                                   | 2                               |
| Aggregation level (CCE)  | 8                               |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy   | 0dB                             |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 0dB                             |
| Bandwidth (PRBs)   | 24                              |
| Sub-carrier spacing (kHz)  | Same as the SCS of RMSI CORESET |
| DMRS precoder granularity  | REG bundle size                 |
| REG bundle size  | 6                               |
| CP length  | Normal                          |
| Mapping from REG to CCE  | Distributed                     |

### 8.5.2.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured SSB resource in set  $\bar{q}_0$  estimated over the last  $T_{Evaluate\_BFD\_SSB}$  ms period becomes worse than the threshold  $Q_{out\_LR\_SSB}$  within  $T_{Evaluate\_BFD\_SSB}$  ms period.

The value of  $T_{Evaluate\_BFD\_SSB}$  is defined in Table 8.5.2.2-1 for FR1.

The value of  $T_{Evaluate\_BFD\_SSB}$  is defined in Table 8.5.2.2-2 for FR2 with scaling factor  $N=8$

For FR1,

- $P = \frac{1}{1 - \frac{T_{SSB}}{MGRP}}$ , when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the SSB.
- $P = 1$  when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

For FR2,

- $P = \frac{1}{1 - \frac{T_{SSB}}{T_{SMTCperiod}}}$ , when BFD-RS resource is not overlapped with measurement gap and the BFD-RS resource is partially overlapped with SMTC occasion ( $T_{SSB} < T_{SMTCperiod}$ ).
- $P = P_{\text{sharing factor}}$ , when the BFD-RS resource is not overlapped with measurement gap and the BFD-RS resource is fully overlapped with SMTC period ( $T_{SSB} = T_{SMTCperiod}$ ).
- $P = \frac{1}{1 - \frac{T_{SSB}}{MGRP} - \frac{T_{SSB}}{T_{SMTCperiod}}}$ , when the BFD-RS resource is partially overlapped with measurement gap and the BFD-RS resource is partially overlapped with SMTC occasion ( $T_{SSB} < T_{SMTCperiod}$ ) and SMTC occasion is not overlapped with measurement gap and
  - $T_{SMTCperiod} \neq MGRP$  or
  - $T_{SMTCperiod} = MGRP$  and  $T_{SSB} < 0.5 \times T_{SMTCperiod}$
- $P = \frac{P_{\text{sharing factor}}}{1 - \frac{T_{SSB}}{MGRP}}$ , when the BFD-RS resource is partially overlapped with measurement gap and the BFD-RS resource is partially overlapped with SMTC occasion ( $T_{SSB} < T_{SMTCperiod}$ ) and SMTC occasion is not overlapped with measurement gap and  $T_{SMTCperiod} = MGRP$  and  $T_{SSB} = 0.5 * T_{SMTCperiod}$
- $P = \frac{1}{1 - \frac{T_{SSB}}{\text{Min}(MGRP, T_{SMTCperiod})}}$ , when the BFD-RS resource is partially overlapped with measurement gap ( $T_{SSB} < MGRP$ ) and the BFD-RS resource is partially overlapped with SMTC occasion ( $T_{SSB} < T_{SMTCperiod}$ ) and SMTC occasion is partially or fully overlapped with measurement gap.
- $P = \frac{P_{\text{sharing factor}}}{1 - \frac{T_{SSB}}{MGRP}}$ , when the BFD-RS resource is partially overlapped with measurement gap and the BFD-RS resource is fully overlapped with SMTC occasion ( $T_{SSB} = T_{SMTCperiod}$ ) and SMTC occasion is partially overlapped with measurement gap ( $T_{SMTCperiod} < MGRP$ )

$P_{\text{sharing factor}} = 1$ , if the BFD-RS resource outside measurement gap is

- not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and;
- not overlapped with the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.
- $P_{\text{sharing factor}} = 3$ , otherwise.

where,

If the high layer in TS 38.331 [2] signaling of *smtc2* is configured,  $T_{SMTCperiod}$  corresponds to the value of higher layer parameter *smtc2*; Otherwise  $T_{SMTCperiod}$  corresponds to the value of higher layer parameter *smtc1*.  $T_{SMTCperiod}$  is the shortest SMTC period among all CCs in the same FR2 band, given the SMTC offset of all CCs in FR2 provided the same offset.

Longer evaluation period would be expected if the combination of BFD-RS resource, SMTC occasion and measurement gap configurations does not meet pervious conditions.

**Table 8.5.2.2-1: Evaluation period  $T_{\text{Evaluate\_BFD\_SSB}}$  for FR1**

| Configuration   | $T_{\text{Evaluate\_BFD\_SSB}}$ (ms)  |
|---|---|
| no DRX  | $\text{Max}(50, \text{Ceil}(5 \times P) \times T_{SSB})$                        |
| DRX cycle $\leq 320\text{ms}$   | $\text{Max}(50, \text{Ceil}(7.5 \times P) \times \text{Max}(T_{DRX}, T_{SSB}))$ |
| DRX cycle $> 320\text{ms}$  | $\text{Ceil}(5 \times P) \times T_{DRX}$  |
| Note: $T_{SSB}$ is the periodicity of SSB in the set $\bar{q}_0$ . $T_{DRX}$ is the DRX cycle length. |   |

**Table 8.5.2.2-2: Evaluation period  $T_{\text{Evaluate\_BFD\_SSB}}$  for FR2**

| Configuration   | $T_{\text{Evaluate\_BFD\_SSB}}$ (ms)   |
|---|--|
| no DRX  | $\text{Max}(50, \text{Ceil}(5 \times P \times N) \times T_{\text{SSB}})$                               |
| DRX cycle $\leq 320\text{ms}$   | $\text{Max}(50, \text{Ceil}(7.5 \times P \times N) \times \text{Max}(T_{\text{DRX}}, T_{\text{SSB}}))$ |
| DRX cycle $> 320\text{ms}$  | $\text{Ceil}(5 \times P \times N) \times T_{\text{DRX}}$   |
| Note: $T_{\text{SSB}}$ is the periodicity of SSB in the set $\bar{q}_0$ . $T_{\text{DRX}}$ is the DRX cycle length. |  |

### 8.5.2.3 Measurement restriction for SSB based beam failure detection

The UE is required to be capable of measuring SSB for BFD without measurement gaps. The UE is required to perform the SSB measurements with measurement restrictions as described in the following clauses.

For FR1, when the SSB for BFD measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for BFD measurement without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for BFD measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for BFD measurement and CSI-RS. Longer measurement period for SSB based BFD measurement is expected, and no requirements are defined.

For FR2, when the SSB for BFD measurement on one CC is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSB for BFD measurement and CSI-RS. Longer measurement period for SSB based BFD measurement is expected, and no requirements are defined.

## 8.5.3 Requirements for CSI-RS based beam failure detection

### 8.5.3.1 Introduction

The requirements in this clause apply for each CSI-RS resource in the set  $\bar{q}_0$  of resource configurations for a serving cell, provided that the CSI-RS resource(s) in set  $\bar{q}_0$  for beam failure detection are actually transmitted within the UE active DL BWP during the entire evaluation period specified in clause 8.5.3.2. UE is not expected to perform beam failure detection measurements on the CSI-RS configured for BFD if the CSI-RS is not QCL-ed, with QCL-TypeD when applicable, with the RS in the active TCI state of any CORESET configured in the UE active BWP.

**Table 8.5.3.1-1: PDCCH transmission parameters for beam failure instance**

| Attribute   | Value for BLER           |
|---|--------------------------|
| DCI format  | 1-0                      |
| Number of control OFDM symbols                                      | 2                        |
| Aggregation level (CCE)   | 8                        |
| Ratio of hypothetical PDCCH RE energy to average CSI-RS RE energy   | 0dB                      |
| Ratio of hypothetical PDCCH DMRS energy to average CSI-RS RE energy | 0dB                      |
| Bandwidth (PRBs)  | 48                       |
| Sub-carrier spacing (kHz)   | SCS of the active DL BWP |
| DMRS precoder granularity   | REG bundle size          |
| REG bundle size   | 6                        |
| CP length   | Normal                   |

|                         |             |
|-------------------------|-------------|
| Mapping from REG to CCE | Distributed |
|-------------------------|-------------|

### 8.5.3.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the CSI-RS resource in set  $\bar{Q}_0$  estimated over the last  $T_{\text{Evaluate\_BFD\_CSI-RS}}$  ms period becomes worse than the threshold  $Q_{\text{out\_LR\_CSI-RS}}$  within  $T_{\text{Evaluate\_BFD\_CSI-RS}}$  ms period.

The value of  $T_{\text{Evaluate\_BFD\_CSI-RS}}$  is defined in Table 8.5.3.2-1 for FR1.

The value of  $T_{\text{Evaluate\_BFD\_CSI-RS}}$  is defined in Table 8.5.3.2-2 for FR2 with  $N=1$ . The requirements of  $T_{\text{Evaluate\_BFD\_CSI-RS}}$  apply provided that the CSI-RS for BFD is not in a resource set configured with repetition ON. The requirements shall not apply when the CSI-RS resource in the active TCI state of CORESET is the same CSI-RS resource for BFD and the TCI state information of the CSI-RS resource is not given, wherein the TCI state information means QCL Type-D to SSB for L1-RSRP or CSI-RS with repetition ON.

For FR1,

- $P = \frac{1}{1 - \frac{T_{\text{CSI-RS}}}{\text{MGRP}}}$ , when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the CSI-RS.
- $P = 1$  when in the monitored cell there are no measurement gaps overlapping with any occasion of the CSI-RS.

For FR2,

- $P = 1$ , when the BFD-RS resource is not overlapped with measurement gap and also not overlapped with SMTC occasion.
- $P = \frac{1}{1 - \frac{T_{\text{CSI-RS}}}{\text{MGRP}}}$ , when the BFD-RS resource is partially overlapped with measurement gap and the BFD-RS resource is not overlapped with SMTC occasion ( $T_{\text{CSI-RS}} < \text{MGRP}$ )
- $P = \frac{1}{1 - \frac{T_{\text{CSI-RS}}}{T_{\text{SMTCperiod}}}}$ , when the BFD-RS resource is not overlapped with measurement gap and the BFD-RS resource is partially overlapped with SMTC occasion ( $T_{\text{CSI-RS}} < T_{\text{SMTCperiod}}$ ).
- $P = P_{\text{sharing factor}}$ , when the BFD-RS resource is not overlapped with measurement gap and the BFD-RS resource is fully overlapped with SMTC occasion ( $T_{\text{CSI-RS}} = T_{\text{SMTCperiod}}$ ).
- $P = \frac{1}{1 - \frac{T_{\text{CSI-RS}}}{\text{MGRP}} - \frac{T_{\text{CSI-RS}}}{T_{\text{SMTCperiod}}}}$ , when the BFD-RS resource is partially overlapped with measurement gap and the BFD-RS resource is partially overlapped with SMTC occasion ( $T_{\text{CSI-RS}} < T_{\text{SMTCperiod}}$ ) and SMTC occasion is not overlapped with measurement gap and
  - $T_{\text{SMTCperiod}} \neq \text{MGRP}$  or
  - $T_{\text{SMTCperiod}} = \text{MGRP}$  and  $T_{\text{CSI-RS}} < 0.5 \times T_{\text{SMTCperiod}}$
- $P = \frac{P_{\text{sharing factor}}}{1 - \frac{T_{\text{CSI-RS}}}{\text{MGRP}}}$ , when the BFD-RS resource is partially overlapped with measurement gap and the BFD-RS resource is partially overlapped with SMTC occasion ( $T_{\text{CSI-RS}} < T_{\text{SMTCperiod}}$ ) and SMTC occasion is not overlapped with measurement gap and  $T_{\text{SMTCperiod}} = \text{MGRP}$  and  $T_{\text{CSI-RS}} = 0.5 \times T_{\text{SMTCperiod}}$
- $P = \frac{1}{1 - \frac{T_{\text{CSI-RS}}}{\text{Min}(\text{MGRP}, T_{\text{SMTCperiod}})}}$ , when the BFD-RS resource is partially overlapped with measurement gap ( $T_{\text{CSI-RS}} < \text{MGRP}$ ) and the BFD-RS resource is partially overlapped with SMTC occasion ( $T_{\text{CSI-RS}} < T_{\text{SMTCperiod}}$ ) and SMTC occasion is partially or fully overlapped with measurement gap.
- $P = \frac{P_{\text{sharing factor}}}{1 - \frac{T_{\text{CSI-RS}}}{\text{MGRP}}}$ , when the BFD-RS resource is partially overlapped with measurement gap and the BFD-RS resource is fully overlapped with SMTC occasion ( $T_{\text{CSI-RS}} = T_{\text{SMTCperiod}}$ ) and SMTC occasion is partially overlapped with measurement gap ( $T_{\text{SMTCperiod}} < \text{MGRP}$ )

- $P_{\text{sharing factor}} = 1$ , if the BFD-RS resource outside measurement gap is
  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and;
  - not overlapped with the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured,
- $P_{\text{sharing factor}} = 3$ , otherwise.

where,

If the high layer in TS 38.331 [2] signaling of *smtc2* is configured,  $T_{\text{SMTCperiod}}$  corresponds to the value of higher layer parameter *smtc2*; Otherwise  $T_{\text{SMTCperiod}}$  corresponds to the value of higher layer parameter *smtc1*.  $T_{\text{SMTCperiod}}$  is the shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.

Note: The overlap between CSI-RS for BFD and SMTC means that CSI-RS for BFD is within the SMTC window duration.

Longer evaluation period would be expected if the combination of the BFD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

The values of  $M_{\text{BFD}}$  used in Table 8.5.3.2-1 and Table 8.5.3.2-2 are defined as

- $M_{\text{BFD}} = 10$ , if the CSI-RS resource(s) in set  $\bar{q}_0$  used for BFD is transmitted with Density = 3 and over the bandwidth  $\geq 24$  PRBs.

**Table 8.5.3.2-1: Evaluation period  $T_{\text{Evaluate\_BFD\_CSI-RS}}$  for FR1**

| Configuration  | $T_{\text{Evaluate\_BFD\_CSI-RS}}$ (ms)  |
|--|--|
| no DRX   | $\text{Max}(50, \text{Ceil}(M_{\text{BFD}} \times P) \times T_{\text{CSI-RS}})$  |
| DRX cycle $\leq 320\text{ms}$  | $\text{Max}(50, \text{Ceil}(1.5 \times M_{\text{BFD}} \times P) \times \text{Max}(T_{\text{DRX}}, T_{\text{CSI-RS}}))$ |
| DRX cycle $> 320\text{ms}$   | $\text{Ceil}(M_{\text{BFD}} \times P) \times T_{\text{DRX}}$   |
| Note: $T_{\text{CSI-RS}}$ is the periodicity of CSI-RS resource in the set $\bar{q}_0$ . $T_{\text{DRX}}$ is the DRX cycle length. |  |

**Table 8.5.3.2-2: Evaluation period  $T_{\text{Evaluate\_BFD\_CSI-RS}}$  for FR2**

| Configuration  | $T_{\text{Evaluate\_BFD\_CSI-RS}}$ (ms)   |
|--|---|
| no DRX   | $\text{Max}(50, \text{Ceil}(M_{\text{BFD}} \times P \times N) \times T_{\text{CSI-RS}})$  |
| DRX cycle $\leq 320\text{ms}$  | $\text{Max}(50, \text{Ceil}(1.5 \times M_{\text{BFD}} \times P \times N) \times \text{Max}(T_{\text{DRX}}, T_{\text{CSI-RS}}))$ |
| DRX cycle $> 320\text{ms}$   | $\text{Ceil}(M_{\text{BFD}} \times P \times N) \times T_{\text{DRX}}$   |
| Note: $T_{\text{CSI-RS}}$ is the periodicity of CSI-RS resource in the set $\bar{q}_0$ . $T_{\text{DRX}}$ is the DRX cycle length. |   |

### 8.5.3.3 Measurement restrictions for CSI-RS beam failure detection

The UE is required to be capable of measuring CSI-RS for BFD without measurement gaps. The UE is required to perform the CSI-RS measurements with measurement restrictions as described in the following clauses.

For both FR1 and FR2, when the CSI-RS for BFD measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for BFD measurement in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for BFD measurement, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for BFD measurement, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS measurement without restrictions.
- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for BFD measurement and SSB. Longer measurement period for CSI-RS based BFD measurement is expected, and no requirements are defined.

For FR1, when the CSI-RS for BFD measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for BFD measurement without any restriction.

For FR2, when the CSI-RS for BFD measurement on one CC is in the same OFDM symbol as SSB for RLM, BFD or L1-RSRP measurement on the same CC or different CCs in the same band, or in the same symbol as SSB for CBD measurement on the same CC or different CCs in the same band when beam failure is detected, UE is required to measure one of but not both CSI-RS for BFD measurement and SSB. Longer measurement period for CSI-RS based BFD measurement is expected, and no requirements are defined.

For FR2, when the CSI-RS for BFD measurement on one CC is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band,

- In the following cases, UE is required to measure one of but not both CSI-RS for BFD measurement and the other CSI-RS. Longer measurement period for CSI-RS based BFD measurement is expected, and no requirements are defined.
  - The CSI-RS for BFD measurement or the other CSI-RS in a resource set configured with repetition ON, or
  - The other CSI-RS is configured in set  $\bar{q}_1$  and beam failure is detected, or
  - The two CSI-RS-es are not QCL-ed w.r.t. QCL-TypeD, or the QCL information is not known to UE,
- Otherwise, UE shall be able to measure the CSI-RS for BFD measurement without any restriction.

## 8.5.4 Minimum requirement for L1 indication

When the radio link quality on all the RS resources in set  $\bar{q}_0$  is worse than  $Q_{out\_LR}$ , layer 1 of the UE shall send a beam failure instance indication to the higher layers.

The beam failure instance evaluation for the RS resources in set  $\bar{q}_0$  shall be performed as specified in clause 6 in TS 38.213 [3]. Two successive indications from layer 1 shall be separated by at least  $T_{Indication\_interval\_BFD}$ .

When DRX is not used,  $T_{Indication\_interval\_BFD}$  is  $\max(2\text{ms}, T_{SSB-RS,M})$  or  $\max(2\text{ms}, T_{CSI-RS,M})$ , where  $T_{SSB-RS,M}$  and  $T_{CSI-RS,M}$  is the shortest periodicity of all RS resources in set  $\bar{q}_0$  for the accessed cell, corresponding to either the shortest periodicity of the SSB in the set  $\bar{q}_0$  or CSI-RS resource in the set  $\bar{q}_0$ .

When DRX is used, for SSB based link quality measurement,

- $T_{Indication\_interval\_BFD} = \text{Max}(1.5 \times \text{DRX\_cycle\_length}, 1.5 \times T_{SSB-RS,M})$ , if  $\text{DRX\_cycle\_length} \leq 320\text{ms}$ ,
- $T_{Indication\_interval\_BFD} = \text{DRX\_cycle\_length}$ , if  $\text{DRX\_cycle\_length} > 320\text{ms}$ .

When DRX is used, for CSI-RS based link quality measurement,

- $T_{Indication\_interval\_BFD} = \text{Max}(1.5 \times \text{DRX\_cycle\_length}, 1.5 \times T_{CSI-RS,M})$ , if  $\text{DRX\_cycle\_length} \leq 320\text{ms}$ ,
- $T_{Indication\_interval\_BFD} = \text{DRX\_cycle\_length}$ , if  $\text{DRX\_cycle\_length} > 320\text{ms}$ .

## 8.5.5 Requirements for SSB based candidate beam detection

### 8.5.5.1 Introduction

The requirements in this clause apply for each SSB resource in the set  $\bar{q}_1$  configured for a serving cell, provided that the SSBs configured for candidate beam detection are actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.5.5.2.

### 8.5.5.2 Minimum requirement

Upon request the UE shall be able to evaluate whether the L1-RSRP measured on the configured SSB resource in set  $\bar{q}_1$  estimated over the last  $T_{\text{Evaluate\_CBD\_SSB}}$  ms period becomes better than the threshold  $Q_{\text{in\_LR}}$  provided SSB\_RP and SSB  $\hat{E}_s/\text{Iot}$  are according to Annex Table B.2.4.1 for a corresponding band.

The UE shall monitor the configured SSB resources using the evaluation period in table 8.5.5.2-1 and 8.5.5.2-2 corresponding to the non-DRX mode, if the configured DRX cycle  $\leq 320$ ms.

The value of  $T_{\text{Evaluate\_CBD\_SSB}}$  is defined in Table 8.5.5.2-1 for FR1.

The value of  $T_{\text{Evaluate\_CBD\_SSB}}$  is defined in Table 8.5.5.2-2 for FR2 with scaling factor  $N=8$ .

where,

For FR1,

- $P = \frac{1}{1 - \frac{T_{\text{SSB}}}{\text{MGRP}}}$ , when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the SSB,
- $P = 1$  when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

For FR2,

- $P = \frac{1}{1 - \frac{T_{\text{SSB}}}{T_{\text{SMTCperiod}}}}$ , when candidate beam detection RS is not overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ( $T_{\text{SSB}} < T_{\text{SMTCperiod}}$ ).
- $P$  is  $P_{\text{sharing factor}}$ , when candidate beam detection RS is not overlapped with measurement gap and candidate beam detection RS is fully overlapped with SMTC period ( $T_{\text{SSB}} = T_{\text{SMTCperiod}}$ ).
- $P = \frac{1}{1 - \frac{T_{\text{SSB}}}{\text{MGRP}} - \frac{T_{\text{SSB}}}{T_{\text{SMTCperiod}}}}$ , when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ( $T_{\text{SSB}} < T_{\text{SMTCperiod}}$ ) and SMTC occasion is not overlapped with measurement gap and
  - $T_{\text{SMTCperiod}} \neq \text{MGRP}$  or
  - $T_{\text{SMTCperiod}} = \text{MGRP}$  and  $T_{\text{SSB}} < 0.5 \times T_{\text{SMTCperiod}}$
- $P = \frac{P_{\text{sharing factor}}}{1 - \frac{T_{\text{SSB}}}{\text{MGRP}}}$ , when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ( $T_{\text{SSB}} < T_{\text{SMTCperiod}}$ ) and SMTC occasion is not overlapped with measurement gap and  $T_{\text{SMTCperiod}} = \text{MGRP}$  and  $T_{\text{SSB}} = 0.5 \times T_{\text{SMTCperiod}}$
- $P = \frac{1}{1 - \frac{T_{\text{SSB}}}{\text{Min}(\text{MGRP}, T_{\text{SMTCperiod}})}}$ , when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ( $T_{\text{SSB}} < T_{\text{SMTCperiod}}$ ) and SMTC occasion is partially or fully overlapped with measurement gap
- $P = \frac{P_{\text{sharing factor}}}{1 - \frac{T_{\text{SSB}}}{\text{MGRP}}}$ , when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is fully overlapped with SMTC occasion ( $T_{\text{SSB}} = T_{\text{SMTCperiod}}$ ) and SMTC occasion is partially overlapped with measurement gap ( $T_{\text{SMTCperiod}} < \text{MGRP}$ )

- $P_{\text{sharing factor}} = 1$ , if the candidate beam detection RS outside measurement gap is
  - not overlapped with the SSB symbols indicated by SSB-ToMeasure and 1 data symbol before each consecutive SSB symbols indicated by SSB-ToMeasure and 1 data symbol after each consecutive SSB symbols indicated by SSB-ToMeasure, given that SSB-ToMeasure is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and;
  - not overlapped with the RSSI symbols indicated by ss-RSSI-Measurement and 1 data symbol before each RSSI symbol indicated by ss-RSSI-Measurement and 1 data symbol after each RSSI symbol indicated by ss-RSSI-Measurement, given that ss-RSSI-Measurement is configured
- $P_{\text{sharing factor}} = 3$ , otherwise.

where,

If the high layer in TS 38.331 [2] signaling of *smtc2* is present,  $T_{\text{SMTCperiod}}$  follows *smtc2*; Otherwise  $T_{\text{SMTCperiod}}$  follows *smtc1*.  $T_{\text{SMTCperiod}}$  is the shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.

Longer evaluation period would be expected if the combination of the CBD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

**Table 8.5.5.2-1: Evaluation period  $T_{\text{Evaluate\_CBD\_SSB}}$  for FR1**

| Configuration                          | $T_{\text{Evaluate\_CBD\_SSB}}$ (ms)  |
|--|---|
| non-DRX, DRX cycle $\leq 320\text{ms}$ | $\text{Max}(25, \text{Ceil}(3 \times P) \times T_{\text{SSB}})$   |
| DRX cycle $> 320\text{ms}$             | $\text{Ceil}(3 \times P) \times T_{\text{DRX}}$   |
| Note:                                  | $T_{\text{SSB}}$ is the periodicity of SSB in the set $\bar{q}_1$ . $T_{\text{DRX}}$ is the DRX cycle length. |

**Table 8.5.5.2-2: Evaluation period  $T_{\text{Evaluate\_CBD\_SSB}}$  for FR2**

| Configuration                          | $T_{\text{Evaluate\_CBD\_SSB}}$ (ms)  |
|--|---|
| non-DRX, DRX cycle $\leq 320\text{ms}$ | $\text{Max}(25, \text{Ceil}(3 \times P \times N) \times T_{\text{SSB}})$                                      |
| DRX cycle $> 320\text{ms}$             | $\text{Ceil}(3 \times P \times N) \times T_{\text{DRX}}$  |
| Note:                                  | $T_{\text{SSB}}$ is the periodicity of SSB in the set $\bar{q}_1$ . $T_{\text{DRX}}$ is the DRX cycle length. |

### 8.5.5.3 Measurement restriction for SSB based candidate beam detection

For FR1, when the SSB for CBD measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for CBD measurement without any restrictions;
- If SSB and CSI-RS have different SCS-es,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for CBD measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for CBD measurement and CSI-RS. Longer measurement period for SSB based CBD measurement is expected, and no requirements are defined.

For FR2, when the SSB for CBD measurement on one CC is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSB for CBD measurement and CSI-RS. Longer measurement period for SSB based CBD measurement is expected, and no requirements are defined.

## 8.5.6 Requirements for CSI-RS based candidate beam detection

### 8.5.6.1 Introduction

The requirements in this clause apply for each CSI-RS resource in the set  $\bar{q}_1$  configured for a serving cell, provided that the CSI-RS resources configured for candidate beam detection are actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.5.6.2.

### 8.5.6.2 Minimum requirement

Upon request the UE shall be able to evaluate whether the L1-RSRP measured on the configured CSI-RS resource in set  $\bar{q}_1$  estimated over the last  $T_{\text{Evaluate\_CBD\_CSI-RS}}$  [ms] period becomes better than the threshold  $Q_{\text{in\_LR}}$  within  $T_{\text{Evaluate\_CBD\_CSI-RS}}$  [ms] period provided CSI-RS  $\hat{E}_s/I_{\text{ot}}$  is according to Annex Table B.2.4.2 for a corresponding band.

The UE shall monitor the configured CSI-RS resources using the evaluation period in table 8.5.6.2-1 and 8.5.6.2-2 corresponding to the non-DRX mode, if the configured DRX cycle  $\leq 320$ ms.

The value of  $T_{\text{Evaluate\_CBD\_CSI-RS}}$  is defined in Table 8.5.6.2-1 for FR1.

The value of  $T_{\text{Evaluate\_CBD\_CSI-RS}}$  is defined in Table 8.5.6.2-2 for FR2 with scaling factor  $N=8$ .

For FR1,

- $P = \frac{1}{1 - \frac{T_{\text{CSI-RS}}}{MGRP}}$ , when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the CSI-RS; and
- $P = 1$  when in the monitored cell there are no measurement gaps overlapping with any occasion of the CSI-RS.

For FR2,

- $P = 1$ , when candidate beam detection RS is not overlapped with measurement gap and also not overlapped with SMTC occasion.
- $P = \frac{1}{1 - \frac{T_{\text{CSI-RS}}}{MGRP}}$ , when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is not overlapped with SMTC occasion ( $T_{\text{CSI-RS}} < MGRP$ )
- $P = \frac{1}{1 - \frac{T_{\text{CSI-RS}}}{T_{\text{SMTCperiod}}}}$ , when candidate beam detection RS is not overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ( $T_{\text{CSI-RS}} < T_{\text{SMTCperiod}}$ ).
- $P = P_{\text{sharing factor}}$ , when candidate beam detection RS is not overlapped with measurement gap and candidate beam detection RS is fully overlapped with SMTC occasion ( $T_{\text{CSI-RS}} = T_{\text{SMTCperiod}}$ ).
- $P = \frac{1}{1 - \frac{T_{\text{CSI-RS}}}{MGRP} - \frac{T_{\text{CSI-RS}}}{T_{\text{SMTCperiod}}}}$ , when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ( $T_{\text{CSI-RS}} < T_{\text{SMTCperiod}}$ ) and SMTC occasion is not overlapped with measurement gap and
  - $T_{\text{SMTCperiod}} \neq MGRP$  or
  - $T_{\text{SMTCperiod}} = MGRP$  and  $T_{\text{CSI-RS}} < 0.5 \times T_{\text{SMTCperiod}}$
- $P = \frac{P_{\text{sharing factor}}}{1 - \frac{T_{\text{CSI-RS}}}{MGRP}}$ , when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ( $T_{\text{CSI-RS}} < T_{\text{SMTCperiod}}$ ) and SMTC occasion is not overlapped with measurement gap and  $T_{\text{SMTCperiod}} = MGRP$  and  $T_{\text{CSI-RS}} = 0.5 \times T_{\text{SMTCperiod}}$

- $P = \frac{1}{1 - \frac{T_{\text{CSI-RS}}}{\text{Min}(M_{\text{GRP}}, T_{\text{SMTCperiod}})}}$ , when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ( $T_{\text{CSI-RS}} < T_{\text{SMTCperiod}}$ ) and SMTC occasion is partially or fully overlapped with measurement gap
- $P = \frac{3}{1 - \frac{T_{\text{CSI-RS}}}{M_{\text{GRP}}}}$ , when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is fully overlapped with SMTC occasion ( $T_{\text{CSI-RS}} = T_{\text{SMTCperiod}}$ ) and SMTC occasion is partially overlapped with measurement gap ( $T_{\text{SMTCperiod}} < M_{\text{GRP}}$ )
- $P_{\text{sharing factor}} = 1$ , if the candidate beam detection RS outside measurement gap is
  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and;
  - not overlapped with the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.
- $P_{\text{sharing factor}} = 3$ , otherwise.

where,

If the high layer in TS 38.331 [2] signaling of *smtc2* is present,  $T_{\text{SMTCperiod}}$  follows *smtc2*; Otherwise  $T_{\text{SMTCperiod}}$  follows *smtc1*.  $T_{\text{SMTCperiod}}$  is the shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.

Note: The overlap between CSI-RS for CBD and SMTC means that CSI-RS for CBD is within the SMTC window duration.

Longer evaluation period would be expected if the combination of the CBD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

Longer evaluation period would be expected if the CSI-RS is on the same OFDM symbols with RLM, BFD, BM-RS, or other CBD-RS, according to the measurement restrictions defined in clause 8.5.6.3.

The values of  $M_{\text{CBD}}$  used in Table 8.5.6.2-1 and Table 8.5.6.2-2 are defined as

- $M_{\text{CBD}} = 3$ , if the CSI-RS resource configured in the set  $\bar{q}_1$  is transmitted with Density = 3 and over the bandwidth  $\geq 24$  PRBs.

**Table 8.5.6.2-1: Evaluation period  $T_{\text{Evaluate\_CBD\_CSI-RS}}$  for FR1**

| Configuration                          | $T_{\text{EvaluateC\_CBD\_CSI-RS}}$ (ms)   |
|--|--|
| non-DRX, DRX cycle $\leq 320\text{ms}$ | $\text{Max}(25, \text{Ceil}(M_{\text{CBD}} \times P) \times T_{\text{CSI-RS}})$  |
| DRX cycle $> 320\text{ms}$             | $\text{Ceil}(M_{\text{CBD}} \times P) \times T_{\text{DRX}}$   |
| Note:                                  | $T_{\text{CSI-RS}}$ is the periodicity of CSI-RS resource in the set $\bar{q}_1$ . $T_{\text{DRX}}$ is the DRX cycle length. |

**Table 8.5.6.2-2: Evaluation period  $T_{\text{Evaluate\_CBD\_CSI-RS}}$  for FR2**

| Configuration                          | $T_{\text{Evaluate\_CBD\_CSI-RS}}$ (ms)  |
|--|--|
| non-DRX, DRX cycle $\leq 320\text{ms}$ | $\text{Max}(25, \text{Ceil}(M_{\text{CBD}} \times P \times N) \times T_{\text{CSI-RS}})$                                     |
| DRX cycle $> 320\text{ms}$             | $\text{Ceil}(M_{\text{CBD}} \times P \times N) \times T_{\text{DRX}}$  |
| Note:                                  | $T_{\text{CSI-RS}}$ is the periodicity of CSI-RS resource in the set $\bar{q}_1$ . $T_{\text{DRX}}$ is the DRX cycle length. |

### 8.5.6.3 Measurement restriction for CSI-RS based candidate beam detection

For both FR1 and FR2, when the CSI-RS for CBD measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for CBD measurement in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for CBD measurement, the UE shall be able to perform CSI-RS based CBD measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for CBD measurement, the UE shall be able to perform CSI-RS based CBD measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS based CBD measurement for without restrictions.
- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for CBD measurement and SSB. Longer measurement period for CSI-RS based CBD measurement is expected, and no requirements are defined.

For FR1, when the CSI-RS for CBD measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for CBD measurement without any restriction.

For FR2, when the CSI-RS for CBD measurement on one CC is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both CSI-RS for CBD measurement and SSB. Longer evaluation period for CSI-RS based CBD measurement is expected, and no requirements are defined.

For FR2, when the CSI-RS for CBD measurement on one CC is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both CSI-RS for CBD measurement and the other CSI-RS. Longer evaluation period for CSI-RS based CBD measurement is expected, and no requirements are defined.

## 8.5.7 Scheduling availability of UE during beam failure detection

Scheduling availability restrictions when the UE is performing beam failure detection are described in the following clauses.

### 8.5.7.1 Scheduling availability of UE performing beam failure detection with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to beam failure detection performed on SSB and CSI-RS configured for BFD with the same SCS as PDSCH or PDCCH in FR1.

### 8.5.7.2 Scheduling availability of UE performing beam failure detection with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to beam failure detection when SSB is configured as BFD. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to beam failure detection when SSB is configured as BFD.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for beam failure detection.

When intra-band carrier aggregation in FR1 is configured, the scheduling restrictions on FR1 serving PCell or PSCell apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols. When inter-band carrier aggregation within FR1 is configured, there are no scheduling restrictions on FR1 serving cell(s) configured in other bands than the bands in which PCell or PSCell is configured.

### 8.5.7.3 Scheduling availability of UE performing beam failure detection on FR2

The following scheduling restriction applies due to beam failure detection.

- For the case where no RSs are provided for BFD, or when CSI-RS is configured for BFD is explicitly configured and is type-D QCLed with active TCI state for PDCCH or PDSCH, and the CSI-RS is not in a CSI-RS resource set with repetition ON
  - There are no scheduling restrictions due to beam failure detection performed based on the CSI-RS.
- Otherwise
  - The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on BFD-RS resource symbols to be measured for beam failure detection.

When intra-band carrier aggregation in FR2 is performed, the scheduling restrictions on FR2 serving PCell or PSCell apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

For FR2, if following conditions are met,

- UE has been notified about system information update through paging,
- The gap between UE's reception of PDCCH that UE monitors in the Type2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, UE is expected to receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for BFD measurement; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, UE is expected to receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for BFD measurement.

### 8.5.7.4 Scheduling availability of UE performing beam failure detection on FR1 or FR2 in case of FR1-FR2 inter-band CA and NR DC

There are no scheduling restrictions on FR1 serving cell(s) due to beam failure detection performed on FR2 serving PCell and/or PSCell.

There are no scheduling restrictions on FR2 serving cell(s) due to beam failure detection performed on FR1 serving PCell and/or PSCell.

NR-DC in Rel-15 only includes the scenarios where all serving cells in MCG are in FR1 and all serving cells in SCG are in FR2.

## 8.5.8 Scheduling availability of UE during candidate beam detection

Scheduling availability restrictions when the UE is performing L1-RSRP measurement for candidate beam detection are described in the following clauses.

### 8.5.8.1 Scheduling availability of UE performing L1-RSRP measurement with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to L1-RSRP measurement performed on SSB and CSI-RS configured as link recovery detection resource with the same SCS as PDSCH or PDCCH in FR1.

### 8.5.8.2 Scheduling availability of UE performing L1-RSRP measurement with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to L1-RSRP measurement based on SSB as link recovery detection resource. For UEs which do not

support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to L1-RSRP measurement based on SSB configured as link recovery detection resource.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH, TRS, CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for L1-RSRP.

When intra-band carrier aggregation in FR1 is configured, the scheduling restrictions on one serving cell apply to all other serving cells in the same band on the symbols that fully or partially overlap with the restricted symbols. When inter-band carrier aggregation within FR1 is configured, there are no scheduling restrictions on FR1 serving cell(s) configured in other bands.

### 8.5.8.3 Scheduling availability of UE performing L1-RSRP measurement on FR2

The following scheduling restriction applies due to candidate beam detection

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH, CSI-RS for tracking or CSI-RS for CQI on reference symbols to be measured for candidate beam detection.

When intra-band carrier aggregation in FR2 is configured, the scheduling restrictions on to one serving cell apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

For FR2, if following conditions are met,

- UE has been notified about system information update through paging,
- The gap between UE's reception of PDCCH that UE monitors in the Type2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, UE is expected to receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for CBD measurement; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, UE is expected to receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for CBD measurement.

### 8.5.8.4 Scheduling availability of UE performing L1-RSRP measurement on FR1 or FR2 in case of FR1-FR2 inter-band CA and NR-DC

There are no scheduling restrictions on FR1 serving cell(s) due to L1-RSRP measurement performed on FR2 serving cell(s).

There are no scheduling restrictions on FR2 serving cell(s) due to L1-RSRP measurement performed on FR1 serving cell(s).

NR-DC in Rel-15 only includes the scenarios where all serving cells in MCG are in FR1 and all serving cells in SCG are in FR2.

## 8.5.9 Minimum requirement at transitions for beam failure detection

When the UE transitions between DRX and no DRX or when DRX cycle periodicity changes, for each BFD-RS resource, for a duration of time equal to the evaluation period corresponding to the second mode after the transition occurs, the UE shall use an evaluation period that is no less than the minimum of evaluation period corresponding to the first mode and the second mode. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second mode for each BFD-RS resource.

When the UE transitions from a first configuration of BFD resources to a second configuration of BFD resources that is different from the first configuration, for each BFD resource present in the second configuration, for a duration of time equal to the evaluation period corresponding to the second configuration after the transition occurs, the UE shall use an evaluation period that is no less than the minimum of evaluation periods corresponding to the first configuration and the second configuration. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second configuration for each BFD resource present in the second configuration.

When the UE transitions from a first configuration of active TCI state of the CORESET to a second configuration of active TCI state of the CORESET, for each CSI-RS for BFD present in the second configuration, the UE shall use an evaluation period corresponding to the second configuration from the time of transition.

## 8.6 Active BWP switch delay

### 8.6.1 Introduction

The requirements in this clause apply for a UE configured PCell or any activated SCell in standalone NR or NE-DC, PCell, PSCell or any activated SCell in MCG or SCG in NR-DC, or PSCell or any activated SCell in SCG in EN-DC. UE shall complete the switch of active DL and/or UL BWP within the delay defined in this clause.

### 8.6.2 DCI and timer based BWP switch delay

The requirements in this clause only apply to the case that the BWP switch is performed on a single CC with more than one BWP configurations configured.

For DCI based BWP switch, if the serving cell where UE receives DCI for BWP switch request is different from the serving cell on which BWP switch occurs, the UE is not required to follow the requirements specified in this clause.

For DCI-based BWP switch, after the UE receives BWP switching request at DL slot  $n$  on a serving cell, UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL or UL slot occurs right after a time duration of  $T_{\text{BWPswitchDelay}}$  which starts from the beginning of DL slot  $n$ .

The UE is not required to transmit UL signals or receive DL signals until the first DL or UL slot occurs right after a time duration of  $T_{\text{BWPswitchDelay}}$  which starts from the beginning of DL slot  $n$  except DCI triggering BWP switch on the cell where DCI-based BWP switch occurs. The UE is not required to follow the requirements defined in this clause when performing a DCI-based BWP switch between the BWPs in disjoint channel bandwidths or in partially overlapping channel bandwidths.

For timer-based BWP switch, the UE shall start BWP switch at DL slot  $n$ , where slot  $n$  is the first slot of a DL subframe (FR1) or DL half-subframe (FR2) immediately after a BWP-inactivity timer *bwp-InactivityTimer* [2] expires on a serving cell, and the UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL or UL slot occurs right after a time duration of  $T_{\text{BWPswitchDelay}}$  which starts from the beginning of DL slot  $n$ .

The UE is not required to transmit UL signals or receive DL signals during time duration  $T_{\text{BWPswitchDelay}}$  after *bwp-InactivityTimer* [2] expires on the cell where timer-based BWP switch occurs.

Depending on UE capability *bwp-SwitchingDelay* [2], UE shall finish BWP switch within the time duration  $T_{\text{BWPswitchDelay}}$  defined in Table 8.6.2-1.

**Table 8.6.2-1: BWP switch delay**

| $\mu$  | NR Slot length (ms) | BWP switch delay $T_{\text{BWPswitchDelay}}$ (slots) |                          |
|--|---------------------|--|--------------------------|
|  |                     | Type 1 <sup>Note 1</sup>                             | Type 2 <sup>Note 1</sup> |
| 0  | 1                   | 1  | 3                        |
| 1  | 0.5                 | 2  | 5                        |
| 2  | 0.25                | 3  | 9                        |
| 3  | 0.125               | 6  | 18                       |
| Note 1: Depends on UE capability.<br>Note 2: If the BWP switch involves changing of SCS, the BWP switch delay is determined by the smaller SCS between the SCS before BWP switch and the SCS after BWP switch. |                     |  |                          |

Provided the UE does not have the required TCI-state information to receive PDCCH and PDSCH in the new BWP, the UE shall use old TCI-states before the BWP switch until a new MAC CE updating the required TCI-state information for PDCCH and PDSCH is received after the BWP switch.

If UE has the information on the required TCI-state information to receive PDCCH and PDSCH in the new BWP,

- UE shall be able to receive PDCCH and PDSCH with old TCI-states before the delay as specified in Clause 8.10 in the new BWP.
- UE shall be able to receive PDCCH and PDSCH with new TCI-states after the delay as specified in Clause 8.10 in the new BWP

### 8.6.3 RRC based BWP switch delay

The requirements in this clause only apply to the case that the BWP switch is performed on a single CC with one or more than one BWP configuration(s) configured, with

- Active BWP switch or parameter change of its active BWPs for SpCell
- Parameter change of its active BWPs except parameter *firstActiveDownlinkBWP-Id* and *firstActiveUplinkBWP-Id* for SCell

For RRC-based BWP switch, after the UE receives RRC reconfiguration involving active BWP switching or parameter change of its active BWP, UE shall be able to receive PDSCH/PDCCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch occurs on the first DL or UL slot right after a time duration of  $\frac{T_{RRCprocessingDelay} + T_{BWPswitchDelayRRC}}{NR\ Slot\ length}$  slots which begins from the beginning of DL slot *n*, where

DL slot *n* is the last slot overlapping with the PDSCH containing the RRC command, and

*NR Slot length* is determined by the smaller SCS between the SCS before BWP switch and the SCS after BWP switch if the BWP switch involves changing of SCS.

$T_{RRCprocessingDelay}$  is the length of the RRC procedure delay in ms as defined in clause 11.2 in TS 36.331 [16] if the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the length of the RRC procedure delay in ms as defined in clause 12 in TS 38.331 [2], and

$T_{BWPswitchDelayRRC} = 6ms$  is the time used by the UE to perform BWP switch.

The UE is not required to transmit UL signals or receive DL signals during the time defined by  $T_{RRCprocessingDelay} + T_{BWPswitchDelayRRC}$  on the cell where RRC-based BWP switch occurs. When  $T_{HARQ} > T_{RRCprocessingDelay}$  a longer switching delay is allowed. Where  $T_{HARQ}$  is the time between DL data transmission and acknowledgement as specified in TS 38.213 [3].

## 8.7 Void

## 8.8 NE-DC: E-UTRAN PSCell Addition and Release Delay

### 8.8.1 Introduction

This clause defines requirements for the delay within which the UE shall be able to configure an E-UTRAN PSCell in NR - E-UTRA dual connectivity. The requirements are applicable to an NR - E-UTRA dual connectivity capable UE.

### 8.8.2 E-UTRAN PSCell Addition Delay Requirement

The requirements in this clause shall apply for the UE, which is configured with PCell, and may also be configured with one or more SCells.

Upon receiving E-UTRAN PSCell addition in subframe  $n$ , the UE shall be capable to transmit PRACH preamble towards E-UTRAN PSCell no later than in subframe  $n + T_{\text{config\_E-UTRAN-PSCell}}$ :

Where:

$$T_{\text{config\_E-UTRAN-PSCell}} = T_{\text{RRC\_delay}} + T_{\text{activation\_time}} + 50\text{ms} + T_{\text{E-UTRAN-PSCell\_DU}}$$

$T_{\text{RRC\_delay}}$  is the RRC procedure delay as specified in TS 38.331 [2].

$T_{\text{activation\_time}}$  is the E-UTRAN PSCell activation delay. If the E-UTRAN PSCell is known, then  $T_{\text{activation\_time}}$  is 20ms. If the E-UTRAN PSCell is unknown, then  $T_{\text{activation\_time}}$  is 30ms provided the E-UTRAN PSCell can be successfully detected on the first attempt.

$T_{\text{E-UTRAN-PSCell\_DU}}$  is the delay uncertainty in acquiring the first available PRACH occasion in the E-UTRAN PSCell.  $T_{\text{E-UTRAN-PSCell\_DU}}$  is up to 30ms.

E-UTRAN PSCell is known if it has been meeting the following conditions:

- During the last 5 seconds before the reception of the E-UTRAN PSCell configuration command:
  - the UE has sent a valid measurement report for the E-UTRAN PSCell being configured and
  - the E-UTRAN PSCell being configured remains detectable according to the cell identification conditions specified in clause 8.8 of TS 36.133 [15],
- E-UTRAN PSCell being configured also remains detectable during the E-UTRAN PSCell configuration delay  $T_{\text{config\_E-UTRAN-PSCell}}$  according to the cell identification conditions specified in clause 8.8 of TS 36.133 [15].

otherwise it is unknown.

The PCell interruption specified in clause 8.2 is allowed only during the RRC reconfiguration procedure [2].

### 8.8.3 E-UTRAN PSCell Release Delay Requirement

The requirements in this clause shall apply for a UE which is configured with PCell and E-UTRAN PSCell and may also be configured with one or more SCells and/or E-UTRAN SCells.

Upon receiving E-UTRAN PSCell release in subframe  $n$ , the UE shall accomplish the release actions specified in TS 38.331 [2] no later than in subframe  $n + T_{\text{RRC\_delay}}$ :

Where

$T_{\text{RRC\_delay}}$  is the RRC procedure delay as specified in TS 38.331 [2].

The PCell interruption specified in clause 8.2 is allowed only during the RRC reconfiguration procedure [2].

## 8.9 NR-DC: PSCell Addition and Release Delay

### 8.9.1 Introduction

This clause defines requirements for the delay within which the UE shall be able to configure an PSCell in NR dual connectivity. The requirements are applicable to an NR dual connectivity capable UE.

### 8.9.2 PSCell Addition Delay Requirement

The requirements in this clause shall apply for the UE configured with only PCell in FR1.

Upon receiving PSCell addition in subframe  $n$ , the UE shall be capable to transmit PRACH preamble towards PSCell in FR2 no later than in slot  $n + \frac{T_{\text{config\_PSCell}}}{\text{NR slot length}}$ .

where:

$$T_{\text{config\_PSCell}} = T_{\text{RRC\_delay}} + T_{\text{processing}} + T_{\text{search}} + T_{\Delta} + T_{\text{PSCell\_DU}} + 2 \text{ ms}$$

$T_{\text{RRC\_delay}}$  is the RRC procedure delay as specified in TS 38.331 [2].

$T_{\text{processing}}$  is the SW processing time needed by UE, including RF warm up period.  $T_{\text{processing}} = 40 \text{ ms}$ .

$T_{\text{search}}$  is the time for AGC settling and PSS/SSS detection. If the target cell is known,  $T_{\text{search}} = 0 \text{ ms}$ . If the target cell is unknown and the target cell  $\hat{E}_s/I_{ot} \geq -2\text{dB}$ ,  $T_{\text{search}} = 24 * T_{\text{rs}} \text{ ms}$ .

$T_{\Delta}$  is time for fine time tracking and acquiring full timing information of the target cell.  $T_{\Delta} = 1 * T_{\text{rs}} \text{ ms}$  for a known or unknown PSCell.

$T_{\text{PSCell\_DU}}$  is the delay uncertainty in acquiring the first available PRACH occasion in the PSCell.  $T_{\text{PSCell\_DU}}$  is up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in Table 8.1-1 of TS 38.213 [3].

$T_{\text{rs}}$  is the SMTC periodicity of the target cell if the UE has been provided with an SMTC configuration for the target cell in PSCell addition message, otherwise  $T_{\text{rs}}$  is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with  $T_{\text{rs}} = 5 \text{ ms}$  assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms.

In FR1 and FR2, the PSCell is known if it has been meeting the following conditions:

During the last 5 seconds before the reception of the PSCell configuration command:

- the UE has sent a valid measurement report for the PSCell being configured and
- One of the SSBs measured from the PSCell being configured remains detectable according to the cell identification conditions specified in clause 9.3.
- One of the SSBs measured from PSCell being configured also remains detectable during the PSCell configuration delay  $T_{\text{config\_PSCell}}$  according to the cell identification conditions specified in clause 9.3.

otherwise it is unknown.

The PCell interruption specified in clause 8.2 is allowed only during the RRC reconfiguration procedure [2].

### 8.9.3 PSCell Release Delay Requirement

The requirements in this clause shall apply for a UE which is configured with PCell and one PSCell.

Upon receiving PSCell release in subframe  $n$ , the UE shall accomplish the release actions specified in TS 38.331 [2] no later than in slot  $n + \frac{T_{\text{RRC\_delay}}}{NR \text{ slot length}}$ .

where

$T_{\text{RRC\_delay}}$  is the RRC procedure delay as specified in TS 38.331 [2].

The PCell interruption specified in clause 8.2 is allowed only during the RRC reconfiguration procedure [2].

## 8.10 Active TCI state switching delay

### 8.10.1 Introduction

The requirements in this clause apply for a UE configured with one or more TCI state configurations on serving cell in MR-DC or standalone NR. UE shall complete the switch of active TCI state within the delay defined in this clause.

### 8.10.2 Known conditions for TCI state

The TCI state is known if the following conditions are met:

- During the period from the last transmission of the RS resource used for the L1-RSRP measurement reporting for the target TCI state to the completion of active TCI state switch, where the RS resource for L1-RSRP measurement is the RS in target TCI state or QCLed to the target TCI state
  - TCI state switch command is received within 1280 ms upon the last transmission of the RS resource for beam reporting or measurement
  - The UE has sent at least 1 L1-RSRP report for the target TCI state before the TCI state switch command
  - The TCI state remain detectable during the TCI state switching period
  - The SSB associated with the TCI state remain detectable during the TCI switching period
    - SNR of the TCI state  $\geq -3\text{dB}$

Otherwise, the TCI state is unknown.

### 8.10.3 MAC-CE based TCI state switch delay

If the target TCI state is known, upon receiving PDSCH carrying MAC-CE for indication of UE-specific PDCCH TCI state as defined in clause 6.1.3.15 of TS 38.321 [7] in slot  $n$ , UE shall be able to receive PDCCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot  $n + T_{\text{HARQ}} + 3N_{\text{slot}}^{\text{subframe},\mu} + T_{\text{Ok}} \cdot (T_{\text{first-SSB}} + T_{\text{SSB-proc}}) / NR \text{ slot length}$ . The UE shall be able to receive PDCCH with the old TCI state until slot  $n + T_{\text{HARQ}} + 3N_{\text{slot}}^{\text{subframe},\mu}$ .

Where  $T_{\text{HARQ}}$  is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3];

$T_{\text{first-SSB}}$  is time to first SSB transmission after MAC CE command is decoded by the UE;

$T_{\text{SSB-proc}} = 2 \text{ ms}$ ;

$T_{\text{Ok}} = 1$  if target TCI state is not in the active TCI state list for PDSCH, 0 otherwise.

If the target TCI state is unknown, upon receiving PDSCH carrying MAC-CE for indication of UE-specific PDCCH TCI state as defined in clause 6.1.3.15 of TS 38.321 [7] in slot  $n$ , UE shall be able to receive PDCCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot  $n + T_{\text{HARQ}} + 3N_{\text{slot}}^{\text{subframe},\mu} + T_{\text{L1-RSRP}} + T_{\text{Ok}} \cdot (T_{\text{first-SSB}} + T_{\text{SSB-proc}}) / NR \text{ slot length}$ . The UE shall be able to receive PDCCH with the old TCI state until slot  $n + T_{\text{HARQ}} + 3N_{\text{slot}}^{\text{subframe},\mu}$ .

Where

$T_{\text{L1-RSRP}} = 0$  in FR1 or when the TCI state switching not involving QCL-TypeD in FR2. Otherwise,

$T_{\text{L1-RSRP}}$  is the time for Rx beam refinement in FR2, defined as

- $T_{\text{L1-RSRP\_Measurement\_Period\_SSB}}$  for SSB as specified in clause 9.5.4.1,
  - with the assumption of  $M=1$
  - with  $T_{\text{Report}} = 0$
- $T_{\text{L1-RSRP\_Measurement\_Period\_CSI-RS}}$  for CSI-RS as specified in clause 9.5.4.2
  - configured with higher layer parameter *repetition* set to ON
  - with the assumption of  $M=1$  for periodic CSI-RS
  - for aperiodic CSI-RS if number of resources in resource set at least equal to *MaxNumberRxBeam*
  - with  $T_{\text{Report}} = 0$
- $T_{\text{Ok}} = 1$  for CSI-RS based L1-RSRP measurement, and 0 for SSB based L1-RSRP measurement when TCI state switching involves QCL-TypeD
- $T_{\text{Ok}} = 1$  when TCI state switching involves other QCL types only

- $T_{\text{first-SSB}}$  is time to first SSB transmission after L1-RSRP measurement when TCI state switching involves QCL-TypeD;
- $T_{\text{first-SSB}}$  is time to first SSB transmission after MAC CE command is decoded by the UE for other QCL types;
  - The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state

#### 8.10.4 DCI based TCI state switch delay

If the target TCI state is known, when a UE is configured with the higher layer parameter *tcj-PresentInDCI* which is set as 'enabled' for the CORESET scheduling PDSCH at slot  $n$ , UE shall be able to receive PDSCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot  $n + \text{timeDurationForQCL}$ , where, *timeDurationForQCL* is the time required by the UE to perform PDCCH reception and applying spatial QCL information received in DCI for PDSCH processing as described in TS 38.214 [26], the value of *timeDurationForQCL* is defined in TS 38.331 [2].

The known condition for TCI state defined in clause 8.10.2 is applied.

#### 8.10.5 RRC based TCI state switch delay

If the target TCI state is known, UE shall be able to receive PDCCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot  $n + (T_{\text{RRC\_processing}} + TO_k * (T_{\text{first-SSB}} + T_{\text{SSB-proc}})) / NR \text{ slot length}$ , The UE is not required to receive PDCCH/PDSCH/CSI-RS or transmit PUCCH/PUSCH until the end of switching period.

Where

- Slot  $n$  is the last slot overlapping with the PDSCH carrying RRC activation command.
- $T_{\text{RRC\_processing}}$  is the RRC processing delay defined in Clause 11.2 of TS 36.331 [16] if the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the RRC processing delay defined in Clause 12 of TS 38.331 [2].
- $T_{\text{first-SSB}}$  is time to first SSB transmission after RRC processing by the UE; The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state.
- $T_{\text{SSB-proc}}$  and  $TO_k$  are defined in clause 8.10.3.

If the target TCI state is unknown, UE shall be able to receive PDCCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot  $n + (T_{\text{RRC\_processing}} + T_{\text{L1-RSRP}} + TO_{\text{uk}} * (T_{\text{first-SSB}} + T_{\text{SSB-proc}})) / NR \text{ slot length}$ , The UE is not required to receive PDCCH/PDSCH/CSI-RS or transmit PUCCH/PUSCH until the end of switching period.

Where

- Slot  $n$  is the last slot overlapping with the PDSCH carrying RRC activation command.
- $T_{\text{RRC\_processing}}$  is the RRC processing delay defined in Clause 11.2 of TS 36.331 [16] if the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the RRC processing delay defined in Clause 12 of TS 38.331 [2].
- $T_{\text{first-SSB}}$  is time to first SSB transmission after L1-RSRP measurement when TCI state switching involves QCL-TypeD;
- $T_{\text{first-SSB}}$  is time to first SSB transmission after RRC processing time at the UE for other QCL types;
  - The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state
- $T_{\text{L1-RSRP}}$ ,  $TO_{\text{uk}}$  and  $T_{\text{SSB-proc}}$  are defined in clause 8.10.3.

The requirements for RRC based TCI state switch delay apply when only 1 TCI state is configured in RRC TCI state list. When  $T_{HARQ} > T_{RRC\_processing}$  a longer switching delay is allowed. Where  $T_{HARQ}$  is the time between DL data transmission and acknowledgement as specified in TS 38.213 [3].

### 8.10.6 Active TCI state list update delay

If the target TCI state is known, upon receiving PDSCH carrying MAC-CE for activation/deactivation of UE-specific PDSCH TCI state as defined in clause 6.1.3.14 of TS 38.321 [7] at slot  $n$ , UE shall be able to receive PDCCH to schedule PDSCH with the new target TCI state at the first slot that is after  $n + T_{HARQ} + 3N_{slot}^{subframe,\mu} + TO_k * (T_{first-SSB} + T_{SSB-proc}) / NR\ slot\ length$ . Where  $T_{HARQ}$ ,  $T_{first-SSB}$ ,  $T_{SSB-proc}$  and  $TO_k$  are defined in clause 8.10.3.

## 8.11 PSCell Change

This clause defines requirements for the delay within which the UE shall be able to change PSCell to other cell in EN-DC or NR-DC. The requirements in this clause are applicable to EN-DC and NR-DC.

The UE shall be capable of transmitting PRACH preamble towards the target PSCell no later than specified in clause 8.9.2 for the case of NR-DC and in TS 36.133 clause 7.31.2 for the case of EN-DC, where the following values for slot  $n$ ,  $T_{processing}$  and  $T_{RRC\_delay}$  shall override the existing ones:

- Slot  $n$  is the last slot overlapping with the PDSCH containing PSCell change,
- $T_{processing} = 20$  ms when source and target cells are in the same FR,
- $T_{processing} = 40$  ms when source and target cells are in different FRs.
- $T_{RRC\_delay}$  is the RRC procedure delay as specified in TS 36.331 [16] if the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the RRC procedure delay as specified in TS 38.331 [2].

If the SMTC periodicity of the target cell is not provided within the PSCell change message, and  $measObjectNRs$  having the same SSB frequency and subcarrier spacing configured by MN and SN have different SMTC,  $T_{rs}$  is the periodicity of one of the SMTC which is up to UE implementation.

The target PSCell is known if it has been meeting the conditions in clause 8.9.2 for the case of NR-DC and in TS36.133 clause 7.31.2 for the case of EN-DC.

The interruption on PCell and other serving cells specified in TS36.133 clause 7.32.2.1 for EN-DC and in TS38.133 clause 8.2.4.2.1 for NR-DC is allowed only during the RRC reconfiguration procedure [2].

## 9 Measurement Procedure

### 9.1 General measurement requirement

#### 9.1.1 Introduction

This clause contains general requirements on the UE regarding measurement reporting in RRC\_CONNECTED state. The requirements are split in intra-frequency, inter-frequency, inter-RAT E-UTRAN FDD, inter-RAT E-UTRAN TDD, and L1-RSRP measurements requirements. These measurements may be used by the NG-RAN. The measurement quantities are defined in TS38.215 [4], the measurement model is defined in TS38.300 [10], TS37.340 [17] and measurement accuracies are specified in clause 10. Control of measurement reporting is specified in TS 38.331 [2].

In the requirements of clause 9, the exceptions for side conditions apply as follows:

- for the UE capable of CA but not configured with any SCell, the applicable exceptions for side conditions are specified in Annex B, clause B.3.2.1 for UE supporting CA in FR1, and clause B.3.2.3 for UE supporting CA in FR2, respectively;

- for the UE capable of CA and configured with at least one SCell, the applicable exceptions for side conditions are specified in Annex B, clause B.3.2.2 for UE configured with CA in FR1, and clause B.3.2.4 for UE supporting CA in FR2, respectively;
- for the UE capable of SUL but not configured with SUL, the applicable exceptions for side conditions are specified in Annex B, clause B.3.4.1 for UE supporting SUL in FR1;
- for the UE capable of SUL and configured with at least one SUL, the applicable exceptions for side conditions are specified in Annex B, clause B.3.4.2 for UE configured with SUL in FR1.

## 9.1.2 Measurement gap

If the UE requires measurement gaps to identify and measure intra-frequency cells and/or inter-frequency cells and/or inter-RAT E-UTRAN cells, and the UE does not support independent measurement gap patterns for different frequency ranges as specified in Table 5.1-1 in [18, 19, 20], in order for the requirements in the following clauses to apply the network must provide a single per-UE measurement gap pattern for concurrent monitoring of all frequency layers.

If the UE requires measurement gaps to identify and measure intra-frequency cells and/or inter-frequency cells and/or inter-RAT E-UTRAN cells, and the UE supports independent measurement gap patterns for different frequency ranges as specified in Table 5.1-1 in [18, 19, 20], in order for the requirements in the following clauses to apply the network must provide either per-FR measurement gap patterns for frequency range where UE requires per-FR measurement gap for concurrent monitoring of all frequency layers of each frequency range independently, or a single per-UE measurement gap pattern for concurrent monitoring of all frequency layers of all frequency ranges.

During the per-UE measurement gaps the UE:

- is not required to conduct reception/transmission from/to the corresponding E-UTRAN PCell, E-UTRAN SCell(s) and NR serving cells for E-UTRA-NR dual connectivity except the reception of signals used for RRM measurement(s) and the signals used for random access procedure according to TS38.321 [7].
- is not required to conduct reception/transmission from/to the corresponding NR serving cells for SA (with single carrier or CA configured) except the reception of signals used for RRM measurement(s) and the signals used for random access procedure according to TS38.321 [7].
- is not required to conduct reception/transmission from/to the corresponding PCell, SCell(s) and E-UTRAN serving cells for NR-E-UTRA dual connectivity except the reception of signals used for RRM measurement(s) and the signals used for random access procedure according to TS38.321 [7].
- is not required to conduct reception/transmission from/to the corresponding NR serving cells for NR-DC except the reception of signals used for RRM measurement(s) and the signals used for random access procedure according to TS38.321 [7].

During the per-FR measurement gaps the UE:

- is not required to conduct reception/transmission from/to the corresponding E-UTRAN PCell, E-UTRAN SCell(s) and NR serving cells in the corresponding frequency range for E-UTRA-NR dual connectivity except the reception of signals used for RRM measurement(s) and the signals used for random access procedure according to [7].
- is not required to conduct reception/transmission from/to the corresponding NR serving cells in the corresponding frequency range for SA (with single carrier or CA configured) except the reception of signals used for RRM measurement(s) and the signals used for random access procedure according to TS38.321 [7].
- is not required to conduct reception/transmission from/to the corresponding PCell, SCell(s) and E-UTRAN serving cells in the corresponding frequency range for NR-E-UTRA dual connectivity except the reception of signals used for RRM measurement(s) and the signals used for random access procedure according to TS38.321 [7].
- is not required to conduct reception/transmission from/to the corresponding NR serving cells in the corresponding frequency range for NR-DC except the reception of signals used for RRM measurement(s) and the signals used for random access procedure according to TS38.321 [7].

UEs shall support the measurement gap patterns listed in Table 9.1.2-1 based on the applicability specified in table 9.1.2-2 and 9.1.2-3. UE determines measurement gap timing based on gap offset configuration and measurement gap timing advance configuration provided by higher layer signalling as specified in TS 38.331 [2] and TS 36.331 [16].

**Table 9.1.2-1: Gap Pattern Configurations**

| Gap Pattern Id | Measurement Gap Length (MGL, ms) | Measurement Gap Repetition Period (MGRP, ms) |
|----------------|----------------------------------|--|
| 0              | 6                                | 40   |
| 1              | 6                                | 80   |
| 2              | 3                                | 40   |
| 3              | 3                                | 80   |
| 4              | 6                                | 20   |
| 5              | 6                                | 160  |
| 6              | 4                                | 20   |
| 7              | 4                                | 40   |
| 8              | 4                                | 80   |
| 9              | 4                                | 160  |
| 10             | 3                                | 20   |
| 11             | 3                                | 160  |
| 12             | 5.5                              | 20   |
| 13             | 5.5                              | 40   |
| 14             | 5.5                              | 80   |
| 15             | 5.5                              | 160  |
| 16             | 3.5                              | 20   |
| 17             | 3.5                              | 40   |
| 18             | 3.5                              | 80   |
| 19             | 3.5                              | 160  |
| 20             | 1.5                              | 20   |
| 21             | 1.5                              | 40   |
| 22             | 1.5                              | 80   |
| 23             | 1.5                              | 160  |

**Table 9.1.2-2: Applicability for Gap Pattern Configurations supported by the E-UTRA-NR dual connectivity UE or NR-E-UTRA dual connectivity UE**

| Measurement gap pattern configuration | Serving cell  | Measurement Purpose                                    | Applicable Gap Pattern Id |
|---------------------------------------|---|--|---------------------------|
| Per-UE measurement gap                | E-UTRA + FR1, or<br>E-UTRA + FR2, or<br>E-UTRA + FR1 +<br>FR2 | non-NR RAT <sup>Note1,2</sup><br>FR1 and/or FR2        | 0,1,2,3<br>0-11           |
|                                       |   | non-NR RAT <sup>Note1,2</sup><br>and FR1 and/or<br>FR2 | 0, 1, 2, 3, 4, 6, 7, 8,10 |
|                                       |   |  |                           |
| Per-FR measurement gap                | E-UTRA and, FR1 if<br>configured                              | non-NR RAT <sup>Note1,2</sup>                          | 0,1,2,3                   |
|                                       | FR2 if configured   |  | No gap                    |
|                                       | E-UTRA and, FR1 if<br>configured                              | FR1 only   | 0-11                      |
|                                       | FR2 if configured   |  | No gap                    |
|                                       | E-UTRA and, FR1 if<br>configured                              | FR2 only   | No gap                    |
|                                       | FR2 if configured   |  | 12-23                     |
|                                       | E-UTRA and, FR1 if<br>configured                              | non-NR RAT <sup>Note1,2</sup><br>and FR1               | 0, 1, 2, 3, 4, 6, 7, 8,10 |
|                                       | FR2 if configured   |  | No gap                    |
|                                       | E-UTRA and, FR1 if<br>configured                              | FR1 and FR2  | 0-11                      |
|                                       | FR2 if configured   |  | 12-23                     |
|                                       | E-UTRA and, FR1 if<br>configured                              | non-NR RAT <sup>Note1,2</sup><br>and FR2               | 0, 1, 2, 3, 4, 6, 7, 8,10 |
|                                       | FR2 if configured   |  | 12-23                     |

|         |  |   |                           |
|---------|--|---|---------------------------|
|         | E-UTRA and, FR1 if configured  | non-NR RAT <sup>Note1,2</sup> and FR1 and FR2 | 0, 1, 2, 3, 4, 6, 7, 8,10 |
|         | FR2 if configured  |   | 12-23                     |
| Note:   | In E-UTRA-NR dual connectivity mode, if GSM or UTRA TDD or UTRA FDD inter-RAT frequency layer is configured to be monitored, only measurement gap pattern #0 and #1 can be used for per-FR gap in E-UTRA and FR1 if configured, or for per-UE gap. |   |                           |
| NOTE 1: | In E-UTRA-NR dual connectivity mode, non-NR RAT includes E-UTRA, UTRA and/or GSM. In NR-E-UTRA dual connectivity mode, non-NR RAT means E-UTRA.  |   |                           |
| NOTE 2: | Void   |   |                           |
| NOTE 3: | When E-UTRA inter-frequency RSTD measurements are configured and the UE requires measurement gaps for performing such measurements, only Gap Pattern #0 can be used.   |   |                           |

In E-UTRA-NR dual connectivity mode,

- if per-UE measurement gap is configured with MG timing advance of  $T_{MG}$  ms, the measurement gap starts at time  $T_{MG}$  ms advanced to the end of the latest E-UTRA subframe occurring immediately before the configured measurement gap among MCG serving cells subframes.
- if per-FR measurement gap for FR1 is configured with MG timing advance of  $T_{MG}$  ms, the measurement gap for FR1 starts at time  $T_{MG}$  ms advanced to the end of the latest E-UTRA subframe occurring immediately before the configured measurement gap among MCG serving cells subframes.
- if per-FR measurement gap for FR2 is configured with MG timing advance of  $T_{MG}$  ms, the measurement gap for FR2 starts at time  $T_{MG}$  ms advanced to the end of the latest NR subframe occurring immediately before the configured measurement gap among SCG serving cells subframes in FR2.

In NR-E-UTRA dual connectivity mode,

- if per-UE measurement gap is configured with MG timing advance of  $T_{MG}$  ms, the measurement gap starts at time  $T_{MG}$  ms advanced to the end of the latest NR subframe occurring immediately before the configured measurement gap among MCG serving cells subframes.
- if per-FR measurement gap for FR1 is configured with MG timing advance of  $T_{MG}$  ms and UE has NR serving cell in FR1, the measurement gap for FR1 starts at time  $T_{MG}$  ms advanced to the end of the latest NR subframe occurring immediately before the configured measurement gap among MCG serving cells subframes in FR1.
- if per-FR measurement gap for FR1 is configured with MG timing advance of  $T_{MG}$  ms and UE doesn't have NR serving cell in FR1, the measurement gap for FR1 starts at time  $T_{MG}$  ms advanced to the end of the latest E-UTRA subframe occurring immediately before the configured measurement gap among SCG serving cells subframes.
- if per-FR measurement gap for FR2 is configured with MG timing advance of  $T_{MG}$  ms, the measurement gap for FR2 starts at time  $T_{MG}$  ms advanced to the end of the latest NR subframe occurring immediately before the configured measurement gap among MCG serving cells subframes in FR2.

In NR-NR dual connectivity mode,

- If per-UE measurement gap is configured with MG timing advance of  $T_{MG}$  ms, the measurement gap starts at time  $T_{MG}$  ms advanced to the end of the latest MCG subframe occurring immediately before the configured measurement gap among MCG serving cells subframes.
- If per-FR measurement gap for FR1 is configured with MG timing advance of  $T_{MG}$  ms, the measurement gap for FR1 starts at time  $T_{MG}$  ms advanced to the end of the latest MCG subframe occurring immediately before the configured measurement gap among MCG serving cells subframes.
- If per-FR measurement gap for FR2 is configured with MG timing advance of  $T_{MG}$  ms, the measurement gap for FR2 starts at time  $T_{MG}$  ms advanced to the end of the latest SCG subframe occurring immediately before the configured measurement gap among SCG serving cells subframes in FR2.

$T_{MG}$  is the MG timing advance value provided in *mgta* according to TS38.331 [2].

In determining the measurement gap starting point, UE shall use the DL timing of the latest E-UTRA or NR subframe occurring immediately before the configured measurement gap among E-UTRA or NR serving cells.

NR-DC in Rel-15 only includes the scenarios where all serving cells in MCG in FR1 and all serving cells in SCG in FR2.

For per-FR measurement gap capable UE configured with E-UTRA-NR dual connectivity or NR-E-UTRA dual connectivity, when serving cells are in E-UTRA and FR1, measurement objects are in both E-UTRA/FR1 and FR2,

- If MN indicates UE that the measurement gap from MN applies to E-UTRA/FR1/FR2 serving cells, UE fulfils the per-UE measurement requirements for both E-UTRA/FR1 and FR2 measurement objects based on the measurement gap pattern configured by MN;
- If MN indicates UE that the measurement gap from MN applies to only LTE/FR1 serving cell(s),
  - UE fulfils the measurement requirements for FR1/LTE measurement objects based on the configured measurement gap pattern;
  - UE fulfils the requirements for FR2 measurement objects based on effective MGRP=20ms;

For per-FR measurement gap capable configured with E-UTRA-NR dual connectivity, NR-E-UTRA dual connectivity or NR-NR dual connectivity, when serving cells are in E-UTRA, FR1 and FR2, or in E-UTRA and FR2, or in FR1 and FR2, measurement objects are in both E-UTRA /FR1 and FR2,

- If MN indicates UE that the measurement gap from MN applies to E-UTRA/FR1/FR2 serving cells, UE fulfils the per-UE measurement requirements for both E-UTRA/FR1 and FR2 measurement objects based on the measurement gap pattern configured by MN.

**Table 9.1.2-3: Applicability for Gap Pattern Configurations supported by the UE with NR standalone operation (with single carrier, NR CA and NR-DC configuration)**

| Measurement gap pattern configuration | Serving cell                           | Measurement Purpose <sup>NOTE 2</sup>       | Applicable Gap Pattern Id    |         |
|---------------------------------------|--|---|------------------------------|---------|
| Per-UE measurement gap                | FR1 <sup>NOTE5</sup> , or<br>FR1 + FR2 | E-UTRA only <sup>NOTE3</sup>                | 0,1,2,3                      |         |
|                                       |  | FR1 and/or FR2                              | 0-11                         |         |
|                                       |  | E-UTRAN and FR1 and/or FR2 <sup>NOTE3</sup> | 0, 1, 2, 3, 4, 6, 7, 8,10    |         |
|                                       | FR2 <sup>NOTE5</sup>                   | E-UTRA only <sup>NOTE3</sup>                | 0,1,2,3                      |         |
|                                       |  | FR1 only                                    | 0-11                         |         |
|                                       |  | FR1 and FR2                                 | 0-11                         |         |
|                                       |  | E-UTRAN and FR1 and/or FR2 <sup>NOTE3</sup> | 0, 1, 2, 3, 4, 6, 7, 8,10    |         |
|                                       |  | FR2 only                                    | 12-23                        |         |
|                                       | Per-FR measurement gap                 | FR1 if configured                           | E-UTRA only <sup>NOTE3</sup> | 0,1,2,3 |
|                                       |  | FR2 if configured                           |                              | No gap  |
| FR1 if configured                     |  | FR1 only                                    | 0-11                         |         |
| FR2 if configured                     |  |   | No gap                       |         |
| FR1 if configured                     |  | FR2 only                                    | No gap                       |         |
| FR2 if configured                     |  |   | 12-23                        |         |
| FR1 if configured                     |  | E-UTRA and FR1 <sup>NOTE3</sup>             | 0, 1, 2, 3, 4, 6, 7, 8,10    |         |
| FR2 if configured                     |  |   | No gap                       |         |
| FR1 if configured                     |  | FR1 and FR2                                 | 0-11                         |         |
| FR2 if configured                     |  |   | 12-23                        |         |
| FR1 if configured                     |  | E-UTRA and FR2 <sup>NOTE3</sup>             | 0, 1, 2, 3, 4, 6, 7, 8,10    |         |
| FR2 if configured                     |  |   | 12-23                        |         |
| FR1 if configured                     |  | E-UTRA and FR1 and FR2 <sup>NOTE3</sup>     | 0, 1, 2, 3, 4, 6, 7, 8,10    |         |
| FR2 if configured                     |  |   | 12-23                        |         |

NOTE 1: When E-UTRA inter-RAT RSTD measurements are configured and the UE requires measurement gaps for performing such measurements, only Gap Pattern #0 can be used.

NOTE 2: Measurement purpose which includes E-UTRA measurements includes also inter-RAT E-UTRA RSRP and RSRQ measurements for E-CID

NOTE 3: Void

NOTE4: If per-UE measurement gap is configured with MG timing advance of  $T_{MG}$  ms, the measurement gap starts at time  $T_{MG}$  ms advanced to the end of the latest subframe occurring immediately before the configured measurement gap among all serving cells subframes. If per-FR measurement gap for FR1 is configured with MG timing advance of  $T_{MG}$  ms, the measurement gap for FR1 starts at time  $T_{MG}$  ms advanced to the end of the latest subframe occurring immediately before the configured measurement gap among serving cells subframes in FR1. If per-FR measurement gap for FR2 is configured with MG timing advance of  $T_{MG}$  ms, the measurement gap for FR2 starts at time  $T_{MG}$  ms advanced to the end of the latest subframe occurring immediately before the configured measurement gap among serving cells subframes in FR2.  $T_{MG}$  is the MG timing advance value provided in *mgta* according to [2]. In determining the measurement gap starting point, UE shall use the DL timing of the latest subframe occurring immediately before the configured measurement gap among serving cells.

NOTE 5: NR-DC in Rel-15 only includes the scenarios where all serving cells in MCG in FR1 and all serving cells in SCG in FR2.

For per-FR measurement gap capable UE in NR standalone operation (with single carrier, NR CA and NR-DC configuration), for per-FR gap based measurement, when there is no serving cell in a particular FR, where measurement objects are configured, regardless if explicit per-FR measurement gap is configured in this FR, the effective MGRP in this FR is used to determine requirements;

- 20 ms for FR2 NR measurements
- 40 ms for FR1 NR measurements
- 40 ms for LTE measurements
- 40 ms for FR1+LTE measurements

For per-FR measurement gap capable UE in NR standalone operation (with single carrier, NR CA and NR-DC configuration), when serving cells are in FR1 or FR2, measurement objects are in both E-UTRA /FR1 and FR2,

- If MN indicates UE that the measurement gap from MN applies to E-UTRA/FR1/FR2 serving cells, UE fulfils the per-UE measurement requirements for both E-UTRA/FR1 and FR2 measurement objects based on the measurement gap pattern configured by MN;

If measurement gap is configured in one FR but measurement object is not configured in the FR, the scheduling opportunity in the FR depends on the configured measurement gap pattern.

For E-UTRA-NR dual connectivity, if UE is not capable of per-FR-gap, total interruption time on SCG during MGL is defined only when  $MGL(N) = 6ms, 4ms$  and  $3ms$ . And if UE is capable of per-FR-gap, total interruption time on FR1 serving cells in SCG during MGL is defined only when  $MGL(N) = 6ms, 4ms$  and  $3ms$ , and total interruption time on FR2 serving cells in SCG during MGL is defined only when  $MGL(N) = 5.5ms, 3.5ms$  and  $1.5ms$ .

For NR standalone operation (with single carrier, NR CA and NR-DC configuration), if UE is not capable of per-FR-gap, total interruption time on a serving cell during MGL is defined when  $MGL(N) = 6ms, 5.5ms, 4ms, 3.5ms, 3ms$ , and  $1.5ms$ . And if UE is capable of per-FR-gap, total interruption time on FR1 serving cells during MGL is defined only when  $MGL(N) = 6ms, 4ms$  and  $3ms$ , and total interruption time on FR2 serving cells during MGL is defined only when  $MGL(N) = 5.5ms, 3.5ms$  and  $1.5ms$ .

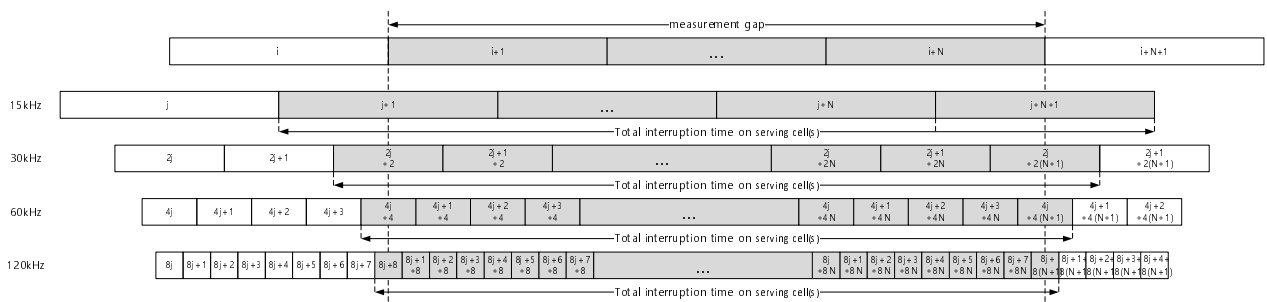

For NR-E-UTRA dual connectivity, if UE is not capable of per-FR-gap, total interruption time on MCG during MGL is defined only when  $MGL(N) = 6ms, 4ms$  and  $3ms$ . And if UE is capable of per-FR-gap, total interruption time on FR1 serving cells in MCG during MGL is defined only when  $MGL(N) = 6ms, 4ms$  and  $3ms$ , and total interruption time on FR2 serving cells in MCG during MGL is defined only when  $MGL(N) = 5.5ms, 3.5ms$  and  $1.5ms$ .

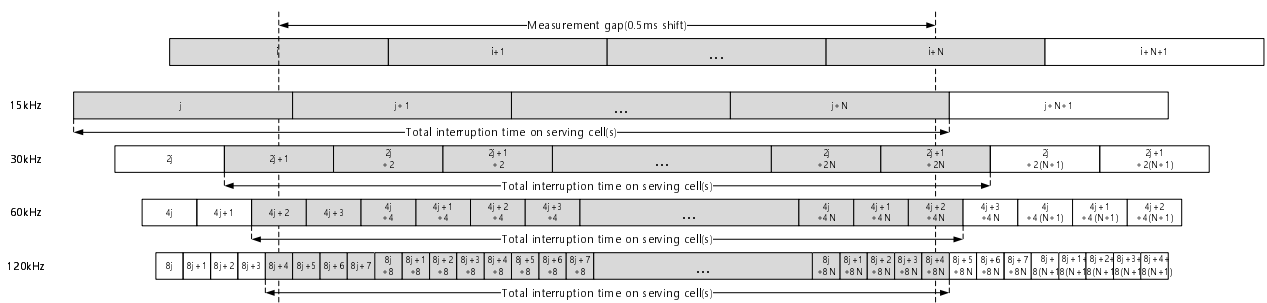

(a) Measurement gap with MGL = N(ms) with MG timing advance of 0ms for synchronous EN-DC, NR standalone operation (with single carrier, NR CA and NR-DC configuration) and synchronous NE-DC

(b) Measurement gap with MGL = N(ms) with MG timing advance of 0.5ms for synchronous EN-DC, NR standalone operation (with single carrier, NR CA and NR-DC configuration) and synchronous NE-DC

(c) Measurement gap with MGL = N(ms) with MG timing advance of 0ms for asynchronous EN-DC and asynchronous NE-DC

(d) Measurement gap with MGL = N(ms) with MG timing advance of 0.5ms for asynchronous EN-DC and asynchronous NE-DC

**Figure 9.1.2-1: Measurement GAP and total interruption time on serving cells for EN-DC, NR standalone operation (with single carrier, NR CA and NR-DC configuration) and NE-DC**

The corresponding total number of interrupted slots on serving cells is listed in Table 9.1.2-4 for synchronous EN-DC, NR standalone and NE-DC, and in Table 9.1.2-4a for asynchronous EN-DC respectively.

**Table 9.1.2-4: Total number of interrupted slots on serving cells during MGL for Synchronous EN-DC, NR standalone operation (with single carrier, NR CA and NR-DC configuration) and NE-DC with per-UE measurement gap or per-FR measurement gap for FR1**

| NR SCS (kHz)  | Total number of interrupted slots on serving cells |         |         |  |                    |                    |
|---|--|---------|---------|--|--------------------|--------------------|
|   | When MG timing advance of 0ms is applied           |         |         | When MG timing advance of 0.5ms is applied |                    |                    |
|   | MGL=6ms  | MGL=4ms | MGL=3ms | MGL=6ms                                    | MGL=4ms            | MGL=3ms            |
| 15  | 6  | 4       | 3       | 7 <sup>Note3</sup>                         | 5 <sup>Note3</sup> | 4 <sup>Note3</sup> |
| 30  | 12   | 8       | 6       | 12   | 8                  | 6                  |
| 60  | 24   | 16      | 12      | 24   | 16                 | 12                 |
| 120   | 48   | 32      | 24      | 48   | 32                 | 24                 |
| NOTE 1: Void  |  |         |         |  |                    |                    |
| NOTE 2: NR SCS of 120 kHz is only applicable to the case with per-UE measurement gap.   |  |         |         |  |                    |                    |
| NOTE 3: Non-overlapped half-slots occur before and after the measurement gap. Whether a Rel-15 UE can receive and/or transmit in those half-slots is up to UE implementation. |  |         |         |  |                    |                    |

**Table 9.1.2-4a: Total number of interrupted slots on serving cells during MGL for Asynchronous EN-DC with per-UE measurement gap or per-FR measurement gap for FR1**

| NR SCS (kHz)  | Total number of interrupted slots on serving cells |         |         |  |         |         |
|---|--|---------|---------|--|---------|---------|
|   | When MG timing advance of 0ms is applied           |         |         | When MG timing advance of 0.5ms is applied |         |         |
|   | MGL=6ms  | MGL=4ms | MGL=3ms | MGL=6ms                                    | MGL=4ms | MGL=3ms |
| 15  | 7  | 5       | 4       | 7  | 5       | 4       |
| 30  | 13   | 9       | 7       | 13   | 9       | 7       |
| 60  | 25   | 17      | 13      | 25   | 17      | 13      |
| 120   | 49   | 33      | 25      | 49   | 33      | 25      |
| NOTE 1: Void  |  |         |         |  |         |         |
| NOTE 2: NR SCS of 120 kHz is only applicable to the case with per-UE measurement gap. |  |         |         |  |         |         |

In case that UE capable of per-FR measurement gap is configured with per-FR measurement gap for FR2 serving cells, total number of interrupted slots on FR2 serving cells during MGL is listed in Table 9.1.2-4b.

**Table 9.1.2-4b: Total number of interrupted slots on FR2 serving cells during MGL for EN-DC, NR standalone operation (with single carrier, NR CA and NR-DC configuration) and NE-DC with per-UE measurement gap or per-FR measurement gap for FR2**

| NR SCS (kHz)  | Total number of interrupted slots on FR2 serving cells |           |           |   |           |           |
|---|--|-----------|-----------|---|-----------|-----------|
|   | When MG timing advance of 0ms is applied               |           |           | When MG timing advance of 0.25ms is applied |           |           |
|   | MGL=5.5ms  | MGL=3.5ms | MGL=1.5ms | MGL=5.5ms                                   | MGL=3.5ms | MGL=1.5ms |
| 60  | 22   | 14        | 6         | 22  | 14        | 6         |
| 120   | 44   | 28        | 12        | 44  | 28        | 12        |
| NOTE 1: The total number of interrupted slots is based on that SFN and subframe reference for per-FR gap in FR2 indicated by high layer parameter <i>refServCellIndicator</i> is an FR2 serving cell.                             |  |           |           |   |           |           |
| NOTE 2: Slot occurs before or after the measurement gap may be interrupted additionally if SFN and subframe reference for per-FR gap in FR2 indicated by high layer parameter <i>refServCellIndicator</i> is an FR1 serving cell. |  |           |           |   |           |           |

It is up to UE implementation whether or not the UE is able to conduct transmission in the following slot(s),

- when MGTA is not applied, in the L consecutive UL slots with respect to the SCS of the UL carrier with the same slot indices as the DL slots occurring immediately after measurement gap
- when MGTA is applied and the SCS of the UL carrier is other than 15kHz, in the L consecutive UL slots with respect to the SCS of the UL carrier with the same slot indices as the DL slots occurring immediately after measurement gap

- when MGTA is applied and the SCS of the UL carrier is 15kHz, in the L consecutive UL slots with respect to the SCS of the UL carrier with the same slot indices as the DL slots occurring immediately after the slot partially overlapped with measurement gap

where UL slot denotes that all the symbols in the slot are uplink symbols, and  $L=1$  if  $(N_{TA} + N_{TA\text{offset}}) \times T_c$  for the UL transmission is less than the length of one slot;  $L=2$  otherwise.

Note: Network is supposed to take into account the possible difference between the estimated TA at network and actual TA at UE when scheduling UE in the above slot(s).

**Table 9.1.2-5: (Void)**

### 9.1.2.1 EN-DC: Measurement Gap Sharing

For E-UTRA-NR dual connectivity UE configured with per-UE measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on intra-frequency carriers or when SMTC configured for intra-frequency measurement are fully overlapping with per-UE measurement gaps, and when UE is configured to identify and measure cells on inter-frequency carriers, E-UTRA gap-needed inter-frequency carriers and inter-RAT UTRAN carriers and/or inter-RAT GSM carriers.

For E-UTRA-NR dual connectivity UE configured with per-FR1 measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on FR1 intra-frequency carriers or when SMTC configured for FR1 intra-frequency measurement are fully overlapping with per-FR1 measurement gaps, and when UE is configured to identify and measure cells on FR1 inter-frequency carriers, E-UTRA gap-needed inter-frequency carriers, inter-RAT UTRAN carriers and/or inter-RAT GSM carriers.

For E-UTRA-NR dual connectivity UE configured with per-FR2 measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on FR2 intra-frequency carriers or when SMTC configured for FR2 intra-frequency measurement are fully overlapping with per-FR2 measurement gaps, and when UE is configured to identify and measure cells on FR2 inter-frequency carriers.

When network signals “01”, “10” or “11” with RRC parameter *MeasGapSharingScheme* [2][16] and the value of X is defined as in Table 9.1.2.1-1, and

- $K_{\text{intra}} = 1 / X * 100$ ,
- $K_{\text{inter}} = 1 / (100 - X) * 100$ ,

When network signals “00” indicating equal splitting gap sharing, X is not applied.

The RRC parameter *MeasGapSharingScheme* shall be applied to the calculation of carrier specific scaling factor as specified in clause 9.1.5.2.1.

**Table 9.1.2.1-1: Value of parameter X for EN-DC measurement gap sharing**

| <b>measGapSharingScheme</b> | <b>Value of X (%)</b>   |
|-----------------------------|---|
| ‘00’                        | Equal splitting   |
| ‘01’                        | 25  |
| ‘10’                        | 50  |
| ‘11’                        | 75  |
| Note:                       | It is left to UE implementation to determine which measurement gap sharing scheme in the table <i>to be applied</i> , when <i>MeasGapSharingScheme</i> is absent and there is no stored value in the field. |

#### 9.1.2.1a SA: Measurement Gap Sharing

For NR standalone UE without NR-DC operation and configured with per-UE measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on intra-frequency carriers

or when SMTC configured for intra-frequency measurement are fully overlapping with per-UE measurement gaps, and when UE is configured to identify and measure cells on inter-frequency carriers, and/or inter-RAT E-UTRAN carriers.

For NR standalone UE without NR-DC operation and configured with per-FR1 measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on FR1 intra-frequency carriers or when SMTC configured for FR1 intra-frequency measurement are fully overlapping with per-FR1 measurement gaps, and when UE is configured to identify and measure cells on FR1 inter-frequency carriers and/or inter-RAT E-UTRAN carriers.

For NR standalone UE without NR-DC operation and configured with per-FR2 measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on FR2 intra-frequency carriers or when SMTC configured for FR2 intra-frequency measurement are fully overlapping with per-FR2 measurement gaps, and when UE is configured to identify and measure cells on FR2 inter-frequency carriers.

When network signals “01”, “10” or “11” with RRC parameter *MeasGapSharingScheme* [2] and the value of X is defined as in Table 9.1.2.1a-1, and

- $K_{\text{intra}} = 1 / X * 100$ ,
- $K_{\text{inter}} = 1 / (100 - X) * 100$ ,

When network signals “00” indicating equal splitting gap sharing, X is not applied.

The RRC parameter *MeasGapSharingScheme* shall be applied to the calculation of carrier specific scaling factor as specified in clause 9.1.5.2.2.

**Table 9.1.2.1a-1: Value of parameter X for NR standalone measurement gap sharing**

| <b>measGapSharingScheme</b> | <b>Value of X (%)</b>   |
|-----------------------------|---|
| '00'                        | Equal splitting   |
| '01'                        | 25  |
| '10'                        | 50  |
| '11'                        | 75  |
| Note:                       | It is left to UE implementation to determine which measurement gap sharing scheme in the table <i>to be applied</i> , when <i>MeasGapSharingScheme</i> is absent and there is no stored value in the field. |

### 9.1.2.1b NE-DC: Measurement Gap Sharing

For NR-E-UTRA dual connectivity UE configured with per-UE measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on intra-frequency carriers or when SMTC configured for intra-frequency measurement are fully overlapping with per-UE measurement gaps, and when UE is configured to identify and measure cells on inter-frequency carriers, E-UTRA gap-needed inter-frequency carriers, and/or inter-RAT E-UTRA carriers.

For NR-E-UTRA dual connectivity UE configured with per-FR1 measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on FR1 intra-frequency carriers or when SMTC configured for FR1 intra-frequency measurement are fully overlapping with per-FR1 measurement gaps, and when UE is configured to identify and measure cells on inter-frequency carriers, E-UTRA gap-needed inter-frequency carriers, and/or inter-RAT E-UTRA carriers.

For NR-E-UTRA dual connectivity UE configured with per-FR2 measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on FR2 intra-frequency carriers or when SMTC configured for FR2 intra-frequency measurement are fully overlapping with per-FR2 measurement gaps, and when UE is configured to identify and measure cells on FR2 inter-frequency carriers.

When network signals “01”, “10” or “11” with RRC parameter *measGapSharingConfig* [2][16] and the value of X is defined as in Table 9.1.2.1b-1, and

- $K_{\text{intra}} = 1 / X * 100$ ,
- $K_{\text{inter}} = 1 / (100 - X) * 100$ ,

When network signals “00” indicating equal splitting gap sharing, X is not applied.

The RRC parameter *MeasGapSharingScheme* shall be applied to the calculation of carrier specific scaling factor as specified in clause 9.1.5.2.3.

