Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
  - 1 presented to TSG for information;
  - 2 presented to TSG for approval;
  - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

In the present document, modal verbs have the following meanings:

shall indicates a mandatory requirement to do something

shall not indicates an interdiction (prohibition) to do something

The constructions "shall" and "shall not" are confined to the context of normative provisions, and do not appear in Technical Reports.

The constructions "must" and "must not" are not used as substitutes for "shall" and "shall not". Their use is avoided insofar as possible, and they are not used in a normative context except in a direct citation from an external, referenced, non-3GPP document, or so as to maintain continuity of style when extending or modifying the provisions of such a referenced document.

should indicates a recommendation to do something

should not indicates a recommendation not to do something

may indicates permission to do something

need not indicates permission not to do something

The construction "may not" is ambiguous and is not used in normative elements. The unambiguous constructions "might not" or "shall not" are used instead, depending upon the meaning intended.

can indicates that something is possible

cannot indicates that something is impossible

The constructions "can" and "cannot" are not substitutes for "may" and "need not".

will indicates that something is certain or expected to happen as a result of action taken by an agency the behaviour of which is outside the scope of the present document

will not indicates that something is certain or expected not to happen as a result of action taken by an agency the behaviour of which is outside the scope of the present document

might indicates a likelihood that something will happen as a result of action taken by some agency the behaviour of which is outside the scope of the present document

might not indicates a likelihood that something will not happen as a result of action taken by some agency the behaviour of which is outside the scope of the present document

In addition:

is (or any other verb in the indicative mood) indicates a statement of fact

is not (or any other negative verb in the indicative mood) indicates a statement of fact

The constructions "is" and "is not" do not indicate requirements.

1 Scope

The present document specifies requirements for support of Radio Resource Management for the FDD and TDD modes of New Radio (NR). These requirements include requirements on measurements in NR and the UE as well as requirements on node dynamical behaviour and interaction, in terms of delay and response characteristics.

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document.*

3.4 Test tolerances

The requirements given in the present document make no allowance for measurement uncertainty. The test specification TS 38.533 [5] defines the test tolerances.

3.5 Frequency bands grouping

3.5.1 Introduction

The intention with the frequency band grouping below is to increase the readability of the specification.

The frequency bands grouping is derived based on UE REFSENS requirements specified in [18], [19], [20] and assuming 0.5 dB step between the neighbour groups. The groups are defined in the order of increasing REFSENS, i.e. the group A has the smallest REFSENS among the groups. For the same SCS and a given bandwidth, the bands within the same group have the same Io conditions in a corresponding requirement in this specification, provided the bands support this SCS. For different SCSs supported by a frequency band and the same bandwidth, different Io conditions may apply for the frequency band in the requirements, while the band group is the same, based on the lowest REFSENS requirement normalized by the number of subcarriers among its supported SCSs for this bandwidth. For the same SCS but different supported bandwidths, the group for a band is determined based on the lowest REFSENS requirement normalized by the number of subcarriers among its supported bandwidths.

Requirements for NR-DC (FR1+FR1) are applicable for the UE configured with the following number of serving NR CCs:

- up to [6] NR DL CCs in total, with [1] UL in PCell, [1] UL in PSCell, [1] UL in SCell(s).

Requirements for NR-DC (FR1+FR2) are applicable for the UE configured with the following number of serving NR CCs:

- up to 2 NR DL CCs in total in FR1, up to 8 NR DL CCs in total in FR2, with 1 UL in PCell, 1 UL in PSCell, and up to 1 UL in each SCell.

3.6.3 Applicability for intra-band FR2

For the requirements in RRC connected state specified in this version of the specification, UE shall assume that the transmitted signals from the serving cells have the same downlink spatial domain transmission filter on one OFDM symbol in the same band in FR2. Otherwise, the UE is not required to satisfy any requirements for SCell.

3.6.4 Applicability for FR2 UE power classes

For the requirements of each FR2 power class specified in this version of the specification, certain UE types with specific device architectures are assumed. The UE types can be found in TS 38.101-2 [19].

3.6.5 Applicability for SDL bands

The measurements accuracy requirements for SDL bands in this version of specification in clause 10.1 shall apply for NR intra-frequency measurements on SCC (SS-RSRP, SS-RSRQ, SS-SINR, and L1-RSRP) and inter-frequency measurements (SS-RSRP, SS-RSRQ, and SS-SINR).

3.6.6 Applicability of requirements for NGEN-DC operation

All the requirements in this specification applicable for EN-DC are also applicable for NGEN-DC.

3.6.7 Applicability of QCL

For the requirements specified in this version of the specification for TCI state switching, DL TCI state switching for unified TCI or UL TCI state switching for unified TCI, a reference signal is considered to be QCLed to another reference signal if it is in the same TCI chain as the other reference signal, provided that the number of Reference Signals in the chain is no more than 4. It is assumed there is single QCL type per TCI chain.

A DL TCI chain consists of an SSB, and one or more CSI-RS resources, and the TCI state of each Reference Signal includes another Reference Signal in the same TCI chain, where the SSB can be associated with serving cell PCI or associated with a PCI different from serving cell PCI.

DMRS of PDCCH or PDSCH is QCLed with the reference signal in its active TCI state and any other reference signal that is QCLed, based on the criteria for DL TCI chain, with the reference signal in the active TCI state.

A UL TCI chain consists of an SSB, and one or more CSI-RS resources, and the TCI state of each Reference Signal includes another Reference Signal in the same TCI chain, where the SSB can be associated with serving cell PCI or associated with a PCI different from serving cell PCI.

DMRS of PUCCH or PUSCH is QCLed with the reference signal in its active TCI state and any other reference signal that is QCLed, based on the criteria for UL TCI chain, with the reference signal in the active TCI state.

The scheduling availability requirements in clauses 8.1.7.3, 8.5.7.3, 8.5.8.3, 9.5.6.3 and 9.10.2.6.2 assumes that:

- The UE is not configured with simultaneous UL/DL between two FR2 bands if the UE does not have the capability of supporting *simultaneousRxTxInterBandCA*, and
- The UE is not configured with mixed numerology on two FR2 CCs if the UE does not have the capability of supporting simultaneous reception with two different numerologies between FR2 CCs in DL.

4 SA: RRC_IDLE state mobility

4.1 Cell Selection

After a UE has switched on and a PLMN has been selected, the Cell selection process takes place, as described in TS 38.304 [1]. This process allows the UE to select a suitable cell where to camp on in order to access available services. In this process, the UE can use stored information (*Stored information cell selection*) or not (*Initial cell selection*).

The 1 Rx RedCap UE for the cell selection procedure [1] applies:

- *Qrxlevmin* as the signaled value of *Qrxlevmin* [2] -1 dB.
- *Qqualmin* as the signaled value of *Qqualmin* [2] -1 dB.

The above offset for *Qrxlevmin* and *Qqualmin* is also applicable to RedCap UEs with satellite access.

4.2 Cell Re-selection

4.2.1 Introduction

The cell reselection procedure allows the UE to select a more suitable cell and camp on it.

When the UE is in either *Camped Normally* state or *Camped on Any Cell* state on a cell, the UE shall attempt to detect, synchronise, and monitor intra-frequency, inter-frequency and inter-RAT cells indicated by the serving cell. For intra-frequency and inter-frequency cells the serving cell may provide explicit neighbour list, or only carrier frequency information and bandwidth information. UE measurement activity is also controlled by measurement rules defined in TS 38.304 [1], allowing the UE to limit its measurement activity. For inter-frequency cell re-selection, when NTN

carrier is not configured, requirements specified in clause 4.2.2.4 apply and when NTN carrier is configured, requirements specified in clause 4.2.2.12 shall be applied.

In the requirements of clause 4.2, the exceptions for side conditions apply as follows:

- for the UE capable of CA, the applicable exceptions for side conditions are specified in Annex B, clause B.3.2.1, B.3.2.3, or B.3.2.5 for UE supporting CA in FR1, CA in FR2 and CA between FR1 and FR2, respectively;
- for the UE capable of SUL, the applicable exceptions for side conditions are specified in Annex B, clause B.3.4.1 for UE supporting SUL in FR1.

4.2.2 Requirements

4.2.2.1 UE measurement capability

For idle mode cell re-selection purposes, and for UE supporting *idleInactiveNR-MeasReport-r16*, *idleInactiveEUTRA-MeasReport-r16* or *idleInactiveNR-MeasReport-r17*, for NR CA and MR-DC measurement purpose, the UE shall be capable of monitoring at least:

- Intra-frequency carrier, and
- Depending on UE capability, 7 NR inter-frequency carriers, and
- Depending on UE capability, 7 FDD E-UTRA inter-RAT carriers, and
- Depending on UE capability, 7 TDD E-UTRA inter-RAT carriers.

In addition to the requirements defined above, a UE supporting E-UTRA measurements in RRC_IDLE state shall be capable of monitoring a total of at least 14 carrier frequency layers, which includes serving layers, comprising of any above defined combination of E-UTRA FDD, E-UTRA TDD and NR layers.

4.2.2.2 Measurement and evaluation of serving cell

The UE shall measure the SS-RSRP and SS-RSRQ level of the serving cell and evaluate the cell selection criterion S defined in TS 38.304 [1] for the serving cell at least once every M1*N1 DRX cycle; where:

- M1=2 if SMTC periodicity (T_{SMTC}) > 20 ms and DRX cycle ≤ 0.64 second,
- otherwise M1=1.

The UE shall filter the SS-RSRP and SS-RSRQ measurements of the serving cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by, at least eDRX_IDLE cycle/2, if the UE is configured with eDRX cycle ≤ 10.24 s; otherwise DRX cycle/2.

For UE not configured with *highSpeedMeasFlagFR2-r17*, N_{serv} is specified in table 4.2.2.2-1. For FR2 power class 6 UE configured with *highSpeedMeasFlagFR2-r17*, N_{serv} is specified in table 4.2.2.2-4.

If the UE is not configured with eDRX_IDLE cycle and the UE has evaluated according to table 4.2.2.2-1 or table 4.2.2.2-4 in N_{serv} consecutive DRX cycles that the serving cell does not fulfil the cell selection criterion S, the UE shall initiate the measurements of all neighbour cells indicated by the serving cell, regardless of the measurement rules currently limiting UE measurement activities.

If the UE is configured with eDRX_IDLE cycle ≤ 10.24 s and the UE has evaluated according to table 4.2.2.2-2 or table 4.2.2.2-3 in N_{serv} consecutive eDRX cycles that the serving cell does not fulfil the cell selection criterion S, the UE shall initiate the measurements of all neighbour cells indicated by the serving cell, regardless of the measurement rules currently limiting UE measurement activities.

If the UE is configured with eDRX_IDLE cycle > 10.24 s and the UE has evaluated according to table 4.2.2.2-2 or table 4.2.2.2-3 in N_{serv} consecutive DRX cycles within a single PTW that the serving cell does not fulfil the cell selection criterion S, the UE shall initiate the measurements of all neighbour cells indicated by the serving cell, regardless of the measurement rules currently limiting UE measurement activities.

If the UE in RRC_IDLE has not found any new suitable cell based on searches and measurements using the intra-frequency, inter-frequency and inter-RAT information indicated in the system information during the time T, the UE shall initiate cell selection procedures for the selected PLMN as defined in TS 38.304 [1], where

- T= 10s if the UE is not configured with eDRX_IDLE cycle, or
- T= MAX (10s, one eDRX_IDLE cycle) if the UE is configured with eDRX_IDLE cycle in FR1, or
- T= MAX (10s, N1* eDRX_IDLE cycle) if the UE is configured with eDRX_IDLE cycle less than 20.48s in FR2,
- Otherwise, T= MAX (10s, one eDRX_IDLE cycle) if the UE is configured with eDRX_IDLE cycle no less than 20.48 s in FR2

For any requirement in this section, when the UE transitions between any two states when being configured with eDRX_IDLE, changing eDRX_IDLE cycle length, or changing PTW configuration, the UE shall meet the transition requirement, which is the less stringent requirement of the two requirements corresponding to the first state and the second state, during the transition time interval which is the time corresponding to the transition requirement. After the transition time interval, the UE shall meet the requirement corresponding to the second state.

4.2.2.3 Measurements of intra-frequency NR cells

The UE shall be able to identify new intra-frequency cells and perform SS-RSRP and SS-RSRQ measurements of the identified intra-frequency cells without an explicit intra-frequency neighbour list containing physical layer cell identities.

The UE shall be able to evaluate whether a newly detectable intra-frequency cell meets the reselection criteria defined in TS 38.304 [1] within T_{detect,NR_Intra} when that $T_{reselection}$= 0. An intra frequency cell is considered to be detectable according to the conditions defined in Annex B.1.2 for a corresponding Band.

The UE shall measure SS-RSRP and SS-RSRQ at least every $T_{measure,NR_Intra}$ (see table 4.2.2.3-1, table 4.2.2.3-2, table 4.2.2.3-3, table 4.2.2.3-4 or table 4.2.2.3-5) for intra-frequency cells that are identified and measured according to the measurement rules.

The UE shall filter SS-RSRP and SS-RSRQ measurements of each measured intra-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,NR_Intra}/2$.

The UE shall not consider an NR neighbour cell for cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For an intra-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that the intra-frequency cell has met reselection criterion defined in TS 38.304 [1] within $T_{evaluate,NR_Intra}$ when $T_{reselection}$ = 0 as specified in table 4.2.2.3-1, table 4.2.2.3-2, table 4.2.2.3-3, table 4.2.2.3-4 or table 4.2.2.3-5 provided that:

when *rangeToBestCell* is not configured:

- the cell is at least 3 dB better ranked in FR1 or 4.5 dB better ranked in FR2.

when *rangeToBestCell* is configured:

- the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value in TS 38.304 [1] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.

  - if there are multiple such cells, the cell has the highest rank among them.

    - the cell is at least 3 dB better ranked in FR1 or 4.5 dB better ranked in FR2 if the current serving cell is among them.

When evaluating cells for reselection, the SSB side conditions apply to both serving and non-serving intra-frequency cells.

If the $T_{reselection}$ timer has a non-zero value and an intra-frequency cell satisfies the reselection criteria defined in TS 38.304 [1], the UE shall evaluate this intra-frequency cell for the $T_{reselection}$ time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect to this cell.

For UE neither configured with *highSpeedMeasFlag-r16* nor *highSpeedMeasFlagFR2-r17*, T_{detect,NR_Intra}, $T_{measure,NR_Intra}$ and $T_{evaluate,\ NR_intra}$ are specified in table 4.2.2.3-1. For UE configured with *highSpeedMeasFlag-r16*, T_{detect,NR_Intra}, $T_{measure,NR_Intra}$ and $T_{evaluate,NR_intra}$ are specified in table 4.2.2.3-2.

For a UE configured with *highSpeedMeasFlag-r16*, and configured with relaxed measurement criterion (*lowMobilityEvaluation* or both *lowMobilityEvaluation* and *cellEdgeEvaluation*),

- if the relaxed measurement criteria in section 4.2.2.9.2 are fulfilled, it is up to UE implementation whether to apply the relaxed measurements requirements specified in clause 4.2.2.9.2 or high speed requirements specified in this clause

- otherwise, high speed requirements specified in this clause shall be applied.

For FR2 power class 6 UE configured with *highSpeedMeasFlagFR2-r17*, T_{detect,NR_Intra}, $T_{measure,NR_Intra}$ and $T_{evaluate,\ NR_intra}$ are specified in table 4.2.2.3-3.

For UE not configured with eDRX_IDLE cycle, T_{detect,NR_Intra}, $T_{measure,NR_Intra}$ and $T_{evaluate,NR_Intra}$ are specified in table 4.2.2.3-1, 4.2.2.3-2 and 4.2.2.3-3.

For UE configured with eDRX_IDLE cycle, T_{detect,NR_Intra}, $T_{measure,NR_Intra}$ and $T_{evaluate,NR_Intra}$ are specified in table 4.2.2.3-4 and table 4.2.2.3-5 for FR1 and FR2 respectively, where the requirements apply provided that the serving cell is configured with eDRX_IDLE and the DRX cycle length is same in all PTWs during any of T_{detect,NR_Intra}, $T_{measure,NR_Intra}$ and $T_{evaluate,NR_Intra}$ when multiple PTWs are used.

The requirements in table 4.2.2.3-2 apply only when the UE supports *measurementEnhancement-r16* or *intraNR-MeasurementEnhancement-r16*. For UE neither supporting *measurementEnhancement-r16* nor *intraNR-MeasurementEnhancement-r16*, the UE is not required to meet the requirements specified in table 4.2.2.3-2.

If different SMTC periodicities are configured for different cells, the SMTC periodicity in this note is the one used by the cell being identified. During PSS/SSS detection, the periodicity of the SMTC configured for the intra-frequency carrier is assumed, and if the actual SSB transmission periodicity is greater than the SMTC configured for the intra-frequency carrier, longer $T_{detect,\ NR_intra}$ is expected.

NOTE 1: Applies for UE supporting FR2-1 power class 2&3&4. For UE supporting FR2-1 power class 1 or 5, N1 = 8 for all DRX cycle length.
NOTE 2: The number of DRX cycles in this table corresponds to the DRX cycles within PTWs, when PTW is configured.
NOTE 3: The eDRX_IDLE cycle lengths are as specified in section 10.5.5.32 of TS 24.008 [42].
NOTE 4: Number of eDRX cycles when eDRX_IDLE cycle length equals 2.56 s, 5.12 s and 10.24 s. Otherwise, number of DRX cycles.
NOTE 5: The lower bound of PTW length is derived based on $\left\lceil \frac{Tevaluate,NR_Intra*DRX_cycle}{1.28} \right\rceil * 1.28$.
NOTE 6: When eDRX=20.48 s and DRX=0.32 s, UE is allowed to perform cell evaluation within PTW in every 2 eDRX cycles.

For any requirement in this section, when the UE transitions between any two states when being configured with eDRX_IDLE, changing eDRX_IDLE cycle length, or changing PTW configuration, the UE shall meet the transition requirement, which is the less stringent requirement of the two requirements corresponding to the first state and the second state, during the transition time interval which is the time corresponding to the transition requirement. After the transition time interval, the UE shall meet the requirement corresponding to the second state.

4.2.2.4 Measurements of inter-frequency NR cells

The UE shall be able to identify new inter-frequency cells and perform SS-RSRP or SS-RSRQ measurements of identified inter-frequency cells if carrier frequency information is provided by the serving cell, even if no explicit neighbour list with physical layer cell identities is provided.

If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$ then the UE shall search for inter-frequency layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2.2.7.

If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$ then the UE shall search for and measure inter-frequency layers of higher, equal or lower priority in preparation for possible reselection. In this scenario, the minimum rate at which the UE is required to search for and measure higher priority layers shall be the same as that defined below in this clause.

For a UE configured with *highSpeedMeasInterFreq-r17*, and configured with relaxed measurement criterion (*lowMobilityEvaluation* or both *lowMobilityEvaluation* and *cellEdgeEvaluation*),

- if the relaxed measurement criteria in section 4.2.2.9.2 are fulfilled, it is up to UE implementation whether to apply the relaxed measurements requirements specified in clause 4.2.2.10.2 or high speed requirements specified in this clause
- otherwise, high speed requirements specified in this clause shall be applied

The UE shall be able to evaluate whether a newly detectable inter-frequency cell meets the reselection criteria defined in TS 38.304 [1] within $K_{carrier} * T_{detect,NR_Inter} + K_{carrier_HST} * T_{detect,NR_Inter_HST}$ if at least carrier frequency information is provided for inter-frequency neighbour cells by the serving cells when $T_{reselection} = 0$ provided that the reselection criteria is met by a margin of at least 5 dB in FR1 or 6.5dB in FR2 for reselections based on ranking or 6dB in FR1 or 7.5dB in FR2 for SS-RSRP reselections based on absolute priorities or 4dB in FR1 and 4dB in FR2 for SS-RSRQ reselections based on absolute priorities.

The parameter $K_{carrier}$ is the number of NR inter-frequency carriers which are not configured with *highSpeedMeasInterFreq-r17* for FR1 or *highSpeedMeasFlagFR2-r17* for FR2 indicated by the serving cell. The

parameter $K_{carrier_HST}$ is the number of NR inter-frequency carriers which are configured with *highSpeedMeasInterFreq-r17* for FR1 or*highSpeedMeasFlagFR2-r17* for FR2 indicated by the serving cell. The parameter $K_{carrier}$ for a UE configured with idle mode CA/DC measurements (while T331 is running), is the combined number of NR inter-frequency carriers indicated by the serving cell and the number of NR inter-frequency carriers configured for idle mode CA/DC measurements which are not configured with *highSpeedMeasInterFreq-r17* for FR1 or *highSpeedMeasFlagFR2-r17* for FR2. The parameter $K_{carrier_HST}$ for a UE configured with idle mode CA/DC measurements (while T331 is running), is the combined number of NR inter-frequency carriers indicated by the serving cell and the number of NR inter-frequency carriers configured for idle mode CA/DC measurements which are configured with *highSpeedMeasInterFreq-r17* for FR1 or *highSpeedMeasFlagFR2-r17* for FR2.

Note: Combined total number means that if a carrier is an inter-frequency carrier indicated by the serving cell for mobility and additionally a carrier configured for idle mode CA measurements, it only counts as one carrier.

An inter-frequency cell is considered to be detectable according to the conditions defined in Annex B.1.3 for a corresponding Band.

When higher priority cells are found by the higher priority search, they shall be measured at least every $T_{measure,NR_Inter}$. If, after detecting a cell in a higher priority search, it is determined that reselection has not occurred then the UE is not required to continuously measure the detected cell to evaluate the ongoing possibility of reselection. However, the minimum measurement filtering requirements specified later in this clause shall still be met by the UE before it makes any determination that it may stop measuring the cell. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

A UE not configured with eDRX_IDLE cycle shall measure SS-RSRP or SS-RSRQ at least every $K_{carrier} * T_{measure,NR_Inter} + K_{carrier_HST} * T_{measure,NR_Inter_HST}$ (see table 4.2.2.4-1, table 4.2.2.4-2 if UE declares support of idle mode inter-frequency measurement enhancement when configured with *highSpeedMeasInterFreq-r17* in FR1; or table 4.2.2.4-2a if UE declares support of idle mode inter-frequency measurement enhancement when configured with *highSpeedMeasFlagFR2-r17* in FR2; else see Table 4.2.2.4-1) for identified lower or equal priority inter-frequency cells. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

A UE not configured with eDRX_IDLE cycle shall filter SS-RSRP or SS-RSRQ measurements of each measured higher, lower and equal priority inter-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,NR_Inter}/2$ for carriers which are not configured with *highSpeedMeasInterFreq-r17* for FR1 or *highSpeedMeasFlagFR2-r17* for FR2 or $T_{measure,NR_Inter_HST}/2$ for carriers which are configured with *highSpeedMeasInterFreq-r17* for FR1 and *highSpeedMeasFlagFR2-r17* for FR2.

A UE configured with eDRX_IDLE cycle shall measure SS-RSRP or SS-RSRQ at least every $K_{carrier} * T_{measure,NR_Inter}$ (see table 4.2.2.4-3 and table 4.2.2.4-4) for identified lower or equal priority inter-frequency cells. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

A UE configured with eDRX_IDLE cycle shall filter SS-RSRP or SS-RSRQ measurements of each measured higher, lower and equal priority inter-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,NR_Inter}/2$.

The UE shall not consider a NR neighbour cell in cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For an inter-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE not configured with eDRX_IDLE cycle shall be capable of evaluating that the inter-frequency cell has met reselection criterion defined TS 38.304 [1] within $K_{carrier} * T_{evaluate,NR_Inter} + K_{carrier_HST} * T_{evaluate,NR_Inter_HST}$ when $T_{reselection} = 0$ (as specified in table 4.2.2.4-1, table 4.2.2.4-2 if UE declares support of idle mode inter-frequency measurement enhancement when configured with *highSpeedMeasInterFreq-r17* in FR1; or table 4.2.2.4-2a if UE declares support of idle mode inter-frequency measurement enhancement when configured with *highSpeedMeasFlagFR2-r17* in FR2; else in table 4.2.2.4-1), provided that the reselection criteria is met by

- the condition when performing equal priority reselection and
  - when *rangeToBestCell* is not configured:

- the cell is at least 5 dB better ranked in FR1 or 6.5 dB better ranked in FR2 or.

- when *rangeToBestCell* is configured:

  - the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value in TS 38.304 [1] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.

    - if there are multiple such cells, the cell has the highest rank among them

    - the cell is at least 5 dB better ranked in FR1 or 6.5 dB better ranked in FR2 if the current serving cell is among them. or

- 6 dB in FR1 or 7.5 dB in FR2 for SS-RSRP reselections based on absolute priorities or

- 4 dB in FR1 or 4 dB in FR2 for SS-RSRQ reselections based on absolute priorities.

For an inter-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE configured with eDRX_IDLE cycle shall be capable of evaluating that the inter-frequency cell has met reselection criterion defined TS 38.304 [1] within $K_{carrier} * T_{evaluate,NR_Inter}$ when $T_{reselection} = 0$ as specified in table 4.2.2.4-3 and table 4.2.2.4-4, provided that the reselection criteria is met by

- the condition when performing equal priority reselection and

  - when *rangeToBestCell* is not configured:

    - the cell is at least 5 dB better ranked in FR1 or 6.5 dB better ranked in FR2 or.

  - when *rangeToBestCell* is configured:

    - the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value in TS 38.304 [1] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.

      - if there are multiple such cells, the cell has the highest rank among them

      - the cell is at least 5 dB better ranked in FR1 or 6.5 dB better ranked in FR2 if the current serving cell is among them. or

- 6 dB in FR1 or 7.5 dB in FR2 for SS-RSRP reselections based on absolute priorities or

- 4 dB in FR1 or 4 dB in FR2 for SS-RSRQ reselections based on absolute priorities.

When evaluating cells for reselection, the SSB side conditions apply to both serving and inter-frequency cells.

If the $T_{reselection}$ timer has a non-zero value and the inter-frequency cell satisfies the reselection criteria, the UE shall evaluate this inter-frequency cell for the $T_{reselection}$ time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect to this cell.

The UE is not expected to meet the measurement requirements for an inter-frequency carrier under DRX cycle=320 ms defined in table 4.2.2.4-1 and table 4.2.2.4-2 under the following conditions:

- $T_{SMTC_intra} = T_{SMTC_inter} = 160$ ms; where

  - T_{SMTC_intra} is the periodicity of the SMTC configured for the intra-frequency carrier if no identified intra-frequency cell is in the PCI list of *smtc2-LP* on this intra-frequency carrier; T_{SMTC_intra} is the periodicity of the *smtc2-LP* configured for the intra-frequency carrier if at least one identified intra-frequency cell is in the PCI list of *smtc2-LP* on this intra-frequency carrier. During PSS/SSS detection, the periodicity of the SMTC configured for the intra-frequency carrier is assumed for T_{SMTC_intra}. If the actual SSB transmission periodicity is greater than the SMTC configured for the intra-frequency carrier, longer T_{detect, NR_intra} is expected.

  - T_{SMTC_inter} is the actual SMTC periodicity used by the inter-frequency cell being identified. During PSS/SSS detection, the periodicity of the SMTC configured for the inter-frequency carrier is assumed for T_{SMTC_inter}. If the actual SSB transmission periodicity is greater than the SMTC configured for the inter-frequency carrier, longer T_{detect, NR_inter} is expected.

- SMTC occasions configured for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the SMTC occasions configured for the intra-frequency carrier, and

- SMTC occasions configured for the intra-frequency carrier and for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the paging occasion in TS 38.304 [1].

For UE not configured with eDRX_IDLE cycle, T_{detect,NR_Inter}, $T_{measure,NR_Inter}$ and $T_{evaluate,NR_Inter}$ are specified in Table 4.2.2.4.1-1 and 4.2.2.4.1-2.

For UE configured with eDRX_IDLE cycle, T_{detect,NR_Inter}, $T_{measure,NR_Inter}$ and $T_{evaluate,NR_Inter}$ are specified in table 4.2.2.4-3 and table 4.2.2.4-4 for FR1 and FR2 respectively. The requirements apply provided that the serving cell is configured with eDRX_IDLE and the DRX cycle length is the same in all PTWs during any of T_{detect,NR_Inter}, $T_{measure,NR_Inter}$ and $T_{evaluate,NR_Inter}$ when multiple PTWs are used.

NOTE 5: The lower bound of PTW length is derived based on $\left\lceil \frac{Tevaluate,NR_Inter * DRX_cycle}{1.28} \right\rceil * 1.28$.
NOTE 6: When eDRX=20.48 s and DRX=0.32 s, UE is allowed to perform cell evaluation within PTW in every 2 eDRX cycles.

For any requirement in this section, when the UE transitions between any two states when being configured with eDRX_IDLE, changing eDRX_IDLE cycle length, or changing PTW configuration, the UE shall meet the transition requirement, which is the less stringent requirement of the two requirements corresponding to the first state and the second state, during the transition time interval which is the time corresponding to the transition requirement. After the transition time interval, the UE shall meet the requirement corresponding to the second state.

4.2.2.5 Measurements of inter-RAT E-UTRAN cells

If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$ then the UE shall search for inter-RAT E-UTRAN layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2.2.

If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$ then the UE shall search for and measure inter-RAT E-UTRAN layers of higher, lower priority in preparation for possible reselection. In this scenario, the minimum rate at which the UE is required to search for and measure higher priority inter-RAT E-UTRAN layers shall be the same as that defined below for lower priority RATs.

The requirements in this clause apply to inter-RAT E-UTRAN FDD measurements and E-UTRA TDD measurements. When the measurement rules indicate that inter-RAT E-UTRAN cells are to be measured, the UE shall measure RSRP and RSRQ of detected E-UTRA cells in the neighbour frequency list at the minimum measurement rate specified in this clause.

The parameter $N_{EUTRA_carrier}$ is the total number of configured E-UTRA carriers indicated to meet non high speed requirements in the neighbour frequency list. The parameter $N_{EUTRA_carrier_HST}$ is the total number of configured E-UTRA carriers indicated to meet high speed requirements in the neighbour frequency list. If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$, an inter-RAT E-UTRAN layer is indicated to meet high speed requirements if *highSpeedMeasFlag-r16* is configured and the carrier to be measured is configured with *highSpeedEUTRACarrier-r16* and UE supports the enhanced inter-RAT E-UTRAN measurement requirements. If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$, UE is required to meet non high speed requirements no matter whether *highSpeedMeasFlag-r16* or *highSpeedEUTRACarrier-r16* is configured or not.

For a UE configured with *highSpeedMeasFlag-r16*, and configured with relaxed measurement criterion (*lowMobilityEvaluation* or both *lowMobilityEvaluation* and *cellEdgeEvaluation*),

- if the relaxed measurement criteria in section 4.2.2.9.2 are fulfilled, it is up to UE implementation whether to apply the relaxed measurements requirements specified in clause 4.2.2.11.2 or high speed requirements specified in this clause
- otherwise, high speed requirements specified in this clause shall apply

The parameter $N_{EUTRA_carrier}$ for a UE configured with idle mode DC measurements (while T331 is running), is the combined number of configured E-UTRA carriers in the neighbour frequency list and E-UTRA carriers configured for idle mode DC measurements, excluding the configured E-UTRA carriers indicated to meet high speed requirements in the neighbour frequency list.

NOTE: combined total number means that if a carrier is an E-UTRA carrier indicated by the serving cell for mobility and additionally a carrier configured for idle mode DC measurements, it only counts as one carrier.

The UE shall filter RSRP and RSRQ measurements of each measured E-UTRA cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least half the minimum specified measurement period.

An inter-RAT E-UTRA cell is considered to be detectable provided the following conditions are fulfilled:

- the same conditions as for inter-frequency RSRP measurements specified in TS 36.133 [15, Annex B.1.2] are fulfilled for a corresponding Band, and
- the same conditions as for inter-frequency RSRQ measurements specified in TS 36.133 [15, Annex B.1.2] are fulfilled for a corresponding Band.
- SCH conditions specified in TS 36.133 [15, Annex B.1.2] are fulfilled for a corresponding Band

The UE shall be able to evaluate whether a newly detectable inter-RAT E-UTRAN cell meets the reselection criteria defined in TS 38.304 [1] within $N_{EUTRA_carrier_HST} * T_{detect,EUTRAN_HST} + N_{EUTRA_carrier} * T_{detect,EUTRAN}$ when Srxlev ≤

$S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$ when $T_{reselection}$ = 0 provided that the reselection criteria is met by a margin of at least 6dB for RSRP reselections based on absolute priorities or 4dB for RSRQ reselections based on absolute priorities.

Cells which have been detected shall be measured at least every $N_{EUTRA_carrier_HST}$ * $T_{measure,EUTRAN_HST}$ + $N_{EUTRA_carrier}$ * $T_{measure,EUTRAN}$ when Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$.

When higher priority cells are found by the higher priority search, they shall be measured at least every $T_{measure,EUTRAN}$. If, after detecting a cell in a higher priority search, it is determined that reselection has not occurred then the UE is not required to continuously measure the detected cell to evaluate the ongoing possibility of reselection. However, the minimum measurement filtering requirements specified later in this clause shall still be met by the UE before it makes any determination that it may stop measuring the cell.

If the UE detects, on an inter-RAT E-UTRAN carrier, a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall not consider an inter-RAT E-UTRA cell in cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For a cell that has been already detected, but has not been reselected to, the filtering shall be such that a UE not configured with eDRX_IDLE cycle shall be capable of evaluating that an already identified inter-RAT E-UTRA cell has met reselection criterion defined in TS 38.304 [1] within $N_{EUTRA_carrier_HST}$ * $T_{evaluate,EUTRAN_HST}$ + $N_{EUTRA_carrier}$ * $T_{evaluate,EUTRAN}$ when $T_{reselection}$ = 0 as specified in table 4.2.2.5-1 and 4.2.2.5-2 provided that the reselection criteria is met by a margin of at least 6dB for RSRP reselections based on absolute priorities or 4dB for RSRQ reselections based on absolute priorities.

For a cell that has been already detected, but that has not been reselected to, the filtering shall be such that a UE configured with eDRX_IDLE cycle shall be capable of evaluating that an already identified inter-RAT E-UTRA cell has met reselection criterion defined in TS 38.304 [1] within $N_{EUTRA_carrier}$ * $T_{evaluate,EUTRAN}$ when $T_{reselection}$ = 0 as specified in table 4.2.2.5-3 provided that the reselection criteria is met by a margin of at least 6dB for RSRP reselections based on absolute priorities or 4dB for RSRQ reselections based on absolute priorities.

If the $T_{reselection}$ timer has a non-zero value and an inter-RAT E-UTRA cell satisfies the reselection criteria defined in TS 38.304 [1], the UE shall evaluate this E-UTRA cell for the $T_{reselection}$ time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect to this cell.

For UE not configured with eDRX_IDLE cycle, $T_{detect,EUTRAN}$, $T_{measure,EUTRAN}$ and $T_{evaluate,\ E\text{-}UTRAN}$ are specified in tables 4.2.2.5-1 and 4.2.2.5-2.

For UE configured with eDRX_IDLE cycle, $T_{detect,EUTRAN}$, $T_{measure,EUTRAN}$ and $T_{evaluate,\ E\text{-}UTRAN}$ are specified in table 4.2.2.5-3, where the requirements apply provided that the serving cell is configured with eDRX_IDLE and the DRX cycle length is the same in all PTWs during any of $T_{detect,EUTRAN}$, $T_{measure,EUTRAN}$ and $T_{evaluate,\ E\text{-}UTRAN}$ when multiple PTWs are used.

NOTE 1: The number of DRX cycles in this table corresponds to the DRX cycles within PTWs, when PTW is configured.
NOTE 2: The eDRX_IDLE cycle lengths are as specified in section 10.5.5.32 of TS 24.008 [42].
NOTE 3: Number of eDRX cycles when eDRX_IDLE cycle length equals 2.56 s, 5.12 s, or 10.24 s; number of DRX cycles otherwise.
NOTE 4: The lower bound of PTW length is derived based on $\left\lceil \frac{Tevaluate,E-UTRAN*DRX_cycle}{1.28} \right\rceil * 1.28$.
NOTE 5: When eDRX=20.48 s and DRX=0.32 s, UE is allowed to perform cell evaluation within PTW in every 2 eDRX cycles.

For any requirement in this section, when the UE transitions between any two states when being configured with eDRX_IDLE, changing eDRX_IDLE cycle length, or changing PTW configuration, the UE shall meet the transition requirement, which is the less stringent requirement of the two requirements corresponding to the first state and the second state, during the transition time interval which is the time corresponding to the transition requirement. After the transition time interval, the UE shall meet the requirement corresponding to the second state.

4.2.2.6 Maximum interruption in paging reception

UE shall perform the cell re-selection with minimum interruption in monitoring downlink channels for paging reception. In addition, when the UE is configured with eDRX_IDLE cycle, the UE shall not miss any paging in a PTW provided the paging is sent in at least 2 DRX cycles before the end of that PTW.

At intra-frequency and inter-frequency cell re-selection, the UE shall monitor the downlink of serving cell for paging reception until the UE is capable to start monitoring downlink channels of the target intra-frequency and inter-frequency cell for paging reception. The interruption time shall not exceed $T_{SI-NR} + 2*T_{target_cell_SMTC_period}$ ms. $T_{target_cell_SMTC_period}$ is the periodicity of the SMTC occasions configured for the target NR cell. If the target cell is in the PCI list of *smtc2-LP*, the SMTC periodicity follows *smtc2-LP*; otherwise, the SMTC periodicity follows *smtc*. The interruption time could be longer due to on demand SIB1 acquisition if the target NR cell is an NES cell and UE is capable of on demand SIB1 acquisition.

At inter-RAT cell re-selection, the UE shall monitor the downlink of serving cell for paging reception until the UE is capable to start monitoring downlink channels for paging reception of the target inter-RAT cell. For NR to E-UTRAN cell re-selection the interruption time must not exceed $T_{SI-EUTRA}$ + 55 ms.

T_{SI-NR} is the time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks defined in TS 38.331 [2] for an NR cell. If the target NR cell is an NES cell and UE is capable of on demand SIB1 acquisition, T_{SI-NR} could be longer due to UL WUS transmission and RAR reception for on demand SIB1 acquisition of NES cell.

$T_{SI-EUTRA}$ is the time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks defined in TS 36.331 [16] for an E-UTRAN cell.These requirements assume sufficient radio conditions, so that decoding of system information can be made without errors and does not take into account cell re-selection failure.

4.2.2.7 General requirements

When configured with eDRX_IDLE, the UE shall search every layer of higher priority at least every $T_{higher_priority_search}$, where $T_{higher_priority_search}$ is defined as follows:

- $T_{higher_priority_search}$ = max(60, 15*eDRX_IDLE cycle length) * N_{layers} seconds if eDRX_IDLE cycle ≤ 10.24 s,
- $T_{higher_priority_search}$ = max(60, ceil (15/$N_{DRX-PTW}$)*eDRX_IDLE cycle length) * N_{layers} seconds if eDRX_IDLE cycle > 10.24 s, where $N_{DRX-PTW}$ is the number of DRX cycles within a single PTW.

Otherwise, if the UE is not configured with eDRX_IDLE cycle, the UE shall search every layer of higher priority at least every $T_{higher_priority_search}$ = (60 * N_{layers}) seconds.

N_{layers} is the total number of higher priority NR and E-UTRA carrier frequencies broadcasted in system information.

For a UE configured with early measurement reporting, while T331 is running, N_{layers} is the combined total number of higher priority NR and E-UTRA carrier frequencies broadcasted in system information and carriers configured for idle mode CA/DC measurements.

NOTE: Combined total number means that if a carrier is a high priority carrier and additionally a carrier configured for idle mode CA/DC measurements, it only counts as one carrier.

4.2.2.8 Minimum requirement at transitions

When switching from low mobility scenario or not-at-cell-edge scenario to low mobility and not-at-cell-edge scenario during cell-reselection period, the UE shall fulfill the requirements corresponding to low mobility scenario or not-at-cell-edge scenario over measurement period ($T_{relaxed}$) and thereafter switch to requirements corresponding to low mobility and not-at-cell-edge scenario. The measurement period, $T_{relaxed}$, is any of:

- $T_{measure,NR_Intra}$ and $T_{evaluate,NR_Intra,}$ defined in section 4.2.2.9 for intra-frequency measurements on NR cells,
- $T_{measure,NR_Inter}$ and $T_{evaluate,NR_Inter}$ defined in section 4.2.2.10 for inter-frequency measurements on NR cells and
- $T_{measure,EUTRAN}$ and $T_{evaluate,EUTRAN}$ defined in sections 4.2.2.11 for inter-RAT E-UTRAN measurements.

When switching from low mobility and not-at-cell-edge scenario to low mobility scenario or not-at-cell-edge scenario during cell-reselection period, the UE shall fulfill the requirements corresponding to low mobility scenario or not-at-cell-edge scenario upon fulfilling the switching criteria.

When switching from normal mode to low mobility scenario or not-at-cell-edge scenario or low mobility and not-at-cell-edge scenario during cell-reselection period, the UE shall fulfill the requirements corresponding to normal mode over measurement period (T_{normal}) and thereafter switch to requirements corresponding to low mobility scenario or not-at-cell-edge scenario or low mobility and not-at-cell-edge scenario. The measurement period, T_{normal}, is any of:

- $T_{measure,NR_Intra}$ and $T_{evaluate,NR_Intra,}$ defined in section 4.2.2.3 for intra-frequency measurements on NR cells,
- $T_{measure,NR_Inter}$ and $T_{evaluate,NR_Inter}$ defined in section 4.2.2.4 for inter-frequency measurements on NR cells and
- $T_{measure,EUTRAN}$ and $T_{evaluate,EUTRAN}$ defined in sections 4.2.2.5 for inter-RAT E-UTRAN measurements.

When switching from low mobility scenario or not-at-cell-edge scenario or low mobility and not-at-cell-edge scenario to normal mode during cell-reselection period, the UE shall fulfill the requirements corresponding to normal mode upon fulfilling the switching criteria.

No requirement is defined for multiple transitions of scenarios within one measurement period.

4.2.2.9 Measurements of intra-frequency NR cells for UE configured with relaxed measurement criterion

4.2.2.9.1 Introduction

This clause contains the requirements for measurements on intra-frequency NR cells when Srxlev ≤ $S_{IntraSearchP}$ or Squal ≤ $S_{IntraSearchQ}$ and when the UE is configured any of the following relaxed measurement criteria:

- Relaxed measurement criterion for UE with low mobility defined in clause 5.2.4.9.1 in [1],
- Relaxed measurement criterion for UE not-at-cell edge defined in clause 5.2.4.9.2 in [1],
- Both low mobility criterion and not-at-cell edge criterion as defined in clauses 5.2.4.9.1 and 5.2.4.9.2 in [1] respectively.

4.2.2.9.2 Measurements for UE fulfilling low mobility criterion

This clause contains requirements for measurements on intra-frequency NR cells provided that:

- UE is only configured with *lowMobilityEvaluation* [2] criterion and UE has fulfilled the *lowMobilityEvaluation* [2] criterion, or
- UE is configured with both *lowMobilityEvaluation* [2] criterion and *cellEdgeEvaluation* [2] criterion and *combineRelaxedMeasCondition* [2] is not configured, and UE has fulfilled only the *lowMobilityEvaluation* [2] criterion.

The requirements defined in clause 4.2.2.3 apply for this clause except that:

- For a UE not configured with eDRX_IDLE, T_{detect,NR_Intra}, $T_{measure,NR_Intra}$ and $T_{evaluate,NR_Intra}$ are as specified in table 4.2.2.9.2-1.
- For a UE configured with eDRX_IDLE cycle up to 10.24 s, T_{detect,NR_Intra}, $T_{measure,NR_Intra}$ and $T_{evaluate,NR_Intra}$ are as specified in table 4.2.2.9.2-2 and table 4.2.2.9.2-3 for FR1 and FR2, respectively.
- For a UE configured with eDRX_IDLE cycle greater than 10.24 s, T_{detect,NR_Intra}, $T_{measure,NR_Intra}$ and $T_{evaluate,NR_Intra}$ are as specified in table 4.2.2.9.2-4 and table 4.2.2.9.2-5 for FR1 and FR2, respectively, provided eDRX cycle is ≤ [163.84] sec and evaluation/measurement period with relaxation on one carrier is not greater than single PTW length.

4.2.2.9.4 Measurements for UE fulfilling low mobility and not-at-cell edge criteria

This clause contains requirements for measurements on intra-frequency NR cells provided that:

- UE is configured with both *lowMobilityEvaluation* [2] criterion and *cellEdgeEvaluation* [2] criterion, and
- both *lowMobilityEvaluation* [2] and *cellEdgeEvaluation* [2] criteria are fulfilled, and
- less than 1 hour have passed since measurements for cell reselection were last performed

In this case the UE is not required to meet T_{detect,NR_Intra}, $T_{measure,NR_Intra}$ and $T_{evaluate,NR_Intra}$ as defined in table 4.2.2.3-1 or table 4.2.2.3-4 or table 4.2.2.3-5.

4.2.2.10 Measurements of inter-frequency NR cells for UE configured with relaxed measurement criterion

4.2.2.10.1 Introduction

This clause contains the requirements for measurements on inter-frequency NR cells when the UE is configured with any of following relaxed measurement criteria:

- Relaxed measurement criterion for UE with low mobility defined in clause 5.2.4.9.1 in [1],
- Relaxed measurement criterion for UE not-at-cell edge defined in clause 5.2.4.9.2 in [1],
- Both low mobility criterion and not-at-cell edge criterion as defined in clauses 5.2.4. 9.1 and 5.2.4.9.2 in [1] respectively.

4.2.2.10.2 Measurements for UE fulfilling low mobility criterion

This clause contains requirements for measurements on inter-frequency NR cells provided that:

- T331 timer is not running for EMR measurements on inter-RAT E-UTRAN, and
- UE is only configured with *lowMobilityEvaluation* [2] criterion and UE has fulfilled the *lowMobilityEvaluation* [2] criterion, or
- UE is configured with both *lowMobilityEvaluation* [2] and *cellEdgeEvaluation* [2] criteria and *combineRelaxedMeasCondition* [2] is not configured, and UE has fulfilled only the *lowMobilityEvaluation* [2] criterion.

The UE shall not relax measurements on NR inter-frequency carriers configured for idle mode CA/DC measurements (defined in clause 4.4) while T331 is running.

When Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$ then the requirements are defined as follows:

- The UE shall be able to evaluate whether a newly detectable inter-frequency NR cell meets the reselection criteria defined in TS 38.304 [1] within $N_{carrier_Relax} * T_{detect,NR_Inter_Relax} + N_{carrier_Non_relax} * T_{detect,NR_Inter}$. Cells which have been detected shall be measured at least every $N_{carrier_Relax} * T_{measure,NR_Inter_Relax} + N_{carrier_Non_relax} * T_{measure,NR_Inter}$. The UE shall be able to evaluate that an already identified inter-frequency NR cell has met reselection criterion defined in TS 38.304 [1] within $N_{carrier_Relax} * T_{evaluate,NR_Inter_Relax} + N_{carrier_Non_relax} * T_{evaluate,NR_Inter}$.

- When T331 is running,

  - The parameter $N_{carrier_Relax}$ is the total number of NR inter-frequency carriers not configured for idle mode CA/DC measurements.

  - The parameter $N_{carrier_Non_relax}$ is the total number of NR inter-frequency carriers configured for idle mode CA/DC measurements.

- When T331 is not running,

  - The parameter $N_{carrier_Relax}$ is the total number of inter-frequency carriers configured for mobility measurements only and the number of inter-frequency carriers configured for both mobility measurement and idle mode CA/DC measurements.

  - The parameter $N_{carrier_Non_relax}$ =0.

- For a UE not configured with eDRX_IDLE, $T_{detect,NR_Inter_Relax}$, $T_{measure,NR_Inter_Relax}$ and $T_{evaluate,NR_Inter_Relax}$ are as specified in table 4.2.2.10.2-1 and T_{detect,NR_Inter}, $T_{measure,NR_Inter}$ and $T_{evaluate,NR_Inter}$ are as specified in table 4.2.2.4.1-1.

- For a UE configured with eDRX_IDLE, T_{detect,NR_Inter}, $T_{measure,NR_Inter}$ and $T_{evaluate,NR_Inter}$ are as specified in table 4.2.2.4-3 and table 4.2.2.4-4 for FR1 and FR2 respectively.

- For a UE configured with eDRX_IDLE cycle up to 10.24 s, $T_{detect,NR_Inter_Relax}$, $T_{measure,NR_Inter_Relax}$ and $T_{evaluate,NR_Inter_Relax}$ are as specified in table 4.2.2.10.2-2 and table 4.2.2.10.2-3 for FR1 and FR2, respectively.

- For a UE configured with eDRX_IDLE cycle greater than 10.24 s, $T_{detect,NR_Inter_Relax}$, $T_{measure,NR_Inter_Relax}$ and $T_{evaluate,NR_Inter_Relax}$ are as specified in table 4.2.2.10.2-4 and table 4.2.2.10.2-5 for FR1 and FR2, respectively, provided eDRX cycle is ≤ [163.84] sec and evaluation/measurement time with relaxation on one carrier is not greater than single PTW length.

When UE is only configured with *lowMobilityEvaluation* [2] criterion and UE has fulfilled the *lowMobilityEvaluation* [2] criterion, and Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$,

- if the UE is configured with *highPriorityMeasRelax* [2] then the UE shall search for inter-frequency layers of higher priority at least every $K2*T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2.2.7 and, K2 = 60

- otherwise, the UE shall search for inter-frequency layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2.2.7.

4.2.2.10.3 Measurements for UE fulfilling not-at-cell edge criterion

This clause contains requirements for measurements on inter-frequency NR cells provided that:

- T331 timer is not running for EMR measurements on inter-RAT E-UTRAN, and
- UE is only configured with *cellEdgeEvaluation* [2] criterion, and UE has fulfilled the *cellEdgeEvaluation* [2] criterion or
- UE is configured with both *lowMobilityEvaluation* [2] criterion and *cellEdgeEvaluation* [2] criterion and *combineRelaxedMeasCondition* [2] is not configured, and UE has fulfilled only the *cellEdgeEvaluation* [2] criterion.

The UE shall not relax measurements on NR inter-frequency carriers configured for idle mode CA/DC measurements (defined in clause 4.4) while T331 is running.

When Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$ then the requirements defined in clause 4.2.2.4 apply for this clause except that:

- The UE shall be able to evaluate whether a newly detectable inter-frequency NR cell meets the reselection criteria defined in TS 38.304 [1] within $N_{carrier_Relax} * T_{detect,NR_Inter_Relax} + N_{carrier_Non_relax} * T_{detect,NR_Inter}$. Cells which have been detected shall be measured at least every $N_{carrier_Relax} * T_{measure,NR_Inter_Relax} + N_{carrier_Non_relax} * T_{measure,NR_Inter}$. The UE shall be able to evaluate that an already identified inter-frequency NR cell has met reselection criterion defined in TS 38.304 [1] within $N_{carrier_Relax} * T_{evaluate,NR_Inter_Relax} + N_{carrier_Non_relax} * T_{evaluate,NR_Inter}$.
- When T331 is running,
  - The parameter $N_{carrier_Relax}$ is the total number of NR inter-frequency carriers not configured for idle mode CA/DC measurements.
  - The parameter $N_{carrier_Non_relax}$ is the total number of NR inter-frequency carriers configured for idle mode CA/DC measurements.
- When T331 is not running,
  - The parameter $N_{carrier_Relax}$ is the total number of inter-frequency carriers configured for mobility measurements only and the number of inter-frequency carriers configured for both mobility measurement and idle mode CA/DC measurements.
  - The parameter $N_{carrier_Non_relax}$ =0.
- For a UE not configured with eDRX_IDLE, $T_{detect,NR_Inter_Relax}$, $T_{measure,NR_Inter_Relax}$ and $T_{evaluate,NR_Inter_Relax}$ are as specified in table 4.2.2.10.3-1 and T_{detect,NR_Inter}, $T_{measure,NR_Inter}$ and $T_{evaluate,NR_Inter}$ are as specified in table 4.2.2.4.1-1.

- For a UE configured with eDRX_IDLE, T_{detect,NR_Inter}, $T_{measure,NR_Inter}$ and $T_{evaluate,NR_Inter}$ are as specified in table 4.2.2.4-3 and table 4.2.2.4-4 for FR1 and FR2 respectively.

- For a UE configured with eDRX_IDLE cycle up to 10.24 s, $T_{detect,NR_Inter_Relax}$, $T_{measure,NR_Inter_Relax}$ and $T_{evaluate,NR_Inter_Relax}$ are as specified in table 4.2.2.10.3-2 and table 4.2.2.10.3-3 for FR1 and FR2, respectively.

- For a UE configured with eDRX_IDLE cycle greater than 10.24 s, $T_{detect,NR_Inter_Relax}$, $T_{measure,NR_Inter_Relax}$ and $T_{evaluate,NR_Inter_Relax}$ are as specified in table 4.2.2.10.3-4 and table 4.2.2.10.3-5 for FR1 and FR2, respectively, provided eDRX cycle is ≤ [163.84] sec and evaluation/measurement time with relaxation on one carrier is not greater than single PTW length.

When Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$, then regardless of whether the UE is configured with *highPriorityMeasRelax* [2] or not, the UE shall search for inter-frequency layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2.2.7.

- For a UE not configured with eDRX_IDLE, $T_{detect,EUTRAN_Relax}$, $T_{measure,EUTRAN_Relax}$ and $T_{evaluate,EUTRAN_Relax}$ are as specified in table 4.2.2.11.3-1 and $T_{detect,EUTRAN}$, $T_{measure,EUTRAN}$ and $T_{evaluate,EUTRAN}$ are as specified in table 4.2.2.5-1.
- For a UE configured with eDRX_IDLE, $T_{detect,EUTRAN}$, $T_{measure,EUTRAN}$ and $T_{evaluate,EUTRAN}$ are as specified in table 4.2.2.5-3.
- For a UE configured with eDRX_IDLE cycle up to 10.24 s, $T_{detect,EUTRAN_Relax}$, $T_{measure,EUTRAN_Relax}$ and $T_{evaluate,EUTRAN_Relax}$ are as specified in table 4.2.2.11.3-2.
- For a UE configured with eDRX_IDLE cycle greater than 10.24 s, $T_{detect,EUTRAN_Relax}$, $T_{measure,EUTRAN_Relax}$ and $T_{evaluate,EUTRAN_Relax}$ are as specified in table 4.2.2.11.3-3, provided eDRX cycle is ≤ [163.84] sec and evaluation/measurement time with relaxation on one carrier is not greater than single PTW length.

When Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$ and regardless of whether the UE is configured with *highPriorityMeasRelax* [2] or not, the UE shall search for inter-RAT E-UTRAN frequency layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2.2.7.

4.2.2.11.4 Measurements for UE fulfilling low mobility and not-at-cell edge criterion

This clause contains requirements for measurements on inter-RAT E-UTRAN cells provided that:

- T331 timer is not running for EMR measurements on inter-RAT E-UTRAN, and
- UE is configured with both *lowMobilityEvaluation* [2] criterion and *cellEdgeEvaluation* [2] criterion, and
- both *lowMobilityEvaluation* [2] and *cellEdgeEvaluation* [2] criteria are fulfilled.

In this case the UE is not required to meet $T_{detect,EUTRAN}$, $T_{measure,EUTRAN}$ and $T_{evaluate,EUTRAN}$ as defined in table 4.2.2.5-1 or table 4.2.2.5-3.

When Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$, the UE shall search for, measure and evaluate inter-RAT E-UTRAN layers of higher or lower priority at least every 1 hour.

When Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$, the UE shall search for inter-RAT E-UTRAN of higher priority at least every K2*$T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2.2.7 and K2=60.

4.2.2.12 Measurements of inter-frequency NR cells with NTN carrier

This clause applies for the inter-frequency cell reselection for NTN carriers in FR1 NTN, and TN carriers if configured. The requirements in clause 4.2.2.12 apply provided that network provides SIB19 and UE is configured with one or more NTN carrier. UE is not required to ensure having a valid version of SIB19 and the exact time of reacquiring SIB19 is up to UE implementation.

The UE shall be able to identify new inter-frequency cells and perform SS-RSRP or SS-RSRQ measurements of identified inter-frequency cells if carrier frequency information is provided by the serving cell, even if no explicit neighbour list with physical layer cell identities is provided.

If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$, then the UE shall search for inter-frequency layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2.2.7.

If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$, then the UE shall search for and measure inter-frequency layers of higher, equal or lower priority in preparation for possible reselection. In this scenario, the minimum rate at which the UE is required to search for and measure higher priority layers shall be the same as that defined below in this clause.

The UE shall be able to evaluate whether a newly detectable inter-frequency cell meets the reselection criteria defined in TS 38.304 [1] within $K_{carrier_TN}$* T_{detect,NR_Inter_TN} + $\sum_{i=1}^{K_{carrier_NTN}} K_{multi_SMTC,i} * T_{detect,NR_Inter_NTN}$+T_GNSS if the UE does not support Enhanced RRM requirements for measurements in IDLE and INACTIVE modes defined in TS 38.306 [14] or if the *enhancedMeasurementNGSO-r17* is not enabled, or within $K_{carrier_TN}$* T_{detect,NR_Inter_TN} + $\sum_{i=1}^{K_{carrier_NTN}} K_{multi_SMTC,i} * T_{detect,NR_Inter_NTN_enh}$+T_GNSS if the UE supports Enhanced RRM requirements for measurements in IDLE and INACTIVE modes defined in TS 38.306 [14] and the *enhancedMeasurementNGSO-r17* is enabled, if at least carrier frequency information is provided for inter-frequency neighbour cells by the serving cells when $T_{reselection}$ = 0 provided that the reselection criteria is met by a margin of at least [5]dB in FR1 for reselections based on ranking or [6]dB in FR1 for SS-RSRP reselections based on absolute priorities or [4]dB in FR1 for SS-RSRQ reselections based on absolute priorities. The parameter $K_{carrier_TN}$ is the number of NR TN inter-frequency carriers and the parameter $K_{carrier_NTN}$ is the number of NR NTN inter-frequency carriers indicated by the serving cell.

The parameter $K_{multi_SMTC,i}$ is the scaling factor for measurement of multiple SMTCs or multiple satellites

- If SMTCs do not overlap with each other,
  - $K_{multi_{SMTC,i}} = 1$, if GEO satellites are measured on the carrier;
  - $K_{multi_{SMTC,i}} = \left\lceil \frac{N_{LEO,i}}{N_{LEO,simul}} \right\rceil$, if LEO satellites are measured on the carrier;
- If SMTCs partially overlap with each other,
  - $K_{multi_{SMTC,i}} = N_{SMTC,overlap}$, if only GEO satellites are measured on the carrier;
  - $K_{multi_{SMTC,i}} = \sum_{i=1}^{N_{SMTC,overlap}} \left\lceil \frac{N_{LEO,i}}{N_{LEO,simul}} \right\rceil$, if only LEO satellites are measured on the carrier;

  where

  $N_{LEO,i}$ is the number of LEO satellites to be measured within *i*-th SMTC,

  $N_{LEO,simul}$ is the number of LEO satellites that UE can measure in parallel within an SMTC,$N_{SMTC,overlap}$ is the number of SMTCs that partially overlap with each other.

  NOTE: for deriving $K_{multi_SMTC,i}$ for T_{detect,NR_Inter}, $T_{measure,NR_Inter}$ and $T_{evaluate,NR_Inter}$ of frequency layer *i*, two SMTCs are considered as overlapping if they overlap in one or more occasions during a single T_{detect,NR_Inter}, $T_{measure,NR_Inter}$ or $T_{evaluate,NR_Inter}$.

$T_{detecet,NR_Inter_TN}$, $T_{measure,NR_Inter_TN}$ and $T_{evaluate,NR_Inter_TN}$ are the NR TN inter-frequency cell re-selection requirement defined in table 4.2.2.4-1 in TS 38.133.

T_{detect,NR_Inter_NTN}, $T_{measure,NR_Inter_NTN}$ and $T_{evaluate,NR_Inter_NTN}$ are the NR NTN inter-frequency cell re-selection requirement defined in table 4.2C.2.4-1 in TS 38.133.

$T_{detect,NR_Inter_NTN_enh}$, $T_{measure,NR_Inter_NTN_enh}$ and $T_{evaluate,NR_Inter_NTN_enh}$ are the NR NTN inter-frequency cell re-selection requirement defined in table 4.2C.2.4-2 in TS 38.133.

$T_{_GNSS}$ is TTFF (Time To First Fix) of which value is left undefined in RRM spec. If UE GNSS has been switched ON, $T_{_GNSS}$ can be assumed zero.

NOTE: The above requirement does not assume UE always performs NTN cell detection/measurement as well as TN cells.

An inter-frequency cell is considered to be detectable according to the conditions defined in Annex B.1.7 for a corresponding Band.

When higher priority cells are found by the higher priority search, they shall be measured at least every $T_{measure,NR_Inter}$. If, after detecting a cell in a higher priority search, it is determined that reselection has not occurred then the UE is not required to continuously measure the detected cell to evaluate the ongoing possibility of reselection. However, the minimum measurement filtering requirements specified later in this clause shall still be met by the UE before it makes any determination that it may stop measuring the cell. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall measure SS-RSRP or SS-RSRQ at least every $K_{carrier_TN}$* $T_{measure,NR_Inter_TN}$ + $\sum_{i=1}^{K_{carrier_NTN}} K_{multi_SMTC,i} * T_{measure,NR_Inter_NTN}$+T_GNSS (see table 4.2C.2.4-1) if the UE does not support Enhanced RRM requirements for measurements in IDLE and INACTIVE mdoes defined in TS 38.306 [14] or if the *enhancedMeasurementNGSO-r17* is not enabled, or every $K_{carrier_TN}$* $T_{measure,NR_Inter_TN}$ + $\sum_{i=1}^{K_{carrier_NTN}} K_{multi_SMTC,i} * T_{measure,NR_Inter_NTN_enh}$+T_GNSS (see table 4.2C.2.4-2) if the UE supports Enhanced RRM requirements for measurements in IDLE and INACTIVE modes defined in TS 38.306 [14] and the *enhancedMeasurementNGSO-r17* is enabled, for identified lower or equal priority inter-frequency cells. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall filter SS-RSRP or SS-RSRQ measurements of each measured higher, lower and equal priority inter-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,NR_Inter}/2$.

The UE shall not consider a NR neighbour cell in cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For an inter-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that the inter-frequency cell has met reselection criterion defined TS 38.304 [1] within $K_{carrier_TN}$* $T_{evaluate,NR_Inter_TN}$ + $\sum_{i=1}^{K_{carrier_NTN}} K_{multi_SMTC,i} * T_{evaluste,NR_Inter_NTN}$+T_GNSS if the UE does not support Enhanced RRM requirements for measurements in IDLE and INACTIVE modes defined in TS 38.306 [14] or if the *enhanceddMeasurementLEO-r17* is not enabled, or within $K_{carrier_TN}$* $T_{evaluate,NR_Inter_TN}$ + $\sum_{i=1}^{K_{carrier_NTN}} K_{multi_SMTC,i} * T_{evaluste,NR_Inter_NTN_enh}$+T_GNSS if the UE supports Enhanced RRM requirements for measurements in IDLE and INACTIVE modes defined in TS 38.306 [14] and the *enhancedMeasurementNGSO-r17* is enabled, when $T_{reselection}$ = 0 as specified in table 4.2C.2.4-1 provided that the reselection criteria is met by

- the condition when performing equal priority reselection and

  when *rangeToBestCell* is not configured:

  - the cell is at least [5]dB better ranked in FR1 or.

  when *rangeToBestCell* is configured:

  - the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value in TS 38.304 [1] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.

    - if there are multiple such cells, the cell has the highest rank among them

    - the cell is at least [5]dB better ranked in FR1 if the current serving cell is among them. or

- [6]dB in FR1 for SS-RSRP reselections based on absolute priorities or

- [4]dB in FR1 for SS-RSRQ reselections based on absolute priorities.

When evaluating cells for reselection, the SSB side conditions apply to both serving and inter-frequency cells.

If $T_{reselection}$ timer has a non-zero value and the inter-frequency cell is satisfied with the reselection criteria, the UE shall evaluate this inter-frequency cell for the $T_{reselection}$ time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect that cell.

The UE is not expected to meet the measurement requirements for an inter-frequency carrier under DRX cycle=320 ms defined in table 4.2C.2.4-1 under the following conditions:

- $T_{SMTC_intra} = T_{SMTC_inter} = 160$ ms; where

  - T_{SMTC_intra} is the periodicity of the SMTC configured for the intra-frequency carrier if no identified intra-frequency cell is in the PCI list of *smtc2-LP* on this intra-frequency carrier; T_{SMTC_intra} is the periodicity of the *smtc2-LP* configured for the intra-frequency carrier if at least one identified intra-frequency cell is in the PCI list of *smtc2-LP* on this intra-frequency carrier. During PSS/SSS detection, the periodicity of the SMTC configured for the intra-frequency carrier is assumed for T_{SMTC_intra}. If the actual SSB transmission periodicity is greater than the SMTC configured for the intra-frequency carrier, longer T_{detect, NR_intra} is expected.

  - T_{SMTC_inter} is the actual SMTC periodicity used by the inter-frequency cell being identified. During PSS/SSS detection, the periodicity of the SMTC configured for the inter-frequency carrier is assumed for T_{SMTC_inter}. If the actual SSB transmission periodicity is greater than the SMTC configured for the inter-frequency carrier, longer Tdetect, NR_inter is expected.

  - SMTC occasions configured for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the SMTC occasions configured for the intra-frequency carrier, and

  - SMTC occasions configured for the intra-frequency carrier and for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the paging occasion in TS 38.304 [1].

The requirements in this clause apply provided that the number of SMTCs for any inter-frequency carrier does not exceed the value indicated by *parallelSMTC-r17*, otherwise UE may select one or subset of all the configured SMTCs sequentially until all of the SMTCs can be measured, the selection of SMTCs to be used is up to UE implementation, and longer measurement delay than the corresponding measurement period specified in table 4.2C.2.4-1 and table 4.2C.2.4-2 is expected.

The requirements in this clause apply provided that the valid information for the satellite serving the target cell has been provided by the serving cell.

The requirements in this clause apply provided that SSB of neighbour cells are within the time shifted SMTC.

4.2A Cell Re-selection when subject to CCA

4.2A.1 Introduction

The cell reselection procedure allows the UE to select a more suitable cell and camp on it. The requirements in clauses 4.2A.2.3, 4.2A.2.4, and 4.2A.2.6, apply when at least the target cell is on a carrier frequency subject to CCA, and the requirements in clauses 4.2A.2.2, and 4.2A.2.5 apply when at least the camping cell is on a carrier frequency subject to CCA.

When the UE is in either *Camped Normally* state or *Camped on Any Cell* state on a cell, the UE shall attempt to detect, synchronise, and monitor intra-frequency, inter-frequency and inter-RAT cells indicated by the serving cell. For intra-frequency and inter-frequency cells the serving cell may provide explicit neighbour list, or only carrier frequency information and bandwidth information. UE measurement activity is also controlled by measurement rules defined in TS 38.304 [1], allowing the UE to limit its measurement activity.

In the requirements of clause 4.2A, the exceptions for side conditions apply as follows:

- for the UE capable of CA, the applicable exceptions for side conditions are specified in Annex B, clause B.3.2 for UE supporting CA in FR1.

In the requirements of clause 4.2A.2, the term SMTC occasion not available at the UE refers to when the SMTC contains SSBs configured by gNB in a cell on a carrier frequency subject to CCA, but *N* candidate SSB positions for the same SS/PBCH block index within the discovery burst transmission window are not available at the UE due to DL CCA failures at gNB during the corresponding detection, measurement, or evaluation period, where:

- For the cell detection procedure: *N* is at least one candidate SSB position (NOTE: the one candidate SSB position for the cell detection shall not be impacted by the set of candidate SSB positions which are already being measured by the UE within the current measurement period of the on-going measurements), and
- For other procedures in clause 4.2A.2: *N* are the first two successive candidate SSB positions when two or more candidate SSB positions are configured for this SSB index in one discovery burst transmission window, otherwise N is one candidate SSB position;

Otherwise, the SMTC occasion is considered as available at the UE.

4.2A.2 Requirements

4.2A.2.1 UE measurement capability

For idle mode cell re-selection purposes, the UE shall be capable of monitoring at least:

- Intra-frequency carrier, and
- Depending on UE capability, 7 NR inter-frequency carriers, and
- Depending on UE capability, 7 FDD E-UTRA inter-RAT carriers, and
- Depending on UE capability, 7 TDD E-UTRA inter-RAT carriers.

In addition to the requirements defined above, a UE supporting E-UTRA measurements in RRC_IDLE state shall be capable of monitoring a total of at least 14 carrier frequency layers, which includes serving layer, comprising of any above defined combination of E-UTRA FDD, E-UTRA TDD and NR layers. The inter-frequency carriers include carriers on unlicensed band and/or licensed band.

4.2A.2.2 Measurement and evaluation when subject to CCA on the serving cell

The UE shall measure the SS-RSRP and SS-RSRQ level of the serving cell and evaluate the cell selection criterion S defined in TS 38.304 [1] for the serving cell at least once every $(1+M_n)*M1*N1$ DRX cycles in N_{serv_CCA} consecutive DRX cycles; where:

- M1=2 if SMTC periodicity (T_{SMTC}) > 20 ms and DRX cycle $\leq$ 0.64 second,
- otherwise M1=1.
- $N1*M_n$ is the maximum separation in DRX cycles between two measurements that are used for filtering.

The UE shall filter the SS-RSRP and SS-RSRQ measurements of the serving cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by, at least DRX cycle/2 but not separated in time by more than $N1*M_n$, where M_n=2.

If the UE has evaluated according to table 4.2A.2.2-1 in N_{serv_CCA} consecutive DRX cycles that the serving cell does not fulfil the cell selection criterion S, the UE shall initiate the measurements of all neighbour cells indicated by the serving cell, regardless of the measurement rules currently limiting UE measurement activities.

UE shall initiate measurements on neighbour cells indicated by the serving cell if it is unable to measure on the serving cell for at least $N1*M_p$ consecutive number of DRX cycles each with at least one SMTC occasion not available at the UE, where M_p=4 when DRX cycle length <1.28 s, M_p=2 when DRX cycle length $\geq$1.28 s.

UE shall initiate the measurements on neighbour cells of any intra-frequency or inter-frequency if it is unable to measure on serving cell during at least consecutive $N1*M_q$ number of DRX cycles each with at least one SMTC occasion not available at the UE, regardless of any condition of $S_{nonIntraSearchP}$ and $S_{nonIntraSearchQ}$, where M_q=8 when DRX cycle length <1.28 s, M_q=4 when DRX cycle length $\geq$1.28 s.

If the UE in RRC_IDLE has not found any new suitable cell based on searches and measurements using the intra-frequency, inter-frequency and inter-RAT information indicated in the system information for 10 s, the UE shall initiate cell selection procedures for the selected PLMN as defined in TS 38.304 [1].

DRX cycle length [s]	Scaling Factor (N1)		N_{serv_CCA} [number of DRX cycles]
	FR1	FR2-2 Note 3	
0.32	1	12	N1*M1*(4+ M_s)
0.64		8	N1*M1*(4+ M_s)
1.28		6	N1*(2+M_s)
2.56		5	N1*(2+M_s)
Note 1: Ms is the number of groups of consecutive N1 DRX cycles each group with at least one SMTC occasion not available at the UE during N_{serv_CCA}, and $M_s < M_{s,max}$			
Note 2: $M_{s,max}$=8 for DRX cycle length < 1.28 s, $M_{s,max}$= 4 for DRX cycle length ≥ 1.28 s.			
Note 3: Applies for UE supporting FR2-2 power class 2&3. For UE supporting FR2-2 power class 1, N1 = 12 for all DRX cycle length.			

The UE shall restart the measurements used for serving cell evaluation if M_s exceeds $M_{s,max}$.

4.2A.2.3 Measurements of intra-frequency NR cells when subject to CCA on the serving cell and target cell

The UE shall be able to identify new intra-frequency cells with CCA and perform SS-RSRP and SS-RSRQ measurements of the identified intra-frequency cells without an explicit intra-frequency neighbour list containing physical layer cell identities.

When the intra-frequency measurement is performed on a neighbour cell in FR2-2 with shared spectrum channel access, UE shall determine the CCA mode of the neighbour cell according to *channelAccessMode2-r17*of the cell configured in *SIB3*. If *channelAccessMode2-r17* of the cell is enabled, UE shall assume that CCA applies to the cell and perform measurement accordingly, and the requirements in clause 4.2A.2.3 shall apply; otherwise, UE shall assume that CCA does not apply to the cell and perform measurement accordingly, and requirements in clause 4.2.2.3 shall apply.

The UE shall be able to evaluate whether a newly detectable intra-frequency cell meets the reselection criteria defined in TS 38.304 [1] within T_{detect,NR_Intra_CCA} when that $T_{reselection}$= 0 . An intra frequency cell is considered to be detectable according to the conditions defined in annex B.1.2A for a corresponding Band.

The UE shall measure SS-RSRP and SS-RSRQ at least every $T_{measure,NR_Intra_CCA}$ (see table 4.2A.2.3-1) for intra-frequency cells that are identified and measured according to the measurement rules. For a cell that is already identified, after 2 unsuccessful measurement attempts due to exceeding the maximum number of SMTC occasions not available at the UE, the UE shall detect cells on any of the configured serving- and/or non-serving carriers.

The UE shall filter SS-RSRP and SS-RSRQ measurements of each measured intra-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,NR_Intra_CCA}/2$.

The UE shall not consider a NR neighbour cell in cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For an intra-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that the intra-frequency cell has met reselection criterion defined [1] within $T_{evaluate,NR_Intra_CCA}$ when $T_{reselection}$ = 0 as specified in table 4.2A.2.3-1 provided that:

when *rangeToBestCell* is not configured:

- the cell is at least 3 dB better ranked in FR1 or 4.5 dB better ranked in FR2-2.

when *rangeToBestCell* is configured:

- the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value [1] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.
    - if there are multiple such cells, the cell has the highest rank among them.

- the cell is at least 3 dB better ranked in FR1 or 4.5 dB better ranked in FR2-2 if the current serving cell is among them.

When evaluating cells for reselection, the SSB side conditions apply to both serving and non-serving intra-frequency cells.

If $T_{reselection}$ timer has a non-zero value and the intra-frequency cell is satisfied with the reselection criteria, which are defined in TS 38.304 [1], the UE shall evaluate this intra-frequency cell for the $T_{reselection}$ time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect that cell.

NOTE 1: M2 = 1.5 if SMTC periodicity of measured intra-frequency cell > 20 ms; otherwise M2=1.
NOTE 2: Md, Mm, Me are the number of groups of consecutive N1 DRX cycles each group with at least one SMTC occasion not available during the T_{detect,NR_Intra_CCA}, $T_{measure,NR_Intra_CCA}$ and $T_{evaluate,NR_Intra_CCA}$, and $M_m \le M_{m,max}$, $M_d \le M_{d,max}$ and $M_e \le M_{e,max}$
NOTE 3: $M_{m,max}$ = 16 for DRX cycle length = 0.32 s; $M_{m,max}$ = 8 for DRX cycle length = 0.64 s; $M_{m,max}$ = 4 for DRX cycle length = 1.28 s; $M_{m,max}$ = 4 for DRX cycle length = 2.56 s.
NOTE 4: $M_{d,max} = 4*M_{m,max}$, $M_{e,max} = 2*M_{m,max}$.
NOTE 5: Applies for UE supporting FR2-2 power class 2&3. For UE supporting FR2-2 power class 1, N1 = 12 for all DRX cycle length.

The UE shall restart the measurements upon exceeding $M_{m,max}$, $M_{d,max}$, or $M_{e,max}$.

4.2A.2.4 Measurements of inter-frequency NR cells when subject to CCA on the target cell

The UE shall be able to identify new inter-frequency cells and perform SS-RSRP or SS-RSRQ measurements of identified inter-frequency cells if carrier frequency information is provided by the serving cell, even if no explicit neighbour list with physical layer cell identities is provided.

When the inter-frequency measurement is performed on a neighbour cell in FR2-2 with shared spectrum channel access, UE shall determine the CCA mode of the neighbour cell according to *channelAccessMode2-r17*of the cell configured in *SIB4*. If *channelAccessMode2-r17* of the cell is enabled, UE shall assume that CCA applies to the cell and perform measurement accordingly, and the requirements in clause 4.2A.2.4 shall apply; otherwise, UE shall assume that CCA does not apply to the cell and perform measurement accordingly, and requirements in clause 4.2.2.4 shall apply.

If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$ then the UE shall search for inter-frequency layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2A.2.7.

If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$ then the UE shall search for and measure inter-frequency layers of higher, equal or lower priority in preparation for possible reselection. In this scenario, the minimum rate at which the UE is required to search for and measure higher priority layers shall be the same as that defined below in this clause.

The UE shall be able to evaluate whether a newly detectable inter-frequency cell meets the reselection criteria defined in TS 38.304 [1] within $K_{carrier} * T_{detect,NR_Inter} + K_{carrier_CCA} * T_{detect,NR_Inter_CCA}$ if at least carrier frequency information is provided for inter-frequency neighbour cells by the serving cells when $T_{reselection} = 0$ provided that the reselection criteria is met by a margin of at least 5 dB in FR1 or 6.5dB in FR2-2 for reselections based on ranking or 6dB in FR1 or 7.5 dB in FR2-2 for SS-RSRP reselections based on absolute priorities or 4dB in FR1 and 4 dB in FR2-2 for SS-RSRQ reselections based on absolute priorities. The parameter $K_{carrier}$ is the number of NR inter-frequency carriers on licensed band and $K_{carrier_CCA}$ is the number of NR inter-frequency carriers on unlicensed band indicated by the serving cell. An inter-frequency cell is considered to be detectable according to the conditions defined in annex B.1.3A for a corresponding Band.

When higher priority cells are found by the higher priority search, they shall be measured at least every $T_{measure,NR_Inter_CCA}$. If after detecting a cell in a higher priority search, it is determined that reselection has not occurred then the UE is not required to continuously measure the detected cell to evaluate the ongoing possibility of reselection. However, the minimum measurement filtering requirements specified later in this clause shall still be met by the UE before it makes any determination that it may stop measuring the cell. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall measure SS-RSRP or SS-RSRQ at least every $K_{carrier} * T_{measure,NR_Inter} + K_{carrier_CCA} * T_{measure,NR_Inter_CCA}$ for identified lower or equal priority inter-frequency cells. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

For a cell that is already identified, after 2 unsuccessful measurement attempts due to exceeding the maximum number of SMTC occasions not available at the UE, the UE shall detect cells on any of the configured serving- and/or non-serving carriers.

The UE shall filter SS-RSRP or SS-RSRQ measurements of each measured higher, lower and equal priority inter-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,NR_Inter_CCA}/2$.

The UE shall not consider a NR neighbour cell in cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For an inter-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that the inter-frequency cell has met reselection criterion defined TS 38.304 [1] within $K_{carrier} * T_{evaluate,NR_Inter} + K_{carrier_CCA} * T_{evaluate,NR_Inter_CCA}$ when $T_{reselection} = 0$ as specified in table 4.2A.2.4-1 provided that the reselection criteria is met by

- the condition when performing equal priority reselection and

  when *rangeToBestCell* is not configured:

  - the cell is at least 5 dB better ranked in FR1 or 6.5 dB better ranked in FR2-2 or.

  when *rangeToBestCell* is configured:

  - the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value [1] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.

    - if there are multiple such cells, the cell has the highest rank among them

  - the cell is at least 5 dB better ranked in FR1 or 6.5 dB better ranked in FR2-2 if the current serving cell is among them. or

- 6 dB in FR1 or 7.5 dB in FR2-2 for SS-RSRP reselections based on absolute priorities or

- 4 dB in FR1 or 4 dB in FR2-2 for SS-RSRQ reselections based on absolute priorities.

When evaluating cells for reselection, the SSB side conditions apply to both serving and inter-frequency cells.

If $T_{reselection}$ timer has a non-zero value and the inter-frequency cell is satisfied with the reselection criteria, the UE shall evaluate this inter-frequency cell for the $T_{reselection}$ time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect that cell.

The UE is not expected to meet the measurement requirements for an inter-frequency carrier under DRX cycle=320 ms defined in table 4.2A.2.4-1 under the following conditions:

- $T_{SMTC_intra} = T_{SMTC_inter} = 160$ ms; where T_{SMTC_intra} and T_{SMTC_inter} are periodicities of the SMTC occasions configured for the intra-frequency carrier and the inter-frequency carrier respectively, and
- SMTC occasions configured for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the SMTC occasions configured for the intra-frequency carrier, and
- SMTC occasions configured for the intra-frequency carrier and for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the paging occasion [1].

