| <b>sps-ConfigIndex</b>               | Indicates the index of one of multiple SPS configurations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>sps-HARQ-Deferral</b>             | Indicates the maximum number of slots or subslots the transmission of DL SPS HARQ-ACK in a slot or subslot can be deferred (see TS 38.213 [13], clause 9.2.5.4).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Conditional Presence | Explanation                                                                                                                                                      |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SPS-List             | The field is mandatory present when included in <i>sps-ConfigToAddModList-r16</i> or <i>sps-ConfigMulticastToAddModList-r17</i> , otherwise the field is absent. |

— *SPS-ConfigIndex*

The IE *SPS-ConfigIndex* is used to indicate the index of one of multiple DL SPS configurations in one BWP.

***SPS-ConfigIndex* information element**

```
-- ASN1START
-- TAG-SPS-CONFIGINDEX-START

SPS-ConfigIndex-r16 ::= INTEGER (0.. maxNrofSPS-Config-1-r16)

-- TAG-SPS-CONFIGINDEX-STOP
-- ASN1STOP
```

— *SPS-PUCCH-AN*

The IE *SPS-PUCCH-AN* is used to indicate a PUCCH resource for HARQ ACK and configure the corresponding maximum payload size for the PUCCH resource.

***SPS-PUCCH-AN* information element**

```
-- ASN1START
-- TAG-SPS-PUCCH-AN-START

SPS-PUCCH-AN-r16 ::= SEQUENCE {
    sps-PUCCH-AN-ResourceID-r16 PUCCH-ResourceId,
    maxPayloadSize-r16 INTEGER (4..256) OPTIONAL -- Need R
}

-- TAG-SPS-PUCCH-AN-STOP
-- ASN1STOP
```

| <i>SPS-PUCCH-AN</i> field descriptions                                                                      |
|-------------------------------------------------------------------------------------------------------------|
| <b><i>maxPayloadSize</i></b><br>Indicates the maximum payload size for the corresponding PUCCH resource ID. |
| <b><i>sps-PUCCH-AN-ResourceID</i></b><br>Indicates the PUCCH resource ID                                    |

— *SPS-PUCCH-AN-List*

The IE *SPS-PUCCH-AN-List* is used to configure the list of PUCCH resources per HARQ ACK codebook

***SPS-PUCCH-AN-List* information element**

```
-- ASN1START
```

```
-- TAG-SPS-PUCCH-AN-LIST-START
SPS-PUCCH-AN-List-r16 ::= SEQUENCE (SIZE(1..4)) OF SPS-PUCCH-AN-r16
-- TAG-SPS-PUCCH-AN-LIST-STOP
-- ASN1STOP
```

## — *SRB-Identity*

The IE *SRB-Identity* is used to identify a Signalling Radio Bearer (SRB) used by a UE.

### *SRB-Identity* information element

```
-- ASN1START
-- TAG-SRB-IDENTITY-START
SRB-Identity ::= INTEGER (1..3)
SRB-Identity-v1700 ::= INTEGER (4)
-- TAG-SRB-IDENTITY-STOP
-- ASN1STOP
```

## — *SRS-CarrierSwitching*

The IE *SRS-CarrierSwitching* is used to configure SRS carrier switching when PUSCH is not configured or to configure independent SRS power control from that of PUSCH.

### *SRS-CarrierSwitching* information element

```
-- ASN1START
-- TAG-SRS-CARRIERSWITCHING-START
SRS-CarrierSwitching ::= SEQUENCE {
    srs-SwitchFromServCellIndex INTEGER (0..31) OPTIONAL, -- Need M
    srs-SwitchFromCarrier ENUMERATED {sUL, nUL},

|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>monitoringCells</b><br>A set of serving cells for monitoring PDCCH conveying SRS DCI format with CRC scrambled by TPC-SRS-RNTI (see TS 38.212 [17], TS 38.213 [13], clause 7.3.1, 11.4).                                                                                                                                                                                                                                                                                                                                             |
| <b>srs-SwitchFromCarrier</b><br>The UE ignores this field in case of independent SRS power control from that of PUSCH.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>srs-SwitchFromServCellIndex</b><br>Indicates the serving cell whose UL transmission may be interrupted during SRS transmission on a PUSCH-less SCell. During SRS transmission on a PUSCH-less SCell, the UE may temporarily suspend the UL transmission on a serving cell with PUSCH in the same CG to allow the PUSCH-less SCell to transmit SRS. (see TS 38.214 [19], clause 6.2.1.3).                                                                                                                                             |
| <b>srs-TPC-PDCCH-Group</b><br>Network configures the UE with either typeA-SRS-TPC-PDCCH-Group or typeB-SRS-TPC-PDCCH-Group, if any.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>typeA</b><br>Type A trigger configuration for SRS transmission on a PUSCH-less SCell, or for SRS transmission on a serving cell with independent SRS power control from that of PUSCH (see TS 38.213 [13], clause 11.4). In this release, the network configures at most one entry (the first entry) of <i>typeA</i> , and the first entry corresponds to the serving cell in which the <i>SRS-CarrierSwitching</i> field is configured. SRS carrier switching to SUL carrier is not supported in this version of the specification. |
| <b>typeB</b><br>Type B trigger configuration for SRS transmission on a PUSCH-less SCell, or for SRS transmission on a serving cell with independent SRS power control from that of PUSCH (see TS 38.213 [13], clause 11.4).                                                                                                                                                                                                                                                                                                             |

| SRS-TPC-PDCCH-Config field descriptions                                                                                                                                                                    |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>srs-CC-SetIndexlist</b><br>A list of pairs of [cc-SetIndex; cc-IndexInOneCC-Set] (see TS 38.212 [17], TS 38.213 [13], clause 7.3.1, 11.4). The network does not configure this field for <i>typeB</i> . |

–
SRS-Config

The IE *SRS-Config* is used to configure sounding reference signal transmissions. The configuration defines a list of SRS-Resources, a list of SRS-PosResources, a list of SRS-PosResourceSets and a list of SRS-ResourceSets. Each resource set defines a set of SRS-Resources or SRS-PosResources. The network triggers the transmission of the set of

SRS-Resources or SRS-PosResources using a configured aperiodicSRS-ResourceTrigger (L1 DCI). The network does not configure SRS specific power control parameters *alpha* (without suffix) or *pathlossReferenceRS* if *unifiedTCI-StateType* is configured for the serving cell.

### SRS-Config information element

```

| <b>enableStartRBHopping</b><br>When this RRC parameter is configured, start RB location hopping is enabled for partial frequency sounding in different SRS frequency hopping periods for periodic/semi-persistent/aperiodic SRS as described in Clause 6.4.1.4 in TS 38.211.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>freqHopping</b><br>Includes parameters capturing SRS frequency hopping (see TS 38.214 [19], clause 6.2.1). For CLI SRS-RSRP measurement, the network always configures this field such that $b\text{-hop} > b\text{-SRS}$ .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>groupOrSequenceHopping</b><br>Parameter(s) for configuring group or sequence hopping (see TS 38.211 [16], clause 6.4.1.4.2). For CLI SRS-RSRP measurement, the network always configures this parameter to 'neither'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>nrofSRS-Ports</b><br>Number of ports. For CLI SRS-RSRP measurement, the network always configures this parameter to 'port1'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>periodicityAndOffset-p, periodicityAndOffset-p-Ext</b><br>Periodicity and slot offset for this SRS resource. All values are in "number of slots". Value $s/1$ corresponds to a periodicity of 1 slot, value $s/2$ corresponds to a periodicity of 2 slots, and so on. For each periodicity the corresponding offset is given in number of slots. For periodicity $s/1$ the offset is 0 slots (see TS 38.214 [19], clause 6.2.1). For CLI SRS-RSRP measurement, $s/1280$ and $s/2560$ cannot be configured. For <i>SRS-PosResource</i> , values $s/20480$ , $s/40960$ and $s/81920$ cannot be configured for SCS=15kHz, values $s/40960$ and $s/81920$ cannot be configured for SCS=30kHz, and value $s/81920$ cannot be configured for SCS=60kHz.<br>When <i>periodicityAndOffset-p-Ext</i> is present, <i>periodicityAndOffset-p</i> shall be ignored by the UE.                                                                                                                                                                                                                                                                                         |
| <b>periodicityAndOffset-sp, periodicityAndOffset-sp-Ext</b><br>Periodicity and slot offset for this SRS resource. All values are in "number of slots". Value $s/1$ corresponds to a periodicity of 1 slot, value $s/2$ corresponds to a periodicity of 2 slots, and so on. For each periodicity the corresponding offset is given in number of slots. For periodicity $s/1$ the offset is 0 slots (see TS 38.214 [19], clause 6.2.1). For <i>SRS-PosResource</i> , values $s/20480$ , $s/40960$ and $s/81920$ cannot be configured for SCS=15kHz, values $s/40960$ and $s/81920$ cannot be configured for SCS=30kHz, and value $s/81920$ cannot be configured for SCS=60kHz.<br>When <i>periodicityAndOffset-sp-Ext</i> is present, <i>periodicityAndOffset-sp</i> shall be ignored by the UE.                                                                                                                                                                                                                                                                                                                                                               |
| <b>ptrs-PortIndex</b><br>The PTRS port index for this SRS resource for non-codebook based UL MIMO. This is only applicable when the corresponding <i>PTRS-UplinkConfig</i> is set to CP-OFDM. The <i>ptrs-PortIndex</i> configured here must be smaller than the <i>maxNrofPorts</i> configured in the <i>PTRS-UplinkConfig</i> (see TS 38.214 [19], clause 6.2.3.1). This parameter is not applicable to CLI SRS-RSRP measurement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>resourceMapping</b><br>OFDM symbol location of the SRS resource within a slot including <i>nrofSymbols</i> (number of OFDM symbols), <i>startPosition</i> (value 0 refers to the last symbol, value 1 refers to the second last symbol, and so on) and <i>repetitionFactor</i> (see TS 38.214 [19], clause 6.2.1 and TS 38.211 [16], clause 6.4.1.4). The configured SRS resource does not exceed the slot boundary. If <i>resourceMapping-r16</i> is signalled, UE shall ignore the <i>resourceMapping</i> (without suffix). If <i>resourceMapping-r17</i> is signalled, <i>resourceMapping-r16</i> is not signalled and the UE shall ignore the <i>resourceMapping</i> (without suffix) and only the values of <i>nrofSymbols</i> which are integer multiples of the configured <i>repetitionFactor</i> can be configured. The network can only signal <i>repetitionFactor-v1730</i> if <i>resourceMapping-r17</i> is signalled. When <i>repetitionFactor-v1730</i> is signalled, the UE shall ignore <i>repetitionFactor-r17</i> . For CLI SRS-RSRP measurement, the network always configures <i>nrofSymbols</i> and <i>repetitionFactor</i> to 'n1'. |
| <b>resourceType</b><br>Periodicity and offset for semi-persistent and periodic SRS resource, or slot offset for aperiodic SRS resource for positioning (see TS 38.214 [19], clause 6.2.1). For CLI SRS-RSRP measurement, only 'periodic' is applicable for <i>resourceType</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>sequenceId</b><br>Sequence ID used to initialize pseudo random group and sequence hopping (see TS 38.214 [19], clause 6.2.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>slotOffset</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| An offset in number of slots between the triggering DCI and the actual transmission of this <i>SRS-PosResource</i> . If the field is absent the UE applies no offset (value 0).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b><i>alpha</i></b><br>alpha value for SRS power control (see TS 38.213 [13], clause 7.3). When the field is absent the UE applies the value 1.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>aperiodicSRS-ResourceTriggerList</i></b><br>An additional list of DCI "code points" upon which the UE shall transmit SRS according to this SRS resource set configuration (see TS 38.214 [19], clause 6). When the field is not included during a reconfiguration of <i>SRS-ResourceSet</i> of <i>resourceType</i> set to <i>aperiodic</i> , UE maintains this value based on the Need M; that is, this list is not considered as an extension of <i>aperiodicSRS-ResourceTrigger</i> for purpose of applying the general rule for extended list in clause 6.1.3. |
| <b><i>aperiodicSRS-ResourceTrigger</i></b><br>The DCI "code point" upon which the UE shall transmit SRS according to this SRS resource set configuration (see TS 38.214 [19], clause 6).                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>associatedCSI-RS</i></b><br>ID of CSI-RS resource associated with this SRS resource set in non-codebook based operation (see TS 38.214 [19], clause 6.1.1.2).                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>availableSlotOffsetList</i></b><br>Indicates a list of up to four different available slot offset values from slot $n+k$ to the slot where the aperiodic SRS resource set is transmitted, where slot $n$ is the slot with the triggering DCI, and $k$ is the <i>slotOffset</i> (without suffix) as described in clause 6.2.1 of TS 38.214 [19].                                                                                                                                                                                                                   |
| <b><i>csi-RS</i></b><br>ID of CSI-RS resource associated with this SRS resource set (see TS 38.214 [19], clause 6.1.1.2).                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>dl-PRS</i></b><br>This field indicates a PRS configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>followUnifiedTCI-StateSRS</i></b><br>When set to enabled, for SRS resource Set, the UE applies the "indicated" UL only TCI or joint TCI as specified in TS 38.214 [19], clause 5.1.5. This parameter may be configured for aperiodic SRS for BM or SRS of any time-domain behavior for codebook, non-codebook, and antenna switching.                                                                                                                                                                                                                             |
| <b><i>p0</i></b><br>P0 value for SRS power control. The value is in dBm. Only even values (step size 2) are allowed (see TS 38.213 [13], clause 7.3).                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>pathlossReferenceRS</i></b><br>A reference signal (e.g. a CSI-RS config or a SS block) to be used for SRS path loss estimation (see TS 38.213 [13], clause 7.3).                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>pathlossReferenceRS-Pos</i></b><br>A reference signal (e.g. a SS block or a DL-PRS config) to be used for SRS path loss estimation (see TS 38.213 [13], clause 7.3).                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>pathlossReferenceRSList</i></b><br>Multiple candidate pathloss reference RS(s) for SRS power control, where one candidate RS can be mapped to SRS Resource Set via MAC CE (clause 6.1.3.27 in TS 38.321 [3]). The network can only configure this field if <i>pathlossReferenceRS</i> is not configured in the same <i>SRS-ResourceSet</i> .                                                                                                                                                                                                                      |
| <b><i>resourceType</i></b><br>Time domain behavior of SRS resource configuration, see TS 38.214 [19], clause 6.2.1. The network configures SRS resources in the same resource set with the same time domain behavior on periodic, aperiodic and semi-persistent SRS. The aperiodic SRS is not applicable for the UE in RRC INACTIVE.                                                                                                                                                                                                                                    |
| <b><i>slotOffset</i></b><br>An offset in number of slots between the triggering DCI and the actual transmission of this <i>SRS-ResourceSet</i> . If the field is absent the UE applies no offset (value 0).                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>srs-PowerControlAdjustmentStates</i></b><br>Indicates whether $h_{srs,c(i)} = f_c(i,1)$ or $h_{srs,c(i)} = f_c(i,2)$ (if twoPUSCH-PC-AdjustmentStates are configured) or separate close loop is configured for SRS. This parameter is applicable only for Uls on which UE also transmits PUSCH. If absent or release, the UE applies the value sameAs-Fci1 (see TS 38.213 [13], clause 7.3).                                                                                                                                                                      |
| <b><i>srs-ResourceIdList, srs-PosResourceIdList</i></b><br>The IDs of the SRS-Resources/SRS-PosResource used in this <i>SRS-ResourceSet</i> / <i>SRS-PosResourceSet</i> . If this <i>SRS-ResourceSet</i> is configured with usage set to codebook, the <i>srs-ResourceIdList</i> contains at most 2 entries. If this <i>SRS-ResourceSet</i> is configured with usage set to <i>nonCodebook</i> , the <i>srs-ResourceIdList</i> contains at most 4 entries.                                                                                                              |
| <b><i>srs-ResourceSetId, srs-PosResourceSetId</i></b><br>The ID of this resource set. It is unique in the context of the BWP in which the parent <i>SRS-Config</i> is defined.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>ssb-IndexServing</i></b><br>Indicates SSB index belonging to a serving cell where the SRS is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                                                                                                                                                                                                                                                                       |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ssb-Ncell</i></b>                                                                                                                                                                                                                                               |
| This field indicates a SSB configuration from neighboring cell.                                                                                                                                                                                                       |
| <b><i>usage</i></b>                                                                                                                                                                                                                                                   |
| Indicates if the SRS resource set is used for beam management, codebook based or non-codebook based transmission or antenna switching. See TS 38.214 [19], clause 6.2.1. Reconfiguration between codebook based and non-codebook based transmission is not supported. |
| <b><i>usagePDC</i></b>                                                                                                                                                                                                                                                |
| If configured, it indicates that this SRS resource set is used for propagation delay compensation. The field can be present in only one <i>SRS-ResourceSet</i> .                                                                                                      |

| <b><i>csi-RS-IndexServing</i></b>                                                                                                                                                                                             |
| Indicates CSI-RS index belonging to a serving cell.                                                                                                                                                                           |
| <b><i>dl-PRS</i></b>                                                                                                                                                                                                          |
| This field indicates a PRS configuration.                                                                                                                                                                                     |
| <b><i>resourceSelection</i></b>                                                                                                                                                                                               |
| Indicates whether the configured SRS spatial relation resource is a <i>SRS-Resource</i> or <i>SRS-PosResource</i> .                                                                                                           |
| <b><i>servingCellId</i></b>                                                                                                                                                                                                   |
| The serving Cell ID of the source SSB, CSI-RS, or SRS for the spatial relation of the target SRS resource. If this field is absent the SSB, the CSI-RS, or the SRS is from the same serving cell where the SRS is configured. |
| <b><i>ssb-IndexServing</i></b>                                                                                                                                                                                                |
| Indicates SSB index belonging to a serving cell.                                                                                                                                                                              |
| <b><i>ssb-Ncell</i></b>                                                                                                                                                                                                       |
| This field indicates a SSB configuration from neighboring cell.                                                                                                                                                               |

| <b><i>SSB-InfoNcell</i></b> field descriptions                                                                                                                                                                                                                                                                           |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>physicalCellId</i></b>                                                                                                                                                                                                                                                                                             |
| This field specifies the physical cell ID of the neighbour cell for which SSB configuration is provided.                                                                                                                                                                                                                 |
| <b><i>ssb-IndexNcell</i></b>                                                                                                                                                                                                                                                                                             |
| This field specifies the index of the SSB for a neighbour cell. See TS 38.213 [13]. If this field is absent, the UE determines the <i>ssb-IndexNcell</i> of the <i>physicalCellId</i> based on its SSB measurement from the cell.                                                                                        |
| <b><i>ssb-Configuration</i></b>                                                                                                                                                                                                                                                                                          |
| This field specifies the full configuration of the SSB. If this field is absent, the UE obtains the configuration for the SSB from <i>nr-SSB-Config</i> received as part of DL-PRS assistance data in LPP, see TS 37.355 [49], by looking up the corresponding SSB configuration using the field <i>physicalCellId</i> . |

| <b><i>DL-PRS-Info</i></b> field descriptions                                                                                                                                                                                |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>dl-PRS-ID</i></b>                                                                                                                                                                                                     |
| This field specifies the UE specific TRP ID (see TS 37.355 [49]) for which PRS configuration is provided.                                                                                                                   |
| <b><i>dl-PRS-ResourceSetId</i></b>                                                                                                                                                                                          |
| This field specifies the PRS-ResourceSet ID of a PRS resourceSet.                                                                                                                                                           |
| <b><i>dl-PRS-ResourceId</i></b>                                                                                                                                                                                             |
| This field specifies the PRS-Resource ID of a PRS resource. If this field is absent, the UE determines the <i>dl-PRS-ResourceID</i> based on its PRS measurement from the TRP (see TS 37.355 [49]) and DL-PRS Resource Set. |

| <b>SSB-Configuration field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>halfFrameIndex</b>                       | Indicates whether SSB is in the first half or the second half of the frame. Value zero indicates the first half and value 1 indicates the second half.                                                                                                                                                                                                                                                                 |
| <b>integerSubframeOffset</b>                | Indicates the subframe boundary offset of the cell in which SSB is transmitted.                                                                                                                                                                                                                                                                                                                                        |
| <b>sfn0-Offset</b>                          | Indicates the time offset of the SFN0 slot 0 for the cell with respect to SFN0 slot 0 of serving cell.                                                                                                                                                                                                                                                                                                                 |
| <b>sfn-Offset</b>                           | Specifies the SFN offset between the cell in which SSB is transmitted and serving cell. The offset corresponds to the number of full radio frames counted from the beginning of a radio frame #0 of serving cell to the beginning of the closest subsequent radio frame #0 of the cell in which SSB is transmitted.                                                                                                    |
| <b>sfn-SSB-Offset</b>                       | Indicates the SFN offset of the transmitted SSB relative to the start of the SSB period. Value 0 indicates that the SSB is transmitted in the first system frame, value 1 indicates that SSB is transmitted in the second system frame and so on. The network configures this field according to the field <i>ssb-Periodicity</i> such that the indicated system frame does not exceed the configured SSB periodicity. |
| <b>ssb-Freq</b>                             | Indicates the frequency of the SSB.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>ss-PBCH-BlockPower</b>                   | Average EPRE of the resources elements that carry secondary synchronization signals in dBm that the NW used for SSB transmission, see TS 38.213 [13], clause 7.                                                                                                                                                                                                                                                        |
| <b>ssb-Periodicity</b>                      | Indicates the periodicity of the SSB. If the field is absent, the UE applies the value ms5. (see TS 38.213 [13], clause 4.1)                                                                                                                                                                                                                                                                                           |

## – SRS-RSRP-Range

The IE *SRS-RSRP-Range* specifies the value range used in SRS-RSRP measurements and thresholds. The integer value for SRS-RSRP measurements is according to Table 10.1.22.1.2-1 in TS 38.133 [14]. For thresholds, the actual value is (IE value –140) dBm, except for the IE value 98, in which case the actual value is infinity.

### **SRS-RSRP-Range information element**

| <b>additionalPCI</b><br>PCI of the additional SSB different from serving cell PCI.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>periodicity</b><br>Periodicity of the SS/PBCH blocks, see 5.5.2.10. Periodicity is given in number of subframes.                                                                                                                                                                                                                                                                                                                                                             |
| <b>ssb-PositionsInBurst</b><br>Indicates the time domain positions of the transmitted SS-blocks in a half frame with SS/PBCH blocks as defined in TS 38.213 [13], clause 4.1. The first/leftmost bit corresponds to SS/PBCH block index 0, the second bit corresponds to SS/PBCH block index 1, and so on. Value 0 in the bitmap indicates that the corresponding SS/PBCH block is not transmitted while value 1 indicates that the corresponding SS/PBCH block is transmitted. |
| <b>ss-PBCH-BlockPower</b><br>Average EPRE of the resources elements that carry secondary synchronization signals in dBm that the NW used for SSB transmission, see TS 38.213 [13], clause 7.                                                                                                                                                                                                                                                                                    |

– SSB-PositionQCL-Relation

The IE *SSB-PositionQCL-Relation* is used to indicate the QCL relationship between SSB positions on the frequency indicated by *ssbFrequency* (see TS 38.213 [13], clause 4.1) for operation with shared spectrum channel access. Value n1 corresponds to 1, value n2 corresponds to 2 and so on.

SSB-PositionQCL-Relation information element

-- ASN1START  
 -- TAG-SSB-POSITIONQCL-RELATION-START

SSB-PositionQCL-Relation-r16 ::= ENUMERATED {n1,n2,n4,n8}

```
SSB-PositionQCL-Relation-r17 ::= ENUMERATED {n32, n64}

-- TAG-SSB-POSITIONQCL-RELATION-STOP
-- ASN1STOP
```

– SSB-ToMeasure

The IE *SSB-ToMeasure* is used to configure a pattern of SSBs. For operation with shared spectrum channel access in FR1, only *mediumBitmap* is used, and for FR2-2, *longBitmap* is used.

SSB-ToMeasure information element

```
-- ASN1START
-- TAG-SSB-TOMEASURE-START

SSB-ToMeasure ::=
    shortBitmap          CHOICE {
        shortBitmap      BIT STRING (SIZE (4)),
        mediumBitmap     BIT STRING (SIZE (8)),
        longBitmap       BIT STRING (SIZE (64))
    }

-- TAG-SSB-TOMEASURE-STOP
-- ASN1STOP
```

| SSB-ToMeasure field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>longBitmap</b><br>Bitmap when maximum number of SS/PBCH blocks per half frame equals to 64 as defined in TS 38.213 [13], clause 4.1. For operation with shared spectrum channel access in FR2-2, if the k-th bit is set to 1, the UE assumes that one or more SS/PBCH blocks within the SMTC measurement duration with candidate SS/PBCH block indexes corresponding to SS/PBCH block index equal to (k– 1) may be transmitted; if the k-th bit is set to 0, the UE assumes that the corresponding SS/PBCH block(s) are not transmitted.                                                                                                                                                                                                                                                                                                                                                                         |
| <b>mediumBitmap</b><br>Bitmap when maximum number of SS/PBCH blocks per half frame equals to 8 as defined in TS 38.213 [13], clause 4.1. For operation with shared spectrum channel access, if the k-th bit is set to 1, the UE assumes that one or more SS/PBCH blocks within the SMTC measurement duration with candidate SS/PBCH block indexes corresponding to SS/PBCH block index equal to k – 1 may be transmitted; if the kt-th bit is set to 0, the UE assumes that the corresponding SS/PBCH block(s) are not transmitted. The k-th bit is set to 0, where k > <i>ssb-PositionQCL-Common</i> and the number of actually transmitted SS/PBCH blocks is not larger than the number of 1's in the bitmap. If <i>ssb-PositionQCL</i> is configured with a value smaller than <i>ssb-PositionQCL-Common</i> , only the leftmost K bits (K = <i>ssb-PositionQCL</i> ) are applicable for the corresponding cell. |
| <b>shortBitmap</b><br>Bitmap when maximum number of SS/PBCH blocks per half frame equals to 4 as defined in TS 38.213 [13], clause 4.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

– SS-RSSI-Measurement

The IE *SS-RSSI-Measurement* is used to configure RSSI measurements based on synchronization reference signals.

SS-RSSI-Measurement information element

```
-- ASN1START
-- TAG-SS-RSSI-MEASUREMENT-START

SS-RSSI-Measurement ::=
    measurementSlots
    endSymbol
}

SEQUENCE {
    BIT STRING (SIZE (1..80)),
    INTEGER(0..3)

-- TAG-SS-RSSI-MEASUREMENT-STOP
-- ASN1STOP
```

| SS-RSSI-Measurement field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>endSymbol</b><br>Within a slot that is configured for RSSI measurements (see <i>measurementSlots</i> ) the UE measures the RSSI from symbol 0 to symbol <i>endSymbol</i> . This field identifies the entry in Table 5.1.3-1 in TS 38.215 [9], which determines the actual end symbol.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>measurementSlots</b><br>Indicates the slots in which the UE can perform RSSI measurements. The length of the BIT STRING is equal to the number of slots in the configured SMTC window (determined by the duration and by the subcarrierSpacing). The first (left-most / most significant) bit in the bitmap corresponds to the first slot in the SMTC window, the second bit in the bitmap corresponds to the second slot in the SMTC window, and so on. The UE measures in slots for which the corresponding bit in the bitmap is set to 1. In case this field is configured for a SCell with <i>ca-SlotOffset-r16</i> , the bits in the bitmap corresponds to the slots that are fully contained in the SMTC window. |

SubcarrierSpacing

The IE *SubcarrierSpacing* determines the subcarrier spacing. Restrictions applicable for certain frequencies, channels or signals are clarified in the fields that use this IE.

SubcarrierSpacing information element

```
-- ASN1START
-- TAG-SUBCARRIERSPACING-START

SubcarrierSpacing ::=
    ENUMERATED {kHz15, kHz30, kHz60, kHz120, kHz240, kHz480-v1700, kHz960-v1700, spare1}

-- TAG-SUBCARRIERSPACING-STOP
-- ASN1STOP
```

TAG-Config

The IE *TAG-Config* is used to configure parameters for a time-alignment group.

TAG-Config information element

```
-- ASN1START
-- TAG-TAG-CONFIG-START
```

```
TAG-Config ::=
    tag-ToReleaseList
    tag-ToAddModList
}

TAG ::=
    tag-Id
    timeAlignmentTimer
    ...
}

TAG-Id ::=
    INTEGER (0..maxNrofTAGs-1)

-- TAG-TAG-CONFIG-STOP
-- ASN1STOP
```

| TAG field descriptions                                                                                                                                           |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>tag-Id</b><br>Indicates the TAG of the SpCell or an SCell, see TS 38.321 [3]. Uniquely identifies the TAG within the scope of a Cell Group (i.e. MCG or SCG). |
| <b>timeAlignmentTimer</b><br>The <i>timeAlignmentTimer</i> for TAG with ID <i>tag-Id</i> , as specified in TS 38.321 [3].                                        |

– TAR-Config

The IE *TAR-Config* is used to configure Timing Advance reporting in non-terrestrial networks.

TAR-Config information element

```
-- ASN1START
-- TAG-TAR-CONFIG-START

TAR-Config-r17 ::=
    offsetThresholdTA-r17
    timingAdvancesSR-r17
    ...
}

-- TAG-TAR-CONFIG-STOP
-- ASN1STOP
```

| TAR-Config field descriptions                                                                                                                                                                                                   |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>offsetThresholdTA</b><br>Offset for TA reporting as specified in TS 38.321 [3]. Network only configures this parameter for MCG. Value <i>ms0dot5</i> corresponds to 0.5 ms, value <i>ms1</i> corresponds to 1 ms, and so on. |
| <b>timingAdvanceSR</b><br>Used to configure whether a Timing Advance report may trigger a Scheduling Request as specified in TS 38.321 [3].                                                                                     |

– TCI-ActivatedConfig

The IE *TCI-ActivatedConfig* is used to provide activated TCI states for PDSCH and/or PDCCH of the PSCell or of an SCell.

TCI-ActivatedConfig information element

```
-- ASN1START
-- TAG-TCI-ACTIVATEDCONFIG-START

TCI-ActivatedConfig-r17 ::= SEQUENCE {
    pdcch-TCI-r17          SEQUENCE (SIZE (1..5)) OF TCI-StateId,
    pdsch-TCI-r17          BIT STRING (SIZE (1..maxNrofTCI-States))
}

-- TAG-TCI-ACTIVATEDCONFIG-STOP
-- ASN1STOP
```

| TCI-ActivatedConfig field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>pdccch-TCI</b><br>Indicates the TCI state for PDCCH for each configured CORESET of the DL BWP to be activated at SCell activation, to be activated for the PSCell at SCG activation and/or to be used for BFD, RLM and measurements while the SCG is deactivated. The list includes exactly as many entries as CORESETs configured in this BWP, ordered by increasing values of <i>ControlResourceSet-Id</i> , i.e. the first entry indicates the TCI state for the configured CORESET with the lowest <i>ControlResourceSet-Id</i> value, the second value indicates the TCI states for the configured CORESET with the second lowest <i>ControlResourceSet-Id</i> value, and so on. |
| <b>pdsch-TCI</b><br>Indicates TCI states for PDSCH reception at SCell addition/activation or of the PSCell at SCG activation. This field indicates activated TCI state(s) for this BWP ordered by increasing values of <i>TCI-StateId</i> , i.e. the first bit indicates the activation state of the TCI state with the lowest <i>TCI-StateId</i> value, the second value indicates the activation status of the TCI state with the second lowest <i>TCI-State-Id</i> value, and so on. A bit set to 0 indicates that the corresponding TCI state is deactivated, a bit set to 1 indicates that the TCI state is activated.                                                              |

– TCI-State

The IE *TCI-State* associates one or two DL reference signals with a corresponding quasi-colocation (QCL) type.

TCI-State information element

```
-- ASN1START

|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>additionalPCI</b><br/>Indicates the physical cell IDs (PCI) of the SSBs when <i>referenceSignal</i> is configured as SSB for both QCL-Type1 and QCL-Type2. In case the <i>cell</i> is present, the <i>additionalPCI</i> refers to a PCI value configured in the list configured using <i>additionalPCI-ToAddModList</i> in the serving cell indicated by the field <i>cell</i>. Otherwise, it refers to a PCI value configured in a list <i>additionalPCI-ToAddModList</i> configured in the serving cell where the <i>TCI-State</i> is applied by the UE. When this field is present the <i>cell</i> for <i>qcl-Type1</i> and <i>qcl-Type2</i> is configured with same value, if present.</p>                                              |
| <p><b>pathlossReferenceRS-Id</b><br/>The ID of the reference signal (e.g. a CSI-RS or an SS block) used for PUSCH, PUCCH and SRS path loss estimation. This field refers to an element in the list configured using <i>pathlossReferenceRSToAddModList</i> in the serving cell and UL BWP where the TCI State is applied by the UE.</p>                                                                                                                                                                                                                                                                                                                                                                                                           |
| <p><b>qcl-Type1, qcl-Type2</b><br/>QCL information for the TCI state as specified in TS 38.214 [19] clause 5.1.5.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <p><b>tcid-StateId</b><br/>ID number of the TCI state.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <p><b>ul-PowerControl</b><br/>Configures power control parameters for PUCCH, PUSCH and SRS for this TCI state. The field is present here only if <i>ul-powerControl</i> is not configured in any <i>BWP-Uplink-Dedicated</i> of this serving cell. This field refers to an element in the list configured using <i>uplink-PowerControlToAddModList</i> in the serving cell where the <i>dl-OrJointTCI-StateToAddModList</i> is configured. For each serving cell, <i>ul-powerControl</i> is either configured in each <i>TCI-State</i> configured or referred to in <i>dl-OrJointTCI-StateList</i> in each DL BWP, or it is not configured in any <i>TCI-State</i> configured or referred to in <i>dl-OrJointTCI-StateList</i> in any DL BWP.</p> |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                            |

|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>additionalPCI</i></b><br>Indicates the physical cell IDs (PCI) of the SSBs when <i>referenceSignal</i> is configured as SSB. In case the <i>servingCellId</i> is present, the <i>additionalPCI</i> refers to a PCI value configured in the list configured using <i>additionalPCI-ToAddModList</i> in the serving cell indicated by the field <i>servingCellId</i> . Otherwise, it refers to a PCI value configured in the list configured using <i>additionalPCI-ToAddModList</i> in the serving cell where the <i>ul-TCI-StateList</i> is applied by the UE.                                                                                                                                                                       |
| <b><i>bwp-Id</i></b><br>The DL BWP which the CSI-RS is located in or UL BWP where the SRS is located in.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>servingCellId</i></b><br>The UE's serving cell in which the <i>referenceSignal</i> is configured. If the field is absent, the <i>referenceSignal</i> is configured in the serving cell in which the <i>TCI-UL-State</i> is applied by the UE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>pathlossReferenceRS-Id</i></b><br>The ID of the reference Signal (e.g. a CSI-RS or a SS block) used for PUSCH, PUCCH and SRS path loss estimation. This field refers to an element in the list configured using <i>pathlossReferenceRSToAddModList</i> in the serving cell and UL BWP where the UL TCI State is applied by the UE.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>ul-powerControl</i></b><br>Configures power control parameters for PUCCH, PUSCH and SRS for this TCI state. The field is present here only if <i>ul-powerControl</i> is not configured in any <i>BWP-Uplink-Dedicated</i> of this serving cell. This field refers to an element in the list configured using <i>uplink-PowerControlToAddModList</i> in the serving cell where the <i>ul-TCI-ToAddModList</i> is configured. For each serving cell, <i>ul-powerControl</i> is either configured in each <i>TCI-UL-State</i> configured or referred to in <i>ul-OrJointTCI-StateList</i> in each UL BWP, or it is not configured in any <i>TCI-UL-State</i> configured or referred to in <i>ul-OrJointTCI-StateList</i> in any UL BWP. |

| Conditional Presence                  | Explanation                                                                                                                 |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <i>CSI-RS</i> or <i>SRS-Indicated</i> | This field is mandatory present if <i>referenceSignal</i> is set to <i>csi-RS-index</i> or to <i>srs</i> , absent otherwise |
| <i>Mandatory</i>                      | The field is mandatory present.                                                                                             |

## – *TCI-UL-StateId*

The IE *TCI-UL-StateId* is used to identify one *TCI-UL-State* configuration.

### *TCI-UL-StateId* information element

```
-- ASN1START
-- TAG-TCI-UL-STATEID-START

Value <i>allDownlink</i> indicates that all symbols in this slot are used for downlink; value <i>allUplink</i> indicates that all symbols in this slot are used for uplink; value <i>explicit</i> indicates explicitly how many symbols in the beginning and end of this slot are allocated to downlink and uplink, respectively; value <i>explicit-IAB-MT</i> indicates explicitly how many symbols in the beginning and end of this slot are allocated to uplink and downlink, respectively. |

– TrackingAreaCode

The IE *TrackingAreaCode* is used to identify a tracking area within the scope of a PLMN/SNPN, see TS 24.501 [23].

TrackingAreaCode information element

```

-- ASN1START
-- TAG-TRACKINGAREACODE-START

TrackingAreaCode ::= BIT STRING (SIZE (24))

-- TAG-TRACKINGAREACODE-STOP
-- ASN1STOP

```

## — *T-Reselection*

The IE *T-Reselection* concerns the cell reselection timer  $T_{\text{reselection\_RAT}}$  for NR and E-UTRA. Value in seconds. For value 0, behaviour as specified in 7.1.2 applies.

### ***T-Reselection* information element**

```
-- ASN1START
-- TAG-TRESELECTION-START
```

```
T-Reselection ::= INTEGER (0..7)
```

```
-- TAG-TRESELECTION-STOP
-- ASN1STOP
```

## — *TimeAlignmentTimer*

The IE *TimeAlignmentTimer* is used to configure the time alignment timer as specified in TS 38.321 [3]. The values are in ms.

### ***TimeAlignmentTimer* information element**

```
-- ASN1START
-- TAG-TIMEALIGNMENTTIMER-START
```

```
TimeAlignmentTimer ::= ENUMERATED {ms500, ms750, ms1280, ms1920, ms2560, ms5120, ms10240, infinity}
```

```
-- TAG-TIMEALIGNMENTTIMER-STOP
-- ASN1STOP
```

## — *TimeToTrigger*

The IE *TimeToTrigger* specifies the value range used for time to trigger parameter, which concerns the time during which specific criteria for the event needs to be met in order to trigger a measurement report. Value *ms0* corresponds to 0 ms and behaviour as specified in 7.1.2 applies, value *ms40* corresponds to 40 ms, and so on.

### ***TimeToTrigger* information element**

```
-- ASN1START
-- TAG-TIMETOTRIGGER-START
```

```
TimeToTrigger ::= ENUMERATED {
    ms0, ms40, ms64, ms80, ms100, ms128, ms160, ms256,
    ms320, ms480, ms512, ms640, ms1024, ms1280, ms2560,
    ms5120}

```

```
-- TAG-TIMETOTRIGGER-STOP
-- ASN1STOP
```

## – *UAC-BarringInfoSetIndex*

The IE *UAC-BarringInfoSetIndex* provides the index of the entry in *uac-BarringInfoSetList*. Value 1 corresponds to the first entry in *uac-BarringInfoSetList*, value 2 corresponds to the second entry in this list and so on. An index value referring to an entry not included in *uac-BarringInfoSetList* indicates no barring.