**Table 9.1.2.1b-1: Value of parameter X for NE-DC measurement gap sharing**

| <i>measGapSharingScheme</i> | Value of X (%)  |
|-----------------------------|---|
| '00'                        | Equal splitting   |
| '01'                        | 25  |
| '10'                        | 50  |
| '11'                        | 75  |
| Note:                       | It is left to UE implementation to determine which measurement gap sharing scheme in the table <i>to be applied</i> , when <i>MeasGapSharingScheme</i> is absent and there is no stored value in the field. |

### 9.1.2.1c NR-DC: Measurement Gap Sharing

For UE with NR-DC operation and configured with per-UE measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on intra-frequency carriers or when SMTC configured for intra-frequency measurement are fully overlapping with per-UE measurement gaps, and when UE is configured to identify and measure cells on inter-frequency carriers, and/or inter-RAT E-UTRAN carriers.

For UE with NR-DC operation and configured with per-FR1 measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on FR1 intra-frequency carriers or when SMTC configured for FR1 intra-frequency measurement are fully overlapping with per-FR1 measurement gaps, and when UE is configured to identify and measure cells on FR1 inter-frequency carriers and/or inter-RAT E-UTRAN carriers.

For UE with NR-DC operation and configured with per-FR2 measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on FR2 intra-frequency carriers or when SMTC configured for FR2 intra-frequency measurement are fully overlapping with per-FR2 measurement gaps, and when UE is configured to identify and measure cells on FR2 inter-frequency carriers.

When network signals “01”, “10” or “11” with RRC parameter *measGapSharingConfig* [2] and the value of X is defined as in Table 9.1.2.1c-1, and

- $K_{\text{intra}} = 1 / X * 100$ ,
- $K_{\text{inter}} = 1 / (100 - X) * 100$ ,

When network signals “00” indicating equal splitting gap sharing, X is not applied.

The RRC parameter *MeasGapSharingScheme* shall be applied to the calculation of carrier specific scaling factor as specified in clause 9.1.5.2.4.

**Table 9.1.2.1c-1: Value of parameter X for NR-DC measurement gap sharing**

| <i>measGapSharingConfig</i> | Value of X (%)  |
|-----------------------------|---|
| '00'                        | Equal splitting   |
| '01'                        | 25  |
| '10'                        | 50  |
| '11'                        | 75  |
| Note:                       | It is left to UE implementation to determine which measurement gap sharing scheme in the table <i>to be applied</i> , when <i>MeasGapSharingScheme</i> is absent and there is no stored value in the field. |

## 9.1.3 UE Measurement capability

### 9.1.3.1 EN-DC: Monitoring of multiple layers using gaps

The requirements in this clause are applicable for UE capable of and configured with the EN-DC operation mode.

When monitoring of multiple inter-frequency E-UTRAN, inter-RAT NR, GSM, UTRA FDD and UTRA TDD carriers as configured by E-UTRA PCell, and inter-frequency NR carriers as configured by PSCell using gaps (or without using gaps provided the UE supports such capability or the effective MGRP is applied for per-FR measurement gap capable UE) is configured, the UE shall be capable of performing one measurement of the configured measurement type (SS-RSRP, SS-RSRQ, SS-SINR, SFTD, E-UTRAN RSRP, E-UTRAN RSRQ, E-UTRAN RS-SINR measurements, UTRAN TDD P-CCPCH RSCP, UTRAN FDD CPICH measurements, GSM carrier RSSI, etc.) of detected cells on all the layers.

For UE configured with the EN-DC operation, the effective total number of frequencies excluding the frequencies of the PSCell, SCells, E-UTRA PCell, and E-UTRA SCells being monitored is  $N_{\text{freq, EN-DC}}$ , which is defined as:

$$N_{\text{freq, EN-DC}} = N_{\text{freq, EN-DC, NR}} + N_{\text{freq, EN-DC, E-UTRA}} + N_{\text{freq, EN-DC, UTRA}} + M_{\text{EN-DC, GSM}},$$

where

$N_{\text{freq, EN-DC, E-UTRA}}$  is the number of E-UTRA inter-frequency carriers being monitored (FDD and TDD) as configured by E-UTRA PCell or via LPP [22],

$$N_{\text{freq, EN-DC, NR}} \leq N_{\text{freq, EN-DC, NR, inter-RAT}} + N_{\text{freq, EN-DC, NR, inter-freq}}$$

where

$N_{\text{freq, EN-DC, NR, inter-RAT}}$  is the number of NR inter-RAT carriers excluding NR serving carrier(s) being monitored as configured by E-UTRA PCell [15],

$N_{\text{freq, EN-DC, NR, inter-freq}}$  is the number of NR inter-frequency carriers being monitored as configured by PSCell,

$N_{\text{freq, EN-DC, UTRA}}$  is the number of UTRA inter-RAT carriers being monitored as configured by E-UTRA PCell (FDD and TDD).

$M_{\text{EN-DC, GSM}}$  is an integer which is a function of the number of GSM inter-RAT carriers as configured by E-UTRA PCell on which measurements are being performed.  $M_{\text{EN-DC, GSM}}$  is equal to 0 if no GSM carrier is being monitored. For a MGRP of 40 ms,  $M_{\text{EN-DC, GSM}}$  is equal to 1 if cells on up to 32 GSM carriers are being measured. For a MGRP of 80 ms,  $M_{\text{EN-DC, GSM}}$  is equal to  $\text{ceil}(N_{\text{carriers, GSM}}/20)$  where  $N_{\text{carriers, GSM}}$  is the number of GSM carriers on which cells are being measured.

#### 9.1.3.1a SA: Monitoring of multiple layers using gaps

The requirements in this clause are applicable for UE configured with SA NR operation mode.

When monitoring of multiple inter-RAT E-UTRAN carriers and inter-frequency NR carriers using gaps (or without using gaps provided the UE supports such capability or the effective MGRP is applied for per-FR measurement gap capable UE) is configured by PCell, the UE shall be capable of performing one measurement of the configured measurement type (SS-RSRP, SS-RSRQ, SS-SINR, E-UTRAN RSRP, E-UTRAN RSRQ, E-UTRAN RS-SINR measurements, etc.) of detected cells on all the layers.

For UE configured with the NR SA operation, the effective total number of frequencies, excluding the frequencies of the PCell, PSCell and SCells being monitored, is  $N_{\text{freq, SA}}$ , which is defined as:

$$N_{\text{freq, SA}} = N_{\text{freq, SA, NR}} + N_{\text{freq, SA, E-UTRA}},$$

where

$N_{\text{freq, SA, E-UTRA}}$  is the number of E-UTRA inter-RAT carriers being monitored (FDD and TDD) as configured by PCell or via LPP [22],

$N_{\text{freq, SA, NR}}$  is the number of NR inter-frequency carriers being monitored as configured by PCell.

### 9.1.3.1b NE-DC: Monitoring of multiple layers using gaps

The requirements in this clause are applicable for UE capable of and configured with the NE-DC operation mode.

When monitoring of multiple inter-frequency E-UTRAN carriers as configured by E-UTRA PSCell, inter-RAT E-UTRAN carriers as configured by PCell, and inter-frequency NR carriers as configured by PCell using gaps (or without using gaps provided the UE supports such capability or the effective MGRP is applied for per-FR measurement gap capable UE) is configured, the UE shall be capable of performing one measurement of the configured measurement type (SS-RSRP, SS-RSRQ, SS-SINR, SFTD, E-UTRAN RSRP, E-UTRAN RSRQ, and E-UTRAN RS-SINR measurements, etc.) of detected cells on all the layers.

For UE configured with the NE-DC operation, the effective total number of frequencies excluding the frequencies of the PCell, SCells, E-UTRA PSCell, and E-UTRA SCells being monitored is  $N_{\text{freq, NE-DC}}$ , which is defined as:

$$N_{\text{freq, NE-DC}} = N_{\text{freq, NE-DC, NR}} + N_{\text{freq, NE-DC, E-UTRA}},$$

where

$N_{\text{freq, NE-DC, NR}}$  is the number of NR inter-frequency carriers being monitored as configured by PCell,

$$N_{\text{freq, NE-DC, E-UTRA}} \leq N_{\text{freq, NE-DC, E-UTRA, inter-RAT}} + N_{\text{freq, NE-DC, E-UTRA, inter-freq}}$$

where

$N_{\text{freq, NE-DC, E-UTRA, inter-RAT}}$  is the number of E-UTRA inter-RAT carriers (FDD and TDD) excluding E-UTRA serving carrier(s) being monitored as configured by PCell or via LPP [22],

$N_{\text{freq, NE-DC, E-UTRA, inter-freq}}$  is the number of E-UTRA inter-frequency carriers (FDD and TDD) being monitored as configured by E-UTRA PSCell [15] or via LPP [22].

### 9.1.3.1c NR-DC: Monitoring of multiple layers using gaps

The requirements in this clause are applicable for UE configured with NR-DC operation mode.

When monitoring of multiple inter-RAT E-UTRAN carriers and inter-frequency NR carriers using gaps (or without using gaps provided the UE supports such capability) as configured by PCell, and inter-frequency NR carriers as configured by PSCell is configured, the UE shall be capable of performing one measurement of the configured measurement type (SS-RSRP, SS-RSRQ, SS-SINR, E-UTRAN RSRP, E-UTRAN RSRQ, E-UTRAN RS-SINR measurements, etc.) of detected cells on all the layers.

For UE configured with the NR-DC operation, the effective total number of frequencies, excluding the frequencies of the PCell, PSCell and SCells being monitored, is  $N_{\text{freq, NR-DC}}$ , which is defined as:

$$N_{\text{freq, NR-DC}} = N_{\text{freq, NR-DC, NR}} + N_{\text{freq, NR-DC, E-UTRA}},$$

where

$N_{\text{freq, NR-DC, E-UTRA}}$  is the number of E-UTRA inter-RAT carriers being monitored (FDD and TDD) as configured by PCell or via LPP [22].

$N_{\text{freq, NR-DC, NR}}$  is the number of NR inter-frequency carriers being monitored as configured by PCell and PSCell.

### 9.1.3.2 EN-DC: Maximum allowed layers for multiple monitoring

If a UE is configured with EN-DC operation, the UE shall be capable of monitoring at least:

- Depending on UE capability, 7 NR inter-frequency carriers configured by PSCell, and
- Depending on UE capability, 7 NR inter-RAT carriers excluding NR serving carrier(s) configured by E-UTRA PCell [15], and
- Depending on UE capability, 6 E-UTRA TDD inter-frequency carriers configured by E-UTRA PCell [15], and
- Depending on UE capability, 6 E-UTRA FDD inter-frequency carriers configured by E-UTRA PCell [15], and

- Depending on UE capability, 3 FDD UTRA carriers, and
- Depending on UE capability, 3 TDD UTRA carriers, and
- Depending on UE capability, 32 GSM carriers (one GSM layer corresponds to 32 carriers), and
- Depending on UE capability, 1 E-UTRA FDD inter-frequency carrier for RSTD measurements configured via LPP [22], and
- Depending on UE capability, 1 E-UTRA TDD inter-frequency carrier for RSTD measurements configured via LPP [22].

In addition to the requirements defined above, the UE shall be capable of monitoring a total of at least 13 effective carrier frequency layers comprising of any above defined combination of NR, E-UTRA FDD, E-UTRA TDD, UTRA FDD, UTRA TDD and GSM (one GSM layer corresponds to 32 carriers) layers. The UE shall be capable of monitoring a total of at least 7 effective NR carrier frequency layers excluding NR serving carrier(s), comprising of any above defined combination of NR inter-RAT carriers excluding NR serving carrier(s) configured by E-UTRA PCell and NR inter-frequency carriers configured by PSCell.

When the E-UTRA PCell and PSCell configures the same NR carrier frequency layer to be monitored by the UE in synchronous intra-band EN-DC, this layer shall be counted only once to the total number of effective carrier frequency layers provided that the SFN-s and slot boundaries are aligned, unless the configured NR carrier frequency layers to be monitored have

- different RSSI measurement resources or
- different *deriveSSB-IndexFromCell* indications or
- different SMTTC configurations.

Note 1: The E-UTRA-NR dual connectivity capable UE configured with PSCell shall fulfil the requirements defined in only one of clause 9.1.3.2 and clause 8.1.2.1.1b.1 of TS 36.133 [15].

### 9.1.3.2a SA: Maximum allowed layers for multiple monitoring

If a UE is configured with SA NR operation mode, the UE shall be capable of monitoring at least:

- Depending on UE capability, 7 NR inter-frequency carriers configured by PCell, and
- Depending on UE capability, 7 E-UTRA TDD inter-RAT carriers configured by PCell, and
- Depending on UE capability, 7 E-UTRA FDD inter-RAT carriers configured by PCell, and
- Depending on UE capability, 1 E-UTRA FDD inter-RAT carrier for RSTD measurements configured via LPP [22], and
- Depending on UE capability, 1 E-UTRA TDD inter-RAT carrier for RSTD measurements configured via LPP [22].

In addition to the requirements defined above, the UE shall be capable of monitoring a total of at least 13 effective carrier frequency layers comprising of any above defined combination of NR, E-UTRA FDD and E-UTRA TDD layers.

### 9.1.3.2b NE-DC: Maximum allowed layers for multiple monitoring

If a UE is configured with NE-DC operation mode, the UE shall be capable of monitoring at least:

- Depending on UE capability, 7 NR inter-frequency carriers configured by PCell, and
- Depending on UE capability, 6 E-UTRA TDD inter-RAT carriers excluding E-UTRA serving carriers configured by PCell, and
- Depending on UE capability, 6 E-UTRA FDD inter-RAT carriers excluding E-UTRA serving carriers configured by PCell, and
- Depending on UE capability, 6 E-UTRA TDD inter-frequency carriers configured by E-UTRA PSCell [15], and

- Depending on UE capability, 6 E-UTRA FDD inter-frequency carriers configured by E-UTRA PSCell [15], and
- Depending on UE capability, 1 E-UTRA FDD inter-frequency carrier for RSTD measurements configured via LPP [22], and
- Depending on UE capability, 1 E-UTRA TDD inter-frequency carrier for RSTD measurements configured via LPP [22].

In addition to the requirements defined above, the UE shall be capable of monitoring a total of at least 13 effective carrier frequency layers comprising of any above defined combination of NR, E-UTRA FDD, and E-UTRA TDD layers. The UE shall be capable of monitoring a total of at least 6 effective E-UTRA carrier frequency layers, excluding E-UTRA serving carrier(s), comprising of any above defined combination of E-UTRA inter-RAT carriers excluding E-UTRA serving carrier(s) configured by PCell and E-UTRA inter-frequency carriers configured by E-UTRA PSCell.

### 9.1.3.2c NR-DC: Maximum allowed layers for multiple monitoring

If a UE is configured with NR-DC operation, the UE shall be capable of monitoring at least:

- Depending on UE capability, 7 NR inter-frequency carriers configured by PCell, and
- Depending on UE capability, 7 NR inter-frequency carriers configured by PSCell, and
- Depending on UE capability, 7 E-UTRA TDD inter-RAT carriers configured by PCell, and
- Depending on UE capability, 7 E-UTRA FDD inter-RAT carriers configured by PCell, and
- Depending on UE capability, 1 E-UTRA FDD inter-RAT carrier for RSTD measurements configured via LPP [22], and
- Depending on UE capability, 1 E-UTRA TDD inter-RAT carrier for RSTD measurements configured via LPP [22].

In addition to the requirements defined above, the UE shall be capable of monitoring a total of at least 13 effective carrier frequency layers comprising of any above defined combination of NR, E-UTRA FDD and E-UTRA TDD layers. The UE shall be capable of monitoring a total of at least 7 effective NR carrier frequency layers excluding NR serving carrier(s), which are configured by PCell and PSCell.

When PCell and PSCell configures the same NR carrier frequency layer to be monitored by the UE in NR-DC, this layer shall be counted only once to the total number of effective carrier frequency layers provided that the SFN-s and slot boundaries are aligned, unless the configured NR carrier frequency layers to be monitored have

- different RSSI measurement resources or
- different *deriveSSB-IndexFromCell* indications or
- different SMTC configurations.

## 9.1.4 Capabilities for Support of Event Triggering and Reporting Criteria

### 9.1.4.1 Introduction

This clause contains requirements on UE capabilities for support of event triggering and reporting criteria. As long as the measurement configuration does not exceed the requirements stated in clause 9.1.4.2, the UE shall meet all other performance requirements defined in clause 9 and clause 10.

The UE can be requested to make measurements under different measurement identities defined in TS 38.331 [2]. Each measurement identity corresponds to either event-based reporting, periodic reporting, or no reporting. In case of event-based reporting, each measurement identity is associated with an event triggering criterion. In case of periodic reporting, a measurement identity is associated with one periodic reporting criterion. In case of no reporting, a measurement identity is associated with one no reporting criterion.

The purpose of this clause is to set some limits on the number of different event triggering, periodic, and no reporting criteria the UE may be requested to track in parallel.

### 9.1.4.2 Requirements

In this clause a reporting criterion corresponds to either one event (in the case of event-based reporting), or one periodic reporting criterion (in case of periodic reporting), or one no reporting criterion (in case of no reporting). For event-based reporting, each instance of event, with the same or different event identities, is counted as separate reporting criterion in Table 9.1.4.2-1.

The UE shall be able to support in parallel per category up to  $E_{cat}$  reporting criteria according to Table 9.1.4.2-1. For the measurement categories belonging to intra-frequency, inter-frequency, and inter-RAT measurements (i.e. without counting other categories that the UE shall always support in parallel), the UE need not support more than the total number of reporting criteria as follows:

- For UE configured with EN-DC:  $E_{cat,EN-DC,NR} + E_{cat,EN-DC,E-UTRA}$ , where

$E_{cat,EN-DC,NR} = 10 + 9 \times n$  is the total number of NR reporting criteria configured by PSCell (NR intra- and inter-frequency reporting criteria) and by E-UTRA PCell on NR serving frequencies (NR intra-frequency reporting criteria) applicable for UE configured with EN-DC according to Table 9.1.4.2-1, and  $n$  is the number of configured NR serving frequencies, including PSCell and SCells carrier frequencies,

$E_{cat,EN-DC,E-UTRA}$  is the total number of reporting criteria configured by E-UTRA PCell except PSCell and SCells carrier frequencies, as specified in TS 36.133 [15] for UE configured with EN-DC.

- For UE configured with NE-DC:  $E_{cat,NE-DC,NR} + E_{cat,NE-DC,E-UTRA}$ , where

$E_{cat,NE-DC,NR} = 10 + 9 \times n$  is the total number of NR reporting criteria according to Table 9.1.4.2-1, and  $n$  is the number of configured NR serving frequencies, including PCell, and SCells carrier frequencies,

$E_{cat,NE-DC,E-UTRA} = E_{cat,NE-DC,E-UTRA,inter-RAT} + E_{cat,NE-DC,E-UTRA,intra-RAT}$ , where

$E_{cat,NE-DC,E-UTRA,inter-RAT}$  is the total number of inter-RAT E-UTRA reporting criteria configured by PCell except E-UTRA PSCell and E-UTRA SCells carrier frequencies, according to Table 9.1.4.2-1,

$E_{cat,NE-DC,E-UTRA,intra-RAT}$  is the total number of E-UTRA reporting criteria including E-UTRA PSCell and E-UTRA SCells carrier frequencies as specified in TS 36.133 [15] for UE configured with NE-DC.

- For UE configured with SA operation mode:  $E_{cat,SA,NR} + E_{cat,SA,E-UTRA}$ , where

$E_{cat,SA,NR} = 10 + 9 \times n$  is the total number of NR reporting criteria according to Table 9.1.4.2-1, and  $n$  is the number of configured NR serving frequencies, including PCell, and SCells carrier frequencies,

$E_{cat,SA,E-UTRA}$  is the total number of inter-RAT E-UTRA reporting criteria according to Table 9.1.4.2-1.

- For UE configured with NR-DC:  $E_{cat,NR-DC,NR} + E_{cat,NR-DC,E-UTRA}$ , where

$E_{cat,NR-DC,NR} = 10 + 9 \times n$  is the total number of NR reporting criteria according to Table 9.1.4.2-1, and  $n$  is the number of configured NR serving frequencies, including PCell, PSCell and SCells carrier frequencies,

$E_{cat,NR-DC,E-UTRA}$  is the total number of inter-RAT E-UTRA reporting criteria according to Table 9.1.4.2-1.

**Table 9.1.4.2-1: Requirements for reporting criteria per measurement category**

| Measurement category                                     | $E_{cat}$ | Note  |
|--|-----------|---|
| Intra-frequency <sup>Note 1,2,3,4,5</sup>                | 9         | Events for any one or a combination of intra-frequency SS-RSRP, SS-RSRQ, and SS-SINR for NG-RAN intra-frequency cells   |
| Inter-frequency <sup>Note 2,3,4,5</sup>                  | 10        | Events for any one or a combination of inter-frequency SS-RSRP, SS-RSRQ, and SS-SINR for NG-RAN inter-frequency cells   |
| Inter-RAT (E-UTRA FDD, E-UTRA TDD) <sup>Note 2,4,5</sup> | 10        | Only applicable for UE with this (inter-RAT) capability. These reporting criteria apply for any E-UTRA carrier frequencies other than the carrier frequency of the E-UTRA PSCell or E-UTRA SCell. |

|   |   |  |
|---|---|--|
| Inter-RAT (E-UTRA FDD, E-UTRA TDD) RSTD <sup>Note 2,4,5</sup>   | 1 | Inter-RAT RSTD measurement reporting for UE supporting OTDOA; 1 report capable of minimum 16 inter-RAT cell measurements. Only applicable for UE with this (inter-RAT RSTD via LPP [22]) capability. These reporting criteria apply for any E-UTRA carrier frequencies other than the carrier frequency of the E-UTRA PSCell or E-UTRA SCell.  |
| Inter-RAT (E-UTRA FDD, E-UTRA TDD) RSRP and RSRQ measurements for E-CID <sup>Note 2,4,5</sup>   | 1 | Inter-RAT RSRP and RSRQ measurements for E-CID reported to E-SMLC via LPP [22]. One report capable of at least in total 10 inter-RAT RSRP and RSRQ measurements. Applicable to UE capable of reporting inter-RAT RSRP and RSRQ to E-SMLC via LPP. These reporting criteria apply for any E-UTRA carrier frequencies other than the carrier frequency of the E-UTRA PSCell or E-UTRA SCell. |
| <p>NOTE 1: When the UE is configured with PSCell and SCell carrier frequencies, <math>E_{cat}</math> for Intra-frequency is applied per corresponding NR serving frequency.</p> <p>NOTE 2: Applicable for UE configured with SA NR operation mode.</p> <p>NOTE 3: Applicable for UE configured with EN-DC operation mode.</p> <p>NOTE 4: Applicable for UE configured with NE-DC operation mode.</p> <p>NOTE 5: Applicable for UE configured with NR-DC operation mode.</p> |   |  |

## 9.1.5 Carrier-specific scaling factor

This clause specifies the derivation of carrier-specific scaling factor (CSSF) values, which scales the measurement delay requirements given in clause 9.2, 9.3 and 9.4 when UE is configured to monitor multiple measurement objects. The CSSF values are categorized into  $CSSF_{outside\_gap,i}$  and  $CSSF_{within\_gap,i}$ , for the measurements conducted outside measurement gaps and within measurement gaps, respectively.

### 9.1.5.1 Monitoring of multiple layers outside gaps

The carrier-specific scaling factor  $CSSF_{outside\_gap,i}$  for measurement object  $i$  derived in this chapter is applied to following measurement types:

- Intra-frequency measurement with no measurement gap in clause 9.2.5, when none of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap.
- Intra-frequency measurement with no measurement gap in clause 9.2.5, when part of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap.
- For a UE in E-UTRA-NR dual connectivity operation, NR inter-RAT measurement object configured by the E-UTRAN PCell on an NR serving carrier
  - the SSB is completely contained in the active BWP of the UE, and
  - none or part of the SMTC occasions of this inter-RAT measurement object are overlapped by the measurement gap;

UE is expected to conduct the measurement of this measurement object  $i$  only outside the measurement gaps.

For a UE in E-UTRA-NR dual connectivity operation, if a measurement object configured by PSCell and an NR inter-RAT measurement object configured by E-UTRAN PCell are on the same serving carrier, they shall be counted as one intra-frequency measurement object, provided that they meet the measurement object merging conditions [in clause 9.1.3.2].

If the higher layer signaling in TS 38.331 [2] of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps,  $CSSF_{outside\_gap,i}$  and requirements derived from  $CSSF_{outside\_gap,i}$  are not specified.

The UE cell identification and measurement periods derived based on  $CSSF_{outside\_gap,i}$  in clauses 9.2.5.1, 9.2.5.2 may be extended for measurement objects of which the cell identification and measurement periods are overlapped with  $T_{measure\_SFTD1}$  specified in clause 9.3.8 when no measurement gaps are provided.

The requirements in this clause apply provided that

- The SMTC on all CCs in FR2 have the same offset, and one of following conditions is met
  - If *smtc2* is configured on any FR2 CC,
    - All CCs have the same configuration for *smtc1*, and
    - All CCs configured with *smtc2* have the same configuration for *smtc2*
  - If *smtc2* is not configured on any FR2 CC,
    - The total number of different SMTC periodicities on all serving CCs does not exceed 4

Note: Longer delays for cell identification and measurement periods derived based on  $CSSF_{outside\_gap,i}$  in clauses 9.2.5.1, 9.2.5.2, can be expected, if the UE is configured with more than 4 different SMTC periodicities on FR2 serving carriers. The longer delay applies for the FR2 intra-frequency measurement objects with the longest SMTC periodicity/periodicities.

**9.1.5.1.1 EN-DC mode: carrier-specific scaling factor for SSB-based measurements performed outside gaps**

For UE configured with the E-UTRA-NR dual connectivity operation, the carrier-specific scaling factor  $CSSF_{outside\_gap,i}$  for intra-frequency SSB-based measurements performed outside measurements gaps will be as specified in Table 9.1.5.1.1-1.

**Table 9.1.5.1.1-1:  $CSSF_{outside\_gap,i}$  scaling factor for EN-DC mode**

| Scenario   | $CSSF_{outside\_gap,i}$ for FR1 PSCC | $CSSF_{outside\_gap,i}$ for FR1 SCC | $CSSF_{outside\_gap,i}$ for FR2 PSCC | $CSSF_{outside\_gap,i}$ for FR2 SCC where neighbour cell measurement is required <sup>Note 2</sup> | $CSSF_{outside\_gap,i}$ for FR2 SCC where neighbour cell measurement is not required |
|--|--------------------------------------|-------------------------------------|--------------------------------------|--|--|
| EN-DC with FR1 only CA   | 1                                    | Number of configured FR1 SCell(s)   | N/A                                  | N/A  | N/A  |
| EN-DC with FR2 only intra band CA  | N/A                                  | N/A                                 | 1                                    | N/A  | Number of configured FR2 SCells  |
| EN-DC with FR1 +FR2 CA (FR1 PSCell) <sup>Note 1</sup>  | 1                                    | 2x(Number of configured SCell(s)-1) | N/A                                  | <sup>2</sup> Note 5  | 2x(Number of configured SCell(s)-1)  |
| EN-DC with FR1 +FR2 CA (FR2 PSCell) <sup>Note 1</sup>  | N/A                                  | Number of configured SCell(s)       | 1                                    | N/A  | Number of configured SCell(s)  |
| Note 1: Only one NR FR1 operating band and one NR FR2 operating band are included for FR1+FR2 inter-band EN-DC.<br>Note 2: Selection of FR2 SCC where neighbour cell measurement is required follows clause 9.2.3.2.<br>Note 3: Void<br>Note 4: Void<br>Note 5: $CSSF_{outside\_gap,i} = 1$ if only one SCell is configured.<br>Note 6: If a measurement object configured by PSCell and an NR inter-RAT measurement object configured by E-UTRAN PCell are on the same serving carrier, they shall be counted as one intra-frequency measurement object, provided that they meet the measurement object merging conditions [in clause 9.1.3.2], otherwise they are counted separately as two measurement objects. |                                      |                                     |                                      |  |  |

**9.1.5.1.2 SA mode: carrier-specific scaling factor for SSB-based measurements performed outside gaps**

For UE in SA operation mode, the carrier-specific scaling factor  $CSSF_{outside\_gap,i}$  for intra-frequency SSB-based measurements performed outside measurements gaps will be as specified in Table 9.1.5.1.2-1, which shall also be applied for a UE configured with NE-DC operation.

Table 9.1.5.1.2-1:  $CSSF_{outside\_gap,i}$  scaling factor for SA mode

| Scenario                                  | $CSSF_{outside\_gap,i}$ for FR1 PCC | $CSSF_{outside\_gap,i}$ for FR1 SCC | $CSSF_{outside\_gap,i}$ for FR2 PCC | $CSSF_{outside\_gap,i}$ for FR2 SCC where neighbour cell measurement is required | $CSSF_{outside\_gap,i}$ for FR2 SCC where neighbour cell measurement is not required |
|---|-------------------------------------|-------------------------------------|-------------------------------------|--|--|
| FR1 only CA                               | 1                                   | Number of configured FR1 SCell(s)   | N/A                                 | N/A  | N/A  |
| FR2 only intra band CA                    | N/A                                 | N/A                                 | 1                                   | N/A  | Number of configured FR2 SCell(s)  |
| FR1 +FR2 CA (FR1 PCell) <sup>Note 1</sup> | 1                                   | 2x(Number of configured SCell(s)-1) | N/A                                 | <sup>2</sup> <sup>Note 5</sup>   | 2x(Number of configured SCell(s)-1)  |
| FR1 +FR2 CA (FR2 PCell) <sup>Note 1</sup> | N/A                                 | Number of configured SCell(s)       | 1                                   | N/A  | Number of configured SCell(s)  |

Note 1: Only one FR1 operating band and one FR2 operating band are included for FR1+FR2 inter-band CA.

Note 2: Selection of FR2 SCC where neighbour cell measurement is required follows clause 9.2.3.2.

Note 3: Void

Note 4: Void

Note 5:  $CSSF_{outside\_gap,i}=1$  if only one SCell is configured.

### 9.1.5.1.3 NR-DC mode: carrier-specific scaling factor for SSB-based measurements performed outside gaps

For UE configured with NR-DC operation, the carrier-specific scaling factor  $CSSF_{outside\_gap,i}$  for intra-frequency SSB-based measurements performed outside measurements gaps will be as specified in Table 9.1.5.1.3-1.

Table 9.1.5.1.3-1:  $CSSF_{outside\_gap,i}$  scaling factor for NR-DC mode

| Scenario   | $CSSF_{outside\_gap,i}$ for FR1 PCC | $CSSF_{outside\_gap,i}$ for FR1 SCC | $CSSF_{outside\_gap,i}$ for FR2 PSCC | $CSSF_{outside\_gap,i}$ for FR2 SCC where neighbour cell measurement is not required |
|--|-------------------------------------|-------------------------------------|--------------------------------------|--|
| FR1 + FR2 NR-DC (FR1 PCell and FR2 PSCell) <sup>Note 1</sup> | 1                                   | 2x(Number of configured SCell(s))   | <sup>2</sup> <sup>Note 3</sup>       | 2x(Number of configured SCell(s))  |

Note 1: NR-DC in Rel-15 only includes the scenarios where all serving cells in MCG in FR1 and all serving cells in SCG in FR2.

Note 2: Void

Note 3:  $CSSF_{outside\_gap,i}=1$  if no SCell is configured.

### 9.1.5.1.4 NE-DC mode: carrier-specific scaling factor for SSB-based measurements performed outside gaps

For UE configured with NE-DC operation, the carrier-specific scaling factor  $CSSF_{outside\_gap,i}$  for intra-frequency SSB-based measurements performed outside measurements gaps will be as specified in Table 9.1.5.1.4-1.

Table 9.1.5.1.4-1:  $CSSF_{outside\_gap,i}$  scaling factor for NE-DC mode

| Scenario                          | $CSSF_{outside\_gap,i}$ for FR1 PCC | $CSSF_{outside\_gap,i}$ for FR1 SCC | $CSSF_{outside\_gap,i}$ for FR2 PCC | $CSSF_{outside\_gap,i}$ for FR2 SCC where neighbour cell measurement is required | $CSSF_{outside\_gap,i}$ for FR2 SCC where neighbour cell measurement is not required |
|-----------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|--|--|
| NE-DC with FR1 only CA            | 1                                   | Number of configured FR1 SCell(s)   | N/A                                 | N/A  | N/A  |
| NE-DC with FR2 only intra band CA | N/A                                 | N/A                                 | 1                                   | N/A  | Number of configured FR2 SCell(s)  |

|  |   |                                     |     |                     |                                     |
|--|---|-------------------------------------|-----|---------------------|-------------------------------------|
| <b>NE-DC with FR1 +FR2 CA (FR1 PCell)</b> <sup>Note 1</sup>  | 1 | 2x(Number of configured SCell(s)-1) | N/A | 2 <sup>Note 3</sup> | 2x(Number of configured SCell(s)-1) |
| Note 1: Only one FR1 operating band and one FR2 operating band are included for FR1+FR2 inter-band CA. |   |                                     |     |                     |                                     |
| Note 2: Selection of FR2 SCC where neighbour cell measurement is required follows clause 9.2.3.2.      |   |                                     |     |                     |                                     |
| Note 3: $CSSF_{outside\_gap,i} = 1$ if only one SCell is configured.                                   |   |                                     |     |                     |                                     |

### 9.1.5.2 Monitoring of multiple layers within gaps

The carrier-specific scaling factor  $CSSF_{within\_gap,i}$  for measurement object  $i$  derived in this chapter is applied to following measurement types:

- Intra-frequency measurement object with no measurement gap in clause 9.2.5, when all of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap.
- Intra-frequency measurement object with measurement gap in clause 9.2.6.
- Inter-frequency measurement object in clause 9.3.
- E-UTRA Inter-RAT measurement object in clauses 9.4.2 and 9.4.3.
- E-UTRA Inter-RAT RSTD and E-CID measurements in clauses 9.4.4 and 9.4.5.
- For a UE in E-UTRA-NR dual connectivity operation, NR Inter-RAT measurement object configured by the E-UTRAN PCell (TS 36.133 [15] clause 8.17.4) on an NR serving carrier
  - the SSB is not completely contained in the active BWP of the UE, or
  - all of the SMTC occasions of this inter-RAT measurement object are overlapped by the measurement gap;
- NR Inter-RAT measurement object configured by the E-UTRAN PCell (TS 36.133 [15] clause 8.17.4) on an NR non-serving carrier.
- E-UTRAN Inter-frequency measurement object configured by the E-UTRAN PCell (TS 36.133 [15] clause 8.17.3) and by the E-UTRAN PSCell (TS 36.133 [15] clause 8.19.3).
- E-UTRAN Inter-frequency RSTD measurement configured by the E-UTRAN PCell (TS 36.133 [15] clause 8.17.15).
- UTRA Inter-RAT measurement object configured by the E-UTRAN PCell (TS 36.133 [15] clauses 8.17.5 to 8.17.12).
- GSM Inter-RAT measurements configured by the E-UTRAN PCell (TS 36.133 [15] clauses 8.17.13 and 8.17.14).

UE is expected to conduct the measurement of this measurement object  $i$  only within the measurement gaps.

If the higher layer signaling in TS 38.331 [2] of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps,  $CSSF_{within\_gap,i}$  and requirements derived from  $CSSF_{outside\_gap,i}$  are not specified.

#### 9.1.5.2.1 EN-DC mode: carrier-specific scaling factor for SSB-based measurements performed within gaps

The scaling value  $CSSF_{within\_gap,i}$  below has been derived without considering GSM inter-RAT carriers.

For UE supporting per-FR gap, for each measurement object  $i$  that are measured based on effective MGRP as defined in clause 9.1.2,  $CSSF_{within\_gap,i}$  used for deriving the measurement requirements is defined as the total number of measurement objects in the same FR as measurement object  $i$ .

When one or more measurement objects are monitored within measurement gaps, the carrier specific scaling factor for a target measurement object with index  $i$  is designated as  $CSSF_{within\_gap,i}$  and is derived as described in this clause.

For a UE in E-UTRA-NR dual connectivity operation, if a measurement object configured by PSCell and an NR inter-RAT measurement object configured by E-UTRAN PCell are on the same carrier, they shall be counted as one measurement object in  $M_{\text{tot},i,j}$ , provided that they meet the measurement object merging conditions [in clause 9.1.3.2].

If measurement object  $i$  refers to an RSTD measurement with periodicity  $T_{\text{prs}} > 160\text{ms}$  or with periodicity  $T_{\text{prs}} = 160\text{ms}$  but *prs-MutingInfo-r9* is configured,  $\text{CSSF}_{\text{within\_gap},i} = 1$ . Otherwise, the  $\text{CSSF}_{\text{within\_gap},i}$  for other measurement objects (including RSTD measurement with periodicity  $T_{\text{prs}} = 160\text{ms}$ ) participate in the gap competition are derived as below.

For each measurement gap  $j$  not used for an RSTD measurement with periodicity  $T_{\text{prs}} > 160\text{ms}$  or with periodicity  $T_{\text{prs}} = 160\text{ms}$  but *prs-MutingInfo-r9* is configured within an arbitrary 160ms period, count the total number of intrafrequency measurement objects and interfrequency/interRAT measurement objects which are candidates to be measured within the gap  $j$ .

- An NR measurement object is a candidate to be measured in a gap if its SMTC duration is fully covered by the MGL excluding RF switching time. For intra-frequency NR carriers, if the higher layer in TS 38.331 [2] signaling of *smtc2* is configured, the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc2*; otherwise the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc1*
- An inter-RAT UTRA measurement object configured by E-UTRA PCell [15] is a candidate to be measured in all measurement gaps.
- An inter-frequency E-UTRA measurement object configured by E-UTRA PCell [15] is a candidate to be measured in all measurement gaps.
- For UEs which support and are configured with per FR gaps, the counting is done on a per FR basis, and for UEs which are configured with per UE gaps the counting is done on a per UE basis.
- $M_{\text{intra},i,j}$ : Number of intra-frequency measurement objects which are candidates to be measured in gap  $j$  where the measurement object  $i$  is also a candidate. Otherwise  $M_{\text{intra},i,j}$  equals 0.
- $M_{\text{inter},i,j}$ : Number of NR inter-frequency measurement objects or NR inter-RAT measurement objects configured by E-UTRA PCell, EUTRA inter-frequency measurement objects configured by E-UTRA PCell, UTRA inter-RAT measurement objects configured by E-UTRA PCell which are candidates to be measured in gap  $j$  where the measurement object  $i$  is also a candidate. Otherwise  $M_{\text{inter},i,j}$  equals 0.
- $M_{\text{tot},i,j} = M_{\text{intra},i,j} + M_{\text{inter},i,j}$ : Total number of intra-frequency, inter-frequency and inter-RAT measurement objects which are candidates to be measured in gap  $j$  where the measurement object  $i$  is also a candidate. Otherwise  $M_{\text{tot},i,j}$  equals 0.

For each measurement gap  $j$  used for an RSTD measurement with periodicity  $T_{\text{prs}} > 160\text{ms}$  or with periodicity  $T_{\text{prs}} = 160\text{ms}$  but *prs-MutingInfo-r9* is configured within an arbitrary 160ms period,  $M_{\text{intra},i,j} = M_{\text{inter},i,j} = M_{\text{tot},i,j} = 0$ .

The carrier specific scaling factor  $\text{CSSF}_{\text{within\_gap},i}$  is given by:

If *measGapSharingScheme* is equal sharing,  $\text{CSSF}_{\text{within\_gap},i} = \max(\text{ceil}(R_i \times M_{\text{tot},i,j}))$ , where  $j = 0 \dots (160/\text{MGRP}) - 1$

If *measGapSharingScheme* is not equal sharing and

- measurement object  $i$  is an intra-frequency measurement object,  $\text{CSSF}_{\text{within\_gap},i}$  is the maximum among
  - $\text{ceil}(R_i \times K_{\text{intra}} \times M_{\text{intra},i,j})$  in gaps where  $M_{\text{inter},i,j} \neq 0$ , where  $j = 0 \dots (160/\text{MGRP}) - 1$
  - $\text{ceil}(R_i \times M_{\text{intra},i,j})$  in gaps where  $M_{\text{inter},i,j} = 0$ , where  $j = 0 \dots (160/\text{MGRP}) - 1$
- measurement object  $i$  is an inter-frequency or inter-RAT measurement object,  $\text{CSSF}_{\text{within\_gap},i}$  is the maximum among
  - $\text{ceil}(R_i \times K_{\text{inter}} \times M_{\text{inter},i,j})$  in gaps where  $M_{\text{intra},i,j} \neq 0$ , where  $j = 0 \dots (160/\text{MGRP}) - 1$

Where  $R_i$  is the maximal ratio of the number of measurement gap where measurement object  $i$  is a candidate to be measured over the number of measurement gap where measurement object  $i$  is a candidate and not used for RSTD measurement with periodicity  $T_{\text{prs}} > 160\text{ms}$  or with periodicity  $T_{\text{prs}} = 160\text{ms}$  but *prs-MutingInfo-r9* is configured within an arbitrary 1280ms period.

Note: In this release of specification, longer delays for cell identification and measurement periods derived based on  $CSSF_{within\_gap,i}$  can be expected, if the UE is configured with inter-RAT MO on NR serving CC by E-UTRAN PCell in EN-DC mode.

### 9.1.5.2.2 SA mode: carrier-specific scaling factor for SSB-based measurements performed within gaps

When one or more measurement objects are monitored within measurement gaps, the carrier specific scaling factor for a target measurement object with index  $i$  is designated as  $CSSF_{within\_gap,i}$  and is derived as described in this clause.

For UE supporting per-FR gap, for each measurement object  $i$  that are measured based on effective MGRP as defined in clause 9.1.2,  $CSSF_{within\_gap,i}$  used for deriving the measurement requirements is defined as the total number of measurement objects in the same FR as measurement object  $i$ .

If measurement object  $i$  refers to an RSTD measurement with periodicity  $T_{prs} > 160ms$  or with periodicity  $T_{prs} = 160ms$  but *prs-MutingInfo-r9* is configured,  $CSSF_{within\_gap,i} = 1$ . Otherwise, the the  $CSSF_{within\_gap,i}$  for other measurement objects (including RSTD measurement with periodicity  $T_{prs} = 160ms$ ) participate in the gap competition and the  $CSSF_{within\_gap,i}$  are derived as below.

For each measurement gap  $j$  not used for an RSTD measurement with periodicity  $T_{prs} > 160ms$  or with periodicity  $T_{prs} = 160ms$  but *prs-MutingInfo-r9* is configured within an arbitrary 160ms period, count the total number of intrafrequency measurement objects and interfrequency/interRAT measurement objects which are candidates to be measured within the gap  $j$ .

- An NR measurement object is a candidate to be measured in a gap if its SMTC duration is fully covered by the MGL excluding RF switching time. For intra-frequency NR measurement objects, if the higher layer in TS 38.331 [2] signaling of *smtc2* is configured, the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc2*; otherwise the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc1*.
- An inter-RAT measurement object is a candidate to be measured in all measurement gaps.
- An inter-frequency SFTD measurement object, if to be measured with measurement gaps, is a candidate to be measured in all measurement gaps.
- For UEs which support and are configured with per FR gaps, the counting is done on a per FR basis, and for UEs which are configured with per UE gaps the counting is done on a per UE basis.
- $M_{intra,i,j}$ : Number of intra-frequency measurement objects which are candidates to be measured in gap  $j$  where the measurement object  $i$  is also a candidate. Otherwise  $M_{intra,i,j}$  equals 0.
- $M_{inter,i,j}$ : Number of NR inter-frequency and EUTRA inter-RAT measurement objects which are candidates to be measured in gap  $j$  where the measurement object  $i$  is also a candidate. Otherwise  $M_{inter,i,j}$  equals 0.
- $M_{tot,i,j} = M_{intra,i,j} + M_{inter,i,j}$ : Total number of intra-frequency, inter-frequency and inter-RAT measurement objects which are candidates to be measured in gap  $j$  where the measurement object  $i$  is also a candidate. Otherwise  $M_{tot,i,j}$  equals 0.

For each measurement gap  $j$  used for an RSTD measurement with periodicity  $T_{prs} > 160ms$  or with periodicity  $T_{prs} = 160ms$  but *prs-MutingInfo-r9* is configured within an arbitrary 160ms period,  $M_{intra,i,j} = M_{inter,i,j} = M_{tot,i,j} = 0$ .

The carrier specific scaling factor  $CSSF_{within\_gap,i}$  is given by:

- If *measGapSharingScheme* is equal sharing,  $CSSF_{within\_gap,i} = \max(\text{ceil}(R_i \times M_{tot,i,j}))$ , where  $j = 0 \dots (160/MGRP) - 1$
- If *measGapSharingScheme* is not equal sharing and
  - measurement object  $i$  is an intra-frequency measurement object,  $CSSF_{within\_gap,i}$  is the maximum among
    - $\text{ceil}(R_i \times K_{intra} \times M_{intra,i,j})$  in gaps where  $M_{inter,i,j} \neq 0$ , where  $j = 0 \dots (160/MGRP) - 1$
    - $\text{ceil}(R_i \times M_{intra,i,j})$  in gaps where  $M_{inter,i,j} = 0$ , where  $j = 0 \dots (160/MGRP) - 1$
  - measurement object  $i$  is an inter-frequency or inter-RAT measurement object,  $CSSF_{within\_gap,i}$  is the maximum among

- $\text{ceil}(R_i \times K_{\text{inter}} \times M_{\text{inter},i,j})$  in gaps where  $M_{\text{intra},i,j} \neq 0$ , where  $j=0 \dots (160/\text{MGRP})-1$
- $\text{ceil}(R_i \times M_{\text{inter},i,j})$  in gaps where  $M_{\text{intra},i,j}=0$ , where  $j=0 \dots (160/\text{MGRP})-1$
- Where  $R_i$  is the maximal ratio of the number of measurement gap where measurement object  $i$  is a candidate to be measured over the number of measurement gap where measurement object  $i$  is a candidate and not used for RSTD measurement with periodicity  $T_{\text{prs}} > 160\text{ms}$  or with periodicity  $T_{\text{prs}} = 160\text{ms}$  but *prs-MutingInfo-r9* is configured within an arbitrary 1280ms period.

$\text{CSSF}_{\text{within\_gap},k}=1$  during  $T_{\text{Detect, E-UTRAN FDD}}$  specified in clause 9.4.4.1.2.2 and  $T_{\text{Detect, E-UTRAN TDD}}$  specified in clause 9.4.4.2.2.2, where  $k$  is the carrier frequency where the UE is performing cell detection of the inter-RAT E-UTRA OTDOA assistance data reference cell when acquiring the subframe and slot timing of the cell according to clause 9.4.4. In this case, the UE cell identification and measurement periods derived based on  $\text{CSSF}_{\text{within\_gap},i}$  in clauses 9.2.5.1, 9.2.5.2, 9.2.6.2, 9.2.6.3, 9.3.4, 9.3.5, 9.4.2.2, and 9.4.2.3 may be extended for measurement objects of which the cell identification and measurement periods are overlapped with  $T_{\text{Detect, E-UTRAN FDD}}$  and  $T_{\text{Detect, E-UTRAN TDD}}$ .

### 9.1.5.2.3 NE-DC: carrier-specific scaling factor for SSB-based measurements performed within gaps

When one or more measurement objects are monitored within measurement gaps, the carrier specific scaling factor for a target measurement object with index  $i$  is designated as  $\text{CSSF}_{\text{within\_gap},i}$  and is derived as described in this clause.

For UE supporting per-FR gap, for each measurement object  $i$  that are measured based on effective MGRP as defined in clause 9.1.2,  $\text{CSSF}_{\text{within\_gap},i}$  used for deriving the measurement requirements is defined as the total number of measurement objects in the same FR as measurement object  $i$ .

If measurement object  $i$  refers to an RSTD measurement with periodicity  $T_{\text{prs}} > 160\text{ms}$  or with periodicity  $T_{\text{prs}} = 160\text{ms}$  but *prs-MutingInfo-r9* is configured,  $\text{CSSF}_{\text{within\_gap},i}=1$ . Otherwise, the  $\text{CSSF}_{\text{within\_gap},i}$  for other measurement objects (including RSTD measurement with periodicity  $T_{\text{prs}} = 160\text{ms}$ ) participate in the gap competition are derived as below.

For each measurement gap  $j$  not used for an RSTD measurement with periodicity  $T_{\text{prs}} > 160\text{ms}$  or with periodicity  $T_{\text{prs}} = 160\text{ms}$  but *prs-MutingInfo-r9* is configured within an arbitrary 160ms period, count the total number of intrafrequency measurement objects and interfrequency/interRAT measurement objects which are candidates to be measured within the gap  $j$ .

- An NR measurement object is a candidate to be measured in a gap if its SMTC duration is fully covered by the MGL excluding RF switching time. For intra-frequency NR measurement objects, if the higher layer in TS 38.331 [2] signaling of *smtc2* is configured, the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc2*; otherwise the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc1*.
- An inter-RAT measurement object is a candidate to be measured in all measurement gaps.
- An inter-frequency E-UTRA measurement object is a candidate to be measured in all measurement gaps.
- For UEs which support and are configured with per FR gaps, the counting is done on a per FR basis, and for UEs which are configured with per UE gaps the counting is done on a per UE basis.
- If the number of configured inter-frequency and inter-RAT measurement objects is non-zero and the UE is configured with per UE gaps, or if the UE is configured with per FR gaps:
  - FR1 and FR2 intra-frequency measurement objects belong to group A
  - Inter-frequency and inter-RAT measurement objects belong to group B
  - $M_{\text{groupA},i,j}$ : Sum of the number of FR1 intra-frequency measurement objects  $M_{\text{intra-FR1},i,j}$  and the number of FR2 intra-frequency measurement objects  $M_{\text{intra-FR2},i,j}$  which are candidates to be measured in gap  $j$  where the measurement object  $i$  is also a candidate. Otherwise  $M_{\text{groupA},i,j}$  equals 0.
  - $M_{\text{groupB},i,j}$ : Number of NR inter-frequency and EUTRA inter-RAT measurement objects which are candidates to be measured in gap  $j$  where the measurement object  $i$  is also a candidate. Otherwise  $M_{\text{groupB},i,j}$  equals 0.
- If the number of configured inter-frequency and inter-RAT measurement objects is zero and the UE is configured with per UE gaps:

- FR1 intra-frequency measurement objects belong to group A
- FR2 intra-frequency measurement objects belong to group B
- $M_{\text{groupA},i,j}$ : The number of FR1 intra-frequency measurement objects  $M_{\text{intra-FR1},i,j}$  which are candidates to be measured in gap  $j$  where the measurement object  $i$  is also a candidate. Otherwise  $M_{\text{groupA},i,j}$  equals 0.
- $M_{\text{groupB},i,j}$ : The number of FR2 intra-frequency measurement objects  $M_{\text{intra-FR2},i,j}$  which are candidates to be measured in gap  $j$  where the measurement object  $i$  is also a candidate. Otherwise  $M_{\text{groupB},i,j}$  equals 0.
- $M_{\text{tot},i,j} = M_{\text{groupA},i,j} + M_{\text{groupB},i,j}$ : Total number of group A and group B measurement objects which are candidates to be measured in gap  $j$  where the measurement object  $i$  is also a candidate. Otherwise  $M_{\text{tot},i,j}$  equals 0.

For each measurement gap  $j$  used for an RSTD measurement with periodicity  $T_{\text{prs}} > 160\text{ms}$  or with periodicity  $T_{\text{prs}} = 160\text{ms}$  but *prs-MutingInfo-r9* is configured within an arbitrary 160ms period,  $M_{\text{intra},i,j} = M_{\text{inter},i,j} = M_{\text{tot},i,j} = 0$ .

- The carrier specific scaling factor  $\text{CSSF}_{\text{within\_gap},i}$  is given by:
  - If *measGapSharingScheme* is equal sharing,  $\text{CSSF}_{\text{within\_gap},i} = \max(\text{ceil}(R_i \times M_{\text{tot},i,j}))$ , where  $j = 0 \dots (160/\text{MGRP}) - 1$
  - If *measGapSharingScheme* is not equal sharing and
    - measurement object  $i$  is a group A measurement object,  $\text{CSSF}_{\text{within\_gap},i}$  is the maximum among
      - $\text{ceil}(R_i \times K_{\text{intra}} \times M_{\text{groupA},i,j})$  in gaps where  $M_{\text{groupB},i,j} \neq 0$ , where  $j = 0 \dots (160/\text{MGRP}) - 1$
      - $\text{ceil}(R_i \times M_{\text{groupA},i,j})$  in gaps where  $M_{\text{groupB},i,j} = 0$ , where  $j = 0 \dots (160/\text{MGRP}) - 1$
    - measurement object  $i$  is an group B measurement object,  $\text{CSSF}_{\text{within\_gap},i}$  is the maximum among
      - $\text{ceil}(R_i \times K_{\text{inter}} \times M_{\text{groupB},i,j})$  in gaps where  $M_{\text{groupA},i,j} \neq 0$ , where  $j = 0 \dots (160/\text{MGRP}) - 1$
      - $\text{ceil}(R_i \times M_{\text{groupB},i,j})$  in gaps where  $M_{\text{groupA},i,j} = 0$ , where  $j = 0 \dots (160/\text{MGRP}) - 1$
  - Where  $R_i$  is the maximal ratio of the number of measurement gap where measurement object  $i$  is a candidate to be measured over the number of measurement gap where measurement object  $i$  is a candidate and not used for RSTD measurement with periodicity  $T_{\text{prs}} > 160\text{ms}$  or with periodicity  $T_{\text{prs}} = 160\text{ms}$  but *prs-MutingInfo-r9* is configured within an arbitrary 1280ms period.

#### 9.1.5.2.4 NR-DC: carrier-specific scaling factor for SSB-based measurements performed within gaps

When one or more measurement objects are monitored within measurement gaps, the carrier specific scaling factor for a target measurement object with index  $i$  is designated as  $\text{CSSF}_{\text{within\_gap},i}$  and is derived as described in this clause.

For UE supporting per-FR gap, for each measurement object  $i$  that are measured based on effective MGRP as defined in clause 9.1.2,  $\text{CSSF}_{\text{within\_gap},i}$  used for deriving the measurement requirements is defined as the total number of measurement objects in the same FR as measurement object  $i$ .

If measurement object  $i$  refers to an RSTD measurement with periodicity  $T_{\text{prs}} > 160\text{ms}$  or with periodicity  $T_{\text{prs}} = 160\text{ms}$  but *prs-MutingInfo-r9* is configured,  $\text{CSSF}_{\text{within\_gap},i} = 1$ . Otherwise, the  $\text{CSSF}_{\text{within\_gap},i}$  for other measurement objects (including RSTD measurement with periodicity  $T_{\text{prs}} = 160\text{ms}$ ) participate in the gap competition and the  $\text{CSSF}_{\text{within\_gap},i}$  are derived as below.

For each measurement gap  $j$  not used for an RSTD measurement with periodicity  $T_{\text{prs}} > 160\text{ms}$  or with periodicity  $T_{\text{prs}} = 160\text{ms}$  but *prs-MutingInfo-r9* is configured within an arbitrary 160ms period, count the total number of intra-frequency measurement objects and inter-frequency/interRAT measurement objects which are candidates to be measured within the gap  $j$ .

- An NR measurement object is a candidate to be measured in a gap if its SMTC duration is fully covered by the MGL excluding RF switching time. For intra-frequency NR measurement objects, if the higher layer in TS 38.331 [2] signaling of *smtc2* is configured, the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc2*; otherwise the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc1*.

- An inter-RAT measurement object is a candidate to be measured in all measurement gaps.

For UEs which support and are configured with per FR gaps, the counting is done on a per FR basis, and for UEs which are configured with per UE gaps the counting is done on a per UE basis.

If the number of configured inter-frequency and inter-RAT measurement objects is non-zero and the UE is configured with per UE gaps, or if the UE is configured with per FR gaps:

FR1 and FR2 intra-frequency measurement objects belong to group A

Inter-frequency and inter-RAT measurement objects belong to group B

$M_{\text{groupA},i,j}$ : Sum of the number of FR1 intra-frequency measurement objects  $M_{\text{intra-FR1},i,j}$  and the number of FR2 intra-frequency measurement objects  $M_{\text{intra-FR2},i,j}$  which are candidates to be measured in gap  $j$  where the measurement object  $i$  is also a candidate. Otherwise  $M_{\text{groupA},i,j}$  equals 0.

$M_{\text{groupB},i,j}$ : Number of NR inter-frequency and EUTRA inter-RAT measurement objects which are candidates to be measured in gap  $j$  where the measurement object  $i$  is also a candidate. Otherwise  $M_{\text{groupB},i,j}$  equals 0.

If the number of configured inter-frequency and inter-RAT measurement objects is zero and the UE is configured with per UE gaps:

FR1 intra-frequency measurement objects belong to group A

FR2 intra-frequency measurement objects belong to group B

$M_{\text{groupA},i,j}$ : The number of FR1 intra-frequency measurement objects  $M_{\text{intra-FR1},i,j}$  which are candidates to be measured in gap  $j$  where the measurement object  $i$  is also a candidate. Otherwise  $M_{\text{groupA},i,j}$  equals 0.

$M_{\text{groupB},i,j}$ : The number of FR2 intra-frequency measurement objects  $M_{\text{intra-FR2},i,j}$  which are candidates to be measured in gap  $j$  where the measurement object  $i$  is also a candidate. Otherwise  $M_{\text{groupB},i,j}$  equals 0.

$M_{\text{tot},i,j} = M_{\text{groupA},i,j} + M_{\text{groupB},i,j}$ : Total number of group A and group B measurement objects which are candidates to be measured in gap  $j$  where the measurement object  $i$  is also a candidate. Otherwise  $M_{\text{tot},i,j}$  equals 0.

For each measurement gap  $j$  used for an RSTD measurement with periodicity  $T_{\text{prs}} > 160\text{ms}$  or with periodicity  $T_{\text{prs}} = 160\text{ms}$  but *prs-MutingInfo-r9* is configured within an arbitrary 160ms period,  $M_{\text{intra},i,j} = M_{\text{inter},i,j} = M_{\text{tot},i,j} = 0$ .

The carrier specific scaling factor  $\text{CSSF}_{\text{within\_gap},i}$  is given by:

If *measGapSharingScheme* is equal sharing,  $\text{CSSF}_{\text{within\_gap},i} = \max(\text{ceil}(R_i \times M_{\text{tot},i,j}))$ , where  $j=0 \dots (160/\text{MGRP})-1$

If *measGapSharingScheme* is not equal sharing and

- measurement object  $i$  is a group A measurement object,  $\text{CSSF}_{\text{within\_gap},i}$  is the maximum among
  - $\text{ceil}(R_i \times K_{\text{intra}} \times M_{\text{groupA},i,j})$  in gaps where  $M_{\text{groupB},i,j} \neq 0$ , where  $j=0 \dots (160/\text{MGRP})-1$
  - $\text{ceil}(R_i \times M_{\text{groupA},i,j})$  in gaps where  $M_{\text{groupB},i,j} = 0$ , where  $j=0 \dots (160/\text{MGRP})-1$
- measurement object  $i$  is a group B measurement object,  $\text{CSSF}_{\text{within\_gap},i}$  is the maximum among
  - $\text{ceil}(R_i \times K_{\text{inter}} \times M_{\text{groupB},i,j})$  in gaps where  $M_{\text{groupA},i,j} \neq 0$ , where  $j=0 \dots (160/\text{MGRP})-1$
  - $\text{ceil}(R_i \times M_{\text{groupB},i,j})$  in gaps where  $M_{\text{groupA},i,j} = 0$ , where  $j=0 \dots (160/\text{MGRP})-1$

$R_i$  is the maximal ratio of the number of measurement gap where measurement object  $i$  is a candidate to be measured over the number of measurement gap where measurement object  $i$  is a candidate and not used for RSTD measurement with periodicity  $T_{\text{prs}} > 160\text{ms}$  or with periodicity  $T_{\text{prs}} = 160\text{ms}$  but *prs-MutingInfo-r9* is configured within an arbitrary 1280ms period.

## 9.1.6 Minimum requirement at transitions

When the measurement on one intra-frequency measurement object transitions from measurements performed outside gaps to measurements performed within gaps or vice versa during one measurement period, the cell identification and measurement period requirements with the longer delay apply.

The carrier-specific scaling factor specified in clause 9.1.5 that applies to the other impacted measurement objects will also apply based on the longer measurement or cell identification delay before or after the transition.

When the UE transitions between DRX and non-DRX or when DRX cycle periodicity changes, the cell identification and measurement period requirements apply based on the longer delay before or after the transition.

Subsequent to this measurement period, the cell identification and measurement period requirements on each measurement object are corresponding to the second mode after transition.

## 9.2 NR intra-frequency measurements

### 9.2.1 Introduction

A measurement is defined as a SSB based intra-frequency measurement provided the centre frequency of the SSB of the serving cell indicated for measurement and the centre frequency of the SSB of the neighbour cell are the same, and the subcarrier spacing of the two SSBs are also the same.

The UE shall be able to identify new intra-frequency cells and perform SS-RSRP, SS-RSRQ, and SS-SINR measurements of identified intra-frequency cells if carrier frequency information is provided by PCell or the PSCell, even if no explicit neighbour list with physical layer cell identities is provided.

The UE can perform intra-frequency SSB based measurements without measurement gaps if

- the SSB is completely contained in the active BWP of the UE, or
- the active downlink BWP is initial BWP[3].

For intra-frequency SSB based measurements without measurement gaps, UE may cause scheduling restriction as specified in clause 9.2.5.3.

SSB based measurements are configured along with one or two measurement timing configuration(s) (SMTC(s)) which provides periodicity, duration and offset information on a window of up to 5ms where the measurements are to be performed. For intra-frequency connected mode measurements, up to two measurement window periodicities may be configured. A single measurement window offset and measurement duration are configured per intra-frequency measurement object.

When measurement gaps are needed, the UE is not expected to detect SSB and measure RSSI of RSRQ which start earlier than the gap starting time + switching time, nor detect SSB and measure RSSI of RSRQ which end later than the gap end – switching time. Switching time is 0.5ms for frequency range FR1 and 0.25ms for frequency range FR2.

### 9.2.2 Requirements applicability

The requirements in clause 9.2 apply, provided:

- The cell being identified or measured is detectable.

An intra-frequency cell shall be considered detectable when for each relevant SSB:

- SS-RSRP related side conditions given in clauses 10.1.2 and 10.1.3 for FR1 and FR2, respectively, for a corresponding Band,
- SS-RSRQ related side conditions given in clauses 10.1.7 and 10.1.8 for FR1 and FR2, respectively, for a corresponding Band,
- SS-SINR related side conditions given in clauses 10.1.12 and 10.1.13 for FR1 and FR2, respectively, for a corresponding Band,
- SSB<sub>RP</sub> and SSB  $\hat{E}_s/I_{ot}$  according to Annex B.2.2 for a corresponding Band.

## 9.2.3 Number of cells and number of SSB

### 9.2.3.1 Requirements for FR1

For each intra-frequency layer, during each layer 1 measurement period, the UE shall be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least:

- 8 identified cells, and
- 14 SSBs with different SSB index and/or PCI on the intra-frequency layer, where the number of SSBs in the serving cell (except for the SCell) is not smaller than the number of configured RLM-RS SSB resources.

### 9.2.3.2 Requirements for FR2

For one single intra-frequency layer in a band, during each layer 1 measurement period, the UE shall be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least:

- 6 identified cells, and
- 24 SSBs with different SSB index and/or PCI,

where this single intra-frequency layer shall be:

- PCC when UE is configured with SA NR operation mode with PCC in the band; or
- PSCC when UE is configured with EN-DC with PSCC in the band; or
- PSCC when UE is configured with NR-DC with PSCC in the band; or
- One of the SCCs on which UE is configured to report SSB based measurements when neither PCC nor PSCC is in the same band, so that the selected SCC shall be an SCC where the UE is configured with SS-RSRP measurement reporting if such SCC exists, otherwise the selected SCC is determined by UE implementation.

The UE shall also be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least 2 SSBs on serving cell for each of the other intra-frequency layer(s) in the same band.

## 9.2.4 Measurement Reporting Requirements

### 9.2.4.1 Periodic Reporting

Reported RSRP, RSRQ, and RS-SINR measurements contained in periodic measurement reports shall meet the requirements in clauses 10.1.2.1 (RSRP for FR1), 10.1.3.1 (RSRP for FR2), 10.1.7.1 (RSRQ for FR1), 10.1.8.1 (RSRQ for FR2), 10.1.12.1 (RS-SINR for FR1) and 10.1.13.1 (RS-SINR for FR2).

### 9.2.4.2 Event-triggered Periodic Reporting

Reported RSRP, RSRQ, and RS-SINR measurements contained in event-triggered periodic measurement reports shall meet the requirements in clauses 10.1.2.1 (RSRP for FR1), 10.1.3.1 (RSRP for FR2), 10.1.7.1 (RSRQ for FR1), 10.1.8.1 (RSRQ for FR2), 10.1.12.1 (RS-SINR for FR1) and 10.1.13.1 (RS-SINR for FR2).

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.2.4.3.

### 9.2.4.3 Event Triggered Reporting

Reported RSRP, RSRQ, and RS-SINR measurements contained in event triggered measurement reports shall meet the requirements in clauses 10.1.2.1 (RSRP for FR1), 10.1.3.1 (RSRP for FR2), 10.1.7.1 (RSRQ for FR1), 10.1.8.1 (RSRQ for FR2), 10.1.12.1 (RS-SINR for FR1) and 10.1.13.1 (RS-SINR for FR2).

The UE shall not send any event triggered measurement reports as long as no reporting criteria is fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which caused by no UL resources being available for UE to send the measurement report on.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{identify\_intra\_with\_index}}$  Or  $T_{\text{identify\_intra\_without\_index}}$  defined in clause 9.2.5.1 or clause 9.2.6.2. When L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSBs measured from the Cell being configured remains detectable during the time period  $T_{\text{identify\_intra\_without\_index}}$  or  $T_{\text{identify\_intra\_with\_index}}$  as defined in clause 9.2.5.1 or clause 9.2.6.2. If a cell which has been detectable at least for the time period  $T_{\text{identify\_intra\_without\_index}}$  or  $T_{\text{identify\_intra\_with\_index}}$  defined in clause 9.2.5.1 or clause 9.2.6.2 becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again with the same spatial reception parameter and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{SSB\_measurement\_period\_intra}$  provided the timing to that cell has not changed more than  $\pm 3200/2^\mu T_c$  while the measurement gap has not been available and L3 filtering has not been used, where  $\mu$  is the SCS configuration as defined in clause 4.2 of TS 38.211 [3]. When L3 filtering is used, an additional delay can be expected.

## 9.2.5 Intrafrequency measurements without measurement gaps

### 9.2.5.1 Intrafrequency cell identification

The UE shall be able to identify a new detectable intra-frequency cell within  $T_{\text{identify\_intra\_without\_index}}$  if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE is indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). Otherwise UE shall be able to identify a new detectable intra frequency cell within  $T_{\text{identify\_intra\_with\_index}}$ . The UE shall be able to identify a new detectable intra frequency SS block of an already detected cell within  $T_{\text{identify\_intra\_without\_index}}$ . It is assumed that *deriveSSB-IndexFromCell* is always enabled for FR1 TDD and FR2.

$$T_{\text{identify\_intra\_without\_index}} = (T_{\text{PSS/SSS\_sync\_intra}} + T_{\text{SSB\_measurement\_period\_intra}}) \text{ ms}$$

$$T_{\text{identify\_intra\_with\_index}} = (T_{\text{PSS/SSS\_sync\_intra}} + T_{\text{SSB\_measurement\_period\_intra}} + T_{\text{SSB\_time\_index\_intra}}) \text{ ms}$$

Where:

$T_{\text{PSS/SSS\_sync\_intra}}$ : it is the time period used in PSS/SSS detection given in table 9.2.5.1-1, 9.2.5.1-2, 9.2.5.1-4 (deactivated SCell) or 9.2.5.1-5 (deactivated SCell)

$T_{\text{SSB\_time\_index\_intra}}$ : it is the time period used to acquire the index of the SSB being measured given in table 9.2.5.1-3 or 9.2.5.1-6 (deactivated SCell)

$T_{\text{SSB\_measurement\_period\_intra}}$ : equal to a measurement period of SSB based measurement given in table 9.2.5.2-1, table 9.2.5.2-2 table 9.2.5.2-3 (deactivated SCell) or 9.2.5.2-4(deactivated SCell)

$CSSF_{\text{intra}}$ : it is a carrier specific scaling factor and is determined

according to  $CSSF_{\text{outside\_gap},i}$  in clause 9.1.5.1 for measurement conducted outside measurement gaps, i.e. when intra-frequency SMTC is fully non overlapping or partially overlapping with measurement gaps, or according to  $CSSF_{\text{within\_gap},i}$  in clause 9.1.5.2 for measurement conducted within measurement gaps, i.e. when intra-frequency SMTC is fully overlapping with measurement gaps.

if the high layer in TS 38.331 [2] signalling of *smtc2* is configured, the assumed periodicity of intra-frequency SMTC occasions corresponds to the value of higher layer parameter *smtc2*; Otherwise the assumed periodicity of intra-frequency SMTC occasions corresponds to the value of higher layer parameter *smtc1*.

$M_{\text{pss/sss\_sync\_w/o\_gaps}}$  : For a UE supporting FR2 power class 1,  $M_{\text{pss/sss\_sync\_w/o\_gaps}}=40$ . For a UE supporting power class 2,  $M_{\text{pss/sss\_sync\_w/o\_gaps}}=24$ . For a UE supporting FR2 power class 3,  $M_{\text{pss/sss\_sync\_w/o\_gaps}}=24$ . For a UE supporting FR2 power class 4,  $M_{\text{pss/sss\_sync\_w/o\_gaps}}=24$

$M_{\text{meas\_period\_w/o\_gaps}}$  : For a UE supporting power class 1,  $M_{\text{meas\_period\_w/o\_gaps}} = 40$ . For a UE supporting FR2 power class 2,  $M_{\text{meas\_period\_w/o\_gaps}} = 24$ . For a UE supporting power class 3,  $M_{\text{meas\_period\_w/o\_gaps}} = 24$ . For a UE supporting power class 4,  $M_{\text{meas\_period\_w/o\_gaps}} = 24$ .

When intra-frequency SMTC is fully non overlapping with measurement gaps or intra-frequency SMTC is fully overlapping with MGs,  $K_p = 1$

When intra-frequency SMTC is partially overlapping with measurement gaps,  $K_p = 1 / (1 - (\text{SMTC period} / \text{MGRP}))$ , where  $\text{SMTC period} < \text{MGRP}$ . For calculation of  $K_p$ , if the high layer signalling (TS 38.331 [2]) of *smtc2* is configured, for cells indicated in the *pci-List* parameter in *smtc2*, the SMTC periodicity corresponds to the value of higher layer parameter *smtc2*; for the other cells, the SMTC periodicity corresponds to the value of higher layer parameter *smtc1*.

If the higher layer signaling in TS38.331 [2] signalling of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for  $T_{\text{identify\_intra\_without\_index}}$  Or  $T_{\text{identify\_intra\_with\_index}}$

For FR2,

$K_{\text{layer1\_measurement}} = 1,$

- if all of the reference signals configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any FR2 serving frequency in the same band outside measurement gap are not fully overlapped by intra-frequency SMTC occasions, or
- if all of the reference signal configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any FR2 serving frequency in the same band outside measurement gap and fully-overlapped by intra-frequency SMTC occasions are not overlapped with any of the SSB symbols and the RSSI symbols, and 1 symbol before each consecutive SSB symbols and the RSSI symbols, and 1 symbol after each consecutive SSB symbols and the RSSI symbols, given that *SSB-ToMeasure* and *SS-RSSI-Measurement* are configured, where SSB symbols are indicated by the union set of *SSB-ToMeasure* from all the configured measurement objects on the same serving carrier which can be merged and RSSI symbols are indicated by *SS-RSSI-Measurement*;

$K_{\text{layer1\_measurement}} = 1.5,$  otherwise.

If the above-mentioned reference signal configured for L1-RSRP measurement is aperiodic CSI-RS resource, longer cell identification delay would be expected.

If MCG DRX is in use, cell identification requirements for intra-frequency measurement in MCG specified in Table 9.2.5.1-1, Table 9.2.5.1-2, Table 9.2.5.1-3, Table 9.2.5.1-4, Table 9.2.5.1-5 and Table 9.2.5.1-6 shall depend on the MCG DRX cycle. If SCG DRX is in use, cell identification requirements for intra-frequency measurement in SCG specified in Table 9.2.5.1-1, Table 9.2.5.1-2, Table 9.2.5.1-3, Table 9.2.5.1-4, Table 9.2.5.1-5 and Table 9.2.5.1-6 shall depend on the SCG DRX cycle. Otherwise, the requirements for when DRX is not in use shall apply.

**Table 9.2.5.1-1: Time period for PSS/SSS detection, (Frequency range FR1)**

| DRX cycle   | $T_{\text{PSS/SSS\_sync\_intra}}$  |
|---|--|
| No DRX  | $\max(600\text{ms}, \text{ceil}(5 \times K_p) \times \text{SMTC period})^{\text{Note 1}} \times \text{CSSF}_{\text{intra}}$                    |

**Table 9.2.5.1-7: Void****Table 9.2.5.1-8: Void**

## 9.2.5.2 Measurement period

The measurement period for intrafrequency measurements without gaps is as shown in table 9.2.5.2-1, 9.2.5.2-2, 9.2.5.2-3 (deactivated SCell) or 9.2.5.2-4 (deactivated SCell). If the higher layer signaling in TS38.331 [2] signalling of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for  $T_{\text{SSB\_measurement\_period\_intra}}$

If MCG DRX is in use, measurement period requirements for intra-frequency measurement in MCG specified in Table 9.2.5.2-1, Table 9.2.5.2-2, Table 9.2.5.2-3 and Table 9.2.5.2-4 shall depend on the MCG DRX cycle. If SCG DRX is in use, measurement period requirements for intra-frequency measurement in SCG specified in Table 9.2.5.2-1, Table 9.2.5.2-2, Table 9.2.5.2-3 and Table 9.2.5.2-4 shall depend on the SCG DRX cycle. Otherwise, the requirements for when DRX is not in use shall apply.

For FR2, a longer measurement period is allowed, if aperiodic CSI-RS resource is measured for L1-RSRP measurement on any FR2 serving frequency in the same band, and the CSI-RS resource is outside measurement gap and overlapped with any of the SSB symbols and the RSSI symbols, and 1 symbol before each consecutive SSB symbols and the RSSI symbols, and 1 symbol after each consecutive SSB symbols and the RSSI symbols. If *SSB-ToMeasure* or *SS-RSSI-Measurement* is configured, the SSB symbols are indicated by the union set of *SSB-ToMeasure* from all the configured measurement objects on the same band which can be merged and the RSSI symbols are indicated by *SS-RSSI-Measurement*.

**Table 9.2.5.2-1: Measurement period for intrafrequency measurements without gaps(FR1)**

| DRX cycle                     | $T_{SSB\_measurement\_period\_intra}$   |
|-------------------------------|---|
| No DRX                        | $\max(200\text{ms}, \text{ceil}(5 \times K_p) \times \text{SMTC period})^{\text{Note 1}} \times \text{CSSF}_{intra}$                    |
| DRX cycle $\leq 320\text{ms}$ | $\max(200\text{ms}, \text{ceil}(1.5 \times 5 \times K_p) \times \max(\text{SMTC period}, \text{DRX cycle})) \times \text{CSSF}_{intra}$ |
| DRX cycle $> 320\text{ms}$    | $\text{ceil}(5 \times K_p) \times \text{DRX cycle} \times \text{CSSF}_{intra}$  |

NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified

**Table 9.2.5.2-2: Measurement period for intra-frequency measurements without gaps(FR2)**

| DRX cycle                     | $T_{SSB\_measurement\_period\_intra}$  |
|-------------------------------|--|
| No DRX                        | $\max(400\text{ms}, \text{ceil}(M_{meas\_period\_w/o\_gaps} \times K_p \times K_{layer1\_measurement}) \times \text{SMTC period})^{\text{Note 1}} \times \text{CSSF}_{intra}$                    |
| DRX cycle $\leq 320\text{ms}$ | $\max(400\text{ms}, \text{ceil}(1.5 \times M_{meas\_period\_w/o\_gaps} \times K_p \times K_{layer1\_measurement}) \times \max(\text{SMTC period}, \text{DRX cycle})) \times \text{CSSF}_{intra}$ |
| DRX cycle $> 320\text{ms}$    | $\text{ceil}(M_{meas\_period\_w/o\_gaps} \times K_p \times K_{layer1\_measurement}) \times \text{DRX cycle} \times \text{CSSF}_{intra}$  |

NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified

**Table 9.2.5.2-3: Measurement period for intra-frequency measurements without gaps (deactivated SCell) (FR1)**

| DRX cycle                     | $T_{SSB\_measurement\_period\_intra}$  |
|-------------------------------|--|
| No DRX                        | $\text{Ceil}(5 \times K_p) \times \text{measCycleSCell} \times \text{CSSF}_{intra}$                                    |
| DRX cycle $\leq 320\text{ms}$ | $\text{Ceil}(5 \times K_p) \times \max(\text{measCycleSCell}, 1.5 \times \text{DRX cycle}) \times \text{CSSF}_{intra}$ |
| DRX cycle $> 320\text{ms}$    | $\text{Ceil}(5 \times K_p) \times \max(\text{measCycleSCell}, \text{DRX cycle}) \times \text{CSSF}_{intra}$            |

**Table 9.2.5.2-4: Measurement period for intra-frequency measurements without gaps (deactivated SCell) FR2)**

| DRX cycle                     | $T_{SSB\_measurement\_period\_intra}$  |
|-------------------------------|--|
| No DRX                        | $\text{Ceil}(M_{meas\_period\_w/o\_gaps} \times K_p) \times \text{measCycleSCell} \times \text{CSSF}_{intra}$                                    |
| DRX cycle $\leq 320\text{ms}$ | $\text{Ceil}(M_{meas\_period\_w/o\_gaps} \times K_p) \times \max(\text{measCycleSCell}, 1.5 \times \text{DRX cycle}) \times \text{CSSF}_{intra}$ |
| DRX cycle $> 320\text{ms}$    | $\text{Ceil}(M_{meas\_period\_w/o\_gaps} \times K_p) \times \max(\text{measCycleSCell}, \text{DRX cycle}) \times \text{CSSF}_{intra}$            |

### 9.2.5.3 Scheduling availability of UE during intra-frequency measurements

UE are required to be capable of measuring without measurement gaps when the SSB is completely contained in the active bandwidth part of the UE. When any of the conditions in the following clauses is met, there are restrictions on the scheduling availability; otherwise, there is no scheduling restriction. Note that the SSB symbols to be measured in the following clauses are the SSB symbols indicated by the union set of *SSB-ToMeasure* from all the configured measurement objects on the same serving carrier which can be merged [2], if it is configured; otherwise, all *L* SSB symbols within SMTC window duration defined in clause 4.1 of TS 38.213 [3] are included.

#### 9.2.5.3.1 Scheduling availability of UE performing measurements in TDD bands on FR1

When the UE performs intra-frequency measurements in a TDD band, the following restrictions apply due to SS-RSRP or SS-SINR measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration. If the high layer in TS 38.331 [2] signalling of *smtc2* is configured, the SMTC periodicity follows *smtc2*; Otherwise SMTC periodicity follows *smtc1*.

When the UE performs intra-frequency measurements in a TDD band, the following restrictions apply due to SS-RSRQ measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB to be measured/RSSI symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration. If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*

When TDD intra-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell should also apply to all other serving cells in the same band on the symbols that fully or partially overlap with aforementioned restricted symbols.

#### 9.2.5.3.2 Scheduling availability of UE performing measurements with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UE which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to SS-RSRP/RSRQ/SINR measurement

- If *deriveSSB\_IndexFromCell* is enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration. If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.
- If *deriveSSB\_IndexFromCell* is not enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within SMTC window duration. If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

If the following conditions are met:

- The UE has been notified about system information update through paging,
- The gap between the UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots

The UE is expected to receive the PDCCH that the UE monitors in the Type0-PDCCH CSS set, and/or the corresponding PDSCH, on SSB symbols to be measured.

When intra-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell should also apply to all other serving cells in the same band on the symbols that fully or partially overlap with aforementioned restricted symbols.

### 9.2.5.3.3 Scheduling availability of UE performing measurements on FR2

The following scheduling restriction applies due to SS-RSRP or SS-SINR measurement on an FR2 intra-frequency cell

The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration (The signaling *deriveSSB\_IndexFromCell* is always enabled for FR2). If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

The following scheduling restriction applies to SS-RSRQ measurement on an FR2 intra-frequency cell

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB to be measured/RSSI symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration (The signaling *deriveSSB\_IndexFromCell* is always enabled for FR2). If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

When intra-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell should also apply to all other serving cells in the same band on the symbols that fully or partially overlap with aforementioned restricted symbols.

If following conditions are met:

- The UE has been notified about system information update through paging,
- The gap between the UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, the UE is expected to receive the PDCCH that the UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, the UE is expected to receive PDSCH that corresponds to the PDCCH that the UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured.

### 9.2.5.3.4 Scheduling availability of UE performing measurements on FR1 or FR2 in case of FR1-FR2 inter-band CA

There are no scheduling restrictions on FR1 serving cell(s) due to measurements performed on FR2 serving cell frequency layer.

There are no scheduling restrictions on FR2 serving cell(s) due to measurements performed on FR1 serving cell frequency layer.

## 9.2.5.4 SFTD Measurements between PCell and PSCell

### 9.2.5.4.1 Introduction

This clause contains SFTD measurement requirements for UE which supports NR-DC and is configured with a PSCell in RRC\_CONNECTED state. The UE shall perform SFTD measurement between PCell and PSCell, and report the SFTD result with/without SS-RSRP after the network requests with *reportType* for the associated *reportConfig* set to *reportSFTD*. The overall delay includes RRC procedure delay defined in clause 12 in TS 38.331 [2], and SFTD measurement reporting delay in clause 9.2.5.4.3.

### 9.2.5.4.2 SFTD Measurement delay

When no DRX is used in either of PCell and PSCell, the physical layer measurement period of the SFTD measurement shall be  $T_{\text{measure\_SFTD1}} = \max(200, 5 \times \text{SMTC period})$  ms, where the SMTC period refers to the maximum between the configured SMTC period in PCell and PSCell.

When DRX is used in either of the PCell or the PSCell, or in both PCell and PSCell, the physical layer measurement period ( $T_{\text{measure\_SFTD1}}$ ) of the SFTD measurement shall be as specified in Table 9.2.5.4.2-1.

**Table 9.2.5.4.2-1: SFTD measurement requirement when DRX is used**

| DRX cycle length (s) <sup>Note 3</sup>   | $T_{\text{measure\_SFTD1}}$ (s)                       |
|--|---|
| $\leq 0.04$  | $\max(0.2, 5 \times \text{SMTC period})$ (Note2)      |
| $0.04 < \text{DRX cycle} \leq 0.32$  | $8 \times \max(\text{DRX cycle}, \text{SMTC period})$ |
| $0.32 < \text{DRX cycle} \leq 10.24$   | $5 \times \text{DRX cycle}$                           |
| Note 1: SMTC period in this table refers to the maximum between the configured SMTC period in PCell and PSCell.<br>Note 2: Number of DRX cycles depends upon the DRX cycle in use<br>Note 3: DRX cycle length in this table refers to the DRX cycle length configured for PCell or PSCell. When DRX is used in both PCell and PSCell, DRX cycle length in this table refers to the longer of the DRX cycle lengths for PCell and PSCell. |   |

If PSCell is changed without changing carrier frequency of PSCell, while the UE is performing SFTD measurements, the UE shall still meet SFTD measurement and accuracy requirements for the new PSCell. In this case the UE shall restart the SFTD measurement, and the total physical layer measurement period shall not exceed  $T_{\text{measure\_SFTD2}}$  as defined by the following expression:

$$T_{\text{measure\_SFTD2}} = (M+1) \cdot (T_{\text{measure\_SFTD1}}) + M \cdot T_{\text{PSCell\_change\_NRDC}}$$

where:

M is the number of times the NR PSCell is changed over the measurement period ( $T_{\text{measure\_SFTD2}}$ ), and

$T_{\text{PSCell\_change\_NRDC}}$  is the time necessary to change the PSCell; it can be up to 25 ms.

If PCell is changed, or if PSCell is changed with different carrier frequency from PSCell, the UE shall terminate SFTD measurements.

The measurement accuracy for the SFTD measurement when DRX is used as well as when no DRX is used shall be as specified in the sub-clause 10.1.21.

### 9.2.5.4.3 SFTD Measurement Reporting Delay

The SFTD measurement reporting delay is defined as the time between a command that will trigger an SFTD measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{\text{DCCH}}$ . This measurement reporting delay excludes any delay caused by no UL resources available for UE to send the measurement report.

The SFTD measurement reporting delay shall be less than measurement period defined in clause 9.2.5.4.2 plus the RRC procedure delay defined in TS 38.331 [2].

## 9.2.6 Intra-frequency measurements with measurement gaps

### 9.2.6.1 Void

### 9.2.6.2 Intra-frequency cell identification

The UE shall be able to identify a new detectable intra-frequency cell within  $T_{\text{identify\_intra\_without\_index}}$  if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRSIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE has been indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). Otherwise UE shall be able to identify a new detectable intra frequency cell within  $T_{\text{identify\_intra\_with\_index}}$ . The UE shall be able to identify a new detectable intra frequency SS block of an already detected cell within  $T_{\text{identify\_intra\_without\_index}}$ . It is assumed that *deriveSSB-IndexFromCell* is always enabled for FR1 TDD and FR2.

$$T_{\text{identify\_intra\_without\_index}} = T_{\text{PSS/SSS\_sync\_intra}} + T_{\text{SSB\_measurement\_period\_intra}} \text{ ms}$$

$$T_{\text{identify\_intra\_with\_index}} = T_{\text{PSS/SSS\_sync\_intra}} + T_{\text{SSB\_measurement\_period\_intra}} + T_{\text{SSB\_time\_index\_intra}}$$

Where:

$T_{\text{PSS/SSS\_sync\_intra}}$ : it is the time period used in PSS/SSS detection given in table 9.2.6.2-1 or 9.2.6.2-2.

$T_{\text{SSB\_time\_index\_intra}}$ : it is the time period used to acquire the index of the SSB being measured given in table 9.2.6.2-3.

$T_{\text{SSB\_measurement\_period\_intra}}$ : equal to a measurement period of SSB based measurement given in table 9.2.6.3-1 or 9.2.6.3-2.

$\text{CSSF}_{\text{intra}}$ : it is a carrier specific scaling factor and is determined according to  $\text{CSSF}_{\text{within\_gap},i}$  in clause 9.1.5.2 for measurement conducted within measurement gaps.

$M_{\text{pss/sss\_sync\_with\_gaps}}$ : For a UE supporting FR2 power class 1,  $M_{\text{pss/sss\_sync\_with\_gaps}}=40$ . For a UE supporting FR2 power class 2,  $M_{\text{pss/sss\_sync\_with\_gaps}}=24$ . For a UE supporting FR2 power class 3,  $M_{\text{pss/sss\_sync\_with\_gaps}}=24$ . For a UE supporting power class 4,  $M_{\text{pss/sss\_sync\_with\_gaps}}=24$

$M_{\text{meas\_period\_with\_gaps}}$ : For a UE supporting power class 1,  $M_{\text{meas\_period\_with\_gaps}}=40$ . For a UE supporting power class 2,  $M_{\text{meas\_period\_with\_gaps}}=24$ . For a UE supporting power class 3,  $M_{\text{meas\_period\_with\_gaps}}=24$ . For a UE supporting power class 4,  $M_{\text{meas\_period\_with\_gaps}}=24$ .

If the higher layer signaling in TS 38.331 [2] of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for  $T_{\text{identify\_intra\_without\_index}}$  OR  $T_{\text{identify\_intra\_with\_index}}$ .

If MCG DRX is in use, cell identification requirements for intra-frequency measurement in MCG specified in Table 9.2.6.2-1, Table 9.2.6.2-2, and Table 9.2.6.2-3 shall depend on the MCG DRX cycle. If SCG DRX is in use, cell identification requirements for intra-frequency measurement in SCG specified in Table 9.2.6.2-1, Table 9.2.6.2-2, and Table 9.2.6.2-3 shall depend on the SCG DRX cycle. Otherwise, the requirements for when DRX is not in use shall apply.

**Table 9.2.6.2-1: Time period for PSS/SSS detection (FR1)**

| DRX cycle                            | $T_{\text{PSS/SSS\_sync\_intra}}$  |
|--------------------------------------|--|
| No DRX                               | $\max(600\text{ms}, 5 \times \max(\text{MGRP}, \text{SMTC period})) \times \text{CSSF}_{\text{intra}}$   |
| $\text{DRX cycle} \leq 320\text{ms}$ | $\max(600\text{ms}, \text{ceil}(1.5 \times 5) \times \max(\text{MGRP}, \text{SMTC period}, \text{DRX cycle})) \times \text{CSSF}_{\text{intra}}$ |
| $\text{DRX cycle} > 320\text{ms}$    | $5 \times \max(\text{MGRP}, \text{DRX cycle}) \times \text{CSSF}_{\text{intra}}$   |

**Table 9.2.6.2-2: Time period for PSS/SSS detection (FR2)**

### 9.2.6.3 Intra-frequency Measurement Period

The measurement period for FR1 intra-frequency measurements with gaps is as shown in table 9.2.6.3-1.

The measurement period for FR2 intra-frequency measurements with gaps is as shown in table 9.2.6.3-2.

If MCG DRX is in use, measurement period requirements for intra-frequency measurement in MCG specified in Table 9.2.6.3-1 and Table 9.2.6.3-2, shall depend on the MCG DRX cycle. If SCG DRX is in use, measurement period requirements for intra-frequency measurement in SCG specified in Table 9.2.6.3-1 and Table 9.2.6.3-2, shall depend on the SCG DRX cycle. Otherwise, the requirements for when DRX is not in use shall apply.

**Table 9.2.6.3-1: Measurement period for intra-frequency measurements with gaps(FR1)**

|--------------------------------------|--|
| No DRX                               | $\max(400\text{ms}, M_{meas\_period\ with\_gaps} \times \max(\text{MGRP}, \text{SMTC period})) \times \text{CSSF}_{intra}$   |
| $\text{DRX cycle} \leq 320\text{ms}$ | $\max(400\text{ms}, \text{ceil}(1.5 \times M_{meas\_period\ with\_gaps}) \times \max(\text{MGRP}, \text{SMTC period}, \text{DRX cycle})) \times \text{CSSF}_{intra}$ <sup>Note 1</sup> |
| $\text{DRX cycle} > 320\text{ms}$    | $M_{meas\_period\ with\_gaps} \times \max(\text{MGRP}, \text{DRX cycle}) \times \text{CSSF}_{intra}$   |

## 9.3 NR inter-frequency measurements

### 9.3.1 Introduction

A measurement is defined as an SSB based inter-frequency measurement provided it is not defined as an intra-frequency measurement according to clause 9.2.

The UE shall be able to identify new inter-frequency cells and perform SS-RSRP, SS-RSRQ, and SS-SINR measurements of identified inter-frequency cells if carrier frequency information is provided by PCell or PSCell, even if no explicit neighbour list with physical layer cell identities is provided.

SSB based measurements are configured along with a measurement timing configuration (SMTC) per carrier, which provides periodicity, duration and offset information on a window of up to 5ms where the measurements on the configured inter-frequency carrier are to be performed. For inter-frequency connected mode measurements, one measurement window periodicity may be configured per inter-frequency measurement object.

When measurement gaps are needed, the UE is not expected to detect SSB and measure RSSI of RSRQ on an inter-frequency measurement object which starts earlier than the gap starting time + switching time, nor detect SSB and measure RSSI of RSRQ which ends later than the gap end – switching time. When the inter-frequency cells are in FR2 and the per-FR gap is configured to the UE in EN-DC, SA NR, NE-DC and NR-DC, or the serving cells are in FR2, the inter-frequency cells are in FR2 and the per-UE gap is configured to the UE in SA NR and NR-DC, the switching time is 0.25ms. Otherwise the switching time is 0.5ms.

### 9.3.2 Requirements applicability

The requirements in clause 9.3 apply, provided:

- The cell being identified or measured is detectable.

An inter-frequency cell shall be considered detectable when for each relevant SSB:

- SS-RSRP related side conditions given in clauses 10.1.4 and 10.1.5 for FR1 and FR2, respectively, for a corresponding Band,
- SS-RSRQ related side conditions given in clauses 10.1.9 and 10.1.10 for FR1 and FR2, respectively, for a corresponding Band,
- SS-SINR related side conditions given in clauses 10.1.14 and 10.1.15 for FR1 and FR2, respectively, for a corresponding Band,
- SSB<sub>RP</sub> and SSB  $\hat{E}_s/I_{ot}$  according to Annex B.2.3 for a corresponding Band.

9.3.2.1 Void

9.3.2.2 Void

### 9.3.3 Number of cells and number of SSB

#### 9.3.3.1 Requirements for FR1

For each inter-frequency layer, during each layer 1 measurement period, the UE shall be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least:

- 4 identified cells, and
- 7 SSBs with different SSB index and/or PCI on the inter-frequency layer.

#### 9.3.3.2 Requirements for FR2

For each inter-frequency layer, during each layer 1 measurement period, the UE shall be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least:

- 4 identified cells, and
- 10 SSBs with different SSB index and/or PCI on the inter-frequency layer, and
- 1 SSB per identified cell.

### 9.3.4 Inter-frequency cell identification

When measurement gaps are provided, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable inter frequency cell within  $T_{\text{identify\_inter\_without\_index}}$  if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRSIndexes* or *maxNrofRSIndexesToReport* is not configured). Otherwise UE shall be able to identify a new detectable inter frequency cell within  $T_{\text{identify\_inter\_with\_index}}$ . The UE shall be able to identify a new detectable inter frequency SS block of an already detected cell within  $T_{\text{identify\_inter\_without\_index}}$ .

$$T_{\text{identify\_inter\_without\_index}} = (T_{\text{PSS/SSS\_sync\_inter}} + T_{\text{SSB\_measurement\_period\_inter}}) \text{ ms}$$

$$T_{\text{identify\_inter\_with\_index}} = (T_{\text{PSS/SSS\_sync\_inter}} + T_{\text{SSB\_measurement\_period\_inter}} + T_{\text{SSB\_time\_index\_inter}}) \text{ ms}$$

Where:

$T_{\text{PSS/SSS\_sync\_inter}}$ : it is the time period used in PSS/SSS detection given in table 9.3.4-1 and table 9.3.4-2.

$T_{\text{SSB\_time\_index\_inter}}$ : it is the time period used to acquire the index of the SSB being measured given in table 9.3.4-3 and table 9.3.4-4.