Note 5: Applies for UE supporting FR2-2 power class 2&3. For UE supporting FR2-2 power class 1, N1 = 12 for all DRX cycle length.

The UE shall restart the measurements upon exceeding $M_{m,max}$, $M_{d,max}$, or $M_{e,max}$.

4.2A.2.5 Measurements of inter-RAT E-UTRAN cells when subject to CCA on the serving cell

The requirements in clause 4.2.2.5 shall apply.

4.2A.2.6 Maximum interruption in paging reception when subject to CCA on the target cell

UE shall perform the cell re-selection with minimum interruption in monitoring downlink channels for paging reception.

At intra-frequency and inter-frequency cell re-selection, the UE shall monitor the downlink of serving cell for paging reception until the UE is capable to start monitoring downlink channels of the target intra-frequency and inter-frequency cell for paging reception. The interruption time shall not exceed $T_{SI,CCA} + 2*T_{target_cell_SMTC_period}$.

At inter-RAT cell re-selection, the UE shall monitor the downlink of serving cell for paging reception until the UE is capable to start monitoring downlink channels for paging reception of the target inter-RAT cell. For NR to E-UTRAN cell re-selection the interruption time shall not exceed $T_{SI\text{-}EUTRA}$ + 55 ms.

T_{SI_CCA} is the time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks defined in TS 38.331 [2] for an NR cell.

$T_{SI\text{-}EUTRA}$ is the time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks defined in TS 36.331 [16] for an E-UTRAN cell.

These requirements assume sufficient radio conditions, so that decoding of system information can be made without errors and does not take into account cell re-selection failure.

4.2A.2.7 General requirements

The requirements in clause 4.2.2.7 shall apply.

4.2B Cell Re-selection for RedCap

4.2B.1 Introduction

The terms SSB and SMTC in this clause apply to CD-SSB only if not specified otherwise.

The 1 Rx RedCap UE for performing the cell reselection procedure [1] applies:

- *Qrxlevmin* as the signaled value of *Qrxlevmin* [2] -1 dB.
- *Qqualmin* as the signaled value of *Qqualmin* [2] -1 dB.

4.2B.2 Requirements

4.2B.2.1 UE measurement capability for RedCap

4.2B.2.1.1 UE measurement capability for 1 Rx RedCap

For idle mode cell re-selection purposes, and for UE supporting *IdleInactiveMeasurements-r16* or *idleInactiveEUTRA-MeasReport-r16*, the UE shall be capable of monitoring at least:

- Intra-frequency carrier, and
- Depending on UE capability, 6 NR inter-frequency carriers, and
- Depending on UE capability, 6 FDD E-UTRA inter-RAT carriers, and
- Depending on UE capability, 6 TDD E-UTRA inter-RAT carriers.

In addition to the requirements defined above, a UE supporting E-UTRA measurements in RRC_IDLE state shall be capable of monitoring a total of at least 11 carrier frequency layers, which includes serving layer, comprising of any above defined combination of E-UTRA FDD, E-UTRA TDD and NR layers.

4.2B.2.1.2 UE measurement capability for 2 Rx RedCap

The capability defined in section 4.2.2.1 apply for this section.

4.2B.2.2 Measurement and evaluation of serving cell for RedCap UE

The UE shall measure the SS-RSRP and SS-RSRQ level of the serving cell and evaluate the cell selection criterion S defined in TS 38.304 [1] for the serving cell at least once every M1*N1 DRX cycle; where:

- M1=2 if SMTC periodicity (T_{SMTC}) > 20 ms and DRX cycle $\leq$ 0.64 second,
- otherwise M1=1.

The UE shall filter the SS-RSRP and SS-RSRQ measurements of the serving cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by, at least eDRX_IDLE cycle/2, if the UE is configured with eDRX cycle $\leq$ 10.24 s; otherwise DRX cycle/2.

If the UE is not configured with eDRX_IDLE cycle and the UE has evaluated according to table 4.2B.2.2-1 for both 1Rx RedCap and 2Rx RedCap in N_{serv_RedCap} consecutive DRX cycles that the serving cell does not fulfil the cell selection criterion S, the UE shall initiate the measurements of all neighbour cells indicated by the serving cell,

regardless of the measurement rules currently limiting UE measurement activities. In this case the UE shall not relax measurements on any of the neighbour cells even if UE has fulfilled the criteria for meeting the relaxed measurement requirements defined clauses 4.2B.2.9.3, 4.2B.2.9.5, 4.2B.2.9.6, 4.2B.2.9.7, 4.2B.2.10.3, 4.2B.2.10.5, 4.2B.2.10.6, 4.2B.2.10.7, 4.2B.2.11.3, 4.2B.2.11.5, 4.2B.2.11.6, and 4.2B.2.11.7.

If the UE is configured with eDRX_IDLE cycle and has evaluated according to table 4.2B.2.2-2 or table 4.2B.2.2-3, in N_{serv_RedCap} consecutive eDRX cycles if eDRX_IDLE cycle $\leq$ 10.24 s, otherwise N_{serv_RedCap} consecutive DRX cycles within a single PTW that the serving cell does not fulfil the cell selection criterion S, the UE shall initiate the measurements of all neighbour cells indicated by the serving cell, regardless of the measurement rules currently limiting UE measurement activities. In this case the UE shall not relax measurements on any of the neighbour cells even if UE has fulfilled the criteria for meeting the relaxed measurement requirements defined clauses 4.2B.2.9.3, 4.2B.2.9.5, 4.2B.2.9.6, 4.2B.2.9.7, 4.2B.2.10.3, 4.2B.2.10.5, 4.2B.2.10.6, 4.2B.2.10.7, 4.2B.2.11.3, 4.2B.2.11.5, 4.2B.2.11.6, and 4.2B.2.11.7.

For the UE configured with eDRX_IDLE cycle, N_{serv_RedCap} is specified in table 4.2B.2.2-2 for 1 Rx RedCap and 2 Rx RedCap in FR1 and in table 4.2B.2.2-3 for FR2 for 2 Rx RedCap.

If the UE in RRC_IDLE has not found any new suitable cell based on searches and measurements using the intra-frequency, inter-frequency and inter-RAT information indicated in the system information during the time T, the UE shall initiate cell selection procedures for the selected PLMN as defined in TS 38.304 [1], where

- T= 10 s if the UE is not configured with eDRX_IDLE cycle, or
- T= MAX (10 s, one eDRX_IDLE cycle) if the UE is configured with eDRX_IDLE cycle in FR1, or
- T= MAX (10 s, N1* eDRX_IDLE cycle) if the UE is configured with eDRX_IDLE cycle less than 20.48 s in FR2,
- Otherwise, T= MAX (10 s, one eDRX_IDLE cycle) if the UE is configured with eDRX_IDLE cycle no less than 20.48 s in FR2

NOTE 1: Applies for RedCap UE of all FR2 power class.
NOTE 2: The number of DRX cycles in this table corresponds to the DRX cycles within PTWs, when PTW is configured.
NOTE 3: The eDRX_IDLE cycle lengths are as specified in section 10.5.5.32 of TS 24.008 [42].
NOTE 4: Number of eDRX cycles when eDRX_IDLE cycle length equals 2.56 s, 5.12 s and 10.24 s. Otherwise, number of DRX cycles.

NOTE 6: When eDRX=20.48 s and DRX=0.32 s, UE is allowed to perform cell evaluation within PTW in every 2 eDRX cycles.

For any requirement in this section, when the UE transitions between any two states when being configured with eDRX_IDLE, changing eDRX_IDLE cycle length, or changing PTW configuration, the UE shall meet the transition requirement, which is the less stringent requirement of the two requirements corresponding to the first state and the second state, during the transition time interval which is the time corresponding to the transition requirement. After the transition time interval, the UE shall meet the requirement corresponding to the second state.

4.2B.2.3 Measurements of intra-frequency NR cells for RedCap UE

The UE shall be able to identify new intra-frequency cells and perform SS-RSRP and SS-RSRQ measurements of the identified intra-frequency cells without an explicit intra-frequency neighbour list containing physical layer cell identities.

The UE shall be able to evaluate whether a newly detectable intra-frequency cell meets the reselection criteria defined in TS 38.304 [1] within $T_{detect,NR_Intra_RedCap}$ when that $T_{reselection}= 0$. An intra frequency cell is considered to be detectable according to the conditions defined in Annex B.1.4 for a corresponding Band.

The UE shall measure SS-RSRP and SS-RSRQ at least every $T_{measure,NR_Intra_RedCap}$ for intra-frequency cells that are identified and measured according to the measurement rules.

The UE shall filter SS-RSRP and SS-RSRQ measurements of each measured intra-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,NR_Intra_RedCap}/2$.

The UE shall not consider an NR neighbour cell for cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For an intra-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that the intra-frequency cell has met reselection criterion defined in TS 38.304 [1] within $T_{evaluate,NR_Intra_RedCap}$ when $T_{reselection}$ = 0 provided that:

when *rangeToBestCell* is not configured:

- the cell is at least 3 dB better ranked in FR1 or 4.5 dB better ranked in FR2 for 2 Rx RedCap.
- the cell is at least 4 dB better ranked in FR1 for 1 Rx RedCap.

when *rangeToBestCell* is configured:

- the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value in TS 38.304 [1] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.

- if there are multiple such cells, the cell has the highest rank among them.

  - the cell is at least 3 dB better ranked in FR1 or 4.5 dB better ranked in FR2 if the current serving cell is among them for 2 Rx RedCap.

  - the cell is at least 4 dB better ranked in FR1 if the current serving cell is among them for 1 Rx RedCap.

The 1 Rx RedCap UE applies *absThreshSS-BlocksConsolidation* as the signalled value of *absThreshSS-BlocksConsolidation* [2] + 1 dB.

When evaluating cells for reselection, the SSB side conditions apply to both serving and non-serving intra-frequency cells.

If the $T_{reselection}$ timer has a non-zero value and an intra-frequency cell satisfies the reselection criteria defined in TS 38.304 [1], the UE shall evaluate this intra-frequency cell for the $T_{reselection}$ time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect this cell.

For both 1Rx RedCap and 2Rx RedCap not configured with eDRX_IDLE cycle, $T_{detect,NR_Intra_RedCap}$, $T_{measure,NR_Intra_RedCap}$ and $T_{evaluate,NR_Intra_RedCap}$ are specified in table 4.2B.2.3-1

For 1 Rx RedCap and 2 Rx RedCap configured with eDRX_IDLE cycle, $T_{detect,NR_Intra_RedCap}$, $T_{measure,NR_Intra_RedCap}$ and $T_{evaluate,NR_Intra_RedCap}$ are specified in table 4.2B.2.3-2 and table 4.2B.2.3-3 for FR1 and FR2 respectively, where the requirements apply provided that the serving cell is configured with eDRX_IDLE and the DRX cycle length is same in all PTWs during any of $T_{detect,NR_Intra_RedCap}$, $T_{measure,NR_Intra_RedCap}$ and $T_{evaluate,NR_Intra_RedCap}$ when multiple PTWs are used.

NOTE 2: M2 = 1.5 if SMTC periodicity of measured intra-frequency cell > 20 ms; otherwise M2=1. During PSS/SSS detection, the periodicity of the SMTC configured for the intra-frequency carrier is assumed, and if the actual SSB transmission periodicity is greater than the SMTC configured for the intra-frequency carrier, longer $T_{detect,\ NR_intra_RedCap}$ is expected.

NOTE 1: Applies for RedCap UE of all power class.
NOTE 2: The number of DRX cycles in this table corresponds to the DRX cycles within PTWs, when PTW is configured.
NOTE 3: The eDRX_IDLE cycle lengths are as specified in section 10.5.5.32 of TS 24.008 [42].
NOTE 4: Number of eDRX cycles when eDRX_IDLE cycle length equals 2.56 s, 5.12 s and 10.24 s. Otherwise, number of DRX cycles.
NOTE 5: The lower bound of PTW length is derived based on $\left\lceil \frac{Tevaluate,NR_Intra_RedCap * DRX_cycle}{1.28} \right\rceil * 1.28$.
NOTE 6: When eDRX=20.48 s and DRX=0.32 s, UE is allowed to perform cell evaluation within PTW in every 2 eDRX cycles.

For any requirement in this section, when the UE transitions between any two states when being configured with eDRX_IDLE, changing eDRX_IDLE cycle length, or changing PTW configuration, the UE shall meet the transition requirement, which is the less stringent requirement of the two requirements corresponding to the first state and the second state, during the transition time interval which is the time corresponding to the transition requirement. After the transition time interval, the UE shall meet the requirement corresponding to the second state.

4.2B.2.4 Measurements of inter-frequency NR cells for RedCap UE

The UE shall be able to identify new inter-frequency cells and perform SS-RSRP or SS-RSRQ measurements of identified inter-frequency cells if carrier frequency information is provided by the serving cell, even if no explicit neighbour list with physical layer cell identities is provided.

If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$ then the UE shall search for inter-frequency layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2.2.7.

If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$ then the UE shall search for and measure inter-frequency layers of higher, equal, or lower priority in preparation for possible reselection. In this scenario, the minimum rate at which the UE is required to search for and measure higher priority layers shall be the same as that defined below in this clause.

The UE shall be able to evaluate whether a newly detectable inter-frequency cell meets the reselection criteria defined in TS 38.304 [1] within $K_{carrier_RedCap}$ * $T_{detect,NR_Inter_RedCap}$ if at least carrier frequency information is provided for inter-frequency neighbour cells by the serving cells when $T_{reselection}$ = 0 provided that the reselection criteria is met

For 2 Rx RedCap by a margin of at least

5 dB in FR1 or 6.5 dB in FR2 for reselections based on ranking or

6 dB in FR1 or 7.5 dB in FR2 for SS-RSRP reselections based on absolute priorities or

4 dB in FR1 and 4 dB in FR2 for SS-RSRQ reselections based on absolute priorities

For 1 Rx RedCap by a margin of at least

6 dB in FR1 for reselections based on ranking or

7 dB in FR1 for SS-RSRP reselections based on absolute priorities or

5 dB in FR1 for SS-RSRQ reselections based on absolute priorities.

The parameter $K_{carrier_RedCap}$ is the number of NR inter-frequency carriers indicated by the serving cell. An inter-frequency cell is considered to be detectable according to the conditions defined in Annex B.1.5 for a corresponding Band. When higher priority cells are found by the higher priority search, they shall be measured at least every $T_{measure,NR_Inter_RedCap}$. If, after detecting a cell in a higher priority search, it is determined that reselection has not occurred then the UE is not required to continuously measure the detected cell to evaluate the ongoing possibility of reselection. However, the minimum measurement filtering requirements specified later in this clause shall still be met by the UE before it makes any determination that it may stop measuring the cell. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall measure SS-RSRP or SS-RSRQ at least every $K_{carrier_RedCap} * T_{measure,NR_Inter_RedCap}$ for identified lower or equal priority inter-frequency cells. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall filter SS-RSRP or SS-RSRQ measurements of each measured higher, lower and equal priority inter-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,NR_Inter}/2$.

The UE shall not consider a NR neighbour cell in cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For an inter-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that the inter-frequency cell has met reselection criterion defined TS 38.304 [1] within $K_{carrier} * T_{evaluate,NR_Inter_RedCap}$ when $T_{reselection} = 0$ provided that the reselection criteria is met by

- the condition when performing equal priority reselection and
  - when *rangeToBestCell* is not configured:
    - the cell is at least 5 dB better ranked in FR1 or 6.5 dB better ranked in FR2 for 2 Rx RedCap.
    - the cell is at least 6 dB better ranked in FR1 for 1 Rx RedCap.
  - when *rangeToBestCell* is configured:
    - the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value defined in TS 38.304 [1] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.
      - if there are multiple such cells, the cell has the highest rank among them
      - the cell is at least 5 dB better ranked in FR1 or 6.5 dB better ranked in FR2 if the current serving cell is among them, or 6 dB in FR1 or 7.5 dB in FR2 for SS-RSRP reselections based on absolute priorities for 2 Rx RedCap or 4 dB in FR1 or 4 dB in FR2 for SS-RSRQ reselections based on absolute priorities for 2 Rx RedCap.
      - the cell is at least 6 dB better ranked in FR1 if the current serving cell is among them, or 7 dB in FR1 for SS-RSRP reselections based on absolute priorities or 5 dB in FR1 for SS-RSRQ reselections based on absolute priorities for 1 Rx RedCap.

The 1 Rx RedCap UE applies *absThreshSS-BlocksConsolidation* as the signalled value of *absThreshSS-BlocksConsolidation* [2] + 1 dB.

When evaluating cells for reselection, the SSB side conditions apply to both serving and inter-frequency cells.

If the $T_{reselection}$ timer has a non-zero value and the inter-frequency cell satisfies the reselection criteria, the UE shall evaluate this inter-frequency cell for the $T_{reselection}$ time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect this cell.

The UE is not expected to meet the measurement requirements for an inter-frequency carrier under DRX cycle=320 ms defined in table 4.2B.2.4-1 for both 1Rx RedCap and 2Rx RedCap under the following conditions:

- $T_{SMTC_intra} = T_{SMTC_inter} = 160$ ms; where T_{SMTC_intra} and T_{SMTC_inter} are periodicities of the SMTC occasions configured for the intra-frequency carrier and the inter-frequency carrier respectively, and

- SMTC occasions configured for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the SMTC occasions configured for the intra-frequency carrier, and

- SMTC occasions configured for the intra-frequency carrier and for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the paging occasion defined in TS 38.304 [1].

For 1 Rx RedCap and 2 Rx RedCap not configured with eDRX_IDLE cycle, $T_{detect,NR_Inter_RedCap}$, $T_{measure,NR_Inter_RedCap}$ and $T_{evaluate,NR_Inter_RedCap}$ are specified in table 4.2B.2.4.1-1.

For 1 Rx RedCap and 2 Rx RedCap configured with eDRX_IDLE cycle, $T_{detect,NR_Inter_RedCap}$, $T_{measure,NR_Inter_RedCap}$ and $T_{evaluate,NR_Inter_RedCap}$ are specified in table 4.2B.2.4-2 and table 4.2B.2.4-3 for FR1 and FR2 respectively. The requirements apply provided that the serving cell is configured with eDRX_IDLE and the DRX cycle length is same in all PTWs during any of $T_{detect,NR_Inter_RedCap}$, $T_{measure,NR_Inter_RedCap}$ and $T_{evaluate,NR_Inter_RedCap}$ when multiple PTWs are used.

4.2B.2.5 Measurements of inter-RAT E-UTRAN cells for RedCap UE

If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$ then the UE shall search for inter-RAT E-UTRAN layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2B.2.7.

If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$ then the UE shall search for and measure inter-RAT E-UTRAN layers of higher, lower priority in preparation for possible reselection. In this scenario, the minimum rate at which the UE is required to search for and measure higher priority inter-RAT E-UTRAN layers shall be the same as that defined below for lower priority RATs.

The requirements in this clause apply to inter-RAT E-UTRAN FDD measurements and E-UTRA TDD measurements. When the measurement rules indicate that inter-RAT E-UTRAN cells are to be measured, the UE shall measure RSRP and RSRQ of detected E-UTRA cells in the neighbour frequency list at the minimum measurement rate specified in this clause.

The parameter $N_{EUTRA_carrier_RedCap}$ is the total number of configured E-UTRA carriers in the neighbour frequency list. The UE shall filter RSRP and RSRQ measurements of each measured E-UTRA cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,EUTRAN_RedCap}/2$.

An inter-RAT E-UTRA cell is considered to be detectable provided the following conditions are fulfilled:

- the same conditions as for inter-frequency RSRP measurements specified in TS 36.133 [15], annex B.1.2, are fulfilled for a corresponding Band, and

- the same conditions as for inter-frequency RSRQ measurements specified in TS 36.133 [15], annex B.1.2, are fulfilled for a corresponding Band.

- SCH conditions specified in TS 36.133 [15], annex B.1.2, are fulfilled for a corresponding Band

The UE shall be able to evaluate whether a newly detectable inter-RAT E-UTRAN cell meets the reselection criteria defined in TS 38.304 [1] within ($N_{EUTRA_carrier_RedCap}$) * $T_{detect,EUTRAN_RedCap}$ when Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$ when $T_{reselection}$ = 0 provided that the reselection criteria are met by a margin of at least 6dB for RSRP reselections based on absolute priorities or 4dB for RSRQ reselections based on absolute priorities for 2 Rx RedCap and at least 6dB for RSRP reselections based on absolute priorities or 4dB for RSRQ reselections based on absolute priorities for 1 Rx RedCap.

Cells which have been detected shall be measured at least every ($N_{EUTRA_carrier_RedCap}$) * $T_{measure,EUTRAN_RedCap}$ when Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$.

When higher priority cells are found by the higher priority search, they shall be measured at least every $T_{measure,EUTRAN_RedCap}$. If, after detecting a cell in a higher priority search, it is determined that reselection has not occurred then the UE is not required to continuously measure the detected cell to evaluate the ongoing possibility of reselection. However, the minimum measurement filtering requirements specified later in this clause shall still be met by the UE before it makes any determination that it may stop measuring the cell.

If the UE detects on an inter-RAT E-UTRAN carrier, a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall not consider an inter-RAT E-UTRA cell in cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For a cell that has been already detected, but has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that an already identified inter-RAT E-UTRA cell has met reselection criterion defined in TS 38.304 [1] within ($N_{EUTRA_carrier_RedCap}$) * $T_{evaluate,EUTRAN_RedCap}$ when $T_{reselection}$ = 0 provided that the reselection criteria are met by a margin of at least 6 dB for RSRP reselections based on absolute priorities or 4 dB for RSRQ reselections based on absolute priorities for 2 Rx RedCap and at least 6 dB for RSRP reselections based on absolute priorities or 4 dB for RSRQ reselections based on absolute priorities for 1 Rx RedCap.

If the $T_{reselection}$ timer has a non-zero value and the inter-RAT E-UTRA cell satisfies the reselection criteria defined in TS 38.304 [1], the UE shall evaluate this E-UTRA cell for the $T_{reselection}$ time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect this cell.

For 1 Rx RedCap and 2 Rx RedCap configured with eDRX_IDLE cycle, $T_{detect,EUTRAN_RedCap}$, $T_{measure,EUTRAN_RedCap}$ and $T_{evaluate,\ E\text{-}UTRAN_RedCap}$ are specified in table 4.2B.2.5-2, where the requirements apply provided that the serving cell is configured with eDRX_IDLE and the DRX cycle length is the same in all PTWs during any of $T_{detect,EUTRAN_RedCap}$, $T_{measure,EUTRAN_RedCap}$ and $T_{evaluate,\ E\text{-}UTRAN_RedCap}$ when multiple PTWs are used.

4.2B.2.9.11 Measurements for UE fulfilling low mobility and not-at-cell edge criteria

This clause contains requirements for measurements on intra-frequency NR cells provided that:

- UE is configured with both *lowMobilityEvaluation* [2] criterion and *cellEdgeEvaluation* [2] criterion, and
- both criteria are fulfilled, and
- less than 1 hour have passed since measurements for cell reselection were performed

In this case the UE is not required to meet $T_{detect,NR_Intra_RedCap}$, $T_{measure,NR_Intra_RedCap}$ and $T_{evaluate,NR_Intra_RedCap}$ as defined in table 4.2B.2.3.

4.2B.2.10 Measurements of inter-frequency NR cells for UE configured with relaxed measurement criterion

4.2B.2.10.1 Introduction

This clause contains the requirements for measurements on inter-frequency NR cells when Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$ and when the UE is configured any of the following relaxed measurement criteria:

- Relaxed measurement criterion for a stationary UE defined in clause 5.2.4.9.3 in [1],
- Relaxed measurement criterion for a stationary UE not at cell edge defined in clause 5.2.4.9.4 in [1],
- Both low mobility criterion and stationary criterion as defined in clause 5.2.4.9.1 and 5.2.4.9.3 or 5.2.4.9.4 in [1] respectively.
- Relaxed measurement criterion for UE with low mobility defined in clause 5.2.4.9.1 in [1],
- Relaxed measurement criterion for UE not-at-cell edge defined in clause 5.2.4. 9.2 in [1],
- Both low mobility criterion and not-at-cell edge criterion as defined in clauses 5.2.4. 9.1 and 5.2.4.9.2 in [1] respectively.

4.2B.2.10.2 Measurements for UE fulfilling stationary criterion

This clause contains requirements for measurements on inter-frequency NR cells provided that:

- UE is configured with *stationaryMobilityEvaluation* [2] criterion and UE is not configured with *cellEdgeEvaluationWhileStationary* [2] criterion and UE has fulfilled the *stationaryMobilityEvaluation* [2] criterion, or

- UE is configured with both *stationaryMobilityEvaluation* [2] criterion and *cellEdgeEvaluationWhileStationary* [2] criterion and *combineRelaxedMeasCondition2* [2] is not configured, and UE has fulfilled only the *stationaryMobilityEvaluation* [2] criterion.

When Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$ then the requirements defined in clause 4.2B.2.4 apply for this clause except that:

- For a UE not configured with eDRX_IDLE, $T_{detect,NR_Inter_RedCap_Relax}$, $T_{measure,NR_Inter_RedCap_Relax}$ and $T_{evaluate,NR_Inter_RedCap_Relax}$ are as specified in table 4.2B.2.10.2-1 and table 4.2B.2.10.2-2 for 1 Rx RedCap and 2 Rx RedCap respectively.

- For a UE configured with eDRX_IDLE up to 10.24s, $T_{detect,NR_Inter_RedCap_Relax}$, $T_{measure,NR_Inter_RedCap_Relax}$ and $T_{evaluate,NR_Inter_RedCap_Relax}$ are as specified in table 4.2B.2.10.2-3 and table 4.2B.2.10.2-4 for 1 Rx RedCap and 2 Rx RedCap respectively.

- For a UE configured with eDRX_IDLE greater than 10.24 s, $T_{detect,NR_Inter_RedCap_Relax}$, $T_{measure,NR_Inter_RedCap_Relax}$ and $T_{evaluate,NR_Inter_RedCap_Relax}$ are as specified in table 4.2B.2.10.2-5 and table 4.2B.2.10.2-6 for 1 Rx RedCap and 2 Rx RedCap respectively, provided eDRX_IDLE cycle is ≤ [163.84] sec and evaluation/measurement time with relaxation on one carrier is not greater than single PTW window length.

When Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$ then the UE shall search for inter-frequency layers of higher priority at least every K2*$T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2.2.7 and, K2 = 240.

In this case the UE is not required to meet $T_{detect,NR_Inter_RedCap,}$ $T_{measure,NR_Inter_RedCap}$ and $T_{evaluate,NR_Inter_RedCap}$ as defined in clause 4.2B.2.4.

When Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$, the UE shall search for, measure and evaluate inter-frequency layers of higher, equal or lower priority at least every 1 hour.

4.2B.2.11.11 Measurements for UE fulfilling low mobility and not-at-cell edge criterion

This clause contains requirements for measurements on inter-RAT E-UTRAN cells provided that:

- UE is configured with both *lowMobilityEvalutation* [2] criterion and *cellEdgeEvaluation* [2] criterion, and both criteria are fulfilled, and

- less than 1 hour have passed since measurements for cell reselection were last performed,

In this case the UE is not required to meet $T_{detect,EUTRAN_RedCap}$, $T_{measure,EUTRAN_RedCap}$ and $T_{evaluate,EUTRAN_RedCap}$ as defined in clause 4.2B.2.5.

When Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$, the UE shall search for, measure and evaluate inter-RAT E-UTRAN layers of higher, equal or lower priority at least every 1 hour.

4.2C Cell Re-selection for NR UE for Satellite Access

4.2C.1 Introduction

The cell reselection procedure allows the UE to select a more suitable cell and camp on it.

When the UE is in either *Camped Normally* state or *Camped on Any Cell* state on a cell, the UE shall attempt to detect, synchronise, and monitor intra-frequency , inter-frequency and inter-RAT cells indicated by the serving cell. For intra-frequency ,inter-frequency and inter-RAT cells, the serving cell may provide explicit neighbour list, or only carrier frequency information and bandwidth information. UE measurement activity is also controlled by measurement rules defined in TS 38.304 [1], allowing the UE to limit its measurement activity.

For intra-frequency cell re-selection, requirements in 4.2C.2.3 apply.

For inter-frequency cell re-selection, when TN carrier is not configured, requirements specified in clause 4.2C.2.4 apply and when NTN carrier is configured, requirements specified in clause 4.2C.2.10 apply.

For inter-RAT cell re-selection, requirements in 4.2C.2.11 apply.

The requirements specified in clause 4.2C shall apply for the quasi-earth fixed cell and the earth moving cell.

The requirements specified in clause 4.2C apply to FR1-NTN and FR2-NTN as defined in TS 38.101-5 [43].

The requirements specified in clause 4.2C apply to FR2-NTN with the following assumption:

- no inter-satellite measurement is configured;
- single SAN Tx beam per radio cell in DL;
- same UE Rx beam is used for both serving and neighbouring cells which belong to the same satellite.

4.2C.2 Requirements

4.2C.2.1 UE measurement capability

For idle mode cell re-selection purposes, the UE shall be capable of monitoring at least:

- Intra-frequency carrier, and
- Depending on UE capability, 7 NR inter-frequency carriers,and
- Depending on UE capability, 7 FDD E-UTRAN inter-RAT carriers.

4.2C.2.2 Measurement and evaluation of serving cell

The UE shall measure the SS-RSRP and SS-RSRQ level of the serving cell and evaluate the cell selection criterion S defined in TS 38.304 [1] for the serving cell at least once every M1*N1 DRX cycle; where:

- M1=2 if SMTC periodicity (T_{SMTC}) > 20 ms and DRX cycle ≤ 0.64 second and N_{SMTC} =1, upon one SMTC configured at the UE,
- M1=2.5 if SMTC periodicity (T_{SMTC}) > 20 ms and DRX cycle ≤ 0.64 second and 1<N_{SMTC} ≤ 4,

- otherwise M1=1.

Where, N_{SMTC} is the number of SMTCs configured by SAN.

The UE shall filter the SS-RSRP and SS-RSRQ measurements of the serving cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by, at least DRX cycle/2.

If the UE has evaluated according to table 4.2C.2.2-1 in N_{serv} consecutive DRX cycles that the serving cell does not fulfil the cell selection criterion S, the UE shall initiate the measurements of all neighbour cells indicated by the serving cell, regardless of the measurement rules currently limiting UE measurement activities.

Additionally, if the UE is configured with '*t-service*' [2], the UE shall start measurements of the neighbour cells indicated by the serving cell before '*t-service*' is reached according to the requirements provided in clauses 4.2C.2.3 and 4.2C.2.4.

Also,

- if *distanceThresh* and *referenceLocation* are configured by the network [2] and the UE supports location-based measurement initiation and has obtained its location information, the UE shall initiate the measurements of all neighbour cells indicated by the serving cell if the distance between UE and the serving cell reference location – *referenceLocation* – is larger than *distanceThresh.* The requirements apply provided that the distance exceeds the *distanceThresh* by a margin of 50 m.

- if *distanceThresh* and *movingReferenceLocation* are configured by the network [2] and the UE supports location-based measurement initiation and has obtained its location information, the UE shall initiate the measurements of all neighbour cells indicated by the serving cell if the distance between UE and the serving cell moving reference location – *movingReferenceLocation* – is larger than *distanceThresh.* The requirements apply provided that the distance exceeds the *distanceThresh* by a margin of 80 m.

If the UE is not configured with'*t-Service*' [2] in the serving cell and if the UE in RRC_IDLE has not found any new suitable cell based on searches and measurements using the intra-frequency, inter-frequency and inter-RAT information indicated in the system information for 10 s, the UE shall initiate cell selection procedures for the selected PLMN as defined in TS 38.304 [1].

If the UE is configured with '*t-Service*' in the serving cell then the UE shall initiate cell selection procedures for the selected PLMN as defined in TS 38.304 [1] when any of the following conditions is fulfilled:

- If the UE in RRC_IDLE has not found any new suitable cell based on searches and measurements using the intra-frequency, inter-frequency and inter-RAT information indicated in the system information within 10 s since time instance T1 provided that '*t-Service*' > T1 or

- If the UE in RRC_IDLE has not found any new suitable cell based on searches and measurements using the intra-frequency, inter-frequency and inter-RAT information indicated in the system information within 10 s since the time instance '*t-Service*'.

- Where, T1 is the time instance in seconds when the UE has determined that the serving cell does not fulfil the cell selection criterion S.

Table 4.2C.2.2-1: N_{serv}

DRX cycle length [s]	Scaling Factor (N1)	N_{serv} [number of DRX cycles]
	FR1-NTN and FR2-NTN	
0.32	1	M1*N1*4
0.64		M1*N1*4
1.28		N1*2
2.56		N1*2
NOTE 1: The UE is not required to meet the requirements for 2.56 s DRX cycle length for earth-moving LEO deployment.		

4.2C.2.3 Measurements of intra-frequency NR cells

The UE shall be able to identify new intra-frequency cells and perform SS-RSRP and SS-RSRQ measurements of the identified intra-frequency cells without an explicit intra-frequency neighbour list containing physical layer cell identities.

If Srxlev > $S_{IntraSearchP}$ and Squal > $S_{IntraSearchQ}$, and the distance between UE and serving cell reference location or serving cell moving reference location is smaller than *distanceThresh* if the *distanceThresh* is configured (see TS 38.304[1]) and UE has location information, then the UE is not required to perform measurement of intra-frequency.

The UE shall be able to evaluate whether a newly detectable intra-frequency cell meets the reselection criteria defined in TS 38.304 [1] within $K_{multi_SMTC} * T_{detect,NR_Intra}$ when that $T_{reselection}$= 0 if the UE does not support *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] or if the *enhancedMeasurementNGSO-r17* is not enabled, or within $K_{multi_SMTC} * T_{detect,NR_Intra_enh}$ if the UE supports *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] and the *enhancedMeasurementNGSO-r17* is enabled. An intra frequency cell is considered to be detectable according to the conditions defined in annex B.1.6 for a corresponding Band.

The UE shall measure SS-RSRP and SS-RSRQ at least every $K_{multi_SMTC} * T_{measure,NR_Intra}$ (see table 4.2C.2.3-1) if the UE does not support *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] or if the *enhancedMeasurementNGSO-r17* is not enabled, or every $K_{multi_SMTC} * T_{measure,NR_Intra_enh}$ (see table 4.2C.2.3-2) if the UE supports *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] and the *enhancedMeasurementNGSO-r17* is enabled, for intra-frequency cells that are identified and measured according to the measurement rules.

The UE shall filter SS-RSRP and SS-RSRQ measurements of each measured intra-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,NR_Intra}/2$.

For UE in FR1-NTN-NTN:

If SMTCs do not overlap with each other,

- $K_{multi_SMTC} = 1$, if GEO satellites are measured on the carrier;
- $K_{multi_SMTC} = \left\lceil \frac{N_{LEO,i}}{N_{LEO,simul}} \right\rceil$, if LEO satellites are measured on the carrier;

- If SMTCs partially overlap with each other,
  - $K_{multi_SMTC} = N_{SMTC,overlap}$, if only GEO satellites are measured on the carrier;
  - $K_{multi_SMTC} = \sum_{i=1}^{N_{SMTC,overlap}} \left\lceil \frac{N_{LEO,i}}{N_{LEO,simul}} \right\rceil$, if only LEO satellites are measured on the carrier;

Where

- $N_{LEO,i}$ Is the number of LEO satellites to be measured within i-th SMTC,
- $N_{LEO,simul}$ Is the number of LEO satellites that UE can measure in parallel within an SMTC,
- $N_{SMTC,overlap}$ Is the number of SMTCs that partially overlap with each other.

Note: for deriving K_{multi_SMTC} for T_{detect,NR_Intra}, $T_{measure,NR_Intra}$ and $T_{evaluate,NR_Intra}$, two SMTCs are considered as overlapping if they overlap in one or more occasions during a single T_{detect,NR_Intra}, $T_{measure,NR_Intra}$ or $T_{evaluate,NR_Intra}$.

For UE in FR2-NTN, K_{multi_SMTC} = 1.

The parameter K_{multi_SMTC} is the scaling factor for measurements of multiple SMTCs which correspond to different satellites.

The UE shall not consider a NR neighbour cell in cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For an intra-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that the intra-frequency cell has met reselection criterion defined in TS 38.304 [1] within K_{multi_SMTC} * $T_{evaluate,NR_Intra}$ if the UE does not support *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] or if the *enhancedMeasurementNGSO-r17* is not enabled, or within K_{multi_SMTC} * $T_{evaluate,NR_Intra_enh}$ if the UE supports *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] and the *enhancedMeasurementNGSO-r17* is enabled, when $T_{reselection}$ = 0 as specified in table 4.2C.2.3-1 or table 4.2C.2.3-2 provided that:

- when *rangeToBestCell* is not configured:
- the cell is at least 3 dB better ranked in FR1-NTN or 4.5 dB better ranked in FR2.
- when *rangeToBestCell* is configured:
- the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value in TS 38.304 [1] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.
    - if there are multiple such cells, the cell has the highest rank among them.
        - the cell is at least 3 dB better ranked in FR1-NTN or 4.5 dB better ranked in FR2 if the current serving cell is among them.

When evaluating cells for reselection, the SSB side conditions apply to both serving and non-serving intra-frequency cells.

If $T_{reselection}$ timer has a nonzero value and the intra-frequency cell is satisfied with the reselection criteria which are defined in TS 38.304 [1], the UE shall evaluate this intra-frequency cell for the $T_{reselection}$ time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect that cell.

Where, N_{SMTC} is the number of SMTCs configured by SAN If different SMTC periodicities are configured for different cells, the SMTC periodicity in this note is the one used by the cell being identified. During PSS/SSS detection, the periodicity of the SMTC configured for the intra-frequency carrier is assumed, and if the actual SSB transmission periodicity is greater than the SMTC configured for the intra-frequency carrier, longer T_{detect, NR_intra} is expected.

If '*t-Service*' is broadcasted and applicable, UE shall be able to detect, measure, and evaluate neighbour cells before the serving cell stops serving the area regardless of whether the distance condition based on serving cell reference location or serving cell moving reference location is met or the legacy Srxlev/Squal condition are met, and when to start the detection, measurement and evaluation on neighbour cells is up to UE implementation. This requirement does not apply when the time span from the last slot of SI transmission within SI modification period where the broadcasting of the last updated value for t-Service is acquired by the UE for the first time to the first slot when the cell is scheduled to stop serving the area according to the broadcasted information is less than $T_{trigger}$.

$$T_{trigger} = \max(K_{multi_SMTC} * T_{detect,NR_Intra}, K_{multi_SMTC} * K_{carrier} * T_{detect,NR_Inter}),$$

where

- $K_{carrier}$ is the number of NR inter-frequency carriers indicated by the serving cell,
- T_{detect,NR_Intra} refers to intra-frequency cell detection delay in IDLE/INACTIVE mode defined in table 4.2C.2.3-2,
- T_{detect,NR_Inter} refers to inter-frequency cell detection delay in IDLE/INACTIVE mode defined in table 4.2C.2.4-2.

The requirements in this clause apply provided that the number of SMTCs for intra-frequency carrier does not exceed the *parallelSMTC-r17*, otherwise UE may select one or subset of all the configured SMTCs sequentially for performing the measurements until all of the SMTCs can be measured. The selection of SMTCs to be used is up to UE implementation, and in this case, measurement period longer than the corresponding measurement period specified in table 4.2C.2.3-1 and table 4.2C.2.3-2 is expected.

4.2C.2.4 Measurements of inter-frequency NR cells

The UE shall be able to identify new inter-frequency cells and perform SS-RSRP or SS-RSRQ measurements of identified inter-frequency cells if carrier frequency information is provided by the serving cell, even if no explicit neighbour list with physical layer cell identities is provided.

If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$, and the distance between UE and serving cell reference location or serving cell moving reference location is smaller than *distanceThresh* if *distanceThresh* is configured and UE has location information, then the UE shall search for inter-frequency layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2C.2.9.

If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$, or the distance between UE and serving cell reference location or serving cell moving reference location is larger than *distanceThresh* if *distanceThresh* is configured and UE has location information, then the UE shall search for and measure inter-frequency layers of higher, equal or lower priority in preparation for possible reselection. The requirements apply provided that the distance exceeds the *distanceThresh* by a margin of 50 m when *referenceLocation* is configured by the network or 80 m when *movingReferenceLocation* is configured by the network. In this scenario, the minimum rate at which the UE is required to search for and measure higher priority layers shall be the same as that defined below in this clause.

The UE shall be able to evaluate whether a newly detectable inter-frequency cell meets the reselection criteria defined in TS 38.304 [1] within $K_{carrier} * K_{multi_SMTC} * T_{detect,NR_Inter}$ if the UE does not support t *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] or if the *enhancedMeasurementNGSO-r17* is not enabled, or within $K_{carrier} * K_{multi_SMTC} * T_{detect,NR_Inter_enh}$ if the UE supports *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] and the *enhancedMeasurementNGSO-r17* is enabled, if at least carrier frequency information is provided for inter-frequency neighbour cells by the serving cells when $T_{reselection}$ = 0 provided that the reselection criteria is met by a margin of at least [5]dB in FR1-NTN for reselections based on ranking or [6]dB in FR1-NTN for SS-RSRP reselections based on absolute priorities or [4]dB in FR1-NTN for SS-RSRQ reselections based on absolute priorities. The parameter $K_{carrier}$ is the number of NR inter-frequency carriers indicated by the serving cell.

The parameter K_{multi_SMTC} is the scaling factor for measurement of multiple SMTCs or multiple satellites.

For FR2-NTN, K_{multi_SMTC} = 1.

For UE in FR1-NTN:

- If SMTCs do not overlap with each other,
  - $K_{multi_{SMTC}} = 1$, if GEO satellites are measured on the carrier;

- $K_{multi_{SMTC}} = \left\lceil \frac{N_{LEO,i}}{N_{LEO,simul}} \right\rceil$, if LEO satellites are measured on the carrier;

- If SMTCs partially overlap with each other,
  - $K_{multi_{SMTC}} = N_{SMTC,overlap}$, if only GEO satellites are measured on the carrier;
  - $K_{multi_{SMTC}} = \sum_{i=1}^{N_{SMTC,overlap}} \left\lceil \frac{N_{LEO,i}}{N_{LEO,simul}} \right\rceil$, if only LEO satellites are measured on the carrier;

  where

  $N_{LEO,i}$ is the number of LEO satellites to be measured within i-th SMTC,

  $N_{LEO,simul}$ is the number of LEO satellites that UE can measure in parallel within an SMTC,$N_{SMTC,overlap}$ is the number of SMTCs that partially overlap with each other.

NOTE: For deriving K_{multi_SMTC} for T_{detect,NR_Inter}, $T_{measure,NR_Inter}$ and $T_{evaluate,NR_Inter}$ of frequency layer *j*, two SMTCs are considered as overlapping if they overlap in one or more occasions during a single T_{detect,NR_Inter}, $T_{measure,NR_Inter}$ or $T_{evaluate,NR_Inter}$.

An inter-frequency cell is considered to be detectable according to the conditions defined in Annex B.1.7 for a corresponding Band.

When higher priority cells are found by the higher priority search, they shall be measured at least every $T_{measure,NR_Inter}$. If, after detecting a cell in a higher priority search, it is determined that reselection has not occurred then the UE is not required to continuously measure the detected cell to evaluate the ongoing possibility of reselection. However, the minimum measurement filtering requirements specified later in this clause shall still be met by the UE before it makes any determination that it may stop measuring the cell. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall measure SS-RSRP or SS-RSRQ at least every $K_{carrier} * K_{multi_SMTC} * T_{measure,NR_Inter}$ (see table 4.2C.2.4-1) if the UE does not support *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] or if the *enhancedMeasurementNGSO-r17* is not enabled, or every $K_{carrier} * K_{multi_SMTC} * T_{measure,NR_Inter_enh}$ (see table 4.2C.2.4-2) if the UE supports *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] and the *enhancedMeasurementNGSO-r17* is enabled, for identified lower or equal priority inter-frequency cells. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall filter SS-RSRP or SS-RSRQ measurements of each measured higher, lower and equal priority inter-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,NR_Inter}/2$.

The UE shall not consider a NR neighbour cell in cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For an inter-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that the inter-frequency cell has met reselection criterion defined TS 38.304 [1] within $K_{carrier} * K_{multi_SMTC} * T_{evaluate,NR_Inter}$ if the UE does not support *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] or if the *enhancedMeasurementNGSO-r17* is not enabled, or within $K_{carrier} * K_{multi_SMTC} * T_{evaluate,NR_Inter_enh}$ if the UE supports *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] and the *enhancedMeasurementNGSO-r17* is enabled, when $T_{reselection} = 0$ as specified in table 4.2C.2.4-1 provided that the reselection criteria is met by

- the condition when performing equal priority reselection and

  when *rangeToBestCell* is not configured:

  - the cell is at least [5]dB better ranked in FR1-NTN or.

  when *rangeToBestCell* is configured:

- the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value in TS 38.304 [1] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.
  - if there are multiple such cells, the cell has the highest rank among them
  - the cell is at least [5]dB better ranked in FR1-NTN if the current serving cell is among them. or

- [6]dB in FR1-NTN for SS-RSRP reselections based on absolute priorities or
- [4]dB in FR1-NTN for SS-RSRQ reselections based on absolute priorities.

When evaluating cells for reselection, the SSB side conditions apply to both serving and inter-frequency cells.

If $T_{reselection}$ timer has a non-zero value and the inter-frequency cell is satisfied with the reselection criteria, the UE shall evaluate this inter-frequency cell for the $T_{reselection}$ time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect that cell.

The UE is not expected to meet the measurement requirements for an inter-frequency carrier under DRX cycle=320 ms defined in table 4.2C.2.4-1 under the following conditions:

- $T_{SMTC_intra} = T_{SMTC_inter} = 160$ ms; where
  - T_{SMTC_intra} is the periodicity of the SMTC configured for the intra-frequency carrier if no identified intra-frequency cell is in the PCI list of *smtc2-LP* on this intra-frequency carrier; T_{SMTC_intra} is the periodicity of the *smtc2-LP* configured for the intra-frequency carrier if at least one identified intra-frequency cell is in the PCI list of *smtc2-LP* on this intra-frequency carrier. During PSS/SSS detection, the periodicity of the SMTC configured for the intra-frequency carrier is assumed for T_{SMTC_intra}. If the actual SSB transmission periodicity is greater than the SMTC configured for the intra-frequency carrier, longer T_{detect, NR_intra} is expected.
  - T_{SMTC_inter} is the actual SMTC periodicity used by the inter-frequency cell being identified. During PSS/SSS detection, the periodicity of the SMTC configured for the inter-frequency carrier is assumed for T_{SMTC_inter}. If the actual SSB transmission periodicity is greater than the SMTC configured for the inter-frequency carrier, longer T_{detect, NR_inter} is expected.
  - SMTC occasions configured for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the SMTC occasions configured for the intra-frequency carrier, and
  - SMTC occasions configured for the intra-frequency carrier and for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the paging occasion in TS 38.304 [1].

If *t-Service* is broadcasted and applicable, UE shall be able to detect, measure, and evaluate neighbour cells before the serving cell stops serving the area regardless of whether the distance condition based on serving cell reference location or serving cell moving reference location or the legacy Srxlev/Squal condition are met, and when to start detection, measurement, and evaluation is up to UE implementation. This requirement does not apply when the time span from the last slot of SI transmission within SI modification period where the broadcasting of the last updated value for t-Service is acquired by the UE for the first time to the first slot when the cell is scheduled to stop serving the area according to the broadcasted information is less than $T_{trigger}$, and $T_{trigger} = \max(K_{multi_SMTC}*T_{detect,NR_Intra}, K_{multi_SMTC}*K_{carrier}*T_{detect,NR_Inter})$ when serving cell is below the search threshold, and $T_{trigger} = \max(K_{multi_SMTC}*T_{detect,NR_Intra}, N_{layer}*$ [60 s]) when serving cell is above the search threshold, where

- $K_{carrier}$ is the number of NR inter-frequency carriers indicated by the serving cell,
- N_{layer} is the total number of higher priority NR carrier frequencies broadcasted in system information,
- T_{detect,NR_Intra} refers to HST intra-frequency cell detection delay in IDLE/INACTIVE mode defined table 4.2.2.3-2,
- T_{detect,NR_Inter} refers to HST inter-frequency cell detection delay in IDLE/INACTIVE mode defined table 4.2.2.4-2.

The requirements in this clause apply provided that the number of SMTCs for any inter-frequency carrier does not exceed the values indicated by *parallelSMTC-r17*, otherwise UE may select one or subset of all the configured SMTCs sequentially until all of the SMTCs can be measured, the selection of SMTCs to be used is up to UE implementation, and longer measurement delay than the corresponding measurement period specified in table 4.2C.2.4-1 and table 4.2C.2.4-2 is expected.

The requirements in this clause apply provided that the valid information for the satellite serving the target cell has been provided by the serving cell.

The requirements in this clause apply provided that SSB of neighbour cells are within the time shifted SMTC.

4.2C.2.5 Maximum interruption in paging reception

UE shall perform the cell re-selection with minimum interruption in monitoring downlink channels for paging reception.

At intra-frequency and inter-frequency cell re-selection, the UE shall monitor the downlink of serving cell for paging reception until the UE is capable to start monitoring downlink channels of the target intra-frequency and inter-frequency cell for paging reception. The interruption time shall not exceed $T_{SI-NR} + K*T_{target_cell_SMTC_period}$ ms.

At inter-frequency cell re-selection with TN carrier, the UE shall monitor the downlink of serving cell for paging reception until the UE is capable to start monitoring downlink channels of the target inter-frequency cell for paging reception. The interruption time shall not exceed $T_{SI-NR} + K*T_{target_cell_SMTC_period}$ ms.

At inter-RAT cell re-selection with TN carrier, the UE shall monitor the downlink of serving cell for paging reception until the UE is capable to start monitoring downlink channels for paging reception of the target inter-RAT cell. The interruption time must not exceed $T_{SI-EUTRA}$ + 55 ms.

Where,

If the target cell belongs to the same satellite as the current one, and if the target cell is known, then K = 2.

If the target cell belongs to a different satellite than the current one and the target cell's satellite is GEO, and if the target cell is known, then K = 2.

If the target cell belongs to a different satellite than the current one and the target cell's satellite is non-GEO, then K = 5 if the target cell is known.

If the target cell is NR cell with TN carrier, then K = 2.

$T_{target_cell_SMTC_period}$ is the periodicity of the SMTC occasions configured for the target NR cell. The SMTC periodicity is according to the physical cell ID of the target cell. If the target cell is in the PCI list of *smtc2-LP*, the SMTC periodicity follows *smtc2-LP*; otherwise, the SMTC periodicity follows *smtc*.

$T_{SI\text{-}NR}$ is the time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks defined in TS 38.331 [2] for an NR cell.

$T_{SI\text{-}EUTRA}$ is the time required for receiving all the relevant system information data according to the reception procedure and the RRC procedure delay of system information blocks defined in TS 36.331 [16] for an E-UTRAN cell.

The target cell is considered as known if it has been detectable during T_{detect,NR_Intra} or T_{detect,NR_Inter}, and the time span between SIB broadcasting cell stop time and the cell stop time is not less than Ttrigger. Otherwise, the target cell is considered as unknown, where T_{detect,NR_Intra}, T_{detect,NR_Inter} and Ttrigger are defined in clauses 4.2C.2.3 and 4.2C.2.4. A longer interruption can be expected if the target cell is unknown.

These requirements assume sufficient radio conditions, so that decoding of system information can be made without errors and does not take into account cell re-selection failure.

4.2C.2.6 Minimum requirement at transitions

The requirements in clause 4.2.2.8 apply provided that target cell's satellite is GEO.

4.2C.2.7 Measurements of intra-frequency NR cells for UE configured with relaxed measurement criterion

The requirements in clause 4.2.2.9 apply provided that target cell's satellite is GEO.

4.2C.2.8 Measurements of inter-frequency NR cells for UE configured with relaxed measurement criterion

The requirements in clause 4.2.2.10 apply provided that target cell's satellite is GEO.

4.2C.2.9 General requirements

The UE shall search every layer of higher priority at least every $T_{higher_priority_search} = (60 * N_{layers})$ seconds, where N_{layers} is the total number of higher priority NR carrier frequencies broadcasted in system information.

4.2C.2.10 Measurements of inter-frequency NR cells with TN carrier

This clause applies for the inter-frequency cell re-selection for TN carriers, and NTN carriers if configured. The requirements in clause 4.2C.2.10 apply provided that network provides SIB19 and UE is configured with and one or more TN carriers.

UE is allowed to skip TN neighbour cells measurement in an area where there is no coverage of the frequency based on the provided TN cell coverage information and UE GNSS position information. Otherwise, UE shall perform TN measurement if its estimated distance to *tn-ReferenceLocation* is smaller than *tn-DistanceRadius*. The requirements apply provided that the actual distance between UE to *tn-ReferenceLocation* is smaller than *tn-DistanceRadius* – 50m.This clause considers the inter-frequency cell reselection from NTN to TN in FR1-NTN.

The UE shall be able to identify new inter-frequency cells and perform SS-RSRP or SS-RSRQ measurements of identified inter-frequency cells if carrier frequency information is provided by the serving cell, even if no explicit neighbour list with physical layer cell identities is provided.

If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$, and the distance between UE and serving cell reference location is smaller than *distanceThresh* if *distanceThresh* is configured and UE has location information, then the UE shall search for inter-frequency layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2C.2.9.

If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$, or the distance between UE and serving cell reference location is larger than *distanceThresh* if *distanceThresh* is configured and UE has location information, then the UE shall search for and measure inter-frequency layers of higher, equal or lower priority in preparation for possible reselection. The requirements apply provided that the distance exceeds the *distanceThresh* by a margin of 50 m. In this scenario, the

minimum rate at which the UE is required to search for and measure higher priority layers shall be the same as that defined below in this clause.

The UE shall be able to evaluate whether a newly detectable inter-frequency cell meets the reselection criteria defined in TS 38.304 [1] within $K_{carrier_TN} * T_{detect,NR_Inter_TN} + K_{carrier} * K_{multi_SMTC} * T_{detect,NR_Inter_NTN}$ if the UE does not support Enhanced RRM requirements for measurements in IDLE and INACTIVE modes defined in TS 38.306 [14] or if the *enhancedMeasurementNGSO-r17* is not enabled, or within$K_{carrier_TN} * T_{detect,NR_Inter_TN} + K_{carrier} * K_{multi_SMTC} * T_{detect,NR_Inter_NTN_enh}$ if the UE supports Enhanced RRM requirements for measurements in IDLE and INACTIVE modes defined in TS 38.306 [14] and the *enhancedMeasurementNGSO-r17* is enabled, if at least carrier frequency information is provided for inter-frequency neighbour cells by the serving cells when $T_{reselection} = 0$ provided that the reselection criteria is met by a margin of at least [5]dB in FR1-NTN for reselections based on ranking or [6]dB in FR1-NTN for SS-RSRP reselections based on absolute priorities or [4]dB in FR1-NTN for SS-RSRQ reselections based on absolute priorities.

The parameter K_{multi_SMTC} is the scaling factor for measurement of multiple SMTCs or multiple satellites

- If SMTCs do not overlap with each other,
  - $K_{multi_{SMTC}} = 1$, if GEO satellites are measured on the carrier;
  - $K_{multi_{SMTC}} = \left\lceil \frac{N_{LEO,i}}{N_{LEO,simul}} \right\rceil$, if LEO satellites are measured on the carrier;
- If SMTCs partially overlap with each other,
  - $K_{multi_{SMTC}} = N_{SMTC,overlap}$, if only GEO satellites are measured on the carrier;
  - $K_{multi_{SMTC}} = \sum_{i=1}^{N_{SMTC,overlap}} \left\lceil \frac{N_{LEO,i}}{N_{LEO,simul}} \right\rceil$, if only LEO satellites are measured on the carrier;

  where

  $N_{LEO,i}$ is the number of LEO satellites to be measured within i-th SMTC,

  $N_{LEO,simul}$ is the number of LEO satellites that UE can measure in parallel within an SMTC,$N_{SMTC,overlap}$ is the number of SMTCs that partially overlap with each other.

NOTE: For deriving K_{multi_SMTC} for T_{detect,NR_Inter}, $T_{measure,NR_Inter}$ and $T_{evaluate,NR_Inter}$ of frequency layer *j*, two SMTCs are considered as overlapping if they overlap in one or more occasions during a single T_{detect,NR_Inter}, $T_{measure,NR_Inter}$ or $T_{evaluate,NR_Inter}$.

The parameter $K_{carrier_TN}$ is the number of NR TN inter-frequency carriers indicated by the serving cell, except for the frequency carrier where there is no coverage of that frequency based on the provide TN cell coverage information and UE GNSS position information.

T_{detect,NR_Inter_TN} ,$T_{measure,NR_Inter_TN}$ and $T_{evaluate,NR_Inter_TN}$ are the NR TN inter-frequency cell re-selection requirement defined in table 4.2.2.4-1 in TS 38.133

T_{detect,NR_Inter_NTN} ,$T_{measure,NR_Inter_NTN}$ and $T_{evaluate,NR_Inter_NTN}$ are the NR NTN inter-frequency cell re-selection requirement defined in table 4.2C.2.4-1 in TS 38.133.

$T_{detect,NR_Inter_NTN_enh}$, $T_{measure,NR_Inter_NTN_enh}$ and $T_{evaluate,NR_Inter_NTN_enh}$ are the NR NTN inter-frequency cell re-selection requirement defined in table 4.2C.2.4-2 in TS 38.133.

An inter-frequency cell is considered to be detectable according to the conditions defined in Annex B.1.7 for a corresponding band.

When higher priority cells are found by the higher priority search, they shall be measured at least every $T_{measure,NR_Inter}$. If, after detecting a cell in a higher priority search, it is determined that re-selection has not occurred then the UE is not required to continuously measure the detected cell to evaluate the ongoing possibility of re-selection. However, the minimum measurement filtering requirements specified later in this clause shall still be met by the UE before it makes any determination that it may stop measuring the cell. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall measure SS-RSRP or SS-RSRQ at least every $K_{carrier_TN} * T_{measure,NR_Inter_TN} + K_{carrier} * K_{multi_SMTC} * T_{measure,NR_Inter_NTN}$ (see table 4.2C.2.4-1) if the UE does not support Enhanced RRM requirements for measurements in IDLE and INACTIVE modes defined in TS 38.306 [14] or if the *enhancedMeasurementNGSO-r17* is not enabled, or every $K_{carrier_TN} * T_{measure,NR_Inter_TN} + K_{carrier} * K_{multi_SMTC} * T_{measure,NR_Inter_NTN_enh}$ (see table 4.2C.2.4-2) if the UE supports Enhanced RRM requirements for measurements in IDLE and INACTIVE modes defined in TS 38.306 [14] and the *enhancedMeasurementNGSO-r17* is enabled, for identified lower or equal priority inter-frequency cells. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall filter SS-RSRP or SS-RSRQ measurements of each measured higher, lower and equal priority inter-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,NR_Inter}/2$.

The UE shall not consider a NR neighbour cell in cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For an inter-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that the inter-frequency cell has met reselection criterion defined TS 38.304 [1] within $K_{carrier_TN} * T_{evaluate,NR_Inter_TN} + K_{carrier} * K_{multi_SMTC} * T_{evaluate,NR_Inter_NTN}$ if the UE does not support *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] or if the *enhancedMeasurementNGSO-r17* is not enabled, or within $K_{carrier_TN} * T_{evaluate,NR_Inter_TN} + K_{carrier} * K_{multi_SMTC} * T_{evaluate,NR_Inter_NTN_enh}$ if the UE supportsEnhanced RRM requirements for measurements in IDLE and INACTIVE modes defined in TS 38.306 [14] and the *enhancedMeasurementNGSO-r17* is enabled, when $T_{reselection} = 0$ as specified in table 4.2C.2.4-1 provided that the reselection criteria is met by

- the condition when performing equal priority reselection and

  when *rangeToBestCell* is not configured:

  - the cell is at least [5]dB better ranked in FR1-NTN or.

  when *rangeToBestCell* is configured:

  - the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value in TS 38.304 [1] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.

    - if there are multiple such cells, the cell has the highest rank among them

    - the cell is at least [5]dB better ranked in FR1-NTN if the current serving cell is among them. or

- [6]dB in FR1-NTN for SS-RSRP reselections based on absolute priorities or

- [4]dB in FR1-NTN for SS-RSRQ reselections based on absolute priorities.

When evaluating cells for reselection, the SSB side conditions apply to both serving and inter-frequency cells.

If $T_{reselection}$ timer has a non-zero value and the inter-frequency cell is satisfied with the reselection criteria, the UE shall evaluate this inter-frequency cell for the $T_{reselection}$ time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect that cell.

The UE is not expected to meet the measurement requirements for an inter-frequency carrier under DRX cycle=320 ms defined in table 4.2C.2.4-1 under the following conditions:

$T_{SMTC_intra} = T_{SMTC_inter} = 160$ ms; where

- T_{SMTC_intra} is the periodicity of the SMTC configured for the intra-frequency carrier if no identified intra-frequency cell is in the PCI list of *smtc2-LP* on this intra-frequency carrier; T_{SMTC_intra} is the periodicity of the *smtc2-LP* configured for the intra-frequency carrier if at least one identified intra-frequency cell is in the PCI list of *smtc2-LP* on this intra-frequency carrier. During PSS/SSS detection, the periodicity of the SMTC configured for the intra-frequency carrier is assumed for T_{SMTC_intra}. If the actual SSB transmission periodicity is greater than the SMTC configured for the intra-frequency carrier, longer $T_{detect,\ NR_intra}$ is expected.

- T_{SMTC_inter} is the actual SMTC periodicity used by the inter-frequency cell being identified. During PSS/SSS detection, the periodicity of the SMTC configured for the inter-frequency carrier is assumed for T_{SMTC_inter}. If the actual SSB transmission periodicity is greater than the SMTC configured for the inter-frequency carrier, longer T_{detect, NR_inter} is expected.

- SMTC occasions configured for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the SMTC occasions configured for the intra-frequency carrier, and

- SMTC occasions configured for the intra-frequency carrier and for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the paging occasion in TS 38.304 [1].

If *t-Service* is broadcasted and applicable, UE shall be able to detect, measure, and evaluate neighbour cells before the serving cell stops serving the area regardless of whether the distance condition based on serving cell reference location or the legacy Srxlev/Squal condition are met, and when to start detection, measurement, and evaluation is up to UE implementation. This requirement does not apply when the time span from the last slot of SI transmission within SI modification period where the broadcasting of the last updated value for t-Service is acquired by the UE for the first time to the first slot when the cell is scheduled to stop serving the area according to the broadcasted information is less than $T_{trigger}$, and $T_{trigger} = \max(T_{detect,NR_Intra}, K_{carrier} * T_{detect,NR_Inter})$ when serving cell is below the search threshold, and $T_{trigger} = \max(T_{detect,NR_Intra}, N_{layer} * [60s])$ when serving cell is above the search threshold, where

- $K_{carrier}$ is the number of NR inter-frequency carriers indicated by the serving cell,

- N_{layer} is the total number of higher priority NR carrier frequencies broadcasted in system information,

- T_{detect,NR_Intra} refers to HST intra-frequency cell detection delay in IDLE/INACTIVE mode defined table 4.2.2.3-2,

- T_{detect,NR_Inter} refers to HST inter-frequency cell detection delay in IDLE/INACTIVE mode defined table 4.2.2.4-2.

The requirements in this clause apply provided that the number of SMTCs for any inter-frequency carrier does not exceed the values indicated by *parallelSMTC-r17*, otherwise UE may select one or subset of all the configured SMTCs sequentially until all of the SMTCs can be measured, the selection of SMTCs to be used is up to UE implementation, and longer measurement delay than the corresponding measurement period specified in table 4.2C.2.4-1 and table 4.2C.2.4-2 is expected.

The requirements in this clause apply provided that the valid information for the satellite serving the target cell has been provided by the serving cell.

The requirements in this clause apply provided that SSB of neighbour cells are within the time shifted SMTC.

4.2C.2.11 Measurements of inter-RAT E-UTRAN cells with TN carrier

This clause applies for the inter-RAT cell re-selection for TN carriers. The requirements in clause 4.2C.2.11 apply provided that network provides SIB19 and UE is configured with and one or more TN carriers.

UE is allowed to skip TN neighbour cells measurement in an area where there is no coverage of the frequency based on the provided TN cell coverage information and UE GNSS position information. Otherwise, UE shall perform TN measurement if its estimated distance to tn-ReferenceLocation is smaller than tn-DistanceRadius. The requirements apply provided that the actual distance between UE to tn-ReferenceLocation is smaller than tn-DistanceRadius – 50m.This clause considers the inter-RAT cell reselection from NTN to E-UTRAN TN in FR1-NTN.

If $Srxlev > S_{nonIntraSearchP}$ and $Squal > S_{nonIntraSearchQ}$ then the UE shall search for inter-RAT E-UTRAN layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2.2.

If $Srxlev \leq S_{nonIntraSearchP}$ or $Squal \leq S_{nonIntraSearchQ}$ then the UE shall search for and measure inter-RAT E-UTRAN layers of higher, lower priority in preparation for possible reselection. In this scenario, the minimum rate at which the UE is required to search for and measure higher priority inter-RAT E-UTRAN layers shall be the same as that defined below for lower priority RATs.

The requirements in this clause apply to inter-RAT E-UTRAN FDD measurements and E-UTRA TDD measurements. When the measurement rules indicate that inter-RAT E-UTRAN cells are to be measured, the UE shall measure RSRP and RSRQ of detected E-UTRA cells in the neighbour frequency list at the minimum measurement rate specified in this clause.

The parameter $N_{EUTRA_carrier}$ is the number of EUTRA TN carriers indicated by the serving cell, except for the frequency carrier where there is no coverage of that frequency based on the provide TN cell coverage information and UE GNSS position information. The UE shall filter RSRP and RSRQ measurements of each measured E-UTRA cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least half the minimum specified measurement period.

An inter-RAT E-UTRA cell is considered to be detectable provided the following conditions are fulfilled:

- the same conditions as for inter-frequency RSRP measurements specified in TS 36.133 [15, Annex B.1.2] are fulfilled for a corresponding Band, and
- the same conditions as for inter-frequency RSRQ measurements specified in TS 36.133 [15, Annex B.1.2] are fulfilled for a corresponding Band.
- SCH conditions specified in TS 36.133 [15, Annex B.1.2] are fulfilled for a corresponding Band

The UE shall be able to evaluate whether a newly detectable inter-RAT E-UTRAN cell meets the reselection criteria defined in TS 38.304 [1] within $N_{EUTRA_carrier} * T_{detect,EUTRAN}$ when $Srxlev \leq S_{nonIntraSearchP}$ or $Squal \leq S_{nonIntraSearchQ}$ when $T_{reselection} = 0$ provided that the reselection criteria is met by a margin of at least 6dB for RSRP reselections based on absolute priorities or 4dB for RSRQ reselections based on absolute priorities.

Cells which have been detected shall be measured at least every $N_{EUTRA_carrier} * T_{measure,EUTRAN}$ when $Srxlev \leq S_{nonIntraSearchP}$ or $Squal \leq S_{nonIntraSearchQ}$.

When higher priority cells are found by the higher priority search, they shall be measured at least every $T_{measure,EUTRAN}$. If, after detecting a cell in a higher priority search, it is determined that reselection has not occurred then the UE is not required to continuously measure the detected cell to evaluate the ongoing possibility of reselection. However, the minimum measurement filtering requirements specified later in this clause shall still be met by the UE before it makes any determination that it may stop measuring the cell.

If the UE detects, on an inter-RAT E-UTRAN carrier, a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall not consider an inter-RAT E-UTRA cell in cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For a cell that has been already detected, but has not been reselected to, the filtering shall be such that a UE shall be capable of evaluating that an already identified inter-RAT E-UTRA cell has met reselection criterion defined in TS 38.304 [1] within $N_{EUTRA_carrier} * T_{evaluate,EUTRAN}$ when $T_{reselection} = 0$ as specified in table 4.2.2.5-1 provided that the reselection criteria is met by a margin of at least 6 dB for RSRP reselections based on absolute priorities or 4 dB for RSRQ reselections based on absolute priorities.

If the $T_{reselection}$ timer has a non-zero value and an inter-RAT E-UTRA cell satisfies the reselection criteria defined in TS 38.304 [1], the UE shall evaluate this E-UTRA cell for the $T_{reselection}$ time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect to this cell.

When the distance between the UE and tn-ReferenceLocation is larger than tn-DistanceRadius +50m, the UE is allowed to not perform measurements on the TN frequency in the corresponding area.

$T_{detect,EUTRAN}$, $T_{measure,EUTRAN}$ and $T_{evaluate,\ E\text{-}UTRAN}$ are specified in table 4.2.2.5-1.

4.2D Cell Re-selection for ATG

4.2D.1 Introduction

The cell reselection procedure allows the UE to select a more suitable cell and camp on it.

When the UE is in either *Camped Normally* state or *Camped on Any Cell* state on a cell, the UE shall attempt to detect, synchronise, and monitor intra-frequency and inter-frequency cells indicated by the serving cell. For intra-frequency and inter-frequency cells, the serving cell may provide explicit neighbour list, or only carrier frequency information and bandwidth information. UE measurement activity is also controlled by measurement rules defined in TS 38.304 [1], allowing the UE to limit its measurement activity.

In the requirements of clause 4.2D, the exceptions for side conditions apply as follows:

- for the UE capable of CA, the applicable exceptions for side conditions are specified in Annex B, clause B.3.2.1, for UE supporting CA in FR1.

4.2D.2 Requirements

4.2D.2.1 UE measurement capability

For idle mode cell re-selection purposes, the UE shall be capable of monitoring at least:

- Intra-frequency carrier, and
- Depending on UE capability, 7 NR inter-frequency carriers

4.2D.2.2 Measurement and evaluation of serving cell

The UE shall measure the SS-RSRP and SS-RSRQ level of the serving cell and evaluate the cell selection criterion S defined in TS 38.304 [1] for the serving cell at least once every M1*N1 DRX cycle; where:

- M1=2 if SMTC periodicity (T_{SMTC}) > 20 ms and DRX cycle $\leq$ 0.64 second,
- otherwise M1=1.

The UE shall filter the SS-RSRP and SS-RSRQ measurements of the serving cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by, at least DRX cycle/2.

If the UE has evaluated according to table 4.2D.2.2-1 in N_{serv} consecutive DRX cycles that the serving cell does not fulfil the cell selection criterion S, the UE shall initiate the measurements of all neighbour cells indicated by the serving cell, regardless of the measurement rules currently limiting UE measurement activities.

If the UE in RRC_IDLE has not found any new suitable cell based on searches and measurements using the intra-frequency and inter-frequency information indicated in the system information for 10 s, the UE shall initiate cell selection procedures for the selected PLMN as defined in TS 38.304 [1].

Table 4.2D.2.2-1: N_{serv}

DRX cycle length [s]	Scaling Factor (N1)	N_{serv} [number of DRX cycles]
	FR1	
0.32	N1[Note 1]	M1*N1*4
0.64		M1*N1*4
1.28		N1*2
2.56		N1*2
NOTE 1: For ATG UEs capable of *antennaArrayType-r18*, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4. Otherwise, N1 = 1.		

4.2D.2.3 Measurements of intra-frequency NR cells

The UE shall be able to identify new intra-frequency cells and perform SS-RSRP and SS-RSRQ measurements of the identified intra-frequency cells without an explicit intra-frequency neighbour list containing physical layer cell identities.

The UE shall be able to evaluate whether a newly detectable intra-frequency cell meets the reselection criteria defined in TS 38.304 [1] within T_{detect,NR_Intra} when that $T_{reselection}$= 0 . An intra-frequency cell is considered to be detectable according to the conditions defined in Annex B.1.2 for a corresponding Band.

The UE shall measure SS-RSRP and SS-RSRQ at least every $T_{measure,NR_Intra}$ (see table 4.2D.2.3-1) for intra-frequency cells that are identified and measured according to the measurement rules.

The UE shall filter SS-RSRP and SS-RSRQ measurements of each measured intra-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,NR_Intra}/2$.

The UE shall not consider a NR neighbour cell in cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For an intra-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that the intra-frequency cell has met reselection criterion defined in TS 38.304 [1] within $T_{evaluate,NR_Intra}$ when $T_{reselection}$ = 0 as specified in table 4.2D.2.3-1 provided that:

when *rangeToBestCell* is not configured:

- the cell is at least 3 dB better ranked in FR1.

when *rangeToBestCell* is configured:

- the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value in TS 38.304 [1] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.
    - if there are multiple such cells, the cell has the highest rank among them.
        - the cell is at least 3 dB better ranked in FR1 if the current serving cell is among them.

When evaluating cells for reselection, the SSB side conditions apply to both serving and non-serving intra-frequency cells.

If $T_{reselection}$ timer has a non-zero value and the intra-frequency cell is satisfied with the reselection criteria which are defined in TS 38.304 [1], the UE shall evaluate this intra-frequency cell for the $T_{reselection}$ time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect that cell.

T_{detect,NR_Intra}, $T_{measure,NR_Intra}$ and $T_{evaluate,\ NR_intra}$ are specified in table 4.2D.2.3-1. The requirements in this clause apply provided that SSB of neighbour cells are within SMTC window duration.

2.56		58.88 x N1 (23 x N1)	2.56 x N1 (1 x N1)	7.68 x N1 (3 x N1)

NOTE 1: For ATG UEs capable of *antennaArrayType-r18*, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4.
Otherwise, N1 = 1.

NOTE 2: M2 = 1.5 if SMTC periodicity of measured intra-frequency cell > 20 ms; otherwise M2=1. If different SMTC periodicities are configured for different cells, the SMTC periodicity in this note is the one used by the cell being identified. During PSS/SSS detection, the periodicity of the SMTC configured for the intra-frequency carrier is assumed, and if the actual SSB transmission periodicity is greater than the SMTC configured for the intra-frequency carrier, longer $T_{detect,\ NR_intra}$ is expected.

4.2D.2.4 Measurements of inter-frequency NR cells

The UE shall be able to identify new inter-frequency cells and perform SS-RSRP or SS-RSRQ measurements of identified inter-frequency cells if carrier frequency information is provided by the serving cell, even if no explicit neighbour list with physical layer cell identities is provided.

If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$ then the UE shall search for inter-frequency layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2D.2.6.

If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$ then the UE shall search for and measure inter-frequency layers of higher, equal or lower priority in preparation for possible reselection. In this scenario, the minimum rate at which the UE is required to search for and measure higher priority layers shall be the same as that defined below in this clause.

If at least carrier frequency information is provided for inter-frequency neighbour cells by the serving cells when $T_{reselection}$ = 0 provided that the reselection criteria is met by a margin of at least 5 dB in FR1 for reselections based on ranking or 6 dB in FR1 for SS-RSRP reselections based on absolute priorities or 4 dB in FR1 for SS-RSRQ reselections based on absolute priorities, the UE shall be able to evaluate whether a newly detectable inter-frequency cell meets the reselection criteria defined in TS 38.304 [1] within $K_{carrier}$ * T_{detect,NR_Inter_enh} as specified in table 4.2D.2.4-2 if UE indicates support of *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes for ATG* and is configured with *hs-ATG-cellReselectionSet-r18* for FR1, otherwise the UE shall be able to evaluate whether a newly detectable inter-frequency cell meets the reselection criteria defined in TS 38.304 [1] within $K_{carrier}$ * T_{detect,NR_Inter} as specified in table 4.2D.2.4-1. The parameter $K_{carrier}$ is the number of NR inter-frequency carriers indicated by the serving cell.

An inter-frequency cell is considered to be detectable according to the conditions defined in Annex B.1.3 for a corresponding Band.

When higher priority cells are found by the higher priority search, they shall be measured at least every $T_{measure,NR_Inter}$. If, after detecting a cell in a higher priority search, it is determined that reselection has not occurred then the UE is not required to continuously measure the detected cell to evaluate the ongoing possibility of reselection. However, the minimum measurement filtering requirements specified later in this clause shall still be met by the UE before it makes any determination that it may stop measuring the cell. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall measure SS-RSRP or SS-RSRQ at least every $K_{carrier}$ * $T_{measure,NR_Inter}$ for identified lower or equal priority inter-frequency cells. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall filter SS-RSRP or SS-RSRQ measurements of each measured higher, lower and equal priority inter-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,NR_Inter}$/2.

The UE shall not consider a NR neighbour cell in cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For an inter-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that the inter-frequency cell has met reselection criterion defined TS 38.304 [1] within $K_{carrier}$ * $T_{evaluate,NR_Inter}$ when $T_{reselection}$ = 0 as specified in table 4.2D.2.4-1, provided that the reselection criteria is met by

- the condition when performing equal priority reselection and
- when *rangeToBestCell* is not configured:
  - the cell is at least 5 dB better ranked in FR1 or.

  when *rangeToBestCell* is configured:
  - the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value in TS 38.304 [1] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.
    - if there are multiple such cells, the cell has the highest rank among them

- the cell is at least 5 dB better ranked in FR1 if the current serving cell is among them. or

- 6 dB in FR1 for SS-RSRP reselections based on absolute priorities or

- 4 dB in FR1 for SS-RSRQ reselections based on absolute priorities.

When evaluating cells for reselection, the SSB side conditions apply to both serving and inter-frequency cells.

If $T_{reselection}$ timer has a non-zero value and the inter-frequency cell is satisfied with the reselection criteria, the UE shall evaluate this inter-frequency cell for the $T_{reselection}$ time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect that cell.

The UE is not expected to meet the measurement requirements for an inter-frequency carrier under DRX cycle=320 ms defined in table 4.2D.2.4-1 and table 4.2D.2.4-2 under the following conditions:

- $T_{SMTC_intra} = T_{SMTC_inter} = 160$ ms; where

  - T_{SMTC_intra} is the periodicity of the SMTC configured for the intra-frequency carrier if no identified intra-frequency cell is in the PCI list of *smtc2-LP* on this intra-frequency carrier; T_{SMTC_intra} is the periodicity of the *smtc2-LP* configured for the intra-frequency carrier if at least one identified intra-frequency cell is in the PCI list of *smtc2-LP* on this intra-frequency carrier. During PSS/SSS detection, the periodicity of the SMTC configured for the intra-frequency carrier is assumed for T_{SMTC_intra}. If the actual SSB transmission periodicity is greater than the SMTC configured for the intra-frequency carrier, longer T_{detect, NR_intra} is expected.

  - T_{SMTC_inter} is the actual SMTC periodicity used by the inter-frequency cell being identified. During PSS/SSS detection, the periodicity of the SMTC configured for the inter-frequency carrier is assumed for T_{SMTC_inter}. If the actual SSB transmission periodicity is greater than the SMTC configured for the inter-frequency carrier, longer T_{detect, NR_inter} is expected.

- SMTC occasions configured for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the SMTC occasions configured for the intra-frequency carrier, and

- SMTC occasions configured for the intra-frequency carrier and for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the paging occasion in TS 38.304 [1].

The requirements in this clause apply provided that SSB of neighbour cells are within SMTC window duration.

4.2D.2.5 Maximum interruption in paging reception

The requirements in clause 4.2.2.6 shall apply without considering inter-RAT cell re-selection.

4.2D.2.6 General requirements

The UE shall search every layer of higher priority at least every $T_{higher_priority_search} = (60 * N_{layers})$ seconds, where N_{layers} is the total number of higher priority NR carrier frequencies broadcasted in system information.

4.2E Cell Re-selection for NR RedCap UE with Satellite Access

4.2E.1 Introduction

The cell reselection procedure allows the UE to select a more suitable cell and camp on it.

When the RedCap UE is in either *Camped Normally* state or *Camped on Any Cell* state on a cell, the RedCap UE shall attempt to detect, synchronize, and monitor intra-frequency , inter-frequency and inter-RAT cells indicated by the serving cell. For intra-frequency, inter-frequency and inter-RAT cells, the serving cell may provide explicit neighbour list, or only carrier frequency information and bandwidth information. RedCap UE measurement activity is also controlled by measurement rules defined in TS 38.304 [1], allowing the RedCap UE to limit its measurement activity.

For intra-frequency cell re-selection, requirements defined in clause 4.2E.2.3 apply.

For inter-frequency cell re-selection, when TN carrier is not configured, requirements specified in clause 4.2E.2.4 apply and when NTN carrier is configured, requirements specified in clause 4.2E.2.10 apply.

For inter-RAT cell re-selection, requirements defined in clause 4.2E.2.11 apply.

The requirements specified in clause 4.2E shall apply for the quasi-earth fixed cell and the earth moving cell.

The requirements specified in clause 4.2E apply to FR1-NTN as defined in TS 38.101-5 [43].

The terms SSB and SMTC in this clause apply to CD-SSB only if not specified otherwise.

The 1 Rx RedCap UE for performing the cell reselection procedure [1] applies:

- *Qrxlevmin* as the signaled value of *Qrxlevmin* [2] -1 dB.
- *Qqualmin* as the signaled value of *Qqualmin* [2] -1 dB.