### *UAC-BarringInfoSetIndex* information element

```
-- ASN1START
-- TAG-UAC-BARRINGINFOSETINDEX-START

UAC-BarringInfoSetIndex ::=                INTEGER (1..maxBarringInfoSet)

-- TAG-UAC-BARRINGINFOSETINDEX-STOP
-- ASN1STOP
```

## – *UAC-BarringInfoSetList*

The IE *UAC-BarringInfoSetList* provides a list of access control parameter sets. An access category can be configured with access parameters according to one of the sets.

### *UAC-BarringInfoSetList* information element

```
-- ASN1START
-- TAG-UAC-BARRINGINFOSETLIST-START

UAC-BarringInfoSetList ::=                SEQUENCE (SIZE(1..maxBarringInfoSet)) OF UAC-BarringInfoSet
UAC-BarringInfoSetList-v1700 ::= SEQUENCE (SIZE(1..maxBarringInfoSet)) OF UAC-BarringInfoSet-v1700

UAC-BarringInfoSet ::=                    SEQUENCE {
    uac-BarringFactor                      ENUMERATED {p00, p05, p10, p15, p20, p25, p30, p40,
                                                    p50, p60, p70, p75, p80, p85, p90, p95},
    uac-BarringTime                        ENUMERATED {s4, s8, s16, s32, s64, s128, s256, s512},
    uac-BarringForAccessIdentity           BIT STRING (SIZE(7))
}

UAC-BarringInfoSet-v1700 ::= SEQUENCE {
    uac-BarringFactorForAI3-r17            ENUMERATED {p00, p05, p10, p15, p20, p25, p30, p40, p50, p60, p70, p75, p80, p85, p90, p95}
                                           OPTIONAL -- Need S
}

-- TAG-UAC-BARRINGINFOSETLIST-STOP
-- ASN1STOP

|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ci-PayloadSize</i></b>                             | Configures the field size for each UL cancelation indicator of this serving cell ( <i>servingCellId</i> ) (see TS 38.213 [13], clause 11.2A).                                                                                                                                                                                                                                                                                                                                          |
| <b><i>deltaOffset</i></b>                                | Configures the additional offset from the end of a PDCCH reception where the UE detects the DCI format 2_4 and the first symbol of the T_ "CI" symbols, in the unit of OFDM symbols (see TS 38.213 [13], clause 11.2A).                                                                                                                                                                                                                                                                |
| <b><i>frequencyRegionForCI</i></b>                       | Configures the reference frequency region where a detected UL CI is applicable (see TS 38.213 [13], clause 11.2A). It is defined in the same way as <i>locationAndBandwidth</i> .                                                                                                                                                                                                                                                                                                      |
| <b><i>positionInDCI</i></b>                              | Starting position (in number of bit) of the <i>ci-PayloadSize</i> bit CI value applicable for this serving cell ( <i>servingCellId</i> ) within the DCI payload (see TS 38.213 [13], clause 11.2A).                                                                                                                                                                                                                                                                                    |
| <b><i>positionInDCI-ForSUL</i></b>                       | Starting position (in number of bit) of the <i>ci-PayloadSize</i> bit CI value applicable for SUL of this serving cell ( <i>servingCellId</i> ) within the DCI payload (see TS 38.213 [13], clause 11.2A).                                                                                                                                                                                                                                                                             |
| <b><i>timeDurationForCI</i></b>                          | Configures the duration of the reference time region in symbols where a detected UL CI is applicable of this serving cell ( <i>servingCellId</i> ) (see TS 38.213 [13], clause 11.2A). If the field is absent, i.e., the configured UL CI monitoring periodicity indicated by <i>monitoringSlotPeriodicityAndOffset</i> for DCI format 2_4 is larger than 1 slot or 1 slot with only one monitoring occasion, the UE applies the value of the configured UL CI monitoring periodicity, |
| <b><i>timeFrequencyRegion</i></b>                        | Configures the reference time and frequency region where a detected UL CI is applicable of this serving cell ( <i>servingCellId</i> ) (see TS 38.213 [13], clause 11.2A).                                                                                                                                                                                                                                                                                                              |
| <b><i>timeGranularityForCI</i></b>                       | Configures the number of partitions within the time region of this serving cell ( <i>servingCellId</i> ) (see TS 38.213 [13], clause 11.2A).                                                                                                                                                                                                                                                                                                                                           |
| <b><i>uplinkCancellationPriority</i></b>                 | Configures uplink cancellation behavior if both UL CI and intra-UE priority indicator are configured for a given UE. If the field is present, then UL CI is only applicable to the UL transmissions indicated/configured as low priority level. If the field is absent, UL CI is applicable to UL transmission irrespective of its priority level (see TS 38.213 [13], clause 11.2A).                                                                                                  |

| Conditional Presence     | Explanation                                                                                                                                                                                                                  |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>SUL-Only</i>          | The field is optionally present, Need R, if <i>supplementaryUplink</i> is configured in <i>ServingCellConfig</i> . It is absent otherwise.                                                                                   |
| <i>SymbolPeriodicity</i> | This field is mandatory present if the configured UL CI monitoring periodicity indicated by <i>monitoringSlotPeriodicityAndOffset</i> for DCI format 2_4 is 1 slot with more than one monitoring occasion, otherwise absent. |

## – *UplinkConfigCommon*

|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CC-Group</b><br>The contiguous carriers sharing the same PA in an intra-band UL CA configuration. The UE shall report only one DC location for an intra-band CC combination with one active uplink carrier in case <i>DefaultDC-Location</i> is set to <i>activeCarrier</i> or <i>activeBWP</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>defaultDC-Location</b><br>Indicates the default DC location derivation option. The default Tx Direct Current is located at the mathematical center of the UE bandwidth, i.e. between the lower edge of the lowest subcarrier of the lowest frequency component and the upper edge of the highest subcarrier of the highest frequency component, rounded to the subcarrier grid of the lowest SCS defined for the component carrier on which the default Direct Current is located. The lowest and highest frequency components used for derivation of mathematical center are indicated by <i>FrequencyComponent</i> in the associated <i>CC-Group</i> , where the lowest frequency component and the highest frequency component may be the same. If the mathematical center of the UE bandwidth lands on frequencies where there is no subcarrier grid defined, the subcarrier grid of the lowest SCS of the nearest lower frequency component carrier shall be extended to cover the frequency of the mathematical default Direct Current location. |
| <b>offsetToDefault</b><br>Indicates the DC location offset to the default DC location derived from <i>defaultDC-Location</i> . The lowest SCS in the CC group is used as the offset granularity. Value 0 represents no offset.<br>offsetValue is used in case <i>DefaultDC-Location</i> is set to <i>configuredCarrier</i> or <i>configuredBWP</i> . <i>offsetlist</i> is used in case <i>DefaultDC-Location</i> is set to <i>activeCarrier</i> or <i>activeBWP</i> . Each entity in this list corresponds to the entry in carriers combination in <i>IntraBandCC-CombinationReqList</i> of the intra-band CA component. For each CC group, the UE shall include the same number of entries, and listed in the same order as in <i>CC-CombinationList</i> . If <i>DefaultDC-Location</i> is set the <i>activeCarrier</i> , same offsetValue is signalled for all requested carriers combinations with same active carriers states (regardless of the active BWP index).                                                                                   |
| <b>servCellIndexHigher</b><br>Indicates the serving cell index of the highest edge of the <i>CC-Group</i> . If absent, there is only one carrier in this group indicated by <i>servCellIndexLower</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>servCellIndexLower</b><br>Indicates the serving cell index of the lowest edge of the <i>CC-Group</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>shift7dot5kHz</b><br>Indicates whether there is 7.5 kHz shift or not. 7.5 kHz shift is applied if the field is set to true, otherwise 7.5 kHz shift is not applied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>ul</b><br>Indicates that the default DC location is derived based on the UL frequencies of the frequency component.                           |
| <b>ulAndDL</b><br>Indicates that the default DC location is derived based on the edge most frequencies among any DL and UL frequency components. |

## – *UplinkTxDirectCurrentTwoCarrierList*

The IE *UplinkTxDirectCurrentTwoCarrierList* indicates the Tx Direct Current locations when uplink intra-band CA with two carriers is configured, based on the configured carriers and BWP numerology and the associated carrier bandwidth of the carriers. The UE does not report the uplink Direct Current location information for SUL carrier(s).

| <b>bwp-Id</b><br>The BWP ID of the serving cell which is part of the two carrier uplink carrier aggregation. The UE shall not report this field if the serving cell is reported as deactivated using <i>deactivatedCarrier-r16</i> .                                                                             |
| <b>deactivatedCarrier</b><br>For the reported uplink Tx Direct Current location(s) corresponding to <i>singlePA-TxDirectCurrent-r16</i> , indicates whether the carrier is deactivated or not for this serving cell. If the carrier refers to the PCell, the UE shall not set this field to <i>deactivated</i> . |
| <b>servCellIndex</b><br>The serving cell ID of the serving cell which is part of the two carrier uplink carrier aggregation.                                                                                                                                                                                     |

| <i>UplinkTxDirectCurrentTwoCarrier</i> field descriptions                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>carrierOneInfo</b><br>The serving cell ID and BWP ID of the first carrier of the uplink carrier aggregation for which the uplink Tx Direct Current location(s) are being reported.                                                                                                                                                                                               |
| <b>carrierTwoInfo</b><br>The serving cell ID and BWP ID of the second carrier of the uplink carrier aggregation for which the uplink Tx Direct Current location(s) are being reported.                                                                                                                                                                                              |
| <b>singlePA-TxDirectCurrent</b><br>The uplink Tx Direct Current location for the UE which support single PA for this uplink carrier aggregation. For the UEs which support dual PA for this uplink carrier aggregation, this field is for reporting the uplink Tx Direct Current location of the first PA.                                                                          |
| <b>secondPA-TxDirectCurrent</b><br>The uplink Tx Direct Current location used by the UE with the second PA for the UEs which support dual PA for this uplink carrier aggregation. This field shall be absent for the <i>UplinkTxDirectCurrentTwoCarrier</i> entity where <i>deactivatedCarrier</i> of <i>carrierOneInfo</i> or <i>carrierTwoInfo</i> is set to <i>deactivated</i> . |

## – ZP-CSI-RS-Resource

The IE *ZP-CSI-RS-Resource* is used to configure a Zero-Power (ZP) CSI-RS resource (see TS 38.214 [19], clause 5.1.4.2). Reconfiguration of a *ZP-CSI-RS-Resource* between periodic or semi-persistent and aperiodic is not supported.

### *ZP-CSI-RS-Resource* information element

| <b>periodicityAndOffset</b><br>Periodicity and slot offset for periodic/semi-persistent ZP-CSI-RS (see TS 38.214 [19], clause 5.1.4.2). Network always configures the UE with a value for this field for periodic and semi-persistent ZP-CSI-RS resource (as indicated in PDSCH-Config). |
| <b>resourceMapping</b><br>OFDM symbol and subcarrier occupancy of the ZP-CSI-RS resource within a slot.                                                                                                                                                                                  |
| <b>zp-CSI-RS-ResourceId</b><br>ZP CSI-RS resource configuration ID (see TS 38.214 [19], clause 5.1.4.2).                                                                                                                                                                                 |

| Conditional Presence            | Explanation                                                                                                                                                  |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>PeriodicOrSemiPersistent</i> | The field is optionally present, Need M, for periodic and semi-persistent ZP-CSI-RS-Resources (as indicated in PDSCH-Config). The field is absent otherwise. |

— *ZP-CSI-RS-ResourceSet*

The IE *ZP-CSI-RS-ResourceSet* refers to a set of *ZP-CSI-RS-Resources* using their *ZP-CSI-RS-ResourceIds*.

***ZP-CSI-RS-ResourceSet* information element**

```
-- ASN1START
-- TAG-ZP-CSI-RS-RESOURCESET-START

ZP-CSI-RS-ResourceSet ::=
    zp-CSI-RS-ResourceSetId          SEQUENCE {
        zp-CSI-RS-ResourceSetId,
        zp-CSI-RS-ResourceIdList     SEQUENCE (SIZE(1..maxNrofZP-CSI-RS-ResourcesPerSet)) OF ZP-CSI-RS-ResourceId,
        ...
    }

-- TAG-ZP-CSI-RS-RESOURCESET-STOP
-- ASN1STOP
```

| <i>ZP-CSI-RS-ResourceSet</i> field descriptions                                                                                                             |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>zp-CSI-RS-ResourceIdList</i></b><br>The list of <i>ZP-CSI-RS-ResourceId</i> identifying the <i>ZP-CSI-RS-Resource</i> elements belonging to this set. |

— *ZP-CSI-RS-ResourceSetId*

The IE *ZP-CSI-RS-ResourceSetId* identifies a *ZP-CSI-RS-ResourceSet*.

***ZP-CSI-RS-ResourceSetId* information element**

```
-- ASN1START
-- TAG-ZP-CSI-RS-RESOURCESETID-START

ZP-CSI-RS-ResourceSetId ::=
    INTEGER (0..maxNrofZP-CSI-RS-ResourceSets-1)

-- TAG-ZP-CSI-RS-RESOURCESETID-STOP
-- ASN1STOP
```

### 6.3.3 UE capability information elements

#### – *AccessStratumRelease*

The IE *AccessStratumRelease* indicates the release supported by the UE.

##### ***AccessStratumRelease* information element**

```
-- ASN1START
-- TAG-ACCESSSTRATUMRELEASE-START

AccessStratumRelease ::= ENUMERATED {
    rel15, rel16, rel17, spare5, spare4, spare3, spare2, spare1, ... }

-- TAG-ACCESSSTRATUMRELEASE-STOP
-- ASN1STOP
```

#### – *AppLayerMeasParameters*

The IE *AppLayerMeasParameters* is used to convey the capabilities supported by the UE for application layer measurements.

##### ***AppLayerMeasParameters* information element**

```
-- ASN1START
-- TAG-APPLAYERMEASPARAMETERS-START

AppLayerMeasParameters-r17 ::= SEQUENCE {
    qoe-Streaming-MeasReport-r17    ENUMERATED {supported}    OPTIONAL,
    qoe-MTSI-MeasReport-r17        ENUMERATED {supported}    OPTIONAL,
    qoe-VR-MeasReport-r17          ENUMERATED {supported}    OPTIONAL,
    ran-VisibleQoE-Streaming-MeasReport-r17    ENUMERATED {supported}    OPTIONAL,
    ran-VisibleQoE-VR-MeasReport-r17    ENUMERATED {supported}    OPTIONAL,

**srs-TxSwitch**

Indicates supported SRS antenna switch capability for the associated band. If the UE indicates support of *SRS-SwitchingTimeNR*, the UE is allowed to set this field for a band with associated *FeatureSetUplinkId* set to 0 for SRS carrier switching.

**supportedIntraENDC-BandCombinationList**

Indicates BCS and/or spectrum contiguity capability for each entry in a list of intra-band (NG)EN-DC components in an inter-band (NG)EN-DC band combination. The UE shall include the entries in the order corresponding to the order of NR band entries of the intra-band (NG)EN-DC components in the *bandList* in the inter-band (NG)EN-DC band combination (i.e., *BandCombination* without suffix).

**uplinkTxSwitchingBandParametersList-v1700**

Indicates a list of per band per band combination capabilities for UL Tx switching.

## – *BandCombinationListSidelinkEUTRA-NR*

The IE *BandCombinationListSidelinkEUTRA-NR* contains a list of V2X sidelink and NR sidelink band combinations.

#### ***BandParametersSidelinkEUTRA-NR field descriptions***

##### ***bandParametersSidelinkEUTRA1, bandParametersSidelinkEUTRA2***

This field includes the V2X-BandParameters-r14 and V2X-BandParameters-v1530 IE as specified in 36.331 [10]. It is used for reporting the per-band capability for V2X sidelink communication.

#### – ***BandCombinationListSL-Discovery***

The IE *BandCombinationListSL-Discovery* contains a list of NR Sidelink discovery band combinations.

#### ***BandCombinationListSidelinkSL-Discovery* information element**

```

## — CA-BandwidthClassEUTRA

The IE *CA-BandwidthClassEUTRA* indicates the E-UTRA CA bandwidth class as defined in TS 36.101 [22], table 5.6A-1.

### CA-BandwidthClassEUTRA information element

```

-- ASN1START
-- TAG-CA-BANDWIDTHCLASSEUTRA-START

CA-BandwidthClassEUTRA ::= ENUMERATED {a, b, c, d, e, f, ...}

-- TAG-CA-BANDWIDTHCLASSEUTRA-STOP
-- ASN1STOP

```

## — *CA-BandwidthClassNR*

The IE *CA-BandwidthClassNR* indicates the NR CA bandwidth class as defined in TS 38.101-1 [15], table 5.3A.5-1 and TS 38.101-2 [39], table 5.3A.4-1.

### *CA-BandwidthClassNR* information element

```
-- ASN1START
-- TAG-CA-BANDWIDTHCLASSNR-START

-- R4 17-6: new CA BW Classes R2-R12
-- R4 17-7: new CA BW Classes V, W

CA-BandwidthClassNR ::=
    ENUMERATED {a, b, c, d, e, f, g, h, i, j, k, l, m, n, o, p, q, ..., r2-v1730, r3-v1730, r4-v1730, r5-v1730, r6-

```

## — *CA-ParametersEUTRA*

The IE *CA-ParametersEUTRA* contains the E-UTRA part of band combination parameters for a given MR-DC band combination.

NOTE: If additional E-UTRA band combination parameters are defined in TS 36.331 [10], which are supported for MR-DC, they will be defined here as well.

### *CA-ParametersEUTRA* information element

```
-- ASN1START
-- TAG-CA-PARAMETERSEUTRA-START

#### CodebookParameters field descriptions

##### ***supportedCSI-RS-ResourceListAlt***

This field indicates the alternative list of *SupportedCSI-RS-Resource* supported for each codebook type. The supported CSI-RS resource is indicated by an integer value which pinpoints *SupportedCSI-RS-Resource* defined in *CodebookVariantsList*. The value 0 corresponds to the first entry of *CodebookVariantsList*. The value 1 corresponds to the second entry of *CodebookVariantsList*, and so on. For each codebook type, the field shall be included in both *codebookParametersPerBC* (but optional for single CC) and *codebookParametersPerBand*.

## – FeatureSetCombination

The IE *FeatureSetCombination* is a two-dimensional matrix of *FeatureSet* entries.

Each *FeatureSetsPerBand* contains a list of feature sets applicable to the carrier(s) of one band entry of the associated band combination. Across the associated bands, the UE shall support the combination of *FeatureSets* at the same position in the *FeatureSetsPerBand*. All *FeatureSetsPerBand* in one *FeatureSetCombination* must have the same number of entries.

The number of *FeatureSetsPerBand* in the *FeatureSetCombination* must be equal to the number of band entries in an associated band combination. The first *FeatureSetPerBand* applies to the first band entry of the band combination, and so on.

Each *FeatureSet* contains either a pair of NR or E-UTRA feature set IDs for UL and DL.

In case of NR, the actual feature sets for UL and DL are defined in the *FeatureSets* IE and referred to from here by their ID, i.e., their position in the *featureSetsUplink* / *featureSetsDownlink* list in the *FeatureSet* IE.

In case of E-UTRA, the feature sets referred to from this list are defined in TS 36.331 [10] and conveyed as part of the *UE-EUTRA-Capability* container.

The *FeatureSetUplink* and *FeatureSetDownlink* referred to from the *FeatureSet* comprise, among other information, a set of *FeatureSetUplinkPerCC-Ids* and *FeatureSetDownlinkPerCC-Ids*. The number of these per-CC IDs determines the number of carriers that the UE is able to aggregate contiguously in frequency domain in the corresponding band. The number of carriers supported by the UE is also restricted by the bandwidth class indicated in the associated *BandCombination*, if present.

In feature set combinations the UE shall exclude entries with same or lower capabilities, since the network may anyway assume that the UE supports those.

NOTE 1: The UE may advertise fallback band-combinations in which it supports additional functionality explicitly in two ways: Either by setting FeatureSet IDs to zero (inter-band and intra-band non-contiguous fallback) and by reducing the number of FeatureSet-PerCC Ids in a Feature Set (intra-band contiguous fallback). Or by separate *BandCombination* entries with associated *FeatureSetCombinations*.

NOTE 2: The UE may advertise a *FeatureSetCombination* containing only fallback band combinations. That means, in a *FeatureSetCombination*, each group of *FeatureSets* across the bands may contain at least one pair of *FeatureSetUplinkId* and *FeatureSetDownlinkId* which is set to 0/0.

NOTE 3: The Network configures serving cell(s) and BWP(s) configuration to comply with capabilities derived from the combination of FeatureSets at the same position in the *FeatureSetsPerBand*, regardless of activated/deactivated serving cell(s) and BWP(s).

### ***FeatureSetCombination* information element**

```
-- ASN1START
-- TAG-FEATURESETCOMBINATION-START

FeatureSetCombination ::= SEQUENCE (SIZE (1..maxSimultaneousBands)) OF FeatureSetsPerBand
FeatureSetsPerBand ::= SEQUENCE (SIZE (1..maxFeatureSetsPerBand)) OF FeatureSet
FeatureSet ::= CHOICE {
    eutra SEQUENCE {
        downlinkSetEUTRA FeatureSetEUTRA-DownlinkId,
        uplinkSetEUTRA FeatureSetEUTRA-UplinkId
    },
    nr SEQUENCE {
        downlinkSetNR FeatureSetDownlinkId,
        uplinkSetNR FeatureSetUplinkId
    }
}

-- TAG-FEATURESETCOMBINATION-STOP
-- ASN1STOP
```

### **— *FeatureSetCombinationId***

The IE *FeatureSetCombinationId* identifies a *FeatureSetCombination*. The *FeatureSetCombinationId* of a *FeatureSetCombination* is the position of the *FeatureSetCombination* in the *featureSetCombinations* list (in *UE-NR-Capability* or *UE-MRDC-Capability*). The *FeatureSetCombinationId* = 0 refers to the first entry in the *featureSetCombinations* list (in *UE-NR-Capability* or *UE-MRDC-Capability*).

NOTE: The *FeatureSetCombinationId* = 1024 is not used due to the maximum entry number of *featureSetCombinations*.

***FeatureSetCombinationId* information element**

```
-- ASN1START
-- TAG-FEATURESETCOMBINATIONID-START

FeatureSetCombinationId ::=          INTEGER (0.. maxFeatureSetCombinations)

-- TAG-FEATURESETCOMBINATIONID-STOP
-- ASN1STOP
```

***FeatureSetDownlink***

The IE *FeatureSetDownlink* indicates a set of features that the UE supports on the carriers corresponding to one band entry in a band combination.

***FeatureSetDownlink* information element**

```
-- ASN1START
-- TAG-FEATURESETDOWNLINK-START

|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>featureSetListPerDownlinkCC</b><br>Indicates which features the UE supports on the individual DL carriers of the feature set (and hence of a band entry that refer to the feature set). The UE shall hence include at least as many <i>FeatureSetDownlinkPerCC-Id</i> in this list as the number of carriers it supports according to the <i>ca-BandwidthClassDL</i> , except if indicating additional functionality by reducing the number of <i>FeatureSetDownlinkPerCC-Id</i> in the feature set (see NOTE 1 in <i>FeatureSetCombination</i> IE description). The order of the elements in this list is not relevant, i.e., the network may configure any of the carriers in accordance with any of the <i>FeatureSetDownlinkPerCC-Id</i> in this list. |
| <b>supportedSRS-Resources</b><br>Indicates supported SRS resources for SRS carrier switching to the band associated with this <i>FeatureSetDownlink</i> . The UE is only allowed to set this field for a band with associated <i>FeatureSetUplinkId</i> set to 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

– FeatureSetDownlinkId

The IE *FeatureSetDownlinkId* identifies a downlink feature set. The *FeatureSetDownlinkId* of a *FeatureSetDownlink* is the index position of the *FeatureSetDownlink* in the *featureSetsDownlink* list in the *FeatureSets* IE. The first element in that list is referred to by *FeatureSetDownlinkId* = 1. The *FeatureSetDownlinkId*=0 is not used by an actual *FeatureSetDownlink* but means that the UE does not support a carrier in this band of a band combination.

FeatureSetDownlinkId information element

```

-- ASN1START
-- TAG-FEATURESETDOWNLINKID-START
```

FeatureSetDownlinkId ::= INTEGER (0..maxDownlinkFeatureSets)

-- TAG-FEATURESETDOWNLINKID-STOP  
-- ASN1STOP

## – FeatureSetDownlinkPerCC

The IE *FeatureSetDownlinkPerCC* indicates a set of features that the UE supports on the corresponding carrier of one band entry of a band combination.

### FeatureSetDownlinkPerCC information element

}

-- TAG-FEATURESETDOWNLINKPERCC-STOP
-- ASN1STOP

```

## – FeatureSetDownlinkPerCC-Id

The IE *FeatureSetDownlinkPerCC-Id* identifies a set of features applicable to one carrier of a feature set. The *FeatureSetDownlinkPerCC-Id* of a *FeatureSetDownlinkPerCC* is the index position of the *FeatureSetDownlinkPerCC* in the *featureSetsDownlinkPerCC*. The first element in the list is referred to by *FeatureSetDownlinkPerCC-Id* = 1, and so on.

### FeatureSetDownlinkPerCC-Id information element

```

-- ASN1START
-- TAG-FEATURESETDOWNLINKPERCC-ID-START

FeatureSetDownlinkPerCC-Id ::=            INTEGER (1..maxPerCC-FeatureSets)

```

```
-- TAG-FEATURESETDOWNLINKPERCC-ID-STOP
-- ASN1STOP
```

### – *FeatureSetEUTRA-DownlinkId*

The IE *FeatureSetEUTRA-DownlinkId* identifies a downlink feature set in E-UTRA list (see TS 36.331 [10]. The first element in that list is referred to by *FeatureSetEUTRA-DownlinkId* = 1. The *FeatureSetEUTRA-DownlinkId*=0 is used when the UE does not support a carrier in this band of a band combination.

#### ***FeatureSetEUTRA-DownlinkId* information element**

```
-- ASN1START
-- TAG-FEATURESETEUTRADOWNLINKID-START
```

**FeatureSetEUTRA-DownlinkId ::= INTEGER (0..maxEUTRA-DL-FeatureSets)**

```
-- TAG-FEATURESETEUTRADOWNLINKID-STOP
-- ASN1STOP
```

### – *FeatureSetEUTRA-UplinkId*

The IE *FeatureSetEUTRA-UplinkId* identifies an uplink feature set in E-UTRA list (see TS 36.331 [10]. The first element in that list is referred to by *FeatureSetEUTRA-UplinkId* = 1. The *FeatureSetEUTRA-UplinkId* =0 is used when the UE does not support a carrier in this band of a band combination.

#### ***FeatureSetEUTRA-UplinkId* information element**

```
-- ASN1START
-- TAG-FEATURESETEUTRAUPLINKID-START
```

**FeatureSetEUTRA-UplinkId ::= INTEGER (0..maxEUTRA-UL-FeatureSets)**

```
-- TAG-FEATURESETEUTRAUPLINKID-STOP
-- ASN1STOP
```

### – *FeatureSets*

The IE *FeatureSets* is used to provide pools of downlink and uplink features sets. A *FeatureSetCombination* refers to the IDs of the feature set(s) that the UE supports in that *FeatureSetCombination*. The *BandCombination* entries in the *BandCombinationList* then indicate the ID of the *FeatureSetCombination* that the UE supports for that band combination.

The entries in the lists in this IE are identified by their index position. For example, the *FeatureSetUplinkPerCC-Id* = 4 identifies the 4<sup>th</sup> element in the *featureSetsUplinkPerCC* list.

NOTE: When feature sets (per CC) IEs require extension in future versions of the specification, new versions of the *FeatureSetDownlink*, *FeatureSetUplink*, *FeatureSets*, *FeatureSetDownlinkPerCC* and/or *FeatureSetUplinkPerCC* will be created and instantiated in corresponding new lists in the *FeatureSets* IE. For example, if new capability bits are to be added to the *FeatureSetDownlink*, they will instead be defined in a new *FeatureSetDownlink-rxy* which will be instantiated in a new *featureSetDownlinkList-rxy* list. If a UE indicates in a *FeatureSetCombination* that it supports the *FeatureSetDownlink* with ID #5, it implies that it supports both the features in *FeatureSetDownlink* #5 and *FeatureSetDownlink-rxy* #5 (if present). The number of entries in the new list(s) shall be the same as in the original list(s).

### FeatureSets information element

#### ***FeatureSetUplink* field descriptions**

##### ***featureSetListPerUplinkCC***

Indicates which features the UE supports on the individual UL carriers of the feature set (and hence of a band entry that refers to the feature set). The UE shall hence include at least as many *FeatureSetUplinkPerCC-Id* in this list as the number of carriers it supports according to the *ca-BandwidthClassUL*, except if indicating additional functionality by reducing the number of *FeatureSetUplinkPerCC-Id* in the feature set (see NOTE 1 in *FeatureSetCombination* IE description). The order of the elements in this list is not relevant, i.e., the network may configure any of the carriers in accordance with any of the *FeatureSetUplinkPerCC-Id* in this list.

#### – ***FeatureSetUplinkId***

The IE *FeatureSetUplinkId* identifies an uplink feature set. The *FeatureSetUplinkId* of a *FeatureSetUplink* is the index position of the *FeatureSetUplink* in the *featureSetsUplink* list in the *FeatureSets* IE. The first element in the list is referred to by *FeatureSetUplinkId* = 1, and so on. The *FeatureSetUplinkId* = 0 is not used by an actual *FeatureSetUplink* but means that the UE does not support a carrier in this band of a band combination.

**FeatureSetUplinkId information element**

```

-- ASN1START
-- TAG-FEATURESETUPLINKID-START

FeatureSetUplinkId ::=                INTEGER (0..maxUplinkFeatureSets)

-- TAG-FEATURESETUPLINKID-STOP
-- ASN1STOP

```

– **FeatureSetUplinkPerCC**

The IE *FeatureSetUplinkPerCC* indicates a set of features that the UE supports on the corresponding carrier of one band entry of a band combination.

**FeatureSetUplinkPerCC information element**

```

-- ASN1START

```

## — *FeatureSetUplinkPerCC-Id*

The IE *FeatureSetUplinkPerCC-Id* identifies a set of features applicable to one carrier of a feature set. The *FeatureSetUplinkPerCC-Id* of a *FeatureSetUplinkPerCC* is the index position of the *FeatureSetUplinkPerCC* in the *featureSetsUplinkPerCC*. The first element in the list is referred to by *FeatureSetUplinkPerCC-Id* = 1, and so on.

### *FeatureSetUplinkPerCC-Id* information element

```
-- ASN1START
-- TAG-FEATURESETUPLINKPERCC-ID-START

FeatureSetUplinkPerCC-Id ::=          INTEGER (1..maxPerCC-FeatureSets)

-- TAG-FEATURESETUPLINKPERCC-ID-STOP
-- ASN1STOP
```

## — *FreqBandIndicatorEUTRA*

```
-- ASN1START
-- TAG-FREQBANDINDICATOREUTRA-START

FreqBandIndicatorEUTRA ::=  INTEGER (1..maxBandsEUTRA)

-- TAG-FREQBANDINDICATOREUTRA-STOP
-- ASN1STOP
```

## — *FreqBandList*

The IE *FreqBandList* is used by the network to request NR CA, NR non-CA and/or MR-DC band combinations for specific NR and/or E-UTRA frequency bands and/or up to a specific number of carriers and/or up to specific aggregated bandwidth. This is also used to request feature sets (for NR) and feature set combinations (for NR and MR-DC). For NR sidelink communication, this is used by the initiating UE to request sidelink UE radio access capabilities from the peer UE.

### *FreqBandList* information element

```
-- ASN1START
-- TAG-FREQBANDLIST-START

FreqBandList ::=
    SEQUENCE (SIZE (1..maxBandsMRDC)) OF FreqBandInformation

FreqBandInformation ::=
    CHOICE {
        bandInformationEUTRA,
        bandInformationNR
    }
}
```

```

FreqBandInformationEUTRA ::= SEQUENCE {

FreqSeparationClassUL-v1620 ::= ENUMERATED {mhz1000}

-- TAG-FREQSEPARATIONCLASS-STOP
-- ASN1STOP

```

## — *FreqSeparationClassDL-Only*

The IE *FreqSeparationClassDL-Only* is used to indicate the frequency separation between lower edge of lowest CC and upper edge of highest CC of DL only frequency spectrum in a frequency band.

***FreqSeparationClassDL-Only* information element**

```
-- ASN1START
-- TAG-FREQSEPARATIONCLASSDL-Only-START

FreqSeparationClassDL-Only-r16 ::= ENUMERATED {mhz200, mhz400, mhz600, mhz800, mhz1000, mhz1200}

-- TAG-FREQSEPARATIONCLASSDL-Only-STOP
-- ASN1STOP
```

***FR2-2-AccessParamsPerBand***

The IE *FR2-2-AccessParamsPerBand* is used to convey FR2-2 related parameters specific for a certain frequency band (not per feature set or band combination).

**FR2-2-AccessParamsPerBand information element**

```

#### ***Phy-ParametersFRX-Diff* field descriptions**

##### ***csi-RS-IM-ReceptionForFeedback/ csi-RS-ProcFrameworkForSRS/ csi-ReportFramework***

These fields are optionally present in *fr1-fr2-Add-UE-NR-Capabilities* in *UE-NR-Capability*. They shall not be set in any other instance of the IE *Phy-ParametersFRX-Diff*. If the network configures the UE with serving cells on both FR1 and FR2 bands, these parameters, if present, limit the corresponding parameters in *MIMO-ParametersPerBand*.

| <b>codebookTypeRequest</b>                                 | Only if this field is present, the UE includes <i>SupportedCSI-RS-Resource</i> supported for the codebook type(s) requested within this field (i.e. type I single/multi-panel, type II and type II port selection) into <i>codebookVariantsList</i> , <i>codebookParametersPerBand</i> and <i>codebookParametersPerBC</i> . If this field is present and none of the codebook types is requested within this field (i.e. empty field), the UE includes <i>SupportedCSI-RS-Resource</i> supported for all codebook types into <i>codebookVariantsList</i> , <i>codebookParametersPerBand</i> and <i>codebookParametersPerBC</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>fallbackGroupFiveRequest</b>                            | Only if this field is present, the UE supporting FR2 CA bandwidth class from fallback group 5 shall include band combinations with FR2 CA bandwidth class from fallback group 5, and shall omit band combinations with FR2 CA bandwidth class from fallback group 2 or 3 (see TS 38.101-2 [39]) with same or lower capabilities.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>includeNE-DC</b>                                        | Only if this field is present, the UE supporting NE-DC shall indicate support for NE-DC in band combinations and include feature set combinations which are applicable to NE-DC. Band combinations supporting both NE-DC and (NG)EN-DC shall be included in <i>supportedBandCombinationList</i> , band combinations supporting only NE-DC shall be included in <i>supportedBandCombinationListNEDC-Only</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>includeNR-DC</b>                                        | Only if this field is present, the UE supporting NR-DC shall indicate support for NR-DC in band combinations and include feature set combinations which are applicable to NR-DC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>mode</b>                                                | The mode of NR-DC operation that the NW is interested in for this cell grouping. The value <i>sync</i> means that the UE only indicates NR-DC support for band combinations for which it supports synchronous NR-DC with the requested cell grouping. The value <i>async</i> means that the UE only indicates NR-DC support for band combinations for which it supports asynchronous NR-DC with the requested cell grouping.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>omitEN-DC</b>                                           | Only if this field is present, the UE shall omit band combinations and feature set combinations which are only applicable to (NG)EN-DC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>requestedCellGrouping</b>                               | The NR-DC cell groupings that the NW is interested in, i.e., the bands that it might use in an MCG and the bands that it might use in an SCG. Only if this field is present, the UE indicates NR-DC support for band combinations for which it supports the requested cell grouping, i.e., in which it supports at least one of the <i>mcg</i> bands on MCG and at least one of the <i>scg</i> bands on the SCG. In its <i>supportedBandCombinationList</i> , the UE indicates which of its NR-DC band combinations supports which of the requested cell groupings. The first element in this list is referred to by ID#0, the second by ID#1 and so on. If this field is absent, the UE only includes band combinations for which it supports NR-DC with only FR1 bands in MCG and only FR2 bands in SCG.<br>Example 1: <i>requestedCellGrouping</i> is set to <i>mcg</i> =[n1, n7, n41, n66] and <i>scg</i> =[n78, n261]. This assumes that the NW would always use CA among n1, n7, n41 and n66 (depending on which are deployed on a given site) whereas with n78 and/or n261 the NW may need to use DC. With this filter a UE may report a band combination n1A-n7A-n78A for NR-DC only if it supports that serving cells for n1 and n7 are in the MCG and a serving cell for n78 is in the SCG. The UE may also report a band combination n41C-n261M for NR-DC provided that it supports a serving cell for n41 in the MCG and a serving cell for n261 in the SCG.<br>Example 2: One <i>requestedCellGrouping</i> is set to <i>mcg</i> =[n1, n7, n41, n66] and <i>scg</i> =[n78, n261] and another <i>requestedCellGrouping</i> is set to <i>mcg</i> =[n1, n7, n66] and <i>scg</i> =[n41, n78, n261]. This assumes that the NW uses sometimes CA among n1, n7, n41 and n66 (as in example 1) and sometimes CA among n1, n7 and n66 but DC towards one or several of n41, n78, n261. If a UE supports n1A-n41A-n78A only if n41A and n78A are in the same cell group, this UE may only indicate cell grouping ID#1 (not #0) in its BC. |
| <b>uplinkTxSwitchRequest</b>                               | Only if this field is present, the UE supporting dynamic UL Tx switching shall indicate support for UL Tx switching in band combinations which are applicable to inter-band UL CA, SUL and (NG)EN-DC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>measConfigAppLayerContainer</i></b><br>The field contains configuration of application layer measurements, see Annex L (normative) in TS 26.247 [68], clause 16.5 in TS 26.114 [69] and TS 26.118 [70].                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>pauseReporting</i></b><br>The field indicates whether the transmission of <i>measReportAppLayerContainer</i> is paused or not. Value <i>true</i> indicates the transmission of <i>measReportAppLayerContainer</i> is paused; value <i>false</i> indicates the transmission of <i>measReportAppLayerContainer</i> is not paused.                                                                                                                                                                                                                                        |
| <b><i>ran-VisibleParameters</i></b><br>The field indicates whether RAN visible application layer measurements shall be reported or not.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>rrc-SegAllowed</i></b><br>This field indicates that RRC segmentation of <i>MeasurementReportAppLayer</i> is enabled. It may be present only if the UE supports RRC segmentation of the <i>MeasurementReportAppLayer</i> message in UL.                                                                                                                                                                                                                                                                                                                                 |
| <b><i>serviceType</i></b><br>Indicates the type of application layer measurement. Value <i>streaming</i> indicates Quality of Experience Measurement Collection for streaming services (see TS 26.247 [68]), value <i>mtsi</i> indicates Quality of Experience Measurement Collection for MTSI (see TS 26.114 [69]) and value <i>vr</i> indicates Quality of Experience Measurement Collection for VR service (see TS 26.118 [70]). The network always configures <i>serviceType</i> when application layer measurements are initially configured and at <i>fullConfig</i> . |
| <b><i>transmissionOfSessionStartStop</i></b><br>Value <i>true</i> indicates that the UE shall transmit indications when the measurement session in the application layer starts and stops. Value <i>false</i> indicates that the UE shall not transmit any session status indications. The UE transmits a session start indication upon configuration of this field set to value <i>true</i> if a session already has started in the application layer.                                                                                                                      |

| <b><i>RAN-VisibleParameters</i> field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>numberOfBufferLevelEntries</i></b><br>The field contains the maximum number of buffer level entries that can be reported for RAN visible application layer measurements. This field is also used by application layer to calculate the interval of RAN visible buffer level measurement, which is equal to the periodicity of RAN visible application layer measurements reporting divided by <i>numberOfBufferLevelEntries</i> . |
| <b><i>ran-VisiblePeriodicity</i></b><br>The field indicates the periodicity of RAN visible application layer measurements reporting. Value <i>ms120</i> indicates 120 ms, value <i>ms240</i> indicates 240 ms and so on. If this field is absent, the periodicity of RAN visible application layer measurements reporting is the same as the reporting periodicity indicated in <i>measConfigAppLayerContainer</i> .                    |
| <b><i>reportPayoutDelayForMediaStartup</i></b><br>The field indicates whether the UE shall report Payout Delay for Media Startup for RAN visible application layer measurements.                                                                                                                                                                                                                                                        |

| <b>Conditional Presence</b> | <b>Explanation</b>                                                                                                                   |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <i>ServiceType</i>          | This field is optionally present, Need M, when <i>serviceType</i> is set to <i>streaming</i> or <i>vr</i> . Otherwise, it is absent. |

— *AreaConfiguration*

The *AreaConfiguration* indicates area for which UE is requested to perform measurement logging. If not configured, measurement logging is not restricted to specific cells or tracking areas but applies as long as the RPLMN is contained in *plmn-IdentityList* stored in *VarLogMeasReport*.

**AreaConfiguration information element**

```
-- ASN1START
-- TAG-AREACONFIGURATION-START

AreaConfiguration-r16 ::=          SEQUENCE {

|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>InterFreqTargetInfo</b><br>If configured, it indicates the neighbouring frequency and cells for which UE is requested to perform measurement logging. It can include sync raster or non-sync raster frequencies. |

— *BT-NameList*

The IE *BT-NameList* is used to indicate the names of the Bluetooth beacon which the UE is configured to measure.