$T_{SSB\_measurement\_period\_inter}$ : equal to a measurement period of SSB based measurement given in table 9.3.5-1 and table 9.3.5-2.

$M_{pss/sss\_sync\_inter}$ : For a UE supporting FR2 power class 1,  $M_{pss/sss\_sync\_inter} = 64$  samples. For a UE supporting FR2 power class 2,  $M_{pss/sss\_sync\_inter} = 40$  samples. For a UE supporting FR2 power class 3,  $M_{pss/sss\_sync\_inter} = 40$  samples. For a UE supporting FR2 power class 4,  $M_{pss/sss\_sync\_inter} = 40$  samples.

$M_{SSB\_index\_inter}$ : For a UE supporting FR2 power class 1,  $M_{SSB\_index\_inter} = 40$  samples. For a UE supporting FR2 power class 2,  $M_{SSB\_index\_inter} = 24$  samples. For a UE supporting FR2 power class 3,  $M_{SSB\_index\_inter} = 24$  samples. For a UE supporting FR2 power class 4,  $M_{SSB\_index\_inter} = 24$  samples.

$M_{meas\_period\_inter}$ : For a UE supporting FR2 power class 1,  $M_{meas\_period\_inter} = 64$  samples. For a UE supporting FR2 power class 2,  $M_{meas\_period\_inter} = 40$  samples. For a UE supporting FR2 power class 3,  $M_{meas\_period\_inter} = 40$  samples. For a UE supporting FR2 power class 4,  $M_{meas\_period\_inter} = 40$  samples.

$CSSF_{inter}$ : it is a carrier specific scaling factor and is determined according to  $CSSF_{within\_gap,i}$  in clause 9.1.5.2 for measurement conducted within measurement gaps.

9.3.4.1 Void

9.3.4.2 Void

## 9.3.5 Inter-frequency measurements

When measurement gaps are provided for inter frequency measurements, or the UE supports capability of conducting such measurements without gaps, the UE physical layer shall be capable of reporting SS-RSRP, SS-RSRQ and SS-SINR measurements to higher layers with measurement accuracy as specified in sub-clauses 10.1.4, 10.1.5, 10.1.9, 10.1.10, 10.1.14 and 10.1.15, respectively, as shown in table 9.3.5-1 and 9.3.5-2:

**Table 9.3.5-1: Measurement period for inter-frequency measurements with gaps (Frequency FR1)**

| Condition <sup>NOTE1,2</sup>   | $T_{SSB\_measurement\_period\_inter}$   |
|--|---|
| No DRX   | $\text{Max}(200\text{ms}, 8 \times \text{Max}(\text{MGRP}, \text{SMTC period})) \times \text{CSSF}_{inter}$   |
| DRX cycle $\leq 320\text{ms}$  | $\text{Max}(200\text{ms}, \text{Ceil}(8 \times 1.5) \times \text{Max}(\text{MGRP}, \text{SMTC period}, \text{DRX cycle})) \times \text{CSSF}_{inter}$ |
| DRX cycle $> 320\text{ms}$   | $8 \times \text{DRX cycle} \times \text{CSSF}_{inter}$  |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1  |   |
| NOTE 2: In EN-DC operation, the parameters, timers and scheduling requests referred to in clause 3.6.1 are for the secondary cell group. The DRX cycle is the DRX cycle of the secondary cell group. |   |

**Table 9.3.5-2: Measurement period for inter-frequency measurements with gaps (Frequency FR2)**

| Condition <sup>NOTE1,2</sup>   | $T_{SSB\_measurement\_period\_inter}$  |
|--|--|
| No DRX   | $\text{Max}(400\text{ms}, M_{meas\_period\_inter} \times \text{Max}(\text{MGRP}, \text{SMTC period})) \times \text{CSSF}_{inter}$                                |
| DRX cycle $\leq 320\text{ms}$  | $\text{Max}(400\text{ms}, (1.5 \times M_{meas\_period\_inter}) \times \text{Max}(\text{MGRP}, \text{SMTC period}, \text{DRX cycle})) \times \text{CSSF}_{inter}$ |
| DRX cycle $> 320\text{ms}$   | $M_{meas\_period\_inter} \times \text{DRX cycle} \times \text{CSSF}_{inter}$   |

9.3.5.1 Void

9.3.5.2 Void

9.3.5.3 Void

## 9.3.6 Inter-frequency measurements reporting requirements

### 9.3.6.1 Periodic Reporting

Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.1.4.1, 10.1.5.1, 10.1.9.1, 10.1.10.1, 10.1.14.1 and 10.1.15.1, respectively.

### 9.3.6.2 Event-triggered Periodic Reporting

Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered periodic measurement reports shall meet the requirements in clauses 10.1.4.1, 10.1.5.1, 10.1.9.1, 10.1.10.1, 10.1.14.1 and 10.1.15.1, respectively.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.3.6.3.

### 9.3.6.3 Event-triggered Reporting

Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered measurement reports shall meet the requirements in clauses 10.1.4.1, 10.1.5.1, 10.1.9.1, 10.1.10.1, 10.1.14.1 and 10.1.15.1, respectively.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be within  $T_{\text{identify\_inter\_without\_index}}$  if UE is not indicated to report SSB based RRM measurement result with the associated SSB index. Otherwise UE shall be able to identify a new detectable inter frequency cell within  $T_{\text{identify\_inter\_with\_index}}$ . Both  $T_{\text{identify\_inter\_without\_index}}$  and  $T_{\text{identify\_inter\_with\_index}}$  are defined in clause 9.3.4. When L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSB measured from the cell being configured remains detectable during the time period  $T_{\text{identify\_inter\_without\_index}}$  or  $T_{\text{identify\_inter\_with\_index}}$  defined in clause 9.3.4. If a cell which has been detectable at least for the time period  $T_{\text{identify\_inter\_without\_index}}$  or  $T_{\text{identify\_inter\_with\_index}}$  defined in clause 9.3.4 becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again with the same spatial reception parameter and then triggers the measurement report as per TS 38.331 [2], the event triggered measurement reporting delay shall be less than  $T_{\text{SSB\_measurement\_period\_inter}}$  defined in clause 9.3.5 provided the timing to that cell has not changed more than  $\pm 3200/2^\mu$  Tc while measurement gap has not been available and the L3 filtering has not been used, where  $\mu$  is the SCS configuration as defined in clause 4.2 of TS 38.211 [3]. When L3 filtering is used an additional delay can be expected.

### 9.3.7 Void

## 9.3.8 Inter-frequency SFTD measurement requirements

### 9.3.8.1 Introduction

This clause contains requirements for a UE supporting NR inter-frequency SFTD measurement and is applicable in RRC\_CONNECTED state. The UE shall, depending on network request, perform inter-frequency SFTD measurement and report SFTD result with or without SS-RSRP. The overall delay includes RRC procedure delay defined in clause 12 in TS 38.331 [2] and SFTD measurement reporting delay in clause 9.3.8.3.

UE which fulfils the requirements in clause 9.3.8 is not supposed to fulfil the requirements defined in clause 9.2.5.4.

### 9.3.8.2 SFTD Measurement delay

The requirements on SFTD measurement delay defined in this clause are applicable under the side condition  $SCH \hat{E}_s/I_{ot} \geq -3$  dB for the inter-frequency neighbour cell. Depending on configuration, the SFTD measurement may be carried out with or without the support of configured measurement gaps. In the current release, indication on whether to carry out the SFTD measurement with or without measurement gaps is implicit and depending on whether measurement gaps are configured.

The UE shall be able to detect, identify and measure SFTD of up to 3 of the strongest applicable inter-frequency neighbour cells on the carrier frequency provided in the SFTD measurement configuration. Further depending on the SFTD measurement configuration, the UE shall additionally report SS-RSRP for the one or more strongest cells. The UE may or may not be configured with *cellsForWhichToReportSFTD*. The UE does not expect *cellsForWhichToReportSFTD* to change during an ongoing SFTD measurement.

When no measurement gaps are provided, the UE shall be capable of finding the inter-frequency neighbour cell regardless of its SSB position in the SMTC period, provided that the carrier frequency where SFTD measurement is configured and the serving carrier(s) form a supported CA or NR-DC band combination of the UE. The SFTD measurement shall be conducted with sustained connection to the PCell and activated SCell(s) in MCG. Depending on capability, the UE may be allowed to cause a certain amount of interruptions for reconfiguration of the radio receiver, as specified in clause 8.2.2.2.6.

When measurement gaps are provided, the UE shall be capable of finding the inter-frequency neighbour cell under the additional condition that the SSB at least occasionally falls within the measurement gap.

When no DRX is used, the UE shall be capable of determining SFTD within a physical layer measurement period of  $T_{\text{measure\_SFTD1}}$  as follows:

- For SFTD measurements without measurement gaps, and without additional SS-RSRP reporting:
  - For carrier frequency in FR1:  $T_{\text{measure\_SFTD1}} = 14$  SMTC periods
  - For carrier frequency in FR2:  $T_{\text{measure\_SFTD1}} = 112$  SMTC periods
- For SFTD measurements in measurement gaps, and without additional SS-RSRP reporting:
  - For carrier frequency in FR1:  $T_{\text{measure\_SFTD1}} = \text{CSSF}_{\text{inter}} \times 8 \times \text{Max}(\text{MGRP}, \text{SMTC period})$
  - For carrier frequency in FR2:  $T_{\text{measure\_SFTD1}} = \text{CSSF}_{\text{inter}} \times 64 \times \text{Max}(\text{MGRP}, \text{SMTC period})$
- For SFTD measurements without measurement gaps, and with additional SS-RSRP reporting:
  - For carrier frequency in FR1:  $T_{\text{measure\_SFTD1}} = 19$  SMTC periods
  - For carrier frequency in FR2:  $T_{\text{measure\_SFTD1}} = 152$  SMTC periods
- For SFTD measurements in measurement gaps, and with additional SS-RSRP reporting:
  - For carrier frequency in FR1:  $T_{\text{measure\_SFTD1}} = \text{CSSF}_{\text{inter}} \times 13 \times \text{Max}(\text{MGRP}, \text{SMTC period})$
  - For carrier frequency in FR2:  $T_{\text{measure\_SFTD1}} = \text{CSSF}_{\text{inter}} \times 104 \times \text{Max}(\text{MGRP}, \text{SMTC period})$

where  $\text{CSSF}_{\text{inter}}$  is a carrier specific scaling factor and is determined according to  $\text{CSSF}_{\text{within\_gap},i}$  in clause 9.1.5.2 for measurement conducted within measurement gaps.

When DRX is used, the same  $T_{\text{measure\_SFTD1}}$  as for non-DRX applies, but the reporting delay depends on the DRX cycle length in use.

In case PCell is changed due to handover, the UE shall terminate the inter-frequency SFTD measurement.

The measurement accuracy for the SFTD measurement shall fulfil the requirement in clause 10.1.21.3. The measurement accuracy for additionally reported SS-RSRP shall fulfil the requirement in clauses 10.1.4.1 and 10.1.5.1 for neighbour cell in FR1 and FR2, respectively.

### 9.3.8.3 SFTD Measurement reporting delay

The SFTD measurement reporting delay is defined as the time between a command that will trigger an SFTD measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty of  $2 \times \text{TTI}_{\text{DCCH}}$  resulting when inserting the measurement report to the TTI of the uplink DCCH. This measurement reporting delay excludes any delay caused by lack of UL resources for UE to send the measurement report.

The SFTD measurement reporting delay shall be less than  $T_{\text{measure\_SFTD1}}$  defined in clause 9.3.8.2 plus the RRC procedure delay defined in TS 38.331 [2].

## 9.4 Inter-RAT measurements

### 9.4.1 Introduction

The requirements in this clause are specified for NR–E-UTRAN FDD and NR–E-UTRAN TDD measurements and are applicable without an explicit E-UTRAN neighbour cell list containing physical layer cell identities, for a UE:

- in RRC\_CONNECTED state, and

- configured with SA or NR-DC operation mode or configured in NE-DC operation mode by PCell with NR-E-UTRAN FDD or TDD measurement (RSRP, RSRQ, RS-SINR, RSTD, or E-CID) on E-UTRA non-serving frequency carrier, and
- configured with an appropriate measurement gap pattern according to Table 9.1.2-3.

When the UE is in NE-DC operation mode and an NR-E-UTRAN FDD or TDD measurement (RSRP, RSRQ, RS-SINR, or E-CID RSRP and RSRQ) configured by NR PCell is on a E-UTRA serving frequency carrier, then the corresponding E-UTRA intra-frequency measurements requirements specified in clause 8.19 of TS 36.133 [15] shall apply.

Parameter  $T_{\text{inter1}}$  used in inter-RAT requirements in clause 9.4 is specified in Table 9.4.1-1.

**Table 9.4.1-1: Minimum available time for inter-RAT measurements**

| Gap Pattern Id | Measurement Gap Length (MGL, ms) | Measurement Gap Repetition Period (MGRP, ms) | Minimum available time for inter-frequency and inter-RAT measurements during 480 ms period ( $T_{\text{inter1}}$ , ms) |
|----------------|----------------------------------|--|--|
| 0              | 6                                | 40   | 60   |
| 1              | 6                                | 80   | 30   |
| 2              | 3                                | 40   | 24 <sup>Note 1</sup>   |
| 3              | 3                                | 80   | 12 <sup>Note 1</sup>   |
| 4              | 6                                | 20   | 120 <sup>Note 1</sup>  |
| 6              | 4                                | 20   | 72 <sup>Note 1,3,6</sup>   |
| 7              | 4                                | 40   | 36 <sup>Note 1,4,6</sup>   |
| 8              | 4                                | 80   | 18 <sup>Note 1,5,6</sup>   |
| 10             | 3                                | 20   | 48 <sup>Note 1</sup>   |

NOTE 1: When determining UE requirements using  $T_{\text{inter1}}$  for gap pattern IDs 2, 3, 4, 6, 7, 8, 10,  $T_{\text{inter1}} = 60$  for gap pattern IDs 2, 4, 6, 7, 10, and  $T_{\text{inter1}} = 30$  for gap pattern IDs 3 and 8 shall be used.

NOTE 2: Measurement gaps pattern configurations applicability is as specified in Table 9.1.2-1.

NOTE 3: When this gap pattern is used, the  $T_{\text{inter}}$  for E-UTRA inter-frequency measurements is 48 ms corresponding to the first 3 ms of the 4 ms gap.

NOTE 4: When this gap pattern is used, the  $T_{\text{inter}}$  for E-UTRA inter-frequency measurements is 24 ms corresponding to the first 3 ms of the 4 ms gap.

NOTE 5: When this gap pattern is used, the  $T_{\text{inter}}$  for E-UTRA inter-frequency measurements is 12 ms corresponding to the first 3 ms of the 4 ms gap.

NOTE 6: This gap pattern is applicable for E-UTRA inter-frequency measurements only if gap based NR measurements are also configured.

A UE configured with gap pattern ID 2, 3 or 10 shall be able to detect a target cell, provided that

- the E-UTRA subframe #0 or #5 of the target E-UTRAN cell begins not earlier than 500  $\mu\text{s}$  from the start of the measurement gap, and
- the E-UTRA subframe #0 or #5 of the target E-UTRAN cell ends not later than 500  $\mu\text{s}$  before the end of the measurement gap in case of FDD and not later than 750  $\mu\text{s}$  before the end of measurement gap in case of TDD.

A UE configured with gap pattern ID 6, 7 or 8 shall be able to detect a target cell, provided that

- the E-UTRA subframe #0 or #5 of the target E-UTRAN cell begins not earlier than 500  $\mu\text{s}$  from the start of the measurement gap, and
- the E-UTRA subframe #0 or #5 of the target E-UTRAN cell ends no later than 1500  $\mu\text{s}$  before the end of the measurement gap in case of FDD and no later than 1750  $\mu\text{s}$  before the end of measurement gap in case of TDD.

## 9.4.2 NR – E-UTRAN FDD measurements

### 9.4.2.1 Introduction

The requirements are applicable for NR–E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements.

In the requirements, an E-UTRAN FDD cell is considered to be detectable when:

- RSRP related conditions in the accuracy requirements in clause 10.2.2 are fulfilled for a corresponding Band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [15],
- RSRQ related conditions in the accuracy requirements in clause 10.2.3 are fulfilled for a corresponding Band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [15],
- RS-SINR related conditions in the accuracy requirements in clause 10.2.5 are fulfilled for a corresponding Band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.19 of TS 36.133 [15].

### 9.4.2.2 Requirements when no DRX is used

When the UE requires measurement gaps to identify and measure inter-RAT cells and an appropriate measurement gap pattern is scheduled, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable FDD cell within  $T_{\text{Identify, E-UTRAN FDD}}$  according to the following expression:

$$T_{\text{Identify, E-UTRAN FDD}} = T_{\text{BasicIdentify}} \cdot \frac{480}{T_{\text{Inter1}}} \cdot \text{CSSF}_{\text{interRAT}} \quad \text{ms},$$

where:

$$T_{\text{BasicIdentify}} = 480 \text{ ms},$$

$T_{\text{Inter1}}$  is defined in clause 9.4.1,

$\text{CSSF}_{\text{interRAT}} = \text{CSSF}_{\text{within\_gap},i}$  is the scaling factor for the measured inter-RAT E-UTRA carrier  $i$  which is calculated as specified in clause 9.1.5.2.

Identification of a cell shall include detection of the cell and additionally performing a single measurement with measurement period of  $T_{\text{Measure, E-UTRAN FDD}}$  defined in Table 9.4.2.2-1.

**Table 9.4.2.2-1: Measurement period and measurement bandwidth**

| Configuration                           | Physical Layer Measurement period:<br>$T_{\text{Measure, E-UTRAN FDD}}$ [ms] | Measurement bandwidth [RB] |
|---|--|----------------------------|
| 0                                       | $480 \times \text{CSSF}_{\text{interRAT}}$                                   | 6                          |
| 1 (Note 1)                              | $240 \times \text{CSSF}_{\text{interRAT}}$                                   | 50                         |
| NOTE 1: This configuration is optional. |  |                            |

When measurement gaps are scheduled for E-UTRAN FDD inter-RAT measurements, or the UE supports capability of conducting such measurements without gaps, the UE physical layer shall be capable of reporting RSRP, RSRQ, and RS-SINR measurements to higher layers with measurement period  $T_{\text{Measure, E-UTRAN FDD}}$  given by table 9.4.2.2-1.

The UE shall be capable of identifying and performing NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements of at least 4 identified E-UTRAN FDD cells per E-UTRA FDD carrier frequency layer during each layer 1 measurement period, for up to 7 E-UTRA FDD carrier frequency layers.

If higher layer filtering is used, an additional cell identification delay can be expected.

The NR – E-UTRAN FDD RSRP measurement accuracy for all measured cells shall be as specified in clause 10.2.2.

The NR – E-UTRAN FDD RSRQ measurement accuracy for all measured cells shall be as specified in clause 10.2.3.

The NR – E-UTRAN FDD RS-SINR measurement accuracy for all measured cells shall be as specified in clause 10.2.5.

### 9.4.2.3 Requirements when DRX is used

When DRX is in use and measurement gaps are configured, the UE shall be able to identify a new detectable E-UTRAN FDD cell within  $T_{\text{Identify, E-UTRAN FDD}}$  specified in Table 9.4.2.3-1.

**Table 9.4.2.3-1: Requirement to identify a newly detectable E-UTRAN FDD cell**

| DRX cycle length (s)  | $T_{\text{Identify, E-UTRAN FDD}}$ (s) (DRX cycles)                                |  |
|---|--|--|
|   | Gap period = 40 ms, 20 ms  | Gap period = 80 ms   |
| $\leq 0.16$   | Non-DRX requirements in clause 9.4.2.2 apply                                       | Non-DRX requirements in clause 9.4.2.2 apply                                       |
| 0.256   | $5.12^* \text{CSSF}_{\text{interRAT}}$<br>( $20^* \text{CSSF}_{\text{interRAT}}$ ) | $7.68^* \text{CSSF}_{\text{interRAT}}$<br>( $30^* \text{CSSF}_{\text{interRAT}}$ ) |
| 0.32  | $6.4^* \text{CSSF}_{\text{interRAT}}$<br>( $20^* \text{CSSF}_{\text{interRAT}}$ )  | $7.68^* \text{CSSF}_{\text{interRAT}}$<br>( $24^* \text{CSSF}_{\text{interRAT}}$ ) |
| $0.32 < \text{DRX-cycle} \leq 10.24$  | Note1 ( $20^* \text{CSSF}_{\text{interRAT}}$ )                                     | Note1 ( $20^* \text{CSSF}_{\text{interRAT}}$ )                                     |
| NOTE 1: The time depends on the DRX cycle length.<br>NOTE 2: $\text{CSSF}_{\text{interRAT}}$ is as defined in clause 9.4.2.2. |  |  |

When DRX is in use, the UE shall be capable of performing NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements of at least 4 identified E-UTRAN FDD cells per E-UTRA FDD frequency layer during each layer 1 measurement period, for up to 7 E-UTRA FDD carrier frequency layers, and the UE physical layer shall be capable of reporting NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements to higher layers with the measurement period  $T_{\text{measure, E-UTRAN FDD}}$  specified in Table 9.4.2.3-2.

**Table 9.4.2.3-2: Requirement to measure E-UTRAN FDD cells**

| DRX cycle length (s)  | $T_{\text{measure, E-UTRAN FDD}}$ (s) (DRX cycles) |
|---|--|
| $\leq 0.08$   | Non-DRX requirements in clause 9.4.2.2 apply       |
| $0.08 < \text{DRX-cycle} \leq 10.24$  | Note1 ( $5^* \text{CSSF}_{\text{interRAT}}$ )      |
| NOTE 1: The time depends on the DRX cycle length.<br>NOTE 2: $\text{CSSF}_{\text{interRAT}}$ is as defined in clause 9.4.2.2. |  |

If higher layer filtering is used, an additional cell identification delay can be expected.

The NR – E-UTRAN FDD RSRP measurement accuracy for all measured cells shall be as specified in clause 10.2.2.  
The NR – E-UTRAN FDD RSRQ measurement accuracy for all measured cells shall be as specified in clause 10.2.3.  
The NR – E-UTRAN FDD RS-SINR measurement accuracy for all measured cells shall be as specified in clause 10.2.5.

### 9.4.2.4 Measurement reporting requirements

#### 9.4.2.4.1 Periodic Reporting

The reported NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

#### 9.4.2.4.2 Event-Triggered Periodic Reporting

The reported NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements contained in event-triggered periodic measurement reports shall meet the requirements in clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

The first report in event-triggered periodic measurement reporting shall meet the requirements specified in clause 9.4.2.4.3.

#### 9.4.2.4.3 Event-Triggered Reporting

The reported NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements contained in event-triggered measurement reports shall meet the requirements in clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

The UE shall not send any event-triggered measurement reports as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times T_{\text{TTI}_{\text{DCCH}}}$  where  $T_{\text{TTI}_{\text{DCCH}}}$  is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{Identify, E-UTRAN FDD}}$  defined in clauses 9.4.2.2 and 9.4.2.3 without DRX and with DRX, respectively. When L3 filtering is used, an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{\text{Identify, E-UTRAN FDD}}$  becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again and triggers an event as per TS 38.331 [2], the event triggered measurement reporting delay shall be less than  $T_{\text{Measure, E-UTRAN FDD}}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  while measurement gap has not been available and the L3 filter has not been used.

## 9.4.3 NR – E-UTRAN TDD measurements

### 9.4.3.1 Introduction

The requirements are applicable for NR–E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements.

In the requirements, an E-UTRAN TDD cell is considered to be detectable when:

- RSRP related conditions in the accuracy requirements in clause 10.2.2 are fulfilled for a corresponding Band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [15],
- RSRQ related conditions in the accuracy requirements in clause 10.2.3 are fulfilled for a corresponding Band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [15],

RS-SINR related conditions in the accuracy requirements in clause 10.2.5 are fulfilled for a corresponding Band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.19 of TS 36.133 [15].

### 9.4.3.2 Requirements when no DRX is used

When the UE requires measurement gaps to identify and measure inter-RAT cells and an appropriate measurement gap pattern is scheduled, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable TDD cell within  $T_{\text{Identify, E-UTRAN TDD}}$  according to the following expression:

- When configuration 0 or configuration 1 in Table 9.4.3.2-1 is applied,

$$T_{\text{Identify, E-UTRAN TDD}} = T_{\text{BasicIdentify}} \cdot \frac{480}{T_{\text{Inter1}}} \cdot \text{CSSF}_{\text{interRAT}} \quad \text{ms},$$

- When configuration 2 or configuration 3 in Table 9.4.3.2-1 is applied,

$$T_{\text{Identify, E-UTRAN TDD}} = T_{\text{BasicIdentify}} \cdot \frac{480}{T_{\text{Inter1}}} \cdot \text{CSSF}_{\text{interRAT}} + 240 \cdot \text{CSSF}_{\text{interRAT}} \quad \text{ms},$$

where:

$$T_{\text{BasicIdentify}} = 480 \text{ ms},$$

$T_{\text{Inter1}}$  is defined in clause 9.4.1,

$\text{CSSF}_{\text{interRAT}} = \text{CSSF}_{\text{within\_gap}, i}$  is the scaling factor for the measured inter-RAT E-UTRA carrier  $i$  which is calculated as specified in clause 9.1.5.2.

Identification of a cell shall include detection of the cell and additionally performing a single measurement with measurement period of  $T_{\text{Measure, E-UTRAN TDD}}$  defined in Table 9.4.3.2-1.

**Table 9.4.3.2-1:  $T_{\text{Measure, E-UTRAN TDD}}$  for different configurations**

| Configuration | Measurement bandwidth (RB) | Number of UL/DL sub-frames per half frame (5 ms) |    | DwPTS             |                   | $T_{\text{Measure, E-UTRAN TDD}}$ (ms) |
|---------------|----------------------------|--|----|-------------------|-------------------|--|
|               |                            | DL   | UL | Normal CP         | Extended CP       |  |
| 0             | 6                          | 2  | 2  | $19760 \cdot T_s$ | $20480 \cdot T_s$ | 480 x $\text{CSSF}_{\text{interRAT}}$  |
| 1 (Note 1)    | 50                         | 2  | 2  | $19760 \cdot T_s$ | $20480 \cdot T_s$ | 240 x $\text{CSSF}_{\text{interRAT}}$  |
| 2             | 6                          | 1  | 3  | $19760 \cdot T_s$ | $20480 \cdot T_s$ | 720 x $\text{CSSF}_{\text{interRAT}}$  |
| 3 (Note 1)    | 50                         | 1  | 3  | $19760 \cdot T_s$ | $20480 \cdot T_s$ | 480 x $\text{CSSF}_{\text{interRAT}}$  |

NOTE 1: This configuration is optional.  
NOTE 2: Void

When measurement gaps are scheduled for E-UTRAN TDD inter-RAT measurements, or the UE supports capability of conducting such measurements without gaps, the UE physical layer shall be capable of reporting RSRP, RSRQ, and RS-SINR measurements to higher layers with measurement period  $T_{\text{measure, E-UTRAN TDD}}$  given by table 9.4.3.2-1.

The UE shall be capable of identifying and performing NR – E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements of at least 4 identified E-UTRAN TDD cells per E-UTRA TDD carrier frequency layer during each layer 1 measurement period, for up to 7 E-UTRA TDD carrier frequency layers.

If higher layer filtering is used, an additional cell identification delay can be expected.

The NR – E-UTRAN TDD RSRP measurement accuracy for all measured cells shall be as specified in clause 10.2.2. The NR – E-UTRAN TDD RSRQ measurement accuracy for all measured cells shall be as specified in clause 10.2.3. The NR – E-UTRAN TDD RS-SINR measurement accuracy for all measured cells shall be as specified in clause 10.2.5.

### 9.4.3.3 Requirements when DRX is used

When DRX is in use and measurement gaps are configured, the UE shall be able to identify a new detectable E-UTRAN TDD cell within  $T_{\text{Identify, E-UTRAN TDD}}$  specified in Table 9.4.3.3-1.

**Table 9.4.3.3-1: Requirement to identify a newly detectable E-UTRAN TDD cell**

| DRX cycle length (s)                 | $T_{\text{Identify, E-UTRAN TDD}}$ (s) (DRX cycles)                                |  |
|--------------------------------------|--|--|
|                                      | Gap period = 40 ms, 20 ms  | Gap period = 80 ms   |
| $\leq 0.16$                          | Non-DRX requirements in clause 9.4.3.2 apply                                       | Non-DRX requirements in clause 9.4.3.2 apply                                       |
| 0.256                                | $5.12^* \text{CSSF}_{\text{interRAT}}$<br>( $20^* \text{CSSF}_{\text{interRAT}}$ ) | $7.68^* \text{CSSF}_{\text{interRAT}}$<br>( $30^* \text{CSSF}_{\text{interRAT}}$ ) |
| 0.32                                 | $6.4^* \text{CSSF}_{\text{interRAT}}$<br>( $20^* \text{CSSF}_{\text{interRAT}}$ )  | $7.68^* \text{CSSF}_{\text{interRAT}}$<br>( $24^* \text{CSSF}_{\text{interRAT}}$ ) |
| $0.32 < \text{DRX-cycle} \leq 10.24$ | Note1 ( $20^* \text{CSSF}_{\text{interRAT}}$ )                                     | Note1 ( $20^* \text{CSSF}_{\text{interRAT}}$ )                                     |

NOTE 1: The time depends on the DRX cycle length.  
NOTE 2:  $\text{CSSF}_{\text{interRAT}}$  is as defined in clause 9.4.3.2.

When DRX is in use, the UE shall be capable of performing NR – E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements of at least 4 identified E-UTRAN TDD cells per E-UTRA TDD frequency layer during each layer 1 measurement period, for up to 7 E-UTRA TDD carrier frequency layers, and the UE physical layer shall be capable of reporting NR – E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements to higher layers with the measurement period  $T_{\text{measure, E-UTRAN TDD}}$  specified in Table 9.4.3.3-2.

**Table 9.4.3.3-2: Requirement to measure E-UTRAN TDD cells**

| DRX cycle length (s) | $T_{\text{measure, E-UTRAN TDD}}$ (s) (DRX cycles) |
|----------------------|--|
| $\leq 0.08$          | Non-DRX Requirements in clause 9.4.3.2 apply       |

|   |  |
|---|--|
| 0.128   | For configuration 2 <sup>Note3</sup> , non-DRX requirements in clause 9.4.3.2 apply,<br>Otherwise: Note1 ( $5 \cdot \text{CSSF}_{\text{interRAT}}$ ) |
| $0.128 < \text{DRX-cycle} \leq 10.24$   | Note1 ( $5 \cdot \text{CSSF}_{\text{interRAT}}$ )  |
| NOTE 1: The time depends on the DRX cycle length.<br>NOTE 2: $\text{CSSF}_{\text{interRAT}}$ is as defined in clause 9.4.3.2.<br>NOTE 3: See Table 9.4.3.2-1. |  |

If higher layer filtering is used, an additional cell identification delay can be expected.

The NR – E-UTRAN TDD RSRP measurement accuracy for all measured cells shall be as specified in clause 10.2.2.  
The NR – E-UTRAN TDD RSRQ measurement accuracy for all measured cells shall be as specified in clause 10.2.3.  
The NR – E-UTRAN TDD RS-SINR measurement accuracy for all measured cells shall be as specified in clause 10.2.5.

### 9.4.3.4 Measurement reporting requirements

#### 9.4.3.4.1 Periodic Reporting

The reported NR – E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

#### 9.4.3.4.2 Event-Triggered Periodic Reporting

The reported NR – E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements contained in event-triggered periodic measurement reports shall meet the requirements in clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

The first report in event-triggered periodic measurement reporting shall meet the requirements specified in clause 9.4.3.4.3.

#### 9.4.3.4.3 Event-Triggered Reporting

The reported NR – E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements contained in event-triggered measurement reports shall meet the requirements in clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

The UE shall not send any event-triggered measurement reports as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times \text{TTI}_{\text{DCCH}}$  where  $\text{TTI}_{\text{DCCH}}$  is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{Identify, E-UTRAN TDD}}$  defined in clauses 9.4.3.2 and 9.4.3.3 without DRX and with DRX, respectively. When L3 filtering is used, an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{\text{Identify, E-UTRAN TDD}}$  becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again and triggers an event as per TS 38.331 [2], the event triggered measurement reporting delay shall be less than  $T_{\text{Measure, E-UTRAN TDD}}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  while measurement gap has not been available and the L3 filter has not been used.

## 9.4.4 Inter-RAT RSTD measurements

### 9.4.4.1 NR – E-UTRAN FDD RSTD measurements

#### 9.4.4.1.1 Introduction

The requirements are applicable for NR–E-UTRAN FDD RSTD measurements requested via LPP [22, 27].

When the UE is in NE-DC operation mode and an NR–E-UTRAN FDD RSTD measurement configured by NR PCell is on a E-UTRA serving frequency carrier, then the corresponding E-UTRA intra-frequency measurements requirements as follows shall apply.

- Measurements configured on E-UTRA PSCC shall meet E-UTRAN OTDOA intra-frequency measurements requirements in clause 8.1.2.5. The applicable measurement accuracy requirements are in clause 9.1.10.
- Measurements configured on E-UTRA SCC shall meet all applicable requirements in clause 8.4, except that the terms PCell and primary component carrier shall be deemed to be swapped with PSCell and PSCC. The applicable measurement accuracy requirements are in clause 9.1.12, except that the terms PCell and primary component carrier shall be deemed to be swapped with PSCell and PSCC.

The requirements in clause 9.4.4.1 apply when:

- the UE is provided with the LTE timing information via LPP [27], including both *nr-LTE-SFN-Offset* and *nr-LTE-fineTiming-Offset*, or
- the UE is not provided with *nr-LTE-SFN-Offset* or *nr-LTE-fineTiming-Offset*, or
- the UE is provided with *nr-LTE-SFN-Offset* but not with *nr-LTE-fineTiming-Offset*.

When the UE is not aware of the SFN of at least one LTE cell in the OTDOA assistance data, the UE may be using autonomous gaps to acquire SFN of the OTDOA assistance data reference cell prior to requesting measurement gaps for performing the requested E-UTRA RSTD measurements before the  $T_{\text{RSTD InterRAT, E-UTRAN FDD}}$  time period starts while meeting all the requirements in clause 9.4.4.1.2, provided that the OTDOA assistance data is provided to allow sufficient time for the UE to acquire the SFN before the  $T_{\text{RSTD InterRAT, E-UTRAN FDD}}$  starts.

When the UE is not aware of and cannot derive the subframe timing difference between the NR serving cell and the OTDOA assistance data reference cell, the UE may need to request measurement gaps to perform cell detection for the OTDOA assistance data reference cell prior to requesting measurement gaps for performing the requested E-UTRA RSTD measurements before the  $T_{\text{RSTD InterRAT, E-UTRAN FDD}}$  time period starts while meeting all the requirements in clause 9.4.4.1.2, provided that the OTDOA assistance data is provided to allow sufficient time for the UE to detect the cell before the  $T_{\text{RSTD InterRAT, E-UTRAN FDD}}$  starts.

#### 9.4.4.1.2 Requirements

When the physical layer cell identities of neighbour cells together with the OTDOA assistance data are provided, the UE shall be able to detect and measure inter-RAT E-UTRAN FDD RSTD, specified in TS 38.215 [4], for at least  $n=16$  cells, including the reference cell, within  $T_{\text{RSTD InterRAT, E-UTRAN FDD}}$  ms as given below:

$$T_{\text{RSTD InterRAT, E-UTRAN FDD}} = T_{\text{PRS}} \cdot (M - 1) + \Delta \quad \text{ms},$$

where

$T_{\text{RSTD InterRAT, E-UTRAN FDD}}$  is the total time for detecting and measuring at least  $n$  cells,

$T_{\text{PRS}}$  is the largest value of the cell-specific positioning subframe configuration period, defined in TS 36.211 [23], among the measured  $n$  cells including the reference cell,

$M$  is the number of PRS positioning occasions as defined in Table 9.4.4.1.2-1, where each PRS positioning occasion comprises of  $N_{PRS}$  ( $1 \leq N_{PRS} \leq 6$ ) consecutive downlink positioning subframes defined in TS 36.211 [23],

$CSSF_{interRAT} = CSSF_{within\_gap,i}$  is the scaling factor determined by the gap sharing scheme for the RSTD measurements on the carrier frequency  $i$  as defined in clause 9.1.5.2,

$\Delta = 160 \cdot \left\lceil \frac{n}{M} \right\rceil$  ms is the measurement time for a single PRS positioning occasion which includes the sampling time and the processing time, and

the  $n$  cells are distributed on up to two E-UTRAN FDD carrier frequencies.

**Table 9.4.4.1.2-1: Number of PRS positioning occasions within  $T_{RSTD, InterRAT, E-UTRAN FDD}$**

| Positioning subframe configuration period $T_{PRS}$   | Number of PRS positioning occasions $M$ |                             |
|---|---|-----------------------------|
|   | f2 <sup>Note1</sup>                     | f1 and f2 <sup>Note2</sup>  |
| 160 ms  | $16 \times CSSF_{interRAT}$             | $32 \times CSSF_{interRAT}$ |
| >160 ms   | $8 \times CSSF_{interRAT}$              | $16 \times CSSF_{interRAT}$ |
| NOTE 1: When inter-RAT E-UTRAN FDD RSTD measurements are performed over the reference cell and neighbour cells, which belong to the E-UTRAN FDD carrier frequency f2.   |   |                             |
| NOTE 2: When inter-RAT E-UTRAN FDD RSTD measurements are performed over the reference cell and the neighbour cells, which belong to the E-UTRAN FDD carrier frequency f1 and the E-UTRAN FDD carrier frequency f2 respectively. |   |                             |

The UE physical layer shall be capable of reporting RSTD for the reference cell and all the neighbor cells  $i$  out of at least  $(n-1)$  neighbor cells within  $T_{RSTD, InterRAT, E-UTRAN FDD}$  provided:

$(PRS \hat{E}_s / Iot)_{ref} \geq -6$  dB for all Frequency Bands for the reference cell,

$(PRS \hat{E}_s / Iot)_i \geq -13$  dB for all Frequency Bands for neighbour cell  $i$ ,

$(PRS \hat{E}_s / Iot)_{ref}$  and  $(PRS \hat{E}_s / Iot)_i$  conditions apply for all subframes of at least  $L = \frac{M}{2}$  PRS positioning

occasions,

PRP 1,2<sub>dBm</sub> according to TS 36.133 [15, Annex B.2.6] for a corresponding Band,

$PRS \hat{E}_s / Iot$  is defined as the ratio of the average received energy per PRS resource element during the useful part of the symbol to the average received power spectral density of the total noise and interference for this resource element, where the ratio is measured over all resource elements which carry PRS.

The time  $T_{RSTD, InterRAT, E-UTRAN FDD}$  starts from the first subframe of the PRS positioning occasion closest in time after both the *OTDOA-RequestLocationInformation* message and the OTDOA assistance data in the *OTDOA-ProvideAssistanceData* message via LPP as specified in TS 38.305 [22], are delivered to the physical layer of the UE.

The RSTD measurement accuracy for all measured neighbor cells  $i$  shall be fulfilled according to the accuracy as specified in clause 10.2.4.

#### 9.4.4.1.2.1 RSTD Measurement Reporting Delay

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{DCCH}$  where  $TTI_{DCCH}$  is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

#### 9.4.4.1.2.2 Requirements for acquiring the timing of the E-UTRA OTDOA reference cell

When the UE is not aware of the SFN of at least one LTE cell in the OTDOA assistance data, the UE supporting per-FR gaps may make autonomous gaps in downlink reception and uplink transmission of the PCell, PSCell, and each of the SCells in FR1 for acquiring SFN of the reference cell in the E-UTRA OTDOA assistance data, while no autonomous gaps in downlink reception or uplink transmission are allowed in any of the UE serving cells in FR2. The UE, which are only supporting per-UE gaps, may make autonomous gaps in downlink reception and uplink transmission of the PCell, PSCell, and each of the SCells for acquiring the SFN of the reference cell in the E-UTRA OTDOA assistance data.

When the UE is not aware of and cannot derive the subframe timing difference between the NR serving cell and the OTDOA assistance data reference cell, the UE may need to request measurement gaps while indicating *utra-FineTimingDetection* according to TS 38.331 [2] for detecting the reference cell in the E-UTRA OTDOA assistance data.

When the UE is performing one or both of SFN acquisition or cell detection as specified above, the UE shall be able to determine the timing of the E-UTRA OTDOA assistance data reference cell during the time period

$$T_{\text{RefCell,E-UTRAN}} = T_{\text{Detect, E-UTRAN FDD}} + T_{\text{MIB}} + T_{\text{ECGI}},$$

where

$T_{\text{Detect, E-UTRAN FDD}} = T_{\text{Identify, E-UTRAN FDD}} - T_{\text{measure, E-UTRAN FDD}}$  is according to clause 9.4.2 assuming  $\text{CSSF}_{\text{interRAT}}=1$  and it is the time needed to detect the E-UTRA OTDOA assistance data reference cell when the UE needs to acquire the subframe and slot timing of the cell, provided the UE is configured with measurement gaps ( $T_{\text{Detect, E-UTRAN FDD}}=0$  when both *nr-LTE-SFN-Offset* and *nr-LTE-fineTiming-Offset* are provided in the E-UTRA OTDOA assistance data or the E-UTRA OTDOA assistance data reference cell is known to the UE), and

$T_{\text{MIB}} = 50$  ms is the time required to acquire SFN and/or PHICH configuration of the E-UTRA OTDOA assistance data reference cell provided the OTDOA assistance data reference cell is decodable and at least all E-UTRA subframes #0 during  $T_{\text{MIB}}$  are available at the UE receiver ( $T_{\text{MIB}}=0$  when *nr-LTE-SFN-Offset* is provided in the E-UTRA OTDOA assistance data and ECGI acquisition is not needed), and

$T_{\text{ECGI}} = 100$  ms is the time required to acquire ECGI of the E-UTRA OTDOA assistance data reference cell when *cellGlobalId* is included in *OTDOA-ReferenceCellInfo* and the UE is not aware of the ECGI of this cell ( $T_{\text{ECGI}} = 0$  when *cellGlobalId* is not included in *OTDOA-ReferenceCellInfo* or the UE is aware of the ECGI of the E-UTRA OTDOA assistance data reference cell).

When detecting the E-UTRAN OTDOA reference cell, the requirements in this clause shall be met, provided the conditions for the detectable cell are fulfilled according to clause 9.4.2.1. In addition, the MIB of the E-UTRA OTDOA reference cell whose SFN is acquired shall be considered decodable by the UE provided the PBCH demodulation requirements are met according to TS 36.101 [25].

The requirement for acquiring the timing of the E-UTRA OTDOA reference cell within  $T_{\text{RefCell,E-UTRAN}}$  is applicable when no DRX is used as well as when any of the DRX cycles specified in TS 38.331 [2] is used.

When  $T_{\text{MIB}}>0$  and UE is using autonomous gaps during  $T_{\text{MIB}}$ , the UE shall transmit at least  $N_{\text{ACK/NACK, MIB, FDD}}$  ACK/NACKs on PCell, PSCell, and each of activated SCell(s) in the frequency range where the autonomous gaps are created, specified in Table 9.4.4.1.2.2-1. When both  $T_{\text{MIB}}>0$  and  $T_{\text{ECGI}}>0$  and UE is using autonomous gaps during  $T_{\text{MIB}}+T_{\text{ECGI}}$ , the UE shall transmit on PCell, PSCell, and each of activated SCell(s) in the frequency range where autonomous gaps are created at least  $N_{\text{ACK/NACK, MIB+ECGI, FDD}}$  ACK/NACKs specified in Table 9.4.4.1.2.2-3, provided the OTDOA reference cell bandwidth is configured in the OTDOA assistance data [22, 27]. The requirements in Tables 9.4.4.1.2.2-1, 9.4.4.1.2.2-2, and 9.4.4.1.2.2-3 apply, provided that:

- there is continuous DL data allocation,
- no DRX cycle is used,
- no measurement gaps are configured,
- only one code word is transmitted in each slot,
- 2 slot ACK/NACK feedback is configured,
- 20 ms SMTC period is configured,
- SSBs are transmitted in one slot within SMTC window.

**Table 9.4.4.1.2.2-1: Number of ACK/NACKs transmitted by the UE during  $T_{MIB}$** 

| NACK/NACK, MIB, FDD | Configuration of the serving cell in which the transmitted ACK/NACKs are counted |         |
|---------------------|--|---------|
|                     | Duplex mode configuration  | SCS     |
| 15                  | FDD  | 15 kHz  |
| 39                  | FDD  | 30 kHz  |
| 85                  | FDD  | 60 kHz  |
| 0                   | TDD <sup>Note 1</sup>  | 15 kHz  |
| 4                   | TDD <sup>Note 1</sup>  | 30 kHz  |

NOTE 1: TDD UL-DL configuration is as specified in Table A.3.3.1-1 of TS 38.101-1 [18].  
NOTE 2: TDD UL-DL configuration is as specified in Table A.3.3.1-1 of TS 38.101-2 [19].

## 9.4.4.2 NR – E-UTRAN TDD RSTD measurements

### 9.4.4.2.1 Introduction

The requirements are applicable for NR–E-UTRAN TDD RSTD measurements requested via LPP [22, 27].

When the UE is in NE-DC operation mode and an NR–E-UTRAN TDD RSTD measurement configured by NR PCell is on a E-UTRA serving frequency carrier, then the corresponding E-UTRA intra-frequency measurements requirements as follows shall apply.

- Measurements configured on E-UTRA PSCC shall meet E-UTRAN OTDOA intra-frequency measurements requirements in clause 8.1.2.5. The applicable measurement accuracy requirements are in clause 9.1.10.
- Measurements configured on E-UTRA SCC shall meet all applicable requirements in clause 8.4, except that the terms PCell and primary component carrier shall be deemed to be swapped with PSCell and PSCC. The applicable measurement accuracy requirements are in clause 9.1.12, except that the terms PCell and primary component carrier shall be deemed to be swapped with PSCell and PSCC.

The requirements in clause 9.4.4.1 apply when:

- the UE is provided with the LTE timing information via LPP [27], including both *nr-LTE-SFN-Offset* and *nr-LTE-fineTiming-Offset*, or
- the UE is not provided with *nr-LTE-SFN-Offset* or *nr-LTE-fineTiming-Offset*, or

- the UE is provided with *nr-LTE-SFN-Offset* but not with *nr-LTE-fineTiming-Offset*.

When the UE is not aware of the SFN of at least one LTE cell in the OTDOA assistance data, the UE may be using autonomous gaps to acquire SFN of the OTDOA assistance data reference cell prior to requesting measurement gaps for performing the requested E-UTRA RSTD measurements before the  $T_{\text{RSTD InterRAT,E-UTRAN TDD}}$  time period starts while meeting all the requirements in clause 9.4.4.2.2, provided that the OTDOA assistance data is provided to allow sufficient time for the UE to acquire the SFN before the  $T_{\text{RSTD InterRAT,E-UTRAN TDD}}$  starts. When the UE is not aware of and cannot derive the subframe timing difference between the NR serving cell and the OTDOA assistance data reference cell, the UE may need to request measurement gaps to perform cell detection for the OTDOA assistance data reference cell prior to requesting measurement gaps for performing the requested E-UTRA RSTD measurements before the  $T_{\text{RSTD InterRAT,E-UTRAN TDD}}$  time period starts while meeting all the requirements in clause 9.4.4.2.2, provided that the OTDOA assistance data is provided to allow sufficient time for the UE to detect the cell before the  $T_{\text{RSTD InterRAT,E-UTRAN TDD}}$  starts.

#### 9.4.4.2.2 Requirements

When the physical layer cell identities of neighbour cells together with the OTDOA assistance data are provided, the UE shall be able to detect and measure inter-RAT -UTRAN TDD RSTD, specified in TS 38.215 [4], for at least  $n=16$  cells, including the reference cell, within  $T_{\text{RSTD InterRAT,E-UTRAN TDD}}$  ms as given below:

$$T_{\text{RSTD InterRAT,E-UTRAN TDD}} = T_{\text{PRS}} \cdot (M - 1) + \Delta \quad \text{ms} \quad ,$$

where

$T_{\text{RSTD InterRAT,E-UTRAN TDD}}$  is the total time for detecting and measuring at least  $n$  cells,

$T_{\text{PRS}}$  is the largest value of the cell-specific positioning subframe configuration period, defined in TS 36.211 [23], among the measured  $n$  cells including the reference cell,

$M$  is the number of PRS positioning occasions as defined in Table 9.4.4.2.2-1, where a PRS positioning occasion is as defined in clause 9.4.4.1.2,

$\text{CSSF}_{\text{interRAT}} = \text{CSSF}_{\text{within\_gap},i}$  is the scaling factor determined by the gap sharing scheme for the RSTD measurements on the carrier frequency  $i$  as defined in clause 9.1.5.2,

$\Delta = 160 \cdot \left\lceil \frac{n}{M} \right\rceil$  ms is the measurement time for a single PRS positioning occasion which includes the sampling time and the processing time, and

the  $n$  cells are distributed on up to two E-UTRAN TDD carrier frequencies.

**Table 9.4.4.2.2-1: Number of PRS positioning occasions within  $T_{\text{RSTD InterRAT,E-UTRAN TDD}}$**

| Positioning subframe configuration period $T_{\text{PRS}}$  | Number of PRS positioning occasions $M$   |   |
|---|---|---|
|   | f2 <sup>Note1</sup>                       | f1 and f2 <sup>Note2</sup>                |
| 160 ms  | $16 \times \text{CSSF}_{\text{interRAT}}$ | $32 \times \text{CSSF}_{\text{interRAT}}$ |
| >160 ms   | $8 \times \text{CSSF}_{\text{interRAT}}$  | $16 \times \text{CSSF}_{\text{interRAT}}$ |
| NOTE 1: When inter-RAT E-UTRAN TDD RSTD measurements are performed over the reference cell and neighbour cells, which belong to the E-UTRAN TDD carrier frequency f2.   |   |   |
| NOTE 2: When inter-RAT E-UTRAN TDD RSTD measurements are performed over the reference cell and the neighbour cells, which belong to the E-UTRAN TDD carrier frequency f1 and the E-UTRAN TDD carrier frequency f2 respectively. |   |   |

The requirements in this clause shall apply for all TDD special subframe configurations specified in TS 36.211 [23] and for the TDD uplink-downlink configurations as specified in Table 9.4.4.2.2-2 for UE requiring measurement gaps for these measurements. For UEs capable of performing inter-RAT RSTD measurements without measurement gaps, TDD uplink-downlink subframe configurations as specified in Table 9.4.4.2.2-3 shall apply.

**Table 9.4.4.2.2-2: TDD uplink-downlink subframe configurations applicable for inter-RAT RSTD requirements**

| PRS Transmission Bandwidth (RB)  | Applicable TDD uplink-downlink configurations |
|--|---|
| 6, 15  | 3, 4 and 5                                    |
| 25   | 1, 2, 3, 4, 5 and 6                           |
| 50, 75, 100  | 0, 1, 2, 3, 4, 5 and 6                        |
| NOTE 1: Uplink-downlink configurations are specified in Table 4.2-2 in TS 36.211 [23]. |   |

**Table 9.4.4.2.2-3: TDD uplink-downlink subframe configurations applicable for inter-RAT RSTD requirements without gaps**

| PRS Transmission Bandwidth (RB)  | Applicable TDD uplink-downlink configurations |
|--|---|
| 6, 15  | 1, 2, 3, 4 and 5                              |
| 25, 50, 75, 100  | 0, 1, 2, 3, 4, 5 and 6                        |
| NOTE 1: Uplink-downlink configurations are specified in Table 4.2-2 in TS 36.211 [23]. |   |

The UE physical layer shall be capable of reporting RSTD for the reference cell and all the neighbor cells  $i$  out of at least  $(n-1)$  neighbor cells within  $T_{\text{RSTD InterRAT,E-UTRAN TDD}}$  provided:

$$\begin{aligned} & \left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{\text{ref}} \geq -6 \text{ dB for all Frequency Bands for the reference cell,} \\ & \left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \geq -13 \text{ dB for all Frequency Bands for neighbour cell } i, \\ & \left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{\text{ref}} \text{ and } \left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \text{ conditions apply for all subframes of at least } L = \frac{M}{2} \text{ PRS positioning} \end{aligned}$$

occasions,

PRP 1,2<sub>dBm</sub> according to TS 36.133 [15, Annex B.2.6] for a corresponding Band,

$\text{PRS } \hat{E}_s / \text{Iot}$  is as defined in clause 9.4.4.1.2.

The time  $T_{\text{RSTD InterRAT,E-UTRAN TDD}}$  starts from the first subframe of the PRS positioning occasion closest in time after both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message via LPP as specified in TS 38.305 [22], are delivered to the physical layer of the UE.

The RSTD measurement accuracy for all measured neighbor cells  $i$  shall be fulfilled according to the accuracy as specified in clause 10.2.4.

#### 9.4.4.2.2.1 RSTD Measurement Reporting Delay

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times \text{TTI}_{\text{DCCH}}$  where  $\text{TTI}_{\text{DCCH}}$  is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

#### 9.4.4.2.2.2 Requirements for acquiring the timing of the E-UTRA OTDOA reference cell

When the UE is not aware of the SFN of at least one LTE cell in the OTDOA assistance data, the UE supporting per-FR gaps may make autonomous gaps in downlink reception and uplink transmission of the PCell, PSCell, and each of the SCells in FR1 for acquiring SFN of the reference cell in the E-UTRA OTDOA assistance data, while no autonomous gaps in downlink reception or uplink transmission are allowed in any of the UE serving cells in FR2. The UE, which are only supporting per-UE gaps, may make autonomous gaps in downlink reception and uplink transmission of the PCell, PSCell, and each of the SCells for acquiring the SFN of the reference cell in the E-UTRA OTDOA assistance data.

When the UE is not aware of and cannot derive the subframe timing difference between the NR serving cell and the OTDOA assistance data reference cell, the UE may need to request measurement gaps while indicating *eutra-*

*FineTimingDetection* according to TS 38.331 [2] for detecting the reference cell in the E-UTRA OTDOA assistance data.

When the UE is performing one or both of SFN acquisition or cell detection as specified above, the UE shall be able to determine the timing of the E-UTRA OTDOA assistance data reference cell during the time period

$$T_{\text{RefCell,E-UTRAN}} = T_{\text{Detect, E-UTRAN TDD}} + T_{\text{MIB}} + T_{\text{ECGI}},$$

where

$T_{\text{Detect, E-UTRAN TDD}} = T_{\text{Identify, E-UTRAN TDD}} - T_{\text{measure, E-UTRAN TDD}}$  is according to clause 9.4.3 assuming  $\text{CSSF}_{\text{interRAT}}=1$  and it is the time needed to detect the E-UTRA OTDOA assistance data reference cell when the UE needs to acquire the subframe and slot timing of the cell, provided the UE is configured with measurement gaps ( $T_{\text{Detect, E-UTRAN TDD}}=0$  when both *nr-LTE-SFN-Offset* and *nr-LTE-fineTiming-Offset* are provided in the E-UTRA OTDOA assistance data or the E-UTRA OTDOA assistance data reference cell is known to the UE), and

$T_{\text{MIB}} = 50$  ms is the time required to acquire SFN and/or PHICH configuration of the E-UTRA OTDOA assistance data reference cell provided the OTDOA assistance data reference cell is decodable and at least all E-UTRA subframes #0 during  $T_{\text{MIB}}$  are available at the UE receiver ( $T_{\text{MIB}}=0$  when *nr-LTE-SFN-Offset* is provided in the E-UTRA OTDOA assistance data and ECGI acquisition is not needed), and

$T_{\text{ECGI}} = 100$  ms is the time required to acquire ECGI of the E-UTRA OTDOA assistance data reference cell when *cellGlobalId* is included in *OTDOA-ReferenceCellInfo* and the UE is not aware of the ECGI of this cell ( $T_{\text{ECGI}} = 0$  when *cellGlobalId* is not included in *OTDOA-ReferenceCellInfo* or the UE is aware of the ECGI of the E-UTRA OTDOA assistance data reference cell).

When detecting the E-UTRAN OTDOA reference cell, the requirements in this clause shall be met, provided the conditions for the detectable cell are fulfilled according to clause 9.4.3.1. In addition, the MIB of the E-UTRA OTDOA reference cell whose SFN is acquired shall be considered decodable by the UE provided the PBCH demodulation requirements are met according to TS 36.101 [25].

The requirement for acquiring the timing of the E-UTRA OTDOA reference cell within  $T_{\text{RefCell,E-UTRAN}}$  is applicable when no DRX is used as well as when any of the DRX cycles specified in TS 38.331 [2] is used.

When  $T_{\text{MIB}}>0$  and UE is using autonomous gaps during  $T_{\text{MIB}}$ , the UE shall transmit at least  $N_{\text{ACK/NACK, MIB, TDD}}$  ACK/NACKs on PCell, PSCell, and each of activated SCell(s) in the frequency range where the autonomous gaps are created, specified in Table 9.4.4.2.2.2-1. When both  $T_{\text{MIB}}>0$  and  $T_{\text{ECGI}}>0$  and UE is using autonomous gaps during  $T_{\text{MIB}}+T_{\text{ECGI}}$ , the UE shall transmit on PCell, PSCell, and each of activated SCell(s) in the frequency range where autonomous gaps are created at least  $N_{\text{ACK/NACK, MIB+ECGI, TDD}}$  ACK/NACKs specified in Table 9.4.4.2.2.2-3, provided the OTDOA reference cell bandwidth is configured in the OTDOA assistance data [22, 27]. The requirements in Tables 9.4.4.2.2.2-1, 9.4.4.2.2.2-2 and 9.4.4.2.2.2-3 apply, provided that:

- there is continuous DL data allocation,
- no DRX cycle is used,
- no measurement gaps are configured,
- only one code word is transmitted in each slot,
- 2 slot ACK/NACK feedback is configured,
- 20 ms SMTC period is configured,
- SSBs are transmitted in one slot within SMTC window.

**Table 9.4.4.2.2-1: Minimum number of ACK/NACKs transmitted by the UE during  $T_{\text{MIB}}$**

| $N_{\text{ACK/NACK, MIB, TDD}}$ | Configuration of the serving cell in which the transmitted ACK/NACKs are counted |        |
|---------------------------------|--|--------|
|                                 | Duplex mode configuration  | SCS    |
| 15                              | FDD  | 15 kHz |

## 9.4.5 Inter-RAT E-CID measurements

### 9.4.5.1 NR–E-UTRAN FDD E-CID RSRP and RSRQ measurements

#### 9.4.5.1.1 Introduction

The requirements in clause 9.4.5.1. shall apply provided the UE has received *ECID-RequestLocationInformation* message from LMF via LPP requesting the UE to report inter-RAT E-UTRAN FDD E-CID RSRP and RSRQ measurements [22, 27].

#### 9.4.5.1.2 Requirements

The requirements in clause 9.4.2 also apply for this clause except the measurement reporting requirements. The measurement reporting requirements for E-CID RSRP and RSRQ are defined in clause 9.4.5.1.3.

#### 9.4.5.1.3 Measurement Reporting Delay

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{DCCH}$  where  $TTI_{DCCH}$  is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

Reported RSRP and RSRQ measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.2.2 and 10.2.3, respectively.

### 9.4.5.2 NR–E-UTRAN TDD E-CID RSRP and RSRQ measurements

#### 9.4.5.2.1 Introduction

The requirements in clause 9.4.5.2. shall apply provided the UE has received *ECID-RequestLocationInformation* message from LMF via LPP requesting the UE to report inter-RAT E-UTRAN TDD E-CID RSRP and RSRQ measurements [22, 27].

### 9.4.5.2.2 Requirements

The requirements in clause 9.4.3 also apply for this clause except the measurement reporting requirements. The measurement reporting requirements for E-CID RSRP and RSRQ are defined in clause 9.4.5.2.3.

### 9.4.5.2.3 Measurement Reporting Delay

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{DCCH}$  where  $TTI_{DCCH}$  is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

Reported RSRP and RSRQ measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.2.2 and 10.2.3, respectively.

## 9.5 L1-RSRP measurements for Reporting

### 9.5.1 Introduction

When configured by the network, the UE shall be able to perform L1-RSRP measurements of configured CSI-RS, SSB or CSI-RS and SSB resources for L1-RSRP. The measurements shall be performed for a serving cell, including PCell, PSCell, or SCell, on the resources configured for L1-RSRP measurements within the active BWP.

The UE shall be able to measure all CSI-RS resources and/or SSB resources of the *nzp-CSI-RS-ResourceSet* and/or *csi-SSB-ResourceSet* within the *CSI-ResourceConfig* settings configured for L1-RSRP for the active BWP, provided that the number of resources does not exceed the UE capability indicated by *beamManagementSSB-CSI-RS*.

The UE shall report the measurement quantity (*reportQuantity*) and send periodic, semi-persistent or aperiodic reports, according to the *reportConfigType* according to the CSI reporting configuration(s) (*CSI-ReportConfig*) for the active BWP.

### 9.5.2 Requirements applicability

The requirements in clause 9.5 apply, provided:

- The CSI-RS or SSB or CSI-RS and SSB resources configured for L1-RSRP measurements are measurable.

An SSB resource configured for L1-RSRP shall be considered measurable when for each relevant SSB the following conditions are met:

- L1-RSRP related side conditions given in clauses 10.1.19.1 and 10.1.20.1 for FR1 and FR2, respectively, for a corresponding band,
- SSB<sub>RP</sub> and SSB  $\hat{E}_s/I_{ot}$  according to Annex B.2.4.1 for a corresponding band.

A CSI-RS resource configured for L1-RSRP shall be considered measurable when for each relevant CSI-RS the following conditions are met:

- L1-RSRP related side conditions given in clauses 10.1.19.2 and 10.1.20.2 for FR1 and FR2, respectively, for a corresponding band,
- CSI-RS<sub>RP</sub> and CSI-RS  $\hat{E}_s/I_{ot}$  according to Annex B.2.4.2 for a corresponding band.

A CSI-RS and SSB resource configured for L1-RSRP shall be considered measurable when the measurable resource conditions are met for both CSI-RS resource and SSB resource.

Requirements are defined for periodic, semi-persistent and aperiodic resources.

## 9.5.3 Measurement Reporting Requirements

The UE shall send L1-RSRP reports only for report configurations configured for the active BWP.

The UE shall report the L1-RSRP value as a 7-bit value in the range [-140, -44] dBm with 1dB step size according to clause 10.1.19 for FR1 and 10.1.20 for FR2 if *nrofReportedRS* is configured to one. If *nrofReportedRS* is configured to be larger than one, or if *groupBasedBeamReporting* is enabled, the UE shall use differential L1-RSRP based reporting as defined in clause 10.1.19 for FR1 and 10.1.20 for FR2. The differential L1-RSRP is quantized to a 4-bit value with 2dB step size. The mapping between the reported L1-RSRP value and the measured quantity is described in 10.1.6.

### 9.5.3.1 Periodic Reporting

Reported L1-RSRP measurements contained in periodic L1-RSRP measurement reports shall meet the requirements in clauses 10.1.19 for FR1 and 10.1.20 for FR2, respectively.

The UE shall only send periodic L1-RSRP measurement reports for an active BWP.

The UE shall transmit the periodic L1-RSRP reporting on PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.5.3.2 Semi-Persistent Reporting

Reported L1-RSRP measurements contained in a Semi-Persistent L1-RSRP measurement report shall meet the requirements in clauses 10.1.19 for FR1 and 10.1.20 for FR2, respectively. This requirement applies for semi-persistent L1-RSRP reports send on PUSCH or PUCCH.

The UE shall only send semi-persistent L1-RSRP measurement reports on PUSCH, if a DCI request has been received.

The UE shall only send semi-persistent L1-RSRP measurement reports on PUCCH, if an activation command [7] has been received.

The UE shall transmit the semi-persistent L1-RSRP reporting on PUSCH or PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.5.3.3 Aperiodic Reporting

Reported L1-RSRP measurements contained in aperiodic triggered, aperiodic triggered periodic and aperiodic triggered semi-persistent L1-RSRP reports shall meet the requirements in clauses 10.1.19 for FR1 and 10.1.20 for FR2, respectively.

The UE shall only send aperiodic L1-RSRP measurement reports, if a DCI trigger has been received.

After the UE receives CSI request in DCI, the UE shall transmit the aperiodic L1-RSRP reporting on PUSCH over the air interface at the time specified according to clause 6.1.2.1 in TS 38.214 [26].

## 9.5.4 L1-RSRP measurement requirements

### 9.5.4.1 SSB based L1-RSRP Reporting

The UE shall be capable of performing L1-RSRP measurements based on the configured SSB resource for L1-RSRP computation, and the UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of  $T_{L1-RSRP\_Measurement\_Period\_SSB}$ .

The value of  $T_{L1-RSRP\_Measurement\_Period\_SSB}$  is defined in Table 9.5.4.1-1 for FR1 and Table 9.5.4.1-2 for FR2, where

- $M=1$  if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and  $M=3$  otherwise
- $N=8$ .

For FR1,

- $P = \frac{1}{1 - \frac{T_{SSB}}{MGRP}}$ , when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the SSB; and
- $P=1$  when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

For FR2,

- $P = \frac{1}{1 - \frac{T_{SSB}}{T_{SMTCperiod}}}$ , when SSB is not overlapped with measurement gap and SSB is partially overlapped with SMTC occasion ( $T_{SSB} < T_{SMTCperiod}$ ).
- $P$  is  $P_{sharing}$  factor, when SSB is not overlapped with measurement gap and SSB is fully overlapped with SMTC period ( $T_{SSB} = T_{SMTCperiod}$ ).
- $P = \frac{1}{1 - \frac{T_{SSB}}{MGRP} \cdot \frac{T_{SSB}}{T_{SMTCperiod}}}$ , when SSB is partially overlapped with measurement gap and SSB is partially overlapped with SMTC occasion ( $T_{SSB} < T_{SMTCperiod}$ ) and SMTC occasion is not overlapped with measurement gap and
  - $T_{SMTCperiod} \neq MGRP$  or
  - $T_{SMTCperiod} = MGRP$  and  $T_{SSB} < 0.5 * T_{SMTCperiod}$
- $P$  is  $\frac{1}{1 - \frac{T_{SSB}}{MGRP}} * P_{sharing}$  factor, when SSB is partially overlapped with measurement gap and SSB is partially overlapped with SMTC occasion ( $T_{SSB} < T_{SMTCperiod}$ ) and SMTC occasion is not overlapped with measurement gap and  $T_{SMTCperiod} = MGRP$  and  $T_{SSB} = 0.5 * T_{SMTCperiod}$
- $P = \frac{1}{1 - \frac{T_{SSB}}{\min(T_{SMTCperiod}, MGRP)}}$ , when SSB is partially overlapped with measurement gap ( $T_{SSB} < MGRP$ ) and SSB is partially overlapped with SMTC occasion ( $T_{SSB} < T_{SMTCperiod}$ ) and SMTC occasion is partially or fully overlapped with measurement gap.
- $P$  is  $\frac{1}{1 - \frac{T_{SSB}}{MGRP}} * P_{sharing}$  factor, when SSB is partially overlapped with measurement gap and SSB is fully overlapped with SMTC occasion ( $T_{SSB} = T_{SMTCperiod}$ ) and SMTC occasion is partially overlapped with measurement gap ( $T_{SMTCperiod} < MGRP$ )
- $P$  is  $\frac{1}{1 - \frac{T_{SSB}}{MGRP}} * P_{sharing}$  factor, when SSB is partially overlapped with measurement gap and SSB is fully overlapped with SMTC occasion ( $T_{SSB} = T_{SMTCperiod}$ ) and SMTC occasion is partially overlapped with measurement gap ( $T_{SMTCperiod} < MGRP$ )  $P_{sharing}$  factor = 1
  - not overlapped with the SSB symbols indicated by SSB-ToMeasure and 1 data symbol before each consecutive SSB symbols indicated by SSB-ToMeasure and 1 data symbol after each consecutive SSB symbols indicated by SSB-ToMeasure, given that SSB-ToMeasure is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,
  - not overlapped with the RSSI symbols indicated by ss-RSSI-Measurement and 1 data symbol before each RSSI symbol indicated by ss-RSSI-Measurement and 1 data symbol after each RSSI symbol indicated by ss-RSSI-Measurement, given that ss-RSSI-Measurement is configured,
- $P_{sharing}$  factor = 3, otherwise.

Where:

$T_{SSB} = \text{ssb-periodicityServingCell}$

$T_{SMTCperiod} = \text{the configured SMTC period}$

If the high layer in TS 38.331 [2] signaling of *smtc2* is configured,  $T_{SMTCperiod}$  corresponds to the value of higher layer parameter *smtc2*; Otherwise  $T_{SMTCperiod}$  corresponds to the value of higher layer parameter *smtc1*.  $T_{SMTCperiod}$  is the shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.

Longer evaluation period would be expected if the combination of SSB, SMTC occasion and measurement gap configurations does not meet previous conditions.

**Table 9.5.4.1-1: Measurement period  $T_{L1-RSRP\_Measurement\_Period\_SSB}$  for FR1**

| Configuration           | $T_{L1-RSRP\_Measurement\_Period\_SSB}$ (ms)  |
|-------------------------|---|
| non-DRX                 | $\max(T_{Report}, \text{ceil}(M \cdot P) \cdot T_{SSB})$  |
| DRX cycle $\leq 320$ ms | $\max(T_{Report}, \text{ceil}(1.5 \cdot M \cdot P) \cdot \max(T_{DRX}, T_{SSB}))$   |
| DRX cycle $> 320$ ms    | $\text{ceil}(M \cdot P) \cdot T_{DRX}$  |
| Note:                   | $T_{SSB}$ = ssb-periodicityServingCell is the periodicity of the SSB-Index configured for L1-RSRP measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting. |

**Table 9.5.4.1-2: Measurement period  $T_{L1-RSRP\_Measurement\_Period\_SSB}$  for FR2**

| Configuration           | $T_{L1-RSRP\_Measurement\_Period\_SSB}$ (ms)  |
|-------------------------|---|
| non-DRX                 | $\max(T_{Report}, \text{ceil}(M \cdot P \cdot N) \cdot T_{SSB})$  |
| DRX cycle $\leq 320$ ms | $\max(T_{Report}, \text{ceil}(1.5 \cdot M \cdot P \cdot N) \cdot \max(T_{DRX}, T_{SSB}))$   |
| DRX cycle $> 320$ ms    | $\text{ceil}(1.5 \cdot M \cdot P \cdot N) \cdot T_{DRX}$  |
| Note:                   | $T_{SSB}$ = ssb-periodicityServingCell is the periodicity of the SSB-Index configured for L1-RSRP measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting. |

## 9.5.4.2 CSI-RS based L1-RSRP Reporting

The UE shall be capable of performing L1-RSRP measurements based on the configured CSI-RS resource for L1-RSRP computation, and the UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of  $T_{L1-RSRP\_Measurement\_Period\_CSI-RS}$ .

The value of  $T_{L1-RSRP\_Measurement\_Period\_CSI-RS}$  is defined in Table 9.5.4.2-1 for FR1 and in Table 9.5.4.2-2 for FR2, where

- For periodic and semi-persistent CSI-RS resources,  $M=1$  if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and  $M=3$  otherwise
- For aperiodic CSI-RS resources  $M=1$
- For periodic CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to ON,  $N=\text{ceil}(\text{maxNumberRxBeam} / N_{\text{res\_per\_set}})$ , where  $N_{\text{res\_per\_set}}$  is number of resources in the resource set. The requirements apply provided *qcl-InfoPeriodicCSI-RS* is configured for all resources in the resource set.
  - SSB for L1-RSRP measurement, or
  - another CSI-RS in resource set configured with repetition ON.
- For periodic CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to ON,  $N=\text{ceil}(\text{maxNumberRxBeam} / N_{\text{res\_per\_set}})$ , where  $N_{\text{res\_per\_set}}$  is number of resources in the resource set. The requirements apply provided *qcl-InfoPeriodicCSI-RS* is configured for with QCL-TypeD all resources in the resource set.
- For semi-persistent CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to OFF,  $N=1$ . The requirements apply provided TCI state is provided for all resources in the resource set in the MAC CE activating the resource set and for each resource one RS has QCL-TypeD with
  - SSB for L1-RSRP measurement, or
  - another CSI-RS in resource set configured with repetition ON.
- For semi-persistent CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to ON,  $N=\text{ceil}(\text{maxNumberRxBeam} / N_{\text{res\_per\_set}})$ , where  $N_{\text{res\_per\_set}}$  is number of resources in the resource set. The requirements apply provided TCI state is provided with QCL-TypeD for all resources in the resource set in the MAC CE activating the resource set.

- For aperiodic CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to OFF,  $N=1$ . The requirements apply provided *qcl-info* is configured for all resources in the resource set and for each resource one RS has QCL-TypeD with
  - SSB for L1-RSRP measurement, or
  - another CSI-RS in resource set configured with repetition ON.
- For aperiodic CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to ON,  $N=1$ . UE is not required to meet the accuracy requirements in clause 10.1.19.2 and 10.1.20.2 if number of resources in the resource set is smaller than *maxNumberRxBeam*. The requirements apply provided *qcl-info* is configured with QCL-TypeD for all resources in the resource set.

For FR1,

- $P = \frac{1}{1 - \frac{T_{\text{CSI-RS}}}{\text{MGRP}}}$ , when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the CSI-RS; and
- $P=1$  when in the monitored cell there are no measurement gaps overlapping with any occasion of the CSI-RS.

For FR2,

- $P=1$ , when CSI-RS is not overlapped with measurement gap and also not overlapped with SMTC occasion.
- $P = \frac{1}{1 - \frac{T_{\text{CSI-RS}}}{\text{MGRP}}}$ , when CSI-RS is partially overlapped with measurement gap and CSI-RS is not overlapped with SMTC occasion ( $T_{\text{CSI-RS}} < \text{MGRP}$ )
- $P = \frac{1}{1 - \frac{T_{\text{CSI-RS}}}{T_{\text{SMTCperiod}}}}$ , when CSI-RS is not overlapped with measurement gap and CSI-RS is partially overlapped with SMTC occasion ( $T_{\text{CSI-RS}} < T_{\text{SMTCperiod}}$ ).
- $P = P_{\text{sharing factor}}$ , when CSI-RS is not overlapped with measurement gap and CSI-RS is fully overlapped with SMTC occasion ( $T_{\text{CSI-RS}} = T_{\text{SMTCperiod}}$ ).
- $P=1$ , when aperiodic CSI-RS resource is not overlapped with measurement gap.
- $P = \frac{1}{1 - \frac{T_{\text{CSI-RS}}}{\text{MGRP}} - \frac{T_{\text{CSI-RS}}}{T_{\text{SMTCperiod}}}}$ , when CSI-RS is partially overlapped with measurement gap and CSI-RS is partially overlapped with SMTC occasion ( $T_{\text{CSI-RS}} < T_{\text{SMTCperiod}}$ ) and SMTC occasion is not overlapped with measurement gap and
  - $T_{\text{SMTCperiod}} \neq \text{MGRP}$  or
  - $T_{\text{SMTCperiod}} = \text{MGRP}$  and  $T_{\text{CSI-RS}} < 0.5 * T_{\text{SMTCperiod}}$
- $P = \frac{3}{1 - \frac{T_{\text{CSI-RS}}}{\text{MGRP}}}$ , when CSI-RS is partially overlapped with measurement gap and CSI-RS is partially overlapped with SMTC occasion ( $T_{\text{CSI-RS}} < T_{\text{SMTCperiod}}$ ) and SMTC occasion is not overlapped with measurement gap and  $T_{\text{SMTCperiod}} = \text{MGRP}$  and  $T_{\text{CSI-RS}} = 0.5 * T_{\text{SMTCperiod}}$
- $P = \frac{1}{1 - \frac{T_{\text{CSI-RS}}}{\min(T_{\text{SMTCperiod}}, \text{MGRP})}}$ , when CSI-RS is partially overlapped with measurement gap ( $T_{\text{CSI-RS}} < \text{MGRP}$ ) and CSI-RS is partially overlapped with SMTC occasion ( $T_{\text{CSI-RS}} < T_{\text{SMTCperiod}}$ ) and SMTC occasion is partially or fully overlapped with measurement gap.
- $P = \frac{3}{1 - \frac{T_{\text{CSI-RS}}}{\text{MGRP}}}$ , when CSI-RS is partially overlapped with measurement gap and CSI-RS is fully overlapped with SMTC occasion ( $T_{\text{CSI-RS}} = T_{\text{SMTCperiod}}$ ) and SMTC occasion is partially overlapped with measurement gap ( $T_{\text{SMTCperiod}} < \text{MGRP}$ )
- $P_{\text{sharing factor}} = 1$ , if the CSI-RS configured for L1-RSRP measurement outside measurement gap is

- not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,
- not overlapped with the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured
- $P_{\text{sharing factor}} = 3$ , otherwise.

Where:

$T_{\text{SMTCperiod}}$  = the configured SMTC period.

$T_{\text{CSI-RS}}$  = the periodicity of CSI-RS configured for L1-RSRP measurement

If the high layer in TS 38.331 [2] signaling of *smtc2* is configured,  $T_{\text{SMTCperiod}}$  corresponds to the value of higher layer parameter *smtc2*; Otherwise  $T_{\text{SMTCperiod}}$  corresponds to the value of higher layer parameter *smtc1*.  $T_{\text{SMTCperiod}}$  is the shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.

Note: The overlap between CSI-RS for L1-RSRP measurement and SMTC means that CSI-RS for L1-RSRP measurement is within the SMTC window duration.

Longer evaluation period would be expected if the combination of CSI-RS, SMTC occasion and measurement gap configurations does not meet pervious conditions.

**Table 9.5.4.2-1: Measurement period  $T_{\text{L1-RSRP\_Measurement\_Period\_CSI-RS}}$  for FR1**

| Configuration                 | $T_{\text{L1-RSRP\_Measurement\_Period\_CSI-RS}}$ (ms)  |
|-------------------------------|---|
| non-DRX                       | $\max(T_{\text{Report}}, \text{ceil}(M \cdot P) \cdot T_{\text{CSI-RS}})$   |
| DRX cycle $\leq 320\text{ms}$ | $\max(T_{\text{Report}}, \text{ceil}(1.5 \cdot M \cdot P) \cdot \max(T_{\text{DRX}}, T_{\text{CSI-RS}}))$   |
| DRX cycle $> 320\text{ms}$    | $\text{ceil}(M \cdot P) \cdot T_{\text{DRX}}$   |
| Note 1:                       | $T_{\text{CSI-RS}}$ is the periodicity of CSI-RS configured for L1-RSRP measurement. $T_{\text{DRX}}$ is the DRX cycle length. $T_{\text{Report}}$ is configured periodicity for reporting. |
| Note 2:                       | the requirements are applicable provided that the CSI-RS resource configured for L1-RSRP measurement is transmitted with Density = 3.   |

**Table 9.5.4.2-2: Measurement period  $T_{\text{L1-RSRP\_Measurement\_Period\_CSI-RS}}$  for FR2**

| Configuration                 | $T_{\text{L1-RSRP\_Measurement\_Period\_CSI-RS}}$ (ms)  |
|-------------------------------|---|
| non-DRX                       | $\max(T_{\text{Report}}, \text{ceil}(M \cdot P \cdot N) \cdot T_{\text{CSI-RS}})$   |
| DRX cycle $\leq 320\text{ms}$ | $\max(T_{\text{Report}}, \text{ceil}(1.5 \cdot M \cdot P \cdot N) \cdot \max(T_{\text{DRX}}, T_{\text{CSI-RS}}))$   |
| DRX cycle $> 320\text{ms}$    | $\text{ceil}(M \cdot P \cdot N) \cdot T_{\text{DRX}}$   |
| Note 1:                       | $T_{\text{CSI-RS}}$ is the periodicity of CSI-RS configured for L1-RSRP measurement. $T_{\text{DRX}}$ is the DRX cycle length. $T_{\text{Report}}$ is configured periodicity for reporting. |
| Note 2:                       | the requirements are applicable provided that the CSI-RS resource configured for L1-RSRP measurement is transmitted with Density = 3.   |

## 9.5.5 Measurement restriction for CSI-RS and SSB for L1-RSRP measurement

The UE is required to be capable of measuring SSB and CSI-RS for L1-RSRP without measurement gaps. The UE is required to perform the SSB and CSI-RS measurements with measurement restrictions as described in the following clauses.

### 9.5.5.1 Measurement restriction for SSB based L1-RSRP

For FR1, when the SSB for L1-RSRP measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for L1-RSRP measurement and CSI-RS. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

For FR2, when the SSB for L1-RSRP measurement on one CC is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSB for L1-RSRP measurement and CSI-RS. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

### 9.5.5.2 Measurement restriction for CSI-RS based L1-RSRP

For both FR1 and FR2, when the CSI-RS for L1-RSRP measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for L1-RSRP measurement in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for L1-RSRP measurement, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for L1-RSRP measurement, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS measurement without restrictions.
- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for L1-RSRP measurement and SSB. Longer measurement period for CSI-RS based L1-RSRP measurement is expected, and no requirements are defined.

For FR1, when the CSI-RS for L1-RSRP measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for L1-RSRP measurement without any restriction.

For FR2, when the CSI-RS for L1-RSRP measurement on one CC is in the same OFDM symbol as SSB for RLM, BFD or L1-RSRP measurement on the same CC or different CCs in the same band, or in the same symbol as SSB for CBD measurement on the same CC or different CCs in the same band when beam failure is detected, UE is required to measure one of but not both CSI-RS for L1-RSRP measurement and SSB. Longer measurement period for CSI-RS based L1-RSRP measurement is expected, and no requirements are defined.

For FR2, when the CSI-RS for L1-RSRP measurement on one CC is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band,

- In the following cases, UE is required to measure one of but not both CSI-RS for L1-RSRP measurement and the other CSI-RS. Longer measurement period for CSI-RS based L1-RSRP measurement is expected, and no requirements are defined.
  - The CSI-RS for L1-RSRP measurement or the other CSI-RS in a resource set configured with repetition ON, or
  - The other CSI-RS is configured in q1 and beam failure is detected, or
  - The two CSI-RS-es are not QCL-ed w.r.t. QCL-TypeD, or the QCL information is not known to UE,

- Otherwise, UE shall be able to measure the CSI-RS for L1-RSRP measurement without any restriction.

## 9.5.6 Scheduling availability of UE during L1-RSRP measurement

Scheduling availability restrictions when the UE is performing L1-RSRP measurement are described in the following clauses.

### 9.5.6.1 Scheduling availability of UE performing L1-RSRP measurement with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to L1-RSRP measurement performed on SSB and CSI-RS configured as RS for L1-RSRP measurement with the same SCS as PDSCH/PDCCH in FR1.

### 9.5.6.2 Scheduling availability of UE performing L1-RSRP measurement with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to L1-RSRP measurement based on SSB as RS for L1-RSRP measurement. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to L1-RSRP measurement based on SSB configured for L1-RSRP measurement.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on symbols corresponding to the SSB indexes configured for L1-RSRP measurement.

When intra-band carrier aggregation in FR1 is configured, the scheduling restrictions on serving cell where L1-RSRP measurement is performed apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols. When inter-band carrier aggregation within FR1 is configured, there are no scheduling restrictions on FR1 serving cell(s) configured in other bands than the bands in which the serving cell where L1-RSRP measurement is performed is configured.

### 9.5.6.3 Scheduling availability of UE performing L1-RSRP measurement on FR2

The following scheduling restriction applies due to L1-RSRP measurement.

- For the case where RS for L1-RSRP measurement is CSI-RS which is QCLed with active TCI state for PDCCH/PDSCH and not in a CSI-RS resource set with repetition ON, and N=1 applies as specified in clause 9.5.4.2
  - There are no scheduling restrictions due to L1-RSRP measurement performed based on the CSI-RS.
- Otherwise
  - The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on
    - symbols corresponding to the SSB indexes configured for L1-RSRP measurement, and/or
    - symbols corresponding to the periodic CSI-RS resource configured for L1-RSRP measurement, and/or
    - symbols corresponding to the semi-persistent CSI-RS resource configured for L1-RSRP measurement when the resource is activated, and/or
    - symbols corresponding to the aperiodic CSI-RS resource configured for L1-RSRP measurement when the reporting is triggered.

When intra-band carrier aggregation is performed, the scheduling restrictions on serving cell where L1-RSRP measurement is performed apply to all serving cells in the band on the symbols that fully or partially overlap with restricted symbols.

If following conditions are met,

- UE has been notified about system information update through paging,

- The gap between UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, UE is expected to receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for L1-RSRP measurement; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, UE is expected to receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for L1-RSRP measurement.

#### 9.5.6.4 Scheduling availability of UE performing L1-RSRP measurement on FR1 or FR2 in case of FR1-FR2 inter-band CA

There are no scheduling restrictions on FR1 serving cell(s) due to L1-RSRP measurement performed on FR2 serving cell(s).

There are no scheduling restrictions on FR2 serving cell(s) due to L1-RSRP measurement performed on FR1 serving cell(s).

## 9.6 NE-DC: Measurements

### 9.6.1 Introduction

This clause contains requirements for UE supporting dual connectivity with NR PCell and E-UTRA FDD or TDD PSCell. The requirements apply to UEs that have been configured with NE-DC.

### 9.6.2 SFTD Measurements

#### 9.6.2.1 Introduction

This clause contains requirements on UE capabilities for reporting of SFN and frame time difference between NR PCell and E-UTRA PSCell in RRC\_CONNECTED state. The requirements comprise measurement reporting delay and measurement accuracy. The overall measurement reporting delay includes a RRC procedure delay specified in TS 38.331 [2], and the SFTD measurement reporting delay specified below.

#### 9.6.2.2 SFTD Measurement requirements

When no DRX is used in either of the NR PCell and E-UTRA PSCell, the physical layer measurement period of the SFTD measurement shall be  $T_{\text{measure\_SFTD1}} = \max(0.2, 5 * \text{SMTC period})$  s.

When DRX is used in either of the NR PCell or the E-UTRA PSCell, or in both PCell and PSCell, the physical layer measurement period ( $T_{\text{measure\_SFTD1}}$ ) of the SFTD measurement shall be as specified in Table 9.6.2.2-1.

**Table 9.6.2.2-1: SFTD measurement requirement when DRX is used**

| DRX cycle length (s) <sup>Note2</sup> | $T_{\text{measure\_SFTD1}}$ (s)   |
|---------------------------------------|---|
| DRX cycle $\leq 0.04$                 | $\max(0.2, 5 \times \text{SMTC period})$ (Note1)  |
| $0.04 < \text{DRX cycle} \leq 0.32$   | $8 \times \max(\text{DRX cycle}, \text{SMTC period})$   |
| $0.32 < \text{DRX cycle} \leq 10.24$  | $5 \times \text{DRX cycle}$   |
| Note1:                                | Number of DRX cycles depends upon the DRX cycle in use  |
| Note2:                                | DRX cycle length in this table refers to the DRX cycle length configured for PCell or PSCell. When DRX is used in both PCell and PSCell, DRX cycle length in this table refers to the longer of the DRX cycle lengths for PCell and PSCell. |

If PSCell is changed without changing carrier frequency of PSCell while the UE is performing SFTD measurements, the UE shall still meet SFTD measurement and accuracy requirements for the new PSCell. In this case the UE shall

restart the SFTD measurement, and the total physical layer measurement period shall not exceed  $T_{\text{measure\_SFTD2}}$  as defined by the following expression:

$$T_{\text{measure\_SFTD2}} = (M+1) \cdot (T_{\text{measure\_SFTD1}}) + M \cdot T_{\text{PSCell\_change\_NEDC}}$$

where:

$M$  is the number of times the E-UTRA PSCell is changed over the measurement period ( $T_{\text{measure\_SFTD2}}$ ), and

$T_{\text{PSCell\_change\_NEDC}}$  is the time necessary to change the PSCell; it can be up to 25 ms.

If PCell is changed, or if PSCell is changed to a different carrier frequency, the UE shall terminate the SFTD measurement.

The measurement accuracy for the SFTD measurement when DRX is used as well as when no DRX is used shall be as specified in clause 10.1.21.1.

## 10 Measurement Performance requirements

### 10.1 NR measurements

#### 10.1.1 Introduction

The requirements in clause 10.1 apply as follows:

- intra-frequency requirements apply for PCell measurements in SA, NR-DC, or NE-DC operation mode,
- intra-frequency requirements apply for PSCell measurements in NR-DC or EN-DC operation mode,
- intra-frequency requirements apply for SCell measurements in SA operation mode with NR CA or any MR-DC operation mode with NR CA,
- inter-frequency requirements apply for non-serving cell measurements on NR carrier frequencies,
- inter-frequency requirements apply for measurements from one cell on a frequency compared to the measurement from another cell on a different frequency.

In the requirements of clause 10.1, the exceptions for side conditions apply as follows:

- for the UE capable of CA but not configured with any SCell, the applicable exceptions for side conditions are specified in Annex B, clause B.3.2.1 for UE supporting CA in FR1, and clause B.3.2.3 for UE supporting CA in FR2, respectively;
- for the UE capable of CA and configured with at least one SCell, the applicable exceptions for side conditions are specified in Annex B, clause B.3.2.2 for UE configured with CA in FR1, and clause B.3.2.4 for UE supporting CA in FR2 respectively;
- for the UE capable of SUL but not configured with SUL, the applicable exceptions for side conditions are specified in Annex B, clause B.3.4.1 for UE supporting SUL in FR1;
- for the UE capable of SUL and configured with at least one SUL, the applicable exceptions for side conditions are specified in Annex B, clause B.3.4.2 for UE configured with SUL in FR1.

## 10.1.2 Intra-frequency RSRP accuracy requirements for FR1

### 10.1.2.1 Intra-frequency SS-RSRP accuracy requirements

#### 10.1.2.1.1 Absolute SS-RSRP Accuracy

Unless otherwise specified, the requirements for absolute accuracy of SS-RSRP in this clause apply to a cell on the same frequency as that of the serving cell in FR1.

The accuracy requirements in Table 10.1.2.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to Annex B.2.2 for a corresponding Band for each relevant SSB.

**Table 10.1.2.1.1-1: SS-RSRP Intra frequency absolute accuracy in FR1**

| Accuracy         |                   | Conditions                 |  |                              |                              |                     |                     |
|------------------|-------------------|----------------------------|--|------------------------------|------------------------------|---------------------|---------------------|
| Normal condition | Extreme condition | SSB $\hat{E}_s/\text{lot}$ | $I_o$ <sup>Note 1</sup> range  |                              |                              |                     |                     |
|                  |                   |                            | NR operating band groups <sup>Note 2</sup>   | Minimum $I_o$                |                              | Maximum $I_o$       |                     |
| dB               | dB                | dB                         |  | dBm / $SCS_{SSB}$            |                              | dBm/ $BW_{Channel}$ | dBm/ $BW_{Channel}$ |
|                  |                   |                            |  | $SCS_{SSB} = 15 \text{ kHz}$ | $SCS_{SSB} = 30 \text{ kHz}$ |                     |                     |
| $\pm 4.5$        | $\pm 9$           | $\geq 6 \text{ dB}$        | NR_FDD_FR1_A,<br>NR_TDD_FR1_A,<br>NR_SDL_FR1_A   | -121                         | -118                         | N/A                 | -70                 |
|                  |                   |                            | NR_FDD_FR1_B   | -120.5                       | -117.5                       | N/A                 | -70                 |
|                  |                   |                            | NR_TDD_FR1_C   | -120                         | -117                         | N/A                 | -70                 |
|                  |                   |                            | NR_FDD_FR1_D,<br>NR_TDD_FR1_D  | -119.5                       | -116.5                       | N/A                 | -70                 |
|                  |                   |                            | NR_FDD_FR1_E,<br>NR_TDD_FR1_E  | -119                         | -116                         | N/A                 | -70                 |
|                  |                   |                            | NR_FDD_FR1_G,<br>NR_FDD_FR1_H  | -118<br>-117.5               | -115<br>-114.5               | N/A<br>N/A          | -70<br>-70          |
| $\pm 8$          | $\pm 11$          | $\geq 6 \text{ dB}$        | NR_FDD_FR1_A,<br>NR_TDD_FR1_A,<br>NR_SDL_FR1_A,<br>NR_FDD_FR1_B,<br>NR_TDD_FR1_C,<br>NR_FDD_FR1_D,<br>NR_TDD_FR1_D,<br>NR_FDD_FR1_E,<br>NR_TDD_FR1_E,<br>NR_FDD_FR1_G,<br>NR_FDD_FR1_H | N/A                          | N/A                          | -70                 | -50                 |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
 NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2.

#### 10.1.2.1.2 Relative SS-RSRP Accuracy

The relative accuracy of SS-RSRP is defined as the SS-RSRP measured from one cell compared to the SS-RSRP measured from another cell on the same frequency, or between any two SS-RSRP levels measured on the same cell in FR1.

The accuracy requirements in Table 10.1.2.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to Annex B.2.2 for a corresponding Band for each relevant SSB.

**Table 10.1.2.1.2-1: SS-RSRP Intra frequency relative accuracy in FR1**

| Accuracy         |                   | Conditions                           |  |                              |        |                            |                            |
|------------------|-------------------|--------------------------------------|--|------------------------------|--------|----------------------------|----------------------------|
| Normal condition | Extreme condition | SSB $\hat{E}_s/\text{lot}$<br>Note 2 | $l_o$ Note 1 range                             |                              |        |                            |                            |
|                  |                   |                                      | NR operating band groups<br>Note 4             | Minimum $l_o$                |        | Maximum $l_o$              |                            |
| dB               | dB                | dB                                   |  | dBm / $SCS_{SSB}$            |        | dBm/ $BW_{\text{Channel}}$ | dBm/ $BW_{\text{Channel}}$ |
|                  |                   |                                      | $SCS_{SSB} = 15 \text{ kHz}$                   | $SCS_{SSB} = 30 \text{ kHz}$ |        |                            |                            |

### 10.1.3 Intra-frequency RSRP accuracy requirements for FR2

#### 10.1.3.1 Intra-frequency SS-RSRP accuracy requirements

##### 10.1.3.1.1 Absolute SS-RSRP Accuracy

Unless otherwise specified, the requirements for absolute accuracy of SS-RSRP in this clause apply to a cell on the same frequency as that of the serving cell in FR2.