4.2E.2 Requirements for RedCap UE with Satellite Access

4.2E.2.1 UE measurement capability for RedCap with Satellite Access

4.2E.2.1.1 UE measurement capability for 1Rx RedCap UEs

For idle mode cell re-selection purposes, the UE shall be capable of monitoring at least:

- Intra-frequency carrier, and
- Depending on UE capability, 6 NR inter-frequency carriers.

4.2E.2.1.2 UE measurement capability for 2Rx RedCap UEs

The capability defined in section 4.2C.2.1 shall apply.

4.2E.2.2 Measurement and evaluation of serving cell for RedCap UEs

The RedCap UE shall measure the SS-RSRP and SS-RSRQ level of the serving cell and evaluate the cell selection criterion S defined in TS 38.304 [1] for the serving cell at least once every M1*N1 DRX cycle; where:

- M1=2 if SMTC periodicity (T_{SMTC}) > 20 ms and DRX cycle ≤ 0.64 second and N_{SMTC} =1, upon one SMTC configured at the UE,

- M1=2.5 if SMTC periodicity (T_{SMTC}) > 20 ms and DRX cycle ≤ 0.64 second and 1<N_{SMTC} ≤ 4,

- otherwise M1=1.

Where, N_{SMTC} is the number of SMTCs configured by SAN.

The UE shall filter the SS-RSRP and SS-RSRQ measurements of the serving cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by, at least eDRX_IDLE cycle/2, when the RedCap UE is configured with eDRX cycle ≤10.24s; otherwise, DRX cycle/2.

If the UE is not configured with eDRX_IDLE cycle and the UE has evaluated according to table 4.2C.2.2-1 (only FR1) for both 1Rx RedCap and 2Rx RedCap in N_{serv_RedCap} consecutive DRX cycles that the serving cell does not fulfil the cell selection criterion S, the UE shall initiate the measurements of all neighbour cells indicated by the serving cell, regardless of the measurement rules currently limiting UE measurement activities. In this case the UE shall not relax measurements on any of the neighbour cells even if UE has fulfilled the criteria for meeting the relaxed measurement requirements defined clauses 4.2E.2.7 and 4.2E.2.8.

If the UE is configured with eDRX_IDLE cycle and has evaluated according to table 4.2X.2.2-1, in N_{serv_RedCap} consecutive eDRX cycles, the UE shall initiate the measurements of all neighbour cells indicated by the serving cell, regardless of the measurement rules currently limiting UE measurement activities. In this case the UE shall not relax measurements on any of the neighbour cells even if UE has fulfilled the criteria for meeting the relaxed measurement requirements defined clauses 4.2E.2.7 and 4.2E.2.8.

For the UE configured with eDRX_IDLE cycle, N_{serv_RedCap} is specified in table 4.2X.2.2-1 for 1 Rx RedCap and 2 Rx RedCap in FR1.Additionally, if the UE is configured with '*t-service*' [2], the UE shall start measurements of the neighbour cells indicated by the serving cell before '*t-service*' is reached according to the requirements provided in clauses 4.2E.2.3 and 4.2E.2.4.
Also,

- if *distanceThresh* and *referenceLocation* are configured by the network [2] and the UE supports location-based measurement initiation and has obtained its location information, the UE shall initiate the measurements of all neighbour cells indicated by the serving cell if the distance between UE and the serving cell reference location – *referenceLocation* – is larger than *distanceThresh.* The requirements apply provided that the distance exceeds the *distanceThresh* by a margin of 50 m.

- if *distanceThresh* and *movingReferenceLocation* are configured by the network [2] and the UE supports location-based measurement initiation and has obtained its location information, the UE shall initiate the measurements of all neighbour cells indicated by the serving cell if the distance between UE and the serving cell moving reference location – *movingReferenceLocation* – is larger than *distanceThresh.* The requirements apply provided that the distance exceeds the *distanceThresh* by a margin of 80 m.

If the UE is not configured with'*t-Service*' [2] in the serving cell and if the UE in RRC_IDLE has not found any new suitable cell based on searches and measurements using the intra-frequency, inter-frequency and inter-RAT information indicated in the system information during the time T, the UE shall initiate cell selection procedures for the selected PLMN as defined in TS 38.304 [1], where

- T= 10 s if the UE is not configured with eDRX_IDLE cycle, or

- T= MAX (10 s, one eDRX_IDLE cycle) if the UE is configured with eDRX_IDLE cycle in FR1

If the UE is configured with '*t-Service*' in the serving cell then the UE shall initiate cell selection procedures for the selected PLMN as defined in TS 38.304 [1] when any of the following conditions is fulfilled:

- If the UE in RRC_IDLE has not found any new suitable cell based on searches and measurements using the intra-frequency, inter-frequency and inter-RAT information indicated in the system information within T since time instance T1 provided that '*t-Service*' > T1 or

- If the UE in RRC_IDLE has not found any new suitable cell based on searches and measurements using the intra-frequency, inter-frequency and inter-RAT information indicated in the system information within T since the time instance '*t-Service*'.

- Where, T1 is the time instance in seconds when the UE has determined that the serving cell does not fulfil the cell selection criterion S.

4.2E.2.3 Measurements of intra-frequency NR cells for RedCap UE

The UE shall be able to identify new intra-frequency cells and perform SS-RSRP and SS-RSRQ measurements of the identified intra-frequency cells without an explicit intra-frequency neighbour list containing physical layer cell identities.

If Srxlev > $S_{IntraSearchP}$ and Squal > $S_{IntraSearchQ}$, and the distance between UE and serving cell reference location or serving cell moving reference location is smaller than *distanceThresh* if the *distanceThresh* is configured (see TS 38.304[1]) and UE has location information, then the UE is not required to perform measurement of intra-frequency.

The UE shall be able to evaluate whether a newly detectable intra-frequency cell meets the reselection criteria defined in TS 38.304 [1] within $K_{multi_SMTC} * T_{detect,NR_Intra}$ when that $T_{reselection}$= 0 if the UE does not support *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] or if the *enhancedMeasurementNGSO-r17* is not enabled, or within $K_{multi_SMTC} * T_{detect,NR_Intra_enh}$ if the UE supports *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] and the *enhancedMeasurementNGSO-r17* is enabled. An intra-frequency cell is considered to be detectable according to the conditions defined in annex B.1.6 for a corresponding Band.

The UE shall measure SS-RSRP and SS-RSRQ at least every $K_{multi_SMTC} * T_{measure,NR_Intra}$ if the UE does not support *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] or if the *enhancedMeasurementNGSO-r17* is not enabled, or every $K_{multi_SMTC} * T_{measure,NR_Intra_enh}$ if the UE supports *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] and the *enhancedMeasurementNGSO-r17* is enabled, for intra-frequency cells that are identified and measured according to the measurement rules.The UE shall filter SS-RSRP and SS-RSRQ measurements of each measured intra-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,NR_Intra}/2$. The UE shall not consider an NR neighbour cell for cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For UE in FR1-NTN:

If SMTCs do not overlap with each other,

- $K_{multi_SMTC} = 1$, if GEO satellites are measured on the carrier;
- $K_{multi_SMTC} = \left\lceil \frac{N_{LEO,i}}{N_{LEO,simul}} \right\rceil$, if LEO satellites are measured on the carrier;

- If SMTCs partially overlap with each other,
  - $K_{multi_SMTC} = N_{SMTC,overlap}$, if only GEO satellites are measured on the carrier;
  - $K_{multi_SMTC} = \sum_{i=1}^{N_{SMTC,overlap}} \left\lceil \frac{N_{LEO,i}}{N_{LEO,simul}} \right\rceil$, if only LEO satellites are measured on the carrier;

Where

- $N_{LEO,i}$ is the number of LEO satellites to be measured within i-th SMTC,
- $N_{LEO,simul}$ is the number of LEO satellites that UE can measure in parallel within an SMTC,
- $N_{SMTC,overlap}$ is the number of SMTCs that partially overlap with each other.

Note: for deriving K_{multi_SMTC} for T_{detect,NR_Intra}, $T_{measure,NR_Intra}$ and $T_{evaluate,NR_Intra}$, two SMTCs are considered as overlapping if they overlap in one or more occasions during a single T_{detect,NR_Intra}, $T_{measure,NR_Intra}$ or $T_{evaluate,NR_Intra}$.

The parameter K_{multi_SMTC} is the scaling factor for measurements of multiple SMTCs which correspond to different satellites.

For an intra-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that the intra-frequency cell has met reselection criterion defined in TS 38.304 [1] within $K_{multi_SMTC} * T_{evaluate,NR_Intra}$ if the UE does not support *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] or if the *enhancedMeasurementNGSO-r17* is not enabled, or within $K_{multi_SMTC} * T_{evaluate,NR_Intra_enh}$ if the UE supports *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] and the *enhancedMeasurementNGSO-r17* is enabled, when $T_{reselection} = 0$ as specified in table 4.2C.2.3-1(with FR1), table 4.2E.2.3-1 or table 4.2E.2.3-2 provided that:

- when *rangeToBestCell* is not configured:
- the cell is at least 3 dB better ranked in FR1 for 2Rx RedCap, or
- the cell is at least 4 dB better ranked in FR1 for 1Rx RedCap.
- when *rangeToBestCell* is configured:
- the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value in TS 38.304 [1] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.
  - if there are multiple such cells, the cell has the highest rank among them.
    - the cell is at least 3 dB better ranked in FR1 if the current serving cell is among them for 2 Rx RedCap.
    - the cell is at least 4 dB better ranked in FR1 if the current serving cell is among them for 1 Rx RedCap.

The 1 Rx RedCap UE applies *absThreshSS-BlocksConsolidation* as the signalled value of *absThreshSS-BlocksConsolidation* [2] + 1 dB.

When evaluating cells for reselection, the SSB side conditions apply to both serving and non-serving intra-frequency cells.

If $T_{reselection}$ timer has a nonzero value and the intra-frequency cell is satisfied with the reselection criteria which are defined in TS 38.304 [1], the UE shall evaluate this intra-frequency cell for the $T_{reselection}$ time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect that cell.

For both 1Rx RedCap and 2Rx RedCap not configured with eDRX_IDLE cycle, $T_{detect,NR_Intra_RedCap}$, $T_{measure,NR_Intra_RedCap}$ and $T_{evaluate,NR_Intra_RedCap}$ are specified in table 4.2C.2.3-1.

For 1 Rx RedCap and 2 Rx RedCap configured with eDRX_IDLE cycle, $T_{detect,NR_Intra_RedCap}$, $T_{measure,NR_Intra_RedCap}$ and $T_{evaluate,NR_Intra_RedCap}$ are specified in table 4.2X.2.3-1 for FR1, where the requirements apply provided that the serving cell is configured with eDRX_IDLE.

For both 1Rx RedCap and 2Rx RedCap, $T_{detect,NR_Intra_enh_RedCap}$,$T_{measure,NR_Intra_enh_RedCap}$ and $T_{evaluate,NR_Intra_enh_RedCap}$ are defined in table 4.2E.2.3-2.

The parameter $K_{multi_SMTC,i}$ is the scaling factor for measurement of multiple SMTCs or multiple satellites, which refers to clause 4.2C.2.3.

For any requirement in this section, when the UE transitions between any two states when being configured with eDRX_IDLE, changing eDRX_IDLE cycle length, the UE shall meet the transition requirement, which is the less stringent requirement of the two requirements corresponding to the first state and the second state, during the transition time interval which is the time corresponding to the transition requirement. After the transition time interval, the UE shall meet the requirement corresponding to the second state.

If '*t-Service*' is broadcasted and applicable, UE shall be able to detect, measure, and evaluate neighbour cells before the serving cell stops serving the area regardless of whether the distance condition based on serving cell reference location or serving cell moving reference location is met or the legacy Srxlev/Squal condition are met, and when to start the detection, measurement and evaluation on neighbour cells is up to UE implementation. This requirement does not apply when the time span from the last slot of SI transmission within SI modification period where the broadcasting of the last updated value for t-Service is acquired by the UE for the first time to the first slot when the cell is scheduled to stop serving the area according to the broadcasted information is less than $T_{trigger}$.

$$T_{trigger} = \max(K_{multi_SMTC} * T_{detect,NR_Intra}, K_{multi_SMTC} * K_{carrier} * T_{detect,NR_Inter}),$$

where

- $K_{carrier}$ is the number of NR inter-frequency carriers indicated by the serving cell,
- $T_{detect,NR_Intra_RedCap}$ refers to intra-frequency cell detection delay in IDLE/INACTIVE mode defined in tables 4.2C.2.3-1(with FR1) and 4.2E.2.3-1,
- $T_{detect,NR_Inter_RedCap}$ refers to inter-frequency cell detection delay in IDLE/INACTIVE mode defined in table 4.2C.2.4-1(with FR1) and 4.2E.2.4-1.

The requirements in this clause apply provided that the number of SMTCs for intra-frequency carrier does not exceed the *parallelSMTC-r17*, otherwise UE may select one or subset of all the configured SMTCs sequentially for performing the measurements until all of the SMTCs can be measured. The selection of SMTCs to be used is up to UE implementation, and in this case, measurement period longer than the corresponding measurement period specified in tables 4.2C.2.3-1 (with FR1), 4.2E.2.3-1 and table 4.2E.2.3-2 is expected.

4.2E.2.4 Measurements of inter-frequency NR cells for RedCap UE

The UE shall be able to identify new inter-frequency cells and perform SS-RSRP or SS-RSRQ measurements of identified inter-frequency cells if carrier frequency information is provided by the serving cell, even if no explicit neighbour list with physical layer cell identities is provided.

If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$, and the distance between UE and serving cell reference location or serving cell moving reference location is smaller than *distanceThresh* if *distanceThresh* is configured and UE has location information, then the UE shall search for inter-frequency layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2E.2.9.

If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$, or the distance between UE and serving cell reference location or serving cell moving reference location is larger than *distanceThresh* if *distanceThresh* is configured and UE has location information, then the UE shall search for and measure inter-frequency layers of higher, equal or lower priority in preparation for possible reselection. The requirements apply provided that the distance exceeds the *distanceThresh* by a margin of 50 m when *referenceLocation* is configured by the network or 80 m when *movingReferenceLocation* is configured by the network. In this scenario, the minimum rate at which the UE is required to search for and measure higher priority layers shall be the same as that defined below in this clause.

The UE shall be able to evaluate whether a newly detectable inter-frequency cell meets the reselection criteria defined in TS 38.304 [1] within $K_{carrier} * K_{multi_SMTC} * T_{detect,NR_{Inter_RedCap}}$ if the UE does not support t *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] or if the *enhancedMeasurementLEO-r17* is not enabled, or within $K_{carrier} * K_{multi_SMTC} * T_{detect,NR_Inter_RedCap_enh}$ if the UE supports *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] and the *enhancedMeasurementLEO-r17* is enabled, if at least carrier frequency information is provided for inter-frequency neighbour cells by the serving cells when $T_{reselection}$ = 0 provided that the reselection criteria is met:

For 2 Rx RedCap by a margin of at least

5 dB in FR1 for reselections based on ranking or

6 dB in FR1 for SS-RSRP reselections based on absolute priorities or

4 dB in FR1 for SS-RSRQ reselections based on absolute priorities

For 1 Rx RedCap by a margin of at least

6 dB in FR1 for reselections based on ranking or

7 dB in FR1 for SS-RSRP reselections based on absolute priorities or

5 dB in FR1 for SS-RSRQ reselections based on absolute priorities.

The parameter $K_{carrier}$ is the number of NR inter-frequency carriers indicated by the serving cell.

The parameter K_{multi_SMTC} is the scaling factor for measurement of multiple SMTCs or multiple satellites, which refers to clause 4.2C.2.4.

For UE in FR1-NTN:

- If SMTCs do not overlap with each other,
  - $K_{multi_{SMTC}} = 1$, if GEO satellites are measured on the carrier;
  - $K_{multi_{SMTC}} = \left\lceil \frac{N_{LEO,i}}{N_{LEO,simul}} \right\rceil$, if LEO satellites are measured on the carrier;
- If SMTCs partially overlap with each other,
  - $K_{multi_{SMTC}} = N_{SMTC,overlap}$, if only GEO satellites are measured on the carrier;
  - $K_{multi_{SMTC}} = \sum_{i=1}^{N_{SMTC,overlap}} \left\lceil \frac{N_{LEO,i}}{N_{LEO,simul}} \right\rceil$, if only LEO satellites are measured on the carrier;

where

$N_{LEO,i}$ is the number of LEO satellites to be measured within i-th SMTC,

$N_{LEO,simul}$ is the number of LEO satellites that UE can measure in parallel within an SMTC, $N_{SMTC,overlap}$ is the number of SMTCs that partially overlap with each other.

NOTE: For deriving K_{multi_SMTC} for T_{detect,NR_Inter}, $T_{measure,NR_Inter}$ and $T_{evaluate,NR_Inter}$ of frequency layer *j*, two SMTCs are considered as overlapping if they overlap in one or more occasions during a single T_{detect,NR_Inter}, $T_{measure,NR_Inter}$ or $T_{evaluate,NR_Inter}$.

An inter-frequency cell is considered to be detectable according to the conditions defined in Annex B.1.7 for a corresponding Band.

When higher priority cells are found by the higher priority search, they shall be measured at least every $T_{measure,NR_Inter}$. If, after detecting a cell in a higher priority search, it is determined that reselection has not occurred then the UE is not required to continuously measure the detected cell to evaluate the ongoing possibility of reselection. However, the minimum measurement filtering requirements specified later in this clause shall still be met by the UE before it makes any determination that it may stop measuring the cell. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall measure SS-RSRP or SS-RSRQ at least every $K_{carrier} * K_{multi_SMTC} * T_{measure,NR_Inter_RedCap}$ if the UE does not support *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] or if the *enhancedMeasurementLEO-r17* is not enabled, or every $K_{carrier} * K_{multi_SMTC} * T_{measure,NR_Inter_RedCap_enh}$ if the UE supports *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] and the *enhancedMeasurementLEO-r17*is enabled, for identified lower or equal priority inter-frequency cells. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall filter SS-RSRP or SS-RSRQ measurements of each measured higher, lower and equal priority inter-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,NR_Inter_RedCap}/2$.

The UE shall not consider a NR neighbour cell in cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For an inter-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that the inter-frequency cell has met reselection criterion defined TS 38.304 [1] within $K_{carrier} * K_{multi_SMTC} * T_{evaluate,NR_Inter_RedCap}$ if the UE does not support *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] or if the *enhancedMeasurementLEO-r17* is not enabled, or within $K_{carrier} * K_{multi_SMTC} * T_{evaluate,NR_Inter_RedCap_enh}$ if the UE supports *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] and the *enhancedMeasurementLEO-r17* is enabled, when $T_{reselection} = 0$ as specified in tables 4.2C.2.4-1(with FR1) and 4.2E.2.4-1 provided that the reselection criteria is met by

- the condition when performing equal priority reselection and
  - when *rangeToBestCell* is not configured:
    - the cell is at least 5 dB better ranked in FR1 for 2 Rx RedCap.
    - the cell is at least 6 dB better ranked in FR1 for 1 Rx RedCap.
  - when *rangeToBestCell* is configured:
    - the cell has the highest number of beams above the threshold *absThreshSS-BlocksConsolidation* among all detected cells whose cell-ranking criterion R value defined in TS 38.304 [1] is within *rangeToBestCell* of the cell-ranking criterion R value of the highest ranked cell.
      - if there are multiple such cells, the cell has the highest rank among them
      - the cell is at least 5 dB better ranked in FR1 if the current serving cell is among them, or 6 dB in FR1 for SS-RSRP reselections based on absolute priorities for 2 Rx RedCap or 4 dB in FR1 for SS-RSRQ reselections based on absolute priorities for 2 Rx RedCap.

- the cell is at least 6 dB better ranked in FR1 if the current serving cell is among them, or 7 dB in FR1 for SS-RSRP reselections based on absolute priorities or 5 dB in FR1 for SS-RSRQ reselections based on absolute priorities for 1 Rx RedCap.

The 1 Rx RedCap UE applies *absThreshSS-BlocksConsolidation* as the signalled value of *absThreshSS-BlocksConsolidation* [2] + 1 dB.

When evaluating cells for reselection, the SSB side conditions apply to both serving and inter-frequency cells.

If $T_{reselection}$ timer has a non-zero value and the inter-frequency cell is satisfied with the reselection criteria, the UE shall evaluate this inter-frequency cell for the $T_{reselection}$ time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect that cell.

The UE is not expected to meet the measurement requirements for an inter-frequency carrier under DRX cycle=320 ms defined in table 4.2C.2.4-1(with FR1) under the following conditions:

- $T_{SMTC_intra} = T_{SMTC_inter} = 160$ ms; where
  - T_{SMTC_intra} is the periodicity of the SMTC configured for the intra-frequency carrier if no identified intra-frequency cell is in the PCI list of *smtc2-LP* on this intra-frequency carrier; T_{SMTC_intra} is the periodicity of the *smtc2-LP* configured for the intra-frequency carrier if at least one identified intra-frequency cell is in the PCI list of *smtc2-LP* on this intra-frequency carrier. During PSS/SSS detection, the periodicity of the SMTC configured for the intra-frequency carrier is assumed for T_{SMTC_intra}. If the actual SSB transmission periodicity is greater than the SMTC configured for the intra-frequency carrier, longer T_{detect, NR_intra} is expected.
  - T_{SMTC_inter} is the actual SMTC periodicity used by the inter-frequency cell being identified. During PSS/SSS detection, the periodicity of the SMTC configured for the inter-frequency carrier is assumed for T_{SMTC_inter}. If the actual SSB transmission periodicity is greater than the SMTC configured for the inter-frequency carrier, longer T_{detect, NR_inter} is expected.
  - SMTC occasions configured for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the SMTC occasions configured for the intra-frequency carrier, and
  - SMTC occasions configured for the intra-frequency carrier and for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the paging occasion in TS 38.304 [1].

If *t-Service* is broadcasted and applicable, UE shall be able to detect, measure, and evaluate neighbour cells before the serving cell stops serving the area regardless of whether the distance condition based on serving cell reference location or serving cell moving reference location or the legacy Srxlev/Squal condition are met, and when to start detection, measurement, and evaluation is up to UE implementation. This requirement does not apply when the time span from the last slot of SI transmission within SI modification period where the broadcasting of the last updated value for t-Service is acquired by the UE for the first time to the first slot when the cell is scheduled to stop serving the area according to the broadcasted information is less than $T_{trigger}$, and $T_{trigger} = \max(K_{multi_SMTC}*T_{detect,NR_Intra}, K_{multi_SMTC}*K_{carrier}*T_{detect,NR_Inter})$ when serving cell is below the search threshold, and $T_{trigger} = \max(K_{multi_SMTC}*T_{detect,NR_Intra}, N_{layer}* 60\ s)$ when serving cell is above the search threshold, where

- $K_{carrier}$ is the number of NR inter-frequency carriers indicated by the serving cell,
- N_{layer} is the total number of higher priority NR carrier frequencies broadcasted in system information,
- T_{detect,NR_Intra} refers to HST intra-frequency cell detection delay in IDLE/INACTIVE mode defined table 4.2.2.3-2,
- T_{detect,NR_Inter} refers to HST inter-frequency cell detection delay in IDLE/INACTIVE mode defined table 4.2.2.4-2.

The requirements in this clause apply provided that the number of SMTCs for any inter-frequency carrier does not exceed the values indicated by *parallelSMTC-r17*, otherwise UE may select one or subset of all the configured SMTCs sequentially until all of the SMTCs can be measured, the selection of SMTCs to be used is up to UE implementation, and longer measurement delay than the corresponding measurement period specified in tables 4.2C.2.4-1 (with FR1), table 4.2E.2.4-1 and table 4.2C.2.4-2 is expected.

The requirements in this clause apply provided that the valid information for the satellite serving the target cell has been provided by the serving cell.

The requirements in this clause apply provided that SSB of neighbour cells are within the time shifted SMTC.

The FDD and HD-FDD RedCap UE shall meet all applicable requirements specified in clause 4.2C.5, except that

- 'T_{detect,NR_Intra}' is replaced with '$T_{detect,NR_Intra_RedCap}$' , and
- 'T_{detect,NR_Inter}' is replaced with $T_{detect,NR_Inter_RedCap}$, and
- clause 4.2C.2.3 is replaced with 4.2E.2.3, and

- UE is configured with both *lowMobilityEvaluation* [2] criterion and *cellEdgeEvaluation* [2] criterion, and
- both criteria are fulfilled, and
- less than 1 hour have passed since measurements for cell reselection were performed

In this case the UE is not required to meet $T_{detect,NR_Intra_RedCap}$, $T_{measure,NR_Intra_RedCap}$ and $T_{evaluate,NR_Intra_RedCap}$ as defined in table 4.2E.2.3.

4.2E.2.8 Measurements of inter-frequency NR cells for UE configured with relaxed measurement criterion

4.2E.2.8.1 Introduction

This clause contains the requirements for measurements on inter-frequency NR cells when $Srxlev \leq S_{nonIntraSearchP}$ or $Squal \leq S_{nonIntraSearchQ}$ and when the UE is configured any of the following relaxed measurement criteria:

- Relaxed measurement criterion for UE with low mobility defined in clause 5.2.4.9.1 in [1],
- Relaxed measurement criterion for UE not-at-cell edge defined in clause 5.2.4. 9.2 in [1],
- Both low mobility criterion and not-at-cell edge criterion as defined in clauses 5.2.4.9.1 and 5.2.4.9.2 in [1] respectively.

4.2E.2.8.2 Measurements for UE fulfilling low mobility criterion

This clause contains requirements for measurements on inter-frequency NR cells provided that:

- UE is configured with *lowMobilityEvaluation* [2] criterion and UE is not configured with *cellEdgeEvaluation* [2] criterion and UE has fulfilled the *lowMobilityEvaluation* [2] criterion, or
- UE is configured with both *lowMobilityEvaluation* [2] and *cellEdgeEvaluation* [2] criterion and *combineRelaxedMeasCondition* [2] is not configured, and UE has fulfilled only the *lowMobilityEvaluation* [2] criterion.

When $Srxlev \leq S_{nonIntraSearchP}$ or $Squal \leq S_{nonIntraSearchQ}$ then the requirements are defined as follows:

- For a UE not configured with eDRX_IDLE, $T_{detect,NR_Inter_RedCap_Relax}$, $T_{measure,NR_Inter_RedCap_Relax}$ and $T_{evaluate,NR_Inter_RedCap_Relax}$ refer to table 4.2B.2.10.9-1 and table 4.2B.2.10.9-2 for 1 Rx RedCap and 2 Rx RedCap respectively
- For a UE configured with eDRX_IDLE up to 10.24s, $T_{detect,NR_Inter_RedCap_Relax}$, $T_{measure,NR_Inter_RedCap_Relax}$ and $T_{evaluate,NR_Inter_RedCap_Relax}$ refer to table 4.2B.2.10.9-3 and table 4.2B.2.10.9-4 for 1 Rx RedCap and 2 Rx RedCap respectively.

When $Srxlev > S_{nonIntraSearchP}$ and $Squal > S_{nonIntraSearchQ}$ and the UE is configured with *highPriorityMeasRelax* [2] then the UE shall search for inter-frequency layers of higher priority at least every $K2*T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2B.2.7 and, K2 = 60. Otherwise, if the UE is not configured with *highPriorityMeasRelax* [2] then the UE shall search for inter-frequency layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2E.2.9.

4.2E.2.8.3 Measurements for UE fulfilling not-at-cell edge criterion

This clause contains requirements for measurements on inter-frequency NR cells provided that:

- UE is configured with *cellEdgeEvaluation* [2] criterion, and UE is not configured with *lowMobilityEvaluation* [2] criterion and UE has fulfilled the *cellEdgeEvaluation* [2] criterion or

- UE is configured with both *lowMobilityEvaluation* [2] criterion and *cellEdgeEvaluation* [2] criterion and *combineRelaxedMeasCondition* [2] is not configured, and UE has fulfilled only the *cellEdgeEvaluation* [2] criterion.

When Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$ then the requirements defined in clause 4.2B.2.4 apply for this clause except that:

- For a UE not configured with eDRX_IDLE, $T_{detect,NR_Inter_RedCap_Relax}$, $T_{measure,NR_Inter_RedCap_Relax}$ and $T_{evaluate,NR_Inter_RedCap_Relax}$ are as specified in table 4.2B.2.10.10-1 and table 4.2B.2.10.10-2 with FR1 only for 1 Rx RedCap and 2 Rx RedCap respectively.

- For a UE configured with eDRX_IDLE up to 10.24s, $T_{detect,NR_Inter_RedCap_Relax}$, $T_{measure,NR_Inter_RedCap_Relax}$ and $T_{evaluate,NR_Inter_RedCap_Relax}$ are as specified in table 4.2B.2.10.10-3 and table 4.2B.2.10.10-4 for 1 Rx RedCap and 2 Rx RedCap respectively.

When Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$ and regardless of whether the UE is configured with *highPriorityMeasRelax* [2] or not, the UE shall search for inter-frequency layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2E.2.9.

4.2E.2.8.4 Measurements for UE fulfilling low mobility and not-at-cell edge criterion

This clause contains requirements for measurements on inter-frequency NR cells provided that:

- UE is configured with both *lowMobilityEvaluation* [2] criterion and *cellEdgeEvaluation* [2] criterion, and has fulfilled both criteria, and

- less than 1 hour have passed since measurements for cell reselection were last performed

In this case the UE is not required to meet $T_{detect,NR_Inter_RedCap}$, $T_{measure,NR_Inter_RedCap}$ and $T_{evaluate,NR_Inter_RedCap}$ as defined in clause 4.2E.2.4.

When Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$, the UE shall search for, measure and evaluate inter-frequency layers of higher, equal or lower priority at least every 1 hour.

When Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$, the UE shall search for inter-frequency layers of higher priority at least every K2*$T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2E.2.9 and K2=60.

The requirements defined in this clause apply regardless of eDRX_IDLE configurations.

4.2E.2.9 General requirements

When configured with eDRX_IDLE, the UE shall search every layer of higher priority at least every $T_{higher_priority_search}$, where $T_{higher_priority_search}$ is defined as follows:

- $T_{higher_priority_search}$ = max(60, 15*eDRX_IDLE cycle length) * N_{layers} seconds if eDRX_IDLE cycle ≤ 10.24 s,

Otherwise, if the UE is not configured with eDRX_IDLE cycle, the UE shall search every layer of higher priority at least every $T_{higher_priority_search}$ = (60 * N_{layers}) seconds.

N_{layers} is the total number of higher priority NR and E-UTRA carrier frequencies broadcasted in system information.

For a UE configured with early measurement reporting, while T331 is running, N_{layers} is the combined total number of higher priority NR and E-UTRA carrier frequencies broadcasted in system information.

4.2E.2.10 Measurements of inter-frequency NR cells with TN carrier

This clause applies for the inter-frequency cell re-selection for TN carriers, and NTN carriers if configured. The requirements in clause 4.2E.2.10 apply provided that network provides SIB19 and UE is configured with and one or more TN carriers.

UE is allowed to skip TN neighbour cells measurement in an area where there is no coverage of the frequency based on the provided TN cell coverage information and UE GNSS position information. Otherwise, UE shall perform TN measurement if its estimated distance to *tn-ReferenceLocation* is smaller than *tn-DistanceRadius*. The requirements apply provided that the actual distance between UE to *tn-ReferenceLocation* is smaller than *tn-DistanceRadius* – 50m.This clause considers the inter-frequency cell reselection from NTN to TN in FR1.

The UE shall be able to identify new inter-frequency cells and perform SS-RSRP or SS-RSRQ measurements of identified inter-frequency cells if carrier frequency information is provided by the serving cell, even if no explicit neighbour list with physical layer cell identities is provided.

If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$, and the distance between UE and serving cell reference location is smaller than *distanceThresh* if *distanceThresh* is configured and UE has location information, then the UE shall search for inter-frequency layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2E.2.9.

If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$, or the distance between UE and serving cell reference location is larger than *distanceThresh* if *distanceThresh* is configured and UE has location information, then the UE shall search for and measure inter-frequency layers of higher, equal or lower priority in preparation for possible reselection. The requirements apply provided that the distance exceeds the *distanceThresh* by a margin of 50 m. In this scenario, the minimum rate at which the UE is required to search for and measure higher priority layers shall be the same as that defined below in this clause.

The UE shall be able to evaluate whether a newly detectable inter-frequency cell meets the reselection criteria defined in TS 38.304 [1] within $K_{carrier_TN} * T_{detect,NR_Inter_TN} + K_{carrier} * K_{multi_SMTC} * T_{detect,NR_Inter_NTN_RedCap}$ if the UE does not support Enhanced RRM requirements for measurements in IDLE and INACTIVE modes defined in TS 38.306 [14] or if the *enhancedMeasurementLEO-r17* is not enabled, or within $K_{carrier_TN} * T_{detect,NR_Inter_TN} + K_{carrier} * K_{multi_SMTC} * T_{detect,NR_Inter_NTN_RedCap_enh}$ if the UE supports Enhanced RRM requirements for measurements in IDLE and INACTIVE modes defined in TS 38.306 [14] and the *enhancedMeasurementLEO-r17* is enabled, if at least carrier frequency information is provided for inter-frequency neighbour cells by the serving cells when $T_{reselection} = 0$ provided that the reselection criteria is met:

For 2 Rx RedCap by a margin of at least

5 dB in FR1 for reselections based on ranking or

6 dB in FR1 for SS-RSRP reselections based on absolute priorities or

4 dB in FR1 for SS-RSRQ reselections based on absolute priorities

For 1 Rx RedCap by a margin of at least

6 dB in FR1 for reselections based on ranking or

7 dB in FR1 for SS-RSRP reselections based on absolute priorities or

5 dB in FR1 for SS-RSRQ reselections based on absolute priorities.

The parameter K_{multi_SMTC} is the scaling factor for measurement of multiple SMTCs or multiple satellites

- If SMTCs do not overlap with each other,
  - $K_{multi_{SMTC}} = 1$, if GEO satellites are measured on the carrier;
  - $K_{multi_{SMTC}} = \left\lceil \frac{N_{LEO,i}}{N_{LEO,simul}} \right\rceil$, if LEO satellites are measured on the carrier;
- If SMTCs partially overlap with each other,
  - $K_{multi_{SMTC}} = N_{SMTC,overlap}$, if only GEO satellites are measured on the carrier;
  - $K_{multi_{SMTC}} = \sum_{i=1}^{N_{SMTC,overlap}} \left\lceil \frac{N_{LEO,i}}{N_{LEO,simul}} \right\rceil$, if only LEO satellites are measured on the carrier;

where

$N_{LEO,i}$ is the number of LEO satellites to be measured within i-th SMTC,

$N_{LEO,simul}$ is the number of LEO satellites that UE can measure in parallel within an SMTC, $N_{SMTC,overlap}$ is the number of SMTCs that partially overlap with each other.

NOTE: For deriving K_{multi_SMTC} for T_{detect,NR_Inter}, $T_{measure,NR_Inter}$ and $T_{evaluate,NR_Inter}$ of frequency layer *j*, two SMTCs are considered as overlapping if they overlap in one or more occasions during a single T_{detect,NR_Inter}, $T_{measure,NR_Inter}$ or $T_{evaluate,NR_Inter}$.

The parameter $K_{carrier_TN}$ is the number of NR TN inter-frequency carriers indicated by the serving cell, except for the frequency carrier where there is no coverage of that frequency based on the provide TN cell coverage information and UE GNSS position information.

T_{detect,NR_Inter_TN} ,$T_{measure,NR_Inter_TN}$ and $T_{evaluate,NR_Inter_TN}$ are the NR TN inter-frequency cell re-selection requirement defined in table 4.2.2.4-1 in TS 38.133

$T_{detect,NR_Inter_NTN_RedCap}$,$T_{measure,NR_Inter_NTN_RedCap}$ and $T_{evaluate,NR_Inter_NTN\text{-}RedCap}$ are the NR NTN inter-frequency cell re-selection requirement defined in tables 4.2C.2.4-1 (with FR1) and 4.2C.2.4-1 in TS 38.133.

$T_{detect,NR_Inter_NTN_RedCap_enh}$, $T_{measure,NR_Inter_NTN_RedCap_enh}$ and $T_{evaluate,NR_Inter_NTN_RedCap_enh}$ are the NR NTN inter-frequency cell re-selection requirement defined in table 4.2E.2.4-2 in TS 38.133.

An inter-frequency cell is considered to be detectable according to the conditions defined in Annex B.1.7 for a corresponding band.

When higher priority cells are found by the higher priority search, they shall be measured at least every $T_{measure,NR_Inter}$. If, after detecting a cell in a higher priority search, it is determined that re-selection has not occurred then the UE is not required to continuously measure the detected cell to evaluate the ongoing possibility of re-selection. However, the minimum measurement filtering requirements specified later in this clause shall still be met by the UE before it makes any determination that it may stop measuring the cell. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall measure SS-RSRP or SS-RSRQ at least every $K_{carrier_TN} * T_{measure,NR_Inter_TN} + K_{carrier} * K_{multi_SMTC} * T_{measure,NR_Inter_NTN_RedCap}$ if the UE does not support Enhanced RRM requirements for measurements in IDLE and INACTIVE modes defined in TS 38.306 [14] or if the *enhancedMeasurementLEO-r17* is not enabled, or every $K_{carrier_TN} * T_{measure,NR_Inter_TN} + K_{carrier} * K_{multi_SMTC} * T_{measure,NR_Inter_NTN_RedCap_enh}$ if the UE supports Enhanced RRM requirements for measurements in IDLE and INACTIVE modes defined in TS 38.306 [14] and the *enhancedMeasurementLEO-r17*is enabled, for identified lower or equal priority inter-frequency cells. If the UE detects on a NR carrier a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall filter SS-RSRP or SS-RSRQ measurements of each measured higher, lower and equal priority inter-frequency cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least $T_{measure,NR_Inter_NTN_RedCap_enh}/2$.

The UE shall not consider a NR neighbour cell in cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For an inter-frequency cell that has been already detected, but that has not been reselected to, the filtering shall be such that the UE shall be capable of evaluating that the inter-frequency cell has met reselection criterion defined TS 38.304 [1] within $K_{carrier_TN} * T_{evaluate,NR_Inter_TN} + K_{carrier} * K_{multi_SMTC} * T_{evaluate,NR_Inter_NTN_RedCap}$ if the UE does not support *Enhanced RRM requirements for measurements in IDLE and INACTIVE modes* defined in TS 38.306 [14] or if the *enhancedMeasurementLEO-r17* is not enabled, or within $K_{carrier_TN} * T_{evaluate,NR_Inter_TN} + K_{carrier} * K_{multi_SMTC} * T_{evaluate,NR_Inter_NTN_RedCap_enh}$ if the UE supportsEnhanced RRM requirements for measurements in IDLE and INACTIVE modes defined in TS 38.306 [14] and the *enhancedMeasurementLEO-r17* is enabled, when $T_{reselection} = 0$ as specified in tables 4.2C.2.4-1 (with FR1) and table 4.2E.2.3-1 provided that the reselection criteria is met by

- For 2 Rx RedCap by a margin of at least

  5 dB in FR1 for reselections based on ranking or

  6 dB in FR1 for SS-RSRP reselections based on absolute priorities or

  4 dB in FR1 for SS-RSRQ reselections based on absolute priorities

  For 1 Rx RedCap by a margin of at least

6 dB in FR1 for reselections based on ranking or

7 dB in FR1 for SS-RSRP reselections based on absolute priorities or

5 dB in FR1 for SS-RSRQ reselections based on absolute priorities.

When evaluating cells for reselection, the SSB side conditions apply to both serving and inter-frequency cells.

If $T_{reselection}$ timer has a non-zero value and the inter-frequency cell is satisfied with the reselection criteria, the UE shall evaluate this inter-frequency cell for the $T_{reselection}$ time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect that cell.

The UE is not expected to meet the measurement requirements for an inter-frequency carrier under DRX cycle=320 ms defined in table 4.2C.2.4-1 under the following conditions:

$T_{SMTC_intra} = T_{SMTC_inter} = 160$ ms; where

- T_{SMTC_intra} is the periodicity of the SMTC configured for the intra-frequency carrier if no identified intra-frequency cell is in the PCI list of *smtc2-LP* on this intra-frequency carrier; T_{SMTC_intra} is the periodicity of the *smtc2-LP* configured for the intra-frequency carrier if at least one identified intra-frequency cell is in the PCI list of *smtc2-LP* on this intra-frequency carrier. During PSS/SSS detection, the periodicity of the SMTC configured for the intra-frequency carrier is assumed for T_{SMTC_intra}. If the actual SSB transmission periodicity is greater than the SMTC configured for the intra-frequency carrier, longer T_{detect, NR_intra} is expected.

- T_{SMTC_inter} is the actual SMTC periodicity used by the inter-frequency cell being identified. During PSS/SSS detection, the periodicity of the SMTC configured for the inter-frequency carrier is assumed for T_{SMTC_inter}. If the actual SSB transmission periodicity is greater than the SMTC configured for the inter-frequency carrier, longer T_{detect, NR_inter} is expected.

- SMTC occasions configured for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the SMTC occasions configured for the intra-frequency carrier, and

- SMTC occasions configured for the intra-frequency carrier and for the inter-frequency carrier occur up to 1 ms before the start or up to 1 ms after the end of the paging occasion in TS 38.304 [1].

If *t-Service* is broadcasted and applicable, UE shall be able to detect, measure, and evaluate neighbour cells before the serving cell stops serving the area regardless of whether the distance condition based on serving cell reference location or the legacy Srxlev/Squal condition are met, and when to start detection, measurement, and evaluation is up to UE implementation. This requirement does not apply when the time span from the last slot of SI transmission within SI modification period where the broadcasting of the last updated value for t-Service is acquired by the UE for the first time to the first slot when the cell is scheduled to stop serving the area according to the broadcasted information is less than $T_{trigger}$, and $T_{trigger} = \max(T_{detect,NR_Intra}, K_{carrier} * T_{detect,NR_Inter})$ when serving cell is below the search threshold, and $T_{trigger} = \max(T_{detect,NR_Intra}, N_{layer} * 60s)$ when serving cell is above the search threshold, where

- $K_{carrier}$ is the number of NR inter-frequency carriers indicated by the serving cell,

- N_{layer} is the total number of higher priority NR carrier frequencies broadcasted in system information,

- T_{detect,NR_Intra} refers to HST intra-frequency cell detection delay in IDLE/INACTIVE mode defined table 4.2.2.3-2,

- T_{detect,NR_Inter} refers to HST inter-frequency cell detection delay in IDLE/INACTIVE mode defined table 4.2.2.4-2.

The requirements in this clause apply provided that the number of SMTCs for any inter-frequency carrier does not exceed the values indicated by *parallelSMTC-r17*, otherwise UE may select one or subset of all the configured SMTCs sequentially until all of the SMTCs can be measured, the selection of SMTCs to be used is up to UE implementation, and longer measurement delay than the corresponding measurement period specified in table 4.2C.2.4-1 and table 4.2E.2.4-2 is expected.

For 1 Rx RedCap and 2 Rx RedCap not configured with eDRX_IDLE cycle, $T_{detect,NR_Inter_RedCap}$, $T_{measure,NR_Inter_RedCap}$ and $T_{evaluate,NR_Inter_RedCap}$ are specified in table 4.2C.2.4-1 with FR1.

For 1 Rx RedCap and 2 Rx RedCap configured with eDRX_IDLE cycle, $T_{detect,NR_Inter_RedCap}$, $T_{measure,NR_Inter_RedCap}$ and $T_{evaluate,NR_Inter_RedCap}$ are specified in table 4.2E.2.4-1 for FR1.

For both 1Rx RedCap and 2Rx RedCap, $T_{detect,NR_Inter_RedCap_enh}$,$T_{measure,NR_Intra_RedCap_enh}$,$T_{evaluate,NR_Intra_RedCap_enh}$ are defined in table 4.2E.2.4-2.

4.2E.2.11 Measurements of inter-RAT E-UTRAN cells with TN carrier

This clause applies for the inter-RAT cell re-selection for TN carriers. The requirements in clause 4.2C.2.11 apply provided that network provides SIB19 and UE is configured with and one or more TN carriers.

UE is allowed to skip TN neighbour cells measurement in an area where there is no coverage of the frequency based on the provided TN cell coverage information and UE GNSS position information. Otherwise, UE shall perform TN measurement if its estimated distance to tn-ReferenceLocation is smaller than *tn-DistanceRadius*. The requirements apply provided that the actual distance between UE to *tn-ReferenceLocation* is smaller than *tn-DistanceRadius* – 50m.This clause considers the inter-RAT cell reselection from NTN to E-UTRAN TN in FR1.

If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$ then the UE shall search for inter-RAT E-UTRAN layers of higher priority at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2E.2.9

If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$ then the UE shall search for and measure inter-RAT E-UTRAN layers of higher, lower priority in preparation for possible reselection. In this scenario, the minimum rate at which the UE is required to search for and measure higher priority inter-RAT E-UTRAN layers shall be the same as that defined below for lower priority RATs.

The requirements in this clause apply to inter-RAT E-UTRAN FDD measurements and E-UTRA TDD measurements. When the measurement rules indicate that inter-RAT E-UTRAN cells are to be measured, the UE shall measure RSRP and RSRQ of detected E-UTRA cells in the neighbour frequency list at the minimum measurement rate specified in this clause.

The parameter $N_{EUTRA_carrier}$ is the number of EUTRA TN carriers indicated by the serving cell, except for the frequency carrier where there is no coverage of that frequency based on the provide TN cell coverage information and UE GNSS position information.

The UE shall filter RSRP and RSRQ measurements of each measured E-UTRA cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by at least half the minimum specified measurement period.

An inter-RAT E-UTRA cell is considered to be detectable provided the following conditions are fulfilled:

- the same conditions as for inter-frequency RSRP measurements specified in TS 36.133 [15, Annex B.1.2] are fulfilled for a corresponding Band, and
- the same conditions as for inter-frequency RSRQ measurements specified in TS 36.133 [15, Annex B.1.2] are fulfilled for a corresponding Band.
- SCH conditions specified in TS 36.133 [15, Annex B.1.2] are fulfilled for a corresponding Band

The UE shall be able to evaluate whether a newly detectable inter-RAT E-UTRAN cell meets the reselection criteria defined in TS 38.304 [1] within $N_{EUTRA_carrier}$ * $T_{detect,EUTRAN}$ when Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$ when $T_{reselection}$ = 0 provided that the reselection criteria is met by a margin of at least 6dB for RSRP reselections based on absolute priorities or 4dB for RSRQ reselections based on absolute priorities.

Cells which have been detected shall be measured at least every $N_{EUTRA_carrier}$ * $T_{measure,EUTRAN}$ when Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$.

When higher priority cells are found by the higher priority search, they shall be measured at least every $T_{measure,EUTRAN}$. If, after detecting a cell in a higher priority search, it is determined that reselection has not occurred then the UE is not required to continuously measure the detected cell to evaluate the ongoing possibility of reselection. However, the minimum measurement filtering requirements specified later in this clause shall still be met by the UE before it makes any determination that it may stop measuring the cell.

If the UE detects, on an inter-RAT E-UTRAN carrier, a cell whose physical identity is indicated as not allowed for that carrier in the measurement control system information of the serving cell, the UE is not required to perform measurements on that cell.

The UE shall not consider an inter-RAT E-UTRA cell in cell reselection, if it is indicated as not allowed in the measurement control system information of the serving cell.

For a cell that has been already detected, but has not been reselected to, the filtering shall be such that a UE not configured with eDRX_IDLE cycle shall be capable of evaluating that an already identified inter-RAT E-UTRA cell has met reselection criterion defined in TS 38.304 [1] within $N_{EUTRA_carrier_RedCap}$ * $T_{evaluate,EUTRAN_RedCap}$ when $T_{reselection}$ = 0 as specified in table 4.2.2.5-1provided that the reselection criteria is met by a margin of at least 6 dB for RSRP reselections based on absolute priorities or 4 dB for RSRQ reselections based on absolute priorities for 2Rx RedCap and at least 6dB for RSRP reselections based on absolute priorities or 4dB for RSRQ reselections based on absolute priorities for 1 Rx RedCap.

If the $T_{reselection}$ timer has a non-zero value and an inter-RAT E-UTRA cell satisfies the reselection criteria defined in TS 38.304 [1], the UE shall evaluate this E-UTRA cell for the $T_{reselection}$ time. If this cell remains satisfied with the reselection criteria within this duration, then the UE shall reselect to this cell.

When the distance between the UE and *tn-ReferenceLocation* is larger than *tn-DistanceRadius* +50m, the UE is allowed to not perform measurements on the TN frequency in the corresponding area.

For 1 Rx RedCap and 2 Rx RedCap configured with eDRX_IDLE cycle, $T_{detect,EUTRAN_RedCap}$, $T_{measure,EUTRAN_RedCap}$ and $T_{evaluate,\ E\text{-}UTRAN_RedCap}$ are specified in table 4.2B.2.5-2.

For UE not configured with eDRX_IDLE cycle, $T_{detect,EUTRAN_RedCap}$, $T_{measure,EUTRAN_RedCap}$ and $T_{evaluate,\ E\text{-}UTRAN_RedCap}$ are specified in table 4.2B.2.5-1.

4.4 Idle Mode CA/DC Measurements

4.4.1 Introduction

A UE supporting *idleInactiveNR-MeasReport-r16* or *idleInactiveEUTRA-MeasReport-r16* shall perform the idle mode measurement on the inter-frequency CA and DC candidate frequencies/cells and E-UTRAN inter-RAT DC candidate frequencies/cells indicated by higher layers and meet the requirement specified in this clause. The UE shall perform idle mode measurements provided that the serving cell support early measurement and is within the validity area. The idle mode measurement requirements apply to a configured carrier frequency and the serving cell are among the supported band combination of the UE.

4.4.2 Measurement Requirements

For a UE which supports *idleInactiveNR-MeasReport-r16* or *idleInactiveEUTRA-MeasReport-r16* the UE shall support the idle mode CA/DC measurements on the serving cell, and carriers configured for idle mode CA/DC measurement reporting provided T331 has not expired, the serving cell is supporting idle mode CA/DC measurement reporting and the serving cell is in the validity area.

4.4.2.1 Detected cell requirement during state transition and Idle mode

This subclause defines the requirements for the detected cell status for the idle mode CA/DC measurement when UE transitions from RRC Connected mode to Idle mode and after UE has entered Idle mode. The requirements are applicable to an NE-DC and NR carrier aggregation capable UE which has been configured with one or more of following, one or more SCells, one E-UTRAN PSCell or one or more downlink E-UTRAN SCells during the Connected mode and which supports *idleInactiveNR-MeasReport-r16* or *idleInactiveEUTRA-MeasReport-r16.* The requirements are applicable for SCell(s) and E-UTRAN FDD and TDD PSCell and SCells.

Upon releasing the connection and if the UE has been configured with idle mode CA/DC measurement reporting, following requirements apply concerning the detected cells in Connected mode upon state transitioning to Idle mode and during Idle mode:

- A cell which is detected cell in Connected mode prior to connection release, shall remain detected after UE has entered Idle mode and during Idle mode, provided that the following conditions are met:
  - The UE has been provided with a list of cells and/or carrier frequencies for early measurement reporting by dedicated RRC signalling and
  - The detected cell is among the list of cells or on a carrier frequency provided for early measurement reporting, and
  - The UE is provided with a valid timer T331 by dedicated RRC signalling, and
  - The detected cell and SSBs remains detectable until UE reconnect to the network and transmits the early measurement reporting, and
  - The carrier frequency of the detected cell and the carrier frequency of the serving cell are among the supported band combination of the UE.

An inter-RAT E-UTRAN cell is considered detectable according to RSRP, RSRP Ês/Iot, SCH_RP and SCH Ês/Iot defined in Annex B.1.1 and Annex B.1.2 in [15] for a corresponding Band. An inter-frequency cell is considered detectable according to the conditions in Annex B.1.2 and B.1.3 for a corresponding band. An SSB of an inter-frequency cell is considered detectable according to SSB_RP and SSB Ês/Iot defined in Annex B.1.2 and B.1.3 for a corresponding Band.

4.4.2.2 Measurements of inter-frequency CA/DC candidate cells

While T331 is running, the UE shall perform measurement on the configured inter-frequency carriers for idle mode CA/DC measurement reporting according to the UE measurement capability.

A UE which supports *idleInactiveNR-MeasReport-r16* shall support idle mode CA/DC measurements of:

- at least 7 inter-frequency carriers which are also configured for inter-frequency mobility measurements, and

- at least 7 inter-frequency carriers which are not configured for inter-frequency mobility measurements.

The UE shall be capable of monitoring a total of at least 7 inter-frequency carriers for idle mode CA/DC measurements comprising of carriers configured for inter-frequency mobility measurements and carriers not configured for inter-frequency mobility measurements.

For inter-frequency carriers configured for idle mode CA/DC measurements, if Srxlev $\leq S_{nonIntraSearchP}$ or Squal $\leq S_{nonIntraSearchQ}$ the inter-frequency measurement requirements in clause 4.2.2.4 shall apply, where UE shall search for and measure inter-frequency layers configured for idle mode CA/DC measurements in preparation for possible reporting. If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$ the UE shall search for inter-frequency layers configured for idle mode CA/DC measurements at least every $T_{higher_priority_search}$ where $T_{higher_priority_search}$ is described in clause 4.2.2.7, where UE shall search for and measure inter-frequency layers configured for idle mode CA/DC measurements in preparation for possible reporting.

- 7 SSBs with different SSB index and/or PCI on an inter-frequency layer in FR1,

- 10 SSBs with different SSB index and/or PCI on an inter-frequency layer in FR2.

For UE supporting *idleInactiveNR-MeasBeamReport-r16*, if the UE is configured with *beamMeasConfigIdle-r16* on one or more carrier for idle mode CA/DC measurement, the UE, on each carrier, shall be able to:

- detect a newly detectable inter-frequency NR cell and perform RSRP/RSRQ measurement in preparation for reporting, and

- acquire the SSB index for a newly detectable inter-frequency NR cell if *beamMeasConfigIdle-r16* is configured on this carrier and perform RSRP/RSRQ measurement in preparation for reporting,

within the requirements defined in clause 4.2.2.4 plus k* T_{SSB_index,NR_Inter}, where k is the number of carriers configured for idle mode CA/DC measurement with *beamMeasConfigIdle-r16*, and T_{SSB_index,NR_Inter} is the additional time period used to acquire the index of the SSB being measured as defined in table 4.4.2.2-1.

Table 4.4.2.2-1: T_{SSB_index,NR_Inter}

DRX cycle length [s]	Scaling Factor (N1)		T_{SSB_index,NR_Inter} [s] (number of DRX cycles)
	FR1	FR2[Note1]	
0.32	1	8	N2 x 1.28 x N1 x 1.5 (N2 x 4 x N1 x 1.5)
0.64		5	N2 x 1.28 x N1 (N2 x 2 x N1)
1.28		4	N2 x 1.28 x N1 (N2 x 1 x N1)
2.56		3	N2 x 2.56 x N1 (N2 x 1 x N1)
NOTE 1: Applies for UE supporting power class 2&3&4. For UE supporting power class 1, N1 = 8 for all DRX cycle length.			
NOTE 2: N2 = 3 if the NR inter-frequency carrier for idle mode CA/DC measurement reporting is in FR1, N2=6 if the NR inter-frequency carrier for idle mode CA/DC measurement reporting is in FR1 and UE operating on a target cell with 12 PRB, and N2 = 5 if the NR inter-frequency carrier for idle mode CA/DC measurement reporting is in FR2.			

In the absence or expiration of T331, it is up to UE implementation to perform the idle mode CA/DC measurement.

For inter-frequency carriers configured for idle mode CA/DC measurements, the UE shall be capable of performing SS-RSRP and SS-RSRQ measurements of the carriers, and the UE physical layer shall be capable of reporting SS-RSRP and SS-RSRQ measurements of the carriers configured for idle mode CA/DC measurements to higher layers, with measurement accuracy as specified in clauses 10.1.4B and 10.1.5B and 10.1.9B and 10.1.10B, respectively.

The UE shall be able to report idle mode CA/DC measurements when idle mode CA/DC measurement reporting is requested by the network.

For inter-RAT carriers configured for idle mode DC measurements, if Srxlev $\leq S_{nonIntraSearchP}$ or Squal $\leq S_{nonIntraSearchQ}$ the inter-RAT measurement requirements in clause 4.2.2.5 shall apply, where UE shall search for and measure inter-RAT layers configured for idle mode DC measurements in preparation for possible reporting. 4.5 NR measurements for positioning

4.5.1 Introduction

This clause contains requirements for UE capable of performing NR positioning measurements defined in TS 38.215 [4], including RSTD, PRS-RSRP, PRS-RSRPP, and RSCPD with RSTD measurements in RRC_IDLE state.

The requirements in clauses 4.5.2, 4.5.3, 4.5.4, and 4.5.5 are applicable to PRS resources that do not collide with other DL signals/channels which include SSB, SIB1, CORESET0, MSG2/MSGB, paging and DL SDT. In addition, a UE is not expected to receive PRS resources that collide with a time interval starting at symbol *m* and ending at symbol $m + N_2$, where symbol *m* is the last symbol in which the UE is configured to receive PDCCH and N_2 is defined in clause 6.4 of TS 38.214 [26] for the subcarrier spacing μ of the DL PRS.

If a PRS resource is outside or partially overlapped with the initial DL BWP, a PRS resource instance collides with another DL signals/channels if any portion of the other DL signal/channel overlaps with the time interval starting X symbols before the PRS instance and ending X symbols after the PRS instance, taking into account *nr-DL- PRS-ExpectedRSTD-Uncertainty* and *nr-DL-PRS-ExpectedRSTD*, where X is defined in table 5.6.1-1.

All measurement requirements specified in clauses 4.5.2, 4.5.3, 4.5.4, and 4.5.5 shall apply for DRX and eDRX configurations specified in TS 38.331 [2] for RRC_IDLE state.

The requirements in clauses 4.5.2, 4.5.3, 4.5.4 and 4.5.5 are applicable provided that the cell selection procedure for the selected PLMN defined in TS 38.304 [1] is not triggered during PRS measurement period.

The requirements in clauses 4.5.2, 4.5.3, and 4.5.4 apply provided that all PRS resources within a PFL are within up to 2 separate windows within $T_{PRS,i}$ for each positioning frequency layer *i*, where each window is up to 10ms and $T_{PRS,i}$ is defined in clauses 4.5.2, 4.5.3, and 4.5.4.

The UE is not required to perform additional SSB measurement for the SSB configured as QCL source of PRS resources.

When the UE is configured with measurement for more than one positioning requests, the measurement period for each request may be longer than measurement period when UE is configured with measurement for single positioning request.

4.5.2 RSTD measurements

4.5.2.1 Introduction

The requirements in clause 4.5.2 shall apply provided the UE has received *NR-DL-TDOA-RequestLocationInformation* message from the LMF via LPP [34] requesting the UE to measure and report DL RSTD measurements defined in TS 38.215 [4].

4.5.2.2 Requirements Applicability

The requirements in clause 4.5.2 apply for periodic and triggered RSTD measurements, provided:

- PRS-RSTD related side conditions given in clause 10.1.23.2 for FR1 and FR2 are fulfilled, for a corresponding band.

4.5.2.3 Measurement Capability

The UE PRS RSTD measurement capability in RRC_IDLE state is as indicated by the UE in *NR-DL-TDOA-ProvideCapabilities*, according to TS 37.355 [34].

4.5.2.4 Measurement Reporting Requirements

The measurement reporting delay is defined as the time between the moment when the periodic measurement report is triggered and the moment when the UE is ready to transmit the measurement report over the air interface. The UE will transition to RRC_CONNECTED state prior to transmitting the measurement report.

For RSTD measurements performed by a UE in RRC_IDLE state, the measurement reporting delay excludes all of the following:

- additional delay caused other LPP signalling on the DCCH,
- delay uncertainty introduced when inserting the measurement report in the TTI of the uplink DCCH, equal to 2 x TTI_{DCCH} where TTI_{DCCH} is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration,
- any delay caused by unavailability of UL resources to transmit the measurement report,
- the time needed to transition to RRC_CONNECTED state to report the measurements.

The reported RSTD measurement values contained in measurement reports shall be based on the measurement report mapping requirements specified in clause 10.1.23.3.

The RSTD measurements performed and reported according to this section shall meet the RSTD measurement accuracy requirements in clause 10.1.23.2, for each measured DL PRS resource.

4.5.2.5 Measurements Period Requirements

After receiving both *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message from the LMF via LPP [34], the UE shall be able to measure multiple (up to the UE capability specified in clause 4.5.2.3) DL RSTD measurements, defined in TS 38.215 [4], during the measurement period $T_{RSTD,Total}$ defined as:

$$T_{RSTD,Total} = \sum_{i=1}^{L} T_{RSTD,i} + (L-1) * \max(T_{effect,i})$$

Where:

- i is the index of positioning frequency layer,

Where:

- $N_{RxBeam,i}$ is the UE Rx beam sweeping factor:
  - $N_{RxBeam,i}$ = 1 if positioning frequency layer *i* is in FR1, and if positioning frequency layer *i* is in FR2
    - $N_{RxBeam,i}$ equals to the value as UE reported in *supportedLowerRxBeamSweepingFactor-FR2* if the capability is reported by the UE for the band containing positioning frequency layer i, and LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation* .
  - $N_{RxBeam,i}$ equals to 8, otherwise.
- $K_{carrier_PRS}$ is a scaling factor for PRS-based NR positioning measurements in RRC_IDLE. If the UE supports *parallelPRS-MeasRRC-Inactive-r17*, $K_{carrier_PRS}$ = 1; otherwise,

- If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$, $K_{carrier_PRS} = N_{layers} + 1$, where N_{layers} is defined in clause 4.2.2.7.
- $N_{Rx,TEG,i}$ is the Rx TEG specific scaling factor:
  - $N_{Rx,TEG,i}$ =1 if the UE is not configured by the LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34].
  - $N_{Rx,TEG,i}$ is defined as follows if the UE is configured by the LMF with *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] to perform measurement on same DL PRS resource of a TRP using different Rx TEGs in *NR-DL-TDOA-RequestLocationInformation* [34]:
    - $N_{Rx,TEG,i} = P$, if the UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, where P is the number of UE Rx TEGs that the UE is requested by LMF to measure the same DL-PRS Resource of a TRP indicated by *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* in [34], and in case 'n0' is indicated, P is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*.
    - $N_{Rx,TEG,i} = \left\lceil \frac{P}{Q} \right\rceil$, if the UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs, where Q is the number of UE Rx TEGs for measuring the same DL-PRS Resource simultaneously indicated by *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul-r17* in [34].

For calculation of $L_{available_PRS,i}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered.
- N_{sample} is the number of PRS RSTD samples, where
  - N_{sample} = 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive-r17* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:

  - PRS bandwidth is within the initial BWP and

  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

- N_{sample} = 4 otherwise.

- $T_{last,i}$ is the measurement duration for the last PRS RSTD sample in positioning frequency layer *i*, including the sampling time and processing time, $T_{\text{last,i}} = T_{\text{i}} + T_{available_PRS,\text{i}}$,

$$T_{\text{effect,i}} = \left\lceil \frac{T_{\text{i}}}{T_{available_PRS,\text{i}}} \right\rceil * T_{available_PRS,\text{i}}$$

Where:

- T_i corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [34],

- $T_{available_PRS,\text{i}} = LCM(T_{PRS,\text{i}}, T_{DRX})$, the least common multiple between $T_{PRS,\text{i}}$ and T_{DRX}, where T_{DRX} is the DRX cycle of the UE, defined in TS 38.304 [1], clause 7.1.

- $T_{PRS,\text{i}}$ is the periodicity of DL PRS resource with muting on positioning frequency layer *i*.

If more than one PRS periodicities are configured in positioning frequency layer *i*, the least common multiple of PRS periodicities $T_{per}^{PRS\ with\ muting}$ among all DL PRS resource sets in the positioning frequency layer is used to derive $T_{PRS,\text{i}}$, where,

- $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, is the PRS periodicity with muting per PRS resource,

- T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

- N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where

- T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

- $\{N, T\}$ is the UE capability combination per band for RRC_IDLE state where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSymbols-r17* in TS 37.355 [34], T (ms) corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [34], for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [34],

- N' is UE capability for number of DL PRS resources that it can process in a slot in RRC_IDLE state as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive-r17* specified in TS 37.355 [34].

If the following conditions are met, the time $T_{\text{RSTD,Total}}$ starts from the first DL PRS resource(s) instances inside a PTW after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the UE via LPP [34].

- UE is configured with CN eDRX > 10.24 s, and

- periodic PRS measurement reporting is configured, and

- CN eDRX cycle is smaller or equal to the PRS measurement reporting periodicity configured via higher layer parameter *reportingInterval* in TS 37.355 [34], and

- there is one or more PRS resources occurring in PTW.

Otherwise, the time $T_{RSTD,Total}$ starts from the first DL PRS resource(s) after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the UE via LPP [34].When the UE is configured with periodic reporting, as defined in TS 23.273, clause 4.1a.5.1,

If the UE operates in eDRX and eDRX is configured by higher layers [1], and the eDRX cycle $T_{eDRX, CN}$ is smaller than or equal to the configured PRS measurement reporting periodicity given by *reportingInterval* in TS 37.355 [34], and $T_{eDRX, CN}$ > 10.24 s, the time $T_{RSTD,Total}$ starts from the first DL PRS resource(s) instances in the assistance data contained inside a Paging Time Window (PTW) after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the UE via LPP [34]. Otherwise, the time $T_{RSTD,Total}$ starts from the first DRX cycle containing the DL PRS resource(s) in the assistance data after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the UE via LPP [34].

When the UE is not configured with periodic reporting, the time $T_{RSTD,Total}$ starts from the first DRX cycle containing the DL PRS resource(s) in the assistance data after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the UE via LPP [34].

NOTE: No per-positioning frequency layer requirement is applied in scenarios when multiple positioning frequency layers are configured.

If the UE DRX cycle T_{DRX} changes during the RSTD measurement period, then the measurement period can be longer.

When PRS-RSRP is configured for DL-TDOA, RSTD and PRS-RSRP are performed over the same measurement period.

When PRS-RSRPP is configured for DL-TDOA, RSTD and PRS-RSRPP are performed over the same measurement period.

The measurement requirements do not apply to any PRS resource that always collides with other higher-priority DL signals/channels, as specified in clause 4.5.1.

Longer RSTD measurement period is expected when there are collisions between PRS resources and other higher-priority DL signals/channels.

If $K_{\text{carrier_PRS}}$ changes for any PFL during the measurement period, the measurement period could be longer.

The measurement requirements do not apply for a PRS resource, if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$.

The measurement requirements do not apply for a PRS resource, if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

The requirements in clause 4.5.2 do not apply if the PRS configuration given by higher layer parameters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-TDOA-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If cell re-selection occurs while RSTD measurements are being performed, then the UE shall continue and complete the on-going RSTD measurements after the cell selection is completed. The RSTD measurement period can be longer.

If the RRC state transition occurs from RRC_IDLE to RRC_CONNECTED state during the RSTD measurement period, then the UE shall continue the RSTD measurement in the RRC_CONNECTED state. The RSTD measurement period can be longer.

The UE shall meet the RSTD measurement accuracy requirements in clause 10.1.23.2.

- $(L-1) * \max(T_{effect,i})$ is replace by $(L-1) * T'_{margin}$.

$T_{RSTD,aggr}$ is zero if no resource sets on any PFL are linked for aggregation with other resource sets on other PFLs. Otherwise, $T_{RSTD,aggr}$ is defined as

$$T_{RSTD,aggr} = \sum_{m=1}^{M} T_{RSTD,aggr,m} + (M-1) * T'_{margin}$$

Otherwise, the time $T_{RSTD,Total}$ starts from the first DL PRS resource(s) after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the UE via LPP [34].

The requirements in this clause for aggregated measurements apply provided that the linked PRS resource sets on multiple PFLs for aggregated measurements satisfy all the conditions specified in clause 5.1.6.5.3 in TS 38.214 [26].

NOTE: No separate requirement on non-aggregated measurement based on $T_{RSTD,non-aggr}$ or on aggregated measurement based on $T_{RSTD,aggr}$ is applied when both $T_{RSTD,aggr}$ and $T_{RSTD,non-aggr}$ are non-zero.

If the DRX cycle is reconfigured during the RSTD measurement period, then the measurement period can be longer.

When PRS-RSRP is also reported by UE together with RSTD measurement based on aggregated DL-PRS resources from multiple-PFLs, PRS-RSRP are performed over the measurement period defined in clause 4.5.2.6.

When PRS-RSRPP is also reported by UE together with RSTD measurement based on aggregated DL-PRS resources from multiple-PFLs, PRS-RSRPP are performed over the measurement period defined in clause 4.5.2.6.

Longer RSTD measurement period is expected when there are collisions between PRS resources in any of the PFLs configured for aggregation and other higher-priority DL signals/channels.

If $K_{carrier_PRS}$ changes for any PFL or any PFL combination during the measurement period, the measurement period could be longer.

The measurement requirements do not apply for a PRS resource, if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$.

The measurement requirements do not apply for a PRS resource, if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

The requirements in clause 4.5.2.6 do not apply if the PRS configuration given by higher layer parameters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-TDOA-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If cell re-selection occurs while RSTD measurements are being performed, then the UE shall continue and complete the on-going RSTD measurements after the cell selection is completed. The RSTD measurement period can be longer.

If the RRC state transition occurs from RRC_IDLE to RRC_CONNECTED state during the RSTD measurement period then the UE shall continue the RSTD measurement in the RRC_CONNECTED state. The RSTD measurement period can be longer.

The UE shall meet the RSTD measurement accuracy requirements in clause 10.1.23A.2.

    - $N_{RxBeam,i}$ equals to 8, otherwise.
- $L_{available_PRS,i}$ is the time duration of available PRS to be measured in the positioning frequency layer i to be measured during $T_{PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered.
- $N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

    - PRS bandwidth is within the initial BWP and

    - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

  - N_{sample} = 2, if UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* [34], and the LMF indicates the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples* [34], and the following conditions are not met:

    - PRS bandwidth is within the initial BWP and

    - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

  - N_{sample} = 4 otherwise

  $T_{last,i} = T_i + T_{available_PRS,i}$ is the measurement duration for the last PRS-RSRP sample, including the sampling time and processing time,

  - $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$ is the periodicity of PRS-RSRP measurement in positioning frequency layer *i*,

  - T_{DRX} is the DRX cycle length if UE is not configured with eDRX_IDLE cycle, and T_{DRX} is defined as T in TS 38.304[1] if UE is configured with eDRX_IDLE cycle.

If positioning frequency layer *i* has more than one DL PRS resource set with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among the DL PRS resource sets is used to derive $T_{PRS,i}$, where:

- T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

- N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

If the following conditions are met, the time $T_{PRS-RSRP,Total}$ starts from the first DL PRS resource(s) instances inside a PTW after both the *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message are delivered from LMF to the UE via LPP [34].

NOTE: No per-positioning frequency layer requirement is applied in scenarios when multiple positioning frequency layers are configured.

When the PRS-RSRP measurement is configured together with RSTD measurement then the PRS-RSRP measurement shall meet the RSTD measurement requirements defined in clause 4.5.2.

The measurement requirements do not apply for a PRS resource:

- if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$ or
- if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

Longer PRS-RSRP measurement period is expected when there is collision/overlap between other DL signals/channels and PRS resources in RRC_IDLE state.

The requirements in clause 4.5.3 do not apply if the PRS configuration given by higher layer paramters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-AoD-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If the DRX cycle is reconfigured during the PRS-RSRP measurement period then the PRS-RSRP measurement period can be longer.

- $\{N, T\}$ is the UE capability combination per band for RRC_IDLE state where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSymbols-r17* in TS 37.355 [34], T (ms) corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [34], and T-N>0 is the time required to process duration N of DL PRS symbols already buffered in memory, for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [34],

- N' is UE capability for number of DL PRS resources that it can process in a slot in RRC_IDLE state as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive-r17* specified in TS 37.355 [34].

If the following conditions are met, the time $T_{RSTD,Total}$ starts from the first DL PRS resource(s) instances inside a PTW after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the UE via LPP [34].

- UE is configured with CN eDRX > 10.24 s, and

- periodic PRS measurement reporting is configured, and

- CN eDRX cycle is smaller or equal to the PRS measurement reporting periodicity configured via higher layer parameter *reportingInterval* in TS 37.355 [34], and

- there is one or more PRS resources occurring in PTW.

Otherwise, the time $T_{RSTD,Total}$ starts from the first DL PRS resource(s) after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the UE via LPP [34].

NOTE: No per-positioning frequency layer requirement is applied in scenarios when multiple positioning frequency layers are configured.

If the DRX cycle is reconfigured during the RSCPD with RSTD measurement period, then the measurement period can be longer.

When PRS-RSRP is configured for DL-TDOA with a request to perform RSCPD measurement with RSTD measurement, RSCPD with RSTD and PRS-RSRP are performed over the same measurement period.

When PRS-RSRPP is configured for DL-TDOA with a request to perform RSCPD measurement with RSTD measurement, RSCPD with RSTD and PRS-RSRPP are performed over the same measurement period.The measurement requirements do not apply to any PRS resource that always collides with other higher-priority DL signals/channels, as specified in clause 5.6.1.

Longer RSCPD with RSTD measurement period is expected when there are collisions between PRS resources and other higher-priority DL signals/channels.

If $K_{\text{carrier_PRS}}$ changes for any PFL during the measurement period, the measurement period could be longer.

The measurement requirements do not apply for a PRS resource, if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$.

The measurement requirements do not apply for a PRS resource, if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

The requirements in clause 4.5.5 do not apply if the PRS configuration given by higher layer parameters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-TDOA-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If cell re-selection occurs while RSTD and DL RSCPD measurements are being performed, then the UE shall continue and complete the on-going RSTD and DL RSCPD measurements after the cell selection is completed. The RSTD and DL RSCPD measurement period can be longer.

If the RRC state transition occurs from RRC_IDLE to RRC_CONNECTED state during the measurement period then the UE shall continue the RSTD and DL RSCPD measurement in the RRC_CONNECTED state. The RSTD and DL RSCPD measurement period can be longer.

The UE shall meet the RSTD measurement accuracy requirements in clause 10.1.23.2.

The UE shall meet the DL-RSCPD measurement accuracy requirements in clause 10.1.43.2.

4.6 NR measurements for positioning for RedCap

4.6.1 Introduction

This clause contains requirements for RedCap UE capable of performing NR positioning measurements defined in TS 38.215 [4], including RSTD, PRS-RSRP, and PRS-RSRPP, in RRC_IDLE state.

The requirements in clauses 4.6.2, 4.6.3, and 4.6.4 are applicable to PRS resources that do not collide with other DL signals/channels which include SSB, SIB1, CORESET0, MSG2/MSGB, paging and DL SDT. In addition, a UE is not expected to receive PRS resources that collide with a time interval starting at symbol *m* and ending at symbol $m + N_2$, where symbol *m* is the last symbol in which the UE is configured to receive PDCCH and N_2 is defined in clause 6.4 of TS 38.214 [26] for the subcarrier spacing μ of the DL PRS.

If a PRS resource is outside or partially overlapped with the initial DL BWP, a PRS resource instance collides with another DL signals/channels if any portion of the other DL signal/channel overlaps with the time interval starting X symbols before the PRS instance and ending X symbols after the PRS instance, taking into account *nr-DL- PRS-ExpectedRSTD-Uncertainty* and *nr-DL-PRS-ExpectedRSTD*. Where X is defined in table 5.6.1-1.

All measurement requirements specified in clauses 4.6.2, 4.6.3, and 4.6.4 shall apply for DRX and eDRX configurations specified in TS 38.331 [2] for RRC_IDLE state.

The requirements in clauses 4.6.2, 4.6.3, and 4.6.4 are applicable provided that the cell selection procedure for the selected PLMN defined in TS 38.304 [1] is not triggered during PRS measurement period.

The requirements in clauses 4.6.2, 4.6.3, and 4.6.4 apply provided that all PRS resources within a PFL are within up to 2 separate windows within $T_{PRS,i}$ for each positioning frequency layer *i*, where each window is up to 10 ms and $T_{PRS,i}$ is defined in in clauses 4.6.2, 4.6.3, and 4.6.4.

The UE is not required to perform additional SSB measurement for the SSB configured as QCL source of PRS resources.

When the UE is configured with measurement for more than one positioning requests, the measurement period for each request may be longer than measurement period when UE is configured with measurement for single positioning request.

4.6.2 RSTD measurements for RedCap

4.6.2.1 Introduction

The requirements in clause 4.6.2 shall apply provided the RedCap UE performing PRS measurement with Rx FH or without RX FH in RRC_IDLE state has received *NR-DL-TDOA-RequestLocationInformation* message from the LMF via LPP [34] requesting the UE to measure and report DL RSTD measurements defined in TS 38.215 [4].

4.6.2.2 Requirements Applicability

The requirements in clause 4.6.2 apply for periodic and triggered RSTD measurements, provided:

4.6.2.5 Measurements Period Requirements without RX FH

After receiving both *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message from the LMF via LPP [34], and UE is not configured to perform DL RSTD measurement with RX FH, the UE shall be able to measure multiple (up to the UE capability specified in clause 4.6.2.3) DL RSTD measurements without RX FH, defined in TS 38.215 [4], during the measurement period $T_{RSTD,Total}$ defined in 4.5.2.5.

If the following conditions are met, the time $T_{RSTD,Total}$ starts from the first DL PRS resource(s) instances inside a PTW after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the UE via LPP [34].

- UE is configured with CN eDRX > 10.24 s, and
- periodic PRS measurement reporting is configured, and
- CN eDRX cycle is smaller or equal to the PRS measurement reporting periodicity configured via higher layer parameter *reportingInterval* in TS 37.355 [34], and
- there is one or more PRS resources occurring in PTW.

Otherwise, the time $T_{RSTD,Total}$ starts from the first DL PRS resource(s) after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the UE via LPP [34].

NOTE: No per-positioning frequency layer requirement is applied in scenarios when multiple positioning frequency layers are configured.

If the DRX cycle is reconfigured during the RSTD measurement period, then the measurement period can be longer.

When PRS-RSRP is configured for DL-TDOA, RSTD and PRS-RSRP are performed over the same measurement period.

When PRS-RSRPP is configured for DL-TDOA, RSTD and PRS-RSRPP are performed over the same measurement period.

The measurement requirements do not apply to any PRS resource that always collides with other higher-priority DL signals/channels, as specified in clause 4.6.2.

Longer RSTD measurement period is expected when there are collisions between PRS resources and other higher-priority DL signals/channels.

If $K_{\text{carrier_PRS}}$ changes for any PFL during the measurement period, the measurement period could be longer.

The measurement requirements do not apply for a PRS resource, if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$.

The measurement requirements do not apply for a PRS resource, if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

The requirements in clause 4.6.2.5 do not apply if the PRS configuration given by higher layer parameters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-TDOA-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If cell re-selection occurs while RSTD measurements are being performed, then the UE shall continue and complete the on-going RSTD measurements after the cell selection is completed. The RSTD measurement period can be longer.

If the RRC state transition occurs from RRC_IDLE to RRC_CONNECTED state during the RSTD measurement period then the UE shall continue the RSTD measurement in the RRC_CONNECTED state. The RSTD measurement period can be longer.

The UE shall meet the RSTD measurement accuracy requirements in clause 10.1.23.2.

4.6.2.6 Measurement Period Requirements with RX FH

The requirements in this clause apply when a RedCap UE is requested by the LMF to perform measurements with FH, and UE reports measurement based on multiple hops.

The requirements in clause 4.5.2.5 shall apply with the following modifications.

- N_{sample} = 2 if the UE supports the capability of positioning measurements with reduced number of samples as indicated by *reducedNumOfSampleForMeasurementWithFH-RRC-IdleAndInactive* specified in TS 37.355 [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples.
- A measurement sample with FH is defined as a PRS measurement over multiple hops within a single time window.
- $L_{available_PRS,i} = \sum_{j=1}^{J} N_{hop,i,j} * L_{per-hop,i,j}$, where
  - $N_{hop,i,j}$ is the number of hops that UE can do within a time window occasion *j* as defined in the following, and
  - $L_{per-hop,i,j}$ is the time duration of available PRS resources in the positioning frequency layer *i* in each hop to be measured in time window occasion *j* during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{per-hop,i,j}$, only the PRS resources unmuted and fully or partially overlapped with the sampling duration in each hop are considered;
  - *J* is the number of time window occasions during $T_{available_PRS,i}$.