***BT-NameList* information element**

```
-- ASN1START
-- TAG-BTNAMELIST-START

BT-NameList-r16 ::=          SEQUENCE (SIZE (1..maxBT-Name-r16)) OF BT-Name-r16

BT-Name-r16 ::=              OCTET STRING (SIZE (1..248))

-- TAG-BTNAMELIST-STOP
-- ASN1STOP
```

| <i>BT-NameList</i> field descriptions                                                                                                                                                                  |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>bt-Name</i></b><br>If configured, the UE only performs Bluetooth measurements according to the names identified. For each name, it refers to LOCAL NAME defined in Bluetooth specification [51]. |

— *DedicatedInfoF1c*

The IE *DedicatedInfoF1c* is used to transfer IAB-DU specific F1-C related information between the network and the IAB node. The carried information consists of F1AP message encapsulated in SCTP/IP or F1-C related (SCTP)/IP packet, see TS 38.472 [64]. The RRC layer is transparent for this information.

***DedicatedInfoF1c* information element**

```
-- ASN1START
-- TAG-DEDICATEDINFOF1C-START

DedicatedInfoF1c-r17 ::=      OCTET STRING

-- TAG-DEDICATEDINFOF1C-STOP
-- ASN1STOP
```

— *EUTRA-AllowedMeasBandwidth*

The IE *EUTRA-AllowedMeasBandwidth* is used to indicate the maximum allowed measurement bandwidth on a carrier frequency as defined by the parameter Transmission Bandwidth Configuration "N<sub>RB</sub>" in TS 36.104 [33]. The values *mbw6*, *mbw15*, *mbw25*, *mbw50*, *mbw75*, *mbw100* indicate 6, 15, 25, 50, 75 and 100 resource blocks, respectively.

***EUTRA-AllowedMeasBandwidth* information element**

```

-- ASN1START
-- TAG-EUTRA-ALLOWEDMEASBANDWIDTH-START

EUTRA-AllowedMeasBandwidth ::= ENUMERATED {mbw6, mbw15, mbw25, mbw50, mbw75, mbw100}

-- TAG-EUTRA-ALLOWEDMEASBANDWIDTH-STOP
-- ASN1STOP

```

***EUTRA-MBSFN-SubframeConfigList***

The IE *EUTRA-MBSFN-SubframeConfigList* is used to define an E-UTRA MBSFN subframe pattern (for the purpose of NR rate matching).

***EUTRA-MBSFN-SubframeConfigList* information element**

```

-- ASN1START
-- TAG-EUTRA-MBSFN-SUBFRAMECONFIGLIST-START

EUTRA-MBSFN-SubframeConfigList ::= SEQUENCE (SIZE (1..maxMBSFN-Allocations)) OF EUTRA-MBSFN-SubframeConfig

EUTRA-MBSFN-SubframeConfig ::= SEQUENCE {

| <b>subframeAllocation1</b><br>Field as defined in <i>MBSFN-SubframeConfig</i> in TS 36.331 [10], where the UE assumes the duplex mode (FDD or TDD) of the NR cell for which the <i>E-UTRA-MBSFN-SubframeConfig</i> is provided.       |
| <b>subframeAllocation2</b><br>Field as defined in <i>MBSFN-SubframeConfig-v1430</i> in TS 36.331 [10], where the UE assumes the duplex mode (FDD or TDD) of the NR cell for which the <i>E-UTRA-MBSFN-SubframeConfig</i> is provided. |

– EUTRA-MultiBandInfoList

The IE *EUTRA-MultiBandInfoList* indicates the list of frequency bands in addition to the band represented by *CarrierFreq* for which cell reselection parameters are common, and a list of *additionalPmax* and *additionalSpectrumEmission*.

EUTRA-MultiBandInfoList information element

```
-- ASN1START
-- TAG-EUTRA-MULTIBANDINFOLIST-START

EUTRA-MultiBandInfoList ::=      SEQUENCE (SIZE (1..maxMultiBands)) OF EUTRA-MultiBandInfo

EUTRA-MultiBandInfo ::=          SEQUENCE {
    eutra-FreqBandIndicator      FreqBandIndicatorEUTRA,
    eutra-NS-PmaxList             EUTRA-NS-PmaxList             OPTIONAL  -- Need R
}

-- TAG-EUTRA-MULTIBANDINFOLIST-STOP
-- ASN1STOP
```

– EUTRA-NS-PmaxList

The IE *EUTRA-NS-PmaxList* concerns a list of *additionalPmax* and *additionalSpectrumEmission*, as defined in TS 36.101 [22], table 6.2.4-1 for UEs neither in CE nor BL UEs and TS 36.101 [22], table 6.2.4E-1 for UEs in CE or BL UEs, for a given frequency band.

EUTRA-NS-PmaxList information element

```
-- ASN1START
-- TAG-EUTRA-NS-PMAXLIST-START

EUTRA-NS-PmaxList ::=            SEQUENCE (SIZE (1..maxEUTRA-NS-Pmax)) OF EUTRA-NS-PmaxValue

EUTRA-NS-PmaxValue ::=          SEQUENCE {
```

```

    additionalPmax          INTEGER (-30..33)          OPTIONAL, -- Need R
    additionalSpectrumEmission INTEGER (1..288)        OPTIONAL -- Need R
}

-- TAG-EUTRA-NS-PMAXLIST-STOP
-- ASN1STOP

```

### — *EUTRA-PhysCellId*

The IE *EUTRA-PhysCellId* is used to indicate the physical layer identity of the cell, as defined in TS 36.211 [31].

#### *EUTRA-PhysCellId* information element

```

-- ASN1START
-- TAG-EUTRA-PHYSCELLID-START

EUTRA-PhysCellId ::= INTEGER (0..503)

-- TAG-EUTRA-PHYSCELLID-STOP
-- ASN1STOP

```

### — *EUTRA-PhysCellIdRange*

The IE *EUTRA-PhysCellIdRange* is used to encode either a single or a range of physical cell identities. The range is encoded by using a *start* value and by indicating the number of consecutive physical cell identities (including *start*) in the range. For fields comprising multiple occurrences of *EUTRA-PhysCellIdRange*, NW may configure overlapping ranges of physical cell identities.

#### *EUTRA-PhysCellIdRange* information element

```

-- ASN1START
-- TAG-EUTRA-PHYSCELLIDRANGE-START

EUTRA-PhysCellIdRange ::= SEQUENCE {
    start          EUTRA-PhysCellId,
    range          ENUMERATED {n4, n8, n12, n16, n24, n32, n48, n64, n84, n96,
                                n128, n168, n252, n504, spare2, spare1}
}

-- TAG-EUTRA-PHYSCELLIDRANGE-STOP
-- ASN1STOP

```

OPTIONAL -- Need N

## — *EUTRA-PresenceAntennaPort1*

The IE *EUTRA-PresenceAntennaPort1* is used to indicate whether all the neighbouring cells use Antenna Port 1. When set to *true*, the UE may assume that at least two cell-specific antenna ports are used in all neighbouring cells.

### *EUTRA-PresenceAntennaPort1* information element

```
-- ASN1START
-- TAG-EUTRA-PRESENCEANTENNAPORT1-START

EUTRA-PresenceAntennaPort1 ::=          BOOLEAN

-- TAG-EUTRA-PRESENCEANTENNAPORT1-STOP
-- ASN1STOP
```

## — *EUTRA-Q-OffsetRange*

The IE *EUTRA-Q-OffsetRange* is used to indicate a cell, or frequency specific offset to be applied when evaluating triggering conditions for measurement reporting. The value in dB. Value *dB-24* corresponds to -24 dB, value *dB-22* corresponds to -22 dB and so on.

### *EUTRA-Q-OffsetRange* information element

```
-- ASN1START
-- TAG-EUTRA-Q-OFFSETRANGE-START

EUTRA-Q-OffsetRange ::=          ENUMERATED {
    dB-24, dB-22, dB-20, dB-18, dB-16, dB-14,
    dB-12, dB-10, dB-8, dB-6, dB-5, dB-4, dB-3,
    dB-2, dB-1, dB0, dB1, dB2, dB3, dB4, dB5,
    dB6, dB8, dB10, dB12, dB14, dB16, dB18,
    dB20, dB22, dB24}

-- TAG-EUTRA-Q-OFFSETRANGE-STOP
-- ASN1STOP
```

## — *IAB-IP-Address*

The IE *IAB-IP-Address* is used to indicate the IP address/prefix.

### *IAB-IP-Address* information element

```
-- ASN1START
-- TAG-IABIPADDRESS-START

IAB-IP-Address-r16 ::= CHOICE {
    ipv4-Address-r16          BIT STRING (SIZE(32)),
```

```
        iIPv6-Address-r16          BIT STRING (SIZE(128)),
        iIPv6-Prefix-r16          BIT STRING (SIZE(64)),
        ...
    }

-- TAG-IABIPADDRESS-STOP
-- ASN1STOP
```

| IAB-IP-Address field descriptions                                                 |
|-----------------------------------------------------------------------------------|
| <b>iIPv4-Address</b><br>This field is used to provide the allocated IPv4 address. |
| <b>iIPv6-Address</b><br>This field is used to provide the allocated IPv6 address. |
| <b>iIPv6-Prefix</b><br>This field is used to provide the allocated IPv6 prefix.   |

— IAB-IP-AddressIndex

The IE *IAB-IP-AddressIndex* is used to identify a configuration of an IP address.

IAB-IP-AddressIndex information element

```
-- ASN1START
-- TAG-IABIPADDRESSINDEX-START

IAB-IP-AddressIndex-r16 ::= INTEGER (1..maxIAB-IP-Address-r16)

-- TAG-IABIPADDRESSINDEX-STOP
-- ASN1STOP
```

— IAB-IP-Usage

The IE *IAB-IP-Usage* is used to indicate the usage of the assigned IP address/prefix.

IAB-IP-Usage information element

```
-- ASN1START
-- TAG-IAB-IP-USAGE-START

IAB-IP-Usage-r16 ::= ENUMERATED {f1-C, f1-U, non-F1, spare}

-- TAG-IAB-IP-USAGE-STOP
-- ASN1STOP
```

## — *LoggingDuration*

The *LoggingDuration* indicates the duration for which UE is requested to perform measurement logging. Value min10 corresponds to 10 minutes, value min20 corresponds to 20 minutes and so on.

### *LoggingDuration* information element

```
-- ASN1START
-- TAG-LOGGINGDURATION-START

LoggingDuration-r16 ::= ENUMERATED {
    min10, min20, min40, min60, min90, min120, spare2, spare1}

-- TAG-LOGGINGDURATION-STOP
-- ASN1STOP
```

## — *LoggingInterval*

The *LoggingInterval* indicates the periodicity for logging measurement results. Value ms1280 corresponds to 1.28s, value ms2560 corresponds to 2.56s and so on. Value infinity means it is equal to the configured value of the *LoggingDuration* IE.

### *LoggingInterval* information element

```
-- ASN1START
-- TAG-LOGGINGINTERVAL-START

LoggingInterval-r16 ::= ENUMERATED {
    ms320, ms640, ms1280, ms2560, ms5120, ms10240, ms20480,
    ms30720, ms40960, ms61440 , infinity}

-- TAG-LOGGINGINTERVAL-STOP
-- ASN1STOP
```

## — *LogMeasResultListBT*

The IE *LogMeasResultListBT* covers measured results for Bluetooth.

### *LogMeasResultListBT* information element

```
-- ASN1START
-- TAG-LOGMEASRESULTLISTBT-START

LogMeasResultListBT-r16 ::= SEQUENCE (SIZE (1..maxBT-IdReport-r16)) OF LogMeasResultBT-r16

LogMeasResultBT-r16 ::= SEQUENCE {
    bt-Addr-r16          BIT STRING (SIZE (48)),
```

```

    rssi-BT-r16          INTEGER (-128..127)    OPTIONAL,
    ...
}

-- TAG-LOGMEASRESULTLISTBT-STOP
-- ASN1STOP
```

| LogMeasResultListBT field descriptions                                                                                          |
|---------------------------------------------------------------------------------------------------------------------------------|
| <b>bt-Addr</b><br>This field indicates the Bluetooth public address of the Bluetooth beacon as defined in TS 37.355 [49].       |
| <b>rssi-BT</b><br>This field provides the beacon received signal strength indicator (RSSI) in dBm as defined in TS 37.355 [49]. |

– LogMeasResultListWLAN

The IE *LogMeasResultListWLAN* covers measured results for WLAN.

LogMeasResultListWLAN information element

```

-- ASN1START
-- TAG-LOGMEASRESULTLISTWLAN-START

LogMeasResultListWLAN-r16 ::= SEQUENCE (SIZE (1..maxWLAN-Id-Report-r16)) OF LogMeasResultWLAN-r16

LogMeasResultWLAN-r16 ::= SEQUENCE {
    wlan-Identifiers-r16      WLAN-Identifiers-r16,
    rssiWLAN-r16              WLAN-RSSI-Range-r16      OPTIONAL,
    rtt-WLAN-r16              WLAN-RTT-r16              OPTIONAL,
    ...
}

WLAN-Identifiers-r16 ::= SEQUENCE {
    ssid-r16                  OCTET STRING (SIZE (1..32)) OPTIONAL,
    bssid-r16                 OCTET STRING (SIZE (6))      OPTIONAL,
    hessid-r16                 OCTET STRING (SIZE (6))      OPTIONAL,
    ...
}

WLAN-RSSI-Range-r16 ::= INTEGER(0..141)

| Prohibit timer for release preference assistance information reporting. Value in seconds. Value <i>s0</i> means prohibit timer is set to 0 seconds, value <i>s0dot5</i> means prohibit timer is set to 0.5 seconds, value <i>s1</i> means prohibit timer is set to 1 second and so on. Value <i>infinity</i> means that once a UE has reported a release preference, the UE cannot report a release preference again during the RRC connection. |
| <b>s-SearchDeltaP-Stationary</b>                                                                                                                                                                                                                                                                                                                                                                                                                |
| Parameter "S <sub>SearchDeltaP-StationaryConnected</sub> " in 5.7.4.4. Value dB2 corresponds to 2 dB, dB3 corresponds to 3 dB and so on.                                                                                                                                                                                                                                                                                                        |
| <b>scg-DeactivationPreferenceConfig</b>                                                                                                                                                                                                                                                                                                                                                                                                         |
| Configuration of the UE to indicate its preference for SCG deactivation.                                                                                                                                                                                                                                                                                                                                                                        |

| <b>thresholdPercentageT304</b><br>This field indicates the threshold for the ratio in percentage between the elapsed T304 timer and the configured value of the T304 timer. Value <i>p40</i> corresponds to 40%, value <i>p60</i> corresponds to 60% and so on. This field is set in the <i>otherConfig</i> configured by the target cell of the handover.    |
| <b>thresholdPercentageT310</b><br>This field indicates the threshold for the ratio in percentage between the elapsed T310 timer and the configured value of the T310 timer. Value <i>p40</i> corresponds to 40%, value <i>p60</i> corresponds to 60% and so on. This field is set in the <i>otherConfig</i> configured by the source cell of the handover.    |
| <b>thresholdPercentageT312</b><br>This field indicates the threshold for the ratio in percentage between the elapsed T312 timer and the configured value(s) of the T312 timer. Value <i>p20</i> corresponds to 20%, value <i>p40</i> corresponds to 40% and so on. This field is set in the <i>otherConfig</i> configured by the source cell of the handover. |
| <b>threshPropDelayDiff</b><br>Threshold for one-way service link propagation delay difference report as specified in 5.7.4.2.                                                                                                                                                                                                                                 |
| <b>ul-GapFR2-PreferenceConfig</b><br>Indicates whether UE is configured to request for FR2 UL gap activation/deactivation and preferred FR2 UL gap pattern.                                                                                                                                                                                                   |
| <b>wlanNameList</b><br>Configuration for the UE to report measurements from specific WLAN APs. NG-RAN configures the field if <i>includeWLAN-Meas</i> is configured for one or more measurements.                                                                                                                                                             |

| NeighbourCellInfo field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>epochTime</b><br>Indicates the epoch time used along with the <i>ephemerisInfo</i> to derive the propagation delay difference for the associated neighbour cell. The UE considers epoch time, indicated by the SFN and sub-frame number in this field, to be the frame nearest to the frame in which the message indicating the epoch time is received. This field is used based on the timing of the serving cell, i.e. the SFN and sub-frame number indicated in this field refers to the SFN and sub-frame of the serving cell. |

| Conditional Presence | Explanation                                                                                                                                                                                                                             |

| <i>minOffset</i>     | This field is optionally present, need R, if <i>minSchedulingOffsetPreferenceConfig-r16</i> is setup; otherwise it is absent, need R.                                                                                                   |
| <i>SCG</i>           | This field is optionally present, need M, in an <i>RRCReconfiguration</i> message not within <i>mrdc-SecondaryCellGroup</i> and received, either via SRB3 within <i>DLInformationTransferMRDC</i> or via SRB1. Otherwise, it is absent. |

– PhysCellIdUTRA-FDD

The IE *PhysCellIdUTRA-FDD* is used to indicate the physical layer identity of the cell, i.e. the primary scrambling code, as defined in TS 25.331 [45].

PhysCellIdUTRA-FDD information element

```
-- ASN1START
-- TAG-PHYSCELLIDUTRA-FDD-START

PhysCellIdUTRA-FDD-r16 ::=          INTEGER (0..511)

-- TAG-PHYSCELLIDUTRA-FDD-STOP
-- ASN1STOP
```

— *RRC-TransactionIdentifier*

The IE *RRC-TransactionIdentifier* is used, together with the message type, for the identification of an RRC procedure (transaction).

***RRC-TransactionIdentifier* information element**

```
-- ASN1START
-- TAG-RRC-TRANSACTIONIDENTIFIER-START

RRC-TransactionIdentifier ::=      INTEGER (0..3)

-- TAG-RRC-TRANSACTIONIDENTIFIER-STOP
-- ASN1STOP
```

— *Sensor-NameList*

The IE *Sensor-NameList* is used to indicate the names of the sensors which the UE is configured to measure.

***Sensor-NameList* information element**

```
-- ASN1START
-- TAG-SENSORNAMELIST-START

Sensor-NameList-r16 ::= SEQUENCE {
    measUncomBarPre-r16      ENUMERATED {true}      OPTIONAL, -- Need R
    measUeSpeed              ENUMERATED {true}      OPTIONAL, -- Need R
    measUeOrientation        ENUMERATED {true}      OPTIONAL  -- Need R
}

-- TAG-SENSORNAMELIST-STOP
-- ASN1STOP
```

| <i>Sensor-NameList</i> field descriptions                                                                                                      |
|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>measUncomBarPre</i></b><br>If configured, the UE reports the uncompensated Barometric pressure measurement as defined in TS 37.355 [49]. |
| <b><i>measUeSpeed</i></b><br>If configured, the UE reports the UE speed measurement as defined in TS 37.355 [49].                              |
| <b><i>measUeOrientation</i></b><br>If configured, the UE reports the UE orientation information as defined in TS 37.355 [49].                  |

## – *TraceReference*

The *TraceReference* contains parameter Trace Reference as defined in TS 32.422 [52].

### *TraceReference* information element

```
-- ASN1START
-- TAG-TRACEREFERENCE-START

TraceReference-r16 ::= SEQUENCE {
    plmn-Identity-r16      PLMN-Identity,
    traceId-r16            OCTET STRING (SIZE (3))
}

-- TAG-TRACEREFERENCE-STOP
-- ASN1STOP
```

## – *UE-MeasurementsAvailable*

The IE *UE-MeasurementsAvailable* is used to indicate all relevant available indicators for UE measurements.

### *UE-MeasurementsAvailable* information element

```
-- ASN1START
-- TAG-UE-MeasurementsAvailable-START

UE-MeasurementsAvailable-r16 ::=
    SEQUENCE {
        logMeasAvailable-r16      ENUMERATED {true}      OPTIONAL,
        logMeasAvailableBT-r16    ENUMERATED {true}      OPTIONAL,
        logMeasAvailableWLAN-r16  ENUMERATED {true}      OPTIONAL,
        connEstFailInfoAvailable-r16  ENUMERATED {true}  OPTIONAL,
        rlf-InfoAvailable-r16      ENUMERATED {true}      OPTIONAL,
        ...,
        [[
            successH0-InfoAvailable-r17  ENUMERATED {true}  OPTIONAL,
            sigLogMeasConfigAvailable-r17  BOOLEAN          OPTIONAL
        ]]
    }

-- TAG-UE-MeasurementsAvailable-STOP
-- ASN1STOP
```

## – *UTRA-FDD-Q-OffsetRange*

The IE *UTRA-FDD-Q-OffsetRange* is used to indicate a frequency specific offset to be applied when evaluating triggering conditions for measurement reporting. The value is in dB. Value *dB-24* corresponds to -24 dB, value *dB-22* corresponds to -22 dB and so on.

**UTRA-FDD-Q-OffsetRange information element**

```

-- ASN1START
-- TAG-UTRA-FDD-Q-OFFSETRANGE-START

UTRA-FDD-Q-OffsetRange-r16 ::=
    ENUMERATED {
        dB-24, dB-22, dB-20, dB-18, dB-16, dB-14,
        dB-12, dB-10, dB-8, dB-6, dB-5, dB-4, dB-3,
        dB-2, dB-1, dB0, dB1, dB2, dB3, dB4, dB5,
        dB6, dB8, dB10, dB12, dB14, dB16, dB18,
        dB20, dB22, dB24}

-- TAG-UTRA-FDD-Q-OFFSETRANGE-STOP
-- ASN1STOP

```

**VisitedCellInfoList**

The IE *VisitedCellInfoList* includes the mobility history information of maximum of 16 most recently visited primary cells or time spent in any cell selection state and/or camped on any cell state in NR or E-UTRA and, in case of Dual Connectivity, the mobility history information of *maxPSCellHistory* most recently visited primary secondary cell group cells across all the primary cells included in the *VisitedCellInfoList*. The most recently visited cell is stored first in the list. The list includes cells visited in RRC\_IDLE, RRC\_INACTIVE and RRC\_CONNECTED states for NR and RRC\_IDLE and RRC\_CONNECTED for E-UTRA.

**VisitedCellInfoList information element**

```

-- ASN1START
-- TAG-VISITEDCELLINFOLIST-START

VisitedCellInfoList-r16 ::= SEQUENCE (SIZE (1..maxCellHistory-r16)) OF VisitedCellInfo-r16

VisitedCellInfo-r16 ::= SEQUENCE {
    visitedCellId-r16 CHOICE {
        nr-CellId-r16 CHOICE {
            cgi-Info CGI-Info-Logging-r16,
            pci-arfcn-r16 PCI-ARFCN-NR-r16
        },
        eutra-CellId-r16 CHOICE {
            cellGlobalId-r16 CGI-InfoEUTRA,
            pci-arfcn-r16 PCI-ARFCN-EUTRA-r16
        }
    },
    timeSpent-r16 OPTIONAL,
    INTEGER (0..4095),
    ...
    [[
        visitedPSCellInfoListReport-r17 VisitedPSCellInfoList-r17 OPTIONAL
    ]]
}

VisitedPSCellInfoList-r17 ::= SEQUENCE (SIZE (1..maxPSCellHistory-r17)) OF VisitedPSCellInfo-r17

VisitedPSCellInfo-r17 ::= SEQUENCE {

```

```
visitedCellId-r17      CHOICE {
  nr-CellId-r17        CHOICE {
    cgi-Info-r17       CGI-Info-Logging-r16,
    pci-arfcn-r17      PCI-ARFCN-NR-r16
  },
  eutra-CellId-r17     CHOICE {
    cellGlobalId-r17   CGI-InfoEUTRALogging,
    pci-arfcn-r17      PCI-ARFCN-EUTRA-r16
  }
}
timeSpent-r17          INTEGER (0..4095),
...
}

-- TAG-VISITEDCELLINFOLIST-STOP
-- ASN1STOP
```

| VisitedCellInfoList field descriptions                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>timeSpent</b><br>This field indicates the duration of stay in the cell or in any cell selection state and/or camped on any cell state in NR or E-UTRA approximated to the closest second. If included in <i>VisitedPSCellInfo</i> , it indicates the duration of stay in the PSCell or without any PSCell. If the duration of stay exceeds 4095s, the UE shall set it to 4095s. |
| <b>visitedCellId</b><br>This field indicates the visited cell id including NR and E-UTRA cells.                                                                                                                                                                                                                                                                                    |

– **WLAN-NameList**

The IE *WLAN-NameList* is used to indicate the names of the WLAN AP for which the UE is configured to measure.

**WLAN-NameList information element**

```
-- ASN1START
-- TAG-WLANNAMELIST-START

WLAN-NameList-r16 ::= SEQUENCE (SIZE (1..maxWLAN-Name-r16)) OF WLAN-Name-r16

WLAN-Name-r16 ::= OCTET STRING (SIZE (1..32))

-- ASN1STOP
-- TAG-WLANNAMELIST-STOP
```

| WLAN-NameList field descriptions                                                                                                                                                                         |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>WLAN-Name</b><br>If configured, the UE only performs WLAN measurements according to the names identified. For each name, it refers to Service Set Identifier (SSID) defined in IEEE 802.11-2012 [50]. |

## 6.3.5 Sidelink information elements

### – *SL-BWP-Config*

The IE *SL-BWP-Config* is used to configure the UE specific NR sidelink communication/discovery on one particular sidelink bandwidth part.

#### *SL-BWP-Config* information element

```
-- ASN1START
-- TAG-SL-BWP-CONFIG-START

SL-BWP-Config-r16 ::=
    sl-BWP-Id
    sl-BWP-Generic-r16
    sl-BWP-PoolConfig-r16
    ...
    [[
        sl-BWP-PoolConfigPS-r17
        sl-BWP-DiscPoolConfig-r17
    ]]
}

SL-BWP-Generic-r16 ::=
    sl-BWP-r16
    sl-LengthSymbols-r16
    sl-StartSymbol-r16
    sl-PSBCH-Config-r16
    sl-TxDirectCurrentLocation-r16
    ...
}

-- TAG-SL-BWP-CONFIG-STOP
-- ASN1STOP
```

**SEQUENCE {**

|                                          |           |    |        |
|------------------------------------------|-----------|----|--------|
| BWP-Id,                                  |           |    |        |

## – *SL-CBR-PriorityTxConfigList*

The IE *SL-CBR-PriorityTxConfigList* indicates the mapping between PSSCH transmission parameter (such as MCS, PRB number, retransmission number, CR limit) sets by using the indexes of the configurations provided in *sl-CBR-PSSCH-TxConfigList*, CBR ranges by an index to the entry of the CBR range configuration in *sl-CBR-RangeConfigList*, and priority ranges. It also indicates the default PSSCH transmission parameters to be used when CBR measurement results are not available, and MCS range for the MCS tables used in the resource pool.

### ***SL-CBR-PriorityTxConfigList* information element**

```
-- ASN1START
-- TAG-SL-CBR-PRIORITYTXCONFIGLIST-START

SL-CBR-PriorityTxConfigList-r16 ::= SEQUENCE (SIZE (1..8)) OF SL-PriorityTxConfigIndex-r16

SL-CBR-PriorityTxConfigList-v1650 ::= SEQUENCE (SIZE (1..8)) OF SL-PriorityTxConfigIndex-v1650

SL-PriorityTxConfigIndex-r16 ::= SEQUENCE {
    sl-PriorityThreshold-r16          INTEGER (1..8)                OPTIONAL, -- Need M
    sl-DefaultTxConfigIndex-r16      INTEGER (0..maxCBR-Level-1-r16)  OPTIONAL, -- Need M
    sl-CBR-ConfigIndex-r16          INTEGER (0..maxCBR-Config-1-r16)  OPTIONAL, -- Need M
    sl-Tx-ConfigIndexList-r16       SEQUENCE (SIZE (1.. maxCBR-Level-r16)) OF SL-TxConfigIndex-r16  OPTIONAL -- Need M
}

SL-PriorityTxConfigIndex-v1650 ::= SEQUENCE {
    sl-MCS-RangeList-r16            SEQUENCE (SIZE (1..maxCBR-Level-r16)) OF SL-MinMaxMCS-List-r16  OPTIONAL -- Need M
}

SL-TxConfigIndex-r16 ::= INTEGER (0..maxTxConfig-1-r16)

-- TAG-SL-CBR-PRIORITYTXCONFIGLIST-STOP
-- ASN1STOP
```

### ***SL-CBR-PriorityTxConfigList* field descriptions**

#### ***sl-CBR-ConfigIndex***

Indicates the CBR ranges to be used by an index to the entry of the CBR range configuration in *sl-CBR-RangeConfigList*.

#### ***sl-DefaultTxConfigIndex***

Indicates the PSSCH transmission parameters to be used by the UEs which do not have available CBR measurement results, by means of an index to the corresponding entry in *sl-Tx-ConfigIndexList*. Value 0 indicates the first entry in *sl-Tx-ConfigIndexList*. The field is ignored if the UE has available CBR measurement results.

#### ***sl-MCS-RangeList***

Indicates the minimum MCS value and maximum MCS value for the associated MCS table(s). UE shall ignore the minimum MCS value and maximum MCS value used for table of 64QAM indicated in *SL-CBR-PriorityTxConfigList-r16* if *SL-CBR-PriorityTxConfigList-v1650* is present.

#### ***sl-PriorityThreshold***

Indicates the upper bound of priority range which is associated with the configurations in *sl-CBR-ConfigIndex* and in *sl-Tx-ConfigIndexList*. The upper bounds of the priority ranges are configured in ascending order for consecutive entries of *SL-PriorityTxConfigIndex* in *SL-CBR-PriorityTxConfigList*. For the first entry of *SL-PriorityTxConfigIndex*, the lower bound of the priority range is 1.

#### ***SL-CBR-PriorityTxConfigList-v1650***

If included, it includes the same number of entries, and listed in the same order, as in *SL-CBR-PriorityTxConfigList-r16*.

— *SL-CBR-CommonTxConfigList*

The IE *SL-CBR-CommonTxConfigList* indicates the list of PSSCH transmission parameters (such as MCS, sub-channel number, retransmission number, CR limit) in *sl-CBR-PSSCH-TxConfigList*, and the list of CBR ranges in *sl-CBR-RangeConfigList*, to configure congestion control to the UE for sidelink communication.

| <i>SL-CBR-CommonTxConfigList</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>sl-CBR-RangeConfigList</i></b><br>Each entry in <i>sl-CBR-RangeConfigList</i> is <i>SL-CBR-LevelsConfig</i> containing the list of CBR ranges. The values within each <i>SL-CBR-LevelsConfig</i> indicate the upper bound of the each CBR range (and implicitly indicate the lower bound of next CBR range) and are configured in ascending order. For the first CBR range of each <i>SL-CBR-LevelsConfig</i> , the lower bound of the CBR range is 0. Value 0 corresponds to 0, value 1 to 0.01, value 2 to 0.02, and so on. |
| <b><i>sl-CR-Limit</i></b><br>Indicates the maximum limit on the occupancy ratio. Value 0 corresponds to 0, value 1 to 0.0001, value 2 to 0.0002, and so on (i.e. in steps of 0.0001) until value 10000, which corresponds to 1.                                                                                                                                                                                                                                                                                                     |
| <b><i>sl-CBR-PSSCH-TxConfigList</i></b><br>Indicates the list of available PSSCH transmission parameters (such as MCS, sub-channel number, retransmission number and CR limit) configurations.                                                                                                                                                                                                                                                                                                                                      |
| <b><i>sl-TxParameters</i></b><br>Indicates PSSCH transmission parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## — *SL-ConfigDedicatedNR*

The IE *SL-ConfigDedicatedNR* specifies the dedicated configuration information for NR sidelink communication/discovery.