The accuracy requirements in Table 10.1.3.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to Annex B.2.2 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.3.1.1-1: SS-RSRP Intra frequency absolute accuracy in FR2**

| Accuracy         |                   | Conditions                 |  |                             |                            |                            |
|------------------|-------------------|----------------------------|--|-----------------------------|----------------------------|----------------------------|

|                  |                   |                            | Minimum $l_o$  |                             | Maximum $l_o$              |                            |
| dB               | dB                | dB                         | dBm / $SCS_{SSB}$ Note 1                                     |                             | dBm/ $BW_{\text{Channel}}$ | dBm/ $BW_{\text{Channel}}$ |
|                  |                   |                            | $SCS_{SSB} = 120\text{kHz}$                                  | $SCS_{SSB} = 240\text{kHz}$ |                            |                            |
| $\pm 6$          | $\pm 9$           | $\geq -6$                  | Same value as SSB_RP in Table B.2.2-2, according to UE Power |                             | N/A                        | -70                        |

|  |     |  |  |     |     |
|--|-----|--|--|-----|-----|
|  |     |  | class, operating band and angle of arrival |     |     |
| ±8   | ±11 |  | N/A  | -70 | -50 |
| Note 1: Values based on Refsens and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.<br>Note 2: $I_0$ specified at the Reference point, and assumed to have constant EPRE across the bandwidth.<br>Note 3: In the test cases, the SSB $\hat{E}_s/lot$ and related parameters may need to be adjusted to ensure $\hat{E}_s/lot$ at UE baseband is above the value defined in this table. |     |  |  |     |     |

### 10.1.3.1.2 Relative SS-RSRP Accuracy

The relative accuracy of SS-RSRP is defined as the SS-RSRP measured from one cell compared to the SS-RSRP measured from another cell on the same frequency, or between any two SS-RSRP levels measured on the same cell in FR2.

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to Annex B.2.2 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.3.1.2-1: SS-RSRP Intra frequency relative accuracy in FR2**

| Accuracy  |                   | Conditions          |   |                      |
|---|-------------------|---------------------|---|----------------------|
| Normal condition  | Extreme condition | SSB $\hat{E}_s/lot$ | $I_0$ <sup>Note 2</sup> range   |                      |
|   |                   |                     | Minimum $I_0$   | Maximum $I_0$        |
| dB  | dB                | dB                  | dBm / $SCS_{SSB}$ <sup>Note 1</sup>   |                      |
|   |                   |                     | $SCS_{SSB} = 120kHz$  | $SCS_{SSB} = 240kHz$ |
|   |                   |                     | dBm/ $BW_{Channel}$   |                      |
| ±6  | ±9                | ≥-6                 | Same value as SSB_RP in Table B.2.2-2, according to UE Power class, operating band and angle of arrival |                      |
| Note 1: Values based on Refsens and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.<br>Note 2: $I_0$ specified at the Reference point, and assumed to have constant EPRE across the bandwidth.<br>Note 3: In the test cases, the SSB $\hat{E}_s/lot$ and related parameters may need to be adjusted to ensure $\hat{E}_s/lot$ at UE baseband is above the value defined in this table.<br>Note 4: The parameter SSB $\hat{E}_s/lot$ is the minimum SSB $\hat{E}_s/lot$ of the pair of cells to which the requirement applies. |                   |                     |   |                      |

### 10.1.3.2 Void

## 10.1.4 Inter-frequency RSRP accuracy requirements for FR1

### 10.1.4.1 Inter-frequency SS-RSRP accuracy requirements

#### 10.1.4.1.1 Absolute Accuracy of SS-RSRP in FR1

The requirements for absolute accuracy of SS-RSRP in this clause apply to a cell on a frequency in FR1 that has different carrier frequency from the serving cell.

The accuracy requirements in Table 10.1.4.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.3 for a corresponding Band for each relevant SSB.

**Table 10.1.4.1.1-1: SS-RSRP Inter frequency Absolute accuracy in FR1**

| Accuracy         |                   | Conditions                           |  |                              |        |                     |                     |
|------------------|-------------------|--------------------------------------|--|------------------------------|--------|---------------------|---------------------|
| Normal condition | Extreme condition | SSB $\hat{E}_s/\text{lot}$<br>Note 2 | $I_o$ <sup>Note 1</sup> range  |                              |        |                     |                     |
|                  |                   |                                      | NR operating band groups<br>Note 3   | Minimum $I_o$                |        | Maximum $I_o$       |                     |
| dB               | dB                | dB                                   |  | dBm / $SCS_{SSB}$            |        | dBm/ $BW_{Channel}$ | dBm/ $BW_{Channel}$ |
|                  |                   |                                      | $SCS_{SSB} = 15 \text{ kHz}$   | $SCS_{SSB} = 30 \text{ kHz}$ |        |                     |                     |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
 NOTE 2: Void  
 NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2.

**10.1.4.1.2 Relative Accuracy of SS-RSRP in FR1**

The relative accuracy of SS-RSRP in inter frequency case is defined as the RSRP measured from one cell on a frequency in FR1 compared to the RSRP measured from another cell on a different frequency in FR1.

The accuracy requirements in Table 10.1.4.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] Clause 7.3 for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.3 for a corresponding Band for each relevant SSB.
- $|SSB\_RP1_{dBm} - SSB\_RP2_{dBm}| \leq 27 \text{ dB}$
- $|Channel\ 1\_I_o - Channel\ 2\_I_o| \leq 20 \text{ dB}$

**Table 10.1.4.1.2-1: SS-RSRP Inter frequency relative accuracy in FR1**

| Accuracy         |                   | Conditions                           |                                    |                   |                     |

|      |    |        | NR_FDD_FR1_H                                   | -117.5                         | -114.5                         | N/A | -50 |

NOTE 1: I<sub>o</sub> is assumed to have constant EPRE across the bandwidth.  
 NOTE 2: The parameter SSB Ês/lot is the minimum SSB Ês/lot of the pair of cells to which the requirement applies.  
 NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2.

10.1.4.2 Void

10.1.5 Inter-frequency RSRP accuracy requirements for FR2

10.1.5.1 Inter-frequency SS-RSRP accuracy requirements

10.1.5.1.1 Absolute SS-RSRP Accuracy

Unless otherwise specified, the requirements for absolute accuracy of SS-RSRP in this clause apply to a cell on a frequency in FR2 that is on a different frequency than the serving cell.

The accuracy requirements in Table 10.1.5.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.3 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.5.1.1-1: SS-RSRP Inter frequency absolute accuracy in FR2**

| Accuracy         |                   | Conditions |   |                             |                           |                           |
|------------------|-------------------|------------|---|-----------------------------|---------------------------|---------------------------|
| Normal condition | Extreme condition | SSB Ês/lot | I <sub>o</sub> <sup>Note 2</sup> range  |                             |                           |                           |
|                  |                   |            | Minimum I <sub>o</sub>  |                             | Maximum I <sub>o</sub>    |                           |
| dB               | dB                | dB         | dBm / SCS <sub>SSB</sub> <sup>Note 1</sup>  |                             | dBm/BW <sub>Channel</sub> | dBm/BW <sub>Channel</sub> |
|                  |                   |            | SCS <sub>SSB</sub> = 120kHz   | SCS <sub>SSB</sub> = 240kHz |                           |                           |
| ±6               | ±9                | ≥-4        | Same value as SSB_RP in Table B.2.3-2, according to UE Power class, operating band and angle of arrival |                             | N/A                       | -70                       |
| ±8               | ±11               |            | N/A   |                             | -70                       | -50                       |

Note 1: Values based on Refsens and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.  
 Note 2: I<sub>o</sub> specified at the Reference point, and assumed to have constant EPRE across the bandwidth.  
 Note 3: In the test cases, the SSB Ês/lot and related parameters may need to be adjusted to ensure Ês/lot at UE baseband is above the value defined in this table.

### 10.1.5.1.2 Relative SS-RSRP Accuracy

The relative accuracy of SS-RSRP is defined as the SS-RSRP measured from one cell on a frequency in FR2 compared to the SS-RSRP measured from another cell on another frequency in FR2.

The accuracy requirements in Table 10.1.5.1.2-1 are valid under the following conditions:

- Conditions defined in 38.101-2 [19] Clause 7.3 for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.3 for a corresponding Band for each relevant SSB.
- $|\text{SSB\_RP1}_{\text{dBm}} - \text{SSB\_RP2}_{\text{dBm}}| \leq 27\text{dB}$
- $|\text{Channel 1\_Io} - \text{Channel 2\_Io}| \leq 20\text{ dB}$
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.5.1.2-1: SS-RSRP Inter frequency relative accuracy in FR2**

| Accuracy  |                   | Conditions                 |   |   |   |
|---|-------------------|----------------------------|---|---|---|
| Normal condition  | Extreme condition | SSB $\hat{E}_s/\text{lot}$ | $I_o$ <sup>Note 2</sup> range   |   | Maximum $I_o$                           |
|   |                   |                            | dBm / $\text{SCS}_{\text{SSB}}$ <sup>Note 1</sup>   |   |   |
| dB  | dB                | dB                         | $\text{SCS}_{\text{SSB}} = 120\text{kHz}$   | $\text{SCS}_{\text{SSB}} = 240\text{kHz}$ | $\text{dBm}/\text{BW}_{\text{Channel}}$ |
| $\pm 6$   | $\pm 9$           | $\geq -4$                  | Same value as SSB_RP in Table B.2.3-2, according to UE Power class, operating band and angle of arrival |   | -50                                     |
| Note 1: Values based on Refsens and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.<br>Note 2: $I_o$ specified at the Reference point, and assumed to have constant EPRE across the bandwidth.<br>Note 3: In the test cases, the SSB $\hat{E}_s/\text{lot}$ and related parameters may need to be adjusted to ensure $\hat{E}_s/\text{lot}$ at UE baseband is above the value defined in this table.<br>Note 4: The parameter SSB $\hat{E}_s/\text{lot}$ is the minimum SSB $\hat{E}_s/\text{lot}$ of the pair of cells to which the requirement applies. |                   |                            |   |   |   |

### 10.1.5.2 Void

## 10.1.6 RSRP Measurement Report Mapping

The reporting range of SS-RSRP for L3 reporting is defined from -156 dBm to -31 dBm with 1 dB resolution. The reporting range of SS-RSRP and CSI-RSRP for L1 reporting is defined from -140 to -44 dBm with 1 dB resolution.

The mapping of measured quantity is defined in Table 10.1.6.1-1. The range in the signalling may be larger than the guaranteed accuracy range.

The reporting range of differential SS-RSRP and CSI-RSRP for L1 reporting is defined from 0 dBm to -30 dB with 2 dB resolution.

The mapping of measured quantity is defined in Table 10.1.6.1-2. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 10.1.6.1-1: SS-RSRP and CSI-RSRP measurement report mapping**

| Reported value | Measured quantity value (L3 SS-RSRP) | Measured quantity value (L1 SS-RSRP and CSI-RSRP) | Unit |
|----------------|--------------------------------------|---|------|
|                |                                      |   |      |

## 10.1.7 Intra-frequency RSRQ accuracy requirements for FR1

### 10.1.7.1 Intra-frequency SS-RSRQ accuracy requirements in FR1

#### 10.1.7.1.1 Absolute SS-RSRQ Accuracy in FR1

Unless otherwise specified, the requirements for absolute accuracy of SS-RSRQ in this clause apply to a cell on the same frequency as that of the serving cell in FR1.

The accuracy requirements in Table 10.1.7.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to Annex B.2.2 for a corresponding Band for each relevant SSB.

**Table 10.1.7.1.1-1: SS-RSRQ Intra frequency absolute accuracy in FR1**

| Accuracy         |                   | Conditions    |  |                                |        |            |                           |

|                  |                   |               | NR_FDD_FR1_G                                   | -118                           | -115   | N/A        | -50                       |
|                  |                   |               | NR_FDD_FR1_H                                   | -117.5                         | -114.5 | N/A        | -50                       |
| ±3.5             | ±4                | ≥6 dB         | Note 2   | Note 2                         | Note 2 | Note 2     | Note 2                    |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.

NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2.

## 10.1.8 Intra-frequency RSRQ accuracy requirements for FR2

### 10.1.8.1 Intra-frequency SS-RSRQ accuracy requirements in FR2

#### 10.1.8.1.1 Absolute SS-RSRQ Accuracy in FR2

Unless otherwise specified, the requirements for absolute accuracy of SS-RSRQ in this clause apply to a cell on the same frequency as that of the serving cell in FR2.

The accuracy requirements in Table 10.1.8.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to Annex B.2.2 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.8.1.1-1: SS-RSRQ Intra frequency absolute accuracy in FR2**

| Accuracy   |                   | Conditions         |   |                      |
|--|-------------------|--------------------|---|----------------------|
| Normal condition   | Extreme condition | SSB $\hat{E}s/lot$ | $I_o$ <sup>Note 2</sup> range   |                      |
|  |                   |                    | Minimum $I_o$   | Maximum $I_o$        |
| dB   | dB                | dB                 | dBm / $SCS_{SSB}$ <sup>Note 1</sup>   |                      |
|  |                   |                    | $SCS_{SSB} = 120kHz$  | $SCS_{SSB} = 240kHz$ |
| $\pm 2.5$  | $\pm 4$           | $\geq -3$          | Same value as SSB_RP in Table B.2.2-2, according to UE Power class, operating band and angle of arrival |                      |
| $\pm 3.5$  | $\pm 4$           | $\geq -6$          |   |                      |
| -50  |                   |                    |   |                      |
| Note 1: Values based on Refsens and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.<br>Note 2: $I_o$ specified at the Reference point, and assumed to have constant EPRE across the bandwidth.<br>Note 3: In the test cases, the SSB $\hat{E}s/lot$ and related parameters may need to be adjusted to ensure $\hat{E}s/lot$ at UE baseband is above the value defined in this table. |                   |                    |   |                      |

## 10.1.9 Inter-frequency RSRQ accuracy requirements for FR1

### 10.1.9.1 Inter-frequency SS-RSRQ accuracy requirements in FR1

#### 10.1.9.1.1 Absolute Accuracy of SS-RSRQ in FR1

The requirements for absolute accuracy of SS-RSRQ in this clause apply to a cell on a frequency in FR1 that has different carrier frequency from the serving cell.

The accuracy requirements in Table 10.1.9.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.3 for a corresponding Band for each relevant SSB.

**Table 10.1.9.1.1-1: SS-RSRQ Inter frequency absolute accuracy in FR1**

| Accuracy |  | Conditions                    |  |
|----------|--|-------------------------------|--|
|          |  | $I_o$ <sup>Note 1</sup> range |  |
|          |  |                               |  |

| Normal condition | Extreme condition | SSB $\hat{E}_s/\text{lot}$<br>dB | NR operating band groups<br>Note 3             | Minimum $I_o$                |                              |                            | Maximum $I_o$              |
|------------------|-------------------|----------------------------------|--|------------------------------|------------------------------|----------------------------|----------------------------|
|                  |                   |                                  |  | dBm / $SCS_{SSB}$            |                              | dBm/ $BW_{\text{Channel}}$ | dBm/ $BW_{\text{Channel}}$ |
|                  |                   |                                  |  | $SCS_{SSB} = 15 \text{ kHz}$ | $SCS_{SSB} = 30 \text{ kHz}$ |                            |                            |
| $\pm 2.5$        | $\pm 4$           | $\geq -3 \text{ dB}$             | NR_FDD_FR1_A,<br>NR_TDD_FR1_A,<br>NR_SDL_FR1_A | -121                         | -118                         | N/A                        | -50                        |
|                  |                   |                                  | NR_FDD_FR1_B                                   | -120.5                       | -117.5                       | N/A                        | -50                        |
|                  |                   |                                  | NR_TDD_FR1_C                                   | -120                         | -117                         | N/A                        | -50                        |
|                  |                   |                                  | NR_FDD_FR1_D,<br>NR_TDD_FR1_D                  | -119.5                       | -116.5                       | N/A                        | -50                        |
|                  |                   |                                  | NR_FDD_FR1_E,<br>NR_TDD_FR1_E                  | -119                         | -116                         | N/A                        | -50                        |
|                  |                   |                                  | NR_FDD_FR1_G                                   | -118                         | -115                         | N/A                        | -50                        |
|                  |                   |                                  | NR_FDD_FR1_H                                   | -117.5                       | -114.5                       | N/A                        | -50                        |
| $\pm 3.5$        | $\pm 4$           | $\geq -6 \text{ dB}$             | Note 2   | Note 2                       | Note 2                       | Note 2                     | Note 2                     |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The same bands and the same  $I_o$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2.

### 10.1.9.1.2 Relative Accuracy of SS-RSRQ in FR1

The relative accuracy of SS-RSRQ in inter frequency case is defined as the RSRQ measured from one cell on a frequency in FR1 compared to the RSRP measured from another cell on a different frequency in FR1.

The accuracy requirements in Table 10.1.9.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.3 for a corresponding Band for each relevant SSB.
- $|\text{SSB\_RP1}_{\text{dBm}} - \text{SSB\_RP2}_{\text{dBm}}| \leq 27 \text{ dB}$
- $|\text{Channel 1}_{I_o} - \text{Channel 2}_{I_o}| \leq 20 \text{ dB}$

**Table 10.1.9.1.2-1: SS-RSRQ Inter frequency relative accuracy in FR1**

| Accuracy         |                   |                                      | Conditions                                     |                              |                              |               |                            |

|                  |                   |                                      |  | Minimum $I_o$                |                              | Maximum $I_o$ |                            |
|                  |                   |                                      |  | dBm / $SCS_{SSB}$            |                              |               | dBm/ $BW_{\text{Channel}}$ |
| dB               | dB                | dB                                   |  | $SCS_{SSB} = 15 \text{ kHz}$ | $SCS_{SSB} = 30 \text{ kHz}$ |               |                            |
| $\pm 3$          | $\pm 4$           | $\geq -3 \text{ dB}$                 | NR_FDD_FR1_A,<br>NR_TDD_FR1_A,<br>NR_SDL_FR1_A | -121                         | -118                         | N/A           | -50                        |
|                  |                   |                                      | NR_FDD_FR1_B                                   | -120.5                       | -117.5                       | N/A           | -50                        |
|                  |                   |                                      | NR_TDD_FR1_C                                   | -120                         | -117                         | N/A           | -50                        |
|                  |                   |                                      | NR_FDD_FR1_D,<br>NR_TDD_FR1_D                  | -119.5                       | -116.5                       | N/A           | -50                        |
|                  |                   |                                      | NR_FDD_FR1_E,<br>NR_TDD_FR1_E                  | -119                         | -116                         | N/A           | -50                        |
|                  |                   |                                      | NR_FDD_FR1_G                                   | -118                         | -115                         | N/A           | -50                        |
|                  |                   |                                      | NR_FDD_FR1_H                                   | -117.5                       | -114.5                       | N/A           | -50                        |
| $\pm 4$          | $\pm 4$           | $\geq -6 \text{ dB}$                 | Note 3   | Note 3                       | Note 3                       | Note 3        | Note 3                     |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The parameter SSB  $\hat{E}_s/\text{lot}$  is the minimum SSB  $\hat{E}_s/\text{lot}$  of the pair of cells to which the requirement applies.  
NOTE 3: The same bands and the same  $I_o$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.

NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.

### 10.1.10 Inter-frequency RSRQ accuracy requirements for FR2

#### 10.1.10.1 Inter-frequency SS-RSRQ accuracy requirements in FR2

##### 10.1.10.1.1 Absolute Accuracy of SS-RSRQ in FR2

The requirements for absolute accuracy of SS-RSRQ in this clause apply to a cell on a frequency in FR2 that has different carrier frequency from the serving cell.

The accuracy requirements in Table 10.1.10.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.3 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.10.1.1-1: SS-RSRQ Inter frequency absolute accuracy in FR2**

| Accuracy   |                   | Conditions                 |   |                             |                           |
|--|-------------------|----------------------------|---|-----------------------------|---------------------------|
| Normal condition   | Extreme condition | SSB $\hat{E}_s/\text{lot}$ | $I_o$ <sup>Note 2</sup> range   |                             | Maximum $I_o$             |
|  |                   |                            | Minimum $I_o$   |                             |                           |
| dB   | dB                | dB                         | dBm / $SCS_{SSB}$ <sup>Note 1</sup>   |                             | dBm/BW <sub>Channel</sub> |
|  |                   |                            | $SCS_{SSB} = 120\text{kHz}$   | $SCS_{SSB} = 240\text{kHz}$ |                           |
| $\pm 2.5$  | $\pm 4$           | $\geq -3$                  | Same value as SSB_RP in Table B.2.2-2, according to UE Power class, operating band and angle of arrival |                             | -50                       |
| $\pm 3.5$  | $\pm 4$           | $\geq -4$                  |   |                             |                           |
| Note 1: Values based on Refsens and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.<br>Note 2: $I_o$ specified at the Reference point, and assumed to have constant EPRE across the bandwidth.<br>Note 3: In the test cases, the SSB $\hat{E}_s/\text{lot}$ and related parameters may need to be adjusted to ensure $\hat{E}_s/\text{lot}$ at UE baseband is above the value defined in this table. |                   |                            |   |                             |                           |

##### 10.1.10.1.2 Relative Accuracy of SS-RSRQ in FR2

The relative accuracy of SS-RSRQ in inter frequency case is defined as the RSRQ measured from one cell on a frequency in FR2 compared to the RSRP measured from another cell on a different frequency in FR2.

The accuracy requirements in Table 10.1.10.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.3 for a corresponding Band for each relevant SSB.
- $|SSB\_RP1_{dBm} - SSB\_RP2_{dBm}| \leq 27$  dB
- $|Channel\ 1\_I_o - Channel\ 2\_I_o| \leq 20$  dB
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.10.1.2-1: SS-RSRQ Inter frequency relative accuracy in FR2**

| Accuracy | Conditions |
|----------|------------|
|----------|------------|

| Normal condition  | Extreme condition | SSB $\hat{E}_s/\text{lot}$ | $I_o$ <sup>Note 2</sup> range   |                             |                            |
|---|-------------------|----------------------------|---|-----------------------------|----------------------------|
|   |                   |                            | Minimum $I_o$   |                             | Maximum $I_o$              |
|   |                   |                            | dBm / $SCS_{SSB}$ <sup>Note 1</sup>   |                             |                            |
| dB  | dB                | dB                         | $SCS_{SSB} = 120\text{kHz}$   | $SCS_{SSB} = 240\text{kHz}$ | dBm/ $BW_{\text{Channel}}$ |
| $\pm 3$   | $\pm 4$           | $\geq -3$                  | Same value as SSB_RP in Table B.2.2-2, according to UE Power class, operating band and angle of arrival |                             | -50                        |
| $\pm 4$   | $\pm 4$           | $\geq -4$                  |   |                             |                            |
| Note 1: Values based on Refsens and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.<br>Note 2: $I_o$ specified at the Reference point, and assumed to have constant EPRE across the bandwidth.<br>Note 3: The parameter SSB $\hat{E}_s/\text{lot}$ is the minimum SSB $\hat{E}_s/\text{lot}$ of the pair of cells to which the requirement applies.<br>Note 4: In the test cases, the SSB $\hat{E}_s/\text{lot}$ and related parameters may need to be adjusted to ensure $\hat{E}_s/\text{lot}$ at UE baseband is above the value defined in this table. |                   |                            |   |                             |                            |

## 10.1.11 RSRQ report mapping

### 10.1.11.1 SS-RSRQ measurement report mapping

The reporting range of SS-RSRQ is defined from -43 dB to 20 dB with 0.5 dB resolution. The mapping of measured quantity is defined in Table 10.1.11.1-1. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 10.1.11.1-1: SS-RSRQ measurement report mapping**

| Reported value | Measured quantity value           | Unit |
|----------------|-----------------------------------|------|
| SS-RSRQ_0      | $SS\text{-RSRQ} < -43$            | dB   |
| SS-RSRQ_1      | $-43 \leq SS\text{-RSRQ} < -42.5$ | dB   |
| SS-RSRQ_2      | $-42.5 \leq SS\text{-RSRQ} < -42$ | dB   |
| SS-RSRQ_3      | $-42 \leq SS\text{-RSRQ} < -41.5$ | dB   |
| SS-RSRQ_4      | $-41.5 \leq SS\text{-RSRQ} < -41$ | dB   |
| ..             | ..                                | ...  |
| SS-RSRQ_122    | $17.5 \leq SS\text{-RSRQ} < 18$   | dB   |
| SS-RSRQ_123    | $18 \leq SS\text{-RSRQ} < 18.5$   | dB   |
| SS-RSRQ_124    | $18.5 \leq SS\text{-RSRQ} < 19$   | dB   |
| SS-RSRQ_125    | $19 \leq SS\text{-RSRQ} < 19.5$   | dB   |
| SS-RSRQ_126    | $19.5 \leq SS\text{-RSRQ} < 20$   | dB   |
| SS-RSRQ_127    | $20 \leq SS\text{-RSRQ}$          | dB   |

## 10.1.12 Intra-frequency SINR accuracy requirements for FR1

### 10.1.12.1 Intra-frequency SS-SINR accuracy requirements in FR1

#### 10.1.12.1.1 Absolute SS-SINR Accuracy in FR1

Unless otherwise specified, the requirements for absolute accuracy of SS-SINR in this clause apply to a cell on the same frequency as that of the serving cell in FR1.

The accuracy requirements in Table 10.1.12.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to Annex B.2.2 for a corresponding Band.

**Table 10.1.12.1.1-1: SS-SINR Intra frequency absolute accuracy in FR1**

| Accuracy         |                   | Conditions                           |  |                              |                              |                            |                            |
|------------------|-------------------|--------------------------------------|--|------------------------------|------------------------------|----------------------------|----------------------------|
| Normal condition | Extreme condition | SSB $\hat{E}_s/\text{lot}$<br>Note 3 | NR operating band groups<br>Note 4             | $I_o$ Note 1 range           |                              |                            |                            |
|                  |                   |                                      |  | Minimum $I_o$                |                              | Maximum $I_o$              |                            |
| dB               | dB                | dB                                   |  | dBm / $SCS_{SSB}$            |                              | dBm/ $BW_{\text{Channel}}$ | dBm/ $BW_{\text{Channel}}$ |
|                  |                   |                                      |  | $SCS_{SSB} = 15 \text{ kHz}$ | $SCS_{SSB} = 30 \text{ kHz}$ |                            |                            |
| $\pm 3.0$        | $\pm 4$           | $\geq -3 \text{ dB}$                 | NR_FDD_FR1_A,<br>NR_TDD_FR1_A,<br>NR_SDL_FR1_A | -121                         | -118                         | N/A                        | -50                        |
|                  |                   |                                      | NR_FDD_FR1_B                                   | -120.5                       | -117.5                       | N/A                        | -50                        |
|                  |                   |                                      | NR_TDD_FR1_C                                   | -120                         | -117                         | N/A                        | -50                        |
|                  |                   |                                      | NR_FDD_FR1_D,<br>NR_TDD_FR1_D                  | -119.5                       | -116.5                       | N/A                        | -50                        |
|                  |                   |                                      | NR_FDD_FR1_E,<br>NR_TDD_FR1_E                  | -119                         | -116                         | N/A                        | -50                        |
|                  |                   |                                      | NR_FDD_FR1_G                                   | -118                         | -115                         | N/A                        | -50                        |
|                  |                   |                                      | NR_FDD_FR1_H                                   | -117.5                       | -114.5                       | N/A                        | -50                        |
| $\pm 3.5$        | $\pm 4$           | $\geq -6 \text{ dB}$                 | Note 2   | Note 2                       | Note 2                       | Note 2                     | Note 2                     |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
 NOTE 2: The same bands and the same  $I_o$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
 NOTE 3: The requirements apply for SSB  $\hat{E}_s/\text{lot} \leq 25 \text{ dB}$ .  
 NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.

### 10.1.13 Intra-frequency SINR accuracy requirements for FR2

#### 10.1.13.1 Intra-frequency SS-SINR accuracy requirements in FR2

##### 10.1.13.1.1 Absolute SS-SINR Accuracy in FR2

Unless otherwise specified, the requirements for absolute accuracy of SS-SINR in this clause apply to a cell on the same frequency as that of the serving cell in FR2.

The accuracy requirements in Table 10.1.13.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to Annex B.2.2 for a corresponding Band.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.13.1.1-1: SS-SINR Intra frequency absolute accuracy in FR2**

| Accuracy         |                   | Conditions                 |   |                             |                            |
|------------------|-------------------|----------------------------|---|-----------------------------|----------------------------|
| Normal condition | Extreme condition | SSB $\hat{E}_s/\text{lot}$ | $I_o$ Note 2 range  |                             |                            |
|                  |                   |                            | Minimum $I_o$   |                             | Maximum $I_o$              |
| dB               | dB                | dB                         | dBm / $SCS_{SSB}$ Note 1  |                             | dBm/ $BW_{\text{Channel}}$ |
|                  |                   |                            | $SCS_{SSB} = 120\text{kHz}$   | $SCS_{SSB} = 240\text{kHz}$ |                            |
| $\pm 3$          | $\pm 4$           | $\geq -3$                  | Same value as SSB_RP in Table B.2.2-2, according to UE Power class, operating band and angle of arrival |                             | -50                        |
| $\pm 3.5$        | $\pm 4$           | $\geq -6$                  |   |                             |                            |

Note 1: Values based on Refsens and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.  
 Note 2:  $I_o$  specified at the Reference point, and assumed to have constant EPRE across the bandwidth.  
 Note 3: In the test cases, the SSB  $\hat{E}_s/\text{lot}$  and related parameters may need to be adjusted to ensure  $\hat{E}_s/\text{lot}$  at UE baseband is above the value defined in this table.

Note 4: The requirements apply for SSB  $\hat{E}_s/\text{lot} \leq 25$  dB.

### 10.1.14 Inter-frequency SINR accuracy requirements for FR1

#### 10.1.14.1 Inter-frequency SS-SINR accuracy requirements in FR1

##### 10.1.14.1.1 Absolute Accuracy of SS-SINR in FR1

The requirements for absolute accuracy of SS-SINR in this clause apply to a cell on a frequency in FR1 that has different carrier frequency from the serving cell.

The accuracy requirements in Table 10.1.14.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.3 for a corresponding Band.

**Table 10.1.14.1.1-1: SS-SINR Inter frequency absolute accuracy in FR1**

| Accuracy         |                   | Conditions                           |  |                      |                      |                     |                     |
|------------------|-------------------|--------------------------------------|--|----------------------|----------------------|---------------------|---------------------|
| Normal condition | Extreme condition | SSB $\hat{E}_s/\text{lot}$<br>Note 3 | NR operating band groups<br>Note 4             | $I_o$ Note 1 range   |                      |                     |                     |
|                  |                   |                                      |  | Minimum $I_o$        |                      | Maximum $I_o$       |                     |
| dB               | dB                | dB                                   |  | dBm / $SCS_{SSB}$    |                      | dBm/ $BW_{Channel}$ | dBm/ $BW_{Channel}$ |
|                  |                   |                                      |  | $SCS_{SSB} = 15$ kHz | $SCS_{SSB} = 30$ kHz |                     |                     |
| $\pm 3.0$        | $\pm 4$           | $\geq 3$ dB                          | NR_FDD_FR1_A,<br>NR_TDD_FR1_A,<br>NR_SDL_FR1_A | -121                 | -118                 | N/A                 | -50                 |
|                  |                   |                                      | NR_FDD_FR1_B                                   | -120.5               | -117.5               | N/A                 | -50                 |

|                  |                   |                                      | NR_FDD_FR1_G                                   | -118                 | -115                 | N/A                 | -50                 |
|                  |                   |                                      | NR_FDD_FR1_H                                   | -117.5               | -114.5               | N/A                 | -50                 |
| $\pm 3.5$        | $\pm 4$           | $\geq 6$ dB                          | Note 2   | Note 2               | Note 2               | Note 2              | Note 2              |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
 NOTE 2: The same bands and the same  $I_o$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
 NOTE 3: The requirements apply for SSB  $\hat{E}_s/\text{lot} \leq 25$  dB.  
 NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.

##### 10.1.14.1.2 Relative Accuracy of SS-SINR in FR1

The relative accuracy of SS-SINR in inter frequency case is defined as the SS-SINR measured from one cell on a frequency in FR1 compared to the SS-SINR measured from another cell on a different frequency in FR1.

The accuracy requirements in Table 10.1.14.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.3 for a corresponding Band.
- $|SSB\_RP1_{dBm} - SSB\_RP2_{dBm}| \leq 27$  dB
- $|Channel\ 1\_I_o - Channel\ 2\_I_o| \leq 20$  dB

**Table 10.1.14.1.2-1: SS-SINR Inter frequency relative accuracy in FR1**

| Accuracy         |                   | Conditions                             |  |                              |                              |                     |                     |

|                  |                   |  | NR_FDD_FR1_D,<br>NR_TDD_FR1_D                  | -119.5                       | -116.5                       | N/A                 | -50                 |
|                  |                   |  | NR_FDD_FR1_E,<br>NR_TDD_FR1_E                  | -119                         | -116                         | N/A                 | -50                 |
|                  |                   |  | NR_FDD_FR1_G                                   | -118                         | -115                         | N/A                 | -50                 |
|                  |                   |  | NR_FDD_FR1_H                                   | -117.5                       | -114.5                       | N/A                 | -50                 |
| ±4               | ±4                | ≥-6 dB                                 | Note 3   | Note 3                       | Note 3                       | Note 3              | Note 3              |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
 NOTE 2: The parameter SSB  $\hat{E}_s/\text{lot}$  is the minimum SSB  $\hat{E}_s/\text{lot}$  of the pair of cells to which the requirement applies.  
 NOTE 3: The same bands and the same  $I_o$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
 NOTE 4: The requirements apply for SSB  $\hat{E}_s/\text{lot} \leq 25\text{ dB}$ .  
 NOTE 5: NR operating band groups in FR1 are as defined in clause 3.5.2.

### 10.1.15 Inter-frequency SINR accuracy requirements for FR2

#### 10.1.15.1 Inter-frequency SS-SINR accuracy requirements in FR2

##### 10.1.15.1.1 Absolute Accuracy of SS-SINR in FR2

The requirements for absolute accuracy of SS-SINR in this clause apply to a cell on a frequency in FR2 that has different carrier frequency from the serving cell.

The accuracy requirements in Table 10.1.15.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.3 for a corresponding Band.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.15.1.1-1: SS-SINR Inter frequency absolute accuracy in FR2**

| Accuracy         |                   | Conditions                 |   |                              |                     |
|------------------|-------------------|----------------------------|---|------------------------------|---------------------|
| Normal condition | Extreme condition | SSB $\hat{E}_s/\text{lot}$ | $I_o$ Note 2 range  |                              | Maximum $I_o$       |
|                  |                   |                            | Minimum $I_o$   |                              |                     |
| dB               | dB                | dB                         | dBm / $SCS_{SSB}$ Note 1  |                              | dBm/ $BW_{Channel}$ |
|                  |                   |                            | $SCS_{SSB} = 120\text{ kHz}$  | $SCS_{SSB} = 240\text{ kHz}$ |                     |
| ±3               | ±4                | ≥-3                        | Same value as SSB_RP in Table B.2.2-2, according to UE Power class, operating band and angle of arrival |                              | -50                 |
| ±3.5             | ±4                | ≥-4                        |   |                              |                     |

Note 1: Values based on Refsens and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.  
 Note 2:  $I_o$  specified at the Reference point, and assumed to have constant EPRE across the bandwidth.

Note 3: In the test cases, the SSB  $\hat{E}_s/\text{lot}$  and related parameters may need to be adjusted to ensure  $\hat{E}_s/\text{lot}$  at UE baseband is above the value defined in this table.  
 Note 4: The requirements apply for SSB  $\hat{E}_s/\text{lot} \leq 25$  dB.

### 10.1.15.1.2 Relative Accuracy of SS-SINR in FR2

The relative accuracy of SS-SINR in inter frequency case is defined as the SS-SINR measured from one cell on a frequency in FR2 compared to the SS-SINR measured from another cell on a different frequency in FR2.

The accuracy requirements in Table 10.1.15.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.3 for a corresponding Band.
- $|\text{SSB\_RP1}_{\text{dBm}} - \text{SSB\_RP2}_{\text{dBm}}| \leq 27$  dB
- $|\text{Channel 1}_{\text{Io}} - \text{Channel 2}_{\text{Io}}| \leq 20$  dB
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.15.1.2-1: SS-SINR Inter frequency relative accuracy in FR2**

| Accuracy  |                   | Conditions                 |   |                             |                           |
|---|-------------------|----------------------------|---|-----------------------------|---------------------------|
| Normal condition  | Extreme condition | SSB $\hat{E}_s/\text{lot}$ | Io <sup>Note 2</sup> range  |                             | Maximum Io                |
|   |                   |                            | Minimum Io  |                             |                           |
| dB  | dB                | dB                         | dBm / SCS <sub>SSB</sub> <sup>Note 1</sup>  |                             | dBm/BW <sub>Channel</sub> |
|   |                   |                            | SCS <sub>SSB</sub> = 120kHz   | SCS <sub>SSB</sub> = 240kHz |                           |
| ±3.5  | ±4                | ≥-3                        | Same value as SSB_RP in Table B.2.2-2, according to UE Power class, operating band and angle of arrival |                             | -50                       |
| ±4  | ±4                | ≥-6                        |   |                             |                           |
| Note 1: Values based on Refsens and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.<br>Note 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.<br>Note 3: The parameter SSB $\hat{E}_s/\text{lot}$ is the minimum SSB $\hat{E}_s/\text{lot}$ of the pair of cells to which the requirement applies.<br>Note 4: In the test cases, the SSB $\hat{E}_s/\text{lot}$ and related parameters may need to be adjusted to ensure $\hat{E}_s/\text{lot}$ at UE baseband is above the value defined in this table.<br>Note 5: The requirements apply for SSB $\hat{E}_s/\text{lot} \leq 25$ dB. |                   |                            |   |                             |                           |

## 10.1.16 SINR report mapping

### 10.1.16.1 SS-SINR measurement report mapping

The reporting range of SS-SINR is defined from -23 dB to 40 dB with 0.5 dB resolution. The mapping of measured quantity is defined in Table 10.1.16.1-1. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 10.1.16.1-1: SS-SINR measurement report mapping**

| Reported value | Measured quantity value | Unit |
|----------------|-------------------------|------|
| SS-SINR_0      | SS-SINR < -23           | dB   |
| SS-SINR_1      | -23 ≤ SS-SINR < -22.5   | dB   |
| SS-SINR_2      | -22.5 ≤ SS-SINR < -22   | dB   |
| SS-SINR_3      | -22 ≤ SS-SINR < -21.5   | dB   |
| SS-SINR_4      | -21.5 ≤ SS-SINR < -21   | dB   |

|             |                                 |     |
|-------------|---------------------------------|-----|
| ..          | ..                              | ... |
| SS-SINR_123 | $38 \leq \text{SS-SINR} < 38.5$ | dB  |
| SS-SINR_124 | $38.5 \leq \text{SS-SINR} < 39$ | dB  |
| SS-SINR_125 | $39 \leq \text{SS-SINR} < 39.5$ | dB  |
| SS-SINR_126 | $39.5 \leq \text{SS-SINR} < 40$ | dB  |
| SS-SINR_127 | $40 \leq \text{SS-SINR}$        | dB  |

## 10.1.17 Power Headroom

### 10.1.17.1 Power Headroom Report

#### 10.1.17.1.1 Power Headroom Report Mapping

The power headroom reporting range is from -32 ...+38 dB. Table 10.1.17.1-1 defines the report mapping.

**Table 10.1.17.1-1: Power headroom report mapping**

| Reported value    | Measured quantity value (dB) |
|-------------------|------------------------------|
| POWER_HEADROOM_0  | $\text{PH} < -32$            |
| POWER_HEADROOM_1  | $-32 \leq \text{PH} < -31$   |
| POWER_HEADROOM_2  | $-31 \leq \text{PH} < -30$   |
| POWER_HEADROOM_3  | $-30 \leq \text{PH} < -29$   |
| ...               | ...                          |
| POWER_HEADROOM_53 | $20 \leq \text{PH} < 21$     |
| POWER_HEADROOM_54 | $21 \leq \text{PH} < 22$     |
| POWER_HEADROOM_55 | $22 \leq \text{PH} < 24$     |
| POWER_HEADROOM_56 | $24 \leq \text{PH} < 26$     |
| POWER_HEADROOM_57 | $26 \leq \text{PH} < 28$     |
| POWER_HEADROOM_58 | $28 \leq \text{PH} < 30$     |
| POWER_HEADROOM_59 | $30 \leq \text{PH} < 32$     |
| POWER_HEADROOM_60 | $32 \leq \text{PH} < 34$     |
| POWER_HEADROOM_61 | $34 \leq \text{PH} < 36$     |
| POWER_HEADROOM_62 | $36 \leq \text{PH} < 38$     |
| POWER_HEADROOM_63 | $\text{PH} \geq 38$          |

## 10.1.18 $P_{\text{CMAX},c,f}$

The UE is required to report the UE configured maximum output power ( $P_{\text{CMAX},c,f}$ ) together with the power headroom. This clause defines the requirements for the  $P_{\text{CMAX},c,f}$  reporting.

### 10.1.18.1 Report Mapping

The  $P_{\text{CMAX},c,f}$  reporting range is defined from -29 dBm to 33 dBm with 1 dB resolution. Table 10.1.18.1-1 defines the reporting mapping.

**Table 10.1.18.1-1 Mapping of  $P_{\text{CMAX},c,f}$**

| Reported value | Measured quantity value              | Unit |
|----------------|--------------------------------------|------|
| PCMAX_C_00     | $P_{\text{CMAX},c,f} < -29$          | dBm  |
| PCMAX_C_01     | $-29 \leq P_{\text{CMAX},c,f} < -28$ | dBm  |
| PCMAX_C_02     | $-28 \leq P_{\text{CMAX},c,f} < -27$ | dBm  |
| ...            | ...                                  | ...  |
| PCMAX_C_61     | $31 \leq P_{\text{CMAX},c,f} < 32$   | dBm  |
| PCMAX_C_62     | $32 \leq P_{\text{CMAX},c,f} < 33$   | dBm  |
| PCMAX_C_63     | $33 \leq P_{\text{CMAX},c,f}$        | dBm  |

## 10.1.19 L1-RSRP accuracy requirements for FR1

### 10.1.19.1 SSB based L1-RSRP accuracy requirements

#### 10.1.19.1.1 Absolute Accuracy

Unless otherwise specified, the requirements for absolute accuracy of SSB based L1-RSRP in this clause apply to all SSBs of the serving cell configured for L1-RSRP measurement.

The accuracy requirements in Table 10.1.19.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to Annex B.2.4.1 for a corresponding Band for each relevant SSB.

**Table 10.1.19.1.1-1: SSB based L1-RSRP absolute accuracy in FR1**

| Accuracy         |                   | Conditions                 |   |                              |        |                            |                            |
|------------------|-------------------|----------------------------|---|------------------------------|--------|----------------------------|----------------------------|
| Normal condition | Extreme condition | SSB $\hat{E}_s/\text{lot}$ | $I_0$ <sup>Note 1</sup> range   |                              |        |                            |                            |
|                  |                   |                            | NR operating band groups <sup>Note 2</sup>  | Minimum $I_0$                |        | Maximum $I_0$              |                            |

|                  |                   |                            | NR_FDD_FR1_B  | -120.5                       | -117.5 | N/A                        | -70                        |
|                  |                   |                            | NR_TDD_FR1_C  | -120                         | -117   | N/A                        | -70                        |
|                  |                   |                            | NR_FDD_FR1_D,<br>NR_TDD_FR1_D   | -119.5                       | -116.5 | N/A                        | -70                        |
|                  |                   |                            | NR_FDD_FR1_E,<br>NR_TDD_FR1_E   | -119                         | -116   | N/A                        | -70                        |
|                  |                   |                            | NR_FDD_FR1_G  | -118                         | -115   | N/A                        | -70                        |
|                  |                   |                            | NR_FDD_FR1_H  | -117.5                       | -114.5 | N/A                        | -70                        |
| $\pm 8.5$        | $\pm 11.5$        | $\geq -3\text{dB}$         | NR_FDD_FR1_A,<br>NR_TDD_FR1_A,<br>NR_SDL_FR1_A,<br>NR_FDD_FR1_B,<br>NR_TDD_FR1_C,<br>NR_FDD_FR1_D,<br>NR_TDD_FR1_D,<br>NR_FDD_FR1_E,<br>NR_TDD_FR1_E,<br>NR_FDD_FR1_G,<br>NR_FDD_FR1_H, | N/A                          | N/A    | -70                        | -50                        |

NOTE 1:  $I_0$  is assumed to have constant EPRE across the bandwidth.  
 NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2.

#### 10.1.19.1.2 Relative Accuracy

The relative accuracy of SSB based L1-RSRP is defined as the L1-RSRP measured from one SSB compared to the largest measured value of L1-RSRP among all SSBs of the serving cell.

The accuracy requirements in Table 10.1.19.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to Annex B.2.4.1 for a corresponding Band for each relevant SSB.

Table 10.1.19.1.2-1: SSB based L1-RSRP relative accuracy in FR1

| Accuracy         |                   | Conditions                           |  |                              |                              |     |                            |                            |

|                  |                   |                                      | NR_FDD_FR1_B                                   | -120.5                       | -117.5                       | N/A | -50                        |                            |
|                  |                   |                                      | NR_TDD_FR1_C                                   | -120                         | -117                         | N/A | -50                        |                            |
|                  |                   |                                      | NR_FDD_FR1_D,<br>NR_TDD_FR1_D                  | -119.5                       | -116.5                       | N/A | -50                        |                            |
|                  |                   |                                      | NR_FDD_FR1_E,<br>NR_TDD_FR1_E                  | -119                         | -116                         | N/A | -50                        |                            |
|                  |                   |                                      | NR_FDD_FR1_G                                   | -118                         | -115                         | N/A | -50                        |                            |
|                  |                   |                                      | NR_FDD_FR1_H                                   | -117.5                       | -114.5                       | N/A | -50                        |                            |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
 NOTE 2: The parameter SSB  $\hat{E}_s/\text{lot}$  is the minimum SSB  $\hat{E}_s/\text{lot}$  of the pair of SSBs to which the requirement applies.  
 NOTE 3: Void  
 NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2..

10.1.19.2 CSI-RS based L1-RSRP accuracy requirements

10.1.19.2.1 Absolute Accuracy

Unless otherwise specified, the requirements for absolute accuracy of CSI-RS based L1-RSRP in this clause apply to all CSI-RS resources of the serving cell configured for L1-RSRP measurement.

The accuracy requirements in Table 10.1.19.2.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to Annex B.2.4.2 for a corresponding Band for each relevant CSI-RS.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.

The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in Table 10.1.19.2.1-1.

Table 10.1.19.2.1-1: CSI-RS based L1-RSRP absolute accuracy in FR1

| Accuracy         |                   | Conditions                    |  |  |  |  |                            |                            |

### 10.1.19.2.2 Relative Accuracy

The relative accuracy of CSI-RS based L1-RSRP is defined as the L1-RSRP measured from one CSI-RS compared to the largest measured value of L1-RSRP among all CSI-RS resources of the serving cell.

The accuracy requirements in Table 10.1.19.2.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to Annex B.2.4.2 for a corresponding Band for each relevant CSI-RS.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.

The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in Table 10.1.19.2.2-1.

**Table 10.1.19.2.2-1: CSI-RS based L1-RSRP relative accuracy in FR1**

| Accuracy  |                   | Conditions                           |  |                                |                                |                                |                            |                            |

## 10.1.20 L1-RSRP accuracy requirements for FR2

### 10.1.20.1 SSB based L1-RSRP accuracy requirements

#### 10.1.20.1.1 Absolute Accuracy

Unless otherwise specified, the requirements for absolute accuracy of SSB based L1-RSRP in this clause apply to all SSBs of the serving cell configured for L1-RSRP measurement.

The accuracy requirements in Table 10.1.20.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to Annex B.2.4.1 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.20.1.1-1: SSB based L1-RSRP absolute accuracy in FR2**

| Accuracy   |                   | Conditions                 |   |                             |                     |
|--|-------------------|----------------------------|---|-----------------------------|---------------------|
| Normal condition   | Extreme condition | SSB $\hat{E}_s/\text{lot}$ | $I_o$ <sup>Note 1</sup> range   |                             |                     |
|  |                   |                            | Minimum $I_o$   |                             | Maximum $I_o$       |
| dB   | dB                | dB                         | dBm / $SCS_{SSB}$ <sup>Note 2</sup>   |                             | dBm/ $BW_{Channel}$ |
|  |                   |                            | $SCS_{SSB} = 120\text{kHz}$   | $SCS_{SSB} = 240\text{kHz}$ |                     |
| $\pm 6.5$  | $\pm 9.5$         | $\geq -3$                  | Same value as SSB_RP in Table B.2.4.1-2, according to UE Power class, operating band and angle of arrival |                             | N/A                 |
| $\pm 8.5$  | $\pm 11.5$        | $\geq -3$                  | N/A   |                             | -70                 |
| NOTE 1: $I_o$ specified at the Reference point, and assumed to have constant EPRE across the bandwidth.  |                   |                            |   |                             |                     |
| NOTE 2: Values based on Refsens and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.            |                   |                            |   |                             |                     |
| NOTE 3: In the test cases, the SSB $\hat{E}_s/\text{lot}$ and related parameters may need to be adjusted to ensure $\hat{E}_s/\text{lot}$ at UE baseband is above the value defined in this table. |                   |                            |   |                             |                     |

#### 10.1.20.1.2 Relative Accuracy

The relative accuracy of SSB based L1-RSRP is defined as the L1-RSRP measured from one SSB compared to the largest measured value of L1-RSRP among all SSBs of the serving cell.

The accuracy requirements in Table 10.1.20.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to Annex B.2.4.1 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.20.1.2-1: SSB based L1-RSRP relative accuracy in FR2**

| Accuracy         |                   | Conditions                 |                                     |                             |                     |
|------------------|-------------------|----------------------------|-------------------------------------|-----------------------------|---------------------|
| Normal condition | Extreme condition | SSB $\hat{E}_s/\text{lot}$ | $I_o$ <sup>Note 1</sup> range       |                             |                     |
|                  |                   |                            | Minimum $I_o$                       |                             | Maximum $I_o$       |
| dB               | dB                | dB                         | dBm / $SCS_{SSB}$ <sup>Note 3</sup> |                             | dBm/ $BW_{Channel}$ |
|                  |                   |                            | $SCS_{SSB} = 120\text{kHz}$         | $SCS_{SSB} = 240\text{kHz}$ |                     |
|                  |                   |                            |                                     |                             |                     |

|  |      |     |   |     |
|--|------|-----|---|-----|
| ±6.5   | ±9.5 | ≥-3 | Same value as SSB_RP in Table B.2.4.1-2, according to UE Power class, operating band and angle of arrival | -50 |
| <p>NOTE 1: <math>I_0</math> specified at the Reference point, and assumed to have constant EPRE across the bandwidth.</p> <p>NOTE 2: The parameter SSB <math>\dot{E}_s/\text{lot}</math> is the minimum SSB <math>\dot{E}_s/\text{lot}</math> of the pair of SSBs to which the requirement applies.</p> <p>NOTE 3: Values based on Refsens and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.</p> <p>NOTE 4: In the test cases, the SSB <math>\dot{E}_s/\text{lot}</math> and related parameters may need to be adjusted to ensure <math>\dot{E}_s/\text{lot}</math> at UE baseband is above the value defined in this table.</p> |      |     |   |     |

### 10.1.20.2 CSI-RS based L1-RSRP accuracy requirements

#### 10.1.20.2.1 Absolute Accuracy

Unless otherwise specified, the requirements for absolute accuracy of CSI-RS based L1-RSRP in this clause apply to all CSI-RS resources of the serving cell configured for L1-RSRP measurement.

The accuracy requirements in Table 10.1.20.2.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to Annex B.2.4.2 for a corresponding Band for each relevant CSI-RS.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in Table 10.1.20.2.1-1.

**Table 10.1.20.2.1-1: CSI-RS based L1-RSRP absolute accuracy in FR2**

| Accuracy  |                   | Conditions                    |  |                                       |                            |
|---|-------------------|-------------------------------|--|---------------------------------------|----------------------------|
| Normal condition  | Extreme condition | CSI-RS $\dot{E}_s/\text{lot}$ | $I_0$ <sup>Note 1</sup> range  |                                       |                            |
|   |                   |                               | Minimum $I_0$  |                                       | Maximum $I_0$              |
| dB  | dB                | dB                            | dBm / $SCS_{\text{CSI-RS}}$ <sup>Note 2</sup>  |                                       | dBm/ $BW_{\text{Channel}}$ |
|   |                   |                               | $SCS_{\text{CSI-RS}} = 60\text{kHz}$   | $SCS_{\text{CSI-RS}} = 120\text{kHz}$ |                            |
| ±6.5  | ±9.5              | ≥-3                           | Same value as CSI-RS_RP in Table B.2.4.2-2, according to UE Power class, operating band and angle of arrival |                                       | N/A                        |
| ±8.5  | ±11.5             | ≥-3                           | N/A  |                                       | -70                        |
| <p>NOTE 1: <math>I_0</math> specified at the Reference point, and assumed to have constant EPRE across the bandwidth.</p> <p>NOTE 2: Values based on Refsens and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.</p> <p>NOTE 3: In the test cases, the CSI-RS <math>\dot{E}_s/\text{lot}</math> and related parameters may need to be adjusted to ensure <math>\dot{E}_s/\text{lot}</math> at UE baseband is above the value defined in this table.</p> |                   |                               |  |                                       |                            |

#### 10.1.20.2.2 Relative Accuracy

The relative accuracy of CSI-RS based L1-RSRP is defined as the L1-RSRP measured from one CSI-RS compared to the largest measured value of L1-RSRP among all CSI-RS resources of the serving cell.

The accuracy requirements in Table 10.1.20.2.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to Annex B.2.4.2 for a corresponding Band for each relevant CSI-RS.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in Table 10.1.20.2.2-1.

**Table 10.1.20.2.2-1: CSI-RS based L1-RSRP relative accuracy in FR2**

| Accuracy  |                   | Conditions            |  |                         |                     |
|---|-------------------|-----------------------|--|-------------------------|---------------------|
| Normal condition  | Extreme condition | CSI-RS $\hat{E}s/lot$ | $I_o$ <sup>Note 1</sup> range  |                         | Maximum $I_o$       |
|   |                   |                       | dBm / $SCS_{CSI-RS}$   |                         |                     |
| dB  | dB                | dB                    | Minimum $I_o$  |                         | dBm/ $BW_{Channel}$ |
|   |                   |                       | $SCS_{CSI-RS} = 60kHz$   | $SCS_{CSI-RS} = 120kHz$ |                     |
| ±6.5  | ±9.5              | ≥-3                   | Same value as CSI-RS RP in Table B.2.4.2-2, according to UE Power class, operating band and angle of arrival |                         | -50                 |
| NOTE 1: $I_o$ specified at the Reference point, and assumed to have constant EPRE across the bandwidth.   |                   |                       |  |                         |                     |
| NOTE 2: The parameter CSI-RS $\hat{E}s/lot$ is the minimum CSI-RS $\hat{E}s/lot$ of the pair of CSI-RS resources to which the requirement applies.                                      |                   |                       |  |                         |                     |
| NOTE 3: Values based on Refsens and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival. |                   |                       |  |                         |                     |
| NOTE 4: In the test cases, the CSI-RS $\hat{E}s/lot$ and related parameters may need to be adjusted to ensure $\hat{E}s/lot$ at UE baseband is above the value defined in this table.   |                   |                       |  |                         |                     |

### 10.1.21 SFTD accuracy requirements

#### 10.1.21.1 SFTD accuracy requirements for NE-DC

The SFN and frame timing difference (SFTD) is measured between PCell and E-UTRAN PSCell under NE-DC.

The accuracy requirements in Table 10.1.21.1-4 are applicable under the following conditions:

For FR1 PCell SFN and frame timing measurement:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- $I_o$  range defined in Table 10.1.21.1-1.

**Table 10.1.21.1-1: PCell  $I_o$  range conditions in FR1**

| Parameter  | $I_o$ <sup>Note 1</sup> range                 |                                    |                      |                    |
|------------|---|------------------------------------|----------------------|--------------------|
|            | NR operating band groups <sup>Note 4, 5</sup> | Minimum $I_o$ <sup>Note 2, 3</sup> |                      | Maximum $I_o$      |
|            |   | dBm/ $SCS_{SSB}$                   |                      |                    |
| Conditions |   | $SCS_{SSB} = 15 kHz$               | $SCS_{SSB} = 30 kHz$ | $dBm/BW_{Channel}$ |
|            |   | NR_FDD_FR1_A, NR_TDD_FR1_A         | -121                 | -118               |
|            | NR_FDD_FR1_B                                  | -120.5                             | -117.5               | -50                |
|            | NR_TDD_FR1_C                                  | -120                               | -117                 | -50                |
|            | NR_FDD_FR1_D, NR_TDD_FR1_D                    | -119.5                             | -116.5               | -50                |

|   |                            |        |        |     |
|---|----------------------------|--------|--------|-----|
|   | NR_FDD_FR1_E, NR_TDD_FR1_E | -119   | -116   | -50 |
|   | NR_FDD_FR1_G               | -118   | -115   | -50 |
|   | NR_FDD_FR1_H               | -117.5 | -114.5 | -50 |
| <p>NOTE 1: <math>I_0</math> is assumed to have constant EPRE across the bandwidth.</p> <p>NOTE 2: The condition level is increased by <math>\Delta R_{IB,c}</math> as defined in clause 7.3B in TS 38.101-3 [20], depending on E-UTRA – NR band combination.</p> <p>NOTE 3: The condition level is increased by MSD as defined in clause 7.3B in TS 38.101-3 [20], if applicable depending on E-UTRA – NR band combination.</p> <p>NOTE 4: NR operating band groups are as defined in clause 3.5.</p> <p>NOTE 5: Only NR bands within EN-DC band combinations as specified in clause 5.5B in TS 38.101-3 [20] are applicable.</p> |                            |        |        |     |

For FR2 PCell SFN and frame timing measurement:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- $I_0$  range defined in Table 10.1.21.1-2.

**Table 10.1.21.1-2: PCell  $I_0$  range conditions in FR2**

| Parameter  | $I_0$ <sup>Note 1</sup> range   |   |                           |
|--|---|---|---------------------------|
|  | Minimum $I_0$ <sup>Note 2, 3</sup>  |   | Maximum $I_0$             |
|  | dBm/ SCS <sub>SSB</sub>   |   | dBm/BW <sub>Channel</sub> |
|  | SCS <sub>SSB</sub> = 15 kHz   | SCS <sub>SSB</sub> = 30 kHz   |                           |
| Conditions   | Same value as SSB_RP in Table B.2.4.1-2, according to UE Power class, operating band and angle of arrival | Same value as SSB_RP in Table B.2.4.1-2, according to UE Power class, operating band and angle of arrival | -50                       |
| <p>NOTE 1: <math>I_0</math> is assumed to have constant EPRE across the bandwidth and specified at the Reference point.</p> <p>NOTE 2: Values based on Refsens and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.</p> <p>NOTE 3: In the test cases, the SSB <math>\hat{E}_s/I_0</math> and related parameters may need to be adjusted to ensure <math>\hat{E}_s/I_0</math> at UE baseband is above the value defined in this table.</p> |   |   |                           |

For E-UTRA PCell SFN and frame timing measurement:

- Cell specific reference signals are transmitted either from one, two or four antenna ports.
- Conditions defined in TS 36.101 [25] Clause 7.3 for reference sensitivity are fulfilled.
- No changes to the uplink transmission timing are applied during the measurement period.
- RSRP<sub>dBm</sub> according to Annex B.3.5 in TS 36.101 [25] for a corresponding Band.
- $I_0$  range defined in Table 10.1.21.1-3.

**Table 10.1.21.1-3: E-UTRA PCell  $I_0$  range conditions**

| Parameter   | $I_0$ <sup>Note 1</sup> range                  |                             |                           |
|---|--|-----------------------------|---------------------------|
|   | E-UTRA operating band groups <sup>Note 3</sup> | Minimum $I_0$               | Maximum $I_0$             |
|   |  | dBm/15kHz <sup>Note 2</sup> | dBm/BW <sub>Channel</sub> |
| Conditions  | FDD_A, TDD_A                                   | -121                        | -50                       |
|   | FDD_C, TDD_C                                   | -120                        | -50                       |
|   | FDD_D  | -119.5                      | -50                       |
|   | FDD_E, TDD_E                                   | -119                        | -50                       |
|   | FDD_F  | -118.5                      | -50                       |
|   | FDD_G  | -118                        | -50                       |
|   | FDD_H  | -117.5                      | -50                       |
|   | FDD_N  | -114.5                      | -50                       |
| <p>NOTE 1: When in dBm/15kHz, the minimum <math>I_0</math> condition is expressed as the average <math>I_0</math> per RE over all REs in that symbol. <math>I_0</math> may be different in different symbols within a subframe.</p> <p>NOTE 2: The condition level is increased by <math>\Delta &gt; 0</math>, when applicable, as described in clauses B.4.2 and B.4.3 in TS36.133 [15].</p> <p>NOTE 3: E-UTRA operating band groups are as defined in clause 3.5 in TS 36.133 [15].</p> |  |                             |                           |

**Table 10.1.21.1-4: SFTD measurement accuracy**

| Accuracy  | Conditions                               |                 |
|---|--|-----------------|
|   | $\hat{E}_s/\text{lot}$ <sup>Note 2</sup> | Frequency range |
| $T_s$ <sup>Note 1</sup>   | <b>dB</b>                                |                 |
| $40 \cdot 64 \cdot T_c$   | $\geq -3$ dB                             | FR1             |
| $40 \cdot 64 \cdot T_c$   |  | FR2             |
| NOTE 1: $T_c$ is the basic timing unit defined in TS 38.211 [6].  |  |                 |
| NOTE 2: The parameter $\hat{E}_s/\text{lot}$ is the minimum $\hat{E}_s/\text{lot}$ of the pair of cells to which the requirement applies. |  |                 |

**10.1.21.2 SFTD accuracy requirements for NR-DC**

The SFN and frame timing difference (SFTD) is measured between PCell in FR1 and PSCell in FR2 under NR dual connectivity.

The accuracy requirements in Table 10.1.21.2-3 are applicable under the following conditions:

For FR1 PCell SFN and frame timing measurement:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- $I_o$  range defined in Table 10.1.21.2-1.

**Table 10.1.21.2-1: PCell  $I_o$  range conditions in FR1**

| Parameter  | $I_o$ <sup>Note 1</sup> range              |                      |        |                     |
|--|--|----------------------|--------|---------------------|
|  | NR operating band groups <sup>Note 2</sup> | Minimum $I_o$        |        | Maximum $I_o$       |
|  |  | dBm/ $SCS_{SSB}$     |        | dBm/ $BW_{Channel}$ |
|  | $SCS_{SSB} = 15$ kHz                       | $SCS_{SSB} = 30$ kHz |        |                     |
| Conditions   | NR_FDD_FR1_A, NR_TDD_FR1_A                 | -121                 | -118   | -50                 |
|  | NR_FDD_FR1_B                               | -120.5               | -117.5 | -50                 |
|  | NR_TDD_FR1_C                               | -120                 | -117   | -50                 |
|  | NR_FDD_FR1_D, NR_TDD_FR1_D                 | -119.5               | -116.5 | -50                 |
|  | NR_FDD_FR1_E, NR_TDD_FR1_E                 | -119                 | -116   | -50                 |
|  | NR_FDD_FR1_G                               | -118                 | -115   | -50                 |
|  | NR_FDD_FR1_H                               | -117.5               | -114.5 | -50                 |
| NOTE 1: $I_o$ is assumed to have constant EPRE across the bandwidth. |  |                      |        |                     |
| NOTE 2: NR operating band groups are as defined in clause 3.5.2.     |  |                      |        |                     |

For FR2 PSCell SFN and frame timing measurement:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- $I_o$  range defined in Table 10.1.21.2-2.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.21.2-2: PSCell  $I_o$  range conditions in FR2**

| Parameter            | $I_o$ <sup>Note 1</sup> range      |  |                     |
|----------------------|------------------------------------|--|---------------------|
|                      | Minimum $I_o$ <sup>Note 2, 3</sup> |  | Maximum $I_o$       |
|                      | dBm/ $SCS_{SSB}$                   |  | dBm/ $BW_{Channel}$ |
| $SCS_{SSB} = 15$ kHz | $SCS_{SSB} = 30$ kHz               |  |                     |

|  |   |   |     |
|--|---|---|-----|
| <b>Conditions</b>  | Same value as SSB_RP in Table B.2.4.1-2, according to UE Power class, operating band and angle of arrival | Same value as SSB_RP in Table B.2.4.1-2, according to UE Power class, operating band and angle of arrival | -50 |
| NOTE 1: $I_o$ is assumed to have constant EPRE across the bandwidth and specified at the Reference point.<br>NOTE 2: Values based on Refsens and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.<br>NOTE 3: In the test cases, the SSB $\hat{E}_s/lot$ and related parameters may need to be adjusted to ensure $\hat{E}_s/lot$ at UE baseband is above the value defined in this table. |   |   |     |

**Table 10.1.21.2-3: SFTD measurement accuracy**

| Accuracy   | Conditions                        |                     |
|--|-----------------------------------|---------------------|
|  | $\hat{E}_s/lot$ <sup>Note 2</sup> | Frequency range     |
| <b>T<sub>s</sub></b> <sup>Note 1</sup>   | <b>dB</b>                         |                     |
| 40*64*T <sub>c</sub>   | ≥ -3 dB                           | Between FR1 and FR2 |
| NOTE 1: T <sub>c</sub> is the basic timing unit defined in TS 38.211 [6].<br>NOTE 2: The parameter $\hat{E}_s/lot$ is the minimum $\hat{E}_s/lot$ of the pair of cells to which the requirement applies. |                                   |                     |

**10.1.21.3 Inter frequency SFTD accuracy requirements**

The SFN and frame timing difference (SFTD) is measured between PCell and inter-frequency neighbour cell.

The accuracy requirements in Table 10.1.21.3-3 are applicable under the following conditions:

For FR1 PCell, inter frequency neighbour cell SFN and frame timing measurement:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- $I_o$  range defined in Table 10.1.21.3-1.

**Table 10.1.21.3-1: PCell, inter frequency neighbour cell  $I_o$  range conditions in FR1**

| Parameter  | $I_o$ <sup>Note 1</sup> range              |                             |                             |                           |
|--|--|-----------------------------|-----------------------------|---------------------------|

|  | NR_FDD_FR1_G                               | -118                        | -115                        | -50                       |
|  | NR_FDD_FR1_H                               | -117.5                      | -114.5                      | -50                       |
| NOTE 1: $I_o$ is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR operating band groups are as defined in clause 3.5.2. |  |                             |                             |                           |

For FR2 PCell, inter frequency neighbour cell SFN and frame timing measurement:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- $I_o$  range defined in Table 10.1.21.3-2.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.21.3-2: PCell, inter frequency neighbour cell  $I_o$  range conditions in FR2**

| Parameter | $I_o$ <sup>Note 1</sup> range |
|-----------|-------------------------------|
|-----------|-------------------------------|

|  | Minimum $I_o$ <sup>Note 2, 3</sup>   |  | Maximum $I_o$             |
|--|--|--|---------------------------|
|  | dBm/ $SCS_{SSB}$   |  | dBm/BW <sub>Channel</sub> |
|  | $SCS_{SSB} = 15$ kHz   | $SCS_{SSB} = 30$ kHz   |                           |
| <b>Conditions</b>  | Same value as $SSB\_RP$ in Table B.2.4.1-2, according to UE Power class, operating band and angle of arrival | Same value as $SSB\_RP$ in Table B.2.4.1-2, according to UE Power class, operating band and angle of arrival | -50                       |
| NOTE 1: $I_o$ is assumed to have constant EPRE across the bandwidth and specified at the Reference point.  |  |  |                           |
| NOTE 2: Values based on Refsens and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.    |  |  |                           |
| NOTE 3: In the test cases, the SSB $\hat{E}_s/I_{ot}$ and related parameters may need to be adjusted to ensure $\hat{E}_s/I_{ot}$ at UE baseband is above the value defined in this table. |  |  |                           |

Table 10.1.21.3-3: Inter frequency SFTD measurement accuracy

| Accuracy  | Conditions                           |                 |
|---|--------------------------------------|-----------------|
|   | $\hat{E}_s/I_{ot}$ <sup>Note 2</sup> | Frequency range |
| $T_s$ <sup>Note 1</sup>   | dB                                   |                 |
| $40 \cdot 64 \cdot T_c$   | $\geq -3$ dB                         | FR1, FR2        |
| NOTE 1: $T_c$ is the basic timing unit defined in TS 38.211 [6].  |                                      |                 |
| NOTE 2: The parameter $\hat{E}_s/I_{ot}$ is the minimum $\hat{E}_s/I_{ot}$ of the pair of cells to which the requirement applies. |                                      |                 |

## 10.2 E-UTRAN measurements

### 10.2.1 Introduction

Accuracy requirements for measurements on E-UTRAN carrier frequencies are specified in clause 10.2 and apply for UE in SA or NR-DC or NE-DC operation mode.

The requirements in clause 10.2 are applicable for a UE:

- in RRC\_CONNECTED state
- performing measurements with appropriate measurement gaps according to clause 9.1.2.
- that is synchronised to the cell that is measured.

The reported measurement result after layer 1 filtering shall be an estimate of the average value of the measured quantity over the measurement period. The reference point for the measurement result after layer 1 filtering is referred to as point B in the measurement model described in TS 36.300 [24].

The accuracy requirements of E-UTRA measurements in this clause are valid for the reported measurement result after layer 1 filtering. The accuracy requirements are verified from the measurement report at point D in the measurement model having the layer 3 filtering disabled.

If the UE needs measurement gaps to perform the inter-RAT NR — E-UTRAN FDD and NR — E-UTRAN TDD measurements, the relevant measurement procedure and measurement gap patterns stated in clause 9.1.2 shall apply.

### 10.2.2 E-UTRAN RSRP measurements

NOTE: This measurement is for handover between NR and E-UTRAN.

The measurement period of E-UTRA RSRP in RRC\_CONNECTED state is specified in clause 9.4.2 and 9.4.3.

The accuracy requirements of E-UTRA RSRP measurements in RRC\_CONNECTED state and the corresponding side conditions shall be the same as the inter-frequency RSRP Accuracy Requirements in clause 9.1.3 of TS 36.133 [15].

The reporting range and mapping specified for RSRP measurements in clause 9.1.4 of TS 36.133 [15] shall apply.

### 10.2.3 E-UTRAN RSRQ measurements

NOTE: This measurement is for handover between NR and E-UTRAN.

The measurement period of E-UTRA RSRQ in RRC\_CONNECTED state is specified in clause 9.4.2 and 9.4.3.

The accuracy requirements of E-UTRA RSRQ measurements in RRC\_CONNECTED state and the corresponding side conditions shall be the same as the inter-frequency RSRQ Accuracy Requirements in clause 9.1.6 of TS 36.133 [15].

The requirements for accuracy of E-UTRA RSRQ measurements in RRC\_CONNECTED state and the corresponding side conditions shall be the same as the inter-frequency RSRQ Accuracy Requirements in clause 9.1.6 of TS 36.133 [15].

The reporting range and mapping specified for RSRQ measurements in clause 9.1.7 of TS 36.133 [15] shall apply.

### 10.2.4 E-UTRAN RSTD measurements

The requirements in this clause are valid for UE supporting this capability.

The measurement period is specified in clauses 9.4.4.1 and 9.4.4.2 for inter-RAT NR — E-UTRAN FDD and inter-RAT NR — E-UTRAN TDD RSTD measurements, respectively.

The accuracy requirements and the corresponding side conditions shall be the same as the inter-frequency measurement accuracy requirements for RSTD measurements in RRC\_CONNECTED in clause 9.1.10.2 of TS 36.133 [15].

If the UE needs measurement gaps to perform the inter-RAT NR — E-UTRAN FDD and NR — E-UTRAN TDD RSTD measurements, the relevant measurement procedure and measurement gap patterns stated in clause 9.1.2 shall apply.

The reporting range and mapping for the inter-RAT NR — E-UTRAN FDD and NR — E-UTRAN TDD RSTD measurements is the same as specified for RSTD measurements in TS 36.133 [15, clauses 9.1.10.3 and 9.1.10.4].

### 10.2.5 E-UTRAN RS-SINR measurements

NOTE: This measurement is for handover between NR and E-UTRAN.

The measurement period of E-UTRA RS-SINR in RRC\_CONNECTED state is specified in clause 9.4.2 and 9.4.3.

The accuracy requirements of E-UTRA RS-SINR measurements in RRC\_CONNECTED state and the corresponding side conditions shall be the same as the inter-frequency RS-SINR Accuracy Requirements in clause 9.1.17.3 of TS 36.133 [15].

The reporting range and mapping for E-UTRA RS-SINR measurements shall be the same as specified for RS-SINR measurements in clause 9.1.17.1 of TS 36.133 [15].

## Annex A (normative): Test Cases

---

### A.1 Purpose of annex

### A.2 Requirement classification for statistical testing

Requirements in this specification are either expressed as absolute requirements with a single value stating the requirement, or expressed as a success rate. There are no provisions for the statistical variations that will occur when the parameter is tested.

Annex A outlines the tests in more detail and lists the test parameters needed. The test will result in an outcome of a test variable value for the device under test (DUT) inside or outside the test limit. Overall, the probability of a "good" DUT being inside the test limit(s) and the probability of a "bad" DUT being outside the test limit(s) should be as high as possible. For this reason, when selecting the test variable and the test limit(s), the statistical nature of the test is accounted for.

The statistical nature depends on the type of requirement. Some have large statistical variations, while others are not statistical in nature at all. When testing a parameter with a statistical nature, a confidence level is set. This establishes the probability that a DUT passing the test actually meets the requirements and determines how many times a test has to be repeated and what the pass and fail criteria are. Those aspects are not covered by TS 38.133. The details of the tests on how many times to run it and how to establish confidence in the tests are described in TS 38.533 [5]. This Annex establishes the variable to be used in the test and whether it can be viewed as statistical in nature or not.

#### A.2.1 Types of requirements in TS 38.133

##### A.2.1.1 Time and delay requirements on UE higher layer actions

A very large part of the RRM requirements are delay requirements:

- In RRC\_IDLE state mobility (clause A.6.1 and A.7.1) there is cell re-selection delay.
- In RRC\_CONNECTED state mobility (clauses A.4.3, A.4.6, A.5.3, A.5.6, A.6.3, A.6.6, A.7.3 and A.7.6) there is handover delay, cell search delay and measurement reporting delay.
- In RRC Connection Control (clauses A.4.3.2, A.5.3.2, A.6.3.2 and A.7.3.2) there is RRC re-establishment delay.

All have in common that the UE is required to perform an action observable in higher layers (e.g. camp on the correct cell) within a certain time after a specific event (e.g. when a new strong pilot or reference signal appears). The delay time is statistical in nature for several reasons, among others that several of the measurements are performed by the UE in a fading radio environment.

The variations make a strict limit unsuitable for a test. Instead there is a condition set for a correct action by the UE, e.g. that the UE shall camp on the correct cell within X seconds. Then the rate of correct events is observed during repeated tests and a limit is set on the rate of correct events, usually 90% correct events are required. How the limit is applied in the test depends on the confidence required, further detailed are in TS 38.533 [5].

## A.2.1.2 Measurements of power levels, relative powers and time

A very large number of requirements are on measurements that the UE performs:

- In RRC\_CONNECTED state mobility (clauses A.4.3, A.5.3, A.6.3 and A.7.3) there are measurement reports.
- In Measurement Performance Requirements (clauses A.4.7, A.5.7, A.6.7 and A.7.7) there are requirements for all type of measurements.

The accuracy requirements on measurements are expressed in this specification as a fixed limit (e.g. +/-X dB), but the measurement error will have a distribution that is not easily confined in fixed limits. Assuming a Gaussian distribution of the error, the limits will have to be set at  $\pm 3.29\sigma$  if the probability of failing a "good DUT" in a single test is to be kept at 0.1%. It is more reasonable to set the limit tighter and test the DUT by counting the rate of measurements that are within the limits, in a way similar to the requirements on delay.

## A.2.1.3 Implementation requirements

A few requirements are strict actions the UE should take or capabilities the UE should have, without any allowance for deviations. These requirements are absolute and should be tested as such. Examples are:

- "Event triggered report rate" in RRC\_CONNECTED state mobility (clauses A.4.3, A.4.6, A.5.3, A.5.6, A.6.3, A.6.6, A.7.3 and A.7.6)
- "Correct behaviour at time-out" in RRC connection control (clauses A.4.3.2, A.5.3.2, A.6.3.2 and A.7.3.2)

## A.2.1.4 Physical layer timing requirements

There are requirements on Timing (clauses A.4.4, A.5.4, A.6.4 and A.7.4). There are both absolute and relative limits on timing accuracy depending upon the type of requirement. Examples are:

- Initial Transmit Timing (clauses A.4.4.1, A.5.4.1, A.6.4.1 and A.7.4.1) has an absolute limit on timing accuracy.
- Timing Advance (clauses A.4.4.2, A.5.4.2, A.6.4.2 and A.7.4.2) has a relative limit on timing accuracy.

Table A.3.1.1.2-2: PDSCH Reference Measurement Channels for SCS=30kHz

| Parameter   | Unit  | Value                      |  |  |  |  |  |  |
|---|-------|----------------------------|--|--|--|--|--|--|
| Reference channel                                     |       | SR.2.1<br>TDD              |  |  |  |  |  |  |
| Channel bandwidth                                     | MHz   | Defined<br>in test<br>case |  |  |  |  |  |  |
| Number of transmitter antennas                        |       | 1                          |  |  |  |  |  |  |
| Allocated resource blocks for PDSCH <sup>Note 1</sup> |       | 24                         |  |  |  |  |  |  |
| Allocated slots per Radio Frame                       |       |                            |  |  |  |  |  |  |
| Radio frame containing SSB                            | slots | Note 5                     |  |  |  |  |  |  |
| Radio frame not containing SSB                        | slots | 10                         |  |  |  |  |  |  |
| MCS table   |       | 64QAM                      |  |  |  |  |  |  |
| MCS index   |       | 4                          |  |  |  |  |  |  |
| Modulation  |       | QPSK                       |  |  |  |  |  |  |
| Target Coding Rate                                    |       | 1/3                        |  |  |  |  |  |  |

|  |      |        |  |  |  |  |  |
|--|------|--------|--|--|--|--|--|
| Number of control symbols  |      | 2      |  |  |  |  |  |
| PDSCH mapping type   |      | Type A |  |  |  |  |  |
| Information Bit Payload  |      |        |  |  |  |  |  |
| For slots with RMSI <sup>Note 2</sup>  | bits | 1608   |  |  |  |  |  |
| For slots without RMSI   | bits | 1864   |  |  |  |  |  |
| Number of Code Blocks per slot   |      | 1      |  |  |  |  |  |
| Binary Channel Bits Per slot   |      |        |  |  |  |  |  |
| For slots with RMSI <sup>Note 2, Note 4</sup>  | bits | 6048   |  |  |  |  |  |
| <p>Note 1: Allocated outside the SMTC duration in time and in resource blocks which do not overlap with the resource blocks allocated for SS/PBCH block.</p> <p>Note 2: PDSCH is scheduled on the slots with RMSI.</p> <p>Note 3: If necessary the information bit payload size can be adjusted to facilitate the test implementation. The payload sizes are defined in TS 38.213 [3].</p> <p>Note 4: Derived based on the PDSCH DMRS assumption: dmrs-TypeA-Position=2, dmrs-Type=1, dmrs-AdditionalPositions=2, maxLength=1, Antenna port index: 1000, and Number of PDSCH DMRS CDM group(s) without data: 2.</p> <p>Note 5: PDSCH is not scheduled in slots containing SSB according to the SSB configuration used in the test. SSB configurations are defined in clause A.3.10.</p> <p>Note 6: Derived based on the PDSCH DMRS assumption: dmrs-TypeA-Position=2, dmrs-Type=1, dmrs-AdditionalPositions=2, maxLength=1, Antenna port index: 1000, and Number of PDSCH DMRS CDM group(s) without data: 1.</p> <p>Note 7: When DRX is configured, PDCCH can be scheduled both for downlink assignment and/or UL grant only during (<math>[10]ms - drx-InactivityTimer</math>) from timing when drx-onDurationTimer starts, unless otherwise specified in the test case</p> |      |        |  |  |  |  |  |

Table A.3.1.1.2-3: PDSCH Reference Measurement Channels for SCS=120kHz

| Parameter                           | Unit  | Value                |                      |                      |  |  |  |
|-------------------------------------|-------|----------------------|----------------------|----------------------|--|--|--|
| Reference channel                   |       | SR.3.1<br>TDD        | SR.3.2<br>TDD        | SR.3.3<br>TDD        |  |  |  |
| Channel bandwidth                   | MHz   | 100                  | 100                  | 100                  |  |  |  |
| Number of transmitter antennas      |       | 1                    | 1                    | 1                    |  |  |  |
| Allocated resource blocks for PDSCH |       | 24 <sup>Note 1</sup> | 24 <sup>Note 7</sup> | 48 <sup>Note 7</sup> |  |  |  |
| Allocated slots per Radio Frame     |       |                      |                      |                      |  |  |  |
| Radio frame containing SSB          | slots | Note 5               | Note 5               | Note 5               |  |  |  |
| Radio frame not containing SSB      | slots | 48                   | 48                   | 48                   |  |  |  |
| MCS table                           |       | 64QAM                | 64QAM                | 64QAM                |  |  |  |
| MCS index                           |       | 4                    | 4                    | 4                    |  |  |  |
| Modulation                          |       | QPSK                 | QPSK                 | QPSK                 |  |  |  |
| Target Coding Rate                  |       | 1/3                  | 1/3                  | 1/3                  |  |  |  |
| Number of control symbols           |       | 2                    | 2                    | 2                    |  |  |  |
| PDSCH mapping type                  |       | Type A               | Type A               | Type A               |  |  |  |
| Information Bit Payload             |       |                      |                      |                      |  |  |  |
| For slots with RMSI                 | bits  | 1608                 | 1608                 | 3104                 |  |  |  |
| For slots without RMSI              | bits  | 1864                 | 1864                 | 3624                 |  |  |  |
| Number of Code Blocks per slot      |       | 1                    | 1                    | 1                    |  |  |  |
| Binary Channel Bits Per slot        |       |                      |                      |                      |  |  |  |

|   |      |      |      |       |  |  |  |  |
|---|------|------|------|-------|--|--|--|--|
| For slots with RMSI <sup>Note 4</sup>   | bits | 5184 | 5184 | 10368 |  |  |  |  |
| For slots without RMSI <sup>Note 6</sup>  | bits | 6048 | 6048 | 12096 |  |  |  |  |
| <p>Note 1: Allocated in resource blocks which do not overlap with the resource blocks allocated for SS/PBCH block</p> <p>Note 2: Void</p> <p>Note 3: If necessary the information bit payload size can be adjusted to facilitate the test implementation. The payload sizes are defined in TS 38.213 [3].</p> <p>Note 4: Derived based on the PDSCH DMRS assumption: dmrs-TypeA-Position=2, dmrs-Type=1, dmrs-AdditionalPositions=2, maxLength=1, Antenna port index: 1000, and Number of PDSCH DMRS CDM group(s) without data: 2.</p> <p>Note 5: PDSCH is not scheduled in slots containing SSB according to the SSB configuration used in the test. SSB configurations are defined in clause A.3.10.</p> <p>Note 6: Derived based on the PDSCH DMRS assumption: dmrs-TypeA-Position=2, dmrs-Type=1, dmrs-AdditionalPositions=2, maxLength=1, Antenna port index: 1000, and Number of PDSCH DMRS CDM group(s) without data: 1.</p> <p>Note 7: Allocated in the same resource blocks as the CORESET.</p> <p>Note 8: When DRX is configured, PDSCH is scheduled only while <i>drx-onDurationTimer</i> is running, unless otherwise specified in the test case.</p> |      |      |      |       |  |  |  |  |

### A.3.1.2 CORESET for RMSI scheduling

#### A.3.1.2.1 FDD

**Table A.3.1.2.1-1: RMSI CORESET Reference Channel for FDD with SCS=15KHz**

| Parameter  | Unit    | Value                   |  |  |  |  |  |  |
|--|---------|-------------------------|--|--|--|--|--|--|
| Reference channel  |         | CR.1.1<br>FDD           |  |  |  |  |  |  |
| Channel bandwidth  | MHz     | Defined in<br>test case |  |  |  |  |  |  |
| Subcarrier spacing for<br>RMSI CORESET   | kHz     | 15                      |  |  |  |  |  |  |
| Allocated resource blocks<br>for RMSI CORESET <sup>Note 7</sup>                      |         | 24                      |  |  |  |  |  |  |
| Subcarrier spacing for<br>SSB  | kHz     | 15                      |  |  |  |  |  |  |
| SSB and RMSI<br>CORESET multiplexing<br>configuration <sup>Note 7</sup>              |         | Pattern 1               |  |  |  |  |  |  |
| Offset between SSB and<br>RMSI CORESET <sup>Note 3, 7</sup>                          | RB      | 0 (Note8)               |  |  |  |  |  |  |
| Configuration of PDCCH<br>monitoring occasions for<br>RMSI CORESET <sup>Note 4</sup> |         | Index 4                 |  |  |  |  |  |  |
| Number of transmitter<br>antennas  |         | 1                       |  |  |  |  |  |  |
| Duration of RMSI<br>CORESET <sup>Note 7</sup>  | symbols | 2                       |  |  |  |  |  |  |
| DCI Format <sup>Note 1</sup>   |         | Note 2                  |  |  |  |  |  |  |
| Aggregation level  | CCE     | 8                       |  |  |  |  |  |  |
| DMRS precoder<br>granularity   |         | 6                       |  |  |  |  |  |  |
| REG bundle size  |         | 6                       |  |  |  |  |  |  |
| Mapping from REG to<br>CCE   |         | Distributed             |  |  |  |  |  |  |
| Cell ID  |         | Note 5                  |  |  |  |  |  |  |
| Payload (without CRC)  | bits    | Note 6                  |  |  |  |  |  |  |
| Note 1: DCI formats are defined in TS 38.212.  |         |                         |  |  |  |  |  |  |

|         |  |
|---------|--|
| Note 2: | DCI format shall depend upon the test configuration.   |
| Note 3: | The offset is defined with respect to the subcarrier spacing of the CORESET from the smallest RB index of RMSI CORESET to the smallest RB index of the common RB overlapping with the first RB of the SS/PBCH block. |
| Note 4: | The configuration of PDCCH monitoring occasions for RMSI CORESET is defined in Table 13-11 in TS 38.213 [3].   |
| Note 5: | Cell ID shall depend upon the test configuration.  |
| Note 6: | Payload size shall depend upon the test configuration.   |
| Note 7: | The configuration of set of resource blocks and slot symbols of control resource set for Type0-PDCCH search space corresponds to index 0 in Table 13-1 in TS 38.213 [3]  |
| Note 8: | Other values can be used to align with GSCN [13] as long as SSB does not overlap the RMC.  |

### A.3.1.2.2 TDD

**Table A.3.1.2.2-1: RMSI CORESET Reference Channel for TDD with SCS=15KHz**

| Parameter  | Unit   | Value                   |  |  |  |  |  |  |
|--|--|-------------------------|--|--|--|--|--|--|
| Reference channel  |  | CR.1.1<br>TDD           |  |  |  |  |  |  |
| Channel bandwidth  | MHz  | Defined in<br>test case |  |  |  |  |  |  |
| Subcarrier spacing   | kHz  | 15                      |  |  |  |  |  |  |
| Allocated resource blocks<br>for RMSI CORESET <sup>Note 7</sup>                      |  | 24                      |  |  |  |  |  |  |
| SSB and RMSI<br>CORESET multiplexing<br>configuration <sup>Note 7</sup>              |  | Pattern 1               |  |  |  |  |  |  |
| Offset between SSB and<br>RMSI CORESET <sup>Note 3, 7</sup>                          | RB   | 0 (Note 8)              |  |  |  |  |  |  |
| Configuration of PDCCH<br>monitoring occasions for<br>RMSI CORESET <sup>Note 4</sup> |  | Index 4                 |  |  |  |  |  |  |
| Number of transmitter<br>antennas  |  | 1                       |  |  |  |  |  |  |
| Duration of RMSI<br>CORESET <sup>Note 7</sup>  | symbols  | 2                       |  |  |  |  |  |  |
| DCI Format <sup>Note 1</sup>   |  | Note 2                  |  |  |  |  |  |  |
| Aggregation level  | CCE  | 8                       |  |  |  |  |  |  |
| DMRS precoder<br>granularity   |  | 6                       |  |  |  |  |  |  |
| REG bundle size  |  | 6                       |  |  |  |  |  |  |
| Mapping from REG to<br>CCE   |  | Distributed             |  |  |  |  |  |  |
| Cell ID  |  | Note 5                  |  |  |  |  |  |  |
| Payload (without CRC)  | bits   | Note 6                  |  |  |  |  |  |  |
| Note 1:  | DCI formats are defined in TS 38.212.  |                         |  |  |  |  |  |  |
| Note 2:  | DCI format shall depend upon the test configuration.   |                         |  |  |  |  |  |  |
| Note 3:  | The offset is defined with respect to the subcarrier spacing of the CORESET from the smallest RB index of RMSI CORESET to the smallest RB index of the common RB overlapping with the first RB of the SS/PBCH block. |                         |  |  |  |  |  |  |
| Note 4:  | The configuration of PDCCH monitoring occasions for RMSI CORESET is defined in Table 13-11 in TS 38.213 [3].   |                         |  |  |  |  |  |  |
| Note 5:  | Cell ID shall depend upon the test configuration.  |                         |  |  |  |  |  |  |
| Note 6:  | Payload size shall depend upon the test configuration.   |                         |  |  |  |  |  |  |
| Note 7:  | The configuration of set of resource blocks and slot symbols of control resource set for Type0-PDCCH search space corresponds to index 0 in Table 13-1 in TS 38.213 [3].   |                         |  |  |  |  |  |  |
| Note 8:  | Other values can be used to align with GSCN [13] as long as SSB does not overlap the RMC.  |                         |  |  |  |  |  |  |

**Table A.3.1.2.2-2: RMSI CORESET Reference Channel for TDD with SCS=30KHz**

| Parameter  | Unit    | Value                   |  |  |  |  |  |
|--|---------|-------------------------|--|--|--|--|--|
| Reference channel  |         | CR.2.1<br>TDD           |  |  |  |  |  |
| Channel bandwidth  | MHz     | Defined in<br>test case |  |  |  |  |  |
| Subcarrier spacing   | kHz     | 30                      |  |  |  |  |  |

## A.3.2 OFDMA channel noise generator (OCNG)

### A.3.2.1 Generic OFDMA Channel Noise Generator (OCNG)

The OCNG pattern is used in a test for modelling allocations of unused resources in the channel bandwidth to virtual UEs (which are not under test). The OCNG pattern comprises PDCCH and PDSCH transmissions to the virtual UEs.