The sampling window per hop is the first $T_{sample,hop}$ symbols in each hop, where $T_{sample,hop} = T_{hop} - RRT_{FH}$, T_{hop} is the applicable length per hop as defined in table 4.6.2.6-1, and RRT_{FH} is the retuning time between Rx hops as reported by UE in *rf-RxRetuneTimeFR1* or *rf-RxRetuneTimeFR2* via *NR-DL-PRS-ProcessingCapability* [34]. The first hop within a time window instance starts at no earlier than the earliest arrival time of the first unmuted PRS resource fully or partially overlapped with the time window instance considering the *expectedRSTD* and *expectedRSTD-uncertainty* in the PRS assistance data.

Table 4.6.2.6-1: Applicable number of hops per slot and applicable length of each hop

RRT_{FH}	(comb size, Number of PRS symbols)	Applicable number of hops per slot $\left(N_{hops}^{slot}\right)$	Applicable length per hop (T_{hop}) in number of symbols

RRT_{FH} ≤ 2 symbols	(2, 12) with SCS 15 kHz, 30 kHz, 60 kHz in FR2, 120 kHz	2	7
	All others	1	14
2 symbols < RRT_{FH} ≤ 6 symbols	(≤ 6, any)	1	14
	(12, 12)	½	28
RRT_{FH} > 6 symbols	Any combination	½	28

The number of hops within a single time window occasion $N_{hop,i,j}$ is defined as

$$N_{hop,i,j} = min\left(N_{hops,effect,i,j}, \left\lfloor \frac{N3_i}{L_{per-hop,i,j}} \right\rfloor, N_{hop,max,i}\right),$$

where

- $N_{hop,max,i}$ is the maximum number of Rx hops signaled as reported by UE in *maximumFH-Hops* via *NR-DL-PRS-ProcessingCapability* as specified in [34] for positioning frequency layer *i*,
- $N_{hops,effect,i,j}$ is the effective number of Rx hops within a single time window occasion *j*,
  - $N_{hops,effect,i,j} = 2 * N_{rep}^{PRS}$, if $N_{hops}^{slot} = 2$,
  - $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot} = 1$,
  - $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot} = 1/2$ and $M_{rep}^{PRS} > 1$,
  - $N_{hops,effect,i,j} = \left\lfloor \frac{\left(N_{rep}^{PRS}-1\right)}{2} \right\rfloor + 1$, if $N_{hops}^{slot} = 1/2$ and $M_{rep}^{PRS} = 1$,

    where N_{rep}^{PRS} is the number of PRS repetitions within the time window occasion, which are unmuted and fully or partially overlapped with the sampling duration within each hop. M_{rep}^{PRS} is the PRS repetition interval configured by *dl-PRS-ResourceTimeGap* and N_{hops}^{slot} is the applicable number of hops per slot as defined in table 4.6.2.6-1.

The measurement period requirement with the above modifications applies provided all PRS resources in each PFL have the same number of PRS repetitions $\left(N_{rep}^{PRS}\right)$ within a time window instance and the same PRS repetition interval $\left(M_{rep}^{PRS}\right)$, otherwise the measurement period can be longer.

UE shall be able to measure PRS resources with multiple hops at least over the BW of BW_{total} defined as

$$BW_{total} = min\left(BW_{PRS}, N_{hop,i,j} * BW_{per-hop} - \left(N_{hop,i,j} - 1\right) * BW_{overlap}\right),$$

where

BW_{PRS} is the minimum among:

- configured PRS BW, and
- UE capability of maximum PRS BW across all hops indicated via *maximumPRS-BandwidthAcrossAllHopsFR1-r18* or *maximumPRS-BandwidthAcrossAllHopsFR2-r18* as specified in [34], and
- total BW of all hops requested by LMF via *nr-DL-PRS-RxHoppingTotalBandwidth-r18* as specified in [34],

$N_{hop,i,j}$ is number of hops within a single time window as define above,

$BW_{per-hop}$ is the UE capability on PRS BW per hop indicated via *supportedBandwidthPRS-r16* as specified in [34].

$BW_{overlap}$ is the UE capability on BW of the overlapping RB indicated via *numOfOverlappingPRB-r18* as specified in [34].

4.6.3 PRS-RSRP measurements for RedCap

4.6.3.1 Introduction

The requirements in clause 4.6.3 shall apply provided the RedCap UE has received a message from LMF via LPP [34] requesting the RedCap UE to measure and report PRS-RSRP measurements defined in TS 38.215 [4]. And the RedCap UE is capable of supporting the PRS-RSRP measurement in RRC IDLE state.

4.6.3.2 Requirements applicability

The requirements in clause 4.6.3 apply for periodic and triggered PRS-RSRP measurements, provided:

- PRS-RSRP related side conditions given in clause 10.1.23.2 for FR1 are met for a corresponding Band for 1 Rx RedCap UE.
- PRS-RSRP related side conditions given in clause 10.1.23.2 for FR1 and FR2 are met for a corresponding Band for 2 Rx RedCap UE.

4.6.3.3 Measurement Capability

UE PRS-RSRP measurement capability is as indicated by the UE in *NR-DL-AoD-ProvideCapabilities* according to TS 37.355 [34].

4.6.3.4 Measurement Reporting Requirements

The measurement reporting delay is defined as the time between the moment when the periodic measurement report is triggered and the moment when the UE is ready to transmit the measurement report over the air interface. The UE will transition to RRC_CONNECTED state prior to transmitting the measurement report.

For PRS-RSRP measurements performed by the UE in RRC_IDLE state, the measurement reporting delay excludes all of the following:

- any delay caused by other LPP signalling on the DCCH,
- delay uncertainty introduced when inserting the measurement report in the TTI of the uplink DCCH which is equal to 2 x TTI_{DCCH} where TTI_{DCCH} is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration,
- any delay caused by no UL resources for UE to send the measurement report,
- the time needed to transition to RRC_CONNECTED state to report the measurements.

The reported PRS-RSRP measurement values contained in measurement reports shall be based on the measurement report mapping requirements specified in clause 10.1.24.3.

The PRS-RSRP measurement accuracy for all measured PRS resources shall be fulfilled according to the accuracy requirements specified in the clause 10.1.24.2 for FR1 for 1 Rx RedCap UE.

The PRS-RSRP measurement accuracy for all measured PRS resources shall be fulfilled according to the accuracy requirements specified in the clause 10.1.24.2 for FR1 and FR2 for 2 Rx RedCap UE.

4.6.3.5 Measurement Period Requirements without RX FH

When the physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [34], and UE is not configured to perform measurement with RX FH, the UE shall be able to measure multiple (up to the UE capability specified in clause 4.6.3.3) PRS-RSRP measurements, defined in TS 38.215 [4], from configured PRS resources for configured TRPs on configured positioning frequency layers, within $T_{PRS-RSRP,total}$.

$$T_{PRS-RSRP,\,total} = \sum_{i=1}^{L} T_{PRS-RSRP,i} + (L-1) * \max\left(T_{effect,i}\right)$$

Where:

- *i* is the index of positioning frequency layer,
- L is total number of positioning frequency layers,
- $T_{effect,i}$ is the periodicity of the PRS-RSRP measurement in positioning frequency layer *i*.

$$T_{PRS-RSRP,i} = \left(K_{carrier_PRS_RedCap_i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last}$$

Where:

- $K_{carrier_PRS_RedCap_i}$ is a scaling factor for PRS-based NR positioning measurements in RRC_IDLE. If the UE can perform RRM measurement and PRS measurement in parallel to each other, $K_{carrier_PRS_RedCap_i} = 1$. Otherwise,
- If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$, $K_{carrier_PRS_RedCap} = K_{carrier_RedCap} + 1$, where $K_{carrier_RedCap}$ is defined in clause 4.2B.2.4.
- If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$, $K_{carrier_PRS_RedCap} = N_{layers} + 1$, where N_{layer} is defined in clause 4.2.2.7.
- $N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping:
  - $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1 or UE has only 1 Rx branch, and if positioning frequency layer *i* is in FR2 or UE has 2 Rx branches
    - $N_{RxBeam,i}$ equals to the value as UE reported in *supportedLowerRxBeamSweepingFactor-FR2* if the capability is reported by the UE for the band containing positioning frequency layer i, and LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-AoD-RequestLocationInformation*.
    - $N_{RxBeam,i}$ equals to 8, otherwise.
- $L_{available_PRS,i}$ is the time duration of available PRS to be measured in the positioning frequency layer i to be measured during $T_{PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered.
- $N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,
- {N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSymbols-r17* in TS 37.355 [34] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms-r17*in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [34],
- N′ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive-r17* in clause 6.4.3 of TS 37.355 [34],
- N_{sample} is the number of PRS-RSRP measurement samples and
  - N_{sample} = 1, if UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* [34], and the LMF indicates the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples* [34], and the following conditions are met:
    - PRS bandwidth is within the initial BWP and
    - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.
  - N_{sample} = 2, if UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* [34], and the LMF indicates the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples* [34], and the following conditions are not met:
    - PRS bandwidth is within the initial BWP and

- Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

- N_{sample} = 4 otherwise

$T_{last,i} = T_i + T_{available_PRS,i}$ is the measurement duration for the last PRS-RSRP sample, including the sampling time and processing time,

- $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$ is the periodicity of PRS-RSRP measurement in positioning frequency layer *i*,

- T_i corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [34],

- $T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$, the least common multiple between $T_{PRS,i}$ and T_{DRX}.

- $T_{PRS,i}$ is the maximum PRS resource periodicity among all PRS resources in positioning frequency layer i,

- T_{DRX} is the DRX cycle length if UE is not configured with eDRX. Otherwise, T_{DRX} is defined as T in TS 38.304 [1].

If positioning frequency layer *i* has more than one DL PRS resource set with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among the DL PRS resource sets is used to derive $T_{PRS,i}$, where:

- T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

- N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

If the following conditions are met, the time $T_{PRS-RSRP,Total}$ starts from the first DL PRS resource(s) instances inside a PTW after both the *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* messages are delivered from LMF to the UE via LPP [34].

- UE is configured with CN eDRX > 10.24 s, and

- periodic PRS measurement reporting is configured, and

- CN eDRX cycle is smaller or equal to the PRS measurement reporting periodicity configured via higher layer parameter *reportingInterval* in TS 37.355 [34], and

- there is one or more PRS resources occurring in PTW.

Otherwise, the time $T_{PRS-RSRP,Total}$ starts from the first DL PRS resource(s) after both the *NR-DL-TDOAProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* messages are delivered from LMF to the UE via LPP [34].

NOTE: No per-positioning frequency layer requirement is applied in scenarios when multiple positioning frequency layers are configured.

When the PRS-RSRP measurement is configured together with RSTD measurement then the PRS-RSRP measurement shall meet the RSTD measurement requirements defined in clause 4.6.2.

The measurement requirements do not apply for a PRS resource:

- if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$ or

- if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

Longer PRS-RSRP measurement period is expected when there is collision/overlap between other DL signals/channels and PRS resources in RRC_IDLE state.

The requirements in clause 4.6.3 do not apply if the PRS configuration given by higher layer parameters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-AoD-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If the DRX cycle is reconfigured during the PRS-RSRP measurement period, then the PRS-RSRP measurement period can be longer.

If cell reselection occurs while PRS-RSRP measurement is being performed, then the UE shall continue and complete the on-going PRS-RSRP measurement after the cell selection is completed. The PRS-RSRP measurement period can be longer.

If the UE's RRC state changes from the RRC_IDLE to RRC_CONNECTED during the PRS-RSRP measurement period, then the UE shall continue the PRS-RSRP measurement in the RRC_CONNECTED state. The PRS-RSRP measurement period can be longer.

4.6.3.6 Measurement Period Requirements with RX FH

When physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [34], and UE is configured to perform PRS-RSRP measurement with RX FH via *nr-DL-PRS-RxHoppingRequest-r18* as defined in TS 37.355 [34], the UE shall be able to measure multiple (up to the UE capability specified in clause 4.6.3.3) PRS-RSRP measurements, defined in TS 38.215 [4], during the measurement period $T_{PRS-RSRP,Total}$ defined in clause 4.6.3.5 with using the following definition for N_{sample} and $L_{available_PRS,i}$.

N_{sample} is the number of PRS-RSRP measurement samples, where

- N_{sample} = 2 if the RedCap UE supports *reducedNumOfSampleForMeasurementWithFH-RRC-IdleAndInactive* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples.
- N_{sample} = 4 otherwise.

A measurement sample under RX FH is defined as a PRS measurement over multiple hops.

$L_{available_PRS,i}$ is the time duration of available PRS in the positioning frequency layer *i* to be measured, and is calculated by:

$$L_{available_PRS,i} = \sum_{j=1}^{J} N_{hop,i,j} * L_{per-hop,i,j} ,$$

where,

- $N_{hop,i,j}$ is the number of hops that UE can perform within a time window occasion *j* as defined in the following, and
- $L_{per-hop,i,j}$ is the time duration of available PRS resources in the positioning frequency layer *i* in each hop to be measured in time window occasion *j* during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{per-hop,i,j}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered;
- *J* is the number of time window occasions during $T_{available_PRS,i}$.

The sampling duration per hop is the first $T_{sample,hop}$ symbols in each hop, where $T_{sample,hop} = T_{hop} - RRT_{FH}$, T_{hop} is the applicable length per hop as defined in table 4.6.3.6-1, and RRT_{FH} is the retuning time between Rx hops indicated by UE in *rf-RxRetuneTimeFR1* or *rf-RxRetuneTimeFR2* via *NR-DL-PRS-ProcessingCapability* [34]. The first hop starts at no earlier than the earliest arrival time of the first unmuted PRS resource fully or partially overlapped with the measurement time window, defined in clause 4.6.1, taking into account the *expectedRSTD* and *expectedRSTD-uncertainty* in the PRS assistance data.

Table 4.6.3.6-1: Applicable number of hops per slot and applicable length of each hop

RRT_{FH}	(comb size, Number of PRS symbols)	Applicable number of hops per slot (N_{hops}^{slot})	Applicable length per hop ($T_{per-hop}$) in number of symbols

The number of hops within a single time window N_{hop} is defined as

$$N_{hop,i,j} = min\left(N_{hops,effect,i,j}, \left\lfloor \frac{N3_i}{L_{per-hop,i,j}} \right\rfloor, N_{hop,max,i}\right) \quad ,$$

where

- $N_{hop,max,i}$ is the maximum number of Rx hops signaled by UE in *maximumFH-Hops* via *NR-DL-PRS-ProcessingCapability* for positioning frequency layer *i* as specified in [34].

  - $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if N_{hops}^{slot} = 1/2 and M_{rep}^{PRS} >1,
  - $N_{hops,effect,i,j} = \left\lfloor \frac{\left(N_{rep}^{PRS}-1\right)}{2} \right\rfloor + 1$, if N_{hops}^{slot} = 1/2 and M_{rep}^{PRS} =1,

M_{rep}^{PRS} is the PRS repetition interval configured by *dl-PRS-ResourceTimeGap*, N_{hops}^{slot} is the applicable number of hops per slot as defined in table 4.6.3.6-1.

The measurement period requirement with the above modifications applies provided all PRS resources in each PFL have the same number of PRS repetitions $\left(N_{rep}^{PRS}\right)$ within a time window instance and the same PRS repetition interval $\left(M_{rep}^{PRS}\right)$, otherwise the measurement period can be longer.

UE shall be able to measure PRS resources with multiple hops at least over the BW of BW_{total} defined as

$$BW_{total} = min\left(BW_{PRS}, N_{hop,i,j} * BW_{per-hop} - \left(N_{hop,i,j} - 1\right) * BW_{overlap}\right) \quad ,$$

where

BW_{PRS} is the minimum among:

5.1 Cell Re-selection

5.1.1 Introduction

The cell reselection procedure allows the UE to select a more suitable cell and camp on it.

When the UE is in *Camped Normally* state on a cell, the UE shall attempt to detect, synchronise, and monitor intra-frequency, inter-frequency and inter-RAT cells indicated by the serving cell. For intra-frequency and inter-frequency cells the serving cell may provide explicit neighbour list, or only carrier frequency information and bandwidth information. UE measurement activity is also controlled by measurement rules defined in TS 38.304 [1], allowing the UE to limit its measurement activity. For inter-frequency cell re-selection, when NTN carrier is not configured, requirements in clause 5.1.2.4 apply and when NTN carrier is configured, requirements in clause 5.1.2.8 shall be applied.

5.1.2 Requirements

5.1.2.1 UE measurement capability

The requirements in clause 4.2.2.1 shall apply.

5.1.2.2 Measurement and evaluation of serving cell

The requirements in this clause apply when UE is configured with eDRX_IDLE, otherwise the requirements in clause 4.2.2.2 shall apply.

When UE is configured with eDRX_IDLE and UE is not configured with eDRX by *ran-ExtendedPagingCycleConfig-r18* or *eDRX-AllowedInactive-r18* is not signalled in SIB1, the UE shall measure the SS-RSRP and SS-RSRQ level of the serving cell and evaluate the cell selection criterion S defined in TS 38.304 [1] for the serving cell at least once every M1* T for FR1 and N1*T for FR2; where:

- T is determined according to clause 7.1 in [1],
- M1=2 if SMTC periodicity (T_{SMTC}) > 20 ms and T $\leq$ 0.64 second, otherwise M1=1.

When UE is configured with eDRX_IDLE and eDRX by *ran-ExtendedPagingCycleConfig-r18* and *eDRX-AllowedInactive-r18* is signalled in SIB1, within a single eDRX INACTIVE PTW, the UE shall measure the SS-RSRP and SS-RSRQ level of the serving cell and evaluate the cell selection criterion S defined in TS 38.304 [1] for the serving cell at least once every M1* T for FR1 and N1*T for FR2; where:

- T is determined according to clause 7.1 in [1],
- M1=2 if SMTC periodicity (T_{SMTC}) > 20 ms and T $\leq$ 0.64 second, otherwise M1=1.

The UE shall filter the SS-RSRP and SS-RSRQ measurements of the serving cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by, at least T/2.

If UE is not configured with eDRX by *ran-ExtendedPagingCycleConfig-r18* or *eDRX-AllowedInactive-r18* is not signalled in SIB1 and the UE has evaluated according to table 5.1.2.2-1 or table 5.1.2.2-2 in N_{serv} consecutive T cycles that the serving cell does not fulfil the cell selection criterion S, the UE shall initiate the measurements of all neighbour cells indicated by the serving cell, regardless of the measurement rules currently limiting UE measurement activities.

If UE is configured with eDRX by *ran-ExtendedPagingCycleConfig-r18* and *eDRX-AllowedInactive-r18* is signalled in SIB1 and the UE has evaluated according to table 5.1.2.2-3 or table 5.1.2.2-4 in N_{serv} consecutive T within a single eDRX INACTIVE PTW that the serving cell does not fulfil the cell selection criterion S, the UE shall initiate the measurements of all neighbour cells indicated by the serving cell, regardless of the measurement rules currently limiting UE measurement activities.

NOTE 1: Applies for UE of all FR2 power class. NOTE 2: eDRX INACTIVE PTW in this table is RAN configured PTW. NOTE 3: N_{serv} requirements are only defined within a single eDRX INACTIVE PTW duration. NOTE 4: T is determined according to clause 7.1 in [1]. NOTE 5: The eDRX_INACTIVE cycle lengths are as specified in section 10.5.5.32 of TS 24.008 [42]. NOTE 6: The lower bound of PTW length is derived based on $\left\lceil \frac{Nserv * DRX_cycle}{1.28} \right\rceil * 1.28$. NOTE 7: When eDRX=20.48 s and DRX=0.32 s, UE is allowed to perform cell evaluation within PTW in every 2 eDRX cycles.				

If UE is not configured with eDRX_INACTIVE ≥ 20.48 s, when UE transitions from measurements within eDRX_IDLE PTW to measurements outside eDRX_IDLE PTW or vice versa during one measurement period, the UE measurement requirements apply based on the longer measurement period requirements before or after the transition.

When the UE transitions between any two states when changing eDRX_IDLE cycle length, eDRX_INACTIVE cycle length, INACTIVE RAN DRX length or changing PTW configuration, the UE shall meet the transition requirement, which is the less stringent requirement of the two requirements corresponding to the first state and the second state, during the transition time interval which is the time corresponding to the transition requirement. After the transition time interval, the UE shall meet the requirement corresponding to the second state.

If the UE in RRC_INACTIVE has not found any new suitable cell based on searches and measurements using the intra-frequency, inter-frequency and inter-RAT information indicated in the system information during the time T', the UE shall initiate cell selection procedures for the selected PLMN as defined in TS 38.304 [1], where:

- T'= 10 s, if the UE is not configured with eDRX_INACTIVE cycle, or
- T'= MAX (10 s, one eDRX_INACTIVE cycle) if the UE is configured with eDRX_INACTIVE cycle for FR1, or
- T'= MAX (10 s, N1* eDRX_INACTIVE cycle) if the UE is configured with eDRX_INACTIVE cycle for FR2.

5.1.2.3 Measurements of intra-frequency NR cells

When UE is configured with eDRX_IDLE and UE is not configured with eDRX by *ran-ExtendedPagingCycleConfig-r18* or *eDRX-AllowedInactive-r18* is not signalled in SIB1, the requirements defined in section 4.2.2.3 shall apply with T_{detect,NR_Intra}, $T_{measure,NR_Intra}$ and $T_{evaluate,NR_Intra}$ defined in table 5.1.2.3-1 and table 5.1.2.3-2.

After the transition time interval, the UE shall meet the requirement corresponding to the second state.

5.1.2.6 Maximum interruption in paging reception

The requirements in clause 4.2.2.6 shall apply.

5.1.2.7 General requirements

When configured with eDRX_INACTIVE, the UE shall search every layer of higher priority at least every $T_{higher_priority_search}$, where $T_{higher_priority_search}$ is defined as follows:

- $T_{higher_priority_search}$ = max(60, 15*eDRX_INACTIVE cycle length) * N_{layers} seconds if eDRX_INACTIVE cycle ≤ 10.24 s,

- $T_{higher_priority_search}$ = max(60, ceil (15/$N_{DRX-PTW}$)*eDRX_INACTIVE cycle length) * N_{layers} seconds if eDRX_INACTIVE cycle > 10.24 s, where $N_{DRX-PTW}$ is the number of RAN DRX cycles within a single RAN configured PTW.

Otherwise, if the UE is not configured with eDRX_INACTIVE cycle, the UE shall search every layer of higher priority at least every $T_{higher_priority_search}$ = (60 * N_{layers}) seconds.

N_{layers} is the total number of higher priority NR and E-UTRA carrier frequencies broadcasted in system information. For a UE configured with early measurement reporting, while T331 is running, N_{layers} is the combined total number of higher priority NR and E-UTRA carrier frequencies broadcasted in system information and carriers configured for idle mode CA measurements.

NOTE: Combined total number means that if a carrier is a high priority carrier and additionally a carrier configured for idle mode CA measurements, it only counts as one carrier.

If UE is not configured to perform PRS measurement, or if UE is configured to perform PRS measurement and supports *parallelPRS-MeasRRC-Inactive-r17*, the requirements in this clause shall apply.

If UE is configured to perform PRS measurement but does not support *parallelPRS-MeasRRC-Inactive-r17*, the requirements in this clause shall apply with N_{layers} being replaced with N_{layers} + 1.

5.1.2.8 Measurement of inter-frequency NR cells with NTN carrier

This clause applies for the inter-frequency cell re-selection from TN to NTN only in FR1-NTN. The requirements in clause 4.2.2.12 shall apply.

5.1.2.9 Minimum requirement at transitions

The requirements in sub-clause 4.2.2.8 shall apply.

5.1.2.10 Measurements of intra-frequency NR cells for UE configured with relaxed measurement criterion

The requirements in clause 4.2.2.9 apply for UE configured with relaxed measurement criterion except when UE is configured with eDRX_IDLE cycle greater than 10.24 s and UE has fulfilled low mobility criterion or not-at-cell edge criterion.

If the UE is configured with eDRX_IDLE cycle greater than 10.24 s in FR1 and FR2, and UE has fulfilled low mobility criterion or not-at-cell edge criterion, then the requirements in table 5.1.2.10-1 and table 5.1.2.10-2 respectively apply provided that eDRX cycle is ≤ [10485.76] sec.

The requirements in clause 4.2.2.11 apply for UE configured with relaxed measurement criterion except when UE is configured with eDRX_IDLE cycle greater than 10.24 s and UE has fulfilled low mobility criterion or not-at-cell edge criterion.

5.1A Cell Re-selection with CCA

5.1A.1 Introduction

The cell reselection procedure allows the UE to select a more suitable cell and camp on it. The requirements in subclauses 5.1A.2.3, 5.1A.2.4, and 5.1A.2.6 apply when at least the target cell is on a carrier frequency with CCA, and the requirements in subclauses 5.1A.2.2 and 5.1A.2.5 apply when at least the camping cell is on a carrier frequency with CCA.

When the UE is in *Camped Normally* state on a cell, the UE shall attempt to detect, synchronise, and monitor intra-frequency, inter-frequency and inter-RAT cells indicated by the serving cell. For intra-frequency and inter-frequency cells the serving cell may provide explicit neighbour list, or only carrier frequency information and bandwidth information. UE measurement activity is also controlled by measurement rules defined in TS 38.304 [1], allowing the UE to limit its measurement activity.

5.1A.2 Requirements

5.1A.2.1 UE measurement capability

The requirements in clause 4.2A.2.1 shall apply.

5.1A.2.2 Measurement and evaluation when CCA is used on the serving cell

The requirements in clause 4.2A.2.2 shall apply.

5.1A.2.3 Measurements of intra-frequency NR cells when CCA is used on the serving cell and target cell

The requirements in clause 4.2A.2.3 shall apply.

5.1A.2.4 Measurements of inter-frequency NR cells when CCA is used on the target cell

The requirements in clause 4.2A.2.4 shall apply.

5.1A.2.5 Measurements of inter-RAT E-UTRAN cells when CCA is used on the serving cell

The requirements in clause 4.2.2.5 shall apply.

5.1A.2.6 Maximum interruption in paging reception when CCA is used on the target cell

The requirements in clause 4.2A.2.6 shall apply.

5.1A.2.7 General requirements

The requirements in clause 4.2.2.7 shall apply.

5.1B Cell Re-selection for RedCap

5.1B.1 Introduction

5.1B.2 Requirements

5.1B.2.1 UE measurement capability

The requirements in clause 4.2B.2.1 shall apply.

5.1B.2.2 Measurement and evaluation of serving cell

The requirements in clause 4.2B.2.2 shall apply when UE is not configured with eDRX_IDLE.

When UE is configured with eDRX_IDLE and UE is not configured with eDRX by *ran-ExtendedPagingCycleConfig-r18* or *eDRX-AllowedInactive-r18* is not signalled in SIB1, the UE shall measure the SS-RSRP and SS-RSRQ level of the serving cell and evaluate the cell selection criterion S defined in TS 38.304 [1] for the serving cell at least once every M1* T for FR1 and N1*T for FR2; where:

- T is determined according to clause 7.1 in [1],
- M1=2 if SMTC periodicity (T_{SMTC}) > 20 ms and T $\leq$ 0.64 second, otherwise M1=1.

When UE is configured with eDRX_IDLE and eDRX by *ran-ExtendedPagingCycleConfig-r18* and *eDRX-AllowedInactive-r18* is signalled in SIB1, within a single eDRX INACTIVE PTW, the UE shall measure the SS-RSRP and SS-RSRQ level of the serving cell and evaluate the cell selection criterion S defined in TS 38.304 [1] for the serving cell at least once every M1* T for FR1 and N1*T for FR2; where:

- T is determined according to clause 7.1 in [1],
- M1=2 if SMTC periodicity (T_{SMTC}) > 20 ms and T $\leq$ 0.64 second, otherwise M1=1.

The UE shall filter the SS-RSRP and SS-RSRQ measurements of the serving cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by, at least T/2.

If UE is not configured with eDRX by *ran-ExtendedPagingCycleConfig-r18* or *eDRX-AllowedInactive-r18* is not signalled in SIB1 and the UE has evaluated according to table 5.1B.2.2-1or table 5.1B.2.2-2 in N_{serv_RedCap} consecutive T that the serving cell does not fulfil the cell selection criterion S, the UE shall initiate the measurements of all neighbour cells indicated by the serving cell, regardless of the measurement rules currently limiting UE measurement activities.

If UE is configured with eDRX by *ran-ExtendedPagingCycleConfig-r18* and *eDRX-AllowedInactive-r18* is signalled in SIB1 and the UE has evaluated according to table 5.1B.2.2-3 or table 5.1B.2.2-4 in N_{serv_RedCap} consecutive T within a single eDRX INACTIVE PTW that the serving cell does not fulfil the cell selection criterion S, the UE shall initiate the measurements of all neighbour cells indicated by the serving cell, regardless of the measurement rules currently limiting UE measurement activities.

NOTE 3: The number of RAN DRX cycles in this table is given for the DRX cycles within RAN configured PTWs.
NOTE 4: eDRX INACTIVE PTW in this table is RAN configured PTW.

NOTE 8: The lower bound of PTW length is derived based on $\left\lceil \frac{Nserv_RedCap * DRX_cycle}{1.28} \right\rceil * 1.28$.
NOTE 9: When eDRX=20.48 s and DRX=0.32 s, UE is allowed to perform cell evaluation within PTW in every 2 eDRX cycles.

If UE is not configured with eDRX_INACTIVE ≥ 20.48 s, when UE transitions from measurements within eDRX_IDLE PTW and to measurements outside eDRX_IDLE PTW or vice versa during one measurement period, the UE measurement requirements apply based on the longer measurement period requirements before or after the transition.

When the UE transitions between any two states when changing eDRX_IDLE cycle length, eDRX_INACTIVE cycle length, INACTIVE RAN DRX length or changing PTW configuration, the UE shall meet the transition requirement, which is the less stringent requirement of the two requirements corresponding to the first state and the second state, during the transition time interval which is the time corresponding to the transition requirement. After the transition time interval, the UE shall meet the requirement corresponding to the second state.

If the UE in RRC_INACTIVE has not found any new suitable cell based on searches and measurements using the intra-frequency, inter-frequency and inter-RAT information indicated in the system information during the time T', the UE shall initiate cell selection procedures for the selected PLMN as defined in TS 38.304 [1], where

- T'= 10 s, if the UE is not configured with eDRX_INACTIVE cycle, or
- T'= MAX (10 s, one eDRX_INACTIVE cycle) if the UE is configured with eDRX_INACTIVE cycle for FR1, or
- T'= MAX (10 s, N1* eDRX_INACTIVE cycle) if the UE is configured with eDRX_INACTIVE cycle for FR2.

5.1B.2.3 Measurements of intra-frequency NR cells

5.1E Cell Re-selection for RedCap UE with Satellite Access

5.1E.1 Introduction

The cell reselection procedure allows the UE to select a more suitable cell and camp on it.

When the UE is in *Camped Normally* state on a cell, the UE shall attempt to detect, synchroniZe, and monitor intra-frequency, inter-frequency and inter-RAT cells indicated by the serving cell. For intra-frequency, inter-frequency and inter-RAT cells the serving cell may provide explicit neighbour list, or only carrier frequency information and bandwidth information. UE measurement activity is also controlled by measurement rules defined in TS 38.304 [1], allowing the UE to limit its measurement activity. The requirements in this clause shall apply for the quasi-earth_fixed cell and the earth_moving cell.

The 1 Rx RedCap UE for performing the cell reselection procedure [1] applies:

- *Qrxlevmin* as the signaled value of *Qrxlevmin* [2] -1 dB.
- *Qqualmin* as the signaled value of *Qqualmin* [2] -1 dB.

5.1E.2 Requirements

5.1E.2.1 UE measurement capability

The requirements in clause 4.2E.2.1 shall apply.

5.1E.2.2 Measurement and evaluation of serving cell

The requirements in clause 4.2E.2.2 shall apply when UE is not configured with eDRX_IDLE.

When UE is configured with eDRX_IDLE and UE is not configured with eDRX by *ran-ExtendedPagingCycleConfig-r18* or *eDRX-AllowedInactive-r18* is not signalled in SIB1, the UE shall measure the SS-RSRP and SS-RSRQ level of the serving cell and evaluate the cell selection criterion S defined in TS 38.304 [1] for the serving cell at least once every M1* T for FR1; where:

- T is determined according to clause 7.1 in [1],
- M1=2 if SMTC periodicity (T_{SMTC}) > 20 ms and T $\leq$ 0.64 second, otherwise M1=1.

When UE is configured with eDRX_IDLE and eDRX by *ran-ExtendedPagingCycleConfig-r18* and *eDRX-AllowedInactive-r18* is signalled in SIB1, within a single eDRX INACTIVE PTW, the UE shall measure the SS-RSRP and SS-RSRQ level of the serving cell and evaluate the cell selection criterion S defined in TS 38.304 [1] for the serving cell at least once every M1* T for FR1; where:

- T is determined according to clause 7.1 in [1],
- M1=2 if SMTC periodicity (T_{SMTC}) > 20 ms and T $\leq$ 0.64 second, otherwise M1=1.

The UE shall filter the SS-RSRP and SS-RSRQ measurements of the serving cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by, at least T/2.

If UE is not configured with eDRX by *ran-ExtendedPagingCycleConfig-r18* or *eDRX-AllowedInactive-r18* is not signalled in SIB1 and the UE has evaluated according to table 5.1E.2.2-1 in N_{serv_RedCap} consecutive T that the serving cell does not fulfil the cell selection criterion S, the UE shall initiate the measurements of all neighbour cells indicated by the serving cell, regardless of the measurement rules currently limiting UE measurement activities.

NOTE 1: T is determined according to clause 7.1 in [1]. NOTE 2: M1=2 if SMTC periodicity (T_{SMTC}) > 20 ms and T≤ 0.64 second, otherwise M1=1.			

When the UE transitions between any two states when changing eDRX_IDLE cycle length, eDRX_INACTIVE cycle length, the UE shall meet the transition requirement, which is the less stringent requirement of the two requirements corresponding to the first state and the second state, during the transition time interval which is the time corresponding to the transition requirement. After the transition time interval, the UE shall meet the requirement corresponding to the second state.

If the UE in RRC_INACTIVE has not found any new suitable cell based on searches and measurements using the intra-frequency, inter-frequency and inter-RAT information indicated in the system information during the time T', the UE shall initiate cell selection procedures for the selected PLMN as defined in TS 38.304 [1], where

- T'= 10 s, if the UE is not configured with eDRX_INACTIVE cycle, or
- T'= MAX (10 s, one eDRX_INACTIVE cycle) if the UE is configured with eDRX_INACTIVE cycle for FR1

The requirements in this clause are applicable when the UE is configured with timing alignment (TA) validation using *cg-SDT-RSRP-ChangeThreshold* for transmitting in uplink using CG-SDT as specified in TS 38.331 [2].

5.5.2 Requirements on UE synchronization for small data transmissions

The requirements in this clause are applicable for the UE performing small data transmissions using configured resources as TS 38.331 [2].

The UE is allowed to transmit using the configured uplink resources provided that the UE is synchronized towards (i.e. using the timing derived using the latest available N_{TA} value as specified in subclause 7.1.2) the serving cell prior to transmission. If the UE is not able to obtain the synchronization towards the serving cell, then the UE shall drop the small data transmission. The UE determines the small data transmission occasion according to the received CG-SDT configuration [2].

5.5.3 TA validation requirements

When *cg-SDT-RSRP-ChangeThreshold* [2] is configured for TA validation based on the RSRP change criterion according to clause 5.8.2 in TS 38.331 [7], the UE is allowed to transmit using CG-SDT using the timing derived using the latest available N_{TA} value as specified in subclause 7.1 provided that

- the first RSRP ($RSRP_1$) measurement and the second RSRP ($RSRP_2$) measurements used in the TA validation are valid measurements and,
- timing alignment validation for transmission using CG-SDT is valid according to the validation criteria in clause 5.8.2 in TS 38.321 [7].

$RSRP_1$ and $RSRP_2$ are considered valid provided that the conditions in table 5.5.3-1 are met for FR1 when UE is not configured with any eDRX cycle by serving gNB or core network.

$RSRP_1$ and $RSRP_2$ are considered valid provided that the conditions in table 5.5.3-2 are met for FR2-1 regardless of whether the UE is configured with eDRX cycle by serving gNB or core network (AMF).

$RSRP_1$ and $RSRP_2$ are considered valid provided that the conditions in table 5.5.3-3 are met for FR1 when UE is configured:

- only with CN eDRX cycle ($T_{eDRX-CN}$) by the core network (AMF), or
- with both RAN eDRX cycle ($T_{eDRX-RAN}$) by serving gNB and CN eDRX cycle ($T_{eDRX-CN}$) by the core network (AMF) and $T_{eDRX-RAN} \leq 10.24$s.

$RSRP_1$ and $RSRP_2$ are considered valid provided that the conditions in table 5.5.3-1 are met for FR1 when UE is configured with both RAN eDRX cycle ($T_{eDRX-RAN}$) by serving gNB and CN eDRX cycle ($T_{eDRX-CN}$) by the core network (AMF) and $T_{eDRX-RAN} > 10.24$s.

$RSRP_2$	$(T2 - \min(640\text{ ms}, M1*T)) \leq T2' \leq T2$
NOTE 1: T is determined according to clause 7.1 in [1].	

If at least one of $RSRP_1$ and $RSRP_2$ is considered to be invalid based on the above conditions, then the UE shall not validate the CG-SDT using $RSRP_1$ and $RSRP_2$ and shall not transmit using CG-SDT. Additionally, for the initial CG-SDT transmission, the UE shall not transmit in an CG-SDT occasion that occurs more than 640 ms after T2.

Where:

- T1 is the time when
  - *RRCRelease* with CG-SDT configuration (TS 38.331 [2]) is received, or
  - the latest TA is received if TA is received while in RRC_INACITVE state.

- T1' is the time when the UE has completed $RSRP_1$.
- T2 is the time when the UE performs TA validation as defined in clause 5.27.2 in (TS 38.321 [7]) for transmission using CG-SDT.
- T2' is the time when the UE has completed $RSRP_2$.
- T_{DRX} is the DRX cycle length in ms.
- M1 the scaling factor as defined in clause 4.2.2.2.

5.5.4 Scheduling restriction

5.5.4.1 Scheduling availability of UE performing measurements in TDD bands on FR1

When the UE performs intra-frequency measurements in a TDD band, the following restrictions apply due to SS-RSRP measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration.

When the UE performs intra-frequency measurements in a TDD band, the following restrictions apply due to SS-RSRQ measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB to be measured/RSSI symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration.

5.5.4.2 Scheduling availability of UE performing measurements with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UE which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to SS-RSRP/RSRQ measurement

- If *deriveSSB_IndexFromCell* is enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration.
- If *deriveSSB_IndexFromCell* is not enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH on all symbols within SMTC window duration.

For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to measurement of serving cell.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/ on SSB symbols of the serving cell.

5.5.4.3 Scheduling availability of UE performing measurements on FR2

The following scheduling restriction applies due to SS-RSRP measurement on an FR2 intra-frequency cell

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration (The signalling *deriveSSB_IndexFromCell* is always enabled for FR2).

The following scheduling restriction applies to SS-RSRQ measurement on an FR2 intra-frequency cell

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/ on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB to be measured/RSSI

symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration (The signalling *deriveSSB_IndexFromCellc* is always enabled for FR2).

The following scheduling restriction applies to measurement on an FR2 serving cell

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/ on SSB symbols of the serving cell.

5.5.5 Applicability conditions for SDT

The UE is not required to meet the following measurement requirements during subsequent SDT transmissions:

- Measurements of inter-frequency NR cells in clause 5.1.2.4

The requirements in this clause are applicable for 1 Rx (e)RedCap and 2 Rx (e)RedCap UEs with FR1-NTN when the UE is configured with timing alignment (TA) validation for transmitting in uplink using CG-SDT as specified in TS 38.331 [2].

The 1 Rx (e)RedCap UE for determining whether to perform SDT procedure defined in clause 5.27 [7] applies:

- *sdt-RSRP-Threshold-r17* as the signaled value of *sdt-RSRP-Threshold-r17* [2] + 1 dB.

5.5E.2 Requirements on UE synchronization for small data transmissions

The requirements in this clause are applicable for the UE performing small data transmissions using configured resources as TS 38.331 [2].

The UE is allowed to transmit using the configured uplink resources provided that the UE is synchronized towards (i.e. using the timing derived using the latest available N_{TA}, $N_{\mathrm{TA,adj}}^{\mathrm{common}}$, and $N_{\mathrm{TA,adj}}^{\mathrm{UE}}$ values as specified in subclause 7.1E.2) the serving cell prior to transmission. If the UE is not able to obtain the synchronization towards the serving cell, then the UE shall drop the small data transmission. The UE determines the small data transmission occasion according to the received CG-SDT configuration [2].

5.5E.3 TA validation requirements

The UE is allowed to transmit using CG-SDT using the timing derived using the latest available N_{TA}, $N_{TA,adj}^{common}$, and $N_{TA,adj}^{UE}$ values as specified in subclause 7.1C before CG-SDT transmission provided that

- timing alignment validation for transmission using CG-SDT is valid according to the validation criteria in clause 5.8.2 in TS 38.321 [7], and
- either *cg-SDT-TimeAlignmentTimer* is not configured or *cg-SDT-TimeAlignmentTimer* is running as confirmed by lower layers, as defined in clause 5.27.2 in TS 38.321 [7] with UE expected to not perform any threshold comparison against *cg-SDT-RSRP-ChangeThreshold*.

Additionally, for the initial CG-SDT transmission, the UE shall not transmit in an CG-SDT occasion that occurs more than 640ms after T2, where T2 is the time when the UE performs TA validation as defined in clause 5.27.2 in (TS 38.321 [7]) for transmission using CG-SDT.

5.5E.4 Scheduling restriction

The requirements in clause 5.5.4 shall apply for (e)RedCap UEs with FR1-NTN.

5.5E.5 Applicability conditions for SDT

The UE is not required to meet the following measurement requirements during subsequent SDT transmissions:

- Measurements of inter-frequency NR cells in clause 5.1E.2.4
- Measurements of inter-RAT E-UTRAN cells in clause 5.1E.2.5

5.6 NR measurements for positioning

5.6.1 Introduction

This clause contains requirements for UE capable of performing NR positioning measurements defined in TS 38.215 [4], including RSTD, PRS-RSRP, UE Rx-Tx time difference, PRS-RSRPP, RSCPD and RSCP in RRC_INACTIVE state. For RSTD and UE Rx-Tx time difference, measurement requirements are specified both with and without aggregation of PRS resources from multiple PFLs. Requirements for RSCPD are specified only for measurements reported together with RSTD. Requirements for RSCP are specified only for measurements reported together with UE Rx-Tx time difference measurement.

The requirements in clauses 5.6.2, 5.6.3, 5.6.4, 5.6.5, 5.6.7, and 5.6.8 are applicable to PRS resources that do not collide with other DL signals/channels which include SSB, SIB1, CORESET0, MSG2/MSGB, paging and DL SDT. In addition, a UE is not expected to receive PRS resources that collide with a time interval starting at symbol *m* and ending at symbol $m + N_2$, where symbol *m* is the last symbol in which the UE is configured to receive PDCCH and N_2 is defined in clause 6.4 of TS 38.214 [26] for the subcarrier spacing μ of the DL PRS.

If a PRS resource is outside or partially overlapped with the initial DL BWP, a PRS resource instance collides with another DL signal/channel if any portion of the other DL signal/channel overlaps with the time interval starting X symbols before the PRS instance and ending X symbols after the PRS instance, taking into account *nr-DL- PRS-ExpectedRSTD-Uncertainty* and *nr-DL-PRS-ExpectedRSTD,* where X is defined in table 5.6.1-1.

Table 5.6.1-1: Value of X number of symbols

FR	μ	NR Slot length (ms)	X symbols
FR1	0	1	7
	1	0.5	14
	2	0.25	28
FR2	2	0.25	14
	3	0.125	28

NOTE 1: The FR1 value applies if one or both of the serving cell and the positioning frequency layer are in FR1. FR2 value applies if both of the serving cell and the positioning frequency layer are in FR2.

Measurement requirements specified in clauses 5.6.2, 5.6.3, 5.6.4, 5.6.5, 5.6.7, and 5.6.8 shall apply for any DRX and eDRX configuration specified in TS 38.331 [2].

The requirements in clauses 5.6.2, 5.6.3, 5.6.4, 5.6.5, 5.6.7, and 5.6.8 are applicable provided that the cell selection procedure for the selected PLMN defined in TS 38.304 [1] is not triggered during PRS measurement period.

The requirements in clauses 5.6.2, 5.6.3, 5.6.4, 5.6.5, 5.6.7, and 5.6.8 apply provided that:

- all PRS resources within a PFL are within up to 2 separate windows within $T_{PRS,i}$ for each positioning frequency layer *i* as defined in clauses 5.6.2, 5.6.3, 5.6.4 and 5.6.5, where each window is up to 10 ms.

The UE is not required to perform additional SSB measurement for the SSB configured as QCL source of PRS resources.

When the UE is configured with measurement for more than one positioning requests, the measurement period for each request may be longer than measurement period when UE is configured with measurement for single positioning request.

5.6.1A Cell re-selection for positioning

The requirements in this clause apply when UE is configured to perform SRS transmission for positioning.

The requirements in clause 5.1.2 shall apply in the following conditions.

- UE is not configured with eDRX_IDLE, or
- UE is configured with eDRX_IDLE but without eDRX_INACTIVE, or
- UE is configured with both eDRX_IDLE and eDRX_INACTIVE, and eDRX_INACTIVE cycle is smaller or equal to T_{POS},

where T_{POS} is

- SRS transmission periodicity, if UE is configured to only perform SRS transmission for positioning, or if UE is configured to both perform PRS measurements without periodic reporting and to perform SRS transmission for positioning,
- the minimum of PRS measurement reporting periodicity and SRS transmission periodicity, if UE is configured to both perform PRS measurements with periodic reporting and to perform SRS transmission for positioning.

NOTE: PRS measurement reporting periodicity is the configured *reportingInterval* in *RequestLocationInformation as defined in [34]*.

When UE is configured with both eDRX_IDLE and eDRX_INACTIVE, and eDRX_INACTIVE cycle is larger than T_{POS}, the requirements in clause 5.1.2 except clauses 5.1.2.2 and 5.1.2.3 shall apply, and the requirements in clause 5.6.1A.1 apply for measurement and evaluation of serving cell, and the requirements in clause 5.6.1A.2 apply for measurements of intra-frequency NR cells.

5.6.1A.1 Measurement and evaluation of serving cell

When UE is configured with both eDRX_IDLE and eDRX_INACTIVE, and eDRX_INACTIVE cycle is larger than T_{POS}, the UE shall measure the SS-RSRP and SS-RSRQ level of the serving cell and evaluate the cell selection criterion S defined in TS 38.304 [1] for the serving cell at least once every $M1*T_{serv}$ for FR1 and $N1* T_{serv}$ for FR2; where:

- T_{serv} is defined as $\max(T_{DRX}, T_{POS})$, where
  - T_{DRX} is defined as T in clause 7.1 TS 38.304 [1] when RAN eDRX <= 10.24s and CN eDRX <= 10.24s

- T_{DRX} is the maximum of the T inside and outside of the CN PTW, where T inside and outside of the CN PTW are defined in clause 7.1 TS 38.304 [1], when RAN eDRX <= 10.24s and CN eDRX > 10.24s

- T_{DRX} is the maximum of the DRX cycles within the CN PTW and the RAN PTW when RAN eDRX > 10.24 s

- M1=2 if SMTC periodicity (T_{SMTC}) > 20 ms and $T_{serv} \leq 0.64$ second, otherwise M1=1.

- The serving cell measurement is not limited to PTW.

The UE shall filter the SS-RSRP and SS-RSRQ measurements of the serving cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by, at least $T_{serv}/2$.

If the UE has evaluated according to table 5.6.1A.1-1 or table 5.6.1A.1-2 in N_{serv} consecutive T_{serv} that the serving cell does not fulfil the cell selection criterion S, the UE shall initiate the measurements of all neighbour cells indicated by the serving cell, regardless of the measurement rules currently limiting UE measurement activities.

		1.28 ≤ T_{serv} < 2.56	4	2*N1
		2.56 ≤ T_{serv}	3	2*N1

If the UE in RRC_INACTIVE has not found any new suitable cell based on searches and measurements using the intra-frequency, inter-frequency and inter-RAT information indicated in the system information during the time T', the UE shall initiate cell selection procedures for the selected PLMN as defined in TS 38.304 [1], where

- T' = MAX (10 s, one eDRX_INACTIVE cycle) for FR1, or

- T'= MAX (10 s, N1* eDRX_INACTIVE cycle) for FR2.

5.6.1A.2 Measurements of intra-frequency NR cells

When UE is configured with both eDRX_IDLE and eDRX_INACTIVE, and eDRX_INACTIVE cycle is larger than T_{POS}, the requirements defined in section 5.1.2.3 shall apply with T_{detect,NR_Intra}, $T_{measure,NR_Intra}$ and $T_{evaluate,NR_Intra}$ defined in table 5.6.1A.2-1 and table 5.6.1A.2-2, where

- T_{serv} is defined as max(T_{DRX}, T_{POS}), where

  - T_{DRX} is the maximum of the DRX cycles within the CN PTW and the RAN PTW when RAN eDRX > 10.24 s

- M2 = 1.5 if SMTC periodicity of measured intra-frequency cell > 20 ms; otherwise M2=1.

- The detection, measurement and evaluation of intra-frequency neighbour cells are not limited to PTW.

5.6.2 RSTD measurements

5.6.2.1 Introduction

The requirements in clause 5.6.2 shall apply provided the UE has received *NR-DL-TDOA-RequestLocationInformation* message from the LMF via LPP [34] requesting the UE to measure and report DL RSTD measurements defined in TS 38.215 [4].

5.6.2.2 Requirements Applicability

The requirements in clause 5.6.2 apply for periodic and triggered RSTD measurements, provided:

- PRS-RSTD related side conditions given in clause 10.1.23.2 for FR1 and FR2 are fulfilled, for a corresponding Band.

5.6.2.3 Measurement Capability

The UE PRS RSTD measurement capability in RRC_INACTIVE state is as indicated by the UE in *NR-DL-TDOA-ProvideCapabilities*, according to TS 37.355 [34].

5.6.2.4 Measurement Reporting Requirements

The measurement reporting delay is defined as the time between the moment when the periodic measurement report is triggered and the moment when the UE is ready to transmit the measurement report over the air interface. If the UE supports reporting of NR positioning measurements via SDT, the UE may be able to report the measurements while it remains in RRC_INACTIVE state; otherwise, the UE will transition to RRC_CONNECTED state prior to transmitting the measurement report.

For RSTD measurements performed by the UE in RRC_INACTIVE state, the measurement reporting delay excludes all of the following:

- additional delay caused by other LPP signalling on the DCCH,
- delay uncertainty introduced when inserting the measurement report in the TTI of the uplink DCCH, equal to 2 x TTI_{DCCH} where TTI_{DCCH} is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration,

- any delay caused by unavailability of UL resources to transmit the measurement report,
- any transmission delay needed by SDT,
- the time needed to transition to RRC_CONNECTED state to report the measurements.

The reported RSTD measurement values contained in measurement reports shall be based on the measurement report mapping requirements specified in clause 10.1.23.3.

The RSTD measurements performed and reported according to this section shall meet the RSTD measurement accuracy requirements in clause 10.1.23.2, for each measured DL PRS resource.

5.6.2.5 Measurements Period Requirements

After receiving both *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message from the LMF via LPP [34], the UE shall be able to measure multiple (up to the UE capability specified in clause 5.6.2.3) DL RSTD measurements, defined in TS 38.215 [4], during the measurement period $T_{RSTD,Total}$ defined as:

$$T_{RSTD,Total} = \sum_{i=1}^{L} T_{RSTD,i} + (L-1) * \max(T_{effect,i})$$

Where:

- i is the index of positioning frequency layer,
- L is total number of positioning frequency layers, and
- $T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i

$T_{RSTD,i}$ is the measurement period for PRS RSTD measurement in positioning frequency layer *i* as specified below:

$$T_{RSTD,i} = \left(K_{carrier_PRS} * N_{Rx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil * \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i} ,$$

Where:

- $N_{RxBeam,i}$ is the UE Rx beam sweeping factor:
  - $N_{RxBeam,i}$ = 1 if positioning frequency layer *i* is in FR1, and if positioning frequency layer *i* is in FR2
    - $N_{RxBeam,i}$ equals to the value as UE reported in *supportedLowerRxBeamSweepingFactor-FR2* if the capability is reported by the UE for the band containing positioning frequency layer i, and LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation* .
  - $N_{RxBeam,i}$ equals to 8, otherwise.
- $K_{carrier_PRS}$ is a scaling factor for PRS-based NR positioning measurements in RRC_INACTIVE. If the UE supports *parallelPRS-MeasRRC-Inactive-r17*, $K_{carrier_PRS}$ = 1; otherwise,
- If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$, $K_{carrier_PRS} = K_{carrier} + 1$, where $K_{carrier}$ is defined in clause 4.2.2.4
- If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$, $K_{carrier_PRS} = N_{layers} + 1$, where N_{layers} is defined in clause 4.2.2.7.
- $N_{Rx,TEG,i}$ is the Rx TEG specific scaling factor:
  - $N_{Rx,TEG,i}$ =1 if the UE is not configured by the LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34].
  - $N_{Rx,TEG,i}$ is defined as follows if the UE is configured by the LMF with *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] to perform measurement on same DL PRS resource of a TRP using different Rx TEGs in *NR-DL-TDOA-RequestLocationInformation* [34]:

- $N_{Rx,TEG,i} = P$, if the UE is not capable of measuring same DL PRS resource simultaneously from multiple Rx TEGs, where P is the number of UE Rx TEGs that the UE is requested by LMF to measure the same DL-PRS Resource of a TRP indicated by *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* in [34], and in case 'n0' is indicated, P is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*.

- $N_{Rx,TEG,i} = \left\lceil \frac{P}{Q} \right\rceil$, if the UE is capable of measuring the same DL PRS resource simultaneously from multiple Rx TEGs, where Q is the number of UE Rx TEGs for measuring the same DL-PRS Resource simultaneously indicated by *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul-r17* in [34].

- $N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources in positioning frequency layer *i* configured in a slot.

- $L_{available_PRS,\mathrm{i}}$ is the time duration of available PRS in positioning frequency layer *i* to be measured within $T_{PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,\mathrm{i}}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered.

- N_{sample} is the number of PRS RSTD samples, where

  - N_{sample} = 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:

    - PRS bandwidth is within the initial BWP and

    - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

  - N_{sample} = 2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:

    - PRS bandwidth is within the initial BWP and

    - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

  - N_{sample} = 4 otherwise.

- $T_{last,i}$ is the measurement duration for the last PRS RSTD sample in positioning frequency layer *i*, including the sampling time and processing time, $T_{\mathrm{last,i}} = T_{\mathrm{i}} + T_{available_PRS,\mathrm{i}}$,

- $T_{\mathrm{effect},i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i defined as:

$$T_{\mathrm{effect,i}} = \left\lceil \frac{T_{\mathrm{i}}}{T_{available_PRS,\mathrm{i}}} \right\rceil * T_{available_PRS,\mathrm{i}}$$

Where:

- T_i corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [34],

- $T_{available_PRS,\mathrm{i}} = LCM\left(T_{PRS,\mathrm{i}}, T_{DRX}\right)$, the least common multiple between $T_{PRS,\mathrm{i}}$ and T_{DRX}

- T_{DRX} is defined as following:

  - T_{DRX} is DRX cycle length, defined in clause 7.1 TS 38.304, when no extended DRX (eDRX) cycle is configured

  - T_{DRX} is defined as T in clause 7.1 TS 38.304 when RAN eDRX <= 10.24 s and CN eDRX <= 10.24 s

  - T_{DRX} is the maximum of the T inside and outside of the CN PTW, where T inside and outside of the CN PTW are defined in clause 7.1 TS 38.304, when RAN eDRX <= 10.24 s and CN eDRX > 10.24 s

- T_{DRX} is the maximum of the DRX cycles within the CN PTW and the RAN PTW when RAN eDRX > 10.24 s
- $T_{PRS,\mathrm{i}}$ is the periodicity of DL PRS resource with muting on positioning frequency layer *i*.

If more than one PRS periodicities are configured in positioning frequency layer *i*, the least common multiple of PRS periodicities $T_{per}^{PRS\ with\ muting}$ among all DL PRS resource sets in the positioning frequency layer is used to derive $T_{PRS,\mathrm{i}}$, where,

- $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, is the PRS periodicity with muting per PRS resource,
- T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.
- N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where
- T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.
- $\{N, T\}$ is the UE capability combination per band for RRC_INACTIVE state where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSymbols-r17* in TS 37.355 [34], T (ms) corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [34], for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [34],
- N' is UE capability for number of DL PRS resources that it can process in a slot in RRC_INACTIVE state as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive-r17* specified in TS 37.355 [34].

If the following conditions are met, the time $\mathrm{T_{RSTD,Total}}$ starts from the first DL PRS resource(s) instances inside a PTW after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the UE via LPP [34].

- UE is configured with RAN eDRX > 10.24 s, and
- periodic PRS measurement reporting is configured, and
- RAN eDRX cycle is smaller or equal to the PRS measurement reporting periodicity configured via higher layer parameter *reportingInterval* in TS 37.355 [34], and
- there is one or more PRS resources occurring in PTW.

Otherwise, the time $T_{RSTD,Total}$ starts from the first DL PRS resource(s) after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the UE via LPP [34].

NOTE 1: No per-positioning frequency layer requirement is applied in scenarios when multiple positioning frequency layers are configured.

If the DRX cycle is reconfigured during the RSTD measurement period, then the measurement period can be longer.

When PRS-RSRP is configured for DL-TDOA, RSTD and PRS-RSRP are performed over the same measurement period.

When PRS-RSRPP is configured for DL-TDOA, RSTD and PRS-RSRPP are performed over the same measurement period.

The measurement requirements do not apply to any PRS resource that always collides with other higher-priority DL signals/channels, as specified in clause 5.6.1.

Longer RSTD measurement period is expected when there are collisions between PRS resources and other higher-priority DL signals/channels.

If $K_{\mathrm{carrier_PRS}}$ changes for any PFL during the measurement period, the measurement period could be longer.

The measurement requirements do not apply for a PRS resource, if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,\mathrm{i}}$.

The measurement requirements do not apply for a PRS resource, if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

The requirements in clause 5.6.2 do not apply if the PRS configuration given by higher layer parameters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-TDOA-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If cell re-selection occurs while RSTD measurements are being performed, then the UE shall continue and complete the on-going RSTD measurements after the cell selection is completed. The RSTD measurement period can be longer.

If the RRC state transition occurs from RRC_INACTIVE to RRC_CONNECTED state during the RSTD measurement period then the UE shall continue the RSTD measurement in the RRC_CONNECTED state. The RSTD measurement period can be longer.

The UE shall meet the RSTD measurement accuracy requirements in clause 10.1.23.2

5.6.2.6 Measurements Period Requirements with Bandwidth Aggregation

The requirements in this clause apply provided that UE receives requests from LMF to perform PRS measurement on aggregated positioning frequency layers (PFLs) via *nr-DL-PRS-JointMeasurementRequestedPFL-List [34]*.

After receiving both *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message from the LMF via LPP [34], the UE shall be able to measure multiple (up to the UE capability specified in clause 5.6.2.3) DL RSTD measurements, defined in TS 38.215 [4], during the measurement period $T_{RSTD,Total}$ defined as:

$$T_{RSTD,total} = T_{RSTD,aggr} + T_{RSTD,non-aggr} + T_{margin}$$

Where:

- $T_{RSTD,aggr}$ is the total measurement period for aggregated measurements as defined in this clause, and
- $T_{RSTD,non-aggr}$ is the total measurement period for non-aggregated measurements as defined in this clause, and
- When both $T_{RSTD,aggr}$ and $T_{RSTD,non-aggr}$ are non-zero, then $T_{margin} = T'_{margin}$; otherwise $T_{margin} = 0$, where $T'_{margin} = \max(T_{effect,j})$, andthe maximum $T_{effect,j}$ is across all the PFL combination(s) and non-aggregated PFL(s) configured for positioning measurements.

    - If more than one PRS periodicities are configured in PFL combination m, the least common multiple of PRS periodicities $T_{per}^{\text{PRS with muting}}$ among all DL PRS resource sets that are linked to other resource set in PFL combination m, is used to derive $T_{PRS,aggr,m}$, and for each applicable PRS resource set,

The requirements in this clause for aggregated measurements apply provided that the linked PRS resource sets on multiple PFLs for aggregated measurements are transmitted by the TRP using single Tx chain as defined in clause 5.1.6.5.3 in TS 38.214 [26].

If PRS resources in one or more of the aggregated PFLs in PFL combination m are dropped because of collision with other signals, $T_{RSTD,aggr,m}$ can be longer than specified above.

The time $T_{RSTD,Total}$ starts from the first DRX cycle containing the DL PRS resource(s) in the assistance data after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the UE via LPP [34].

NOTE: No separate requirement on non-aggregated measurement based on $T_{RSTD,non-aggr}$ or on aggregated measurement based on $T_{RSTD,aggr}$ is applied when both $T_{RSTD,aggr}$ and $T_{RSTD,non-aggr}$ are non-zero.

If the DRX cycle is reconfigured during the RSTD measurement period, then the measurement period can be longer.

When PRS-RSRP is configured for DL-TDOA, RSTD and PRS-RSRP are performed over the same measurement period. When PRS-RSRPP is configured for DL-TDOA, RSTD and PRS-RSRPP are performed over the same measurement period.

The measurement requirements do not apply to any PRS resource that always collides with other higher-priority DL signals/channels, as specified in clause 5.6.1.

Longer RSTD measurement period is expected when there are collisions between PRS resources and other higher-priority DL signals/channels.

If $K_{\text{carrier_PRS}}$ changes for any PFL or any PFL combination during the measurement period, the measurement period could be longer.

The measurement requirements do not apply for a PRS resource, if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$.

The measurement requirements do not apply for a PRS resource, if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

The requirements in clause 5.6.2 do not apply if the PRS configuration given by higher layer parameters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-TDOA-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If cell re-selection occurs while RSTD measurements are being performed, then the UE shall continue and complete the on-going RSTD measurements after the cell selection is completed. The RSTD measurement period can be longer.

If the RRC state transition occurs from RRC_INACTIVE to RRC_CONNECTED state during the RSTD measurement period, then the UE shall continue the RSTD measurement in the RRC_CONNECTED state. The RSTD measurement period can be longer.

The UE shall meet the RSTD measurement accuracy requirements in clause 10.1.23A.2.

  - T_{DRX} is the maximum of the T inside and outside of the CN PTW, where T inside and outside of the CN PTW are defined in clause 7.1 TS 38.304 [1], when RAN eDRX <= 10.24 s and CN eDRX > 10.24 s

  - T_{DRX} is the maximum of the DRX cycles within the CN PTW and the RAN PTW when RAN eDRX > 10.24 s

If positioning frequency layer *i* has more than one DL PRS resource set with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among the DL PRS resource sets is used to derive $T_{PRS,i}$, where:

5.6.4.4 Measurement Reporting Requirements

The measurement reporting delay is defined as the time between the moment when the measurement report is triggered and the moment when the UE starts to transmit the measurement report over the air interface.

This measurement reporting delay excludes the delay caused by any of the following:

- $L_{available_PRS,i}$ is the time duration of available PRS resources in the positioning frequency layer *i*, to be measured during $T_{PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. - N_{sample} is the number of UE Rx-Tx time difference measurement samples:

  - N_{sample} = 4 if the UE is not capable of *supportedDL-PRS-ProcessingSamples-RRC-Inactive* defined in [34] or not configured to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples-r17* [34].

  - N_{sample} = 1 if the UE is capable of *supportedDL-PRS-ProcessingSamples-RRC-Inactive* defined in [34] and LMF requests the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples-r17* [34] and the following conditions are met:

    - PRS bandwidth is within the initial BWP and

    - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

  - N_{sample} = 2 if the UE is capable of *supportedDL-PRS-ProcessingSamples-RRC-Inactive* defined in [34] and the LMF requests the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples-r17* [34] but the following conditions are not met:

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$$

Where:

- T_i corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [34],

- $T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$, the least common multiple between $T_{PRS,i}$ and T_{DRX}.

  - When UE is configured with RAN eDRX ≤ 10.24 s:

    - T_{DRX} is defined as T in TS 38.304 [1] when CN eDRX ≤ 10.24 s.

    - T_{DRX} is the maximum of the T inside and outside of the CN PTW when CN eDRX > 10.24 s, where T inside and outside of the CN PTW are defined in TS 38.304 [1].

- $T_{PRS,i}$ is the PRS resource periodicity in positioning frequency layer *i*. If the positioning frequency layer *i* has more than one DL PRS resource sets with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among DL PRS resource sets is used to derive $T_{PRS,i}$, where:

  - T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

- N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$

If the following conditions are met, the time $T_{UE\,Rx\,Tx,\,Total}$ starts from the first DL PRS resource(s) instances inside a PTW after both the *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message are delivered from LMF to the UE via LPP [34].

- UE is configured with RAN eDRX > 10.24 s, and

- there is one or more PRS resources occurring in PTW.

Otherwise, the time $T_{UE\,Rx\,Tx,\,Total}$ starts from the first DL PRS resource(s) after both the *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message are delivered from LMF to the UE via LPP [34].

NOTE 1: No per-positioning frequency layer requirement is applied in scenarios when multiple positioning frequency layers are configured.

If the RRC state transition occurs from RRC_INACTIVE to RRC_CONNECTED state during the UE Rx-Tx time difference measurement period then the UE shall restart the UE Rx-Tx time difference measurement after it obtains SRS configuration and Timing Advance command from the serving cell.

If cell reselection occurs during the UE Rx-Tx time difference measurement period then the UE shall restart the UE Rx-Tx time difference measurement after it obtains SRS configuration and Timing Advance command from the new serving cell.

If cell reselection occurs, and UE reselects to a cell out of the positioning validity area or if UE performs autonomous TA adjustment at reselection, then UE shall restart the measurement.

The measurement requirements do not apply for a PRS resource:

- if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,\mathrm{i}}$ or
- if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

If the DRX cycle is reconfigured during the UE Rx-Tx time difference measurement period then the UE Rx-Tx time difference measurement period can be longer.

If during UE Rx-Tx time difference measurement period PRS resources overlap with other DL signals/channels then the UE Rx-Tx time difference measurement period can be longer.

When PRS-RSRP is configured for multi-RTT, the UE Rx-Tx time difference measurements and PRS-RSRP measurements are performed over the same measurement period.

When PRS-RSRPP is configured for multi-RTT, the UE Rx-Tx time difference measurements and PRS-RSRPP measurements are performed over the same measurement period.

The requirements in clause 5.6.4 do not apply if the PRS configuration given by higher layer parameters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-Multi-RTT-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If UE uplink transmission timing changes due to the network-configured Timing Advance command during the UE Rx-Tx measurement period, then the UE Rx-Tx time difference measurement period is restarted after uplink transmission timing changes, and the UE Rx-Tx time difference measurement period requirements in this clause shall not apply.

If UE uplink transmission timing changes due to the change in the N_{TA_offset} defined in table 7.1.2-2 during the UE Rx-Tx measurement period, then the UE Rx-Tx time difference measurement period is restarted after uplink transmission timing changes, and the UE Rx-Tx time difference measurement period requirements in this clause shall not apply.

5.6.4.6 Measurement Period Requirements with Bandwidth Aggregation

The requirements in this clause apply provided that UE receives requests from LMF to perform PRS measurement on aggregated positioning frequency layers (PFLs) via *nr-DL-PRS-JointMeasurementRequestedPFL-List* [34].

When physical layer receives last of *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message from LMF via LPP [34], the UE shall be able to measure multiple (up to the UE capability specified in clause 5.6.4.3) UE Rx-Tx time difference measurements, defined in TS 38.215 [4], during the measurement period $T_{UERxTx,Total}$ defined as:

When PRS-RSRP is configured for multi-RTT, the UE Rx-Tx time difference measurements and PRS-RSRP measurements are performed over the same measurement period. When PRS-RSRPP is configured for multi-RTT, the UE Rx-Tx time difference measurements and PRS-RSRPP are performed over the same measurement period.

5.6.5.2 Requirements Applicability

The requirements in clause 5.6.5 apply for periodic and triggered PRS-RSRPP measurements, provided:

- PRS-RSRPP related side conditions given in clause 10.1.38 are met for a corresponding Band.

5.6.5.3 Measurement Capability

UE PRS-RSRPP measurement capability is as indicated by the UE in *NR-DL-AoD-ProvideCapabilities* according to TS 37.355 [34].

5.6.5.4 Measurement Reporting Requirements

The measurement reporting delay is defined as the time between the moment when the periodic measurement report is triggered and the moment when the UE is ready to transmit the measurement report over the air interface. If the UE supports reporting of NR positioning measurements via SDT, the UE may be able to report the measurements while it remains in RRC_INACTIVE state; otherwise, the UE will transition to RRC_CONNECTED state prior to transmitting the measurement report.

For PRS-RSRPP measurements performed by the UE in RRC_INACTIVE state, the measurement reporting delay excludes all of the following:

- any delay caused by other LPP signalling on the DCCH,
- delay uncertainty introduced when inserting the measurement report in the TTI of the uplink DCCH which is equal to 2 x TTI_{DCCH} where TTI_{DCCH} is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration,
- any delay caused by no UL resources for UE to send the measurement report,
- any transmission delay needed by SDT,
- the time needed to transition to RRC_CONNECTED state to report the measurements.

The reported PRS-RSRPP measurement values contained in measurement reports shall be based on the measurement report mapping requirements specified in clause 10.1.38.3.

The PRS-RSRPP measurement accuracy for all measured PRS resources shall be fulfilled according to the accuracy requirements specified in the clause 10.1.38.2.

5.6.5.5 Measurement Period Requirements

When the physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message in RRC_INACTIVE state, measurement period requirements for PRS-RSRP defined in clause 5.6.3.5 is re-used for PRS-RSRPP measurement.

5.6.6 TA validation requirements for positioning

5.6.6.1 Introduction

The requirements in clause 5.6.6 shall apply when the UE is configured with the SRS transmission on the PCell and with *inactivePosSRS-RSRP-ChangeThreshold* for the time alignment (TA) validation before the SRS transmission [2].

5.6.6.2 TA validation requirements

When *inactivePosSRS-RSRP-ChangeThreshold* [2] is configured for TA validation based on the RSRP change criterion according to clause 5.26.2 in [7], the UE is allowed to transmit the SRS using the timing derived using the latest available N_{TA} value as specified in subclause 7.1 provided that the following conditions are met:

- the first RSRP ($RSRP_1$) measurement and the second RSRP ($RSRP_2$) measurements used in the TA validation are valid measurements and,
- TA for the SRS transmission is valid according to the TA validation criteria in clause 5.26.2 in [7].

$RSRP_1$ and $RSRP_2$ are considered valid provided that the conditions in table 5.6.6.2-1 and table 5.6.6.2-2 are met for FR1 and FR2-1 respectively.

Table 5.6.6.2-1 Valid measurement for FR1

Measurement	FR1
$RSRP_1$	$(T1 - \min(640\ ms, M1*T_{DRX})) \le T1' \le (T1 + \min(640\ ms, M1*T_{DRX}))$
$RSRP_2$	$(T2 - \min(640\ ms, M1*T_{DRX})) \le T2' \le T2$

Table 5.6.6.2-2 Valid measurement for FR2-1

$RSRP_2$	$(T2 - \max(480\ ms, 8*SMTC\ periodicity)) \le T2' \le T2$

If at least one of $RSRP_1$ and $RSRP_2$ is invalid based on the above conditions, then the UE shall not validate the SRS transmission using $RSRP_1$ and $RSRP_2$ and shall not transmit the SRS. The UE shall not transmit in an SRS resource that occurs more than 640 ms after T2.

Where:

- T1 is the time when:
  - *RRCRelease* with *SRS-PosRRC-InactiveConfig* [2] is received by the UE, or
  - the latest TA is received by the UE while the UE is in RRC_INACTIVE state.
- T1' is the time when the UE has completed $RSRP_1$.
- T2 is the time when the UE performs TA validation as defined in clause 5.26.2 in [7] for the SRS transmission.
- T2' is the time when the UE has completed $RSRP_2$.
- T_{DRX} is the DRX cycle length in ms.
- M1 the scaling factor as defined in clause 4.2.2.2.

5.6.6.3 TA validation requirements when configured with validity area

The requirement in this section shall apply when the UE is configured with:

- *inactivePosSRS-ValidityAreaRSRP* [2] for TA validation based on the RSRP change criterion according to clause 5.26.2 in [7] and
- *SRS-PosRRC-InactiveValidityAreaConfig* [2] for SRS for positioning configuration which is valid during RRC_INACTIVE state across the cells included in *srs-PosRRC-InactiveValidityArea area* [2].

The UE is allowed to transmit the SRS using the timing derived using the latest available N_{TA} value as specified in subclause 7.1 and is allowed to perform the cell reselection to a cell included in *srs-PosRRC-InactiveValidityArea area* [2], provided that the following conditions are met:

the first RSRP ($RSRP_1$) measurement and the second RSRP ($RSRP_2$) measurements used in the TA validation are valid measurements and,

TA for the SRS transmission is valid according to the TA validation criteria defined in clause 5.26.2 in [7].

$RSRP_1$ and $RSRP_2$ are measured by the UE from the same camped cell. $RSRP_1$ and $RSRP_2$ are considered valid provided that the conditions in table 5.6.6.3-1 and table 5.6.6.3-2 are met for FR1 and FR2-1 respectively.

- T1 is the time when:

- *RRCRelease* with *SRS-PosRRC-InactiveConfig* [2] is received by the UE, or
- the latest TA is received by the UE while in RRC_INACTIVE state, or
- according to clause 7.1.2.4, the UE while in RRC_INACTIVE state has autonomously adjusted the TA during the cell reselection to a cell included in *srs-PosRRC-InactiveValidityArea area* [2].

- T1' is the time when the UE has completed $RSRP_1$.

5.6.7 Measurement requirements for DL RSCPD reported with RSTD

5.6.7.1 Introduction

The requirements in clause 5.6.7 shall apply provided the UE has received *NR-DL-TDOA-RequestLocationInformation* message with *dl-PRS-RSCPD-Request-r18* from the LMF via LPP [34] requesting the UE to measure and report RSCPD measurement together with DL RSTD measurements defined in TS 38.215 [4].

5.6.7.2 Requirements Applicability

The requirements in clause 5.6.7 apply for periodic and triggered reporting of RSCPD with RSTD measurements, provided:

- PRS-RSTD related side conditions given in clause 10.1.23.2 for FR1 and FR2 are fulfilled, for a corresponding Band.
- RSCPD related side conditions given in clause 10.1.43.2 for FR1 and FR2 are fulfilled, for a corresponding Band.

5.6.7.3 Measurement Capability

The UE PRS RSTD and DL-RSCPD measurement measurement capabilities in RRC_INACTIVE state are as indicated by the UE in *NR-DL-TDOA-ProvideCapabilities*, according to TS 37.355 [34].

5.6.7.4 Measurement Reporting Requirements

The measurement reporting delay shall satisfy the requirements defined in clause 5.6.2.4, and the applicable measurement report mapping and measurement accuracy requirements are specified below.

The reported RSTD measurement values contained in measurement reports shall be based on the measurement report mapping requirements specified in clause 10.1.23.3.

The reported RSCPD measurement values contained in the measurement reports shall be based on the measurement report mapping requirements specified in clauses 10.1.43.3.

The RSTD measurements performed and reported according to this section shall meet the RSTD measurement accuracy requirements in clause 10.1.23.2, for each measured DL PRS resource.

The RSCPD measurements performed and reported according to this section shall meet the RSCPD measurement accuracy requirements in clause 10.1.43.2, for the measured DL PRS resource.

5.6.7.5 Measurements Period Requirements

After receiving both *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message with *dl-PRS-RSCPD-Request-r18* from the LMF via LPP [34], when LMF configures measurement time window(s) for a PFL, the UE shall be able to measure multiple (up to the UE capability specified in clause 5.6.7.3) DL RSTD and RSCPD measurements, defined in TS 38.215 [4], during the time window configured to UE via *nr-DL-PRS-MeasurementTimeWindowsConfig*.

When LMF does not configure measurement time window(s):

- When a single PFL is configured, requirements in clause 5.6.2.5 apply to both RSCPD and RSTD measurements.
- When multiple PFLs are configured for legacy measurements, the UE performs RSCPD measurement on a single PFL that is common between the reference TRP and the target TRP. The requirement in clause 5.6.2.5 apply to both RSTD and RSCPD measurements.

When LMF configures measurement time window(s), but UE does not support RSCPD measurement inside time window as indicated in *supportOfMeasurementsInTimeWindow*:

- The UE performs RSCPD measurement on the indicated PFL by the network. The requirements in clause 5.6.2.5 apply to both RSTD and RSCPD measurements.

When LMF configures measurement time window(s), but UE does not support RSTD measurement inside time window as indicated in *supportOfMeasurementsInTimeWindow* but supports RSCPD measurement inside time window as indicated in *supportOfMeasurementsInTimeWindow*:

- The requirements in the clause 5.6.2.5 apply to RSTD measurements.
- The requirements in clause 5.6.7.5 apply to RSCPD measurement for the PRS resource(s) that have occasions only within the measurement time window.

When LMF configures measurement time window(s), and UE supports RSTD and RSCPD measurements inside time window as indicated in *supportOfMeasurementsInTimeWindow*:

- The requirements in Clause 5.6.7.5 apply to DL RSTD measurement and DL RSCPD measurement.

If a one-shot time window is configured, the UE shall be able to measure multiple (up to the UE capability specified in clause 5.6.7.3) DL RSTD and DL RSCPD measurements, defined in TS 38.215 [4], based on the indicated PRS resource sets occurring inside the one-shot time window during the measurement period $T_{RSCPD\ with\ RSTD,Total}$ defined as:

$$T_{RSCPD\ with\ RSTD,Total} = \min(L_{window}, 10\ \text{ms}) + T_i \quad ,$$

and the UE shall be able to measure multiple DL RSTD measurements, defined in TS 38.215 [4], during the measurement period $T_{RSTD,Total,with\ one\ shot\ window}$ defined as:

$$T_{RSTD,Total,with\ one\ shot\ window} = T_{RSCPD\ with\ RSTD,Total} + max(T_{effect,i}) + T_{RSTD,Total}$$

Where:

- the start of the measurement is the start of the one-shot time window, and
- L_{window} is the length of the one-shot window, and
- $T_{effect,i}$ and T_i are defined in the following of this clause, and
- $T_{RSTD,Total}$ is defined in clause 5.6.2.5.

The requirements with one-shot window assume scaling factors equal to 1 for the PFLs, for which the one-shot time window is configured.

If a periodic time window is configured, the UE shall be able to measure multiple (up to the UE capability specified in clause 5.6.8.3) DL RSTD and DL RSCPD measurements, defined in TS 38.215 [4], during the measurement period $T_{RSCPD\ with\ RSTD,Total}$ defined as:

$$T_{\text{RSCPD with RSTD,Total}} = \sum_{i=1}^{L} T_{\text{RSCPD with RSTD,i}} + (L-1) * \max\left(T_{\text{effect,i}}\right)$$

Where:

- i is the index of positioning frequency layer,
- L is total number of positioning frequency layers, and
- $T_{\text{effect},i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i

$T_{\text{RSCPD with RSTD,i}}$ is the measurement period for PRS RSTD with RSCPD measurement in positioning frequency layer *i* as specified below:

$$T_{\text{RSCPD with RSTD}} = \left(K_{\text{carrier_PRS}} * N_{Rx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil * \left\lceil \frac{L_{available_{PRS},i}}{N} \right\rceil * N_{sample} - 1\right) * T_{\text{effect,i}} + T_{\text{last,i}},$$

where:

- $K_{\text{carrier_PRS}}$, $N_{Rx,TEG,i}$, $N_{RxBeam,i}$, $N_{PRS,i}^{slot}$, N, N', N_{sample}, $T_{\text{effect,i}}$ and $T_{last,i}$ are defined in clause 5.6.2.5
- $L_{available_{PRS},i}$ is the time duration of available PRS in the positioning frequency layer to be measured during T_{PRS}, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_{PRS},i}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered.
- When periodic time window(s) are configured by the LMF and PFL *i* is associated with the configured time window, $T_{available_{PRS},i} = LCM\left(T_{PRS,i}, T_{DRX}, T_{window}\right)$, the least common multiple between $T_{\text{PRS,i}}$, the DRX cycle length T_{DRX} and T_{window} being the maximum periodicity of the indicated time window(s). $T_{PRS.i}$ is defined in clause 5.6.2.5.
- When periodic time window(s) are configured by the LMF and PFL *i* is not associated with the configured time window(s), $T_{available_{PRS},i} = LCM\left(T_{PRS,i}, T_{DRX}\right)$, the least common multiple between $T_{PRS,i}$ and the DRX cycle length T_{DRX} . $T_{PRS,i}$ is defined in clause 5.6.2.5.