### *SL-ConfigDedicatedNR* information element

```

| <b>SL-PHY-MAC-RLC-Config field descriptions</b>            |                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>networkControlledSyncTx</b>                             | This field indicates whether the UE shall transmit synchronisation information (i.e. become synchronisation source). Value <i>on</i> indicates the UE to transmit synchronisation information while value <i>off</i> indicates the UE to not transmit such information.                                                                                    |
| <b>sl-DRX-Config</b>                                       | This field indicates the sidelink DRX configuration(s) for unicast, groupcast and/or broadcast communication, as specified in TS 38.321 [3].                                                                                                                                                                                                               |
| <b>sl-MaxNumConsecutiveDTX</b>                             | This field indicates the maximum number of consecutive HARQ DTX before triggering sidelink RLF. Value n1 corresponds to 1, value n2 corresponds to 2, and so on.                                                                                                                                                                                           |
| <b>sl-FreqInfoToAddModList, sl-FreqInfoToAddModListExt</b> | This field indicates the NR sidelink communication configuration on some carrier frequency (ies) to add and/or modify. In this release, only one entry can be configured in the list. If network includes <i>sl-FreqInfoToAddModListExt</i> , it includes the same number of entries, and listed in the same order, as in <i>sl-FreqInfoToAddModList</i> . |
| <b>sl-FreqInfoToReleaseList</b>                            | This field indicates the NR sidelink communication configuration on some carrier frequency (ies) to remove. In this release, only one entry can be configured in the list.                                                                                                                                                                                 |
| <b>sl-RLC-BearerToAddModList</b>                           | This field indicates one or multiple sidelink RLC bearer configurations to add and/or modify.                                                                                                                                                                                                                                                              |
| <b>sl-RLC-BearerToReleaseList</b>                          | This field indicates one or multiple sidelink RLC bearer configurations to remove.                                                                                                                                                                                                                                                                         |
| <b>sl-RLC-ChannelToAddModList</b>                          | This field indicates one or multiple PC5 Relay RLC Channel configurations to add and/or modify. Each PC5 Relay RLC channel configuration provided by network to L2 U2N Relay UE is uniquely associated with one L2 U2N Remote UE.                                                                                                                          |
| <b>sl-RLC-ChannelToReleaseList</b>                         | This field indicates one or multiple PC5 Relay RLC Channel configurations to remove.                                                                                                                                                                                                                                                                       |
| <b>sl-ScheduledConfig</b>                                  | Indicates the configuration for UE to transmit NR sidelink communication based on network scheduling. This field is not configured simultaneously with <i>sl-UE-SelectedConfig</i> . This field is not configured to a L2 U2N Remote UE.                                                                                                                   |
| <b>sl-UE-SelectedConfig</b>                                | Indicates the configuration used for UE autonomous resource selection. This field is not configured simultaneously with <i>sl-ScheduledConfig</i> .                                                                                                                                                                                                        |
| <b>sl-CSI-Acquisition</b>                                  | Indicates whether CSI reporting is enabled in sidelink unicast. If the field is absent, sidelink CSI reporting is disabled.                                                                                                                                                                                                                                |
| <b>sl-CSI-SchedulingRequestId</b>                          | If present, it indicates the scheduling request configuration applicable for Sidelink CSI Reporting MAC CE and Sidelink DRX Command MAC CE, as specified in TS 38.321 [3].                                                                                                                                                                                 |
| <b>sl-SSB-PriorityNR</b>                                   | This field indicates the priority of NR sidelink SSB transmission and reception.                                                                                                                                                                                                                                                                           |

| Conditional Presence | Explanation                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------------------|
| <i>L2RelayUE</i>     | For L2 U2N Relay UE, the field is optionally present, Need M. Otherwise, it is absent.                   |
| <i>L2RemoteUE</i>    | For L2 U2N Remote UE, the field is optionally present, Need M. Otherwise, it is absent.                  |
| <i>L2U2N</i>         | The field is optional present for L2 U2N Relay UE and L2 U2N Remote UE, need N. Otherwise, it is absent. |

## – *SL-ConfiguredGrantConfig*

The IE *SL-ConfiguredGrantConfig* specifies the configured grant configuration information for NR sidelink communication.

| <b><i>rrc-ConfiguredSidelinkGrant</i></b><br>Configuration for "sidelink configured grant" transmission with fully RRC-configured SL grant (Type1). If this field is not configured, the UE uses SL grant configured by DCI addressed to SL-CS-RNTI (Type2).                                                                                                                                                                                                                        |
| <b><i>sl-ConfigIndexCG</i></b><br>This field indicates the ID to identify sidelink configured grant.                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>sl-CG-MaxTransNumList</i></b><br>This field indicates the maximum number of times that a TB can be transmitted using the resources provided by the sidelink configured grant. <i>sl-Priority</i> corresponds to the logical channel priority.                                                                                                                                                                                                                                 |
| <b><i>sl-FreqResourceCG-Type1</i></b><br>Indicates the frequency resource location of sidelink configured grant type 1. An index giving valid combinations of one or two starting sub-channel and length (jointly encoded) as resource indicator value (RIV), as defined in TS 38.214 [19].                                                                                                                                                                                         |
| <b><i>sl-HARQ-ProclD-Offset</i></b><br>Indicates the offset used in deriving the HARQ process ID for sidelink configured grant type 1 or sidelink configured grant type 2, see TS 38.321 [3], clause 5.8.3.                                                                                                                                                                                                                                                                         |
| <b><i>sl-N1PUCCH-AN</i></b><br>This field indicates the PUCCH resource for HARQ feedback for sidelink configured grant type 1. The actual PUCCH-Resource is configured in <i>sl-PUCCH-Config</i> and referred to by its ID.                                                                                                                                                                                                                                                         |
| <b><i>sl-N1PUCCH-AN-Type2</i></b><br>This field indicates the PUCCH resource for HARQ feedback for PSCCH/PSSCH transmissions without a corresponding PDCCH on sidelink configured grant type 2. The actual PUCCH-Resource is configured in <i>sl-PUCCH-Config</i> and referred to by its ID.                                                                                                                                                                                        |
| <b><i>sl-NrofHARQ-Processes</i></b><br>This field indicates the number of HARQ processes configured for a specific sidelink configured grant. It applies for both type 1 and type 2.                                                                                                                                                                                                                                                                                                |
| <b><i>sl-PeriodCG</i></b><br>This field indicates the period of sidelink configured grant in the unit of ms.                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>sl-PSFCH-ToPUCCH-CG-Type1</i></b><br>This field, for sidelink configured grant type 1, indicates slot offset between the PSFCH associated with the last PSSCH resource of each period and the PUCCH occasion used for reporting sidelink HARQ.                                                                                                                                                                                                                                |
| <b><i>sl-ResourcePoolID</i></b><br>Indicates the resource pool in which the sidelink configured grant type 1 is applied.                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>sl-StartSubchannelCG-Type1</i></b><br>This field indicates the starting sub-channel of sidelink configured grant type 1. An index giving valid sub-channel index.                                                                                                                                                                                                                                                                                                             |
| <b><i>sl-TimeOffsetCG-Type1</i></b><br>This field indicates the slot offset with respect to logical slot defined by <i>sl-TimeReferenceSFN-Type1</i> , as specified in TS 38.321 [3].                                                                                                                                                                                                                                                                                               |
| <b><i>sl-TimeReferenceSFN-Type1</i></b><br>Indicates SFN used for determination of the offset of a resource in time domain. If it is present, the UE uses the 1 <sup>st</sup> logical slot of associated resource pool after the starting time of the closest SFN with the indicated number preceding the reception of the sidelink configured grant configuration type 1 as reference logical slot, see TS 38.321 [3], clause 5.8.3. If it is not present, the reference SFN is 0. |
| <b><i>sl-TimeResourceCG-Type1</i></b><br>This field indicates the time resource location of sidelink configured grant type 1. An index giving valid combinations of up to two slot positions (jointly encoded) as time resource indicator value (TRIV), as defined in TS 38.212 [17].                                                                                                                                                                                               |

## – *SL-DestinationIdentity*

The IE *SL-DestinationIdentity* is used to identify a destination of a NR sidelink communication.

***SL-DestinationIdentity* information element**

```
-- ASN1START
-- TAG-SL-DESTINATIONIDENTITY-START

SL-DestinationIdentity-r16 ::=
-- TAG-SL-DESTINATIONIDENTITY-STOP
-- ASN1STOP
```

— ***SL-DRX-Config***

The IE *SL-DRX-Config* is used to configure DRX related parameters for NR sidelink communication/discovery. The SL DRX timers should be calculated in the unit of physical slot.

***SL-DRX-Config* information element**

```

## – SL-DRX-ConfigGC-BC

The IE *SL-DRX-ConfigGC-BC* is used to configure DRX related parameters for NR sidelink groupcast and broadcast communication, unicast/broadcast based communication of Direct Link Establishment Request (TS 24.587 [57]), and discovery message (TS 24.554 [72]).

| <i>SL-FreqConfig</i> field descriptions  |                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>additionalSpectrumEmission</i></b> | Provides the <i>additionalSpectrumEmission</i> values as defined in TS 38.101-1 [15], clause 6.2E.3.1.                                                                                                                                                                                                                                                                                          |
| <b><i>frequencyShift7p5khzSL</i></b>     | Enable the NR SL transmission with a 7.5 kHz shift to the LTE raster. If the field is absent, the frequency shift is disabled.                                                                                                                                                                                                                                                                  |
| <b><i>sl-AbsoluteFrequencyPointA</i></b> | Absolute frequency of the reference resource block (Common RB 0). Its lowest subcarrier is also known as Point A.                                                                                                                                                                                                                                                                               |
| <b><i>sl-AbsoluteFrequencySSB</i></b>    | Indicates the frequency location of sidelink SSB. The transmission bandwidth for sidelink SSB is within the bandwidth of this sidelink BWP.                                                                                                                                                                                                                                                     |
| <b><i>sl-BWP-ToAddModList</i></b>        | This field indicates the list of sidelink BWP(s) on which the NR sidelink communication configuration is to be added or reconfigured. In this release, only one BWP is allowed to be configured for NR sidelink communication.                                                                                                                                                                  |
| <b><i>sl-BWP-ToReleaseList</i></b>       | This field indicates the list of sidelink BWP(s) on which the NR sidelink communication configuration is to be released.                                                                                                                                                                                                                                                                        |
| <b><i>sl-Freq-Id</i></b>                 | This field indicates the identity of the dedicated configuration information on the carrier frequency for NR sidelink communication.                                                                                                                                                                                                                                                            |
| <b><i>sl-SCS-SpecificCarrierList</i></b> | A set of UE specific channel bandwidth and location configurations for different subcarrier spacings (numerologies). Defined in relation to Point A. The UE uses the configuration provided in this field only for the purpose of channel bandwidth and location determination. In this release, only one <i>SCS-SpecificCarrier</i> is allowed to be configured for NR sidelink communication. |
| <b><i>sl-SyncPriority</i></b>            | This field indicates synchronization priority order, as specified in clause 5.8.6.                                                                                                                                                                                                                                                                                                              |
| <b><i>valueN</i></b>                     | Indicate the NR SL transmission with a valueN *5kHz shift to the LTE raster. (see TS 38.101-1 [15], clause 5.4E.2).                                                                                                                                                                                                                                                                             |

| Conditional Presence | Explanation                                                                                                                                                                 |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| V2X-SL-Shared        | This field is mandatory present if the carrier frequency configured for NR sidelink communication is shared by V2X sidelink communication. It is absent, Need R, otherwise. |

## – *SL-FreqConfigCommon*

The IE *SL-FreqConfigCommon* specifies the cell-specific configuration information on one particular carrier frequency for NR sidelink communication.

### *SL-FreqConfigCommon* information element

```
-- ASN1START
-- TAG-SL-FREQCONFIGCOMMON-START
```

```
SL-FreqConfigCommon-r16 ::= SEQUENCE {
    sl-SCS-SpecificCarrierList-r16 SEQUENCE (SIZE (1..maxSCSs)) OF SCS-SpecificCarrier,

#### SL-FreqConfigCommon field descriptions

##### **additionalSpectrumEmission**

Provides the *additionalSpectrumEmission* values as defined in TS 38.101-1 [15], clause 6.2E.3.1.

##### **frequencyShift7p5khzSL**

Enable the NR SL transmission with a 7.5 kHz shift to the LTE raster. If the field is absent, the frequency shift is disabled.

##### **sl-AbsoluteFrequencyPointA**

Absolute frequency of the reference resource block (Common RB 0). Its lowest subcarrier is also known as Point A.

##### **sl-AbsoluteFrequencySSB**

Indicates the frequency location of sidelink SSB. The transmission bandwidth for sidelink SSB is within the bandwidth of this sidelink BWP.

##### **sl-BWP-List**

This field indicates the list of sidelink BWP(s) on which the NR sidelink communication configuration. In this release, only one BWP is allowed to be configured for NR sidelink communication.

##### **sl-NbAsSync**

This field indicates whether the network can be selected as synchronization reference directly/indirectly only, if *sl-SyncPriority* is set to gnss. If this field is set to TRUE, the network is enabled to be selected as synchronization reference directly/indirectly. The field is only present in *SidelinkPreconfigNR*. Otherwise it is absent.

##### **sl-SyncPriority**

This field indicates synchronization priority order, as specified in clause 5.8.6..

##### **sl-SyncConfigList**

This field indicates the configuration by which the UE is allowed to receive and transmit synchronisation information for NR sidelink communication. Network configures *sl-SyncConfig* including *txParameters* when configuring UEs to transmit synchronisation information. If this field is configured in *SL-PreconfigurationNR-r16*, only one entry is configured in *sl-SyncConfigList*.

##### **valueN**

Indicate the NR SL transmission with a valueN \*5kHz shift to the LTE raster (see TS 38.101-1 [15], clause 5.4E.2).

| Conditional Presence | Explanation                                                                                                                                                                 |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| V2X-SL-Shared        | This field is mandatory present if the carrier frequency configured for NR sidelink communication is shared by V2X sidelink communication. It is absent, Need R, otherwise. |

## – *SL-InterUE-CoordinationConfig*

The IE *SL-InterUE-CoordinationConfig* is used to configure the sidelink inter-UE coordination (between a UE, UE-A, and a peer UE, UE-B) parameters. The network ensures sidelink inter-UE coordination and sidelink DRX are not configured at the same time for a UE.

| <b><i>SL-InterUE-CoordinationScheme1</i></b> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>sl-Condition1-A-2</i></b><br>Indicates disabling the use of condition of excluding from preferred resource set resource(s) in slot(s) where UE-A, when it is intended receiver of UE-B, does not expect to perform SL reception from UE-B due to half duplex operation.                                                                                                                                                                                                                                                                                                |
| <b><i>sl-ContainerCoordInfo</i></b><br>Indicates whether a SCI format 2-C can be used as the container of inter-UE coordination information transmission from UE-A to UE-B in Scheme 1 in addition to using MAC CE.                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>sl-ContainerRequest</i></b><br>Indicates whether a SCI format 2-C can be used as the container of an explicit request for inter-UE coordination information transmission from UE-B to UE-A in Scheme 1 in addition to using MAC CE.                                                                                                                                                                                                                                                                                                                                    |
| <b><i>sl-DetermineResourceType</i></b><br>Indicates how to determine the resource set type to be provided by inter-UE coordination information transmission. Value "uea" means the resource set type is determined by UE-A's implementation. Value "ueb" means the resource set type is determined by UE-B's request.                                                                                                                                                                                                                                                        |
| <b><i>sl-IUC-Condition</i></b><br>Indicates whether inter-UE coordination information triggered by a condition is enabled or not other than explicit request reception.                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>sl-IUC-Explicit</i></b><br>Indicates whether inter-UE coordination information triggered by an explicit request is enabled or not.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>sl-MaxSlotOffsetTRIV</i></b><br>Indicates the maximum value of logical slot offset with respect to a reference slot that is used for representing the first resource location of each TRIV to indicate the set of resources in Scheme 1 as specified in TS 38.214 [19].                                                                                                                                                                                                                                                                                                |
| <b><i>sl-NumSubCH-PreferredResourceSet</i></b><br>Indicates the number of sub-channels used for determining the preferred resource set in Scheme 1 when the inter-UE coordination information transmission is triggered by a condition other than explicit request reception.                                                                                                                                                                                                                                                                                                |
| <b><i>sl-PriorityCoordInfoCondition</i></b><br>Parameter used to determine the priority values for the purpose defined in TS 38.213 [13] and TS 38.214 [19] including, the priority value for sensing and candidate resource (re-)selection for transmitting the TB carrying the IUC MAC CE and the priority value in the SCI Format 1-A corresponding to the TB carrying the IUC MAC CE, triggered by a condition other than explicit request reception in Scheme 1. The priority value of IUC MAC CE used in LCP procedure (see TS 38.321 [3]) is fixed as "1".            |
| <b><i>sl-PriorityCoordInfoExplicit</i></b><br>Parameter used to determine the priority values for the purpose defined in TS 38.213 [13] and TS 38.214 [19] including, the priority value for sensing and candidate resource (re-)selection for transmitting the TB carrying the IUC MAC CE and the priority value in the SCI Format 1-A corresponding to the TB carrying the IUC MAC CE, triggered by an explicit request in Scheme 1. The priority value of IUC MAC CE used in LCP procedure (see TS 38.321 [3]) is fixed as "1".                                           |
| <b><i>sl-PriorityPreferredResourceSet</i></b><br>Indicates the priority value used for determining the preferred resource set in Scheme 1 when the inter-UE coordination information transmission is triggered by a condition other than explicit request reception.                                                                                                                                                                                                                                                                                                         |
| <b><i>sl-PriorityRequest</i></b><br>Parameter used to determine the priority values for the purpose defined in TS 38.213 [13] and TS 38.214 [19] including, the priority value for sensing and candidate resource (re-)selection for transmitting the TB carrying the IUC request MAC CE and the priority value in the SCI Format 1-A corresponding to the TB carrying the IUC request MAC CE, in an explicit request for inter-UE coordination information in Scheme 1. The priority value of IUC request MAC CE used in LCP procedure (see TS 38.321 [3]) is fixed as "1". |
| <b><i>sl-ReservedPeriodPreferredResourceSet</i></b><br>Indicates the resource reservation interval used for determining the preferred resource set in Scheme 1 when the inter-UE coordination information transmission is triggered by a condition, by means of an index to the corresponding entry of <i>sl-ResourceReservePeriodList-r16</i> .                                                                                                                                                                                                                             |
| <b><i>sl-TriggerConditionCoordInfo</i></b><br>Indicates the additional alternative trigger condition of inter-UE coordination information triggered by a condition rather than request reception in Scheme-1 from UE-A to UE-B. Value 0 means inter-UE coordination information is triggered by UE-A's implementation. Value 1 means inter-UE coordination information can be triggered only when UE-A has data to be transmitted together with the inter-UE coordination information to UE-B.                                                                               |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b><i>sl-TriggerConditionRequest</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Indicates the trigger condition of an explicit request from UE-B to UE-A. Value 0 means the explicit request is triggered by UE-B's implementation. Value 1 means the explicit request can be triggered only when UE-B has data to be transmitted to UE-A.                                                                                                                                                                                                              |
| <b><i>sl-ThresholdRSRP-Condition1-B-1-Option1List</i></b>                                                                                                                                                                                                                                                                                                                                                                                                               |
| Indicates the RSRP threshold used to determine reserved resource(s) of other UE(s) whose RSRP measurement is larger than it as the set of resource(s) non-preferred for UE-B's transmission for Condition 1-B-1 of Scheme 1, as specified in TS 38.214 [19]. Value 0 corresponds to minus infinity dBm, value 1 corresponds to -128dBm, value 2 corresponds to -126dBm, value n corresponds to $(-128 + (n-1)*2)$ dBm and so on, value 66 corresponds to infinity dBm.  |

| Indicates whether inter-UE coordination Scheme 2 is enabled or not.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>sl-OptionForCondition2-A-1</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Indicates the RSRP threshold used to consider additional criteria for condition 2-A-1. Value 0 corresponds to using the RSRP threshold according to the priorities included in the SCI, UE uses thresholds <i>sl-Thres-RSRP-List</i> , in its resource pool configuration <i>sl-UE-SelectedConfigRP</i> , corresponding to <i>ThresPSSCH-RSRP-List</i> specified in clause 16.3.0 of TS 38.213 [13]. Value 1 corresponds to using a (pre)configured RSRP threshold delta value <i>sl-DeltaRSRP-Thresh</i> , corresponding to <i>deltaRSRPThresh</i> specified in clause 16.3.0 of TS 38.213 [13]. |
| <b><i>sl-PSFCH-Occasion</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Indicates the reference slot from which a PSFCH occasion for inter-UE coordination information transmission is derived. Value 0 corresponds to the slot where UE-B's SCI is transmitted and value 1 corresponds to the slot where expected/potential resource conflict occurs on PSSCH resource indicated by UE-B's SCI.                                                                                                                                                                                                                                                                          |
| <b><i>sl-RB-SetPSFCH</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Indicates the set of PRBs that are actually used for inter-UE coordination information transmission and reception in Scheme 2. The leftmost bit of the bitmap refers to the lowest RB index in the resource pool, and so on.                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>sl-SlotLevelResourceExclusion</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Indicates that physical layer of UE-B reports resources in a slot including the next reserved resource indicated by the corresponding UE-B's SCI to higher layer.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>sl-TypeUE-A</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Indicates that a non-destination UE of a TB transmitted by UE-B can be UE-A which sends inter-UE coordination information to UE-B, when UE-A is a destination UE of another TB conflicting with the TB transmitted by UE-B.                                                                                                                                                                                                                                                                                                                                                                       |

#### – ***SL-LogicalChannelConfig***

The IE *SL-LogicalChannelConfig* is used to configure the sidelink logical channel parameters.

#### ***SL-LogicalChannelConfig*** information element

-- ASN1START

| <i><b>SL-LogicalChannelConfig</b></i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b><i>sl-AllowedCG-List</i></b><br>This restriction applies only when the SL grant is a configured grant. If present, SL MAC SDUs from this logical channel can only be mapped to the indicated configured grant configuration. If the size of the sequence is zero, then SL MAC SDUs from this logical channel cannot be mapped to any configured grant configurations. If the field is not present, SL MAC SDUs from this logical channel can be mapped to any configured grant configurations. If the field <i>sl-ConfiguredGrantType1Allowed</i> is present, only those sidelink configured grant type 1 configurations indicated in this sequence are allowed for use by this sidelink logical channel; otherwise, this sequence shall not include any sidelink configured grant type 1 configuration. Corresponds to "sl-AllowedCG-List" as specified in TS 38.321 [3]. |
| <b><i>sl-AllowedSCS-List</i></b><br>If present, it indicates the numerology of UL-SCH resources that this sidelink logical channel is mapped to, when checking the SR trigger condition. Corresponds to 'sl-AllowedSCS-List' in TS 38.321 [3].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>sl-BucketSizeDuration</i></b><br>Value in ms. <i>ms5</i> corresponds to 5 ms, value <i>ms10</i> corresponds to 10 ms, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>sl-ConfiguredGrantType1Allowed</i></b><br>If present and set to true, or if the capability <i>lcp-RestrictionSidelink</i> as specified in TS 38.306 [26] is not indicated, SL MAC SDUs from this sidelink logical channel can be transmitted on a sidelink configured grant type 1. Otherwise, SL MAC SDUs from this logical channel cannot be transmitted on a sidelink configured grant type 1. Corresponds to 'sl-configuredGrantType1Allowed' in TS 38.321 [3].                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>sl-HARQ-FeedbackEnabled</i></b><br>Network always includes this field. It indicates the HARQ feedback enabled/disabled restriction in LCP for this sidelink logical channel. If set to <i>enabled</i> , the sidelink logical channel will be multiplexed only with a logical channel which enabling the HARQ feedback. If set to <i>disabled</i> , the sidelink logical channel cannot be multiplexed with a logical channel which enabling the HARQ feedback. Corresponds to 'sl-HARQ-FeedbackEnabled' in TS 38.321 [3]. If this field of at least one sidelink logical channel for the UE is set to enabled, <i>sl-PSFCH-Config</i> should be mandatory present in configuration <i>SL-ResourcePool</i> of at least one of the sidelink resource pools.                                                                                                               |
| <b><i>sl-LogicalChannelGroup</i></b><br>ID of the sidelink logical channel group, as specified in TS 38.321 [3], which the sidelink logical channel belongs to.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>sl-LogicalChannelSR-DelayTimerApplied</i></b><br>Indicates whether to apply the delay timer for SR transmission for this sidelink logical channel. Set to false if <i>logicalChannelSR-DelayTimer</i> is not included in <i>sl-BSR-Config</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>sl-MaxPUSCH-Duration</i></b><br>If present, it indicates the maximum PUSCH duration of UL-SCH resources that this sidelink logical channel is mapped to, when checking the SR trigger condition. | <b>sl-ReportConfigToAddModList</b><br>List of sidelink measurement reporting configurations to add and/or modify. |
| <b>sl-ReportConfigToRemoveList</b><br>List of sidelink measurement reporting configurations to remove.            |

— SL-MeasIdList

The IE *SL-MeasIdList* concerns a list of SL measurement identities to add or modify for a destination, with for each entry the *sl-MeasId*, the associated *sl-MeasObjectId* and the associated *sl-ReportConfigId*.

SL-MeasIdList information element

```

-- ASN1START
-- TAG-SL-MEASIDLIST-START

SL-MeasIdList-r16 ::= SEQUENCE (SIZE (1..maxNrofSL-MeasId-r16)) OF SL-MeasIdInfo-r16

SL-MeasIdInfo-r16 ::= SEQUENCE {
```

```

    sl-MeasId-r16
    sl-MeasObjectId-r16
    sl-ReportConfigId-r16
    ...
}

SL-MeasId-r16 ::=
    INTEGER (1..maxNrofSL-MeasId-r16)

-- TAG-SL-MEASIDLIST-STOP
-- ASN1STOP
```

— *SL-MeasObjectList*

The IE *SL-MeasObjectList* concerns a list of SL measurement objects to add or modify for a destination.

*SL-MeasObjectList* information element

```

-- ASN1START
-- TAG-SL-MEASOBJECTLIST-START

SL-MeasObjectList-r16 ::=
    SEQUENCE (SIZE (1..maxNrofSL-ObjectId-r16)) OF SL-MeasObjectInfo-r16

SL-MeasObjectInfo-r16 ::=
    SEQUENCE {
        sl-MeasObjectId-r16
        sl-MeasObject-r16
        ...
    }

SL-MeasObjectId-r16 ::=
    INTEGER (1..maxNrofSL-ObjectId-r16)

SL-MeasObject-r16 ::=
    SEQUENCE {
        frequencyInfoSL-r16
        ...
    }

-- TAG-SL-MEASOBJECTLIST-STOP
-- ASN1STOP
```

| SL-MeasObjectList field descriptions                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>frequencyInfoSL</b><br>It indicates the lowest usable subcarrier on the carrier where SL RSRP is measured, determined according to <i>sl-AbsoluteFrequencyPointA</i> in IE <i>SL-FreqConfig/SL-FreqConfigCommon</i> and <i>offsetToCarrier</i> in IE <i>SCS-SpecificCarrier</i> configured for <i>sl-SCS-SpecificCarrierList</i> in IE <i>SL-FreqConfig/SL-FreqConfigCommon</i> . See TS 38.211 [16], clause 8.2.5. |
| <b>sl-MeasObjectId</b><br>It is used to identify a sidelink measurement object configuration.                                                                                                                                                                                                                                                                                                                          |
| <b>sl-MeasObject</b><br>It specifies information applicable for sidelink DMRS measurement.                                                                                                                                                                                                                                                                                                                             |

## – *SL-PagingIdentityRemoteUE*

The IE *SL-PagingIdentityRemoteUE* includes the Remote UE's paging UE ID.

### *SL-PagingIdentityRemoteUE* information element

```
-- ASN1START
-- TAG-SL-PAGINGIDENTITYREMOTEUE-START

SL-PagingIdentityRemoteUE-r17 ::= SEQUENCE {
    ng-5G-S-TMSI-r17          NG-5G-S-TMSI,
    fullI-RNTI-r17            I-RNTI-Value OPTIONAL -- Need R
}

-- TAG-SL-PAGINGIDENTITYREMOTEUE-STOP
-- ASN1STOP
```

## – *SL-PBPS-CPS-Config*

The IE *SL-PBPS-CPS-Config* specifies the operation information for a resource pool which can be (pre-)configured to enable full sensing only, partial sensing only, random resource selection only, or any combination(s) thereof.

### *SL-PBPS-CPS-Config* information element

```

|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>sl-Additional-PBPS-Occasion</i></b><br>Indicates that UE additionally monitors periodic sensing occasions that correspond to a set of values. (see TS 38.214 [19], clause 8.1.4).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>sl-AllowedResourceSelectionConfig</i></b><br>Indicates the allowed resource selection mechanism(s), i.e. full sensing only, partial sensing only, random resource selection only, or any combination(s) thereof. (see TS 38.214 [19], clause 8.1.4). Only c1, c4, c5 or c7 can be configured for a Rel-16 resource pool. If this field is not configured for a resource pool included in <i>sl-TxPoolSelectedNormal</i> , only full sensing is allowed in the corresponding resource pool.<br>c1: only full sensing allowed<br>c2: only partial sensing allowed<br>c3: only random selection allowed<br>c4: full sensing+random selection allowed<br>c5: full sensing+ partial sensing allowed<br>c6: partial sensing + random selection allowed<br>c7: full sensing+ partial sensing + random selection allowed. |
| <b><i>sl-CPS-WindowAperiodic</i></b><br>Parameter that indicates the minimum size of contiguous partial sensing window in logical slot units for a resource (re)selection procedure and re-evaluation/pre-emption checking triggered by aperiodic transmission. (see TS 38.214 [19], clause 8.1.4). If not configured, the size of contiguous partial sensing window in logical slot units is 31.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>sl-CPS-WindowPeriodic</i></b><br>Indicates the size of contiguous partial sensing window in logical slot units when UE performs periodic-based and contiguous partial sensing for a resource (re)selection procedure triggered by periodic transmission. If not configured, the size of contiguous partial sensing window in logical slot units is 31.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>sl-DefaultCBR-PartialSensing</i></b><br>Indicates default value of SL CBR measurement for a UE that is configured to perform partial sensing by its higher layer (including when SL DRX is configured) if the number of SL RSSI measurement slots over CBR measurement window is below <i>sl-MinNumRssiMeasurementSlots</i> , (see TS 38.214 [19], clause 8.1.6). Value 0 corresponds to 0, value 1 to 0.01, value 2 to 0.02, and so on.                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>sl-DefaultCBR-RandomSelection</i></b><br>Indicates default value of CBR measurement for a UE that performs random resource selection if no SL CBR measurement result over SL CBR measurement window, (see TS 38.214 [19], clause 8.1.6). Value 0 corresponds to 0, value 1 to 0.01, value 2 to 0.02, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>sl-MinNumCandidateSlotsAperiodic</i></b><br>Indicates the minimum number of Y slots that are included in the possible candidate resources corresponding to periodic-based partial sensing and/or contiguous partial sensing for resource (re)selection triggered by aperiodic transmission. (see TS 38.214 [19], clause 8.1.4).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>sl-MinNumCandidateSlotsPeriodic</i></b><br>Indicates the minimum number of Y slots that are included in the possible candidate resources corresponding to periodic-based partial sensing for resource (re)selection triggered by periodic transmission. (see TS 38.214 [19], clause 8.1.4).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>sl-MinNumRssiMeasurementSlots</i></b><br>Indicates a threshold for a minimum number of SL RSSI measurement slots over CBR measurement window for which the SL RSSI is measured for a UE that is configured to perform partial sensing by its higher layer (including when SL DRX is configured). (see TS 38.214 [19], clause 8.1.6).                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>sl-PartialSensingInactiveTime</i></b><br>Indicates whether or not UE is required to perform SL reception of PSCCH and RSRP measurement for partial sensing on slots in SL DRX inactive time when partial sensing is configured by its higher layer. (see TS 38.214 [19], clause 8.1.4).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>sl-PBPS-OccasionReservePeriodList</i></b><br>Indicates the subset of periodicity values from <i>sl-ResourceReservePeriodList</i> used to determine periodic sensing occasions in periodic-based partial sensing, by means of an index to the corresponding entry in <i>sl-ResourceReservePeriodList-r16</i> . If not configured, all periodicity values from <i>sl-ResourceReservePeriodList</i> are used to determine periodic sensing occasions in periodic-based partial sensing (see TS 38.214 [19], clause 8.1.4).                                                                                                                                                                                                                                                                                           |

— *SL-PDCP-Config*

The IE *SL-PDCP-Config* is used to set the configurable PDCP parameters for a sidelink radio bearer.

-- ASN1STOP

```

#### ***SL-PSBCH-Config* field descriptions**

##### ***dl-Alpha-PSBCH***

Indicates alpha value for DL pathloss based power control for PSBCH. When the field is not configured the UE applies the value 1.

##### ***dl-P0-PSBCH***

Indicates P0 value for DL pathloss based power control for PSBCH. If not configured, DL pathloss based power control is disabled for PSBCH. When *dl-P0-PSBCH-r17* is configured, the UE ignores *dl-P0-PSBCH-r16*.

A Remote UE which is out of coverage, considers downlink pathloss based power control is disabled for PSBCH when *dl-P0-PSBCH* is configured.

## ***SL-PSSCH-TxConfigList***

The IE *SL-PSSCH-TxConfigList* indicates PSSCH transmission parameters. When lower layers select parameters from the range indicated in IE *SL-PSSCH-TxConfigList*, the UE considers both configurations in IE *SL-PSSCH-TxConfigList* and the CBR-dependent configurations represented in IE *SL-CBR-PriorityTxConfigList*. Only one IE *SL-PSSCH-TxConfig* is provided per *SL-TypeTxSync*.

#### SL-ZoneConfigMCR field descriptions

##### **sl-TransRange**

Indicates the communication range requirement for the corresponding *sl-ZoneConfigMCR-Index*. The unit is meter.

##### **sl-ZoneConfig**

Indicates the zone configuration for the corresponding *sl-ZoneConfigMCR-Index*.

##### **sl-ZoneConfigMCR-Index**

Indicates the codepoint of the communication range requirement field in SCI.

| <b><i>SL-ResourcePool</i> field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>dummy</i></b><br>This field is not used in the specification. If received it shall be ignored by the UE.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>sl-Additional-MCS-Table</i></b><br>Indicates the MCS table(s) additionally used in the resource pool. 64QAM table is (pre-)configured as default. Zero, one or two can be additionally (pre-)configured using the 256QAM and/or low-SE MCS tables. If two MCS tables are indicated, 256QAM MCS table is the 1 <sup>st</sup> table and qam64lowSE MCS table is the 2 <sup>nd</sup> table as specified in TS 38.214 [19], clause 8.1.3.1.                                                  |
| <b><i>sl-FilterCoefficient</i></b><br>This field indicates the filtering coefficient for long-term measurement and reference signal power derivation used for sidelink open-loop power control.                                                                                                                                                                                                                                                                                                |
| <b><i>sl-InterUE-CoordinationConfig</i></b><br>Indicates the configured sidelink inter-UE coordination parameters.                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>sl-NumSubchannel</i></b><br>Indicates the number of subchannels in the corresponding resource pool, which consists of contiguous PRBs only.                                                                                                                                                                                                                                                                                                                                              |
| <b><i>sl-PBPS-CPS-Config</i></b><br>Indicates the allowed resource allocation schemes of full sensing only, partial sensing only, random resource selection only, or any combination(s), and the related configuration for power saving resource allocation schemes. This field is absent for <i>sl-TxPoolExceptional</i> .                                                                                                                                                                    |
| <b><i>sl-PreemptionEnable</i></b><br>Indicates whether pre-emption is disabled or enabled in a resource pool. If the field is present and the value is <i>p1</i> , <i>p2</i> , and so on (but not <i>enabled</i> ), it means that pre-emption is enabled and a priority level <i>p_preemption</i> is configured. If the field is present and the value is <i>enabled</i> , the pre-emption is enabled (but <i>p_preemption</i> is not configured) and pre-emption is applicable to all levels. |
| <b><i>sl-PriorityThreshold-UL-URLLC</i></b><br>Indicates the threshold used to determine whether NR sidelink transmission is prioritized over uplink transmission of priority index 1 as specified in TS 38.213[13], clause 16.2.4.3, or whether PUCCH transmission carrying SL HARQ is prioritized over PUCCH transmission carrying UCI of priority index 1 if they overlap in time as specified in TS 38.213 [13], clause 9.2.5.0.                                                           |
| <b><i>sl-PriorityThreshold</i></b><br>Indicates the threshold used to determine whether NR sidelink transmission is prioritized over uplink transmission of priority index 0 as specified in TS 38.213[13], clause 16.2.4.3, or whether PUCCH transmission carrying SL HARQ is prioritized over PUCCH transmission carrying UCI of priority index 0 if they overlap in time as specified in TS 38.213 [13], clause 9.2.5.0.                                                                    |
| <b><i>sl-RB-Number</i></b><br>Indicates the number of PRBs in the corresponding resource pool, which consists of contiguous PRBs only. The remaining RB cannot be used (See TS 38.214[19], clause 8).                                                                                                                                                                                                                                                                                          |
| <b><i>sl-StartRB-Subchannel</i></b><br>Indicates the lowest RB index of the subchannel with the lowest index in the resource pool with respect to the lowest RB index of a SL BWP.                                                                                                                                                                                                                                                                                                             |
| <b><i>sl-SubchannelSize</i></b><br>Indicates the minimum granularity in frequency domain for the sensing for PSSCH resource selection in the unit of PRB.                                                                                                                                                                                                                                                                                                                                      |
| <b><i>sl-SyncAllowed</i></b><br>Indicates the allowed synchronization reference(s) which is (are) allowed to use the configured resource pool.                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>sl-SyncConfigIndex</i></b><br>Indicates the synchronisation configuration that is associated with a reception pool, by means of an index to the corresponding entry <i>SL-SyncConfigList</i> of in <i>SIB12</i> for NR sidelink communication.                                                                                                                                                                                                                                           |
| <b><i>sl-TDD-Configuration</i></b><br>Indicates the TDD configuration associated with the reception pool of the cell indicated by <i>sl-SyncConfigIndex</i> .                                                                                                                                                                                                                                                                                                                                  |
| <b><i>sl-ThreshS-RSSI-CBR</i></b><br>Indicates the S-RSSI threshold for determining the contribution of a sub-channel to the CBR measurement. Value 0 corresponds to -112 dBm, value 1 to -110 dBm, value <i>n</i> to $(-112 + n \cdot 2)$ dBm, and so on.                                                                                                                                                                                                                                     |
| <b><i>sl-TimeResource</i></b><br>Indicates the bitmap of the resource pool, which is defined by repeating the bitmap with a periodicity during a SFN or DFN cycle.                                                                                                                                                                                                                                                                                                                             |

|                                                                                                                                          |
|------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>sl-TimeWindowSizeCBR</i></b>                                                                                                       |
| Indicates the time window size for CBR measurement.                                                                                      |
| <b><i>sl-TimeWindowSizeCR</i></b>                                                                                                        |
| Indicates the time window size for CR evaluation.                                                                                        |
| <b><i>sl-TxPercentageList</i></b>                                                                                                        |
| Indicates the portion of candidate single-slot PSSCH resources over the total resources. Value <i>p20</i> corresponds to 20%, and so on. |
| <b><i>sl-X-Overhead</i></b>                                                                                                              |
| Accounts for overhead from CSI-RS, PT-RS. If the field is absent, the UE applies value <i>n0</i> (see TS 38.214 [19], clause 8.1.3.2).   |

| <b><i>SL-SyncAllowed</i> field descriptions</b>                                                                                                                                                                |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>gnbEnb-Sync</i></b>                                                                                                                                                                                      |
| If configured, the (pre-) configured resources can be used if the UE is directly or indirectly synchronized to eNB or gNB (i.e., synchronized to a reference UE which is directly synchronized to eNB or gNB). |
| <b><i>gnss-Sync</i></b>                                                                                                                                                                                        |
| If configured, the (pre-) configured resources can be used if the UE is directly or indirectly synchronized to GNSS (i.e., synchronized to a reference UE which is directly synchronized to GNSS).             |
| <b><i>ue-Sync</i></b>                                                                                                                                                                                          |
| If configured, the (pre-) configured resources can be used if the UE is synchronized to a reference UE which is not synchronized to eNB, gNB and GNSS directly or indirectly.                                  |

| <b><i>SL-PSCCH-Config</i> field descriptions</b>                                                                          |
|---------------------------------------------------------------------------------------------------------------------------|
| <b><i>sl-FreqResourcePSCCH</i></b>                                                                                        |
| Indicates the number of PRBs for PSCCH in a resource pool where it is not greater than the number PRBs of the subchannel. |
| <b><i>sl-DMRS-ScrambleID</i></b>                                                                                          |
| Indicates the initialization value for PSCCH DMRS scrambling.                                                             |
| <b><i>sl-NumReservedBits</i></b>                                                                                          |
| Indicates the number of reserved bits in first stage SCI.                                                                 |
| <b><i>sl-TimeResourcePSCCH</i></b>                                                                                        |
| Indicates the number of symbols of PSCCH in a resource pool.                                                              |

| <b><i>SL-PSSCH-Config</i> field descriptions</b>                                                                                                                                                        |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>sl-BetaOffsets2ndSCI</i></b>                                                                                                                                                                      |
| Indicates candidates of beta-offset values to determine the number of coded modulation symbols for second stage SCI. The value indicates the index of Table 9.3-2 of TS 38.213 [13].                    |
| <b><i>sl-PSSCH-DMRS-TimePatternList</i></b>                                                                                                                                                             |
| Indicates the set of PSSCH DMRS time domain patterns in terms of PSSCH DMRS symbols in a slot that can be used in the resource pool.                                                                    |
| <b><i>sl-Scaling</i></b>                                                                                                                                                                                |
| Indicates a scaling factor to limit the number of resource elements assigned to the second stage SCI on PSSCH. Value <i>f0p5</i> corresponds to 0.5, value <i>f0p65</i> corresponds to 0.65, and so on. |

| <b><i>SL-PSFCH-Config</i> field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>sl-MinTimeGapPSFCH</i></b><br>The minimum time gap between PSFCH and the associated PSSCH in the unit of slots.                                                                                                                                                                                                                                                                                                                                   |
| <b><i>sl-NumMuxCS-Pair</i></b><br>Indicates the number of cyclic shift pairs used for a PSFCH transmission that can be multiplexed in a PRB.                                                                                                                                                                                                                                                                                                            |
| <b><i>sl-PSFCH-CandidateResourceType</i></b><br>Indicates the number of PSFCH resources available for multiplexing HARQ-ACK information in a PSFCH transmission (see TS 38.213 [13], clause 16.3).                                                                                                                                                                                                                                                      |
| <b><i>sl-PSFCH-HopID</i></b><br>Scrambling ID for sequence hopping of the PSFCH used in the resource pool.                                                                                                                                                                                                                                                                                                                                              |
| <b><i>sl-PSFCH-Period</i></b><br>Indicates the period of PSFCH resource in the unit of slots within this resource pool. If set to <i>s/0</i> , no resource for PSFCH, and HARQ feedback for all transmissions in the resource pool is disabled.                                                                                                                                                                                                         |
| <b><i>sl-PSFCH-RB-Set</i></b><br>Indicates the set of PRBs that are actually used for PSFCH transmission and reception. The leftmost bit of the bitmap refers to the lowest RB index in the resource pool, and so on. Value 0 in the bitmap indicates that the corresponding PRB is not used for PSFCH transmission and reception while value 1 indicates that the corresponding PRB is used for PSFCH transmission and reception (see TS 38.213 [13]). |

| <b><i>SL-PTRS-Config</i> field descriptions</b>                                                                                                                                                   |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>sl-PTRS-FreqDensity</i></b><br>Presence and frequency density of SL PT-RS as a function of scheduled BW. If the field is not configured, the UE uses $K_{\text{PT-RS}} = 2$                 |
| <b><i>sl-PTRS-TimeDensity</i></b><br>Presence and time density of SL PT-RS as a function of MCS. If the field is not configured, the UE uses $L_{\text{PT-RS}} = 1$                               |
| <b><i>sl-PTRS-RE-Offset</i></b><br>Indicates the subcarrier offset for SL PT-RS. If the field is not configured, the UE applies the value <i>offset00</i> (see TS 38.211 [16], clause 8.4.1.2.2). |

| <b><i>SL-UE-SelectedConfigRP</i></b> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>sl-CBR-PriorityTxConfigList</i></b><br>Indicates the mapping between PSSCH transmission parameter (such as MCS, PRB number, retransmission number, CR limit) sets by using the indexes of the configurations in <i>sl-CBR-PSSCH-TxConfigList</i> , CBR ranges by using the indexes to the entry of the CBR range configurations in <i>sl-CBR-RangeConfigList</i> , and priority ranges. It also indicates the default PSSCH transmission parameters to be used when CBR measurement results are not available, and MCS range for the MCS tables used in the resource pool. The field <i>sl-CBR-PriorityTxConfigList-v1650</i> is present only when <i>sl-CBR-PriorityTxConfigList-r16</i> is configured. |
| <b><i>sl-MaxNumPerReserve</i></b><br>Indicates the maximum number of reserved PSCCH/PSSCH resources that can be indicated by an SCI.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>sl-MultiReserveResource</i></b><br>Indicates if it is allowed to reserve a sidelink resource for an initial transmission of a TB by an SCI associated with a different TB, based on sensing and resource selection procedure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>sl-ResourceReservePeriodList</i></b><br>Set of possible resource reservation period allowed in the resource pool in the unit of ms. Up to 16 values can be configured per resource pool. The value <i>ms0</i> is always configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>sl-RS-ForSensing</i></b><br>Indicates whether DMRS of PSCCH or PSSCH is used for L1 RSRP measurement in the sensing operation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>sl-SensingWindow</i></b><br>Parameter that indicates the start of the sensing window.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>sl-SelectionWindowList</i></b><br>Parameter that determines the end of the selection window in the resource selection for a TB with respect to priority indicated in SCI. Value <i>n1</i> corresponds to $1 \cdot 2^\mu$ , value <i>n5</i> corresponds to $5 \cdot 2^\mu$ , and so on, where $\mu = 0,1,2,3$ refers to SCS 15,30,60,120 kHz respectively.                                                                                                                                                                                                                                                                                                                                                |
| <b><i>sl-Thres-RSRP-List</i></b><br>Indicates a list of 64 thresholds, and the threshold should be selected based on the priority in the decoded SCI and the priority in the SCI to be transmitted. A resource is excluded if it is indicated or reserved by a decoded SCI and PSSCH/PSCCH RSRP in the associated data resource is above a threshold.                                                                                                                                                                                                                                                                                                                                                          |

| SL-PowerControl field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>sl-MaxTransPower</b><br>Indicates the maximum value of the UE's sidelink transmission power on this resource pool when the sidelink transmission is performed only on this resource pool. The unit is dBm. If the sidelink transmission is PSFCH, and multiple resource pools are used, the maximum transmission power for PSFCH is configured as sum of fields <i>sl-maxTransPower</i> over multiple resource pools, as specified in TS 38.101-1 [15].                                                                                                                                                                    |
| <b>sl-Alpha-PSSCH-PSCCH</b><br>Indicates alpha value for sidelink pathloss based power control for PSCCH/PSSCH when <i>sl-P0-PSSCH-PSCCH</i> is configured. When the field is absent the UE applies the value 1.                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>sl-P0-PSSCH-PSCCH</b><br>Indicates P0 value for sidelink pathloss based power control for PSCCH/PSSCH. If not configured, sidelink pathloss based power control is disabled for PSCCH/PSSCH. | <b><i>sl-TimeOffsetSSB</i></b><br>Indicates the slot offset from the start of sidelink SSB period to the first sidelink SSB.                                                                                                                                                                                                                                                             |
| <b><i>sl-TimeInterval</i></b><br>Indicates the slot interval between neighboring sidelink SSBs. This value is applicable when there are more than one sidelink SSBs within one sidelink SSB period.                                                                                                                                                                                      |
| <b><i>sl-SSID</i></b><br>Indicates the ID of sidelink synchronization signal associated with different synchronization priorities.                                                                                                                                                                                                                                                       |
| <b><i>syncInfoReserved</i></b><br>Reserved for future use.                                                                                                                                                                                                                                                                                                                               |
| <b><i>syncTxThreshIC, syncTxThreshOoC</i></b><br>Indicates the thresholds used while in coverage and out of coverage, respectively. Value 0 corresponds to -infinity, value 1 to -115 dBm, value 2 to -110 dBm, and so on (i.e. in steps of 5 dBm) until value 12, which corresponds to -60 dBm, while value 13 corresponds to +infinity.                                                |

## – *SL-Thres-RSRP-List*

IE *SL-Thres-RSRP-List* indicates a threshold used for sensing based UE autonomous resource selection (see TS 38.215 [9]). A resource is excluded if it is indicated or reserved by a decoded SCI and PSSCH/PSCCH RSRP in the associated data resource is above the threshold defined by IE *SL-Thres-RSRP-List*. Value 0 corresponds to minus infinity dBm, value 1 corresponds to -128dBm, value 2 corresponds to -126dBm, value n corresponds to  $(-128 + (n-1)*2)$  dBm and so on, value 66 corresponds to infinity dBm.

### *SL-Thres-RSRP-List* information element