#### A.3.2.1.1 OCNG pattern 1: Generic OCNG pattern for all unused REs

**Table A.3.2.1.1-1: OP.1: Generic OCNG pattern for all unused REs**

| OCNG Parameters             | Control Region  | Data Region                                    |
|-----------------------------|---|--|
| Resource allocation         | Unused REs (Note 1)   | Unused REs (Note 2)                            |
| Channel                     | PDCCH   | PDSCH  |
| Contents                    | Virtual UE IDs  | Uncorrelated pseudo random QPSK modulated data |
| Antenna transmission scheme | Same as used in PDCCH RMC   | Same as used in PDSCH RMC                      |
| Subcarrier spacing          | Same as used in PDCCH RMC   | Same as used in PDSCH RMC                      |
| Aggregation level           | Same as used in PDCCH RMC   | N/A  |
| Code rate                   | Same as used in PDCCH RMC   | Same as used in PDSCH RMC                      |
| Transmit Power              | Same as used in PDCCH RMC   | Same as used in PDSCH RMC                      |
| CP length                   | Same as used in PDCCH RMC   | Same as used in PDSCH RMC                      |
| Note 1:                     | REs not used in the active CORESETs where PDCCH is scheduled for the UE under test.   |  |
| Note 2:                     | REs not allocated to any physical channels, CORESET, SSB or any other reference signal within the channel bandwidth of the cell, confined to BW <sub>occupied</sub> where specified in the test case. |  |

#### A.3.2.1.2 OCNG pattern 2: Generic OCNG pattern for all unused REs for 2AoA setup

**Table A.3.2.1.2-2: OP.2: Generic OCNG pattern for all unused REs for 2AoA setup**

| OCNG Parameters | Control Region                | Data Region |
|-----------------|-------------------------------|-------------|
| Probe           | Transmitting the serving beam |             |

|                             |   |  |
|-----------------------------|---|--|
| Resource allocation         | Unused REs (Note 1) in the symbols where SSB/CSI-RS are not transmitted from both the serving beam probe and non-serving beam probe.  | Unused REs (Note 2) in the symbols where SSB/CSI-RS are not transmitted from both the serving beam probe and non-serving beam probe. |
| Channel                     | PDCCH   | PDSCH  |
| Contents                    | Virtual UE IDs  | Uncorrelated pseudo random QPSK modulated data   |
| Antenna transmission scheme | Same as used in PDCCH RMC   | Same as used in PDSCH RMC  |
| Subcarrier spacing          | Same as used in PDCCH RMC   | Same as used in PDSCH RMC  |
| Aggregation level           | Same as used in PDCCH RMC   | N/A  |
| Code rate                   | Same as used in PDCCH RMC   | Same as used in PDSCH RMC  |
| Transmit Power              | Same as used in PDCCH RMC   | Same as used in PDSCH RMC  |
| CP length                   | Same as used in PDCCH RMC   | Same as used in PDSCH RMC  |
| Note 1:                     | REs not used in the active CORESETs where PDCCH is scheduled for the UE under test.   |  |
| Note 2:                     | REs not allocated to any physical channels, CORESET, SSB or any other reference signal within the channel bandwidth of the cell, confined to $BW_{occupied}$ where specified in the test case |  |
| Note 3:                     | No OCNG is transmitted from the probe transmitting non-serving beam.  |  |

#### A.3.2.1.3 OCNG pattern 3: Generic OCNG pattern for unused REs in the same bandwidth as CORESET

**Table A.3.2.1.3-1: OP.3: Generic OCNG pattern for unused REs in the same BW as CORESET**

| OCNG Parameters             | Control Region  | Data Region                                    |
|-----------------------------|---|--|
| Resource allocation         | Unused REs (Note 1)   | Unused REs (Note 2)                            |
| Channel                     | PDCCH   | PDSCH  |
| Contents                    | Virtual UE IDs  | Uncorrelated pseudo random QPSK modulated data |
| Antenna transmission scheme | Same as used in PDCCH RMC   | Same as used in PDSCH RMC                      |
| Subcarrier spacing          | Same as used in PDCCH RMC   | Same as used in PDSCH RMC                      |
| Aggregation level           | Same as used in PDCCH RMC   | N/A  |
| Code rate                   | Same as used in PDCCH RMC   | Same as used in PDSCH RMC                      |
| Transmit Power              | Same as used in PDCCH RMC   | Same as used in PDSCH RMC                      |
| CP length                   | Same as used in PDCCH RMC   | Same as used in PDSCH RMC                      |
| Note 1:                     | REs not used in the active CORESETs where PDCCH is scheduled for the UE under test. REs for OCNG shall not be allocated outside the allocated bandwidth of the CORESET of the serving cell.   |  |
| Note 2:                     | REs not allocated to any physical channels, CORESET, SSB or any other reference signal within the allocated bandwidth of the CORESET of the serving cell. REs for OCNG shall not be allocated outside the allocated bandwidth of the CORESET of the serving cell. |  |

#### A.3.2.1.4 OCNG pattern 4: Generic OCNG pattern for all unused REs outside SSB slot(s)

**Table A.3.2.1.4-1: OP.4: Generic OCNG pattern for all unused REs outside SSB slot(s)**

| OCNG Parameters     | Control Region      | Data Region                                    |
|---------------------|---------------------|--|
| Resource allocation | Unused REs (Note 1) | Unused REs (Note 2)                            |
| Channel             | PDCCH               | PDSCH  |
| Contents            | Virtual UE IDs      | Uncorrelated pseudo random QPSK modulated data |

|                             |  |                           |
|-----------------------------|--|---------------------------|
| Antenna transmission scheme | Same as used in PDCCH RMC  | Same as used in PDSCH RMC |
| Subcarrier spacing          | Same as used in PDCCH RMC  | Same as used in PDSCH RMC |
| Aggregation level           | Same as used in PDCCH RMC  | N/A                       |
| Code rate                   | Same as used in PDCCH RMC  | Same as used in PDSCH RMC |
| Transmit Power              | Same as used in PDCCH RMC  | Same as used in PDSCH RMC |
| CP length                   | Same as used in PDCCH RMC  | Same as used in PDSCH RMC |
| Note 1:                     | REs not used in the active CORESETs where PDCCH is scheduled for the UE under test. REs for OCNG shall not be allocated in the slot(s) containing SSB of the respective cell.  |                           |
| Note 2:                     | REs not allocated to any physical channels, CORESET, SSB or any other reference signal within the channel bandwidth of the cell. REs for OCNG shall not be allocated in the slot(s) containing SSB of the respective cell. |                           |

#### A.3.2.1.5 OCNG pattern 5: Generic OCNG pattern for unused REs in the same bandwidth as CORESET for 2AoA setup

**Table A.3.2.1.5-1: OP.5: Generic OCNG pattern for unused REs in the same BW as CORESET for 2AoA setup**

| OCNG Parameters             | Control Region  | Data Region  |
|-----------------------------|---|--|
| Probe                       | Transmitting the serving beam   |  |
| Resource allocation         | Unused REs (Note 1) in the symbols where SSB/CSI-RS are not transmitted from both the serving beam probe and non-serving beam probe.  | Unused REs (Note 2) in the symbols where SSB/CSI-RS are not transmitted from both the serving beam probe and non-serving beam probe. |
| Channel                     | PDCCH   | PDSCH  |
| Contents                    | Virtual UE IDs  | Uncorrelated pseudo random QPSK modulated data   |
| Antenna transmission scheme | Same as used in PDCCH RMC   | Same as used in PDSCH RMC  |
| Subcarrier spacing          | Same as used in PDCCH RMC   | Same as used in PDSCH RMC  |
| Aggregation level           | Same as used in PDCCH RMC   | N/A  |
| Code rate                   | Same as used in PDCCH RMC   | Same as used in PDSCH RMC  |
| Transmit Power              | Same as used in PDCCH RMC   | Same as used in PDSCH RMC  |
| CP length                   | Same as used in PDCCH RMC   | Same as used in PDSCH RMC  |
| Note 1:                     | REs not used in the active CORESETs where PDCCH is scheduled for the UE under test. REs for OCNG shall not be allocated outside the allocated bandwidth of the CORESET of the serving cell.   |  |
| Note 2:                     | REs not allocated to any physical channels, CORESET, SSB or any other reference signal within the allocated bandwidth of the CORESET of the serving cell. REs for OCNG shall not be allocated outside the allocated bandwidth of the CORESET of the serving cell. |  |
| Note 3:                     | No OCNG is transmitted from the probe transmitting non-serving beam.  |  |

### A.3.2.2 Void

## A.3.3 Reference DRX configurations

### A.3.3.1 DRX Configuration 1: DRX cycle = 40 ms and TAT = 500 ms

**Table A.3.3.1-1: DRX.1: DRX cycle = 40 ms and time alignment timer (TAT) = 500 ms**

| Field                     | Value  |
|---------------------------|--|
| drx-onDurationTimer       | 1 ms   |
| drx-InactivityTimer       | 1 ms   |
| drx-RetransmissionTimerDL | 1 slot   |
| drx-RetransmissionTimerUL | 1 slot   |
| drx-LongCycleStartOffset  | 40 ms  |
| shortDRX                  | disable  |
| TimeAlignmentTimer        | 500 ms   |
| Note:                     | This DRX configuration is applicable for NR serving cell. The DRX cycle and time alignment timer parameters are specified in clause 6.3.2 in TS 38.331 [2] |

### A.3.3.2 DRX Configuration 2: DRX cycle = 640 ms and TAT = 500 ms

**Table A.3.3.2-1: DRX.2: DRX cycle = 640 ms and time alignment timer (TAT) = 500 ms**

| Field                     | Value  |
|---------------------------|--|
| drx-onDurationTimer       | 1 ms   |
| drx-InactivityTimer       | 1 ms   |
| drx-RetransmissionTimerDL | 1 slot   |
| drx-RetransmissionTimerUL | 1 slot   |
| drx-LongCycleStartOffset  | 640 ms   |
| shortDRX                  | disable  |
| TimeAlignmentTimer        | 500 ms   |
| Note:                     | This DRX configuration is applicable for NR serving cell. The DRX cycle and time alignment timer parameters are specified in clause 6.3.2 in TS 38.331 [2] |

### A.3.3.3 DRX Configuration 3: DRX cycle = 40 ms and TAT = Infinity

**Table A.3.3.3-1: DRX.3: DRX cycle = 40 ms and time alignment timer (TAT) = Infinity**

| Field                     | Value  |
|---------------------------|--|
| drx-onDurationTimer       | 6 ms   |
| drx-InactivityTimer       | 1 ms   |
| drx-RetransmissionTimerDL | 1 slot   |
| drx-RetransmissionTimerUL | 1 slot   |
| drx-LongCycleStartOffset  | 40 ms  |
| shortDRX                  | disable  |
| TimeAlignmentTimer        | Infinity   |
| Note:                     | This DRX configuration is applicable for NR serving cell. The DRX cycle and time alignment timer parameters are specified in clause 6.3.2 in TS 38.331 [2] |

### A.3.3.4 DRX Configuration 4: DRX cycle = 160 ms and TAT = Infinity

**Table A.3.3.4-1: DRX.4: DRX cycle = 160 ms and time alignment timer (TAT) = Infinity**

| Field                    | Value   |
|--------------------------|---|
| drx-onDurationTimer      | psf2  |
| drx-InactivityTimer      | psf2  |
| drx-RetransmissionTimer  | Psf16   |
| longDRX-CycleStartOffset | sf160, 0  |
| shortDRX                 | disable   |
| TimeAlignmentTimer       | Infinity  |
| Note:                    | This DRX configuration is applicable for E-UTRA serving cell. For further information see clause 6.3.2 in TS 36.331 [16]. |

### A.3.3.5 DRX Configuration 5: DRX cycle = 320 ms and TAT = Infinity

**Table A.3.3.5-1: DRX.5: DRX cycle = 320 ms and time alignment timer (TAT) = Infinity**

| Field                    | Value   |
|--------------------------|---|
| drx-onDurationTimer      | psf6  |
| drx-InactivityTimer      | psf1920   |
| drx-RetransmissionTimer  | psf16   |
| longDRX-CycleStartOffset | sf320, 0  |
| shortDRX                 | disable   |
| TimeAlignmentTimer       | Infinity  |
| Note:                    | This DRX configuration is applicable for E-UTRA serving cell. For further information see clause 6.3.2 in TS 36.331 [16]. |

### A.3.3.6 DRX Configuration 6: DRX cycle = 320 ms and TAT = 500 ms

**Table A.3.3.6-1: DRX.6: DRX cycle = 320 ms and time alignment timer (TAT) = 500 ms**

| Field                     | Value  |
|---------------------------|--|
| drx-onDurationTimer       | 1 ms   |
| drx-InactivityTimer       | 1 ms   |
| drx-RetransmissionTimerDL | 1 slot   |
| drx-RetransmissionTimerUL | 1 slot   |
| drx-LongCycleStartOffset  | 320 ms   |
| shortDRX                  | disable  |
| TimeAlignmentTimer        | 500 ms   |
| Note:                     | This DRX configuration is applicable for NR serving cell. The DRX cycle and time alignment timer parameters are specified in clause 6.3.2 in TS 38.331 [2] |

### A.3.3.7 DRX Configuration 7: DRX cycle = 640 ms and TAT = Infinity

**Table A.3.3.7-1: DRX.7: DRX cycle = 640 ms and time alignment timer (TAT) = Infinity**

| Field                     | Value  |
|---------------------------|--|
| drx-onDurationTimer       | 6 ms   |
| drx-InactivityTimer       | 1 ms   |
| drx-RetransmissionTimerDL | 1 slot   |
| drx-RetransmissionTimerUL | 1 slot   |
| drx-LongCycleStartOffset  | 640 ms   |
| shortDRX                  | disable  |
| TimeAlignmentTimer        | Infinity   |
| Note:                     | This DRX configuration is applicable for NR serving cell. The DRX cycle and time alignment timer parameters are specified in clause 6.3.2 in TS 38.331 [2] |

### A.3.3.8 DRX Configuration 8: DRX cycle = 320 ms and TAT = Infinity

**Table A.3.3.8-1: DRX.8: DRX cycle = 320 ms and time alignment timer (TAT) = Infinity**

| Field                     | Value  |
|---------------------------|--|
| drx-onDurationTimer       | 6 ms   |
| drx-InactivityTimer       | 1 ms   |
| drx-RetransmissionTimerDL | 1 slot   |
| drx-RetransmissionTimerUL | 1 slot   |
| drx-LongCycleStartOffset  | 320 ms   |
| shortDRX                  | disable  |
| TimeAlignmentTimer        | Infinity   |
| Note:                     | This DRX configuration is applicable for NR serving cell. The DRX cycle and time alignment timer parameters are specified in clause 6.3.2 in TS 38.331 [2] |

### A.3.3.9 DRX Configuration 9: DRX cycle = 40 ms and TAT = 500 ms

**Table A.3.3.9-1: DRX.9: DRX cycle = 40 ms and time alignment timer (TAT) = 500 ms**

| Field                    | Value   |
|--------------------------|---|
| drx-onDurationTimer      | psf2  |
| drx-InactivityTimer      | psf2  |
| drx-RetransmissionTimer  | psf16   |
| longDRX-CycleStartOffset | sf40, 0   |
| shortDRX                 | disable   |
| TimeAlignmentTimer       | 500 ms  |
| Note:                    | This DRX configuration is applicable for E-UTRA serving cell. For further information see clause 6.3.2 in TS 36.331 [16]. |

### A.3.3.10 DRX Configuration 10: DRX cycle = 640 ms and TAT = 500 ms

**Table A.3.3.10-1: DRX.10: DRX cycle = 640 ms and time alignment timer (TAT) = 500 ms**

| Field                    | Value   |
|--------------------------|---|
| drx-onDurationTimer      | psf6  |
| drx-InactivityTimer      | psf2  |
| drx-RetransmissionTimer  | psf16   |
| longDRX-CycleStartOffset | sf640, 0  |
| shortDRX                 | disable   |
| TimeAlignmentTimer       | 500 ms  |
| Note:                    | This DRX configuration is applicable for E-UTRA serving cell. For further information see clause 6.3.2 in TS 36.331 [16]. |

### A.3.3.11 DRX Configuration 11: DRX cycle = 20 ms and TAT = Infinity

**Table A.3.3.11-1: DRX.11: DRX cycle = 20 ms and time alignment timer (TAT) = Infinity**

| Field                     | Value   |
|---------------------------|---|
| drx-onDurationTimer       | 6 ms  |
| drx-InactivityTimer       | 1 ms  |
| drx-RetransmissionTimerDL | 1 slot  |
| drx-RetransmissionTimerUL | 1 slot  |
| drx-LongCycleStartOffset  | 20 ms   |
| shortDRX                  | disable   |
| TimeAlignmentTimer        | Infinity  |
| Note:                     | This DRX configuration is applicable for NR serving cell. The DRX cycle and time alignment timer parameters are specified in clause 6.3.2 in TS 38.331 [2]. |

### A.3.3.12 DRX Configuration 12: DRX cycle = 640 ms and TAT = Infinity

**Table A.3.3.12-1: DRX.12: DRX cycle = 640 ms and time alignment timer (TAT) = Infinity**

| Field                    | Value   |
|--------------------------|---|
| drx-onDurationTimer      | psf6  |
| drx-InactivityTimer      | psf2  |
| drx-RetransmissionTimer  | psf16   |
| longDRX-CycleStartOffset | sf640, 0  |
| shortDRX                 | disable   |
| TimeAlignmentTimer       | Infinity  |
| Note:                    | This DRX configuration is applicable for E-UTRA serving cell. For further information see clause 6.3.2 in TS 36.331 [16]. |

## A.3.4 Test Cases with Different Channel Bandwidths

### A.3.4.1 Test Cases with Different E-UTRA Channel Bandwidths

#### A.3.4.1.1 Introduction

In Annex A test cases involving E-UTRA cell(s) may be defined with different E-UTRA channel bandwidths to verify the same type of RRM requirement.

#### A.3.4.1.2 Principle of testing

If multiple test cases involving E-UTRA cell(s) are defined with different E-UTRA channel bandwidths to verify the same type of RRM requirement that is E-UTRA channel bandwidth independent, then the UE needs to be tested with only one channel bandwidth in each E-UTRA cell and with the same bandwidth in all the E-UTRA cells used in the test case.

## A.3.5 Test Cases for Synchronous and Asynchronous DC Operations

### A.3.5.1 EN-DC Test Cases for Synchronous and Asynchronous EN-DC Operations

#### A.3.5.1.1 Introduction

This clause defines a principle which is applicable to test cases verifying RRM requirements for EN-DC operation in synchronous and asynchronous scenarios.

In Annex A test cases may be defined in both synchronous EN-DC and asynchronous EN-DC scenarios to verify the same type of RRM requirement.

#### A.3.5.1.2 Principle of Testing

If EN-DC test cases are defined in both synchronous and asynchronous EN-DC scenarios to verify the same type of RRM requirement then the UE capable of both synchronous and asynchronous EN-DC operations needs to be tested with one of the tests in either synchronous or asynchronous EN-DC scenarios.

## A.3.6 Antenna configurations

### A.3.6.1 Antenna configurations for FR1

Unless otherwise specified, NR FDD or NR TDD cells in all RRM Test cases in AWGN propagation condition are configured with Antenna Configuration 1x2.

### A.3.6.1.1 Antenna connection for 4 Rx capable UEs

#### A.3.6.1.1.1 Introduction

All tests in clause A.4 and A.6 are specified for UEs supporting 2RX. In this clause, the antenna connection method for applying 2RX tests to UEs supporting 4RX antenna ports is specified. No tests are currently specified in clause A.4 or A.6 which are applicable only to 4RX antenna ports, so 4RX capable UEs are always tested by reusing tests which were originally specified for 2RX UEs.

#### A.3.6.1.1.2 Principle of testing

##### A.3.6.1.1.2.1 Single carrier tests

For 4RX capable UEs supporting at least one band where 2RX is supported and 4RX is not supported, all single carrier tests specified in clause A.4 and A.6 except those in A.4.7 and A.6.7 shall be tested on any band where 2RX is supported and 4RX is not supported with the antenna connection specified in A.3.6.1.1.2.4. For single carrier tests specified in clause A.4.7 or A.6.7, all tests shall be tested with the antenna connection specified in A.3.6.1.1.2.4 for bands where 2RX is supported and 4RX is not supported, and the antenna connection specified in A.3.6.1.1.2.5 for bands where 4RX is supported.

For 4RX capable UEs which do not support any band where 2RX is supported and 4RX is not supported, all tests specified in clauses A.4 and A.6 shall be tested using the antenna connection specified in clause A.3.6.1.1.2.5. For radio link monitoring tests, the SNR levels are modified according to table A.3.6.1.1.2.1-1 and table A.3.6.1.1.2.1-2. For beam failure detection and link recovery tests, the SNR levels are modified according to table A.3.6.1.1.2.1-3.

**Table A.3.6.1.1.2.1-1: Modified parameters for RLM out of sync testing with 4 RX antenna connection**

| Test case | SNR during T3 (dB) |        |        |        |
|-----------|--------------------|--------|--------|--------|
|           | Test 1             | Test 2 | Test 3 | Test 4 |
| A.4.5.1.1 | -18                | N/A    | N/A    | N/A    |
| A.4.5.1.3 | -18                | N/A    | N/A    | N/A    |
| A.4.5.1.5 | -18                | N/A    | N/A    | N/A    |
| A.4.5.1.7 | -18                | N/A    | N/A    | N/A    |
| A.5.5.1.1 | -18                | N/A    | N/A    | N/A    |
| A.5.5.1.3 | -18                | N/A    | N/A    | N/A    |
| A.5.5.1.5 | -18                | N/A    | N/A    | N/A    |
| A.5.5.1.7 | -18                | N/A    | N/A    | N/A    |
| A.6.5.1.1 | -18                | N/A    | N/A    | N/A    |
| A.6.5.1.3 | -18                | N/A    | N/A    | N/A    |
| A.6.5.1.5 | -18                | N/A    | N/A    | N/A    |
| A.6.5.1.7 | -18                | N/A    | N/A    | N/A    |
| A.7.5.1.1 | -18                | N/A    | N/A    | N/A    |
| A.7.5.1.3 | -18                | N/A    | N/A    | N/A    |
| A.7.5.1.5 | -18                | N/A    | N/A    | N/A    |
| A.7.5.1.7 | -18                | N/A    | N/A    | N/A    |

**Table A.3.6.1.1.2.1-2: Modified parameters for RLM in sync single carrier testing with 4 RX antenna connection**

| Test case | SNR during T3 (dB) |        | SNR during T4 (dB) |        |

#### A.3.6.1.1.2.2 Carrier aggregation tests

All carrier aggregation tests are performed using the antenna connection in clause A.3.6.1.1.2.4 for the PCell antenna connection if the PCell is on a band where 2RX is supported and 4RX is not supported, or using the antenna connection in A.3.6.1.1.2.5 for the PCell antenna connection if the PCell is on a band where 4RX is supported.

All carrier aggregation tests are performed using the antenna connection in clause A.3.6.1.1.2.4 for the SCell antenna connection if an SCell is on band where 2RX is supported and 4RX is not supported, or using the antenna connection in A.3.6.1.1.2.5 for the SCell antenna connection if an SCell is on a band where 4RX is supported.

#### A.3.6.1.1.2.3 EN-DC tests

All EN-DC tests are performed using the antenna connection in clause A.3.6.1.1.2.6 for the PCell antenna connection if the PCell is on a band where 2RX is supported and 4RX is not supported, or using the antenna connection in A.3.6.1.1.2.7 for the PCell antenna connection if the PCell is on a band where 4RX is supported.

All EN-DC tests are performed using the antenna connection in clause A.3.6.1.1.2.4 for the PSCell or SCell antenna connection if an SCell is on band where 2RX is supported and 4RX is not supported, or using the antenna

connection in A.3.6.1.1.2.5 for the SCell antenna connection if an SCell or PSCell is on a band where 4RX is supported.

#### A.3.6.1.1.2.4 Antenna connection for bands where 2RX is supported

For bands where 2RX is supported and 4RX is not supported, it is left to the UE declaration and antenna port configuration to decide which 2 of the 4 Rx ports are connected with data source from system simulator. The remaining 2 RX ports shall be connected with zero input. No test parameters or requirements are modified.

#### A.3.6.1.1.2.5 Antenna connection for bands where 4RX is supported

For bands where 4RX is supported, all 4 RX antennas are connected with data source from system simulator. The system simulator shall provide independent noise and fading (low correlation) for each antenna port. Except for the modifications to radio link monitoring thresholds and beam failure detection thresholds described in clauses A.3.6.1.1.2.1, no test parameters or requirements are modified.

#### A.3.6.1.1.2.6 EN-DC LTE Antenna connection for bands where 2RX is supported

For E-UTRAN bands where 2RX is supported and 4RX is not supported, it is left to the UE declaration and antenna port configuration to decide which 2 of the 4 Rx ports are connected with data source from system simulator. The remaining 2 RX ports shall be connected with zero input. No test parameters or requirements are modified.

#### A.3.6.1.1.2.7 EN-DC LTE Antenna connection for bands where 4RX is supported

For E-UTRAN bands where 4RX is supported, all 4 RX antennas are connected with data source from system simulator. The system simulator shall provide independent noise and fading (low correlation) for each antenna port. Except for the modifications to radio link monitoring thresholds described in clauses A.3.8.1.2.1 and A.3.8.1.2.2 of TS 36.133 [15], no test parameters or requirements are modified.

## A.3.6.2 Antenna configurations for FR2

Unless otherwise specified, the default Downlink Antenna Configuration for NR FR2 cells is 1x2.

In case of Downlink Antenna Configuration 2x2 for NR FR2 cells, unless otherwise specified, the downlink signal is transmitted over the two polarizations (V and H) of the dual polarized antenna of the test equipment.

In both cases, the downlink signal is received assuming 2 UE baseband receivers. As the UE is tested following the Blackbox Approach with regard to the UE Rx antennas, the exact UE Rx antenna configuration is not relevant for the test configuration and has no impact on the test implementation.

## A.3.7 EN-DC test setup

### A.3.7.1 Introduction

### A.3.7.2 E-UTRAN Serving Cell Parameters

#### A.3.7.2.1 E-UTRAN Serving Cell Parameters for Tests with NR Cell(s) in FR1

Table A.3.7.2.1-1 defines cell specific test parameters for E-UTRAN cell which can be used in EN-DC test cases or in any test case comprising at least one E-UTRA serving cell with all NR cells in FR1. Unless otherwise stated within the test, all measurements in Annex A.4 and A.5 are performed only on the NR carrier. The E-UTRA serving cell shall be configured to not interfere with NR operation and the E-UTRA serving cell signal power shall not be critical to the test purpose.

Table A.3.7.2.1-1: E-UTRAN cell specific test parameters for tests with all NR cells in FR1

| Parameter   | Unit       | E-UTRAN Cell  |      |
|---|------------|---|------|
| Duplex mode   |            | FDD or TDD  |      |
| TDD special subframe configuration <sup>Note1</sup>   |            | 6   |      |
| TDD uplink-downlink configuration <sup>Note1</sup>  |            | 1   |      |
| $BW_{channel}$  |            | 5 MHz: $N_{RB,c} = 25$<br>10 MHz: $N_{RB,c} = 50$<br>20 MHz: $N_{RB,c} = 100$   |      |
| PDSCH parameters:<br>DL Reference Measurement Channel <sup>Note2</sup>  |            | 5 MHz: R.7 FDD<br>10 MHz: R.3 FDD<br>20 MHz: R.6 FDD<br>5 MHz: R.4 TDD<br>10 MHz: R.0 TDD<br>20 MHz: R.3 TDD          |      |
| PCFICH/PDCCH/PHICH parameters:<br>DL Reference Measurement Channel <sup>Note2</sup>   |            | 5 MHz: R.11 FDD<br>10 MHz: R.6 FDD<br>20 MHz: R.10 FDD<br>5 MHz: R.11 TDD<br>10 MHz: R.6 TDD<br>20 MHz: R.10 TDD      |      |

| PBCH_RA   | dB         | 0   |      |
| PBCH_RB   | dB         |   |      |
| PSS_RA  | dB         |   |      |
| SSS_RA  | dB         |   |      |
| PCFICH_RB   | dB         |   |      |
| PHICH_RA  | dB         |   |      |
| PHICH_RB  | dB         |   |      |
| PDCCH_RA  | dB         |   |      |
| PDCCH_RB  | dB         |   |      |
| PDSCH_RA  | dB         |   |      |
| PDSCH_RB  | dB         |   |      |
| OCNG_RA <sup>Note3</sup>  | dB         |   |      |
| OCNG_RB <sup>Note3</sup>  | dB         |   |      |
| $N_{oc}$ <sup>Note4</sup>   | dBm/15 kHz |   | -104 |
| $\bar{E}_s/N_{oc}$  | dB         |   | 17   |
| $\bar{E}_s/I_{ot}$  | dB         | 17  |      |
| RSRP <sup>Note5</sup>   | dBm/15 kHz | -87   |      |
| SCH_RP <sup>Note5</sup>   | dBm/15 kHz | -87   |      |
| $I_o$ <sup>Note5</sup>  | dBm/Ch BW  | $-59.13+10\log(N_{RB,c}/50)$  |      |
| Propagation Condition   |            | AWGN  |      |
| Antenna Configuration   |            | 1x2   |      |
| <p>Note 1: Special subframe and uplink-downlink configurations are specified in table 4.2-1 in TS 36.211.</p> <p>Note 2: DL RMCs and OCNG patterns are specified in clauses A 3.1 and A 3.2 of TS 36.133 respectively.</p> <p>Note 3: OCNG shall be used such that all cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.</p> <p>Note 4: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for <math>N_{oc}</math> to be fulfilled.</p> <p>Note 5: <math>\bar{E}_s/I_{ot}</math>, RSRP, SCH_RP and <math>I_o</math> levels have been derived from other parameters for information purposes. They are not settable parameters themselves.</p> |            |   |      |

### A.3.7.2.2 E-UTRAN Serving Cell Parameters for Tests with NR Cell(s) in FR2

Table A.3.7.2.2-1 defines cell specific test parameters for E-UTRAN cell which can be used in EN-DC test cases or in any test case comprising at least one E-UTRA serving cell with one or more NR cells in FR2.

**Table A.3.7.2.2-1: E-UTRAN cell specific test parameters for tests with one or more NR cells in FR2**

| Parameter   | Unit  | E-UTRAN Cell  |
|---|---|---|
| Duplex mode   |   | FDD or TDD  |
| TDD special subframe configuration <sup>Note1</sup>                                 |   | 6   |
| TDD uplink-downlink configuration <sup>Note1</sup>                                  |   | 1   |
| BW <sub>channel</sub>   | MHz   | 5 MHz: N <sub>RB,c</sub> = 25<br>10 MHz: N <sub>RB,c</sub> = 50<br>20 MHz: N <sub>RB,c</sub> = 100                    |
| PDSCH parameters:<br>DL Reference Measurement Channel <sup>Note2</sup>              |   | 5 MHz: R.7 FDD<br>10 MHz: R.3 FDD<br>20 MHz: R.6 FDD<br>5 MHz: R.4 TDD<br>10 MHz: R.0 TDD<br>20 MHz: R.3 TDD          |
| PCFICH/PDCCH/PHICH parameters:<br>DL Reference Measurement Channel <sup>Note2</sup> |   | 5 MHz: R.11 FDD<br>10 MHz: R.6 FDD<br>20 MHz: R.10 FDD<br>5 MHz: R.11 TDD<br>10 MHz: R.6 TDD<br>20 MHz: R.10 TDD      |
| OCNG Patterns <sup>Note2</sup>  |   | 5 MHz: OP.20 FDD<br>10 MHz: OP.10 FDD<br>20 MHz: OP.17 FDD<br>5 MHz: OP.9 TDD<br>10 MHz: OP.1 TDD<br>20 MHz: OP.7 TDD |
| PBCH_RA   | dB  | 0   |
| PBCH_RB   | dB  |   |
| PSS_RA  | dB  |   |
| SSS_RA  | dB  |   |
| PCFICH_RB   | dB  |   |
| PHICH_RA  | dB  |   |
| PHICH_RB  | dB  |   |
| PDCCH_RA  | dB  |   |
| PDCCH_RB  | dB  |   |
| PDSCH_RA  | dB  |   |
| PDSCH_RB  | dB  |   |
| OCNG_RA <sup>Note3</sup>  | dB  |   |
| OCNG_RB <sup>Note3</sup>  | dB  |   |
| Note 1:   | Special subframe and uplink-downlink configurations are specified in table 4.2-1 in TS 36.211.  |   |
| Note 2:   | DL RMCs and OCNG patterns are specified in clauses A 3.1 and A 3.2 of TS 36.133 respectively.   |   |
| Note 3:   | OCNG shall be used such that all cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.  |   |
| Note 4:   | The E-UTRA signal is required only to ensure the E-UTRA link to the DUT in the EN-DC operation. The Test System shall provide a stable and noise-free E-UTRA signal without need of precise propagation modelling, path loss and polarization control. Further details of the E-UTRA signal configuration are not defined as part of the cell specific test parameters, since the E-UTRA link is not under performance verification and shall not affect the test result unless otherwise specifically stated in the test case. |   |

## A.3.7A NR FR1-FR2 test setup

Some Test cases in clause A.7 have NR cells in both FR1 and FR2. Unless otherwise stated within the test, the NR FR1 Cell signal is required only to provide a link to the UE under test. The Test System shall provide a stable and noise-free NR FR1 signal without need of precise propagation modelling, path loss and polarization control. Further details of the NR FR1 signal configuration are not defined as part of the cell specific test parameters, since the NR FR1 link is not under performance verification and shall not affect the test result unless otherwise specifically stated in the test case.

## A.3.7B Void

## A.3.7C LTE-FR1/FR2 test setup

Some Test cases in clause A.5 have LTE and FR2 NR cells. Unless otherwise stated within the test, the LTE Cell signal is required only to provide a link to the UE under test. The Test System shall provide a stable and noise-free LTE signal without need of precise propagation modelling, path loss and polarization control. Further details of the LTE signal configuration are not defined as part of the cell specific test parameters, since the LTE link is not under performance verification and shall not affect the test result unless otherwise specifically stated in the test case.

## A.3.7D NE-DC test setup

### A.3.7D.1 Introduction

### A.3.7D.2 E-UTRAN Serving Cell Parameters

#### A.3.7D.2.1 E-UTRAN Serving Cell Parameters for Tests with NR Cell(s) in FR1

The parameters are same as as specified in clause A.3.7.2.1.

#### A.3.7D.2.2 E-UTRAN Serving Cell Parameters for Tests with NR Cell(s) in FR2

The parameters are same as as specified in clause A.3.7.2.2.

## A.3.8 PRACH configurations

### A.3.8.1 Introduction

This clause provides the typical PRACH configurations used for RRM test cases defined in Annex A. To note that for other parameters not listed in this clause, either it can be derived from the set up of each test or it is subjected to RAN5 specifications.

## A.3.8.2 PRACH configurations in FR1

### A.3.8.2.1 FR1 PRACH configuration 1

FR1 PRACH configuration 1 in this clause provides the typical PRACH configuration for SSB-based contention based random access in FR1.

**Table A.3.8.2.1-1: Parameters for FR1 PRACH configuration 1**

| Field                                     | Value  | Comment   |
|---|--|---|
| prach-ConfigurationIndex                  | 102  | 10ms PRACH periodicity, and other detailed configuration defined in table 6.3.3.2-2 and table 6.3.3.2-3 in TS 38.211 [6]. |
| msg1-SubcarrierSpacing                    | Same as UL carrier SCS                                     |   |
| totalNumberOfRA-Preambles                 | 48   | Total number of preambles used for contention based and contention free random access                                     |
| numberOfRA-PreamblesGroupA                | 48   | No group B.   |
| prach-RootSequenceIndex                   | 0  | Logic sequence index = 0, resulting in root sequence = 1.   |
| ssb-perRACH-OccasionAndCB-PreamblesPerSSB | oneFourth, n48   | OneFourth: 1 SSB associated with 4 RACH occasions<br>n48: 48 contention based preambles per SSB                           |
| msg1-FDM                                  | One  | One PRACH transmission occasions FDMed in one time instance.  |
| rsrp-ThresholdSSB                         | RSRP_51  | The actual value of the threshold is -105dBm, as defined in TS 38.331 [2].  |
| ra-ContentionResolutionTimer              | sf48   | 48 sub-frames   |
| powerRampingStep                          | dB2  |   |
| preambleReceivedTargetPower               | dBm-120  |   |
| preambleTransMax                          | n6   | Max number of RA preamble transmission performed before declaring a failure is 6  |
| ra-ResponseWindow                         | sl10   | 10 slots  |
| zeroCorrelationZoneConfig                 | 11   | N-CS configuration, N <sub>cs</sub> = 23  |
| Backoff Parameter Index                   | 2  | 20ms, as defined in table 7.2-1 in TS 38.321 [7].   |
| Note:                                     | For further information see clause 6.3.2 in TS 38.331 [2]. |   |

### A.3.8.2.2 FR1 PRACH configuration 2

FR1 PRACH configuration 2 in this clause provides the typical PRACH configuration for SSB based non-contention based random access in FR1.

**Table A.3.8.2.2-1: Parameters for FR1 PRACH configuration 2**

| Field                      | Value                  | Comment   |
|----------------------------|------------------------|---|
| prach-ConfigurationIndex   | 102                    | 10ms PRACH periodicity, and other detailed configuration defined in table 6.3.3.2-2 and table 6.3.3.2-3 in TS 38.211 [6]. |
| msg1-SubcarrierSpacing     | Same as UL carrier SCS |   |
| totalNumberOfRA-Preambles  | 48                     | Total number of preambles used for contention based and contention free random access                                     |
| numberOfRA-PreamblesGroupA | 48                     | No group B.   |
| prach-RootSequenceIndex    | 0                      | Logic sequence index = 0, resulting in root sequence = 1.   |

|  |                       |   |
|--|-----------------------|---|
| ssb-perRACH-Occasion   | oneFourth             | OneFourth: 1 SSB associated with 4 RACH occasions   |
| msg1-FDM   | One                   | One PRACH transmission occasions FDMed in one time instance.  |
| powerRampingStep   | dB2                   |   |
| preambleReceivedTargetPower                                      | dBm-120               |   |
| preambleTransMax   | n6                    | Max number of RA preamble transmission performed before declaring a failure is 6  |
| ra-ResponseWindow  | sl10                  | 10 slots  |
| zeroCorrelationZoneConfig  | 11                    | N-CS configuration, N <sub>cs</sub> = 23  |
| Backoff Parameter Index  | 2                     | 20ms, as defined in table 7.2-1 in TS 38.321 [7].   |
| <i>ssb-ResourceList</i>  | ra-PreambleIndex = 50 | Associated with SSB index 0. UE doesn't use <i>ssb-ResourceList</i> and BFR-SSB-Resource IEs at the same time. UE doesn't use this field if is transmitting CFRA to convey BFR. |
| <i>BFR-SSB-Resource</i>  | ra-PreambleIndex = 50 | Associated with SSB index 0. UE doesn't use <i>ssb-ResourceList</i> and BFR-SSB-Resource IEs at the same time. UE uses this field only if is transmitting CFRA to convey BFR    |
| ra-ssb-OccasionMaskIndex   | 1                     | PRACH occasion index 1 is allowed   |
| rsrp-ThresholdSSB  | RSRP_51               | The actual value of the threshold is -105dBm, as defined in TS 38.331 [2].  |
| Note: For further information see clause 6.3.2 in TS 38.331 [2]. |                       |   |

### A.3.8.2.3 FR1 PRACH configuration 3

FR1 PRACH configuration 3 in this clause provides the typical PRACH configuration for CSI-RS based non-contention based random access in FR1.

**Table A.3.8.2.3-1: Parameters for FR1 PRACH configuration 3**

| Field                           | Value                  | Comment   |
|---------------------------------|------------------------|---|
| <i>prach-ConfigurationIndex</i> | 102                    | 10ms PRACH periodicity, and other detailed configuration defined in table 6.3.3.2-2 and table 6.3.3.2-3 in TS 38.211 [6]. |
| msg1-SubcarrierSpacing          | Same as UL carrier SCS |   |
| totalNumberOfRA-Preambles       | 48                     | Total number of preambles used for contention based and contention free random access                                     |
| numberOfRA-PreamblesGroupA      | 48                     | No group B.   |
| prach-RootSequenceIndex         | 0                      | Logic sequence index = 0, resulting in root sequence = 1.   |
| ssb-perRACH-Occasion            | oneFourth              | OneFourth: 1 SSB associated with 4 RACH occasions   |
| msg1-FDM                        | One                    | One PRACH transmission occasions FDMed in one time instance.  |
| powerRampingStep                | dB2                    |   |
| preambleReceivedTargetPower     | dBm-120                |   |
| preambleTransMax                | n6                     | Max number of RA preamble transmission performed before declaring a failure is 6  |
| ra-ResponseWindow               | sl10                   | 10 slots  |
| zeroCorrelationZoneConfig       | 11                     | N-CS configuration, N <sub>cs</sub> = 23  |
| Backoff Parameter Index         | 2                      | 20ms, as defined in table 7.2-1 in TS 38.321 [7].   |

|  |                       |  |
|--|-----------------------|--|
| csirs-ResourceList   | ra-PreambleIndex = 50 | Associated with CSI-RS configured  |
| ra-OccasionList  | 1                     | RA occasions allowed corresponding to CSI-RS                               |
| rsrp-ThresholdCSI-RS   | RSRP_51               | The actual value of the threshold is -105dBm, as defined in TS 38.331 [2]. |
| Note: For further information see clause 6.3.2 in TS 38.331 [2]. |                       |  |

#### A.3.8.2.4 FR1 PRACH configuration 4

FR1 PRACH configuration 4 in this clause provides the PRACH configuration for CSI-RS based non-contention based random access in FR1 to convey BFR.

**Table A.3.8.2.4-1: Parameters for FR1 PRACH configuration 4**

| Field  | Value                 | Comment   |
|--|-----------------------|---|
| prach-ConfigurationIndex   | 102                   | 10ms PRACH periodicity, and other detailed configuration defined in table 6.3.3.2-2 and table 6.3.3.2-3 in TS 38.211 [6]. |
| totalNumberOfRA-Preambles  | 48                    | Total number of preambles used for contention based and contention free random access                                     |
| numberOfRA-PreamblesGroupA                                       | 48                    | No group B.   |
| prach-RootSequenceIndex  | 0                     | Logic sequence index = 0, resulting in root sequence = 1.   |
| ssb-perRACH-Occasion   | oneFourth             | OneFourth: 1 SSB associated with 4 RACH occasions   |
| msg1-FDM   | One                   | One PRACH transmission occasions FDMed in one time instance.  |
| powerRampingStep   | dB2                   |   |
| preambleReceivedTargetPower                                      | dBm-120               |   |
| preambleTransMax   | n200                  | Max number of RA preamble transmission performed before declaring a failure is 200  |
| ra-ResponseWindow  | sl1                   | 1 slot  |
| zeroCorrelationZoneConfig  | 11                    | N-CS configuration, $N_{CS} = 93$   |
| Backoff Parameter Index  | 2                     | 20ms, as defined in table 7.2-1 in TS 38.321 [7].   |
| BFR-CSIRS-Resource   | ra-PreambleIndex = 50 | Associated with CSI-RS configured   |
| ra-OccasionList  | 1                     | RA occasions allowed corresponding to CSI-RS  |
| rsrp-ThresholdSSB  | RSRP_51               | The actual value of the threshold is -105dBm, as defined in TS 38.331 [2].  |
| Note: For further information see clause 6.3.2 in TS 38.331 [2]. |                       |   |

#### A.3.8.3 PRACH configurations in FR2

##### A.3.8.3.1 FR2 PRACH configuration 1

FR2 PRACH configuration 1 in this clause provides the typical PRACH configuration for SSB-based contention based random access in FR2.

**Table A.3.8.3.1-1: Parameters for FR2 PRACH configuration 1**

| Field | Value | Comment |
|-------|-------|---------|
|-------|-------|---------|

|  |                        |  |
|--|------------------------|--|
| prach-ConfigurationIndex   | 190                    | Preamble Format C2, with 10ms PRACH periodicity, and other detailed configuration defined in table 6.3.3.2-4 in TS 38.211 [6]. |
| msg1-SubcarrierSpacing   | Same as UL carrier SCS |  |
| totalNumberOfRA-Preambles  | 48                     | Total number of preambles used for contention based and contention free random access  |
| numberOfRA-PreamblesGroupA                                       | 48                     | No group B.  |
| prach-RootSequenceIndex  | 0                      | Logic sequence index = 0, resulting in root sequence = 1.  |
| ssb-perRACH-OccasionAndCB-PreamblesPerSSB                        | oneFourth, n48         | OneFourth: 1 SSB associated with 4 RACH occasions<br>n48: 48 contention based preambles per SSB                                |
| msg1-FDM   | One                    | One PRACH transmission occasions FDMed in one time instance.   |
| rsrp-ThresholdSSB  | RSRP_51                | The actual value of the threshold is -105dBm, as defined in TS 38.331 [2].   |
| ra-ContentionResolutionTimer                                     | sf48                   | 48 sub-frames  |
| powerRampingStep   | dB2                    |  |
| preambleReceivedTargetPower                                      | dBm-120                |  |
| preambleTransMax   | n6                     | Max number of RA preamble transmission performed before declaring a failure is 6   |
| ra-ResponseWindow  | sl10                   | 10 slots   |
| zeroCorrelationZoneConfig  | 11                     | N-CS configuration, N <sub>CS</sub> = 23   |
| Backoff Parameter Index  | 2                      | 20 ms, as defined in table 7.2-1 in TS 38.321 [7].   |
| Note: For further information see clause 6.3.2 in TS 38.331 [2]. |                        |  |

### A.3.8.3.2 FR2 PRACH configuration 2

FR2 PRACH configuration 2 in this clause provides the typical PRACH configuration for SSB based non-contention based random access in FR2.

**Table A.3.8.3.2-1: Parameters for FR2 PRACH configuration 2**

| Field                       | Value                  | Comment  |
|-----------------------------|------------------------|--|
| prach-ConfigurationIndex    | 190                    | Preamble Format C2, with 10ms PRACH periodicity, and other detailed configuration defined in table 6.3.3.2-4 in TS 38.211 [6]. |
| msg1-SubcarrierSpacing      | Same as UL carrier SCS |  |
| totalNumberOfRA-Preambles   | 48                     | Total number of preambles used for contention based and contention free random access  |
| numberOfRA-PreamblesGroupA  | 48                     | No group B.  |
| prach-RootSequenceIndex     | 0                      | Logic sequence index = 0, resulting in root sequence = 1.  |
| ssb-perRACH-Occasion        | oneFourth              | OneFourth: 1 SSB associated with 4 RACH occasions  |
| msg1-FDM                    | One                    | One PRACH transmission occasions FDMed in one time instance.   |
| powerRampingStep            | dB2                    |  |
| preambleReceivedTargetPower | dBm-120                |  |
| preambleTransMax            | n6                     | Max number of RA preamble transmission performed before declaring a failure is 6   |
| ra-ResponseWindow           | sl10                   | 10 slots   |
| zeroCorrelationZoneConfig   | 11                     | N-CS configuration, N <sub>CS</sub> = 23   |
| Backoff Parameter Index     | 2                      | 20 ms, as defined in table 7.2-1 in TS 38.321 [7].   |

|  |                       |   |
|--|-----------------------|---|
| <i>ssb-ResourceList</i>  | ra-PreambleIndex = 50 | Associated with SSB index 0. UE doesn't use <i>ssb-ResourceList</i> and BFR-SSB-Resource IEs at the same time. UE doesn't use this field if is transmitting CFRA to convey BFR. |
| <i>BFR-SSB-Resource</i>  | ra-PreambleIndex = 50 | Associated with SSB index 0. UE doesn't use <i>ssb-ResourceList</i> and BFR-SSB-Resource IEs at the same time. UE uses this field only if is transmitting CFRA to convey BFR    |
| ra-ssb-OccasionMaskIndex   | 1                     | PRACH occasion index 1 is allowed   |
| rsrp-ThresholdSSB  | RSRP_51               | The actual value of the threshold is -105dBm, as defined in TS 38.331 [2].  |
| Note: For further information see clause 6.3.2 in TS 38.331 [2]. |                       |   |

### A.3.8.3.3 FR2 PRACH configuration 3

FR2 PRACH configuration 3 in this clause provides the typical PRACH configuration for CSI-RS based non-contention based random access in FR2.

**Table A.3.8.3.3-1: Parameters for FR2 PRACH configuration 3**

| Field  | Value                  | Comment  |
|--|------------------------|--|
| prach-ConfigurationIndex   | 190                    | Preamble Format C2, with 10ms PRACH periodicity, and other detailed configuration defined in table 6.3.3.2-4 in TS 38.211 [6]. |
| msg1-SubcarrierSpacing   | Same as UL carrier SCS |  |
| totalNumberOfRA-Preambles  | 48                     | Total number of preambles used for contention based and contention free random access  |
| numberOfRA-PreamblesGroupA                                       | 48                     | No group B.  |
| prach-RootSequenceIndex  | 0                      | Logic sequence index = 0, resulting in root sequence = 1.  |
| ssb-perRACH-Occasion   | oneFourth              | OneFourth: 1 SSB associated with 4 RACH occasions  |
| msg1-FDM   | One                    | One PRACH transmission occasions FDMed in one time instance.   |
| powerRampingStep   | dB2                    |  |
| preambleReceivedTargetPower                                      | dBm-120                |  |
| preambleTransMax   | n6                     | Max number of RA preamble transmission performed before declaring a failure is 6   |
| ra-ResponseWindow  | sl10                   | 10 slots   |
| zeroCorrelationZoneConfig  | 11                     | N-CS configuration, N <sub>cs</sub> = 23   |
| Backoff Parameter Index  | 2                      | 20 ms, as defined in table 7.2-1 in TS 38.321 [7].   |
| csirs-ResourceList   | ra-PreambleIndex = 50  | Associated with CSI-RS configured  |
| ra-OccasionList  | 1                      | RA occasions allowed corresponding to CSI-RS   |
| rsrp-ThresholdCSI-RS   | RSRP_51                | The actual value of the threshold is -105dBm, as defined in TS 38.331 [2].   |
| Note: For further information see clause 6.3.2 in TS 38.331 [2]. |                        |  |

### A.3.8.3.4 FR2 PRACH configuration 4

FR2 PRACH configuration 4 in this clause provides the PRACH configuration for CSI-RS based non-contention based random access in FR2 to convey BFR.

**Table A.3.8.3.4-1: Parameters for FR2 PRACH configuration 4**

| Field                       | Value  | Comment  |
|-----------------------------|--|--|
| prach-ConfigurationIndex    | 190  | Preamble Format C2, with 10ms PRACH periodicity, and other detailed configuration defined in table 6.3.3.2-4 in TS 38.211 [6]. |
| msg1-SubcarrierSpacing      | Same as UL carrier SCS                                     |  |
| totalNumberOfRA-Preambles   | 48   | Total number of preambles used for contention based and contention free random access  |
| numberOfRA-PreamblesGroupA  | 48   | No group B.  |
| prach-RootSequenceIndex     | 0  | Logic sequence index = 0, resulting in root sequence = 1.  |
| ssb-perRACH-Occasion        | oneFourth  | OneFourth: 1 SSB associated with 4 RACH occasions  |
| msg1-FDM                    | One  | One PRACH transmission occasions FDMed in one time instance.   |
| powerRampingStep            | dB2  |  |
| preambleReceivedTargetPower | dBm-120  |  |
| preambleTransMax            | n200   | Max number of RA preamble transmission performed before declaring a failure is 200.  |
| ra-ResponseWindow           | sl40   | 40 slots   |
| zeroCorrelationZoneConfig   | 11   | N-CS configuration, $N_{CS} = 23$  |
| Backoff Parameter Index     | 2  | 20 ms, as defined in table 7.2-1 in TS 38.321 [7].   |
| BFR-CSIRS-Resource          | ra-PreambleIndex = 50                                      | Associated with CSI-RS configured  |
| ra-OccasionList             | 1  | RA occasions allowed corresponding to CSI-RS   |
| rsrp-ThresholdSSB           | RSRP_51  | The actual value of the threshold is -105dBm, as defined in TS 38.331 [2].   |
| Note:                       | For further information see clause 6.3.2 in TS 38.331 [2]. |  |

## A.3.9 BWP configurations

### A.3.9.1 Introduction

This clause provides the typical BWP configurations used for RRM test cases defined in Annex A. For downlink BWP, both initial BWP and dedicated BWP configurations are specified in clause A.3.9.2 and for uplink BWP, both initial BWP and dedicated BWP configurations are specified in clause A.3.9.3. To note that for other parameters not listed in this clause, either it can be derived from the set up of each test or it is subjected to RAN5 specifications.

### A.3.9.2 Downlink BWP configurations

#### A.3.9.2.1 Initial BWP

**Table A.3.9.2.1-1: Downlink BWP patterns for initial BWP configuration**

| BWP Parameters | Unit | Values    |           |
|----------------|------|-----------|-----------|
| Reference BWP  |      | DLBWP.0.1 | DLBWP.0.2 |

|  |    |   |  |
|--|----|---|--|
| Starting PRB index   |    | 0                                       | $RB_c$ <sup>Note 1</sup>                               |
| Bandwidth  | RB | Same as RF channel defined in each test | same as RMSI CORESET (CORESET #0) defined in each test |
| Note 1: $RB_c$ is the lowest PRB index to guarantee the BWP including CORESET #0 which is defined in Clause A.3.1.2. |    |   |  |

A.3.9.2.2 Dedicated BWP

**Table A.3.9.2.2-1: Downlink BWP patterns for dedicated BWP configuration**

| BWP Parameters  | Unit | Values                                  |  |  |  |  |
|---|------|---|--|--|--|--|
|   |      | DLBWP.1.1                               | DLBWP.1.2  | DLBWP.1.3  | DLBWP.1.4  | DLBWP.1.7  |
| Reference BWP   |      |   |  |  |  |  |
| Starting PRB index  |      | 0                                       | $RB_b$ <sup>Note 1</sup>   | $RB_a$ <sup>Note 2</sup>   | 0  | $RB_c$ <sup>Note 3</sup>   |
| Bandwidth   | RB   | Same as RF channel defined in each test | 25 for SSB<br>SCS = 15KHz,<br>51 for SSB<br>SCS = 30KHz,<br>32 for SSB<br>SCS = 120KHz<br>48 for SSB<br>SCS = 240KHz | 25 for SSB<br>SCS = 15KHz,<br>51 for SSB<br>SCS = 30KHz,<br>32 for SSB<br>SCS = 120KHz<br>48 for SSB<br>SCS = 240KHz | 24 for SSB<br>SCS = 120KHz<br>24 for SSB<br>SCS = 240KHz | 25 for SSB<br>SCS = 15KHz,<br>51 for SSB<br>SCS = 30KHz,<br>32 for SSB<br>SCS = 120KHz<br>48 for SSB<br>SCS = 240KHz |
| Note 1: $RB_b$ is the lowest PRB index to guarantee the BWP not fully overlapped with SSB PRB index ( $RB_J, RB_{J+1}, \dots, RB_{J+19}$ ) which is defined in Clause A.3.10.   |      |   |  |  |  |  |
| Note 2: $RB_a$ is the lowest PRB index to guarantee the BWP including SSB PRB index ( $RB_J, RB_{J+1}, \dots, RB_{J+19}$ ) which is defined in Clause A.3.10.                   |      |   |  |  |  |  |
| Note 3: $RB_c$ is the PRB index having an offset of 6 PRBs with respect to the start of SSB PRB index ( $RB_J, RB_{J+1}, \dots, RB_{J+19}$ ) which is defined in Clause A.3.10. |      |   |  |  |  |  |

A.3.9.3 Uplink BWP configurations

A.3.9.3.1 Initial BWP

**Table A.3.9.3.1-1: Uplink BWP patterns for initial BWP configuration**

| BWP Parameters  | Unit | Values                                  |  |
|---|------|---|--|
|   |      | ULBWP.0.1                               | ULBWP.0.2  |
| Reference BWP   |      |   |  |
| Starting PRB index  |      | 0                                       | $RB_c$ <sup>Note 1</sup>                               |
| Bandwidth   | RB   | Same as RF channel defined in each test | same as RMSI CORESET (CORESET #0) defined in each test |
| Note 1: $RB_c$ is same as $RB_c$ for DLBWP.0.2 as defined in Table A.3.9.2.1-1. |      |   |  |

A.3.9.3.2 Dedicated BWP

**Table A.3.9.3.2-1: Uplink BWP patterns for dedicated BWP configuration**

| BWP Parameters | Unit | Values    |           |           |           |           |
|----------------|------|-----------|-----------|-----------|-----------|-----------|
|                |      | ULBWP.1.1 | ULBWP.1.2 | ULBWP.1.3 | ULBWP.1.4 | ULBWP.1.7 |
| Reference BWP  |      |           |           |           |           |           |

| Starting PRB index  |    | 0                                       | RB <sub>b</sub> <sup>Note 1</sup>  | RB <sub>a</sub> <sup>Note 2</sup>  | 0  | RB <sub>c</sub> <sup>Note 3</sup>  |
|---|----|---|--|--|--|--|
| Bandwidth   | RB | Same as RF channel defined in each test | 25 for SSB<br>SCS = 15KHz,<br>51 for SSB<br>SCS = 30KHz,<br>32 for SSB<br>SCS = 120KHz<br>48 for SSB<br>SCS = 240KHz | 25 for SSB<br>SCS = 15KHz,<br>51 for SSB<br>SCS = 30KHz,<br>32 for SSB<br>SCS = 120KHz<br>48 for SSB<br>SCS = 240KHz | 24 for SSB<br>SCS =<br>120KHz<br>24 for SSB<br>SCS =<br>240KHz | 25 for SSB<br>SCS = 15KHz,<br>51 for SSB<br>SCS = 30KHz,<br>32 for SSB<br>SCS = 120KHz<br>48 for SSB<br>SCS = 240KHz |
| Note 1: RB <sub>b</sub> is same as RB <sub>b</sub> for DLBWP.1.2 as defined in Table A.3.9.2.2-1. |    |   |  |  |  |  |
| Note 2: RB <sub>a</sub> is same as RB <sub>a</sub> for DLBWP.1.3 as defined in Table A.3.9.2.2-1. |    |   |  |  |  |  |
| Note 3: RB <sub>c</sub> is same as RB <sub>c</sub> for DLBWP.1.7 as defined in Table A.3.9.2.2-1. |    |   |  |  |  |  |

## A.3.10 SSB Configurations

### A.3.10.1 SSB Configurations for FR1

#### A.3.10.1.1 SSB pattern 1 in FR1: SSB allocation for SSB SCS=15 kHz in 10 MHz

**Table A.3.10.1.1-1: SSB.1 FR1: SSB Pattern 1 for SSB SCS=15 kHz in 10 MHz channel**

| SSB Parameters                                  | Values  |
|---|---|
| Channel bandwidth                               | 10 MHz  |
| SSB SCS   | 15 kHz  |
| SSB periodicity (T <sub>SSB</sub> )             | 20 ms   |
| Number of SSBs per SS-burst                     | 1   |
| SS/PBCH block index                             | 0   |
| Symbol numbers containing SSB <sup>Note 2</sup> | 2-5   |
| Slot numbers containing SSB <sup>Note 2</sup>   | 0   |
| SFN containing SSB                              | SFN mod (max(T <sub>SSB</sub> ,10ms)/10ms) = 0  |
| RB numbers containing SSB within channel BW     | (RB <sub>J</sub> , RB <sub>J+1</sub> , ..., RB <sub>J+19</sub> ) <sup>Note 1</sup>  |
| Note 1:   | RBs containing SSB can be configured in any frequency location within the cell bandwidth according to the allowed synchronization raster defined in TS 38.104 [13]. |
| Note 2:   | These values have been derived from other parameters for information purposes (as per TS 38.213 [3]). They are not settable parameters themselves.                  |

#### A.3.10.1.2 SSB pattern 2 in FR1: SSB allocation for SSB SCS=30 kHz in 40 MHz

**Table A.3.10.1.2-1: SSB.2 FR1: SSB Pattern 2 for SSB SCS=30 kHz in 40 MHz channel**

| SSB Parameters                                  | Values  |
|---|---|
| Channel bandwidth                               | 40 MHz  |
| SSB SCS   | 30 kHz  |
| SSB periodicity (T <sub>SSB</sub> )             | 20 ms   |
| Number of SSBs per SS-burst                     | 1   |
| SS/PBCH block index                             | 0   |
| Symbol numbers containing SSB <sup>Note 3</sup> | 4-7 or 2-5 <sup>Note 2</sup>  |
| Slot numbers containing SSB <sup>Note 3</sup>   | 0   |
| SFN containing SSB                              | SFN mod (max(T <sub>SSB</sub> ,10ms)/10ms) = 0  |
| RB numbers containing SSB within channel BW     | (RB <sub>J</sub> , RB <sub>J+1</sub> , ..., RB <sub>J+19</sub> ) <sup>Note 1</sup>  |
| Note 1:   | RBs containing SSB can be configured in any frequency location within the cell bandwidth according to the allowed synchronization raster defined in TS 38.104 [13]. |

|         |  |
|---------|--|
| Note 2: | Symbols 4-7 is chosen, if the SSB pattern Case B should be used for the current band as indicated by Table 5.4.3.3-1 of TS 38.104 [13]; Otherwise, symbol 2-5 is chosen. |
| Note 3: | These values have been derived from other parameters for information purposes (as per TS 38.213 [3]). They are not settable parameters themselves.                       |

### A.3.10.1.3 SSB pattern 3 in FR1: SSB allocation for SSB SCS=15 kHz in 10 MHz

**Table A.3.10.1.3-1: SSB.3 FR1: SSB Pattern 3 for SSB SCS=15 kHz in 10 MHz channel**

| SSB Parameters                                  | Values  |      |
|---|---|------|
| Channel bandwidth                               | 10 MHz  |      |
| SSB SCS   | 15 kHz  |      |
| SSB periodicity ( $T_{SSB}$ )                   | 20 ms   |      |
| Number of SSBs per SS-burst                     | 2   |      |
| SS/PBCH block index                             | 0   | 1    |
| Symbol numbers containing SSB <sup>Note 2</sup> | 2-5   | 8-11 |
| Slot numbers containing SSB <sup>Note 2</sup>   | 0   | 0    |
| SFN containing SSB                              | SFN mod ( $\max(T_{SSB}, 10\text{ms})/10\text{ms}$ ) = 0  |      |
| RB numbers containing SSB within channel BW     | $(RB_J, RB_{J+1}, \dots, RB_{J+19})^{\text{Note 1}}$  |      |
| Note 1:   | RBs containing SSB can be configured in any frequency location within the cell bandwidth according to the allowed synchronization raster defined in TS 38.104 [13]. |      |
| Note 2:   | These values have been derived from other parameters for information purposes (as per TS 38.213 [3]). They are not settable parameters themselves.                  |      |

### A.3.10.1.4 SSB pattern 4 in FR1: SSB allocation for SSB SCS=30 kHz in 40 MHz

**Table A.3.10.1.4-1: SSB.4 FR1: SSB Pattern 4 for SSB SCS=30 kHz in 40 MHz channel**

| SSB Parameters                                  | Values   |      |
|---|--|------|
| Channel bandwidth                               | 40 MHz   |      |
| SSB SCS   | 30 kHz   |      |
| SSB periodicity ( $T_{SSB}$ )                   | 20 ms  |      |
| Number of SSBs per SS-burst                     | 2  |      |
| SS/PBCH block index                             | 0  | 1    |
| Symbol numbers containing SSB <sup>Note 3</sup> | 4-7 or 2-5 <sup>Note 2</sup>   | 8-11 |
| Slot numbers containing SSB <sup>Note 3</sup>   | 0  | 0    |
| SFN containing SSB                              | SFN mod ( $\max(T_{SSB}, 10\text{ms})/10\text{ms}$ ) = 0   |      |
| RB numbers containing SSB within channel BW     | $(RB_J, RB_{J+1}, \dots, RB_{J+19})^{\text{Note 1}}$   |      |
| Note 1:   | RBs containing SSB can be configured in any frequency location within the cell bandwidth according to the allowed synchronization raster defined in TS 38.104 [13].      |      |
| Note 2:   | Symbols 4-7 is chosen, if the SSB pattern Case B should be used for the current band as indicated by Table 5.4.3.3-1 of TS 38.104 [13]; Otherwise, symbol 2-5 is chosen. |      |
| Note 3:   | These values have been derived from other parameters for information purposes (as per TS 38.213 [3]). They are not settable parameters themselves.                       |      |

### A.3.10.1.5 SSB pattern 5 in FR1: SSB allocation for SSB SCS=15 kHz starting from odd SFN in 10 MHz

**Table A.3.10.1.5-1: SSB.5 FR1: SSB Pattern 5 for SSB SCS=15 kHz in 10 MHz channel**

| SSB Parameters                                  | Values  |
|---|---|
| Channel bandwidth                               | 10 MHz  |
| SSB SCS   | 15 kHz  |
| SSB periodicity ( $T_{SSB}$ )                   | 20 ms   |
| Number of SSBs per SS-burst                     | 1   |
| SS/PBCH block index                             | 0   |
| Symbol numbers containing SSB <sup>Note 2</sup> | 2-5   |
| Slot numbers containing SSB <sup>Note 2</sup>   | 0   |
| SFN containing SSB                              | $SFN \bmod (\max(T_{SSB}, 10\text{ms})/10\text{ms}) = 1$  |
| RB numbers containing SSB within channel BW     | $(RB_J, RB_{J+1}, \dots, RB_{J+19})^{\text{Note 1}}$  |
| Note 1:   | RBs containing SSB can be configured in any frequency location within the cell bandwidth according to the allowed synchronization raster defined in TS 38.104 [13]. |
| Note 2:   | These values have been derived from other parameters for information purposes (as per TS 38.213 [3]). They are not settable parameters themselves.                  |

### A.3.10.1.6 SSB pattern 6 in FR1: SSB allocation for SSB SCS=30 kHz starting from odd SFN in 40 MHz

**Table A.3.10.1.6-1: SSB.6 FR1: SSB Pattern 6 for SSB SCS=30 kHz in 40 MHz channel**

| SSB Parameters                                  | Values   |
|---|--|
| Channel bandwidth                               | 40 MHz   |
| SSB SCS   | 30 kHz   |
| SSB periodicity ( $T_{SSB}$ )                   | 20 ms  |
| Number of SSBs per SS-burst                     | 1  |
| SS/PBCH block index                             | 0  |
| Symbol numbers containing SSB <sup>Note 3</sup> | 4-7 or 2-5 <sup>Note 2</sup>   |
| Slot numbers containing SSB <sup>Note 3</sup>   | 0  |
| SFN containing SSB                              | $SFN \bmod (\max(T_{SSB}, 10\text{ms})/10\text{ms}) = 1$   |
| RB numbers containing SSB within channel BW     | $(RB_J, RB_{J+1}, \dots, RB_{J+19})^{\text{Note 1}}$   |
| Note 1:   | RBs containing SSB can be configured in any frequency location within the cell bandwidth according to the allowed synchronization raster defined in TS 38.104 [13].      |
| Note 2:   | Symbols 4-7 is chosen, if the SSB pattern Case B should be used for the current band as indicated by Table 5.4.3.3-1 of TS 38.104 [13]; Otherwise, symbol 2-5 is chosen. |
| Note 3:   | These values have been derived from other parameters for information purposes (as per TS 38.213 [3]). They are not settable parameters themselves.                       |

## A.3.10.2 SSB Configurations for FR2

### A.3.10.2.1 SSB pattern 1 in FR2: SSB allocation for SSB SCS=120 kHz in 100 MHz

**Table A.3.10.2.1-1: SSB.1 FR2: SSB Pattern 1 for SSB SCS = 120 kHz in 100 MHz channel with 2 SSBs per SS-burst**

| SSB Parameters    | Values  |
|-------------------|---------|
| Channel bandwidth | 100 MHz |

|  |   |      |
|--|---|------|
| SSB SCS  | 120 kHz   |      |
| SSB periodicity ( $T_{SSB}$ )                    | 20 ms   |      |
| Number of SSBs per SS-burst                      | 2   |      |
| SS/PBCH block index                              | 0   | 1    |
| Symbol numbers containing SSBs <sup>Note 2</sup> | 4-7   | 8-11 |
| Slot numbers containing SSB <sup>Note 2</sup>    | 0   | 0    |
| SFN containing SSB                               | SFN mod ( $\max(T_{SSB}, 10\text{ms})/10\text{ms}$ ) = 0  |      |
| RB numbers containing SSBs within channel BW     | $(RB_J, RB_{J+1}, \dots, RB_{J+19})^{\text{Note 1}}$  |      |
| Note 1:  | RBs containing SSB can be configured in any frequency location within the cell bandwidth according to the allowed synchronization raster defined in TS 38.104 [13]. |      |
| Note 2:  | These values have been derived from other parameters for information purposes (as per TS 38.213 [3]). They are not settable parameters themselves.                  |      |

### A.3.10.2.2 SSB pattern 2 in FR2: SSB allocation for SSB SCS=240 kHz in 100 MHz

**Table A.3.10.2.2-1: SSB.2 FR2: SSB Pattern 2 for SSB SCS = 240 kHz in 100 MHz channel with 2 SSBs per SS-burst**

| SSB Parameters                                   | Values  |       |     |
|--|---|-------|-----|
| Channel bandwidth                                | 100 MHz   |       |     |
| SSB SCS  | 240 kHz   |       |     |
| SSB periodicity ( $T_{SSB}$ )                    | 20 ms   |       |     |
| Number of SSBs per SS-burst                      | 2   |       |     |
| SS/PBCH block index                              | 0   | 1     |     |
| Symbol numbers containing SSBs <sup>Note 2</sup> | 8-11  | 12-13 | 0-1 |
| Slot numbers containing SSB <sup>Note 2</sup>    | 0   | 0     | 1   |
| SFN containing SSB                               | SFN mod ( $\max(T_{SSB}, 10\text{ms})/10\text{ms}$ ) = 0  |       |     |
| RB numbers containing SSBs within channel BW     | $(RB_J, RB_{J+1}, \dots, RB_{J+39})^{\text{Note 1}}$  |       |     |
| Note 1:  | RBs containing SSB can be configured in any frequency location within the cell bandwidth according to the allowed synchronization raster defined in TS 38.104 [13]. |       |     |
| Note 2:  | These values have been derived from other parameters for information purposes (as per TS 38.213 [3]). They are not settable parameters themselves.                  |       |     |

### A.3.10.2.3 SSB pattern 3 in FR2: SSB allocation for SSB SCS=120 kHz in 100 MHz

**Table A.3.10.2.3-1: SSB.3 FR2: SSB Pattern 3 for SSB SCS = 120 kHz in 100 MHz channel with 1 SSB per SS-burst**

| SSB Parameters                                   | Values  |  |  |
|--|---|--|--|
| Channel bandwidth                                | 100 MHz   |  |  |
| SSB SCS  | 120 kHz   |  |  |
| SSB periodicity ( $T_{SSB}$ )                    | 20 ms   |  |  |
| Number of SSBs per SS-burst                      | 1   |  |  |
| SS/PBCH block index                              | 0   |  |  |
| Symbol numbers containing SSBs <sup>Note 2</sup> | 4-7   |  |  |
| Slot numbers containing SSB <sup>Note 2</sup>    | 0   |  |  |
| SFN containing SSB                               | SFN mod ( $\max(T_{SSB}, 10\text{ms})/10\text{ms}$ ) = 0  |  |  |
| RB numbers containing SSBs within channel BW     | $(RB_J, RB_{J+1}, \dots, RB_{J+19})^{\text{Note 1}}$  |  |  |
| Note 1:  | RBs containing SSB can be configured in any frequency location within the cell bandwidth according to the allowed synchronization raster defined in TS 38.104 [13]. |  |  |
| Note 2:  | These values have been derived from other parameters for information purposes (as per TS 38.213 [3]). They are not settable parameters themselves.                  |  |  |

## A.3.10.2.4 SSB pattern 4 in FR2: SSB allocation for SSB SCS=240 kHz in 100 MHz

**Table A.3.10.2.4-1: SSB.4 FR2: SSB Pattern 4 for SSB SCS = 240 kHz in 100 MHz channel with 1 SSB per SS-burst**

| SSB Parameters                                   | Values  |
|--|---|
| Channel bandwidth                                | 100 MHz   |
| SSB SCS  | 240 kHz   |
| SSB periodicity ( $T_{SSB}$ )                    | 20 ms   |
| Number of SSBs per SS-burst                      | 1   |
| SS/PBCH block index                              | 0   |
| Symbol numbers containing SSBs <sup>Note 2</sup> | 8-11  |
| Slot numbers containing SSB <sup>Note 2</sup>    | 0   |
| SFN containing SSB                               | $SFN \bmod (\max(T_{SSB}, 10\text{ms})/10\text{ms}) = 0$  |
| RB numbers containing SSBs within channel BW     | $(RB_J, RB_{J+1}, \dots, RB_{J+39})$ <sup>Note 1</sup>  |
| Note 1:  | RBs containing SSB can be configured in any frequency location within the cell bandwidth according to the allowed synchronization raster defined in TS 38.104 [13]. |
| Note 2:  | These values have been derived from other parameters for information purposes (as per TS 38.213 [3]). They are not settable parameters themselves.                  |

## A.3.10.2.5 SSB pattern 5 in FR2: SSB allocation for SSB SCS=120 kHz in 100 MHz

**Table A.3.10.2.5-1: SSB.5 FR2: SSB Pattern 5 for SSB SCS = 120 kHz in 100 MHz channel with 2 SSBs per SS-burst**

| SSB Parameters                                   | Values  |     |
|--|---|-----|
| Channel bandwidth                                | 100 MHz   |     |
| SSB SCS  | 120 kHz   |     |
| SSB periodicity ( $T_{SSB}$ )                    | 20 ms   |     |
| Number of SSBs per SS-burst                      | 2   |     |
| SS/PBCH block index                              | 2   | 3   |
| Symbol numbers containing SSBs <sup>Note 2</sup> | 2-5   | 6-9 |
| Slot numbers containing SSB <sup>Note 2</sup>    | 1   | 1   |
| SFN containing SSB                               | $SFN \bmod (\max(T_{SSB}, 10\text{ms})/10\text{ms}) = 0$  |     |
| RB numbers containing SSBs within channel BW     | $(RB_J, RB_{J+1}, \dots, RB_{J+19})$ <sup>Note 1</sup>  |     |
| Note 1:  | RBs containing SSB can be configured in any frequency location within the cell bandwidth according to the allowed synchronization raster defined in TS 38.104 [13]. |     |
| Note 2:  | These values have been derived from other parameters for information purposes (as per TS 38.213 [3]). They are not settable parameters themselves.                  |     |

## A.3.10.2.6 SSB pattern 6 in FR2: SSB allocation for SSB SCS=240 kHz in 100 MHz

**Table A.3.10.2.6-1: SSB.6 FR2: SSB Pattern 6 for SSB SCS = 240 kHz in 100 MHz channel with 2 SSBs per SS-burst**

| SSB Parameters                                   | Values   |     |
|--|--|-----|
| Channel bandwidth                                | 100 MHz  |     |
| SSB SCS  | 240 kHz  |     |
| SSB periodicity ( $T_{SSB}$ )                    | 20 ms  |     |
| Number of SSBs per SS-burst                      | 2  |     |
| SS/PBCH block index                              | 2  | 3   |
| Symbol numbers containing SSBs <sup>Note 2</sup> | 2-5  | 6-9 |
| Slot numbers containing SSB <sup>Note 2</sup>    | 1  | 1   |
| SFN containing SSB                               | $SFN \bmod (\max(T_{SSB}, 10\text{ms})/10\text{ms}) = 0$ |     |

|  |   |
|--|---|
| RB numbers containing SSBs within channel BW | $(RB_J, RB_{J+1}, \dots, RB_{J+39})^{\text{Note 1}}$  |
| Note 1:                                      | RBs containing SSB can be configured in any frequency location within the cell bandwidth according to the allowed synchronization raster defined in TS 38.104 [13]. |
| Note 2:                                      | These values have been derived from other parameters for information purposes (as per TS 38.213 [3]). They are not settable parameters themselves.                  |

### A.3.10.2.7 SSB pattern 7 in FR2: SSB allocation for SSB SCS=120 kHz in 100 MHz

**Table A.3.10.2.7-1: SSB.7 FR2: SSB Pattern 7 for SSB SCS = 120 kHz in 100 MHz channel with 1 SSB per SS-burst**

| SSB Parameters                                   | Values  |
|--|---|
| Channel bandwidth                                | 100 MHz   |
| SSB SCS  | 120 kHz   |
| SSB periodicity ( $T_{SSB}$ )                    | 20 ms   |
| Number of SSBs per SS-burst                      | 1   |
| SS/PBCH block index                              | 1   |
| Symbol numbers containing SSBs <sup>Note 2</sup> | 8-11  |
| Slot numbers containing SSB <sup>Note 2</sup>    | 0   |
| SFN containing SSB                               | $SFN \bmod (\max(T_{SSB}, 10\text{ms})/10\text{ms}) = 0$  |
| RB numbers containing SSBs within channel BW     | $(RB_J, RB_{J+1}, \dots, RB_{J+19})^{\text{Note 1}}$  |
| Note 1:  | RBs containing SSB can be configured in any frequency location within the cell bandwidth according to the allowed synchronization raster defined in TS 38.104 [13]. |
| Note 2:  | These values have been derived from other parameters for information purposes (as per TS 38.213 [3]). They are not settable parameters themselves.                  |

### A.3.10.2.8 SSB pattern 8 in FR2: SSB allocation for SSB SCS=240 kHz in 100 MHz

**Table A.3.10.2.8-1: SSB.8 FR2: SSB Pattern 8 for SSB SCS = 240 kHz in 100 MHz channel with 1 SSB per SS-burst**

| SSB Parameters                                   | Values  |
|--|---|
| Channel bandwidth                                | 100 MHz   |
| SSB SCS  | 240 kHz   |
| SSB periodicity ( $T_{SSB}$ )                    | 20 ms   |
| Number of SSBs per SS-burst                      | 1   |
| SS/PBCH block index                              | 1   |
| Symbol numbers containing SSBs <sup>Note 2</sup> | 12-13   |
| Slot numbers containing SSB <sup>Note 2</sup>    | 0   |
| SFN containing SSB                               | $SFN \bmod (\max(T_{SSB}, 10\text{ms})/10\text{ms}) = 0$  |
| RB numbers containing SSBs within channel BW     | $(RB_J, RB_{J+1}, \dots, RB_{J+39})^{\text{Note 1}}$  |
| Note 1:  | RBs containing SSB can be configured in any frequency location within the cell bandwidth according to the allowed synchronization raster defined in TS 38.104 [13]. |
| Note 2:  | These values have been derived from other parameters for information purposes (as per TS 38.213 [3]). They are not settable parameters themselves.                  |

## A.3.11 SMTC Configurations

### A.3.11.1 SMTC pattern 1: SMTC period = 20 ms with SMTC duration = 1 ms

**Table A.3.11.1-1: SMTC.1: SMTC Pattern 1 for SMTC period = 20 ms and duration = 1 ms**

| SMTC Parameters  | Values |
|------------------|--------|
| SMTC periodicity | 20 ms  |
| SMTC offset      | 0 ms   |
| SMTC duration    | 1 ms   |

### A.3.11.2 SMTC pattern 2: SMTC period = 20 ms with SMTC duration = 5 ms

**Table A.3.11.2-1: SMTC.2: SMTC Pattern 2 for SMTC period = 20 ms and duration = 5 ms**

| SMTC Parameters  | Values |
|------------------|--------|
| SMTC periodicity | 20 ms  |
| SMTC offset      | 0 ms   |
| SMTC duration    | 5 ms   |

### A.3.11.3 SMTC pattern 3: SMTC period = 160 ms with SMTC duration = 1 ms

**Table A.3.11.3-1: SMTC.3: SMTC Pattern 3 for SMTC period = 160 ms and duration = 1 ms**

| SMTC Parameters  | Values |
|------------------|--------|
| SMTC periodicity | 160 ms |
| SMTC offset      | 0 ms   |
| SMTC duration    | 1 ms   |

### A.3.11.4 SMTC pattern 4: SMTC period = 20 ms with SMTC duration = 1 ms

**Table A.3.11.4-1: SMTC.4: SMTC Pattern 4 for SMTC period = 20 ms and duration = 1 ms**

| SMTC Parameters  | Values |
|------------------|--------|
| SMTC periodicity | 20 ms  |
| SMTC offset      | 10 ms  |
| SMTC duration    | 1 ms   |

### A.3.11.5 SMTC pattern 5: SMTC period = 20 ms with SMTC duration = 5 ms

**Table A.3.11.5-1: SMTC.5: SMTC Pattern 5 for SMTC period = 20 ms and duration = 5 ms**

| SMTC Parameters  | Values |
|------------------|--------|
| SMTC periodicity | 20 ms  |
| SMTC offset      | 10 ms  |
| SMTC duration    | 5 ms   |

### A.3.11.6 SMTC pattern 6: SMTC period = 20 ms with SMTC duration = 5 ms

**Table A.3.11.6-1: SMTC.6: SMTC Pattern 6 for SMTC period = 20 ms and duration = 5 ms**

| SMTC Parameters  | Values |
|------------------|--------|
| SMTC periodicity | 20 ms  |
| SMTC offset      | 17 ms  |
| SMTC duration    | 5 ms   |

## A.3.12 Test Cases with Different CC Configurations

### A.3.12.1 EN-DC Test Cases with Different EN-DC Configurations

#### A.3.12.1.1 Introduction

In Annex A EN-DC test cases may be defined for two component carriers (CCs) as well as for more than two CCs to verify the same RRM requirement.

#### A.3.12.1.2 Principle of testing

If multiple EN-DC test cases are defined for two CCs as well as for more than two CCs to verify the same type of RRM requirement, which depends on the number of CCs, then from the UE performance point of view the test coverage can be considered fulfilled by executing only the EN-DC test cases with the maximum number of CCs in EN-DC supported by the UE. Otherwise if the same type of RRM requirement is independent of the number of CCs then from the UE performance point of view the test coverage can be considered fulfilled by executing only the EN-DC test cases with two CCs in EN-DC supported by the UE.

*Editor's: The maximum number of CCs that can be used in FR2 tests in EN-DC would depend on the test equipment capability.*

### A.3.12.2 Carrier Aggregation Test Cases with Different CA Configurations

#### A.3.12.2.1 Introduction

In Annex A carrier aggregation test cases may be defined for two CCs as well as for more than two CCs to verify the same RRM requirement.

### A.3.12.2.2 Principle of testing

If multiple carrier aggregation test cases are defined for two CCs as well as for more than two CCs to verify the same RRM requirement, which depends on the number of CCs, then from the UE performance point of view the test coverage can be considered fulfilled by executing only the CA test cases with the maximum number of CCs in CA supported by the UE. Otherwise if the same type of RRM requirement is independent of the number of CCs then from the UE performance point of view the test coverage can be considered fulfilled by executing only the CA test cases with at least two CCs in CA supported by the UE.

*Editor's: The maximum number of CCs that can be used in FR2 tests in CA would depend on the test equipment capability.*

## A.3.13 Test Cases in SA and EN-DC Operations

### A.3.13.1 Introduction

This clause defines a principle which is applicable to test cases verifying RRM requirements in standalone (SA) or EN-DC operations.

In Annex A test cases may be defined in SA and EN-DC operations to verify the same RRM requirement.

*Editor's note: this clause may need to define further for NE-DC and NR-DC test cases, which subjects to the test cases defined in the future.*

### A.3.13.2 Principle of Testing

If test cases are defined in both SA and EN-DC operations to verify the same RRM requirement then the UE capable of both SA and EN-DC operations needs to verify that RRM requirement by performing test case(s) in either SA operation or in EN-DC operation.

If test cases are defined in both SA and EN-DC operations to verify at least one common RRM requirement then the UE capable of both SA and EN-DC operations needs to verify RRM requirements by performing test case(s) in either SA operation or in EN-DC operation provided that the performed test case(s):

- verifies the largest number of RRM requirements and
- verifies at least all RRM requirements covered in the test case(s), which is not performed.

## A.3.13A Test Cases involving E-UTRA/FR1 and FR2 carriers

### A.3.13A.1 Introduction

The following applies to UE compliant to this version of the specification when undergoing tests with a mix of E-UTRA/NR FR1 and NR FR2 carriers in clauses A.5, A.7 and A.8.

### A.3.13A.2 Principle of Testing in EN-DC

For test cases in clause A.5 listed in Table A.3.13A.2-1, the following applies:

- UE does not have to pass the test case

**Table A.3.13A.2-1: Test cases UE does not have to pass in current version of specification (EN-DC)**

| Clause      | Test case slogan   |
|-------------|--|
| A.5.5.3.2   | SCell Activation and deactivation of known SCell in FR1 for 160ms SCell measurement cycle                |
| A.5.5.3.5   | SCell Activation and deactivation of SCell in FR2  |
| A.5.5.6.1.2 | E-UTRAN – NR PSCell FR2 with FR2 SCell DL active BWP switch in non-DRX in synchronous EN-DC              |
| A.5.6.2.5   | EN-DC event triggered reporting tests for FR2 cell without SSB time index detection when DRX is not used |
| A.5.6.2.6   | EN-DC event triggered reporting tests for FR2 cell without SSB time index detection when DRX is used     |
| A.5.6.2.7   | EN-DC event triggered reporting tests for FR2 cell with SSB time index detection when DRX is not used    |
| A.5.6.2.8   | EN-DC event triggered reporting tests for FR2 cell with SSB time index detection when DRX is used        |
| A.5.7.1.3   | EN-DC inter-frequency measurement accuracy with FR1 serving cell and FR2 target cell                     |

### A.3.13A.3 Principle of Testing in SA

For test cases in clause A.7 listed in Table A.3.13A.3-1, the following applies:

- UE does not have to pass the test case

**Table A.3.13A.3-1: Test cases UE does not have to pass in current version of specification (SA)**

| Clause      | Test case slogan  |
|-------------|---|
| A.7.3.1.1   | Inter-frequency handover from FR1 to FR2; unknown target cell   |
| A.7.5.3.2   | SCell Activation and deactivation for FR1+FR2 inter-band with target SCell in FR2                               |
| A.7.5.6.1.2 | NR FR1- NR FR2 DL active BWP switch of PCell with non-DRX in SA   |
| A.7.5.7.1   | Addition and Release Delay of known NR PSCell   |
| A.7.5.7.2   | Addition and Release Delay of unknown NR PSCell   |
| A.7.6.2.5   | SA event triggered reporting tests for FR2 without SSB time index detection when DRX is not used (PCell in FR1) |
| A.7.6.2.6   | SA event triggered reporting tests for FR2 without SSB time index detection when DRX is used (PCell in FR1)     |
| A.7.6.2.7   | SA event triggered reporting tests for FR2 with SSB time index detection when DRX is not used (PCell in FR1)    |
| A.7.6.2.8   | SA event triggered reporting tests for FR2 with SSB time index detection when DRX is used (PCell in FR1)        |
| A.7.7.1.3   | SA inter-frequency measurement accuracy with FR1 serving cell and FR2 target cell                               |

### A.3.13A.4 Principle of Testing in E-UTRA

For test cases in clause A.8 listed in Table A.3.13A.4-1, the following applies:

- UE does not have to pass the test case.

**Table A.3.13A.4-1: Test cases UE does not have to pass in current version of specification (E-UTRA)**

| Clause    | Test case slogan   |
|-----------|--|
| A.8.4.2.5 | NR Inter-RAT event triggered reporting tests for FR2 without SSB time index detection when DRX is not used |
| A.8.4.2.6 | NR Inter-RAT event triggered reporting tests for FR2 without SSB time index detection when DRX is used     |
| A.8.4.2.7 | NR Inter-RAT event triggered reporting tests for FR2 with SSB time index detection when DRX is not used    |
| A.8.4.2.8 | NR Inter-RAT event triggered reporting tests for FR2 with SSB time index detection when DRX is used        |

## A.3.13B Test Cases for EN-DC and NE-DC Operations

### A.3.13B.1 Active BWP switch Test Cases for EN-DC and NE-DC Operations

#### A.3.13B.1.1 Introduction

This clause defines a principle which is applicable to test cases verifying active BWP switch requirements for EN-DC and NE-DC operations.

In Annex A test cases are defined for both EN-DC and NE-DC operations to verify the same type of RRM requirement.

#### A.3.13B.1.2 Principle of Testing

UE capable of both EN-DC and NE-DC operations needs to be tested with one of the tests in either EN-DC or NE-DC operations.

### A.3.13B.2 SFTD accuracy Test Cases for EN-DC and NE-DC Operations

#### A.3.13B.2.1 Introduction

This clause defines a principle which is applicable to test cases verifying SFTD accuracy requirements for EN-DC and NE-DC operations.

In Annex A test cases are defined for both EN-DC and NE-DC operations to verify the same type of RRM requirement.

#### A.3.13B.2.2 Principle of Testing

UE capable of both EN-DC and NE-DC operations needs to be tested with one of the tests in either EN-DC or NE-DC operations.

## A.3.14 CSI-RS configurations

### A.3.14.1 FDD

**Table A.3.14.1-1: CSI-RS Reference Measurement Channels for SCS=15kHz**

| Resource Type  | CSI-RS.1.1 FDD    | CSI-RS.1.2 FDD             | CSI-RS.1.3 FDD     | CSI-RS.1.4 FDD    |
|--|-------------------|----------------------------|--------------------|-------------------|
| Resource Type  | periodic          | periodic                   | aperiodic          | aperiodic         |
| <b>Resource Set Config</b>   |                   |                            |                    |                   |
| nzp-CSI-ResourceSetId  | 0                 | 0                          | 0                  | 0                 |
| repetition   | n.a.              | off                        | off                | on                |
| aperiodicTriggeringOffset  | n.a.              | n.a.                       | 0                  | 0                 |
| trs-Info   | n.a.              | n.a.                       | n.a.               | n.a.              |
| <b>Resource Config</b>   |                   |                            |                    |                   |
| nzp-CSI-RS-ResourceId  | 0 for resource #0 | 0 for resource #0          | 0 for resource #0  | 0 for resource #0 |
|  |                   |                            |                    | 1 for resource #1 |
|  |                   |                            |                    | 2 for resource #2 |
|  |                   |                            |                    | 3 for resource #3 |
|  |                   | 1 for resource #1          | 1 for resource #1  | 4 for resource #4 |
|  |                   |                            |                    | 5 for resource #5 |
|  |                   |                            |                    | 6 for resource #6 |

### A.3.15 Angle of Arrival (AoA) for FR2 RRM test cases

This clause specifies the AoA setups for FR2 RRM test cases in clause A.5 and A.7. The applicable AoA setup is defined in each test case in clause A.5 and A.7.

#### A.3.15.1 Setup 1: Single AoA in Rx beam peak direction

There is only one active probe in the test. The DL signals, and noise if applicable, transmitted from the probe, are aligned to the UE Rx beam peak direction (as defined in TS 38.101-2 [19]).

#### A.3.15.2 Setup 2: Single AoA in non Rx beam peak direction

##### A.3.15.2.1 Setup 2a: Single AoA in non Rx beam peak direction without change in direction

There is only one active probe in the test. The DL signals, and noise if applicable, transmitted from the probe, align to a direction (AoA) which is from the set of directions corresponding to the EIS spherical coverage percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [19] for each UE power class. The direction (AoA) of the signals shall not be changed between test iterations.

##### A.3.15.2.2 Setup 2b: Single AoA in non Rx beam peak direction with change in direction

There is only one active probe in the test. The DL signals, and noise if applicable, transmitted from the probe, align to a direction (AoA) which is from the set of directions corresponding to the EIS spherical coverage percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [19] for each UE power class. For UE power class 3, the direction (AoA) of the signals shall be changed for each test iteration (for UE power classes other than 3, this is FFS).

#### A.3.15.3 Setup 3: 2 AoAs

There are 2 active probes in the test. The DL signals, and noise if applicable, transmitted from the two active probes, align to directions (AoAs) which are from the set of directions corresponding to the EIS spherical coverage

percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [19] for each UE power class. The relative angular offset between the directions (AoAs) of the 2 active probes, shall be changed for each test iteration. The applicable set of relative angular offsets between the 2 active probes is given in Table 3.15.3-1 for each UE power class.

Editor Note: If RAN5 finds the changing of angular offset between the directions (AoAs) of the 2 active probes per test iteration to be infeasible from the perspectives of EIS spherical coverage and other impacts, e.g.: testing time, then the test setup will be revised.

**Table A.3.15.3-1: Set of relative angular offsets between active probes for each power class**

| UE Power class | Relative angular offset between active probes |
|----------------|---|
| 1              | 30°, 60°, 90° and 120°                        |
| 2              | FFS   |
| 3              | 30°, 60°, 90°, 120° and 150°                  |
| 4              | FFS   |

#### A.3.15.4 Setup 4: 2 AoAs, 1 AoA in Rx beam peak direction, 1 in non Rx beam peak

##### A.3.15.4.1 Setup 4a: 2 AoAs, 1 AoA in Rx beam peak direction, 1 in non Rx beam peak without change in direction

There are 2 active probes in the test. The DL signals, and noise if applicable, are transmitted from the two active probes. One probe is aligned to the UE Rx beam peak direction as defined in TS 38.101-2 [19]. The second is aligned to a direction (AoA) which is from the set of directions corresponding to the EIS spherical coverage percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [19] for each UE power class. The direction (AoA) of the non Rx beam peak signal shall not be changed between test iterations.

##### A.3.15.4.2 Setup 4b: 2 AoAs, 1 AoA in Rx beam peak direction, 1 in non Rx beam peak with change in direction

There are 2 active probes in the test. The DL signals, and noise if applicable, are transmitted from the two active probes. One probe is aligned to the UE Rx beam peak direction as defined in TS 38.101-2 [19]. The second is aligned to a direction (AoA) which is from the set of directions corresponding to the EIS spherical coverage percentile of the DUT as defined in clause 7.3.4 of TS 38.101-2 [19] for each UE power class.

For UE power class 3, the relative angular offset between the directions (AoAs) of the 2 active probes shall be changed for each test iteration, within the probe alignment described above. The applicable set of relative angular offsets between the 2 active probes is given in Table 3.15.3-1 for each UE power class.

## A.3.16 TCI State Configuration

### A.3.16.1 Introduction

This clause provides the configurations for TCI states towards either SSB or CSI-RS. The TCI states defined in this clause are configured in each test when applicable to indicate that certain DL signals are QCL'ed with the referenceSignal configured in the TCI states.

## A.3.16.2 TCI states

**Table A.3.16.2-1: TCI States**

| Parameter  | TCI.State.0 | TCI.State.1 | TCI.State.2  | TCI.State.3  |
|--|-------------|-------------|--|--|
| tcid-StateId   | Id0         | Id1         | Id2  | Id3  |
| qcl-Type1  | typeC       | typeC       | typeA  | typeA  |
| qcl-Type2 <sup>Note1</sup>   | typeD       | typeD       | typeD  | typeD  |
| referenceSignal  | SSB0        | SSB1        | Resource #4 in TRS resource set 1 <sup>Note3</sup> | Resource #4 in TRS resource set 2 <sup>Note3</sup> |
| Note 1: qcl-Type2 of typeD only where applicable. For RRM test cases, this will be only in FR2<br>Note 2: referenceSignal configurations towards which the TCI states are configured are defined in a test-specific manner.<br>Note 3: Reference TRS resource sets are defined in A.3.17, and the applicable TRS resource set(s) are specified in each test case. When a single TRS resource set is configured in a test case, it is considered as resource set 1. |             |             |  |  |

**Table A.3.16.2-2: Void**

## A.3.17 Configurations of CSI-RS for tracking

### A.3.17.1 Configuration of CSI-RS for tracking for FR1

#### A.3.17.1.1 FDD

**Table A.3.17.1.1-1: CSI-RS for tracking for SCS=15kHz**

| Parameter   | Unit  | Value  |
|---|-------|--|
| Reference channel   |       | TRS.1.1 FDD  |
| Bandwidth   |       | BW of Active BWP <sup>Note 1</sup>   |
| SCS   | kHz   | 15   |
| First subcarrier index in the PRB used for CSI-RS   |       | $k_0=0$ for CSI-RS resource 1,2,3,4  |
| First OFDM symbol in the slot used for CSI-RS   |       | $l_0 = 5$ for CSI-RS resource 1 and 3<br>$l_0 = 9$ for CSI-RS resource 2 and 4 |
| Number of CSI-RS ports (X)  |       | 1 for CSI-RS resource 1,2,3,4  |
| CDM Type  |       | 'No CDM' for CSI-RS resource 1,2,3,4   |
| Density ( $\rho$ )  |       | 3 for CSI-RS resource 1,2,3,4  |
| CSI-RS periodicity  | slots | 20 for CSI-RS resource 1,2,3,4   |
| CSI-RS offset   | slots | 10 for CSI-RS resource 1 and 2<br>11 for CSI-RS resource 3 and 4               |
| EPRE ratio to SSS   | dB    | 0 <sup>Note 2</sup>  |
| TCI state   |       | TCI.State.0  |
| Note 1: BW of TRS is configured same as the BW size of UE active BWP in the RRM test cases<br>Note 2: Unless otherwise specified in the test case |       |  |

**Table A.3.17.1.1-2: CSI-RS for tracking for SCS=30kHz**

| Parameter         | Unit | Value       |
|-------------------|------|-------------|
| Reference channel |      | TRS.1.2 FDD |

|  |       |  |
|--|-------|--|
| Bandwidth  |       | BW of Active BWP <sup>Note 1</sup>   |
| SCS  | kHz   | 30   |
| First subcarrier index in the PRB used for CSI-RS  |       | $k_0=0$ for CSI-RS resource 1,2,3,4  |
| First OFDM symbol in the slot used for CSI-RS  |       | $l_0 = 5$ for CSI-RS resource 1 and 3<br>$l_0 = 9$ for CSI-RS resource 2 and 4 |
| Number of CSI-RS ports (X)   |       | 1 for CSI-RS resource 1,2,3,4  |
| CDM Type   |       | 'No CDM' for CSI-RS resource 1,2,3,4   |
| Density ( $\rho$ )   |       | 3 for CSI-RS resource 1,2,3,4  |
| CSI-RS periodicity   | slots | 40 for CSI-RS resource 1,2,3,4   |
| CSI-RS offset  | slots | 20 for CSI-RS resource 1 and 2<br>21 for CSI-RS resource 3 and 4               |
| EPRE ratio to SSS  | dB    | 0 <sup>Note 2</sup>  |
| TCI state  |       | TCI.State.0  |
| Note 1: BW of TRS is configured same as the BW size of UE active BWP in the RRM test cases |       |  |
| Note 2: Unless otherwise specified in the test case  |       |  |

### A.3.17.1.2 TDD

**Table A.3.17.1.2-1: CSI-RS for tracking for SCS=15kHz**

| Parameter  | Unit  | Value  |
|--|-------|--|
| <b>Reference channel</b>   |       | TRS.1.1 TDD  |
| Bandwidth  |       | BW of Active BWP <sup>Note 1</sup>   |

| Note 2: Unless otherwise specified in the test case   |    |                     |
| Note 3: If active BWP is larger than 52RBs, BW of TRS is configured as 52RBs. Otherwise, same as active BWP size. |    |                     |

## A.3.18 Additional definitions related to OTA testing for FR2 RRM test cases

### A.3.18.1 Introduction

FR2 RRM test cases are performed over the air (OTA). This clause provides additional definitions and clarifications on the OTA measurements and metrics defined or referred in the test cases.

### A.3.18.2 PRACH Power Measurement

PRACH power is measured as EIRP(Link=Link angle, Meas=Link angle) as defined in clause 3.1 of TS 38.101-2 [19].

---

## A.4 EN-DC tests with all NR cells in FR1

### A.4.1 Void

### A.4.2 Void

### A.4.3 RRC\_CONNECTED state mobility

#### A.4.3.1 Void

#### A.4.3.2 RRC Connection Mobility Control

##### A.4.3.2.1 Void

##### A.4.3.2.2 Random Access

###### A.4.3.2.2.1 Contention based random access test in FR1 for PSCell in EN-DC

###### A.4.3.2.2.1.1 Test Purpose and Environment

The purpose of this test is to verify that the behavior of the random access procedure is according to the requirements and that the PRACH power settings and timing are within specified limits. This test will verify the requirements in clause 6.2.2.2 and clause 7.1.2 in an AWGN model.

For this test two cells are used, with the configuration of Cell 1 (E-UTRA PCell) specified in clause A.3.7.2.1 and Cell 2 configured as PSCell in FR1. Supported test parameters are shown in Table A.4.3.2.2.1.1-1. UE capable of EN-DC with PSCell in FR1 needs to be tested by using the parameters in Table A.4.3.2.2.1.1-2.

**Table A.4.3.2.2.1.1-1: Supported test configurations for contention based random access test in FR1 for PSCell in EN-DC**

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode   |
| 2      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode   |
| 3      | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode   |
| 4      | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode   |
| Note:  | The UE is only required to be tested in one of the supported test configurations depending on UE capability |

**Table A.4.3.2.2.1.1-2: General test parameters for contention based random access test in FR1 for PSCell in EN-DC**

| Parameter                           | Unit                 | Test-1               | Comments               |  |
|-------------------------------------|----------------------|----------------------|------------------------|--|

| <p>Note 1: OCNG shall be used such that the cell is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. The OCNG pattern is chosen during the test according to the presence of a DL reference measurement channel.</p> <p>Note 2: SS-RSRP, Es/I<sub>0</sub> and I<sub>0</sub> levels have been derived from other parameters for information purpose. They are not settable parameters.</p> <p>Note 3: Void</p> <p>Note 4: The DL PDSCH reference measurement channel is used in the test only when a downlink transmission dedicated to the UE under test is required.</p> |            |          |                           |  |

#### A.4.3.2.2.1.2 Test Requirements

Contention based random access is triggered by *not* explicitly assigning a random access preamble via dedicated signalling in the downlink.

##### A.4.3.2.2.1.2.1 Random Access Preamble Transmission

To test the UE behavior specified in Clause 6.2.2.2.1.1 the System Simulator shall receive the Random Access Preamble which belongs to one of the Random Access Preambles associated with the SSB with index 0, which has SS-RSRP above the configured *rsrp-ThresholdSSB*.

In addition, the power applied to all preambles shall be in accordance with what is specified in Clause 6.2.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.4.2 of TS 38.101-1 [18]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.4.3 of TS 38.101-1 [18].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Clause 7.1.2.

##### A.4.3.2.2.1.2.2 Random Access Response Reception

To test the UE behavior specified in Clause 6.2.2.2.1.2 the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator. In response to the first 4 preambles, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

The UE may stop monitoring for Random Access Response(s) and shall transmit the msg3 if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall again perform the Random Access Resource selection procedure specified in clause 5.1.2 in TS38.321 [7], and transmit with the calculated PRACH transmission power when the backoff time expires if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in Clause 6.2.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.4.2 of TS 38.101-1 [18]. The

relative power applied to additional preambles shall have an accuracy specified in clause 6.3.4.3 of TS 38.101-1 [18].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Clause 7.1.2.

#### A.4.3.2.2.1.2.3 No Random Access Response Reception

To test the UE behavior specified in clause 6.2.2.2.1.3 the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator. The System Simulator shall *not* respond to the first 4 preambles.

The UE shall again perform the Random Access Resource selection procedure specified in clause 5.1.2 in TS38.321 [7], and transmit with the calculated PRACH transmission power when the backoff time expires if no Random Access Response is received within the RA Response window.

In addition, the power applied to all preambles shall be in accordance with what is specified in Clause 6.2.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.4.2 of TS 38.101-1 [18]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.4.3 of TS 38.101-1 [18].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Clause 7.1.2.

#### A.4.3.2.2.1.2.4 Receiving an UL grant for msg3 retransmission

To test the UE behavior specified in clause 6.2.2.2.1.4, the System Simulator shall provide an UL grant for msg3 retransmission following a successful Random Access Response.

The UE shall re-transmit the msg3 upon the reception of an UL grant for msg3 retransmission..

A.4.3.2.2.1.2.5 void

A.4.3.2.2.1.2.6 void

#### A.4.3.2.2.1.2.7 Contention Resolution Timer expiry

To test the UE behavior specified in Clause 6.2.2.2.1.6 the System Simulator shall *not* send a response to a msg3.

The UE shall again perform the Random Access Resource selection procedure specified in clause 5.1.2 in TS38.321 [7], and transmit with the calculated PRACH transmission power when the backoff time expires if the Contention Resolution Timer expires.

### A.4.3.2.2.2 Non-contention based random access test in FR1 for PSCell in EN-DC

#### A.4.3.2.2.2.1 Test Purpose and Environment

The purpose of this test is to verify that the behavior of the random access procedure is according to the requirements and that the PRACH power settings and timing are within specified limits. This test will verify the requirements in clause 6.2.2.2 and clause 7.1.2 in an AWGN model.

For this test two cells are used, with the configuration of Cell 1 (E-UTRA PCell) specified in clause A.3.7.2.1 and Cell 2 configured as PCell in FR1. Supported test parameters are shown in Table A.4.3.2.2.1-1. UE capable of EN-DC with PCell in FR1 needs to be tested by using the parameters in Table A.4.3.2.2.1-2 for SSB-based non-contention based random access test (Test 1) and CSI-RS-based non-contention based random access test (Test 2). Test 2 is only applicable to UE which supports csi-RSRP-AndRSRQ-MeasWithSSB or csi-RSRP-AndRSRQ-MeasWithoutSSB.

**Table A.4.3.2.2.1-1: Supported test configurations for non-contention based random access test in FR1 for PCell in EN-DC**

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode   |
| 2      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode   |
| 3      | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode   |
| 4      | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode   |
| Note:  | The UE is only required to be tested in one of the supported test configurations depending on UE capability |

**Table A.4.3.2.2.1-2: General test parameters for non-contention based random access test in FR1 for PCell in EN-DC**

| Parameter                           |                      | Unit       | Test-1               | Test-2               | Comments               |

#### A.4.3.2.2.2.2 Test Requirements

Non-Contention based random access is triggered by explicitly assigning a random access preamble via dedicated signalling in the downlink. In the test, the non-contention based random access procedure is not initialized for Other SI requested from UE or beam failure recovery.

##### A.4.3.2.2.2.2.1 SSB-based Random Access Preamble Transmission

In Test-1, to test the UE behavior specified in Clause 6.2.2.2.1 for SSB-based Random Access Preamble transmission, with the contention-free Random Access Resources and the contention-free PRACH occasions associated with SSBs configured, the System Simulator shall receive the Random Access Preamble which has the Preamble Index associated with the SSB with index 0.

In addition, the System Simulator shall receive the Random Access Preamble on the PRACH occasion which belongs to the PRACH occasions corresponding to the SSB with index 0, and the selected PRACH occasion shall belong to the PRACH occasions permitted by the restrictions given by the *ra-ssb-OccasionMaskIndex*.

In addition, the power applied to all preambles shall be in accordance with what is specified in Clause 6.2.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.4.2 of TS 38.101-1 [18]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.4.3 of TS 38.101-1 [18].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Clause 7.1.2.

##### A.4.3.2.2.2.2.2 CSI-RS-based Random Access Preamble Transmission

In Test-2, to test the UE behavior specified in Clause 6.2.2.2.1 for CSI-RS-based Random Access Preamble transmission, with the contention-free Random Access Resources and the contention-free PRACH occasions

associated with CSI-RSs configured, the System Simulator shall receive the Random Access Preamble which has the Preamble Index associated with the CSI-RS configured.

In addition, the System Simulator shall receive the Random Access Preamble on the PRACH occasion which belongs to the PRACH occasions corresponding to the CSI-RS configured, and the selected PRACH occasion shall belong to the PRACH occasions permitted by the restrictions given by the *ra-OccasionList*.

In addition, the power applied to all preambles shall be in accordance with what is specified in Clause 6.2.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.4.2 of TS 38.101-1 [18]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.4.3 of TS 38.101-1 [18].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Clause 7.1.2.

#### A.4.3.2.2.2.3 Random Access Response Reception

To test the UE behavior specified in Clause 6.2.2.2.2 the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator. In response to the first 4 preambles, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

The UE may stop monitoring for Random Access Response(s) if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall again perform the Random Access Resource selection procedure specified in clause 5.1.2 in TS38.321 [7], and transmit with the calculated PRACH transmission power if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in Clause 6.2.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.4.2 of TS 38.101-1 [18]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.4.3 of TS 38.101-1 [18].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Clause 7.1.2.

#### A.4.3.2.2.2.4 No Random Access Response Reception

To test the UE behavior specified in clause 6.2.2.2.2.3 the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator. The System Simulator shall *not* respond to the first 4 preambles.

The UE shall again perform the Random Access Resource selection procedure specified in clause 5.1.2 in TS38.321 [7], and transmit with the calculated PRACH transmission power when the backoff time expires if no Random Access Response is received within the RA Response window configured in *RACH-ConfigCommon*.

In addition, the power applied to all preambles shall be in accordance with what is specified in Clause 6.2.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.4.2 of TS 38.101-1 [18]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.4.3 of TS 38.101-1 [18].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Clause 7.1.2.

## A.4.3.2.3 Void

## A.4.4 Timing

## A.4.4.1 UE transmit timing

## A.4.4.1.1 NR UE Transmit Timing Test for FR1

## A.4.4.1.1.1 Test Purpose and environment

The purpose of this test is to verify that the UE can follow frame timing change of the connected gNodeB and that the UE initial transmit timing accuracy, maximum amount of timing change in one adjustment, minimum and maximum adjustment rate are within the specified limits. This test will verify the requirements in clause 7.1.2. Supported test configurations are shown in Table 4.4.1.1.1-1.

Table A.4.4.1.1.1-1: Supported test configurations for FR1 PSCell

| Configuration | Description  |
|---------------|--|
| 1             | LTE FDD, NR FDD, SSB SCS 15 kHz, data SCS 15 kHz, BW 10 MHz                      |
| 2             | LTE FDD, NR TDD, SSB SCS 15 kHz, data SCS 15 kHz, BW 10 MHz                      |
| 3             | LTE FDD, NR TDD, SSB SCS 30 kHz, data SCS 30 kHz, BW 40 MHz                      |
| 4             | LTE TDD, NR FDD, SSB SCS 15 kHz, data SCS 15 kHz, BW 10 MHz                      |
| 5             | LTE TDD, NR TDD, SSB SCS 15 kHz, data SCS 15 kHz, BW 10 MHz                      |
| 6             | LTE TDD, NR TDD, SSB SCS 30 kHz, data SCS 30 kHz, BW 40 MHz                      |
| Note:         | The UE is only required to be tested in one of the supported test configurations |

The test consists of E-UTRA PCell and NR PSCell. The configuration for E-UTRA is given in A.3.7.2.1. Table A.4.4.1.1.1-2 defines the parameters to be configured and strength of the transmitted signals. The transmit timing is verified by the UE transmitting SRS using the configuration defined in Table A.4.4.1.1.1-3.

Table A.4.4.1.1.1-2: Cell Specific Test Parameters for UL Transmit Timing test

| Parameter                           | Unit | Config      | Test1                       | Test2                  | Band Group |

|---------|--|
| Note 1: | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.  |
| Note 2: | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |
| Note 3: | SS-RSRP and $I_0$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.  |
| Note 4: | SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.  |
| Note 5: | DRx related parameters are given in Table A.3.3.8-1  |
| Note 6: | SRS configs are given in Table A.4.4.1.1-3   |

**Table A.4.4.1.1-3: SRS Configuration for Timing Accuracy Test**

#### A.4.4.1.1.2 Test requirements

The test sequence shall be carried out in RRC\_CONNECTED for every test case.

Following will be the test sequence for this test

- 1) Set up E-UTRA PCell according to parameters given in Table A.3.7.2.1-1 and setup NR PSCell according to parameters given in Table A.4.4.1.1.1-1.
- 2) After connection set up with the cell, the test equipment will verify that the timing of the NR cell is within  $(N_{TA} + N_{TA\_offset}) \times T_c \pm T_e$  of the first detected path of DL SSB.
  - a. The  $N_{TA}$  offset value (in  $T_c$  units) is 25600
  - b. The  $T_e$  values depend on the DL and UL SCS for which the test is being run and are given in Table 7.1.2-1
- 3) The test system shall adjust the timing of the DL path by values given in Table A.4.4.1.1.2-1

**Table A.4.4.1.1.2-1: Adjustment Value for DL Timing**

| SCS of SSB signals (kHz) | Adjustment Value     |                      |
|--------------------------|----------------------|----------------------|
|                          | Test1                | Test2                |
| 15                       | +64*64T <sub>c</sub> | +32*64T <sub>c</sub> |
| 30                       | +32*64T <sub>c</sub> | +16*64T <sub>c</sub> |

- 4) The test system shall verify that the adjustment step size and the adjustment rate shall be according to requirements specified in Clause 7.1.2 Table 7.1.2.1-1 until the UE transmit timing offset is within  $(N_{TA} + N_{TA\_offset}) \times T_c \pm T_e$  respective to the first detected path (in time) of DL SSB. Skip this step for test 2 with DRX configured.
- 5) The test system shall verify that the UE transmit timing offset stays within  $(N_{TA} + N_{TA\_offset}) \times T_c \pm T_e$  of the first detected path of DL SSB. For Test 2 the UE transmit timing offset shall be verified for the first transmission in the DRX cycle immediately after DL timing adjustment.

## A.4.4.2 UE timer accuracy

### A.4.4.3 Timing advance

#### A.4.4.3.1 EN-DC FR1 timing advance adjustment accuracy

##### A.4.4.3.1.1 Test Purpose and Environment

The purpose of the test is to verify UE Timing Advance adjustment delay and accuracy requirement defined in clause 7.3.

##### A.4.4.3.1.2 Test Parameters

Supported test configurations are shown in table A.4.4.3.1.2-1. Both timing advance adjustment delay and accuracy are tested by using the parameters in table A.4.4.3.1.2-2, A.4.4.3.1.2-3 and A.4.4.3.1.2-4. The configuration of Cell 1 (LTE PCell) is specified in clause A.3.7.2.1.

In all test cases, two cells are used. Cell 1 is the PCell in the primary Timing Advance Group (pTAG) and cell 2 is the PSCell in the secondary Timing Advance Group (sTAG). Each test consists of two successive time periods, with time duration of T1 and T2 respectively. In each time period, timing advance commands for sTAG are sent to the UE and Sounding Reference Signals (SRS), as specified in table A.4.4.3.1.2-3, are sent from the UE and received by the test equipment. By measuring the reception of the SRS, the transmit timing, and hence the timing advance adjustment accuracy, can be measured for PSCell in sTAG.

During time period T1, the test equipment shall send one message with a Timing Advance Command MAC Control Element for sTAG, as specified in clause 6.1.3.4 in TS 38.321 [7]. The Timing Advance Command value shall be set to 31, which according to clause 4.2 in TS 38.213 [3] results in zero adjustment of the Timing Advance. In this way, a reference value for the timing advance for sTAG used by the UE is established.

During time period T2, the test equipment shall send a sequence of messages with Timing Advance Command MAC Control Elements for sTAG, with Timing Advance Command value specified in table A.4.4.3.1.2-2. This value shall result in changes of the timing advance for sTAG used by the UE, and the accuracy of the change shall then be measured, using the SRS sent from the UE.

As specified in clause 7.3.2.1, the UE adjusts its uplink timing at slot  $n+k$  for a timing advance command received in slot  $n$ . This delay must be taken into account when measuring the timing advance adjustment accuracy, via the SRS sent from the UE.

The UE Time Alignment Timer, described in clause 5.2 in TS 38.321, shall be configured so that it does not expire in the duration of the test.

**Table A.4.4.3.1.2-1: Timing advance supported test configurations**

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3      | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6      | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |

Note: The UE is only required to be tested in one of the supported test configurations

**Table A.4.4.3.1.2-2: General test parameters for timing advance**

| Parameter  | Unit | Value                  | Comment  |
|--|------|------------------------|--|
| RF channel number                                |      | Cell 1: 1<br>Cell 2: 2 | 1 for E-UTRAN PCell<br>2 for NR PSCell   |

### A.4.4.3.1.3 Test Requirements

The UE shall apply the signalled Timing Advance value for PSCell in sTAG to the transmission timing at the designated activation time i.e.  $k+l$  slots after the reception of the timing advance command, where  $k=5$ .

The Timing Advance adjustment accuracy for PSCell in sTAG shall be within the limits specified in clause 7.3.2.2.

The rate of correct Timing Advance adjustments observed during repeated tests shall be at least 90%.

## A.4.5 Signaling characteristics

### A.4.5.1 Radio link Monitoring

In the following clause, any uplink signal transmitted by the UE is used for detecting the In-/Out-of-Sync state of the UE. In terms of measurement, the uplink signal is verified on the basis of the UE output power:

For intra-band contiguous carrier aggregation, transmit OFF power is measured as the mean power per component carrier.

For UE with multiple transmit antennas, transmit OFF power is measured as the mean power at each transmit connector.

- UE output power higher than Transmit OFF power -50 dBm (as defined in TS 38.101-3 [20]) means uplink signal
- UE output power equal to or less than Transmit OFF power -50 dBm (as defined in TS 38.101-3 [20]) means no uplink signal.

#### A.4.5.1.1 Radio Link Monitoring Out-of-sync Test for FR1 PSCell configured with SSB-based RLM RS in non-DRX mode

##### A.4.5.1.1.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the out of sync and in sync for the purpose of monitoring downlink radio link quality of the PSCell. This test will partly verify the FR1 PSCell radio link monitoring requirements in clause 8.1.

In the test, UE is configured to perform RLM on SSB, with *detectionResource* included in *RadioLinkMonitoringRS* set to SSB#0, and *purpose* set to 'rlf'. Supported test configurations are shown in table A.4.5.1.1.1-1. The test parameters are given in Tables A.4.5.1.1.1-2, A.4.5.1.1.1-3, and A.4.5.1.1.1-4 below. There are two cells, Cell 1 is the E-UTRAN PCell, and Cell 2 is the PSCell, in the test. The E-UTRAN PCell setting refers to Table A.3.7.2.1-1. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Figure A.4.5.1.1.1-1 shows the variation of the downlink SNR in the active Cell 2 to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1 and Cell 2. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. The UE is configured to perform inter-frequency measurements using Gap Pattern ID #0 (40ms) in test 1.

**Table A.4.5.1.1.1-1: Supported test configurations for FR1 PSCell**

| Configuration  | Description   |
|--|---|
| 1  | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2  | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3  | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4  | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5  | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6  | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| Note: The UE is only required to pass in one of the supported test configurations in FR1 |   |

**Table A.4.5.1.1.1-2: General test parameters for FR1 out-of-sync testing in non-DRX mode**

| Parameter                    |                         | Unit | Value                       |

| Note 1: OCNG shall be used such that the resources in Cell 2 are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. |             |        |                   |    |     |
| Note 2: The signal contains PDCCH for UEs other than the device under test as part of OCNG.  |             |        |                   |    |     |
| Note 3: SNR levels correspond to the signal to noise ratio over the SSS REs.   |             |        |                   |    |     |

**Table A.4.5.1.1.1-4: Measurement gap configuration for out-of-sync tests in non-DRX mode**

| Field     | Test 1 |
|-----------|--------|
|           | Value  |
| gapOffset | 0      |

Note 1: E-UTRAN PCell and PSCell are SFN-synchronous and frame boundary aligned. (Ensure that RLM RS is partially overlapped with measurement gap).

Figure A.4.5.1.1.1-1: SNR variation for out-of-sync testing

#### A.4.5.1.1.2 Test Requirements

The UE behaviour in each test during time durations T1, T2 and T3 shall be as follows:

During the period from time point A to time point B the UE shall transmit uplink signal at least in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting.

The UE shall stop transmitting uplink signal in Cell 2 no later than time point C (D1 second after the start of the time duration T3).

The rate of correct events observed during repeated tests shall be at least 90%.

#### A.4.5.1.2 Radio Link Monitoring In-sync Test for FR1 PSCell configured with SSB-based RLM RS in non-DRX mode

##### A.4.5.1.2.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the out of sync and in sync for the purpose of monitoring downlink radio link quality of the PSCell. This test will partly verify the FR1 PSCell radio link monitoring requirements in clause 8.1.

In the test, UE is configured to perform RLM on SSB, with *detectionResource* included in *RadioLinkMonitoringRS* set to SSB#0, and *purpose* set to 'rlf'. Supported test configurations are shown in table A.4.5.1.2.1-1. The test parameters are given in Tables A.4.5.1.2.1-2, and A.4.5.1.2.1-3 below. There are two cells, Cell 1 is the E-UTRAN PCell, and Cell 2 is the PSCell, in the test. The E-UTRAN PCell setting refers to Table A.3.7.2.1-1. The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.4.5.1.2.1-1 shows the variation of the downlink SNR in the active Cell 2 to emulate out-of-sync and in-sync states. Prior to the

start of the time duration T1, the UE shall be fully synchronized to Cell 1 and Cell 2. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms.

**Table A.4.5.1.2.1-1: Supported test configurations for FR1 PSCell**

| Configuration | Description  |
|---------------|--|
| 1             | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                      |
| 2             | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode                      |
| 3             | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode                      |
| 4             | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                      |
| 5             | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode                      |
| 6             | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode                      |
| Note:         | The UE is only required to pass in one of the supported test configurations in FR1 |

**Table A.4.5.1.2.1-2: General test parameters for FR1 in-sync testing in non-DRX mode**

| Parameter                           |                         | Unit | Value                       |
|-------------------------------------|-------------------------|------|-----------------------------|
|                                     |                         |      | <b>Test 1</b>               |

| Note 4: The SNR in time periods T1, T2, T3, T4 and T5 is denoted as SNR1, SNR2, SNR3, SNR4 and SNR5 respectively in Figure A.4.5.1.2.1-1.  |             |            |                   |    |     |      |    |
| Note 5: The SNR values are specified for testing a UE which supports 2RX on at least one band. For testing of a UE which supports 4RX on all bands, the SNR during T3 and T4 is modified as specified in clause A.3.6. |             |            |                   |    |     |      |    |

Table A.4.5.1.2.1-4: Void

Figure A.4.5.1.2.1-1: SNR variation for in-sync testing

#### A.4.5.1.2.2 Test Requirements

The UE behaviour in each test during time durations T1, T2, T3, T4 and T5 shall be as follows:

During the period from time point A to time point F (D1 second after the start of time duration T5) the UE shall transmit uplink signal at least in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting.

The rate of correct events observed during repeated tests shall be at least 90%.

#### A.4.5.1.3 Radio Link Monitoring Out-of-sync Test for FR1 PSCell configured with SSB-based RLM RS in DRX mode

##### A.4.5.1.3.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the out of sync and in sync for the purpose of monitoring downlink radio link quality of the PSCell when DRX is used. This test will partly verify the FR1 radio link monitoring requirements in clause 8.1.

In the test, UE is configured to perform RLM on SSB, with *detectionResource* included in *RadioLinkMonitoringRS* set to SSB#0, and *purpose* set to 'rlf'. Supported test configurations are shown in table A.4.5.1.3.1-1. The test parameters are given in Tables A.4.5.1.3.1-2 and A.4.5.1.3.1-3. There are two cells, Cell 1 is the E-UTRAN PCell, and Cell 2 is the PSCell, in the test. The E-UTRAN PCell setting refers to Table A.3.7.2.1-1. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Figure A.4.5.1.3.1-1 shows the variation of the downlink SNR in the active Cell 2 to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1 and Cell 2. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is enabled and DRX inactivity timer has already been expired, i.e. UE tries to decode PDCCH and to send periodic CSI during the period when On-

duration timer is running. Time alignment timers shall be set to “infinity” so that UL timing alignment is maintained during the test.

**Table A.4.5.1.3.1-1: Supported test configurations for FR1 PSCell**

| Configuration | Description  |
|---------------|--|
| 1             | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                      |
| 2             | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode                      |
| 3             | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode                      |
| 4             | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                      |
| 5             | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode                      |
| 6             | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode                      |
| Note:         | The UE is only required to pass in one of the supported test configurations in FR1 |

**Table A.4.5.1.3.1-5: Void**

**Figure A.4.5.1.3.1-1: SNR variation for out-of-sync testing**

**A.4.5.1.3.2 Test Requirements**

The UE behaviour in each test during time durations T1, T2 and T3 shall be as follows:

During the period from time point A to time point B the UE shall transmit uplink signal at least in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting.

The UE shall stop transmitting uplink signal in Cell 2 no later than time point C (D1 second after the start of the time duration T3).

The rate of correct events observed during repeated tests shall be at least 90%.

#### A.4.5.1.4 Radio Link Monitoring In-sync Test for FR1 PSCell configured with SSB-based RLM RS in DRX mode

##### A.4.5.1.4.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the out of sync and in sync for the purpose of monitoring downlink radio link quality of the PSCell when DRX is used. This test will partly verify the FR1 radio link monitoring requirements in clause 8.1.

In the test, UE is configured to perform RLM on SSB, with *detectionResource* included in *RadioLinkMonitoringRS* set to SSB#0, and *purpose* set to 'rlf'. Supported test configurations are shown in table A.4.5.1.4.1-1. The test parameters are given in Tables A.4.5.1.4.1-2, and A.4.5.1.4.1-3. There are two cells, Cell 1 is the E-UTRAN PCell, and Cell 2 is the PSCell, in the test. The E-UTRAN PCell setting refers to Table A.3.7.2.1-1. The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.4.5.1.4.1-1 shows the variation of the downlink SNR in the active Cell 2 to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1 and Cell 2. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is enabled and DRX inactivity timer has already been expired, i.e. UE tries to decode PDCCH and to send periodic CSI during the period when On-duration timer is running. Time alignment timers shall be set to "infinity" so that UL timing alignment is maintained during the test.

| EPRE ratio of PBCH DMRS to SSS   | dB          | 0                 |     |    |     |      |   |
| EPRE ratio of PBCH to PBCH DMRS  | dB          |                   |     |    |     |      |   |
| EPRE ratio of PSS to SSS   | dB          |                   |     |    |     |      |   |
| EPRE ratio of PDSCH DMRS to SSS  | dB          |                   |     |    |     |      |   |
| EPRE ratio of PDSCH to PDSCH DMRS  | dB          |                   |     |    |     |      |   |
| EPRE ratio of OCNG DMRS to SSS   | dB          |                   |     |    |     |      |   |
| EPRE ratio of OCNG to OCNG DMRS  | dB          |                   |     |    |     |      |   |
| SNR on RLM-RS  | Config 1, 4 | dB                | 1   | -7 | -15 | -4.5 | 1 |
|  | Config 2, 5 |                   | 1   | -7 | -15 | -4.5 | 1 |
|  | Config 3, 6 |                   | 1   | -7 | -15 | -4.5 | 1 |
| $N_{oc}$   | Config 1, 4 | dBm/15 kHz        | -98 |    |     |      |   |
|  | Config 2, 5 |                   | -98 |    |     |      |   |
|  | Config 3, 6 |                   | -98 |    |     |      |   |
| $N_{oc}$   | Config 1, 4 | dBm/SCS           | -98 |    |     |      |   |
|  | Config 2, 5 |                   | -98 |    |     |      |   |
|  | Config 3, 6 |                   | -95 |    |     |      |   |
| Propagation condition  |             | TDL-C 300ns 100Hz |     |    |     |      |   |
| Note 1: OCNG shall be used such that the resources in Cell 2 are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.   |             |                   |     |    |     |      |   |
| Note 2: The signal contains PDCCH for UEs other than the device under test as part of OCNG.  |             |                   |     |    |     |      |   |
| Note 3: SNR levels correspond to the signal to noise ratio over the SSS REs.   |             |                   |     |    |     |      |   |
| Note 4: The SNR in time periods T1, T2, T3, T4 and T5 is denoted as SNR1, SNR2, SNR3, SNR4 and SNR5 respectively in Figure A.4.5.1.4.1-1.  |             |                   |     |    |     |      |   |
| Note 5: The SNR values are specified for testing a UE which supports 2RX on at least one band. For testing of a UE which supports 4RX on all bands, the SNR during T3 and T4 is modified as specified in clause A.3.6. |             |                   |     |    |     |      |   |

**Table A.4.5.1.4.1-4: Void****Table A.4.5.1.4.1-5: Void****Figure A.4.5.1.4.1-1: SNR variation for in-sync testing**

#### A.4.5.1.4.2 Test Requirements

The UE behaviour in each test during time durations T1, T2, T3, T4 and T5 shall be as follows:

During the period from time point A to time point F ( $D1$  second after the start of time duration T5) the UE shall transmit uplink signal at least in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting.

The rate of correct events observed during repeated tests shall be at least 90%.

#### A.4.5.1.5 EN-DC Radio Link Monitoring Out-of-sync Test for FR1 PSCell configured with CSI-RS-based RLM in non-DRX mode

##### A.4.5.1.5.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the out of sync for the purpose of monitoring downlink CSI-RS based radio link quality of the PSCell when no DRX is used. This test will partly verify the FR1 PSCell CSI-RS Out-of-sync radio link monitoring requirements in clause 8.1.

The test parameters are given in Tables A.4.5.1.5.1-1, A.4.5.1.5.1-2, A.4.5.1.5.1-3, and A.4.5.1.5.1-3A below. There are two cells, cell 1 is the E-UTRAN PCell, and cell 2 is the PSCell, in the test. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Figure A.4.5.1.5.1-1 shows the variation of the downlink SNR in the E-UTRAN PCell and the PSCell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to cell 1 and cell 2. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5ms. In the test, DRX configuration is not enabled. The UE is

configured to perform inter-frequency measurements using GP ID #0 (40ms). In the test, SSB0 is configured as the BFD-RS.

**Table A.4.5.1.5.1-1: Supported test configurations for FR1 PSCell**

| Configuration | Description  |
|---------------|--|
| 1             | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                      |
| 2             | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode                      |
| 3             | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode                      |
| 4             | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                      |
| 5             | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode                      |
| 6             | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode                      |
| Note:         | The UE is only required to pass in one of the supported test configurations in FR1 |

| Field  | Test 1 |
|--|--------|
|  | Value  |
| gapOffset  | 0      |
| Note 1: E-UTRAN PCell and PSCell are SFN-synchronous and frame boundary aligned. |        |

**Table A.4.5.1.5.1-4: Void**

**Figure A.4.5.1.5.1-1: SNR variation for CSI-RS out-of-sync testing**

**A.4.5.1.5.2 Test Requirements**

The UE behaviour during time durations T1, T2, and T3 shall be as follows:

During the period from time point A to time point B the UE shall transmit uplink signal in Cell 2 (PSCell) at least in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting for Cell 2.

The UE shall stop transmitting uplink signal in Cell 2 (PSCell) no later than time point C ( $D_1$  after the start of the time duration T3) on the PSCell.

The rate of correct events observed during repeated tests shall be at least 90%.

**A.4.5.1.6 EN-DC Radio Link Monitoring In-sync Test for FR1 PSCell configured with CSI-RS-based RLM in non-DRX mode**

**A.4.5.1.6.1 Test Purpose and Environment**

The purpose of this test is to verify that the UE properly detects the in sync for the purpose of monitoring downlink CSI-RS based radio link quality of the PSCell when no DRX is used. This test will partly verify the FR1 PSCell CSI-RS In-sync radio link monitoring requirements in clause 8.1.

The test parameters are given in Tables A.4.5.1.6.1-1, A.4.5.1.6.1-2, and A.4.5.1.6.1-3 below. There are two cells, cell 1 which is the E-UTRAN PCell, and cell 2 is the PSCell, in the test. The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.4.5.1.6.1-1 shows the variation of the downlink SNR in the PSCell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to cell 1 and cell 2. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5ms. In the test, DRX configuration is not enabled. In the test, SSB0 is configured as the BFD-RS.

**Table A.4.5.1.6.1-1: Supported test configurations for FR1 PSCell**

| Configuration | Description   |
|---------------|---|
| 1             | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |

|  |   |
|--|---|
| 2  | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3  | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4  | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5  | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6  | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| Note: The UE is only required to pass in one of the supported test configurations in FR1 |   |

**Table A.4.5.1.6.1-2: General test parameters for FR1 PSCell for CSI-RS in-sync testing in non-DRX mode**

| Parameter                                    |                                | Unit | Value                      |

For testing of a UE which supports 4RX on all bands, the SNR during T3 is specified in section A.3.6.1.1.</p> |             |                   |     |    |     |      |   |

Table A.4.5.1.6.1-3A: Void

Table A.4.5.1.6.1-4: Void

Figure A.4.5.1.6.1-1: SNR variation for CSI-RS in-sync testing

#### A.4.5.1.6.2 Test Requirements

The UE behaviour in each test during time durations T1, T2, T3, T4 and T5 shall be as follows:

During the period from time point A to time point F (T6 second after the start of time duration T5) the UE shall transmit uplink signal at least in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting on the PSCell.

The rate of correct events observed during repeated tests shall be at least 90%.

#### A.4.5.1.7 EN-DC Radio Link Monitoring Out-of-sync Test for FR1 PSCell configured with CSI-RS-based RLM in DRX mode

##### A.4.5.1.7.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the out of sync for the purpose of monitoring downlink CSI-RS based radio link quality of the PSCell when no DRX is used. This test will partly verify the FR1 PSCell CSI-RS Out-of-sync radio link monitoring requirements in clause 8.1.

The test parameters are given in Tables A.4.5.1.7.1-1, A.4.5.1.7.1-2, and A.4.5.1.7.1-3 below. There are two cells, cell 1 is the E-UTRAN PCell, and cell 2 is the PSCell, in the test. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Figure A.4.5.1.7.1-1 shows the variation of the downlink SNR in the E-UTRAN PCell and the PSCell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to cell 1 and cell 2. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5ms. In the test, DRX configuration is enabled in PSCell and DRX inactivity timer has already been expired, i.e. UE tries to decode PDCCH and to send periodic CQI during the period when On-duration timer is running. Time alignment timers shall be set to “infinity” so that UL timing alignment is maintained during the test. In the test, SSB0 is configured as the BFD-RS.

**Table A.4.5.1.7.1-1: Supported test configurations for FR1 PSCell**

| Configuration  | Description   |
|--|---|
| 1  | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2  | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3  | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4  | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5  | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6  | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| Note: The UE is only required to pass in one of the supported test configurations in FR1 |   |

**Table A.4.5.1.7.1-2: General test parameters for FR1 PSCell for CSI-RS out-of-sync testing in DRX mode**

| Parameter                | Unit              | Value          |
|--------------------------|-------------------|----------------|
|                          |                   | Test 1         |
| Active E-UTRA PCell      |                   | Cell 1         |
| E-UTRA RF Channel Number |                   | 1              |
| Active PSCell            |                   | Cell 2         |

**Figure A.4.5.1.7.1-1: SNR variation for CSI-RS out-of-sync testing**

#### A.4.5.1.7.2 Test Requirements

The UE behaviour during time durations T1, T2, and T3 shall be as follows:

During the period from time point A to time point B the UE shall transmit uplink signal in Cell 2 (PSCell) at least in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting for Cell 2.

The UE shall stop transmitting uplink signal in Cell 2 (PSCell) no later than time point C ( $D_1$  after the start of the time duration T3) on the PSCell.

The rate of correct events observed during repeated tests shall be at least 90%.

#### A.4.5.1.8 EN-DC Radio Link Monitoring In-sync Test for FR1 PSCell configured with CSI-RS-based RLM in DRX mode

##### A.4.5.1.8.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the in sync for the purpose of monitoring downlink CSI-RS based radio link quality of the PSCell when no DRX is used. This test will partly verify the FR1 PSCell CSI-RS In-sync radio link monitoring requirements in clause 8.1.

The test parameters are given in Tables A.4.5.1.8.1-1, A.4.5.1.8.1-2, A.4.5.1.8.1-3 and A.4.5.1.8.1-3A below. There are two cells, cell 1 which is the E-UTRAN PCell, and cell 2 is the NR PSCell, in the test. The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.4.5.1.8.1-1 shows the

variation of the downlink SNR in the PSCell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to cell 1 and cell 2. The UE shall be configured for periodic CSI reporting with a reporting periodicity defined in CSI-RS configuration. In the test, DRX configuration is not enabled. The UE is configured to perform inter-frequency measurements using GP ID #0 (40ms). In the test, SSB0 is configured as the BFD-RS.

**Table A.4.5.1.8.1-1: Supported test configurations for FR1 PSCell**

| Configuration | Description   |
|---------------|---|
| 1             | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2             | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3             | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4             | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5             | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6             | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |

Note: The UE is only required to pass in one of the supported test configurations in FR1

**Table A.4.5.1.8.1-2: General test parameters for FR1 PSCell for CSI-RS in-sync testing in DRX mode**

| Parameter                           | Unit                    | Value          |

### A.4.5.1.8.2 Test Requirements

The UE behaviour in each test during time durations T1, T2, T3, T4 and T5 shall be as follows:

During the period from time point A to time point F (T6 second after the start of time duration T5) the UE shall transmit uplink signal at least in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting on the PSCell.

The rate of correct events observed during repeated tests shall be at least 90%.

## A.4.5.2 Interruption

### A.4.5.2.1 E-UTRAN – NR FR1 interruptions at transitions between active and non-active during DRX in synchronous EN-DC

#### A.4.5.2.1.1 Test Purpose and Environment

The purpose of this test is to verify that when LTE PCell is in DRX and NR PSCell is in non-DRX, NR PSCell interruptions due to transitions from active to non-active and from non-active to active during LTE PCell DRX the UE missed ACK/NACK does not exceed the limits. This test will verify the missed ACK/NACK rate for NR PSCell in EN-DC specified in TS38.133 clause 8. 2.1.2. Supported test configurations are shown in table A.4.5.2.1.1-1.

The general test parameters and NR cell specific test parameters are given in Table A.4.5.2.1.1-2 and A.4.5.2.1.1-3. The E-UTRAN PCell DRX configuration parameters are given in Table A.4.5.2.1.1-4 below. And the E-UTRAN

cell specific test parameters can refer to Table A.3.7.2.1-1. In the test there are two cells: Cell1 and Cell2. Cell1 is LTE PCell and Cell2 is NR FR1 PSCell. The test consists of one time period, with duration of T1. During T1, NR PSCell is continuously scheduled in DL while LTE PCell is not scheduled and has DRX configured. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell1 and Cell2. Cell1 shall be configured as LTE PCell and Cell2 shall be configured as NR PSCell. Prior to start of T1 the DRX inactivity timer for the LTE PCell has already expired. During T1 the UE shall be continuously scheduled on NR PSCell while not scheduled on LTE PCell. CORESET indicating a new transmission on PSCell shall be sent continuously during the entire time duration to ensure UE would not enter DRX state on PSCell.

**Table A.4.5.2.1.1-1: Interruption at transitions between active and non-active during DRX supported test configurations**

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3      | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6      | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |

Note: The UE is only required to be tested in one of the supported test configurations

**Table A.4.5.2.1.1-2: General test parameters for E-UTRAN – NR FR1 interruptions at transitions between active and non-active during DRX in synchronous EN-DC**

| Parameter                  | Unit | Value  | Comment  |
|----------------------------|------|--------|--|
| RF Channel Number          |      | 1, 2   | One is E-UTRAN RF channel and the other is NR RF channel |
| Active PCell               |      | Cell1  | PCell on E-UTRAN RF channel number 1.                    |
| Configured PSCell          |      | Cell2  | PSCell on NR RF channel number 2.                        |
| CP length                  |      | Normal | Applicable to Cell1 and Cell2                            |
| DRX                        |      | DRX.4  | DRX related parameters are defined in Table A.3.3.4-1    |
| Measurement gap pattern Id |      | OFF    |  |
| T1                         | s    | 10     |  |

**Table A.4.5.2.1.1-3: NR cell specific test parameters for E-UTRAN – NR FR1 interruptions at transitions between active and non-active during DRX in synchronous EN-DC**

|         |  |
|---------|--|
| Note 1: | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.  |
| Note 2: | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modeled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.    |
| Note 3: | SS-RSRP and $I_0$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.  |
| Note 4: | Receive time difference of signals received between subframe timing boundary of E-UTRA PCell and slot timing boundary of PSCell at the UE antenna connector including time alignment error between the two cells |

**Table A.4.5.2.1.1-4: Void**

#### A.4.5.2.1.2 Test Requirements

The UE shall be continuously scheduled in NR PSCell during the entire length of T1. UE shall not be scheduled in LTE PCell during T1. During the time duration T1 the UE shall transmit at least 99% of ACK/NACK on NR PSCell.

Interruption on NR PSCell shall not exceed X as defined in Table A.4.5.2.1.2-1.

**Table A.4.5.2.1.2-1: Interruption length X at transition between active and non-active during DRX**

| $\mu$ | NR Slot length (ms) | Interruption length X |
|-------|---------------------|-----------------------|
|       |                     | Sync                  |
| 0     | 1                   | 1                     |
| 1     | 0.5                 | 1                     |

The rate of correct events observed during repeated tests shall be at least 90%.

#### A.4.5.2.2 E-UTRAN – NR FR1 interruptions at transitions between active and non-active during DRX in asynchronous EN-DC

##### A.4.5.2.2.1 Test Purpose and Environment

The purpose of this test is to verify that when LTE PCell is in DRX and NR PSCell is in non-DRX, NR PSCell interruptions due to transitions from active to non-active and from non-active to active during LTE PCell DRX the UE missed ACK/NACK does not exceed the limits. This test will verify the missed ACK/NACK rate for NR PSCell in EN-DC specified in TS 38.133 clause 8.2.1.2. Supported test configurations are shown in table A.4.5.2.2.1-1.

The general test parameters and NR cell specific test parameters are given in Table A.4.5.2.2.1-2 and A.4.5.2.2.1-3. The E-UTRAN PCell DRX configuration parameters are given in Table A.4.5.2.2.1-4 below. And the E-UTRAN cell specific test parameters can refer to Table A.3.7.2.1-1. In the test there are two cells: Cell1 and Cell2. Cell1 is LTE PCell and Cell2 is NR FR1 PSCell. The test consists of one time period, with duration of T1. During T1, NR PSCell is continuously scheduled in DL while LTE PCell is not scheduled and has DRX configured. Prior to the start of the time duration T1, Cell1 shall be configured as LTE PCell and Cell2 shall be configured as NR PSCell. Prior to start of T1 the DRX inactivity timer for the LTE PCell has already expired. During T1 the UE shall be continuously scheduled on NR PSCell while not scheduled on LTE PCell. PDCCH indicating a new transmission on PSCell shall be sent continuously during the entire time duration to ensure UE would not enter DRX state on PSCell.

**Table A.4.5.2.2.1-1: Interruption at transitions between active and non-active during DRX supported test configurations**

| Config   | Description   |
|--|---|
| 1  | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2  | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3  | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4  | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5  | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6  | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| Note: The UE is only required to be tested in one of the supported test configurations |   |

**Table A.4.5.2.2.1-2: General test parameters for E-UTRAN – NR FR1 interruptions at transitions between active and non-active during DRX in asynchronous EN-DC**

| Parameter                  | Unit | Value  | Comment  |
|----------------------------|------|--------|--|
| RF Channel Number          |      | 1, 2   | One is E-UTRAN RF channel and the other is NR RF channel |
| Active PCell               |      | Cell1  | PCell on E-UTRAN RF channel number 1.                    |
| Configured PSCell          |      | Cell2  | PSCell on NR RF channel number 2.                        |

**Table A.4.5.2.2.1-4: Void****A.4.5.2.2.2 Test Requirements**

The UE shall be continuously scheduled in NR PSCell during the entire length of T1. UE shall not be scheduled in LTE PCell during T1. During the time duration T1 the UE shall transmit at least 99% of ACK/NACK on NR PSCell.

Interruption on NR PSCell shall not exceed X as defined in Table A.4.5.2.2.2-1.

**Table A.4.5.2.2.2-1: Interruption length X at transition between active and non-active during DRX**

| $\mu$ | NR Slot length (ms) | Interruption length X |
|-------|---------------------|-----------------------|
|       |                     | Async                 |
| 0     | 1                   | 2                     |
| 1     | 0.5                 | 2                     |

The rate of correct events observed during repeated tests shall be at least 90%.

**A.4.5.2.3 E-UTRAN – NR FR1 interruptions during measurements on deactivated NR SCC in synchronous EN-DC****A.4.5.2.3.1 Test Purpose and Environment**

The purpose of this test is to verify E-UTRAN PCell and NR PSCell interruptions during the measurement on the deactivated NR SCC, the UE missed ACK/NACK does not exceed the limits. This test will verify the missed ACK/NACK rate for E-UTRAN PCell and NR PSCell in EN-DC specified in TS 38.133 clause 8.2.1.2. Supported test configurations for LTE PCell and NR PSCell are shown in table A.4.5.2.3.1-1. Supported test configurations for NR SCell are shown in table A.4.5.2.3.1-1A. Test configuration for LTE PCell and NR PSCell and test configuration for NR SCell are chosen independently.

The general test parameters and NR cell specific test parameters are given in Table A.4.5.2.3.1-2, A.4.5.2.3.1-3 and A.4.5.2.3.1-4 below. And the E-UTRAN cell specific test parameters can refer to Table A.3.7.2.1-1. In the test there are three cells: Cell1, Cell2 and Cell3. Cell1 is LTE PCell, Cell2 and Cell3 is NR PSCell and NR deactivated SCell. Cell1 shall be configured as LTE PCell and Cell2 shall be configured as NR PSCell. The test consists of one time period, with duration of T1. Prior to the start of the time duration T1, the UE is connected to Cell1 and Cell2 and the RRC message including *measCycleSCell* or *allowInterruptions* for the deactivated NR SCells is received at the UE antenna connector. During T1, LTE PCell and NR PSCell are continuously scheduled in DL.

**Table A.4.5.2.3.1-1: Interruptions during measurements on deactivated NR SCC supported test configurations for LTE PCell and NR PSCell**

| Config  | Description  |
|---------|--|
| 1       | LTE FDD, NR 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, FDD duplex mode   |
| 2       | LTE FDD, NR 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, TDD duplex mode   |
| 3       | LTE FDD, NR 30 kHz SSB SCS, $\geq 40$ MHz bandwidth, TDD duplex mode   |
| 4       | LTE TDD, NR 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, FDD duplex mode   |
| 5       | LTE TDD, NR 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, TDD duplex mode   |
| 6       | LTE TDD, NR 30 kHz SSB SCS, $\geq 40$ MHz bandwidth, TDD duplex mode   |
| Note 1: | The UE is only required to be tested in one of the supported test configurations   |
| Note 2: | The UE is only required to be tested in one with smallest aggregated channel bandwidth from supported band combinations which is composed of CCs $\geq$ the bandwidth ( $BW_{channel}$ ) defined in each test configuration, |

**Table A.4.5.2.3.1-1A: Interruptions during measurements on deactivated NR SCC supported test configurations for NR SCell**

| Config <sub>SCell</sub> | Description  |
|-------------------------|--|
| 1                       | NR 15 kHz SSB SCS, ≥10 MHz bandwidth, FDD duplex mode  |
| 2                       | NR 15 kHz SSB SCS, ≥10 MHz bandwidth, TDD duplex mode  |
| 3                       | NR 30 kHz SSB SCS, ≥40 MHz bandwidth, TDD duplex mode  |
| Note 1:                 | The UE is only required to be tested in one of the supported test configurations   |
| Note 2:                 | The UE is only required to be tested in one with smallest aggregated channel bandwidth from supported band combinations which is composed of CCs ≥ the bandwidth (BW <sub>channel</sub> ) defined in each test configuration |

**Table A.4.5.2.3.1-2: General test parameters for E-UTRAN – NR interruptions during measurements on deactivated NR SCC in synchronous EN-DC**

| Parameter                                | Unit | Value   | Comment  |
|--|------|---------|--|
| RF Channel Number                        |      | 1, 2, 3 | One is E-UTRAN RF channel and the other two are NR RF channels |
| Active PCell                             |      | Cell1   | PCell on E-UTRAN RF channel number 1.                          |
| Active PSCell                            |      | Cell2   | PSCell on NR RF channel number 2.                              |
| Configured deactivated SCell             |      | Cell3   | Deactivated SCell on NR RF channel number 3.                   |
| CP length                                |      | Normal  | Applicable to Cell1, Cell2 and Cell3                           |
| DRX                                      |      | OFF     |  |
| Measurement gap pattern Id               |      | OFF     |  |
| SCell measurement cycle (measCycleSCell) | ms   | 640     |  |
| T1                                       | s    | 10      |  |

| Note 8: N <sub>RB,c</sub> is derived from Table 5.3.2-1 in TS38.101-1[2] with configured BW <sub>channel</sub> .  |                             |              |   |

#### A.4.5.2.3.2 Test Requirements

The UE shall be continuously scheduled in LTE PCell and NR PSCell during the entire length of T1. During the time duration T1 the UE shall transmit at least 99.5% of ACK/NACK on NR PSCell.

If the NR PSCell is not in the same band as the deactivated SCell, the UE is only allowed to cause interruptions on NR PSCell immediately before and immediately after an SMTC. Each interruption on NR PSCell shall not exceed the value defined in Table A.4.5.2.3.2-1.

If the NR PSCell is in the same band as the deactivated SCell, the UE is only allowed to cause an interruption on PSCell no earlier than 1 slot before an SMTC and no later than 1 slot after the SMTC. the interruption on NR PSCell shall not exceed the value defined in Table A.4.5.2.3.2-2.

**Table A.4.5.2.3.2-1: Interruption duration if the NR PSCell is not in the same band as the deactivated SCell**

| $\mu$ | NR Slot length (ms) | Interruption length |
|-------|---------------------|---------------------|
| 0     | 1                   | 1                   |
| 1     | 0.5                 | 1                   |

**Table A.4.5.2.3.2-2: Interruption duration if the NR PSCell is in the same band as the deactivated SCell**

| $\mu$ | NR Slot length (ms) | Interruption length |
|-------|---------------------|---------------------|
| 0     | 1                   | 2 + SMTC duration   |
| 1     | 0.5                 | 2 + SMTC duration   |

For synchronous inter-band EN-DC, the UE is only allowed to cause interruptions on E-UTRA PCell immediately before and immediately after an SMTC. Each interruption on E-UTRA PCell shall not exceed 1 subframe.

For synchronous intra-band EN-DC, the UE is only allowed to cause an interruption on E-UTRA PCell no earlier than 1 subframe before an SMTC and no later than 1 subframe after the SMTC. The interruption on E-UTRA PCell shall not exceed SMTC duration + 2 subframes.

The rate of correct events observed during repeated tests shall be at least 90%.

#### A.4.5.2.4 E-UTRAN – NR FR1 interruptions during measurements on deactivated NR SCC in asynchronous EN-DC

##### A.4.5.2.4.1 Test Purpose and Environment

The purpose of this test is to verify E-UTRAN PCell and NR PSCell interruptions during the measurement on the deactivated NR SCC, the UE missed ACK/NACK does not exceed the limits. This test will verify the missed ACK/NACK rate for E-UTRAN PCell and NR PSCell in EN-DC specified in TS 38.133 clause 8.2.1. Supported test configurations for LTE PCell and NR PSCell are shown in table A.4.5.2.4.1-1. Supported test configurations for NR SCell are shown in table A.4.5.2.4.1-1. Test configuration for LTE PCell and NR PSCell and test configuration for NR SCell are chosen independently.

The general test parameters and NR cell specific test parameters are given in Table A.4.5.2.4.1-2, A.4.5.2.4.1-3 and A.4.5.2.4.1-4 below. And the E-UTRAN cell specific test parameters can refer to Table A.3.7.2.1-1. In the test there are three cells: Cell1, Cell2 and Cell3. Cell1 is LTE PCell, Cell2 and Cell3 is NR PSCell and NR deactivated SCell. Cell1 shall be configured as LTE PCell and Cell2 shall be configured as NR PSCell. The test consists of one time period, with duration of T1. Prior to the start of the time duration T1, the UE is connected to Cell1 and Cell2 and the RRC message including *measCycleSCell* or *allowInterruptions* for the deactivated NR SCCells is received at the UE antenna connector. During T1, LTE PCell and NR PSCell are continuously scheduled in DL.

**Table A.4.5.2.4.1-1: Interruptions during measurements on deactivated NR SCC supported test configurations for LTE PCell and NR PSCell**

| Config  | Description  |
|---------|--|
| 1       | LTE FDD, NR 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, FDD duplex mode   |
| 2       | LTE FDD, NR 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, TDD duplex mode   |
| 3       | LTE FDD, NR 30 kHz SSB SCS, $\geq 40$ MHz bandwidth, TDD duplex mode   |
| 4       | LTE TDD, NR 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, FDD duplex mode   |
| 5       | LTE TDD, NR 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, TDD duplex mode   |
| 6       | LTE TDD, NR 30 kHz SSB SCS, $\geq 40$ MHz bandwidth, TDD duplex mode   |
| Note 1: | The UE is only required to be tested in one of the supported test configurations   |
| Note 2: | The UE is only required to be tested in one with smallest aggregated channel bandwidth from supported band combinations which is composed of CCs $\geq$ the bandwidth ( $BW_{channel}$ ) defined in each test configuration, |

**Table A.4.5.2.4.1-1A: Interruptions during measurements on deactivated NR SCC supported test configurations for NR SCell**

| Config <sub>SCell</sub> | Description   |
|-------------------------|---|
| 1                       | NR 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, FDD duplex mode   |
| 2                       | NR 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, TDD duplex mode   |
| 3                       | NR 30 kHz SSB SCS, $\geq 40$ MHz bandwidth, TDD duplex mode   |
| Note 1:                 | The UE is only required to be tested in one of the supported test configurations  |
| Note 2:                 | The UE is only required to be tested in one with smallest aggregated channel bandwidth from supported band combinations which is composed of CCs $\geq$ the bandwidth ( $BW_{channel}$ ) defined in each test configuration |

**Table A.4.5.2.4.1-2: General test parameters for E-UTRAN – NR interruptions during measurements on deactivated NR SCC in asynchronous EN-DC**

| Parameter   | Unit | Value   | Comment  |
|---|------|---------|--|
| RF Channel Number                                 |      | 1, 2, 3 | One is E-UTRAN RF channel and the other two are NR RF channels |
| Active PCell                                      |      | Cell1   | PCell on E-UTRAN RF channel number 1.                          |
| Configured PSCell                                 |      | Cell2   | PSCell on NR RF channel number 2.                              |
| Configured deactivated SCell                      |      | Cell3   | Deactivated SCell on NR RF channel number 3.                   |
| CP length   |      | Normal  | Applicable to Cell1, Cell2 and Cell3                           |
| DRX   |      | OFF     |  |
| Measurement gap pattern Id                        |      | OFF     |  |
| SCell measurement cycle ( <i>measCycleSCell</i> ) | ms   | 640     |  |
| T1  | s    | 10      |  |

**Table A.4.5.2.4.1-3: NR cell specific test parameters for NR PSCell for E-UTRAN – NR interruptions during measurements on deactivated NR SCC in asynchronous EN-DC**

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.   |                             |               |                            |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modeled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled within BW <sub>occupied</sub> . |                             |               |                            |
| Note 3: SS-RSRP and I <sub>o</sub> levels have been derived from other parameters for information purposes. They are not settable parameters themselves.  |                             |               |                            |
| Note 4: Receive time difference of signals received between subframe timing boundary of E-UTRA PCell and slot timing boundary of PSCell at the UE antenna connector including time alignment error between the two cells                                    |                             |               |                            |
| Note 5: Receive time difference between slot boundaries of signals received from the two cells at the UE antenna connector including time alignment error between the two cells.  |                             |               |                            |
| Note 6: All UL/DL transmission shall be confined within BW <sub>occupied</sub> (i.e. 10 MHz, 52 RBs) from F <sub>C,low</sub> , and I <sub>o</sub> is independent of the BW <sub>channel</sub> configured.   |                             |               |                            |
| Note 7: All UL/DL transmission shall be confined within BW <sub>occupied</sub> (i.e. 40 MHz, 106 RBs) from F <sub>C,low</sub> , and I <sub>o</sub> is independent of the BW <sub>channel</sub> configured.  |                             |               |                            |
| Note 8: N <sub>RB,c</sub> is derived from Table 5.3.2-1 in TS38.101-1[2] with configured BW <sub>channel</sub> .  |                             |               |                            |

#### A.4.5.2.4.2 Test Requirements

The UE shall be continuously scheduled in LTE PCell and NR PSCell during the entire length of T1. During the time duration T1 the UE shall transmit at least 99.5% of ACK/NACK on NR PSCell.

If the NR PSCell is not in the same band as the deactivated SCell, the UE is only allowed to cause interruptions on NR PSCell immediately before and immediately after an SMTC. Each interruption on NR PSCell shall not exceed the value defined in Table A.4.5.2.4.2-1.

If the NR PSCell is in the same band as the deactivated SCell, the UE is only allowed to cause an interruption on PSCell no earlier than 1 slot before an SMTC and no later than 1 slot after the SMTC. the interruption on NR PSCell shall not exceed the value defined in Table A.4.5.2.4.2-2.

**Table A.4.5.2.4.2-1: Interruption duration if the NR PSCell is not in the same band as the deactivated SCell**

| $\mu$ | NR Slot length (ms) | Interruption length |
|-------|---------------------|---------------------|
| 0     | 1                   | 1                   |
| 1     | 0.5                 | 1                   |

**Table A.4.5.2.4.2-2: Interruption duration if the NR PSCell is in the same band as the deactivated SCell**

| $\mu$ | NR Slot length (ms) | Interruption length |
|-------|---------------------|---------------------|
| 0     | 1                   | 2 + SMTC duration   |
| 1     | 0.5                 | 2 + SMTC duration   |

For asynchronous inter-band EN-DC, the UE is only allowed to cause interruptions on E-UTRA PCell immediately before and immediately after an SMTC. Each interruption on E-UTRA PCell shall not exceed 2 subframe.

The rate of correct events observed during repeated tests shall be at least 90%.

#### A.4.5.2.5 E-UTRAN – NR FR1 interruptions during measurements on deactivated E-UTRAN SCC in synchronous EN-DC

##### A.4.5.2.5.1 Test Purpose and Environment

The purpose of this test is to verify E-UTRAN PCell and NR PSCell interruptions during the measurement on the deactivated E-UTRAN SCC, the UE missed ACK/NACK does not exceed the limits. This test will verify the missed ACK/NACK rate for E-UTRAN PCell and NR PSCell in EN-DC specified in TS38.133 clause 8. 2.1.2. Supported test configurations are shown in table A.4.5.2.5.1-1.

The general test parameters and NR cell specific test parameters are given in Table A.4.5.2.5.1-2 and A.4.5.2.5.1-3 below. And the E-UTRAN cell specific test parameters can refer to Table A.3.7.2.1-1. In the test there are three cells: Cell1, Cell2 and Cell3. Cell1 and Cell3 is E-UTRAN PCell and E-UTRAN deactivated SCell, Cell2 is NR FR1 PSCell. Cell1 shall be configured as LTE PCell and Cell2 shall be configured as NR PSCell. The test consists of one time period, with duration of T1. Prior to the start of the time duration T1, the UE is connected to Cell1 and Cell2 and the RRC message including *measCycleSCell* or *allowInterruptions* for the deactivated E-UTRAN SCells is received at the UE antenna connector. During T1, LTE PCell and NR PSCell are continuously scheduled in DL.

**Table A.4.5.2.5.1-1: Interruptions during measurements on deactivated E-UTRAN SCC supported test configurations**

| Config | Description   |
|--------|---|
|        | LTE PCell + NR PSCell <sup>Note 2</sup>                       |
| 1      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3      | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6      | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |

Note 1: The UE is only required to be tested in one of the supported test configurations  
Note 2: The duplex mode of the LTE SCell is determined based on the band combination to be tested.

**Table A.4.5.2.5.1-2: General test parameters for E-UTRAN – NR interruptions during measurements on deactivated E-UTRAN SCC in synchronous EN-DC**

| Parameter                                | Unit | Value  | Comment  |
|--|------|--------|--|
| RF Channel Number                        |      | 1, 2   | One is E-UTRAN RF channel and the other is NR RF channel |
| Active PCell                             |      | Cell1  | PCell on E-UTRAN RF channel number 1.                    |
| Active PSCell                            |      | Cell2  | PSCell on NR RF channel number 2.                        |
| Configured deactivated SCell             |      | Cell3  | Deactivated SCell on E-UTRAN RF channel number 1.        |
| CP length                                |      | Normal | Applicable to Cell1, Cell2 and Cell3                     |
| DRX                                      |      | OFF    |  |
| Measurement gap pattern Id               |      | OFF    |  |
| SCell measurement cycle (measCycleSCell) | ms   | 640    |  |
| T1                                       | s    | 10     |  |

**Table A.4.5.2.5.1-3: NR cell specific test parameters for E-UTRAN – NR interruptions during measurements on deactivated E-UTRAN SCC in synchronous EN-DC**

| Parameter                      | Unit           | Cell2                       |

#### A.4.5.2.5.2 Test Requirements

The UE shall be continuously scheduled in LTE PCell and NR PSCell during the entire length of T1. During the time duration T1 the UE shall transmit at least 99.5% of ACK/NACK on NR PSCell. The UE is only allowed to cause one interruption on PCell and one interruption on PSCell. Each interruption on NR PSCell shall not exceed X defined in Table A.4.5.2.5.2-1 if the NR PSCell is not in the same band as the E-UTRAN deactivated SCell or Y in Table A.4.5.2.3.2-1 if the NR PSCell is in the same band as the E-UTRAN deactivated SCell.

**Table A.4.5.2.5.2-1: Interruption length X and Y at measurements on deactivated E-UTRA SCC**

| $\mu$ | NR Slot length (ms) | Interruption length X slot | Interruption length Y slot |
|-------|---------------------|----------------------------|----------------------------|
|       |                     | Sync                       |                            |
| 0     | 1                   | 1                          | 1+SMTC duration            |
| 1     | 0.5                 | 1                          | 1+SMTC duration            |

Each interruption on E-UTRAN PCell shall not exceed 1 subframe if the PCell is not in the same band as the deactivated SCell, or 5 subframes if the PCell is in the same band as the deactivated SCell.

The rate of correct events observed during repeated tests shall be at least 90%.

#### A.4.5.2.6 E-UTRAN – NR FR1 interruptions during measurements on deactivated E-UTRAN SCC in asynchronous EN-DC

##### A.4.5.2.6.1 Test Purpose and Environment

The purpose of this test is to verify E-UTRAN PCell and NR PSCell interruptions during the measurement on the deactivated NR SCC, the UE missed ACK/NACK does not exceed the limits. This test will verify the missed ACK/NACK rate for E-UTRAN PCell and NR PSCell in EN-DC specified in TS 38.133 clause 8.2.1. Supported test configurations are shown in table A.4.5.2.6.1-1.

The general test parameters and NR cell specific test parameters are given in Table A.4.5.2.6.1-1 and A.4.5.2.6.1-2 below. And the E-UTRAN cell specific test parameters can refer to Table A.3.7.2.1-1. In the test there are three cells: Cell1, Cell2 and Cell3. Cell1 and Cell3 is E-UTRAN PCell and E-UTRAN deactivated SCell, Cell2 is NR FR1 PSCell. Cell1 shall be configured as LTE PCell and Cell2 shall be configured as NR PSCell. The test consists of one time period, with duration of T1. Prior to the start of the time duration T1, the UE is connected to Cell1 and Cell2 and the RRC message including *measCycleSCell* or *allowInterruptions* for the deactivated NR SCells is received at the UE antenna connector. During T1, LTE PCell and NR PSCell are continuously scheduled in DL.

**Table A.4.5.2.6.1-1: Interruptions during measurements on deactivated E-UTRAN SCC supported test configurations**

| Config | Description                             |
|--------|---|
|        | LTE PCell + NR PSCell <sup>Note 2</sup> |

|  |   |
|--|---|
| 1  | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2  | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3  | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4  | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5  | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6  | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| Note 1: The UE is only required to be tested in one of the supported test configurations           |   |
| Note 2: The duplex mode of the LTE SCell is determined based on the band combination to be tested. |   |

**Table A.4.5.2.6.1-2: General test parameters for E-UTRAN – NR interruptions during measurements on deactivated E-UTRAN SCC in asynchronous EN-DC**

| Parameter                                | Unit | Value   | Comment  |
|--|------|---------|--|
| RF Channel Number                        |      | 1, 2, 3 | One is NR RF channel and the other two are E-UTRAN RF channels |

#### A.4.5.2.6.2 Test Requirements

The UE shall be continuously scheduled in LTE PCell and NR PSCell during the entire length of T1. During the time duration T1 the UE shall transmit at least 99.5% of ACK/NACK on E-UTRAN PCell and NR PSCell. The UE is only allowed to cause one interruption on PCell and one interruption on PSCell. Each interruption on NR PSCell shall not exceed the value defined in Table A.4.5.2.4.2-1 and Table A.4.5.2.4.2-2.

**Table A.4.5.2.6.2-1: Interruption duration if the NR PSCell is not in the same band as the E-UTRAN deactivated SCell**

| $\mu$ | NR Slot length (ms) | Interruption length |
|-------|---------------------|---------------------|
| 0     | 1                   | 2                   |
| 1     | 0.5                 | 2                   |

**Table A.4.5.2.6.2-2: Interruption duration if the NR PSCell is in the same band as the E-UTRAN deactivated SCell**

| $\mu$ | NR Slot length (ms) | Interruption length |
|-------|---------------------|---------------------|
| 0     | 1                   | 2 + SMTC duration   |
| 1     | 0.5                 | 2 + SMTC duration   |

Each interruption on E-UTRAN PCell shall not exceed 1 subframe if the PCell is not in the same band as the deactivated SCell, or 5 subframes if the PCell is in the same band as the deactivated SCell.

The rate of correct events observed during repeated tests shall be at least 90%.

#### A.4.5.2.7 Void

### A.4.5.3 SCell Activation and Deactivation Delay

#### A.4.5.3.1 SCell Activation and deactivation of known SCell in FR1 for 160ms SCell measurement cycle

##### A.4.5.3.1.1 Test Purpose and Environment

The purpose of this test is to verify that the SCell activation and deactivation times are within the requirements stated in clause 8.3, when the SCell in FR1 is known by the UE at the time of activation.

The supported test configurations for LTE PCell and NR PSCell are shown in table A.4.5.3.1.1-1 below. Supported test configurations for NR SCell are shown in table A.4.5.3.1.1-1A below. Test configuration for LTE PCell and NR PSCell and test configuration for NR SCell are chosen independently. The test parameters are given in Tables A.4.5.3.1.1-2 and cell-specific parameters in A.4.5.3.1.1-3 and A.4.5.3.1.1-4 below. The test consists of three successive time periods, with duration of T1, T2 and T3, respectively. There are three carriers, E-UTRA has one cell, NR has two cells. All cells have constant signal levels throughout the test. Before the test starts the UE is connected to Cell 1 (PCell) on E-UTRA and Cell 2 (PSCell) on NR, but is not aware of Cell 3 (SCell) on NR. The UE is monitoring the PCell and PSCell. The UE shall be continuously scheduled in the PCell and PSCell throughout the whole test.

At the beginning of T1 the UE receives an RRC message by which the SCell (Cell 3) becomes configured on NR. The UE now starts monitoring the SCell. The test equipment sends a MAC message for activation of the SCell.

The point in time at which the MAC message is received at the UE antenna connector, in a slot # denoted m, defines the start of time period T2. The UE shall be able to report valid CSI in PSCell for the activated SCell at latest in slot

$m + \frac{T_{\text{HARQ}} + T_{\text{activation\_time}} + T_{\text{CSI\_Reporting}}}{\text{NR slot length}}$ , as defined in clause 8.3. The UE shall start reporting CSI in PSCell after at least one CSI-RS transmission occasion for channel measurement and reporting after slot  $(m+k)$  and shall report CQI index 0 (out-of-range) until the SCell activation has been completed. Any PSCell interruption due to activation of SCell shall occur in the slot  $m + 1 + \frac{T_{\text{HARQ}}}{\text{NR slot length}}$  to slot  $m + 1 + \frac{T_{\text{HARQ}} + 3\text{ms} + T_{\text{X}}}{\text{NR slot length}} + N_{\text{interruption}}$ , as defined in clause 8.3, where  $N_{\text{interruption}}$  is the interruption length given in section 8.2. Any E-UTRA PCell interruption due to activation of SCell shall occur in the subframe  $m_1 + 1 + \frac{T_{\text{HARQ}}}{\text{EUTRA slot length}}$  to subframe  $m_2 + 1 + \frac{T_{\text{HARQ}} + 3\text{ms} + T_{\text{X}}}{\text{EUTRA slot length}} + N_{\text{interruption}}$ , where  $m_1$  and  $m_2$  are the index of the first and last subframe of E-UTRA PCell which overlaps with slot  $m$ , and  $N_{\text{interruption}}$  is the interruption length given in TS 36.133 [14] section 7.32.

Time period T3 starts when a MAC message for deactivation of SCell, sent from the test equipment to the UE in a slot # denoted  $n$ , is received at the UE antenna connector. The UE shall carry out deactivation of the SCell in a slot  $n + \frac{T_{\text{HARQ}} + 3\text{ms}}{\text{NR slot length}}$ , as defined in clause 8.3. The starting point of any PSCell interruption due to the deactivation shall occur in the slot  $n + 1 + \frac{T_{\text{HARQ}}}{\text{NR slot length}}$  to  $n + 1 + \frac{T_{\text{HARQ}} + 3\text{ms}}{\text{NR slot length}}$ , as defined in clause 8.3. The starting point of any E-UTRA PCell interruption due to the deactivation shall occur in the subframe  $n_1 + 1 + \frac{T_{\text{HARQ}}}{\text{EUTRA subframe length}}$  to subframe  $n_2 + 1 + \frac{T_{\text{HARQ}} + 3\text{ms}}{\text{EUTRA subframe length}}$ , where  $n_1$  and  $n_2$  are the index of the first and last subframe of E-UTRA PCell which overlaps with slot  $n$ .

The test equipment verifies that potential interruption is carried out in the correct time span by monitoring ACK/NACK sent in PSCell during activation and deactivation of SCell, respectively.

The test equipment verifies the activation time by counting the slots from the time when the SCell activation command is sent until a CSI report with other than CQI index 0 is received.

The test equipment verifies the deactivation time by counting the slots from the time when the SCell deactivation command is sent until CSI reporting for SCell is discontinued.

**Table A.4.5.3.1.1-1: known FR1 SCell activation in non-DRX for 160ms SCell measurement cycle supported test configurations for LTE PCell and NR PSCell**

| Config  | Description   |
|---------|---|
| 1       | LTE FDD, NR 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, FDD duplex mode  |
| 2       | LTE FDD, NR 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, TDD duplex mode  |
| 3       | LTE FDD, NR 30 kHz SSB SCS, $\geq 40$ MHz bandwidth, TDD duplex mode  |
| 4       | LTE TDD, NR 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, FDD duplex mode  |
| 5       | LTE TDD, NR 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, TDD duplex mode  |
| 6       | LTE TDD, NR 30 kHz SSB SCS, $\geq 40$ MHz bandwidth, TDD duplex mode  |
| Note 1: | The UE is only required to be tested in one of the supported test configurations  |
| Note 2: | The UE is only required to be tested in one with smallest aggregated channel bandwidth from supported band combinations which is composed of CCs $\geq$ the bandwidth ( $BW_{\text{channel}}$ ) defined in each test configuration, |

**Table A.4.5.3.1.1-1A: known FR1 SCell activation in non-DRX for 160ms SCell measurement cycle supported test configurations for NR SCell**

| Config <sub>SCell</sub> | Description  |
|-------------------------|--|
| 1                       | NR 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, FDD duplex mode                      |
| 2                       | NR 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, TDD duplex mode                      |
| 3                       | NR 30 kHz SSB SCS, $\geq 40$ MHz bandwidth, TDD duplex mode                      |
| Note 1:                 | The UE is only required to be tested in one of the supported test configurations |

Note 2: The UE is only required to be tested in one with smallest aggregated channel bandwidth from supported band combinations which is composed of CCs  $\geq$  the bandwidth ( $BW_{\text{channel}}$ ) defined in each test configuration,

**Table A.4.5.3.1.1-2: General test parameters for known FR1 SCell activation case, 160ms SCell measurement cycle**

| Parameter  | Unit          | Value  | Comment   |
|--|---------------|--|---|
| RF Channel Number  |               | 1,2,3  | One E-UTRAN radio channel (1) and two NR radio channel (2,3) are used for this test   |
| Active PCell   |               | Cell 1   | Primary cell on E-UTRAN RF channel number 1.<br>As specified in clause A.3.7.2.1  |
| Active PSCell  |               | Cell 2   | Primary secondary cell on NR RF channel number 2.   |
| Configured deactivated SCell                                 |               | Cell 3   | Configured deactivated secondary cell on NR RF channel number 3   |
| CP length  |               | Normal   |   |
| DRX  |               | OFF  | Continuous monitoring of primary cell   |
| Cell-individual offset for cells on E-UTRA RF channel number | dB            | 0  | Individual offset for cells on primary component carrier.   |
| Cell-individual offset for cells on NR channel number        | dB            | 0  | Individual offset for cells on secondary component carrier.   |
| SCell measurement cycle (measCycleSCell)                     | ms            | 160  |   |
| Cell3 timing offset to cell2                                 | $\mu\text{s}$ | 0  |   |
| Time alignment error between cell3 and cell2                 | $\mu\text{s}$ | $\leq$ Time alignment error as specified in TS 38.104 [13] clause 6.5.3.1. | The value of time alignment error depends upon the type of carrier aggregation.   |
| T1   | s             | 7  | During this time the PSCell shall be known and the SCell configured and detected.   |
| T2   | s             | 1  | During this time the UE shall activate the SCell.   |
| T3   | s             | 1  | During this time the UE shall deactivate the SCell.   |
| $T_{\text{HARQ}}$  | ms            | $k_1 \times \text{NR slot length}$   | $k_1$ is a number of slots indicated by the PDSCH-to-HARQ_feedback timing indicator field in a corresponding DCI format or provided by <i>dl-DataToUL-ACK</i> if the PDSCH-to-HARQ feedback timing field is not present in the DCI format, the value is defined in 38.213 [3]       |
| $T_{\text{CSI\_Reporting}}$                                  | ms            | 15   | The delay (in ms) including uncertainty in acquiring the first available downlink CSI reference resource, UE processing time for CSI reporting (clause 5.2.2.5 in TS 38.214) and uncertainty in acquiring the first available CSI reporting resources as specified in TS 38.331 [2] |
| k  | slot          | $k_1 + 3 \cdot N_{\text{slot}}^{\text{subframe},\mu} + 1$                  | As specified in clause 4.3 of TS 38.213 [3]   |

| Correlation Matrix and Antenna Configuration   |                             | -            | 2x2 Low |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.  |                             |              |         |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled within $BW_{occupied}$ . |                             |              |         |
| Note 3: SS-RSRP, I <sub>o</sub> and SCH_RP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.   |                             |              |         |
| Note 4: The uplink resources for CSI reporting are assigned to the UE prior to the start of time period T2.]   |                             |              |         |
| Note 5: All UL/DL transmission shall be confined within $BW_{channel\_actual-occupied}$ (i.e. 10 MHz, 52 RBs) from $F_{C,low}$ , and I <sub>o</sub> is independent of the $BW_{channel}$ configured.   |                             |              |         |
| Note 6: All UL/DL transmission shall be confined within $BW_{channel\_actual-occupied}$ (i.e. 40 MHz, 106 RBs) from $F_{C,low}$ , and I <sub>o</sub> is independent of the $BW_{channel}$ configured.  |                             |              |         |
| Note 7: $N_{RB,C}$ is derived from Table 5.3.2-1 in TS38.101-1[2] with configured $BW_{channel}$ .   |                             |              |         |

#### A.4.5.3.1.2 Test Requirements

During T2 the UE shall start sending CSI reports for SCell with non-zero CQI index at latest in a slot  $m + \frac{T_{HARQ} + T_{activation\_time} + T_{CSI\_Reporting}}{NR\ slot\ length}$ ,  $T_{activation\_time} = T_{FirstSSB} + 5\text{ms}$ , as defined in clause 8.3.

During T3 the UE shall stop sending CSI reports for SCell at latest in a slot  $n + \frac{T_{HARQ} + 3\text{ms}}{NR\ slot\ length}$ , as defined in clause 8.3.

During T2 interruption of PSCell during SCell activation shall not happen outside the slot  $m + 1 + \frac{T_{HARQ}}{NR\ slot\ length}$  to  $m + 1 + \frac{T_{HARQ} + 3\text{ms} + T_X}{NR\ slot\ length} + N_{interruption}$ , and interruption of E-UTRA PCell during SCell activation shall not happen outside the subframe  $m_1 + 1 + \frac{T_{HARQ}}{EUTRA\ slot\ length}$  to subframe  $m_2 + 1 + \frac{T_{HARQ} + 3\text{ms} + T_X}{EUTRA\ slot\ length} + N_{interruption}$ , as defined in clause 8.3.

During T3 the starting point of interruption of PSCell during SCell deactivation shall not happen outside the slot  $n + 1 + \frac{T_{HARQ}}{NR\ slot\ length}$  to  $n + 1 + \frac{T_{HARQ} + 3\text{ms}}{NR\ slot\ length}$ , as defined in clause 8.3 and the starting point of interruption of E-UTRA PCell during SCell deactivation shall not happen outside the subframe  $n_1 + 1 + \frac{T_{HARQ}}{EUTRA\ subframe\ length}$  to subframe  $n_2 + 1 + \frac{T_{HARQ} + 3\text{ms}}{EUTRA\ subframe\ length}$ .

The interruption of PSCell shall not be more than the values specified for EN-DC in Clause 8.2.1.2.4.

All of the above test requirements shall be fulfilled in order for the observed SCell activation delay and SCell deactivation delay to be counted as correct. The rate of correct observed SCell activation delay and SCell deactivation delay during repeated tests shall be at least 90%.

NOTE: During T2 if there are no uplink resources for reporting the valid CSI in a slot  $m + \frac{T_{HARQ} + T_{activation\_time} + T_{CSI\_Reporting}}{NR\ slot\ length}$  as defined in clause 8.3 then the UE shall use the next available uplink resource for reporting the corresponding valid CSI.

### A.4.5.3.2 SCell Activation and deactivation of known SCell in FR1 for 640ms SCell measurement cycle

#### A.4.5.3.2.1 Test Purpose and Environment

The purpose of this test case is the same as for the test defined in clause A.4.5.3.1.1. The supported test configurations are the same as defined in clause A.4.5.3.1.1. The test parameters are the same except those described in the following clause. The listed parameter values in Tables A.4.5.3.2.1-1 will replace the values of corresponding parameters in Tables A.4.5.3.1.1-2.

**Table A.4.5.3.2.1-1: General test parameters for known FR1 SCell activation case, 640ms SCell measurement cycle**

| Parameter                                | Unit | Value | Comment |
|--|------|-------|---------|
| SCell measurement cycle (measCycleSCell) | ms   | 640   |         |

#### A.4.5.3.2.2 Test Requirements

The test requirements defined in clause A.4.5.3.1.2 shall apply to this test case, except  $T_{\text{activation\_time}}$  will be replaced with the value  $T_{\text{FirstSSB\_MAX}} + T_{\text{rs}} + 5\text{ms}$ .

### A.4.5.3.3 SCell Activation and deactivation of unknown SCell in FR1

#### A.4.5.3.3.1 Test Purpose and Environment

The purpose of this test is to verify that the SCell activation and deactivation times are within the requirements stated in clause 8.3, when the SCell in FR1 is unknown by the UE at the time of activation.

The supported test configurations are defined in clause A.4.5.3.1.1. The test parameters are the same except those described in the following clause. The listed parameter values in Tables A.4.5.3.3.1-1 will replace the values of corresponding parameters in Tables A.4.5.3.1.1-2. The test consists of three successive time periods, with duration of T1, T2 and T3, respectively. There are three carriers, E-UTRA has one cell, NR has two cells. Cell 1 and Cell 2 have constant signal levels throughout the test. Before the test starts the UE is connected to Cell 1 (PCell) on E-UTRA and Cell 2 (PSCell) on NR, but is not aware of Cell 3 (SCell) on NR. The UE is monitoring the PCell and PSCell. The UE shall be continuously scheduled in the PCell and PSCell throughout the whole test.

At the beginning of T1 the UE receives an RRC message by which the SCell (Cell 3) becomes configured on NR. During T1 the SCell is powered off and UE is not aware of SCell.

A MAC message for activation of SCell is sent by the test equipment 100ms after the RRC message, in a slot # denoted  $m$ . The point in time at which the MAC message for activation of SCell is received at the UE antenna connector defines the start of time period T2. The UE shall be able to report valid CSI for the activated SCell at latest in slot  $m + \frac{T_{\text{HARQ}} + T_{\text{activation\_time}} + T_{\text{CSI\_Reporting}}}{\text{NR slot length}}$  as defined in clause 8.3 provided the SCell can be successfully detected on the first attempt. The UE shall start reporting CSI after at least one CSI-RS transmission occasion for channel measurement and reporting after slot  $(m+k)$  and shall report CQI index 0 (out-of-range) until the SCell activation has been completed. Any PSCell interruption due to activation of SCell shall occur in the slot  $m + 1 + \frac{T_{\text{HARQ}}}{\text{NR slot length}}$  to slot  $m + 1 + \frac{T_{\text{HARQ}} + 3\text{ms} + T_{\text{X}}}{\text{NR slot length}} + N_{\text{interruption}}$ , as defined in clause 8.3, where  $N_{\text{interruption}}$  is the interruption length given in section 8.2. Any E-UTRA PCell interruption due to activation of SCell shall occur in the subframe  $m_1 + 1 + \frac{T_{\text{HARQ}}}{\text{EUTRA slot length}}$  to subframe  $m_2 + 1 + \frac{T_{\text{HARQ}} + 3\text{ms} + T_{\text{X}}}{\text{EUTRA slot length}} + N_{\text{interruption}}$ , where  $m_1$  and  $m_2$  are the index of the first and last subframe of E-UTRA PCell which overlaps with slot  $m$ , and  $N_{\text{interruption}}$  is the interruption length given in TS 36.133 [14] section 7.32.

Time period T3 starts when a MAC message for deactivation of the SCell, sent from the test equipment to the UE in a slot # denoted n, is received at the UE antenna connector. The UE shall carry out deactivation of the SCell at latest in slot  $n + \frac{T_{\text{HARQ}} + 3\text{ms}}{\text{NR slot length}}$  as defined in clause 8.3. The starting point of any PSCell interruption due to the deactivation shall occur in the slot  $n + 1 + \frac{T_{\text{HARQ}}}{\text{NR slot length}}$  to  $n + 1 + \frac{T_{\text{HARQ}} + 3\text{ms}}{\text{NR slot length}}$ , as defined in clause 8.3. The starting point of any E-UTRA PCell interruption due to the deactivation shall occur in the subframe  $n_1 + 1 + \frac{T_{\text{HARQ}}}{\text{EUTRA subframe length}}$  to subframe  $n_2 + 1 + \frac{T_{\text{HARQ}} + 3\text{ms}}{\text{EUTRA subframe length}}$ , where  $n_1$  and  $n_2$  are the index of the first and last subframe of E-UTRA PCell which overlaps with slot n.

The test equipment verifies that potential interruption is carried out in the correct time span by monitoring ACK/NACK sent in PSCell during activation of SCell, respectively.

The test equipment verifies the activation time by counting the slots from the time when the SCell activation command is sent until a CSI report with other than CQI index 0 is received.

The test equipment verifies the deactivation time by counting the slots from the time when the SCell1 deactivation command is sent until CSI reporting for SCell1 is discontinued.

**Table A.4.5.3.3.1-1: General test parameters for unknown FR1 SCell activation case, 160ms SCell measurement cycle**

| Parameter | Unit | Value | Comment  |
|-----------|------|-------|--|
| T1        | ms   | 100   | During this time the PSCell shall be known and the SCell configured, but not detected. |

#### A.4.5.3.3.2 Test Requirements

The test requirements defined in clause A.4.5.3.1.2 shall apply to this test case, except  $T_{\text{activation\_time}}$  will be replaced with the value  $T_{\text{FirstSSB\_MAX}} + T_{\text{SMTc\_MAX}} + 2 * T_{\text{rs}} + 5\text{ms}$  as defined in clause 8.3.

### A.4.5.4 UE UL carrier RRC reconfiguration Delay

#### A.4.5.4.1 UE UL carrier RRC reconfiguration Delay

**Table A.4.5.4.1-1 - Table A.4.5.4.1-4 : Void**

##### A.4.5.4.1.1 Test Purpose and Environment

The purpose of this test is to verify that when the UE receives a RRC message implying NR UL or Supplementary UL carrier configuration, the UE shall be ready to start transmission on the newly configured carrier within the time limits specified in clause 8.4.2 and 8.4.3 for configuring and deconfiguring, respectively.

There are three cells: E-UTRAN PCell (Cell 1), FR1 PSCell (Cell 2) and FR1 SCell (Cell 3). For SCell, both NR uplink and supplementary uplink are broadcast by *ServingCellConfigCommonSIB*. The test parameters for PSCell and SCell are given in Table A. 4.5.4.1.1-1, Table A. 4.5.4.1.1-2, Table A. 4.5.4.1.1-3 and Table A. 4.5.4.1.1-4 below. The test parameters and applicability for E-UTRAN PCell are defined in A.3.7.2. The test consists two tests. In test 1, the test consists of three time periods, with duration of T1, T2 and T3 respectively. During time duration T1, NR uplink of cell 3 is configured to UE. At the start of T2, a supplementary uplink of cell3 is configured to UE through *RRCReconfiguration*, then UE shall start transmission both on the NR uplink and supplementary uplink. At the start of T3, the supplementary uplink is released through *RRCReconfiguration*.

In test 2, the test consists of three time periods, with duration of T1, T2 and T3 respectively. During time duration T1, supplementary uplink on cell 3 is configured to UE. At the start of T2, a NR uplink is configured to UE through

*RRCReconfiguration*, then UE shall start transmission both on the NR uplink and supplementary uplink. At the start of T3, the NR uplink is released through *RRCReconfiguration*.

**Table A.4.5.4.1.1-1: Supported test configurations**

| Configuration | PSCell (Cell2)   | SCell (Cell3)   |
|---------------|--|---|
| 1             | 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, FDD duplex mode   | DL and UL: 15kHz SSB SCS, $\geq 10$ MHz bandwidth, FDD duplex mode;<br>SUL: 15kHz SCS, $\geq 10$ MHz bandwidth, SUL duplex mode |
| 2             | 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, FDD duplex mode   | DL and UL: 15kHz SSB SCS, $\geq 10$ MHz bandwidth, TDD duplex mode;<br>SUL: 15kHz SCS, $\geq 10$ MHz bandwidth, SUL duplex mode |
| 3             | 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, FDD duplex mode   | DL and UL: 30kHz SSB SCS, $\geq 40$ MHz bandwidth, TDD duplex mode;<br>SUL: 30kHz SCS, $\geq 40$ MHz bandwidth, SUL duplex mode |
| 4             | 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, TDD duplex mode   | DL and UL: 15kHz SSB SCS, $\geq 10$ MHz bandwidth, FDD duplex mode;<br>SUL: 15kHz SCS, $\geq 10$ MHz bandwidth, SUL duplex mode |
| 5             | 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, TDD duplex mode   | DL and UL: 15kHz SSB SCS, $\geq 10$ MHz bandwidth, TDD duplex mode;<br>SUL: 15kHz SCS, $\geq 10$ MHz bandwidth, SUL duplex mode |
| 6             | 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, TDD duplex mode   | DL and UL: 30kHz SSB SCS, $\geq 40$ MHz bandwidth, TDD duplex mode;<br>SUL: 30kHz SCS, $\geq 40$ MHz bandwidth, SUL duplex mode |
| 7             | 30 kHz SSB SCS, $\geq 40$ MHz bandwidth, TDD duplex mode   | DL and UL: 15kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode;<br>SUL: 15kHz SCS, 10 MHz bandwidth, SUL duplex mode               |
| 8             | 30 kHz SSB SCS, $\geq 40$ MHz bandwidth, TDD duplex mode   | DL and UL: 15kHz SSB SCS, $\geq 10$ MHz bandwidth, TDD duplex mode;<br>SUL: 15kHz SCS, $\geq 10$ MHz bandwidth, SUL duplex mode |
| 9             | 30 kHz SSB SCS, $\geq 40$ MHz bandwidth, TDD duplex mode   | DL and UL: 30kHz SSB SCS, $\geq 40$ MHz bandwidth, TDD duplex mode;<br>SUL: 30kHz SCS, $\geq 40$ MHz bandwidth, SUL duplex mode |
| Note 1:       | The UE is only required to be tested in one of the supported test configurations   |   |
| Note 2:       | The UE is only required to be tested in one with smallest aggregated channel bandwidth from supported band combinations which is composed of CCs $\geq$ the bandwidth ( $BW_{channel}$ ) defined in each test configuration, |   |

**Table A.4.5.4.1.1-2: General test parameters for EN-DC UE UL carrier RRC reconfiguration Delay**

NOTE 1: OCNG shall be used such that both cells are fully allocated, and a constant total transmitted power spectral density is achieved for all OFDM symbols.

NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for  $N_{oc}$  to be fulfilled within  $BW_{occupied}$ .

NOTE 3:  $\hat{E}_s/I_{ot}$ ,  $I_o$ , and SS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

NOTE 4: All UL/DL transmission shall be confined within  $BW_{occupied}$  (i.e. 10 MHz, 52 RBs) from  $F_{C,low}$ , and  $I_o$  is independent of the  $BW_{channel}$  configured.

NOTE 5: All UL/DL transmission shall be confined within  $BW_{occupied}$  (i.e. 40 MHz, 106 RBs) from  $F_{C,low}$ , and  $I_o$  is independent of the  $BW_{channel}$  configured.

NOTE 6:  $N_{RB,c}$  is derived from Table 5.3.2-1 in TS38.101-1[2] with configured  $BW_{channel}$ .

**Table A.4.5.4.1.1-4: NR Cell specific test parameters for EN-DC UE UL carrier RRC reconfiguration Delay on SCell (Cell 3)**

| NOTE 1: OCNG shall be used such that both cells are fully allocated, and a constant total transmitted power spectral density is achieved for all OFDM symbols.   |                |                                |       |       |       |       |       |       |
| NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled within $BW_{occupied}$ . |                |                                |       |       |       |       |       |       |
| NOTE 3: $\hat{E}_s / I_{ot}$ , $I_o$ , and SS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.   |                |                                |       |       |       |       |       |       |
| NOTE 4: All UL/DL transmission shall be confined within $BW_{occupied}$ (i.e. 10 MHz, 52 RBs) from $F_{C,low}$ , and $I_o$ is independent of the $BW_{channel}$ configured.  |                |                                |       |       |       |       |       |       |
| NOTE 5: All UL/DL transmission shall be confined within $BW_{occupied}$ (i.e. 40 MHz, 106 RBs) from $F_{C,low}$ , and $I_o$ is independent of the $BW_{channel}$ configured.   |                |                                |       |       |       |       |       |       |
| NOTE 6: $N_{RB,c}$ is derived from Table 5.3.2-1 in TS38.101-1[2] with configured $BW_{channel}$ .   |                |                                |       |       |       |       |       |       |

#### A.4.5.4.1.2 Test Requirements

In test 1 the UE shall be ready to start transmission on the supplementary uplink carrier on SCell within 20ms from the start of T2.

In test 1 the UE shall stop the transmission on the supplementary uplink carrier on SCell within 20ms from the start of T3.

In test 2 the UE shall be ready to start transmission on the NR uplink carrier on SCell within 20ms from the start of T2.

In test 2 the UE shall stop the transmission on the NR uplink carrier on SCell within 20ms from the start of T3.

All of the above test requirements shall be fulfilled in order for the observed UE UL carrier configuration delay and UE UL carrier release delay to be counted as correct. The rate of correct observed UE UL carrier configuration delay and UE UL carrier release delay during repeated tests shall be at least 90%.

## A.4.5.5 Beam Failure Detection and Link recovery procedures

### A.4.5.5.1 EN-DC Beam Failure Detection and Link Recovery Test for FR1 PSCell configured with SSB-based BFD and LR in non-DRX mode

#### A.4.5.5.1.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects SSB-based beam failure in the set  $q_0$  configured for a serving PSCell and that the UE performs correct SSB-based link recovery based on beam candidate set  $q_1$ . The purpose is to test the downlink monitoring for beam failure detection within the UEs active DL BWP of the PSCell, during the evaluation period, and link recovery, when no DRX is used. This test will partly verify the SSB based beam failure detection and link recovery for an FR1 serving cell requirements in clause 8.5.

The test parameters are given in Tables A.4.5.5.1.1-1, A.4.5.5.1.1-2, A.4.5.5.1.1-3 and A.4.5.5.1.1-4 below. There are two cells, cell 1 is the E-UTRAN PCell, and cell 2 is the PSCell, in the test. The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.4.5.5.1.1-1 shows the variation of the downlink SNR of the PCell and the SNR of the SSB in set  $q_0$  in the active PSCell to emulate SSB based beam failure. Figure A.4.5.5.1.1-2 shows the variation of the downlink L1-RSRP of the SSB in set  $q_1$  of the candidate beam used for link recovery. Prior to the start of the time duration T1, the UE shall be fully synchronized to cell 1 and cell 2. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is not enabled. The UE is configured to perform inter-frequency measurements using GP ID #0 (40ms) in test 1.

**Table A.4.5.5.1.1-1: Supported test configurations for FR1 PCell**

| Configuration | Description  |
|---------------|--|
| 1             | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                      |
| 2             | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode                      |
| 3             | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode                      |
| 4             | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                      |
| 5             | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode                      |
| 6             | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode                      |
| Note:         | The UE is only required to pass in one of the supported test configurations in FR1 |

**Table A.4.5.5.1.1-2: General test parameters for FR1 PSCell for SSB-based beam failure detection and link recovery testing in non-DRX mode**

| Parameter                | Unit | Value  | Comment |
|--------------------------|------|--------|---------|

|                                   | Config 3, 6 |   | -98               |      |     |     |     |
| Propagation condition             |             |   | TDL-C 300ns 100Hz |      |     |     |     |
| Note 1:                           |             | OCNG shall be used such that the resources in Cell 1 are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                      |                   |      |     |     |     |
| Note 2:                           |             | The uplink resources for CSI reporting are assigned to the UE prior to the start of time period T1.   |                   |      |     |     |     |
| Note 3:                           |             | NZP CSI-RS resource set configuration for CSI reporting are assigned to the UE prior to the start of time period T1.  |                   |      |     |     |     |
| Note 4:                           |             | Measurement gap configuration is assigned to the UE prior to the start of time period T1.   |                   |      |     |     |     |
| Note 5:                           |             | The timers and layer 3 filtering related parameters are configured prior to the start of time period T1.  |                   |      |     |     |     |
| Note 6:                           |             | The signal contains PDCCH for UEs other than the device under test as part of OCNG.   |                   |      |     |     |     |
| Note 7:                           |             | SNR levels correspond to the signal to noise ratio over the SSS REs.  |                   |      |     |     |     |
| Note 8:                           |             | The SNR in time periods T1, T2, T3, T4 and T5 is denoted as SNR1, SNR2 and SNR3 respectively in figure A.4.5.5.1.1-1.   |                   |      |     |     |     |
| Note 9:                           |             | The SNR values are specified for testing a UE which supports 2RX on at least one band. For testing of a UE which supports 4RX on all bands, the SNR during T3 is modified as specified in clause A.3.6. |                   |      |     |     |     |

Table A.4.5.5.1.1-4: Void

Figure A.4.5.5.1.1-1: SNR variation for SSB-based beam failure detection and link recovery testing in non-DRX mode

Figure A.4.5.5.1.1-2: L1-RSRP level variation for SSB-based beam failure detection and link recovery testing in non-DRX mode

#### A.4.5.5.1.2 Test Requirements

The UE behaviour during time durations T1, T2, T3, T4 and T5 shall be as follows:

During the time duration T1 and T2, the UE shall transmit uplink signal at least in all subframes configured for CSI transmission on Cell 1.

During the period from time point A to time point B the UE shall transmit uplink signal in Cell 1 in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting for Cell 1.

During T3 the UE shall detect beam failure and initiate link recovery. During T4 and T5 the UE measures and evaluate beam candidate from beam candidate set  $q_1$ .

No later than time point F occurring no later than  $D1 = 120 + 10$  ms after the start of T5, the UE shall transmit preamble on a beam associated with the candidate beam set  $q_1$ . The UE shall not transmit preamble on a beam associated with the candidate beam set  $q_1$  earlier than time point B.

Test is concluded once the test equipment has received the initial preamble transmission from the UE. The rate of correct events observed during repeated tests shall be at least 90%.

#### A.4.5.5.2 EN-DC Beam Failure Detection and Link Recovery Test for FR1 PSCell configured with SSB-based BFD and LR in DRX mode

##### A.4.5.5.2.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects SSB-based beam failure in the set  $q_0$  configured for a serving PSCell and that the UE performs correct SSB-based link recovery based on beam candidate set  $q_1$ . The purpose is to test the downlink monitoring for beam failure detection within the UEs active DL BWP of the PSCell, during the evaluation period, and link recovery, when DRX is used. This test will partly verify the SSB based beam failure detection and link recovery for an FR1 serving cell requirements in clause 8.5.

The test parameters are given in Tables A.4.5.5.2.1-1, A.4.5.5.2.1-2, A.4.5.5.2.1-3, A.4.5.5.2.1-4 and A.4.5.5.2.1-5 below. There are two cells, cell 1 is the E-UTRAN PCell, and cell 2 is the PSCell, in the test. The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.4.5.5.2.1-1 shows the variation of the downlink SNR of the PCell and the SNR of the SSB in set  $q_0$  in the active PSCell to emulate SSB based beam failure. Figure A.4.5.5.2.1-2 shows the variation of the downlink L1-RSRP of the SSB in set  $q_1$  of the candidate beam used for link recovery. Prior to the start of the time duration T1, the UE shall be fully synchronized to cell 1 and cell 2. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is enabled in PSCell and DRX inactivity timer has already been expired, i.e. UE tries to decode PDCCH and to send periodic CQI during the period when On-duration timer is running. Time alignment timers shall be set to "infinity" so that UL timing alignment is maintained during the test.

**Table A.4.5.5.2.1-1: Supported test configurations for FR1 PCell**

| Configuration | Description  |
|---------------|--|
| 1             | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                      |
| 2             | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode                      |
| 3             | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode                      |
| 4             | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                      |
| 5             | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode                      |
| 6             | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode                      |
| Note:         | The UE is only required to pass in one of the supported test configurations in FR1 |

**Table A.4.5.5.2.1-2: General test parameters for FR1 PCell for SSB-based beam failure detection and link recovery testing in DRX mode**

| Parameter                |                   | Unit | Value         | Comment |
|--------------------------|-------------------|------|---------------|---------|

Figure A.4.5.5.2.1-2: L1-RSRP level variation for SSB-based beam failure detection and link recovery testing in DRX mode

#### A.4.5.5.2.2 Test Requirements

The UE behaviour during time durations T1, T2, T3, T4 and T5 shall be as follows:

During the time duration T1 and T2, the UE shall transmit uplink signal at least in all subframes configured for CSI transmission on Cell 1.

During the period from time point A to time point B the UE shall transmit uplink signal in Cell 1 in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting for Cell 1.

During T3 the UE shall detect beam failure and initiate link recovery. During T4 and T5 the UE measures and evaluates beam candidate from beam candidate set  $q_1$ .

No later than time point F occurring no later than  $D1 = 1920 + 10$  ms after the start of T5, the UE shall transmit preamble on a beam associated with the candidate beam set  $q_1$ . The UE shall not transmit preamble on a beam associated with the candidate beam set  $q_1$  earlier than time point B.

Test is concluded once the test equipment has received the initial preamble transmission from the UE. The rate of correct events observed during repeated tests shall be at least 90%.

#### A.4.5.5.3 EN-DC Beam Failure Detection and Link Recovery Test for FR1 PSCell configured with CSI-RS-based BFD and LR in non-DRX mode

##### A.4.5.5.3.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects CSI-RS-based beam failure in the set  $q_0$  configured for a serving PSCell and that the UE performs correct CSI-RS-based link recovery based on beam candidate set  $q_1$ . The purpose is to test the downlink monitoring for beam failure detection within the UEs active DL BWP of the PSCell, during the evaluation period, and link recovery, when no DRX is used. This test will partly verify the CSI-RS based beam failure detection and link recovery for an FR1 serving cell requirements in clause 8.5.

The test parameters are given in Tables A.4.5.5.3.1-1, A.4.5.5.3.1-2, and A.4.5.5.3.1-3 below. There are two cells, cell 1 is the E-UTRAN PCell, and cell 2 is the PSCell, in the test. The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.4.5.5.3.1-1 shows the variation of the downlink SNR of the PSCell and the SNR of the CSI-RS in set  $q_0$  in the active PSCell to emulate CSI-RS based beam failure. Figure A.4.5.5.3.1-2 shows the variation of the downlink L1-RSRP of the CSI-RS in set  $q_1$  of the candidate beam used for link recovery. Prior to the start of the time duration T1, the UE shall be fully synchronized to cell 1 and cell 2. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is not enabled.

**Table A.4.5.5.3.1-1: Supported test configurations for FR1 PSCell**

| Configuration | Description   |
|---------------|---|
| 1             | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2             | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3             | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4             | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5             | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6             | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |

Note: The UE is only required to pass in one of the supported test configurations in FR1

**Table A.4.5.5.3.1-2: General test parameters for FR1 PSCell for CSI-RS-based beam failure detection and link recovery testing in non-DRX mode**

| Parameter                      | Unit                    | Value           | Comment |

**Figure A.4.5.5.3.1-2: L1-RSRP level variation for CSI-RS based beam failure detection and link recovery testing in non-DRX mode**

#### A.4.5.5.3.2 Test Requirements

The UE behaviour during time durations T1, T2, T3, T4 and T5 shall be as follows:

During the time duration T1 and T2, the UE shall transmit uplink signal at least in all subframes configured for CSI transmission on Cell 1.

During the period from time point A to time point B the UE shall transmit uplink signal in Cell 1 in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting for Cell 1.

During T3 the UE shall detect beam failure and initiate link recovery. During T4 and T5 the UE measures and evaluates beam candidate from beam candidate set  $q_1$ .

No later than time point F occurring no later than  $D1 = 30+10$  ms after the start of T5, the UE shall transmit preamble on a beam associated with the candidate beam set  $q_1$ . The UE shall not transmit preamble on a beam associated with the candidate beam set  $q_1$  earlier than time point B.

Test is concluded once the test equipment has received the initial preamble transmission from the UE. The rate of correct events observed during repeated tests shall be at least 90%.

#### A.4.5.5.4 EN-DC Beam Failure Detection and Link Recovery Test for FR1 PSCell configured with CSI-RS-based BFD and LR in DRX mode

##### A.4.5.5.4.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects CSI-RS-based beam failure in the set  $q_0$  configured for a serving PSCell and that the UE performs correct CSI-RS-based link recovery based on beam candidate set  $q_1$ . The purpose is to test the downlink monitoring for beam failure detection within the UEs active DL BWP of the PSCell, during the evaluation period, and link recovery, when DRX is used. This test will partly verify the CSI-RS based beam failure detection and link recovery for an FR1 serving cell requirements in clause 8.5.

The test parameters are given in Tables A.4.5.5.4.1-1, A.4.5.5.4.1-2, A.4.5.5.4.1-3, and A.4.5.5.4.1-4 below. There are two cells, cell 1 is the E-UTRAN PCell, and cell 2 is the PSCell, in the test. The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.4.5.5.4.1-1 shows the variation of the downlink SNR of the PSCell and the SNR of the CSI-RS in set  $q_0$  in the active PSCell to emulate CSI-RS based beam failure. Figure A.4.5.5.4.1-2 shows the variation of the downlink L1-RSRP of the CSI-RS in set  $q_1$  of the candidate beam used for link recovery. Prior to the start of the time duration T1, the UE shall be fully synchronized to cell 1 and cell 2. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is enabled in PSCell and DRX inactivity timer has already been expired, i.e. UE tries to

decode PDCCH and to send periodic CQI during the period when On-duration timer is running. Time alignment timers shall be set to “infinity” so that UL timing alignment is maintained during the test.

**Table A.4.5.5.4.1-1: Supported test configurations for FR1 PSCell**

| Configuration | Description  |
|---------------|--|
| 1             | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                      |
| 2             | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode                      |
| 3             | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode                      |
| 4             | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                      |
| 5             | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode                      |
| 6             | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode                      |
| Note:         | The UE is only required to pass in one of the supported test configurations in FR1 |

#### A.4.5.5.4.2 Test Requirements

The UE behaviour during time durations T1, T2, T3, T4 and T5 shall be as follows:

During the time duration T1 and T2, the UE shall transmit uplink signal at least in all subframes configured for CSI transmission on Cell 1.

During the period from time point A to time point B the UE shall transmit uplink signal in Cell 1 in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting for Cell 1.

During T3 the UE shall detect beam failure and initiate link recovery. During T4 and T5 the UE measures and evaluate beam candidate from beam candidate set  $q_1$ .

No later than time point F occurring no later than  $D1 = 1920 + 10$  ms after the start of T5, the UE shall transmit preamble on a beam associated with the candidate beam set  $q_1$ . The UE shall not transmit preamble on a beam associated with the candidate beam set  $q_1$  earlier than time point B.

Test is concluded once the test equipment has received the initial preamble transmission from the UE. The rate of correct events observed during repeated tests shall be at least 90%.

## A.4.5.6 Active BWP switch

### A.4.5.6.1 DCI-based and Timer-based Active BWP Switch

#### A.4.5.6.1.1 E-UTRAN – NR PSCell FR1 DL active BWP switch in non-DRX in synchronous EN-DC

##### A.4.5.6.1.1.1 Test Purpose and Environment

The purpose of this test is to verify the DL BWP switch delay requirement defined in TS38.133 clause 8.6, and interruption requirement for E-UTRA victim cell defined in TS36.133 clause 7.32.2.7. Supported test configurations are shown in Table A.4.5.6.1.1.1-1.

The test scenario comprises of one E-UTRA PCell (Cell 1), and one PSCell (Cell 2) as given in Table A.4.5.6.1.1.1-2. Cell-specific parameters of E-UTRA PCell are specified in Table A.3.7.2.1-1 and Cell-specific parameters of PSCell is specified in Table A.4.5.6.1.1.1-3 below.

PDCCHs indicating new transmissions shall be sent continuously on E-UTRA PCell (Cell 1) to ensure that the UE will have ACK/NACK sending.

PDCCHs indicating new transmissions shall be sent continuously on PSCell (Cell 2) to ensure that the UE would have ACK/NACK sending except for the time duration when BWP is switching on Cell 2 and the time duration of T2.

Before the test starts,

- UE is connected to Cell 1 (E-UTRA PCell) on radio channel 1 (PCC), and Cell 2 (PSCell) on radio channel 2 (PSCC).
- UE is configured with 2 different UE-specific downlink bandwidth parts for PSCell, BWP-1 and BWP-2, in Cell 2 before starting the test. BWP-1 and BWP-2 always include bandwidth of the initial DL BWP and SSB.
- UE is indicated in *firstActiveDownlinkBWP-Id* that the active DL BWP is BWP-1 in PSCell.
- UE is configured with a *bwp-InactivityTimer* timer value for PSCell.

All cells have constant signal levels throughout the test.

The test consists of 3 successive time periods, with durations of T1, T2, and T3, respectively.

During T1,

Time period T1 starts when a DCI format 1\_1 command for PSCell DL BWP switch, sent from the test equipment to the UE, is received at the UE side in PSCell's slot # denoted  $i$ . The UE shall switch its bandwidth part from BWP-1 to BWP-2.

The UE shall be able to receive PDSCH on the first DL slot that occurs after the beginning of PSCell's DL slot ( $i + T_{BWPswitchDelay}$ ) as defined in clause 8.6 and starts to report valid ACK/NACK for the PSCell no later than the first UL slot that occurs after the beginning of DL slot ( $i + T_{BWPswitchDelay} + kI$ ). The UE shall be continuously scheduled on PSCell's BWP-2 starting from the first DL slot that occurs after the beginning of DL slot ( $i + T_{BWPswitchDelay}$ ).

The starting time of E-UTRA PCell (Cell 1) interruption due to BWP switch on PSCell shall occur within the BWP switch delay.

During T2, the test equipment won't transmit DCI format for PDSCH reception on PSCell(Cell 2).

During T3,

The time period T3 starts from the slot # $j$ , where  $j$  is the first slot of the subframe immediately after the *bwp-InactivityTimer* timer expires. The UE shall switch its bandwidth part from BWP-2 back to the default bandwidth part – BWP-1.

The UE shall be able to receive PDSCH on the first DL slot that occurs after the beginning of PSCell's DL slot ( $j+T_{BWPswitchDelay}$ ) as defined in clause 8.6 and starts to report valid ACK/NACK for the PSCell at latest on the first UL slot that occurs after the beginning of DL slot ( $j+T_{BWPswitchDelay}+kI$ ). The UE shall be continuously scheduled on PSCell's BWP-1 starting from the first DL slot that occurs after the beginning of DL slot ( $j+T_{BWPswitchDelay}$ ).

The starting time of E-UTRA PCell (Cell 1) interruption due to BWP switch of PSCell shall occur within the BWP switch delay.

The test equipment verifies the DL BWP switch time in PSCell by counting the slots from the time when the BWP switch command is received or *bwp-InactivityTimer* timer expires till an ACK/NACK is received.

The test equipment verifies that potential interruption to E-UTRA PCell is carried out in the correct time span by monitoring ACK/NACK sent in E-UTRA PCell during BWP switch of PSCell, respectively.

**Table A.4.5.6.1.1-1: DL BWP switch supported test configurations**

| Config   | Description   |
|--|---|
| 1  | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2  | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3  | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4  | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5  | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6  | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| Note 1: The UE is only required to be tested in one of the supported test configurations.                    |   |
| Note 2: A UE which fulfils the requirements in test case A.4.5.6.1.2 can skip the test cases in A.4.5.6.1.1. |   |

**Table A.4.5.6.1.1-2: General test parameters for DL BWP switch in synchronous EN-DC**

| Parameter   | Unit | Value  | Comment  |

#### A.4.5.6.1.1.2 Test Requirements

During T1, the UE shall start to send the ACK/NACK for PSCell from the first UL slot that occurs after the beginning of DL slot ( $i+T_{BWPswitchDelay}+kI$ ).

During T3, the UE shall start to send the ACK/NACK for PSCell from the first UL slot that occurs after the beginning of DL slot ( $j+T_{BWPswitchDelay}+kI$ ).

Where,  $kI$  is the timing between DL data receiving and acknowledgement as specified in [7].

Depending on UE capability *bwp-SwitchingDelay* [2], UE shall finish BWP switch within the time duration  $T_{BWPswitchDelay}$  defined in Table 8.6.2-1.

All of the above test requirements shall be fulfilled in order for the observed PSCell active BWP switch delay to be counted as correct.

The rate of correct events observed during repeated tests shall be at least 90%.

During T1, the start time of E-UTRA PCell interruption during PSCell active BWP switch shall not happen outside the BWP switch delay.

During T3, the start time of E-UTRA PCell interruption of during PSCell active BWP switch shall not happen outside the BWP switch delay.

The interruption of E-UTRA PCell shall not be longer than the interruption duration specified for active BWP switch in TS36.133 Clause 7.32.2.7.

All of the above test requirements shall be fulfilled in order for the observed E-UTRA PCell active BWP switch interruption to be counted as correct.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: During T1, T3 if there are no uplink resources for reporting the ACK/NACK in the first UL slot that occurs after the beginning of DL slot ( $i+T_{BWPswitchDelay+kI}$ ), ( $j+T_{BWPswitchDelay+kI}$ ), then the UE shall use the next available uplink resource for reporting the corresponding ACK/NACK.

#### A.4.5.6.1.2 E-UTRAN – NR PSCell FR1 DL active BWP switch with FR1 SCell in non-DRX in synchronous EN-DC

##### A.4.5.6.1.2.1 Test Purpose and Environment

The purpose of this test is to verify the DL BWP switch delay requirement defined in clause 8.6, and interruption requirements for NR victim cell defined in clause 8.2.1.2.7 and interruption requirement for E-UTRA victim cell defined in clause 7.32.2.7 of TS 36.133 [15]. Supported test configurations for LTE PCell and NR PSCell are shown in Table A.4.5.6.1.2.1-1. Supported test configurations for NR SCell are shown in table A.4.5.6.1.2.1-1A. Test configuration for LTE PCell and NR PSCell and test configuration for NR SCell are chosen independently.

The test scenario comprises of one E-UTRA PCell (Cell 1), one PSCell (Cell 2) and one SCell (Cell 3) as given in Table A.4.5.6.1.2.1-2. Cell-specific parameters of E-UTRA PCell are specified in Table A.3.7.2.1-1 and Cell-specific parameters of PSCell and SCell are specified in Table A.4.5.6.1.2.1-3 and Table A.4.5.6.1.2.1-4 below.

PDCCHs indicating new transmissions shall be sent continuously on E-UTRA PCell (Cell 1) and PSCell (Cell 2) to ensure that the UE will have ACK/NACK sending.

PDCCHs indicating new transmissions shall be sent continuously on SCell (Cell 3) to ensure that the UE would have ACK/NACK sending except for the time duration when BWP is switching on Cell 3 and the time duration of T2.

Before the test starts,

- UE is connected to Cell 1 (E-UTRA PCell) on radio channel 1 (PCC), Cell 2 (PSCell) on radio channel 2 (PSCC) and Cell 3 (SCell) on radio channel 3 (SCC).
- UE is configured with 2 different UE-specific downlink bandwidth parts for SCell, BWP-1 and BWP-2, in Cell 3 before starting the test. BWP-1 and BWP-2 always include bandwidth of the initial DL BWP and SSB.
- UE is configured with 1 UE-specific downlink bandwidth parts the same as initial BWP for PSCell, BWP-0 in Cell 2 before starting the test.
- UE is indicated in *firstActiveDownlinkBWP-Id* that the active DL BWP is BWP-1 in SCell.
- UE is indicated in *firstActiveDownlinkBWP-Id* that the active DL BWP is BWP-0 in PSCell.
- UE is configured with a *bwp-InactivityTimer* timer value for SCell.

All cells have constant signal levels throughout the test.

The test consists of 3 successive time periods, with durations of T1, T2, and T3, respectively.

During T1,

Time period T1 starts when a DCI format 1\_1 command for SCell DL BWP switch, sent from the test equipment to the UE, is received at the UE side in SCell's slot # denoted  $i$ . The UE shall switch its bandwidth part from BWP-1 to BWP-2.

The UE shall be able to receive PDSCH on the first DL slot that occurs after the beginning of SCell's DL slot ( $i+T_{\text{BWPswitchDelay}}$ ) as defined in clause 8.6 and starts to report valid ACK/NACK for the SCell on PSCell no later than on the first UL slot that occurs after the beginning of slot ( $i+T_{\text{BWPswitchDelay}}+k_1$ ). The UE shall be continuously scheduled on SCell's BWP-2 starting from the first DL slot that occurs after the beginning of slot ( $i+T_{\text{BWPswitchDelay}}$ ).

E-UTRA PCell(Cell 1) interruption due to BWP switch on PSCell shall occur within the BWP switch delay.

PSCell(Cell 2) interruption due to BWP switch on SCell shall occur within the BWP switch delay.

During T2, the test equipment won't transmit DCI format for PDSCH reception on SCell(Cell 3).

During T3,

The time period T3 starts from the slot # $j$ , where  $j$  is the first slot of the subframe immediately after *bwp-InactivityTimer* timer expires. The UE shall switch its bandwidth part from BWP-2 back to the default bandwidth part – BWP-1.

The UE shall be able to receive PDSCH on the first DL slot that occurs after the beginning of SCell's DL slot ( $j+T_{\text{BWPswitchDelay}}$ ) as defined in clause 8.6 and starts to report valid ACK/NACK for the SCell on PSCell no later than on the first UL slot that occurs after the beginning of slot ( $j+T_{\text{BWPswitchDelay}}+k_1$ ). The UE shall be continuously scheduled on SCell's BWP-1 starting from the first DL slot that occurs after the beginning of slot ( $j+T_{\text{BWPswitchDelay}}$ ).

E-UTRA PCell(Cell 1) interruption due to BWP switch of SCell shall occur within the BWP switch delay.

PSCell(Cell 2) interruption due to BWP switch of SCell shall occur within the BWP switch delay.

The test equipment verifies the DL BWP switch time in SCell by counting the slots from the time when the BWP switch command is received or *bwp-InactivityTimer* timer expires till an ACK/NACK is received.

The test equipment verifies that potential interruption to E-UTRA PCell and NR PSCell is carried out in the correct time span by monitoring ACK/NACK sent in E-UTRA PCell and PSCell during BWP switch of SCell, respectively.

**Table A.4.5.6.1.2.1-1: DL BWP switch supported test configurations for LTE PCell and NR PSCell**

| Config  | Description  |
|---------|--|
| 1       | LTE FDD, NR 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, FDD duplex mode   |
| 2       | LTE FDD, NR 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, TDD duplex mode   |
| 3       | LTE FDD, NR 30 kHz SSB SCS, $\geq 40$ MHz bandwidth, TDD duplex mode   |
| 4       | LTE TDD, NR 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, FDD duplex mode   |
| 5       | LTE TDD, NR 15 kHz SSB SCS, $\geq 10$ MHz bandwidth, TDD duplex mode   |
| 6       | LTE TDD, NR 30 kHz SSB SCS, $\geq 40$ MHz bandwidth, TDD duplex mode   |
| Note 1: | The UE is only required to be tested in one of the supported test configurations   |
| Note 2: | A UE which fulfils the requirements in test case A.4.5.6.1.2 can skip the test cases in A.4.5.6.1.1.   |
| Note 3: | Void   |
| Note 4: | The UE is only required to be tested in one with smallest aggregated channel bandwidth from supported band combinations which is composed of CCs $\geq$ the bandwidth ( $BW_{\text{channel}}$ ) defined in each test configuration |

**Table A.4.5.6.1.2.1-1A: DL BWP switch supported test configurations for NR SCell**

| Config <sub>SCell</sub> | Description  |
|-------------------------|--|
| 1                       | NR 15 kHz SSB SCS, ≥10 MHz bandwidth, FDD duplex mode  |
| 2                       | NR 15 kHz SSB SCS, ≥10 MHz bandwidth, TDD duplex mode  |
| 3                       | NR 30 kHz SSB SCS, ≥40 MHz bandwidth, TDD duplex mode  |
| Note 1:                 | The UE is only required to be tested in one of the supported test configurations   |
| Note 2:                 | A UE which fulfils the requirements in test case A.4.5.6.1.2 can skip the test cases in A.4.5.6.1.1.   |
| Note 3:                 | The UE is only required to be tested in one with smallest aggregated channel bandwidth from supported band combinations which is composed of CCs ≥ the bandwidth (BW <sub>channel</sub> ) defined in each test configuration |

**Table A.4.5.6.1.2.1-2: General test parameters for DL BWP switch in synchronous EN-DC**

| Parameter   | Unit | Value  | Comment  |
|---|------|--------|--|
| E-UTRA RF Channel Number                                |      | 1      | One E-UTRA radio channel is used for this test |

|         |  |
|---------|--|
| Note 1: | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.  |
| Note 2: | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled within $BW_{occupied}$ . |
| Note 3: | SS-RSRP and $I_o$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.  |
| Note 4: | For unpaired spectrum, a DL BWP is linked with an UL BWP. DLBWP.0.2 is linked with ULBWP.0.2; DLBWP.1.1 is linked with ULBWP.1.1; DLBWP.1.3 is linked with ULBWP.1.3 defined in clause 12 of TS 38.213 [3].                            |
| Note 5: | All UL/DL transmission shall be confined within $BW_{occupied}$ (i.e. 10 MHz, 52 RBs) from $F_{C,low}$ , and $I_o$ is independent of the $BW_{channel}$ configured.  |
| Note 6: | All UL/DL transmission shall be confined within $BW_{occupied}$ (i.e. 40 MHz, 106 RBs) from $F_{C,low}$ , and $I_o$ is independent of the $BW_{channel}$ configured.   |
| Note 7: | $NRB_c$ is derived from Table 5.3.2-1 in TS38.101-1[2] with configured $BW_{channel}$ .  |

| Note 7:   | NRB <sub>c</sub> is derived from Table 5.3.2-1 in TS38.101-1[2] with configured BW <sub>channel</sub> .  |              |                        |

#### A.4.5.6.1.2.2 Test Requirements

During T1, the UE shall start to send the ACK/NACK for SCell on PSCell from the first UL slot that occurs after the beginning of DL slot ( $i + T_{BWPswitchDelay} + k_1$ ).

During T3, the UE shall start to send the ACK/NACK for SCell on PSCell from the first UL slot that occurs after the beginning of DL slot ( $j + T_{BWPswitchDelay} + k_1$ ).

Where,  $k_1$  is the timing between DL data receiving and acknowledgement as specified in [7].

Depending on UE capability *bwp-SwitchingDelay* [2], UE shall finish BWP switch within the time duration  $T_{BWPswitchDelay}$  defined in Table 8.6.2-1.

All of the above test requirements shall be fulfilled in order for the observed SCell active BWP switch delay to be counted as correct.

The rate of correct events observed during repeated tests shall be at least 90%.

During T1, the start of the interruption of E-UTRA PCell during SCell active BWP switch shall not happen outside the BWP switch delay.

During T3, the start of the interruption of E-UTRA PCell during SCell active BWP switch shall not happen outside the BWP switch delay.

The interruption of E-UTRA PCell shall not be longer than the interruption duration specified for active BWP switch in clause 7.32.2.7 of TS 36.133 [15].

During T1, the start of the interruption of PSCell during SCell active BWP switch shall not happen outside the BWP switch delay.

During T3, the start of the interruption of PSCell during SCell active BWP switch shall not happen outside the BWP switch delay.

The interruption of PSCell shall not be longer than the interruption duration specified for active BWP switch in clause 8.6.2.

All of the above test requirements shall be fulfilled in order for the observed E-UTRA PCell and PSCell active BWP switch interruption to be counted as correct.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: During T1, T3 if there are no uplink resources for reporting the ACK/NACK in the first UL slot that occurs after the beginning of DL slot ( $i+T_{\text{BWPswitchDelay}}+k_1$ ), ( $j+T_{\text{BWPswitchDelay}}+k_1$ ), then the UE shall use the next available uplink resource for reporting the corresponding ACK/NACK.

#### A.4.5.6.2 RRC-based Active BWP Switch

##### A.4.5.6.2.1 E-UTRAN – NR PSCell FR1 DL active BWP switch in non-DRX in synchronous EN-DC

###### A.4.5.6.2.1.1 Test Purpose and Environment

The purpose of this test is to verify the DL BWP switch delay requirement for RRC-based BWP switch defined in clause 8.6.3. Supported test configurations are shown in Table A.4.5.6.2.1.1-1.

The test scenario comprises of one E-UTRA PCell (Cell 1) and one PSCell (Cell 2) as given in Table A.4.5.6.2.1.1-2. Cell-specific parameters of E-UTRA PCell are specified in Table A.3.7.2.1-1 and Cell-specific parameters of PSCell are specified in Table A.4.5.6.2.1.1-3 below.

PDCCHs indicating new transmissions shall be sent continuously on E-UTRA PCell (Cell 1) to ensure that the UE will have ACK/NACK sending.

PDCCHs indicating new transmissions shall be sent continuously on PSCell (Cell 2) to ensure that the UE would have ACK/NACK sending except for the time duration when BWP is switching on Cell 2.

Before the test starts,

- UE is connected to Cell 1 (E-UTRA PCell) on radio channel 1 (PCC) and to Cell 2 (PSCell) on radio channel 2 (PSCC).
- UE has bandwidth part BWP-1 in its RRC-configuration for Cell 1 (PSCell).
- UE is indicated in *firstActiveDownlinkBWP-Id* that the active DL BWP is BWP-1 of initial condition in PSCell.

All cells have constant signal levels throughout the test.

The test consists of 1 time period, with duration of T1.

During T1,

Time period T1 starts when a *RRCReconfiguration* with updated bandwidth part configuration, sent from the test equipment to the UE, is completely received at the UE side in PSCell's slot # denoted *i*. The UE shall reconfigure its bandwidth part with the updated bandwidth part BWP-1 of final condition.

The UE shall be able to receive PDSCH on PSCell from on the first DL slot that occurs after PSCell's DL slot *i* +  $\frac{T_{RRCprocessingDelay} + T_{BWPswitchDelayRRC}}{NR\ Slot\ length}$  as defined in clause 8.6.3 and starts to report valid ACK/NACK for the PSCell from the first UL slot that occurs after the beginning of DL slot *i* +  $\frac{T_{RRCprocessingDelay} + T_{BWPswitchDelayRRC}}{NR\ Slot\ length} + k1$ . The UE shall be continuously scheduled on PSCell's BWP-1 starting from the first DL slot occurs after the beginning of DL slot *i* +  $\frac{T_{RRCprocessingDelay} + T_{BWPswitchDelayRRC}}{NR\ Slot\ length}$ .

$T_{RRCprocessingDelay}$  and  $T_{BWPswitchDelayRRC}$  are defined in clause 8.6.3.

The test equipment verifies the DL BWP switch time in PSCell by counting the time from the time when the *RRCReconfiguration* message including updated BWP configuration is sent till the time when a valid ACK/NACK is received.

**Table A.4.5.6.2.1.1-1: DL BWP switch supported test configurations**

| Config   | Description   |
|--|---|
| 1  | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2  | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3  | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4  | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5  | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6  | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| Note 1: The UE is only required to be tested in one of the supported test configurations |   |

**Table A.4.5.6.2.1.1-2: General test parameters for DL BWP switch in synchronous EN-DC**

| Parameter   | Unit | Value  | Comment  |
|---|------|--------|--|
| E-UTRA RF Channel Number                                |      | 1      | One E-UTRA radio channel is used for this test |
| NR RF Channel Number                                    |      | 2      | One NR radio channel is used for this test     |
| Active PCell  |      | Cell 1 | PCell on RF channel number 1.                  |
| Active PSCell   |      | Cell 2 | PSCell on RF channel number 2.                 |
| CP length   |      | Normal |  |
| DRX   |      | OFF    |  |
| PDCCH and PDSCH maximum number of HARQ transmission     |      | 1      | For both PCell and PSCell                      |
| Cell-individual offset for cells on RF channel number 1 | dB   | 0      | Individual offset for cells on PCC.            |
| Cell-individual offset for cells on RF channel number 2 | dB   | 0      | Individual offset for cells on PSCC.           |
| Cell2 timing offset to cell1                            | µs   | 3      | Synchronous EN-DC                              |
| T1  | s    | 0.2    |  |

Table A.4.5.6.2.1.1-3: NR Cell specific test parameters for DL BWP switch in synchronous EN-DC

| Parameter                           |                               | Unit       | Cell 2                          |           |
|-------------------------------------|-------------------------------|------------|---------------------------------|-----------|
| Frequency Range                     |                               |            | FR1                             |           |
| Duplex mode                         | Config 1,4                    |            | FDD                             |           |

| <p>Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.</p> <p>Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for <math>N_{oc}</math> to be fulfilled.</p> <p>Note 3: SS-RSRP and <math>I_o</math> levels have been derived from other parameters for information purposes. They are not settable parameters themselves.</p> <p>Note 4: For unpaired spectrum, a DL BWP is linked with an UL BWP. DLBWP.0.2 is linked with ULBWP.0.2; DLBWP.1.1 is linked with ULBWP.1.1; DLBWP.1.3 is linked with ULBWP.1.3 defined in clause 12 of TS 38.213 [3].</p> |                |              |             |

#### A.4.5.6.2.1.2 Test Requirements

During T1, the UE shall be ready for the reception of uplink grant on PSCell from the first DL slot occurs after the beginning of DL slot  $i + \frac{T_{RRCPprocessingDelay} + T_{BWPswitchDelayRRC}}{NR\ Slot\ length}$ , and starts to report valid ACK/NACK for the PSCell from the first UL slot that occurs after the beginning of DL slot  $i + \frac{T_{RRCPprocessingDelay} + T_{BWPswitchDelayRRC}}{NR\ Slot\ length} + k1$

Where,  $k1$  is the timing between DL data receiving and acknowledgement as specified in [7].

All of the above test requirements shall be fulfilled in order for the observed PSCell active BWP switch delay to be counted as correct.

The rate of correct events observed during repeated tests shall be at least 90%.

## A.4.5.7 PSCell addition and release delay

### A.4.5.7.1 Addition and Release Delay of known NR PSCell

#### A.4.5.7.1.1 Test purpose and environment

The purpose of this test is to verify that the NR PSCell addition and release delays under EN-DC are within the requirements stated in clause 7.31.2 [15] for the case when the PSCell is known by the UE at the time of addition.

Supported test configurations are shown in A.4.5.7.1.1-1. The test parameters for the E-UTRA cell are given in Table A.3.7.2.1-1. The E-UTRA cell once set up is not changed across time.

The test parameters for NR cell are given in Tables A.4.5.7.1.1-2 and cell-specific parameters in A.4.5.7.1.1-3 below. The test consists of six successive time periods with duration of T1, T2, T3, T4, T5 and T6 respectively. There are two carriers each with one cell. Before the test starts the UE is connected to Cell 1 (E-UTRA PCell) on radio channel 1 (PCC) but is not aware of Cell 2 (NR PSCell) on radio channel 2. The UE is only monitoring the PCC. During T1 only Cell1 is known to the UE.

Before the start of T2, the UE in the measurement control information that event-triggered reporting with Event B1 is configured for neighbour cell (Cell2). Before the start of T2 the UE is configured with the measurement gaps (gap pattern Id # 0). The Cell2 becomes known to the UE during T2. Therefore, during T2 the UE shall report Event B1. The point in time at which the RRC message to release measurement gap is transmitted from the test system defines the start of period T3. During T3, after measurement gap is released, the test system transmits the RRC message to the UE to add PSCell on radio channel 2.

The RRC message (to add PSCell) also includes a request for the UE to start periodic CSI reporting for the PSCell after the PSCell has been successfully added. The point in time at which the RRC message to add PSCell (Cell2) is received at the UE antenna connector defines the start of period T4.

The test system shall observe the periodic reporting of CSI for PSCell during T5. The point in time at which the UE has sent PRACH to the PSCell (Cell 2) defines the start of period T5.

The test system shall send a RRC message to the UE to release PSCell (Cell 2) on radio channel 2. The RRC message to release PSCell (Cell2) shall be sent to the UE during period T5, after the UE has sent at least one CQI report with non-zero CQI index for PSCell (Cell 2). The point in time at which the RRC message to release PSCell (Cell2) is received at the UE antenna connector defines the start of period T6.

**Table A.4.5.7.1.1-1: Supported test configurations for FR1 PSCell**

| Configuration | Description  |
|---------------|--|
| 1             | LTE FDD, NR SCS 15 kHz, BW 10 MHz, FDD   |
| 2             | LTE FDD, NR SCS 15 kHz, BW 10 MHz, TDD   |
| 3             | LTE FDD, NR SCS 30 kHz, BW 40 MHz, TDD   |
| 4             | LTE TDD, NR SCS 15 kHz, BW 10 MHz, FDD   |
| 5             | LTE TDD, NR SCS 15 kHz, BW 10 MHz, TDD   |
| 6             | LTE TDD, NR SCS 30 kHz, BW 40 MHz, TDD   |
| Note:         | The UE is only required to pass in one of the supported test configurations in FR1 |

**Table A.4.5.7.1.1-2: General Test Parameters for PSCell Addition and Release**

| Parameter         | Unit | Value | Comment   |
|-------------------|------|-------|---|
| RF Channel Number |      | 1, 2  | Two radio channels are used for this test. One for E-UTRA cell and second for NR Cell |

|   |                                 |     |                           |  |
|---|---------------------------------|-----|---------------------------|--|
| Initial Condition                                       | Active PCell                    |     | Cell1                     | PCell on RF channel number 1.  |
|   | Neighbour cell                  |     | Cell2                     | Neighbour cell on RF channel number 2.   |
| Final Condition   | Active PCell                    |     | Cell1                     | PCell on RF channel number 1.  |
|   | Neighbour Cell                  |     | Cell2                     | PSCell released on RF channel number 2.  |
| B1  | Hysteresis                      | dB  | 0                         | Hysteresis for evaluation of event B1.   |
|   | Threshold RSRP (Config 1,2,4,5) | dBm | -96                       | Actual RSRP threshold for event B1. Needs to take absolute accuracy tolerance in clause 9.11.1 of TS 36.133 [15] into account plus margin. |
|   | Threshold RSRP (Config 3,6)     | dBm | -93                       | Actual RSRP threshold for event B1. Needs to take absolute accuracy tolerance in clause 9.11.1 of TS 36.133 [15] into account plus margin. |
|   | Time to Trigger                 | S   | 0                         |  |
| DRX   |                                 |     | OFF                       | Continuous monitoring of primary cell  |
| Measurement gap pattern Id                              |                                 |     | 0                         | Gaps are configured before T2 and released before T3.  |
| PRACH configuration on cell2                            |                                 |     | FR1 PRACH configuration 1 | Captured in A.3.8.2.1  |
| Cell-individual offset for cells on RF channel number 1 |                                 | dB  | 0                         | Individual offset for cells on primary component carrier.  |
| Cell-individual offset for cells on RF channel number 2 |                                 | dB  | 0                         | Individual offset for cells on carrier frequency of cell2.   |
| T1  |                                 | s   | 1                         | During this time the PCell shall be known and cell2 shall be unknown.  |
| T2  |                                 | s   | 1.5                       | During this time the UE shall identify neighbour cell (cell2) and report event B1.   |
| T3  |                                 | s   | 3                         | During this time the test system transmits the RRC messages to release measurement gap and add PSCell.                                     |
| T4  |                                 | s   | 0.5                       | During this time the UE adds the PSCell.   |
| T5  |                                 | s   | 0.5                       | During this time the UE sends CSI reports for PSCell.  |
| T6  |                                 | s   | 0.5                       | During this time the UE releases the PSCell.   |

Table A.4.5.7.1.1-3: Cell Specific Parameters for PSCell Addition and Release

| Parameter                   | Unit | Config      | Test                        |    |    |    |    |    |

They are not settable parameters themselves.</p> <p>Note 4: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.</p> |             |             |           |     |

#### A.4.5.7.1.2 Test Requirements

The UE shall transmit the PRACH to PSCell no later than 82 ms<sup>Note1</sup> from the start of T4.

The UE shall send at least one CSI report for PSCell with non-zero CQI index during T5.

The UE shall periodically send CSI reports for PSCell after the UE has sent first CQI report with non-zero CQI index during T5

The UE shall stop sending CSI reports for PSCell no later than 20ms from the start of T6.

All the above test requirements shall be fulfilled in order for the observed PSCell addition delay and PSCell release delay to be counted as correct. The rate of correct observed PSCell addition delay and PSCell release delay during repeated tests shall be at least 90%.

Note1: The PSCell addition delay can be expressed as follows as specified in clause 7.31.2 [15]:

$$T_{\text{config\_PSCell}} = T_{\text{RRC\_delay}} + T_{\text{processing}} + T_{\text{search}} + T_{\Delta} + T_{\text{PSCell\_DU}} + 2\text{ms}$$

Where:

$$T_{\text{RRC\_delay}} = 20\text{ms}$$

$$T_{\text{processing}} = 20\text{ms}$$

$$T_{\text{search}} = 0$$

$$T_{\Delta} = 20\text{ms}$$

$$T_{\text{PSCell\_DU}} = 1 * 10 + 10 = 20\text{ms}$$

## A.4.6 Measurement procedure

### A.4.6.1 Intra-frequency Measurements

#### A.4.6.1.1 EN-DC event triggered reporting tests without gap under non-DRX

##### A.4.6.1.1.1 Test purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the intra-frequency cell search requirements in clause 9.2.5.1 and 9.2.5.2.

##### A.4.6.1.1.2 Test parameters

Three cells are deployed in the test, which are E-UTRAN PCell (Cell 1), FR1 PSCell (Cell 2) and a FR1 neighbour cell (Cell 3) on the same frequency as the PSCell. The test parameters for PSCell are given in Table A.4.6.1.1.2-1, A.4.6.1.1.2-2, A.4.6.1.1.2-3 below and the test parameters and applicability for the E-UTRAN cell are defined in A.3.7.2. In the measurement control information, a measurement object is configured for the frequency of the PSCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of cell 3.

**Table A.4.6.1.1.2-1: Supported test configurations**

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3      | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6      | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |

Note 1: The UE is only required to be tested in one of the supported test configurations  
Note 2: Target NR Cell 3 has the same SCS, BW and duplex mode as NR serving Cell 2

**Table A.4.6.1.1.2-2: General test parameters for EN-DC intra-frequency event triggered reporting without gap for PSCell in FR1**

| Parameter          | Unit | Test configuration | Value                             | Comment                |
|--------------------|------|--------------------|-----------------------------------|------------------------|
| Active cell        |      | 1, 2, 3, 4, 5, 6   | E-UTRAN Cell 1 and NR Cell 2      |                        |
| Neighbour cell     |      | 1, 2, 3, 4, 5, 6   | NR Cell 3                         | Cell to be identified. |
| RF Channel Number  |      | 1, 2, 3, 4, 5, 6   | 1: Cell 1<br>2: Cell 2 and Cell 3 |                        |
| SSB configuration  |      | 1, 4               | SSB.1 FR1                         |                        |
|                    |      | 2, 5               | SSB.1 FR1                         |                        |
|                    |      | 3, 6               | SSB.2 FR1                         |                        |
| SMTC configuration |      | 1, 4               | SMTC.2                            |                        |
|                    |      | 2, 5               | SMTC.1                            |                        |
|                    |      | 3, 6               | SMTC.1                            |                        |
| A3-Offset          | dB   | 1, 2, 3, 4, 5, 6   | -4.5                              |                        |

|   |    |                  |           |   |
|---|----|------------------|-----------|---|
| CP length                                       |    | 1, 2, 3, 4, 5, 6 | Normal    |   |
| Hysteresis                                      | dB | 1, 2, 3, 4, 5, 6 | 0         |   |
| Time To Trigger                                 | s  | 1, 2, 3, 4, 5, 6 | 0         |   |
| Filter coefficient                              |    | 1, 2, 3, 4, 5, 6 | 0         | L3 filtering is not used  |
| DRX   |    | 1, 2, 3, 4, 5, 6 | N/A       | OFF   |
| Time offset between PCell and PSCell            |    | 1, 2, 3, 4, 5, 6 | 3 $\mu$ s | Synchronous EN-DC   |
| Time offset between serving and neighbour cells |    | 1, 4             | 3 ms      | Asynchronous cells.<br>The timing of Cell 3 is 3ms later than the timing of Cell 2. |
|   |    | 2, 5             | 3 $\mu$ s | Synchronous cells   |
|   |    | 3, 6             | 3 $\mu$ s | Synchronous cells   |
| T1  | s  | 1, 2, 3, 4, 5, 6 | 5         |   |
| T2  | s  | 1, 2, 3, 4, 5, 6 | 5         |   |

**Table A.4.6.1.1.2-3: NR Cell specific test parameters for EN-DC intra-frequency event triggered reporting without gap for PSCell in FR1**

| Parameter                           | Unit    | Test configuration | Cell 2                 |    | Cell 3                 |    |
|-------------------------------------|---------|--------------------|------------------------|----|------------------------|----|

| <p>Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.</p> <p>Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for <math>N_{oc}</math> to be fulfilled.</p> <p>Note 3: SS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.</p> |               |                  |        |        |           |        |

#### A.4.6.1.1.3 Test Requirements

The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 800 ms from the beginning of time period T2. The UE is not required to read the neighbour cell SSB index in this test.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2xTTI_{DCC}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCC.

#### A.4.6.1.2 EN-DC event triggered reporting tests without gap under DRX

##### A.4.6.1.2.1 Test purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the TDD intra-frequency cell search requirements in clause 9.2.5.1 and 9.2.5.2.

##### A.4.6.1.2.2 Test parameters

Three cells are deployed in the test, which are E-UTRAN PCell (Cell 1), FR1 PSCell (Cell 2) and a FR1 neighbour cell (Cell 3) on the same frequency as the PSCell. The test parameters for PSCell are given in Table A.4.6.1.2.1-1, A.4.6.1.2.1-2, A.4.6.1.2.1-3 and A.4.6.1.2.1-4 below and the test parameters and applicability for the E-UTRAN cell are defined in A.3.7.2. In the measurement control information, a measurement object is configured for the frequency of the PSCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used. The test

consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of cell 3.

UE needs to be provided with new Timing Advance Command MAC control element at least once during each time alignment timer period to maintain uplink time alignment. Furthermore UE is allocated with PUSCH resource at every DRX cycle.

**Table A.4.6.1.2.2-1: Supported test configurations**

| Config  | Description  |
|---------|--|
| 1       | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                    |
| 2       | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode                    |
| 3       | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode                    |
| 4       | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                    |
| 5       | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode                    |
| 6       | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode                    |
| Note 1: | The UE is only required to be tested in one of the supported test configurations |
| Note 2: | Target NR Cell 3 has the same SCS, BW and duplex mode as NR serving Cell 2       |

| Propagation Condition |  | 1, 2, 3, 4, 5, 6 | AWGN   |        |        |        |
| Note 1:               | The resources for uplink transmission are assigned to the UE prior to the start of time period T2.   |                  |        |        |        |        |
| Note 2:               | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |                  |        |        |        |        |
| Note 3:               | SS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.  |                  |        |        |        |        |

#### A.4.6.1.2.2 Test Requirements

In test 1, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 920 ms from the beginning of time period T2. The UE is not required to read the neighbour cell SSB index in this test.

In test 2, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 6400 ms from the beginning of time period T2. The UE is not required to read the neighbour cell SSB index in this test.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2 \times TTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

#### A.4.6.1.3 EN-DC event triggered reporting tests with per-UE gaps under non-DRX

##### A.4.6.1.3.1 Test purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the TDD intra-frequency cell search requirements in clause 9.2.6.2 and 9.2.6.3.

##### A.4.6.1.3.2 Test parameters

Three cells are deployed in the test, which are E-UTRAN PCell (Cell 1), FR1 PSCell (Cell 2) and a FR1 neighbour cell (Cell 3) on the same frequency as the PSCell. The test parameters for PSCell are given in Table A.4.6.1.3.1-1 and A.4.6.1.3.1-2 below and the test parameters and applicability for the E-UTRAN cell are defined in A.3.7.2. In the measurement control information, a measurement object is configured for the frequency of the PSCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of cell 3.

There are two BWPs configured in Cell 2, BWP1 which contains the cell defining SSB, and BWP2 which does not contain any SSB of Cell 2. During the whole test, BWP2 is always scheduled as the active BWP for the UE.

**Table A.4.6.1.3.2-1: Supported test configurations**

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3      | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |

|  |   |
|--|---|
| 5  | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6  | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| Note 1: The UE is only required to be tested in one of the supported test configurations |   |
| Note 2: Target NR Cell 3 has the same SCS, BW and duplex mode as NR serving Cell 2       |   |

**Table A.4.6.1.3.2-2: General test parameters for EN-DC intra-frequency event triggered reporting with per-UE gaps for PSCell in FR1**

| Parameter                                       | Unit | Test configuration | Value                             | Comment   |
|---|------|--------------------|-----------------------------------|---|

|         |  |
|---------|--|
| Note 1: | The resources for uplink transmission are assigned to the UE prior to the start of time period T2.   |
| Note 2: | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |
| Note 3: | SS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.  |

#### A.4.6.1.3.3 Test Requirements

The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 800 ms from the beginning of time period T2. The UE is not required to read the neighbour cell SSB index in this test.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2 \times TTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

#### A.4.6.1.4 EN-DC event triggered reporting tests with per-UE gaps under DRX

##### A.4.6.1.4.1 Test purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the intra-frequency cell search requirements in clause 9.2.6.2 and 9.2.6.3.

##### A.4.6.1.4.2 Test parameters

Three cells are deployed in the test, which are E-UTRAN PCell (Cell 1), FR1 PSCell (Cell 2) and a FR1 neighbour cell (Cell 3) on the same frequency as the PSCell. The test parameters for PSCell are given in Table A.4.6.1.4.2-1, A.4.6.1.4.2-2, A.4.6.1.4.2-3 A.4.6.1.4.2-4 and A.4.6.1.4.2-5 below and the test parameters and applicability for the E-UTRAN cell are defined in A.3.7.2. In the measurement control information, a measurement object is configured for the frequency of the PSCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of cell 3.

There are two BWPs configured in Cell 2, BWP1 which contains the cell defining SSB, and BWP2 which does not contain any SSB of Cell 2. During the whole test, BWP2 is always scheduled as the active BWP for the UE.

UE needs to be provided with new Timing Advance Command MAC control element at least once during each time alignment timer period to maintain uplink time alignment. Furthermore UE is allocated with PUSCH resource at every DRX cycle.

**Table A.4.6.1.4.2-1: Supported test configurations**

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3      | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6      | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |

Note 1: The UE is only required to be tested in one of the supported test configurations  
 Note 2: Target NR Cell 3 has the same SCS, BW and duplex mode as NR serving Cell 2

**Table A.4.6.1.4.2-2: General test parameters for EN-DC intra-frequency event triggered reporting with per-UE gaps for PSCell in FR1 with DRX**

| Parameter                                       | Unit | Test configuration | Value                             |        | Comment   |
|---|------|--------------------|-----------------------------------|--------|---|
|   |      |                    | Test 1                            | Test 2 |   |
| Active cell                                     |      | 1, 2, 3, 4, 5, 6   | E-UTRAN Cell 1 and NR Cell 2      |        |   |
| Neighbour cell                                  |      | 1, 2, 3, 4, 5, 6   | NR Cell 3                         |        | Cell to be identified.  |
| RF Channel Number                               |      | 1, 2, 3, 4, 5, 6   | 1: Cell 1<br>2: Cell 2 and Cell 3 |        |   |
| Measurement gap type                            |      | 1, 2, 3, 4, 5, 6   | Per-UE gaps                       |        |   |
| Measurement gap repetition periodicity          | ms   | 1, 2, 3, 4, 5, 6   | 40                                |        |   |
| Measurement gap length                          | ms   | 1, 2, 3, 4, 5, 6   | 6                                 |        |   |
| Measurement gap offset                          | ms   | 1, 2, 3, 4, 5, 6   | 39                                |        |   |
| SSB configuration                               |      | 1, 4               | SSB.1 FR1                         |        |   |
|   |      | 2, 5               | SSB.1 FR1                         |        |   |
|   |      | 3, 6               | SSB.2 FR1                         |        |   |
| SMTC configuration                              |      | 1, 4               | SMTC.2                            |        |   |
|   |      | 2, 5               | SMTC.1                            |        |   |
|   |      | 3, 6               | SMTC.1                            |        |   |
| CSI-RS parameters                               |      | 1, 4               | CSI-RS.1.2 FDD resource #0        |        |   |
|   |      | 2, 5               | CSI-RS.1.2 TDD resource #0        |        |   |
|   |      | 3, 6               | CSI-RS.2.2 TDD resource #0        |        |   |
| A3-Offset                                       | dB   | 1, 2, 3, 4, 5, 6   | -4.5                              |        |   |
| CP length                                       |      | 1, 2, 3, 4, 5, 6   | Normal                            |        |   |
| Hysteresis                                      | dB   | 1, 2, 3, 4, 5, 6   | 0                                 |        |   |
| Time To Trigger                                 | s    | 1, 2, 3, 4, 5, 6   | 0                                 |        |   |
| Filter coefficient                              |      | 1, 2, 3, 4, 5, 6   | 0                                 |        | L3 filtering is not used  |
| DRX   |      | 1, 2, 3, 4, 5, 6   | DRX.1                             | DRX.7  |   |
| Time offset between PCell and PSCell            |      | 1, 2, 3, 4, 5, 6   | 3 $\mu$ s                         |        | Synchronous EN-DC   |
| Time offset between serving and neighbour cells |      | 1, 4               | 3 ms                              |        | Asynchronous cells.<br>The timing of Cell 3 is 3ms later than the timing of Cell 2. |
|   |      | 2, 5               | 3 $\mu$ s                         |        | Synchronous cells   |
|   |      | 3, 6               | 3 $\mu$ s                         |        | Synchronous cells   |
| T1  | s    | 1, 2, 3, 4, 5, 6   | 5                                 |        |   |
| T2  | s    | 1, 2, 3, 4, 5, 6   | 5                                 | 10     |   |

**Table A.4.6.1.4.2-3: NR Cell specific test parameters for EN-DC intra-frequency event triggered reporting with per-UE gaps for PSCell in FR1 with DRX**

| Parameter                           | Unit          | Test configuration | Cell 2                 |        | Cell 3                 |        |
|-------------------------------------|---------------|--------------------|------------------------|--------|------------------------|--------|

|         |  |
|---------|--|
| Note 1: | The resources for uplink transmission are assigned to the UE prior to the start of time period T2.   |
| Note 2: | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |
| Note 3: | SS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.  |

#### A.4.6.1.4.3 Test Requirements

In test 1, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 920 ms from the beginning of time period T2. The UE is not required to read the neighbour cell SSB index in this test.

In test 2, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 6400 ms from the beginning of time period T2. The UE is not required to read the neighbour cell SSB index in this test.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2 \times TTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

#### A.4.6.1.5 EN-DC event triggered reporting tests without gap under non-DRX with SSB index reading

##### A.4.6.1.5.1 Test purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the FDD intra-frequency cell search requirements in clause 9.2.5.1 and 9.2.5.2.

##### A.4.6.1.5.2 Test parameters

Three cells are deployed in the test, which are E-UTRAN PCell (Cell 1), FR1 PSCell (Cell 2) and a FR1 neighbour cell (Cell 3) on the same frequency as the PSCell. The test parameters for FDD PSCell are given in Table A.4.6.1.5.1-1 and A.4.6.1.5.1-2 below and the test parameters and applicability for the E-UTRAN cell are defined in A.3.7.2. In the measurement control information, a measurement object is configured for the frequency of the PSCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of cell 3.

**Table A.4.6.1.5.2-1: Supported test configurations**

| Config  | Description  |
|---------|--|
| 1       | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                    |
| 2       | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                    |
| Note 1: | The UE is only required to be tested in one of the supported test configurations |
| Note 2: | Target NR Cell 3 has the same SCS, BW and duplex mode as NR serving Cell 2       |

**Table A.4.6.1.5.2-2: General test parameters for EN-DC intra-frequency event triggered reporting without gap for FDD PSCell in FR1 with SSB index reading**

| Parameter                                       | Unit | Test configuration | Value                             | Comment   |
|---|------|--------------------|-----------------------------------|---|
| Active cell                                     |      | 1, 2               | E-UTRAN Cell 1 and NR Cell 2      |   |

#### A.4.6.1.5.3 Test Requirements

The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 920 ms from the beginning of time period T2. The UE is required to read the neighbour cell SSB index and report the acquired SSB index in this test.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2xTTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

#### A.4.6.1.6 EN-DC event triggered reporting tests with SSB index reading with per-UE gaps

##### A.4.6.1.6.1 Test purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the intra-frequency cell search requirements in clause 9.2.6.2 and 9.2.6.3.

##### A.4.6.1.6.2 Test parameters

Three cells are deployed in the test, which are E-UTRAN PCell (Cell 1), FR1 PSCell (Cell 2) and a FR1 neighbour cell (Cell 3) on the same frequency as the PSCell. The test parameters for PSCell are given in Table A.4.6.1.6.2-1 A.4.6.1.6.2-2 and A.4.6.1.6.2-3 below and the test parameters and applicability for the E-UTRAN cell are defined in A.3.7.2. In the measurement control information, a measurement object is configured for the frequency of the PSCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of cell 3.

There are two BWPs configured in Cell 2, BWP1 which contains the cell defining SSB, and BWP2 which does not contain any SSB of Cell 2. During the whole test, BWP2 is always scheduled as the active BWP for the UE.

**Table A.4.6.1.6.2-1: Supported test configurations**

| Config  | Description  |
|---------|--|
| 1       | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                    |
| 2       | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                    |
| Note 1: | The UE is only required to be tested in one of the supported test configurations |
| Note 2: | Target NR Cell 3 has the same SCS, BW and duplex mode as NR serving Cell 2       |

**Table A.4.6.1.6.2-2: General test parameters for EN-DC intra-frequency event triggered reporting with gap for PSCell in FR1 with SSB index reading**

| Parameter                                       | Unit | Test configuration | Value                             | Comment   |

| <p>Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.</p> <p>Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for <math>N_{oc}</math> to be fulfilled.</p> <p>Note 3: SS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.</p> |              |      |        |        |           |        |

#### A.4.6.1.6.3 Test Requirements

The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 920 ms from the beginning of time period T2. The UE is required to read the neighbour cell SSB index and report the acquired SSB index in this test.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2xTTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

### A.4.6.2 Inter-frequency Measurements

#### A.4.6.2.1 EN-DC event triggered reporting tests for FR1 cell without SSB time index detection when DRX is not used

##### A.4.6.2.1.1 Test Purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the EN-DC inter-frequency NR cell search requirements in clause 9.3.4.

In this test, there are three cells: LTE cell 1 as PCell on E-UTRA RF channel 1, NR cell 2 as PSCell in FR1 on NR RF channel 1 and NR cell 3 as neighbour cell in FR1 on NR RF channel 2. The test parameters and configurations are given in Tables A.4.6.2.1.1-1, A.4.6.2.1.1-2, and A.4.6.2.1.1-3.

Measurement gap pattern configuration is defined in Table A.4.6.2.1.1-2.

In the measurement control information, it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of NR cell 3.

The configuration of LTE cell 1 is defined in table A.3.7.2.1-1. Supported test configurations are shown in table A.4.6.2.1.1-1.

**Table A.4.6.2.1.1-1: EN-DC event triggered reporting tests without SSB index reading for FR1-FR1**

| Config  | Description  |
|---------|--|
| 1       | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                    |
| 2       | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode                    |
| 3       | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode                    |
| 4       | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                    |
| 5       | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode                    |
| 6       | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode                    |
| Note 1: | The UE is only required to be tested in one of the supported test configurations |
| Note 2: | target NR cell3 has the same SCS, BW and duplex mode as NR serving cell2         |

**Table A.4.6.2.1.1-2: General test parameters for EN-DC inter-frequency event triggered reporting without SSB time index detection**

| Parameter                                       | Unit | Test configuration | Value                                     | Comment   |

#### A.4.6.2.1.2 Test Requirements

The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 920 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90%.

UE is not required to report SSB time index.

NOTE: The actual overall delays measured in the test may be up to  $2xTTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.4.6.2.2 EN-DC event triggered reporting tests for FR1 cell without SSB time index detection when DRX is used

### A.4.6.2.2.1 Test Purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the EN-DC inter-frequency NR cell search requirements in clause 9.3.4.

In this test, there are three cells: LTE cell 1 as PCell on E-UTRA RF channel 1, NR cell 2 as PSCell in FR1 on NR RF channel 1 and NR cell 3 as neighbour cell in FR1 on NR RF channel 2. The test parameters and configurations are given in Tables A.4.6.2.2.1-1, A.4.6.2.2.1-2, and A.4.6.2.2.1-3.

Measurement gap pattern configuration is defined in Table A.4.6.2.2.1-2.

In the measurement control information, it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of NR cell 3.

The configuration of LTE cell 1 is defined in table A.3.7.2.1-1. Supported test configurations are shown in table A.4.6.2.2.1-1.

UE needs to be provided with new Timing Advance Command MAC control element at least once during each time alignment timer period to maintain uplink time alignment. Furthermore, UE is allocated with PUSCH resource at every DRX cycle.

**Table A.4.6.2.2.1-1: EN-DC event triggered reporting tests without SSB index reading for FR1-FR1**

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3      | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6      | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |

Note 1: The UE is only required to be tested in one of the supported test configurations  
Note 2: target NR cell3 has the same SCS, BW and duplex mode as NR serving cell2

**Table A.4.6.2.2.1-2: General test parameters for EN-DC inter-frequency event triggered reporting without SSB time index detection**

| Parameter                | Unit | Test configuration | Value                                     |        | Comment   |

|-----------------------|--|-----------------------|------|
| Note 1:               | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.  |                       |      |
| Note 2:               | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |                       |      |
| Note 3:               | SS-RSRP and $I_0$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.  |                       |      |
| Note 4:               | SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.  |                       |      |

#### A.4.6.2.2.2 Test Requirements

In test 1 with per-UE gap, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 1080 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90%.

In test 2 with per-UE gap, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 10240 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90%.

In test 1 and 2, UE is not required to report SSB time index.

NOTE: The actual overall delays measured in the test may be up to  $2 \times TTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

#### A.4.6.2.3 Void

#### A.4.6.2.4 Void

#### A.4.6.2.5 EN-DC event triggered reporting tests for FR1 cell with SSB time index detection when DRX is not used

##### A.4.6.2.5.1 Test Purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the EN-DC inter-frequency NR cell search requirements in clause 9.3.4.

In this test, there are three cells: LTE cell 1 as PCell on E-UTRA RF channel 1, NR cell 2 as PSCell in FR1 on NR RF channel 1 and NR cell 3 as neighbour cell in FR1 on NR RF channel 2. The test parameters and configurations are given in Tables A.4.6.2.5.1-1, A.4.6.2.5.1-2, and A.4.6.2.5.1-3.

Measurement gap pattern configuration is defined in Table A.4.6.2.5.1-2.

In the measurement control information, it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of NR cell 3.

The configuration of LTE cell 1 is defined in table A.3.7.2.1-1. Supported test configurations are shown in table A.4.6.2.5.1-1.

**Table A.4.6.2.5.1-1: EN-DC event triggered reporting tests without SSB index reading for FR1-FR1**

| Config  | Description  |
|---------|--|
| 1       | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                    |
| 2       | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode                    |
| 3       | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode                    |
| 4       | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                    |
| 5       | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode                    |
| 6       | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode                    |
| Note 1: | The UE is only required to be tested in one of the supported test configurations |
| Note 2: | target NR cell3 has the same SCS, BW and duplex mode as NR serving cell2         |

They are not settable parameters themselves.</p> <p>Note 4: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.</p> |              |                    |        |        |           |        |

#### A.4.6.2.5.2 Test Requirements

The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 1040 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90%.

UE is required to report SSB time index.

NOTE: The actual overall delays measured in the test may be up to  $2 \times TTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.4.6.2.6 EN-DC event triggered reporting tests for FR1 cell with SSB time index detection when DRX is used

### A.4.6.2.6.1 Test Purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the EN-DC inter-frequency NR cell search requirements in clause 9.3.4.

In this test, there are three cells: LTE cell 1 as PCell on E-UTRA RF channel 1, NR cell 2 as PSCell in FR1 on NR RF channel 1 and NR cell 3 as neighbour cell in FR1 on NR RF channel 2. The test parameters and configurations are given in Tables A.4.6.2.6.1-1, A.4.6.2.6.1-2, and A.4.6.2.6.1-3.

Measurement gap pattern configuration is defined in Table A.4.6.2.6.1-2.

In the measurement control information, it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of NR cell 3.

The configuration of LTE cell 1 is defined in table A.3.7.2.1-1. Supported test configurations are shown in table A.4.6.2.6.1-1.

UE needs to be provided with new Timing Advance Command MAC control element at least once during each time alignment timer period to maintain uplink time alignment. Furthermore, UE is allocated with PUSCH resource at every DRX cycle.

**Table A.4.6.2.6.1-1: EN-DC event triggered reporting tests without SSB index reading for FR1-FR1**

| Config   | Description   |
|--|---|
| 1  | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2  | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3  | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4  | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5  | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6  | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| Note 1: The UE is only required to be tested in one of the supported test configurations |   |
| Note 2: target NR cell3 has the same SCS, BW and duplex mode as NR serving cell2         |   |

**Table A.4.6.2.6.1-2: General test parameters for EN-DC inter-frequency event triggered reporting with SSB time index detection**

| Parameter                | Unit | Test configuration | Value                                     |        | Comment   |

| Note 1:                         | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.  |                    |        |        |        |        |
| Note 2:                         | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |                    |        |        |        |        |
| Note 3:                         | SS-RSRP and I <sub>o</sub> levels have been derived from other parameters for information purposes. They are not settable parameters themselves.   |                    |        |        |        |        |
| Note 4:                         | SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.  |                    |        |        |        |        |

#### A.4.6.2.6.2 Test Requirements

In test 1 with per-UE gap, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 1280 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90%.

In test 2 with per-UE gap, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 12160 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90%.

In test 1 and 2, UE is required to report SSB time index.

NOTE: The actual overall delays measured in the test may be up to  $2 \times TTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

A.4.6.2.7 Void

A.4.6.2.8 Void

A.4.6.3 Void

#### A.4.6.4 L1-RSRP measurement for beam reporting

A.4.6.4.1 SSB based L1-RSRP measurement when DRX is not used

A.4.6.4.1.1 Test Purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of L1-RSRP measurement. This test will partly verify the L1-RSRP measurement requirements in clause 9.5.4.1, with the testing configurations for NR cells in Table A.4.6.4.1.1-1.

**Table A.4.6.4.1.1-1: Applicable NR configurations for FR1 SSB based L1-RSRP test**

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |

|       |  |
|-------|--|
| 2     | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode                    |
| 3     | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode                    |
| 4     | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                    |
| 5     | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode                    |
| 6     | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode                    |
| Note: | The UE is only required to be tested in one of the supported test configurations |

#### A.4.6.4.1.2 Test parameters

There are two cells in the test, E-UTRAN PCell (Cell 1) and FR1 PSCell (Cell 2). The test parameters and applicability for Cell 1 are defined in A.3.7.2. The test parameters for the Cell 2 are given in Table A.4.6.4.1.2-1 and Table A.4.6.4.1.2-2 below.

In CSI measurement configuration, UE is indicated to perform L1-RSRP measurement on the SSBs and report periodically. The test consists of two successive time periods, with time duration of T1 and T2 respectively. The test has higher layer parameter *timeRestrictionForChannelMeasurements* configured.

There is no measurement gap configured in the test. Before the test, UE is configured to perform RLM, BFD and L1-RSRP measurement based on the SSBs.

**Table A.4.6.4.1.2-1: General test parameters**

| Parameter                           | Config | Unit | Value                       |
|-------------------------------------|--------|------|-----------------------------|
| SSB GSCN                            | 1~6    |      | freq1                       |

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. |     |      |                |

Table A.4.6.4.1.2-2: SSB specific test parameters

| Parameter  | Config  | Unit          | SSB#0  |        | SSB#1     |        |
|--|---------|---------------|--------|--------|-----------|--------|
|  |         |               | T1     | T2     | T1        | T2     |
| $N_{oc}$ <sup>Note2</sup>  | 1~6     | dBm/15kHz     | -94.65 |        |           |        |
| $N_{oc}$ <sup>Note2</sup>  | 1,2,4,5 | dBm/SSB SCS   | -94.65 |        |           |        |
|  | 3,6     |               | -91.65 |        |           |        |
| $\hat{E}_s/I_{ot}$   | 1~6     | dB            | 0      | 0      | -Infinity | 3      |
| SSB RSRP <sup>Note3</sup>  | 1,2,4,5 | dBm/SSB SCS   | -94.65 | -94.65 | -Infinity | -91.65 |
|  | 3,6     |               | -91.65 | -91.65 | -Infinity | -88.65 |
| $I_o$ <sup>Note3</sup>   | 1,2,4,5 | dBm/9.36 MHz  | -63.69 | -63.69 | -66.70    | -61.93 |
|  | 3,6     | dBm/38.16 MHz | -57.59 | -57.59 | -60.61    | -55.84 |
| $\hat{E}_s/N_{oc}$   | 1~6     | dB            | 0      | 0      | -Infinity | 3      |
| Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.   |         |               |        |        |           |        |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |         |               |        |        |           |        |
| Note 3: SS-RSRP and $I_o$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.  |         |               |        |        |           |        |

#### A.4.6.4.1.3 Test Requirements

The UE shall send L1-RSRP report every 80 slots. No later than 640ms plus 80 slots from the beginning of time period T2, UE shall send L1-RSRP report including results of both SSB0 and SSB1 while meeting the absolute accuracy requirement in clause 10.1.19.1.1 and relative accuracy requirement in clause 10.1.19.1.2. The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2 \times TTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

#### A.4.6.4.2 SSB based L1-RSRP measurement when DRX is used

##### A.4.6.4.2.1 Test Purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of L1-RSRP measurement. This test will partly verify the L1-RSRP measurement requirements in clause 9.5.4.1, with the testing configurations for NR cells in Table A.4.6.4.2.1-1.

**Table A.4.6.4.2.1-1: Applicable NR configurations for FR1 SSB based L1-RSRP test**

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3      | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6      | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |

Note: The UE is only required to be tested in one of the supported test configurations

##### A.4.6.4.2.2 Test parameters

There are two cells in the test, E-UTRAN PCell (Cell 1) and FR1 PSCell (Cell 2). The test parameters and applicability for Cell 1 are defined in A.3.7.2. The test parameters for the Cell 2 are given in Table A.4.6.4.2.2-1 and Table A.4.6.4.2.2-2 below.

In CSI measurement configuration, UE is indicated to perform L1-RSRP measurement on the SSBs and report periodically. The test consists of two successive time periods, with time duration of T1 and T2 respectively. The test has higher layer parameter *timeRestrictionForChannelMeasurements* configured.

There is no measurement gap configured in the test. Before the test, UE is configured to perform RLM, BFD and L1-RSRP measurement based on the SSBs.

**Table A.4.6.4.2.2-1: General test parameters**

| Parameter             | Config | Unit | Value                      |
|-----------------------|--------|------|----------------------------|

| $\hat{E}_s/N_{oc}$   | 1~6     | dB            | 0      | 0      | -Infinity | 3      |
| <p>Note 1: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.</p> <p>Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for <math>N_{oc}</math> to be fulfilled.</p> <p>Note 3: SS-RSRP and <math>I_o</math> levels have been derived from other parameters for information purposes. They are not settable parameters themselves.</p> |         |               |        |        |           |        |

#### A.4.6.4.2.3 Test Requirements

The UE shall send L1-RSRP report every 80 slots. No later than 640ms plus 80 slots from the beginning of time period T2, UE shall send L1-RSRP report including results of both SSB0 and SSB1 while meeting absolute accuracy requirement in clause 10.1.19.1.1 and relative accuracy requirement in clause 10.1.19.1.2. The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2xTTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

#### A.4.6.4.3 CSI-RS based L1-RSRP measurement when DRX is not used

##### A.4.6.4.3.1 Test Purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of L1-RSRP measurement. This test will partly verify the L1-RSRP measurement requirements in clause 9.5.4.2, with the testing configurations for NR cells in Table A.4.6.4.3.1-1.

**Table A.4.6.4.3.1-1: Applicable NR configurations for FR1 CSI-RS based L1-RSRP test**

| Config | Description  |
|--------|--|
| 1      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                    |
| 2      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode                    |
| 3      | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode                    |
| 4      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode                    |
| 5      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode                    |
| 6      | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode                    |
| Note:  | The UE is only required to be tested in one of the supported test configurations |

#### A.4.6.4.3.2 Test parameters

There are two cells in the test, E-UTRAN PCell (Cell 1) and FR1 PSCell (Cell 2). The test parameters and applicability for Cell 1 are defined in A.3.7.2. The test parameters for the Cell 2 are given in Table A.4.6.4.3.2-1 and Table A.4.6.4.3.2-2 below.

In CSI measurement configuration, UE is indicated to perform L1-RSRP measurement on the CSI-RS and report aperiodically. The test consists of a single time period T1, during which the UE is triggered via DCI to report L1-RSRP on aperiodic CSI-RS resources. UE is also configured to measure L1-RSRP based on SSB. After 80ms from the beginning of the test, the DCI trigger comes in slot n (0 for Config 1,2,4,5 and 8 for Config 3,6) of a frame and UE provides the report back based on the reporting configuration as defined in Table A.4.6.4.3.2-1.

There is no measurement gap configured in the test. Before the test, UE is configured to perform RLM and BFD based on the SSBs.

**Table A.4.6.4.3.2-1: General test parameters**

| Parameter                           | Config | Unit | Value                       |
|-------------------------------------|--------|------|-----------------------------|
| SSB GSCN                            | 1~6    |      | freq1                       |
| Duplex mode                         | 1,4    |      | FDD                         |
|                                     | 2,5    |      | TDD                         |
|                                     | 3,6    |      | TDD                         |

Table A.4.6.4.3.2-2: CSI-RS specific test parameters

| Parameter  | Config  | Unit          | CSI-RS#0 | CSI-RS#1 |
|--|---------|---------------|----------|----------|
| $N_{oc}$ <sup>Note1</sup>  | 1~6     | dBm/15kHz     | -94.65   |          |
| $N_{oc}$ <sup>Note1</sup>  | 1,2,4,5 | dBm/SSB SCS   | -94.65   |          |
|  | 3,6     |               | -91.65   |          |
| $\hat{E}_s / I_{ot}$   | 1~6     | dB            | 0        | 3        |
| CSI-RS RSRP <sup>Note2</sup>   | 1,2,4,5 | dBm/SSB SCS   | -94.65   | -91.65   |
|  | 3,6     |               | -91.65   | -88.65   |
| $I_o$ <sup>Note2</sup>   | 1,2,4,5 | dBm/9.36 MHz  | -63.69   | -61.93   |
|  | 3,6     | dBm/38.16 MHz | -57.59   | -55.84   |
| $\hat{E}_s / N_{oc}$   | 1~6     | dB            | 0        | 3        |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |         |               |          |          |
| Note 3: CSI-RS RSRP and $I_o$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.  |         |               |          |          |

#### A.4.6.4.3.3 Test Requirements

After 80ms from the beginning of the test, the UE shall send L1-RSRP report at slot 8 from the reception of DCI triggering the L1-RSRP measurement. The L1-RSRP report shall include the results for both CSI-RS#0 and CSI-

RS#1 while meeting the absolute accuracy requirement in clause 10.1.20.1.1 and relative accuracy requirement in clause 10.1.20.1.2.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2 \times TTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

#### A.4.6.4.4 CSI-RS based L1-RSRP measurement when DRX is used

##### A.4.6.4.4.1 Test Purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of L1-RSRP measurement. This test will partly verify the L1-RSRP measurement requirements in clause 9.5.4.2, with the testing configurations for NR cells in Table A.4.6.4.4.1-1.

**Table A.4.6.4.4.1-1: Applicable NR configurations for FR1 CSI-RS based L1-RSRP test**

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3      | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6      | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |

Note: The UE is only required to be tested in one of the supported test configurations

##### A.4.6.4.4.2 Test parameters

There are two cells in the test, E-UTRAN PCell (Cell 1) and FR1 PSCell (Cell 2). The test parameters and applicability for Cell 1 are defined in A.3.7.2. The test parameters for the Cell 2 are given in Table A.4.6.4.4.2-1 and Table A.4.6.4.4.2-2 below.

In CSI measurement configuration, UE is indicated to perform L1-RSRP measurement on the CSI-RS and report aperiodically. The test consists of a single time period T1, during which the UE is triggered via DCI to report L1-RSRP on aperiodic CSI-RS resources. UE is also configured to measure L1-RSRP based on SSB. After 80ms from the beginning of the test, the DCI trigger comes in slot n (0 for Config 1,2,4,5 and 8 for Config 3,6) of a frame and UE provides the report back based on the reporting configuration as defined in Table A.4.6.4.4.2-1.

There is no measurement gap configured in the test. Before the test, UE is configured to perform RLM and BFD based on the SSBs.

**Table A.4.6.4.4.2-1: General test parameters**

| Parameter             | Config | Unit | Value                       |

| <p>Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for <math>N_{oc}</math> to be fulfilled.</p> <p>Note 3: CSI-RS RSRP and <math>I_o</math> levels have been derived from other parameters for information purposes. They are not settable parameters themselves.</p> |         |               |        |        |

#### A.4.6.4.4.3 Test Requirements

After 80ms from the beginning of the test, the UE shall send L1-RSRP report at slot 8 from the reception of DCI triggering the L1-RSRP measurement. The L1-RSRP report shall include the results for both CSI-RS#0 and CSI-RS#1 while meeting absolute accuracy requirement in clause 10.1.20.1.1 and relative accuracy requirement in clause 10.1.20.1.2.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2 \times TTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

### A.4.7 Measurement Performance requirements

Unless explicitly stated otherwise:

- Reported measurements shall be within defined range of accuracy limits defined in Clause 10 for at least 90 % of the reported cases. If multiple measurement performance requirements are verified in the same test, the reported measurements for each requirement shall be within defined range of accuracy limits of the corresponding requirement defined in Clause 10 for at least 90% of the reported cases.
- Measurements are performed in RRC\_CONNECTED state.
- The reference channels assume transmission of PDSCH with a maximum number of 5 HARQ transmissions unless otherwise specified.

#### A.4.7.1 SS-RSRP

##### A.4.7.1.1 EN-DC Intra-frequency measurement accuracy with FR1 serving cell and FR1 target cell

###### A.4.7.1.1.1 Test Purpose and Environment

The purpose of this test is to verify that the SS-RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Clauses 10.1.2.1.1 and 10.1.2.1.2 for intra-frequency measurements.

## A.4.7.1.1.2 Test parameters

In this set of test cases all NR cells are on the same carrier frequency. Supported test configurations are shown in table A.4.7.1.1.2-1. Both absolute and relative accuracy of SS-RSRP intra-frequency measurements are tested by using the parameters in A.4.7.1.1.2-2. The configuration of cell 1 (E-UTRA PCell) is specified in clause A.3.7.2.1 In all test cases, Cell 2 is the PSCell, and Cell 3 is the target cell.

Table A.4.7.1.1.2-1: SS-RSRP Intra frequency SS-RSRP supported test configurations

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3      | LTE FDD, NR 30kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode  |
| 4      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6      | LTE TDD, NR 30kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode  |

Note: The UE is only required to be tested in one of the supported test configurations for each supported band

Table A.4.7.1.1.2-2: SS-RSRP Intra frequency test parameters

| Parameter                            | Unit           | Test 1                      |              | Test 2         |              | Test 3         |              |

| <p>Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.</p> <p>Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for <math>N_{oc}</math> to be fulfilled.</p> <p>Note 3: SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.</p> <p>Note 4: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.</p> <p>Note 5: Subtest 1 is not used when testing with 30kHz SSB SCS</p> <p>Note 6: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification</p> |                |   |   |                  |                                    |                                  |     |         |         |         |

### A.4.7.1.1.3 Test Requirements

The SS-RSRP measurement accuracy for cell 2 and cell 3 shall fulfil absolute requirement in clause 10.1.2.1.1 and relative requirement in clause 10.1.2.1.2.

## A.4.7.1.2 EN-DC inter-frequency measurement accuracy with FR1 serving cell and FR1 target cell

### A.4.7.1.2.1 Test Purpose and Environment

The purpose of this test is to verify that the SS-RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Clauses 10.1.4.1.1 and 10.1.4.1.2 for inter-frequency measurements with the testing configurations in Table A.4.7.1.2.1-1.

**Table A.4.7.1.2.1-1: Applicable NR configurations for FR1 inter-frequency SS-RSRP accuracy test**

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3      | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6      | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |

Note: The UE is only required to be tested in one of the supported test configurations on each supported band

### A.4.7.1.2.2 Test parameters

In this set of test cases there are three cells in the test, E-UTRAN PCell (Cell 1), FR1 PSCell (Cell 2) and a FR1 neighbour cell (Cell 3) on a different frequency than the PSCell. The test parameters and applicability for Cell 1 are defined in A.3.7.2. The test parameters for the Cell 2 and Cell 3 are given in Table A.4.7.1.2.2-1 below. Both absolute and relative accuracy of RSRP inter-frequency measurements are tested by using the parameters in Table A.4.7.1.2.2-1. The inter-frequency measurements are supported by a measurement gap.

**Table A.4.7.1.2.2-1: SS-RSRP inter-frequency test parameters**

| Parameter                           | Config | Unit | Test 1                      |                 | Test 2                      |                 |

| <p>Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.</p> <p>Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for <math>N_{oc}</math> to be fulfilled.</p> |   |         |                     |                      |   |   |         |        |

|         |   |
|---------|---|
| Note 3: | RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.             |
| Note 4: | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                            |
| Note 5: | The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification |

#### A.4.7.1.2.3 Test Requirements

The SS-RSRP measurement accuracy for Cell 2 and Cell 3 shall fulfil the Absolute requirement in clause 10.1.4.1.1 and Relative requirement in clause 10.1.4.1.2.

#### A.4.7.1.3 Void

### A.4.7.2 SS-RSRQ

#### A.4.7.2.1 EN-DC Intra-frequency measurement accuracy with FR1 serving cell and FR1 target cell

##### A.4.7.2.1.1 Test Purpose and Environment

The purpose of this test is to verify that the SS-RSRQ measurement accuracy is within the specified limits. This test will verify the requirements in Clause 10.1.7.1.1.

##### A.4.7.2.1.2 Test Parameters

In this test case all cells are on the same carrier frequency. Supported test configuration are shown in Table A.4.7.2.1.2-1. The absolute accuracy of SS-RSRQ intra-frequency measurement is test by using the parameters in Table A.4.7.2.1.2-2. The configuration of cell 1 (E-UTRA PCell) is specified in clause A.3.7.2.1. In all test cases, Cell 2 is the PCell and Cell 3 is the target cell.

Table A.4.7.2.1.2-1: SS-RSRQ Intra frequency SS-RSRQ supported test configurations

| Config | Description  |
|--------|--|
| 1      | LTE FDD, NR 15 kHz SSB SCS, 10MHz bandwidth, FDD duplex mode |
| 2      | LTE FDD, NR 15 kHz SSB SCS, 10MHz bandwidth, TDD duplex mode |
| 3      | LTE FDD, NR 30kHz SSB SCS, 40MHz bandwidth, TDD duplex mode  |
| 4      | LTE TDD, NR 15 kHz SSB SCS, 10MHz bandwidth, FDD duplex mode |
| 5      | LTE TDD, NR 15 kHz SSB SCS, 10MHz bandwidth, TDD duplex mode |
| 6      | LTE TDD, NR 30kHz SSB SCS, 40MHz bandwidth, TDD duplex mode  |

Note: The UE is only required to be tested in one of the supported test configurations in each supported band

Table A.4.7.2.1.2-2: SS-RSRQ Intra frequency test parameters

| <p>Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.</p> <p>Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for <math>N_{oc}</math> to be fulfilled.</p> <p>Note 3: SS-RSRQ, SS-RSRP, and I<sub>o</sub> levels have been derived from other parameters for information purposes. They are not settable parameters themselves.</p> <p>Note 4: SS-RSRQ, SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.</p> <p>Note 5: NR operating band groups are as defined in Clause 3.5.2.</p> <p>Note 6: Subtest 2 is not used when testing with 30kHz SSB SCS.</p> <p>Note 7: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.</p> |                   |   |                      |        |        |        |        |        |        |

### A.4.7.2.1.3 Test Requirements

The SS-RSRQ measurement accuracy shall fulfil the requirements in clause 10.1.7.1.1.

### A.4.7.2.2 EN-DC Inter-frequency measurement accuracy with FR1 serving cell and FR1 target cell

#### A.4.7.2.2.1 Test Purpose and Environment

The purpose of this test is to verify that the SS-RSRQ measurement accuracy is within the specified limits. This test will verify the requirements in clause 10.1.9.1.1 and 10.1.9.1.2 for inter frequency measurement.

#### A.4.7.2.2.2 Test Parameters

In this test case the two NR cells (i.e., Cell 2 and Cell 3) are on different carrier frequencies and measurement gaps are provided. Supported test configurations are shown in Table A.4.7.2.2.2-1. Both absolute accuracy and relative accuracy requirements of SS-RSRQ inter-frequency measurement are tested by using test parameters in Table A.4.7.2.2.2-2. In all test cases, Cell 2 is the PCell and Cell 3 is target cell. Cell 1 is the E-UTRA cell which specific test parameters for this test case are specified in Table A.3.7.2.1-1.

**Table A.4.7.2.2.2-1: SS-RSRQ Inter frequency SS-RSRQ supported test configurations**

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3      | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6      | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |

Note: The UE is only required to be tested in one of the supported test configurations

**Table A.4.7.2.2.2-2: SS-RSRQ Inter frequency test parameters**

| <p>Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.</p> <p>Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for <math>N_{oc}</math> to be fulfilled.</p> <p>Note 3: SS-RSRQ, SS-RSRP, and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.</p> <p>Note 4: SS-RSRQ, SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.</p> <p>Note 5: NR operating band groups are as defined in Section 3.5.2.</p> |              |                  |      |      |        |        |        |        |

A.4.7.2.2.3 Test Requirements

The SS-RSRQ measurement accuracy shall fulfil the requirements in section 10.1.9.1.1 and 10.1.9.1.2.

A.4.7.3 SS-SINR

A.4.7.3.1 EN-DC Intra-frequency measurement accuracy with FR1 serving cell and FR1 target cell

A.4.7.3.1.1 Test Purpose and Environment

The purpose of this test is to verify that the SS-SINR measurement accuracy is within the specified limits. This test will verify the requirements in clause 10.1.12.1.1.

A.4.7.3.1.2 Test Parameters

In this test case all cells are on the same carrier frequency. Supported test configuration are shown in Table A.4.7.3.1.2-1. The absolute accuracy of SS-SINR intra-frequency measurement is tested by using the parameters in Table A.4.7.3.1.2-2. The configuration of cell 1 (E-UTRA PCell) is specified in clause A.3.7.2.1. In all test cases, Cell 2 is the PCell and Cell 3 is the target cell.

**Table A.4.7.3.1.2-1: SS-SINR Intra frequency SS-SINR supported test configurations**

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3      | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6      | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |

|  |

| <p>Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.</p> <p>Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for <math>N_{oc}</math> to be fulfilled.</p> <p>Note 3: SS-SINR, SS-RSRP, and I<sub>o</sub> levels have been derived from other parameters for information purposes. They are not settable parameters themselves.</p> <p>Note 4: SS-SINR, SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.</p> <p>Note 5: NR operating band groups are as defined in Clause 3.5.2.</p> <p>Note 6: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.</p> |                   |   |                  |        |        |

#### A.4.7.3.1.3 Test Requirements

The SS-SINR measurement accuracy shall fulfil the requirements in clause 10.1.12.1.1.

#### A.4.7.3.2 EN-DC Inter-frequency measurement accuracy with FR1 serving cell and FR1 target cell

##### A.4.7.3.2.1 Test Purpose and Environment

The purpose of this test is to verify that the SS-SINR measurement accuracy is within the specified limits. This test will verify the requirements in clause 10.1.14.1.1 and 10.1.14.1.2 for interfrequency measurement.

##### A.4.7.3.2.2 Test Parameters

In this test case the two NR cells (i.e., Cell 2 and Cell 3) are on different carrier frequencies and measurement gaps are provided. Supported test configurations are shown in Table A.4.7.3.2.2-1. Both absolute accuracy and relative accuracy requirements of SS-SINR inter-frequency measurement are tested by using test parameters in Table A.4.7.3.2.2-2. In all test cases, Cell 2 is the PSCell and Cell 3 is target cell. Cell 1 is the E-UTRA cell of which specific test parameters for this test case are specified in Table A.3.7.2.1-1.

**Table A.4.7.3.2.2-1: SS-SINR Inter frequency SS-SINR supported test configurations**

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3      | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6      | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |

Note: The UE is only required to be tested in one of the supported test configurations

| Note 3: | SS-SINR, SS-RSRP, and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves. |
| Note 4: | SS-SINR, SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                 |
| Note 5: | NR operating band groups are as defined in Clause 3.5.2.   |
| Note 6: | The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification. |

#### A.4.7.3.2.3 Test Requirements

The SS-SINR measurement accuracy shall fulfil the requirements in clause 10.1.14.1.1 and 10.1.14.1.2.

### A.4.7.4 L1-RSRP measurement for beam reporting

#### A.4.7.4.1 SSB based L1-RSRP measurement

##### A.4.7.4.1.1 Test Purpose and Environment

The purpose of this test is to verify that the L1-RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Clauses 9.5.2 and clause 10.1.19.1 for L1-RSRP measurements based on SSB with the testing configurations for NR cells in Table A.4.7.4.1.1-1.

**Table A.4.7.4.1.1-1: Applicable NR configurations for FR1 SSB based L1-RSRP test**

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode   |
| 2      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode   |
| 3      | LTE FDD, NR 30kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode  |
| 4      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode   |
| 5      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode   |
| 6      | LTE TDD, NR 30kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode  |
| Note:  | The UE is only required to be tested in one of the supported test configurations in each supported band |

##### A.4.7.4.1.2 Test parameters

In this set of test cases there are two cells in the test, E-UTRAN PCell (Cell 1), FR1 PSCell (Cell 2). The test parameters and applicability for Cell 1 are defined in A.3.7.2. The test parameters for the Cell 2 are given in Table A.4.7.4.1.2-1 below. The absolute and relative accuracy of L1-RSRP measurements are tested by using the parameters in Table A.4.7.4.1.2-1.

There is no measurement gap configured in the test. Before the test, UE is configured one SSB resource set with two SSB resources. UE is configured to perform RLM, BFD and L1-RSRP measurement based on the SSB resources 0 and 1.

**Table A.4.7.4.1.2-1: FR1 SSB based L1-RSRP test parameters**

| Parameter         | Config | Unit | Test 1      | Test 2      |
|-------------------|--------|------|-------------|-------------|
| SSB GSCN          | 1~6    |      | freq1       | freq1       |
| Duplex mode       | 1,4    |      | FDD         | FDD         |

|         | NR_FDD_FR1_G   |     |    |      | -78.19 |
|         | NR_FDD_FR1_H   |     |    |      | -77.69 |
|         | $\hat{E}_s / N_{oc}$   | 1~6 | dB | 10   | -3     |
|         | Propagation condition  | 1~6 |    | AWGN | AWGN   |
|         | Antenna configuration  | 1~6 |    | 1x2  | 1x2    |
| Note 1: | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.  |     |    |      |        |
| Note 2: | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |     |    |      |        |
| Note 3: | RSRP and $I_0$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.   |     |    |      |        |
| Note 4: | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.   |     |    |      |        |
| Note 5: | The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.   |     |    |      |        |

#### A.4.7.4.1.3 Test Requirements

The L1-RSRP measurement accuracy for SSB resource reported by UE in L1-RSRP report (SSB#0 or SSB#1) of Cell 2 shall fulfil the requirements in clauses 10.1.19.1.

#### A.4.7.4.2 CSI-RS based L1-RSRP measurement on resource set with repetition off

##### A.4.7.4.2.1 Test Purpose and Environment

The purpose of this test is to verify that the L1-RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Clauses 9.5.3 and clause 10.1.19.2 for L1-RSRP measurements based on CSI-RS with the testing configurations for NR cells in Table A.4.7.4.2.1-1.

**Table A.4.7.4.2.1-1: Applicable NR configurations for FR1 CSI-RS based L1-RSRP test**

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR 15 kHz CSI-RS SCS, 10 MHz bandwidth, FDD duplex mode  |
| 2      | LTE FDD, NR 15 kHz CSI-RS SCS, 10 MHz bandwidth, TDD duplex mode  |
| 3      | LTE FDD, NR 30kHz CSI-RS SCS, 40 MHz bandwidth, TDD duplex mode   |
| 4      | LTE TDD, NR 15 kHz CSI-RS SCS, 10 MHz bandwidth, FDD duplex mode  |
| 5      | LTE TDD, NR 15 kHz CSI-RS SCS, 10 MHz bandwidth, TDD duplex mode  |
| 6      | LTE TDD, NR 30kHz CSI-RS SCS, 40 MHz bandwidth, TDD duplex mode   |
| Note:  | The UE is only required to be tested in one of the supported test configurations in each supported band |

##### A.4.7.4.2.2 Test parameters

In this set of test cases there are two cells in the test, E-UTRAN PCell (Cell 1), FR1 PSCell (Cell 2). The test parameters and applicability for Cell 1 are defined in A.3.7.2. The test parameters for the Cell 2 are given in Table

A.4.7.4.2.2-1 below. The absolute and relative accuracy of L1-RSRP measurements are tested by using the parameters in Table A.4.7.4.2.2-1.

There is no measurement gap configured in the test. Before the test, UE is configured one CSI-RS resource set with two CSI-RS resources. UE is configured to perform RLM and BFD based on SSB 0 and 1. CSI-RS is not transmitted in the same OFDM symbols as SSB.

**Table A.4.7.4.2.2-1: FR1 CSI-RS based L1-RSRP test parameters**

| Parameter                           | Config | Unit | Test 1                      | Test 2                      |

| <p>Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.</p> <p>Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for <math>N_{oc}</math> to be fulfilled.</p> <p>Note 3: RSRP and I<sub>o</sub> levels have been derived from other parameters for information purposes. They are not settable parameters themselves.</p> <p>Note 4: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.</p> <p>Note 5: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.</p> |  |         |                  |        |        |

#### A.4.7.4.2.3 Test Requirements

The L1-RSRP measurement accuracy for CSI-RS resource reported by UE in L1-RSRP report (CSI-RS#0 or CSI-RS#1) of Cell 2 shall fulfil the requirements in clauses 10.1.19.2.

## A.4.7.5 SFTD accuracy

### A.4.7.5.1 SFTD accuracy

#### A.4.7.5.1.1 Test Purpose and Environment

The purpose of this set of tests is to verify that the SFTD measurement accuracy is within the specified limits. This test will verify the requirements as specified in clause 9.1.27 in TS 36.133 [15] for EN-DC SFTD measurements.

#### A.4.7.5.1.2 Test Parameters

Supported test configurations are shown in Table A.4.7.5.1.2-1. In this set of test cases there are two cells on different carriers. Cell 1 is E-UTRAN PCell and Cell 2 is NR FR1 PSCell. The test parameters of cell 1 are given in clause A.3.7.2.1. The test parameters of cell 2 are given in Table A.4.7.5.1.2-2. The SFTD between PCell and PSCell shall be set by the test equipment to one of the time differences in Table A.4.7.5.1.2-3.

**Table A.4.7.5.1.2-1: Supported test configurations for SFTD accuracy**

| Configuration | Description   |
|---------------|---|
| 1             | NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode, LTE FDD |
| 2             | NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode, LTE FDD |
| 3             | NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode, LTE FDD |
| 4             | NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode, LTE TDD |
| 5             | NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode, LTE TDD |
| 6             | NR 30kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode, LTE TDD  |

Note: The UE is only required to be tested in one of the supported test configurations

**A.4.7.5.1.3 Test Requirements**

The SFTD reported by the UE consists of 2 elements, SFN offset and frame boundary offset between PCell and PSCell. The reported SFTD accuracy shall fulfil the requirement in clause 9.1.27 in TS 36.133 [15].

A.4.7.5.2 Void

A.4.7.5.3 Void

A.4.8 Void

## A.4A NE-DC test with all NR cells in FR1

### A.4A.1 Signaling characteristics

#### A.4A.1.1 E-UTRAN PSCell addition

##### A.4A.1.1.1 Test purpose and environment

The purpose of this test is to verify that the LTE PSCell addition/release delay and interruption under NE-DC are within the requirements stated in clause 8.8 and clause 8.2.3.2.3 for the case when the PSCell is known by the UE at the time of addition.

Supported test configurations are shown in A.4A.1.1.1-1. The test parameters for the E-UTRA cell are given in Table A.3.7.2.1-1.

The test parameters for NR cell are given in Tables A.4A.1.1.1-2 and cell-specific parameters in A.4A.1.1.1-3 below. The test consists of six successive time periods with duration of T1, T2, T3, T4, T5 and T6 respectively. There are two carriers each with one cell. Before the test starts the UE is connected to Cell 1 (NR PCell) on radio channel 1 (PCC) but is not aware of Cell 2 (E-UTRAN PSCell) on radio channel 2. The UE is only monitoring the PCC. During T1 only Cell1 is known to the UE.

Before the start of T2, the UE in the measurement control information that event-triggered reporting with Event B1 is configured for neighbour cell (Cell2). Before the start of T2 the UE is configured with the measurement gaps (gap pattern Id # 0). The Cell2 becomes known to the UE during T2. Therefore, during T2 the UE shall report Event B1. The point in time at which the RRC message to release measurement gap is transmitted from the test system defines the start of period T3. During T3, after measurement gap is released, the test system transmits the RRC message to the UE to add PSCell on radio channel 2.

The RRC message (to add PSCell) also includes a request for the UE to start periodic CSI reporting for the PSCell after the PSCell has been successfully added. The point in time at which the RRC message to add PSCell (Cell2) is received at the UE antenna connector defines the start of period T4.

The test system shall observe the periodic reporting of CSI for PSCell during T5. The point in time at which the UE has sent PRACH to the PSCell (Cell 2) defines the start of period T5.

The test system shall send a RRC message to the UE to release PSCell (Cell 2) on radio channel 2. The RRC message to release PSCell (Cell2) shall be sent to the UE during period T5, after the UE has sent at least one CQI report with non-zero CQI index for PSCell (Cell 2). The point in time at which the RRC message to release PSCell (Cell2) is received at the UE antenna connector defines the start of period T6.

**Table A.4A.1.1.1-1: Applicable E-UTRA and NR configurations for NE-DC PSCell addition and Release test**

| Config   | Description   |
|--|---|
| 1  | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2  | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3  | LTE FDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| 4  | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5  | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6  | LTE TDD, NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode |
| Note: The UE is only required to be tested in one of the supported test configurations |   |

**Table A.4A.1.1.1-2: General Test Parameters for PSCell Addition and Release**

| Parameter   | Unit                            | Value | Comment  |  |
|---|---------------------------------|-------|--|--|
| RF Channel Number                                       |                                 | 1, 2  | Two radio channels are used for this test. One for NR cell and second for E-UTRAN Cell                 |  |
| Initial   | Active PCell                    | Cell1 | PCell on RF channel number 1.  |  |
|   | Neighbour cell                  | Cell2 | Neighbour cell on RF channel number 2.   |  |
| Final Condition   | Active PCell                    | Cell1 | PCell on RF channel number 1.  |  |
|   | Neighbour Cell                  | Cell2 | PSCell released on RF channel number 2.  |  |
| B1  | Hysteresis                      | dB    | 0  | Hysteresis for evaluation of event B1. |
|   | Threshold RSRP (Config 1,2,4,5) | dBm   | -96  | Actual RSRP threshold for event B1.    |
|   | Threshold RSRP (Config 3,6)     | dBm   | -93  | Actual RSRP threshold for event B1.    |
|   | Time to Trigger                 | s     | 0  |  |
| DRX   |                                 | OFF   | Continuous monitoring of primary cell  |  |
| Measurement gap pattern Id                              |                                 | 0     | Gaps are configured before T2 and released before T3.  |  |
| Cell-individual offset for cells on RF channel number 1 | dB                              | 0     | Individual offset for cells on primary component carrier.  |  |
| Cell-individual offset for cells on RF channel number 2 | dB                              | 0     | Individual offset for cells on carrier frequency of cell2.   |  |
| T1  | s                               | 1     | During this time the PCell shall be known and cell2 shall be unknown.                                  |  |
| T2  | s                               | 1     | During this time the UE shall identify neighbour cell (cell2) and report event B1.                     |  |
| T3  | s                               | 3.5   | During this time the test system transmits the RRC messages to release measurement gap and add PSCell. |  |
| T4  | s                               | 0.5   | During this time the UE adds the PSCell.   |  |
| T5  | s                               | 0.5   | During this time the UE sends CSI reports for PSCell.  |  |
| T6  | s                               | 0.5   | During this time the UE releases the PSCell.   |  |

**Table A.4A.1.1.1-3: NR Cell Specific Parameters for PSCell Addition and Release**

| Parameter                | Unit | Config      | Test           |
|--------------------------|------|-------------|----------------|
| NR RF Channel Number     |      | 1,2,3,4,5,6 | 1              |
| E-UTRA RF Channel Number |      | 1,2,3,4,5,6 | 2              |
| TDD configuration        |      | 1,4         | Not Applicable |

### A.4A.1.1.2 Test Requirements

The UE shall transmit the PRACH to PSCell at latest 120 ms<sup>Note1</sup> into T4.

The UE shall send at least one CSI report for PSCell with non-zero CQI index during T5.

The UE shall periodically send CSI reports for PSCell after the UE has sent first CQI report with non-zero CQI index during T5

The UE shall stop sending CSI reports for PSCell in at latest 20ms into T6.

Interruption on PCell during PSCell addition and release shall not exceed the values specified for NE-DC in Clause 8.2.3.2.3.

All the above test requirements shall be fulfilled in order for the observed PSCell addition delay and PSCell release delay to be counted as correct. The rate of correct observed PSCell addition delay and PSCell release delay during repeated tests shall be at least 90%.

Note1: The PSCell addition delay can be expressed as follows as specified in clause 8.8 [15]:

$$T_{\text{config\_EUTRAN-PSCell}} = 20\text{ms} + T_{\text{activation\_time}} + 50\text{ms} + T_{\text{PCell\_DU}} + T_{\text{E-UTRAN-PSCell\_DU}}$$

Where:

$$T_{\text{activation\_time}} = 20\text{ms}$$

$$T_{\text{PCell\_DU}} = 0\text{ms}$$

$$T_{\text{E-UTRAN-PSCell\_DU}} = 30\text{ms}$$

## A.4A.1.2 Active BWP switch

### A.4A.1.2.1 E-UTRAN PSCell – NR PCell FR1 DCI-based and Timer-based DL active BWP switch in non-DRX in synchronous NE-DC

#### A.4A.1.2.1.1 Test Purpose and Environment

The purpose of this test is to verify the DL BWP switch delay requirement defined in TS38.133 clause 8.6, and interruption requirement for E-UTRA victim cell defined in TS36.133 clause 7.36.2.6. Supported test configurations are shown in Table A.4A.1.2.1.1-1.

The test scenario comprises of one NR PCell (Cell 1), and one E-UTRA PSCell (Cell 2) as given in Table A.4A.1.2.1.1-2. Cell-specific parameters of NR PCell is specified in Table A.4A.1.2.1.1-3. below, and cell-specific parameters of E-UTRA PSCell are specified in Table A.3.7.2.1-1.

PDCCHs indicating new transmissions shall be sent continuously on PCell (Cell 1) to ensure that the UE would have ACK/NACK sending except for the time duration when BWP is switching on Cell 1 and the time duration of T2.

PDCCHs indicating new transmissions shall be sent continuously on PSCell (Cell 2) to ensure that the UE will have ACK/NACK sending.

Before the test starts,

- UE is connected to Cell 1 (PCell) on radio channel 1 (PCC), and Cell 2 (PSCell) on radio channel 2 (PSCC).
- UE is configured with 2 different UE-specific downlink bandwidth parts for PCell, BWP-1 and BWP-2, in Cell 1 before starting the test. BWP-1 and BWP-2 always include bandwidth of the initial DL BWP and SSB.
- UE is indicated in *firstActiveDownlinkBWP-Id* that the active DL BWP is BWP-1 in PCell.
- UE is configured with a *bwp-InactivityTimer* timer value for PCell.

All cells have constant signal levels throughout the test.

The test consists of 3 successive time periods, with durations of T1, T2, and T3, respectively.

During T1,

Time period T1 starts when a DCI format 1\_1 command for PCell DL BWP switch, sent from the test equipment to the UE, is received at the UE side in PCell's slot # denoted  $i$ . The UE shall switch its bandwidth part from BWP-1 to BWP-2.

The UE shall be able to receive PDSCH at the beginning of the DL slot right after PCell's DL slot ( $i + T_{BWPswitchDelay}$ ) as defined in clause 8.6 and starts to report valid ACK/NACK for the PCell no later than at the beginning of the DL slot right after DL slot ( $i + T_{BWPswitchDelay} + kI$ ). The UE shall be continuously scheduled on PCell's BWP-2 starting from the beginning of the DL slot right after DL slot ( $i + T_{BWPswitchDelay}$ ).

The starting time of PSCell(Cell 2) interruption due to BWP switch on PCell shall occur within the BWP switch delay.

During T2, the test equipment won't transmit DCI format for PDSCH reception on PCell(Cell 1).

During T3,

The time period T3 starts from the slot # $j$ , where  $j$  is the beginning slot of the DL subframe immediately after the *bwp-InactivityTimer* timer expires. The UE shall switch its bandwidth part from BWP-2 back to the default bandwidth part – BWP-1.

The UE shall be able to receive PDSCH at the beginning of the DL slot right after PCell's DL slot ( $j+T_{BWPswitchDelay}$ ) as defined in clause 8.6 and starts to report valid ACK/NACK for the PCell at latest at the beginning of the DL slot right after DL slot ( $j+T_{BWPswitchDelay}+kI$ ). The UE shall be continuously scheduled on PCell's BWP-1 starting from the beginning of the DL slot right after DL slot ( $j+T_{BWPswitchDelay}$ ).

The starting time of PSCell(Cell 2) interruption due to BWP switch of PCell shall occur within the BWP switch delay.

The test equipment verifies the DL BWP switch time in PCell by counting the slots from the time when the BWP switch command is received or *bwp-InactivityTimer* timer expires till an ACK is received.

The test equipment verifies that potential interruption to E-UTRA PSCell is carried out in the correct time span by monitoring ACK/NACK sent in PSCell during BWP switch of PCell, respectively.

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2      | LTE FDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3      | LTE FDD, NR 30kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode  |
| 4      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 5      | LTE TDD, NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 6      | LTE TDD, NR 30kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode  |

Note 1: The UE is only required to be tested in one of the supported test configurations.

**Table A.4A.1.2.1.1-2: General test parameters for DL BWP switch in synchronous NE-DC**

| Parameter   | Unit | Value  | Comment  |
|---|------|--------|--|
| NR RF Channel Number                                    |      | 1      | One NR radio channel is used for this test     |
| E-UTRA RF Channel Number                                |      | 2      | One E-UTRA radio channel is used for this test |
| Active PCell  |      | Cell 1 | PCell on RF channel number 1.                  |
| Active PSCell   |      | Cell 2 | PSCell on RF channel number 2.                 |
| CP length   |      | Normal |  |
| DRX   |      | OFF    | For both PCell and PSCell                      |
| <i>bwp-InactivityTimer</i>                              | ms   | [200]  |  |
| Cell-individual offset for cells on RF channel number 1 | dB   | 0      | Individual offset for cells on PCC.            |
| Cell-individual offset for cells on RF channel number 2 | dB   | 0      | Individual offset for cells on PSCC.           |
| Cell2 timing offset to cell1                            | μs   | 3      | Synchronous NE-DC                              |
| T1  | s    | [0.2]  |  |
| T2  | s    | [0.2]  |  |
| T3  | s    | [0.2]  |  |

|         |  |
|---------|--|
| Note 1: | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.  |
| Note 2: | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |
| Note 3: | SS-RSRP and $I_{o}$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.  |
| Note 4: | For unpaired spectrum, a DL BWP is linked with an UL BWP. DLBWP.0.2 is linked with ULBWP.0.2; DLBWP.1.1 is linked with ULBWP.1.1; DLBWP.1.3 is linked with ULBWP.1.3 defined in clause 12 of TS 38.213 [3].    |

#### A.4A.1.2.1.2 Test Requirements

During T1, the UE shall start to send the ACK for PCell in the DL slot right after DL slot  $(i+T_{BWPswitchDelay}+kI)$ .

During T3, the UE shall start to send the ACK for PCell in the DL slot right after DL slot  $(j+T_{BWPswitchDelay}+kI)$ .

Where,  $kI$  is the timing between DL data receiving and acknowledgement as specified in [7].

Depending on UE capability *bwp-SwitchingDelay* [2], UE shall finish BWP switch within the time duration  $T_{BWPswitchDelay}$  defined in Table 8.6.2-1.

All of the above test requirements shall be fulfilled in order for the observed PCell active BWP switch delay to be counted as correct.

The rate of correct events observed during repeated tests shall be at least 90%.

During T1, the start time of PSCell interruption during PCell active BWP switch shall not happen outside the BWP switch delay.

During T3, the start time of PSCell interruption of during PCell active BWP switch shall not happen outside the BWP switch delay.

The interruption of PSCell shall not be longer than the interruption duration specified for active BWP switch in TS36.133 Clause 7.36.2.6.

All of the above test requirements shall be fulfilled in order for the observed PSCell active BWP switch interruption to be counted as correct.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: During T1, T3 if there are no uplink resources for reporting the ACK in the DL slot right after DL slot  $(i+T_{BWPswitchDelay}+kI)$ ,  $(j+T_{BWPswitchDelay}+kI)$ , then the UE shall use the next available uplink resource for reporting the corresponding ACK.

## A.4A.2 Measurement performance

### A.4A.2.1 SFTD accuracy

#### A.4A.2.1.1 SFTD accuracy

##### A.4A.2.1.1.1 Test Purpose

The purpose of this set of tests is to verify that the SFTD measurement accuracy is within the specified limits. This test will verify the requirements as specified in clause 10.21.1.1 for NE-DC SFTD measurements.

##### A.4A.2.1.1.2 Test Environment

Supported test configurations are shown in Table A.4A.2.1.1.2-1. In this set of test cases there are two cells on different carriers. Cell 1 is NR FR1 PCell and Cell 2 is E-UTRAN target cell. The test parameters of cell 1 are given in clause A.4A.2.1.1.2-2. The test parameters of cell 2 are given in Table A.3.7.2.1. The SFTD between PCell and target cell shall be set by the test equipment to one of the time differences in Table A.4A.2.1.1.2-3.

**Table A.4A.2.1.1.2-1: Supported test configurations for SFTD accuracy**

| Configuration | Description   |
|---------------|---|
| 1             | NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode, LTE FDD |
| 2             | NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode, LTE FDD |
| 3             | NR 30 kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode, LTE FDD |
| 4             | NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode, LTE TDD |
| 5             | NR 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode, LTE TDD |
| 6             | NR 30kHz SSB SCS, 40 MHz bandwidth, TDD duplex mode, LTE TDD  |

Note 1: The UE is only required to be tested in one of the supported test configurations  
Note 2: A UE which fulfils the requirements in test case A.4A.1.1 can skip the test cases in A.4.7.5.1

**Table A.4A.2.1.1.2-2: Test parameters for SFTD accuracy (Cell 1)**

| Parameter                           | Config | Unit | Test 1                      |

|         |  |
|---------|--|
| Note 1: | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.  |
| Note 2: | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |
| Note 3: | SS-RSRP and $I_0$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.  |
| Note 4: | SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.  |
| Note 5: | The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification  |

**Table A.4A.2.1.1.2-3: Timing offsets for SFTD accuracy test**

| Configuration | SFN offset between PCell and PSCell | Frame boundary offset between PCell and PSCell (Ts) |
|---------------|-------------------------------------|---|
| 1             | 100                                 | -122000   |
| 2             | 300                                 | -60540  |
| 3             | 500                                 | 1000  |
| 4             | 700                                 | 62540   |
| 5             | 900                                 | 124000  |

#### A.4A.2.1.1.3 Test Requirements

The SFTD reported by the UE consists of 2 elements, SFN offset and frame boundary offset between PCell and E-UTRAN target cell. The reported SFTD accuracy shall fulfil the requirement in clause 10.1.21.1.

## A.5 EN-DC tests with one or more NR cells in FR2

### A.5.1 Void

### A.5.2 Void

### A.5.3 RRC\_CONNECTED state mobility

#### A.5.3.1 Void

#### A.5.3.2 RRC Connection Mobility Control

##### A.5.3.2.1 Void

##### A.5.3.2.2 Random Access

###### A.5.3.2.2.1 Contention based random access test in FR2 for PSCell/SCell in EN-DC

###### A.5.3.2.2.1.1 Test Purpose and Environment

The purpose of this test is to verify that the behavior of the random access procedure is according to the requirements and that the PRACH power settings and timing are within specified limits. This test will verify the requirements in clause 6.2.2.2 and clause 7.1.2 in an AWGN model.

For this test two cells are used, with the configuration of Cell 1 (E-UTRA PCell) specified in clause A.3.7.2.1 and Cell 2 configured as PSCell or SCell in FR2. Supported test parameters are shown in Table A.5.3.2.2.1.1-1. UE capable of EN-DC with PSCell or SCell in FR2 needs to be tested by using the parameters in Table A.5.3.2.2.1.1-2 and Table A.5.3.2.2.1.1-3.

**Table A.5.3.2.2.1.1-1: Supported test configurations for non-contention based random access test in FR2 for PSCell/SCell in EN-DC**

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR PSCell/SCell 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode                                |
| 2      | LTE TDD, NR PSCell/SCell 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode                                |
| Note:  | The UE is only required to be tested in one of the supported test configurations depending on UE capability |

**Table A.5.3.2.2.1.1-2: General test parameters for contention based random access test in FR2 for PSCell/SCell in EN-DC**

| Parameter              | Unit       | Test-1      | Comments             |

#### A.5.3.2.2.1.2 Test Requirements

Contention based random access is triggered by *not* explicitly assigning a random access preamble via dedicated signalling in the downlink.

##### A.5.3.2.2.1.2.1 Random Access Preamble Transmission

To test the UE behavior specified in Clause 6.2.2.2.1.1 the System Simulator shall receive the Random Access Preamble which belongs to one of the Random Access Preambles associated with the SSB with index 0, which has SS-RSRP above the configured *rsrp-ThresholdSSB*.

In addition, the power applied to all preambles shall be in accordance with what is specified in Clause 6.2.2.2. The power of the first preamble shall be 0.6 dBm to be received at TE with an accuracy specified in clause 6.3.4.2 of TS 38.101-2 [19]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.4.3 of TS 38.101-2 [19].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Clause 7.1.2.

##### A.5.3.2.2.1.2.2 Random Access Response Reception

To test the UE behavior specified in Clause 6.2.2.2.1.2 the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 3 preambles have been received by the System Simulator. In response to the first 2 preambles, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

The UE may stop monitoring for Random Access Response(s) and shall transmit the msg3 if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall again perform the Random Access Resource selection procedure specified in clause 5.1.2 in TS38.321 [7], and transmit with the calculated PRACH transmission power when the backoff time expires if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in Clause 6.2.2.2. The power of the first preamble shall be 0.6 dBm to be received at TE with an accuracy specified in clause 6.3.4.2 of TS 38.101-2 [19]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.4.3 of TS 38.101-2 [19].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Clause 7.1.2.

#### A.5.3.2.2.1.2.3 No Random Access Response Reception

To test the UE behavior specified in clause 6.2.2.2.1.3 the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 3 preambles have been received by the System Simulator. The System Simulator shall *not* respond to the first 2 preambles.

The UE shall again perform the Random Access Resource selection procedure specified in clause 5.1.2 in TS38.321 [7], and transmit with the calculated PRACH transmission power when the backoff time expires if no Random Access Response is received within the RA Response window.

In addition, the power applied to all preambles shall be in accordance with what is specified in Clause 6.2.2.2. The power of the first preamble shall be 0.6 dBm to be received at TE with an accuracy specified in clause 6.3.4.2 of TS 38.101-2 [19]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.4.3 of TS 38.101-2 [19].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Clause 7.1.2.

#### A.5.3.2.2.1.2.4 Receiving an UL grant for msg3 retransmission

To test the UE behavior specified in clause 6.2.2.2.1.4 the System Simulator shall provide an UL grant for msg3 retransmission following a successful Random Access Response.

The UE shall re-transmit the msg3 upon the reception of an UL grant for msg3 retransmission.

#### A.5.3.2.2.1.2.5 Void

#### A.5.3.2.2.1.2.6 Void

#### A.5.3.2.2.1.2.7 Contention Resolution Timer expiry

To test the UE behavior specified in Clause 6.2.2.2.1.6 the System Simulator shall *not* send a response to a msg3.

The UE shall again perform the Random Access Resource selection procedure specified in clause 5.1.2 in TS38.321 [7], and transmit with the calculated PRACH transmission power when the backoff time expires if the Contention Resolution Timer expires.

### A.5.3.2.2.2 Non-contention based random access test in FR2 for PSCell/SCell in EN-DC

#### A.5.3.2.2.2.1 Test Purpose and Environment

The purpose of this test is to verify that the behavior of the random access procedure is according to the requirements and that the PRACH power settings and timing are within specified limits. This test will verify the requirements in clause 6.2.2.2 and clause 7.1.2 in an AWGN model.

For this test two cells are used, with the configuration of Cell 1 (E-UTRA PCell) specified in clause A.3.7.2.1 and Cell 2 configured as PSCell or SCell in FR2. Supported test parameters are shown in Table A.5.3.2.2.2.1-1. UE capable of EN-DC with PSCell or SCell in FR2 needs to be tested by using the parameters in Table A.5.3.2.2.2.1-2 and Table A.5.3.2.2.2.1-3 for SSB-based non-contention based random access test (Test 1) and CSI-RS-based non-

contention based random access test (Test 2). Test 2 is only applicable to UE which supports csi-RSRP-AndRSRQ-MeasWithSSB or csi-RSRP-AndRSRQ-MeasWithoutSSB.

**Table A.5.3.2.2.1-1: Supported test configurations for non-contention based random access test in FR2 for PSCell/SCell in EN-DC**

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR PSCell/SCell 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode                                |
| 2      | LTE TDD, NR PSCell/SCell 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode                                |
| Note:  | The UE is only required to be tested in one of the supported test configurations depending on UE capability |

**Table A.5.3.2.2.1-2: General test parameters for non-contention based random access test in FR2 for PSCell/SCell in EN-DC**

| Parameter   | Unit       | Test-1   | Test-2   | Comments   |

| <i>rsrp-ThresholdSSB</i>           | dBm   | RSRP <sub>69</sub> + $\Delta_{DL}$ | RSRP <sub>69</sub> + $\Delta_{DL}$ | RSRP <sub>69</sub> corresponds to -88dBm. $\Delta_{DL}$ is derived from the downlink calibration process <sup>Note 4</sup> |
| <i>preambleReceivedTargetPower</i> | dBm   | -100                               | -100                               | As defined in TS 38.331 [2]  |
| Note 1:                            | OCNG shall be used such that a constant total transmitted power spectral density is achieved for all OFDM symbols. The OCNG pattern is chosen during the test according to the presence of a DL reference measurement channel.  |                                    |                                    |  |
| Note 2:                            | The DL PDSCH reference measurement channel is used in the test only when a downlink transmission dedicated to the UE under test is required.  |                                    |                                    |  |
| Note 3:                            | The $\Delta_{UL}$ value is calculated as $-\text{ROUND}(\text{PPRACH}_0 - 1)$ , where PPRACH <sub>0</sub> is the measured first PRACH power with -80.6dBm/SCS applied, <i>preambleReceivedTargetPower</i> = -100dBm and <i>ss-PBCH-BlockPower</i> = 20dBm. These values are used during the uplink calibration process carried out before the test case is run, with the UE configured to send PRACH.                                 |                                    |                                    |  |
| Note 4:                            | The $\Delta_{DL}$ value is calculated as $(\text{RSRP}_{\text{REP}} - \text{RSRP}_{76})$ , where RSRP <sub>REP</sub> is the SS-RSRP Reported value in Table 10.1.6.1-1 with -80.6dBm/SCS applied. These values are used during the downlink calibration process carried out before the test case is run, with the UE configured to report SS-RSRP. For a Reported value RSRP <sub>x</sub> , x is treated as a positive integer value. |                                    |                                    |  |

**Table A.5.3.2.2.1-3: OTA-related test parameters for non-contention based random access test in FR2 for PSCell/SCell in EN-DC**

| Propagation Condition                     |  | -             | No external noise<br>(Note 4) | No external noise<br>(Note 4) |  |
| Note 1:                                   | No artificial noise is applied in this test.   |               |                               |                               |  |
| Note 2:                                   | void.  |               |                               |                               |  |
| Note 3:                                   | Information about types of UE beam is given in B.2.1.3, and does not limit UE implementation or test system implementation   |               |                               |                               |  |
| Note 4:                                   | The downlink connection between the System Simulator and the UE is without Additive White Gaussian Noise, and has no fading or multipath effects as specified in TS 38.521-2 B.0 [29]. |               |                               |                               |  |

#### A.5.3.2.2.2.2 Test Requirements

Non-Contention based random access is triggered by explicitly assigning a random access preamble via dedicated signalling in the downlink. In the test, the non-contention based random access procedure is not initialized for Other SI requested from UE or beam failure recovery.

##### A.5.3.2.2.2.2.1 SSB-based Random Access Preamble Transmission

In Test-1, to test the UE behavior specified in Clause 6.2.2.2.2.1 for SSB-based Random Access Preamble transmission, with the contention-free Random Access Resources and the contention-free PRACH occasions associated with SSBs configured, the System Simulator shall receive the Random Access Preamble which has the Preamble Index associated with the SSB with index 0.

In addition, the System Simulator shall receive the Random Access Preamble on the PRACH occasion which belongs to the PRACH occasions corresponding to the SSB with index 0, and the selected PRACH occasion shall belong to the PRACH occasions permitted by the restrictions given by the *ra-ssb-OccasionMaskIndex*.

In addition, the power applied to all preambles shall be in accordance with what is specified in Clause 6.2.2.2. The power of the first preamble shall be -60 dBm to be received at TE with an accuracy specified in clause 6.3.4.2 of TS 38.101-2 [19]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.4.3 of TS 38.101-2 [19].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Clause 7.1.2.

##### A.5.3.2.2.2.2.2 CSI-RS-based Random Access Preamble Transmission

In Test-2, to test the UE behavior specified in Clause 6.2.2.2.2.1 for CSI-RS-based Random Access Preamble transmission, with the contention-free Random Access Resources and the contention-free PRACH occasions associated with CSI-RSs configured, the System Simulator shall receive the Random Access Preamble which has the Preamble Index associated with the CSI-RS configured.

In addition, the System Simulator shall receive the Random Access Preamble on the PRACH occasion which belongs to the PRACH occasions corresponding to the CSI-RS configured, and the selected PRACH occasion shall belong to the PRACH occasions permitted by the restrictions given by the *ra-OccasionList*.

In addition, the power applied to all preambles shall be in accordance with what is specified in Clause 6.2.2.2. The power of the first preamble shall be -60 dBm to be received at TE with an accuracy specified in clause 6.3.4.2 of TS 38.101-2 [19]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.4.3 of TS 38.101-2 [19].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Clause 7.1.2.

##### A.5.3.2.2.2.2.3 Random Access Response Reception

To test the UE behavior specified in Clause 6.2.2.2.2.2 the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator. In response to the first 4 preambles, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

The UE may stop monitoring for Random Access Response(s) if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall again perform the Random Access Resource selection procedure specified in clause 5.1.2 in TS38.321 [7], and transmit with the calculated PRACH transmission power if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in Clause 6.2.2.2. The power of the first preamble shall be -60 dBm to be received at TE with an accuracy specified in clause 6.3.4.2 of TS 38.101-2 [19]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.4.3 of TS 38.101-2 [19].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Clause 7.1.2.

#### A.5.3.2.2.2.4 No Random Access Response Reception

To test the UE behavior specified in clause 6.2.2.2.3 the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator. The System Simulator shall *not* respond to the first 4 preambles.

The UE shall again perform the Random Access Resource selection procedure specified in clause 5.1.2 in TS38.321 [7], and transmit with the calculated PRACH transmission power when the backoff time expires if no Random Access Response is received within the RA Response window configured in *RACH-ConfigCommon*.

In addition, the power applied to all preambles shall be in accordance with what is specified in Clause 6.2.2.2. The power of the first preamble shall be -60 dBm to be received at TE with an accuracy specified in clause 6.3.4.2 of TS 38.101-2 [19]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.4.3 of TS 38.101-2 [19].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Clause 7.1.2.

#### A.5.3.2.3 Void

## A.5.4 Timing

### A.5.4.1 UE transmit timing

#### A.5.4.1.1 NR UE Transmit Timing Test for FR2

##### A.5.4.1.1.1 Test Purpose and environment

The purpose of this test is to verify that the UE can follow frame timing change of the connected gNodeB and that the UE initial transmit timing accuracy, maximum amount of timing change in one adjustment, minimum and maximum adjustment rate are within the specified limits. This test will verify the requirements in clause 7.1.2.

Supported test configurations are shown in Table 5.4.1.1.1-1.

**Table A.5.4.1.1.1-1: Supported test configurations for FR2 PSCell**

| Configuration | Description  |
|---------------|--|
| 1             | LTE FDD, NR TDD, SSB SCS 240 kHz, data SCS 120 kHz, BW 100 MHz |
| 2             | LTE TDD, NR TDD, SSB SCS 240 kHz, data SCS 120 kHz, BW 100 MHz |

The test consists of E-UTRA PCell and NR PSCell. The configuration for E-UTRA is given in A.3.7.2.1. Tables A.5.4.1.1.1-2 and A.5.4.1.1.1-2A define the parameters to be configured and strength of the transmitted signals. The transmit timing is verified by the UE transmitting SRS using the configuration defined in Table A.5.4.1.1.1-3.

Table A.5.4.1.1.1-2: Cell Specific Test Parameters for UL Transmit Timing test

| Parameter   | Unit | Config | Test1                      | Test2                      | Band Group |

**Table A.5.4.1.1.1-4: Void****A.5.4.1.1.2 Test requirements**

The test sequence shall be carried out in RRC\_CONNECTED for every test case.

Following will be the test sequence for this test

- 1) Set up E-UTRA PCell according to parameters given in Table A.3.7.2.2-1 and setup NR PSCell according to parameters given in Table A.5.4.1.1.1-1.
- 2) After connection set up with the cell, the test equipment will verify that the timing of the NR cell is within  $(N_{TA} + N_{TA\_offset}) \times T_c \pm T_e$  of the first detected path of DL SSB.
  - a. The  $N_{TA}$  offset value (in  $T_c$  units) is 13792
  - b. The  $T_e$  values depend on the DL and UL SCS for which the test is being run and are given in Table 7.1.2-1
- 3) The test system shall adjust the timing of the DL path by values given in Table A.5.4.1.1.2-1

**Table A.5.4.1.1.2-1 Adjustment Value for DL Timing**

| SCS of SSB signals (kHz) | Adjustment Value |            |
|--------------------------|------------------|------------|
|                          | Test1            | Test2      |
| 240                      | $+8*64T_c$       | $+4*64T_c$ |

- 4) The test system shall verify that the adjustment step size and the adjustment rate shall be according to requirements specified in Clause 7.1.2 Table 7.1.2.1-1 until the UE transmit timing offset is within  $(N_{TA} + N_{TA\_offset}) \times T_c \pm T_e$  respective to the first detected path (in time) of DL SSB. Skip this step for test 2 with DRX configured.
- 5) The test system shall verify that the UE transmit timing offset stays within  $(N_{TA} + N_{TA\_offset}) \times T_c \pm T_e$  of the first detected path of DL SSB. For Test 2 the UE transmit timing offset shall be verified for the first transmission in the DRX cycle immediately after DL timing adjustment

**A.5.4.2 UE timer accuracy****A.5.4.3 Timing advance****A.5.4.3.1 EN-DC FR2 timing advance adjustment accuracy****A.5.4.3.1.1 Test Purpose and Environment**

The purpose of the test is to verify UE Timing Advance adjustment delay and accuracy requirement defined in clause 7.3.

**A.5.4.3.1.2 Test Parameters**

Supported test configurations are shown in table A.5.4.3.1.2-1. Both timing advance adjustment delay and accuracy are tested by using the parameters in table A.5.4.3.1.2-2, A.5.4.3.1.2-3, A.5.4.3.1.2-3A and A.5.4.3.1.2-4. The configuration of Cell 1 (LTE PCell) is specified in clause A.3.7.2.1.

In all test cases, two cells are used. Cell 1 is the PCell in the primary Timing Advance Group (pTAG) and cell 2 is the PSCell in the secondary Timing Advance Group (sTAG). Each test consists of two successive time periods, with time duration of T1 and T2 respectively. In each time period, timing advance commands for sTAG are sent to the UE and Sounding Reference Signals (SRS), as specified in table A.5.4.3.1.2-3, are sent from the UE and received by the test equipment. By measuring the reception of the SRS, the transmit timing, and hence the timing advance adjustment accuracy, can be measured for PSCell in sTAG.

During time period T1, the test equipment shall send one message with a Timing Advance Command MAC Control Element for sTAG, as specified in clause 6.1.3.4 in TS 38.321 [7]. The Timing Advance Command value shall be set to 31, which according to clause 4.2 in TS 38.213 [3] results in zero adjustment of the Timing Advance. In this way, a reference value for the timing advance for sTAG used by the UE is established.

During time period T2, the test equipment shall send a sequence of messages with Timing Advance Command MAC Control Elements for sTAG, with Timing Advance Command value specified in table A.5.4.3.1.2-2. This value shall result in changes of the timing advance for sTAG used by the UE, and the accuracy of the change shall then be measured, using the SRS sent from the UE.

As specified in clause 7.3.2.1, the UE adjusts its uplink timing at slot  $n+k$  for a timing advance command received in slot  $n$ . This delay must be taken into account when measuring the timing advance adjustment accuracy, via the SRS sent from the UE.

The UE Time Alignment Timer, described in clause 5.2 in TS 38.321, shall be configured so that it does not expire in the duration of the test.

**Table A.5.4.3.1.2-1: Timing advance supported test configurations**

| Config   | Description   |
|--|---|
| 1  | LTE FDD, NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| 2  | LTE TDD, NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| Note: The UE is only required to be tested in one of the supported test configurations |   |

**Table A.5.4.3.1.2-2: General test parameters for timing advance**

| Parameter  | Unit | Value                  | Comment   |
|--|------|------------------------|---|
| RF channel number                                |      | Cell 1: 1<br>Cell 2: 2 | 1 for E-UTRAN PCell<br>2 for NR PSCell  |
| Initial DL BWP                                   |      | DLBWP.0.1              | As specified in Table A.3.9.2.1-1   |
| Dedicated DL BWP                                 |      | DLBWP.1.1              | As specified in Table A.3.9.2.2-1   |
| Initial UL BWP                                   |      | ULBWP.0.1              | As specified in Table A.3.9.3.1-1   |
| Dedicated UL BWP                                 |      | ULBWP.1.1              | As specified in Table A.3.9.3.2-1   |
| Timing Advance Command ( $T_A$ ) value during T1 |      | 31                     | $N_{TA\_new} = N_{TA\_old}$ for the purpose of establishing a reference value from which the timing advance adjustment accuracy can be measured during T2 |
| Timing Advance Command ( $T_A$ ) value during T2 |      | 39                     | For 120 kHz SCS $N_{TA\_new} = N_{TA\_old} + 1024 * T_c$ (based on equation in clause 4.2 of TS 38.213 [3])   |
| T1   | s    | 5                      |   |
| T2   | s    | 5                      |   |

### A.5.4.3.1.3 Test Requirements

The UE shall apply the signalled Timing Advance value for PSCell in sTAG to the transmission timing at the designated activation time i.e.  $k+1$  slots after the reception of the timing advance command, where  $k = 11$ .

The Timing Advance adjustment accuracy for PSCell in sTAG shall be within the limits specified in clause 7.3.2.2.

The rate of correct Timing Advance adjustments observed during repeated tests shall be at least 90%.

## A.5.5 Signaling characteristics

### A.5.5.1 Radio link Monitoring

In the following clause, any uplink signal transmitted by the UE is used for detecting the In-/Out-of-Sync state of the UE. In terms of measurement, the uplink signal is verified on the basis of the UE output power:

*Editor note: The metric for the detection of the UE UL transmitted signal by the TE is FFS.*

#### A.5.5.1.1 Radio Link Monitoring Out-of-sync Test for FR2 PSCell configured with SSB-based RLM RS in non-DRX mode

##### A.5.5.1.1.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the out of sync and in sync for the purpose of monitoring downlink radio link quality of the PSCell. This test will partly verify the FR2 radio link monitoring requirements in clause 8.1.

In the test, UE is configured to perform RLM on SSB, with *detectionResource* included in *RadioLinkMonitoringRS* set to SSB#0 and SSB#1, and *purpose* set to 'rlf'. Supported test configurations are shown in table A.5.5.1.1.1-1. The test parameters are given in Tables A.5.5.1.1.1-2, A.5.5.1.1.1-3, and A.5.5.1.1.1-4 below. There are two cells, Cell 1 is the E-UTRAN PCell, and Cell 2 is the PSCell, in the test. The E-UTRAN PCell setting refers to Table A.3.7.2.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Figure A.5.5.1.1.1-1 shows the variation of the downlink SNR in the active cell to emulate out-of-sync and in-sync states, and Figure A.5.5.1.1.1-2 shows the Time multiplexed downlink transmissions from each Angle of Arrival. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1 and Cell 2. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In addition to RLM-RS radio link monitoring using SSB index 0 and SSB index 1, the UE is configured to perform inter-frequency measurements using Gap Pattern ID #0 (40ms) in test 1.

**Table A.5.5.1.1.1-1: Supported test configurations for FR2 PSCell**

| Configuration  | Description   |
|--|---|
| 1  | FDD LTE PCell, NR 120 KHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| 2  | TDD LTE PCell, NR 120 KHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| Note: The UE is only required to pass in one of the supported test configurations in FR2 |   |

**Table A.5.5.1.1.1-2: General test parameters for FR2 out-of-sync testing in non-DRX mode**

| Parameter                           |                                | Unit | Value                       |
|-------------------------------------|--------------------------------|------|-----------------------------|

- Note 1: OCNG shall be used such that a constant total transmitted power spectral density is achieved for all OFDM symbols.
- Note 2: The signal contains PDCCH for UEs other than the device under test as part of OCNG.
- Note 3: SNR levels correspond to the signal to noise ratio over the SSS REs.
- Note 4: The SNR values are specified for testing a UE which supports 2RX on at least one band. For testing of a UE which supports 4RX on all bands, the SNR during T3 is A.3.6.
- Note 5: Information about types of UE beam is given in B.2.1.3, and does not limit UE implementation or test system implementation
- Note 6: This value allows up to 1dB degradation from applied SNR to UE baseband

**Table A.5.5.1.1.1-4: Measurement gap configuration for out-of-sync tests in non-DRX mode**

| Field   | Test 1 |
|---|--------|
|   | Value  |
| gapOffset   | 0      |
| Note 1: E-UTRAN PCell and PSCell are SFN-synchronous and frame boundary aligned. (Ensure that RLM RS is partially overlapped with measurement gap). |        |

**Figure A.5.5.1.1.1-1: SNR variation for out-of-sync testing**

**Figure A.5.5.1.1.1-2: Time multiplexed downlink transmissions**

#### A.5.5.1.1.2 Test Requirements

The UE behavior in each test during time durations T1, T2 and T3 shall be as follows:

During the period from time point A to time point B the UE shall transmit uplink signal at least in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting.

The UE shall stop transmitting uplink signal in Cell 2 no later than time point C (D1 second after the start of the time duration T3).

The rate of correct events observed during repeated tests shall be at least 90%.

#### A.5.5.1.2 Radio Link Monitoring In-sync Test for FR2 PSCell configured with SSB-based RLM RS in non-DRX mode

##### A.5.5.1.2.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the out of sync and in sync for the purpose of monitoring downlink radio link quality of the PSCell. This test will partly verify the FR2 radio link monitoring requirements in clause 8.1.

In the test, UE is configured to perform RLM on SSB, with *detectionResource* included in *RadioLinkMonitoringRS* set to SSB#0 and SSB#1, and *purpose* set to 'rlf'. Supported test configurations are shown in table A.5.5.1.2.1-1. The test parameters are given in Tables A.5.5.1.2.1-2, and A.5.5.1.2.1-3 below. There are two cells, Cell 1 is the E-UTRAN PCell, and Cell 2 is the PSCell, in the test. The E-UTRAN PCell setting refers to Table A.3.7.2.1-2. The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.5.5.1.2.1-1 shows the variation of the downlink SNR in the active cell to emulate out-of-sync and in-sync states, and Figure A.5.5.1.2.1-2 shows the Time multiplexed downlink transmissions from each Angle of Arrival. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1 and Cell 2. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5ms.

**Table A.5.5.1.2.1-1: Supported test configurations for FR2 PSCell**

| Configuration  | Description   |
|--|---|
| 1  | FDD LTE PCell, NR 120 KHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| 2  | TDD LTE PCell, NR 120 KHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| Note: The UE is only required to pass in one of the supported test configurations in FR2 |   |

**Table A.5.5.1.2.1-2: General test parameters for FR2 in-sync testing in non-DRX mode**

| Parameter                           |  | Unit | Value<br>Test 1             |
|-------------------------------------|--|------|-----------------------------|

Figure A.5.5.1.2.1-1: SNR variation for in-sync testing

**Figure A.5.5.1.2.1-2: Time multiplexed downlink transmissions**

#### A.5.5.1.2.2 Test Requirements

The UE behaviour in each test during time durations T1, T2, T3, T4 and T5 shall be as follows:

During the period from time point A to time point F (D1 second after the start of time duration T5) the UE shall transmit uplink signal at least in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting.

The rate of correct events observed during repeated tests shall be at least 90%.

#### A.5.5.1.3 Radio Link Monitoring Out-of-sync Test for FR2 PSCell configured with SSB-based RLM RS in DRX mode

##### A.5.5.1.3.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the out of sync and in sync for the purpose of monitoring downlink radio link quality of the PSCell when DRX is used. This test will partly verify the FR2 radio link monitoring requirements in clause 8.1.

In the test, UE is configured to perform RLM on SSB, with *detectionResource* included in *RadioLinkMonitoringRS* set to SSB#0 and SSB#1, and *purpose* set to *'rlf'*. Supported test configurations are shown in table A.5.5.1.3.1-1. The test parameters are given in Tables A.5.5.1.3.1-2, and A.5.5.1.3.1-3. There are two cells, Cell 1 is the E-UTRAN PCell, and Cell 2 is the PSCell, in the test. The E-UTRAN PCell setting refers to Table A.3.7.2.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Figure A.5.5.1.3.1-1 shows the variation of the downlink SNR in the active cell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1 and Cell 2. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is enabled and DRX inactivity timer has already been expired, i.e. UE tries to decode PDCCH and to send periodic CSI during the period when On-duration timer is running. Time alignment timers shall be set to “infinity” so that UL timing alignment is maintained during the test.

Table A.5.5.1.3.1-1: Supported test configurations for FR2 PSCell

| Configuration  | Description   |
|--|---|
| 1  | FDD LTE PCell, NR 120 KHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| 2  | TDD LTE PCell, NR 120 KHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| Note: The UE is only required to pass in one of the supported test configurations in FR2 |   |

Table A.5.5.1.3.1-2: General test parameters for FR2 out-of-sync testing in DRX mode

| Parameter                           |  | Unit | Value                       |
|-------------------------------------|--|------|-----------------------------|
|                                     |  |      | Test 1                      |

**Table A.5.5.1.3.1-5: Void**

Figure A.5.5.1.3.1-1: SNR variation for out-of-sync testing

#### A.5.5.1.3.2 Test Requirements

The UE behavior in each test during time durations T1, T2 and T3 shall be as follows:

During the period from time point A to time point B the UE shall transmit uplink signal at least in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting.

The UE shall stop transmitting uplink signal in Cell 2 no later than time point C (D1 second after the start of the time duration T3).

The rate of correct events observed during repeated tests shall be at least 90%.

#### A.5.5.1.4 Radio Link Monitoring In-sync Test for FR2 PSCell configured with SSB-based RLM RS in DRX mode

##### A.5.5.1.4.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the out of sync and in sync for the purpose of monitoring downlink radio link quality of the PSCell when DRX is used. This test will partly verify the FR2 radio link monitoring requirements in clause 8.1.

In the test, UE is configured to perform RLM on SSB, with *detectionResource* included in *RadioLinkMonitoringRS* set to SSB#0 and SSB#1, and *purpose* set to 'rlf'. Supported test configurations are shown in table A.5.5.1.4.1-1. The test parameters are given in Tables A.5.5.1.4.1-2, and A.5.5.1.4.1-3. There are two cells, Cell 1 is the E-UTRAN PCell, and Cell 2 is the PSCell, in the test. The E-UTRAN PCell setting refers to Table A.3.7.2.1-2. The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.5.5.1.4.1-1 shows the variation of the downlink SNR in the active cell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1 and Cell 2. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is enabled and DRX inactivity timer has already been expired, i.e. UE tries to decode PDCCH and to send periodic CSI during the period when On-duration timer is running. Time alignment timers shall be set to "infinity" so that UL timing alignment is maintained during the test.

**Table A.5.5.1.4.1-1: Supported test configurations for FR2 PSCell**

| Configuration  | Description   |
|--|---|
| 1  | FDD LTE PCell, NR 120 KHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| 2  | TDD LTE PCell, NR 120 KHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| Note: The UE is only required to pass in one of the supported test configurations in FR2 |   |

|         |   |
|---------|---|
| Note 1: | OCNG shall be used such that the resources in Cell 2 are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.      |
| Note 2: | The signal contains PDCCH for UEs other than the device under test as part of OCNG.3  |
| Note 3: | SNR levels correspond to the signal to noise ratio over the SSS REs.  |
| Note 4: | The SNR values are specified for testing a UE which supports 2RX on at least one band. For testing of a UE which supports 4RX on all bands, the SNR during T3 is A.3.6. |
| Note 5: | Information about types of UE beam is given in B.2.1.3, and does not limit UE implementation or test system implementation  |
| Note 6: | This value allows up to 1dB degradation from applied SNR to UE baseband   |

**Table A.5.5.1.4.1-4: Void**

**Table A.5.5.1.4.1-5: Void**

**Figure A.5.5.1.4.1-1: SNR variation for in-sync testing.**

**A.5.5.1.4.2 Test Requirements**

The UE behaviour in each test during time durations T1, T2, T3, T4 and T5 shall be as follows:

During the period from time point A to time point F (D1 second after the start of time duration T5) the UE shall transmit uplink signal at least in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting.

The rate of correct events observed during repeated tests shall be at least 90%.

### A.5.5.1.5 EN-DC Radio Link Monitoring Out-of-sync Test for FR2 PSCell configured with CSI-RS-based RLM in non-DRX mode

#### A.5.5.1.5.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the out of sync for the purpose of monitoring downlink CSI-RS based radio link quality of the PSCell when no DRX is used. This test will partly verify the FR2 TDD PSCell CSI-RS Out-of-sync radio link monitoring requirements in clause 8.1.

The test parameters are given in Tables A.5.5.1.5.1-1, A.5.5.1.5.1-2, A.5.5.1.5.1-3 and A.5.5.1.5.1-3A below. There are two cells, cell 1 is the E-UTRAN PCell, and cell 2 is the PSCell, in the test. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Figure A.5.5.1.5.1-1 shows the variation of the downlink SNR in the E-UTRAN PCell and the PSCell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to cell 1 and cell 2. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5ms. In the test, DRX configuration is not enabled. The UE is configured to perform inter-frequency measurements using GP ID #0 (40ms). In the test, SSB0 and SSB1 are configured as BFD-RS.

**Table A.5.5.1.5.1-1: Supported test configurations for FR2 PSCell**

| Configuration  | Description   |
|--|---|
| 1  | LTE FDD, NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| 2  | LTE TDD, NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| Note: The UE is only required to pass in one of the supported test configurations in FR2 |   |

**Table A.5.5.1.5.1-4: Void**

**Figure A.5.5.1.5.1-1: SNR variation for CSI-RS out-of-sync testing**

#### A.5.5.1.5.2 Test Requirements

The UE behaviour during time durations T1, T2, and T3 shall be as follows:

During the period from time point A to time point B the UE shall transmit uplink signal in Cell 2 (PSCell) at least in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting for Cell 2.

The UE shall stop transmitting uplink signal in Cell 2 (PSCell) no later than time point C ( $D_1$  after the start of the time duration T3) on the PSCell.

The rate of correct events observed during repeated tests shall be at least 90%.

#### A.5.5.1.6 EN-DC Radio Link Monitoring In-sync Test for FR2 PSCell configured with CSI-RS-based RLM in non-DRX mode

##### A.5.5.1.6.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the in sync for the purpose of monitoring downlink CSI-RS based radio link quality of the PSCell when no DRX is used. This test will partly verify the FR2 TDD PSCell CSI-RS In-sync radio link monitoring requirements in clause 8.1.

The test parameters are given in Tables A.5.5.1.6.1-1, A.5.5.1.6.1-2, and A.5.5.1.6.1-3 below. There are two cells, cell 1 which is the E-UTRAN PCell, and cell 2 is the PSCell, in the test. The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.5.5.1.6.1-1 shows the variation of the downlink SNR in the PSCell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to cell 1 and cell 2. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5ms. In the test, DRX configuration is not enabled. In the test, SSB0 and SSB1 are configured as BFD-RS.

**Table A.5.5.1.6.1-1: Supported test configurations for FR2 PSCell**

| Configuration  | Description   |
|--|---|
| 1  | LTE FDD, NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| 2  | LTE TDD, NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| Note: The UE is only required to pass in one of the supported test configurations in FR2 |   |

**Table A.5.5.1.6.1-2: General test parameters for FR2 PSCell for CSI-RS in-sync testing in non-DRX mode**

| Parameter                           |             | Unit | Value  |

**Table A.5.5.1.6.1-4: Void**

Figure A.5.5.1.6.1-1: SNR variation for CSI-RS in-sync testing

#### A.5.5.1.6.2 Test Requirements

The UE behaviour in each test during time durations T1, T2, T3, T4 and T5 shall be as follows:

During the period from time point A to time point F (D1 second after the start of time duration T5) the UE shall transmit uplink signal at least in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting on the PSCell.

The rate of correct events observed during repeated tests shall be at least 90%.

#### A.5.5.1.7 EN-DC Radio Link Monitoring Out-of-sync Test for FR2 PSCell configured with CSI-RS-based RLM in DRX mode

##### A.5.5.1.7.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the out of sync for the purpose of monitoring downlink CSI-RS based radio link quality of the PSCell when DRX is used. This test will partly verify the FR2 TDD PSCell CSI-RS Out-of-sync radio link monitoring requirements in clause 8.1.

The test parameters are given in Tables A.5.5.1.7.1-1, A.5.5.1.7.1-2, and A.5.5.1.7.1-3 below. There are two cells, cell 1 is the E-UTRAN PCell, and cell 2 is the PSCell, in the test. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Figure A.5.5.1.7.1-1 shows the variation of the downlink SNR in the E-UTRAN PCell and the PSCell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to cell 1 and cell 2. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5ms. In the test, DRX configuration is enabled in PSCell and DRX inactivity timer has already been expired, i.e. UE tries to decode PDCCH and to send periodic CQI during the period when On-duration timer is running. Time alignment timers shall be set to “infinity” so that UL timing alignment is maintained during the test. In the test, SSB0 and SSB1 are configured as BFD-RS and are not same as RLM-RS to avoid triggering the beam failure during the RLM test.

**Table A.5.5.1.7.1-1: Supported test configurations for FR2 PSCell**

| Configuration  | Description   |
|--|---|
| 1  | LTE FDD, NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| 2  | LTE TDD, NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| Note: The UE is only required to pass in one of the supported test configurations in FR2 |   |

**Table A.5.5.1.7.1-2: General test parameters for FR2 PSCell for CSI-RS out-of-sync testing in DRX mode**

| Parameter                           |             | Unit | Value  |

Figure A.5.5.1.7.1-1: SNR variation for CSI-RS out-of-sync testing

### A.5.5.1.7.2 Test Requirements

The UE behaviour during time durations T1, T2, and T3 shall be as follows:

During the period from time point A to time point B the UE shall transmit uplink signal in Cell 2 (PSCell) at least in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting for Cell 2.

The UE shall stop transmitting uplink signal in Cell 2 (PSCell) no later than time point C ( $D_1$  after the start of the time duration T3) on the PSCell.

The rate of correct events observed during repeated tests shall be at least 90%.

### A.5.5.1.8 EN-DC Radio Link Monitoring In-sync Test for FR2 PSCell configured with CSI-RS-based RLM in DRX mode

#### A.5.5.1.8.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the in sync for the purpose of monitoring downlink CSI-RS based radio link quality of the PSCell when DRX is used. This test will partly verify the FR2 TDD PSCell CSI-RS In-sync radio link monitoring requirements in clause 8.1.

The test parameters are given in Tables A.5.5.1.8.1-1, A.5.5.1.8.1-2, A.5.5.1.8.1-3 and A.5.5.1.8.1-3A below. There are two cells, cell 1 which is the E-UTRAN PCell, and cell 2 is the NR PSCell, in the test. The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.5.5.1.8.1-1 shows the variation of the downlink SNR in the PSCell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to cell 1 and cell 2. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5ms. In the test, DRX configuration is enabled. The UE is configured to perform inter-frequency measurements using GP ID #0 (40ms). In the test, SSB0 and SSB1 are configured as BFD-RS and are not same with RLM-RS to avoid triggering the beam failure during the RLM test.

**Table A.5.5.1.8.1-1: Supported test configurations for FR2 PSCell**

| Configuration  | Description   |
|--|---|
| 1  | LTE FDD, NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| 2  | LTE TDD, NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| Note: The UE is only required to pass in one of the supported test configurations in FR2 |   |

#### A.5.5.1.8.2 Test Requirements

The UE behaviour in each test during time durations T1, T2, T3, T4 and T5 shall be as follows:

During the period from time point A to time point F (D1 second after the start of time duration T5) the UE shall transmit uplink signal at least in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting on the PSCell.

The rate of correct events observed during repeated tests shall be at least 90%.

#### A.5.5.1.9 EN-DC Radio Link Monitoring UE Scheduling Restrictions on FR2

##### A.5.5.1.9.1 Test Purpose and Environment

The purpose is to verify that the NR UE correctly follows the RLM scheduling restrictions requirements defined in clause 8.1.7. This test verifies that the UE correctly receive the PDCCH scheduled on the symbols right before the RLM SSB symbols without overlap so that it sends ACK/NACK correctly. The test case is only applicable to UE which supports `pdccch-MonitoringAnyOccasions` or `pdccch-MonitoringAnyOccasionsWithSpanGap`.

Two cells are deployed in the test, which are E-UTRAN PCell (Cell 1) and NR FR2 PSCell (Cell 2). The test parameters for NR PSCell are given in table A.5.5.1.9.1-1, table A.5.5.1.9.1-2 and table A.5.5.1.9.1-3 below and the parameters and applicability for the E-UTRAN cell are defined in A.3.7.2. The UE is required during time period T1 to transmit ACK/NACK correctly upon scheduling of PDSCH.

Table A.5.5.1.9.1-1: Supported test configurations

| Configuration   | Description   |
|---|---|
| 1   | FDD LTE, 120 kHz SSB SCS, 120 kHz RMC SCS, 100 MHz bandwidth, TDD duplex mode |
| 2   | TDD LTE, 120 kHz SSB SCS, 120 kHz RMC SCS, 100 MHz bandwidth, TDD duplex mode |
| Note: The UE is only required to be tested in one of the supported test configurations. |   |

Table A.5.5.1.9.1-2: General test parameters for RLM scheduling restriction test case in FR2

| Parameter          | Unit | Test configuration | Value          | Comment   |

A.5.5.1.9.2 Test Requirements

The UE behaviour follows the requirements defined in clause 8.1.7.3.

## A.5.5.2 Interruption

### A.5.5.2.1 E-UTRAN – NR FR2 interruptions at transitions between active and non-active during DRX in synchronous EN-DC

#### A.5.5.2.1.1 Test Purpose and Environment

The purpose of this test is to verify that when E-UTRA PCell is in DRX and NR PSCell is in non-DRX, NR PSCell interruptions due to transitions from active to non-active and from non-active to active during LTE PCell DRX the UE missed ACK/NACK does not exceed the limits. This test will verify the missed ACK/NACK rate for NR PSCell in EN-DC specified in clause 8. 2.1.2. Supported test configurations are shown in table A.5.5.2.1.1-1.

The general test parameters are given in Table A.5.5.2.1.1-2, and NR cell specific test parameters are given in Table A.5.5.2.1.1-3 and A.5.5.2.1.1-4. The E-UTRAN PCell DRX configuration parameters are given in Table A.5.5.2.1.1-5 below. And the E-UTRAN cell specific test parameters can refer to Table A.3.7.2.2-1. In the test there are two cells: Cell1 and Cell2. Cell1 is LTE PCell on and Cell2 is NR FR2 PSCell. The test consists of one time period, with duration of T1. During T1, NR PSCell is continuously scheduled in DL while LTE PCell is not scheduled and has DRX configured. Prior to the start of the time duration T1, Cell1 shall be configured as LTE PCell and Cell2 shall be configured as NR PSCell. Prior to start of T1 the DRX inactivity timer for the LTE PCell has already expired. During T1 the UE shall be continuously scheduled on NR PSCell while not scheduled on LTE PCell. PDCCH indicating a new transmission on PSCell shall be sent continuously during the entire time duration to ensure UE would not enter DRX state on PSCell.

**Table A.5.5.2.1.1-1: Interruption at transitions between active and non-active during DRX supported test configurations**

| Config   | Description   |
|--|---|
| 1  | LTE FDD, NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| 2  | LTE TDD, NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| Note: The UE is only required to be tested in one of the supported test configurations |   |

**Table A.5.5.2.1.1-2: General test parameters for E-UTRAN – NR FR2 interruptions at transitions between active and non-active during DRX in synchronous EN-DC**

| Parameter                  | Unit | Value  | Comment  |
|----------------------------|------|--------|--|
| RF Channel Number          |      | 1, 2   | One is E-UTRAN RF channel and the other is NR RF channel |
| Active PCell               |      | Cell1  | PCell on E-UTRAN RF channel number 1.                    |

|         |  |
|---------|--|
| Note 1: | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |
| Note 2: | SSB_RP and $I_0$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.   |
| Note 3: | SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.  |
| Note 4: | Equivalent power received by an antenna with 0dBi gain at the centre of the quiet zone   |
| Note 5: | As observed with 0dBi gain antenna at the centre of the quiet zone   |
| Note 6: | Information about types of UE beam is given in B.2.1.3, and does not limit UE implementation or test system implementation   |

**Table A.5.5.2.1.1-5: Void**

### A.5.5.2.1.2 Test Requirements

The UE shall be continuously scheduled in NR PSCell during the entire length of T1. UE shall not be scheduled in LTE PCell during T1. During the time duration T1 the UE shall transmit at least 99% of ACK/NACK on NR PSCell.

Interruption on NR PSCell shall not exceed 0.625ms (5 slots) as defined in clause 8. 2.1.

The rate of correct events observed during repeated tests shall be at least 90%.

### A.5.5.2.2 E-UTRAN – NR FR2 interruptions at transitions between active and non-active during DRX in asynchronous EN-DC

#### A.5.5.2.2.1 Test Purpose and Environment

The purpose of this test is to verify that when LTE PCell is in DRX and NR PSCell is in non-DRX, NR PSCell interruptions due to transitions from active to non-active and from non-active to active during LTE PCell DRX the UE missed ACK/NACK does not exceed the limits. This test will verify the missed ACK/NACK rate for NR PSCell in EN-DC specified in clause 8. 2.1.2. Supported test configurations are shown in table A.5.5.2.2.1-1.

The general test parameters are given in Table A.5.5.2.2.1-2, and NR cell specific test parameters are given in Table A.5.5.2.2.1-3 and A.5.5.2.2.1-4. The E-UTRAN PCell DRX configuration parameters are given in Table A.5.5.2.2.1-5 below. And the E-UTRAN cell specific test parameters can refer to Table A.3.7.2.2-1. In the test there are two cells: Cell1 and Cell2. Cell1 is LTE PCell and Cell2 is NR PSCell. The test consists of one time period, with duration of T1. During T1, NR PSCell is continuously scheduled in DL while LTE PCell is not scheduled and has DRX configured. Prior to the start of the time duration T1, Cell1 shall be configured as LTE PCell and Cell2 shall be configured as NR PSCell. Prior to start of T1 the DRX inactivity timer for the LTE PCell has already expired. During T1 the UE shall be continuously scheduled on NR PSCell while not scheduled on LTE PCell. PDCCCH indicating a new transmission on PSCell shall be sent continuously during the entire time duration to ensure UE would not enter DRX state on PSCell.

**Table A.5.5.2.2.1-1: Interruption at transitions between active and non-active during DRX supported test configurations**

| Config | Description  |
|--------|--|
| 1      | LTE FDD, NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode                  |
| 2      | LTE TDD, NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode                  |
| Note:  | The UE is only required to be tested in one of the supported test configurations |

| <p>Note 1: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for <math>N_{oc}</math> to be fulfilled.</p> <p>Note 2: SSB_RP and <math>I_o</math> levels have been derived from other parameters for information purposes. They are not settable parameters themselves.</p> <p>Note 3: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.</p> <p>Note 4: Equivalent power received by an antenna with 0dBi gain at the centre of the quiet zone</p> <p>Note 5: As observed with 0dBi gain antenna at the centre of the quiet zone</p> <p>Note 6: Information about types of UE beam is given in B.2.1.3, and does not limit UE implementation or test system implementation</p> |                                |                                      |

**Table A.5.5.2.2.1-5: Void**

#### A.5.5.2.2.2 Test Requirements

The UE shall be continuously scheduled in NR PSCell during the entire length of T1. UE shall not be scheduled in LTE PCell during T1. During the time duration T1 the UE shall transmit at least 99% of ACK/NACK on NR PSCell.

Interruption on NR PSCell shall not exceed 0.625ms (5 slots) as defined in clause 8. 2.1.

The rate of correct events observed during repeated tests shall be at least 90%.

### A.5.5.2.3 E-UTRAN – NR FR2 interruptions during measurements on deactivated NR SCC in synchronous EN-DC

#### A.5.5.2.3.1 Test Purpose and Environment

The purpose of this test is to verify that for NR PSCell interruptions during the measurement on the deactivated NR SCC, the UE missed ACK/NACK does not exceed the limits. This test will verify the missed ACK/NACK rate for NR PSCell in EN-DC specified in clause 8. 2.1.2. Supported test configurations are shown in table A.5.5.2.3.1-1.

The general test parameters are given in Table A.5.5.2.3.1-2, and NR cell specific test parameters are given in Table A.5.5.2.3.1-3 and A.5.5.2.3.1-4 below. The E-UTRAN cell specific test parameters can be found in Table A.3.7.2.1-2. In the test there are three cells: Cell1, Cell2 and Cell3. Cell1 is LTE PCell, Cell2 and Cell 3 are NR FR2 PSCell and NR FR2 deactivated SCell, respectively. Cell1 shall be configured as LTE PCell and Cell2 shall be configured as NR PSCell. The test consists of one time period, with duration of T1. Prior to the start of the time duration T1, the UE is connected to Cell1 and Cell2. The point in time at which the RRC message including *measCycleSCell* for the deactivated NR SCells is received by the UE, defines the start of time period T1. During T1, LTE PCell and NR PSCell are continuously scheduled in DL.

**Table A.5.5.2.3.1-1: Interruption during measurements on deactivated NR SCC supported test configurations**

| Config | Description  |
|--------|--|
| 1      | LTE FDD, NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode                  |
| 2      | LTE TDD, NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode                  |
| Note:  | The UE is only required to be tested in one of the supported test configurations |

**Table A.5.5.2.3.1-2: General test parameters for E-UTRAN – NR FR2 interruptions during measurements on deactivated NR SCC in synchronous EN-DC**

| Parameter   | Unit | Value   | Comment  |
|---|------|---------|--|
| RF Channel Number                                 |      | 1, 2, 3 | One is E-UTRAN RF channel and the other two are NR RF channels |
| Active PCell                                      |      | Cell1   | PCell on E-UTRAN RF channel number 1.                          |
| Configured PSCell                                 |      | Cell2   | PSCell on NR RF channel number 2.                              |
| Configured deactivated SCell                      |      | Cell3   | Deactivated SCell on NR RF channel number 3.                   |
| CP length   |      | Normal  | Applicable to cell1, cell 2 and cell3                          |
| AoA number  |      | 1       | Applicable to cell2 and cell3                                  |
| DRX   |      | OFF     |  |
| Measurement gap pattern Id                        |      | OFF     |  |
| SCell measurement cycle ( <i>measCycleSCell</i> ) | ms   | 640     |  |

#### A.5.5.2.3.2 Test Requirements

The UE shall be continuously scheduled in LTE PCell and NR PSCell during the entire length of T1. During the time duration T1 the UE shall transmit at least 99.5% of ACK/NACK on NR PSCell.

If the NR PSCell is not in the same band as the deactivated SCell, the UE is only allowed to cause interruptions on NR PSCell immediately before and immediately after an SMTC. Each interruption on NR PSCell shall not exceed the value defined in Table A.5.5.2.3.2-1.

If the NR PSCell is in the same band as the deactivated SCell, the UE is only allowed to cause an interruption on PSCell no earlier than 4 slot before an SMTC and no later than 4 slot after the SMTC. the interruption on NR PSCell shall not exceed the value defined in Table A.5.5.2.3.2-2.

**Table A.5.5.2.3.2-1: Interruption duration if the NR PSCell is not in the same band as the deactivated SCell**

| $\mu$ | NR Slot length (ms) | Interruption length (slot) |
|-------|---------------------|----------------------------|
| 3     | 0.125               | 4                          |

**Table A.5.5.2.3.2-2: Interruption duration if the NR PSCell is in the same band as the deactivated SCell**

| $\mu$ | NR Slot length (ms) | Interruption length (slot) |
|-------|---------------------|----------------------------|
| 3     | 0.125               | 8 + SMTC duration          |

The rate of correct events observed during repeated tests shall be at least 90%.

#### A.5.5.2.4 E-UTRAN – NR FR2 interruptions during measurements on deactivated NR SCC in asynchronous EN-DC

##### A.5.5.2.4.1 Test Purpose and Environment

The purpose of this test is to verify that for NR PSCell interruptions during the measurement on the deactivated NR SCC, the UE missed ACK/NACK does not exceed the limits. This test will verify the missed ACK/NACK rate for NR PSCell in EN-DC specified in clause 8. 2.1.2. Supported test configurations are shown in table A.5.5.2.4.1-1.

The general test parameters are given in Table A.5.5.2.4.1-2, and NR cell specific test parameters are given in Table A.5.5.2.4.1-3 and A.5.5.2.4.1-4 below. The E-UTRAN cell specific test parameters can be found in Table A.3.7.2.1-2. In the test there are three cells: Cell1, Cell2 and Cell3. Cell1 is LTE PCell, Cell2 and Cell 3 are NR FR2 PSCell and NR FR2 deactivated SCell, respectively. Cell1 shall be configured as LTE PCell and Cell2 shall be configured as NR PSCell. The test consists of one time period, with duration of T1. Prior to the start of the time duration T1, the UE is connected to Cell1 and Cell2. The point in time at which the RRC message including *measCycleSCell* for the deactivated NR SCells is received by the UE, defines the start of time period T1. During T1, LTE PCell and NR PSCell are continuously scheduled in DL.

**Table A.5.5.2.4.1-1: Interruption during measurements on deactivated NR SCC supported test configurations**

| Config | Description  |
|--------|--|
| 1      | LTE FDD, NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode                  |
| 2      | LTE TDD, NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode                  |
| Note:  | The UE is only required to be tested in one of the supported test configurations |

**Table A.5.5.2.4.1-2: General test parameters for E-UTRAN – NR interruptions during measurements on deactivated NR SCC in asynchronous EN-DC**

| Parameter   | Unit | Value  | Comment   |
|---|------|--------|---|
| RF Channel Number                                 |      | 1, 2   | One is E-UTRAN RF channel and the other two are NR RF channel |
| Active PCell                                      |      | Cell1  | PCell on E-UTRAN RF channel number 1.                         |
| Configured PSCell                                 |      | Cell2  | PSCell on NR RF channel number 2.                             |
| Configured deactivated SCell                      |      | Cell3  | Deactivated SCell on NR RF channel number 2.                  |
| CP length   |      | Normal | Applicable to cell1, cell 2 and cell3                         |
| AoA number  |      | 1      | Applicable to cell2 and cell3                                 |
| DRX   |      | OFF    |   |
| Measurement gap pattern Id                        |      | OFF    |   |
| SCell measurement cycle ( <i>measCycleSCell</i> ) | ms   | 640    |   |
| T1  | s    | 10     |   |

#### A.5.5.2.4.2 Test Requirements

The UE shall be continuously scheduled in LTE PCell and NR PSCell during the entire length of T1. During the time duration T1 the UE shall transmit at least 99.5% of ACK/NACK on NR PSCell.

If the NR PSCell is not in the same band as the deactivated SCell, the UE is only allowed to cause interruptions on NR PSCell immediately before and immediately after an SMTC. Each interruption on NR PSCell shall not exceed the value defined in Table A.5.5.2.4.2-1.

If the NR PSCell is in the same band as the deactivated SCell, the UE is only allowed to cause an interruption on PSCell no earlier than 4 slot before an SMTC and no later than 4 slot after the SMTC. the interruption on NR PSCell shall not exceed the value defined in Table A.5.5.2.4.2-2.

**Table A.5.5.2.4.2-1: Interruption duration if the NR PSCell is not in the same band as the deactivated SCell**

| $\mu$ | NR Slot length (ms) | Interruption length (slot) |
|-------|---------------------|----------------------------|
| 3     | 0.125               | 4                          |

**Table A.5.5.2.4.2-2: Interruption duration if the NR PSCell is in the same band as the deactivated SCell**

| $\mu$ | NR Slot length (ms) | Interruption length (slot) |
|-------|---------------------|----------------------------|
| 3     | 0.125               | 8 + SMTC duration          |

The rate of correct events observed during repeated tests shall be at least 90%.

### A.5.5.2.5 E-UTRAN – NR FR2 interruptions during measurements on deactivated E-UTRAN SCC in synchronous EN-DC

#### A.5.5.2.5.1 Test Purpose and Environment

The purpose of this test is to verify that for NR PSCell interruptions during the measurement on the deactivated E-UTRAN SCC, the UE missed ACK/NACK does not exceed the limits. This test will verify the missed ACK/NACK rate for NR PSCell in EN-DC specified in clause 8.2.1.2. Supported test configurations are shown in table A.5.5.2.5.1-1.

The general test parameters are given in Table A.5.5.2.5.1-2, and NR cell specific test parameters are given in Table A.5.5.2.5.1-3 and A.5.5.2.5.1-4 below. The E-UTRAN cell specific test parameters can be found in Table A.3.7.2.1-2. In the test there are three cells: Cell1, Cell2 and Cell3. Cell1 and Cell3 are LTE PCell and LTE deactivated SCell, respectively, and Cell2 is NR FR2 PSCell. Cell1 shall be configured as LTE PCell and Cell2 shall be configured as NR PSCell. The test consists of one time period, with duration of T1. Prior to the start of the time duration T1, the UE is connected to Cell1 and Cell2. The point in time at which the RRC message including *measCycleSCell* or *allowInterruptions* for the deactivated E-UTRA SCell is received by the UE, defines the start of time period T1. During T1, LTE PCell and NR PSCell are continuously scheduled in DL.

**Table A.5.5.2.5.1-1: Interruption during measurements on deactivated E-UTRAN SCC supported test configurations**

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| 2      | LTE TDD, NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |

Note: The UE is only required to be tested in one of the supported test configurations

**Table A.5.5.2.5.1-2: General test parameters for E-UTRAN – NR FR2 interruptions during measurements on deactivated E-UTRAN SCC in synchronous EN-DC**

| Parameter   | Unit | Value   | Comment  |
|---|------|---------|--|
| RF Channel Number                                 |      | 1, 2, 3 | One is NR RF channel and two are E-UTRAN RF channels |
| Active PCell                                      |      | Cell1   | PCell on E-UTRAN RF channel number 1.                |
| Configured PSCell                                 |      | Cell2   | PSCell on NR RF channel number 2.                    |
| Configured deactivated SCell                      |      | Cell3   | Deactivated SCell on E-UTRAN RF channel number 3.    |
| CP length   |      | Normal  | Applicable to cell1, cell 2 and cell3                |
| DRX   |      | OFF     |  |
| Measurement gap pattern Id                        |      | OFF     |  |
| SCell measurement cycle ( <i>measCycleSCell</i> ) | ms   | 640     |  |
| T1  | s    | 10      |  |

#### A.5.5.2.5.2 Test Requirements

The UE shall be continuously scheduled in LTE PCell and NR PSCell during the entire length of T1. During the time duration T1 the UE shall transmit at least 99.5% of ACK/NACK on NR PSCell. The UE is only allowed to cause interruptions immediately before and immediately after an SMTC. Each interruption on NR PSCell shall not exceed the value defined in Table A.5.5.2.5.2-1.

**Table A.5.5.2.5.2-1: Interruption duration if the NR PSCell is not in the same band as the deactivated SCell**

| $\mu$ | NR Slot length (ms) | Interruption length (slot) |
|-------|---------------------|----------------------------|
| 3     | 0.125               | 5                          |

**Table A.5.5.2.5.2-2: Void**

The rate of correct events observed during repeated tests shall be at least 90%.

#### A.5.5.2.6 E-UTRAN – NR FR2 interruptions during measurements on deactivated E-UTRAN SCC in asynchronous EN-DC

##### A.5.5.2.6.1 Test Purpose and Environment

The purpose of this test is to verify that for NR PSCell interruptions during the measurement on the deactivated E-UTRAN SCC, the UE missed ACK/NACK does not exceed the limits. This test will verify the missed ACK/NACK rate for NR PSCell in EN-DC specified in clause 8. 2.1.2. Supported test configurations are shown in table A.5.5.2.6.1-1.

The general test parameters are given in Table A.5.5.2.6.1-2, and NR cell specific test parameters are given in Table A.5.5.2.6.1-3 and A.5.5.2.6.1-4 below. The E-UTRAN cell specific test parameters can be found in Table A.3.7.2.1-2. In the test there are three cells: Cell1, Cell2 and Cell3. Cell1 and Cell3 are LTE PCell and LTE deactivated SCell, respectively, and Cell2 is NR FR2 PSCell. Cell1 shall be configured as LTE PCell and Cell2 shall be configured as

NR PSCell. The test consists of one time period, with duration of T1. Prior to the start of the time duration T1, the UE is connected to Cell1 and Cell2. The point in time at which the RRC message including *measCycleSCell* or *allowInterruptions* for the deactivated E-UTRA SCell is received by the UE, defines the start of time period T1. During T1, LTE PCell and NR PSCell are continuously scheduled in DL.

**Table A.5.5.2.6.1-1: Interruption during measurements on deactivated E-UTRAN SCC supported test configurations**

| Config | Description   |
|--------|---|
| 1      | LTE FDD, NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| 2      | LTE TDD, NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |

Note: The UE is only required to be tested in one of the supported test configurations

| <p>Note 1: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for <math>N_{oc}</math> to be fulfilled.</p> <p>Note 2: SSB_RP and <math>I_o</math> levels have been derived from other parameters for information purposes. They are not settable parameters themselves.</p> <p>Note 3: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.</p> <p>Note 4: Equivalent power received by an antenna with 0dBi gain at the centre of the quiet zone</p> <p>Note 5: As observed with 0dBi gain antenna at the centre of the quiet zone</p> <p>Note 6: Information about types of UE beam is given in B.2.1.3, and does not limit UE implementation or test system implementation.2.1.3, and does not limit UE implementation or test system implementation</p> |                                |                                      |

#### A.5.5.2.6.2 Test Requirements

The UE shall be continuously scheduled in LTE PCell and NR PSCell during the entire length of T1. During the time duration T1 the UE shall transmit at least 99.5% of ACK/NACK on NR PSCell. The UE is only allowed to

cause interruptions immediately before and immediately after an SMTC. Each interruption on NR PSCell shall not exceed the value defined in Table A.5.5.2.6.2-1.

**Table A.5.5.2.6.2-1: Interruption duration if the NR PSCell is not in the same band as the deactivated SCell**

| $\mu$ | NR Slot length (ms) | Interruption length (slot) |
|-------|---------------------|----------------------------|
| 3     | 0.125               | 5                          |

**Table A.5.5.2.6.2-2: Void**

The rate of correct events observed during repeated tests shall be at least 90%.

### A.5.5.3 SCell Activation and Deactivation Delay

#### A.5.5.3.1 SCell Activation and deactivation of SCell in FR2 intra-band

##### A.5.5.3.1.1 Test Purpose and Environment

The purpose of this test case is the same as for the test defined in clause A.4.5.3.1.1 except the SCell is in FR2 intra-band.

The supported test configurations are shown in table A.5.5.3.1.1-1 below. The general and cell specific test parameters are the same except those described in the following clause. The listed parameter values in Tables A.5.5.3.1.1-2 and A.5.5.3.1.1-3 will replace the values of corresponding parameters in Tables A.4.5.3.1.1-2 and A.4.5.3.1.1-3. In this case, OTA related test parameters are shown in table A.5.5.3.1.1-4 below.

In this test it is assumed that the UE is receiving RRC messages pertaining to the SCell in SCG via signaling on SRB3.

**Table A.5.5.3.1.1-1: Supported test configurations for FR2 SCell activation case with FR2 PSCell**

| Configuration | Description   |
|---------------|---|
| 1             | FDD LTE PCell, Cell 2&3 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| 2             | TDD LTE PCell, Cell 2&3 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |

Note: The UE is only required to pass in one of the supported test configurations

**Table A.5.5.3.1.1-2: General test parameters for FR2 SCell activation case with FR2 PSCell**

| Parameter    | Unit | Value  | Comment  |
|--------------|------|--------|--|
| Active PCell |      | Cell 1 | Primary cell on E-UTRAN RF channel number 1.<br>As specified in clause A.3.7.2.2 |

**Table A.5.5.3.1.1-3: Cell specific test parameters for FR2 SCell activation case with FR2 PSCell**

| Parameter <sup>Note 5</sup> | Unit | Cell 2 |    |    | Cell 3 |    |    |

#### A.5.5.3.1.2 Test Requirements

The test requirements defined in clause A.4.5.3.1.2 shall apply to this test case.

#### A.5.5.3.2 SCell Activation and deactivation of known SCell in FR1 for 160ms SCell measurement cycle

##### A.5.5.3.2.1 Test Purpose and Environment

The purpose of this test case is the same as for the test defined in clause A.4.5.3.1.1, except PSCell is in FR2.

The supported test configurations are shown in table A.5.5.3.2.1-1 below. The general test parameters are the same in Tables A.4.5.3.1.1-2. The cell specific test parameters are given in Tables A.5.5.3.2.1-2. In this case, OTA related test parameters are the same as in table A.5.5.3.2.1-3.

**Table A.5.5.3.2.1-1: Supported test configurations for FR1 SCell activation case with PSCell is FR2**

| Configuration | Description   |
|---------------|---|
| 1             | FDD LTE PCell, Cell 2 NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode<br>Cell 3 NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |

### A.5.5.3.2.2 Test Requirements

The test requirements defined in clause A.4.5.3.1.2 shall apply to this test case, with the following exceptions:

- Placement of interruptions is only verified in NR PSCell.

## A.5.5.3.3 Void

## A.5.5.3.4 Void

## A.5.5.3.5 SCell Activation and deactivation of SCell in FR2

## A.5.5.3.5.1 Test Purpose and Environment

The purpose of this test is to verify that the SCell activation and deactivation times are within the requirements stated in clause 8.3, when the SCell is in FR2.

The supported test configurations are shown in table A.5.5.3.5.1-1 below. The test parameters are the same as in clause A.4.5.3.3.1 except those described in the following clause. The listed parameter values in Tables A.5.5.3.5.1-2 will replace the values of corresponding parameters in Tables A.4.5.3.3.1-2. The listed parameter values in Tables A.5.5.3.5.1-3 will replace the values of corresponding parameters in Tables A.4.5.3.3.1-3. In this case, OTA related test parameters are shown in table A.5.5.3.5.1-4 below.

The test consists of three successive time periods, with duration of T1, T2 and T3, respectively. There are three carriers, E-UTRA has one cell (Cell 1), NR has two cells, PSCell (Cell 2) in FR1 and SCell (Cell 3) in FR2. Cell 1 and Cell 2 have constant signal levels throughout the test. Before the test starts the UE is connected to Cell 1 (PCell) on E-UTRAN and Cell 2 (PSCell) on NR, but is not aware of Cell 3 (SCell) on NR. The UE is monitoring the PCell and PSCell. The UE shall be continuously scheduled in the PCell and PSCell throughout the whole test.

At the beginning of T1 the UE receives an RRC message by which the SCell (Cell 3) becomes configured on NR. During T1 the SCell is powered off and UE is not aware of SCell.

A MAC message for activation of SCell is sent by the test equipment 100ms after the RRC message, in a slot # denoted m. The point in time at which the MAC message for activation of SCell is received at the UE antenna connector defines the start of time period T2.

During T2, the test equipment monitors the L1-RSRP measurement reporting for the SCell. The time when test equipment receives a valid L1-RSRP report is denoted as slot  $m+T_{L1-RSRP}$ . In the next DL slot after slot  $m+T_{L1-RSRP}$ , the test equipment sends a MAC message for the activation of the TCI state of the RMC CORESET of the SCell. In the same slot, the test equipment also sends an RRC message to configure the CSI-RS resources for SCell.

Time period T3 starts when a MAC message for deactivation of the SCell, sent from the test equipment to the UE in a slot # denoted n, is received at the UE antenna connector.

The test equipment verifies that potential interruption is carried out in the correct time span by monitoring ACK/NACK sent in PCell and PSCell during activation of SCell, respectively.

The test equipment verifies the activation time by counting the slots from the time when the SCell activation command is sent until a CSI report with other than CQI index 0 is received.

The test equipment verifies the deactivation time by counting the slots from the time when the SCell1 deactivation command is sent until CSI reporting for SCell1 is discontinued.

**Table A.5.5.3.5.1-1: FR2 SCell activation in non-DRX test configurations with FR1 PSCell**

| Configuration | Description   |
|---------------|---|
| 1             | LTE FDD PCell, Cell 2 NR 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode<br>Cell 3 NR 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |

Note 7: Information about types of UE beam is given in B.2.1.3, and does not limit UE implementation or test system implementation.

### A.5.5.3.5.2 Test Requirements

During T2 the UE shall send the first CSI report for SCell in the first available uplink resource after slot  $(m+k)$ . UE is allowed to postpone CSI report to next available UL resource if an available uplink resource is subject to interruption. Whether CSI report in a slot was interrupted is checked by monitoring ACK/NACK sent in PCell in the slot.

During T2 the UE shall start sending valid L1-RSRP report for the SCell in the configured slots for CSI reporting after slot  $(m+T_{L1-RSRP})$ , where  $T_{L1-RSRP}$  is no larger than

$$3\text{ms} + T_{\text{FirstSSB\_MAX}} + 15 * T_{\text{SMTc\_MAX}} + 8 * T_{\text{rs}} + T_{L1-RSRP, \text{measure}} + T_{L1-RSRP, \text{report}}$$

as defined in clause 8.3.2. For this test case,  $T_{\text{FirstSSB\_MAX}}=T_{\text{SMTc\_MAX}}=T_{\text{rs}}=20\text{ms}$ ;  $T_{L1-RSRP, \text{measure}}=480\text{ms}$  and  $T_{L1-RSRP, \text{report}}=5\text{ms}$ , which allows  $T_{L1-RSRP}$  1000ms.

During T2 the UE shall start sending CSI reports for the SCell with non-zero CQI index in the configured slots for CSI reporting no later than slot  $m + \frac{T_{\text{HARQ}} + T_{\text{activation\_time}} + T_{\text{CSI\_Reporting}}}{NR \text{ slot length}}$ , where

-  $T_{\text{HARQ}}$  is defined in Table A.5.5.3.1.1-2

-  $T_{\text{activation\_time}} = 3\text{ms} + T_{\text{FirstSSB\_MAX}} + 15 * T_{\text{SMTc\_MAX}} + 8 * T_{\text{rs}} + T_{L1-RSRP, \text{measure}} + T_{L1-RSRP, \text{report}} + \max \{ (T_{\text{HARQ}} + T_{\text{uncertainty\_MAC}} + 5\text{ms} + T_{\text{FineTiming}}), (T_{\text{uncertainty\_RRC}} + T_{\text{RRC\_delay}}) \}$ , which allows 1030ms

-  $T_{\text{CSI\_Reporting}} = 10\text{ms}$

- NR slot length is 0.125ms for this test case.

During T3 the UE shall stop sending CSI reports for both SCells no later than slot  $n + \frac{T_{\text{HARQ}} + 3\text{ms}}{NR \text{ slot length}}$ , as defined in clause 8.3.

During T2 interruption of PCell during SCell activation shall not happen outside the slot  $m + 1 + \frac{T_{\text{HARQ}}}{NR \text{ slot length}}$  to  $m + 1 + \frac{T_{\text{HARQ}} + 3\text{ms} + T_{\text{X}}}{NR \text{ slot length}}$ , and interruption of E-UTRA PCell during SCell activation shall not happen outside the subframe  $m_1 + 1 + \frac{T_{\text{HARQ}}}{EUTRA \text{ slot length}}$  to subframe  $m_2 + 1 + \frac{T_{\text{HARQ}} + 3\text{ms} + T_{\text{X}}}{EUTRA \text{ slot length}}$ , as defined in clause 8.3, where  $T_{\text{X}} = 20\text{ms}$ , and  $m_1$  and  $m_2$  are the index of the first and last subframe of E-UTRA PCell which overlaps with slot  $m$ .

During T3 the starting point of interruption of PCell during SCell deactivation shall not happen outside the slot  $n + 1 + \frac{T_{\text{HARQ}}}{NR \text{ slot length}}$  to  $n + 1 + \frac{T_{\text{HARQ}} + 3\text{ms}}{NR \text{ slot length}}$ , as defined in clause 8.3 and the starting point of interruption of E-UTRA PCell during SCell deactivation shall not happen outside the subframe  $n_1 + 1 + \frac{T_{\text{HARQ}}}{EUTRA \text{ subframe length}}$  to subframe  $n_2 + 1 + \frac{T_{\text{HARQ}} + 3\text{ms}}{EUTRA \text{ subframe length}}$ , where  $n_1$  and  $n_2$  are the index of the first and last subframe of E-UTRA PCell which overlaps with slot  $n$ .

The interruption of PCell due to activation of SCell1 and SCell2 shall not be more than the values specified for EN-DC in Clause 8.2.1.2.10.

The interruption of PCell due to activation of SCell1 and SCell2 shall not be more than the values specified for EN-DC in Clause 7.32.2.5 of TS 36.133 [50].

## A.5.5.4 Void

## A.5.5.5 Beam Failure Detection and Link recovery procedures

### A.5.5.5.1 EN-DC Beam Failure Detection and Link Recovery Test for FR2 PSCell configured with SSB-based BFD and LR in non-DRX mode

#### A.5.5.5.1.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects SSB-based beam failure in the set  $q_0$  configured for a serving PSCell and that the UE performs correct SSB-based link recovery based on beam candidate set  $q_1$ . The purpose is to test the downlink monitoring for beam failure detection within the UEs active DL BWP of the PSCell, during the evaluation period, and link recovery, when no DRX is used. This test will partly verify the SSB based beam failure detection and link recovery for an FR2 serving cell requirements in clause 8.5.

The test parameters are given in Tables A.5.5.5.1.1-1, A.5.5.5.1.1-2, A.5.5.5.1.1-3 and A.5.5.5.1.1-4 below. There are two cells, cell 1 is the E-UTRAN PCell, and cell 2 is the PSCell, in the test. The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.5.5.5.1.1-1 shows the variation of the downlink SNR of the PCell and the SNR of the SSB in set  $q_0$  in the active PSCell to emulate SSB based beam failure. Figure A.5.5.5.1.1-2 shows the variation of the downlink L1-RSRP of the SSB in set  $q_1$  of the candidate beam used for link recovery. Prior to the start of the time duration T1, the UE shall be fully synchronized to cell 1 and cell 2. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is not enabled. The UE is configured to perform inter-frequency measurements using GP ID #0 (40ms) in test 1.

**Table A.5.5.5.1.1-1: Supported test configurations for FR2 PSCell**

| Configuration | Description  |
|---------------|--|
| 1             | LTE FDD, TDD duplex mode, 120 kHz SSB SCS, 100 MHz bandwidth                       |
| 2             | LTE TDD, TDD duplex mode, 120 kHz SSB SCS, 100 MHz bandwidth                       |
| 3             | LTE FDD, TDD duplex mode, 240 kHz SSB SCS, 100 MHz bandwidth                       |
| 4             | LTE TDD, TDD duplex mode, 240 kHz SSB SCS, 100 MHz bandwidth                       |
| Note:         | The UE is only required to pass in one of the supported test configurations in FR2 |

**Table A.5.5.5.1.1-2: General test parameters for FR2 PCell for SSB-based beam failure detection and link recovery testing in non-DRX mode**

| Parameter                      | Test Config. | Unit | Value                       | Comment |
|--------------------------------|--------------|------|-----------------------------|---------|
|                                |              |      | <b>Test 1</b>               |         |
| Active E-UTRA PCell            | 1-4          |      | Cell 1                      |         |
| E-UTRA RF Channel Number       | 1-4          |      | 1                           |         |
| Active PCell                   | 1-4          |      | Cell 2                      |         |
| RF Channel Number              | 1-4          |      | 2                           |         |
| Duplex mode                    | 1-4          |      | TDD                         |         |
| TDD Configuration              | 1-4          |      | TDDConf.3.1                 |         |
| BW <sub>channel</sub>          | 1-4          | MHz  | 100: N <sub>RB,c</sub> = 66 |         |
| Data RBs allocated             | 1-4          |      | 66                          |         |
| PDSCH/PDCCH subcarrier spacing | 1-4          | kHz  | 120                         |         |
| DL initial BWP configuration   | 1-4          |      | DLBWP.0.1                   |         |