- $L_{available_{PRS},i}$ and $T_{PRS,i}$ are calculated by only considering the PRS resources in the indicated resources sets overlapping with the indicated time window(s).

The time $T_{\text{RSCPD with RSTD}}$ starts from the first time window ($T_{\text{DL RSCPD}}$) configured by LMF within DRX cycle containing the DL PRS resource(s) in the assistance data after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the UE via LPP [34].

If the DRX cycle is reconfigured during the measurement period, then the measurement period can be longer.

When PRS-RSRP is configured for DL-TDOAwith a request to perform RSCPD measurement with RSTD measurement, RSCPD with RSTD and PRS-RSRP are performed over the same measurement period.

When PRS-RSRPP is configured for DL-TDOA with a request to perform RSCPD measurement with RSTD measurement, RSCPD with RSTD and PRS-RSRPP are performed over the same measurement period.

The measurement requirements do not apply to any PRS resource that always collides with other higher-priority DL signals/channels, as specified in clause 5.6.1.

Longer measurement period is expected when there are collisions between PRS resources and other higher-priority DL signals/channels.

If $K_{\text{carrier_PRS}}$ changes for the PFL during the measurement period, the measurement period can be longer.

The measurement requirements do not apply for a PRS resource, if the PRS resource is across two sampling duration of N within duration $L_{available_PRS}$.

The measurement requirements do not apply for a PRS resource, if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

The requirements in clause 5.6.7 do not apply if the PRS configuration given by higher layer parameters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-TDOA-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If cell re-selection occurs while RSCPD together with RSTD measurements are being performed, then the UE shall continue and complete the on-going RSCPD and RSTD measurements after the cell re-selection is completed. The measurement period can be longer.

If the RRC state transition occurs from RRC_INACTIVE to RRC_CONNECTED state during the measurement period then the UE shall continue the RSCPD and RSTD measurements in the RRC_CONNECTED state. The measurement period can be longer.

5.6.8 Measurement requirements for DL RSCP reported with UE Rx-Tx time difference

5.6.8.1 Introduction

The requirements in this clause shall apply, provided the UE has received *nr-Multi-RTT-RequestLocationInformation* message with *dl-PRS-RSCP-Request-r18* from LMF via LPP [34] requesting the UE to measure and report one or more DL RSCP measurements together with UE Rx-Tx time difference measurements defined in TS 38.215 [4].

5.6.8.4 Measurement Reporting Requirements

The measurement reporting delay is defined as the time between the moment the measurement report is triggered and the moment when the UE starts to transmit the measurement report over the air interface.

This measurement reporting delay excludes the delay caused by any of the following:

- delay caused by other LPP signalling on the DCCH.
- delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x TTI_{DCCH} where TTI_{DCCH} is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration.
- delay caused due to lack of UL resources for UE to send the measurement report.
- delay required by SDT for reporting the measurement using SDT resources.
- delay required for transition to RRC_CONNECTED state for report the measurement in RRC_CONNECTED.

The UE Rx-Tx time difference measurement values contained in measurement reports shall be based on the measurement report mapping requirements specified in clause 10.1.25.3.

The DL RSCP measurement values contained in measurement reports shall be based on the measurement report mapping requirements specified in clause 10.1.44.3.

The UE Rx-Tx time difference measurement accuracy for all measured DL PRS resources shall be fulfilled according to the accuracy requirements specified in clause 10.1.25.2.

The DL RSCP measurement accuracy for all measured DL PRS resources shall be fulfilled according to the accuracy requirements specified in clause 10.1.44.2.

5.6.8.5 Measurement Period Requirements

When the physical layer receives the last of *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message from LMF via LPP [34] with *dl-PRS-RSCP-Request-r18* and configuring a measurement time window via *nr-DL-PRS-MeasurementTimeWindowsConfig*, subject to UE capabilities *supportOfRSCP-MeasurementInTimeWindow* and *supportOfLegacyMeasurementInTimeWindow*, the UE shall be able to measure multiple (up to the UE capability specified in clause 5.6.8.3) UE Rx-Tx and DL RSCP measurements, defined in TS 38.215 [4], during the time window only.

When LMF does not configure measurement time window(s):

- When a single PFL is configured, requirements in clause 5.6.4.5 apply to both RSCP and UE Rx-Tx measurements.
- When multiple PFLs are configured for legacy measurements, the UE performs RSCP measurement on a single PFL that is common between the reference TRP and the target TRP. The requirement in clause 5.6.4.5 apply to both RSCP and UE Rx-Tx measurements.

When LMF configures measurement time window(s), but UE does not support DL RSCP measurement inside time window as indicated in *supportOfMeasurementsInTimeWindow*:

- The UE performs RSCP measurement on the indicated PFL by the network. The requirement in clause 5.6.4.5 apply to both UE Rx-Tx and RSCP measurements.

When LMF configures measurement time window(s), but UE does not support UE Rx-Tx measurement inside time window as indicated in *supportOfMeasurementsInTimeWindow*, but supports DL RSCP measurement inside time window as indicated in *supportOfMeasurementsInTimeWindow*:

- The requirements in the clause 5.6.4.5 apply to UE Rx-Tx measurement.
- The requirements in clause 5.6.8.5 apply to RSCP measurement for the PRS resource(s) that have occasions only within the measurement time window.

When LMF configures measurement time window(s), and UE supports DL RSCP and UE Rx-Tx time difference measurements inside time window as indicated in *supportOfMeasurementsInTimeWindow*:

- The requirements in Clause 5.6.8.5 apply to UE Rx-Tx measurement and DL RSCP measurement.

If a one-shot time window is configured, the UE shall be able to measure multiple (up to the UE capability specified in clause 5.6.8.3) UE Rx-Tx and DL RSCP measurements, defined in TS 38.215 [4], based on the indicated PRS resource sets occurring inside the one-shot time window during the measurement period $T_{\text{DL RSCP with UERxTx,Total}}$ defined as:

$$T_{\text{DL RSCP with UERxTx,Total}} = \min(L_{window}, 10\text{ ms}) + T_i \quad ,$$

and the UE shall be able to measure multiple UE Rx-Tx measurements, defined in TS 38.215 [4], during the measurement period $T_{UERxTx,Total,with\ one\ shot\ window}$ defined as:

$$T_{UERxTx,Total,with\ one\ shot\ window} = T_{\text{DL RSCP with UERxTx,Total}} + max(T_{effect,i}) + T_{UERxTx,Total}$$

Where:

- the start of the measurement is the start of the one-shot time window, and
- L_{window} is the length of the one-shot window, and
- $T_{\text{effect},i}$ and T_i are defined in the following of this clause, and

- $T_{UERxTx,Total}$ is defined in clause 5.6.4.5.

The requirements with one-shot window assume scaling factors equal to 1 for the PFLs, for which the one-shot time window is configured.

If a periodic time window is configured, the UE shall be able to measure multiple (up to the UE capability specified in clause 5.6.8.3) UE Rx-Tx and DL RSCP measurements, defined in TS 38.215 [4], during the measurement period $T_{\text{DL RSCP with UERxTx,Total}}$ defined as:

$$T_{\text{RSCP with UERxTx,Total}} = \sum_{i=1}^{L} T_{\text{DL RSCP with UERxTx,i}} + (L-1) * \max(T_{\text{effect,i}})$$

where:

- i is the index of positioning frequency layer,
- L is total number of positioning frequency layers, and
- $T_{\text{effect},i}$ is the periodicity of the UE Rx-Tx time difference measurement in positioning frequency layer *i*.

$T_{\text{DL RSCP with UERxTx,i}}$ is the measurement period for DL RSCP with UE Rx-Tx measurement in positioning frequency layer *i* as specified below:

$$T_{\text{DL RSCP with UERxTx,i}} = \left(K_{\text{carrier_PRS}} * N_{RxTx,TEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_{PRS,i}}}{N} \right\rceil * N_{sample} - 1\right) * T_{\text{effect,i}} + T_{\text{last,i}},$$

where:

- $K_{\text{carrier_PRS}}$, $N_{RxTx,TEG,i}$, $N_{RxBeam,i}$, $N_{PRS,i}^{slot}$, N, N', N_{sample}, $T_{\text{effect,i}}$ and $T_{\text{last,i}}$ are defined in clause 5.6.4.5.
- DL-RSCP performed during $T_{\text{DL RSCP with UERxTx}}$ is a single sample measurement where DL RSCP and UE Rx-Tx measurements are performed on the same PFL.
- $L_{available_{PRS,i}}$ is the time duration of available PRS resources in the positioning frequency layer *i*, to be measured during $T_{PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_{PRS,i}}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered.
- When periodic time window(s) are configured by the LMF and PFL *i* is associated with the configured time window, $T_{available_{PRS,i}} = LCM(T_{PRS,i}, T_{DRX}, T_{window})$, the least common multiple between $T_{\text{PRS,i}}$, T_{DRX} and T_{window} being the maximum periodicity of the indicated time window(s).
- When periodic time window(s) are configured by the LMF and PFL *i* is not associated with the configured time window(s), $T_{available_{PRS,i}} = LCM(T_{PRS,i}, T_{DRX})$, the least common multiple between $T_{PRS,i}$ and the DRX cycle length T_{DRX} .
- $L_{available_{PRS,i}}$ and $T_{PRS,i}$ are calculated by only considering the PRS resources in the indicated resources sets overlapping with the indicated time window(s).

The time $T_{\text{DL RSCP with UERxTx}}$ starts from the first time window ($T_{\text{DL RSCP}}$) configured by LMF within DRX cycle containing the DL PRS resources in the assistance data after both the *NR-Multi-RTT-RequestLocationInformation* message and *NR-Multi-RTT-ProvideAssistanceData* message from LMF via LPP [34] are delivered to the physical layer of UE.

If the RRC state transition occurs from RRC_INACTIVE to RRC_CONNECTED state during the measurement period then the UE shall continue the DL RSCP measurement and shall restart the UE Rx-Tx time difference measurement after it obtains SRS configuration and Timing Advance command from the serving cell.

If cell reselection occurs during the measurement period then the UE shall restart the DL RSCP and UE Rx-Tx time difference measurements after it obtains SRS configuration and Timing Advance command from the new serving cell.

The measurement requirements do not apply for a PRS resource:

- if the PRS resource is across two sampling duration of N within duration $L_{available_{PRS,i}}$ or

- if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

If the DRX cycle is reconfigured during the measurement period, then the measurement period can be longer.

If during the measurement period, PRS resources overlap with other DL signals/channels then the measurement period can be longer.

When PRS-RSRP is configured for multi-RTT, the DL RSCP with UE Rx-Tx time difference measurements and PRS-RSRP measurements are performed over the same measurement period.

When PRS-RSRPP is configured for multi-RTT, the DL RSCP with UE Rx-Tx time difference measurements and PRS-RSRPP measurements are performed over the same measurement period.

The requirements in clause 5.6.8 do not apply if the PRS configuration given by higher layer parameters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-Multi-RTT-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If UE uplink transmission timing changes due to the network-configured Timing Advance command during the DL RSCP with UE Rx-Tx measurement period, then the DL RSCP with UE Rx-Tx time difference measurement period is restarted after uplink transmission timing changes, and the DL RSCP and UE Rx-Tx time difference measurement period requirements in this clause shall not apply.

If UE uplink transmission timing changes due to the change in the N_{TA_offset} defined in table 7.1.2-2 during the DL RSCP with UE Rx-Tx measurement period, then the DL RSCP with UE Rx-Tx time difference measurement period is restarted after uplink transmission timing changes, and the DL RSCP and UE Rx-Tx time difference measurement period requirements in this clause shall not apply.

If UE uplink transmission timing changes due to the UE autonomous timing adjustment defined in clause 7.1.2 during the measurement period, then:

- DL RSCP and UE Rx-Tx measurement period requirements in this clause shall apply for a cell, which is also the downlink reference cell (defined in section 7.1.1) for SRS transmission.
- DL RSCP and UE Rx-Tx measurement period requirements in this clause shall not apply for a cell, which is not the downlink reference cell (defined in section 7.1.1) for SRS transmission. The DL RSCP with UE Rx-Tx time difference measurement period may be restarted in such case.

5.6A NR measurements for positioning for RedCap

5.6A.1 Introduction

This clause contains requirements for RedCap UE capable of performing NR positioning measurements defined in TS 38.215 [4], including RSTD, PRS-RSRP, UE Rx-Tx time difference and PRS-RSRPP, in RRC_INACTIVE state.

The requirements in clauses 5.6A.4, 5.6A.5, 5.6A.6 and 5.6A.7 are applicable to PRS resources that do not collide with other DL signals/channels which include SSB, SIB1, CORESET0, MSG2/MSGB, paging and DL SDT. In addition, a UE is not expected to receive PRS resources that collide with a time interval starting at symbol *m* and ending at symbol $m + N_2$, where symbol *m* is the last symbol in which the UE is configured to receive PDCCH and N_2 is defined in clause 6.4 of TS 38.214 [26] for the subcarrier spacing μ of the DL PRS.

If a PRS resource is outside or partially overlapped with the initial DL BWP, a PRS resource instance collides with another DL signals/channels if any portion of the other DL signal/channel overlaps with the time interval starting X symbols before the PRS instance and ending X symbols after the PRS instance, taking into account *nr-DL- PRS-ExpectedRSTD-Uncertainty* and *nr-DL-PRS-ExpectedRSTD*. Where X is defined in table 5.6.1-1.

All measurement requirements specified in clauses 5.6A.4, 5.6A.5, 5.6A.6 and 5.6A.7 shall apply for DRX and eDRX configuration specified in TS 38.331 [2].

The requirements in clauses 5.6A.4, 5.6A.5, 5.6A.6 and 5.6A.7 are applicable provided that the cell selection procedure for the selected PLMN defined in TS 38.304 [1] is not triggered during PRS measurement period.

The requirements in clauses 5.6A.4, 5.6A.5, 5.6A.6 and 5.6A.7 apply provided that all PRS resources within a PFL are within up to 2 separate windows within $T_{PRS,i}$ for each positioning frequency layer *i*, where each window is up to 10 ms. $T_{PRS,i}$ is defined in clauses 5.6A.4, 5.6A.5, 5.6A.6 and 5.6A.7.

The UE is not required to perform additional SSB measurement for the SSB configured as QCL source of PRS resources.

When the UE is configured with measurement for more than one positioning requests, the measurement period for each request may be longer than measurement period when UE is configured with measurement for single positioning request.

5.6A.2 Cell re-selection for positioning

The requirements in this clause apply for RedCap UE, when the UE is configured to perform SRS transmission for positioning.

The requirements in clause 5.1B.2 shall apply in the following conditions.

- UE is not configured with eDRX_IDLE, or
- UE is configured with eDRX_IDLE but without eDRX_INACTIVE, or
- UE is configured with both eDRX_IDLE and eDRX_INACTIVE, and eDRX_INACTIVE cycle is smaller or equal to T_{POS},

where T_{POS} is

- SRS transmission periodicity, if UE is configured to only perform SRS transmission for positioning, or if UE is configured to both perform PRS measurements without periodic reporting and to perform SRS transmission for positioning,
- the minimum of PRS measurement reporting periodicity and SRS transmission periodicity, if UE is configured to both perform PRS measurements with periodic reporting and to perform SRS transmission for positioning.

NOTE: PRS measurement reporting periodicity is the configured *reportingInterval* in *RequestLocationInformation as defined in [34]*.

When UE is configured with both eDRX_IDLE and eDRX_INACTIVE, and eDRX_INACTIVE cycle is larger than T_{POS}, the requirements in clause 5.1B.2 except clause 5.1B.2.2 and 5.1.2B.3 shall apply, and the requirements in clause 5.6A.2.1 apply for measurement and evaluation of serving cell, and the requirements in clause 5.6A.2.2 apply for measurements of intra-frequency NR cells.

5.6A.2.1 Measurement and evaluation of serving cell

When a RedCap UE is configured with both eDRX_IDLE and eDRX_INACTIVE, and eDRX_INACTIVE cycle is larger than T_{POS}, the UE shall measure the SS-RSRP and SS-RSRQ level of the serving cell and evaluate the cell selection criterion S defined in TS 38.304 [1] for the serving cell at least once every M1*T_{serv} for FR1 and N1* T_{serv} for FR2; where:

- T_{serv} is defined as max(T_{DRX}, T_{POS}), where
  - T_{DRX} is defined as T in clause 7.1 TS 38.304 [1] when RAN eDRX <= 10.24s and CN eDRX <= 10.24s
  - T_{DRX} is the maximum of the T inside and outside of the CN PTW, where T inside and outside of the CN PTW are defined in clause 7.1 TS 38.304 [1], when RAN eDRX <= 10.24s and CN eDRX > 10.24s
  - T_{DRX} is the maximum of the DRX cycles within the CN PTW and the RAN PTW when RAN eDRX > 10.24 s
- M1=2 if SMTC periodicity (T_{SMTC}) > 20 ms and $T_{serv} \leq 0.64$ second, otherwise M1=1.
- The serving cell measurement is not limited to PTW.

The UE shall filter the SS-RSRP and SS-RSRQ measurements of the serving cell using at least 2 measurements. Within the set of measurements used for the filtering, at least two measurements shall be spaced by, at least $T_{serv}/2$.

If the UE has evaluated according to table 5.6A.2.1-1 or table 5.6A.2.1-2 in N_{serv} consecutive T_{serv} that the serving cell does not fulfil the cell selection criterion S, the UE shall initiate the measurements of all neighbour cells indicated by the serving cell, regardless of the measurement rules currently limiting UE measurement activities.

Table 5.6A.2.1-1: N_{serv} for UE configured with eDRX INACTIVE cycle > T_{POS} (FR1)

5.6A.4.4 Measurement Reporting Requirements

The measurement reporting delay is defined as the time between the moment when the periodic measurement report is triggered and the moment when the UE is ready to transmit the measurement report over the air interface. If the UE supports reporting of NR positioning measurements via SDT, the UE may be able to report the measurements while it remains in RRC_INACTIVE state; otherwise, the UE will transition to RRC_CONNECTED state prior to transmitting the measurement report.

For RSTD measurements performed by the UE in RRC_INACTIVE state, with and without FH, the measurement reporting delay excludes all of the following:

- additional delay caused other LPP signalling on the DCCH,
- delay uncertainty introduced when inserting the measurement report in the TTI of the uplink DCCH, equal to 2 x TTI_{DCCH} where TTI_{DCCH} is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration,
- any delay caused by unavailability of UL resources to transmit the measurement report,
- any transmission delay needed by SDT,
- the time needed to transition to RRC_CONNECTED state to report the measurements.

The reported RSTD measurement values contained in measurement reports shall be based on the measurement report mapping requirements specified in clause 10.1.23.3.

The RSTD measurements performed and reported according to this section shall meet the RSTD measurement accuracy requirements in clause 10.1A.16.2.1, for each measured DL PRS resource by 1 Rx RedCap UE without FH.

The RSTD measurements performed and reported according to this section shall meet the RSTD measurement accuracy requirements in clause 10.1A.16.2.2, for each measured DL PRS resource by 1 Rx RedCap UE with FH.

The RSTD measurements performed and reported according to this section shall meet the RSTD measurement accuracy requirements in clause 10.1A.16.2.1, for each measured DL PRS resource by 2 Rx RedCap UE without FH.

The RSTD measurements performed and reported according to this section shall meet the RSTD measurement accuracy requirements in clause 10.1A.16.2.2, for each measured DL PRS resource by 2 Rx RedCap UE with FH.

5.6A.4.5 Measurement Period Requirement without RX FH

After receiving both *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message from the LMF via LPP [34], and UE is not configured to perform measurement with RX FH, the UE shall be able to measure multiple (up to the UE capability specified in clause 5.6A.4.3) DL RSTD measurements, defined in TS 38.215 [4], during the measurement period $T_{RSTD,Total}$ defined as:

$$\mathrm{T_{RSTD,Total}} = \sum_{i=1}^{L} \mathrm{T_{RSTD,i}} + \ (\mathrm{L}-1) \times \max\left(\mathrm{T_{effect,i}}\right)$$

Where:

- i is the index of positioning frequency layer,

- L is total number of positioning frequency layers, and
- $T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i

$T_{RSTD,i}$ is the measurement period for PRS RSTD measurement in positioning frequency layer *i* as specified below:

$$T_{RSTD,i} = \left(K_{carrier_PRS_RedCap} \times N_{Rx,TEG,i} \times N_{RxBeam,i} \times \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \times \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil \times N_{sample} - 1\right) \times T_{effect,i} + T_{last,i},$$

Where:

- $N_{RxBeam,i}$ is the UE Rx beam sweeping factor:
  - $N_{RxBeam,i}$ = 1 if positioning frequency layer *i* is in FR1 or UE has only 1Rx branch,
  - $N_{RxBeam,i}$ equals to the value as UE reported in *supportedLowerRxBeamSweepingFactor-FR2*, if positioning frequency layer *i* is in FR2 or the UE has 2Rx branches, and the capability is reported by the UE for the band containing positioning frequency layer i, and LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*.
  - $N_{RxBeam,i}$ equals to 8, otherwise.
- $K_{carrier_PRS_RedCap}$ is a scaling factor for PRS-based NR positioning measurements in RRC_INACTIVE. If the UE supports *parallelPRS-MeasRRC-Inactive-r17*, $K_{carrier_PRS_RedCap}$ = 1; otherwise,
  - If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$, $K_{carrier_PRS_RedCap} = K_{carrier_RedCap} + 1$, where $K_{carrier_RedCap}$ is defined in clause 4.2B.2.4
  - If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$, $K_{carrier_PRS_RedCap} = N_{layers} + 1$, where N_{layers} is defined in clause 4.2.2.7.
- $N_{Rx,TEG,i}$ is the Rx TEG specific scaling factor:
  - $N_{Rx,TEG,i}$ =1 if the UE is not configured by the LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34].
  - $N_{Rx,TEG,i}$ is defined as follows if the UE is configured by the LMF with *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] to perform measurement on same DL PRS resource of a TRP using different Rx TEGs in *NR-DL-TDOA-RequestLocationInformation* [34]:
    - $N_{Rx,TEG,i} = P$, if the UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, where P is the number of UE Rx TEGs that the UE is requested by LMF to measure the same DL-PRS Resource of a TRP indicated by *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* in [34], and in case 'n0' is indicated, P is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*.
    - $N_{Rx,TEG,i} = \left\lceil \frac{P}{Q} \right\rceil$, if the UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs, where Q is the number of UE Rx TEGs for measuring the same DL-PRS Resource simultaneously indicated by *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul-r17* in [34].
- $N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources in positioning frequency layer *i* configured in a slot.
- $L_{available_PRS,i}$ is the time duration of available PRS in positioning frequency layer *i* to be measured $T_{PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered.
- N_{sample} is the number of PRS RSTD samples, where
  - N_{sample} = 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
    - PRS bandwidth is within the initial BWP and

- Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

- N_{sample} = 2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:

  - PRS bandwidth is within the initial BWP and

  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

- N_{sample} = 4 otherwise.

- $T_{last,i}$ is the measurement duration for the last PRS RSTD sample in positioning frequency layer *i*, including the sampling time and processing time, $T_{\text{last,i}} = T_{\text{i}} + T_{available_PRS,\text{i}}$,

- $T_{\text{effect},i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i defined as:

$$T_{\text{effect,i}} = \left\lceil \frac{T_{\text{i}}}{T_{available_PRS,\text{i}}} \right\rceil \times T_{available_PRS,\text{i}}$$

where:

- T_i corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [34],

- $T_{available_PRS,\text{i}} = LCM\left(T_{PRS,\text{i}}, T_{DRX}\right)$, the least common multiple between $T_{PRS,\text{i}}$ and the DRX cycle length T_{DRX}

  - When UE is configured with RAN eDRX_INACTIVE ≤ 10.24 s:

    T_{DRX} is calculated as T defined in TS 38.304 [1] when CN eDRX_INACTIVE ≤ 10.24 s.

    T_{DRX} is calculated as max(T_{inside}, $T_{outside}$), where T_{inside} and $T_{outside}$ of the CN PTW as defined in TS 38.304 [1].

  - When UE is configured with RAN eDRX_INACTIVE > 10.24 s:

    T_{DRX} is calculated as max(T_{DRX_RAN}, T_{DRX_CN}), T_{DRX_RAN} and T_{DRX_CN} are DRX cycles with the RAN PTW and CN PTW defined in TS 38.304 [1].

  Otherwise, T_{DRX} is the DRX cycle of the UE in the serving cell.

- $T_{PRS,\text{i}}$ is the periodicity of DL PRS resource with muting on positioning frequency layer *i*.

If more than one PRS periodicities are configured in positioning frequency layer *i*, the least common multiple of PRS periodicities $T_{per}^{PRS\ with\ muting}$ among all DL PRS resource sets in the positioning frequency layer is used to derive $T_{PRS,\text{i}}$, where,

- $T_{per}^{PRS\ with\ muting} = N_{muting} \times T_{per}^{PRS}$, is the PRS periodicity with muting per PRS resource,

- T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

- N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} \times L_{muting}$, where

- T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

- $\{N, T\}$ is the UE capability combination per band for RRC_INACTIVE state where N is the duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSymbols-r17* in TS 37.355 [34], T (ms) corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [34], and T-N (>0) is the time required to process duration N of DL PRS symbols already buffered in memory, for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [34] .

- N' is UE capability for number of DL PRS resources that it can process in a slot in RRC_INACTIVE state as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive-r17* specified in TS 37.355 [34].

If the following conditions are met, the time $T_{RSTD,Total}$ starts from the first DL PRS resource(s) instances inside a PTW after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the UE via LPP [34].

- UE is configured with RAN eDRX > 10.24 s, and
- periodic PRS measurement reporting is configured, and
- RAN eDRX cycle is smaller or equal to the PRS measurement reporting periodicity configured via higher layer parameter *reportingInterval* in TS 37.355 [34], and
- there is one or more PRS resources occurring in PTW.

Otherwise, the time $T_{RSTD,Total}$ starts from the first DL PRS resource(s) after both the *NR-DL-TDOAProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the UE via LPP [34].

NOTE: No per-positioning frequency layer requirement is applied in scenarios when multiple positioning frequency layers are configured.

If the DRX cycle is reconfigured during the RSTD measurement period, then the measurement period can be longer.

If eDRX_INACTIVE cycle is reconfigured during the RSTD measurement period, then the measurement period can be longer.

When PRS-RSRP is configured for DL-TDOA, RSTD and PRS-RSRP are performed over the same measurement period.

When PRS-RSRPP is configured for DL-TDOA, RSTD and PRS-RSRPP are performed over the same measurement period.

The measurement requirements do not apply to any PRS resource that always collides with other higher-priority DL signals/channels, as specified in clause 5.6A.1.

Longer RSTD measurement period is expected when there are collisions between PRS resources and other higher-priority DL signals/channels.

If $K_{\text{carrier_PRS_RedCap}}$ changes for any PFL during the measurement period, the measurement period could be longer.

The measurement requirements do not apply for a PRS resource, if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$.

The measurement requirements do not apply for a PRS resource, if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

The requirements in clause 5.6A.4.5 do not apply if the PRS configuration given by higher layer parameters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-TDOA-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If cell re-selection occurs while RSTD measurements are being performed, then the UE shall continue and complete the on-going RSTD measurements after the cell selection is completed. The RSTD measurement period can be longer.

If the RRC state transition occurs from RRC_INACTIVE to RRC_CONNECTED state during the RSTD measurement period, then the UE shall continue the RSTD measurement in the RRC_CONNECTED state. The RSTD measurement period can be longer.

5.6A.4.6 Measurement Period Requirement with RX FH

When physical layer receives last of *NR-TDOA-ProvideAssistanceData* message and *NR-TDOA-RequestLocationInformation* message from LMF via LPP [34], requesting RedCap UE to measure DL RSTD measurement with RX FH via *nr-DL-PRS-RxHoppingRequest-r18* as defined in TS 37.355 [34], the RedCap UE shall be able to measure multiple (up to the RedCap UE capability specified in clause 5.6A.4.3) DL RSTD measurements, defined in TS 38.215 [4], during the measurement period $T_{RSTD,Total}$ defined in clause 5.6A.4.5 with using the following definition for N_{sample} and $L_{available_PRS,\mathrm{i}}$.

N_{sample} is the number of PRS RSTD measurement samples, where

- N_{sample} = 2 if the RedCap UE supports *reducedNumOfSampleForMeasurementWithFH-RRC-IdleAndInactive* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples.
- N_{sample} = 4 otherwise.

A measurement sample under RX FH is defined as a PRS measurement over multiple hops.

$L_{available_PRS,\mathrm{i}}$ is the time duration of available PRS in the positioning frequency layer i to be measured, and is calculated by:

$$L_{available_PRS,i} = \sum_{j=1}^{J} N_{hop,i,j} * L_{per-hop,i,j} \quad ,$$

where

- $N_{hop,i,j}$ is the number of hops that UE can perform within a time window occasion *j* as defined in the following, and
- $L_{per-hop,i,j}$ is the time duration of available PRS resources in the positioning frequency layer *i* in each hop to be measured in time window occasion *j* during $T_{available_PRS,\mathrm{i}}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{per-hop,i,j}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered;
- *J* is the number of time window occasions during $T_{available_PRS,\mathrm{i}}$.

The sampling duration per hop is the first $T_{sample,hop}$ symbols in each hop, where $T_{sample,hop} = T_{hop} - RRT_{FH}$, T_{hop} is the applicable length per hop as defined in table 5.6A.4.6-1, and RRT_{FH} is the RF retuning time between Rx hops indicated by UE in *rf-RxRetuneTimeFR1* or *rf-RxRetuneTimeFR2* via *NR-DL-PRS-ProcessingCapability* [34]. The first hop starts at no earlier than the earliest arrival time of the first unmuted PRS resource fully or partially overlapped with the measurement time window, defined in clause 5.6A.1, taking into account the *expectedRSTD* and *expectedRSTD-uncertainty* in the PRS assistance data.

Table5.6A.4.6-1: Applicable number of hops per slot and applicable length of each hop

RRT_{FH}	(comb size, Number of PRS symbols)	Applicable number of hops per slot (N_{hops}^{slot})	Applicable length per hop ($T_{per-hop}$) in number of symbols
$RRT_{FH} \leq 2$ symbols	(2, 12) with SCS 15 kHz, 30 kHz in FR1, and 60 kHz, 120 kHz in FR2	2	7
	All others	1	14
2 symbols $< RRT_{FH} \leq 6$ symbols	(≤ 6, any)	1	14
	(12, 12)	½	28
$RRT_{FH} > 6$ symbols	Any combination	½	28

The number of hops within a single time window $N_{hop,i,j}$ is defined as

$$N_{hop,i,j} = min\left(N_{hops,effect,i,j}, \left\lfloor \frac{N3_i}{L_{per-hop,i,j}} \right\rfloor, N_{hop,max,i}\right)$$

where

- $N_{hop,max,i}$ is the maximum number of Rx hops as reported by UE in *maximumFH-Hops* via *NR-DL-PRS-ProcessingCapability* as specified in [34] for positioning frequency layer *i* ,
- $N3_i$ is indicated via UE capability *processingPRS-SymbolsDurationN3-r18* for positioning frequency layer *i*,
- $N_{hops,effect,i,j}$ is the effective number of Rx hops within a single time window occasion *j*,
  - $N_{hops,effect,i,j} = 2 * N_{rep}^{PRS}$, if $N_{hops}^{slot} = 2$,
  - $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot} = 1$,
  - $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot} = 1/2$ and $M_{rep}^{PRS} > 1$,
  - $N_{hops,effect,i,j} = \left\lfloor \frac{(N_{rep}^{PRS}-1)}{2} \right\rfloor + 1$, if $N_{hops}^{slot} = 1/2$ and $M_{rep}^{PRS} = 1$,

  where N_{rep}^{PRS} is the number of inter-slot PRS repetitions within a single time window, which are unmuted and fully or partially overlapped with the sampling duration within each hop. M_{rep}^{PRS} is the PRS repetition interval configured by *dl-PRS-ResourceTimeGap*, N_{hops}^{slot} is the applicable number of hops per slot as defined in table 5.6A.4.6-1.

The measurement period requirement with the above modifications applies provided all PRS resources in each PFL have the same number of PRS repetitions $\left(N_{rep}^{PRS}\right)$ within a time window instance and the same PRS repetition interval $\left(M_{rep}^{PRS}\right)$, otherwise the measurement period can be longer.

UE shall be able to measure PRS resources with multiple hops at least over the BW of BW_{total} defined as

$$BW_{total} = min\left(BW_{PRS}, N_{hop,i,j} * BW_{per-hop} - \left(N_{hop,i,j} - 1\right) * BW_{overlap}\right),$$

where

BW_{PRS} is the minimum among:

- configured PRS BW, and
- UE capability of maximum PRS BW across all hops indicated via *maximumPRS-BandwidthAcrossAllHopsFR1-r18* or *maximumPRS-BandwidthAcrossAllHopsFR2-r18* as specified in [34], and
- total BW of all hops requested by LMF via *nr-DL-PRS-RxHoppingTotalBandwidth-r18*.as specified in [34],

$N_{hop,i,j}$ is number of hops within a single time window as define above,

$BW_{per-hop}$ is the UE capability on PRS BW per hop indicated via *supportedBandwidthPRS-r16* as specified in [34].

$BW_{overlap}$ is the UE capability on BW of the overlapping RB indicated via *numOfOverlappingPRB-r18* as specified in [34].

5.6A.5 PRS-RSRP measurements for RedCap

5.6A.5.1 Introduction

The requirements in clause 5.6A.5.5 shall apply provided the RedCap UE has received *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [34] requesting the UE to measure and report PRS-RSRP measurements defined in TS 38.215 [4] without FH via *nr-DL-PRS-RxHoppingRequest*. And the UE is capable of supporting the PRS-RSRP measurement in RRC_INACTIVE state.

The requirements in clause 5.6A.5.6 shall apply provided the RedCap UE has received *NR-DL-AoD-RequestLocationInformation* message from the LMF via LPP [34] requesting the UE to measure and report PRS-RSRP

measurements defined in TS 38.215 [4] with FH via *nr-DL-PRS-RxHoppingRequest*. And the UE is capable of supporting the PRS-RSRP measurement in RRC_INACTIVE state.

5.6A.5.3 Measurement Capability

UE PRS-RSRP measurement capability is as indicated by the UE in *NR-DL-AoD-ProvideCapabilities* according to TS 37.355 [34].

5.6A.5.4 Measurement Reporting Requirements

The measurement reporting delay is defined as the time between the moment when the periodic measurement report is triggered and the moment when the UE is ready to transmit the measurement report over the air interface. If the UE supports reporting of NR positioning measurements via SDT, the UE may be able to report the measurements while it remains in RRC_INACTIVE state; otherwise, the UE will transition to RRC_CONNECTED state prior to transmitting the measurement report.

For PRS-RSRP measurements performed by the UE in RRC_INACTIVE state, the measurement reporting delay excludes all of the following:

- any delay caused other LPP signalling on the DCCH,
- delay uncertainty introduced when inserting the measurement report in the TTI of the uplink DCCH which is equal to $2 \times TTI_{DCCH}$ where TTI_{DCCH} is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration,
- any delay caused by no UL resources for UE to send the measurement report,
- any transmission delay needed by SDT,
- the time needed to transition to RRC_CONNECTED state to report the measurements.

The reported PRS-RSRP measurement values contained in measurement reports shall be based on the measurement report mapping requirements specified in clause 10.1.24.3.

The PRS-RSRP measurement accuracy for all measured PRS resources shall be fulfilled according to the accuracy requirements specified in the clause 10.1A.17.2, for each measured DL PRS resource by 1 Rx RedCap UE without FH.

The PRS-RSRP measurement accuracy for all measured PRS resources shall be fulfilled according to the accuracy requirements specified in the clause 10.1A.17.2, for each measured DL PRS resource by 1 Rx RedCap UE with FH.

The PRS-RSRP measurement accuracy for all measured PRS resources shall be fulfilled according to the accuracy requirements specified in the clause 10.1A.17.2, for each measured DL PRS resource by 2 Rx RedCap UE without FH.

The PRS-RSRP measurement accuracy for all measured PRS resources shall be fulfilled according to the accuracy requirements specified in the clause 10.1A.17.2, for each measured DL PRS resource by 2 Rx RedCap UE with FH.

5.6A.5.5 Measurement Period Requirements without RX FH

When the physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [34], and UE is not configured to perform measurement with RX FH, the UE shall be able to measure multiple (up to the UE capability specified in clause 5.6A.5.3) PRS-RSRP measurements, defined in TS 38.215 [4], from configured PRS resources for configured TRPs on configured positioning frequency layers, within $T_{PRS-RSRP,total}$.

$$T_{PRS-RSRP,\ total} = \sum_{i=1}^{L} T_{PRS-RSRP,i} + (L-1) \times \max\left(T_{effect,i}\right)$$

Where:

- i is the index of positioning frequency layer,
- L is total number of positioning frequency layers,
- $T_{effect,i}$ is the periodicity of the PRS-RSRP measurement in positioning frequency layer i.

$$T_{PRS-RSRP,i} = \left(K_{carrier_PRS_RedCap} \times N_{RxBeam,i} \times \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil \times N_{sample} - 1\right) \times T_{effect,i} + T_{last,i}$$Where:

- $K_{carrier_PRS_RedCap}$ is a scaling factor for PRS-based NR positioning measurements in RRC_INACTIVE. If the UE supports *parallelPRS-MeasRRC-Inactive-r17*, $K_{carrier_PRS} = 1$; otherwise,
  - If Srxlev ≤ $S_{nonIntraSearchP}$ or Squal ≤ $S_{nonIntraSearchQ}$, $K_{carrier_PRS_RedCap} = K_{carrier_RedCap} + 1$, where $K_{carrier_RedCap}$ is defined in clause 4.2B.2.4
  - If Srxlev > $S_{nonIntraSearchP}$ and Squal > $S_{nonIntraSearchQ}$, $K_{carrier_PRS_RedCap} = N_{layers} + 1$, where N_{layers} is defined in clause 4.2.2.7.
- $N_{RxBeam,i}$ is the UE Rx beam sweeping factor:
  - $N_{RxBeam,i}$ = 1 if positioning frequency layer i is in FR1 or UE has only 1Rx branch,
  - $N_{RxBeam,i}$ equals to the value as UE reported in *supportedLowerRxBeamSweepingFactor-FR2*, if positioning frequency layer i is in FR2 or the UE has 2Rx branches, and the capability is reported by the UE for the band containing positioning frequency layer i, and LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*.
- $N_{RxBeam,i}$ equals to 8, otherwise.
- $L_{available_PRS,i}$ is the time duration of available PRS to be measured in the positioning frequency layer i to be measured during $T_{PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered.
- $N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,
- {N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSymbols-r17* in TS 37.355 [34] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [34],
- N′ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot-RRC-Inactive-r17* in clause 6.4.3 of TS 37.355 [34],
- N_{sample} is the number of PRS-RSRP measurement samples and
  - N_{sample} = 1, if UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* [34], and the LMF indicates the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamplesrequestedDL-PRS-ProcessingSamples* [34], and the following conditions are met:
    - PRS bandwidth is within the initial BWP and

- Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

- N_{sample} = 2, if UE supports *supportedDL-PRS-ProcessingSamples-RRC-Inactive* [34], and the LMF indicates the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples* [34], and the following conditions are not met:

  - PRS bandwidth is within the initial BWP and

  - Magnitude of difference between the serving cell's SS-RSRP and the neighbour cell's PRS-RSRP is within 6 dB.

- N_{sample} = 4 otherwise

- $T_{last,i} = T_i + T_{available_PRS,i}$ is the measurement duration for the last PRS-RSRP sample, including the sampling time and processing time,

- $T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil \times T_{available_PRS,i}$ is the periodicity of PRS-RSRP measurement in positioning frequency layer *i*,

- T_i corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms-r17* in TS 37.355 [34],

- $T_{available_PRS,i} = LCM(T_{PRS,i}, T_{DRX})$, the least common multiple between $T_{PRS,i}$ and the DRX cycle length T_{DRX}

  - When UE is configured with RAN eDRX_INACTIVE ≤ 10.24 s:

  T_{DRX} is calculated as T defined in TS 38.304 [1] when CN eDRX_INACTIVE ≤ 10.24 s.

  T_{DRX} is calculated as max(T_{inside}, $T_{outside}$), where T_{inside} and $T_{outside}$ of the CN PTW as defined in TS 38.304 [1].

  When UE is configured with RAN eDRX_INACTIVE > 10.24 s:

  T_{DRX} is calculated as max(T_{DRX_RAN}, T_{DRX_CN}), T_{DRX_RAN} and T_{DRX_CN} are DRX cycles with the RAN PTW and CN PTW defined in TS 38.304 [1].

  Otherwise, T_{DRX} is the DRX cycle of the UE in the serving cell.

  - $T_{PRS,i}$ is the maximum PRS resource periodicity among all PRS resources in positioning frequency layer i,

  - T_{DRX} is the DRX cycle length.

If positioning frequency layer *i* has more than one DL PRS resource set with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} \times T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among the DL PRS resource sets is used to derive $T_{PRS,i}$, where:

- T_{per}^{PRS} is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

- N_{muting} is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} \times L_{muting}$, where T_{muting}^{PRS} is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and L_{muting} is the size of the bitmap $\{b^1\}$.

When UE is configured with DRX_cycle, the time $T_{PRS-RSRP,total}$ starts from the first DRX cycle containing the DL PRS resources in the assistance data after both the *NR-DL-AoD-RequestLocationInformation* message and *NR-DL-AoD-ProvideAssistanceData* message from LMF via LPP [34] are delivered to the physical layer of UE.

If the following conditions are met, the time $T_{PRS-RSRP,\ total}$ starts from the first DL PRS resource(s) instances inside a PTW after both the *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* messages are delivered from LMF to the UE via LPP [34].

- UE is configured with RAN eDRX > 10.24 s, and

- periodic PRS measurement reporting is configured, and

- RAN eDRX cycle is smaller or equal to the PRS measurement reporting periodicity configured via higher layer parameter *reportingInterval* in TS 37.355 [34], and

- there is one or more PRS resources occurring in PTW.

Otherwise, the time $T_{RSTD,Total}$ starts from the first DL PRS resource(s) after both the *NR-DL-TDOAProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* messages are delivered from LMF to the UE via LPP [34].

NOTE: No per-positioning frequency layer requirement is applied in scenarios when multiple positioning frequency layers are configured.

When the PRS-RSRP measurement is configured together with RSTD measurement then the PRS-RSRP measurement shall meet the RSTD measurement requirements defined in clause 5.6A.4.5.

When the PRS-RSRP measurement is configured together with UE Rx-Tx time difference measurement then the PRS-RSRP measurement shall meet the UE Rx-Tx time difference measurement requirements defined in clause 5.6A.6.5.

The measurement requirements do not apply for a PRS resource:

- if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,\mathrm{i}}$ or

- if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

Longer PRS-RSRP measurement period is expected when there is collision/overlap between other DL signals/channels and PRS resources in RRC_INACTIVE state.

The requirements in clause 5.6A.5.5 do not apply if the PRS configuration given by higher layer parameters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-AoD-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If the DRX cycle is reconfigured during the PRS-RSRP measurement period, then the PRS-RSRP measurement period can be longer.

If the eDRX_INACTIVE cycle is reconfigured during the PRS-RSRP measurement period, then the PRS-RSRP measurement period can be longer.

If cell reselection occurs while PRS-RSRPP measurement is being performed, then the UE shall continue and complete the on-going PRS-RSRP measurement after the cell selection is completed. The PRS-RSRP measurement period can be longer.

If the UE's RRC state changes from the RRC_INACTIVE to RRC_CONNECTED during the PRS-RSRP measurement period, then the UE shall continue the PRS-RSRP measurement in the RRC_CONNECTED state. The PRS-RSRP measurement period can be longer.

5.6A.5.6 Measurement Period Requirement with RX FH

When physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [34], and UE is configured to perform PRS-RSRP measurement with RX FH via *nr-DL-PRS-RxHoppingRequest-r18* as defined in TS 37.355 [34], the UE shall be able to measure multiple (up to the UE capability specified in 5.6A.5.3) PRS-RSRP measurements, defined in TS 38.215 [4], during the measurement period $T_{PRS-RSRP,Total}$ defined in clause 5.6A.5.5 with using the following definition for N_{sample} and $L_{available_PRS,\mathrm{i}}$.

N_{sample} is the number of PRS-RSRP measurement samples, where

- N_{sample} = 2 if the RedCap UE supports *reducedNumOfSampleForMeasurementWithFH-RRC-IdleAndInactive* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples.

- N_{sample} = 4 otherwise.

A measurement sample under RX FH is defined as a PRS measurement over multiple hops.

$L_{available_PRS,i}$ is the time duration of available PRS in the positioning frequency layer i to be measured, and is calculated by:

$$L_{available_PRS,i} = \sum_{j=1}^{J} N_{hop,i,j} * L_{per-hop,i,j} ,$$

where,

- $N_{hop,i,j}$ is the number of hops that UE can perform within a time window occasion *j* as defined in the following, and
- $L_{per-hop,i,j}$ is the time duration of available PRS resources in the positioning frequency layer *i* in each hop to be measured in a time window occasion *j* during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{per-hop,i,j}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered;
- *J* is the number of time window occasions during $T_{available_PRS,i}$.

The sampling duration per hop is the first $T_{sample,hop}$ symbols in each hop, where $T_{sample,hop} = T_{hop} - RRT_{FH}$, T_{hop} is the applicable length per hop as defined in table 5.6A.5.6-1, and RRT_{FH} is the retuning time between Rx hops indicated by UE in *rf-RxRetuneTimeFR1* or *rf-RxRetuneTimeFR2* via *NR-DL-PRS-ProcessingCapability* [34]. The first hop starts at no earlier than the earliest arrival time of the first unmuted PRS resource fully or partially overlapped with the measurement time window, defined in clause 5.6A.1, taking into account the *expectedRSTD* and *expectedRSTD-uncertainty* in the PRS assistance data.

Table5.6A.5.6-1: Applicable number of hops per slot and applicable length of each hop

RRT_{FH}	**(comb size, Number of PRS symbols)**	**Applicable number of hops per slot (N_{hops}^{slot})**	**Applicable length per hop ($T_{per-hop}$) in number of symbols**
$RRT_{FH} \leq 2$ symbols	(2, 12) with SCS 15 kHz, 30 kHz in FR1, and 60 kHz, 120 kHz in FR2	2	7
	All others	1	14
2 symbols $< RRT_{FH} \leq 6$ symbols	(≤ 6, any)	1	14
	(12, 12)	½	28
$RRT_{FH} > 6$ symbols	Any combination	½	28

The number of hops within a single time window $N_{hop,i,j}$ is defined as

$$N_{hop,i,j} = min\left(N_{hops,effect,i,j}, \left\lfloor \frac{N3_i}{L_{per-hop,i,j}} \right\rfloor, N_{hop,max,i}\right),$$

where

- $N_{hop,max,i}$ is the maximum number of Rx hops as reported by UE in *maximumFH-Hops* via *NR-DL-PRS-ProcessingCapability* for positioning frequency layer *i* as specified in [34],
- $N3_i$ is indicated via UE capability *processingPRS-SymbolsDurationN3-r18* for positioning frequency layer *i*,
- $N_{hops,effect,i,j}$ is the effective number of Rx hops within a single time window occasion *j*,
  - $N_{hops,effect,i,j} = 2 * N_{rep}^{PRS}$, if $N_{hops}^{slot} = 2$,
  - $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot} = 1$,
  - $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot} = 1/2$ and $M_{rep}^{PRS} > 1$,
  - $N_{hops,effect,i,j} = \left\lfloor \frac{(N_{rep}^{PRS}-1)}{2} \right\rfloor + 1$, if $N_{hops}^{slot} = 1/2$ and $M_{rep}^{PRS} = 1$,
  - where N_{rep}^{PRS} is the number of inter-slot PRS repetitions within a single time window, which are unmuted and fully or partially overlapped with the sampling duration within each hop. M_{rep}^{PRS} is the PRS repetition interval

configured by *dl-PRS-ResourceTimeGap*, N_{hops}^{slot} is the applicable number of hops per slot as defined in table 5.6A.5.6-1.

The measurement period requirement with the above modifications applies provided all PRS resources in each PFL have the same number of PRS repetitions $\left(N_{rep}^{PRS}\right)$ within a time window instance and the same PRS repetition interval $\left(M_{rep}^{PRS}\right)$, otherwise the measurement period can be longer.

UE shall be able to measure PRS resources with multiple hops at least over the BW of BW_{total} defined as

$$BW_{total} = min\left(BW_{PRS}, N_{hop,i,j} * BW_{per-hop} - \left(N_{hop,i,j} - 1\right) * BW_{overlap}\right),$$

where

BW_{PRS} is the minimum among:

- configured PRS BW, and
- UE capability of maximum PRS BW across all hops indicated via *maximumPRS-BandwidthAcrossAllHopsFR1-r18* or *maximumPRS-BandwidthAcrossAllHopsFR2-r18* as specified in [34], and
- total BW of all hops requested by LMF via *nr-DL-PRS-RxHoppingTotalBandwidth-r18* as specified in [34],

$N_{hop,i,j}$ is number of hops within a single time window as define above,

$BW_{per-hop}$ is the UE capability on PRS BW per hop indicated via *supportedBandwidthPRS-r16* as specified in [34],

$BW_{overlap}$ is the UE capability on BW of the overlapping RB indicated via *numOfOverlappingPRB-r18* as specified in [34].

UE Rx-Tx time difference measurement capability is as indicated by the UE in *NR-Multi-RTT-ProvideCapabilities*, according to TS 37.355 [34].

5.6A.6.4 Measurement Reporting Requirements

The measurement reporting delay is defined as the time between the moment the measurement report is triggered and the moment when the UE starts to transmit the measurement report over the air interface.

This measurement reporting delay excludes the delay caused by any of the following:

- delay caused by other LPP signalling on the DCCH.

- delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x TTI_{DCCH} where TTI_{DCCH} is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration.

- delay caused due to lack of UL resources for UE to send the measurement report.

- delay required by SDT for reporting the measurement using SDT resources.

- delay required for transition to RRC_CONNECTED state for report the measurement in RRC_CONNECTED.

The UE Rx-Tx time difference measurement values contained in measurement reports shall be based on the measurement report mapping requirements specified in clause 10.1A.18.2.2.

When physical layer receives last of *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message from LMF via LPP [34], and UE is not configured to perform measurement with RX FH, UE shall be able to measure multiple (up to the UE capability specified in clause 5.6A.6.3) UE Rx-Tx time difference measurements as defined in TS 38.215 [4] in configured positioning frequency layers within the measurement period $T_{UERxTx,Total}$ defined in 5.6.4.5.

If the RRC state transion occurs from RRC_INACTIVE to RRC_CONNECTED state during the UE Rx-Tx time difference measurement period, then the UE shall restart the UE Rx-Tx time difference measurement after it obtains SRS configuration and Timing Advance command from the serving cell.

If cell reselection occurs during the UE Rx-Tx time difference measurement period then the UE shall restart the UE Rx-Tx time difference measurement after it obtains SRS configuration and Timing Advance command from the new serving cell.

The measurement requirements do not apply for a PRS resource:

- if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$ or
- if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

If the DRX cycle is reconfigured during the UE Rx-Tx time difference measurement period then the UE Rx-Tx time difference measurement period can be longer.

If during UE Rx-Tx time difference measurement period PRS resources overlap with other DL signals/channels then the UE Rx-Tx time difference measurement period can be longer.

When PRS-RSRP is configured for multi-RTT, the UE Rx-Tx time difference measurements and PRS-RSRP measurements are performed over the same measurement period.

When PRS-RSRPP is configured for multi-RTT, the UE Rx-Tx time difference measurements and PRS-RSRPP measurements are performed over the same measurement period.

The requirements in clause 5.6.4 do not apply if the PRS configuration given by higher layer parameters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-Multi-RTT-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If UE uplink transmission timing changes due to the network-configured Timing Advance command during the UE Rx-Tx measurement period, then the UE Rx-Tx time difference measurement period is restarted after uplink transmission timing changes, and the UE Rx-Tx time difference measurement period requirements in this clause shall not apply.

If UE uplink transmission timing changes due to the change in the N_{TA_offset} defined in table 7.1.2-2 during the UE Rx-Tx measurement period, then the UE Rx-Tx time difference measurement period is restarted after uplink transmission timing changes, and the UE Rx-Tx time difference measurement period requirements in this clause shall not apply.

The UE shall meet the UE Rx-Tx time difference measurement accuracy requirements in clause 10.1.25.2.

When physical layer receives *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message from LMF via LPP [34], and UE is configured to perform PRS-RSRP measurement with RX FH via *nr-DL-PRS-RxHoppingRequest-r18* as defined in TS 37.355 [34], the RedCap UE shall be able to measure multiple (up to the RedCap UE capability specified in clause 5.6A.6.3) UE Rx-Tx time difference measurements as defined in TS 38.215 [4], during the measurement period $T_{UE\ RxTx,Total}$ defined in clause 5.6.4.5 with using the following definition for N_{sample} and $L_{available_PRS,i}$:

N_{sample} is the number of PRS RSTD measurement samples, where

- N_{sample} = 2 if the RedCap UE supports *reducedNumOfSampleForMeasurementWithFH-RRC-IdleAndInactive* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples.
- N_{sample} = 4 otherwise.

A measurement sample under RX FH is defined as a PRS measurement over multiple hops.

$L_{available_PRS,i}$ is the time duration of available PRS in the positioning frequency layer i to be measured, and is calculated by:
$L_{available_PRS,i}$ is the time duration of available PRS in the positioning frequency layer i to be measured, and is calculated by:

$$L_{available_PRS,i} = \sum_{j=1}^{J} N_{hop,i,j} * L_{per-hop,i,j} \quad ,$$

where

- $N_{hop,i,j}$ is the number of hops that UE can perform within a time window occasion *j* as defined in the following, and

- $L_{per-hop,i,j}$ is the time duration of available PRS resources in the positioning frequency layer *i* in each hop to be measured in time window occasion *j* during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{per-hop,i}$, only unmuted PRS resources that are not fully overlapped with other higher-priority DL signals/channels are considered;

- *J* is the number of time window occasions during $T_{available_PRS,i}$.

The sampling duration per hop is the first $T_{sample,hop}$ symbols in each hop, where $T_{sample,hop} = T_{hop} - RRT_{FH}$, T_{hop} is the applicable length per hop as defined in table 5.6A.6.6-1, and RRT_{FH} is the retuning time between Rx hops indicated by UE in *rf-RxRetuneTimeFR1* or *rf-RxRetuneTimeFR2* via *NR-DL-PRS-ProcessingCapability* [34]. The first hop starts at no earlier than the earliest arrival time of the first unmuted PRS resource fully or partially overlapped with the measurement time window, defined in clause 5.6A.1, taking into account the *expectedRSTD* and *expectedRSTD-uncertainty* in the PRS assistance data.

The number of hops within a single time window $N_{hop,i,j}$ is defined as

$$N_{hop,i,j} = min\left(N_{hops,effect,i,j}, \left\lfloor \frac{N3_i}{L_{per-hop,i,j}} \right\rfloor, N_{hop,max,i}\right),$$

where

- $N_{hop,max,i}$ is the maximum number of Rx hops as reported by UE in *maximumFH-Hops* via *NR-DL-PRS-ProcessingCapability* as specified in [34] for positioning frequency layer *i* ,

- $N3_i$ is indicated via UE capability *processingPRS-SymbolsDurationN3-r18* for positioning frequency layer *i*,

- $N_{hops,effect,i,j}$ is the effective number of Rx hops within a single time window occasion *j*,

  - $N_{hops,effect,i,j} = 2 * N_{rep}^{PRS}$, if $N_{hops}^{slot} = 2$,

  - $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot} = 1$,

  - $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot} = 1/2$ and $M_{rep}^{PRS} > 1$,

  - where N_{rep}^{PRS} is the number of inter-slot PRS repetitions within a single time window, which are unmuted and fully or partially overlapped with the sampling duration within each hop. M_{rep}^{PRS} is the PRS repetition interval configured by *dl-PRS-ResourceTimeGap*, N_{hops}^{slot} is the applicable number of hops per slot as defined in table 5.6A.6.6-1.

The measurement period requirement with the above modifications applies provided all PRS resources in each PFL have the same number of PRS repetitions (N_{rep}^{PRS}) within a time window instance and the same PRS repetition interval (M_{rep}^{PRS}), otherwise the measurement period can be longer.

UE shall be able to measure PRS resources with multiple hops at least over the BW of BW_{total} defined as

$$BW_{total} = min\left(BW_{PRS}, N_{hop,i,j} * BW_{per-hop} - \left(N_{hop,i,j} - 1\right) * BW_{overlap}\right),$$

where

BW_{PRS} is the minimum among:

6 RRC_CONNECTED state mobility

6.1 Handover

6.1.1 NR Handover

6.1.1.1 Introduction

The purpose of NR handover is to change the NR PCell to another NR cell. The requirements in this clause are applicable to SA NR, NE-DC and NR-DC.

Handover is defined as intra-frequency handover if the center frequency and subcarrier spacing (SCS) of the reference SSB of the serving cell is same as the center frequency and SCS of the reference SSB of the target cell, where:

- The reference SSB of the serving cell is the SSB in the active DL BWP of serving cell
- The reference SSB of the target cell is the SSB in the first active DL BWP of the target cell upon reconfiguration.

The requirements in this clause apply for the following handover scenarios:

- Handover to the first active DL BWP of the target cell associated with CD-SSB;
- Handover to the first active DL BWP of the target cell associated with NCD-SSB if the UE supports *ncd-SSB-BWP-Wor-r18*.

6.1.1.2 NR FR1 - NR FR1 Handover

The requirements in this clause are applicable to both intra-frequency and inter-frequency handovers from NR FR1 cell to NR FR1 cell, and to inter-frequency handover from NR FR1 cell in a carrier frequency with CCA to NR FR1 cell.

6.1.1.2.1 Handover delay

When the UE receives a RRC message implying handover the UE shall be ready to start the transmission of the new uplink PRACH channel within $D_{handover}$ msec from the end of the last TTI containing the RRC command.

Where:

$D_{handover}$ equals the applicable RRC procedure delay defined in clause 12 in TS 38.331 [2] plus the interruption time stated in clause 6.1.1.2.2.

6.1.1.2.2 Interruption time

The interruption time is the time between the end of the last TTI containing the RRC command on the old PDSCH and the time the UE starts transmission of the new PRACH, excluding the RRC procedure delay.

When intra-frequency or inter-frequency handover is commanded, the interruption time shall be less than $T_{interrupt}$

$$T_{interrupt} = T_{search} + T_{IU} + T_{processing} + T_{\Delta} + T_{margin} \text{ ms}$$

Where:

T_{search} is the time required to search the target cell when the target cell is not already known when the handover command is received by the UE. Regardless of whether DRX is in use by the UE, T_{search} shall still be based on non-DRX target cell search times.

- If the target cell is a known intra-frequency cell, then T_{search} = 0 ms.
- If the target cell is an unknown intra-frequency cell and the target cell Es/Iot≥-2 dB, then $T_{search} = T_{rs}$ ms.
- If the target cell is a known inter-frequency cell, then

- For a UE supporting *ncd-SSB-BWP-Wor-r18*:
  - if the measured SSB is the target SSB for handover of the target cell, T_{search} = 0 ms;
  - if the measured SSB and the target SSB for handover belong to the same NR target cell and are not the same SSB, T_{search} = T_{rs} ms provided one of the following conditions is satisfied:
    - The measured SSB is the CD-SSB in the target cell and the HO target SSB is the NCD-SSB in the first active DL BWP, or
    - The measured SSB is the NCD-SSB in the target cell and the HO target SSB is the CD-SSB in the first active DL BWP, or
    - The measured SSB is the NCD-SSB in the target cell and the HO target SSB is the NCD-SSB and they are within different DL BWPs
  - For a UE not supporting *ncd-SSB-BWP-Wor-r18*, then T_{search} = 0 ms.
- If the target cell is an unknown inter-frequency cell and the target cell Es/Iot≥-2 dB, T_{search} = 3* T_{rs} ms.

T_{Δ} is time for fine time tracking and acquiring full timing information of the target cell.

T_{Δ} = T_{rs} for both known and unknown target cells operating with 20 PRB SSB BW.

T_{Δ} = 3*T_{rs} for both known and unknown target cells operating with 12 PRB SSB BW.

$T_{processing}$ is time for UE processing. $T_{processing}$ can be up to 20 ms.

T_{margin} is time for SSB post-processing. T_{margin} can be up to 2 ms.

T_{IU} is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell. T_{IU} can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in table 8.1-1 of TS 38.213 [3].

T_{rs} is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cellin the handover command, otherwise T_{rs} is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If the measObjectNRs having the same SSB frequency and subcarrier spacing configured by MN and SN have different SMTC, T_{rs} is the periodicity of one of the SMTC which is up to UE implementation. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with T_{rs}=5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms. If the UE has been provided with higher layer in TS 38.331 [2] signalling of *smtc2* prior to the handover command, T_{rs} follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

In the interruption requirement a cell is known if it has been meeting the relevant cell identification requirement during the last 5 seconds otherwise it is unknown. Relevant cell identification requirements are described in clause 9.2.5 for intra-frequency handover and clause 9.3.4 for inter-frequency handover.

When inter-frequency handover is commanded, the interruption time shall be less than $T_{interrupt}$

$$T_{interrupt} = T_{search} + T_{IU} + T_{processing} + T_{\Delta} + T_{margin} \text{ ms}$$

Where:

T_{search} is the time required to search the target cell when the target cell is not already known when the handover command is received by the UE. Regardless of whether DRX is in use by the UE, T_{search} shall still be based on non-DRX target cell search times.

- If the target cell is a known intra-frequency cell, then T_{search} = 0 ms.
- If the target cell is an unknown intra-frequency cell and the target cell Es/Iot≥-2 dB, then $T_{search} = T_{rs}$ ms.
- If the target cell is a known inter-frequency cell, then
  - For a UE supporting *ncd-SSB-BWP-Wor-r18*:

T_{IU} is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell. T_{IU} can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in table 8.1-1 of TS 38.213 [3].

T_{rs} is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cell in the handover command, otherwise T_{rs} is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If such measObjectNRs configured by MN and SN have different SMTC, T_{rs} is the periodicity of one of the SMTC which is up to UE implementation. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with T_{rs} = 5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms.

In the interruption requirement a cell is known if it has been meeting the relevant cell identification requirement during the last 5 seconds otherwise it is unknown. Relevant cell identification requirements are described in clause 9.2.5 for intra-frequency handover and clause 9.3.4 for inter-frequency handover.

6.1.1.4.2 Interruption time

The interruption time is the time between end of the last TTI containing the RRC command on the old PDSCH and the time the UE starts transmission of the new PRACH, excluding the RRC procedure delay.

When intra-frequency or inter-frequency handover is commanded, the interruption time shall be less than $T_{interrupt}$

$$T_{interrupt} = T_{search} + T_{IU} + T_{processing} + T_{\Delta} + T_{margin} \text{ ms}$$

Where:

When the UE receives a RRC message implying handover the UE shall be ready to start the transmission of the new uplink PRACH channel within $D_{handover}$ ms from the end of the last TTI containing the RRC command.

Where:

$D_{handover}$ equals the applicable RRC procedure delay defined in clause 12 in TS 38.331 [2] plus the interruption time stated in clause 6.1.1.5.2.

6.1.1.5.2 Interruption time

The interruption time is the time between end of the last TTI containing the RRC command on the old PDSCH and the time the UE starts transmission of the new PRACH, excluding the RRC procedure delay.

When in inter-frequency handover is commanded, the interruption time shall be less than $T_{interrupt}$

$$T_{interrupt} = T_{search} + T_{IU} + T_{processing} + T_{\Delta} + T_{margin} \text{ ms}$$

Where:

T_{search} is the time required to search the target cell when the handover command is received by the UE. Regardless of whether DRX is in use by the UE, T_{search} shall still be based on non-DRX target cell search times.

- If the target cell is a known intra-frequency cell, then T_{search} = 0 ms.
- If the target cell is an unknown intra-frequency cell and the target cell Es/Iot≥-2 dB, then $T_{search} = N^* T_{rs}$ ms.
- If the target cell is a known inter-frequency cell, then

- For a UE supporting *ncd-SSB-BWP-Wor-r18*:
  - if the measured SSB is the target SSB for handover of the target cell, T_{search} = 0 ms;
  - if the measured SSB and the target SSB for handover belong to the same NR target cell and are not the same SSB, T_{search} = T_{rs} ms provided one of the following conditions is satisfied:
    - The measured SSB is the CD-SSB in the target cell and the HO target SSB is the NCD-SSB in the first active DL BWP, or
    - The measured SSB is the NCD-SSB in the target cell and the HO target SSB is the CD-SSB in the first active DL BWP, or
    - The measured SSB is the NCD-SSB in the target cell and the HO target SSB is the NCD-SSB and they are within different DL BWPs
- For a UE not supporting *ncd-SSB-BWP-Wor-r18*, then T_{search} = 0 ms.
- If the target cell is an unknown inter-frequency cell and the target cell Es/Iot≥-2 dB, T_{search} = N*3* T_{rs} ms.

Where N = *reduced beam sweeping factor* when the UE supports *Rel-19 L3 fast Rx beam sweeping* and the conditions in clause 3.6.20 are fulfilled, otherwise N = 8 when the target cell is in FR2-1, and N = 12 when the target cell is in FR2-2.

$T_{processing}$ is time for UE processing. $T_{processing}$ can be up 40 ms.

T_{margin} is time for SSB post-processing. T_{margin} can be up to 2 ms.

T_{Δ} is time for fine time tracking and acquiring full timing information of the target cell. T_{Δ} = T_{rs} for both known and unknown target cell.

T_{IU} is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell. T_{IU} can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [3].

T_{rs} is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cell in the handover command, otherwise Trs is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If such measObjectNRs configured by MN and SN have different SMTC, Trs is the periodicity of one of the SMTC which is up to UE implementation. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with T_{rs}=5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms.

In FR2, the target cell is known if it has been meeting the following conditions:

- During the last 5 seconds before the reception of the handover command:
  - the UE has sent a valid measurement report for the target cell and
  - One of the SSBs measured from the NR target cell being configured remains detectable according to the cell identification conditions specified in clause 9.3,
- One of the SSBs measured from the target cell also remains detectable during the handover delay according to the cell identification conditions specified in clause 9.3.

otherwise, it is unknown.

6.1.2 NR Handover to other RATs

6.1.2.1 NR – E-UTRAN Handover

6.1.2.1.1 Introduction

The purpose of inter-RAT handover from NR to E-UTRAN is to change the radio access mode of PCell from NR to E-UTRAN. The handover procedure is initiated from NR with a RRC message that implies a handover as described in TS

38.331 [2]. The requirements in this clause are applicable to SA NR, NE-DC and NR-DC, and to handover from SA NR cell in a carrier frequency with CCA to E-UTRAN.

6.1.2.1.2 Handover delay

When the UE receives a RRC message implying handover to E-UTRAN the UE shall be ready to start the transmission of the uplink PRACH channel in E-UTRA within $D_{handover}$ ms from the end of the last TTI containing the RRC command. $D_{handover}$ is defined as

$$D_{handover} = T_{RRC_procedure_delay} + T_{interrupt}$$

Where:

$T_{RRC_procedure_delay}$: it is the RRC procedure delay, which is 50 ms

$T_{interrupt}$: it is the time between end of the last TTI containing the RRC command on the NR PDSCH and the time the UE starts transmission of the PRACH in E-UTRAN, excluding $T_{RRC_procedure_delay}$. $T_{interrupt}$ is defined in clause 6.1.2.1.3.

6.1.2.1.3 Interruption time

When the inter-RAT handover to E-UTRAN is commanded, the interruption time shall be less than $T_{interrupt}$

$$T_{interrupt} = T_{search} + T_{IU} + 20 \text{ ms}$$

Where:

T_{search} is the time required to search the target cell when the target cell is not already known when the handover command is received by the UE. If the target cell is known, then T_{search} = 0 ms. If the target cell is unknown and signal quality is sufficient for successful cell detection on the first attempt, then T_{search} = 80 ms. Regardless of whether DRX is in use by the UE, T_{search} shall still be based on non-DRX target cell search times.

T_{IU} is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell. T_{IU} can be up to 30 ms. If PRACH occasion is configured in radio frames with even SFN and the relative time difference between radio frame *i* in the current cell and the target cell is larger than or equal to 153600·Ts, the UE is allowed an additional MIB reception delay of 50ms.

NOTE: The actual value of T_{IU} shall depend upon the PRACH configuration used in the target cell.

In the interruption requirement a cell is known if it has been meeting the relevant cell identification requirement during the last 5 seconds otherwise it is unknown. Relevant E-UTRAN cell identification requirements are described in clause 9.4.1.

6.1.2.2 NR – UTRAN Handover

6.1.2.2.1 Introduction

The purpose of inter-RAT handover from NR to UTRAN is to change the radio access mode from NR to UTRAN. The handover procedure is initiated from NR with a RRC message that implies a hard handover as described in TS 38.331 [2].

6.1.2.2.2 Handover delay

When the UE receives a RRC message implying handover to UTRAN the UE shall be ready to start the transmission of the new UTRA uplink DPCCH within $D_{handover}$ msfrom the end of the last NR TTI containing the RRC *MobilityfromNRCommand* command.

where:

- $D_{handover}$ equals the RRC procedure delay, which is 50 ms plus the interruption time stated in clause 6.1.2.2.3.

6.1.2.2.3 Interruption time

The interruption time is the time between the end of the last TTI containing the RRC command on the NR PDSCH and the time the UE starts transmission on the uplink DPCCH in UTRAN, excluding the RRC procedure delay. The interruption time depends on whether the target cell is known to the UE or not.

The target cell is known if it has been measured by the UE during the last 5 seconds otherwise it is unknown. The UE shall always perform a UTRA synchronisation procedure as part of the handover procedure.

If the target cell is known the interruption time shall be less than $T_{interrupt1}$

$$T_{interrupt1} = T_{IU}+T_{sync}+50+ 10*F_{max} + T_{MC} \text{ ms}$$

If the target cell is unknown the interruption time shall be less than $T_{interrupt2}$

$$T_{interrupt2} = T_{IU}+T_{sync}+150 + 10*F_{max} + T_{MC} \text{ ms}$$

This requirement shall be met, if there is one target cell in the *MobilityfromNRCommand* command. Performance requirements for E-UTRA to UTRA soft handover are not specified. When UE is connected to an NR cell, UTRA SFN timing measurements are not reported. This implies that the timing of the DPCH of the UTRA target cells in the active set cannot be configured by UTRAN to guarantee that all target cells fall within the UE reception window of T_0 +/- 148 chips.

Where:

- T_{IU} is the interruption uncertainty when changing the timing from the NR to the new UTRAN cell. T_{IU} can be up to one UTRA frame (10 ms).
- F_{max} denotes the maximum number of radio frames within the transmission time intervals of all transport channels that are multiplexed into the same CCTrCH on the UTRA target cell. If HS-PDSCH is configured in the UTRA target cell, F_{max} is 4 radio frames.
- T_{sync} is the time required for measuring the downlink DPCCH channel as stated in TS 25.214 [32], clause 4.3.1.2. In case higher layers indicate the usage of a post-verification period T_{sync}=0 ms. Otherwise T_{sync}=40 ms.
- T_{MC} is 0 ms if a single UTRA cell is configured as the handover target, otherwise 20 ms if handover to UTRA with 1, 2 or 3 UTRA carriers with secondary HS-PDSCH is configured.

The phase reference is the primary CPICH.

The requirements in this clause assume that N312 has the smallest possible value i.e. only one insync is required.

6.1.3 NR DAPS Handover

6.1.3.1 Introduction

The requirements in this clause are applicable to DAPS handover to change the NR PCell to another NR cell.

NOTE: requirements only apply if

- the UE indicates ‘no-gap’ via *intraFreq-needForGap* for intra-frequency measurement of source cell and intra-frequency measurement of target cell, or
- the SSB of source cell is completely contained in the active DL BWP of the source cell, and the SSB of target cell is completely contained in the active DL BWP of the target cell, or
- the initial DL and UL BWP of source cell is confined within the active DL and UL BWP of the source cell respectively, and the initial DL and UL BWP of target cell is confined within the active DL and UL BWP of the target cell respectively.

6.1.3.2 NR FR1 - NR FR1 DAPS Handover

The requirements in this clause are applicable to both intra-frequency and inter-frequency handovers from NR FR1 cell to NR FR1 cell. A DAPS handover is intra-frequency if the centre frequency of the SSB of the source cell and the

centre frequency of the SSB of the target cell are the same, and the subcarrier spacing of the two SSBs are also the same.

NOTE: For intra-frequency DAPS handover, no requirement applies if active DL and UL BWP of target cell is not confined within the active DL and UL BWP of the source cell respectively.

NOTE: For inter-frequency DAPS handover, no requirement applies if the BWP of target cell is overlapped with the BWP of source cell in frequency domain.

An FR1 DAPS handover is synchronous if it meets the conditions in table 6.1.3.2-1, otherwise it is asynchronous

Table 6.1.3.2-1: Sync conditions for FR1 DAPS handover

Type of handover	Maximum receive timing difference between source and target cell (μs) for sync DAPS handover	Maximum transmit timing difference between source and target cell (μs) for sync DAPS handover
Intra-frequency Note 1,2,3	6μs	7.6 μs
Intra-band inter-frequency Note 1,2,3	6μs	7.6 μs
Inter-band inter-frequency	33 μs	34.6 μs
NOTE 1: For synchronous DAPS handover, if the receive time difference exceeds the cyclic prefix length of that SCS, demodulation performance degradation is expected for the first symbol of the slot. For asynchronous DAPS handover, if the receive time difference exceeds the cyclic prefix length of that SCS, interruptions may occur depending on UE implementation. The duration and frequency of occurrence of such interruptions is not specified. NOTE 2: For DAPS handover on a TDD band, after starting RACH procedure, a UE is not required to transmit in the uplink to any of source and target cells earlier than N_{RX-TX} after the end of the last received downlink symbol from any of source and target cells in the same TDD band where N_{RX-TX}=25600Tc. NOTE 3: For DAPS handover on a TDD band, after starting RACH procedure, a UE is not required to receive in the downlink from any of source and target cells earlier than N_{TX-RX} after the end of the last transmitted uplink symbol to any of source and target cells in the same TDD band where N_{TX-RX}=25600Tc.		

6.1.3.2.1 DAPS handover delay

Procedure delays for the procedure that can command a DAPS handover are specified in TS 38.331 [2].

When the UE receives a RRC message implying handover, the UE shall be ready to start the transmission of the new uplink PRACH channel within $D_{handover1}$ seconds from the end of the last TTI containing the RRC command when UE is configured with dual active protocol stack handover.

$$D_{handover1} = T_{RRC_procedure} + T_{search} + T_{IU} + T_{processing} + T_{\Delta} + T_{margin} \text{ ms}$$

Where:

$T_{RRC_procedure}$ is the maximum RRC procedure delay as specified in clause 12 in TS 38.331 [2].

T_{search}, T_{IU}, $T_{processing}$, T_{Δ} and T_{margin} are defined in clause 6.1.1.2.2.

After successful RACH procedure of the target cell, when the UE receives an RRC message implying source cell release command, the UE shall accomplish the release actions specified in TS 38.331 [2] within $D_{handover2}$.

$$D_{handover2} = T_{RRC_procedure} + T_{interrupt2}$$

Where:

$T_{RRC_procedure}$ is the RRC procedure delay as specified in clause 12 in TS 38.331 [2].

$T_{interrupt2}$ is defined in clause 6.1.3.2.2.

6.1.3.2.2 Interruption time

6.1.4 NR Conditional Handover

6.1.4.1 Introduction

The requirements in this clause are applicable to conditional handover to change the NR PCell to another NR cell.

6.1.4.2 NR FR1 – NR FR1 conditional handover

The requirements in this clause are applicable to both intra-frequency and inter-frequency conditional handover from NR FR1 cell to NR FR1 cell.

6.1.4.2.1 Handover delay

Procedure delays for all procedures that can command a conditional handover are specified in TS 38.331 [2].

When the UE receives a RRC message implying conditional handover the UE shall be ready to start the transmission of the new uplink PRACH channel within D_{CHO} seconds from the end of the last TTI containing the RRC command.

$$D_{CHO} = T_{RRC} + T_{Event_DU} + T_{measure} + T_{CHO_execution} + T_{interrupt}$$

Where:

T_{RRC} is the RRC procedure delay defined in clause 12 in TS 38.331 [2].

T_{Event_DU} is the delay uncertainty which is the time from when the UE successfully decodes a conditional handover command until

- a condition exists at the measurement reference point which will trigger the conditional handover, or
- a condition exists at the measurement reference point which will trigger the NES-based conditional handover

$T_{measure}$ is the time for the UE to measure and realize the condition for CHO is fulfilled. $T_{measure}$ equals to the measurements time stated in clause 6.1.4.2.2.

$T_{CHO_execution}$ is the conditional execution preparation time in clause 6.1.4.2.3.

$T_{interrupt}$ is the interruption time stated in clause 6.1.4.2.4.

The NES-based conditional handover delay requirements shall apply if UE receives a RRC message implying NES-based conditional handover before receiving the NES indication in DCI 2-9 command.

UE is not expected to receive a NES indication in DCI 2-9 command before receiving a RRC message implying NES-based conditional handover. When UE receives a RRC message implying NES-based conditional handover but no NES indication in DCI 2-9 command no NES-based conditional handover requirement is applied. The NES indication is specified in clause 5.5.4 in TS 38.331[2].

6.1.4.2.2 Measurement time

The measurement time delay is defined from the end of T_{Event_DU} until UE starts handover execution preparation ($T_{CHO_execution}$) to a target cell.

For conditional intra-frequency handover, the measurement time delay measured without Time To Trigger (TTT) and L3 filtering shall be less than $T_{identify\ intra\ with\ index}$ or $T_{identify_intra_without_index}$ defined in clause 9.2.5.1 or clause 9.2.6.2.

For conditional inter-frequency handover, the measurement time delay measured without Time To Trigger (TTT) and L3 filtering shall be less than $T_{identify_inter_with_index}$ or $T_{identify_inter_without_index}$ defined in clause 9.3.4 or clause 9.3.9.

For NES-based conditional intra-frequency handover:

- If UE successfully decodes DCI 2-9 command earlier than the time at the end of $T_{Event_DU} + T_{identify_intra_with_index}$ or $T_{Event_DU} + T_{identify_intra_without_index}$, then the measurement time delay equal to $T_{identify_intra_with_index}$ or $T_{identify_intra_without_index}$
- If UE successfully decodes DCI 2-9 command later than the time at the end of $T_{Event_DU} + T_{identify_intra_with_index}$ or $T_{Event_DU} + T_{identify_intra_without_index}$, and the condition of NES-based CHO keeps existing till UE receiving the DCI 2-9 command, then the measurement time delay equals to the time from the end of T_{Event_DU} until UE successfully decodes DCI 2-9 command.
- If UE successfully decodes DCI 2-9 command later than the time at the end of $T_{Event_DU} + T_{identify_intra_with_index}$ or $T_{Event_DU} + T_{identify_intra_without_index}$, and the condition of NES-based CHO is not met when receiving the DCI 2-9 command, then the measurement time delay equals to the time span from the end of T_{Event_DU} until a condition keeps existing for $T_{SSB\ measurement\ period_intra}$ which will immediately trigger the NES-based conditional handover after DCI 2-9.

For NES-based conditional inter-frequency handover:

- If UE successfully decodes DCI 2-9 command earlier than the time at the end of $T_{Event_DU} + T_{identify_inter_with_index}$ or $T_{Event_DU} + T_{identify_inter_without_index}$, and the condition of NES-based CHO keeps existing till UE receiving the DCI 2-9 command, then the measurement time delay equal to $T_{identify_inter_with_index}$ or $T_{identify_inter_without_index}$
- If UE successfully decodes DCI 2-9 command later than the time at the end of $T_{Event_DU} + T_{identify_inter_with_index}$ or $T_{Event_DU} + T_{identify_inter_without_index}$, then the measurement time delay equals to the time from the end of T_{Event_DU} until UE successfully decodes DCI 2-9 command.
- If UE successfully decodes DCI 2-9 command later than the time at the end of $T_{Event_DU} + T_{identify_inter_with_index}$ or $T_{Event_DU} + T_{identify_inter_without_index}$, and the condition of NES-based CHO is not met when receiving the DCI 2-9 command, then the measurement time delay equals to the time span from the end of T_{Event_DU} until a condition keeps existing for $T_{SSB\ measurement\ period_inter}$ which will immediately trigger the NES-based conditional handover after DCI 2-9.