```
-- ASN1START
-- TAG-SL-THRES-RSRP-LIST-START

SL-Thres-RSRP-List-r16 ::= SEQUENCE (SIZE (64)) OF SL-Thres-RSRP-r16

SL-Thres-RSRP-r16 ::= INTEGER (0..66)

-- TAG-SL-THRES-RSRP-LIST-STOP
-- ASN1STOP
```

## – *SL-TxPower*

The IE *SL-TxPower* is used to limit the UE's sidelink transmission power on a carrier frequency. The unit is dBm. Value minusinfinity corresponds to –infinity.

### *SL-TxPower* information element

```
-- ASN1START
-- TAG-SL-TXPOWER-START

SL-TxPower-r16 ::= CHOICE{
    minusinfinity-r16,
    txPower-r16
}

-- TAG-SL-TXPOWER-STOP
-- ASN1STOP
```

## – *SL-TypeTxSync*

The IE *SL-TypeTxSync* indicates the synchronization reference type.

### *SL-TypeTxSync* information element

```
-- ASN1START
-- TAG-SL-TYPETXSYNC-START

SL-TypeTxSync-r16 ::= ENUMERATED {gnss, gnbEnb, ue}
```

-- TAG-SL-TYPETXSYNC-STOP  
-- ASN1STOP

— *SL-UE-SelectedConfig*

IE *SL-UE-SelectedConfig* specifies sidelink communication configurations used for UE autonomous resource selection.

***SL-UE-SelectedConfig* information element**

```
-- ASN1START
-- TAG-SL-UE-SELECTEDCONFIG-START

SL-UE-SelectedConfig-r16 ::=
    sl-PSSCH-TxConfigList-r16          SEQUENCE {
    sl-ProbResourceKeep-r16             SL-PSSCH-TxConfigList-r16          OPTIONAL, -- Need R
    sl-ReselectAfter-r16                ENUMERATED {v0, v0dot2, v0dot4, v0dot6, v0dot8}  OPTIONAL, -- Need R
    sl-CBR-CommonTxConfigList-r16      ENUMERATED {n1, n2, n3, n4, n5, n6, n7, n8, n9}  OPTIONAL, -- Need R

|-----------------------------------------------------------------------|
| <b>sl-ZoneLength</b><br>Indicates the length of each geographic zone. |

– *SLRB-Uu-ConfigIndex*

The IE *SLRB-Uu-ConfigIndex* is used to identify a sidelink DRB configuration from the network side.

*SLRB-Uu-ConfigIndex* information element

```
-- ASN1START
-- TAG-SLRB-UU-CONFIGINDEX-START

SLRB-Uu-ConfigIndex-r16 ::=
    INTEGER (1..maxNrofSLRB-r16)

-- TAG-SLRB-UU-CONFIGINDEX-STOP
-- ASN1STOP
```

6.3.6 MBS information elements

– *CarrierFreqListMBS*

The IE *CarrierFreqListMBS* is used to inform network of the frequencies on which the UE is receiving or interested to receive MBS broadcast service via a broadcast MRB.

*CarrierFreqListMBS* information element

```
-- ASN1START
-- TAG-CARRIERFREQLISTMBS-START

CarrierFreqListMBS-r17 ::=
    SEQUENCE (SIZE (1..maxFreqMBS-r17)) OF ARFCN-ValueNR
```

-- TAG-CARRIERFREQLISTMBS-STOP  
-- ASN1STOP

— *CFR-ConfigMCCH-MTCH*

The IE *CFR-ConfigMCCH-MTCH* is used to configure the common frequency resource used for MCCH and MTCH reception.

***CFR-ConfigMCCH-MTCH* information element**

```
-- ASN1START
-- TAG-CFR-CONFIGMCCH-MTCH-START

| <b>drx-RetransmissionTimerDL-PTM</b><br>Value in number of slot lengths of the CFR where the transport block was received. value <i>s/0</i> corresponds to 0 slots, <i>s/1</i> corresponds to 1 slot, <i>s/2</i> corresponds to 2 slots, and so on. |
| <b>drx-SlotOffsetPTM</b><br>Value in 1/32 ms. Value 0 corresponds to 0 ms, value 1 corresponds to 1/32 ms, value 2 corresponds to 2/32 ms, and so on.                                                                                               |

| Conditional Presence | Explanation                                                                                                                                       |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>HARQFeedback</i>  | The field is mandatory present if HARQ feedback is enabled for a G-RNTI/G-CS-RNTI associated with this DRX configuration. It is absent otherwise. |

– *MBS-NeighbourCellList*

The IE *MBS-NeighbourCellList* indicates a list of neighbour cells where ongoing MBS sessions provided via broadcast MRB in the current cell may also be provided, as indicated in the *mtch-NeighbourCell*.

*MBS-NeighbourCellList* information element

```
-- ASN1START
-- TAG-MBS-NEIGHBOURCELLLIST-START

MBS-NeighbourCellList-r17 ::= SEQUENCE (SIZE (0..maxNeighCellMBS-r17)) OF MBS-NeighbourCell-r17

MBS-NeighbourCell-r17 ::= SEQUENCE {
    physCellId-r17          PhysCellId,
    carrierFreq-r17         ARFCN-ValueNR
}

-- TAG-MBS-NEIGHBOURCELLLIST-STOP
-- ASN1STOP
```

**MBS-NeighbourCellList field descriptions*****carrierFreq***

Indicates the frequency of the neighbour cell indicated by *physCellId*. Absence of the IE means that the neighbour cell is on the same frequency as the current cell.

## – **MBS-ServiceList**

The IE *MBS-ServiceList* is used to inform the network of the MBS services that the UE is receiving or interested to receive.

**MBS-ServiceList information element**

```
-- ASN1START
-- TAG-MBS-SERVICELIST-START

MBS-ServiceList-r17 ::= SEQUENCE (SIZE (1..maxNrofMBS-ServiceListPerUE-r17)) OF MBS-ServiceInfo-r17

MBS-ServiceInfo-r17 ::= SEQUENCE {
    tmgi-r17          TMGI-r17
}

-- TAG-MBS-SERVICELIST-STOP
-- ASN1STOP
```

## – **MBS-SessionInfoList**

The IE *MBS-SessionInfoList* provides the list of ongoing MBS broadcast sessions transmitted via broadcast MRB and, for each MBS broadcast session, the associated G-RNTI and scheduling information.

**MBS-SessionInfoList information element**

```
-- ASN1START
-- TAG-MBS-SESSIONINFOLIST-START

MBS-SessionInfoList-r17 ::= SEQUENCE (SIZE (1..maxNrofMBS-Session-r17)) OF MBS-SessionInfo-r17

MBS-SessionInfo-r17 ::= SEQUENCE {

| <b>g-RNTI</b>                                 | G-RNTI used to scramble the scheduling and transmission of MTCH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>headerCompression</b>                      | If <i>rohc</i> is configured, the UE shall apply the configured ROHC profile(s) in downlink.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>mbs-SessionId</b>                          | Indicates an identifier of the MBS session provided by the MTCH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>mrbs-listBroadcast</b>                     | A list of broadcast MRBs to which the associated broadcast MBS session is mapped to.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>mtch-neighbourCell</b>                     | Indicates neighbour cells which provide this service on MTCH. The first bit is set to 1 if the service is provided on MTCH in the first cell in <i>mbs-NeighbourCellList</i> , otherwise it is set to 0. The second bit is set to 1 if the service is provided on MTCH in the second cell in <i>mbs-NeighbourCellList</i> , and so on. If the service is not available in any neighbouring cell and <i>mbs-NeighbourCellList</i> is signalled, the network sets all bits in this field to 0. The field is absent when <i>mbs-NeighbourCellList</i> is absent or an empty <i>mbs-NeighbourCellList</i> is signalled. If this field is absent when <i>mbs-NeighbourCellList</i> is absent or a non-empty <i>mbs-NeighbourCellList</i> is signalled, the related service may or may not be available in any neighbouring cell, i.e. the UE cannot determine the presence or absence of an MBS service in neighbouring cells based on the absence of this field. If this field is absent and an empty <i>mbs-NeighbourCellList</i> is signalled, then the UE shall assume that MBS broadcast services signalled in <i>mbs-SessionInfoList</i> in the <i>MBSBroadcastConfiguration</i> message are not provided in any neighbour cell. |
| <b>mtch-schedulingInfo</b>                    | Indicates the index of DRX configuration entry in <i>drx-ConfigPTM-List</i> that is used for scheduling the MTCH. The value 0 corresponds to the first entry in <i>drx-ConfigPTM-List</i> , the value 1 corresponds to the second entry in <i>drx-ConfigPTM-List</i> and so on. In case <i>mtch-schedulingInfo</i> is absent for a G-RNTI (i.e. no PTM DRX), the UE shall monitor for PDCCH scrambled with G-RNTI in any slot according to the search space configured for MTCH [see TS 38.213 [13], clause 10.1].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>mtch-SSB-MappingWindowIndex</b>            | Indicates the index of <i>MTCH-SSB-MappingWindowCycleOffset</i> configuration entry in <i>MTCH-SSB-MappingWindowList</i> . The value 0 corresponds to the first entry in <i>MTCH-SSB-MappingWindowList</i> , the value 1 corresponds to the second entry in <i>MTCH-SSB-MappingWindowList</i> and so on. This field is set to the same value for all MBS sessions mapped to the same G-RNTI.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>pdcp-SN-SizeDL</b>                         | Indicates that PDCP sequence number size of 12 bits is used, as specified in TS 38.323 [5]. When the field is absent the UE applies the value as specified in 9.1.1.7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>pdschConfigIndex</b>                       | Indicates the index of PDSCH configuration entry in <i>pdschConfigList</i> for MTCH. Value 0 corresponds to the first entry in <i>pdschConfigList</i> , the value 1 corresponds to the second entry in <i>pdschConfigList</i> and so on. When the field is absent the UE applies the first entry in <i>pdschConfigList</i> for MTCH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>sn-FieldLength</b>                         | Indicates that the RLC SN field size of 6 bits is used, see TS 38.322 [4]. When the field is absent the UE applies the value as specified in 9.1.1.7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>t-Reassembly</b>                           | Timer for reassembly in TS 38.322 [4], in milliseconds. Value ms0 means 0 ms, value ms5 means 5 ms and so on. When the field is absent the UE applies the value in specified in 9.1.1.7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>t-Reordering</b>                           | Value in ms of t-Reordering specified in TS 38.323 [5]. Value ms1 corresponds to 1 ms, value ms10 corresponds to 10 ms, and so on. When the field is absent the UE applies the value as specified in 9.1.1.7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                   |

#### *MTCH-SSB-MappingWindowList* field descriptions

##### *MTCH-SSB-MappingWindowCycleOffset*

Indicates the *cycle* and *offset* for MTCH PDCCH occasions to SSB mapping. Values in unit of ms. *ms10* corresponds to cycle of 10 ms with corresponding offset between 0 and 9 ms, value *ms20* corresponds to cycle of 20 ms with corresponding offset between 0 and 19 ms, and so on. The mapping window starts at a subframe in a SFN where  $[(\text{SFN number} \times 10) + \text{subframe number}] \bmod (\text{cycle}) = \text{offset}$ .

PDCCH monitoring occasions for MTCH in a mapping window which are not overlapping with UL symbols (determined according to *tdd-UL-DL-ConfigurationCommon*) are sequentially numbered starting from 1 in the mapping window. The  $[x \times N + K]^{\text{th}}$  PDCCH monitoring occasion for MTCH in this mapping window corresponds to the  $K^{\text{th}}$  transmitted SSB, where  $x = 0, 1, \dots, X-1$ ,  $K = 1, 2, \dots, N$ ,  $N$  is the number of actual transmitted SSBs determined according to *ssb-PositionsInBurst* in *SIB1* and  $X$  is equal to  $\text{CEIL}(\text{number of PDCCH monitoring occasions in MTCH to SSB mapping transmission window} / N)$ . The actual transmitted SSBs are sequentially numbered from one in ascending order of their SSB indexes.

## – *PDSCH-ConfigBroadcast*

The IE *PDSCH-ConfigBroadcast* is used to configure parameters for acquiring the PDSCH for MCCH and MTCH.

| <b>PDSCH-ConfigBroadcast field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>lte-CRS-ToMatchAround</b>                    | Parameters to determine an LTE CRS pattern that the UE shall rate match around.                                                                                                                                                                                                                                                                        |
| <b>pdschConfigList</b>                          | List of PDSCH parameters which can be configured per G-RNTI. Only one entity is allowed to be configured if included in SIB20.                                                                                                                                                                                                                         |
| <b>pdsch-TimeDomainAllocationList</b>           | List of time-domain configurations for timing of DL assignment to DL data.<br>The field <i>pdsch-TimeDomainAllocationList</i> applies to DCI format 4_0 (see table 5.1.2.1.1-1 in TS 38.214 [19]). When the field is absent, the UE follows PDSCH time domain resource allocation determination rule as specified in TS 38.214 [19], clause 5.1.2.1.1. |
| <b>rateMatchPatternToAddModList</b>             | Resources patterns which the UE should rate match PDSCH around. The UE rate matches around the union of all resources indicated in the rate match patterns (see TS 38.214 [19], clause 5.1.4.1).                                                                                                                                                       |
| <b>mcs-Table</b>                                | Indicates which MCS table the UE shall use for PDSCH. If the field is absent the UE applies the value 64QAM. The field <i>mcs-Table</i> applies to DCI format 4_0 with CRC scrambled by MCCH-RNTI/G-RNTI (see TS 38.214 [19], clause 5.1.3.1).                                                                                                         |
| <b>xOverhead</b>                                | Accounts for an overhead from CSI-RS, CORESET, etc. If the field is absent, the UE applies value x0h0 (see TS 38.214 [19], clause 5.1.3.2).                                                                                                                                                                                                            |

| <b>PDSCH-ConfigPTM field descriptions</b> |                                                                                                                                                                                                                    |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dataScramblingIdentityPDSCH</b>        | Identifier(s) used to initialize data scrambling (c_init) for PDSCH as specified in TS 38.211 [16], clause 7.3.1.1. When the field is absent the UE applies the value physCellId configured for this serving cell. |
| <b>dmrs-ScramblingID0</b>                 | DL DMRS scrambling initialization (see TS 38.211 [16], clause 7.4.1.1.1). When the field is absent the UE applies the value <i>physCellId</i> configured for this serving cell.                                    |
| <b>pdsch-AggregationFactor</b>            | Number of repetitions for dynamic scheduling of MBS broadcast data for MTCH PDSCH (see TS 38.214 [19], clause 5.1.2.1). When the field is absent the UE applies the value 1.                                       |

— **TMGI**

The IE *TMGI* is used to identify the MBS session.

**TMGI information element**

```

-- ASN1START
-- TAG-TMGI-START

TMGI-r17 ::=
    plmn-Id-r17
        plmn-Index
        explicitValue
    },
    serviceId-r17
}

SEQUENCE {
    CHOICE {
        INTEGER (1..maxPLMN),
        PLMN-Identity
    }
    OCTET STRING (SIZE (3))
}

-- TAG-TMGI-STOP
-- ASN1STOP

```

**TMGI field descriptions*****plmn-Index***

PLMN index or NPN index according to the *plmn-IdentityInfoList* and *npn-IdentityInfoList* fields included in *SIB1*. If this field is included in the *MRB-ToAddMod-r17*, the UE translates the *plmn-Index* into the PLMN Identity or SNPN Identity based on the configuration in *SIB1* (which is the *SIB1* of the target cell in case of handover). The *explicitValue* is not used for MBS service(s) of an SNPN.

***serviceId***

Uniquely identifies the identity of an MBS service within a PLMN. The field contains octet 3- 5 of the IE Temporary Mobile Group Identity (TMGI) as defined in TS 24.008 [38]. The first octet contains the third octet of the TMGI, the second octet contains the fourth octet of the TMGI and so on.

## 6.4 RRC multiplicity and type constraint values

### — Multiplicity and type constraint definitions

## 6.5 Short Message

Short Messages can be transmitted on PDCCH using P-RNTI with or without associated *Paging* message using Short Message field in DCI format 1\_0 (see TS 38.212 [17], clause 7.3.1.2.1).

Table 6.5-1 defines Short Messages. Bit 1 is the most significant bit.

**Table 6.5-1: Short Messages**

| Bit   | Short Message                                                                                                                                                                                                                                                                                                                                   |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1     | <b><i>systemInfoModification</i></b><br>If set to 1: indication of a BCCH modification other than <i>SIB6</i> , <i>SIB7</i> , <i>SIB8</i> and <i>posSIBs</i> .                                                                                                                                                                                  |
| 2     | <b><i>etwsAndCmasIndication</i></b><br>If set to 1: indication of an ETWS primary notification and/or an ETWS secondary notification and/or a CMAS notification.                                                                                                                                                                                |
| 3     | <b><i>stopPagingMonitoring</i></b><br>This bit can be used for only operation with shared spectrum channel access and if <i>nrofPDCCH-MonitoringOccasionPerSSB-InPO</i> is present.<br>If set to 1: indication that the UE may stop monitoring PDCCH occasion(s) for paging in this Paging Occasion as specified in TS 38.304 [20], clause 7.1. |
| 4     | <b><i>systemInfoModification-eDRX</i></b><br>If set to 1: indication of a BCCH modification other than <i>SIB6</i> , <i>SIB7</i> , <i>SIB8</i> and <i>posSIBs</i> . This indication applies only to UEs using IDLE eDRX cycle longer than the BCCH modification period.                                                                         |
| 5 – 8 | Not used in this release of the specification, and shall be ignored by UE if received.                                                                                                                                                                                                                                                          |

| T319a | Upon transmission of <i>RRCResumeRequest</i> or <i>RRCResumeRequest1</i> when the resume procedure is initiated for SDT.                                                                       | Upon reception of <i>RRCResume</i> , <i>RRCSetup</i> , <i>RRCRelease</i> , <i>RRCReject</i> message or upon failure to resume RRC connection for SDT as specified in 5.3.13.5 or upon cell reselection.                                                                                     | Perform the actions as specified in 5.3.13.5.                                           |
| T320  | Upon reception of <i>t320</i> or upon cell (re)selection to NR from another RAT with validity time configured for dedicated priorities (in which case the remaining validity time is applied). | Upon entering RRC_CONNECTED, upon reception of <i>RRCRelease</i> , when PLMN selection or SNPN selection is performed on request by NAS, when the UE enters RRC_IDLE from RRC_INACTIVE, or upon cell (re)selection to another RAT (in which case the timer is carried on to the other RAT). | Discard the cell reselection priority information provided by dedicated signalling.     |
| T321  | Upon receiving <i>measConfig</i> including a <i>reportConfig</i> with the <i>reportType</i> set to <i>reportCGI</i>                                                                            | Upon acquiring the information needed to set all fields of <i>cgi-info</i> , upon receiving <i>measConfig</i> that includes removal of the <i>reportConfig</i> with the <i>reportType</i> set to <i>reportCGI</i> and upon detecting that a cell is not broadcasting SIB1.                  | Initiate the measurement reporting procedure, stop performing the related measurements. |
| T322  | Upon receiving <i>measConfig</i> including <i>reportConfigNR</i> with the <i>reportType</i> set to <i>reportSFTD</i> and <i>drx-SFTD-NeighMeas</i> is set to <i>true</i> .                     | Upon acquiring the SFTD measurement results, upon receiving <i>measConfig</i> that includes removal of the <i>reportConfig</i> with the <i>reportType</i> set to <i>reportSFTD</i> .                                                                                                        | Initiate the measurement reporting procedure, stop performing the related measurements. |
| T325  | Upon reception of <i>RRCRelease</i> message with <i>deprioritisationTimer</i> .                                                                                                                |                                                                                                                                                                                                                                                                                             | Stop deprioritisation of all frequencies or NR signalled by <i>RRCRelease</i> .         |
| T330  | Upon receiving <i>LoggedMeasurementConfiguration</i> message                                                                                                                                   | Upon log volume exceeding the suitable UE memory, upon initiating the release of <i>LoggedMeasurementConfiguration</i> procedure                                                                                                                                                            | Perform the actions specified in 5.5a.1.4                                               |

| Timer                                                                 | Start                                                                                      | Stop                                                                                                                                                                                                                                                                     | At expiry                                    |
|-----------------------------------------------------------------------|--------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------|
| T331                                                                  | Upon receiving <i>RRCRelease</i> message with <i>measIdleDuration</i>                      | Upon receiving <i>RRCSetup</i> , <i>RRCResume</i> , <i>RRCRelease</i> with idle/inactive measurement configuration, upon cell selection/reselection to a cell that does not belong to the <i>validityArea</i> (if configured), or upon cell re-selection to another RAT. | Perform the actions as specified in 5.7.8.3. |
| T342                                                                  | Upon transmitting <i>UEAssistanceInformation</i> message with <i>DelayBudgetReport</i> .   | Upon releasing <i>delayBudgetReportingConfig</i> during the connection re-establishment/resume procedures, and upon receiving <i>delayBudgetReportingConfig</i> set to <i>release</i> .                                                                                  | No action.                                   |
| T345                                                                  | Upon transmitting <i>UEAssistanceInformation</i> message with <i>overheatingAssistance</i> | Upon releasing <i>overheatingAssistanceConfig</i> during the connection re-establishment procedure, upon initiating the connection resumption procedure, and upon receiving <i>overheatingAssistanceConfig</i> set to <i>release</i> .                                   | No action.                                   |
| T346a<br>(The UE maintains one instance of this timer per cell group) | Upon transmitting <i>UEAssistanceInformation</i> message with <i>drx-Preference</i> .      | Upon releasing <i>drx-PreferenceConfig</i> during the connection re-establishment/resume procedures, upon receiving <i>drx-PreferenceConfig</i> set to <i>release</i> , or upon performing MR-DC release.                                                                | No action.                                   |

| T380                                                               | Upon reception of t380 in <i>RRCRelease</i> .                                                                                                  | Upon reception of <i>RRCResume</i> , <i>RRCSetup</i> or <i>RRCRelease</i> .                                                                                                                                                                                                                                     | Perform the actions as specified in 5.3.13.   |
| T390                                                               | When access attempt is barred at access barring check for an Access Category. The UE maintains one instance of this timer per Access Category. | Upon cell (re)selection, upon relay (re)selection, upon entering RRC_CONNECTED, upon reception of <i>RRCReconfiguration</i> including <i>reconfigurationWithSync</i> , upon change of PCell while in RRC_CONNECTED, upon reception of <i>MobilityFromNRCommand</i> , or upon reception of <i>RRCRelease</i> .   | Perform the actions as specified in 5.3.14.4. |

| Timer | Start                                                                                                                                                                                                                                                                                                                                                                                      | Stop                                                                                                                                                                                                                                                                                                   | At expiry                                                                        |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| T400  | Upon transmission of <i>RRCReconfigurationSidelink</i>                                                                                                                                                                                                                                                                                                                                     | Upon reception of <i>RRCReconfigurationFailureSidelink</i> or <i>RRCReconfigurationCompleteSidelink</i>                                                                                                                                                                                                | Perform the Sidelink radio link failure related actions as specified in 5.8.9.3. |
| T420  | Upon reception of the <i>RRCReconfiguration</i> message including <i>sl-PathSwitchConfig</i>                                                                                                                                                                                                                                                                                               | Upon successfully sending <i>RRCReconfigurationComplete</i> message (i.e., PC5 RLC acknowledgement is received from target L2 U2N Relay UE)                                                                                                                                                            | Perform the RRC re-establishment procedure as specified in 5.3.7.                |
| T430  | Start or restart from the subframe indicated by <i>epochTime</i> upon reception of SIB19, or upon reception of <i>RRCReconfiguration</i> message for the target cell including <i>reconfigurationWithSync</i> , or upon conditional reconfiguration execution i.e. when applying a stored <i>RRCReconfiguration</i> message for the target cell including <i>reconfigurationWithSync</i> . | Stop T430, if it is running, for the source cell upon reception of <i>RRCReconfiguration</i> message including <i>reconfigurationWithSync</i> , or upon conditional reconfiguration execution i.e. when applying a stored <i>RRCReconfiguration</i> message including <i>reconfigurationWithSync</i> . | Perform the actions as specified in 5.2.2.6.                                     |

## 7.1.2 Timer handling

When the UE applies zero value for a timer, the timer shall be started and immediately expire unless explicitly stated otherwise.

## 7.2 Counters

| Counter | Reset                                                                                                                                                                                                                            | Incremented                                                                       | When reaching max value |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|-------------------------|
| N310    | Upon reception of "in-sync" indication from lower layers;<br>upon receiving <i>RRCReconfiguration</i> with <i>reconfigurationWithSync</i> for that cell group;<br>upon initiating the connection re-establishment procedure.     | Upon reception of "out-of-sync" from lower layer while the timer T310 is stopped. | Start timer T310        |
| N311    | Upon reception of "out-of-sync" indication from lower layers;<br>upon receiving <i>RRCReconfiguration</i> with <i>reconfigurationWithSync</i> for that cell group;<br>upon initiating the connection re-establishment procedure. | Upon reception of the "in-sync" from lower layer while the timer T310 is running. | Stop the timer T310.    |

## 7.3 Constants

| Constant | Usage                                                                                             |
|----------|---------------------------------------------------------------------------------------------------|
| N310     | Maximum number of consecutive "out-of-sync" indications for the SpCell received from lower layers |
| N311     | Maximum number of consecutive "in-sync" indications for the SpCell received from lower layers     |

## 7.4 UE variables

NOTE: To facilitate the specification of the UE behavioural requirements, UE variables are represented using ASN.1. Unless explicitly specified otherwise, it is however up to UE implementation how to store the variables. The optionality of the IEs in ASN.1 is used only to indicate that the values may not always be available.

### – NR-UE-Variables

This ASN.1 segment is the start of the NR UE variable definitions.

```

-- NR-UE-VARIABLES-STOP
-- ASN1STOP

```

### – *VarConditionalReconfig*

The UE variable *VarConditionalReconfig* includes the accumulated configuration of the conditional handover, conditional PSCell addition or conditional PSCell change configurations including the pointers to conditional handover, conditional PSCell addition or conditional PSCell change execution condition (associated *measId(s)*) and the stored target candidate SpCell *RRCReconfiguration*.

#### *VarConditionalReconfig UE variable*

```

-- ASN1START
-- TAG-VARCONDITIONALRECONFIG-START

VarConditionalReconfig ::= SEQUENCE {
    condReconfigList          CondReconfigToAddModList-r16 OPTIONAL
}

-- TAG-VARCONDITIONALRECONFIG-STOP
-- ASN1STOP

```

### – *VarConnEstFailReport*

The UE variable *VarConnEstFailReport* includes the connection establishment failure and/or connection resume failure information.

#### *VarConnEstFailReport UE variable*

```

-- ASN1START
-- TAG-VARCONNESTFAILREPORT-START

VarConnEstFailReport-r16 ::= SEQUENCE {

```

```

    connEstFailReport-r16      ConnEstFailReport-r16,
    plmn-Identity-r16          PLMN-Identity
}

-- TAG-VARCONNЕСТFAILREPORT-STOP
-- ASN1STOP

```

### – *VarConnEstFailReportList*

The UE variable *VarConnEstFailReportList* includes a list of the connection establishment failure and/or connection resume failure information.

#### *VarConnEstFailReportList* UE variable

```

-- ASN1START
-- TAG-VARCONNЕСТFAILREPORTLIST-START

VarConnEstFailReportList-r17 ::= SEQUENCE {
    connEstFailReportList-r17 SEQUENCE (SIZE (1..maxCEReport-r17)) OF VarConnEstFailReport-r16
}

-- TAG-VARCONNЕСТFAILREPORTLIST-STOP
-- ASN1STOP

```

### – *VarLogMeasConfig*

The UE variable *VarLogMeasConfig* includes the configuration of the logging of measurements to be performed by the UE while in RRC\_IDLE, RRC\_INACTIVE, covering intra-frequency, inter-frequency and inter-RAT mobility related measurements. The UE performs logging of measurements only while in RRC\_IDLE and RRC\_INACTIVE.

#### *VarLogMeasConfig* UE variable

```

-- ASN1START
-- TAG-VARLOGMEASCONFIG-START

VarLogMeasConfig-r16 ::= SEQUENCE {
    areaConfiguration-r16      AreaConfiguration-r16      OPTIONAL,
    bt-NameList-r16            BT-NameList-r16            OPTIONAL,
    wlan-NameList-r16          WLAN-NameList-r16          OPTIONAL,
    sensor-NameList-r16        Sensor-NameList-r16        OPTIONAL,
    loggingDuration-r16        LoggingDuration-r16,
    reportType                  CHOICE {
        periodical              LoggedPeriodicalReportConfig-r16,
        eventTriggered          LoggedEventTriggerConfig-r16
    },
    earlyMeasIndication-r17     ENUMERATED {true}          OPTIONAL,
    areaConfiguration-r17      AreaConfiguration-r17      OPTIONAL
}

-- TAG-VARLOGMEASCONFIG-STOP

```

```
-- ASN1STOP
```

## — *VarLogMeasReport*

The UE variable *VarLogMeasReport* includes the logged measurements information.

### *VarLogMeasReport* UE variable

```
-- ASN1START
-- TAG-VARLOGMEASREPORT-START

VarLogMeasReport-r16 ::= SEQUENCE {
    absoluteTimeInfo-r16      AbsoluteTimeInfo-r16,
    traceReference-r16        TraceReference-r16,
    traceRecordingSessionRef-r16 OCTET STRING (SIZE (2)),
    tce-Id-r16                 OCTET STRING (SIZE (1)),
    logMeasInfoList-r16        LogMeasInfoList-r16,

    sigLoggedMeasType-r17      ENUMERATED {true}
}

-- TAG-VARLOGMEASREPORT-STOP
-- ASN1STOP
```

## — *VarMeasConfig*

The UE variable *VarMeasConfig* includes the accumulated configuration of the measurements to be performed by the UE, covering intra-frequency, inter-frequency and inter-RAT mobility related measurements.

### *VarMeasConfig* UE variable

```
-- ASN1START
-- TAG-VARMEASCONFIG-START

VarMeasConfig ::= SEQUENCE {
    -- Measurement identities
    measIdList          MeasIdToAddModList          OPTIONAL,
    -- Measurement objects
    measObjectList       MeasObjectToAddModList      OPTIONAL,
    -- Reporting configurations
    reportConfigList     ReportConfigToAddModList    OPTIONAL,
    -- Other parameters
    quantityConfig        QuantityConfig              OPTIONAL,
    s-MeasureConfig       CHOICE {
        ssb-RSRP          RSRP-Range,
        csi-RSRP           RSRP-Range
    }
}

OPTIONAL
```

```

}
-- TAG-VARMEASCONFIG-STOP
-- ASN1STOP

```

## — *VarMeasConfigSL*

The UE variable *VarMeasConfigSL* includes the accumulated configuration of the NR sidelink measurements to be performed by the UE of unicast destination.

### *VarMeasConfigSL* UE variable

```

-- ASN1START
-- TAG-VARMEASCONFIGSL-START

VarMeasConfigSL-r16 ::=
  -- NR sidelink measurement identities
  sl-MeasIdList-r16
  -- NR sidelink measurement objects
  sl-MeasObjectList-r16
  -- NR sidelink reporting configurations
  sl-ReportConfigList-r16
  -- Other parameters
  sl-QuantityConfig-r16
}

SEQUENCE {
  SL-MeasIdList-r16
  SL-MeasObjectList-r16
  SL-ReportConfigList-r16
  SL-QuantityConfig-r16
}

-- TAG-VARMEASCONFIGSL-STOP
-- ASN1STOP

```

## — *VarMeasIdleConfig*

The UE variable *VarMeasIdleConfig* includes the configuration of the measurements to be performed by the UE while in RRC\_IDLE or RRC\_INACTIVE for NR inter-frequency and inter-RAT (i.e. EUTRA) measurements.

### *VarMeasIdleConfig* UE variable

```

-- ASN1START
-- TAG-VARMEASIDLECONFIG-START

VarMeasIdleConfig-r16 ::=
  measIdleCarrierListNR-r16
  measIdleCarrierListEUTRA-r16
  measIdleDuration-r16
  validityAreaList-r16
}

SEQUENCE {
  SEQUENCE (SIZE (1..maxFreqIdle-r16)) OF MeasIdleCarrierNR-r16
  SEQUENCE (SIZE (1..maxFreqIdle-r16)) OF MeasIdleCarrierEUTRA-r16
  ENUMERATED {sec10, sec30, sec60, sec120, sec180, sec240, sec300, spare},
  ValidityAreaList-r16
}

-- TAG-VARMEASIDLECONFIG-STOP
-- ASN1STOP

```

## – *VarMeasIdleReport*

The UE variable *VarMeasIdleReport* includes the logged measurements information.

### *VarMeasIdleReport UE variable*

```
-- ASN1START
-- TAG-VARMEASIDLEREPORT-START

VarMeasIdleReport-r16 ::= SEQUENCE {
    measReportIdleNR-r16      MeasResultIdleNR-r16      OPTIONAL,
    measReportIdleEUTRA-r16   MeasResultIdleEUTRA-r16   OPTIONAL
}

-- TAG-VARMEASIDLEREPORT-STOP
-- ASN1STOP
```

## – *VarMeasReportList*

The UE variable *VarMeasReportList* includes information about the measurements for which the triggering conditions have been met.

### *VarMeasReportList UE variable*

```
-- ASN1START
-- TAG-VARMEASREPORTLIST-START

VarMeasReportList ::= SEQUENCE (SIZE (1..maxNrofMeasId)) OF VarMeasReport

VarMeasReport ::= SEQUENCE {
    -- List of measurement that have been triggered
    measId                MeasId,
    cellsTriggeredList     CellsTriggeredList          OPTIONAL,
    numberOfReportsSent    INTEGER,
    cli-TriggeredList-r16  CLI-TriggeredList-r16       OPTIONAL,
    tx-PoolMeasToAddModListNR-r16 Tx-PoolMeasList-r16  OPTIONAL,
    relaysTriggeredList-r17 RelaysTriggeredList-r17    OPTIONAL
}

CellsTriggeredList ::= SEQUENCE (SIZE (1..maxNrofCellMeas)) OF CHOICE {
    physCellId            PhysCellId,
    physCellIdEUTRA       EUTRA-PhysCellId,
    physCellIdUTRA-FDD-r16 PhysCellIdUTRA-FDD-r16
}

CLI-TriggeredList-r16 ::= CHOICE {
    srs-RSRP-TriggeredList-r16 SRS-RSRP-TriggeredList-r16,
    cli-RSSI-TriggeredList-r16  CLI-RSSI-TriggeredList-r16
}
```

```

    }

SRS-RSRP-TriggeredList-r16 ::= SEQUENCE (SIZE (1.. maxNrofCLI-SRS-Resources-r16)) OF SRS-ResourceId
CLI-RSSI-TriggeredList-r16 ::= SEQUENCE (SIZE (1.. maxNrofCLI-RSSI-Resources-r16)) OF RSSI-ResourceId-r16
RelaysTriggeredList-r17 ::= SEQUENCE (SIZE (1.. maxNrofRelayMeas-r17)) OF SL-SourceIdentity-r17

-- TAG-VARMEASREPORTLIST-STOP
-- ASN1STOP

```

### — *VarMeasReportListSL*

The UE variable *VarMeasReportListSL* includes information about the NR sidelink measurements for which the triggering conditions have been met.

#### *VarMeasReportListSL* UE variable

```

-- ASN1START
-- TAG-VARMEASREPORTLISTSL-START

VarMeasReportListSL-r16 ::= SEQUENCE (SIZE (1..maxNrofSL-MeasId-r16)) OF VarMeasReportSL-r16

VarMeasReportSL-r16 ::= SEQUENCE {
    -- List of NR sidelink measurement that have been triggered
    sl-MeasId-r16 SL-MeasId-r16,
    sl-FrequencyTriggeredList-r16 SEQUENCE (SIZE (1..maxNrofFreqSL-r16)) OF ARFCN-ValueNR OPTIONAL,
    sl-NumberOfReportsSent-r16 INTEGER
}

-- TAG-VARMEASREPORTLISTSL-STOP
-- ASN1STOP

```

### — *VarMobilityHistoryReport*

The UE variable *VarMobilityHistoryReport* includes the mobility history information.

#### *VarMobilityHistoryReport* UE variable

```

-- ASN1START
-- TAG-VARMOBILITYHISTORYREPORT-START

VarMobilityHistoryReport-r16 ::= VisitedCellInfoList-r16

VarMobilityHistoryReport-r17 ::= SEQUENCE {
    visitedCellInfoList-r16 VisitedCellInfoList-r16,
    visitedPSCellInfoList-r17 VisitedPSCellInfoList-r17 OPTIONAL
}

```

```
-- TAG-VARMOBILITYHISTORYREPORT-STOP
-- ASN1STOP
```

### — *VarPendingRNA-Update*

The UE variable *VarPendingRNA-Update* indicates whether there is a pending RNA update procedure or not. The setting of this BOOLEAN variable to *true* means that there is a pending RNA Update procedure.

#### *VarPendingRNA-Update* UE variable

```
-- ASN1START
-- TAG-VARPENDINGRNA-UPDATE-START

VarPendingRNA-Update ::=
    pendingRNA-Update          SEQUENCE {
                                BOOLEAN                                OPTIONAL
    }

-- TAG-VARPENDINGRNA-UPDATE-STOP
-- ASN1STOP
```

### — *VarRA-Report*

The UE variable *VarRA-Report* includes the random-access related information.

#### *VarRA-Report* UE variable

```
-- ASN1START
-- TAG-VARRA-REPORT-START

VarRA-Report-r16 ::= SEQUENCE {
    ra-ReportList-r16      RA-ReportList-r16,
    plmn-IdentityList-r16  PLMN-IdentityList-r16
}

PLMN-IdentityList-r16 ::= SEQUENCE (SIZE (1..maxPLMN)) OF PLMN-Identity

-- TAG-VARRA-REPORT-STOP
-- ASN1STOP
```

### — *VarResumeMAC-Input*

The UE variable *VarResumeMAC-Input* specifies the input used to generate the *resumeMAC-I* during RRC Connection Resume procedure.

VarResumeMAC-Input UE variable

```
-- ASN1START
-- TAG-VARRESUMEMAC-INPUT-START

VarResumeMAC-Input ::= SEQUENCE {
    sourcePhysCellId      PhysCellId,
    targetCellIdentity     CellIdentity,
    source-c-RNTI          RNTI-Value
}

-- TAG-VARRESUMEMAC-INPUT-STOP
-- ASN1STOP
```

| VarResumeMAC-Input field descriptions                                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>targetCellIdentity</b><br>An input variable used to calculate the <i>resumeMAC-I</i> . Set to the <i>cellIdentity</i> of the first <i>PLMN-Identity</i> included in the <i>PLMN-IdentityInfoList</i> broadcasted in <i>SIB1</i> of the target cell i.e. the cell the UE is trying to resume. |

```

## 8 Protocol data unit abstract syntax

### 8.1 General

The RRC PDU contents in clause 6 and clause 10 are described using abstract syntax notation one (ASN.1) as specified in ITU-T Rec. X.680 [6] and X.681 [7]. Transfer syntax for RRC PDUs is derived from their ASN.1 definitions by use of Packed Encoding Rules, unaligned as specified in ITU-T Rec. X.691 [8].

The following encoding rules apply in addition to what has been specified in X.691:

- When a bit string value is placed in a bit-field as specified in 15.6 to 15.11 in X.691, the leading bit of the bit string value shall be placed in the leading bit of the bit-field, and the trailing bit of the bit string value shall be placed in the trailing bit of the bit-field;

NOTE: The terms 'leading bit' and 'trailing bit' are defined in ITU-T Rec. X.680. When using the 'bstring' notation, the leading bit of the bit string value is on the left, and the trailing bit of the bit string value is on the right.

- When decoding types constrained with the ASN.1 Contents Constraint ("CONTAINING"), automatic decoding of the contained type should not be performed because errors in the decoding of the contained type should not cause the decoding of the entire RRC message PDU to fail. It is recommended that the decoder first decodes the outer PDU type that contains the OCTET STRING or BIT STRING with the Contents Constraint, and then decodes the contained type that is nested within the OCTET STRING or BIT STRING as a separate step;
- When decoding a) RRC message PDUs, b) BIT STRING constrained with a Contents Constraint, or c) OCTET STRING constrained with a Contents Constraint, PER decoders are required to never report an error if there are extraneous zero or non-zero bits at the end of the encoded RRC message PDU, BIT STRING or OCTET STRING.

### 8.2 Structure of encoded RRC messages

An RRC PDU, which is the bit string that is exchanged between peer entities/across the radio interface contains the basic production as defined in X.691.

RRC PDUs shall be mapped to and from PDCP SDUs (in case of DCCH) or RLC SDUs (in case of PCCH, BCCH or CCCH) upon transmission and reception as follows:

- when delivering an RRC PDU as an PDCP SDU to the PDCP layer for transmission, the first bit of the RRC PDU shall be represented as the first bit in the PDCP SDU and onwards; and
- when delivering an RRC PDU as an RLC SDU to the RLC layer for transmission, the first bit of the RRC PDU shall be represented as the first bit in the RLC SDU and onwards; and
- upon reception of an PDCP SDU from the PDCP layer, the first bit of the PDCP SDU shall represent the first bit of the RRC PDU and onwards; and
- upon reception of an RLC SDU from the RLC layer, the first bit of the RLC SDU shall represent the first bit of the RRC PDU and onwards.

### 8.3 Basic production

The 'basic production' is obtained by applying UNALIGNED PER to the abstract syntax value (the ASN.1 description) as specified in X.691. It always contains a multiple of 8 bits.

### 8.4 Extension

The following rules apply with respect to the use of protocol extensions:

- A transmitter compliant with this version of the specification shall, unless explicitly indicated otherwise on a PDU type basis, set the extension part empty. Transmitters compliant with a later version may send non-empty extensions;
- A transmitter compliant with this version of the specification shall set spare bits to zero.

## 8.5 Padding

If the encoded RRC message does not fill a transport block, the RRC layer shall add padding bits. This applies to PCCH and BCCH.

Padding bits shall be set to 0 and the number of padding bits is a multiple of 8.

Figure 8.5-1: RRC level padding

## 9 Specified and default radio configurations

Specified and default configurations are configurations of which the details are specified in the standard. Specified configurations are fixed while default configurations can be modified using dedicated signalling. The default value for the parameters not listed in following clauses shall be set such as the corresponding features are not configured, i.e. *release* or *false* unless explicitly stated otherwise.

NOTE: The UE applies the default values specified in the field description of ASN.1 parameters only when the parent IE is present. Hence, the UE does not apply all default values in field descriptions when it applies the "default radio configuration" in accordance with this clause.

### 9.1 Specified configurations

#### 9.1.1 Logical channel configurations

##### 9.1.1.1 BCCH configuration

Parameters

| Name                          | Value    | Semantics description | Ver |
|-------------------------------|----------|-----------------------|-----|
| SDAP configuration            | Not used |                       |     |
| PDCH configuration            | Not used |                       |     |
| RLC configuration             | TM       |                       |     |
| Logical channel configuration | Not used |                       |     |

NOTE: RRC will perform padding, if required due to the granularity of the TF signalling, as defined in 8.5.

### 9.1.1.2 CCCH configuration

Parameters

| Name                          | Value    | Semantics description | Ver |
|-------------------------------|----------|-----------------------|-----|
| SDAP configuration            | Not used |                       |     |
| PDCH configuration            | Not used |                       |     |
| RLC configuration             | TM       |                       |     |
| Logical channel configuration |          |                       |     |
| >priority                     | 1        | Highest priority      |     |
| >prioritisedBitRate           | infinity |                       |     |
| >bucketSizeDuration           | ms1000   |                       |     |
| >logicalChannelGroup          | 0        |                       |     |

### 9.1.1.3 PCCH configuration

Parameters

| Name                          | Value    | Semantics description | Ver |
|-------------------------------|----------|-----------------------|-----|
| SDAP configuration            | Not used |                       |     |
| PDCH configuration            | Not used |                       |     |
| RLC configuration             | TM       |                       |     |
| Logical channel configuration | Not used |                       |     |

NOTE: RRC will perform padding, if required due to the granularity of the TF signalling, as defined in 8.5.

### 9.1.1.4 SCCH configuration

Parameters that are specified for unicast of NR sidelink communication, which is used for the sidelink signalling radio bearer of PC5-RRC message. The SL-SRB using this SCCH configuration is named as SL-SRB3.

| Name                             | Value     | Semantics description                                                                                          | Ver |
|----------------------------------|-----------|----------------------------------------------------------------------------------------------------------------|-----|
| PDCP configuration               |           |                                                                                                                |     |
| > <i>t-Reordering</i>            | Undefined | Selected by the receiving UE, up to UE implementation                                                          |     |
| > <i>pdcp-SN-Size</i>            | 12        |                                                                                                                |     |
| RLC configuration                |           | AM RLC                                                                                                         |     |
| > <i>sn-FieldLength</i>          | 12        |                                                                                                                |     |
| > <i>t-Reassembly</i>            | Undefined | Selected by the receiving UE, up to UE implementation                                                          |     |
| > <i>t-PollRetransmit</i>        | Undefined | Selected by the transmitting UE, up to UE implementation                                                       |     |
| > <i>pollPDU</i>                 | Undefined | Selected by the transmitting UE, up to UE implementation                                                       |     |
| > <i>pollByte</i>                | Undefined | Selected by the transmitting UE, up to UE implementation                                                       |     |
| > <i>maxRetxThreshold</i>        | Undefined | Selected by the transmitting UE, up to UE implementation                                                       |     |
| > <i>t-StatusProhibit</i>        | Undefined | Selected by the receiving UE, up to UE implementation                                                          |     |
| > <i>logicalChannelIdentity</i>  | 3         |                                                                                                                |     |

| > <i>pdcp-SN-SizeDL</i> | 18    |                       |     |
| RLC configuration       |       | UM RLC                |     |
| > <i>sn-FieldLength</i> | 12    |                       |     |
| > <i>t-Reassembly</i>   | ms0   |                       |     |

### 9.1.2 Void

## 9.2 Default radio configurations

The following clauses only list default values for REL-15 parameters included in protocol version v15.3.0. For all fields introduced in a later protocol version, the default value is "released" or "false" unless explicitly specified otherwise. If the UE is to apply default configuration while it is configured with some critically extended fields, the UE shall apply the original version of those fields with only default values.

NOTE 1: In general, the signalling should preferably support a "release" option for fields introduced after v15.3.0. The "value not applicable" should be used restrictively, mainly limited to for fields which value is relevant only if another field is set to a value other than its default.

NOTE 2: For parameters in *ServingCellConfig*, the default values are specified in the corresponding specification.

## 9.2.1 Default SRB configurations

Parameters

| Name                                                                                                                                           | Value                                        |      |      | Semantics description | Ver |

## 10 Generic error handling

### 10.1 General

The generic error handling defined in the subsequent clauses applies unless explicitly specified otherwise e.g. within the procedure specific error handling.

The UE shall consider a value as not comprehended when it is set:

- to an extended value that is not defined in the version of the transfer syntax supported by the UE;
- to a spare or reserved value unless the specification defines specific behaviour that the UE shall apply upon receiving the concerned spare/reserved value.

The UE shall consider a field as not comprehended when it is defined:

- as spare or reserved unless the specification defines specific behaviour that the UE shall apply upon receiving the concerned spare/reserved field.

### 10.2 ASN.1 violation or encoding error

The UE shall:

- 1> when receiving an RRC message on the BCCH, CCCH, PCCH, MCCH or a PC5 RRC message on SBCCH for which the abstract syntax is invalid [6];
- 2> ignore the message.

NOTE: This clause applies in case one or more fields is set to a value, other than a spare, reserved or extended value, not defined in this version of the transfer syntax. E.g. in the case the UE receives value 12 for a field defined as INTEGER (1..11). In cases like this, it may not be possible to reliably detect which field is in the error hence the error handling is at the message level.

### 10.3 Field set to a not comprehended value

The UE shall, when receiving an RRC message or PC5 RRC message on any logical channel:

- 1> if the message includes a field that has a value that the UE does not comprehend:
  - 2> if a default value is defined for this field:
    - 3> treat the message while using the default value defined for this field;
  - 2> else if the concerned field is optional:
    - 3> treat the message as if the field were absent and in accordance with the need code for absence of the concerned field;
  - 2> else:
    - 3> treat the message as if the field were absent and in accordance with clause 10.4.

### 10.4 Mandatory field missing

The UE shall:

- 1> if the message includes a field that is mandatory to include in the message (e.g. because conditions for mandatory presence are fulfilled) and that field is absent or treated as absent:

- 2> if the RRC message was not received on DCCH or CCCH; or
- 2> if the PC5 RRC message was not received on SCCH:
  - 3> if the field concerns a (sub-field of) an entry of a list (i.e. a SEQUENCE OF):
    - 4> treat the list as if the entry including the missing or not comprehended field was absent;
  - 3> else if the field concerns a sub-field of another field, referred to as the 'parent' field i.e. the field that is one nesting level up compared to the erroneous field:
    - 4> consider the 'parent' field to be set to a not comprehended value;
    - 4> apply the generic error handling to the subsequent 'parent' field(s), until reaching the top nesting level i.e. the message level;
  - 3> else (field at message level):
    - 4> ignore the message.

NOTE 1: The error handling defined in these clauses implies that the UE ignores a message with the message type or version set to a not comprehended value.

NOTE 2: The nested error handling for messages received on logical channels other than DCCH, CCCH and SCCH applies for errors in extensions also, even for errors that can be regarded as invalid network operation e.g. the network not observing conditional presence.

NOTE 3: UE behaviour on receipt of an RRC message on DCCH or CCCH or a PC5 RRC message on SCCH that does not include a field that is mandatory (e.g. because conditions for mandatory presence are fulfilled) is unspecified.

The following ASN.1 further clarifies the levels applicable in case of nested error handling for errors in extension fields.

```
-- /example/ ASN1START
-- Example with extension addition group
ItemInfoList ::=
    SEQUENCE (SIZE (1..max)) OF ItemInfo
ItemInfo ::=
    SEQUENCE {
        itemIdentity
            INTEGER (1..max),
        field1
            Field1,
        field2
            Field2 OPTIONAL, -- Need N
        ...
        [[
            field3-r9
                Field3-r9 OPTIONAL, -- Cond Cond1
            field4-r9
                Field4-r9 OPTIONAL -- Need N
        ]]
    }
-- Example with traditional non-critical extension (empty sequence)
BroadcastInfoBlock1 ::=
    SEQUENCE {
        itemIdentity
            INTEGER (1..max),
        field1
            Field1,
        field2
            Field2 OPTIONAL, -- Need N
        nonCriticalExtension
            BroadcastInfoBlock1-v940-IEs OPTIONAL
    }
BroadcastInfoBlock1-v940-IEs ::= SEQUENCE {
        field3-r9
            Field3-r9 OPTIONAL, -- Cond Cond1
        field4-r9
            Field4-r9 OPTIONAL, -- Need N
        nonCriticalExtension
            SEQUENCE {} OPTIONAL -- Need S
    }
-- ASN1STOP
```

The UE shall, apply the following principles regarding the levels applicable in case of nested error handling:

- an extension addition group is not regarded as a level on its own. E.g. in the ASN.1 extract in the previous, a error regarding the conditionality of *field3* would result in the entire *itemInfo* entry to be ignored (rather than just the extension addition group containing *field3* and *field4*);
- a traditional *nonCriticalExtension* is not regarded as a level on its own. E.g. in the ASN.1 extract in the previous, an error regarding the conditionality of *field3* would result in the entire *BroadcastInfoBlock1* to be ignored (rather than just the non-critical extension containing *field3* and *field4*).

## 10.5 Not comprehended field

The UE shall, when receiving an RRC message on any logical channel:

- 1> if the message includes a field that the UE does not comprehend:
- 2> treat the rest of the message as if the field was absent.

NOTE: This clause does not apply to the case of an extension to the value range of a field. Such cases are addressed instead by the requirements in clause 10.3.

---

# 11 Radio information related interactions between network nodes

## 11.1 General

This clause specifies RRC messages that are transferred between network nodes. These RRC messages may be transferred to or from the UE via another Radio Access Technology. Consequently, these messages have similar characteristics as the RRC messages that are transferred across the NR radio interface, i.e. the same transfer syntax and protocol extension mechanisms apply.

## 11.2 Inter-node RRC messages

### 11.2.1 General

This clause specifies RRC messages that are sent either across the X2-, Xn- or the NG-interface, either to or from the gNB, i.e. a single 'logical channel' is used for all RRC messages transferred across network nodes. The information could originate from or be destined for another RAT.

If the <i>TMGI-r17</i> is included in the <i>MRB-ToAddMod-r17</i> in the <i>RadioBearerConfig</i> , the <i>plmn-Index</i> is replaced by the PLMN ID, if needed.                                                                                                      |
| <b><i>sdt-Config</i></b><br>Contains the IE <i>SDT-Config</i> as generated entirely by the last serving gNB. This field is only used during the SDT procedure and the RNA update procedure with UE context relocation as defined in TS 38.300 [2], clause 18.2 and 9.2.2.5 respectively.                                                                                                        |
| <b><i>sourceRB-SN-Config</i></b><br>Contains the IE <i>RadioBearerConfig</i> as generated entirely by the SN. This field is only used when the UE is configured with SN terminated RB(s).                                                                                                                                                                                                       |
| <b><i>sourceSCG-Configured</i></b><br>Value <i>true</i> indicates that the UE is configured with NR or EUTRA SCG in source configuration. The field is only used in NR-DC and NE-DC and is included only if the fields <i>sourceSCG-NR-Config</i> and <i>sourceSCG-EUTRA-Config</i> are absent.                                                                                                 |
| <b><i>sourceSCG-EUTRA-Config</i></b><br>Contains the current dedicated SCG configuration in <i>RRCCConnectionReconfiguration</i> message as specified in TS 36.331 [10] and generated entirely by the SN. In this version of the specification, the E-UTRA <i>RRCCConnectionReconfiguration</i> message can only include the field <i>scg-Configuration</i> . This field is only used in NE-DC. |
| <b><i>sourceSCG-NR-Config</i></b><br>Contains the current dedicated SCG configuration in <i>RRCReconfiguration</i> message as generated entirely by the SN. In this version of the specification, the <i>RRCReconfiguration</i> message can only include fields <i>secondaryCellGroup</i> and <i>measConfig</i> . This field is only used in NR-DC.                                             |

| <b>AS-Context field descriptions</b>                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>configRestrictInfoDAPS</i></b><br>Includes fields for which source cell explicitly indicates the restriction to be observed by target cell during DAPS handover.                                                                                                                                                                                                              |
| <b><i>mbsInterestIndication</i></b><br>Includes the information last reported by the UE in the NR <i>MBSInterestIndication</i> message, where the <i>plmn-Index</i> (if included by the UE in <i>tmgi</i> ) is replaced by the PLMN ID, if needed. A TMGI for which the <i>plmn-Index</i> points to a non-serving SNPN is removed from the NR <i>MBSInterestIndication</i> message. |
| <b><i>needForGapsInfoNR</i></b><br>Includes measurement gap requirement information of the UE for NR target bands.                                                                                                                                                                                                                                                                  |
| <b><i>selectedBandCombinationSN</i></b><br>Indicates the band combination selected by SN in (NG)EN-DC, NE-DC, and NR-DC.                                                                                                                                                                                                                                                            |
| <b><i>sidelinkUEInformationEUTRA</i></b><br>This field includes <i>SidelinkUEInformation</i> IE as specified in TS 36.331 [10].                                                                                                                                                                                                                                                     |
| <b><i>sidelinkUEInformationNR</i></b><br>This field includes <i>SidelinkUEInformationNR</i> IE.                                                                                                                                                                                                                                                                                     |
| <b><i>ueAssistanceInformation</i></b><br>Includes for each UE assistance feature the information last reported by the UE, if any.                                                                                                                                                                                                                                                   |
| <b><i>ueAssistanceInformationSCG</i></b><br>Includes for each UE assistance feature associated with the SCG, the information last reported by the UE in the NR <i>UEAssistanceInformation</i> message for the SCG, if any.                                                                                                                                                          |

| <b>ConfigRestrictInfoDAPS field descriptions</b>                                                                                                                                                                                                                       |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>sourceFeatureSetPerUplinkCC/sourceFeatureSetPerDownlinkCC</i></b><br>Indicates an index referring to the position of the <i>FeatureSetUplinkPerCC/FeatureSetDownlinkPerCC</i> selected by source in the <i>featureSetsUplinkPerCC/featureSetsDownlinkPerCC</i> . |

| <b><i>RRM-Config</i> field descriptions</b>                                                                                                                                                                                      |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>candidateCellInfoList</i></b><br>A list of the best cells on each frequency for which measurement information was available                                                                                                |
| <b><i>candidateCellInfoListSN-EUTRA</i></b><br>A list of EUTRA cells including serving cells and best neighbour cells on each serving frequency, for which measurement results were available. This field is only used in NE-DC. |

| <b>Conditional Presence</b> | <b>Explanation</b>                                                                                                                                                                                                                    |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>HO</i>                   | The field is mandatory present in case of handover within NR or UE context retrieval, e.g. in case of resume or re-establishment. The field is optionally present in case of handover from E-UTRA/5GC. Otherwise the field is absent. |
| <i>HO2</i>                  | The field is optionally present in case of handover within NR; otherwise the field is absent.                                                                                                                                         |

NOTE 1: The following table indicates per source RAT whether RAT capabilities are included or not.

| <b>Source RAT</b> | <b>NR capabilities</b>                                                                                        | <b>E-UTRA capabilities</b> | <b>MR-DC capabilities</b> | <b>UTRA capabilities</b>                    |
|-------------------|---------------------------------------------------------------------------------------------------------------|----------------------------|---------------------------|---------------------------------------------|
| NR                | May be included if UE Radio Capability ID as specified in 23.502 [43] is used for the UE. Included otherwise. | May be included            | May be included           | May be included, ignored by gNB if received |
| E-UTRAN           | May be included if UE Radio Capability ID as specified in 23.502 [43] is used for the UE. Included otherwise. | May be included            | May be included           | May be included, ignored by gNB if received |

NOTE 2: The following table indicates, in case of inter-RAT handover from E-UTRA, which additional IEs are included or not:

| <b>Source system</b> | <b>sourceConfig</b>                                                                               | <b>rrm-Config</b> | <b>as-Context</b> |
|----------------------|---------------------------------------------------------------------------------------------------|-------------------|-------------------|
| E-UTRA/EPC           | Not included                                                                                      | May be included   | Not included      |
| E-UTRA/5GC           | May be included, but only <i>radioBearerConfig</i> is included in the <i>RRCReconfiguration</i> . | May be included   | Not included      |

## – *CG-Config*

This message is used to transfer the SCG radio configuration as generated by the SgNB or SeNB. It can also be used by a CU to request a DU to perform certain actions, e.g. to request the DU to perform a new lower layer configuration.

Direction: Secondary gNB or eNB to master gNB or eNB, alternatively CU to DU.

This field is only used in NR-DC.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <p><b><i>requestedToffset</i></b><br/>Requests the new value for the time offset restriction used by the SN for scheduling SCG transmissions (i.e. <math>T_{proc,SCG}^{max}</math>, see TS 38.213 [13]). This field is used in NR-DC only when the fields <i>nrdc-PC-mode-FR1-r16</i> or <i>nrdc-PC-mode-FR2-r16</i> are set to dynamic. Value ms0dot5 corresponds to 0.5 ms, value ms0dot75 corresponds to 0.75 ms, value ms1 corresponds to 1ms and so on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <p><b><i>scellFrequenciesSN-EUTRA</i></b>, <b><i>scellFrequenciesSN-NR</i></b><br/>Indicates the frequency of all SCells with SSB configured in SCG. The field <i>scellFrequenciesSN-EUTRA</i> is used in NE-DC; the field <i>scellFrequenciesSN-NR</i> is used in (NG)EN-DC and NR-DC. In (NG)EN-DC, the field is optionally provided to the MN. <i>scellFrequenciesSN-NR</i> indicates <i>absoluteFrequencySSB</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <p><b><i>scg-CellGroupConfig</i></b><br/>Contains the <i>RRCReconfiguration</i> message (containing only <i>secondaryCellGroup</i> and/or <i>measConfig</i> and/or <i>otherConfig</i> and/or <i>conditionalReconfiguration</i> and/or <i>bap-Config</i> and/or <i>iab-IP-AddressConfigurationList</i>):</p> <ul style="list-style-type: none"> <li>- to be sent to the UE, used upon SCG establishment or modification (only when the SCG is not released by the SN), as generated (entirely) by the (target) SgNB. In this case, the SN sets the <i>RRCReconfiguration</i> message in accordance with clause 6 e.g. regarding the "Need" or "Cond" statements.</li> </ul> <p>or</p> <ul style="list-style-type: none"> <li>- including the current SCG configuration of the UE, when provided in response to a query from MN, or in SN triggered SN change in order to enable delta signaling by the target SN, or in SN triggered modification procedure in order to coordinate CHO or MN-initiated CPC with SCG reconfigurations (see TS 38.423 [35]). In this case, the SN sets the <i>RRCReconfiguration</i> message in accordance with clause 11.2.3.</li> </ul> <p>The field is absent if neither SCG (re)configuration nor SCG configuration query nor SN triggered modification procedure in order to coordinate CHO or MN-initiated CPC with SCG reconfigurations (see TS 38.423 [35]) nor SN triggered SN change is performed, e.g. at inter-node capability/configuration coordination which does not result in SCG (re)configuration towards the UE. The field is also absent upon an SCG release triggered by the SN. This field is not applicable in NE-DC.</p> |

**scg-CellGroupConfigEUTRA**

Includes the E-UTRA *RRCConnectionReconfiguration* message as specified in TS 36.331 [10]. In this version of the specification, the E-UTRA RRC message can only include the field *scg-Configuration*:

- to be sent to the UE, used to (re-)configure the SCG configuration upon SCG establishment or modification (only when the SCG is not released by the SN), as generated (entirely) by the (target) SeNB. In this case, the SN sets the *scg-Configuration* within the EUTRA *RRCConnectionReconfiguration* message in accordance with clause 6 in TS 36.331 [10] e.g. regarding the "Need" or "Cond" statements.

or

- including the current SCG configuration of the UE, when provided in response to a query from MN, or in SN triggered SN change in order to enable delta signalling by the target SN.

The field is absent if neither SCG (re)configuration nor SCG configuration query nor SN triggered SN change is performed, e.g. at inter-node capability/configuration coordination which does not result in SCG (re)configuration towards the UE. The field is also absent upon an SCG release triggered by the SN. This field is only used in NE-DC.

**scg-RB-Config**

Contains the IE *RadioBearerConfig*:

- to be sent to the UE, used to (re-)configure the SCG RB configuration upon SCG establishment or modification, as generated (entirely) by the (target) SgNB or SeNB. In this case, the SN sets the *RadioBearerConfig* in accordance with clause 6, e.g. regarding the "Need" or "Cond" statements.

or

- including the current SCG RB configuration of the UE, when provided in response to a query from MN or in SN triggered SN change or in SN triggered SN release or bearer type change between SN terminated bearer to MN terminated bearer in order to enable delta signaling by the MN or target SN. In this case, the SN sets the *RadioBearerConfig* in accordance with clause 11.2.3.

The field is absent if neither SCG (re)configuration nor SCG configuration query nor SN triggered SN change nor SN triggered SN release is performed, e.g. at inter-node capability/configuration coordination which does not result in SCG RB (re)configuration.

**selectedBandCombination**

Indicates the band combination selected by SN in (NG)EN-DC, NE-DC, and NR-DC. The SN should inform the MN with this field whenever the band combination and/or feature set it selected for the SCG changes (i.e. even if the new selection concerns a band combination and/or feature set that is allowed by the *allowedBC-ListMRDC*)

**selectedToffset**

Indicates the value used by the SN for scheduling SCG transmissions (i.e.  $T_{proc,SCG}^{max}$ , see TS 38.213 [13]). This field is used in NR-DC only when the fields *nrdc-PC-mode-FR1-r16* or *nrdc-PC-mode-FR2-r16* are set to dynamic. The SN can only indicate a value that is less than or equal to *maxToffset* received from MN. This field is used in NR-DC only when MN has included the field *maxToffset* in *CG-ConfigInfo*. Value *ms0dot5* corresponds to 0.5 ms, value *ms0dot75* corresponds to 0.75 ms, value *ms1* corresponds to 1ms and so on.

**servCellInfoListSCG-EUTRA**

Indicates the carrier frequency and the transmission bandwidth of the serving cell(s) in the SCG in intra-band NE-DC. The field is needed when MN and SN operate serving cells in the same band for either contiguous or non-contiguous intra-band band combination or LTE NR inter-band band combinations where the frequency range of the E-UTRA band is a subset of the frequency range of the NR band (as specified in Table 5.5B.4.1-1 of TS 38.101-3 [34]) in NE-DC.

**servCellInfoListSCG-NR**

Indicates the frequency band indicator, carrier center frequency, UE specific channel bandwidth and SCS of the serving cell(s) in the SCG in intra-band (NG)EN-DC. The field is needed when MN and SN operate serving cells in the same band for either contiguous or non-contiguous intra-band band combination or LTE NR inter-band band combinations where the frequency range of the E-UTRA band is a subset of the frequency range of the NR band (as specified in Table 5.5B.4.1-1 of TS 38.101-3 [34]) in (NG)EN-DC.

**twoPHRModeSCG**

Indicates if the power headroom for SCG shall be reported as two PHRs (each PHR associated with a SRS resource set) is enabled or not.

|                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>twoSRS-PUSCH-Repetition</b>                                                                                                                                                                                                                                            |
| Indicates whether the indicated serving cell is configured for PUSCH repetition corresponding to two SRS resource sets configured in either <i>srs-ResourceSetToAddModList</i> or <i>srs-ResourceSetToAddModListDCI-0-2</i> with usage 'codebook' or 'noncodebook'.       |
| <b>transmissionBandwidth-EUTRA</b>                                                                                                                                                                                                                                        |
| Indicates the transmission bandwidth on an E-UTRA carrier frequency as defined by the parameter Transmission Bandwidth Configuration "NRB" TS 36.104 [33]. The values rb6, rb15, rb25, rb50, rb75, rb100 indicate 6, 15, 25, 50, 75 and 100 resource blocks respectively. |

| In case of NR-DC, this field indicates the position of a band combination in the <i>supportedBandCombinationList</i> . In case of NE-DC, this field indicates the position of a band combination in the <i>supportedBandCombinationList</i> and/or <i>supportedBandCombinationListNEDC-Only</i> . In case of (NG)EN-DC, this field indicates the position of a band combination in the <i>supportedBandCombinationList</i> and/or <i>supportedBandCombinationList-UplinkTxSwitch</i> . Band combination entries in <i>supportedBandCombinationList</i> are referred by an index which corresponds to the position of a band combination in the <i>supportedBandCombinationList</i> . Band combination entries in <i>supportedBandCombinationListNEDC-Only</i> are referred by an index which corresponds to the position of a band combination in the <i>supportedBandCombinationListNEDC-Only</i> increased by the number of entries in <i>supportedBandCombinationList</i> . Band combination entries in <i>supportedBandCombinationList-UplinkTxSwitch</i> are referred by an index which corresponds to the position of a band combination in the <i>supportedBandCombinationList-UplinkTxSwitch</i> increased by the number of entries in <i>supportedBandCombinationList</i> . |

– CG-ConfigInfo

This message is used by master eNB or gNB to request the SgNB or SeNB to perform certain actions e.g. to establish, modify or release an SCG. The message may include additional information e.g. to assist the SgNB or SeNB to set the SCG configuration. It can also be used by a CU to request a DU to perform certain actions, e.g. to establish, or modify an MCG or SCG.

Direction: Master eNB or gNB to secondary gNB or eNB, alternatively CU to DU.

| <p><b><i>alignedDRX-Indication</i></b><br/>This field is signalled upon MN triggered CGI reporting by the UE that requires aligned DRX configurations between the MCG and the SCG (i.e. same DRX cycle and on-duration configured by MN completely contains on-duration configured by SN).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <p><b><i>allowedAggregatedBandwidthSNList</i></b><br/>A list of allowed maximum aggregated bandwidth at the SN side for the band combination included in the <i>allowedBC-ListMRDC</i>. This field is only used in NR-DC.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <p><b><i>allowedBC-ListMRDC</i></b><br/>A list of indices referring to band combinations in MR-DC capabilities from which SN is allowed to select the SCG band combination. Each entry refers to:<br/>- a band combination numbered according to <i>supportedBandCombinationList</i> and <i>supportedBandCombinationList-UplinkTxSwitch</i> in the <i>UE-MRDC-Capability</i> (in case of (NG)EN-DC), or according to <i>supportedBandCombinationList</i> and <i>supportedBandCombinationListNEDC-Only</i> in the <i>UE-MRDC-Capability</i> (in case of NE-DC), or according to <i>supportedBandCombinationList</i> in the <i>UE-NR-Capability</i> (in case of NR-DC),<br/>- and the Feature Sets allowed for each band entry. All MR-DC band combinations indicated by this field comprise the MCG band combination, which is a superset of the MCG band(s) selected by MN.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <p><b><i>allowedReducedConfigForOverheating</i></b><br/>Indicates the reduced configuration that the SCG is allowed to configure.<br/><i>reducedMaxCCs</i> in <i>allowedReducedConfigForOverheating</i> indicates the maximum number of downlink/uplink PSCell/SCells that the SCG is allowed to configure. This field is used in (NG)EN-DC and NR-DC.<br/><i>reducedMaxBW-FR1</i> and <i>reducedMaxBW-FR2</i> in <i>allowedReducedConfigForOverheating</i> indicates the maximum aggregated bandwidth across all downlink/uplink carriers of FR1 and FR2-1, respectively that the SCG is allowed to configure. <i>reducedMaxBW-FR2-2</i> in <i>allowedReducedConfigForOverheating-r17</i> indicates the maximum aggregated bandwidth across all downlink/uplink carriers of FR2-2 that the SCG is allowed to configure. This field is only used in NR-DC.<br/><i>reducedMaxMIMO-LayersFR1</i> and <i>reducedMaxMIMO-LayersFR2</i> in <i>allowedReducedConfigForOverheating</i> indicates the maximum number of downlink/uplink MIMO layers of each serving cell operating on FR1 and FR2-1, respectively that the SCG is allowed to configure. <i>reducedMaxMIMO-LayersFR2-2</i> in <i>allowedReducedConfigForOverheating-r17</i> indicates the maximum number of downlink/uplink MIMO layers of each serving cell operating on FR2-2 that the SCG is allowed to configure. This field is only used in NR-DC.</p> |
| <p><b><i>allowedResourceConfigNRDC</i></b><br/>Used to indicate the maximum number of resources reserved for the SCG. This field is only used in NR-DC.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <p><b><i>candidateCellInfoListMN</i>, <i>candidateCellInfoListSN</i></b><br/>Contains information regarding cells that the master node or the source node suggests the target gNB or DU to consider configuring. In case of MN initiated CPA or CPC, the field <i>candidateCellInfoListMN</i> contains information regarding cells that the MN suggests the candidate target secondary node to consider configuring for MN initiated CPA or CPC.<br/>For (NG)EN-DC, including CSI-RS measurement results in <i>candidateCellInfoListMN</i> is not supported in this version of the specification. For NR-DC, including SSB and/or CSI-RS measurement results in <i>candidateCellInfoListMN</i> is supported.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Contains all of the fields in the IE <i>RadioBearerConfig</i> used in MN, used by the SN to support delta configuration to UE (i.e. when MN does not use full configuration option), for bearer type change between MN terminated bearer with NR PDCP to SN terminated bearer. It is also used to indicate the PDCP duplication related information for MN terminated split bearer (whether duplication is configured and if so, whether it is initially activated) in SN Addition/Modification procedure. Otherwise, this field is absent. |

| For (NG)EN-DC and NE-DC, the field indicates the maximum total transmit power to be used by the UE in the NR cell group across all serving cells in frequency range 1 (FR1) (see TS 38.104 [12]). For NR-DC, it indicates the maximum total transmit power to be used by the UE in the NR cell group across all serving cells in frequency range 1 (FR1) (see TS 38.104 [12]) the UE can use in NR SCG.                                                                                                                                     |

| <b>ph-Type1or3</b><br>Type of power headroom for a serving cell in MCG (PCell and activated SCells). <i>type1</i> refers to type 1 power headroom, <i>type3</i> refers to type 3 power headroom. (See TS 38.321 [3]).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>ph-Uplink</b><br>Power headroom information for uplink.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>powerCoordination-FR1</b><br>Indicates the maximum power that the UE can use in FR1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>powerCoordination-FR2</b><br>Indicates the maximum power that the UE can use in frequency range 2 (FR2). This field is only used in NR-DC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>scgFailureInfo</b><br>Contains SCG failure type and measurement results. In case the sender has no measurement results available, the sender may include one empty entry (i.e. without any optional fields present) in <i>measResultPerMOList</i> . This field is used in (NG)EN-DC and NR-DC.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>scg-RB-Config</b><br>Contains all of the fields in the IE RadioBearerConfig used in SN, used to allow the target SN to use delta configuration to the UE, e.g. during SN change. The field is signalled upon change of SN unless MN uses full configuration option. Otherwise, the field is absent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>selectedBandEntriesMNList</b><br>A list of indices referring to the position of a band entry selected by the MN, in each band combination entry in <i>allowedBC-ListMRDC</i> IE. <i>BandEntryIndex</i> 0 identifies the first band in the <i>bandList</i> of the <i>BandCombination</i> , <i>BandEntryIndex</i> 1 identifies the second band in the <i>bandList</i> of the <i>BandCombination</i> , and so on. This <i>selectedBandEntriesMNList</i> includes the same number of entries, and listed in the same order as in <i>allowedBC-ListMRDC</i> . The SN uses this information to determine which bands out of the NR band combinations in <i>allowedBC-ListMRDC</i> it can configure in SCG in NR-DC. The SN can use this information to determine for which band pair(s) it should check <i>SimultaneousRxTxPerBandPair</i> . |
| <b>servCellIndexRangeSCG</b><br>Range of serving cell indices that SN is allowed to configure for SCG serving cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>servCellInfoListMCG-EUTRA</b><br>Indicates the carrier frequency and the transmission bandwidth of the serving cell(s) in the MCG in intra-band (NG)EN-DC. The field is needed when MN and SN operate serving cells in the same band for either contiguous or non-contiguous intra-band band combination or LTE NR inter-band band combinations where the frequency range of the E-UTRA band is a subset of the frequency range of the NR band (as specified in Table 5.5B.4.1-1 of TS 38.101-3 [34]) in (NG)EN-DC.                                                                                                                                                                                                                                                                                                                    |
| <b>servCellInfoListMCG-NR</b><br>Indicates the frequency band indicator, carrier center frequency, UE specific channel bandwidth and SCS of the serving cell(s) in the MCG in intra-band NE-DC. The field is needed when MN and SN operate serving cells in the same band for either contiguous or non-contiguous intra-band band combination or LTE NR inter-band band combinations where the frequency range of the E-UTRA band is a subset of the frequency range of the NR band (as specified in Table 5.5B.4.1-1 of TS 38.101-3 [34]) in NE-DC.                                                                                                                                                                                                                                                                                      |
| <b>servFrequenciesMN-NR</b><br>Indicates the frequency of all serving cells that include PCell and SCell(s) with SSB configured in MCG. This field is only used in NR-DC. <i>servFrequenciesMN-NR</i> indicates <i>absoluteFrequencySSB</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>sftdFrequencyList-NR</b><br>Includes a list of SSB frequencies. Each entry identifies the SSB frequency of a PSCell, which corresponds to one <i>MeasResultCellSFTD-NR</i> entry in the <i>MeasResultCellListSFTD-NR</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>sftdFrequencyList-EUTRA</b><br>Includes a list of E-UTRA frequencies. | Includes all of the current SCG configurations used by the target SN to build delta configuration to be sent to UE, e.g. during SN change. The field contains the <i>RRCReconfiguration</i> message, i.e. including <i>secondaryCellGroup</i> and <i>measConfig</i> . The field is signalled upon change of SN, unless MN uses full configuration option. Otherwise, the field is absent. |
| <b>sourceConfigSCG-EUTRA</b>                                                                                                                                                                                                                                                                                                                                                              |
| Includes the E-UTRA <i>RRCConnectionReconfiguration</i> message as specified in TS 36.331 [10]. In this version of the specification, the E-UTRA RRC message can only include the field <i>scg-Configuration</i> . In this version of the specification, this field is absent when master gNB uses full configuration option. This field is only used in NE-DC.                           |
| <b>twoPHRModeMCG</b>                                                                                                                                                                                                                                                                                                                                                                      |
| Indicates if the power headroom for MCG shall be reported as two PHRs (each PHR associated with a SRS resource set) is enabled or not.                                                                                                                                                                                                                                                    |
| <b>twoSRS-PUSCH-Repetition</b>                                                                                                                                                                                                                                                                                                                                                            |
| Indicates whether the indicated serving cell is configured for PUSCH repetition corresponding to two SRS resource sets configured in either <i>srs-ResourceSetToAddModList</i> or <i>srs-ResourceSetToAddModListDCI-0-2</i> with usage 'codebook' or 'noncodebook'.                                                                                                                       |

| This field indicates the position of a band combination in the <i>supportedBandCombinationList</i> . Band combination entries in <i>supportedBandCombinationList</i> are referred by an index which corresponds to the position of a band combination in the <i>supportedBandCombinationList</i> . Band combination entries in <i>supportedBandCombinationList-UplinkTxSwitch</i> are referred by an index which corresponds to the position of a band combination in the <i>supportedBandCombinationList-UplinkTxSwitch</i> increased by the number of entries in <i>supportedBandCombinationList</i> . |

| Defines a subset of the entries in a <i>FeatureSetCombination</i> . Each index identifies a position in the <i>FeatureSetCombination</i> , which corresponds to one <i>FeatureSetUplink/Downlink</i> for each band entry in the associated band combination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| In case of NR-DC, this field indicates the position of a band combination in the <i>supportedBandCombinationList</i> . In case of NE-DC, this field indicates the position of a band combination in the <i>supportedBandCombinationList</i> and/or <i>supportedBandCombinationListNEDC-Only</i> . In case of (NG)EN-DC, this field indicates the position of a band combination in the <i>supportedBandCombinationList</i> and/or <i>supportedBandCombinationList-UplinkTxSwitch</i> . Band combination entries in <i>supportedBandCombinationList</i> are referred by an index which corresponds to the position of a band combination in the <i>supportedBandCombinationList</i> . Band combination entries in <i>supportedBandCombinationListNEDC-Only</i> are referred by an index which corresponds to the position of a band combination in the <i>supportedBandCombinationListNEDC-Only</i> increased by the number of entries in <i>supportedBandCombinationList</i> . Band combination entries in <i>supportedBandCombinationList-UplinkTxSwitch</i> are referred by an index which corresponds to the position of a band combination in the <i>supportedBandCombinationList-UplinkTxSwitch</i> increased by the number of entries in <i>supportedBandCombinationList</i> . |

| <b>carrierFreq, ssbSubcarrierSpacing</b><br>Indicates the frequency and subcarrier spacing of the SS block of the cell for which this message is included, or of other SS blocks within the same carrier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>ssb-MeasurementTimingConfiguration</b><br>Indicates the SMTC which can be used to search for SSB of the cell for which the message is included. When the message is included in "Served NR Cell Information" (see TS 36.423 [37]), "Served Cell Information NR" (see TS 38.423 [35]), or "Served Cell Information" (see TS 38.473 [36]), the timing is based on the cell for which the message is included. When the message is included in "NR Neighbour Information" (see TS 36.423 [37]), or "Served Cell Information" (see TS 38.423 [35]), the timing is based on the cell indicated in the "Served NR Cell Information" or "Served Cell Information NR" with which the "NR Neighbour Information" or "Neighbour Information NR" is provided. When the message is included in "CU to DU RRC Information", the timing is based on the cell indicated by SpCell ID with which the message is included. If the field is provided by an NTN cell, the offset (derived from parameter <i>periodicityAndOffset</i> ) is based on the assumption that the NTN payload to gNB propagation delay of the cell for which the message is included equals to 0 ms. |
| <b>ss-RSSI-Measurement</b><br>Provides the configuration which can be used for RSSI measurements of the cell for which the message is included.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <i>MeasurementTimingConfiguration</i> field descriptions                                                                                                                                                                                                                              |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>campOnFirstSSB</i></b><br>Value <i>true</i> indicates that the SSB indicated in the first instance of <i>MeasTiming</i> in the <i>measTiming</i> list can be used for camping and for a PCell configuration (i.e. in <i>spCellConfigCommon</i> of the <i>masterCellGroup</i> ). |
| <b><i>csi-RS-CellMobility</i></b><br>Indicates the CSI-RS configuration of the cell for which this message is included. The timing of the CSI-RS resources is based on the SSB indicated by <i>refSSBFreq</i> .                                                                       |
| <b><i>csi-RS-SubcarrierSpacing</i></b><br>Indicates the subcarrier spacing of the CSI-RS resources included in <i>csi-rs-CellMobility</i> .                                                                                                                                           |
| <b><i>measTiming</i></b><br>A list of SMTC information, SSB RSSI measurement information and associated NR frequency exchanged via EN-DC X2 Setup, EN-DC Configuration Update, Xn Setup and NG-RAN Node Configuration Update procedures, or F1 messages between gNB DU and gNB CU.    |
| <b><i>physCellId</i></b><br>Physical Cell Identity of the SSB on the ARFCN indicated by <i>carrierFreq</i> .                                                                                                                                                                          |
| <b><i>psCellOnlyOnFirstSSB</i></b><br>Value <i>true</i> indicates that only the SSB indicated in the first instance of <i>MeasTiming</i> in the <i>measTiming</i> list can be used for a PSCell configuration (i.e. in <i>spCellConfigCommon</i> of the <i>secondaryCellGroup</i> ).  |
| <b><i>ssb-ToMeasure</i></b><br>The set of SS blocks to be measured within the SMTC measurement duration (see TS 38.215 [9]).                                                                                                                                                          |

## — *UERadioPagingInformation*

This message is used to transfer radio paging information, covering both upload to and download from the 5GC, and between gNBs.

Direction: gNB to/ from 5GC and gNB to/from gNB

11.2.3 Mandatory information in inter-node RRC messages

For the *AS-Config* transferred within the *HandoverPreparationInformation*:

- The source node shall include all fields necessary to reflect the current AS configuration of the UE, except for the fields *sourceSCG-NR-Config*, *sourceSCG-EUTRA-Config* and *sourceRB-SN-Config*, which can be omitted in case the source MN did not receive the latest configuration from the source SN. For *RRCReconfiguration* included in the field *rrcReconfiguration*, *ReconfigurationWithSync* is included with only the mandatory subfields (e.g. *newUE-Identity* and *t304*) and *ServingCellConfigCommon*;

- Need codes or conditions specified for subfields according to IEs defined in clause 6 do not apply. I.e. some fields shall be included regardless of the "Need" or "Cond" e.g. *discardTimer*;
- Based on the received AS configuration, the target node can indicate the delta (difference) to the current AS configuration (as included in *HandoverCommand*) to the UE. The fields *newUE-Identity* and *t304* included in *ReconfigurationWithSync* are not used for delta configuration purpose.

The *candidateCellInfoListSN(-EUTRA)* in *CG-Config* and the *candidateCellInfoListMN(-EUTRA)/candidateCellInfoListSN(-EUTRA)* in *CG-ConfigInfo* need not be included in procedures that do not involve a change of node.

For fields *scg-CellGroupConfig*, *scg-CellGroupConfigEUTRA* and *scg-RB-Config* in *CG-Config* (sent upon SN initiated SN change or other conditions as specified in field descriptions) and fields *mcg-RB-Config*, *scg-RB-Config* and *sourceConfigSCG* in *CG-ConfigInfo* (sent upon change of SN):

- The source node shall include all fields necessary to reflect the current AS configuration of the UE, unless stated otherwise in the field description. For *RRCReconfiguration* included in the field *scg-CellGroupConfig* in *CG-Config*, *ReconfigurationWithSync* is included with only the mandatory subfields (e.g. *newUE-Identity* and *t304*) and *ServingCellConfigCommon*;
- Need codes or conditions specified for subfields according to IEs defined in clause 6 do not apply;
- Based on the received AS configuration, the target node can indicate the delta (difference) as compared to the current AS configuration to the UE. The fields *newUE-Identity* and *t304* in *ReconfigurationWithSync* are always included by the target node, i.e. they are not used for delta configuration purpose to UE.

For fields in *CG-Config* and *CG-ConfigInfo* listed below, absence of the field means that the receiver maintains the values informed via the previous message. Note that every time there is a change in the configuration covered by a listed field, the MN or SN shall include the field and it shall provide the full configuration provided by that field unless stated otherwise. Otherwise, if there is no change, the field can be omitted:

- *configRestrictInfo*;
- *gapPurpose*;
- *measGapConfig* (for which delta signaling applies);
- *measGapConfigFR2* (for which delta signaling applies);
- *measResultCellListSFTD*;
- *measResultSFTD-EUTRA*;
- *sftdFrequencyList-EUTRA*;
- *sftdFrequencyList-NR*;
- *ue-CapabilityInfo*;
- *servFrequenciesMN-NR*.

For other fields in *CG-Config* and *CG-ConfigInfo*, the sender shall always signal the appropriate value even if same as indicated in the previous inter-node message, unless explicitly stated otherwise.

## 11.3 Inter-node RRC information element definitions

### – ResourceConfigNRDC

The IE is used to indicate or request the maximum values that can be used by the SCG in NR-DC, with each value equal to or lower than the value of the corresponding field in the UE capability, as reported by the UE, unless specified otherwise.

#### ResourceConfigNRDC information element

```

```

## 12 Processing delay requirements for RRC procedures

The UE performance requirements for RRC procedures are specified in the following tables. The performance requirement is expressed as the time in [ms] from the end of reception of the network -> UE message on the UE physical layer up to when the UE shall be ready for the reception of uplink grant for the UE -> network response message with no access delay other than the TTI-alignment (e.g. excluding delays caused by scheduling, the random access procedure or physical layer synchronisation). In case the RRC procedure triggers BWP switching, the RRC procedure delay is the value defined in the following table plus the BWP switching delay defined in TS 38.133 [14], clause 8.6.3.

Figure 12.1-1: Illustration of RRC procedure delay

**Table 12.1-1: UE performance requirements for RRC procedures for UEs**

| Procedure title:                                                                             | Network -> UE                      | UE -> Network                     | Value [ms]     | Notes                          |

|-----------------------------------------------------|----------------------------------|-------------------------------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RRC resume                                          | <i>RRCResume</i>                 | <i>RRCResumeComplete</i>                        | 6 or 10        | Value=6 applies for a UE supporting reduced CP latency for the case of RRCResume message only including MAC and PHY configuration, reestablishPDCP and reestablishRLC for SRB2, multicast MRB(s) and DRB(s), and no DRX, SPS, configured grant, CA or MIMO re-configuration will be triggered by this message. Further, the UL grant for transmission of <i>RRCResumeComplete</i> and the data is transmitted over common search space with DCI format 0_0. In this scenario, the RRC procedure delay [ms] can extend beyond the reception of the UL grant, up to 7 ms.<br><br>For other cases, Value = 10 applies. |

# Annex A (informative): Guidelines, mainly on use of ASN.1

## A.1 Introduction

The following clauses contain guidelines for the specification of RRC protocol data units (PDUs) with ASN.1.

---

## A.2 Procedural specification

### A.2.1 General principles

The procedural specification provides an overall high level description regarding the UE behaviour in a particular scenario.

It should be noted that most of the UE behaviour associated with the reception of a particular field is covered by the applicable parts of the PDU specification. The procedural specification may also include specific details of the UE behaviour upon reception of a field, but typically this should be done only for cases that are not easy to capture in the PDU clause e.g. general actions, more complicated actions depending on the value of multiple fields.

Likewise, the procedural specification need not specify the UE requirements regarding the setting of fields within the messages that are sent to the network i.e. this may also be covered by the PDU specification.

### A.2.2 More detailed aspects

The following more detailed conventions should be used:

- Bullets:
  - Capitals should be used in the same manner as in other parts of the procedural text i.e. in most cases no capital applies since the bullets are part of the sentence starting with 'The UE shall:'
  - All bullets, including the last one in a clause, should end with a semi-colon i.e. an ';'.
- Conditions:
  - Whenever multiple conditions apply, a semi-colon should be used at the end of each conditions with the exception of the last one, i.e. as in 'if cond1, or cond2'.

## A.3 PDU specification

### A.3.1 General principles

#### A.3.1.1 ASN.1 clauses

The RRC PDU contents are formally and completely described using abstract syntax notation (ASN.1), see X.680 [6], X.681 [7].

The complete ASN.1 code is divided into a number of ASN.1 clauses in the specifications. In order to facilitate the extraction of the complete ASN.1 code from the specification, each ASN.1 clause begins with the following:

- a first text paragraph consisting entirely of an *ASN.1 start tag*, which consists of a double hyphen followed by a single space and the text string "ASN1START" (in all upper case letters);
- a second text paragraph consisting entirely of a *block start tag* is included, which consists of a double hyphen followed by a single space and the text string "TAG-NAME-START" (in all upper case letters), where the "NAME" refers to the main name of the paragraph (in all upper-case letters).

Similarly, each ASN.1 clause ends with the following:

- a first text paragraph consisting entirely of a *blockstop tag*, which consists of a double hyphen followed by a single space and the text string "TAG-NAME-STOP" (in all upper-case letters), where the "NAME" refers to the main name of the paragraph (in all upper-case letters);
- a second text paragraph consisting entirely of an *ASN.1 stop tag*, which consists of a double hyphen followed by a singlespace and the text "ASN1STOP" (in all upper case letters).

This results in the following tags:

```
-- ASN1START
-- TAG-NAME-START

-- TAG-NAME-STOP
-- ASN1STOP
```

The text paragraphs containing either of the start and stop tags should not contain any ASN.1 code significant for the complete description of the RRC PDU contents. The complete ASN.1 code may be extracted by copying all the text paragraphs between an ASN.1 start tag and the following ASN.1 stop tag in the order they appear, throughout the specification.

NOTE: A typical procedure for extraction of the complete ASN.1 code consists of a first step where the entire RRC PDU contents description (ultimately the entire specification) is saved into a plain text (ASCII) file format, followed by a second step where the actual extraction takes place, based on the occurrence of the ASN.1 start and stop tags.

### A.3.1.2 ASN.1 identifier naming conventions

The naming of identifiers (i.e., the ASN.1 field and type identifiers) should be based on the following guidelines:

- Message (PDU) identifiers should be ordinary mixed case without hyphenation. These identifiers, *e.g.*, the *RRCCConnectionModificationCommand*, should be used for reference in the procedure text. Abbreviations should be avoided in these identifiers and abbreviated forms of these identifiers should not be used.
- Type identifiers other than PDU identifiers should be ordinary mixed case, with hyphenation used to set off acronyms only where an adjacent letter is a capital, *e.g.*, *EstablishmentCause*, *SelectedPLMN* (not *Selected-PLMN*, since the "d" in "Selected" is lowercase), *InitialUE-Identity* and *MeasSFN-SFN-TimeDifference*.
- Field identifiers shall start with a lowercase letter and use mixed case thereafter, *e.g.*, *establishmentCause*. If a field identifier begins with an acronym (which would normally be in upper case), the entire acronym is lowercase (*plmn-Identity*, not *pLMN-Identity*). The acronym is set off with a hyphen (*ue-Identity*, not *ueIdentity*), in order to facilitate a consistent search pattern with corresponding type identifiers.
- Identifiers should convey the meaning of the identifier and should avoid adding unnecessary postfixes (e.g. abstractions like 'Info') for the name.
- Identifiers that are likely to be keywords of some language, especially widely used languages, such as C++ or Java, should be avoided to the extent possible.
- Identifiers, other than PDU identifiers, longer than 25 characters should be avoided where possible. It is recommended to use abbreviations, which should be done in a consistent manner i.e. use 'Meas' instead of 'Measurement' for all occurrences. Examples of typical abbreviations are given in table A.3.1.2.1-1 below.
- *For future extension:* When an extension is introduced a suffix is added to the identifier of the concerned ASN.1 field and/or type. A suffix of the form "-rX" is used, with X indicating the release, for ASN.1 fields or types introduced in a later release (i.e. a release later than the original/first release of the protocol) as well as for ASN.1 fields or types for which a revision is introduced in a later release replacing a previous version, *e.g.*, *Foo-r9* for the Rel-9 version of the ASN.1 type *Foo*. A suffix of the form "-rXb" is used for the first revision of a field that it appears in the same release (X) as the original version of the field, "-rXc" for a second intra-release revision and so on. A suffix of the form "-vXYZ" is used for ASN.1 fields or types that only are an extension of a corresponding earlier field or type (see clause A.4), *e.g.*, *AnElement-v10b0* for the extension of the ASN.1 type *AnElement* introduced in version 10.11.0 of the specification. A number 0...9, 10, 11, *etc.* is used to represent the first part of the version number, indicating the release of the protocol. Lower case letters *a*, *b*, *c*, *etc.* are used to represent the second (and third) part of the version number if they are greater than 9. In the procedural specification, in field descriptions as well as in headings suffices are not used, unless there is a clear need to distinguish the extension from the original field.
- More generally, in case there is a need to distinguish different variants of an ASN.1 field or IE, a suffix should be added at the end of the identifiers *e.g.* *MeasObjectUTRA*, *ConfigCommon*. When there is no particular need to distinguish the fields (*e.g.* because the field is included in different IEs), a common field identifier name may be used. This may be attractive *e.g.* in case the procedural specification is the same for the different variants.
- It should be avoided to use field identifiers with the same name within the elements of a CHOICE, including using a CHOICE inside a SEQUENCE (to avoid certain compiler errors).

**Table A.3.1.2-1: Examples of typical abbreviations used in ASN.1 identifiers**

| Abbreviation | Abbreviated word       |
|--------------|------------------------|
| Config       | Configuration          |
| DL           | Downlink               |
| Ext          | Extension              |
| Freq         | Frequency              |
| Id           | Identity               |
| Ind          | Indication             |
| Meas         | Measurement            |
| MIB          | MasterInformationBlock |
| Neigh        | Neighbour(ing)         |
| Param(s)     | Parameter(s)           |
| Phys         | Physical               |
| PCI          | Physical Cell Id       |
| Proc         | Process                |
| Reconfig     | Reconfiguration        |
| Reest        | Re-establishment       |
| Req          | Request                |
| Rx           | Reception              |
| Sched        | Scheduling             |
| SIB          | SystemInformationBlock |
| Sync         | Synchronisation        |
| Thr          | Threshold              |
| Tx           | Transmission           |
| UL           | Uplink                 |

NOTE: The table A.3.1.2.1-1 is not exhaustive. Additional abbreviations may be used in ASN.1 identifiers when needed.

### A.3.1.3 Text references using ASN.1 identifiers

A text reference into the RRC PDU contents description from other parts of the specification is made using the ASN.1 field identifier of the referenced type. The ASN.1 field and type identifiers used in text references should be in the *italic font style*. The "do not check spelling and grammar" attribute in Word should be set. Quotation marks (i.e., "") should not be used around the ASN.1 field or type identifier.

A reference to an RRC PDU should be made using the corresponding ASN.1 field identifier followed by the word "message", e.g., a reference to the *RRCRelease* message.

A reference to a specific part of an RRC PDU, or to a specific part of any other ASN.1 type, should be made using the corresponding ASN.1 field identifier followed by the word "field", e.g., a reference to the *prioritisedBitRate* field in the example below.

-- /example/ ASN1START

```
LogicalChannelConfig ::=
    ul-SpecificParameters
        priority
SEQUENCE {
    SEQUENCE {
        Priority,
```

```

        prioritisedBitRate
        bucketSizeDuration
        logicalChannelGroup
    }
    OPTIONAL
}
-- ASN1STOP

```

NOTE: All the ASN.1 start tags in the ASN.1 clauses, used as examples in this annex to the specification, are deliberately distorted, in order not to include them when the ASN.1 description of the RRC PDU contents is extracted from the specification.

A reference to a specific type of information element should be made using the corresponding ASN.1 type identifier preceded by the acronym "IE", e.g., a reference to the IE *LogicalChannelConfig* in the example above.

References to a specific type of information element should only be used when those are generic, i.e., without regard to the particular context wherein the specific type of information element is used. If the reference is related to a particular context, e.g., an RRC PDU type (message) wherein the information element is used, the corresponding field identifier in that context should be used in the text reference.

A reference to a specific value of an ASN.1 field should be made using the corresponding ASN.1 value without using quotation marks around the ASN.1 value, e.g., 'if the *status* field is set to value *true*'.

## A.3.2 High-level message structure

Within each logical channel type, the associated RRC PDU (message) types are alternatives within a CHOICE, as shown in the example below.

```

-- /example/ ASN1START

DL-DCCH-Message ::= SEQUENCE {
    message          DL-DCCH-MessageType
}

DL-DCCH-MessageType ::= CHOICE {
    c1               CHOICE {
        dlInformationTransfer
        handoverFromEUTRAPreparationRequest
        mobilityFromEUTRACommand
        rrcConnectionReconfiguration
        rrcConnectionRelease
        securityModeCommand
        ueCapabilityEnquiry
        spare1 NULL
    },
    messageClassExtension SEQUENCE {}
}

-- ASN1STOP

```

A nested two-level CHOICE structure is used, where the alternative PDU types are alternatives within the inner level *c1* CHOICE.

Spare alternatives (i.e., *spare1* in this case) may be included within the *c1* CHOICE to facilitate future extension. The number of such spare alternatives should not extend the total number of alternatives beyond an integer-power-of-two number of alternatives (i.e., eight in this case).

Further extension of the number of alternative PDU types is facilitated using the *messageClassExtension* alternative in the outer level CHOICE.

### A.3.3 Message definition

Each PDU (message) type is specified in an ASN.1 clause similar to the one shown in the example below.

```
-- /example/ ASN1START

RRConnectionReconfiguration ::= SEQUENCE {
    rrc-TransactionIdentifier      RRC-TransactionIdentifier,
    criticalExtensions             CHOICE {
        c1                       CHOICE {
            rrcConnectionReconfiguration-r8      RRCConnectionReconfiguration-r8-IEs,
            spare3 NULL, spare2 NULL, spare1 NULL
        },
        criticalExtensionsFuture      SEQUENCE {}
    }
}

RRConnectionReconfiguration-r8-IEs ::= SEQUENCE {
    -- Enter the IEs here.
    ...
}

-- ASN1STOP
```

Hooks for *critical* and *non-critical* extension should normally be included in the PDU type specification. How these hooks are used is further described in clause A.4.

Critical extensions are characterised by a redefinition of the PDU contents and need to be governed by a mechanism for protocol version agreement between the encoder and the decoder of the PDU, such that the encoder is prevented from sending a critically extended version of the PDU type, which is not comprehended by the decoder.

Critical extension of a PDU type is facilitated by a two-level CHOICE structure, where the alternative PDU contents are alternatives within the inner level *c1* CHOICE. Spare alternatives (i.e., *spare3* down to *spare1* in this case) may be included within the *c1* CHOICE. The number of spare alternatives to be included in the original PDU specification should be decided case by case, based on the expected rate of critical extension in the future releases of the protocol.

Further critical extension, when the spare alternatives from the original specifications are used up, is facilitated using the *criticalExtensionsFuture* in the outer level CHOICE.

In PDU types where critical extension is not expected in the future releases of the protocol, the inner level *c1* CHOICE and the spare alternatives may be excluded, as shown in the example below.

```
-- /example/ ASN1START
```

```

RRCConnectionReconfigurationComplete ::= SEQUENCE {
    rrc-TransactionIdentifier      RRC-TransactionIdentifier,
    criticalExtensions              CHOICE {
        rrcConnectionReconfigurationComplete-r8
        RRCConnectionReconfigurationComplete-r8-IEs,
        criticalExtensionsFuture    SEQUENCE {}
    }
}

RRCConnectionReconfigurationComplete-r8-IEs ::= SEQUENCE {
    -- Enter the fields here.
    ...
}

-- ASN1STOP

```

Non-critical extensions are characterised by the addition of new information to the original specification of the PDU type. If not comprehended, a non-critical extension may be skipped by the decoder, whilst the decoder is still able to complete the decoding of the comprehended parts of the PDU contents.

Non-critical extensions at locations other than the end of the message or other than at the end of a field contained in a BIT or OCTET STRING are facilitated by use of the ASN.1 extension marker "...". The original specification of a PDU type should normally include the extension marker at the end of the sequence of information elements contained.

Non-critical extensions at the end of the message or at the end of a field that is contained in a BIT or OCTET STRING may be facilitated by use of an empty sequence that is marked OPTIONAL e.g. as shown in the following example:

```

-- /example/ ASN1START

RRCMessage-r8-IEs ::=
    field1
    field2
    nonCriticalExtension
}

SEQUENCE {
    InformationElement1,
    InformationElement2,
    SEQUENCE {} OPTIONAL
}

-- ASN1STOP

```

The ASN.1 clause specifying the contents of a PDU type may be followed by a *field description* table where a further description of, e.g., the semantic properties of the fields may be included. The general format of this table is shown in the example below. The field description table is absent in case there are no fields for which further description needs to be provided e.g. because the PDU does not include any fields, or because an IE is defined for each field while there is nothing specific regarding the use of this IE that needs to be specified.

| %PDU-TypeIdentifier% field descriptions |                    |
|-----------------------------------------|--------------------|
| %field identifier%                      | Field description. |
| %field identifier%                      | Field description. |

The field description table has one column. The header row shall contain the ASN.1 type identifier of the PDU type.

The following rows are used to provide field descriptions. Each row shall include a first paragraph with a *field identifier* (in ***bold and italic*** font style) referring to the part of the PDU to which it applies. The following paragraphs at the same row may include (in regular font style), e.g., semantic description, references to other specifications and/or specification of value units, which are relevant for the particular part of the PDU.

The parts of the PDU contents that do not require a field description shall be omitted from the field description table.

## A.3.4 Information elements

Each IE (information element) type is specified in an ASN.1 clause similar to the one shown in the example below.

```
-- /example/ ASN1START

PRACH-ConfigSIB ::=
    rootSequenceIndex
    prach-ConfigInfo
}

PRACH-Config ::=
    rootSequenceIndex
    prach-ConfigInfo
}

PRACH-ConfigInfo ::=
    prach-ConfigIndex
    highSpeedFlag
    zeroCorrelationZoneConfig
}

-- ASN1STOP
```

IEs should be introduced whenever there are multiple fields for which the same set of values apply. IEs may also be defined for other reasons e.g. to break down a ASN.1 definition in to smaller pieces.

A group of closely related IE type definitions, like the IEs *PRACH-ConfigSIB* and *PRACH-Config* in this example, are preferably placed together in a common ASN.1 clause. The IE type identifiers should in this case have a common base, defined as the *generic type identifier*. It may be complemented by a suffix to distinguish the different variants. The "*PRACH-Config*" is the generic type identifier in this example, and the "*SIB*" suffix is added to distinguish the variant. The clause heading and generic references to a group of closely related IEs defined in this way should use the generic type identifier.

The same principle should apply if a new version, or an extension version, of an existing IE is created for *critical* or *non-critical* extension of the protocol (see clause A.4). The new version, or the extension version, of the IE is included in the same ASN.1 clause defining the original. A suffix is added to the type identifier, using the naming conventions defined in clause A.3.1.2, indicating the release or version of the where the new version, or extension version, was introduced.

Local IE type definitions, like the IE *PRACH-ConfigInfo* in the example above, may be included in the ASN.1 clause and be referenced in the other IE types defined in the same ASN.1 clause. The use of locally defined IE types should be encouraged, as a tool to break up large and complex IE type definitions. It can improve the readability of the code.

There may also be a benefit for the software implementation of the protocol end-points, as these IE types are typically provided by the ASN.1 compiler as independent data elements, to be used in the software implementation.

An IE type defined in a local context, like the IE *PRACH-ConfigInfo*, should not be referenced directly from other ASN.1 clauses in the RRC specification. An IE type which is referenced in more than one ASN.1 clause should be defined in a separate clause, with a separate heading and a separate ASN.1 clause (possibly as one in a set of closely related IE types, like the IEs *PRACH-ConfigSIB* and *PRACH-Config* in the example above). Such IE types are also referred to as 'global IEs'.

NOTE: Referring to an IE type, that is defined as a local IE type in the context of another ASN.1 clause, does not generate an ASN.1 compilation error. Nevertheless, using a locally defined IE type in that way makes the IE type definition difficult to find, as it would not be visible at an outline level of the specification. It should be avoided.

The ASN.1 clause specifying the contents of one or more IE types, like in the example above, may be followed by a *field description* table, where a further description of, e.g., the semantic properties of the fields of the information elements may be included. This table may be absent, similar as indicated in clause A.3.3 for the specification of the PDU type. The general format of the *field description* table is the same as shown in clause A.3.3 for the specification of the PDU type.

## A.3.5 Fields with optional presence

A field with optional presence may be declared with the keyword **DEFAULT**. It identifies a default value to be assumed, if the sender does not include a value for that field in the encoding:

```
-- /example/ ASN1START
PreambleInfo ::=
    numberOfRA-Preambles      SEQUENCE {
        ...                   INTEGER (1..64)
    }                          DEFAULT 1,
-- ASN1STOP
```

Alternatively, a field with optional presence may be declared with the keyword **OPTIONAL**. It identifies a field for which a value can be omitted. The omission carries semantics, which is different from any normal value of the field:

```
-- /example/ ASN1START
PRACH-Config ::=
    rootSequenceIndex         SEQUENCE {
        prach-ConfigInfo      INTEGER (0..1023),
    }                          PRACH-ConfigInfo OPTIONAL -- Need N
-- ASN1STOP
```

The semantics of an optionally present field, in the case it is omitted, should be indicated at the end of the paragraph including the keyword **OPTIONAL**, using a short comment text with a need code. The need code includes the keyword "Need", followed by one of the predefined semantics tags (S, M, N or R) defined in clause 6.1. If the semantics tag S is used, the semantics of the absent field are further specified either in the field description table following the ASN.1 clause, or in procedure text.

The addition of OPTIONAL keywords for capability groups is based on the following guideline. If there is more than one field in the lower level IE, then OPTIONAL keyword is added at the group level. If there is only one field in the lower level IE, OPTIONAL keyword is not added at the group level.

### A.3.6 Fields with conditional presence

A field with conditional presence is declared with the keyword OPTIONAL. In addition, a short comment text shall be included at the end of the paragraph including the keyword OPTIONAL. The comment text includes the keyword "Cond", followed by a condition tag associated with the field ("UL" in this example):

```
-- /example/ ASN1START
LogicalChannelConfig ::=
    ul-SpecificParameters
        priority
        ...
    } OPTIONAL
}
-- Cond UL
-- ASN1STOP
```

When conditionally present fields are included in an ASN.1 clause, the field description table after the ASN.1 clause shall be followed by a *conditional presence* table. The conditional presence table specifies the conditions for including the fields with conditional presence in the particular ASN.1 clause.

| Conditional presence | Explanation                                                                                                                                                                              |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UL                   | Specification of the conditions for including the field associated with the condition tag = "UL". Semantics in case of optional presence under certain conditions may also be specified. |

The conditional presence table has two columns. The first column (heading: "Conditional presence") contains the condition tag (in *italic* font style), which links the fields with a condition tag in the ASN.1 clause to an entry in the table. The second column (heading: "Explanation") contains a text specification of the conditions and requirements for the presence of the field. The second column may also include semantics, in case of an optional presence of the field, under certain conditions i.e. using the same predefined tags as defined for optional fields in A.3.5.

Conditional presence should primarily be used when presence of a field depends on the presence and/or value of other fields within the same message. If the presence of a field depends on whether another feature/function has been configured, while this function can be configured independently e.g. by another message and/or at another point in time, the relation is best reflected by means of a statement in the field description table.

If the ASN.1 clause does not include any fields with conditional presence, the conditional presence table shall not be included.

Whenever a field is only applicable in specific cases e.g. TDD, use of conditional presence should be considered.

### A.3.7 Guidelines on use of lists with elements of SEQUENCE type

Where an information element has the form of a list (the SEQUENCE OF construct in ASN.1) with the type of the list elements being a SEQUENCE data type, an information element shall be defined for the list elements even if it would not otherwise be needed.

For example, a list of PLMN identities with reservation flags is defined as in the following example:

```
-- /example/ ASN1START

PLMN-IdentityInfoList ::=          SEQUENCE (SIZE (1..6)) OF PLMN-IdentityInfo

PLMN-IdentityInfo ::=             SEQUENCE {
    plmn-Identity                PLMN-Identity,
    cellReservedForOperatorUse    ENUMERATED {reserved, notReserved}
}

-- ASN1STOP
```

rather than as in the following (bad) example, which may cause generated code to contain types with unpredictable names:

```
-- /bad example/ ASN1START

PLMN-IdentityList ::=             SEQUENCE (SIZE (1..6)) OF SEQUENCE {
    plmn-Identity                PLMN-Identity,
    cellReservedForOperatorUse    ENUMERATED {reserved, notReserved}
}

-- ASN1STOP
```

### A.3.8 Guidelines on use of parameterised SetupRelease type

The usage of the parameterised *SetupRelease* type is like a function call in programming languages where the element type parameter is passed as a parameter. The parameterised type only implies a textual change in abstract syntax where all references to the parameterised type are replaced by the compiler with the release/setup choice. Two examples of the usage are shown below:

```
-- /example/ ASN1START

RRCMessage-rX-IEs ::= SEQUENCE {
    field-rX          SetupRelease { IE-rX }          OPTIONAL,      -- Need M
    ...
}

RRCMessage-rX-IEs ::= SEQUENCE {
    field-rX          SetupRelease { Element-rX }      OPTIONAL,      -- Need M
}

Element-rX ::= SEQUENCE {
    field1-rX          IE1-rX,
    field2-rX          IE2-rX
}                                OPTIONAL      -- Need N
                                OPTIONAL,      -- Need M

-- /example/ ASN1STOP
```

The *SetupRelease* is always be used with only named IEs, i.e. the example below is not allowed:

```
-- /example/ ASN1START
RRCMesage-rX-IEs ::= SEQUENCE {
    field-rX      SetupRelease { SEQUENCE { -- Unnamed SEQUENCES are not allowed!
        field1-rX  IE1-rX,
        field2-rX  IE2-rX
    }
    OPTIONAL      -- Need N
}
OPTIONAL,      -- Need M
-- /example/ ASN1STOP
```

If a field defined using the parameterized *SetupRelease* type requires procedural text, the field is referred to using the values defined for the type itself, namely, "setup" and "release". For example, procedural text for *field-rX* above could be as follows:

- 1> if *field-rX* is set to "setup":
  - 2> do something;
- 1> else (*field-rX* is set to "release"):
  - 2> release *field-rX* (if appropriate).

### A.3.9 Guidelines on use of *ToAddModList* and *ToReleaseList*

In order to benefit from delta signalling when modifying lists with many and/or large elements, so-called add/mod- and release- lists should be used. Instead of a single list containing all elements of the list, the ASN.1 provides two lists. One list is used to convey the actual elements that are to be added to the list or modified in the list. The second list conveys only the identities (IDs) of the list elements that are to be released from the list. In other words, the ASN.1 defines only means to signal modifications to a list maintained in the receiver (typically the UE). An example is provided below:

```
-- /example/ ASN1START
AnExampleIE ::= SEQUENCE {
    elementsToAddModList SEQUENCE (SIZE (1..maxNrofElements)) OF Element OPTIONAL, -- Need N
    elementsToReleaseList SEQUENCE (SIZE (1..maxNrofElements)) OF ElementId OPTIONAL, -- Need N
    ...
}

Element ::= SEQUENCE {
    elementId ElementId,
    aField INTEGER (0..16777215),
    anotherField OCTET STRING,
    ...
}
```

```

ElementId ::=          INTEGER (0..maxNrofElements-1)
maxNrofElements        INTEGER ::= 50
maxNrofElements-1      INTEGER ::= 49
-- /example/ ASN1STOP

```

As can be seen, the elements of the list must contain an identity (INTEGER) that identifies the elements unambiguously upon addition, modification and removal. It is recommended to define an IE for that identifier (here *ElementId*) so that it can be used both for a field inside the element as well as in the *elementsToReleaseList*.

Both lists should be made OPTIONAL and flagged as "Need N". The need code reflects that the UE does not maintain the received lists as such but rather updates its configuration using the information therein. In other words, it is not possible to provide via delta signalling an update to a previously signalled *elementsToAddModList* or *elementsToReleaseList* (which Need M would imply). The update is always in relation to the UE's internal configuration.

Note that the release of a field (a list element as well as any other field) releases all its sub-fields (sub-fields configured by *elementsToAddModList* and any other sub-field).

If no procedural text is provided for a set of *ToAddModList* and *ToReleaseList*, the following generic procedure applies:

The UE shall:

- 1> for each *ElementId* in the *elementsToReleaseList*,:
  - 2> if the current UE configuration includes an *Element* with the given *ElementId*:
    - 3> release the *Element* from the current UE configuration;
- 1> for each *Element* in the *elementsToAddModList*:
  - 2> if the current UE configuration includes an *Element* with the given *ElementId*:
    - 3> modify the configured *Element* in accordance with the received *Element*;
  - 2> else:
    - 3> add received *Element* to the UE configuration.

### A.3.10 Guidelines on use of lists (without *ToAddModList* and *ToReleaseList*)

As per clause 6.1.3, when using lists without the *ToAddModList* and *ToReleaseList* structure, the contents of the lists are always replaced. To illustrate this, an example is provided below:

```

-- /example/ ASN1START
-- TAG_EXAMPLE_LISTS_START
AnExampleIE ::=          SEQUENCE {

```

```

    elementList          SEQUENCE (SIZE (1..maxNrofElements)) OF Element          OPTIONAL, -- Need M
    ...,
    [[
    elementListExt-v2030 SEQUENCE (SIZE (1..maxNrofElementsExt)) OF Element        OPTIONAL, -- Need M
    ]]
}

Element ::= SEQUENCE {
    useFeatureX          BOOLEAN,
    aField               INTEGER (0..127)
    anotherField         INTEGER (0..127)
    ...
}

maxNrofElements        INTEGER ::= 8
maxNrofElements-1     INTEGER ::= 7
maxNrofElementsExt     INTEGER ::= 8
maxNrofElementsExt-1  INTEGER ::= 7

-- TAG_EXAMPLE_LISTS_STOP
-- /example/ ASN1STOP

```

As can be seen, the *elementList* list itself uses Need M, but each list entry *Element* contains mandatory, Need M and Need R fields. If the list is first signalled to UE with 3 entries, and subsequently again with 2 entries, UE shall retain only the latter list, i.e. the list with 2 elements will completely replace the list with 3 elements. That also means that the field *aField* will be treated as if it was newly created, i.e. network must include it if it wishes UE to utilize the field even if it was previously signalled. This also implies that the Need M field (*aField*) will be treated in the same way as the Need R field (*anotherField*), i.e. delta signalling is not applied and the network has to signal the field to ensure UE does not release the value (which is why Need M should not normally be used in the entries of these lists).

## A.4 Extension of the PDU specifications

### A.4.1 General principles to ensure compatibility

It is essential that extension of the protocol does not affect interoperability i.e. it is essential that implementations based on different versions of the RRC protocol are able to interoperate. In particular, this requirement applies for the following kind of protocol extensions:

- Introduction of new PDU types (i.e. these should not cause unexpected behaviour or damage).
- Introduction of additional fields in an extensible PDUs (i.e. it should be possible to ignore uncomprehended extensions without affecting the handling of the other parts of the message).
- Introduction of additional values of an extensible field of PDUs. If used, the behaviour upon reception of an uncomprehended value should be defined.

It should be noted that the PDU extension mechanism may depend on the logical channel used to transfer the message e.g. for some PDUs an implementation may be aware of the protocol version of the peer in which case selective ignoring of extensions may not be required.

The non-critical extension mechanism is the primary mechanism for introducing protocol extensions i.e. the critical extension mechanism is used merely when there is a need to introduce a 'clean' message version. Such a need appears when the last message version includes a large number of non-critical extensions, which results in issues like readability, overhead associated with the extension markers. The critical extension mechanism may also be considered when it is complicated to accommodate the extensions by means of non-critical extension mechanisms.

## A.4.2 Critical extension of messages and fields

The mechanisms to critically extend a message are defined in A.3.3. There are both "outer branch" and "inner branch" mechanisms available. The "outer branch" consists of a CHOICE having the name *criticalExtensions*, with two values, *c1* and *criticalExtensionsFuture*. The *criticalExtensionsFuture* branch consists of an empty SEQUENCE, while the *c1* branch contains the "inner branch" mechanism.

The "inner branch" structure is a CHOICE with values of the form "*MessageName-rX-IEs*" (e.g., "*RRCConnectionReconfiguration-r8-IEs*") or "*spareX*", with the spare values having type NULL. The "-rX-IEs" structures contain the *complete* structure of the message IEs for the appropriate release; i.e., the critical extension branch for the Rel-10 version of a message includes all Rel-8 and Rel-9 fields (that are not obviated in the later version), rather than containing only the additional Rel-10 fields.

The following guidelines may be used when deciding which mechanism to introduce for a particular message, i.e. only an 'outer branch', or an 'outer branch' in combination with an 'inner branch' including a certain number of spares:

- For certain messages, e.g. initial uplink messages, messages transmitted on a broadcast channel, critical extension may not be applicable.
- An outer branch may be sufficient for messages not including any fields.
- The number of spares within inner branch should reflect the likelihood that the message will be critically extended in future releases (since each release with a critical extension for the message consumes one of the spare values). The estimation of the critical extension likelihood may be based on the number, size and changeability of the fields included in the message.
- In messages where an inner branch extension mechanism is available, all spare values of the inner branch should be used before any critical extensions are added using the outer branch.

The following example illustrates the use of the critical extension mechanism by showing the ASN.1 of the original and of a later release

```
-- /example/ ASN1START                -- Original release
RRCMessage ::=
  rrc-TransactionIdentifier
  criticalExtensions
    c1
      rrcMessage-r8
      spare3 NULL, spare2 NULL, spare1 NULL
    },
  criticalExtensionsFuture
}
-- ASN1STOP
```

```

-- /example/ ASN1START
-- Later release

RRCMessage ::=
  rrc-TransactionIdentifier
  criticalExtensions
    c1
      rrcMessage-r8
      rrcMessage-r10
      rrcMessage-r11
      rrcMessage-r14
    },
    later
    c2
      rrcMessage-r16
      spare7 NULL, spare6 NULL, spare5 NULL, spare4 NULL,
      spare3 NULL, spare2 NULL, spare1 NULL
    },
    criticalExtensionsFuture
  }
}

-- ASN1STOP

```

It is important to note that critical extensions may also be used at the level of individual fields i.e. a field may be replaced by a critically extended version. When sending the extended version, the original version may also be included (e.g. original field is mandatory, E-UTRAN is unaware if UE supports the extended version). In such cases, a UE supporting both versions may be required to ignore the original field. The following example illustrates the use of the critical extension mechanism by showing the ASN.1 of the original and of a later release.

```

-- /example/ ASN1START
-- Original release

RRCMessage ::=
  rrc-TransactionIdentifier
  criticalExtensions
    c1
      rrcMessage-r8
      spare3 NULL, spare2 NULL, spare1 NULL
    },
    criticalExtensionsFuture
  }
}

RRCMessage-rN-IEs ::= SEQUENCE {
  field1-rN
  field2-rN
  nonCriticalExtension
}

RRCConnectionReconfiguration-vMxy-IEs ::= SEQUENCE {
  field2-rM
  nonCriticalExtension
}

-- Original release

SEQUENCE {
  RRC-TransactionIdentifier,
  CHOICE {
    CHOICE{
      RRCMessage-r8-IEs,
      RRCMessage-r10-IEs,
      RRCMessage-r11-IEs,
      RRCMessage-r14-IEs
    }
    CHOICE {
      RRCMessage-r16-IEs,
      spare7 NULL, spare6 NULL, spare5 NULL, spare4 NULL,
      spare3 NULL, spare2 NULL, spare1 NULL
    }
  }
}

SEQUENCE {}

ENUMERATED {
  value1, value2, value3, value4
}
OPTIONAL, -- Need N
OPTIONAL, -- Need N
OPTIONAL

OPTIONAL, -- Cond NoField2rN
OPTIONAL

```

```
}
-- ASN1STOP
```

| Conditional presence | Explanation                                                                                    |
|----------------------|------------------------------------------------------------------------------------------------|
| NoField2rN           | The field is optionally present, need N, if field2-rN is absent. Otherwise the field is absent |

Finally, it is noted that a critical extension may be introduced in the same release as the one in which the original field was introduced e.g. to correct an essential ASN.1 error. In such cases a UE capability may be introduced, to assist the network in deciding whether or not to use the critical extension.

In the case of list fields (SEQUENCE OF types in ASN.1) using the ToAddMod/ToRelease construction, the use of critical extensions to increase the size of a list should be avoided; that is, replacing the original list field by a new field also used to signal entries previously covered by the original field (i.e. extensions done according to the following example) should be avoided:

```
-- /example/ ASN1START
ContainingStructure ::=
  listElementToAddModList
  ...
  [[
    listElementToAddModList-rN
  ]]
}-- ASN1STOP

-- Discouraged example
SEQUENCE {
  SEQUENCE (SIZE (1..maxNrofListElements)) OF ListElement OPTIONAL, -- Need N
  SEQUENCE (SIZE (1..maxNrofListElements-rN)) OF ListElement OPTIONAL -- Need N
```

Instead, a non-critical list extension mechanism should typically be used, such that the extension field only adds the new entries of the list. This approach is further described in clause A.4.3.6.

If the critical extension mechanism for a list is used, it should be clarified in the field description that the two versions of the list are not configured together, and that the network should release the contents of the original version when configuring the replacement version.

## A.4.3 Non-critical extension of messages

### A.4.3.1 General principles

The mechanisms to extend a message in a non-critical manner are defined in A.3.3. W.r.t. the use of extension markers, the following additional guidelines apply:

- When further non-critical extensions are added to a message that has been critically extended, the inclusion of these non-critical extensions in earlier critical branches of the message should be avoided when possible.
- The extension marker ("...") is the primary non-critical extension mechanism that is used but empty sequences may be used if length determinant is not required. Examples of cases where a length determinant is not required:
  - at the end of a message;

- at the end of a structure contained in a BIT STRING or OCTET STRING.
- When an extension marker is available, non-critical extensions are preferably placed at the location (e.g. the IE) where the concerned parameter belongs from a logical/functional perspective (referred to as the '*default extension location*').
- It is desirable to aggregate extensions of the same release or version of the specification into a group, which should be placed at the lowest possible level.
- In specific cases it may be preferable to place extensions elsewhere (referred to as the '*actual extension location*') e.g. when it is possible to aggregate several extensions in a group. In such a case, the group should be placed at the lowest suitable level in the message.
- In case placement at the default extension location affects earlier critical branches of the message, locating the extension at a following higher level in the message should be considered.
- In case an extension is not placed at the default extension location, an IE should be defined. The IE's ASN.1 definition should be placed in the same ASN.1 clause as the default extension location. In case there are intermediate levels in-between the actual and the default extension location, an IE may be defined for each level. Intermediate levels are primarily introduced for readability and overview. Hence intermediate levels need not always be introduced e.g. they may not be needed when the default and the actual extension location are within the same ASN.1 clause.

### A.4.3.2 Further guidelines

Further to the general principles defined in the previous clause, the following additional guidelines apply regarding the use of extension markers:

- Extension markers within SEQUENCE:
  - Extension markers are primarily, but not exclusively, introduced at the higher nesting levels.
  - Extension markers are introduced for a SEQUENCE comprising several fields as well as for information elements whose extension would result in complex structures without it (e.g. re-introducing another list).
  - Extension markers are introduced to make it possible to maintain important information structures e.g. parameters relevant for one particular RAT.
  - Extension markers are also used for size critical messages (i.e. messages on BCCH, BR-BCCH, PCCH and CCCH), although introduced somewhat more carefully.
  - The extension fields introduced (or frozen) in a specific version of the specification are grouped together using double brackets.
- Extension markers within ENUMERATED:
  - Spare values may be used until the number of values reaches the next power of 2, while the extension marker caters for extension beyond that limit, given that the use of spare values in a later Release is possible without any error cases.
  - A suffix of the form "vXYZ" is used for the identifier of each new value, e.g. "value-vXYZ".
- Extension markers within CHOICE:

- Extension markers are introduced when extension is foreseen and when comprehension is not required by the receiver i.e. behaviour is defined for the case where the receiver cannot comprehend the extended value (e.g. ignoring an optional CHOICE field). It should be noted that defining the behaviour of a receiver upon receiving a not comprehended choice value is not required if the sender is aware whether or not the receiver supports the extended value.
- A suffix of the form "vXYZ" is used for the identifier of each new choice value, e.g. "choice-vXYZ".

Non-critical extensions at the end of a message/ of a field contained in an OCTET or BIT STRING:

- When a nonCriticalExtension is actually used, a "Need" code should not be provided for the field, which always is a group including at least one extension and a field facilitating further possible extensions. For simplicity, it is recommended not to provide a "Need" code when the field is not actually used either.

Further, more general, guidelines:

- In case a need code is not provided for a group, a "Need" code is provided for all individual extension fields within the group i.e. including for fields that are not marked as OPTIONAL. The latter is to clarify the action upon absence of the whole group.

### A.4.3.3 Typical example of evolution of IE with local extensions

The following example illustrates the use of the extension marker for a number of elementary cases (sequence, enumerated, choice). The example also illustrates how the IE may be revised in case the critical extension mechanism is used.

**NOTE** In case there is a need to support further extensions of release n while the ASN.1 of release (n+1) has been frozen, without requiring the release n receiver to support decoding of release (n+1) extensions, more advanced mechanisms are needed e.g. including multiple extension markers.

```
-- /example/ ASN1START

InformationElement1 ::=
    field1
    field2
        field2a
        field2b
        ...,
        field2c-v960
    },
    ...,
    [[
        field3-r9
    ]],
    [[
        field3-v9a0
        field4-r9
    ]]
}

InformationElement1-r10 ::=
    field1
    SEQUENCE {
        ENUMERATED {
            value1, value2, value3, value4-v880,
            ..., value5-v960 },
        CHOICE {
            BOOLEAN,
            InformationElement2b,
            InformationElement2c-r9
        }
    }

    InformationElement3-r9 OPTIONAL -- Need R
    InformationElement3-v9a0 OPTIONAL -- Need R
    InformationElement4 OPTIONAL -- Need R

InformationElement1-r10 ::=
    field1
    SEQUENCE {
        ENUMERATED {
            value1, value2, value3, value4-v880,
```

```

        value5-v960, value6-v1170, spare2, spare1, ... },
    field2 CHOICE {
        field2a BOOLEAN,
        field2b InformationElement2b,
        field2c-v960 InformationElement2c-r9,
        ...,
        field2d-v12b0 INTEGER (0..63)
    },
    field3-r9 InformationElement3-r10 OPTIONAL, -- Need R
    field4-r9 InformationElement4 OPTIONAL, -- Need R
    field5-r10 BOOLEAN,
    field6-r10 InformationElement6-r10 OPTIONAL, -- Need R
    ...,
    [[
        field3-v1170 InformationElement3-v1170 OPTIONAL -- Need R
    ]]
}
-- ASN1STOP

```

Some remarks regarding the extensions of *InformationElement1* as shown in the above example:

- The *InformationElement1* is initially extended with a number of non-critical extensions. In release 10 however, a critical extension is introduced for the message using this IE. Consequently, a new version of the IE *InformationElement1* (i.e. *InformationElement1-r10*) is defined in which the earlier non-critical extensions are incorporated by means of a revision of the original field.
- The *value4-v880* is replacing a spare value defined in the original protocol version for *field1*. Likewise *value6-v1170* replaces *spare3* that was originally defined in the r10 version of *field1*.
- Within the critically extended release 10 version of *InformationElement1*, the names of the original fields/IEs are not changed, unless there is a real need to distinguish them from other fields/IEs. E.g. the *field1* and *InformationElement4* were defined in the original protocol version (release 8) and hence not tagged. Moreover, the *field3-r9* is introduced in release 9 and not re-tagged; although, the *InformationElement3* is also critically extended and therefore tagged *InformationElement3-r10* in the release 10 version of *InformationElement1*.

#### A.4.3.4 Typical examples of non critical extension at the end of a message

The following example illustrates the use of non-critical extensions at the end of the message or at the end of a field that is contained in a BIT or OCTET STRING i.e. when an empty sequence is used.

```

-- /example/ ASN1START
RRCMessage-r8-IEs ::= SEQUENCE {
    field1 InformationElement1,
    field2 InformationElement2,
    field3 InformationElement3 OPTIONAL, -- Need N
    nonCriticalExtension RRCMessage-v860-IEs OPTIONAL
}

```

```

RRCMessage-v860-IEs ::= SEQUENCE {
    field4-v860      InformationElement4      OPTIONAL,    -- Need S
    field5-v860      BOOLEAN                  OPTIONAL,    -- Cond C54
    nonCriticalExtension RRCMessage-v940-IEs  OPTIONAL
}

RRCMessage-v940-IEs ::= SEQUENCE {
    field6-v940      InformationElement6-r9    OPTIONAL,    -- Need R
    nonCriticalExtensions SEQUENCE {}          OPTIONAL
}

-- ASN1STOP

```

Some remarks regarding the extensions shown in the above example:

- The *InformationElement4* is introduced in the original version of the protocol (release 8) and hence no suffix is used.

#### A.4.3.5 Examples of non-critical extensions not placed at the default extension location

The following example illustrates the use of non-critical extensions in case an extension is not placed at the default extension location.

##### – *ParentIE-WithEM*

The IE *ParentIE-WithEM* is an example of a high level IE including the extension marker (EM). The root encoding of this IE includes two lower level IEs *ChildIE1-WithoutEM* and *ChildIE2-WithoutEM* which not include the extension marker. Consequently, non-critical extensions of the Child-IEs have to be included at the level of the Parent-IE.

The example illustrates how the two extension IEs *ChildIE1-WithoutEM-vNx0* and *ChildIE2-WithoutEM-vNx0* (both in release N) are used to connect non-critical extensions with a default extension location in the lower level IEs to the actual extension location in this IE.

##### ***ParentIE-WithEM* information element**

```

-- /example/ ASN1START

ParentIE-WithEM ::= SEQUENCE {
    -- Root encoding, including:
    childIE1-WithoutEM      ChildIE1-WithoutEM      OPTIONAL,    -- Need N
    childIE2-WithoutEM      ChildIE2-WithoutEM      OPTIONAL,    -- Need N
    ...,
    [[
    childIE1-WithoutEM-vNx0  ChildIE1-WithoutEM-vNx0 OPTIONAL,    -- Need N
    childIE2-WithoutEM-vNx0  ChildIE2-WithoutEM-vNx0 OPTIONAL      -- Need N
    ]]
}

-- ASN1STOP

```

Some remarks regarding the extensions shown in the above example:

- The fields *childIEEx-WithoutEM-vNx0* may not really need to be optional (depends on what is defined at the next lower level).
- In general, especially when there are several nesting levels, fields should be marked as optional only when there is a clear reason.

### – *ChildIE1-WithoutEM*

The IE *ChildIE1-WithoutEM* is an example of a lower level IE, used to control certain radio configurations including a configurable feature which can be setup or released using the local IE *ChIE1-ConfigurableFeature*. The example illustrates how the new field *chIE1-NewField* is added in release N to the configuration of the configurable feature. The example is based on the following assumptions:

- When initially configuring as well as when modifying the new field, the original fields of the configurable feature have to be provided also i.e. as if the extended ones were present within the setup branch of this feature.
- When the configurable feature is released, the new field should be released also.
- When omitting the original fields of the configurable feature the UE continues using the existing values (which is used to optimise the signalling for features that typically continue unchanged upon handover).
- When omitting the new field of the configurable feature the UE releases the existing values and discontinues the associated functionality (which may be used to support release of unsupported functionality upon handover to an eNB supporting an earlier protocol version).

The above assumptions, which affect the use of conditions and need codes, may not always apply. Hence, the example should not be re-used blindly.

### *ChildIE1-WithoutEM* information element

```
-- /example/ ASN1START

ChildIE1-WithoutEM ::=          SEQUENCE {
    -- Root encoding, including:
    chIE1-ConfigurableFeature    ChIE1-ConfigurableFeature    OPTIONAL    -- Need N
}

ChildIE1-WithoutEM-vNx0 ::=    SEQUENCE {
    chIE1-ConfigurableFeature-vNx0    ChIE1-ConfigurableFeature-vNx0    OPTIONAL    -- Cond ConfigF
}

ChIE1-ConfigurableFeature ::=    CHOICE {
    release                        NULL,
    setup                        SEQUENCE {
        -- Root encoding
    }
}

ChIE1-ConfigurableFeature-vNx0 ::= SEQUENCE {
    chIE1-NewField-rN            INTEGER (0..31)
}
```

```
-- ASN1STOP
```

| Conditional presence | Explanation                                                                                                                                                                                                 |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ConfigF</i>       | The field is optional present, need R, in case of <i>chIE1-ConfigurableFeature</i> is included and set to "setup"; otherwise the field is absent and the UE shall delete any existing value for this field. |

#### – *ChildIE2-WithoutEM*

The IE *ChildIE2-WithoutEM* is an example of a lower level IE, typically used to control certain radio configurations. The example illustrates how the new field *chIE1-NewField* is added in release N to the configuration of the configurable feature.

#### *ChildIE2-WithoutEM* information element

```
-- /example/ ASN1START
ChildIE2-WithoutEM ::=
    release
    setup
    -- Root encoding
}
CHOICE {
    NULL,
    SEQUENCE {
}
ChildIE2-WithoutEM-vNx0 ::=
    chIE2-NewField-rN
    SEQUENCE {
        INTEGER (0..31)
    }
    OPTIONAL -- Cond ConfigF
}
-- ASN1STOP
```

| Conditional presence | Explanation                                                                                                                                                                                                 |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>ConfigF</i>       | The field is optional present, need R, in case of <i>chIE2-ConfigurableFeature</i> is included and set to "setup"; otherwise the field is absent and the UE shall delete any existing value for this field. |

### A.4.3.6 Non-critical extensions of lists with ToAddMod/ToRelease

When the size of a list using the ToAddMod/ToRelease construction is extended and/or fields are added to the list element structure, the list should be non-critically extended in accordance with the following general principles:

- When only the size of the list is extended, this extension is reflected in a non-critical extension of the list, with a "SizeExt" suffix added to the end of the field name (before the -vNxy suffix). The differential size of the extended list uses the suffix "Diff". A new ToRelease list is needed, and its range should include only the increase in list size. In many cases, extending the list size will also require an extended list element ID type to account for the increased size of the list; in these cases the element type will need to be extended to include the extended element ID, resulting in a more complex extension (see example 3 for further discussion of this case). The field

description table should indicate that the UE considers the original list and the extension list as a single list; thus entries added with the original list can be modified by the extension list (or removed by the extension of the ToRelease list), or vice versa. The result is as shown in the following example:

```
-- /example 1/ ASN1START

ContainingStructure ::=
    listElementToAddModList      SEQUENCE {
    listElementToReleaseList      SEQUENCE (SIZE (1..maxNrofListElements)) OF ListElement      OPTIONAL,      -- Need N
    ...,
    listElementToAddModListSizeExt-vNxY SEQUENCE (SIZE (1..maxNrofListElementsDiff-rN)) OF ListElement      OPTIONAL,      -- Need N
    listElementToReleaseListSizeExt-vNxY SEQUENCE (SIZE (1..maxNrofListElementsDiff-rN)) OF ListElementId      OPTIONAL      -- Need N
    }
-- ASN1STOP
```

- When fields are added to the list element structure, an extension marker should normally be used if available. If no extension marker is available or if overhead or other considerations prevent using the extension marker, an extension structure should be created for the new fields, with the suffix "Ext" added to the end of the field name and the element structure type name (before the -vNxY suffix), and a parallel ToAddMod list introduced to hold the new structures, also with the "Ext" suffix. The field description table should indicate that the parallel list contains the same number of entries, and in the same order, as the original list. No new ToRelease list is typically needed (unless the list element ID type changes). It should typically be ensured that the contained fields in the "Ext" elements are releasable without release and add of the entire list element; this can, for instance, be ensured by having the new fields be OPTIONAL Need R. If multiple extensions of the same list are needed, the version suffix should distinguish the lists (e.g. *listElementToAddModListExt-vNwz* added after *listElementToAddModListExt-vNxY*). The result is as shown in the following example:

```
-- /example 2/ ASN1START

ContainingStructure ::=
    listElementToAddModList      SEQUENCE {
    listElementToReleaseList      SEQUENCE (SIZE (1..maxNrofListElements)) OF ListElement      OPTIONAL,      -- Need N
    ...,
    listElementToAddModListExt-vNxY SEQUENCE (SIZE (1..maxNrofListElements)) OF ListElementExt-vNxY      OPTIONAL      -- Need N
    },
    listElementToAddModListExt-vNwz SEQUENCE (SIZE (1..maxNrofListElements)) OF ListElementExt-vNwz      OPTIONAL      -- Need N
    }

ListElement ::=
    elementId
    field1
    field2
    SEQUENCE {
        ListElementId,
        INTEGER (0..3),
        ENUMERATED { value1, value2, value3 }
    }
```

```

ListElementExt-vNxy ::=          SEQUENCE {
    field3-rN                    BIT STRING (SIZE (8))
}                                OPTIONAL    -- Need R

ListElementExt-vNwz ::=          SEQUENCE {
    field4-rN                    INTEGER (0..255)
}                                OPTIONAL    -- Need R
-- ASN1STOP

```

- When the size of a list is extended and fields are added to the list element structure, an extension marker should normally be used for the added fields if available, and the list extended with the non-critical mechanism as described in example 1 above. Note that if the list element ID type changes in this case, the new ID can be added after the extension marker, and the entries of the size-extended ToRelease list should have the type of the new ID (e.g. *ListElementId-vNxy*). If no extension marker is available or if overhead or other considerations prevent using the extension marker, an extension structure should be created for the new fields and a parallel list with ToAddMod introduced to hold the extension structures, as in the second example above, for entries of the original list and for entries of the extension list holding new entries. The field description table should indicate that the parallel list contains the same number of entries, and in the same order, as the concatenation of the original list and the extension list. An extended ToRelease list is needed, but no additional parallel ToRelease list is needed (i.e. there is no *listElementToReleaseListExt-vNxy* in the example below), as the original and extended ToRelease lists suffice to release any element of the combined list. The extended element ID type should be captured as a non-critical extension of the original element ID type, with the field description indicating that if the extended ID is present, the original ID is ignored. The result is as shown in the following example:

```

-- /example 3/ ASN1START

ContainingStructure ::=          SEQUENCE {
    listElementToAddModList      SEQUENCE (SIZE (1..maxNrofListElements)) OF ListElement    OPTIONAL,    -- Need N
    listElementToReleaseList     SEQUENCE (SIZE (1..maxNrofListElements)) OF ListElementId    OPTIONAL,    -- Need N
    ...
    [[
        -- Non-critical extension lists
        listElementToAddModListSizeExt-vNxy SEQUENCE (SIZE (1..maxNrofListElementsDiff-rN)) OF ListElement    OPTIONAL,    -- Need N
        listElementToReleaseListSizeExt-vNxy SEQUENCE (SIZE (1..maxNrofListElementsDiff-rN)) OF ListElementId-vNxy    OPTIONAL,    -- Need N
        -- Parallel list with maxNrofListElements-rN = maxNrofListElements + maxNrofListElementsDiff-rN
        listElementToAddModListExt-vNxy     SEQUENCE (SIZE (1..maxNrofListElements-rN)) OF ListElementExt-vNxy    OPTIONAL    -- Need N
    ]]
}

ListElement ::=                SEQUENCE {
    elementId                    ListElementId,
    field1                       INTEGER (0..3),
    field2                       ENUMERATED { value1, value2, value3 }
}

ListElementExt-vNxy ::=        SEQUENCE {
    -- Field description should indicate that if the elementId-vNxy is present, the elementId (without suffix) is ignored
    elementId-vNxy               ListElementId-vNxy    OPTIONAL,    -- Need S
    field3-rN                    BIT STRING (SIZE (8))    OPTIONAL    -- Need R
}

ListElementId ::= INTEGER (0..maxNrofListElements-1)

ListElementId-vNxy ::= INTEGER (maxNrofListElements..maxNrofListElements-1-rN)

```

```
-- ASN1STOP
```

- When different extensions are made to a list in separate releases, the extension mechanisms described above may interact. In case fields are added in Rel-M (*listElementToAddModListExt-vMxy*) and later the list size is extended in Rel-N (*listElementToAddModListSizeExt-vNwz*), the size-extended list in Rel-N should be a single list extending the combination of *listElementToAddModList* and *listElementToAddModListExt-vMxy*. This requires creating a new type (*ListElement-rN*) to contain the combined fields of *ListElement* and *ListElementExt-vMxy*. A corresponding ToRelease list is needed. The result is as shown in the following example:

```
-- /example 4/ ASN1START

ContainingStructure ::=
    listElementToAddModList      SEQUENCE {
        listElementToReleaseList SEQUENCE (SIZE (1..maxNrofListElements)) OF ListElement OPTIONAL, -- Need N
        ...
    },
    -- Parallel list (Rel-M)
    listElementToAddModListExt-vMxy SEQUENCE (SIZE (1..maxNrofListElements)) OF ListElementExt-vMxy OPTIONAL -- Need N
],
-- Size-extended list (Rel-N) with maxNrofListElements-rN = maxNrofListElements + maxNrofListElementsDiff-rN
listElementToAddModListSizeExt-vNwz SEQUENCE (SIZE (1..maxNrofListElementsDiff-rN)) OF ListElement-rN OPTIONAL, -- Need N
listElementToReleaseListSizeExt-vNwz SEQUENCE (SIZE (1..maxNrofListElementsDiff-rN)) OF ListElementId-vNwz OPTIONAL -- Need N
]

ListElement ::=
    elementId
    field1
    field2
    SEQUENCE {
        ListElementId,
        INTEGER (0..3),
        ENUMERATED { value1, value2, value3 }
    }

ListElementExt-vMxy ::=
    field3-rM
    SEQUENCE {
        BIT STRING (SIZE (8))
    } OPTIONAL -- Need R

ListElement-rN ::=
    elementId-vNwz
    field1
    field2
    field3-rN
    SEQUENCE {
        ListElementId-vNwz,
        INTEGER (0..3),
        ENUMERATED { value1, value2, value3 },
        BIT STRING (SIZE (8))
    } OPTIONAL -- Need R

ListElementId ::= INTEGER (0..maxNrofListElements-1)

ListElementId-vNwz ::= INTEGER (maxNrofListElements..maxNrofListElementsDiff-1-rN)
-- ASN1STOP
```

---

## A.5 Guidelines regarding inclusion of transaction identifiers in RRC messages

The following rules provide guidance on which messages should include a Transaction identifier

- 1: DL messages on CCCH that move UE to RRC-Idle should not include the RRC transaction identifier.
- 2: All network initiated DL messages by default should include the RRC transaction identifier.
- 3: All UL messages that are direct response to a DL message with an RRC Transaction identifier should include the RRC Transaction identifier.
- 4: All UL messages that require a direct DL response message should include an RRC transaction identifier.
- 5: All UL messages that are not in response to a DL message nor require a corresponding response from the network should not include the RRC Transaction identifier.

---

## A.6 Guidelines regarding use of need codes

The following rule provides guidance for determining need codes for optional downlink fields:

- if the field needs to be stored by the UE (i.e. maintained) when absent:
  - use Need M (=Maintain);
- else, if the field needs to be released by the UE when absent:
  - use Need R (=Release);
- else, if UE shall take no action when the field is absent (i.e. UE does not even need to maintain any existing value of the field):
  - use Need N (=None);
- else (UE behaviour upon absence does not fit any of the above conditions):
  - use Need S (=Specified);
  - specify the UE behaviour upon absence of the field in the procedural text or in the field description table.

---

## A.7 Guidelines regarding use of conditions

Conditions are primarily used to specify network restrictions, for which the following types can be distinguished:

- Message Contents related constraints e.g. that a field B is mandatory present if the same message includes field A and when it is set value X.

- Configuration Constraints e.g. that a field D can only be signalled if field C is configured and set to value Y. (i.e. regardless of whether field C is present in the same message or previously configured).

The use of these conditions is illustrated by an example.

```
-- /example/ ASN1START
RRCMessage-IEs ::= SEQUENCE {
    fieldA                FieldA                OPTIONAL, -- Need M
    fieldB                FieldB                OPTIONAL, -- Cond FieldAsetToX
    fieldC                FieldC                OPTIONAL, -- Need M
    fieldD                FieldD                OPTIONAL, -- Cond FieldCsetToY
    nonCriticalExtension  SEQUENCE {}          OPTIONAL
}
-- /example/ ASN1STOP
```

| Conditional presence | Explanation                                                                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>FieldAsetToX</i>  | The field is mandatory present if fieldA is included and set to valueX. Otherwise the field is optionally present, need R.                               |
| <i>FieldCsetToY</i>  | The field is optionally present, need M, if fieldC is configured and set to valueY. Otherwise the field is absent and the UE does not maintain the value |

---

## A.8 Miscellaneous

The following miscellaneous convention should be used:

- UE capabilities: TS 38.306 [26] specifies that the network should in general respect the UE's capabilities. Hence there is no need to include statement clarifying that the network, when setting the value of a certain configuration field, shall respect the related UE capabilities unless there is a particular need e.g. particularly complicated cases.
- UE capabilities: If a UE capability for a feature requires at least FR1/FR2 or at least FDD/TDD differentiation, it is defined in per band signaling (under *BandNR* in *RF-Parameters*) in the ASN.1, i.e. no new UE capabilities is defined in the FR1/FR2 and FDD/TDD differentiation capability signaling branches.

---

## Annex B (informative): RRC Information

### B.1 Protection of RRC messages

The following list provides information which messages can be sent (unprotected) prior to AS security activation and which messages can be sent unprotected after AS security activation. Those messages indicated "-" in "P" column should never be sent unprotected by gNB or UE. Further requirements are defined in the procedural text.

P...Messages that can be sent (unprotected) prior to AS security activation

A – I...Messages that can be sent without integrity protection after AS security activation

A – C...Messages that can be sent unciphered after AS security activation

NA... Message can never be sent after AS security activation

| Message                               | P      | A-I | A-C | Comment                                                                                                                                                                                                                                                                                                                                                                                                                       |

## B.2 Description of BWP configuration options

There are two possible ways to configure BWP#0 (i.e. the initial BWP) for a UE:

- 1) Configure *BWP-DownlinkCommon* and *BWP-UplinkCommon* in *ServingCellConfigCommon*, but do not configure dedicated configurations in *BWP-DownlinkDedicated* or *BWP-UplinkDedicated* in *ServingCellConfig*.
- 2) Configure both *BWP-DownlinkCommon* and *BWP-UplinkCommon* in *ServingCellConfigCommon* and configure dedicated configurations in at least one of *BWP-DownlinkDedicated* or *BWP-UplinkDedicated* in *ServingCellConfig*.

The same way of configuration is used for UL BWP#0 and DL BWP#0 if both are configured.

With the first option (illustrated by figure B2-1 below), the BWP#0 is not considered to be an RRC-configured BWP, i.e., UE only supporting one BWP can still be configured with BWP#1 in addition to BWP#0 when using this configuration. The BWP#0 can still be used even if it does not have the dedicated configuration, albeit in a more limited manner since only the SIB1-defined configurations are available. For example, only DCI format 1\_0 can be used with BWP#0 without dedicated configuration, so changing to another BWP requires RRCReconfiguration since DCI format 1\_0 doesn't support DCI-based switching.

**Figure B2-1: BWP#0 configuration without dedicated configuration**

With the second option (illustrated by figure B2-2 below), the BWP#0 is considered to be an RRC-configured BWP, i.e. UE only supporting one BWP cannot be configured with BWP#1 in addition to BWP#0 when using this configuration. However, UE supporting more than one BWP can still switch to and from BWP#0 e.g. via DCI normally, and there are no explicit limitations to using the BWP#0 (compared to the first option).

**Figure B2-2: BWP#0 configuration with dedicated configuration**

For BWP#0, the *BWP-DownlinkCommon* and *BWP-UplinkCommon* in *ServingCellConfigCommon* should match the parameters configured by MIB and SIB1 (if provided) in the corresponding serving cell.

If a RedCap-specific initial DL BWP is configured, for BWP switching, the BWP #0 always maps to the RedCap-specific initial DL BWP. If a RedCap-specific initial UL BWP is configured, for BWP switching on NUL, the BWP #0 always maps to the RedCap-specific initial UL BWP, for BWP switching on SUL, the BWP#0 always maps to the initial UL BWP.

---

## Annex C (normative): List of CRs Containing Early Implementable Features and Corrections

This annex lists the Change Requests (CRs) whose changes may be implemented by a UE of an earlier release than which the CR was approved in (i.e. CRs that contain on their coversheets the sentence "Implementation of this CR from Rel-N will not cause interoperability issues").

**Table C-1: List of CRs Containing Early Implementable Features and Corrections**

| <b>TDoc Number (RP-xxxxxx): CR Title</b>                                          | <b>CR Number(s)</b> | <b>CR Revision Number(s)</b> | <b>Earliest Implementable Release</b> | <b>Additional Information</b>                                                                                                                                                                         |

## Annex D (normative): UE requirements on ASN.1 comprehension

This clause specifies UE requirements regarding the ASN.1 transfer syntax support, i.e. the ASN.1 definitions to be comprehended by the UE.

A UE that indicates release X in field *accessStratumRelease* shall comprehend the entire transfer syntax (ASN.1) of release X, in particular at least the first version upon ASN.1 freeze. The UE is however not required to support dedicated signalling related transfer syntax associated with optional features it does not support.

In case a UE that indicates release X in field *accessStratumRelease* supports a feature specified in release Y, which is later than release X, (i.e. early UE implementation) additional requirements apply. The UE obviously also has to support the ASN.1 parts related to indicating support of the feature (in UE capabilities).

### Critical extensions (dedicated signaling)

If the early implemented feature involves one or more critical extensions in dedicated signalling, the UE shall comprehend the parts of the transfer syntax (ASN.1) of release Y that are related to the feature implemented early. This, in particular, concerns the ASN.1 parts related to configuration of the feature.

If configuration of an early implemented feature introduced in release Y involves a message or field that has been critically extended, the UE shall support configuration of all features supported by the UE that are associated with sub-fields of this critical extension. Apart from the early implemented feature(s), the UE needs, however, not to support functionality beyond what is defined in the release the UE indicates in access stratum release.

Let's consider the example of a UE indicating value X in field *accessStratumRelease* that supports the features A1, A3, and A5, associated with fields *fieldA1*, *fieldA3* and *fieldA5* of *InformationElementA* (see ASN.1 below).

The feature A5 implemented early is associated with *fieldA5*, and can only be configured by the –rY version of *InformationElementA*. In such case, the UE should support configuration of all the features A1, A3 and A5 associated with fields *fieldA1*, *fieldA3* and *fieldA5* by the –rY version of *InformationElementA*.

If, however, one of the features was modified, e.g. the feature A3 associated with *fieldA3*, the network should assume the UE only supports the feature A3 according to the release it indicated in field *accessStratumRelease* (i.e. X).

The UE is neither required to support the additional code-point (*n80-vY0*) nor the additional sub-field (*fieldA3c-rY*).

**Non-critical extensions (dedicated and broadcast signaling)**

If the early implemented feature involves one or more non-critical extensions, the UE shall comprehend the parts of the transfer syntax (ASN.1) of release Y that are related to the feature implemented early.

If the early implemented feature involves one or more non-critical extensions in dedicated signaling, the network does not include extensions introduced after the release X that are not the parts related to the feature which the UE indicates early support of in UE capabilities. The UE shall anyway comprehend the parts of the transfer syntax (ASN.1) which indicate absence of such extensions.

If the early implemented feature involves one or more non-critical extensions in system information, the SIB(s) containing the release Y fields related to the early implemented features may also include other extensions introduced after the release X that are not the parts related to the feature which the UE supports. The UE shall comprehend such intermediate fields (but again is not required to support the functionality associated with these intermediate fields, in case this concerns optional features not supported by the UE).

## Annex E (informative): Change history