When TTT or L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSB measured from the cell being configured remains detectable during the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ for intra-frequency handover or $T_{identify_inter_without_index}$ for inter-frequency handover. If a cell which has been detectable at least for the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ for intra-frequency handover or $T_{identify_inter_without_index}$ for inter-frequency handover becomes undetectable for a period and then the cell becomes detectable again and triggers a handover, the measurement time delay shall be less than $T_{SSB_measurement_period_intra}$ or $T_{SSB_measurement_period_inter}$ provided the timing to that cell has not changed more than $\pm 3200/2^{\mu}$ Tc while the measurement gap has not been available and the L3 filter has not been used, where μ is the SCS configuration as defined in clause 4.2 of TS 38.211 [3]. When L3 filtering is used, an additional delay can be expected.

6.1.4.2.3 Preparation time

$T_{CHO_execution}$ is the UE execution preparation time for conditional handover. $T_{CHO_execution}$ can be up to 10ms.

For conditional handover, it starts after UE realizes the condition of CHO is fulfilled and identity of the target cell is determined.

For NES-based conditional handover,

- It starts after UE realizes the condition of CHO is met and identity of the target cell is determined provided that UE has already successfully decoded DCI 2-9.

- Otherwise, it starts after UE successfully decodes DCI 2-9.

6.1.4.2.4 Interruption time

The interruption time is the time between when the UE starts to execute the conditional handover to the target cell and the time the UE starts transmission of the new PRACH.

For intra-frequency or inter-frequency conditional handover, the interruption time shall be less than

$$T_{interrupt} = T_{processing} + T_{IU} + T_{\Delta} + T_{margin} \text{ ms}$$

Where:

$T_{processing}$ is time for UE processing. $T_{processing}$ can be up to 20 ms.

T_{IU} is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell. T_{IU} can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [3]

T_{Δ} is time for fine time tracking and acquiring full timing information of the target cell. $T_{\Delta} = T_{rs}$.

T_{margin} is time for SSB post-processing. T_{margin} can be up to 2 ms.

T_{rs} is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cellin the handover command, otherwise T_{rs} is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with T_{rs}=5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms. If the UE has been provided with higher layer in TS 38.331 [2] signalling of *smtc2* prior to the handover command, T_{rs} follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

NOTE 1: The actual value of T_{IU} shall depend upon the PRACH configuration used in the target cell.

6.1.4.3 NR FR2 – NR FR1 conditional handover

The requirements in this clause are applicable to inter-frequency conditional handover from NR FR2 cell to NR FR1 cell.

The requirements defined in clause 6.1.4.2 applies assuming inter-frequency handover and:

$T_{processing}$ is time for UE processing. $T_{processing}$ can be up to 40 ms.

6.1.4.4 NR FR2 – NR FR2 conditional handover

The requirements in this clause are applicable to both intra-frequency and inter-frequency conditional handover from NR FR2 cell to NR FR2 cell.

6.1.4.4.1 Handover delay

Procedure delays for all procedures that can command a conditional handover are specified in TS 38.331 [2].

When the UE receives a RRC message implying conditional handover the UE shall be ready to start the transmission of the new uplink PRACH channel within D_{CHO} seconds from the end of the last TTI containing the RRC command.

$$D_{CHO} = T_{RRC} + T_{Event_DU} + T_{measure} + T_{CHO_execution} + T_{interrupt}$$

Where:

T_{RRC} is the RRC procedure delay defined in clause 12 in TS 38.331 [2].

T_{Event_DU} is the delay uncertainty which is the time from when the UE successfully decodes a conditional handover command until

- a condition exists at the measurement reference point which will trigger the conditional handover, or
- a condition exists at the measurement reference point which will trigger the NES-based conditional handover if NES-based conditional handover applies

$T_{measure}$ is the time for the UE to measure and realize the condition for CHO is fulfilled. $T_{measure}$ equals to the measurements time stated in clause 6.1.4.4.2.

$T_{CHO_execution}$ is the conditional execution preparation time in clause 6.1.4.4.3.

$T_{interrupt}$ is the interruption time stated in clause 6.1.4.4.4.

The NES-based conditional handover delay requirements shall apply if UE receives a RRC message implying NES-based conditional handover before receiving the NES indication in DCI 2-9 command.

UE is not expected to receive a NES indication in DCI 2-9 command before receiving a RRC message implying NES-based conditional handover. When UE receives a RRC message implying NES-based conditional handover but no NES indication in DCI 2-9 command, no NES-based conditional handover requirement is applied. The NES indication is specified in clause 5.5.4 in TS 38.331[2].

6.1.4.4.2 Measurement time

The measurement time delay is defined from the end of T_{Event_DU} until UE starts handover execution preparation ($T_{CHO_execution}$) to a target cell.

For conditional intra-frequency handover, the measurement time delay measured without Time To Trigger (TTT) and L3 filtering shall be less than $T_{identify\ intra\ with\ index}$ or $T_{identify_intra_without_index}$ defined in clause 9.2.5.1 or clause 9.2.6.2.

For conditional inter-frequency handover, the measurement time delay measured without Time To Trigger (TTT) and L3 filtering shall be less than $T_{identify_inter_with_index}$ or $T_{identify_inter_without_index}$ defined in clause 9.3.4 or clause 9.3.9.

For NES-based conditional intra-frequency handover:

- If UE successfully decodes DCI 2-9 command occurs earlier than the time at the end of T_{Event_DU} + $T_{identify_intra_with_index}$ or T_{Event_DU} + $T_{identify_intra_without_index}$, then the measurement time delay equal to $T_{identify_intra_with_index}$ or $T_{identify_intra_without_index}$
- If UE successfully decodes DCI 2-9 command occurs later than the time at the end of T_{Event_DU} + $T_{identify_intra_with_index}$ or T_{Event_DU} + $T_{identify_intra_without_index}$, and the condition of NES-based CHO keeps existing till

UE receiving the DCI 2-9 command, then the measurement time delay equals to the time from the end of T_{Event_DU} until UE successfully decodes DCI 2-9 command.

- If UE successfully decodes DCI 2-9 command later than the time at the end of $T_{Event_DU} + T_{identify_intra_with_index}$ or $T_{Event_DU} + T_{identify_intra_without_index}$, and the condition of NES-based CHO is not met when receiving the DCI 2-9 command, then the measurement time delay equals to the time span from the end of T_{Event_DU} until a condition keeps existing for $T_{SSB\ measurement\ period_intra}$ which will immediately trigger the NES-based conditional handover after DCI 2-9.

For NES-based conditional inter-frequency handover:

- If UE successfully decodes DCI 2-9 command occurs earlier than the time at the end of $T_{Event_DU} + T_{identify_inter_with_index}$ or $T_{Event_DU} + T_{identify_inter_without_index}$, then the measurement time delay equal to $T_{identify_inter_with_index}$ or $T_{identify_inter_without_index}$

- If UE successfully decodes DCI 2-9 command occurs later than the time at the end of $T_{Event_DU} + T_{identify_inter_with_index}$ or $T_{Event_DU} + T_{identify_inter_without_index}$, and the condition of NES-based CHO keeps existing till UE receiving the DCI 2-9 command, then the measurement time delay equals to the time from the end of T_{Event_DU} until UE successfully decodes DCI 2-9 command.

- If UE successfully decodes DCI 2-9 command later than the time at the end of $T_{Event_DU} + T_{identify_inter_with_index}$ or $T_{Event_DU} + T_{identify_inter_without_index}$, and the condition of NES-based CHO is not met when receiving the DCI 2-9 command, then the measurement time delay equals to the time span from the end of T_{Event_DU} until a condition keeps existing for $T_{SSB\ measurement\ period_inter}$ which will immediately trigger the NES-based conditional handover after DCI 2-9.

When TTT or L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSB measured from the cell being configured remains detectable during the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ for intra-frequency handover or $T_{identify_inter_without_index}$ for inter-frequency handover. If a cell which has been detectable at least for the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ for intra-frequency handover or $T_{identify_inter_without_index}$ for inter-frequency handover becomes undetectable for a period and then the cell becomes detectable again and triggers a handover, the measurement time delay shall be less than $T_{SSB_measurement_period_intra}$ or $T_{SSB_measurement_period_inter}$ provided the timing to that cell has not changed more than $\pm 3200/2^{\mu}$ Tc while the measurement gap has not been available and the L3 filter has not been used, where μ is the SCS configuration as defined in clause 4.2 of TS 38.211 [3]. When L3 filtering is used, an additional delay can be expected.

6.1.4.4.3 Preparation time

$T_{CHO_execution}$ is the UE execution preparation time for conditional handover.

For conditional handover, it starts after UE realizes the condition of CHO is fulfilled and identity of the target cell is determined.

For NES-based conditional handover,

- It starts after UE realizes the condition of CHO is met and identity of the target cell is determined provided that UE has already successfully decoded DCI 2-9.

- Otherwise, it starts after UE successfully decodes DCI 2-9.

And $T_{CHO_execution}$ can be up to 10ms.

6.1.4.4.4 Interruption time

The interruption time is the time between when the UE starts to execute the conditional handover to the target cell and the time the UE starts transmission of the new PRACH.

For intra-frequency or inter-frequency conditional handover, the interruption time shall be less than

$$T_{interrupt} = T_{processing} + T_{IU} + T_{\Delta} + T_{margin}\ \text{ms}$$

Where:

$T_{processing}$ is time for UE processing. $T_{processing}$ can be up to 20 ms.

T_{IU} is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell. T_{IU} can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [3]

T_{Δ} is time for fine time tracking and acquiring full timing information of the target cell. $T_{\Delta} = T_{rs}$.

T_{margin} is time for SSB post-processing. T_{margin} can be up to 2 ms.

T_{rs} is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cellin the handover command, otherwise T_{rs} is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with T_{rs}=5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms. If the UE has been provided with higher layer in TS 38.331 [2] signalling of *smtc2* prior to the handover command, T_{rs} follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

NOTE 1: The actual value of T_{IU} shall depend upon the PRACH configuration used in the target cell.

6.1.4.5 NR FR1 – NR FR2 conditional handover

The requirements in this clause are applicable to inter-frequency conditional handover from NR FR1 cell to NR FR2 cell.

The requirements defined in clause 6.1.4.4 applies assuming inter-frequency handover and:

$T_{processing}$ is time for UE processing. $T_{processing}$ can be up to 40 ms.

6.1.5 NR Handover with PSCell

6.1.5.1 Introduction

The purpose of NR handover with PSCell is to change the NR PCell to another NR cell or E-UTRA cell and add or change the PSCell along with PCell handover. The requirements in this clause are applicable to:

- Handover with PSCell from NR SA to EN-DC
- Handover with PSCell from NR-DC to NR-DC

- T_{IU} is same as the one defined in section 6.1.2.1.3.
- $T_{processing}$ is the SW processing time needed by UE, including RF warm up period. When target PSCell is unknown and SMTC configuration of target unknown PSCell is present in *RRCConnectionReconfiguration* [2], $T_{processing}$ = 30ms if target PSCell is in FR1, $T_{processing}$ = 50ms if target PSCell is in FR2; otherwise, $T_{processing}$ = 25ms if target PSCell is in FR1, $T_{processing}$ = 45ms if target PSCell is in FR2.

Where:

- T_{RRC_delay} is the RRC procedure delay. T_{RRC_delay} = 50 ms.
- $T_{processing}$ is as defined in section 6.1.5.2.1.
- T_{search_PCell} is the time for obtaining the timing reference of target PCell. $T_{search_PCell} = T_{search_HO}$ which is as defined in section 6.1.5.2.1 if target PSCell is unknown and SMTC configuration of target unknown PSCell is configured in *RRCConnectionReconfiguration* of *targetRAT-MessageContainer* [2]. Otherwise, $T_{search_PCell} = 0$.

- T_{rs} is the SMTC periodicity of the target NR cell if target PSCell is unknown and SMTC configuration of target unknown PSCell is present in *RRCConnectionReconfiguration* [2], otherwise T_{rs} is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this section is applied with T_{rs} = 5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms.

The PCell handover delay, $D_{HOwithPSCell_PCell}$, equals to the applicable RRC procedure delay defined in clause 12 in TS 38.331 [2] plus the PCell interruption time ($T_{interrupt}$) defined in clause 6.1.5.3.2.

PSCell addition/change delay, $D_{HOwithPSCell_PSCell}$ is defined in clause 6.1.5.3.3.

6.1.5.3.2 HO with PSCell - PCell Interruption time

When intra-frequency or inter-frequency handover is commanded, the interruption time shall be less than $T_{interrupt}$

$$T_{interrupt} = T_{search_PCell} + T_{\Delta_PCell} + T_{margin_PCell} + T_{IU_PCell} + T_{processing} \text{ ms}$$

Where:

- If the source cell is in FR1 and target cell is in FR1, T_{search_PCell}, T_{Δ_PCell}, T_{margin_PCell} is same as the T_{search}, T_{Δ}, T_{margin} defined in section 6.1.1.2.2 respectively.

6.1.5.3.3 PSCell addition/change in NE-DC to NE-DC HO with PSCell

When HO with PSCell addition is commanded, the PSCell addition/change time shall be less than $D_{HOwithPSCell_PSCell}$.

- $D_{HOwithPSCell_PSCell} = T_{config_EUTRAN\text{-}PSCell} + T_{processing_margin}$.

where

- $T_{config_EUTRAN\text{-}PSCell}$ is defined in clause 8.8.2, and
- $T_{processing_margin}$ = 5 ms is the additional delay margin for RF warm-up and software processing in handover with PSCell.

6.1.5.4 HO with PSCell from NR-DC to NR-DC

The requirements in this clause are applicable to handover with PSCell from NR-DC to NR-DC. The requirements in this clause are applicable to

- FR1-FR1 NR-DC to FR1-FR1 NR-DC,
- FR1-FR1 NR-DC to FR1-FR2 NR-DC,
- FR1-FR2 NR-DC to FR1-FR1 NR-DC,
- FR1-FR2 NR-DC to FR1-FR2 NR-DC.

- $D_{HOwithPSCell_PSCell}$ is the PSCell change delay stated in clause 6.1.5.4.2.

6.1.5.4.1 HO with PSCell – PCell Interruption time

The interruption time is the time between end of the last TTI containing the RRC command on the old PDSCH and the time the UE starts transmission of the new PRACH, excluding the RRC procedure delay.

When handover with PSCell from NR-DC to NR-DC is commanded, the interruption time shall be less than $T_{interrupt}$

$$T_{interrupt} = T_{search} + T_{IU} + T_{processing} + T_{\Delta} + T_{margin} \text{ ms}$$

Where:

- T_{search}, T_{IU}, T_{Δ} and T_{margin} are the same as defined in clause 6.1.1.2.2.

- $T_{processing}$ is the SW processing time needed by UE, including RF warm up period.

  For FR1-FR1 NR-DC to FR1-FR1 NR-DC or FR1-FR2 NR-DC to FR1-FR2 NR-DC, $T_{processing}$ = 30 ms if SMTC of the target unknown PSCell is configured in *targetcellSMTC-SCG-r16* but not configured in *reconfigurationWithSync*. Otherwise, $T_{processing}$ = 25 ms.

  For FR1-FR1 NR-DC to FR1-FR2 NR-DC or FR1-FR2 NR-DC to FR1-FR1 NR-DC, $T_{processing}$ = 50 ms if SMTC of the target unknown PSCell is configured in *targetcellSMTC-SCG-r16* but not configured in *reconfigurationWithSync*. Otherwise, $T_{processing}$ = 45 ms.

In the interruption requirement a cell is known if it has been meeting the relevant cell identification requirement during the last 5 seconds otherwise it is unknown. Relevant cell identification requirements are described in clause 9.2.5 for intra-frequency handover and clause 9.3.4 for inter-frequency handover.

6.1.5.4.2 HO with PSCell – PSCell change delay

The requirements in this section shall apply for PSCell change during handover with PSCell from NR-DC to NR-DC. In the case of NR-DC PSCell change in FR1, when the UE indicating *support3MHz-ChannelBW-Symmetric-r18* is configured with a target PSCell that is with 12PRB SSB bandwidth, the UE shall transmit PRACH preamble towards the target PSCell no later than the delay requirements specified in clause 8.9.2.

When handover with PSCell from NR-DC to NR-DC is commanded, the PSCell change time shall be less than $D_{HOwithPSCell_PSCell}$:

- $D_{HOwithPSCell_PSCell} = T_{RRC_delay} + T_{processing} + T_{search_PCell} + T_{search_PSCell} + T_{\Delta_PSCell} + T_{PSCell_DU} + 2$ ms

Where:

- T_{RRC_delay}, T_{search_PSCell}, and T_{PSCell_DU} are the same as defined in clause 8.9.2. $T_{\Delta_PSCell} = T_{\Delta}$ which is specified in clause 8.9.2

- $T_{processing}$ is the SW processing time needed by UE, including RF warm up period.

  For FR1-FR1 NR-DC to FR1-FR1 NR-DC or FR1-FR2 NR-DC to FR1-FR2 NR-DC, $T_{processing}$ = 30 ms if SMTC of the target unknown PSCell is configured in *targetcellSMTC-SCG-r16* but not configured in *reconfigurationWithSync*. Otherwise, $T_{processing}$ = 25 ms.

  For FR1-FR1 NR-DC to FR1-FR2 NR-DC or FR1-FR2 NR-DC to FR1-FR1 NR-DC, $T_{processing}$ = 50 ms if SMTC of the target unknown PSCell is configured in *targetcellSMTC-SCG-r16* but not configured in *reconfigurationWithSync*. Otherwise, $T_{processing}$ = 45 ms.

- T_{search_PCell} is the time for obtaining the timing reference of target PCell. If SMTC of the target unknown PSCell is configured in *targetcellSMTC-SCG-r16* but not configured in *reconfigurationWithSync*, $T_{search_PCell} = T_{search} + T_{\Delta} + T_{margin}$, where T_{search}, T_{Δ} and T_{margin} are specified in clause 6.1.5.4.1. Otherwise, T_{search_PCell} = 0 ms.

The T_{rs} definition from clause 8.9.2 is modified as following for requirements in this section:

- T_{rs} is the SMTC periodicity of the target NR cell if target PSCell is unknown and SMTC configuration of target unknown PSCell is present in either *targetcellSMTC-SCG-r16* or *reconfigurationWithSync*, otherwise T_{rs} is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If the measObjectNRs having the same SSB frequency and subcarrier spacing configured by MN and SN have different SMTC, T_{rs} is the periodicity of one of the SMTC which is up to UE implementation. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this section is applied with T_{rs} = 5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms.

PSCell known and unknown condition is as defined in clause 8.9.2.

6.1.5.5 Handover with PSCell from NR SA to EN-DC with PSCell using CCA

6.1.5.5.1 Introduction

When the UE receives a RRC message implying handover with PSCell change, the UE shall be ready to start the transmission of the new uplink PRACH channel on target E-UTRA PCell within $D_{HOwithPSCell_PCell}$ ms from the end of the last TTI containing the RRC command, and UE shall be ready to start the transmission of the new uplink PRACH channel on a target PSCell on a carrier frequency with CCA within $D_{HOwithPSCell_PSCell}$ seconds and from the end of the last TTI containing the RRC command.

Where:

$D_{HOwithPSCell_PCell}$ equals the maximum RRC procedure delay defined in clause 11.2 in TS 36.331 [16] plus the interruption time stated in clause 6.1.5.5.2.

$D_{HOwithPSCell_PSCell}$ is the PSCell addition delay stated in clause 6.1.5.5.3

6.1.5.5.2 NR SA to EN-DC HO with PSCell- NR to E-UTRA HO Interruption time

The interruption time is the time between end of the last TTI containing the RRC command on the old PDSCH and the time the UE starts transmission of the new PRACH excluding the RRC procedure delay. This requirement applies when UE is not required to perform any synchronisation procedure before transmitting on the new PRACH or on the new PUSCH.

When Handover with PSCell is commanded, the interruption time shall be less than $T_{interrupt}$

$$T_{interrupt} = T_{search} + T_{IU} + T_{processing}\ \text{ms}$$

Where:

T_{search} is same as the T_{search} defined in section 6.1.2.1.3

T_{IU} is same as the one defined in section 6.1.2.1.3.

$T_{processing}$ is the SW processing time needed by UE, including RF warm up period. When target PSCell is unknown and SMTC configuration of target unknown PSCell is present in *RRCConnectionReconfiguration* [2], $T_{processing}$ = 30 ms, otherwise, $T_{processing}$ = 25 ms.

NOTE: The actual value of T_{IU} shall depend upon the PRACH configuration used in the target E-UTRA cell.

In the interruption requirement, a cell is known if it has been meeting the relevant cell identification requirement during the last 5 seconds. Otherwise, it is unknown. Relevant E-UTRA cell identification requirements are described in clause 9.4.1.

6.1.5.5.3 NR SA to EN-DC HO with PSCell - NR PSCell Addition Delay requirements

When Handover with PSCell is commanded, the NR PSCell on a carrier frequency with CCA changing delay shall be less than $D_{HOwithPSCell_PSCell}$:

$$D_{HOwithPSCell_PSCell} = T_{RRC_delay} + T_{processing} + T_{search_PCell} + T_{search_PSCell} + T_{\Delta} + T_{IU_PSCell} + T_{margin}$$

Where:

T_{RRC_delay} is maximum RRC procedure delay defined in clause 11.2 in TS 36.331 [16].

T_{search_PCell} is the time for obtaining the timing reference of target PCell. T_{search_PCell} is same as T_{search_HO} as defined in section 6.1.5.2.1, if target PSCell is unknown and SMTC configuration of target unknown PSCell is present in *RRCConnectionReconfiguration* [2]. Otherwise, $T_{search_PCell} = 0$

T_{search_PSCell} is the time required to search the target cell when the target cell is not already known when the handover command is received by the UE. If the target cell is known, then $T_{search_PSCell} = 0$ ms. If the target cell is an unknown cell and target cell Es/Iot $\geq$ [-2] dB, then $T_{search_PSCell} = (3+L_1) * T_{rs}$ ms. Regardless of whether DRX is in use by the UE, T_{search} shall still be based on non-DRX target cell search times.

L_1 is the number of SMTC occasions not available at the UE during the inter-RAT detection period. Regardless of whether DRX is in use by the UE, T_{search} shall still be based on non-DRX target cell search times.

T_{Δ} is same as $T_{\Delta_withCCA}$ in section 7.31A.2 in TS 36.133[15].

$T_{processing}$ is time for UE processing and is same as defined in clause 6.1.5.5.2.

T_{margin} is time for SSB post-processing. T_{margin} can be up to 2 ms.

T_{IU_PSCell} is the delay uncertainty due to the random-access procedure when sending PRACH to the new cell. T_{IU_PSCell} can be up to: $(1+ L_3) * T_{SSB,RO} + 10$ ms; where $T_{SSB,RO}$ is the SSB to PRACH occasion association period as defined in table 8.1-1 of TS 38.213 [39] and L_3 is the number of consecutive SSB to PRACH occasion association periods during which no PRACH occasion is available for PRACH transmission due to UL CCA failures or RACH collision between PCell and PSCell. $L_3 = 0$ for Type 2C UL channel access procedure as defined in TS 37.213 [57] and when there are no RACH collisions between PCell and PSCell. When the UE is configured with both the UL BWP with PRACH occasion on the target cell and UL LBT failure detection/recovery, the interruption can be longer.

NOTE 1: The actual value of T_{IU_PSCell} shall depend upon the PRACH configuration used in the target cell.

NOTE 2: The interruption time extended by L_1, L_2, and L_3 parameters, and by the UL LBT failure detection/recovery mechanism is limited by the T304 timer. The UE behaviour at the T304 timer expiry is specified in TS 38.331 [2].

T_{rs} is the SMTC periodicity of the target NR cell if target PSCell is unknown and SMTC configuration of target unknown PSCell is present in *RRCConnectionReconfiguration* [2], otherwise T_{rs} is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this section is applied with $T_{rs} = 5$ ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms.

A cell on a carrier frequency with CCA is known if it has been meeting the relevant cell identification requirement during the last 5 seconds. Otherwise, it is unknown. Relevant cell identification requirements are described in clauses 8.1.2.4.21A, and 8.1.2.4.22A in TS 36.133[15].

6.1B Handover to target cell using CCA

6.1B.1 NR Handover

6.1B.1.1 Introduction

The purpose of NR handover to target cell using CCA is to change the NR PCell to a target NR cell in a carrier frequency with CCA. The requirements in this clause are applicable to NR SA.

In the requirements of clause 6.1B.1, the term SMTC occasion not available at the UE refers to when the SMTC contains SSBs configured by gNB in a cell on a carrier frequency subject to CCA, but the first two successive candidate SSB positions for the same SSB index within the discovery burst transmission window are not available at the UE due to DL CCA failures at gNB during the corresponding detection or time tracking period; otherwise the SMTC occasion is considered as available at the UE.

In the requirements of clause 6.1B.1, the term PRACH occasion unavailable for transmission refers to when the PRACH occasion is configured by gNB but not transmitted by the UE during the corresponding period due to UL CCA failure at the UE.

6.1B.1.2 NR FR1 - NR FR1 Handover

The requirements in this clause are applicable to inter-frequency handovers from NR FR1 cell to NR FR1 cell in carrier frequencies with CCA, and to both intra-frequency and inter-frequency handovers from NR FR1 cell in carrier frequencies with CCA to NR FR1 cell in carrier frequencies with CCA.

6.1B.1.2.1 Handover delay

When the UE receives an RRC message implying handover the UE shall be ready to start the transmission of the new uplink PRACH channel within $D_{handover}$ ms from the end of the last TTI containing the RRC command.

Where:

$D_{handover}$ equals the applicable RRC procedure delay to be defined in clause12 in TS 38.331 [2] plus the interruption time stated in clause 6.1B.1.2.2.

6.1B.1.2.2 Interruption time

The interruption time is the time between end of the last TTI containing the RRC command on the old PDSCH and the time the UE starts transmission of the new PRACH, excluding the RRC procedure delay.

When intra-frequency or inter-frequency handover is commanded, the interruption time shall be less than $T_{interrupt}$

$$T_{interrupt} = T_{search} + T_{IU} + T_{processing} + T_{\Delta} + T_{margin} \text{ ms}$$

Where:

T_{search} is the time required to search the target cell when the target cell is not already known when the handover command is received by the UE. If the target cell is known, then T_{search} = 0 ms. If the target cell is an unknown intra-frequency cell and the target cell Es/Iot≥-2 dB, then T_{search} = (1+L_1) *T_{rs}. If the target cell is an unknown inter-frequency cell and the target cell Es/Iot≥-2 dB, then T_{search} = (3+L_1´) *T_{rs} where L_1 and L_1´ are the number of SMTC occasions not available at the UE during the intra-frequency and inter-frequency detection period, respectively. Regardless of whether DRX is in use by the UE, T_{search} shall still be based on non-DRX target cell search times.

T_Δ is time for fine time tracking and acquiring full timing information of the target cell. T_Δ = (1+ L_2) *T_{rs} ms, where L_2 is the number of SMTC occasions not available at the UE during the time tracking period.

$T_{processing}$ is time for UE processing. $T_{processing}$ can be up to 20 ms.

T_{margin} is time for SSB post-processing. T_{margin} can be up to 2 ms.

T_{IU} is the interruption uncertainty due to the random access procedure when sending PRACH to the new cell. T_{IU} can be up to: (1+ L_3)*$T_{SSB,RO}$ + 10 ms where $T_{SSB,RO}$ is the SSB to PRACH occasion association period as defined in table 8.1-1 of TS 38.213 [3] and L_3 is the number of consecutive SSB to PRACH occasion association periods during which no PRACH occasion is available for PRACH transmission due to UL CCA failure. L_3 = 0 for Type 2C UL channel access procedure as defined in TS 37.213 [33]. When the UE is configured with both the UL BWP with PRACH occasion on the target cell and UL CCA failure detection/recovery, the interruption can be longer.

T_{rs} is the SMTC periodicity of the target NR cell in a carrier frequency with CCA if the UE has been provided with an SMTC configuration for the target cell in the handover command, otherwise T_{rs} is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with T_{rs}=5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms.

NOTE 1: The interruption time considering the potential extensions caused by L_1, L_1´,L_2 , L_3 and by the UL CCA failure detection/recovery mechanism is limited by the T304 timer. The UE behaviour at the T304 timer expiry is detailed in TS 38.331 [2].

In the interruption requirement a cell is known if it has been meeting the relevant cell identification requirement during the last 5 seconds otherwise it is unknown. Relevant cell identification requirements are described in clause 9.2A.5 for intra-frequency handover and clause 9.3A.4 for inter-frequency handover to a carrier frequency with CCA.

- T_{rs} is the SMTC periodicity of the target NR SAN cell if the UE has been provided with an SMTC configuration for the target cellin the handover command, otherwise T_{rs} is the SMTC configured in the *measObjectNR* having the same SSB frequency and subcarrier spacing if only a single SMTC periodicity is configured. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with T_{rs}=5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms. If the UE has been provided with higher layer in TS 38.331 [2] signalling of *smtc2* prior to the handover command, T_{rs} follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

6.1C.1.2.2.2 Interruption time for RACH-less handover

When intra-frequency or inter-frequency RACH-less handover to NR SAN cell is commanded,

the interruption time shall be less than $T_{interrupt}$

$$T_{interrupt} = T_{search} + T_{IU} + T_{processing} + T_{\Delta} + T_{margin} \text{ ms}$$

Otherwise, no interruption time requirement is applied.

Where:

- T_{search} is same as the one defined in section 6.1C.1.2.2.1.

- T_{Δ} is same as the one defined in section 6.1C.1.2.2.1.

The requirements in this clause are applicable to both intra-frequency and inter-frequency handovers from NR SAN FR2-NTN cell to NR SAN FR2-NTN cell. The requirements in this clause apply provided that UE has the valid and applicable parameters of ephemeris information, common TA, DL and UL Polarization information, K_{offset}, and K_{mac} for target NR SAN cell during $D_{handover}$, otherwise interruption time may be longer than the requirements in clause 6.1C.1.3.2.

6.1C.1.3.1 Handover delay

6.1C.1.3.2 Interruption time

The interruption time is the time between end of the last TTI containing the RRC command on the old PDSCH and the time the UE starts transmission of the new PRACH, excluding the RRC procedure delay.

When intra-frequency or inter-frequency handover to NR SAN cell is commanded, and if the target NR SAN cell is served by the same satellite as the serving cell, the interruption time shall be less than $T_{interrupt_intra_sat}$, where $T_{interrupt_intra_sat}$ is same as $T_{interrupt}$ defined in clause 6.1C.1.2.2.

- T_{rs} is the SMTC periodicity of the target NR SAN cell if the UE has been provided with an SMTC configuration for the target cellin the handover command, otherwise T_{rs} is the SMTC configured in the *measObjectNR* having the same SSB frequency and subcarrier spacing if only a single SMTC periodicity is configured. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with T_{rs}=5 ms assuming the SSB transmission periodicity is 5 ms. 6.1C.2 NR SAN Conditional Handover

6.1C.2.1 Introduction

The requirements in this clause are applicable to conditional handover to change the NR SAN PCell to another NR SAN cell.

6.1C.2.2 NR SAN FR1 – NR SAN FR1 conditional handover

The requirements in this clause are applicable to both intra-frequency and inter-frequency conditional handover from NR SAN FR1 cell to NR SAN FR1 cell. The requirements in this clause apply provided that UE has the valid and applicable parameters of ephemeris information, common TA, DL and UL Polarization information, K_{offset}, and K_{mac} for

target NR SAN cell during D_{CHO}, otherwise the measurement time, preparation time and interruption time may be longer than the requirements in clauses 6.1C.2.2.2, 6.1C.2.2.3 and 6.1C.2.2.4.

6.1C.2.2.1 Handover delay

Procedure delays for all procedures that can command a conditional handover are specified in TS 38.331 [2]. UE shall start RRM measurement before the time or distance condition is met, the time/distance condition is defined in clause 5.5.4 in TS 38.331[2]

When the UE receives a RRC message implying conditional handover the UE shall be ready to start the transmission of the new uplink PRACH channel or PUSCH channel within D_{CHO} seconds from the end of the last TTI containing the RRC command.

$$D_{CHO} = T_{RRC} + T_{Event_DU} + T_{measure} + T_{interrupt} + T_{CHO_execution}$$

Where:

- T_{RRC} is the RRC procedure delay defined in clause 12 in TS 38.331 [2].
- T_{Event_DU} is the delay uncertainty which is the time from when the UE successfully decodes a conditional handover command until a condition exists at the measurement reference point which will trigger the conditional handover
- $T_{measure}$ is the measurements time stated in clause 6.1C.2.2.2.
- $T_{CHO_execution}$ is the UE conditional execution preparation time for conditional handover in clause 6.1C.2.2.3.
- $T_{interrupt}$ is the interruption time stated in clause 6.1C.2.2.4.

The conditional handover delay requirements are applied if condition T1-1 is later than the end of $T_{measure}$ for time based CHO, both condition D1-1 and condition D1-2 , or both condition D2-1 and condition D2-2 are fulfilled before the end of $T_{measure}$ for location-based CHO, otherwise no CHO requirement is applied.

6.1C.2.2.2 Measurement time

The measurement time delay is defined from the end of T_{Event_DU} until UE executes a handover to a target cell and interruption time starts.

For intra-frequency handover, the measurement time delay for identifying a new detectable intra frequency cell measured without Time To Trigger (TTT) and L3 filtering shall be less than $T_{identify_intra_with_index}$ or $T_{identify_intra_without_index}$, defined in clause 9.2C.5.1 and clause 9.2C.6.1.

For time-based conditional intra-frequency handover:

- If condition T1-1 occurs earlier than the time at the end of $T_{Event_DU} + T_{identify_intra_with_index}$ or $T_{Event_DU} + T_{identify_intra_without_index}$, then the measurement time delay equals to $T_{identify_intra_with_index}$ or $T_{identify_intra_without_index}$ assuming UE only performs the measurements within SMTC window of the target cell.
- If condition T1-1 occurs later than the time at the end of $T_{Event_DU} + T_{identify_intra_with_index}$ or $T_{Event_DU} + T_{identify_intra_without_index}$, then the measurement time delay equals to the time from the end of T_{Event_DU} until condition T1-1.

For location-based conditional intra-frequency handover:

- If both source cell and target cell are quasi-Earth fixed cells,
  - if both condition D1-1 and condition D1-2 are fulfilled earlier than the time at the end of $T_{Event_DU} + T_{identify_intra_with_index}$ or $T_{Event_DU} + T_{identify_intra_without_index}$, then the measurement time delay equals to $T_{identify_intra_with_index}$ or $T_{identify_intra_without_index}$ assuming UE only performs measurements within SMTC window of the target cell.
  - if both condition D1-1 and condition D1-2 are fulfilled is later than the time at the end of $T_{Event_DU} + T_{identify_intra_with_index}$ or $T_{Event_DU} + T_{identify_intra_without_index}$ for intra-frequency handover, then the measurement time delay equals to the time from the end of T_{Event_DU} until the time when both condition D2-1 and condition D1-2 are fulfilled.

- if both source cell and target cell are earth moving cells,

  - if both condition D2-1 and condition D2-2 are fulfilled earlier than the time at the end of T_{Event_DU} + $T_{identify_intra_with_index}$ or T_{Event_DU} + $T_{identify_intra_without_index}$, then the measurement time delay equals to $T_{identify_intra_with_index}$ or $T_{identify_intra_without_index}$ assuming UE only performs measurements within SMTC window of the target cell.

  - if both condition D2-1 and condition D2-2 are fulfilled later than the time at the end of T_{Event_DU} plus $T_{identify_intra_with_index}$ or $T_{identify_intra_without_index}$ for intra-frequency handover, then the measurement time delay equals to the time from the end of T_{Event_DU} until the time when both condition D1-1 and condition D2-2 are fulfilled.

For inter-frequency handover, the measurement time delay for identifying a new detectable inter frequency cell measured without Time To Trigger (TTT) and L3 filtering shall be less than $T_{identify_inter_with_index}$ or $T_{identify_inter_without_index}$, defined in clause 9.3C.7.1.

For time-based conditional inter-frequency handover:

- If condition T1-1 occurs earlier than the time at the end of T_{Event_DU} + $T_{identify_inter_with_index}$ or T_{Event_DU} + $T_{identify_inter_without_index}$, then the measurement time delay equals to $T_{identify_inter_with_index}$ or $T_{identify_inter_without_index}$ assuming that the UE uses only the SMTC window of the target inter-frequency carrier for performing the measurements. In this case $K_{satellite}$=1, $CSSF_{inter}$=1.

- If condition T1-1 occurs later than the time at the end of T_{Event_DU} + $T_{identify_inter_with_index}$ or T_{Event_DU} + $T_{identify_inter_without_index}$, then the measurement time delay equals to the time from the end of T_{Event_DU} until condition T1-1.

For location-based conditional inter-frequency handover,

- if both source cell and target cell are quasi-Earth fixed cells,

  - If both condition D1-1 and condition D1-2 are fulfilled earlier than the time at the end of T_{Event_DU} + $T_{identify_inter_with_index}$ or T_{Event_DU} + $T_{identify_inter_without_index}$, then the measurement time delay equals to $T_{identify_inter_with_index}$ or $T_{identify_inter_without_index}$, assuming that the UE uses only the SMTC window of the target inter-frequency carrier for performing the measurements. In this case $K_{satellite=}$1, $CSSF_{inter}$=1.

  - If both condition D1-1 and condition D1-2 are fulfilled later than the time at the end of T_{Event_DU}+$T_{identify_inter_with_index}$ or T_{Event_DU} + $T_{identify_inter_without_index}$, then the measurement time delay equal to the time from the end of T_{Event_DU} until the time of both condition D1-1 and condition D1-2 are fulfilled.

- if both source cell and target cell are earth moving cells,

  - if both condition D2-1 and condition D2-2 are fulfilled earlier than the time at the end of T_{Event_DU} + $T_{identify_inter_with_index}$ or T_{Event_DU} + $T_{identify_inter_without_index}$, then the measurement time delay equals to $T_{identify_inter_with_index}$ or $T_{identify_inter_without_index}$, assuming that the UE uses only the SMTC window of the target inter-frequency carrier for performing the measurements. In this case $K_{satellite=}$1, $CSSF_{inter}$=1.

  - if both condition D2-1 and condition D1-2 are fulfilled later than the time at the end of T_{Event_DU} + $T_{identify_inter_with_index}$ or T_{Event_DU} + $T_{identify_inter_without_index}$, then the measurement time delay equals to the time from the end of T_{Event_DU} until the time of both condition D2-1 and condition D2-2 are fulfilled.

When TTT or L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSB measured from the cell being configured remains detectable during the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ for intra-frequency handover or [$T_{identify_inter_without_index}$] for inter-frequency handover.

6.1C.2.2.3 Preparation time

$T_{CHO_execution}$ is the UE execution preparation time for conditional handover, and starts after UE realizes the condition of CHO is met and identity of the target cell is determined. $T_{CHO_execution}$ can be up to 10 ms.

6.1C.2.2.4 Interruption time

The interruption time is the time between when the UE starts to execute the conditional handover to the target cell and the time the UE starts transmission of the new PRACH or PUSCH.

For intra-frequency or inter-frequency conditional handover, the measurement time shall be less than

Where:

- $T_{processing}$ is time for UE processing. $T_{processing}$ can be up to 20 ms.

For combination of RACH-less handover with time-based conditional handover, T_{IU} can be a configured grant based PUSCH, dynamic grant based PUSCH, SR on PUCCH, according to NW configuration and scheduling, or PRACH if no valid configured grant based PUSCH is selected.

- T_{margin} is time for SSB post-processing. T_{margin} can be up to 2 ms.
- T_{rs} is the SMTC periodicity of the target NR SAN cell if the UE has been provided with an SMTC configuration for the target cellin the handover command, otherwise T_{rs} is the SMTC configured in the *measObjectNR* having the same SSB frequency and subcarrier spacing. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with T_{rs}=5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms. If the UE has been provided with higher layer in TS 38.331 [2] signalling of *smtc2* prior to the handover command, T_{rs} follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

NOTE 1: The actual value of T_{IU} shall depend upon the PRACH configuration used in the target cell.

The requirements in this clause are applicable to both intra-frequency and inter-frequency conditional handover from NR SAN FR1 cell to NR SAN FR1 cell without L3 measurement criteria. The requirements in this clause apply provided that UE has the valid and applicable parameters of ephemeris information, common TA, DL and UL Polarization information, K_{offset}, and K_{mac} for target NR SAN cell during D_{CHO}, otherwise preparation time and interruption time may be longer than the requirements in clauses 6.1C.2.3.2, 6.1C.2.3.3.

6.1C.2.3.1 Handover delay

Procedure delays for all procedures that can command a conditional handover are specified in TS 38.331 [2]. UE is allowed to execute time-based and location-based conditional handover without RRM measurement once the time or distance condition is met, the time/distance condition is defined in clause 5.5.4 in TS 38.331[2]

When the UE receives a RRC message implying conditional handover the UE shall be ready to start the transmission of the new uplink PRACH channel or PUSCH channel within D_{CHO} seconds from the end of the last TTI containing the RRC command.

$$D_{CHO} = T_{RRC} + T_{Event_DU} + T_{interrupt} + T_{CHO_execution}$$

If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with T_{rs}=5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms. If the UE has been provided with higher layer in TS 38.331 [2] signalling of *smtc2* prior to the handover command, T_{rs} follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

NOTE 1: The actual value of T_{IU} shall depend upon the PRACH configuration used in the target cell.

6.1C.2.4 NR SAN FR2-NTN – NR SAN FR2-NTN conditional handover

The requirements in this clause are applicable to both intra-frequency and inter-frequency conditional handover from NR SAN FR2-NTN cell to NR SAN FR2-NTN cell, when the serving cell and the target cell are served by the same satellite.

The requirements in this clause 6.1C.2.2 shall apply.

6.1C.3 NR SAN Satellite switching with re-synchronization

6.1C.3.1 Introduction

The purpose of NR SAN Satellite switching with re-synchronization is to switch satellite in the same SSB frequency and same gNB without PCI changing. The requirements in this clause are applicable to SA NR SAN.

6.1C.3.2 NR SAN FR1 – NR SAN FR1 Satellite switching with re-synchronization

The requirements in this clause are applicable to both hard and soft switch over quasi-earth fixed scenario from NR SAN FR1 cell to NR SAN FR1 cell. The requirements in this clause apply provided that UE has the valid and applicable parameters of ephemeris information, common TA, DL and UL Polarization information, K_{offset}, and K_{mac} for target NR SAN cell during $D_{switch_unchangedPCI}$, otherwise interruption time may be longer than the requirements in clause 6.1C.3.2.2 for hard satellite switch and satellite switch delay may be longer than the requirements in clause 6.1C.3.2.3 for soft satellite switch.

Requirements for soft satellite switching are applicable for UEs that support *softSatelliteSwitchResyncNTN-r18* [14] when network configures soft satellite switching with resynchronization [2].

Requirements for hard satellite switching are applicable for UEs that support *hardSatelliteSwitchResyncNTN-r18* or *softSatelliteSwitchResyncNTN-r18* [14] when the network configures hard satellite switching with resynchronization [2]; or for UEs that support *hardSatelliteSwitchResyncNTN-r18* but do not support *softSatelliteSwitchResyncNTN-r18* when the network configures soft satellite switching with resynchronization.

6.1C.3.2.1 Satellite switching delay

When the UE receives a broadcast message implying satellite switching within re-synchronization, the UE shall be ready to start the transmission of the new uplink PRACH channel or transmission of the new uplink PUSCH channel within $D_{switch_unchangedPCI}$ msec.

Where:

- $D_{switch_unchangedPCI}$ equals to the interruption time stated in clause 6.1C.3.2.2 for hard satellite switch and satellite switch delay stated in clause 6.1C.3.2.3 for soft satellite switch.

6.1C.3.2.2 Interruption time for hard satellite switch with re-sync

The interruption time is the time between *t-service* and the time when the UE is ready to receive any DL channel/signal and transmit any UL channel/signal from/to the target satellite.

When intra-frequency hard switch to NR SAN cell is commanded,

the interruption time shall be less than $T_{interrupt}$

$$T_{interrupt} = T_{search} + T_{processing} + T_{\Delta} + T_{margin}\ \text{ms}$$

Otherwise, no interruption time requirement is applied.

Where:

- T_{search} is the time required to search the target NR SAN cell assuming the target cell is not already known when UE starts synchronizing with target satellite. If the target cell Es/Iot ≥ -2 dB, then $T_{search} = T_{first_SSB}$ ms. Regardless of whether DRX is in use by the UE, T_{search} shall still be based on non-DRX target cell search times.

- T_{Δ} is time for fine time tracking and acquiring full timing information of the target cell.

  $T_{\Delta} = T_{rs}$ for both known and unknown target cells operating with 20 PRB SSB BW.

  $T_{\Delta} = 3*T_{rs}$ for both known and unknown target cells operating with 12 PRB SSB BW.

- $T_{processing}$ is time for UE processing. $T_{processing}$ can be up to 10 ms.

- T_{margin} is time for SSB post-processing. T_{margin} can be up to 2 ms.

- T_{first_SSB} is the time to the end of the first complete SSB burst of target satellite, the location of which is determined by the periodicity and location of SSB of the source satellite, and if *ssb-TimeOffset* is configured, the *ssb-TimeOffset* and the difference between propagation delay of the serving satellite and the target satellite counted from the *SSB-TimeOffset* reference point as defined in TS 38.331 [2] to UE.

UE is allowed to skip measurements for other cells and satellites than the target satellite and source satellite from *T-service* until the satellite switch completion.

6.1C.3.2.3 Satellite switch delay for soft satellite switch with re-sync

The Satellite switch delay is from *t-serviceStart* to the time instance when UE is ready to receive any DL channel/signal and transmit any UL channel/signal from/to the target satellite.

When intra-frequency soft switch to NR SAN cell is commanded,

the satellite switch time shall be less than T_{soft_switch}

$$T_{soft_switch} = \max(t\text{-}service\text{-}t\text{-}seviceStart, T_{search} + T_{\Delta} + T_{margin}) + T_{processing} \text{ ms}$$

Where:

- T_{search} is the time required to search the target NR SAN cell assuming the target cell is not already known when the handover command is received by the UE. If the target cell Es/Iot ≥ -2 dB, then $T_{search} = T_{first_SSB}$ ms. Regardless of whether DRX is in use by the UE, T_{search} shall still be based on non-DRX target cell search times.

- T_{Δ} is time for fine time tracking and acquiring full timing information of the target cell.

  $T_{\Delta} = T_{rs}$ for both known and unknown target cells operating with 20 PRB SSB BW.

  $T_{\Delta} = 3*T_{rs}$ for both known and unknown target cells operating with 12 PRB SSB BW.

- $T_{processing}$ is time for UE processing. $T_{processing}$ can be up to 10 ms.

- T_{margin} is same as the one defined in section 6.1C.2.2.2.1.

- T_{first_SSB} is the time to the end of the first complete SSB burst of target satellite, the location of which is determined by the periodicity and location of SSB of the source satellite, the *ssb-TimeOffset* and the difference between propagation delay of the serving satellite and the target satellite counted from *SSB-TimeOffset* reference point as defined in 38.331 [2] to UE.

During the time period from *t-seviceStart* to *t-service*, scheduling restriction as defined in clause 9.2C.5.3 is allowed, with the exception that the locations of SSB symbols of target satellite where scheduling restriction applies are determined by the periodicity and location of SSB of the source satellite, the *ssb-TimeOffset* and the difference between propagation delay of the serving satellite and the target satellite counted from the *SSB-TimeOffset* reference point as defined in TS 38.331 [2] to UE.

UE is allowed to skip measurements for other cells and satellites than the target satellite and source satellite from *t-seviceStart* to the satellite switch completion.

The requirement in this clause applies and UE is required to keep the connection (DL and UL) with the source NGSO satellite, under the following conditions:

- SSBs from the two satellites are spaced apart from each other at least by 1 OFDM symbol in the time domain at UE Rx side.

6.1C.3.3 NR SAN FR2 – NR SAN FR2 Satellite switching with re-synchronization

The requirements in this clause are applicable to both hard and soft switch over quasi-earth fixed scenario from FR2-NTN cell to FR2-NTN cell. The requirements in this clause apply provided that UE has the valid and applicable parameters of ephemeris information, common TA, DL and UL Polarization information, K_{offset}, and K_{mac} for target NR SAN cell during $D_{switch_unchangedPCI}$, otherwise interruption time may be longer than the requirements in clause 6.1C.3.3.2 for hard satellite switch and satellite switch delay may be longer than the requirements in clause 6.1C.3.3.3 for soft satellite switch.

Requirements for soft satellite switching are applicable for UEs that support *softSatelliteSwitchResyncNTN-r18* [14] when network configures soft satellite switching with resynchronization [2].

Requirements for hard satellite switching are applicable for UEs that support *hardSatelliteSwitchResyncNTN-r18* or *softSatelliteSwitchResyncNTN-r18* [14] when the network configures hard satellite switching with resynchronization [2]; or for UEs that support *hardSatelliteSwitchResyncNTN-r18* but do not support *softSatelliteSwitchResyncNTN-r18* when the network configures soft satellite switching with resynchronization.

6.1C.3.3.1 Satellite switching delay

The requirements in clause 6.1C.3.2.1 shall apply except that

- clause 6.1C.3.2.2 is replaced with clause 6.1C.3.3.2, and

6.1C.3.3.2 Interruption time for hard satellite switch with re-sync

The requirements in clause 6.1C.3.2.2 shall apply except that $T_{interrupt}$ is replaced with

In addition, following scheduling restriction applies during the time period from *t-serviceStart* to *t-service*,

- If *deriveSSB-IndexFromCell* is enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, and K_{RX_switch} data symbol before and after each consecutive SSB symbols to be measured within SMTC window duration.

The requirements in this clause do not apply if the time span from the last slot of SI transmission within SI modification period where the broadcasting of the last updated value for *t-ServiceStart-r18* is acquired by the UE for the first time to the first slot corresponding to *t-ServiceStart-r18* is less than 1s.

6.1D Handover for RedCap

6.1D.1 NR Handover

6.1D.1.1 Introduction

The purpose of NR handover is to change the NR PCell to another NR cell for RedCap UE. The requirements in this clause are applicable to SA NR.

Handover for a RedCap UE is defined as intra-frequency handover if the center frequency and subcarrier spacing (SCS) of the reference SSB of the serving cell is same as the center frequency and SCS of the reference SSB of the target cell, where:

- The reference SSB of the serving cell is the SSB in the active DL BWP of serving cell
- The reference SSB of the target cell is the SSB in the first active DL BWP of the target cell upon reconfiguration.

The requirements in this clause apply for the following handover scenarios:

- Handover to a target cell's DL BWP associated with CD-SSB;
- Handover to a target cell's Redcap specific DL BWP associated with NCD-SSB with RACH on the corresponding Redcap specific UL BWP.

6.1D.1.2 NR FR1 - NR FR1 Handover

The requirements in this clause are applicable to both intra-frequency and inter-frequency handovers from NR FR1 cell to NR FR1 cell.

6.1D.1.2.1 Handover delay

When the UE receives a RRC message implying handover the UE shall be ready to start the transmission of the new uplink PRACH channel within $D_{handover}$ msec from the end of the last TTI containing the RRC command.

Where:

$D_{handover}$ equals the applicable RRC procedure delay defined in clause 12 in TS 38.331 [2] plus the interruption time stated in clause 6.1D.1.2.2.

6.1D.1.2.2 Interruption time

The interruption time is the time between end of the last TTI containing the RRC command on the old PDSCH and the time the UE starts transmission of the new PRACH, excluding the RRC procedure delay.

When intra-frequency or inter-frequency handover is commanded, the interruption time shall be less than $T_{interrupt}$

$$T_{interrupt} = T_{search} + T_{IU} + T_{processing} + T_{\Delta} + T_{margin} \text{ ms}$$

Where:

T_{search} is the time required to search the target cell which depends on whether the target cell is already known when the handover command is received by the UE.

- If the target cell is a known intra-frequency cell, T_{search} = 0 ms. If the target cell is an unknown intra-frequency cell and the target cell Es/Iot≥-2 dB, then T_{search} = 1*T_{rs} ms if UE is capable of 2 Rx antennas; T_{search} = 2*T_{rs} ms if UE is only required to support 1 Rx antenna.

- If the target cell is a known inter-frequency cell, then

  if the measured SSB is the target SSB for HO of the target cell, T_{search} = 0 ms;

  if the measured SSB and the target SSB for HO belong to the same NR target cell , T_{search} = T_{rs} ms provided one of the following conditions is fulfilled:

  - The measured SSB is the CD-SSB in the DL BWP and the target SSB for HO is the NCD-SSB in RedCap specific DL BWP, or
  - The measured SSB is the NCD-SSB in RedCap specific DL BWP and the target SSB for HO is the CD-SSB in DL BWP, or
  - The measured SSB is the NCD-SSB and the target SSB for HO is the NCD-SSB and both are within different RedCap specific DL BWPs

  If the target cell is an unknown inter-frequency celland if the target cell Es/Iot≥-2 dB, then T_{search} = 3* T_{rs} ms if the UE is operating with 2 Rx antennas; T_{search} = 5*T_{rs} ms if UE is operating with only 1 Rx antenna.

Regardless of whether DRX is in use by the UE, T_{search} shall still be based on non-DRX target cell search times.

T_{Δ} is time for fine time tracking and acquiring full timing information of the target cell. T_{Δ} = T_{rs} for both known and unknown target cell.

$T_{processing}$ is time for UE processing. $T_{processing}$ can be up to 20 ms.

T_{margin} is time for SSB post-processing. T_{margin} can be up to 2 ms.

T_{IU} is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell. T_{IU} can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [3].

T_{rs} is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cell in the handover command, otherwise,

- T_{rs} is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing as NCD-SSB indicated by nonCellDefiningSSB-r17 if the first active DL BWP included in handover command is configured with nonCellDefiningSSB-r17, otherwise, as CD-SSB indicated by *absoluteFrequencySSB* in *frequencyInfoDL* in handover command.

- If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with T_{rs}=5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms. If the UE has been provided with higher layer in TS 38.331 [2] signalling of *smtc2* prior to the handover command, T_{rs} follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

For RedCap UE with HD-FDD, the handover requirements are met provided that

- SSB is available at the UE once every SMTC period during T_{search}

- One SSB is available during T_{Δ}
- One SSB is available during $T_{IU.}$

In FR1, the target cell is known if it has been meeting the following conditions:

- At least one of the SSBs measured belongs to the same NR target cell,
- During the last 5 seconds before the reception of the handover command:
  - at least one of the SSBs measured which belongs to the same NR target cell remains detectable according to the cell identification requirements as described in clause 9.2B for intra-frequency measurements and clause 9.3B for inter-frequency measurements,
- The reference SSB of the NR target cell also remains detectable during the handover delay according to the cell identification requirements are described in clause 9.2B for intra-frequency handover and clause 9.3B for inter-frequency handover.

Otherwise, it is unknown.

6.1D.1.3 NR FR2- NR FR2 Handover

The requirements in this clause are applicable to both intra-frequency and inter-frequency handovers from NR FR2 cell to NR FR2 cell.

6.1D.1.3.1 Handover delay

When the UE receives a RRC message implying handover the UE shall be ready to start the transmission of the new uplink PRACH channel within $D_{handover}$ msec from the end of the last TTI containing the RRC command.

Where:

$D_{handover}$ equals the applicable RRC procedure delay defined in clause 12 in TS 38.331 [2] plus the interruption time stated in clause 6.1D.1.3.2.

6.1D.1.3.2 Interruption time

The interruption time is the time between end of the last TTI containing the RRC command on the old PDSCH and the time the UE starts transmission of the new PRACH, excluding the RRC procedure delay.

When intra-frequency or inter-frequency handover is commanded, the interruption time shall be less than $T_{interrupt}$

$$T_{interrupt} = T_{search} + T_{IU} + T_{processing} + T_{\Delta} + T_{margin} \text{ ms}$$

Where:

T_{search} is the time required to search the target cell which depends on whether the target cell is already known when the handover command is received by the UE.

- If the target cell is a known intra-frequency cell, T_{search} = 0 ms. If the target cell is an unknown intra-frequency cell and the target cell Es/Iot≥-2 dB, then $T_{search} = N*T_{rs}$ ms.
- If the target cell is a known inter-frequency cell, then

  if the measured SSB is the target SSB for HO of the target cell, T_{search} = 0 ms;

  if the measured SSB and the target SSB for HO belong to the same NR target cell, $T_{search} = T_{rs}$ ms provided one of the following conditions is fulfilled:

  - The measured SSB is the CD-SSB in the DL BWP and the target SSB for HO is the NCD-SSB in RedCap specific DL BWP, or
  - The measured SSB is the NCD-SSB in RedCap specific DL BWP and the target SSB for HO is the CD-SSB in DL BWP, or

- The measured SSB is the NCD-SSB and the target SSB for HO is the NCD-SSB and both are within different RedCap specific DL BWPs

- Otherwise, the target cell is an unknown inter-frequency cell. In this case, if the target cell Es/Iot≥-2 dB, then T_{search} = 3*N* T_{rs} ms.

- Where N = 8 when the target cell is in FR2-1.

Regardless of whether DRX is in use by the UE, T_{search} shall still be based on non-DRX target cell search times.

T_{Δ} is time for fine time tracking and acquiring full timing information of the target cell. T_{Δ} = T_{rs} for both known and unknown target cell.

$T_{processing}$ is time for UE processing. $T_{processing}$ can be up to 20 ms.

T_{margin} is time for SSB post-processing. T_{margin} can be up to 2 ms.

T_{IU} is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell. T_{IU} can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [3].

T_{rs} is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cellin the handover command, otherwise,

- T_{rs} is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing as NCD-SSB indicated by *nonCellDefiningSSB-r17* if the first active DL BWP included in handover command is configured with *nonCellDefiningSSB-r17*, otherwise, as CD-SSB indicated by *absoluteFrequencySSB* in *frequencyInfoDL* in handover command.

- If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with T_{rs}=5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms. If the UE has been provided with higher layer in TS 38.331 [2] signalling of *smtc2* prior to the handover command, T_{rs} follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

In FR2, the target cell is known if it has been meeting the following conditions:

- At least one of the SSBs measured belongs to the same NR target cell,

- During the last 5 seconds before the reception of the handover command:

  - the UE has sent a valid measurement report for the target cell and

  - at least one of the SSBs measured which belongs to the same NR target cell remains detectable according to the cell identification requirements as described in clause 9.2B for intra-frequency measurements and clause 9.3B for inter-frequency measurements,

- The reference SSB of the NR target cell also remains detectable during the handover delay according to the cell identification requirements are described in clause 9.2B for intra-frequency handover and clause 9.3B for inter-frequency handover.

Otherwise, it is unknown.

6.1D.2 NR Handover to other RATs

6.1D.2.1 NR – E-UTRAN Handover

The purpose of inter-RAT handover from NR to E-UTRAN is to change the radio access mode of PCell from NR to E-UTRAN for RedCap UE. The handover procedure is initiated from NR with a RRC message that implies a handover as described in TS 38.331 [2]. The requirements in this clause are applicable to SA NR.

The requirements in clause 6.1.2.1 shall apply when RedCap UE is capable of 2 Rx. When UE is only required to support 1 Rx antenna, the requirements for category 1bis UE defined in clause 5.1.2 in [15] shall apply.

6.1E Handover for ATG

6.1E.1 NR Handover

6.1E.1.1 Introduction

The purpose of NR handover for NR ATG is to change the NR PCell to another NR cell. The requirements in this clause are applicable to SA NR ATG.

6.1E.1.2 NR FR1 - NR FR1 Handover

The requirements in this clause are applicable to both intra-frequency and inter-frequency handovers from NR FR1 cell to NR FR1 cell.

6.1E.1.2.1 Handover delay

When the UE receives a RRC message implying handover to NR cell, the UE shall be ready to start the transmission of the new uplink PRACH channel within $D_{handover}$ msec from the end of the last TTI containing the RRC command.

Where:

$D_{handover}$ equals the applicable RRC procedure delay defined in clause 12 in TS 38.331 [2] plus the interruption time stated in clause 6.1E.1.2.2.

6.1E.1.2.2 Interruption time

The interruption time is the time between end of the last TTI containing the RRC command on the old PDSCH and the time the UE starts transmission of the new PRACH, excluding the RRC procedure delay.

When intra-frequency or inter-frequency handover to NR cell is commanded, the interruption time shall be less than $T_{interrupt}$

$$T_{interrupt} = T_{search} + T_{IU} + T_{processing} + T_{\Delta} + T_{margin} \text{ ms}$$

Where:

T_{search} is the time required to search the target cell when the target cell is not already known when the handover command is received by the UE. If the target cell is known, then T_{search} = 0 ms. If the target cell is an unknown intra-frequency cell and the target cell Es/Iot≥-2 dB, then $T_{search} = N*T_{rs}$ ms. If the target cell is an unknown inter-frequency cell and the target cell Es/Iot≥-2 dB, then $T_{search} = 3* N*T_{rs}$ ms. Regardless of whether DRX is in use by the UE, T_{search} shall still be based on non-DRX target cell search times.

For ATG UE capable of *antennaArrayType-r18*,

- When network assistance on ATG cells reference location of the target cell is provided to UE, N = 2;
- Otherwise, N = 4.

- Otherwise, N=1

T_{Δ} is time for fine time tracking and acquiring full timing information of the target cell. $T_{\Delta} = T_{rs}$ for both known and unknown target cell.

$T_{processing}$ is time for UE processing. $T_{processing}$ can be up to 20 ms.

T_{margin} is time for SSB post-processing. T_{margin} can be up to 2 ms.

T_{IU} is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell. T_{IU} can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [3].

T_{rs} is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cell in the handover command, otherwise T_{rs} is the SMTC configured in the *measObjectNR* having the

same SSB frequency and subcarrier spacing. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with T_{rs}=5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms. If the UE has been provided with higher layer in TS 38.331 [2] signalling of *smtc2* prior to the handover command, T_{rs} follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

In the interruption requirement a cell is known if it has been meeting the relevant cell identification requirement during the last 5 seconds otherwise it is unknown. Relevant cell identification requirements are described in clause 9.2D.5 for intra-frequency handover and clause 9.3D.4 for inter-frequency handover.

6.1E.2 NR Conditional Handover

6.1E.2.1 Introduction

The requirements in this clause are applicable to conditional handover to change the NR PCell to another NR cell for NR ATG.

6.1E.2.2 NR FR1 – NR FR1 conditional handover

The requirements in this clause are applicable to both intra-frequency and inter-frequency conditional handover from NR FR1 cell to NR FR1 cell. When the *condEventD1* is configured to UE, the requirements in this clause apply provided that UE has the valid and applicable parameters of BS location information and K_{offset} for target NR cell during D_{CHO}, otherwise the measurement time, preparation time and interruption time may be longer than the requirements in clause 6.1E.2.2.2, 6.1E.2.2.3 and 6.1E.2.2.4.

6.1E.2.2.1 Handover delay

Procedure delays for all procedures that can command a conditional handover are specified in TS 38.331 [2]. UE shall start RRM measurement before the distance condition is met if the *condEventD1* is configured to UE, the distance condition is defined in clause 5.5.4 in TS 38.331[2]. When the UE receives a RRC message implying conditional handover the UE shall be ready to start the transmission of the new uplink PRACH channel within D_{CHO} seconds from the end of the last TTI containing the RRC command.

$$D_{CHO} = T_{RRC} + T_{Event_DU} + T_{measure} + T_{interrupt} + T_{CHO_execution}$$

Where:

T_{RRC} is the RRC procedure delay defined in clause 12 in TS 38.331 [2].

T_{Event_DU} is the delay uncertainty which is the time from when the UE successfully decodes a conditional handover command until a condition exists at the measurement reference point which will trigger the conditional handover.

$T_{measure}$ is the measurements time stated in clause 6.1E.2.2.2.

$T_{CHO_execution}$ is the conditional execution preparation time in clause 6.1E.2.2.3.

$T_{interrupt}$ is the interruption time stated in clause 6.1E.2.2.4.

The conditional handover delay requirements are applied if both condition D1-1 and condition D1-2 are fulfilled before the end of $T_{measure}$ for location-based CHO, otherwise no CHO requirement is applied.

6.1E.2.2.2 Measurement time

The measurement time delay is defined from the end of T_{Event_DU} until UE executes a handover to a target cell and interruption time starts.

For intra-frequency handover, the measurement time delay measured without Time To Trigger (TTT) and L3 filtering shall be less than $T_{identify_intra\ with\ index}$ or $T_{identify_intra_without_index}$ defined in clause 9.2D.5.1 or clause 9.2D.6.2.

For location-based conditional intra-frequency handover:

- If both condition D1-1 and condition D1-2 are fulfilled earlier than the time at the end of T_{Event_DU} + $T_{identify_intra_with_index}$ or T_{Event_DU} + $T_{identify_intra_without_index}$, then the measurement time delay equals to $T_{identify_intra_with_index}$ or $T_{identify_intra_without_index}$ assuming UE only performs measurements within SMTC window of the target cell.

- If both condition D1-1 and condition D1-2 are fulfilled later than the time at the end of T_{Event_DU} + $T_{identify_intra_with_index}$ or T_{Event_DU} + $T_{identify_intra_without_index}$, then the measurement time delay equals to the time from the end of T_{Event_DU} until time when both condition D1-1 and condition D1-2 are fulfilled.

For inter-frequency handover, the measurement time delay measured without Time To Trigger (TTT) and L3 filtering shall be less than $T_{identify_inter_with_index}$ or $T_{identify_inter_without_index}$ defined in clause 9.3D.4.

For location-based conditional inter-frequency handover:

- If both condition D1-1 and condition D1-2 are fulfilled earlier than the time at the end of T_{Event_DU} + $T_{identify_inter_with_index}$ or T_{Event_DU} + $T_{identify_inter_without_index}$, then the measurement time delay equals to $T_{identify_inter_with_index}$ or $T_{identify_inter_without_index}$, assuming that the UE uses only the SMTC window of the target inter-frequency carrier for performing the measurements.

- If both condition D1-1 and condition D1-2 are fulfilled later than the time at the end of T_{Event_DU} + $T_{identify_inter_with_index}$ or T_{Event_DU} + $T_{identify_inter_without_index}$, then the measurement time delay equals to the time from the end of T_{Event_DU} until time when condition D1-1 and condition D1-2 are fulfilled.

When TTT or L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSB measured from the cell being configured remains detectable during the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ for intra-frequency handover or $T_{identify_inter_without_index}$ or $T_{identify_inter_with_index}$ for inter-frequency handover. If a cell which has been detectable at least for the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ for intra-frequency handover or $T_{identify_inter_without_index}$ or $T_{identify_inter_with_index}$ for inter-frequency handover becomes undetectable for a period and then the cell becomes detectable again and triggers a handover, the measurement time delay shall be less than $T_{SSB_measurement_period_intra}$ or $T_{SSB_measurement_period_inter}$ provided the timing to that cell has not changed more than ± $3200/2^{\mu}$ Tc while the measurement gap has not been available and the L3 filter has not been used, where μ is the SCS configuration as defined in clause 4.2 of TS 38.211 [3]. When L3 filtering is used, an additional delay can be expected.

6.1E.2.2.3 Preparation time

The requirements in clause 6.1.4.2.3 shall apply.

6.1E.2.2.4 Interruption time

The requirements in clause 6.1.4.2.4 shall apply.

6.2 RRC Connection Mobility Control

6.2.1 SA: RRC Re-establishment

6.2.1.1 Introduction

This clause contains requirements on the UE regarding RRC connection re-establishment procedure. RRC connection re-establishment is initiated when a UE in RRC_CONNECTED state on the carrier without CCA or on the carrier with CCA loses RRC connection due to any of failure cases, including radio link failure, handover failure, and RRC connection reconfiguration failure. The RRC connection re-establishment procedure is specified in clause 5.3.7 of TS 38.331 [2].

A neighbour cell for RRC re-establishment procedures for UE supporting *ncd-SSB-BWP-Wor-r18* is defined as an intra-frequency cell if the centre frequency and subcarrier spacing (SCS) of the reference SSB of the serving cell is same as the centre frequency and SCS of the reference SSB of the neighbour cell; else it is considered as inter-frequency cell, where:

- The reference SSB of the target cell is the CD-SSB of the target cell.
- The reference SSB of the serving cell is the CD-SSB of the serving cell.

The requirements in this clause are applicable for RRC connection re-establishment to NR cell.

6.2.1.2 Requirements

In RRC_CONNECTED state the UE shall be capable of sending *RRCReestablishmentRequest* message within $T_{re\text{-}establish_delay}$ seconds from the moment it detects a loss in RRC connection. The total RRC connection delay ($T_{re\text{-}establish_delay}$) shall be less than:

$$T_{re-establish_delay} = T_{UE_re-establish_delay} + T_{UL_grant}$$

T_{UL_grant}: It is the time required to acquire and process uplink grant from the target PCell. The uplink grant is required to transmit *RRCReestablishmentRequest* message.

The UE re-establishment delay ($T_{UE_re\text{-}establish_delay}$) is specified in clause 6.2.1.2.1.

6.2.1.2.1 UE Re-establishment delay requirement

The UE re-establishment delay ($T_{UE_re\text{-}establish_delay}$) is the time between the moments when any of the conditions requiring RRC re-establishment as defined in clause 5.3.7 in TS 38.331 [2] is detected by the UE and when the UE sends PRACH to the target PCell. The UE re-establishment delay ($T_{UE_re\text{-}establish_delay}$) requirement shall be less than:

$$T_{UE_re-establish_delay} = 50\ ms + T_{identify_intra_NR} + \sum_{i=1}^{N_{freq}-1} T_{identify_inter_NR,i} + T_{SI-NR} + T_{PRACH}$$

The intra-frequency target NR cell shall be considered detectable if each relevant SSB can satisfy that:

- SS-RSRP related side conditions given in clauses 10.1.2 and 10.1.3 are fulfilled for a corresponding NR Band for FR1 and FR2, respectively, and
- the conditions of SSB_RP and SSB Ês/Iot according to Annex B.2.2 for a corresponding NR Band are fulfilled.

The inter-frequency target NR cell shall be considered detectable when for each relevant SSB:

- SS-RSRP related side conditions given in clauses 10.1.4 and 10.1.5 are fulfilled for a corresponding NR Band for FR1 and FR2, respectively, and
- the conditions of SSB_RP and SSB Ês/Iot according to Annex B.2.3 for a corresponding NR Band are fulfilled.

$T_{identify_intra_NR}$: It is the time to identify the target intra-frequency NR cell and it depends on whether the target NR cell is known cell or unknown cell and on the FR of the target NR cell. If the UE is not configured with intra-frequency NR carrier for RRC re-establishment then $T_{identify_intra_NR}$=0; otherwise $T_{identify_intra_NR}$ shall not exceed the values defined in table 6.2.1.2.1-1 when *highSpeedMeasFlagFR2-r17* is not configured or UE is not capable of FR2 power class 6 and table 6.2.1.2.1-3 when *highSpeedMeasFlagFR2-r17* is configured and UE is capable of FR2 power class 6.

$T_{identify_inter_NR,i}$: It is the time to identify the target inter-frequency NR cell on inter-frequency carrier *i* configured for RRC re-establishment and it depends on whether the target NR cell is known cell or unknown cell and on the FR of the target NR cell. $T_{identify_inter_NR,i}$ shall not exceed the values defined in table 6.2.1.2.1-2.

T_{SMTC}: It is the periodicity of the SMTC occasion configured for the intra-frequency carrier. If the UE has been provided with higher layer in TS 38.331 [2] signalling of *smtc2*, T_{smtc} follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

$T_{SMTC,i}$: It is the periodicity of the SMTC occasion configured for the inter-frequency carrier *i*. If it is not configured, the UE may assume that the target SSB periodicity is no larger than 20 ms.

$T_{SI\text{-}NR}$: It is the time required for receiving all the relevant system information according to the reception procedure and the RRC procedure delay of system information blocks defined in TS 38.331 [2] for the target NR cell.

T_{PRACH}: It is the delay uncertainty in acquiring the first available PRACH occasion in the target NR cell. T_{PRACH} can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in table 8.1-1 of TS 38.213 [3].

N_{freq}: It is the total number of NR frequencies to be monitored for RRC re-establishment; N_{freq} = 1 if the target intra-frequency NR cell is known, else N_{freq} = 2 and $T_{identify_intra_NR}$ = 0 if the target inter-frequency NR cell is known.

There is no requirement if the target cell does not contain the UE context.

In the requirement defined in the below tables, the target FR1 cell is known if it has been meeting the relevant cell identification requirement during the last 5 seconds otherwise it is unknown.

6.2.1A RRC Re-establishment with CCA

6.2.1A.1 Introduction

This clause contains requirements on the UE regarding RRC connection re-establishment procedure on the carrier with CCA. RRC connection re-establishment on the carrier with CCA is initiated when a UE in RRC_CONNECTED state on the carrier w/o or with CCA loses RRC connection due to any of failure cases, including radio link failure, handover failure, and RRC connection reconfiguration failure. The RRC connection re-establishment procedure is specified in clause 5.3.7 of TS 38.331 [2].

In the requirements of clause 6.2.1A, the term SMTC occasion not available at the UE refers to when the SMTC contains SSBs configured by gNB in a cell on a carrier frequency subject to CCA, but the first two successive candidate SSB positions for the same SSB index within the discovery burst transmission window are not available at the UE due to DL CCA failures at gNB during the corresponding RRC re-establishment period; otherwise the SMTC occasion is considered as available at the UE.

In the requirements of clause 6.2.1A, the term PRACH occasion unavailable for transmission refers to when the PRACH occasion is configured by gNB but not transmitted by the UE during the corresponding period due to UL CCA failure at the UE; otherwise the PRACH occasion is considered as available for transmission.

The requirements in this clause are applicable for RRC connection re-establishment to NR cell on the carrier with CCA.

When the RRC connection re-establishment is performed on a cell in FR2-2 with shared spectrum channel access, UE shall determine the CCA mode of the neighbour cell according to *channelAccessMode2-r17* if configured. If *channelAccessMode2-r17* of the cell is enabled, UE shall assume that CCA applies to the cell and perform measurement accordingly, and the requirements in clause 6.2.1A shall apply; otherwise, UE shall assume that CCA does not apply to the cell and perform measurement accordingly, and requirements in clause 6.2.1 shall apply.

6.2.1A.2 Requirements

In RRC_CONNECTED state on the carrier w/o or with CCA the UE shall be capable of sending *RRCReestablishmentRequest* message within $T_{\text{re-establish_delay_CCA}}$ seconds from the moment it detects a loss in RRC connection. The total RRC connection delay ($T_{\text{re-establish_delay_CCA}}$) shall be less than:

$$T_{re-establish_delay_CCA} = T_{UE_re-establish_delay_CCA} + T_{UL_grant}$$

$T_{\text{UL_grant}}$: It is the time required to acquire and process uplink grant from the target PCell with CCA. The uplink grant is required to transmit *RRCReestablishmentRequest* message.

The UE re-establishment delay ($T_{\text{UE_re-establish_delay_CCA}}$) is specified in clause 6.2.1A.2.1.

6.2.1A.2.1 UE Re-establishment with CCA delay requirement

The UE re-establishment on the carrier with CCA delay ($T_{\text{UE_re-establish_delay_CCA}}$) is the time between the moments when any of the conditions requiring RRC re-establishment on the carrier with CCA as defined in clause 5.3.7 in TS 38.331 [2] is detected by the UE and when the UE sends PRACH to the target PCell on the carrier with CCA . The UE re-establishment delay requirement ($T_{\text{UE_re-establish_delay_CCA}}$) on the carrier with CCA shall be less than:

$$T_{UE_re-establish_delay_CCA} = 50\ \text{ms} + T_{identify_intra_NR_CCA} + \sum_{i=1}^{N_{freq}-1} T_{identify_inter_NR_CCA,i} + T_{SI-NR_CCA} + T_{PRACH_CCA}$$

The intra-frequency target NR cell with CCA shall be considered detectable if each relevant SSB can satisfy that:

- SS-RSRP related side conditions given in clauses 10.1.2 and 10.1.3 are fulfilled for a corresponding NR Band for FR1 and FR2-2, respectively, and
- the conditions of SSB_RP and SSB Ês/Iot according to Annex B.2.3 for a corresponding NR Band are fulfilled.

The inter-frequency target NR cell on the carrier with CCA shall be considered detectable when for each relevant SSB:

- SS-RSRP related side conditions given in clauses 10.1.4 and 10.1.5 are fulfilled for a corresponding NR Band for FR1 and FR2-2, respectively, and

- the conditions of SSB_RP and SSB Ês/Iot according to Annex B.2.2 for a corresponding NR Band are fulfilled.

$T_{identify_intra_NR_CCA}$: If the target intra-frequency carrier is the carrier without CCA, it is the time to identify the target intra-frequency NR cell which is defined in clause 6.2.1; otherwise it is the time to identify the target intra-frequency NR cell on the carrier with CCA and it depends on whether the target NR cell on the carrier with CCA is known cell or unknown cell and on the frequency range (FR) of the target NR cell on the carrier with CCA. If the UE is not configured with intra-frequency NR carrier with CCA for RRC re-establishment then $T_{identify_intra_NR_CCA}$=0; otherwise $T_{identify_intra_NR_CCA}$ shall not exceed the values defined in table 6.2.1A.2.1-1.

$T_{identify_inter_NR_CCA,i}$: If the target inter-frequency carrier is the carrier without CCA, it is the time to identify the target inter-frequency NR cell which is defined in clause 6.2.1; otherwise it is the time to identify the target inter-frequency NR cell on inter-frequency carrier *i* with CCA configured for RRC re-establishment and it depends on whether the target NR cell on the inter-frequency carrier with CCA is known or unknown. $T_{identify_inter_NR_CCA,i}$ shall not exceed the values defined in table 6.2.1A.2.1-2.

T_{SMTC}: It is the periodicity of the SMTC occasion configured for the intra-frequency carrier. If the UE has been provided with higher layer in TS 38.331 [2] signalling of *smtc2*, T_{smtc} follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

$T_{SMTC,i}$: It is the periodicity of the SMTC occasion configured for the inter-frequency carrier *i*. If it is not configured, the UE may assume that the target SSB periodicity is not larger than 20 ms.

$T_{SI\text{-}NR_CCA}$: It is the time required for receiving all the relevant system information according to the reception procedure and the RRC procedure delay of system information blocks defined in TS 38.331 [2] for the target NR cell on the carrier with CCA.

T_{PRACH_CCA} is the delay uncertainty in acquiring the first available PRACH occasion in the target NR Cell on the carrier with CCA:

$T_{PRACH_CCA} = (1+ K_3)*T_{SSB,RO} + 10$ ms, where:

- $T_{SSB,RO}$ is the SSB to PRACH occasion association period as defined in table 8.1-1 of TS 38.213 [39].
- K_3 is the number of consecutive SSB to PRACH occasion association periods during which no PRACH occasion is available for PRACH transmission due to UL CCA failure. $K_3 = 0$ for Type 2C UL channel access procedure as defined in TS 37.213 [57]. $L_3 = 0$ if *ra-ChannelAccess-r17* is not configured in FR2-2.

N_{freq}: It is the total number of NR frequencies to be monitored for RRC re-establishment; $N_{freq} = 1$ if the target NR cell on the intra-frequency carrier with CCA is known, else $N_{freq} = 2$ and $T_{identify_intra_NR_CCA} = 0$ if the target NR cell on the inter-frequency carrier with CCA is known.

There is no requirement if the target cell on the carrier with CCA does not contain the UE context.

In the requirement defined in the below tables, the target FR1 cell on the carrier with CCA is known if it has been meeting the relevant cell identification requirement during the last 8 seconds otherwise it is unknown.

When the Redcap specific initial BWP is configured for random access, $T_{UE_re-establish_delay}$ in clause 6.2.1 is extended by 6 ms.

6.2.2 Random access

6.2.2.1 Introduction

This clause contains requirements on the UE regarding random access procedure. The random access procedure is initiated to establish uplink time synchronization for a UE which either has not acquired or has lost its uplink synchronization, or to convey UE's request Other SI, or for beam failure recovery. The random access is specified in clause 8 of TS 38.213 [3] and the control of the RACH transmission is specified in clause 5.1 of TS 38.321 [7]. Two types of procedure are defined for the random access, the 4-step RA type, and the 2-step RA type [7]. The decision on which type of procedure to adopt is as described in clause 5.1.1 of TS 38.321 [7]. The requirements for the 4-step RA type procedure are described in clause 6.2.2.2, whereas the requirements for the 2-step RA type procedure are described in the clause 6.2.2.3 of this specification.

6.2.2.2 Requirements for 4-step RA type

The UE shall select the type of random access at initiation of the random access procedure based on network configuration, as specified in clause 5.1.1 in TS 38.321 [7].

The UE shall have capability to calculate PRACH transmission power according to the PRACH power formula defined in clause 7.4 of TS 38.213 [3] and apply this power level at the first preamble or additional preambles. 6.2.2A.3.1.2 Correct behaviour when receiving MsgB

The UE shall stop monitoring for MsgB, when the UE has successfully received the PDCCH addressed to UE as specified in clause 8.2A in TS 38.213 [3] containing a successRAR MAC subPDU or a fallbackRAR MAC subPDU as described in clause 5.1.4a in TS 38.321 [7].

If the UL CCA is successful, the UE shall send ACK if Success RAR is received in MsgB and the Contention Resolution is successful, as defined in clause 5.1.4a in TS 38.321 [7].

If MsgB contains a fallbackRAR MAC subPDU the UE shall fallback to the 4-step RA type by transmitting the msg3 containing the payload of MsgA PUSCH if the UL CCA is successful, and monitor contention resolution as described in clause 8.2A in TS 38.213 [3].

The UE shall again perform the Random Access Resource selection procedure defined in clause 5.1.2a in TS 38.321 [7], and transmit with the calculated MsgA PRACH and MsgA PUSCH transmission power, if the UL CCA is successful on the next available PRACH occasion, when the backoff time expires unless the Random Access Response reception is considered as successful, as defined in clause 5.1.4a in TS 38.321 [7].

6.2.2A.3.1.3 Correct behaviour when not receiving MsgB

The UE shall again perform the Random Access Resource selection procedure defined in clause 5.1.2a in TS 38.321 [7], and if the UL CCA is successful, transmit with the calculated MsgA PRACH and MsgA PUSCH transmission power if the UL CCA is successful on the next available PRACH occasion when the backoff time expires unless the Random Access Response reception is considered as successful, as defined in clause 5.1.4a in TS 38.321 [7].

6.2.2A.3.2 Non-Contention based random access

6.2.2A.3.2.1 Correct behaviour when transmitting MsgA

If the UL CCA is successful, if the contention-free Random Access Resources and the contention-free PRACH occasions associated with SSBs is configured, with the UE selected SSB with SS-RSRP above *msgA-RSRP-ThresholdSSB* amongst the associated SSBs, UE shall have the capability to select the Random Access Preamble corresponding to the selected SSB, and to transmit Random Access Preamble on the next available PRACH occasion from the PRACH occasions corresponding to the selected SSB permitted by the restrictions given first by the *msgA-SSB-SharedRO-MaskIndex* if configured, or next by the *ra-ssb-OccasionMaskIndex* if configured, and PRACH occasion shall be randomly selected with equal probability amongst the selected SSB associated PRACH occasions occurring simultaneously but on different subcarriers, as specified in clause 5.1.2a in TS 38.321 [7].

In association with the MsgA PRACH, the UE shall be able to transmit MsgA PUSCH, if the UL CCA is successful, on the corresponding PUSCH occasion associated with a DMRS resource, which is mapped from the MsgA PRACH occasion, and preamble index as defined in clause 8.1A in TS 38.213 [3].

If UE is configured *lbt-FailureRecoveryConfig* and is capable of *ul-LBT-FailureDetectionRecovery* [2] then upon detecting uplink CCA failure during the random access procedure for MsgA transmission, as outlined in clause 5.21.2 of TS 38.321 [7], the UE shall have cancel the transmission of the MsgA payload on the associated PUSCH resource and perform the Random Access Resource selection procedure, as specified in clause 5.1.3a in TS 38.321 [7].

If UE is not configured *lbt-FailureRecoveryConfig* or is not capable of *ul-LBT-FailureDetectionRecovery* [2] then upon detecting uplink CCA failure during the random access procedure for MsgA transmission, as outlined in clause 5.21.2 of TS 38.321 [7], the UE shall cancel the transmission of the MsgA payload on the associated PUSCH resource and increment PREAMBLE_TRANSMISSION_COUNTER by 1. The UE shall again perform the Random Access Resource selection procedure if PREAMBLE_TRANSMISSION_COUNTER < *preambleTransMax* + 1, as specified in clause 5.1.3a in TS 38.321 [7]. If the Random Access Procedure is not complete and the UE is configured with *msgA-TransMax* then, as specified in clause 5.1.3a in TS 38.321 [7], the UE shall perform the Random Access Resource selection procedure with 4-step RA type provided that PREAMBLE_TRANSMISSION_COUNTER = *msgA-TransMax* + 1.

6.2.2A.3.2.2 Correct behaviour when receiving MsgB

The UE may stop monitoring for MsgB, when the UE has successfully received the PDCCH addressed to UE as specified in clause 8.2A in TS 38.213 [3] containing a successRAR MAC subPDU or a fallbackRAR MAC subPDU as described in clause 5.1.4a in TS 38.321 [7].

If MsgB contains a fallbackRAR MAC subPDU the UE shall fallback to the 4-step RA type by transmitting the msg3 containing the payload of MsgA PUSCH if the UL CCA is successful, as described in clause 8.2A in TS 38.213 [3].

The UE shall again perform the Random Access Resource selection procedure defined in clause 5.1.2a in TS 38.321 [7] for the next available PRACH occasion, and transmit the preamble with the calculated MsgA PRACH and MsgA PUSCH transmission power if the UL CCA is successful, if all received MsgBs contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

6.2.2A.3.2.3 Correct behaviour when not receiving MsgB

The UE shall again perform the Random Access Resource selection procedure defined in clause 5.1.2a in TS 38.321 [7] for the next available PRACH occasion, and transmit MsgA with the calculated MsgA PRACH and MsgA PUSCH transmission power if the UL CCA is successful on the next available PRACH occasion, if no MsgB is received within the MsgB Response window configured in *RACH-ConfigGenericTwoStepRA* and the Random Access Response Reception has not been considered as successful as defined in clause 5.1.4a in TS 38.321 [7].

6.2.2B Random access for RedCap

6.2.2B.1 Introduction

This clause contains requirements on the RedCap UE regarding random access procedure. The random access procedure is initiated to establish uplink time synchronization for a UE which either has not acquired or has lost its uplink synchronization, or to convey UE's request Other SI, or for beam failure recovery. The random access is specified in clause 8 of TS 38.213 [3] and the control of the RACH transmission is specified in clause 5.1 of TS 38.321 [7]. Two types of procedure are defined for the random access, the 4-step RA type, and the 2-step RA type [7]. The decision on which type of procedure to adopt is as described in clause 5.1.1 of TS 38.321 [7].

The 1 Rx RedCap UE for performing the random access procedure defined in clause 5.1 [7] applies:

- rsrp-ThresholdSSB as the signaled value of rsrp-ThresholdSSB [2] + 1 dB.
- msgA-RSRP-ThresholdSSB as the signaled value of msgA-RSRP-ThresholdSSB [2] + 1 dB.
- msgA-RSRP-Threshold as the signaled value of msgA-RSRP-Threshold [2] + 1 dB.
- rsrp-ThresholdMsg3 as the signaled value of rsrp-ThresholdMsg3 [2] - 1 dB.

6.2.2B.2 Requirements

The requirements for the 4-step RA type procedure described in clause 6.2.2.2 and the requirements for the 2-step RA type procedure described in the clause 6.2.2.3 are applicable for TDD and FDD RedCap UEs. The 4-step and 2-step RA requirements for contention based random access defined in clause 6.2.2.2 and 6.2.2.3 respectively apply to HD-FDD UE with the following conditions:

- The RedCap UE operating in HD-FDD mode is not expected to perform PRACH transmission on a PRACH resource of a cell if UE has not received at least one SSB associated with that PRACH resource during the last Tp period in the cell, where Tp=160 ms.
- The RedCap UE operating in HD-FDD mode shall meet the PRACH requirements when performing PRACH transmission on a PRACH resource of a cell provided that the UE has received at least one SSB associated with that PRACH resource during the last Tp period before the PRACH transmission, where Tp=160 ms.

6.2.2C PDCCH ordered Random Access for LTM

6.2.2C.1 Introduction

The requirements in this clause apply for a UE capable of *rach-EarlyTA-Measurement-r18* configured to trigger RACH procedure toward target LTM candidate cell before receiving cell switch command MAC-CE.

The requirements in this clause apply if PDCCH order-based RACH on candidate cell is triggered based on L1-RSRP report or L3-RSRP beam-level report in FR1, or based on L1-RSRP report in FR2.

The requirements in this clause for PDCCH ordered-based RACH to an inter-frequency target cell is only applicable, when

- network has configured UE to perform SSB based L3 measurement with beam measurement reporting or L1 measurement for the target cell before the PDCCH order, or
- the SFN of the serving cell from which PDCCH order is received and the SFN of the target cell are the same.

6.2.2C.2 PDCCH ordered Random Access delay

UE shall complete the RACH transmission as defined in TS 38.213 [3] clause 8.1, in which T_{SSB} and $\Delta_{RF/BB\ preparation}$ are defined as the following:

- T_{SSB} is the time for T/F tracking and acquiring full timing information of the target cell
  - T_{SSB} = 0, provided:
    - L1-RSRP measurement is configured and
    - The target LTM candidate cell is on an FR1 carrier whose TCI state associated with SSB indicated in the PDCCH-order is activated, and the time between the MAC-CE activating the target TCI state and the PDCCH is larger than TCI state activation delay defined in clause 8.25.3, and
      - L1-RSRP measurement period of candidate cell is not larger than 160 ms, or
      - The time between the MAC-CE activating the target TCI state and the PDCCH is not larger than TCI state activation delay defined in clause 8.25.3 + 160ms.
  - Otherwise, $T_{SSB} = T_{first-SSB_RACH} + T_{SSB-proc}$, where
    - $T_{first-SSB_RACH}$ is the time to the first SSB occasion, after 1slot from the end of the slot of the PDCCH, when SSB is to be measured outside MG
    - $T_{first-SSB_RACH}$ is the time to the first SSB occasion, overlapped with MGL after 2ms and 1slot from the end of the slot of the PDCCH if the SSB to be measured within MG.
    - $T_{SSB-proc}$ = 2 ms, which is the time for SSB processing;
- $\Delta_{RF/BB\ preparation}$ is the time for RF and baseband preparation. The following apply:
  - If PRACH bandwidth is outside active UL BWP of serving cell(s) but within one of configured UL BWPs of an active serving cell, the $\Delta_{RF/BB\ preparation}$ is the DCI based BWP switching delay specified in clause 8.6.
  - If PRACH bandwidth is not within any of the configured UL BWPs of any active serving cell, $\Delta_{RF/BB\ preparation}$ equals to capability value reported in *pdcch-RACH-PrepTimeList-r18*.
  - Otherwise, $\Delta_{RF/BB\ preparation}$ = 0.

6.2.3 SA: RRC Connection Release with Redirection

6.2.3.1 Introduction

This clause contains requirements on the UE regarding RRC connection release with redirection procedure. RRC connection release with redirection is initiated by the *RRCRelease* message with redirection to E-UTRAN or NR from NR specified in TS 38.331 [2]. The RRC connection release with redirection procedure is specified in clause 5.3.8 of TS 38.331 [2].

In the requirements of clause 6.2.3.2, the term SMTC occasion not available at the UE refers to when the SMTC contains SSBs configured by gNB in a cell on a carrier frequency subject to CCA, but the first two successive candidate SSB positions for the same SSB index within the discovery burst transmission window are not available at the UE due to DL CCA failures at gNB during the corresponding identification period; otherwise the SMTC occasion is considered as available at the UE.

In the requirements of clause 6.2.3.2, the term PRACH occasion unavailable for transmission refers to when the PRACH occasion is configured by gNB but not transmitted by the UE during the corresponding period due to UL CCA failure at the UE.

When the RRC connection release with redirection is performed on a cell in FR2-2 with shared spectrum channel access, UE shall determine the CCA mode of the neighbour cell according to *channelAccessMode2-r17* if configured. If *channelAccessMode2-r17* of the cell is enabled, UE shall assume that CCA applies to the cell and perform measurement accordingly, and the requirements in clause 6.2.3.2.3 shall apply; otherwise, UE shall assume that CCA does not apply to the cell and perform measurement accordingly, and requirements in clause 6.2.3.2.1 shall apply.

6.2.3.2 Requirements

6.2.3.2.1 RRC connection release with redirection to NR

The UE shall be capable of performing the RRC connection release with redirection to the target NR cell within $T_{connection_release_redirect_NR}$.

The time delay ($T_{connection_release_redirect_NR}$) is the time between the end of the last slot containing the RRC command, "*RRCRelease*" (TS 38.331 [2]) on the NR PDSCH and the time the UE starts to send random access to the target NR cell. The time delay ($T_{connection_release_redirect_NR}$) shall be less than:

$$T_{connection_release_redirect_NR} = T_{RRC_procedure_delay} + T_{identify\text{-}NR} + T_{SI\text{-}NR} + T_{RACH}$$

The target NR cell shall be considered detectable when for each relevant SSB, the following side conditions are met:

- the conditions of SSB_RP and SSB Ês/Iot according to Annex B.2.5 for a corresponding NR Band are fulfilled.

$T_{RRC_procedure_delay}$: It is the RRC procedure delay for processing the received message "*RRCRelease*" as defined in clause 6.2.2 of TS 38.331 [2].

$T_{identify\text{-}NR}$: It is the time to identify the target NR cell and depends on the FR of the target NR cell. It is defined in table 6.2.3.2.1-1. Note that $T_{identify\text{-}NR} = T_{PSS/SSS\text{-}sync} + T_{meas}$, in which $T_{PSS/SSS\text{-}sync}$ is the cell search time and T_{meas} is the measurement time due to cell selection criteria evaluation.

$T_{SI\text{-}NR}$: It is the time required for acquiring all the relevant system information of the target NR cell. This time depends upon whether the UE is provided with the relevant system information of the target NR cell or not by the old NR cell before the RRC connection is released. $T_{RACH:}$ It is the delay uncertainty in acquiring the first available PRACH occasion in the target NR cell. T_{RACH} can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [3].

T_{rs} is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cell in the redirection command, otherwise T_{rs} is the SMTC periodicity configured in the *measObjectNR* having the same SSB frequency and subcarrier spacing configured for the RRC connection release with redirection. If the measObjectNRs having the same SSB frequency and subcarrier spacing configured by MN and SN have different SMTC, T_{rs} is the periodicity of one of the SMTC which is up to UE implementation. If the UE is not provided with SMTC configuration or measurement object for the frequency which is also configured for the RRC connection release with redirection then:

- the requirement in this clause is applied with T_{rs} = 20 ms if the SSB transmission periodicity is not larger than 20 ms; otherwise,

- there is no requirement if the SSB transmission periodicity is larger than 20 ms.

Table 6.2.3.2.1-1: Time to identify target NR cell for RRC connection release with redirection to NR

FR of target NR cell	$T_{identify\text{-}NR}$
FR1	MAX (680 ms, 11 x T_{rs})
FR2-1	MAX (880 ms, Nx11 x T_{rs} + T_{proc})

FR2-2	MAX (880 ms, 12x11 x T_{rs})
NOTE:	If the UE has been provided with higher layer signalling of *smtc2* specified in TS 38.331 [2] prior to the redirection command, T_{rs} follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.
NOTE2:	If the UE supports *Rel-19 L3 fast Rx beam sweeping*, N = *reduced beam sweeping factor* indicated via UE capability and T_{proc} = 2 ms, otherwise N = 8 and T_{proc} = 0.

6.2.3.2.2 RRC connection release with redirection to E-UTRAN

The UE shall be capable of performing the RRC connection release with redirection to the target E-UTRAN cell within $T_{connection_release_redirect_E\text{-}UTRA}$.

The time delay ($T_{connection_release_redirect_E\text{-}UTRA}$) is the time between the end of the last slot containing the RRC command, "*RRCRelease*" (TS 38.331 [2]) on the PDSCH and the time the UE starts to send random access to the target E-UTRA cell. The time delay ($T_{connection_release_redirect_E\text{-}UTRA}$) shall be less than:

$$T_{connection_release_redirect_E\text{-}UTRA} = T_{RRC_procedure_delay} + T_{identify\text{-}E\text{-}UTRA} + T_{SI\text{-}E\text{-}UTRA} + T_{RACH}$$

The target E-UTRA FDD or TDD cell shall be considered detectable provided the following conditions are fulfilled:

- the same conditions as for inter-frequency RSRP measurements specified in annex B.1.2 of TS 36.133 [15] are fulfilled for a corresponding Band, and
- the same conditions as for inter-frequency RSRQ measurements specified in annex B.1.2 of TS 36.133 [15] are fulfilled for a corresponding Band, and
- SCH conditions specified in annex B.1.2 of TS 36.133 [15] are fulfilled for a corresponding Band.

$T_{RRC_procedure_delay}$: It is the RRC procedure delay for processing the received message "*RRCRelease*" as defined in clause 6.2.2 of TS 38.331 [2].

$T_{identify\text{-}E\text{-}UTRA}$: It is the time to identify the target E-UTRA cell. It shall be less than 320 ms.

$T_{SI\text{-}E\text{-}UTRA}$: It is the time required for acquiring all the relevant system information of the target E-UTRA cell. This time depends upon whether the UE is provided with the relevant system information (SI) of the target E-UTRA cell or not by the old NR cell before the RRC connection is released.

T_{RACH}: It is the delay caused due to the random access procedure when sending random access to the target E-UTRA cell.

6.2.3.2.3 RRC connection release with redirection to NR carrier subject to CCA

The UE shall be capable of performing the RRC connection release with redirection to the target NR cell subject to CCA within $T_{connection_release_redirect_NR_CCA}$.

The time delay ($T_{connection_release_redirect_NR_CCA}$) is the time between the end of the last slot containing the RRC command, "*RRCRelease*" (TS 38.331 [2]) on the NR PDSCH and the time the UE starts to send random access to the target NR cell. The time delay ($T_{connection_release_redirect_NR_CCA}$) shall be less than:

$$T_{connection_release_redirect_NR_CCA} = T_{RRC_procedure_delay} + T_{identify\text{-}NR_CCA} + T_{SI\text{-}NR_CCA} + T_{RACH_CCA}$$

The target NR cell shall be considered detectable when for each relevant SSB, the following side conditions are met:

- the conditions of SSB_RP and SSB Ês/Iot according to Annex B.2.5 for a corresponding NR Band are fulfilled.
- $T_{RRC_procedure_delay}$: It is the RRC procedure delay for processing the received message "*RRCRelease*" as defined in clause 6.2.2 of TS 38.331 [2].
- $T_{identify\text{-}NR_CCA}$: It is the time to identify the target NR cell and is defined as:
- $T_{identify\text{-}NR_CCA} = T_{PSS/SSS\text{-}sync} + T_{meas}$; $T_{PSS/SSS\text{-}sync}$ is the cell search time and T_{meas} is the measurement time due to cell selection criteria evaluation.
- For FR1 target NR cell: $T_{identify\text{-}NR_CCA}$ = MAX (680 ms, $(L_1+11) \times T_{rs}$);
- For FR2-2 target NR cell: $T_{identify\text{-}NR_CCA}$ = MAX (880 ms, $N\times(L_1'+11) \times T_{rs}$);

- where L_1 is the number of SMTC occasions not available at the UE due to DL CCA failures and L_1' is the number of SMTC occasion groups not available at the UE due to DL CCA failures. An SMTC occasion group consists of N consecutive SMTC occasions. An SMTC occasion group is not available, when at least one SMTC occasion in the group is not transmitted by the gNB. N is equal to 12. If $L_1 > L_{1,max}$ or $L_1' > L_{1,max}$ then the UE shall initiate cell selection procedures for the selected PLMN as defined in TS 38.304 [1]; where $L_{1,max}$ is defined in table 6.2.3.2.3-1.

- $T_{SI\text{-}NR_CCA}$: It is the time required for acquiring all the relevant system information of the target NR cell. This time depends upon whether the UE is provided with the relevant system information of the target NR cell or not by the old NR cell before the RRC connection is released.

- T_{RACH_CCA}: It is the delay uncertainty in acquiring the first available PRACH occasion in the target NR cell:

- $T_{RACH_CCA} = (1+L_2) \times T_{SSB,RO} + 10$ ms T_{PRACH}; where:

  - L_2 is the consecutive number of SSB to PRACH occasion association periods during which no PRACH occasion is available for PRACH transmission due to UL CCA failures. $L_2 = 0$ for Type 2C UL channel access procedure as defined in TS 37.213 [33]. $L_3 = 0$ if *ra-ChannelAccess-r17* is not configured in FR2-2.

  - $T_{SSB,RO}$ is the SSB to PRACH occasion association period as defined in the table 8.1-1 of TS 38.213 [3].

  - The value of L2 is limited by *PREAMBLE_TRANSMISSION_COUNTER*, which is increased when PRACH occasion is unavailable for PRACH transmission due to UL CCA failure as specified in TS 38.321 [7]. The UE behaviour when *PREAMBLE_TRANSMISSION_COUNTER* reaches the *preambleTransMax* is specified in TS 38.321 [7].

- T_{rs} is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cell in the redirection command, otherwise T_{rs} is the SMTC periodicity configured in the *measObjectNR* having the same SSB frequency and subcarrier spacing configured for the RRC connection release with redirection. If the UE is not provided with SMTC configuration or measurement object for the frequency which is also configured for the RRC connection release with redirection then:

- the requirement in this clause is applied with $T_{rs} = 20$ ms if the SSB transmission periodicity is not larger than 20 ms;

- otherwise, there is no requirement if the SSB transmission periodicity is larger than 20 ms.

Table 6.2.3.2.3-1: Maximum allowed number of missed SMTC occasions during cell identification

SMTC periodicity (T_{rs}) [ms]	Maximum allowed number of missed SMTC occasions ($L_{1,max}$)
$T_{rs} \leq 40$	8
$T_{rs} > 40$	4

FR1	MAX (680 ms, [12] x T_{rs})
NOTE: If the UE has been provided with higher layer signalling of *smtc2* specified in TS 38.331 [2] prior to the redirection command, T_{rs} follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.	

The HD-FDD UE shall meet the RRC connection release with redirection requirements provided that SSB is available at the UE once every SMTC period during T_{search}.

6.2C RRC Connection Mobility Control for Satellite Access

6.2C.1 SA: RRC Re-establishment for Satellite Access

6.2C.1.1 Introduction

This clause contains requirements on the UE regarding RRC connection re-establishment procedure. RRC connection re-establishment is initiated when a UE in RRC_CONNECTED state on the carrier loses RRC connection due to any of failure cases, including radio link failure, handover failure, and RRC connection reconfiguration failure. The RRC connection re-establishment procedure is specified in clause 5.3.7 of TS 38.331 [2].

The requirements in this clause are applicable for RRC connection re-establishment to NR cell, which is served by satellite access node (SAN).

6.2C.1.2 Requirements

In RRC_CONNECTED state the UE shall be capable of sending *RRCReestablishmentRequest* message within $T_{re-establish_delay}$ seconds from the moment it detects a loss in RRC connection. The total RRC connection delay ($T_{re-establish_delay}$) shall be less than:

$$T_{re-establish_delay} = T_{UE_re-establish_delay} + T_{UL_grant}$$

T_{UL_grant}: It is the time required to acquire and process uplink grant from the target PCell. The uplink grant is required to transmit *RRCReestablishmentRequest* message.

The UE re-establishment delay ($T_{UE_re-establish_delay}$) is specified in clause 6.2C.1.2.1.

6.2C.1.2.1 UE Re-establishment delay requirement

The UE re-establishment delay ($T_{UE_re-establish_delay}$) is the time between the moments when any of the conditions requiring RRC re-establishment as defined in clause 5.3.7 in TS 38.331 [2] is detected by the UE and when the UE sends PRACH to the target PCell. The UE re-establishment delay ($T_{UE_re-establish_delay}$) requirement shall be less than:

$$T_{UE_re-establish_delay} = 50\ \text{ms} + T_{identify_intra_NR} + \sum_{i=1}^{N_{freq}-1} T_{identify_inter_NR,i} + T_{SI-NR} + T_{PRACH}$$

The intra-frequency target NR cell shall be considered detectable if each relevant SSB can satisfy that:

- SS-RSRP related side conditions given in clause 10.1.2C are fulfilled for a corresponding NR Band for FR1-NTN, and
- the conditions of SSB_RP and SSB Ês/Iot according to Annex B.2.17 for a corresponding NR Band are fulfilled.

The inter-frequency target NR cell shall be considered detectable when for each relevant SSB:

- SS-RSRP related side conditions given in clause 10.1.4C are fulfilled for a corresponding NR Band for FR1-NTN, and
- the conditions of SSB_RP and SSB Ês/Iot according to Annex B.2.18 for a corresponding NR Band are fulfilled.

$T_{identify_intra_NR}$: It is the time to identify the target intra-frequency NR cell and it depends on whether the target NR cell is known cell or unknown cell. If the UE is not configured with intra-frequency NR carrier for RRC re-establishment then $T_{identify_intra_NR}$=0; otherwise $T_{identify_intra_NR}$ shall not exceed the values defined in table 6.2C.1.2.1-1 for UE that does not support 160 ms SSB periodicity assumed during initial access, and in table 6.2C.1.2.1-1a for UE that supports 160 ms SSB periodicity assumed during initial access.

$T_{identify_inter_NR,i}$: It is the time to identify the target inter-frequency NR cell on inter-frequency carrier *i* configured for RRC re-establishment and it depends on whether the target NR cell is known cell or unknown cell. $T_{identify_inter_NR,i}$ shall not exceed the values defined in table 6.2C.1.2.1-2 for UE that does not support 160 ms SSB periodicity assumed during initial access, and in table 6.2C.1.2.1-2a for UE that supports 160 ms SSB periodicity assumed during initial access.

T_{SMTC}: It is the periodicity of the SMTC occasion configured for the intra-frequency carrier. If the UE has been provided with higher layer in TS 38.331 [2] signalling of *smtc2*, T_{smtc} follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

$T_{SMTC,i}$: It is the periodicity of the SMTC occasion configured for the inter-frequency carrier *i*. If it is not configured, the UE may assume that the target SSB periodicity is no larger than 20 ms.

$T_{SI\text{-}NR}$: It is the time required for receiving all the relevant system information according to the reception procedure and the RRC procedure delay of system information blocks defined in TS 38.331 [2] for the target NR cell.

$T_{PRACH:}$ It is the delay uncertainty in acquiring the first available PRACH occasion in the target NR cell. T_{PRACH} can be up to the summation of SSB to PRACH occasion association period and [10] ms. SSB to PRACH occasion associated period is defined in table 8.1-1 of TS 38.213 [3].

N_{freq}: It is the total number of NR frequencies to be monitored for RRC re-establishment; N_{freq} = 1 if the target intra-frequency NR cell is known, else N_{freq} = 2 and $T_{identify_intra_NR}$ = 0 if the target inter-frequency NR cell is known.

T_{search}: It is the periodicity with which UE searches for the intra-frequency carrier. T_{search} equals to the periodicity of the SMTC occasion if single SMTC periodicity is configured, and equals to the maximum of the periodicities of the SMTC occasions if multiple SMTC periodicities are configured.

$T_{search,i}$: It is the periodicity with which UE searches for inter-frequency carrier *i*. $T_{search,i}$ equals to the periodicity of the SMTC occasion if single SMTC periodicity is configured, and equals to the maximum of the periodicities of the SMTC occasions if multiple SMTC periodicities are configured. If no SMTC is configured for inter-frequency carrier *i*, $T_{search,i}$ equals to 160ms.

There is no requirement if the target cell does not contain the UE context.

In the requirement defined in the below tables, the target FR1-NTN cell is known if it has been meeting the relevant cell identification requirement during the last 5 seconds otherwise it is unknown.

The requirements in this clause apply provided that the ephemeris information provided by the serving cell for the target cell is valid during UE re-establishment delay ($T_{UE_re\text{-}establish_delay}$).

6.2C.2 Random access for satellite access

6.2C.2.1 Introduction

This clause contains requirements on the UE regarding random access procedure. The random access procedure is initiated to establish uplink time synchronization for a UE which either has not acquired or has lost its uplink synchronization, or to convey UE's request Other SI, or for beam failure recovery. The random access is specified in clause 8 of TS 38.213 [3] and the control of the RACH transmission is specified in clause 5.1 of TS 38.321 [7]. Two types of procedure are defined for the random access, the 4-step RA type, and the 2-step RA type [7]. The decision on which type of procedure to adopt is as described in clause 5.1.1 of TS 38.321 [7]. The requirements for the 4-step RA type procedure are described in clause 6.2C.2.2, whereas the requirements for the 2-step RA type procedure are described in the clause 6.2C.2.3 of this specification.

6.2C.3 SA: RRC Connection Release with Redirection for Satellite Access

6.2C.3.1 Introduction

This clause contains requirements on the UE regarding RRC connection release with redirection procedure. RRC connection release with redirection is initiated by the *RRCRelease* message with redirection to NR from NR specified in TS 38.331 [2]. The RRC connection release with redirection procedure is specified in clause 5.3.8 of TS 38.331 [2].

6.2C.3.2 Requirements

6.2C.3.2.1 RRC connection release with redirection to NR

The UE shall be capable of performing the RRC connection release with redirection to the target NR cell within $T_{connection_release_redirect_NR}$.

The time delay ($T_{connection_release_redirect_NR}$) is the time between the end of the last slot containing the RRC command, "*RRCRelease*" (TS 38.331 [2]) on the NR PDSCH and the time the UE starts to send random access to the target NR cell. The time delay ($T_{connection_release_redirect_NR}$) shall be less than:

$$T_{connection_release_redirect_NR} = T_{RRC_procedure_delay} + T_{identify\text{-}NR} + T_{SI\text{-}NR} + T_{RACH}$$

The target NR cell shall be considered detectable when for each relevant SSB, the following side conditions are met:

- the conditions of SSB_RP and SSB Ês/Iot according to Annex B.2.20 for a corresponding NR Band are fulfilled.

- $T_{RRC_procedure_delay}$: It is the RRC procedure delay for processing the received message "*RRCRelease*" as defined in clause 6.2.2 of TS 38.331 [2].

- $T_{identify\text{-}NR}$: It is the time to identify the target NR cell and depends on the FR of the target NR cell. It is defined in table 6.2C.3.2.1-1. Note that $T_{identify\text{-}NR} = T_{PSS/SSS\text{-}sync} + T_{meas}$, in which $T_{PSS/SSS\text{-}sync}$ is the cell search time and T_{meas} is the measurement time due to cell selection criteria evaluation.

- $T_{SI\text{-}NR}$: It is the time required for acquiring all the relevant system information of the target NR cell. This time depends upon whether the UE is provided with the relevant system information of the target NR cell or not by the old NR cell before the RRC connection is released. $T_{RACH:}$ It is the delay uncertainty in acquiring the first available PRACH occasion in the target NR cell. T_{RACH} can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [3].

- T_{rs} is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cell in the redirection command, otherwise T_{rs} is the SMTC periodicity configured in the *measObjectNR* having the same SSB frequency and subcarrier spacing configured for the RRC connection release with redirection. If the UE is not provided with SMTC configuration or measurement object for the frequency which is also configured for the RRC connection release with redirection then:

- the requirement in this clause is applied with T_{rs} = 20 ms if the SSB transmission periodicity is not larger than 20 ms; otherwise,

- there is no requirement if the SSB transmission periodicity is larger than 20 ms.

The requirements in this clause apply provided that the ephemeris information provided by the serving cell for the target cell is valid during time delay ($T_{connection_release_redirect_NR}$).

Table 6.2C.3.2.1-1: Time to identify target NR cell for RRC connection release with redirection to NR

FR of target NR cell	$T_{identify\text{-}NR}$
FR1-NTN	K_satellite * MAX (680 ms, 11 x T_{rs})
NOTE 1: If the UE has been provided with higher layer signalling of *smtc2* specified in TS 38.331 [2] prior to the redirection command, T_{rs} follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.	
NOTE 2: K_satellite is defined in clause 9.3C.4.	

6.2D RRC Connection Mobility Control for ATG

6.2D.1 SA: RRC Re-establishment

6.2D.1.1 Introduction

This clause contains requirements on the UE regarding RRC connection re-establishment procedure. RRC connection re-establishment is initiated when a UE in RRC_CONNECTED state on the carrier loses RRC connection due to any of failure cases, including radio link failure, handover failure, and RRC connection reconfiguration failure. The RRC connection re-establishment procedure is specified in clause 5.3.7 of TS 38.331 [2].

The requirements in this clause are applicable for RRC connection re-establishment to NR cell.

6.2D.1.2 Requirements

In RRC_CONNECTED state the UE shall be capable of sending *RRCReestablishmentRequest* message within $T_{re\text{-}establish_delay}$ seconds from the moment it detects a loss in RRC connection. The total RRC connection delay ($T_{re\text{-}establish_delay}$) shall be less than:

$$T_{re-establish_delay} = T_{UE_re-establish_delay} + T_{UL_grant}$$

T_{UL_grant}: It is the time required to acquire and process uplink grant from the target PCell. The uplink grant is required to transmit *RRCReestablishmentRequest* message.

The UE re-establishment delay ($T_{UE_re\text{-}establish_delay}$) is specified in clause 6.2D.1.2.1.

6.2D.1.2.1 UE Re-establishment delay requirement

The UE re-establishment delay ($T_{UE_re\text{-}establish_delay}$) is the time between the moments when any of the conditions requiring RRC re-establishment as defined in clause 5.3.7 in TS 38.331 [2] is detected by the UE and when the UE sends PRACH to the target PCell. The UE re-establishment delay ($T_{UE_re\text{-}establish_delay}$) requirement shall be less than:

$$T_{UE_re-establish_delay} = 50\ \text{ms} + T_{identify_intra_NR} + \sum_{i=1}^{N_{freq}-1} T_{identify_inter_NR,i} + T_{SI-NR} + T_{PRACH}$$

The intra-frequency target NR cell shall be considered detectable if each relevant SSB can satisfy that:

- SS-RSRP related side conditions given in clause 10.1.2 is fulfilled for a corresponding NR Band for FR1, and
- the conditions of SSB_RP and SSB Ês/Iot according to Annex B.2.X1 for a corresponding NR Band are fulfilled.

The inter-frequency target NR cell shall be considered detectable when for each relevant SSB:

- SS-RSRP related side conditions given in clause 10.1.4 are fulfilled for a corresponding NR Band for FR1, and
- the conditions of SSB_RP and SSB Ês/Iot according to Annex B.2.X2 for a corresponding NR Band are fulfilled.

$T_{identify_intra_NR}$: It is the time to identify the target intra-frequency NR cell and it depends on whether the target NR cell is known cell or unknown cell. If the UE is not configured with intra-frequency NR carrier for RRC re-establishment then $T_{identify_intra_NR}$=0; otherwise $T_{identify_intra_NR}$ shall not exceed the values defined in table 6.2D.1.2.1-1.

$T_{identify_inter_NR,i}$: It is the time to identify the target inter-frequency NR cell on inter-frequency carrier *i* configured for RRC re-establishment and it depends on whether the target NR cell is known cell or unknown cell. $T_{identify_inter_NR,i}$ shall not exceed the values defined in table 6.2D.1.2.1-2.

T_{SMTC}: It is the periodicity of the SMTC occasion configured for the intra-frequency carrier. If the UE has been provided with higher layer in TS 38.331 [2] signalling of *smtc2*, T_{smtc} follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.

$T_{SMTC,i}$: It is the periodicity of the SMTC occasion configured for the inter-frequency carrier *i*. If it is not configured, the UE may assume that the target SSB periodicity is no larger than 20 ms.

T_{SI-NR}: It is the time required for receiving all the relevant system information according to the reception procedure and the RRC procedure delay of system information blocks defined in TS 38.331 [2] for the target NR cell.

6.2D.2 Random access

6.2D.2.1 Introduction

This clause contains requirements on the UE regarding random access procedure. The random access procedure is initiated to establish uplink time synchronization for a UE which either has not acquired or has lost its uplink synchronization, or to convey UE's request Other SI, or for beam failure recovery. The random access is specified in clause 8 of TS 38.213 [3] and the control of the RACH transmission is specified in clause 5.1 of TS 38.321 [7]. Two types of procedure are defined for the random access, the 4-step RA type, and the 2-step RA type [7]. The decision on which type of procedure to adopt is as described in clause 5.1.1 of TS 38.321 [7]. The requirements for the 4-step RA type procedure are described in clause 6.2D.2.2, whereas the requirements for the 2-step RA type procedure are described in the clause 6.2D.2.3 of this specification.

6.2D.2.2 Requirements for 4-step RA type

The requirements in clause 6.2.2.2 and sub-clauses under 6.2.2.2 shall apply only for FR1 UE in NR SA operation mode.

6.2D.2.3 Requirements for 2-step RA type

The requirements in clause 6.2.2.3 and sub-clauses under 6.2.2.3 shall apply only for FR1 UE in NR SA operation mode.

6.2D.3 SA: RRC Connection Release with Redirection

6.2D.3.1 Introduction

This clause contains requirements on the UE regarding RRC connection release with redirection procedure. RRC connection release with redirection is initiated by the *RRCRelease* message with redirection to NR from NR specified in TS 38.331 [2]. The RRC connection release with redirection procedure is specified in clause 5.3.8 of TS 38.331 [2].

6.2D.3.2 Requirements

6.2D.3.2.1 RRC connection release with redirection to NR

The UE shall be capable of performing the RRC connection release with redirection to the target NR cell within $T_{connection_release_redirect_NR}$.

The time delay ($T_{connection_release_redirect_NR}$) is the time between the end of the last slot containing the RRC command, "*RRCRelease*" (TS 38.331 [2]) on the NR PDSCH and the time the UE starts to send random access to the target NR cell. The time delay ($T_{connection_release_redirect_NR}$) shall be less than:

$$T_{connection_release_redirect_NR} = T_{RRC_procedure_delay} + T_{identify\text{-}NR} + T_{SI\text{-}NR} + T_{RACH}$$

The target NR cell shall be considered detectable when for each relevant SSB, the following side conditions are met:

- the conditions of SSB_RP and SSB Ês/Iot according to Annex B.2.5 for a corresponding NR Band are fulfilled.

$T_{RRC_procedure_delay}$: It is the RRC procedure delay for processing the received message "*RRCRelease*" as defined in clause 6.2.2 of TS 38.331 [2].

$T_{identify\text{-}NR}$: It is the time to identify the target NR cell and depends on the FR of the target NR cell. It is defined in table 6.2D.3.2.1-1. Note that $T_{identify\text{-}NR} = T_{PSS/SSS\text{-}sync} + T_{meas}$, in which $T_{PSS/SSS\text{-}sync}$ is the cell search time and T_{meas} is the measurement time due to cell selection criteria evaluation. $T_{SI\text{-}NR}$: It is the time required for acquiring all the relevant system information of the target NR cell. This time depends upon whether the UE is provided with the relevant system information of the target NR cell or not by the old NR cell before the RRC connection is released.

T_{RACH}: It is the delay uncertainty in acquiring the first available PRACH occasion in the target NR cell. T_{RACH} can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in table 8.1-1 of TS 38.213 [3].

T_{rs} is the SMTC periodicity of the target NR cell if the UE has been provided with an SMTC configuration for the target cell in the redirection command, otherwise T_{rs} is the SMTC periodicity configured in the *measObjectNR* having the same SSB frequency and subcarrier spacing configured for the RRC connection release with redirection. If the *measObjectNR*s with the same SSB frequency and subcarrier spacing configured by MN and SN have different SMTC, T_{rs} is the periodicity of one of the SMTC which is up to UE implementation. If the UE is not provided with SMTC configuration or measurement object for the frequency which is also configured for the RRC connection release with redirection then:

- the requirement in this clause is applied with T_{rs} = 20 ms if the SSB transmission periodicity is not larger than 20 ms; otherwise,
- there is no requirement if the SSB transmission periodicity is larger than 20 ms.

Table 6.2D.3.2.1-1: Time to identify target NR cell for RRC connection release with redirection to NR

FR of target NR cell	$T_{identify\text{-}NR}$
FR1	MAX (680 ms, 11 x $N1^{Note2}$ x T_{rs})
NOTE 1: If the UE has been provided with higher layer signalling of *smtc2* specified in TS 38.331 [2] prior to the redirection command, T_{rs} follows *smtc1* or *smtc2* according to the physical cell ID of the target cell.	

NOTE 2: For ATG UEs capable of *antennaArrayType-r18*, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4.
Otherwise, N1 = 1.

6.2E RRC Connection Mobility Control for RedCap UE with Satellite Access

6.2E.1 SA: RRC Re-establishment for RedCap UE with Satellite Access

6.2E.1.1 Introduction

This clause contains requirements on the RedCap UE regarding RRC connection re-establishment procedure. RRC connection re-establishment is initiated when a UE in RRC_CONNECTED state on the carrier loses RRC connection due to any of failure cases, including radio link failure, handover failure, and RRC connection reconfiguration failure. The RRC connection re-establishment procedure is specified in clause 5.3.7 of TS 38.331 [2].

A neighbour cell for RRC re-establishment procedures for a RedCap UE is defined as an intra-frequency cell if the centre frequency and subcarrier spacing (SCS) of the reference SSB of the serving cell is same as the centre frequency and SCS of the reference SSB of the neighbour cell; else it is considered as inter-frequency cell, where:

- The reference SSB of the target cell is the CD-SSB of the target cell.

The requirements in this clause are applicable for RRC connection re-establishment to NR cell, which is served by satellite access node (SAN).

6.2E.1.2 Requirements

The requirements in clause 6.2C.1.2 shall apply when RedCap UE is capable of 2 Rx. When UE is only required to support 1 Rx antenna, the requirements defined in clause 6.2C.1.2 shall apply except that:

6.3.1.2 LTM Cell Switch delay

LTM cell switch delay D_{LTM} is the delay from the end of the last TTI containing the MAC-CE command for cell switch until the time the UE transmits the first UL message on the target cell.

LTM cell switch delay is defined as:

$$D_{LTM} = T_{cmd} + T_{LTM\text{-}interrupt}$$

Where:

T_{cmd} equals to T_{HARQ} + 3ms, where T_{HARQ} is the timing between cell switch command and acknowledgement as specified in TS 38.213 [3].

$T_{LTM\text{-}interrupt}$ is as stated in clause 6.3.1.3.

6.3.1.3 Interruption time

The interruption time $T_{LTM\text{-}interrupt}$ is the time from the end of T_{cmd} stated in clause 6.3.1.2 until the time the UE transmits the first UL message on the target cell.

$$T_{LTM\text{-}interrupt} = T_{LTM\text{-}RRC\text{-}processing} + T_{LTM\text{-}processing} + T_{first\text{-}RS} + T_{RS\text{-}proc} + T_{LTM\text{-}IU} \text{ ms},$$

Where:

$T_{LTM-RRC-processing}$ is the time for ASN.1 decoding and validity/compliance check for the RRC configuration of the LTM target cell indicated in the LTM cell switch command.

$T_{LTM-RRC-processing}$ = 0, if the UE supports *ltm-FastProcessingConfig-r18* capability, and:

- The number of LTM candidate cell configurations does not exceed *maxNumberConfigs-r18* and the number of the configured serving cells and the cells in the LTM configuration does not exceed *maxNumberStoredConfigCells-r18*, or

  - The total number of LTM candidate cells for which TCI state(s) were activated or PDCCH order was received before the cell switch command does not exceed *maxNumberConfigs-r18*, and the total number of serving cells and the cells in the LTM configuration for which TCI state(s) were activated and/or PDCCH order was received before the cell switch does not exceed *maxNumberStoredConfigCells-r18.*

Otherwise $T_{LTM-RRC-processing}$ = 10 ms.

$T_{LTM-processing}$ is the time for UE processing, consisting of applying the target cell parameters and L1/L2 change.

If the UE supports *ltm-FastUE-Processing-r18* capability, the value of $T_{LTM-processing}$ equals to

$T_{first-RS}$ is the time for fine time tracking and acquiring full timing information of the target cell.

$T_{RS-proc}$ is the time for SSB processing.

$T_{first-RS}$ = 0 and $T_{RS-proc}$= 0 under the following conditions:

- The time between the latest PDCCH ordered RACH preamble transmission on the target cell and the cell switch command is not more than 160 ms.

Otherwise,

$T_{first-RS}$ is the time to the first SSB transmission on the target cell after $T_{cmd} + T_{LTM-RRC-processing} + T_{LTM-processing}$.

$T_{RS-proc}$ = 2 ms.

T_{LTM-IU} is the interruption uncertainty during LTM cell switch.

For RACH-based LTM cell switch, T_{LTM-IU} is the interruption uncertainty in acquiring the first available PRACH occasion in the new cell. T_{LTM-IU} can be up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in the table 8.1-1 of TS 38.213 [3].

For RACH-less LTM cell switch, $T_{LTM-IU_}$is the uncertainty on transmitting the first uplink transmission on the target cell.

When the UE receives CLTM candidate cell configuration implying CLTM the UE shall start to transmit the new uplink transmission to the target cell fulfilling the configured CLTM condition within D_{CLTM} seconds from the end of the last TTI containing the CLTM candidate cell configuration.

$$D_{CLTM} = T_{RRC} + T_{Event_DU} + T_{measure} + T_{CLTM\text{-}RRC\text{-}processing} + T_{CLTM\text{-}interrupt}$$

Where:

- T_{RRC} is the RRC procedure delay defined in clause 12 in TS 38.331 [2].

$$D_{Subsequent-CLTM} = T_{Event_DU} + T_{measure} + T_{CLTM-RRC-processing} + T_{CLTM-interrupt}$$

Where:

- $T_{measure}$, $T_{CLTM-RRC-processing}$ and $T_{CLTM-interrupt}$ are defined in clause 6.3.2.2.

- T_{Event_DU} is the delay uncertainty which is the time from when the UE successfully sends a *RRCReconfigurationComplete* message indicating completion of the previous CLTM cell switch until a condition exists at the measurement reference point which will trigger the subsequent conditional LTM cell switch.

7 Timing

7.1 UE transmit timing

7.1.1 Introduction

The UE shall have capability to follow the frame timing change of the reference cell in RRC_CONNECTED state or when transmitting PUSCH on CG resources for SDT in RRC_INACTIVE. The uplink frame transmission takes place $(N_{\mathrm{TA}} + N_{\mathrm{TA\,offset}}) \times T_c$ before the reception of the first detected path (in time) of the corresponding downlink frame from the reference cell. For serving cell(s) in pTAG, UE shall use the SpCell as the reference cell for deriving the UE transmit timing for cells in the pTAG. For serving cell(s) in sTAG, UE shall use any of the activated SCells as the reference cell for deriving the UE transmit timing for the cells in the sTAG. For UL-WUS transmission for OD-SIB1, UE shall use the target NES cell as the reference cell for deriving the UE transmit timing. UE initial transmit timing accuracy and gradual timing adjustment requirements are defined in the following requirements.

In the requirements of clause 7.1.2, the term reference cell on a carrier frequency subject to CCA is not available at the UE refers to when at least one SSB is configured by gNB, but the first two successive candidate SSB positions for the same SSB index within the discovery burst transmission window are not available during at least one discovery burst transmission window, at the UE due to DL CCA failures at gNB during the last 1280 ms; otherwise the reference cell on the carrier frequency subject to CCA is considered as available at the UE.

For UE supporting *rach-EarlyTA-Measurement-r18* for LTM, and if the candidate cell is a neighbour cell or a secondary serving cell without uplink carrier,

- UE shall have capability to follow the frame timing of the reference cell. The PRACH transmission for early TA acquisition takes place $(N_{\mathrm{TA}} + N_{\mathrm{TA\,offset}}) \times T_c$ before the reception of the first detected path (in time) of the corresponding downlink frame from the reference cell. UE shall use this candidate cell as the reference cell for deriving transmit timing. UE initial transmit timing accuracy is defined in the following requirements.

For multi-DCI based multi-TRP operation with two TAs and for asymmetric DL sTRP/UL mTRP deployment with two TAs, for each TAG, the uplink transmission timing takes place $(N_{\mathrm{TA}} + N_{\mathrm{TA\,offset}}) \times T_c$ before the reception of the downlink reference point.

For multi-DCI based multi-TRP operation with two TAs, the reference point for PUCCH/PUSCH/SRS, is the first detected path (in time) of one of the corresponding downlink reference signal(s) of the reference cell associated with one of the *DLorJointTCIState* TS 38.331 [2] having the same TAG as the uplink signal.

For asymmetric DL sTRP/UL mTRP deployment with two TAs, for the scenario that UE is configured with PL offset in joint/UL TCI state(s) and UE does not expect to receive SSB from UL TRP(s), the reference point for PRACH/PUCCH/PUSCH/SRS is the first detected path in time of one of the corresponding downlink reference signal(s) of the reference cell associated with one of the DL or Joint TCI state.

For asymmetric DL sTRP/UL mTRP deployment with two TAs, for the scenario that UE is not configured with PL offset in joint/UL TCI state(s) and UE may expect to receive SSB from UL TRP(s), for the case UE is configured with *SSB-MTC-additionalPCI*, the reference point for PUCCH/PUSCH/SRS, is the first detected path (in time) of one of the corresponding downlink reference signal(s) of the reference cell associated with one of the *DLorJointTCIState* or -UL TCI states TS 38.331 [2] having the same TAG as the uplink signal, and is the same for both TAGs.

For multi-DCI based multi-TRP operation with two TAs if the UE is not provided *SSB-MTC-AdditionalPCI*, the reference point for PRACH transmission triggered by PDCCH order, is the first detected path (in time) of one of the downlink reference signal(s) in the DL or joint TCI state of the reference cell associated with the same coresetPoolIndex as PDCCH carrying PDCCH order if PRACH association indicator is 0, and that of the other coresetPoolIndex if PRACH association indicator is 1.

For multi-DCI based multi-TRP operation with two TAs if the UE is provided *SSB-MTC-AdditionalPCI*, the reference point for PRACH transmission triggered by PDCCH order,

- if “PRACH association indicator” is 0, the reference timing is the first detected path (in time) of one of the corresponding downlink reference signal(s) of DL TCI state(s) of the reference cell associated with the first TAG.
- if “PRACH association indicator” is 1, the reference timing is the first detected path (in time) of one of the corresponding downlink reference signal(s) of DL TCI state(s) of the reference cell associated with the second TAG.

For asymmetric DL sTRP/UL mTRP deployment with two TAs, for the scenario that UE is not configured with PL offset in joint/UL TCI state(s) and UE may expect to receive SSB from UL TRP(s), for the case UE is configured with *SSB-MTC-additionalPCI*, the reference point for PRACH transmission triggered by PDCCH order,

- if “PRACH association indicator” in DCI format 1_0 is 0, the reference timing is the first detected path (in time) of one of the corresponding downlink reference signal(s) of DL TCI state(s) of the reference cell associated with the first TAG.
- if “PRACH association indicator” in DCI format 1_0 is 1, the reference timing is the first detected path (in time) of one of the corresponding downlink reference signal(s) of DL or UL TCI state(s) of the reference cell associated with the second TAG.

Where N_{TA} and $N_{TA\,offset}$ are commanded by the network independently for each TAG TS 38.331 [2]. $N_{TA\,offset}$ for first TAG and second TAG are as defined in n-TimingAdvanceOffset and n-TimingAdvanceOffset2 respectively, if configured, otherwise it is $N_{TA\,offset}$ defined in table 7.1.2-2.

In the requirements of clause 7.1.2, the SSB applies for both CD-SSB and NCD-SSB if the UE supports *ncd-SSB-BWP-Wor-r18*.

7.1.2 Requirements

The UE initial transmission timing error shall be less than or equal to $\pm T_e$ where the timing error limit value T_e is specified in table 7.1.2-1. This requirement applies:

- when it is the first transmission in a DRX cycle for PUCCH, PUSCH and SRS, or it is the PRACH transmission, or it is the msgA transmission, or it is the first transmission sent on the PSCell for activating the deactivated SCG without RACH, or it is the UL-WUS transmission for OD-SIB1.
- when it is the transmission for PUSCH on CG resources for SDT in RRC_INACTIVE.
- when it is the first transmission on target cell after UE receives LTM cell switch command.
- when it is the first transmission among SCell(s) in an sTAG after a dormant BWP switching delay as defined in 8.6.2 or 8.6.2A, if the dormant BWP switch includes BWP switch of an SCell configured with UL in the sTAG.

When the UL SCS is 120 kHz or smaller, the UE shall meet the Te requirement for an initial transmission provided that at least one SSB is available at the UE during the last 160 ms. When the UL SCS is 480 kHz the UE shall meet the Te requirement for an initial transmission provided that at least one SSB is available in the last 80 ms. When the UL SCS is 960 kHz the UE shall meet the Te requirement for an initial transmission provided that at least one SSB is available in the last 40 ms.

The reference point for the UE initial transmit timing control requirement shall be the downlink timing of the reference cell minus $(N_{\mathrm{TA}} + N_{\mathrm{TA\,offset}}) \times T_c$. The downlink timing is defined as the time when the first path (in time) of the corresponding downlink frame used by the UE to determine downlink timing is received from the reference cell at the UE antenna. N_{TA} for PRACH and UL WUS for OD-SIB1 is defined as 0.

$(N_{\mathrm{TA}} + N_{\mathrm{TA\,offset}}) \times T_c$ (in T_c units) for other channels is the difference between UE transmission timing and the downlink timing immediately after when the last timing advance in clause 7.3 was applied. N_{TA} for other channels is not changed until next timing advance is received. The value of $N_{\mathrm{TA\,offset}}$ depends on the duplex mode of the cell in which the uplink transmission takes place and the frequency range (FR). $N_{\mathrm{TA\,offset}}$ is defined in table 7.1.2-2.

For multi-DCI based multi-TRP operation with two TAs and for asymmetric DL sTRP/UL mTRP deployment with two TAs for first transmission in a DRX cycle for PUCCH, PUSCH, SRS and PRACH transmission triggered by PDCCH order, UE initial transmission timing error requirements specified in this clause is applicable for each TAG and shall be met for each TAG separately. The reference point for each TAG for the PUCCH/PUSCH/SRS and PRACH transmission triggered by PDCCH order is defined in clause 7.1.1.

Note 1:	The UE identifies $N_{\text{TA offset}}$ based on the information n-TimingAdvanceOffset as specified in TS 38.331 [2]. For UL WUS transmission for OD-SIB1, UE identifies $N_{\text{TA offset}}$ based on the information *n-TimingAdvanceOffset* from UL-WUS configuration as specified in TS 38.331 [2]. If UE is not provided with the information n-TimingAdvanceOffset, the default value of $N_{\text{TA offset}}$ is set as 25600 for FR1 band. In case of multiple UL carriers in the same TAG, UE expects that the same value of n-TimingAdvanceOffset is provided for all the UL carriers according to clause 4.2 in TS 38.213 [3] and the value 39936 of $N_{\text{TA offset}}$ can also be provided for an FDD serving cell.
Note 2:	Void

When it is not the first transmission in a DRX cycle or there is no DRX cycle, and when it is the transmission for PUCCH, PUSCH and SRS transmission, the UE shall be capable of changing the transmission timing according to the received downlink frame of the reference cell except when the timing advance in clause 7.3 is applied.

Table 7.1.2-3: void

If the UE uses a reference cell on a carrier frequency subject to CCA for deriving the UE transmit timing, then the UE shall meet all the transmit timing requirements defined in clause 7.1.2 provided that the reference cell is available at the UE. If the reference cell is not available at the UE on a carrier frequency subject to CCA, then the UE is allowed to transmit in the uplink provided that the UE meets all the transmit timing requirements defined in clause 7.1.2; otherwise the UE shall not transmit any uplink signal.

If a reference cell on a carrier frequency belonging to the pTAG, which is subject to CCA, is not available at the UE then the UE is allowed to use any of available activated SCell(s) at the UE in pTAG as a new reference cell. If the SCell used as reference cell is deactivated, or becomes not available, the UE is allowed to use another active serving cell in pTAG as new reference cell.

If a reference cell on a carrier frequency belonging to the sTAG, which is subject to CCA is not available at the UE then the UE is allowed to use any of available activated SCell(s) at the UE in sTAG as a new reference cell.

7.1.2.1 Gradual timing adjustment

Requirements in this section shall apply regardless of whether the reference cell is on a carrier frequency subject to CCA or not.

When the transmission timing error between the UE and the reference timing exceeds $\pm T_e$ then the UE shall adjust the timing such that timing error is to within $\pm T_e$. The reference timing shall be $(N_{\text{TA}} + N_{\text{TA offset}}) \times T_c$ before the downlink timing of the reference cell. All adjustments made to the UE uplink timing shall follow these rules:

1) The maximum amount of the magnitude of the timing change in one adjustment shall be T_q.

2) The minimum aggregate adjustment rate shall be T_p per second.

3) The maximum aggregate adjustment rate shall be T_q per 200 ms for SCS of UL signals smaller or equal to 120 kHz and 100 ms for SCS of uplink signals larger or equal to 480 kHz.

   where the maximum autonomous time adjustment step T_q and the aggregate adjustment rate T_p are specified in table 7.1.2.1-1.

For multi-DCI based multi-TRP operation with two TAs and asymmetric DL sTRP/UL mTRP deployment with two TAs, gradual timing adjustment specified in this clause applies for each TAG and shall be met for each TAG. The reference point for each TAG for the PUCCH/PUSCH/SRS and PRACH transmission triggered by PDCCH order is defined in clause 7.1.1.

Table 7.1.2.2-1: Void

7.1.2.3 One shot large UL timing adjustment for FR2 Power Class 6 UE

When *highSpeedMeasFlagFR2-r17* is configured and *highSpeedLargeOneStepUL-TimingFR2-r17* is enabled for UE supporting FR2 power class 6 and *ue-OneShotUL-TimingAdj-r17* capability, the following requirements apply to the UE:

If the UE also indicates to support *tci-StateSwitchInd-r18* and *cross-RRH TCI state indicator for UE-specific PDCCH MAC-CE* as specified in Clause 6.1.3.77 of TS 38.321 [7] is indicated as '1' for the TCI state switch

- the UE transmit timing immediately after TCI state switch shall be $T_{new} - (N_{TA} + N_{TA\,offset}) + 2\times(T_{old} - T_{new})$ and clause 7.1.2.1 requirements do not apply.
  - The UE UL transmission timing error after the TCI state switching procedure shall be less than or equal to $\pm T_e$ as specified in clause 7.1.2 if the new target TCI state is within active TCI state list, otherwise ±7*64*T_c, and the reference point is $T_{new} - (N_{TA} + N_{TA\,offset}) + 2\times(T_{old} - T_{new})$.

If the UE also indicates to support *tci-StateSwitchInd-r18* and *cross-RRH TCI state indicator for UE-specific PDCCH MAC-CE* as specified in Clause 6.1.3.77 of TS 38.321 [7] is indicated as '0' for the TCI state switch

- the requirement in clause 7.1.2.1 apply to the first UL transmission after a TCI state switch.

If the UE does not indicate to support *tci-StateSwitchInd-r18* or *cross-RRH TCI state indicator for UE-specific PDCCH MAC-CE* as specified in Clause 6.1.3.77 of TS 38.321 [7] is not indicated for the TCI state switch

- If the absolute value $|T_{old} - T_{new}| \leq CP/4$, the requirements in clause 7.1.2.1 apply to the first UL transmission after a TCI state switch.
- Otherwise, the UE transmit timing immediately after TCI state switch shall be $T_{new} - (N_{TA} + N_{TA\,offset}) + 2\times(T_{old} - T_{new})$ and clause 7.1.2.1 requirements do not apply.
  - The UE UL transmission timing error after the TCI state switching procedure shall be less than or equal to $\pm T_e$ as specified in clause 7.1.2 if the new target TCI state is within active TCI state list, otherwise ±7*64*T_c, and the reference point is $T_{new} - (N_{TA} + N_{TA\,offset}) + 2\times(T_{old} - T_{new})$.

Above,

- T_{new} (in T_c units) is the DL timing defined as the time when UE receives downlink frame with new target TCI state.
- T_{old} (in T_c units) is the DL timing defined as the time when UE receives downlink frame with old source TCI state.

7.1.2.4 UE transmit timing for positioning measurements

If cell reselection occurs in RRC_INACTIVE within *srs-PosRRC-InactiveValidityArea area*, the UE shall have capability to follow the frame timing change of the reference cell when transmitting SRS for positioning. The uplink frame transmission takes place $(N_{TA} + N_{TA\,offset}) \times T_c$ before the reception of the first detected path (in time) of the corresponding downlink frame from the reference cell. The UE shall use the current camping cell as reference cell for deriving the UE transmit timing.

When *autonomousTA-AdjustmentEnabled-r18* is configured, the following requirements apply to the UE supporting *posUE-TA-AutoAdjustment-r18* upon cell reselection to a new camping cell within the SRS validity area (*srs-PosRRC-InactiveValidityArea*):

If the absolute value of the DL timing difference between the new camping cell and the previous camping cell immediately after cell reselection is ≥ CP/4, UE shall autonomously adjust the TA as

$$TA_{adjusted} = TA_{old} + 2 * (T_{new} - T_{old})$$

where $TA_{adjusted}$ and TA_{old} are the TA after adjustment in the new camping cell and TA applied in previous camping cell, respectively, T_{new} is the DL timing of the new camping cell immediatedly after cell reselection and T_{old} is the DL timing of the previous camping cell immediately before cell reselection.

- The UE UL transmission timing error after autonomous TA adjustment shall be less than or equal to $\pm T_e$ in clause 7.1.2.
- If the TA value would be negative after applying the autonomous TA adjustment, the TA is set to zero. i.e. the TA applied in the new camping cell shall be set to $\max(TA_{adjusted}, 0)$.

If the DL timing difference is < CP/4, UE follows the DL timing of the new camping cell by performing gradual timing adjustment as defined in clause 7.1.2.1.

7.1A UE transmit timing for RedCap

7.1A.1 Introduction

The UE shall have capability to follow the frame timing change of the reference cell in RRC_CONNECTED state or when transmitting PUSCH on CG resources for SDT in RRC_INACTIVE. The uplink frame transmission takes place $(N_{\text{TA}} + N_{\text{TA offset}}) \times T_c$ before the reception of the first detected path (in time) of the corresponding downlink frame from the reference cell. UE initial transmit timing accuracy and gradual timing adjustment requirements are defined in the following requirements.

7.1A.2 Requirements

The UE initial transmission timing error shall be less than or equal to $\pm T_e$ where the timing error limit value T_e is specified in table 7.1A.2-1. This requirement applies:

- when it is the first transmission in a DRX cycle for PUCCH, PUSCH and SRS, or it is the PRACH transmission, or it is the msgA transmission.
- when it is the transmission for PUSCH on CG resources for SDT in RRC_INACTIVE.

The UE shall meet the Te requirement for an initial transmission provided that at least one SSB (CD-SSB or NCD-SSB) is available at the UE for acquiring the frame timing of the reference cell during the last 160 ms on the condition that:

- the SSB is within the UE's active BWP, or
- the SSB is not within the UE's active BWP, and the measurement gap is configured.

The reference point for the UE initial transmit timing control requirement shall be the downlink timing of the reference cell minus $(N_{\text{TA}} + N_{\text{TA offset}}) \times T_c$. The downlink timing is defined as the time when the first path (in time) of the corresponding downlink frame used by the UE to determine downlink timing is received from the reference cell at UE antenna. N_{TA} for PRACH is defined as 0.

$(N_{\text{TA}} + N_{\text{TA offset}}) \times T_c$ (in T_c units) for other channels is the difference between UE transmission timing and the downlink timing immediately after when the last timing advance in clause 7.3A was applied. N_{TA} for other channels is not changed until next timing advance is received. 7.1A.2.2 UE transmit timing for positioning measurements

The requirements defined in clasue 7.1.2.4 shall apply for this clause.

7.1C UE transmit timing for Satellite Access

7.1C.1 Introduction

The UE shall have capability to follow the frame timing change of the reference cell in RRC_CONNECTED state. The uplink frame transmission takes place $\left(N_{\mathrm{TA}} + N_{\mathrm{TA\,offset}} + N_{\mathrm{TA,adj}}^{\mathrm{common}} + N_{\mathrm{TA,adj}}^{\mathrm{UE}}\right) \times T_{\mathrm{c}}$ before the reception of the first detected path (in time) of the corresponding downlink frame from the reference cell. UE initial transmit timing accuracy and gradual timing adjustment requirements are defined in the following requirements.

7.1C.2 Requirements

The UE initial transmission timing error shall be less than or equal to $\pm T_{e_NTN}$ where the timing error limit value T_{e_NTN}:

- is specified in table 7.1C.2-1 for FR1-NTN.
- is specified in table 7.1C.2-2 and table 7.1C.2-3 for VSAT UE in FR2-NTN.

This requirement applies:

- when it is the first transmission in a DRX cycle for PUCCH, PUSCH and SRS, or it is the PRACH transmission, or it is the msgA transmission.

The UE shall meet the T_{e_NTN} requirement for an initial transmission provided that at least one SSB is available at the UE during the last 160 ms. The reference point for the UE initial transmit timing control requirement shall be the downlink timing of the reference cell minus $\left(N_{\mathrm{TA}} + N_{\mathrm{TA\text{-}offset}} + N_{\mathrm{TA,adj}}^{\mathrm{common}} + N_{\mathrm{TA,adj}}^{\mathrm{UE}}\right) \times T_{\mathrm{c}}$.

The downlink timing is defined as the time when the first path (in time) of the corresponding downlink frame used by the UE to determine downlink timing is received from the reference cell at the UE antenna.

N_{TA} for PRACH is defined as 0. $\left(N_{\mathrm{TA}} + N_{\mathrm{TA\,offset}} + N_{\mathrm{TA,adj}}^{\mathrm{common}} + N_{\mathrm{TA,adj}}^{\mathrm{UE}}\right) \times T_{\mathrm{c}}$ (in T_{c} units) for other channels is the difference between UE transmission timing and the downlink timing immediately after when the last timing advance in clause 7.3C was applied. or after the last update in $N_{\mathrm{TA,adj}}^{\mathrm{common}}$ or $N_{\mathrm{TA,adj}}^{\mathrm{UE}}$.

The value of $N_{\mathrm{TA\,offset}}$ depends on the duplex mode of the cell in which the uplink transmission takes place and the frequency range (FR). $N_{\mathrm{TA\,offset}}$is defined in table 7.1.2-2 for FR1-NTN.

$N_{\mathrm{TA\,offset}}$ is defined in table 7.1C.2-4 for VSAT UE in FR2-NTN.

$N_{\mathrm{TA,adj}}^{\mathrm{common}}$ and $N_{\mathrm{TA,adj}}^{\mathrm{UE}}$ are defined in TS 38.211 [6].

NOTE 1: T_c is the basic timing unit defined in TS 38.211 [6]
NOTE 2: T_{e_NTN} for 120 kHz UL SCS applies under all the following conditions:
- LOS channel between UE and each GNSS satellite
- The GNSS signal power level greater than or equal to the applicable value specified in Table 6.2-1 of TS 38.171
- The GNSS satellite allocation is no less than the applicable value speicifed in Table 6.2-2 of TS 38.171
- The velocity change within one second does not result in the position difference with respect to the projected position, based on the position and velocity obtained one second before, exceeding 10 meters.

NOTE 3: The requirement with 120 kHz SCS for mobile VSAT served by NGSO applies only to UEs that indicate '*mobile'* via UE capability *ntn-VSAT-AntennaType-r19*. The requirement applies when the interval between adjacent epoch times does not exceed 5.12 sec.

Fixed VSAT and mobile VSAT are defined in TS 38.101-5 [43].

Note 1: The UE identifies $N_{\text{TA offset}}$ based on the information n-TimingAdvanceOffset as specified in TS 38.331 [2]. If UE is not provided with the information n-TimingAdvanceOffset, the default value of $N_{\text{TA offset}}$ is set as 0 for FR2-NTN band.

When it is not the first transmission in a DRX cycle or there is no DRX cycle, and when it is the transmission for PUCCH, PUSCH including PUSCH transmissions in Time Domain Window when *pusch-DMRS-Bundling* is enabled, and SRS transmission, the UE shall be capable of changing the transmission timing according to the received downlink frame of the reference cell, the updating of $N_{\text{TA,adj}}^{\text{common}}$ and the updating of $N_{\text{TA,adj}}^{\text{UE}}$, except when the timing advance in clause 7.3C is applied.

7.1C.2.1 Gradual timing adjustment

When the transmission timing error between the UE and the reference timing exceeds $\pm T_{e_NTN}$ then the UE shall adjust the timing such that timing error is to within $\pm T_{e_NTN}$. The reference timing shall be $\left(N_{\text{TA}} + N_{\text{TA offset}} + N_{\text{TA,adj}}^{\text{common}} + N_{\text{TA,adj}}^{\text{UE}}\right) \times T_c$ before the downlink timing of the reference cell. All adjustments made to the UE uplink timing shall follow these rules:

1) The maximum amount of the magnitude of the timing change, apart from a change of $N_{\text{TA,adj}}^{\text{UE}}$ due to satellite position update and $N_{\text{TA,adj}}^{\text{common}}$ between the previous transmission and the current transmission, in one adjustment shall be T_{q_NTN}.

2) The minimum aggregate adjustment rate, apart from a change of $N_{\text{TA,adj}}^{\text{UE}}$ due to satellite position update and $N_{\text{TA,adj}}^{\text{common}}$ during the last one second, shall be T_{p_NTN} per second.

3a) For a FR1-NTN UE or a FR2-NTN fixed UE, the maximum aggregate adjustment rate, apart from a change of $N_{\text{TA,adj}}^{\text{UE}}$ due to satelliteposition update and $N_{\text{TA,adj}}^{\text{common}}$ during the last 200 ms, shall be T_{q_NTN} per 200 ms.

- min (2 SSB symbols, 1 PDSCH symbol) for sub-carrier spacings of SSB and PDSCH up to 240 kHz,

8 Signalling characteristics

8.1 Radio Link Monitoring

8.1.1 Introduction

The requirements in clause 8.1 apply for radio link monitoring on:

- PCell in SA NR, NR-DC and NE-DC operation mode,
- PCell operating with less than 5 MHz BW in SA NR (single carrier) operation mode,
- PSCell in NR-DC and EN-DC operation mode,
- Deactivated PSCell in NR-DC and EN-DC operation mode, when configured.

The UE shall monitor the downlink radio link quality based on the reference signal configured as RLM-RS resource(s) in order to detect the downlink radio link quality of the PCell, PSCell and deactivated PSCell if configured with *bfd-and-RLM* with value *true* as specified in TS 38.331 [2]. The configured RLM-RS resources can be all SSBs, or all CSI-RSs, or a mix of SSBs and CSI-RSs. The configured RLM-RSs can be from the same or different TRPs. UE is not required to perform RLM outside the active DL BWP unless the UE supports *bwpOperationMeasWithoutInterrupt-r18*, provided that the SSB is within the configured UE-specific CBW. For UE supporting *ncd-SSB-BWP-Wor-r18*, the SSB and SMTC in this clause applies for both CD-SSB and NCD-SSB if it is not additional specified. If SSB in the active DL BWP of serving cell *i* is NCD-SSB, for serving cell *i* the requirements in clause 8.1 apply provided that serving cell *i* is PCell or activated PSCell.

On each RLM-RS resource, the UE shall estimate the downlink radio link quality and compare it to the thresholds Q_{out} and Q_{in} for the purpose of monitoring downlink radio link quality of the cell.

When a CORESET that the UE uses for monitoring PDCCH includes two TCI states and the UE is provided *sfnSchemePdcch* set to 'sfnSchemeA' or 'sfnSchemeB', the UE shall estimate a single downlink radio link quality to derive single SNR and compare it to the single thresholds Q_{out} and Q_{in} for the purpose of monitoring downlink radio link quality of the cell(s). How to compute the single SNR based on two active TCI states is up to UE implementation.

The threshold Q_{out} is defined as the level at which the downlink radio link cannot be reliably received and shall correspond to the out-of-sync block error rate ($BLER_{out}$) as defined in table 8.1.1-1. For SSB based radio link monitoring, Q_{out_SSB} is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1.2.1-1. For CSI-RS based radio link monitoring, $Q_{out_CSI\text{-}RS}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1.3.1-1.

The threshold Q_{in} is defined as the level at which the downlink radio link quality can be received with significantly higher reliability than at Q_{out} and shall correspond to the in-sync block error rate ($BLER_{in}$) as defined in table 8.1.1-1. For SSB based radio link monitoring, Q_{in_SSB} is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1.2.1-2. For CSI-RS based radio link monitoring, $Q_{in_CSI\text{-}RS}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1.3.1-2.

The out-of-sync block error rate ($BLER_{out}$) and in-sync block error rate ($BLER_{in}$) are determined from the network configuration via parameter *rlmInSyncOutOfSyncThreshold* signalled by higher layers. When UE is not configured with *rlmInSyncOutOfSyncThreshold* from the network, UE determines out-of-sync and in-sync block error rates from Configuration #0 in table 8.1.1-1 by default. All requirements in clause 8.1 are applicable for BLER Configuration #0 in table 8.1.1-1.

Table 8.1.1-1: Out-of-sync and in-sync block error rates

Configuration	$BLER_{out}$	$BLER_{in}$
0	10 %	2 %

UE shall be able to monitor up to N_{RLM} RLM-RS resources of the same or different types in each corresponding carrier frequency range, depending on a maximum number L_{max} of SSBs per half frame according to TS 38.213 [3], where N_{RLM} is specified in table 8.1.1-2 according TS 38.213 [3], and meet the requirements as specified in clause 8.1. UE is not required to meet the requirements in clause 8.1 if RLM-RS is not configured and no TCI state for PDCCH is activated.

Table 8.1.1-2: Maximum number of RLM-RS resources N_{RLM}

Carrier frequency range of PCell/PSCell	L_{max}	Maximum number of RLM-RS resources, N_{RLM}
FR1, ≤ 3 GHz[Note]	4	2
FR1, > 3 GHz[Note]	8	4
FR2	64	8
NOTE: For unpaired spectrum operation with Case C - 30 kHz SCS, 3 GHz is replaced by 1.88 GHz, as specified in clause 4.1 in TS 38.213 [3].		

8.1.1.1 Introduction of Requirement on Radio Link Monitoring for UE Configured with Relaxed Measurement Criteria

For the UE supports *rlm-Relaxation-r17*and configured with explicit signalling *goodServingCellEvaluationRLM*, which is always configured to the UE when the network enables RLM relaxation for the UE as specified in TS 38.331 [2], the relaxed requirements defined in clause 8.1.2.4 for SSB based radio link monitoring and the relaxed requirements defined in clause 8.1.3.4 for CSI-RS based radio link monitoring are allowed to apply to the relaxed RLM measurements on SpCell after fulfilling the following conditions:

- for the serving cells in intra-band carrier aggregation configured with SSB-based or CSI-RS based RLM on SpCell together with CSI-RS based BFD on SCell, when
  - the good serving cell quality criterion defined in clause 5.7.13.2 of TS 38.331 [2] is fulfilled for the serving cell based on the measurements that are configured for SSB-based or CSI-RS based RLM on SpCell together with CSI-RS based BFD on SCell in the intra-band carrier aggregation if the *lowMobilityEvaluationConnected* is not configured, or
  - the UE is also configured with *lowMobilityEvaluationConnected* and both low mobility criterion defined in clause 5.7.13.1 of TS 38.331 [2] is fulfilled for a period of $T_{SearchDeltaP-Connected}$ and good serving cell quality criterion defined in clause 5.7.13.2 of TS 38.331 [2] is fulfilled for the serving cell based on the measurements that are configured for SSB-based or CSI-RS based RLM on SpCell together with CSI-RS based BFD on SCell in the intra-band carrier aggregation.
- for other serving cells, when
  - the good serving cell quality criterion defined in clause 5.7.13.2 of TS 38.331 [2] is fulfilled for the SpCell if the *lowMobilityEvaluationConnected* is not configured, or
  - the UE is also configured with *lowMobilityEvaluationConnected* and both low mobility criterion defined in clause 5.7.13.1 of TS 38.331 [2] is fulfilled for a period of $T_{SearchDeltaP-Connected}$ and good serving cell quality criterion defined in clause 5.7.13.2 of TS 38.331 [2] is fulfilled for the SpCell.

Otherwise, UE shall apply the requirements defined in clause 8.1.2.2 for SSB based radio link monitoring and the requirements defined in clause 8.1.3.2 for CSI-RS based radio link monitoring. Note that when multiple resources are configured on a serving cell for RLM or BFD evaluation, the good serving cell quality critierion is considered as fulfilled for the serving cell when any resource configured for the cell fulfills the good serving defined in clause 5.7.13.2 of TS 38.331 [2].

The UE is no longer allowed to relax RLM measurements and apply the relaxed radio link monitoring provided that at least one of the following conditions is met:

- The UE sends out-of sync indications to the higher layers,
- The timer T310 is running.
- No DRX is configured or configured DRX cycle is longer than 80 ms

NOTE: Applicability of DRX configuration follows TS 38.331 [2] clause 5.7.13.0.

8.1.2 Requirements for SSB based radio link monitoring

8.1.2.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_SSB}$ period becomes worse than the threshold Q_{out_SSB} within $T_{Evaluate_out_SSB}$ evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_SSB}$ period becomes better than the threshold Q_{in_SSB} within $T_{Evaluate_in_SSB}$ evaluation period.

$T_{Evaluate_out_SSB}$ and $T_{Evaluate_in_SSB}$ are defined in table 8.1.2.2-2 for FR2 with scaling factor N, where

- N=2, 4, or 6 for FR2-1 for UE supporting *fastBeamSweepingMultiRx-r18* according to the conditions in clause 3.6.19, and
- N=8 for other cases in FR2-1, and
- N=12 for FR2-2.

for FR2 power classes other than power class 6 or for FR2 power class 6 when *highSpeedMeasFlagFR2-r17* is not configured.

$T_{Evaluate_out_SSB}$ and $T_{Evaluate_in_SSB}$ are defined in table 8.1.2.2-3 for FR2 power class 6 UE configured with *highSpeedMeasFlagFR2-r17*.

$T_{Evaluate_out_SSB}$ and $T_{Evaluate_in_SSB}$ are defined in table 8.1.2.2-4 for FR1 (deactivated PSCell).

$T_{Evaluate_out_SSB}$ and $T_{Evaluate_in_SSB}$ are defined in table 8.1.2.2-5 for FR2 (deactivated PSCell) with scaling factor N=8 for FR2-1 and N=12 for FR2-2.

For a UE supporting LowBandCA-via-Switching-r19, or for a UE supporting *concurrentMeasGapsPreMG-r18* and when concurrent measurement gap(s) with Pre-MG(s) are configured, or a UE supporting *concurrentMeasGapsNCSG-r18* and when concurrent measurement gap(s) with NCSG(s) are configured, or a UE supporting *concurrentMeasGap-r17* or *musim-GapPreference-r17* or both *concurrentMeasGap-r17* and *musim-GapPreference-r17*, and when concurrent measurement gaps or periodic MUSIM gaps or both concurrent GAPs and periodic MUSIM gaps are configured,

- an RLM-RS resource occasion is not considered to be overlapped by a gap occasion if the gap occasion is dropped according to clauses 9.1.8 and 9.1.10,

P value for an RLM-RS resource to be measured is defined as

- N_{total} / $N_{outside_MG}$ in FR1
- $P_{sharing\ factor}$ * N_{total} / $N_{outside_MG}$ in FR2 with $N_{available}$ = 0
- N_{total} / $N_{available}$ in FR2 with $N_{available}$ > 0

- For a window W of duration max($T_{L1,}$ xRP_max, switching pattern periodicity), where xRP_max is the maximum xRP across all configured per-UE measurement gaps or periodic MUSIM gap(s) or NCSGs and per-FR measurement gaps or NCSGs, and, in case of Pre-MG, all activated per-UE measurement gaps and per-FR measurement gaps, within the same FR as serving cell, and starting at the beginning of any RLM-RS resource occasion:
  - N_{total} is the total number of RLM-RS resource occasions within the window W, including those overlapped with GAP occasions, MUSIM gap occasions or SMTC occasions within the window W. For UEs supporting LB CA via switching, N_{total} also includes RLM-RS occasions that overlap with the SDL ON duration within the window, as defined by the configured switching pattern, and
  - $N_{outside_MG}$ is the number of RLM-RS resource occasions that are not overlapped with any non-dropped GAP occasion nor non-dropped MUSIM gap occasion, or number of RLM-RS that are not overlapped with SDL ON duration corresponding to the LB CA switching pattern within the window W, and
  - $N_{available}$ is the number of RLM-RS resource occasions that are not overlapped with any non-dropped GAP occasion nor non-dropped MUSIM gap occasion nor any SMTC occasion within the window W, and
  - an RLM-RS resource occasion is considered to be overlapped with the MUSIM gap if it overlaps a MUSIM gap occasion, and
  - T_{L1} is periodicity of the target RLM-RS.
  - xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG.
  - for UEs that support LB CA via switching, switching pattern periodicity is the periodicity of the RRC configured semi-static switching pattern; otherwise, it is not applicable.
  - RLM requirement in this clause is not applied when $N_{outside_MG}$ = 0.

Otherwise, for a UE neither supporting *concurrentMeasGap-r17* nor *concurrentMeasGapsPreMG-r18* nor *concurrentMeasGapsNCSG-r18* nor supporting *musim-GapPreference-r17* or when neither of the above configurations applies, i.e. concurrent measurement gaps, concurrent measurement gap(s) with Pre-MG(s), concurrent measurement gap(s) with NCSG(s), and periodic MUSIM gaps,

For FR1,

- $P = \frac{1}{1-\frac{T_{SSB}}{xRP}}$, when in the monitored cell there are GAPs configured for intra-frequency, inter-frequency or inter-RAT measurements, and these GAPs are overlapping with some but not all occasions of the SSB; and
- P = 1 when in the monitored cell there are no GAPs overlapping with any occasion of the SSB.

For FR2

- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when RLM-RS resource is not overlapped with GAP and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$).
- P is $P_{sharing\ factor}$, when the RLM-RS resource is not overlapped with GAP and RLM-RS resource is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$).
- $P = \frac{1}{1-\frac{T_{SSB}}{xRP}-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when the RLM-RS resource is partially overlapped with GAP and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and

- $T_{SMTCperiod} \neq$ xRP or
- $T_{SMTCperiod}$ = xRP and $T_{SSB} < 0.5*T_{SMTCperiod}$

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{xRP}}$, when the RLM-RS is partially overlapped with GAP and the RLM-RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and $T_{SMTCperiod}$ = xRP and $T_{SSB} = 0.5 \times T_{SMTCperiod}$

- $P = \frac{1}{1-\frac{T_{SSB}}{Min(xRP,T_{SMTCperiod})}}$, when the RLM-RS resource is partially overlapped with GAP and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with GAP

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{xRP}}$, when the RLM-RS resource is partially overlapped with GAP and the RLM-RS resource is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with GAP ($T_{SMTCperiod} <$ xRP)

where,

- $P_{sharing\ factor}$ = 1, if the RLM-RS resource outside GAP is
  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,
  - not overlapped by the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.
- $P_{sharing\ factor}$ = 3, otherwise.
- If the higher layer in TS 38.331 [2] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; Otherwise $T_{SMTCperiod}$ follows *smtc1*. $T_{SMTCperiod}$ is the shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.
- When a GAP is configured only and the GAP is not NCSG,
  - an RLM-RS resource or an SMTC occasion is considered to be overlapped with the GAP if it overlaps a GAP occasion, and
  - xRP = MGRP
- Otherwise, when NCSG is configured,
  - an RLM-RS resource or an SMTC occasion is considered to be overlapped with the GAP if
    - it overlaps the VIL1 or VIL2 of NCSG, or
    - it overlaps the ML of NCSG in FR2, and there exists a target carrier to be measured within NCSG that is intra-frequency carrier or inter-frequency carrier in the same band as the serving cell, or inter-frequency carrier in different band as the serving cell and UE does not support IBM between the target carrier and the serving cell,
  - and
    - xRP = VIRP
- If the UE is configured with Pre-MG only, an RLM-RS resource or an SMTC occasion is only considered to be overlapped by the Pre-MG if the Pre-MG is activated.
- When concurrent gaps or concurrent measurement gap(s) with Pre-MG(s) or concurrent measurement gap(s) with NCSG(s) are configured, an RLM-RS resource or an SMTC occasion is not considered as overlapped by a

GAP occasion if the GAP occasion is dropped according to clause 9.1.8, clause 9.1.12, clause 9.1.13, respectively.

If the higher layer in TS 38.331 [2] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; Otherwise $T_{SMTCperiod}$ follows *smtc1*.

For UE supporting *measurement gap occasion cancellation*, the UE is not required to perform SSB measurements during the cancelled gap occasions.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and GAP configurations does not meet previous conditions.

When the configured aperiodic MUSIM gap is overlapping with RLM-RS resource occasion, longer evaluation period would be expected.

When UE is configured with MUSIM gap(s), and if RLM-RS resource occasions are fully overlapped with MUSIM gap(s) or the union of MUSIM gap(s) and GAPs, no requirement applies for SSB based RLM.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

8.1.2.3 Measurement restrictions for SSB based RLM

The UE is required to be capable of measuring SSB for RLM without measurement gaps. The UE is required to perform the SSB measurements with measurement restrictions as described in the following scenarios.

For FR1, when the SSB OFDM symbols used for RLM fully or partially overlap with CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for RLM without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for RLM without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for RLM and CSI-RS. Longer measurement period for SSB based RLM is expected, and no requirements are defined

For FR2, when the SSB for RLM measurement on one CC is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSB for RLM and CSI-RS. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

For FR2, when the SSB for RLM measurement on one CC is in the same or adjacent OFDM symbol as SSB from cell with additional PCI for BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSBs. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

For FR2, when the SSB for RLM measurement on one CC fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap in the same band, UE is required to measure one of but not both SSBs. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

For FR2, when the SSB for RLM measurement on one CC fully or partially overlaps with the OFDM symbol as CSI-RS from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement, UE is required to measure either SSB or CSI-RS but not both. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

For FR2, there is no measurement restriction allowed when the network configures mixed numerology between SSB for RLM measurement on one FR2 band and CSI-RS for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement on the other FR2 band, provided that UE is capable of independent beam management on this FR2 band pair.

8.1.2.4 Minimum requirement of SSB based radio link monitoring for UE fulfilling relaxed measurement criteria

This clause contains minimum requirements for relaxed radio link monitoring based on SSB.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_SSB_Relax}$ period becomes worse than the threshold Q_{out_SSB} within $T_{Evaluate_out_SSB_Relax}$ evaluation period.

$T_{Evaluate_out_SSB_Relax}$ is defined in table 8.1.2.4-1 for FR1.

$T_{Evaluate_out_SSB_Relax}$ is defined in table 8.1.2.4-2 for FR2 with scaling factor N=8.

The value of P is defined in clause 8.1.2.2.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

8.1.3 Requirements for CSI-RS based radio link monitoring

8.1.3.1 Introduction

The requirements in this clause apply for each CSI-RS based RLM-RS resource configured for PCell, PSCell or deactivated PSCell, provided that the CSI-RS configured for RLM is actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.1.3.2. UE is not expected to perform radio link monitoring measurements on the CSI-RS configured as RLM-RS if the CSI-RS is not in the active TCI state of any CORESET configured in the UE active BWP.

8.1.3.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_CSI\text{-}RS}$ period becomes worse than the threshold $Q_{out_CSI\text{-}RS}$ within $T_{Evaluate_out_CSI\text{-}RS}$ evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_CSI\text{-}RS}$ ms period becomes better than the threshold $Q_{in_CSI\text{-}RS}$ within $T_{Evaluate_in_CSI\text{-}RS}$ ms evaluation period.

- $T_{Evaluate_out_CSI\text{-}RS}$ and $T_{Evaluate_in_CSI\text{-}RS}$ are defined in table 8.1.3.2-1 for FR1.
- $T_{Evaluate_out_CSI\text{-}RS}$ and $T_{Evaluate_in_CSI\text{-}RS}$ are defined in table 8.1.3.2-2 for FR2 with scaling factor N=1.
- $T_{Evaluate_out_CSI\text{-}RS}$ and $T_{Evaluate_in_CSI\text{-}RS}$ are defined in table 8.1.3.2-3 for FR1 (deactivated PSCell).
- $T_{Evaluate_out_CSI\text{-}RS}$ and $T_{Evaluate_in_CSI\text{-}RS}$ are defined in table 8.1.3.2-4 for FR2 (deactivated PSCell) with scaling factor N=1.

The requirements of $T_{Evaluate_out_CSI\text{-}RS}$ and $T_{Evaluate_in_CSI\text{-}RS}$ apply provided that the CSI-RS for RLM is not in a resource set configured with repetition ON. The requirements do not apply when the CSI-RS resource in the active TCI state of CORESET is the same CSI-RS resource for RLM and the TCI state information of the CSI-RS resource is not given, wherein the TCI state information means QCL Type-D to SSB for L1-RSRP or CSI-RS with repetition ON.

For the value of $L1_{Out}$ and $L1_{In}$,

1> If the UE does not support *supportSBFD* or SBFD is not configured by the network,

2> $L1_{Out} = 0$;

2> $L1_{In} = 0$;

1> Else if the UE supports *supportSBFD* and SBFD is configured by the network,

2> If DRX is not configured,

3> $L1_{Out}$ is the number of occasions of the CSI-RS resource for RLM that are overlapping with dynamic UL transmission on SBFD symbols during $T_{Evaluate_Out_CSI-RS}$;

3> $L1_{In}$ is the number of occasions of the CSI-RS resource for RLM that are overlapping with dynamic UL transmission on SBFD symbols during $T_{Evaluate_In_CSI-RS}$, when DRX is not configured

2> If DRX is configured,

3> $L1_{Out}$ is the number of DRX cycles in which at least one occasion of the CSI-RS resource for RLM is overlapping with dynamic UL transmission on SBFD symbols during $T_{Evaluate_Out_CSI-RS}$;

3> $L1_{In}$ is the number of DRX cycles in which at least one occasion of the CSI-RS resource for RLM is overlapping with dynamic UL transmission on SBFD symbols during $T_{Evaluate_In_CSI-RS}$;

If the UE supports *supportSBFD* and SBFD is configured by the network, the requirements in this clause apply provided that all the occasions of the CSI-RS resource are in the same type (i.e., SBFD or non-SBFD) of symbols.

For a UE supporting LowBandCA-via-Switching-r19, or for a UE supporting *concurrentMeasGapsPreMG-r18* and when concurrent measurement gap(s) with Pre-MG(s) are configured, or a UE supporting *concurrentMeasGapsNCSG-r18* and when concurrent measurement gap(s) with NCSG(s) are configured, or a UE supporting *concurrentMeasGap-r17* or *musim-GapPreference-r17* or both *concurrentMeasGap-r17* and *musim-GapPreference-r17*, and when concurrent measurement gaps or periodic MUSIM gaps or both concurrent GAPs and periodic MUSIM gaps are are configured,

- an RLM-RS resource occasion is not considered to be overlapped by a gap occasion if the gap occasion is dropped according to clauses 9.1.8 and 9.1.10,
- P value for an RLM-RS resource to be measured is defined as
  - N_{total} / $N_{outside_MG}$ in FR1
  - $P_{sharing\ factor}$ * N_{total} / $N_{outside_MG}$ in FR2 with $N_{available}$ = 0
  - N_{total} / $N_{available}$ in FR2 with Navailable > 0
- For a window W of duration max($T_{L1,}$ xRP_max, switching pattern periodicity), where xRP_max is the maximum xRP across all configured per-UE measurement gaps or periodic MUSIM gap(s) or NCSGs and per-FR measurement gaps or NCSGs, and, in case of Pre-MG, all activated per-UE measurement gaps and per-FR measurement gaps, within the same FR as serving cell, and starting at the beginning of any RLM-RS resource occasion:
  - N_{total} is the total number of RLM-RS resource occasions within the window W, including those overlapped with GAP occasions, MUSIM gap occasions or SMTC occasions within the window W. For UEs supporting LB CA via switching, N_{total} also includes RLM-RS occasions that overlap with the SDL ON duration within the window, as defined by the configured switching pattern, and
  - $N_{outside_MG}$ is the number of RLM-RS resource occasions that are not overlapped with any non-dropped GAP occasion nor non-dropped MUSIM gap occasion, or number of RLM-RS that are not overlapped with SDL ON duration corresponding to the LB CA switching pattern within the window W, and
  - $N_{available}$ is the number of RLM-RS resource occasions that are not overlapped with any non-dropped GAP occasion, nor non-dropped MUSIM gap occasion, nor any SMTC occasion within the window W, and
  - an RLM-RS resource occasion is considered to be overlapped with the MUSIM gap if it overlaps a MUSIM gap occasion, and
  - T_{L1} is periodicity of the target RLM-RS.
  - xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG.
  - for UEs that support LB CA via switching, switching pattern periodicity is the periodicity of the RRC configured semi-static switching pattern; otherwise, it is not applicable.
  - RLM requirement in this clause is not applied when $N_{outside_MG}$ = 0.

Otherwise, for a UE neither supporting *concurrentMeasGap-r17* nor *concurrentMeasGapsPreMG-r18* nor *concurrentMeasGapsNCSG-r18* nor supporting *musim-GapPreference-r17* or when neither of the above configurations applies, i.e. concurrent measurement gaps, concurrent measurement gap(s) with Pre-MG(s), concurrent measurement gap(s) with NCSG(s), and periodic MUSIM gaps,

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{Min(xRP,T_{SMTCperiod})}}$, when the RLM-RS resource is partially overlapped with GAP and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with GAP

If the UE is configured with Pre-MG only, an RLM-RS resource or an SMTC occasion is only considered to be overlapped by the Pre-MG if the Pre-MG is activated.

When concurrent gaps or concurrent measurement gap(s) with Pre-MG(s) or concurrent measurement gap(s) with NCSG(s) are configured , an RLM-RS resource or an SMTC occasion is not considered to be overlapped by a GAP occasion if the GAP occasion is dropped according to clause 9.1.8, clause 9.1.12, clause 9.1.13, respectively.

If the higher layer in TS 38.331 [2] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; Otherwise $T_{SMTCperiod}$ follows *smtc1*.

NOTE: The overlap between CSI-RS for RLM and SMTC means that CSI-RS based RLM is within the SMTC window duration.

For UE supporting *measurement gap occasion cancellation*, the UE is not required to perform CSI-RS measurements during the cancelled gap occasions.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and GAP configurations does not meet previous conditions.

When the configured aperiodic MUSIM gap is overlapping with RLM-RS resource occasion, longer evaluation period would be expected.

When UE is configured with MUSIM gap(s), and if RLM-RS resource occasions are fully overlapped with MUSIM gap(s) or the union of MUSIM gap(s) and GAPs, no requirement applies for CSI-RS based RLM.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

The values of M_{out} and M_{in} used in table 8.1.3.2-1, table 8.1.3.2-2, table 8.1.3.2-3 and table 8.1.3.2-4 are defined as:

- M_{out} = 20 and M_{in} = 10, if the CSI-RS resource configured for RLM is transmitted with higher layer CSI-RS parameter *density* [6, clause 7.4.1] set to 3 and over the bandwidth $\geqslant$ 24 PRBs.

If the UE supports *supportSBFD* and SBFD is configured by the network, the requirements in this clause apply provided that the CSI-RS resource configured for RLM is transmitted with higher layer CSI-RS parameter *density* [6, clause 7.4.1] set to 3 and over the bandwidth $\geqslant$ 24 PRBs in at least one DL subband.

8.1.3.3 Measurement restrictions for CSI-RS based RLM

The SSB mentioned in this clause can be associated with either the serving cell PCI or a PCI different from serving cell PCI or intra-frequency neighbor cell(s) configured with L1-RSRP measurement or inter-frequency neighbor cell(s) configured with L1-RSRP measurement without gap.

The UE is required to be capable of measuring CSI-RS for RLM without measurement gaps. The UE is required to perform the CSI-RS measurements with measurement restrictions as described in the following clauses.

For both FR1 and FR2, when the CSI-RS for RLM is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for RLM in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD, or L1-RSRP measurement has same SCS than CSI-RS for RLM, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement has different SCS than CSI-RS for RLM, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS for RLM measurement without restrictions.
- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for RLM and SSB. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

For FR1, when the CSI-RS for RLM is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for RLM without any restriction.

For FR2, when the CSI-RS for RLM measurement on one CC is in the same OFDM symbol as SSB for RLM, BFD, or L1-RSRP measurement on the same CC or different CCs in the same band, or in the same symbol as SSB for CBD measurement on the same CC or different CCs in the same band when beam failure is detected, UE is required to measure one of but not both CSI-RS for RLM and SSB. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

For both FR1 and FR2, when the CSI-RS for RLM measurement fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap, UE is not required to receive CSI-RS for RLM measurement in the PRBs that overlap with an SSB.

For both FR1 and FR2, when the CSI-RS for RLM measurement fully or partially overlaps with the OFDM symbol as CSI-RS from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement, UE is not required to receive CSI-RS for RLM measurement in the PRBs that overlap with the CSI-RS from candidate LTM neighbour cell.

For FR1, when the CSI-RS for RLM measurement fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap, if CSI-RS and SSB have different SCS and UE does not support simultaneousRxDataSSB-DiffNumerology, UE is required to measure one of but not both CSI-RS for RLM measurement and SSB. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

For FR2, when the CSI-RS for RLM measurement on one CC fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap in the same band, UE is required to measure one of but not both CSI-RS for RLM measurement and SSB. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

For FR2, when the CSI-RS for RLM measurement on one CC fully or partially overlaps with the OFDM symbol as CSI-RS from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement, UE is required to measure one of but not both CSI-RS for RLM measurement and CSI-RS for candidate LTM neighbour L1-RSRP measurement. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

For FR2, when the CSI-RS for RLM measurement on one CC is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band,

- In the following cases, UE is required to measure one of but not both CSI-RS for RLM and the other CSI-RS. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.
  - The CSI-RS for RLM or the other CSI-RS in a resource set configured with repetition ON, or
  - The other CSI-RS is configured in q1 and beam failure is detected, or
  - The two CSI-RS-es are not QCL-ed w.r.t. QCL-TypeD, or the QCL information is not known to UE,

- Otherwise, UE shall be able to measure the CSI-RS for RLM without any restriction.

For FR2-1, there is no measurement restriction allowed for UE supporting *schedulingMeasurementRelaxation-r18*, according to the conditions described in clause 3.6.19, and the UE is required to measure both the CSI-RS for RLM and the other CSI-RS for RLM, BFD or L1-RSRP measurement, while meeting requirements in clause 8.1.3.2, provided the following conditions are met:

- Both CSI-RSs are not in any CSI-RS resource set with repetition ON, and
- One CSI-RS has same QCL source as either
  - the active TCI state of a PDSCH scheduled in the same OFDM symbol or
  - the QCL source based on the default QCL assumption to be applied in the same OFDM symbol according to TS 38.214 [26] clause 5.1.5, and
- the other CSI-RS has same QCL source as either
  - the active TCI state of a PDSCH scheduled in the same OFDM symbol or
  - the QCL source based on the default QCL assumption to be applied in the same OFDM symbol according to TS 38.214 [26] clause 5.1.5, and
- Resources of the active TCI states of the two PDSCHs, or QCL sources of the default QCL assumption, or the active TCI state of PDSCH and QCL source of the default QCL assumption have been reported as a resource group in Rel-17 group-based RSRP report.

8.1.3.4 Minimum requirement of CSI-RS based radio link monitoring for UE fulfilling relaxed measurement criteria

This clause contains minimum requirements for relaxed radio link monitoring based on CSI-RS.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_CSI\text{-}RS_Relax}$ period becomes worse than the threshold $Q_{out_CSI\text{-}RS}$ within $T_{Evaluate_out_CSI\text{-}RS_Relax}$ evaluation period.

$T_{Evaluate_out_CSI\text{-}RS_Relax}$ is defined in table 8.1.3.4-1 for FR1.

$T_{Evaluate_out_CSI\text{-}RS_Relax}$ is defined in table 8.1.3.4-2 for FR2 with scaling factor N=1.

The value of P is defined in clause 8.1.3.2.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

The values of M_{out} used in table 8.1.3.4-1 and table 8.1.3.4-2 are defined as:

- M_{out} = 20, if the CSI-RS resource configured for RLM is transmitted with higher layer CSI-RS parameter *density* [6, clause 7.4.1] set to 3 and over the bandwidth $\geq$ 24 PRBs.

$Max(T_{DRX}, T_{CSI\text{-}RS}) \leq 80$ ms	$Max(200 \times K3^{NOTE3}, Ceil(1.5 \times M_{out} \times P \times K1^{NOTE2}) \times Max(T_{DRX}, T_{CSI\text{-}RS})^{NOTE1})$
NOTE1: $T_{CSI\text{-}RS}$ is the periodicity of the CSI-RS resource configured for RLM. The requirements in this table apply for $T_{CSI\text{-}RS}$ equal to 5 ms, 10 ms, 20 ms or 40 ms. T_{DRX} is the DRX cycle length and no longer than 80 ms.	

NOTE2: K1 = 2 for 40 ms < MAX(T_{DRX}, T_{CSI-RS}) ≤ 80 ms, K1 = 4 for MAX(T_{DRX}, T_{CSI-RS}) ≤ 40 ms
NOTE3: K3 = K1, if K1 ≤ 2; K3 = 1 otherwise.

NOTE1: T_{CSI-RS} is the periodicity of the CSI-RS resource configured for RLM. The requirements in this table apply for T_{CSI-RS} equal to 5 ms, 10 ms, 20 ms or 40 ms. T_{DRX} is the DRX cycle length and no longer than 80 ms. NOTE2: K2 = 2. NOTE3: K4 = K2, if K2 ≤ 2; K4 = 1 otherwise.	

8.1.4 Minimum requirement at transitions

When the UE transitions between DRX and no DRX or when DRX cycle periodicity changes, for each RLM-RS resource, for a duration of time equal to the evaluation period corresponding to the second mode after the transition occurs, the UE shall use an evaluation period that is no less than the minimum of evaluation period corresponding to the first mode and the second mode. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second mode for each RLM-RS resource. This requirement shall be applied to both out-of-sync evaluation and in-sync evaluation of the monitored cell.

When the UE transitions from a first configuration of RLM resources to a second configuration of RLM resources that is different from the first configuration, for each RLM resource present in the second configuration, for a duration of time equal to the evaluation period corresponding to the second configuration after the transition occurs, the UE shall use an evaluation period that is no less than the minimum of evaluation periods corresponding to the first configuration and the second configuration. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second configuration for each RLM resource present in the second configuration. This requirement shall be applied to both out-of-sync evaluation and in-sync evaluation of the monitored cell.

When the UE transitions from a first configuration of active TCI state of the CORESET to a second configuration of active TCI state of the CORESET, for each CSI-RS for RLM present in the second configuration, the UE shall use an evaluation period corresponding to the second configuration from the time of transition. This requirement shall be applied to both out-of-sync evaluation and in-sync evaluation of the monitored cell.

For UE supporting *ncd-SSB-BWP-Wor-r18*, when the UE transitions between RLM CD-SSB resource and RLM NCD-SSB resource due to BWP switching or due to SCG activation or deactivation during one evaluation period, the UE shall use an evaluation period that is the maximum of the evaluation periods corresponding to the first SSB type and the second SSB type after the BWP switching or the SCG activation or deactivation. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second SSB type for each RLM-RS resource.

8.1.5 Minimum requirement for UE turning off the transmitter

The transmitter power of the UE in the monitored cell shall be turned off within 40 ms after expiry of T310 timer as specified in TS 38.331 [2].

8.1.6 Minimum requirement for L1 indication

When the downlink radio link quality on all the configured RLM-RS resources is worse than Q_{out}, layer 1 of the UE shall send an out-of-sync indication for the cell to the higher layers. A layer 3 filter shall be applied to the out-of-sync indications as specified in TS 38.331 [2].

When the downlink radio link quality on at least one of the configured RLM-RS resources is better than Q_{in}, layer 1 of the UE shall send an in-sync indication for the cell to the higher layers. A layer 3 filter shall be applied to the in-sync indications as specified in TS 38.331 [2].

The out-of-sync and in-sync evaluations for the configured RLM-RS resources shall be performed as specified in clause 5 in TS 38.213 [3]. Two successive indications from layer 1 shall be separated by at least $T_{Indication_interval}$.

When DRX is not used $T_{Indication_interval}$ is max(10 ms, $T_{RLM\text{-}RS,M}$), where $T_{RLM\text{-}RS,M}$ is the shortest periodicity of all configured RLM-RS resources for the monitored cell, which corresponds to T_{SSB} specified in clause 8.1.2 if the RLM-RS resource is SSB, or $T_{CSI\text{-}RS}$ specified in clause 8.1.3 if the RLM-RS resource is CSI-RS.

In case DRX is used, $T_{Indication_interval}$ is Max(10ms, 1.5 × DRX_cycle_length, 1.5 × $T_{RLM\text{-}RS,M}$)) if DRX_cycle_length is less than or equal to 320ms, and $T_{Indication_interval}$ is DRX_cycle_length if DRX_cycle_length is greater than 320ms. Upon start of T310 timer as specified in TS 38.331 [2], the UE shall monitor the configured RLM-RS resources for recovery using the evaluation period and layer 1 indication interval corresponding to the no DRX mode until the expiry or stop of T310 timer.

For deactivated PSCell, when DRX is not used $T_{Indication_interval}$ is Max (10ms, *measCyclePSCell*). In case DRX is used, $T_{Indication_interval}$ is Max(10ms, 1.5 × DRX_cycle_length, 1.5 × *measCyclePSCell*)) if DRX_cycle_length is less than or equal to 320ms, and $T_{Indication_interval}$ is Max (DRX_cycle_length, *measCyclePSCell*) if DRX_cycle_length is greater than 320ms.

8.1.7 Scheduling availability of UE during radio link monitoring

When the reference signal to be measured for RLM has different subcarrier spacing than PDSCH/PDCCH or is in FR2, there are restrictions on the scheduling availability as described in the following clauses.

8.1.7.1 Scheduling availability of UE performing radio link monitoring with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to radio link monitoring performed with a same subcarrier spacing as PDSCH/PDCCH on FR1.

8.1.7.2 Scheduling availability of UE performing radio link monitoring with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to radio link monitoring based on SSB as RLM-RS. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to radio link monitoring based on SSB as RLM-RS.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for radio link monitoring.

When intra-band carrier aggregation in FR1 is performed, the scheduling restrictions on FR1 serving PCell or PSCell applies to all serving cells in the same band on the symbols that fully or partially overlap with the restricted symbols.

When intra-band non-contiguous carrier aggregation is configured for a UE indicating *intraBandNR-CA-non-collocated-r18*, there are no scheduling restrictions on FR1 serving cell(s) configured on the non-contiguous CC(s) in the same band if *nonCollocatedTypeNR-CA-r18* is not provided. Otherwise, the scheduling restrictions on FR1 serving PCell or PSCell applies to all serving cells in the same band on the symbols that fully or partially overlap with the restricted symbols if *nonCollocatedTypeNR-CA-r18* is provided.

When intra-band non-contiguous carrier aggregation is configured for a UE indicating *intraBandNR-CA-non-collocated-r19*, there are no scheduling restrictions on FR1 serving cell(s) configured on the non-contiguous CC(s) in the same band if *nonCollocatedTypeNR-CA-v19xy* with value “type 4” is provided. Otherwise, the scheduling restrictions on FR1 serving PCell or PSCell applies to all serving cells in the same band on the symbols that fully or partially overlap with the restricted symbols if *nonCollocatedTypeNR-CA-v19xy* with value “type 1” is provided.

When inter-band FR1-FR1 NR-DC is configured, there are no scheduling restrictions on FR1 serving cell(s) in the bands due to radio link monitoring performed on FR1 serving PCell or PSCell in different bands.

8.1.7.3 Scheduling availability of UE performing radio link monitoring on FR2

The following scheduling restriction applies due to radio link monitoring on an FR2 serving PCell and/or PSCell.

- If the RLM-RS is CSI-RS which is type-D QCLed with active TCI state for PDCCH or PDSCH, and the CSI-RS is not in a CSI-RS resource set with repetition ON,

- There are no scheduling restrictions due to radio link monitoring based on the CSI-RS.

- For FR2-1, for UE supporting *schedulingMeasurementRelaxation-r18*,, according to the conditions described in clause 3.6.19, and is configured to receive two PDSCH transmission occasions from two different QCL sources on PCell, there are no scheduling restrictions for the PDSCHs due to radio link monitoring based on the CSI-RS, when following conditions are met:

  - The CSI-RS is not in a CSI-RS resource set with repetition ON,

  - The CSI-RS has same QCL source as the active TCI state of one of the PDSCHs and has different QCL-TypeD from the other PDSCH,

  - The CSI-RS and both of the PDSCHs are on the same OFDM symbol(s),

  - The CSI-RS and both of the PDSCHs are on the same OFDM symbol(s), or the CSI-RS and one of the PDSCHs with different QCL typeD are on the same OFDM symbol(s) when partially overlapping PDSCHs are scheduled,

  - Resources of the active TCI states for the two PDSCHs have been reported as a resource group in Rel-17 group-based RSRP report.

- Otherwise

  - For FR2-1 or the RLM-RS is not using 480 kHz SCS or 960 kHz SCS on FR2-2, the UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on RLM-RS symbols to be measured for radio link monitoring.

  - For FR2-2 and the RLM-RS is using 480 kHz SCS or 960 kHz SCS, the UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on RLM-RS symbols to be measured for radio link monitoring, and on one data symbol before each RLM-RS symbol to be measured and one data symbol after each RLM-RS symbol to be measured.

When intra-band carrier aggregation in FR2 is performed, the scheduling restrictions on FR2 serving PCell or PSCell applies to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

When inter-band carrier aggregation in FR2 is performed, there are no scheduling restrictions on FR2 serving cell(s) in the bands for the following cases, provided that UE is capable of independent beam management on this FR2 band pair:

- when performing radio link monitoring performed on FR2 serving PCell or PSCell in different bands,

- the UE is configured with same or different numerology between SSB on one FR2 band and data on the other FR2 band.

For FR2, if following conditions are met,

- UE has been notified about system information update through paging,

- The gap between UE’s reception of PDCCH that UE monitors in the Type2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB for RLM and CORESET for RMSI scheduling multiplexing patterns 3, UE shall receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for RLM; and

For the SSB for RLM and CORESET for RMSI scheduling multiplexing patterns 2, UE shall receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for RLM.

8.1.7.4 Scheduling availability of UE performing radio link monitoring on FR1 or FR2 in case of FR1-FR2 inter-band CA and NR-DC

There are no scheduling restrictions on FR1 serving cell(s) due to radio link monitoring performed on FR2 serving PCell and/or PSCell.

There are no scheduling restrictions on FR2 serving cell(s) due to radio link monitoring performed on FR1 serving PCell and/or PSCell.

8.1.8 Minimum requirement under IDC Interference

When the UE is provided with IDC solution, the UE shall also perform radio link monitoring and meet the corresponding requirements in clause 8.1.

8.1A Radio Link Monitoring with CCA on Target Frequency

8.1A.1 Introduction

The requirements in clause 8.1A apply for radio link monitoring on a carrier frequency with CCA for cells:

- PCell in SA NR operation mode,
- PSCell in EN-DC operation mode.
- PSCell in NR-DC operation mode.

The UE shall monitor the downlink radio link quality based on the reference signal configured as RLM-RS resource(s) in order to detect the downlink radio link quality of the PCell and PSCell as specified in TS 38.213 [3]. The configured RLM-RS resources can be all SSBs, or all CSI-RSs, or a mix of SSBs and CSI-RSs. UE is not required to perform RLM outside the active DL BWP.

On each RLM-RS resource, the UE shall estimate the downlink radio link quality and compare it to the thresholds $Q_{out,CCA}$ and $Q_{in,CCA}$ for the purpose of monitoring downlink radio link quality of the cell.

The threshold $Q_{out,CCA}$ is defined as the level at which the downlink radio link cannot be reliably received and shall correspond to the out-of-sync block error rate ($BLER_{out,CCA}$) as defined in table 8.1A.1-1. For SSB based radio link monitoring, $Q_{out_SSB,CCA}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1A.2.1-1.

The threshold $Q_{in,CCA}$ is defined as the level at which the downlink radio link quality can be received with significantly higher reliability than at $Q_{out,CCA}$ and shall correspond to the in-sync block error rate ($BLER_{in}$) as defined in table 8.1A.1-1. For SSB based radio link monitoring, $Q_{in_SSB,CCA}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1A.2.1-2.

The out-of-sync block error rate ($BLER_{out,CCA}$) and in-sync block error rate ($BLER_{in,CCA}$) are determined from the network configuration via parameter *rlmInSyncOutOfSyncThreshold* signalled by higher layers. When UE is not configured with *rlmInSyncOutOfSyncThreshold* from the network, UE determines out-of-sync and in-sync block error rates from Configuration #0 in table 8.1A.1-1 as default. All requirements in clause 8.1A are applicable for BLER Configuration #0 in table 8.1A.1-1.

Configuration	$BLER_{out,CCA}$	$BLER_{in,CCA}$

UE shall be able to monitor up to N_{RLM} RLM-RS resources of the same or different types in each corresponding carrier frequency range, depending on a maximum number L_{max} of SSBs per half frame according to TS 38.213 [3], where N_{RLM} is specified in table 8.1A.1-2, and meet the requirements as specified in clause 8.1A. UE is not required to meet the requirements in clause 8.1A if RLM-RS is not configured and no TCI state for PDCCH is activated.

FR2-2	64	8

In the requirements of clause 8.1A, the term RLM-RS SSB occasion not available at the UE refers to when the RLM-RS SSB is configured by gNB in a cell on a carrier frequency subject to CCA, but the first two successive candidate SSB positions for the same SSB index within the set of configured RLM-RS resources are not available at the UE due to DL CCA failures at gNB during the corresponding evaluation period; otherwise the RLM-RS SSB is considered as available at the UE.

The requirements in clause 8.1A apply for any *channelAccessMode* configuration [2].

8.1A.2 Requirements for SSB Based Radio Link Monitoring

8.1A.2.1 Introduction

The requirements in this clause apply for each SSB based RLM-RS resource configured for PCell or PSCell, provided that the SSB configured for RLM are actually configured to be transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.1A.2.2 but occasionally may not be transmitted due to CCA operation.

8.1A.2.2 Minimum Requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_SSB,CCA}$ period becomes worse than the threshold $Q_{out_SSB,CCA}$ within $T_{Evaluate_out_SSB,CCA}$ evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_SSB,CCA}$ period becomes better than the threshold $Q_{in_SSB,CCA}$ within $T_{Evaluate_in_SSB,CCA}$ evaluation period. During the in-sync evaluation procedure, layer 1 of the UE shall not send any in-sync indication for the cell to the higher layers when L_{in} exceeds $L_{in,max}$, where L_{in} and $L_{in,max}$ are defined in table 8.1A.2.2-1.

$T_{Evaluate_out_SSB,CCA}$ and $T_{Evaluate_in_SSB,CCA}$ are defined in table 8.1A.2.2-1 for FR1.

$T_{Evaluate_out_SSB,CCA}$ and $T_{Evaluate_in_SSB,CCA}$ are defined in table 8.1A.2.2-2 for FR2-2 with scaling factor N = 12.

For a UE supporting *concurrentMeasGapsPreMG-r18* and when concurrent measurement gap(s) with Pre-MG(s) are configured, or a UE supporting *concurrentMeasGapsNCSG-r18* and when concurrent measurement gap(s) with NCSG(s) are configured, or a UE supporting *concurrentMeasGap-r17* and when concurrent gaps are configured,

- P value for an RLM-RS resource to be measured is defined as N_{total} / $N_{outside_MG}$

- For a window W of duration max(T_{L1}, xRP_max), where xRP_max is the maximum xRP across all configured per-UE measurement gap or NCSGs and per-FR measurement gap or NCSGs, and, in case of Pre-MG, all activated per-UE measurement gaps and per-FR measurement gaps, within the same FR as serving cell, and starting at the beginning of any RLM-RS resource occasion:

  - N_{total} is the total number of RLM-RS resource occasions within the window W, including those overlapped with GAP occasions within the window W, and

  - $N_{outside_MG}$ is the number of RLM-RS resource occasions that are not overlapped with any GAP occasion within the window W

  - xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG.

Otherwise, for a UE neither supporting *concurrentMeasGap-r17* nor *concurrentMeasGapsPreMG-r18* nor *concurrentMeasGapsNCSG-r18* or when neither of the above configurations applies, i.e. concurrent measurement gaps, concurrent measurement gap(s) with Pre-MG(s) and concurrent measurement gap(s) with NCSG(s),

For FR1,

- $P = \frac{1}{1-\frac{T_{SSB}}{xRP}}$, when in the monitored cell there are GAPs configured for intra-frequency, inter-frequency or inter-RAT measurements, and these GAPs are overlapping with some but not all occasions of the SSB RLM-RS resources; and

- P=1 when in the monitored cell there are no GAPs overlapping with any occasion of the SSB RLM-RS resources.

When a GAP is configured only and the GAP is not NCSG,

- an RLM-RS resource is considered to be overlapped with the GAP f it overlaps a GAP occasion, and

- xRP = MGRP

Otherwise, when NCSG only is configured,

- an RLM-RS resource is considered to be overlapped with the GAP if it overlaps the VIL1 or VIL2 of NCSG, and

- xRP = VIRP

If the UE is configured with Pre-MG only, an RLM-RS resource is only considered to be overlapped by the Pre-MG if the Pre-MG is activated.

When concurrent gaps or concurrent measurement gap(s) with Pre-MG(s) or concurrent measurement gap(s) with NCSG(s) are configured, an RLM-RS resource is not considered to be overlapped by a GAP occasion if the GAP occasion is dropped according to clause 9.1.8, clause 9.1.12, clause 9.1.13, respectively.

For FR2-2,

- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when RLM-RS resource is not overlapped with GAP and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$).

- P is $P_{sharing\ factor}$, when the RLM-RS resource is not overlapped with GAP and RLM-RS resource is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$).

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when the RLM-RS resource is partially overlapped with GAP and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and

- $T_{SMTCperiod} \neq$ MGRP or
- $T_{SMTCperiod}$ = MGRP and $T_{SSB} < 0.5*T_{SMTCperiod}$

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MGRP}}$, when the RLM-RS is partially overlapped with GAP and the RLM-RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and $T_{SMTCperiod}$ = MGRP and $T_{SSB} = 0.5 \times T_{SMTCperiod}$

- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when the RLM-RS resource is partially overlapped with GAP and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with GAP

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MRGP}}$, when the RLM-RS resource is partially overlapped with GAP and the RLM-RS resource is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with GAP ($T_{SMTCperiod}$ < MGRP)

- $P_{sharing\ factor}$ = 1, if the RLM-RS resource outside GAP is
  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and K data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and K data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and K is defined in clause 9.2.5.3.3, and,
  - not overlapped by the RSSI symbols indicated by *ss-RSSI-Measurement* and K data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and K data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured, and K is defined in clause 9.2.5.3.3.
- $P_{sharing\ factor}$ = 3, otherwise.

where,

If the higher layer in TS 38.331 [2] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; Otherwise $T_{SMTCperiod}$ follows *smtc1*. $T_{SMTCperiod}$ is the shortest SMTC period among all CCs in the same FR2-2 band, provided the SMTC offset of all CCs in FR2-2 have the same offset.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and GAP configurations does not meet previous conditions.

A DRX group consists of N DRX cycles, and the DRX group is not available when there is at least one DRX in which at least one RLM-RS SSB occasion is not available. 8.1A.2.3 Measurement Restrictions for SSB based RLM

The UE is required to be capable of measuring SSB for RLM without measurement gaps. The UE is required to perform the SSB measurements with measurement restrictions as described in the following clauses.

For FR1, when the SSB for RLM is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for RLM without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for RLM without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure SSB for RLM.

For FR2-2, when the SSB for RLM measurement on one CC is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSB for RLM and CSI-RS. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

8.1A.3 Minimum requirement at transitions

When the UE transitions between DRX and no DRX or when DRX cycle periodicity changes, for each RLM-RS resource, for a duration of time equal to the evaluation period corresponding to the second mode after the transition occurs, the UE shall use an evaluation period that is no less than the minimum of evaluation period corresponding to the first mode and the second mode. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second mode for each RLM-RS resource. This requirement shall be applied to both out-of-sync evaluation and in-sync evaluation of the monitored cell.

When the UE transitions from a first configuration of RLM resources to a second configuration of RLM resources that is different from the first configuration, for each RLM resource present in the second configuration, for a duration of time equal to the evaluation period corresponding to the second configuration after the transition occurs, the UE shall use an evaluation period that is no less than the minimum of evaluation periods corresponding to the first configuration and the second configuration. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second configuration for each RLM resource present in the second configuration. This requirement shall be applied to both out-of-sync evaluation and in-sync evaluation of the monitored cell.

8.1A.4 Minimum requirement for UE turning off the transmitter

The transmitter power of the UE in the monitored cell shall be turned off within 40 ms after expiry of T310 timer as specified in TS 38.331 [2]. The UE shall not perform CCA procedure on any of the serving carrier frequencies with CCA after the expiry of T310.

8.1A.5 Minimum requirement for L1 indication

When the downlink radio link quality on all the configured RLM-RS resources is worse than $Q_{out,CCA}$, layer 1 of the UE shall send an out-of-sync indication for the cell to the higher layers. A layer 3 filter shall be applied to the out-of-sync indications as specified in TS 38.331 [2].

When the downlink radio link quality on at least one of the configured RLM-RS resources is better than $Q_{in,CCA}$, layer 1 of the UE shall send an in-sync indication for the cell to the higher layers. A layer 3 filter shall be applied to the in-sync indications as specified in TS 38.331 [2].

The out-of-sync and in-sync evaluations for the configured RLM-RS resources shall be performed as specified in clause 5 in TS 38.213 [3]. Two successive indications from layer 1 shall be separated by at least $T_{Indication_interval,CCA}$.

When DRX is not used $T_{Indication_interval,CCA}$ is max(10 ms, $T_{RLM\text{-}RS,M}$), where $T_{RLM,M}$ is the shortest periodicity of all configured RLM-RS resources for the monitored cell, which corresponds to T_{SSB} specified in clause 8.1A.2 if the RLM-RS resource is SSB.

In case DRX is used, $T_{Indication_interval,CCA}$ is Max(10ms, 1.5 × DRX_cycle_length, 1.5 × $T_{RLM\text{-}RS,M}$)) if DRX_cycle_length is less than or equal to 320ms, and $T_{Indication_interval,CCA}$ is DRX_cycle_length if DRX_cycle_length is greater than 320ms. Upon start of T310 timer as specified in TS 38.331 [2], the UE shall monitor the configured RLM-RS resources for recovery using the evaluation period and layer 1 indication interval corresponding to the no DRX mode until the expiry or stop of T310 timer.

8.1A.6 Scheduling availability of UE during radio link monitoring

When the reference signal to be measured for RLM on a carrier frequency with CCA has different subcarrier spacing than PDSCH/PDCCH, there are restrictions on the scheduling availability as described in the following clauses.

8.1A.6.1 Scheduling availability of UE performing radio link monitoring with the same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to radio link monitoring performed with a same subcarrier spacing as PDSCH/PDCCH on FR1.

8.1A.6.2 Scheduling availability of UE performing radio link monitoring with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to radio link monitoring based on SSB as RLM-RS. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to radio link monitoring based on SSB as RLM-RS.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for radio link monitoring.

When intra-band carrier aggregation is performed, the scheduling restrictions on PCell or PSCell applies to all serving cells in the same band on the symbols that fully or partially overlap with the restricted symbols.

8.1A.6.3 Scheduling availability of UE performing radio link monitoring on FR2-2

The following scheduling restriction applies due to radio link monitoring on an FR2-2 serving PCell and/or PSCell.

- If the RLM-RS is CSI-RS which is type-D QCLed with active TCI state for PDCCH or PDSCH, and the CSI-RS is not in a CSI-RS resource set with repetition ON,

- There are no scheduling restrictions due to radio link monitoring based on the CSI-RS.

- Otherwise

  - When the RLM-RS is using 120 kHz SCS, the UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on RLM-RS symbols to be measured for radio link monitoring.

  - When the RLM-RS is using 480 kHz SCS or 960 kHz SCS, the UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on RLM-RS resource symbols to be measured for radio link monitoring, and on one data symbol before each RLM-RS symbol to be measured and one data symbol after each RLM-RS symbol to be measured.

When intra-band carrier aggregation in FR2-2 is performed, the scheduling restrictions on FR2-2 serving PCell or PSCell applies to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

For FR2-2, if following conditions are met,

- UE has been notified about system information update through paging,

- The gap between UE's reception of PDCCH that UE monitors in the Type2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB for RLM and CORESET for RMSI scheduling multiplexing patterns 3, UE shall receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for RLM; and

For the SSB for RLM and CORESET for RMSI scheduling multiplexing patterns 2, UE shall receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for RLM.

8.1A.6.4 Scheduling availability of UE performing radio link monitoring on FR1 or FR2-2 in case of FR1-FR2-2 inter-band CA and NR-DC

There are no scheduling restrictions on FR1 serving cell(s) due to radio link monitoring performed on FR2-2 serving PCell and/or PSCell.

There are no scheduling restrictions on FR2-2 serving cell(s) due to radio link monitoring performed on FR1 serving PCell and/or PSCell.

8.1B Radio Link Monitoring for RedCap

8.1B.1 Introduction

The requirements in clause 8.1B apply for radio link monitoring on UE with reduced capabilities:

- PCell in SA NR operation mode,

The UE shall monitor the downlink radio link quality based on the reference signal configured as RLM-RS resource(s) in order to detect the downlink radio link quality of the PCell as specified in TS 38.213 [3]. The configured RLM-RS resources can be all SSBs, or all CSI-RSs, or a mix of SSBs and CSI-RSs. UE is not required to perform RLM outside the active DL BWP. The SSB and SMTC in this clause applies for both CD-SSB and NCD-SSB if it is not additional specified.

On each RLM-RS resource, the UE shall estimate the downlink radio link quality and compare it to the thresholds $Q_{out,RedCap}$ and $Q_{in,RedCap}$ for the purpose of monitoring downlink radio link quality of the cell.

The threshold $Q_{out,RedCap}$ is defined as the level at which the downlink radio link cannot be reliably received and shall correspond to the out-of-sync block error rate ($BLER_{out}$) as defined in table 8.1B.1-1. For SSB based radio link monitoring, $Q_{out_SSB,RedCap}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1B.2.1-1. For CSI-RS based radio link monitoring, $Q_{out_CSI\text{-}RS,RedCap}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1B.3.1-1.

The threshold $Q_{in,RedCap}$ is defined as the level at which the downlink radio link quality can be received with significantly higher reliability than at $Q_{out,RedCap}$ and shall correspond to the in-sync block error rate ($BLER_{in,RedCap}$) as defined in table 8.1B.1-1. For SSB based radio link monitoring, $Q_{in_SSB,RedCap}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1B.2.1-2. For CSI-RS based radio link monitoring, $Q_{in_CSI\text{-}RS,RedCap}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1B.3.1-2.

The out-of-sync block error rate ($BLER_{out,RedCap}$) and in-sync block error rate ($BLER_{in,RedCap}$) are determined from the network configuration via parameter *rlmInSyncOutOfSyncThreshold* signalled by higher layers. When UE is not configured with *rlmInSyncOutOfSyncThreshold* from the network, UE determines out-of-sync and in-sync block error rates from Configuration #0 in table 8.1B.1-1 by default. All requirements in clause 8.1B are applicable for BLER Configuration #0 in table 8.1B.1-1.

Table 8.1B.1-1: Out-of-sync and in-sync block error rates for RedCap UE

Configuration	$BLER_{out,RedCap}$	$BLER_{in,RedCap}$
0	10 %	2 %

UE shall be able to monitor up to N_{RLM} RLM-RS resources of the same or different types in each corresponding carrier frequency range, depending on a maximum number L_{max} of SSBs per half frame according to TS 38.213 [3], where N_{RLM} is specified in table 8.1B.1-2 according TS 38.213 [3], and meet the requirements as specified in clause 8.1B. UE is not required to meet the requirements in clause 8.1B if RLM-RS is not configured and no TCI state for PDCCH is activated.

FR1, > 3 GHz[Note]	8	4

NOTE: For unpaired spectrum operation with Case C - 30 kHz SCS, 3 GHz is replaced by 1.88 GHz, as specified in clause 4.1 in TS 38.213 [3].		

8.1B.2 Requirements for SSB based radio link monitoring

8.1B.2.1 Introduction

8.1B.2.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_SSB,RedCap}$ period becomes worse than the threshold $Q_{out_SSB,RedCap}$ within $T_{Evaluate_out_SSB,RedCap}$ evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_SSB,RedCap}$ period becomes better than the threshold $Q_{in_SSB,RedCap}$ within $T_{Evaluate_in_SSB,RedCap}$ evaluation period.

$T_{Evaluate_out_SSB,RedCap}$ and $T_{Evaluate_in_SSB,RedCap}$ are defined in table 8.1B.2.2-1 and table 8.1B.2.2-3 for FR1 for UE with 2Rx RedCap and 1Rx RedCap, respectively.

$T_{Evaluate_out_SSB,RedCap}$ and $T_{Evaluate_in_SSB,RedCap}$ are defined in table 8.1B.2.2-2 and for FR2 with scaling factor N=8 for 2Rx RedCap.

For FR1,

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, and these measurement gaps are overlapping with some but not all occasions of the SSB; and

- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

For FR2,

- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when RLM-RS resource is not overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$).

- P is $P_{sharing\ factor}$, when the RLM-RS resource is not overlapped with measurement gap and RLM-RS resource is fully overlapped with SMTC period ($T_{SSB} = T_{SMTCperiod}$).

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and

  - $T_{SMTCperiod} \neq$ MGRP or

  - $T_{SMTCperiod}$ = MGRP and $T_{SSB} < 0.5*T_{SMTCperiod}$

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MGRP}}$, when the RLM-RS is partially overlapped with measurement gap and the RLM-RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and $T_{SMTCperiod}$ = MGRP and $T_{SSB} = 0.5 \times T_{SMTCperiod}$

- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with measurement gap

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MRGP}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with measurement gap ($T_{SMTCperiod} < MGRP$)

- $P_{sharing\ factor} = 1$, if the RLM-RS resource outside measurement gap is

  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,

  - not overlapped by the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.

- $P_{sharing\ factor} = 3$, otherwise.

where,

If the higher layer in TS 38.331 [2] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; Otherwise $T_{SMTCperiod}$ follows *smtc1*.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

8.1B.2.3 Measurement restrictions for SSB based RLM

The UE is required to be capable of measuring SSB for RLM without measurement gaps. The UE is required to perform the SSB measurements with measurement restrictions as described in the following scenarios.

For FR1, when the SSB for RLM is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for RLM without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for RLM without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for RLM and CSI-RS. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

For FR2, when the SSB for RLM measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE is required to measure one of but not both SSB for RLM and CSI-RS. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

8.1B.3 Requirements for CSI-RS based radio link monitoring

8.1B.3.1 Introduction

The requirements in this clause apply for each CSI-RS based RLM-RS resource configured for PCell, provided that the CSI-RS configured for RLM is actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.1B.3.2. UE is not expected to perform radio link monitoring measurements on the CSI-RS configured as RLM-RS if the CSI-RS is not in the active TCI state of any CORESET configured in the UE active BWP.

8.1B.3.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_CSI-RS,RedCap}$ period becomes worse than the threshold $Q_{out_CSI-RS,RedCap}$ within $T_{Evaluate_out_CSI-RS,RedCap}$ evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_CSI-RS,RedCap}$ period becomes better than the threshold $Q_{in_CSI-RS,RedCap}$ within $T_{Evaluate_in_CSI-RS,RedCap}$ evaluation period.

- $T_{Evaluate_out_CSI-RS,RedCap}$ and $T_{Evaluate_in_CSI-RS,RedCap}$ are defined in table 8.1B.3.2-1 and table 8.1B.3.2-3 for FR1 for RedCap 2Rx RedCap and 1Rx RedCap, respectively.

- $T_{Evaluate_out_CSI-RS,RedCap}$ and $T_{Evaluate_in_CSI-RS,RedCap}$ are defined in table 8.1B.3.2-2 for FR2 with scaling factor N=1 for 2 Rx RedCap.

The requirements of $T_{Evaluate_out_CSI-RS,RedCap}$ and $T_{Evaluate_in_CSI-RS,RedCap}$ apply provided that the CSI-RS for RLM is not in a resource set configured with repetition ON. The requirements do not apply when the CSI-RS resource in the active TCI state of CORESET is the same CSI-RS resource for RLM and the TCI state information of the CSI-RS resource is not given, wherein the TCI state information means QCL Type-D to SSB for L1-RSRP or CSI-RS with repetition ON.

For FR1,

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, and these measurement gaps are overlapping with some but not all occasions of the CSI-RS; and

- P=1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the CSI-RS.

For FR2,

- P=1, when the RLM-RS resource is not overlapped with measurement gap and also not overlapped with SMTC occasion.

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is not overlapped with SMTC occasion (T_{CSI-RS} < MGRP)

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when the RLM-RS resource is not overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$).

- $P = P_{sharing\ factor}$, when the RLM-RS resource is not overlapped with measurement gap and RLM-RS resource is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$).

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and
  - $T_{SMTCperiod} \neq$ MGRP or
  - $T_{SMTCperiod}$ = MGRP and $T_{CSI-RS} < 0.5 \times T_{SMTCperiod}$
- $P = \frac{P_{\text{sharing factor}}}{1-\frac{T_{CSI-RS}}{MGRP}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and $T_{SMTCperiod}$ = MGRP and $T_{CSI-RS} = 0.5 \times T_{SMTCperiod}$
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with measurement gap
- $P = \frac{P_{\text{sharing factor}}}{1-\frac{T_{CSI-RS}}{MGRP}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with measurement gap ($T_{SMTCperiod} <$ MGRP)
- $P_{\text{sharing factor}}$ = 1, if the RLM-RS resource outside measurement gap is
  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,
  - not overlapped by the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.
- $P_{\text{sharing factor}}$ = 3, otherwise.

where,

If the higher layer in TS 38.331 [2] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; Otherwise $T_{SMTCperiod}$ follows *smtc1*.

NOTE: The overlap between CSI-RS for RLM and SMTC means that CSI-RS based RLM is within the SMTC window duration.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

The values of $M_{out,RedCap}$ and $M_{in,RedCap}$ used in table 8.1B.3.2-1 and table 8.1B.3.2-2 for UE with 2Rx are defined as:

- $M_{out,RedCap}$ = 20 and $M_{in,RedCap}$ = 10, if the CSI-RS resource configured for RLM is transmitted with higher layer CSI-RS parameter *density* [6, clause 7.4.1] set to 3 and over the bandwidth $\geqslant$ 24 PRBs.

The values of $M_{out,RedCap}$ and $M_{in,RedCap}$ used in table 8.1B.3.2-3 for RedCap UE with 1Rx are defined as:

- $M_{out,RedCap}$ = 40 and $M_{in,RedCap}$ = 10, if the CSI-RS resource configured for RLM is transmitted with higher layer CSI-RS parameter *density* [6, clause 7.4.1] set to 3 and over the bandwidth $\geqslant$ 24 PRBs.

8.1B.3.3 Measurement restrictions for CSI-RS based RLM

The UE is required to be capable of measuring CSI-RS for RLM without measurement gaps. The UE is required to perform the CSI-RS measurements with measurement restrictions as described in the following clauses.

For both FR1 and FR2, when the CSI-RS for RLM is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for RLM in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD, or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for RLM, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for RLM, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS for RLM measurement without restrictions.

- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for RLM and SSB. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

For FR1, when the CSI-RS for RLM is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for RLM without any restriction.

For FR2, when the CSI-RS for RLM is in the same OFDM symbol as SSB for RLM, BFD, or L1-RSRP measurement, or in the same symbol as SSB for CBD when beam failure is detected, UE is required to measure one of but not both

CSI-RS for RLM and SSB. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

For FR2, when the CSI-RS for RLM measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- In the following cases, UE is required to measure one of but not both CSI-RS for RLM and the other CSI-RS. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.
  - The CSI-RS for RLM or the other CSI-RS in a resource set configured with repetition ON, or
  - The other CSI-RS is configured in q1 and beam failure is detected, or
  - The two CSI-RS-es are not QCL-ed w.r.t. QCL-TypeD, or the QCL information is not known to UE,
- Otherwise, UE shall be able to measure the CSI-RS for RLM without any restriction.

8.1B.4 Minimum requirement at transitions

When the UE transitions between RLM CD-SSB resource and RLM NCD-SSB resource due to BWP switching during one evaluation period, the UE shall use an evaluation period that is the maximum of the evaluation periods corresponding to the first SSB type and the second SSB type after the BWP switching. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second SSB type for each RLM-RS resource.

The requirements in clause 8.1.4 shall also apply except the scenarios described above.

8.1B.5 Minimum requirement for UE turning off the transmitter

The requirements in clause 8.1.5 shall apply.

8.1B.6 Minimum requirement for L1 indication

When the downlink radio link quality on all the configured RLM-RS resources is worse than $Q_{out,RedCap}$, layer 1 of the UE shall send an out-of-sync indication for the cell to the higher layers. A layer 3 filter shall be applied to the out-of-sync indications as specified in TS 38.331 [2].

When the downlink radio link quality on at least one of the configured RLM-RS resources is better than $Q_{in,RedCap}$, layer 1 of the UE shall send an in-sync indication for the cell to the higher layers. A layer 3 filter shall be applied to the in-sync indications as specified in TS 38.331 [2].

The out-of-sync and in-sync evaluations for the configured RLM-RS resources shall be performed as specified in clause 5 in TS 38.213 [3]. Two successive indications from layer 1 shall be separated by at least $T_{Indication_interval,RedCap}$.

When DRX is not used for RedCap UEs, $T_{Indication_interval,RedCap}$ is max(10 ms, $T_{RLM\text{-}RS,M}$), where $T_{RLM,M}$ is the shortest periodicity of all configured RLM-RS resources for the monitored cell, which corresponds to T_{SSB} specified in clause 8.1B.2 if the RLM-RS resource is SSB, or $T_{CSI\text{-}RS}$ specified in clause 8.1B.3 if the RLM-RS resource is CSI-RS.

In case DRX is used for RedCap UEs, $T_{Indication_interval,RedCap}$ is Max(10ms, 1.5 × DRX_cycle_length, 1.5 × $T_{RLM\text{-}RS,M}$)) if DRX_cycle_length is less than or equal to 320ms, and $T_{Indication_interval}$ is DRX_cycle_length if DRX_cycle_length is greater than 320ms. Upon start of T310 timer as specified in TS 38.331 [2], the UE shall monitor the configured RLM-RS resources for recovery using the evaluation period and layer 1 indication interval corresponding to the no DRX mode until the expiry or stop of T310 timer.

When DRX is not used for HD-FDD RedCap UEs, $T_{Indication_interval,RedCap}$ is max(10 ms, $T_{RLM\text{-}RS,M}$), where $T_{RLM,M}$ is the shortest periodicity of all configured RLM-RS resources for the monitored cell, which corresponds to T_{SSB} specified in clause 8.1B.2 if the RLM-RS resource is SSB, or $T_{CSI\text{-}RS}$ specified in clause 8.1B.3 if the RLM-RS resource is CSI-RS, under the following condition

- For each RLM-RS configuration, at least one RLM-RS sample must fall with DL occasion within an indication period.

In case DRX is used for HD-FDD RedCap UEs, $T_{Indication_interval,RedCap}$ is Max(10ms, 1.5 × DRX_cycle_length, 1.5 × $T_{RLM-RS,M}$)) if DRX_cycle_length is less than or equal to 320ms, and $T_{Indication_interval}$ is DRX_cycle_length if DRX_cycle_length is greater than 320ms, under the following condition

- For each RLM-RS configuration, at least one RLM-RS sample must fall with DL occasion within an indication period.

8.1B.7 Scheduling availability of UE during radio link monitoring

The requirements in clause 8.1.7 shall apply.

8.1B.7.1 Scheduling availability of UE performing radio link monitoring with a same subcarrier spacing as PDSCH/PDCCH on FR1

The requirements in clause 8.1.7.1 shall apply.

8.1B.7.2 Scheduling availability of UE performing radio link monitoring with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to radio link monitoring based on SSB as RLM-RS. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to radio link monitoring based on SSB as RLM-RS.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for radio link monitoring.

8.1B.7.3 Scheduling availability of UE performing radio link monitoring on FR2

The following scheduling restriction applies due to radio link monitoring on an FR2 serving PCell.

- If the RLM-RS is CSI-RS which is type-D QCLed with active TCI state for PDCCH or PDSCH, and the CSI-RS is not in a CSI-RS resource set with repetition ON,
  - There are no scheduling restrictions due to radio link monitoring based on the CSI-RS.
- Otherwise
  - The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on RLM-RS symbols to be measured for radio link monitoring.

For FR2, if following conditions are met,

- UE has been notified about system information update through paging,
- The gap between UE’s reception of PDCCH that UE monitors in the Type2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB for RLM and CORESET for RMSI scheduling multiplexing patterns 3, UE shall receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for RLM; and

For the SSB for RLM and CORESET for RMSI scheduling multiplexing patterns 2, UE shall receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for RLM.

8.1C Radio Link Monitoring for Satellite Access

8.1C.1 Introduction

The requirements in clause 8.1C apply for radio link monitoring on PCell and the UE is configured with only PCell, which is served by satellite access node (SAN). The UE shall monitor the downlink radio link quality based on the reference signal configured as RLM-RS resource(s) in order to detect the downlink radio link quality of the PCell as specified in TS 38.213 [3]. The configured RLM-RS resources can be all SSBs, or all CSI-RSs, or a mix of SSBs and CSI-RSs. UE is not required to perform RLM outside the active DL BWP.

On each RLM-RS resource, the UE shall estimate the downlink radio link quality and compare it to the thresholds Q_{out} and Q_{in} for the purpose of monitoring downlink radio link quality of the cell.

The threshold Q_{out} is defined as the level at which the downlink radio link cannot be reliably received and shall correspond to the out-of-sync block error rate ($BLER_{out}$) as defined in table 8.1C.1-1. For SSB based radio link monitoring, Q_{out_SSB} is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1C.2.1-1, and table 8.1C.2.1-3 for a UE operating on a cell with less than 5 MHz BW. For CSI-RS based radio link monitoring, $Q_{out_CSI\text{-}RS}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1C.3.1-1.

The threshold Q_{in} is defined as the level at which the downlink radio link quality can be received with significantly higher reliability than at Q_{out} and shall correspond to the in-sync block error rate ($BLER_{in}$) as defined in table 8.1C.1-1. For SSB based radio link monitoring, Q_{in_SSB} is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1C.2.1-2. For CSI-RS based radio link monitoring, $Q_{in_CSI\text{-}RS}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1C.3.1-2.

The out-of-sync block error rate ($BLER_{out}$) and in-sync block error rate ($BLER_{in}$) are determined from the network configuration via parameter *rlmInSyncOutOfSyncThreshold* signalled by higher layers. When UE is not configured with *rlmInSyncOutOfSyncThreshold* from the network, UE determines out-of-sync and in-sync block error rates from Configuration #0 in table 8.1C.1-1 by default. All requirements in clause 8.1C are applicable for BLER Configuration #0 in table 8.1C.1-1.

Table 8.1C.1-1: Out-of-sync and in-sync block error rates

Configuration	$BLER_{out}$	$BLER_{in}$
0	10 %	2 %

UE shall be able to monitor up to N_{RLM} RLM-RS resources of the same or different types in each corresponding carrier frequency range, depending on a maximum number L_{max} of SSBs per half frame according to TS 38.213 [3], where N_{RLM} is specified in table 8.1C.1-2 according TS 38.213 [3], and meet the requirements as specified in clause 8.1C. UE is not required to meet the requirements in clause 8.1C if RLM-RS is not configured and no TCI state for PDCCH is activated.

FR2-NTN[Note 2]	64	8
NOTE: For unpaired spectrum operation with Case C - 30 kHz SCS, 3 GHz is replaced by 1.88 GHz, as specified in clause 4.1 in TS 38.213 [3].		
NOTE 2: NTN bands within this frequency range are regarded as a FR2-1 band when references from other specifications unless otherwise stated.		

8.1C.2 Requirements for SSB based radio link monitoring

8.1C.2.1 Introduction

8.1C.2.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_SSB}$ period becomes worse than the threshold Q_{out_SSB} within $T_{Evaluate_out_SSB}$ evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_SSB}$ period becomes better than the threshold Q_{in_SSB} within $T_{Evaluate_in_SSB}$ evaluation period.

$T_{Evaluate_out_SSB}$ and $T_{Evaluate_in_SSB}$ are defined in table 8.1C.2.2-1 and table 8.1C.2.2-2 for FR1-NTN and FR2-NTN, respectively.

P value for an RLM-RS resource to be measured is defined as

- $P_{sharing\ factor} * N_{total} / N_{outside_MG}$ with $N_{available} = 0$
- $N_{total} / N_{available}$ with $N_{available} > 0$

For a window W of duration max($T_{L1,}$ MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any RLM-RS resource occasion:

- N_{total} is the total number of RLM-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
- $N_{outside_MG}$ is the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
- $N_{available}$ is
  - the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W, if UE does not support *parallelMeasurementWithoutRestriction* and LEO satellites are measured for intra-frequency measurement, and

- same as $N_{outside_MG}$, otherwise

- T_{L1} is periodicity of the target RLM-RS

- $P_{sharing\ factor} = 3$.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For an FR1-NTN and FR2-NTN serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

NOTE: T_{SSB} is the periodicity of the SSB configured for RLM. T_{DRX} is the DRX cycle length.		

8.1C.2.3 Measurement restrictions for SSB based RLM

The UE is required to be capable of measuring SSB for RLM without measurement gaps. The UE is required to perform the SSB measurements with measurement restrictions as described in the following scenarios.

For FR1-NTN and FR2-NTN, when the SSB for RLM is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for RLM without any restriction;

- If SSB and CSI-RS have different SCS,

  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for RLM without any restriction;

  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for RLM and CSI-RS. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

8.1C.3 Requirements for CSI-RS based radio link monitoring

8.1C.3.1 Introduction

The requirements in this clause apply for each CSI-RS based RLM-RS resource configured for PCell, provided that the CSI-RS configured for RLM is actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.1C.3.2. UE is not expected to perform radio link monitoring measurements on the CSI-RS configured as RLM-RS if the CSI-RS is not in the active TCI state of any CORESET configured in the UE active BWP.

8.1C.3.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_CSI\text{-}RS}$ period becomes worse than the threshold $Q_{out_CSI\text{-}RS}$ within $T_{Evaluate_out_CSI\text{-}RS}$ evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_CSI\text{-}RS}$ period becomes better than the threshold $Q_{in_CSI\text{-}RS}$ within $T_{Evaluate_in_CSI\text{-}RS}$ evaluation period.

- $T_{Evaluate_out_CSI\text{-}RS}$ and $T_{Evaluate_in_CSI\text{-}RS}$ are defined in table 8.1C.3.2-1 for FR1-NTN.
- $T_{Evaluate_out_CSI\text{-}RS}$ and $T_{Evaluate_in_CSI\text{-}RS}$ are defined in table 8.1C.3.2-2 for FR2-NTN.

The requirements of $T_{Evaluate_out_CSI\text{-}RS}$ and $T_{Evaluate_in_CSI\text{-}RS}$ apply provided that the CSI-RS for RLM is not in a resource set configured with repetition ON. The requirements do not apply when the CSI-RS resource in the active TCI state of CORESET is the same CSI-RS resource for RLM and the TCI state information of the CSI-RS resource is not given, wherein the TCI state information means QCL Type-D to SSB for L1-RSRP or CSI-RS with repetition ON.

P value for an RLM-RS resource to be measured is defined as

- $P_{sharing\ factor} * N_{total} / N_{outside_MG}$ with $N_{available} = 0$
- $N_{total} / N_{available}$ with $N_{available} > 0$

For a window W of duration max($T_{L1,}$ MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any RLM-RS resource occasion:

- N_{total} is the total number of RLM-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
- $N_{outside_MG}$ is the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
- $N_{available}$ is

- the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W, if UE does not support *parallelMeasurementWithoutRestriction* and LEO satellites are measured for intra-frequency measurement, and
- same as $N_{outside_MG}$, otherwise

- T_{L1} is periodicity of the target RLM-RS
- $P_{sharing\ factor} = 3$.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For an FR1-NTN and FR2-NTN serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

The values of M_{out} and M_{in} used in table 8.1C.3.2-1 are defined as:

- $M_{out} = 20$ and $M_{in} = 10$, if the CSI-RS resource configured for RLM is transmitted with higher layer CSI-RS parameter *density* [6, clause 7.4.1] set to 3 and over the bandwidth $\geqslant$ 24 PRBs.

The values of M_{out} and M_{in} used in table 8.1C.3.2-2 are defined as:

- $M_{out} = 40$ and $M_{in} = 10$, if the CSI-RS resource configured for RLM is transmitted with higher layer CSI-RS parameter *density* TS 38.211 [6], clause 7.4.1, set to 3 and over the bandwidth $\geqslant$ 24 PRBs.

NOTE: T_{CSI-RS} is the periodicity of the CSI-RS resource configured for RLM. The requirements in this table apply for T_{CSI-RS} equal to 5 ms, 10 ms, 20 ms or 40 ms. T_{DRX} is the DRX cycle length.		

8.1C.3.3 Measurement restrictions for CSI-RS based RLM

The UE is required to be capable of measuring CSI-RS for RLM without measurement gaps. The UE is required to perform the CSI-RS measurements with measurement restrictions as described in the following clauses.

For FR1-NTN and FR2-NTN, when the CSI-RS for RLM is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for RLM in the PRBs that overlap with an SSB.

For FR1-NTN and FR2-NTN, when the SSB for RLM, BFD, CBD, or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for RLM, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1-NTN and FR2-NTN, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for RLM, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS for RLM measurement without restrictions.

- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for RLM and SSB. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

For FR1-NTN and FR2-NTN, when the CSI-RS for RLM is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for RLM without any restriction.

8.1C.4 Minimum requirement at transitions

When the UE transitions between DRX and no DRX or when DRX cycle periodicity changes, for each RLM-RS resource, for a duration of time equal to the evaluation period corresponding to the second mode after the transition occurs, the UE shall use an evaluation period that is no less than the minimum of evaluation period corresponding to the first mode and the second mode. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second mode for each RLM-RS resource. This requirement shall be applied to both out-of-sync evaluation and in-sync evaluation of the monitored cell.

When the UE transitions from a first configuration of RLM resources to a second configuration of RLM resources that is different from the first configuration, for each RLM resource present in the second configuration, for a duration of time equal to the evaluation period corresponding to the second configuration after the transition occurs, the UE shall use an evaluation period that is no less than the minimum of evaluation periods corresponding to the first configuration and the second configuration. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second configuration for each RLM resource present in the second configuration. This requirement shall be applied to both out-of-sync evaluation and in-sync evaluation of the monitored cell.

When the UE transitions from a first configuration of active TCI state of the CORESET to a second configuration of active TCI state of the CORESET, for each CSI-RS for RLM present in the second configuration, the UE shall use an evaluation period corresponding to the second configuration from the time of transition. This requirement shall be applied to both out-of-sync evaluation and in-sync evaluation of the monitored cell.

8.1C.5 Minimum requirement for UE turning off the transmitter

The transmitter power of the UE in the monitored cell shall be turned off within 40 ms after expiry of T310 timer as specified in TS 38.331 [2].

8.1C.6 Minimum requirement for L1 indication

When the downlink radio link quality on all the configured RLM-RS resources is worse than Q_{out}, layer 1 of the UE shall send an out-of-sync indication for the cell to the higher layers. A layer 3 filter shall be applied to the out-of-sync indications as specified in TS 38.331 [2].

When the downlink radio link quality on at least one of the configured RLM-RS resources is better than Q_{in}, layer 1 of the UE shall send an in-sync indication for the cell to the higher layers. A layer 3 filter shall be applied to the in-sync indications as specified in TS 38.331 [2].

The out-of-sync and in-sync evaluations for the configured RLM-RS resources shall be performed as specified in clause 5 in TS 38.213 [3]. Two successive indications from layer 1 shall be separated by at least $T_{Indication_interval}$.

When DRX is not used $T_{Indication_interval}$ is max(10 ms, $T_{RLM\text{-}RS,M}$), where $T_{RLM\text{-}RS,M}$ is the shortest periodicity of all configured RLM-RS resources for the monitored cell, which corresponds to T_{SSB} specified in clause 8.1C.2 if the RLM-RS resource is SSB, or $T_{CSI\text{-}RS}$ specified in clause 8.1C.3 if the RLM-RS resource is CSI-RS.

In case DRX is used, $T_{Indication_interval}$ is Max(10ms, 1.5 × DRX_cycle_length, 1.5 × $T_{RLM\text{-}RS,M}$)) if DRX_cycle_length is less than or equal to 320ms, and $T_{Indication_interval}$ is DRX_cycle_length if DRX_cycle_length is greater than 320ms. Upon start of T310 timer as specified in TS 38.331 [2], the UE shall monitor the configured RLM-RS resources for recovery using the evaluation period and layer 1 indication interval corresponding to the no DRX mode until the expiry or stop of T310 timer.

8.1C.7 Scheduling availability of UE during radio link monitoring

When the reference signal to be measured for RLM has different subcarrier spacing than PDSCH/PDCCH , there are restrictions on the scheduling availability as described in the following clauses.

8.1C.7.1 Scheduling availability of UE performing radio link monitoring with a same subcarrier spacing as PDSCH/PDCCH on FR1-NTN and FR2-NTN

There are no scheduling restrictions due to radio link monitoring performed with a same subcarrier spacing as PDSCH/PDCCH on FR1-NTN and FR2-NTN.

8.1C.7.2 Scheduling availability of UE performing radio link monitoring with a different subcarrier spacing than PDSCH/PDCCH on FR1-NTN and FR2-NTN

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to radio link monitoring based on SSB as RLM-RS. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to radio link monitoring based on SSB as RLM-RS.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for radio link monitoring.

8.1D Radio Link Monitoring for ATG

8.1D.1 Introduction

The requirements in clause 8.1D apply for radio link monitoring on ATG UE.

The UE shall monitor the downlink radio link quality based on the reference signal configured as RLM-RS resource(s) in order to detect the downlink radio link quality of the PCell as specified in TS 38.213 [3]. The configured RLM-RS resources can be all SSBs, or all CSI-RSs, or a mix of SSBs and CSI-RSs. UE is not required to perform RLM outside the active DL BWP.

On each RLM-RS resource, the UE shall estimate the downlink radio link quality and compare it to the thresholds Q_{out} and Q_{in} for the purpose of monitoring downlink radio link quality of the cell.

The threshold Q_{out} is defined as the level at which the downlink radio link cannot be reliably received and shall correspond to the out-of-sync block error rate ($BLER_{out}$) as defined in table 8.1.1-1. For SSB based radio link monitoring, Q_{out_SSB} is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1.2.1-1. For CSI-RS based radio link monitoring, $Q_{out_CSI\text{-}RS}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1.3.1-1.

The threshold Q_{in} is defined as the level at which the downlink radio link quality can be received with significantly higher reliability than at Q_{out} and shall correspond to the in-sync block error rate ($BLER_{in}$) as defined in table 8.1.1-1. For SSB based radio link monitoring, Q_{in_SSB} is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1.2.1-2. For CSI-RS based radio link monitoring, $Q_{in_CSI\text{-}RS}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1.3.1-2.

The out-of-sync block error rate ($BLER_{out}$) and in-sync block error rate ($BLER_{in}$) are determined from the network configuration via parameter *rlmInSyncOutOfSyncThreshold* signalled by higher layers. When UE is not configured with *rlmInSyncOutOfSyncThreshold* from the network, UE determines out-of-sync and in-sync block error rates from Configuration #0 in table 8.1.1-1 by default. All requirements in clause 8.1D are applicable for BLER Configuration #0 in table 8.1.1-1.

UE shall be able to monitor up to N_{RLM} RLM-RS resources of the same or different types in each corresponding carrier frequency range, depending on a maximum number L_{max} of SSBs per half frame according to TS 38.213 [3], where N_{RLM} is specified in table 8.1D.1-2 according TS 38.213 [3], and meet the requirements as specified in clause 8.1D. 8.1D.2.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_SSB}$ period becomes worse than the threshold Q_{out_SSB} within $T_{Evaluate_out_SSB}$ evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_SSB}$ period becomes better than the threshold Q_{in_SSB} within $T_{Evaluate_in_SSB}$ evaluation period.

$T_{Evaluate_out_SSB}$ and $T_{Evaluate_in_SSB}$ are defined in table 8.1D.2.2-1 for FR1.

For FR1 ATG UE with one or multiple omni-directional antenna(s),

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency or inter-frequency measurements, and these measurement gaps are overlapping with some but not all occasions of the SSB; and

- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

For FR1 ATG UE with the antenna array on the measured carrier,

- P value for an RLM-RS resource to be measured is defined as
  - $P_{sharing\ factor}$ * N_{total} / $N_{outside_MG}$ with $N_{available}$ = 0
  - N_{total} / $N_{available}$ with $N_{available}$ > 0
    - For a window W of duration max(T_{L1}, $MGRP_{max}$), where $MGRP_{max}$ is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any RLM-RS resource occasion:
    - N_{total} is the total number of RLM-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
    - $N_{outside_MG}$ is the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
    -- $N_{available}$ is
      - If inter-band carrier aggregation within FR1 is configured, and UE not capable of *antennaArrayType-r18* on the other serving carrier, or UE support two simultaneous separate Rx beams
        - the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion nor CSI-RSs resource occasions for L3 measurements of the same serving cell within the window W,
      - otherwise,
    - the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W
    - T_{L1} is periodicity of the target RLM-RS
    - $P_{sharing\ factor}$ = 3.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

Table 8.1D.2.2-1: Evaluation period $T_{Evaluate_out_SSB}$ and $T_{Evaluate_in_SSB}$ for FR1

Configuration	$T_{Evaluate_out_SSB}$ (ms)	$T_{Evaluate_in_SSB}$ (ms)
no DRX	Max(200, Ceil(10 × P) × T_{SSB})	Max(100, Ceil(5 × P) × T_{SSB})
DRX cycle≤320 ms	Max(200, Ceil(15 × P) × Max(T_{DRX},T_{SSB}))	Max(100, Ceil(7.5 × P) × Max(T_{DRX},T_{SSB}))
DRX cycle>320 ms	Ceil(10 × P) × T_{DRX}	Ceil(5 × P) × T_{DRX}
NOTE: T_{SSB} is the periodicity of the SSB configured for RLM. T_{DRX} is the DRX cycle length.		

8.1D.2.3 Measurement restrictions for SSB based RLM

The UE is required to be capable of measuring SSB for RLM without measurement gaps. The UE is required to perform the SSB measurements with measurement restrictions as described in the following clauses.

For FR1, when the SSB for RLM is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for RLM without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for RLM without any restriction;

- If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for RLM and CSI-RS. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

8.1D.3 Requirements for CSI-RS based radio link monitoring

8.1D.3.1 Introduction

The requirements in this clause apply for each CSI-RS based RLM-RS resource configured for PCell, provided that the CSI-RS configured for RLM is actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.1D.3.2. UE is not expected to perform radio link monitoring measurements on the CSI-RS configured as RLM-RS if the CSI-RS is not in the active TCI state of any CORESET configured in the UE active BWP.

Table 8.1D.3.1-1: Void

Table 8.1D.3.1-2: Void

8.1D.3.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_CSI-RS}$ period becomes worse than the threshold Q_{out_CSI-RS} within $T_{Evaluate_out_CSI-RS}$ evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_CSI-RS}$ period becomes better than the threshold Q_{in_CSI-RS} within $T_{Evaluate_in_CSI-RS}$ evaluation period.

- $T_{Evaluate_out_CSI-RS}$ and $T_{Evaluate_in_CSI-RS}$ are defined in table 8.1D.3.2-1 for FR1.

The requirements of $T_{Evaluate_out_CSI-RS}$ and $T_{Evaluate_in_CSI-RS}$ apply provided that the CSI-RS for RLM is not in a resource set configured with repetition ON. The requirements do not apply when the CSI-RS resource in the active TCI state of CORESET is the same CSI-RS resource for RLM and the TCI state information of the CSI-RS resource is not given, wherein the TCI state information means QCL Type-D to SSB for L1-RSRP or CSI-RS with repetition ON.

For FR1 ATG UE with one or multiple omni-directional antenna(s),

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency or inter-frequency measurements, and these measurement gaps are overlapping with some but not all occasions of the CSI-RS; and
- P = 1, when in the monitored cell there are no measurement gaps overlapping with any occasion of the CSI-RS.

For FR1 ATG UE with the antenna array on the measured carrier,

- P value for an RLM-RS resource to be measured is defined as

  $P_{sharing\ factor} * N_{total} / N_{outside_MG}$ with $N_{available} = 0$

  $N_{total} / N_{available}$ with $N_{available} > 0$

  - For a window W of duration max(T_{L1}, $MGRP_{max}$), where $MGRP_{max}$ is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any RLM-RS resource occasion:
  - N_{total} is the total number of RLM-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
  - $N_{outside_MG}$ is the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
  - $N_{available}$ is
    - If inter-band carrier aggregation within FR1 is configured, and UE not capable of *antennaArrayType-r18* on the other serving carrier, or UE support two simultaneous separate Rx beams

- the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion nor CSI-RSs resource occasions for L3 measurements of the same serving cell within the window W,

- otherwise,

- the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W

- T_{L1} is periodicity of the target RLM-RS

- $P_{sharing\ factor} = 3$.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

The values of M_{out} and M_{in} used in table 8.1D.3.2-1 are defined as:
