It is absent otherwise.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

NOTE: In case of change of AS security key derived from  $S\text{-}K_{\text{gNB}}/S\text{-}K_{\text{eNB}}$ , if *reconfigurationWithSync* is not included in the *masterCellGroup*, the network releases all existing MCG RLC bearers associated with a radio bearer with *keyToUse* set to *secondary*. In case of change of AS security key derived from  $K_{\text{gNB}}/K_{\text{eNB}}$ , if *reconfigurationWithSync* is not included in the *secondaryCellGroup*, the network releases all existing SCG RLC bearers associated with a radio bearer with *keyToUse* set to *master*.

## — *CellGroupId*

The IE *CellGroupId* is used to identify a cell group. Value 0 identifies the master cell group. Other values identify secondary cell groups. In this version of the specification only values 0 and 1 are supported.

### *CellGroupId* information element

```
-- ASN1START
-- TAG-CELLGROUPID-START
```

*CellGroupId* ::= INTEGER (0.. maxSecondaryCellGroups)

```
-- TAG-CELLGROUPID-STOP
-- ASN1STOP
```

## — *CellIdentity*

The IE *CellIdentity* is used to unambiguously identify a cell within a PLMN/SNPN.

### *CellIdentity* information element

```
-- ASN1START
-- TAG-CELLIDENTITY-START
```

*CellIdentity* ::= BIT STRING (SIZE (36))

```
-- TAG-CELLIDENTITY-STOP
-- ASN1STOP
```

## — *CellReselectionPriority*

The IE *CellReselectionPriority* concerns the absolute priority of the concerned carrier frequency, as used by the cell reselection procedure. Corresponds to parameter "priority" in TS 38.304 [20]. Value 0 means lowest priority. The UE behaviour for the case the field is absent, if applicable, is specified in TS 38.304 [20].

### *CellReselectionPriority* information element

```
-- ASN1START
```

```
-- TAG-CELLRESELECTIONPRIORITY-START
```

```
CellReselectionPriority ::= INTEGER (0..7)
```

```
-- TAG-CELLRESELECTIONPRIORITY-STOP
-- ASN1STOP
```

## — *CellReselectionSubPriority*

The IE *CellReselectionSubPriority* indicates a fractional value to be added to the value of *cellReselectionPriority* to obtain the absolute priority of the concerned carrier frequency for E-UTRA and NR. Value *oDot2* corresponds to 0.2, value *oDot4* corresponds to 0.4 and so on.

### *CellReselectionSubPriority* information element

```
-- ASN1START
-- TAG-CELLRESELECTIONSUBPRIORITY-START
```

```
CellReselectionSubPriority ::= ENUMERATED {oDot2, oDot4, oDot6, oDot8}
```

```
-- TAG-CELLRESELECTIONSUBPRIORITY-STOP
-- ASN1STOP
```

## — *CFR-ConfigMulticast*

The IE *CFR-ConfigMulticast* indicates UE specific common frequency resource configuration for multicast for one dedicated BWP.

### *CFR-ConfigMulticast* information element

```
-- ASN1START
-- TAG-CFR-CONFIGMULTICAST-START
```

```
CFR-ConfigMulticast-r17 ::= SEQUENCE {
    locationAndBandwidthMulticast-r17          INTEGER (0..37949)          OPTIONAL, -- Need S

```

| CondReconfigToAddMod field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>condExecutionCond</b></p> <p>The execution condition that needs to be fulfilled in order to trigger the execution of a conditional reconfiguration for CHO, CPA, intra-SN CPC without MN involvement or MN initiated inter-SN CPC. When configuring 2 triggering events (Meas Ids) for a candidate cell, the network ensures that both refer to the same <i>measObject</i>. For CHO, if the network configures <i>condEventD1</i> or <i>condEventT1</i> for a candidate cell, the network configures a second triggering event <i>condEventA3</i>, <i>condEventA4</i> or <i>condEventA5</i> for the same candidate cell. The network does not configure both <i>condEventD1</i> and <i>condEventT1</i> for the same candidate cell. For CHO in terrestrial networks, the network does not indicate a <i>MeasId</i> associated with <i>condEventA4</i>. For CPA and for MN-initiated inter-SN CPC, the network only indicates <i>MeasId</i>(s) associated with <i>condEventA4</i>. For intra-SN CPC, the network only indicates <i>MeasId</i>(s) associated with <i>condEventA3</i> or <i>condEventA5</i>.</p> |
| <p><b>condExecutionCondSCG</b></p> <p>Contains execution condition that needs to be fulfilled in order to trigger the execution of a conditional reconfiguration for SN initiated inter-SN CPC. The Meas Ids refer to the <i>measConfig</i> associated with the SCG. When configuring 2 triggering events (Meas Ids) for a candidate cell, network ensures that both refer to the same <i>measObject</i>. For each <i>condReconfigId</i>, the network always configures either <i>condExecutionCond</i> or <i>condExecutionCondSCG</i> (not both). The network only indicates <i>MeasId</i>(s) associated with <i>condEventA3</i> or <i>condEventA5</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <p><b>condRRCReconfig</b></p> <p>The <i>RRCReconfiguration</i> message to be applied when the condition(s) are fulfilled. The <i>RRCReconfiguration</i> message contained in <i>condRRCReconfig</i> cannot contain the field <i>conditionalReconfiguration</i> or the field <i>daps-Config</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## – ConditionalReconfiguration

The IE *ConditionalReconfiguration* is used to add, modify and release the configuration of conditional reconfiguration.

### ConditionalReconfiguration information element

```
-- ASN1START
-- TAG-CONDITIONALRECONFIGURATION-START

ConditionalReconfiguration-r16 ::= SEQUENCE {
    attemptCondReconfig-r16      ENUMERATED {true}          OPTIONAL, -- Cond CHO

    condReconfigToAddModList-r16 CondReconfigToAddModList-r16 OPTIONAL, -- Need N
    ...
}

CondReconfigToRemoveList-r16 ::= SEQUENCE (SIZE (1.. maxNrofCondCells-r16)) OF CondReconfigId-r16

-- TAG-CONDITIONALRECONFIGURATION-STOP
-- ASN1STOP
```

| ConditionalReconfiguration field descriptions                                                                                                                                                                                  |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>attemptCondReconfig</i></b><br>If present, the UE shall perform conditional reconfiguration if selected cell is a target candidate cell and it is the first cell selection after failure as described in clause 5.3.7.3. |
| <b><i>condReconfigToAddModList</i></b><br>List of the configuration of candidate SpCells to be added or modified for CHO, CPA or CPC.                                                                                          |
| <b><i>condReconfigToRemoveList</i></b><br>List of the configuration of candidate SpCells to be removed.                                                                                                                        |

| Conditional Presence | Explanation                                                                                                                                  |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <i>CHO</i>           | The field is optional present, Need R, if the UE is configured with at least a candidate SpCell for CHO. Otherwise the field is not present. |

## – ConfiguredGrantConfig

The IE *ConfiguredGrantConfig* is used to configure uplink transmission without dynamic grant according to two possible schemes. The actual uplink grant may either be configured via RRC (*type1*) or provided via the PDCCH (addressed to CS-RNTI) (*type2*). Multiple Configured Grant configurations may be configured in one BWP of a serving cell.

| <b>antennaPort</b><br>Indicates the antenna port(s) to be used for this configuration, and the maximum bitwidth is 5. See TS 38.214 [19], clause 6.1.2, and TS 38.212 [17], clause 7.3.1. The UE ignores this field in case of CG-SDT.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>autonomousTx</b><br>If this field is present, the Configured Grant configuration is configured with autonomous transmission, see TS 38.321 [3].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>betaOffsetCG-UCI</b><br>Beta offset for CG-UCI in CG-PUSCH, see TS 38.213 [13], clause 9.3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>cg-betaOffsetsCrossPri0, cg-betaOffsetsCrossPri1</b><br>Selection between and configuration of dynamic and semi-static beta-offset for multiplexing HARQ-ACK in CG-PUSCH with different priorities. The field <i>cg-betaOffsetsCrossPri0</i> indicates multiplexing LP HARQ-ACK in HP CG-PUSCH. This field is configured only if <i>phy-PriorityIndex-r16</i> is configured with value <i>p1</i> . The field <i>cg-betaOffsetsCrossPri1</i> indicates multiplexing HP HARQ-ACK in LP CG-PUSCH. This field is configured only if <i>phy-PriorityIndex-r16</i> is configured with value <i>p0</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>cg-COT-SharingList</b><br>Indicates a table for COT sharing combinations (see 37.213 [48], clause 4.1.3). One row of the table can be set to noCOT-Sharing to indicate that there is no channel occupancy sharing. If the <i>cg-RetransmissionTimer-r16</i> is configured and the UE operates as an initiating device in semi-static channel access mode (see TS 37.213 [48], clause 4.3), then <i>cg-COT-SharingList-r16</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>cg-COT-SharingOffset</b><br>Indicates the offset from the end of the slot where the COT sharing indication in UCI is enabled where the offset in symbols is equal to $14 \cdot n$ , where $n$ is the signaled value for <i>cg-COT-SharingOffset</i> . Applicable when <i>ul-toDL-COT-SharingED-Threshold-r16</i> is not configured (see 37.213 [48], clause 4.1.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>cg-DMRS-Configuration</b><br>DMRS configuration (see TS 38.214 [19], clause 6.1.2.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>cg-minDFI-Delay</b><br>Indicates the minimum duration (in unit of symbols) from the ending symbol of the PUSCH to the starting symbol of the PDCCH containing the downlink feedback indication (DFI) carrying HARQ-ACK for this PUSCH. The HARQ-ACK received before this minimum duration is not considered as valid for this PUSCH (see TS 38.213 [13], clause 10.5). The following minimum duration values are supported, depending on the configured subcarrier spacing [symbols]:<br>15 kHz: 7, $m \cdot 14$ , where $m = \{1, 2, 3, 4\}$<br>30 kHz: 7, $m \cdot 14$ , where $m = \{1, 2, 3, 4, 5, 6, 7, 8\}$<br>60 kHz: 7, $m \cdot 14$ , where $m = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16\}$<br>120 kHz: 7, $m \cdot 14$ , where $m = \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32\}$<br>480 kHz: $m \cdot 14$ , where $m = \{2, 4, 8, 12, 16, 20, 24, 28, 32, 36, 40, 44, 48, 52, 56, 60, 64, 68, 72, 76, 80, 84, 88, 92, 96, 100, 104, 108, 112, 116, 120, 124, 128\}$<br>960 kHz: $m \cdot 14$ , where $m = \{4, 8, 16, 24, 32, 40, 48, 56, 64, 72, 80, 88, 96, 104, 112, 120, 128, 136, 144, 152, 160, 168, 176, 184, 192, 200, 208, 216, 224, 232, 240, 248, 256\}$ |
| <b>cg-nrofPUSCH-InSlot</b><br>Indicates the number of consecutive PUSCH configured to CG within a slot where the SLIV indicating the first PUSCH and additional PUSCH appended with the same length (see TS 38.214 [19], clause 6.1.2.3). The network can only configure this field if <i>cg-RetransmissionTimer</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>cg-nrofSlots</b><br>Indicates the number of allocated slots in a configured grant periodicity following the time instance of configured grant offset (see TS 38.214 [19], clause 6.1.2.3). <i>cg-nrofSlots-r17</i> is only applicable for operation with shared spectrum channel access in FR2-2. When <i>cg-nrofSlots-r17</i> is configured, the UE shall ignore <i>cg-nrofSlots-r16</i> . The network can only configure this field if <i>cg-RetransmissionTimer</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>cg-RetransmissionTimer</b><br>Indicates the initial value of the configured retransmission timer (see TS 38.321 [3]) in multiples of <i>periodicity</i> . The value of <i>cg-RetransmissionTimer</i> is always less than or equal to the value of <i>configuredGrantTimer</i> . This field is always configured together with <i>harq-ProclD-Offset</i> . This field is not configured for operation in licensed spectrum or simultaneously with <i>harq-ProclD-Offset2</i> . The network does not configure this field for CG-SDT.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>cg-StartingOffsets</b><br>This field is not applicable for a UE which is allowed to operate as an initiating device in semi-static channel access mode, i.e., not applicable for a UE configured with UE FFP parameters (e.g. period, offset) regardless whether the UE would initiate its own COT or would share gNB's COT.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>configuredGrantTimer</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Indicates the initial value of the configured grant timer (see TS 38.321 [3]) in multiples of periodicity. When <i>cg-RetransmissionTimer</i> is configured, if HARQ processes are shared among different configured grants on the same BWP, <i>configuredGrantTimer</i> * <i>periodicity</i> is set to the same value for the configurations that share HARQ processes on this BWP. The value of the extension <i>configuredGrantTimer</i> is 2 times the configured value.                                                                                                                                                             |
| <b>dmrs-SeqInitialization</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>channelAccessPriority</b><br>Indicates the Channel Access Priority Class that the gNB can assume when sharing the UE initiated COT (see 37.213 [48], clause 4.1.3).                |
| <b>duration</b><br>Indicates the number of DL transmission slots within UE initiated COT (see 37.213 [48], clause 4.1.3).                                                             |
| <b>offset</b><br>Indicates the number of DL transmission slots from the end of the slot where CG-UCI is detected after which COT sharing can be used (see 37.213 [48], clause 4.1.3). |

| <b>CG-StartingOffsets field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cg-StartingFullBW-InsideCOT</b><br>A set of configured grant PUSCH transmission starting offsets (see TS 38.211[16], Table 5.3.1-2) which indicates the length of a CP extension of the first symbol that is located before the configured resource when frequency domain resource allocation includes all interlaces in the allocated RB set(s) and the CG PUSCH resource is inside gNB COT (see TS 38.214 [19], clause 6.1.2.3).                   |
| <b>cg-StartingFullBW-OutsideCOT</b><br>A set of configured grant PUSCH transmission starting offset indices (see TS 38.211[16], Table 5.3.1-2) which indicates the length of a CP extension of the first symbol that is located before the configured resource when frequency domain resource allocation includes all interlaces in the allocated RB set(s) and the CG PUSCH resource is outside gNB COT (see TS 38.214 [19], clause 6.1.2.3).          |
| <b>cg-StartingPartialBW-InsideCOT</b><br>A set of configured grant PUSCH transmission starting offset index (see TS 38.211[16], Table 5.3.1-2) which indicates the length of a CP extension of the first symbol that is located before the configured resource when frequency domain resource allocation does not include all interlaces in the allocated RB set(s) and the CG PUSCH resource is inside gNB COT (see TS 38.214 [19], clause 6.1.2.3).   |
| <b>cg-StartingPartialBW-OutsideCOT</b><br>A set of configured grant PUSCH transmission starting offset index (see TS 38.211[16], Table 5.3.1-2) which indicates the length of a CP extension of the first symbol that is located before the configured resource when frequency domain resource allocation does not include all interlaces in the allocated RB set(s) and the CG PUSCH resource is outside gNB COT (see TS 38.214 [19], clause 6.1.2.3). |

| <b>CG-SDT-Configuration field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>cg-SDT-RetransmissionTimer</i></b>       | Indicates the initial value of the configured grant retransmission timer used for the initial transmission of CG-SDT with CCCH message (see TS 38.321 [3]) in multiples of <i>periodicity</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>sdt-DMRS-Ports</i></b>                   | Indicates the set of DMRS ports for SSB to PUSCH mapping (see TS 38.213 [13]). The first (left-most / most significant) bit corresponds to DMRS port 0, the second most significant bit corresponds to DMRS port 1, and so on. A bit set to 1 indicates that this DMRS port is used for mapping. In case of a RedCap-specific initial downlink BWP that is associated with NCD-SSB, the SSB is the NCD-SSB. Otherwise, the SSB is the CD-SSB.                                                                                                                                                                                                                                                          |
| <b><i>sdt-NrofDMRS-Sequences</i></b>           | Indicates the number of DMRS sequences for SSB to PUSCH mapping (see TS 38.213 [13]). In case of a RedCap-specific initial downlink BWP that is associated with NCD-SSB, the SSB is the NCD-SSB. Otherwise, the SSB is the CD-SSB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>sdt-SSB-Subset</i></b>                   | Indicates SSB subset for SSB to CG PUSCH mapping within one CG configuration. The first/leftmost bit corresponds to SS/PBCH block index 0, the second bit corresponds to SS/PBCH block index 1, and so on. Value 0 in the bitmap indicates that the corresponding SS/PBCH block is not included in the SSB subset for SSB to CG PUSCH mapping while value 1 indicates that the corresponding SS/PBCH block is included in SSB subset for SSB to CG PUSCH mapping. If this field is absent, UE assumes the SSB set includes all actually transmitted SSBs. In case of a RedCap-specific initial downlink BWP that is associated with NCD-SSB, the SSB is the NCD-SSB. Otherwise, the SSB is the CD-SSB. |
| <b><i>sdt-SSB-PerCG-PUSCH</i></b>              | The number of SSBs per CG PUSCH (see TS 38.213 [13]). Value <i>one</i> corresponds to 1 SSBs per CG PUSCH, value <i>two</i> corresponds to 2 SSBs per CG PUSCH and so on. In case of a RedCap-specific initial downlink BWP that is associated with NCD-SSB, the SSB is the NCD-SSB. Otherwise, the SSB is the CD-SSB.                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>sdt-P0-PUSCH</i></b>                     | Indicates P0 value for PUSCH for CG SDT in steps of 1dB (see TS 38.213 [13]). When this field is configured, the UE ignores the <i>p0-PUSCH-Alpha</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>sdt-Alpha</i></b>                        | Indicates alpha value for PUSCH for CG SDT. <i>alpha0</i> indicates value 0 is used <i>alpha04</i> indicates value 4 is used and so on (see TS 38.213 [13]). When this field is configured, the UE ignores the <i>p0-PUSCH-Alpha</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Conditional Presence</b>    | <b>Explanation</b>                                                                                                                                                                                                                               |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>LCH-BasedPrioritization</i> | This field is optionally present, Need R, if <i>lch-BasedPrioritization</i> is configured in the MAC entity. It is absent otherwise.                                                                                                             |
| <i>RepTypeB</i>                | The field is optionally present if <i>pusch-RepTypeIndicator</i> is set to <i>pusch-RepTypeB</i> , Need S, and absent otherwise.                                                                                                                 |
| <i>CG-List</i>                 | The field is mandatory present when included in <i>configuredGrantConfigToAddModList-r16</i> , otherwise the field is absent.                                                                                                                    |
| <i>CG-IndexMAC</i>             | The field is mandatory present if at least one configured grant is configured by <i>configuredGrantConfigToAddModList-r16</i> in any BWP of this MAC entity, otherwise it is optionally present, need R.                                         |
| <i>SRSsets</i>                 | This field is mandatory present when UE is configured with two SRS sets configured in either <i>srs-ResourceSetToAddModList</i> or <i>srs-ResourceSetToAddModListDCI-0-2</i> with usage codebook or non-codebook. Otherwise it is absent, Need R |

## – *ConfiguredGrantConfigIndex*

The IE *ConfiguredGrantConfigIndex* is used to indicate the index of one of multiple UL Configured Grant configurations in one BWP.

### ***ConfiguredGrantConfigIndex* information element**

```
-- ASN1START
-- TAG-CONFIGUREDGRANTCONFIGINDEX-START
```

ConfiguredGrantConfigIndex-r16 ::= **INTEGER** (0.. maxNrofConfiguredGrantConfig-1-r16)

-- TAG-CONFIGUREDGRANTCONFIGINDEX-STOP  
-- ASN1STOP

## – *ConfiguredGrantConfigIndexMAC*

The IE *ConfiguredGrantConfigIndexMAC* is used to indicate the unique Configured Grant configurations index per MAC entity.

### ***ConfiguredGrantConfigIndexMAC* information element**

-- ASN1START  
-- TAG-CONFIGUREDGRANTCONFIGINDEXMAC-START

ConfiguredGrantConfigIndexMAC-r16 ::= **INTEGER** (0.. maxNrofConfiguredGrantConfigMAC-1-r16)

-- TAG-CONFIGUREDGRANTCONFIGINDEXMAC-STOP  
-- ASN1STOP

## – *ConnEstFailureControl*

The IE *ConnEstFailureControl* is used to configure parameters for connection establishment failure control.

### ***ConnEstFailureControl* information element**

-- ASN1START  
-- TAG-CONNЕСТFAILURECONTROL-START

ConnEstFailureControl ::= **SEQUENCE** {  
     connEstFailCount                   **ENUMERATED** {n1, n2, n3, n4},  
     connEstFailOffsetValidity       **ENUMERATED** {s30, s60, s120, s240, s300, s420, s600, s900},  
     connEstFailOffset               **INTEGER** (0..15)  
 } **OPTIONAL**       -- Need S

-- TAG-CONNЕСТFAILURECONTROL-STOP  
-- ASN1STOP

| <i>ConnEstFailureControl</i> field descriptions                                                                                                                                                                                                     |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>connEstFailCount</i></b><br>Number of times that the UE detects T300 expiry on the same cell before applying <i>connEstFailOffset</i> .                                                                                                       |
| <b><i>connEstFailOffset</i></b><br>Parameter "Qoffset <sub>temp</sub> " in TS 38.304 [20]. If the field is absent, the value of infinity shall be used for "Qoffset <sub>temp</sub> ".                                                              |
| <b><i>connEstFailOffsetValidity</i></b><br>Amount of time that the UE applies <i>connEstFailOffset</i> before removing the offset from evaluation of the cell. Value s30 corresponds to 30 seconds, value s60 corresponds to 60 seconds, and so on. |

## – *ControlResourceSet*

The IE *ControlResourceSet* is used to configure a time/frequency control resource set (CORESET) in which to search for downlink control information (see TS 38.213 [13], clause 10.1). For the UE not supporting *multipleCORESET* in FR1, in order to receive MBS multicast in CFR within the UE's active BWP, if a CORESET is not configured within the *PDCCH-ConfigMulticast*, the CORESET other than CORESET#0 configured within the UE's active BWP for scheduling unicast can be used for scheduling MBS multicast, and the CORESET is expected to be included completely within the CFR and the parameters configured in the CORESET are expected to be supported by the UE for MBS multicast.

| <b>cce-REG-MappingType</b><br>Mapping of Control Channel Elements (CCE) to Resource Element Groups (REG) (see TS 38.211 [16], clauses 7.3.2.2 and 7.4.1.3.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>controlResourceSetId</b><br>Identifies the instance of the <i>ControlResourceSet</i> IE. Value 0 identifies the common CORESET configured in <i>MIB</i> and in <i>ServingCellConfigCommon</i> ( <i>controlResourceSetZero</i> ) and is hence not used here in the <i>ControlResourceSet</i> IE. Other values identify CORESETs configured by dedicated signalling or in <i>SIB1</i> or <i>SIB20</i> . The <i>controlResourceSetId</i> is unique among the BWPs of a serving cell.<br>If the field <i>controlResourceSetId-v1610</i> is present, the UE shall ignore the <i>controlResourceSetId</i> field (without suffix).                                                                                                                                                                                                                                  |
| <b>coresetPoolIndex</b><br>The index of the CORESET pool for this CORESET as specified in TS 38.213 [13] (clauses 9 and 10) and TS 38.214 [19] (clauses 5.1 and 6.1). If the field is absent, the UE applies the value 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>duration</b><br>Contiguous time duration of the CORESET in number of symbols (see TS 38.211 [16], clause 7.3.2.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>followUnifiedTCI-State</b><br>When set to enabled, for PDCCH reception on this CORESET, the UE applies the "indicated" DL only TCI or joint TCI as specified in TS 38.214 [19], clause 5.1.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>frequencyDomainResources</b><br>Frequency domain resources for the CORESET. Each bit corresponds a group of 6 RBs, with grouping starting from the first RB group in the BWP or MBS CFR where the CORESET is configured. When at least one search space is configured with <i>freqMonitorLocation-r16</i> , only the first $N_{\text{RBG, set0}}^{\text{size}}$ bits are valid (see TS 38.213 [13], clause 10.1). The first (left-most / most significant) bit corresponds to the first RB group in the BWP or MBS CFR where the CORESET is configured, and so on. A bit that is set to 1 indicates that this RB group belongs to the frequency domain resource of this CORESET. Bits corresponding to a group of RBs not fully contained in the bandwidth part within which the CORESET is configured are set to zero (see TS 38.211 [16], clause 7.3.2.2). |
| <b>interleaverSize</b><br>Interleaver-size (see TS 38.211 [16], clause 7.3.2.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>pdccch-DMRS-ScramblingID</b><br>PDCCH DMRS scrambling initialization (see TS 38.211 [16], clause 7.4.1.3.1). When the field is absent the UE applies the value of the <i>physCellId</i> configured for this serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>precoderGranularity</b><br>Precoder granularity in frequency domain (see TS 38.211 [16], clauses 7.3.2.2 and 7.4.1.3.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>rb-Offset</b><br>Indicates the RB level offset in units of RB from the first RB of the first 6RB group to the first RB of BWP (see 38.213 [13], clause 10.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>reg-BundleSize</b><br>Resource Element Groups (REGs) can be bundled to create REG bundles. This parameter defines the size of such bundles (see TS 38.211 [16], clause 7.3.2.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>shiftIndex</b><br>When the field is absent the UE applies the value of the <i>physCellId</i> configured for this serving cell (see TS 38.211 [16], clause 7.3.2.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>tcI-PresentInDCI</b><br>This field indicates if TCI field is present or absent in DCI format 1_1 and DCI format 4_2. When the field is absent the UE considers the TCI to be absent/disabled. In case of cross carrier scheduling, the network sets this field to enabled for the <i>ControlResourceSet</i> used for cross carrier scheduling in DCI format 1_1 in the scheduling cell if <i>enableDefaultBeamForCCS</i> is not configured (see TS 38.214 [19], clause 5.1.5).                                                                                                                                                                                                                                                                                                                                                                               |
| <b>tcI-PresentDCI-1-2</b><br>Configures the number of bits for "Transmission configuration indicator" in DCI format 1_2. When the field is absent the UE applies the value of 0 bit for the "Transmission configuration indicator" in DCI format 1_2 (see TS 38.212 [17], clause 7.3.1 and TS 38.214 [19], clause 5.1.5). In case of cross carrier scheduling, the network configures this field for the <i>ControlResourceSet</i> used for cross carrier scheduling in DCI format 1_2 in the scheduling cell if <i>enableDefaultBeamForCCS</i> is not configured (see TS 38.214 [19], clause 5.1.5).                                                                                                                                                                                                                                                           |

***tcj-StatesPDCCH-ToAddList***  
A subset of the TCI states defined in *pdsch-Config*, either with *tcj-StatesToAddModList* or *dl-OrJointTCI-StateList*, included in the *BWP-DownlinkDedicated* corresponding to the serving cell and to the DL BWP to which the *ControlResourceSet* belong to. They are used for providing QCL relationships between the DL RS(s) in one RS Set (TCI-State) and the PDCCH DMRS ports (see TS 38.213 [13], clause 6.). The network configures at most *maxNrofTCI-StatesPDCCH* entries. The QCL relationships defined herein do not apply to MBS broadcast.

| Conditional Presence     | Explanation                                                                                                                                                                                                            |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>NotSIB-initialBWP</i> | The field is absent in <i>SIB1/SIB20</i> and in the <i>PDCCH-ConfigCommon</i> of the initial BWP in <i>ServingCellConfigCommon</i> , if <i>SIB1/SIB20</i> is broadcasted. Otherwise, it is optionally present, Need N. |

– *ControlResourceSetId*

The *ControlResourceSetId* IE concerns a short identity, used to identify a control resource set within a serving cell. The *ControlResourceSetId* = 0 identifies the *ControlResourceSet#0* configured via PBCH (*MIB*) and in *controlResourceSetZero* (*ServingCellConfigCommon*). The ID space is used across the BWPs and MBS CFRs of a Serving Cell.

***ControlResourceSetId* information element**

```
-- ASN1START
-- TAG-CONTROLRESOURCESETID-START

ControlResourceSetId ::=          INTEGER (0..maxNrofControlResourceSets-1)

ControlResourceSetId-r16 ::=      INTEGER (0..maxNrofControlResourceSets-1-r16)

ControlResourceSetId-v1610 ::=    INTEGER (maxNrofControlResourceSets..maxNrofControlResourceSets-1-r16)

-- TAG-CONTROLRESOURCESETID-STOP
-- ASN1STOP
```

– *ControlResourceSetZero*

The IE *ControlResourceSetZero* is used to configure CORESET#0 of the initial BWP (see TS 38.213 [13], clause 13).

***ControlResourceSetZero* information element**

```
-- ASN1START
-- TAG-CONTROLRESOURCESETZERO-START

ControlResourceSetZero ::=        INTEGER (0..15)

-- TAG-CONTROLRESOURCESETZERO-STOP
-- ASN1STOP
```

## – *CrossCarrierSchedulingConfig*

The IE *CrossCarrierSchedulingConfig* is used to specify the configuration when the cross-carrier scheduling is used in a cell.

| <b>carrierIndicatorSizeDCI-0-2, carrierIndicatorSizeDCI-1-2</b><br>Configures the number of bits for the field of carrier indicator in PDCCH DCI format 0_2/1_2. The field <i>carrierIndicatorSizeDCI-0-2</i> refers to DCI format 0_2 and the field <i>carrierIndicatorSizeDCI-1-2</i> refers to DCI format 1_2, respectively (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 10.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |  |
| <b>ccs-BlindDetectionSplit</b><br>Indicates the share of blind detection candidates and non-overlapping CCEs for PDCCH monitoring on an SpCell and an SCell when cross-carrier scheduling is configured from the SCell for the SpCell (see TS 38.213 [13], clause 10.1.1). The network only configures this field when it sets the field <i>other</i> for an SpCell, i.e., when it configures cross-carrier scheduling of the SpCell by a PDCCH on an SCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |  |
| <b>cif-Presence</b><br>The field is used to indicate whether carrier indicator field is present (value <i>true</i> ) or not (value <i>false</i> ) in PDCCH DCI formats, see TS 38.213 [13]. If <i>cif-Presence</i> is set to <i>true</i> , the CIF value indicating a grant or assignment for this cell is 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |  |
| <b>cif-InSchedulingCell</b><br>The field indicates the CIF value used in the scheduling cell to indicate a grant or assignment applicable for this cell, see TS 38.213 [13]. If configured for an SpCell, the non-fallback DCI formats on the SpCell include same number of CIF bits as the corresponding non-fallback DCI formats on the scheduling cell, and the CIF bits are considered reserved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |  |
| <b>enableDefaultBeamForCCS</b><br>This field indicates whether default beam selection for cross-carrier scheduled PDSCH or aperiodic CSI-RS is enabled, see TS 38.214 [19]. If not present, the default beam selection behaviour is not applied, i.e. Rel-15 behaviour is applied. This field can only be configured in the cross-scheduled SCell or SpCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |  |
| <b>other</b><br>Parameters for cross-carrier scheduling. If configured for an SpCell, the SpCell can be scheduled by the PDCCH on another SCell as well as by the PDCCH on the SpCell. If configured for an SCell, the SCell is scheduled by a PDCCH on another cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |  |
| <b>own</b><br>Parameters for self-scheduling, i.e., a serving cell is scheduled by its own PDCCH.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |  |
| <b>schedulingCellId</b><br>If configured for an SpCell, this field indicates which SCell, in addition to the SpCell, signals the downlink allocations and uplink grants, if applicable, for the concerned SpCell. If configured for an SCell, this field indicates which cell signals the downlink allocations and uplink grants, if applicable, for the concerned SCell. In case the UE is configured with DC, the scheduling cell is part of the same cell group (i.e. MCG or SCG) as the scheduled cell. In case the UE is configured with two PUCCH groups, the scheduling cell and the scheduled cell are within the same PUCCH group. If <i>drx-ConfigSecondaryGroup</i> is configured in the <i>MAC-CellGroupConfig</i> associated with this serving cell, the scheduling cell and the scheduled cell belong to the same Frequency Range. In addition, the serving cell with an aperiodic CSI trigger and the PUSCH resource scheduled for the report are on the same carrier and serving cell, but the cell for which CSI is reported may belong to the same or a different Frequency Range. The network should not trigger a CSI request for a serving cell in the other Frequency Range when that serving cell is outside Active Time. |  |

| Conditional Presence | Explanation                                                                                                      |
|----------------------|------------------------------------------------------------------------------------------------------------------|
| CIF-PRESENCE         | The field is mandatory present if the <i>cif-Presence</i> is set to <i>true</i> . The field is absent otherwise. |

– *CSI-AperiodicTriggerStateList*

The *CSI-AperiodicTriggerStateList* IE is used to configure the UE with a list of aperiodic trigger states. Each codepoint of the DCI field "CSI request" is associated with one trigger state (see TS 38.321 [3], clause 6.1.3.13). Upon reception of the value associated with a trigger state, the UE will perform measurement of CSI-RS, CSI-IM and/or SSB (reference signals) and aperiodic reporting on L1 according to all entries in the *associatedReportConfigInfoList* for that trigger state.

| <b>ap-CSI-MultiplexingMode</b>                           | Indicates if the behavior of transmitting aperiodic CSI on the first PUSCH repetitions corresponding to two SRS resource sets configured in <i>srs-ResourceSetToAddModList</i> or <i>srs-ResourceSetToAddModListDCI-0-2</i> with usage 'codebook' or 'noncodebook' is enabled or not.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>csi-IM-ResourcesForInterference</b>                   | CSI-IM-ResourceSet for interference measurement. Entry number in <i>csi-IM-ResourceSetList</i> in the CSI-ResourceConfig indicated by <i>csi-IM-ResourcesForInterference</i> in the CSI-ReportConfig indicated by <i>reportConfigId</i> above (value 1 corresponds to the first entry, value 2 to the second entry, and so on). The indicated CSI-IM-ResourceSet should have exactly the same number of resources like the NZP-CSI-RS-ResourceSet indicated in <i>resourceSet</i> within <i>nzp-CSI-RS</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>csi-SSB-ResourceSet, csi-SSB-ResourceSet2</b>         | CSI-SSB-ResourceSet for channel measurements. Entry number in <i>csi-SSB-ResourceSetList</i> in the CSI-ResourceConfig indicated by <i>resourcesForChannelMeasurement</i> in the CSI-ReportConfig indicated by <i>reportConfigId</i> above (value 1 corresponds to the first entry, value 2 to the second entry, and so on).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>nzp-CSI-RS-ResourcesForInterference</b>               | NZP-CSI-RS-ResourceSet for interference measurement. Entry number in <i>nzp-CSI-RS-ResourceSetList</i> in the CSI-ResourceConfig indicated by <i>nzp-CSI-RS-ResourcesForInterference</i> in the CSI-ReportConfig indicated by <i>reportConfigId</i> above (value 1 corresponds to the first entry, value 2 to the second entry, and so on).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>qcl-info, qcl-info2</b>                               | Fields <i>qcl-Info</i> and <i>qcl-Info2</i> are lists of references to TCI-States for providing the QCL source and QCL type for each NZP-CSI-RS-Resource listed in <i>nzp-CSI-RS-Resources</i> of the NZP-CSI-RS-ResourceSet, indicated by <i>resourceSet</i> within <i>nzp-CSI-RS</i> and by <i>resourceSet2</i> within <i>nzp-CSI-RS2</i> , respectively. Each <i>TCI-StateId</i> refers to the TCI-State which has this value for <i>tcI-StateId</i> and is defined in <i>tcI-StatesToAddModList</i> or in <i>dl-OrJointTCI-StateList</i> in the PD-SCH-Config included in the BWP-Downlink corresponding to the serving cell and to the DL BWP to which the <i>resourcesForChannelMeasurement</i> (in the CSI-ReportConfig indicated by <i>reportConfigId</i> above) belong to. First entry in <i>qcl-info/qcl-info2</i> corresponds to first entry in <i>nzp-CSI-RS-Resources</i> of that NZP-CSI-RS-ResourceSet, second entry in <i>qcl-info/qcl-info2</i> corresponds to second entry in <i>nzp-CSI-RS-Resources</i> , and so on (see TS 38.214 [19], clause 5.2.1.5.1). When this field is absent for aperiodic CSI RS, the UE shall use QCL information included in the "indicated" DL only/Joint TCI state as specified in TS 38.214 [19]. |
| <b>reportConfigId</b>                                    | The <i>reportConfigId</i> of one of the CSI-ReportConfigToAddMod configured in CSI-MeasConfig.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>resourcesForChannel2</b>                              | Configures reference signals for channel measurement corresponding to the second resource set for L1-RSRP measurement as configured in IE CSI-ResourceConfig when <i>nrofReportedGroups-r17</i> is configured in IE CSI-ReportConfig. If this is present, network configures csi-SSB-ResourceSetExt instead of csi-SSB-ResourceSet and the UE ignores csi-SSB-ResourceSet in <i>resourcesForChannel</i> , and the <i>resourcesForChannel</i> configures the reference signals for channel measurement corresponding to the first resource set for L1-RSRP measurement (see TS 38.214 [19], clause 5.2.1.4).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>resourceSet, resourceSet2</b>                         | NZP-CSI-RS-ResourceSet for channel measurements. Entry number in <i>nzp-CSI-RS-ResourceSetList</i> in the CSI-ResourceConfig indicated by <i>resourcesForChannelMeasurement</i> in the CSI-ReportConfig indicated by <i>reportConfigId</i> above (value 1 corresponds to the first entry, value 2 to the second entry, and so on).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## – *CSI-ReportConfig*

The IE *CSI-ReportConfig* is used to configure a periodic or semi-persistent report sent on PUCCH on the cell in which the *CSI-ReportConfig* is included, or to configure a semi-persistent or aperiodic report sent on PUSCH triggered by DCI received on the cell in which the *CSI-ReportConfig* is included (in this case, the cell on which the report is sent is determined by the received DCI). See TS 38.214 [19], clause 5.2.1.

| <p><b>csi-ReportingBand</b><br/>Indicates a contiguous or non-contiguous subset of subbands in the bandwidth part which CSI shall be reported for. Each bit in the bit-string represents one subband in order of frequency position in the BWP. The right-most bit in the bit string represents the lowest subband with the lowest frequency position in the BWP. The choice determines the number of subbands (subbands3 for 3 subbands, subbands4 for 4 subbands, and so on) (see TS 38.214 [19], clause 5.2.1.4). This field is absent if there are less than 24 PRBs (no sub band) and present otherwise (see TS 38.214 [19], clause 5.2.1.4).<br/>NOTE: In TS 38.212 [17] clause 6.3.1.1.2 and TS 38.214 [19] clause 5.2.1.4, only subbands to be reported are numbered, e.g. subband #0 is the subband corresponding to the right-most bit set to 1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <p><b>csi-ReportMode</b><br/>Configures the CSI report modes Mode1 or Mode 2 (see TS 38.214 [19], clause 5.2.1.4.2)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <p><b>groupBasedBeamReporting</b><br/>Turning on/off group beam based reporting (see TS 38.214 [19], clause 5.2.1.4). If <i>groupBasedBeamReporting</i> (without suffix) is set to disabled, <i>groupBasedBeamReporting-v1710</i> is absent.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <p><b>non-PMI-PortIndication</b><br/>Port indication for RI/CQI calculation. For each CSI-RS resource in the linked ResourceConfig for channel measurement, a port indication for each rank R, indicating which R ports to use. Applicable only for non-PMI feedback (see TS 38.214 [19], clause 5.2.1.4.2).<br/>The first entry in <i>non-PMI-PortIndication</i> corresponds to the NZP-CSI-RS-Resource indicated by the first entry in <i>nzp-CSI-RS-Resources</i> in the <i>NZP-CSI-RS-ResourceSet</i> indicated in the first entry of <i>nzp-CSI-RS-ResourceSetList</i> of the <i>CSI-ResourceConfig</i> whose <i>CSI-ResourceConfigId</i> is indicated in a CSI-MeasId together with the above <i>CSI-ReportConfigId</i>; the second entry in <i>non-PMI-PortIndication</i> corresponds to the NZP-CSI-RS-Resource indicated by the second entry in <i>nzp-CSI-RS-Resources</i> in the <i>NZP-CSI-RS-ResourceSet</i> indicated in the first entry of <i>nzp-CSI-RS-ResourceSetList</i> of the same <i>CSI-ResourceConfig</i>, and so on until the NZP-CSI-RS-Resource indicated by the last entry in <i>nzp-CSI-RS-Resources</i> in the in the <i>NZP-CSI-RS-ResourceSet</i> indicated in the first entry of <i>nzp-CSI-RS-ResourceSetList</i> of the same <i>CSI-ResourceConfig</i>. Then the next entry corresponds to the NZP-CSI-RS-Resource indicated by the first entry in <i>nzp-CSI-RS-Resources</i> in the <i>NZP-CSI-RS-ResourceSet</i> indicated in the second entry of <i>nzp-CSI-RS-ResourceSetList</i> of the same <i>CSI-ResourceConfig</i> and so on.</p> |
| <p><b>nrofReportedGroups</b><br/>Number of reported resource groups per CSI-report. Value <i>n1</i> means one resource group, <i>n2</i> means 2 resource groups, and so on. If <i>nrofReportedGroups</i> is configured, the UE ignores <i>groupBasedBeamReporting</i> (without suffix).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Timing offset Y for semi persistent reporting using PUSCH. This field lists the allowed offset values. This list must have the same number of entries as the <i>pusch-TimeDomainAllocationList</i> in <i>PUSCH-Config</i> . A particular value is indicated in DCI. The network indicates in the DCI field of the UL grant, which of the configured report slot offsets the UE shall apply. The DCI value 0 corresponds to the first report slot offset in this list, the DCI value 1 corresponds to the second report slot offset in this list, and so on. The first report is transmitted in slot $n+Y$ , second report in $n+Y+P$ , where P is the configured periodicity.<br>Timing offset Y for aperiodic reporting using PUSCH. This field lists the allowed offset values. This list must have the same number of entries as the <i>pusch-TimeDomainAllocationList</i> in <i>PUSCH-Config</i> . A particular value is indicated in DCI. The network indicates in the DCI field of the UL grant, which of the configured report slot offsets the UE shall apply. The DCI value 0 corresponds to the first report slot offset in this list, the DCI value 1 corresponds to the second report slot offset in this list, and so on (see TS 38.214 [19], clause 6.1.2.1).<br>The field <i>reportSlotOffsetListDCI-0-1</i> applies to DCI format 0_1 and the field <i>reportSlotOffsetListDCI-0-2</i> applies to DCI format 0_2 (see TS 38.214 [19], clause 6.1.2.1).<br>The fields <i>reportSlotOffsetList-r17</i> , <i>reportSlotOffsetListDCI-0-1-r17</i> and <i>reportSlotOffsetListDCI-0-2-r17</i> are only applicable for SCS 480 kHz and 960 kHz and if they are configured, the UE shall ignore the fields <i>reportSlotOffsetList</i> (without suffix), <i>reportSlotOffsetListDCI-0-1</i> (without suffix) and <i>reportSlotOffsetListDCI-0-2</i> (without suffix) for SCS 480 kHz and 960 kHz. |
| <b>resourcesForChannelMeasurement</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Resources for channel measurement. <i>csi-ResourceConfigId</i> of a <i>CSI-ResourceConfig</i> included in the configuration of the serving cell indicated with the field "carrier" above. The <i>CSI-ResourceConfig</i> indicated here contains only NZP-CSI-RS resources and/or SSB resources. This <i>CSI-ReportConfig</i> is associated with the DL BWP indicated by <i>bwp-Id</i> in that <i>CSI-ResourceConfig</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>sharedCMR</b><br>Enables sharing of channel measurement resources between different CSI measurement hypotheses when (1) <i>csi-ReportMode</i> is set to 'Mode1' and <i>numberOfSingleTRP-CSI-Mode1</i> is set to 1 or 2; or (2) <i>csi-ReportMode</i> is set to 'Mode2' (see TS 38.214 [19], clause 5.2.1.4.2). |
| <b>subbandSize</b><br>Indicates one out of two possible BWP-dependent values for the subband size as indicated in TS 38.214 [19], table 5.2.1.4-2 . If <i>csi-ReportingBand</i> is absent, the UE shall ignore this field.                                                                                         |
| <b>timeRestrictionForChannelMeasurements</b><br>Time domain measurement restriction for the channel (signal) measurements (see TS 38.214 [19], clause 5.2.1.1).                                                                                                                                                    |
| <b>timeRestrictionForInterferenceMeasurements</b><br>Time domain measurement restriction for interference measurements (see TS 38.214 [19], clause 5.2.1.1).                                                                                                                                                       |

| <b>csi-SSB-ResourceSetList, csi-SSB-ResourceSetListExt</b><br>List of references to SSB resources used for CSI measurement and reporting in a CSI-RS resource set (see TS 38.214 [19], clause 5.2.1.2). The <i>csi-SSB-ResourceSetListExt</i> provides additional references and can only be configured if <i>csi-SSB-ResourceSetList</i> is configured and <i>groupBasedBeamReporting-v1710</i> is configured in the <i>CSI-ReportConfig</i> that indicates this <i>CSI-ResourceConfig</i> as <i>resourcesForChannelMeasurement</i> . If <i>groupBasedBeamReporting-v1710</i> is configured in the IE <i>CSI-ReportConfig</i> that indicates this <i>CSI-ResourceConfig</i> as <i>resourcesForChannelMeasurement</i> , the network configures 2 resource sets, which may be two CSI SSB resource sets (see TS 38.214 [19], clause 5.2.1.2 and 5.2.1.4.2). In this case, in TS 38.212 [17] Table 6.3.1.1.2-8B, the first resource set is indicated by a resource set indicator set to 0 and the second resource set by a resource set indicator set to 1. |
| <b>nzp-CSI-RS-ResourceSetList</b><br>List of references to NZP CSI-RS resources used for beam measurement and reporting in a CSI-RS resource set.<br>If <i>resourceType</i> is set to 'aperiodic', the network configures up to <i>maxNrofNZP-CSI-RS-ResourceSetsPerConfig</i> resource sets. If <i>resourceType</i> is set to 'periodic' or 'semiPersistent' and <i>groupBasedBeamReporting-v1710</i> is not configured in IE <i>CSI-ReportConfig</i> , the network configures 1 resource set. If <i>resourceType</i> is set to 'periodic' or 'semiPersistent' and <i>groupBasedBeamReporting-v1710</i> is configured, the network configures 2 resource sets, which may be two NZP CSI-RS resource sets (see TS 38.214 [19], clause 5.2.1.2 and 5.2.1.4.2). In this case, in TS 38.212 [17] Table 6.3.1.1.2-8B, the first resource set is indicated by a resource set indicator set to 0 and the second resource set by a resource set indicator set to 1.                                                                                              |
| <b>resourceType</b><br>Time domain behavior of resource configuration (see TS 38.214 [19], clause 5.2.1.2). It does not apply to resources provided in the <i>csi-SSB-ResourceSetList</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## – CSI-ResourceConfigId

The IE *CSI-ResourceConfigId* is used to identify a *CSI-ResourceConfig*.

### CSI-ResourceConfigId information element

```
-- ASN1START
-- TAG-CSI-RESOURCECONFIGID-START

CSI-ResourceConfigId ::=
    INTEGER (0..maxNrofCSI-ResourceConfigurations-1)

-- TAG-CSI-RESOURCECONFIGID-STOP
-- ASN1STOP
```

## – CSI-ResourcePeriodicityAndOffset

The IE *CSI-ResourcePeriodicityAndOffset* is used to configure a periodicity and a corresponding offset for periodic and semi-persistent CSI resources, and for periodic and semi-persistent reporting on PUCCH. both, the periodicity and the offset are given in number of slots. The periodicity value *slots4* corresponds to 4 slots, value *slots5* corresponds to 5 slots, and so on.

***CSI-ResourcePeriodicityAndOffset*** information element

```

-- ASN1START
-- TAG-CSI-RESOURCEPERIODICITYANDOFFSET-START

CSI-ResourcePeriodicityAndOffset ::= CHOICE {
    slots4          INTEGER (0..3),
    slots5          INTEGER (0..4),

| <b>csi-RS-CellList-Mobility</b><br>List of cells for CSI-RS based RRM measurements.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>refServCellIndex</b><br>Indicates the serving cell providing the timing reference for CSI-RS resources without <i>associatedSSB</i> . The field may be present only if there is at least one CSI-RS resource configured without <i>associatedSSB</i> . If this field is absent, the UE shall use the timing of the PCell for measurements on the CSI-RS resources without <i>associatedSSB</i> . The CSI-RS resources and the serving cell indicated by <i>refServCellIndex</i> for timing reference should be located in the same band. |
| <b>subcarrierSpacing</b><br>Subcarrier spacing of CSI-RS.<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15, 30, or 60 kHz<br>FR2-1: 60 or 120 kHz<br>FR2-2: 120, 480, or 960 kHz                                                                                                                                                                                                                                                                                                                     |

| <b>CSI-RS-Resource-Mobility field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>associatedSSB</b><br>If this field is present, the UE may base the timing of the CSI-RS resource indicated in <i>CSI-RS-Resource-Mobility</i> on the timing of the cell indicated by the <i>cellId</i> in the <i>CSI-RS-CellMobility</i> . In this case, the UE is not required to monitor that CSI-RS resource if the UE cannot detect the SS/PBCH block indicated by this <i>associatedSSB</i> and <i>cellId</i> . If this field is absent, the UE shall base the timing of the CSI-RS resource indicated in <i>CSI-RS-Resource-Mobility</i> on the timing of the serving cell indicated by <i>refServCellIndex</i> . In this case, the UE is required to measure the CSI-RS resource even if SS/PBCH block(s) with <i>cellId</i> in the <i>CSI-RS-CellMobility</i> are not detected. CSI-RS resources with and without <i>associatedSSB</i> may be configured in accordance with the rules in TS 38.214 [19], clause 5.1.6.1.3.                                                                                                                                                                                                                                                                          |
| <b>csi-RS-Index</b><br>CSI-RS resource index associated to the CSI-RS resource to be measured (and used for reporting).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>firstOFDMsymbolInTimeDomain</b><br>Time domain allocation within a physical resource block. The field indicates the first OFDM symbol in the PRB used for CSI-RS, see TS 38.211 [16], clause 7.4.1.5.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>frequencyDomainAllocation</b><br>Frequency domain allocation within a physical resource block in accordance with TS 38.211 [16], clause 7.4.1.5.3 including table 7.4.1.5.2-1. The number of bits that may be set to one depend on the chosen row in that table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>isQuasiColocated</b><br>Indicates that the CSI-RS resource is quasi co-located with the associated SS/PBCH block, see TS 38.214 [19], clause 5.1.6.1.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>slotConfig</b><br>Indicates the CSI-RS periodicity (in milliseconds) and for each periodicity the offset (in number of slots). When <i>subcarrierSpacing</i> is set to <i>kHz15</i> , the maximum offset values for periodicities <i>ms4/ms5/ms10/ms20/ms40</i> are 3/4/9/19/39 slots. When <i>subcarrierSpacing</i> is set to <i>kHz30</i> , the maximum offset values for periodicities <i>ms4/ms5/ms10/ms20/ms40</i> are 7/9/19/39/79 slots. When <i>subcarrierSpacing</i> is set to <i>kHz60</i> , the maximum offset values for periodicities <i>ms4/ms5/ms10/ms20/ms40</i> are 15/19/39/79/159 slots. When <i>subcarrierSpacing</i> is set to <i>kHz120</i> , the maximum offset values for periodicities <i>ms4/ms5/ms10/ms20/ms40</i> are 31/39/79/159/319 slots. When <i>subcarrierSpacing</i> is set to <i>kHz480</i> , the maximum offset values for periodicities <i>ms4/ms5/ms10/ms20/ms40</i> are 127/159/319/639/1279 slots. When <i>subcarrierSpacing</i> is set to <i>kHz960</i> , the maximum offset values for periodicities <i>ms4/ms5/ms10/ms20/ms40</i> are 255/319/639/1279/2559 slots. If <i>slotConfig-r17</i> is present, UE shall ignore the <i>slotConfig</i> (without suffix). |

## – CSI-RS-ResourceMapping

The IE *CSI-RS-ResourceMapping* is used to configure the resource element mapping of a CSI-RS resource in time- and frequency domain.

**CSI-RS-ResourceMapping** information element

| <b>frequencyDomainAllocation</b><br>Frequency domain allocation within a physical resource block in accordance with TS 38.211 [16], clause 7.4.1.5.3. The applicable row number in table 7.4.1.5.3-1 is determined by the <i>frequencyDomainAllocation</i> for rows 1, 2 and 4, and for other rows by matching the values in the column Ports, Density and CDMtype in table 7.4.1.5.3-1 with the values of <i>nrofPorts</i> , <i>cdm-Type</i> and <i>density</i> below and, when more than one row has the 3 values matching, by selecting the row where the column (k bar, l bar) in table 7.4.1.5.3-1 has indexes for k ranging from 0 to 2*n-1 where n is the number of bits set to 1 in <i>frequencyDomainAllocation</i> . |
| <b>nrofPorts</b><br>Number of ports (see TS 38.214 [19], clause 5.2.2.3.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## — *CSI-SemiPersistentOnPUSCH-TriggerStateList*

The *CSI-SemiPersistentOnPUSCH-TriggerStateList* IE is used to configure the UE with list of trigger states for semi-persistent reporting of channel state information on L1. See also TS 38.214 [19], clause 5.2.

### *CSI-SemiPersistentOnPUSCH-TriggerStateList* information element

```
-- ASN1START
-- TAG-CSI-SEMIPERSISTENTONPUSCHTRIGGERSTATELIST-START

CSI-SemiPersistentOnPUSCH-TriggerStateList ::= SEQUENCE(SIZE (1..maxNrOfSemiPersistentPUSCH-Triggers)) OF CSI-SemiPersistentOnPUSCH-TriggerState

CSI-SemiPersistentOnPUSCH-TriggerState ::=
    SEQUENCE {
        associatedReportConfigInfo          CSI-ReportConfigId,
        ...
        [[
            sp-CSI-MultiplexingMode-r17      ENUMERATED {enabled}
        ]]
    }
-- TAG-CSI-SEMIPERSISTENTONPUSCHTRIGGERSTATELIST-STOP
-- ASN1STOP
```

OPTIONAL    -- Need R

| CSI-SemiPersistentOnPUSCH-TriggerStateList field descriptions                                                                                                                                                                                                                                                    |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>sp-CSI-MultiplexingMode</b><br>Indicates if the behavior of transmitting SP-CSI on the first PUSCH repetitions corresponding to two SRS resource sets configured in <i>srs-ResourceSetToAddModList</i> or <i>srs-ResourceSetToAddModListDCI-0-2</i> with usage 'codebook' or 'noncodebook' is enabled or not. |

– CSI-SSB-ResourceSet

The IE *CSI-SSB-ResourceSet* is used to configure one SS/PBCH block resource set which refers to SS/PBCH as indicated in *ServingCellConfigCommon* and *ServingCellConfig*.

CSI-SSB-ResourceSet information element

```
-- ASN1START
-- TAG-CSI-SSB-RESOURCESET-START

CSI-SSB-ResourceSet ::=
    SEQUENCE {
        csi-SSB-ResourceSetId
            CSI-SSB-ResourceSetId,
        csi-SSB-ResourceList
            SEQUENCE (SIZE(1..maxNrofCSI-SSB-ResourcePerSet)) OF SSB-Index,
        ...
        [[
            servingAdditionalPCIList-r17
                SEQUENCE (SIZE(1..maxNrofCSI-SSB-ResourcePerSet)) OF ServingAdditionalPCIIndex-r17 OPTIONAL -- Need R
        ]]
    }

ServingAdditionalPCIIndex-r17 ::= INTEGER(0..maxNrofAdditionalPCI-r17)

-- TAG-CSI-SSB-RESOURCESET-STOP
-- ASN1STOP
```

| CSI-SSB-ResourceSet field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>servingAdditionalPCIList</b><br>Indicates the physical cell IDs (PCI) of the SSBs in the <i>csi-SSB-ResourceList</i> . If present, the list has the same number of entries as <i>csi-SSB-ResourceList</i> . The first entry of the list indicates the value of the PCI for the first entry of <i>csi-SSB-ResourceList</i> , the second entry of this list indicates the value of the PCI for the second entry of <i>csi-SSB-ResourceList</i> , and so on. For each entry, the following applies:<br>- If the value is zero, the PCI is the PCI of the serving cell in which this <i>CSI-SSB-ResourceSet</i> is defined;<br>- otherwise, the value is <i>additionalPCIIndex-r17</i> of an <i>SSB-MTC-AdditionalPCI-r17</i> configured using the <i>additionalPCI-ToAddModList-r17</i> in <i>ServingCellConfig</i> , and the PCI is the <i>additionalPCI-r17</i> in this <i>SSB-MTC-AdditionalPCI-r17</i> . |

– CSI-SSB-ResourceSetId

The IE *CSI-SSB-ResourceSetId* is used to identify one SS/PBCH block resource set.

CSI-SSB-ResourceId information element

```
-- ASN1START
```

```
-- TAG-CSI-SSB-RESOURCESETID-START
CSI-SSB-ResourceSetId ::= INTEGER (0..maxNrofCSI-SSB-ResourceSets-1)
-- TAG-CSI-SSB-RESOURCESETID-STOP
-- ASN1STOP
```

## — *DedicatedNAS-Message*

The IE *DedicatedNAS-Message* is used to transfer UE specific NAS layer information between the 5GC CN and the UE. The RRC layer is transparent for this information.

### *DedicatedNAS-Message* information element

```
-- ASN1START
-- TAG-DEDICATED-NAS-MESSAGE-START
DedicatedNAS-Message ::= OCTET STRING
-- TAG-DEDICATED-NAS-MESSAGE-STOP
-- ASN1STOP
```

## — *DL-PPW-PreConfig*

The IE *DL-PPW-PreConfig* provides configuration for a measurement window where a UE is expected to measure the DL PRS, if it is inside the active DL BWP and with the same numerology as the active DL BWP. Based upon the indication received in the configuration, the UE identifies whether the DL PRS priority is higher than that of the other DL signals or channels and accordingly determines, for example, the UE is expected to measure the DL PRS and is not expected to receive other DL signals and channels.

### *DL-PPW-PreConfig* information element

```
-- ASN1START
-- TAG-DL-PPW-PRECONFIG-START
DL-PPW-PreConfig-r17 ::= SEQUENCE {

| <b>DMRS-UplinkConfig</b> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dmrs-AdditionalPosition</b><br>Position for additional DM-RS in UL (see TS 38.211 [16], clause 6.4.1.1.3). If the field is absent, the UE applies the value pos2. See also clause 6.4.1.1.3 for additional constraints on how the network may set this field depending on the setting of other fields.                                                                                                                                                                                                         |
| <b>dmrs-Type</b><br>Selection of the DMRS type to be used for UL (see TS 38.211 [16], clause 6.4.1.1.3) If the field is absent, the UE uses DMRS type 1.                                                                                                                                                                                                                                                                                                                                                          |
| <b>dmrs-Uplink</b><br>This field indicates whether low PAPR DMRS is used, as specified in TS38.211 [16], clause 6.4.1.1.1.1.                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>dmrs-UplinkTransformPrecoding</b><br>This field indicates whether low PAPR DMRS is used for PUSCH with pi/2 BPSK modulation, as specified in TS38.211 [16], clause 6.4.1.1.1.2. The network configures this field only if <i>tp-pi2BPSK</i> is configured in <i>PUSCH-Config</i> .                                                                                                                                                                                                                             |
| <b>maxLength</b><br>The maximum number of OFDM symbols for UL front loaded DMRS. <i>len1</i> corresponds to value 1. <i>len2</i> corresponds to value 2. If the field is absent, the UE applies value <i>len1</i> . If set to <i>len2</i> , the UE determines the actual number of DM-RS symbols by the associated DCI. (see TS 38.211 [16], clause 6.4.1.1.3).                                                                                                                                                   |
| <b>nPUSCH-Identity</b><br>Parameter: $N_{ID}^{(PUSCH)}$ for DFT-s-OFDM DMRS. If the value is absent or released, the UE uses the value Physical cell ID ( <i>physCellId</i> ). See TS 38.211 [16].                                                                                                                                                                                                                                                                                                                |
| <b>phaseTrackingRS</b><br>Configures uplink PTRS (see TS 38.211 [16]).                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>pi2BPSK-ScramblingID0, pi2BPSK-ScramblingID1</b><br>UL DMRS scrambling initialization for pi/2 BPSK DMRS for PUSCH (see TS 38.211 [16], Clause 6.4.1.1.2). When the field is absent the UE applies the value Physical cell ID ( <i>physCellId</i> ) of the serving cell.                                                                                                                                                                                                                                       |
| <b>scramblingID0</b><br>UL DMRS scrambling initialization for CP-OFDM (see TS 38.211 [16], clause 6.4.1.1.1.1). When the field is absent the UE applies the value Physical cell ID ( <i>physCellId</i> ).                                                                                                                                                                                                                                                                                                         |
| <b>scramblingID1</b><br>UL DMRS scrambling initialization for CP-OFDM. (see TS 38.211 [16], clause 6.4.1.1.1.1). When the field is absent the UE applies the value Physical cell ID ( <i>physCellId</i> ).                                                                                                                                                                                                                                                                                                        |
| <b>sequenceGroupHopping</b><br>For DMRS transmission with transform precoder the NW may configure group hopping by the cell-specific parameter <i>groupHoppingEnabledTransformPrecoding</i> in <i>PUSCH-ConfigCommon</i> . In this case, the NW may include this UE specific field to disable group hopping for PUSCH transmission except for Msg3, i.e., to override the configuration in <i>PUSCH-ConfigCommon</i> (see TS 38.211 [16]). If the field is absent, the UE uses the same hopping mode as for Msg3. |
| <b>sequenceHopping</b><br>Determines if sequence hopping is enabled for DMRS transmission with transform precoder for PUSCH transmission other than Msg3 (sequence hopping is always disabled for Msg3). If the field is absent, the UE uses the same hopping mode as for msg3. The network does not configure simultaneous group hopping and sequence hopping. See TS 38.211 [16], clause 6.4.1.1.1.2.                                                                                                           |
| <b>transformPrecodingDisabled</b><br>DMRS related parameters for Cyclic Prefix OFDM.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>transformPrecodingEnabled</b><br>DMRS related parameters for DFT-s-OFDM (Transform Precoding).                                                                                                                                                                                                                                                                                                                                                                                                                 |

## – DownlinkConfigCommon

The IE *DownlinkConfigCommon* provides common downlink parameters of a cell.

### DownlinkConfigCommon information element

| <b><i>frequencyInfoDL-SIB</i></b><br>Basic parameters of a downlink carrier and transmission thereon.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>initialDownlinkBWP</i></b><br>The initial downlink BWP configuration for a PCell. The network configures the <i>locationAndBandwidth</i> so that the initial downlink BWP contains the entire CORESET#0 of this serving cell in the frequency domain. The UE applies the <i>locationAndBandwidth</i> upon reception of this field (e.g. to determine the frequency position of signals described in relation to this <i>locationAndBandwidth</i> ) but it keeps CORESET#0 until after reception of <i>RRCSetup/RRCResume/RRCReestablishment</i> .                                                                                                                                                                                                                                                                                                                          |
| <b><i>initialDownlinkBWP-RedCap</i></b><br>If present, RedCap UEs use this DL BWP instead of <i>initialDownlinkBWP</i> . If the <i>locationAndBandwidth</i> of this BWP contains the entire CORESET#0, the UE applies the <i>locationAndBandwidth</i> upon reception of this field (e.g. to determine the frequency position of signals described in relation to this <i>locationAndBandwidth</i> ) but it keeps CORESET#0 until after reception of <i>RRCSetup/RRCResume/RRCReestablishment</i> . Otherwise, i.e., if the <i>locationAndBandwidth</i> of this BWP does not contain the entire CORESET#0, the UE uses this BWP for receiving DL messages during initial access (Msg2, MsgB, Msg4) and after initial access.<br>If absent, RedCap UEs use <i>initialDownlinkBWP</i> provided that it does not exceed the RedCap UE maximum bandwidth (see also clause 5.2.2.4.2). |
| <b><i>lastUsedCellOnly</i></b><br>When present, the field indicates that the UE monitors PEI only if the latest received <i>RRCRelease</i> without <i>noLastCellUpdate</i> is from this cell. A PEI-capable UE stores its last used cell information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>pcch-Config</i></b><br>The paging related configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## – *EphemerisInfo*

The IE *EphemerisInfo* provides satellite ephemeris. Ephemeris may be expressed either in format of position and velocity state vector in ECEF or in format of orbital parameters in ECI. Note: The ECI and ECEF coincide at *epochTime*, i.e., x,y,z axis in ECEF are aligned with x,y,z axis in ECI at *epochTime*.

### *EphemerisInfo* information element

– *FeatureCombination*

The IE *FeatureCombination* indicates a feature or a combination of features to be associated with a set of Random Access resources (i.e. an instance of *FeatureCombinationPreambles*).

## – *FeatureCombinationPreambles*

The IE *FeatureCombinationPreambles* associates a set of preambles with a feature combination. For parameters which can be provided in this IE, the UE applies this field value when performing Random Access using a preamble in this *featureCombinationPreambles*, otherwise the UE applies the corresponding value as determined by applicable Need Code, e.g. Need S. On a specific BWP, there can be at most one set of preambles associated with a given feature combination per RA Type (i.e. 4-step RACH or 2-step RACH).

| <p><b>ra-SizeGroupA</b><br/>Transport Blocks size threshold in bits below which the UE shall use a contention-based RA preamble of group A. (see TS 38.321 [3], clause 5.1.2). If this feature combination preambles are associated to a <i>RACH-ConfigCommon-twostepRA</i>, this field correspond to <i>ra-MsgA-SizeGroupA</i>, otherwise it corresponds to <i>ra-Msg3SizeGroupA</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <p><b>rsrp-ThresholdSSB</b><br/>UE may select the SS block and corresponding PRACH resource for path-loss estimation and (re)transmission based on SS blocks that satisfy the threshold (see TS 38.213 [13]). If this parameter is included in <i>FeatureCombinationPreambles</i> which is included in <i>RACH-ConfigCommonTwoStepRA</i>, it corresponds to <i>msgA-RSRP-ThresholdSSB</i>, as defined in TS 38.321 [3]. If this parameter is included in <i>FeatureCombinationPreambles</i> which is included in <i>RACH-ConfigCommon</i>, it corresponds to <i>rsrp-ThresholdSSB</i>, as defined in TS 38.321 [3]. If this parameter is not included in <i>FeatureCombinationPreambles</i> which is included in <i>RACH-ConfigCommon</i>, the UE applies <i>rsrp-ThresholdSSB</i> included in the <i>RACH-ConfigCommon</i> which includes this <i>FeatureCombinationPreambles</i>. If this parameter is not included in <i>FeatureCombinationPreambles</i> which is included in <i>RACH-ConfigCommonTwoStepRA</i>, the UE applies <i>msgA-RSRP-ThresholdSSB</i> included in the <i>RACH-ConfigCommonTwoStepRA</i> which includes this <i>FeatureCombinationPreambles</i>.</p> |
| <p><b>separateMsgA-PUSCH-Config</b><br/>If present, it specifies how the 2-step RACH preambles identified by this <i>FeatureCombinationPreambles</i> are mapped to a PUSCH slot separate from the one defined in <i>MsgA-ConfigCommon-r16</i>. If the field is absent, the UE should apply the corresponding parameter in the <i>RACH-ConfigCommonTwoStepRA</i> of the BWP which includes the <i>FeatureCombinationPreambles</i> IE.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <p><b>ssb-SharedRO-MaskIndex</b><br/>Mask index (see TS 38.321 [3]).<br/>Indicates a subset of ROs where preambles are allocated for this feature combination.<br/>If this field is configured within <i>FeatureCombinationPreambles</i> which is included in <i>RACH-ConfigCommonTwoStepRA</i>:</p> <ul style="list-style-type: none"> <li>- in case of separate ROs are configured for 4-step and 2-step random access, this field indicates a subset of ROs configured within this <i>RACH-ConfigCommonTwoStepRA</i>;</li> <li>- in case shared ROs are used for 4-step and 2-step random access, it indicates the subset of ROs configured within <i>RACH-ConfigCommon</i>, which are the subset of ROs configured for 2-step random access.</li> </ul> <p>This field is configured when there is more than one RO per SSB. If the field is absent, all ROs configured in <i>RACH-ConfigCommon</i> or <i>RACH-ConfigCommonTwoStepRA</i> containing this <i>FeatureCombinationPreambles</i> are shared.</p>                                                                                                                                                                 |

**startPreambleForThisPartition**

It defines the first preamble associated with the Feature Combination. If the UE is provided with a number N of SSB block indexes associated with one PRACH occasion, and N<1, the first preamble in each PRACH occasion is the one having the same index as indicated by this field. If N>=1, N blocks of preambles associated with the Feature Combination are defined, each having start index  $n \cdot N_{\text{SSB}} + \text{startPreambleForThisPartition}$ , where n refers to SSB block index (see TS 38.213 [13], clause 8.1).

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                                              |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MsgAConfigCommon     | The field is optionally present, Need S, if <i>FeatureCombinationPreambles</i> is included in <i>RACH-ConfigCommonTwoStepRA</i> . Otherwise, it is absent. If the field is absent in <i>FeatureCombinationPreambles</i> included in <i>RACH-ConfigCommonTwoStepRA</i> , the UE applies <i>MsgA-PUSCH-Config</i> included in the corresponding <i>MsgA-ConfigCommon</i> . |

– *FilterCoefficient*

The IE *FilterCoefficient* specifies the measurement filtering coefficient. Value *fc0* corresponds to k = 0, *fc1* corresponds to k = 1, and so on.

**FilterCoefficient information element**

```
-- ASN1START
-- TAG-FILTERCOEFFICIENT-START

FilterCoefficient ::=          ENUMERATED { fc0, fc1, fc2, fc3, fc4, fc5, fc6, fc7, fc8, fc9, fc11, fc13, fc15, fc17, fc19, spare1, ...}

-- TAG-FILTERCOEFFICIENT-STOP
-- ASN1STOP
```

– *FreqBandIndicatorNR*

The IE *FreqBandIndicatorNR* is used to convey an NR frequency band number as defined in TS 38.101-1 [15], TS 38.101-2 [39] and TS 38.101-5 [75].

**FreqBandIndicatorNR information element**

```
-- ASN1START

| <p><b>absoluteFrequencyPointA</b><br/>                     Absolute frequency position of the reference resource block (Common RB 0). Its lowest subcarrier is also known as Point A (see TS 38.211 [16], clause 4.4.4.2). Note that the lower edge of the actual carrier is not defined by this field but rather in the <i>scs-SpecificCarrierList</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <p><b>absoluteFrequencySSB</b><br/>                     Frequency of the SSB to be used for this serving cell. SSB related parameters (e.g. SSB index) provided for a serving cell refer to this SSB frequency unless mentioned otherwise. The CD-SSB of the PCell is always on the sync raster. Frequencies are considered to be on the sync raster if they are also identifiable with a GSCN value (see TS 38.101-1 [15] or TS 38.101-5 [75]). If the field is absent, the SSB related parameters should be absent, e.g. <i>ssb-PositionsInBurst</i>, <i>ssb-periodicityServingCell</i> and <i>subcarrierSpacing</i> in <i>ServingCellConfigCommon</i> IE. If the field is absent, the UE obtains timing reference from the SpCell or an SCell if applicable as described in TS 38.213 [13], clause 4.1. This is only supported in case the SCell for which the UE obtains the timing reference is in the same frequency band as the cell (i.e. the SpCell or the SCell, respectively) from which the UE obtains the timing reference.<br/>                     For cells supporting RedCap, this field corresponds to the CD-SSB.</p> |
| <p><b>frequencyBandList</b><br/>                     List containing only one frequency band to which this carrier(s) belongs. Multiple values are not supported.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <p><b>scs-SpecificCarrierList</b><br/>                     A set of carriers for different subcarrier spacings (numerologies). Defined in relation to Point A. The network configures a <i>scs-SpecificCarrier</i> at least for each numerology (SCS) that is used e.g. in a BWP (see TS 38.211 [16], clause 5.3).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Conditional Presence | Explanation                                                                                                                     |

| <b><i>absoluteFrequencyPointA</i></b>     | Absolute frequency of the reference resource block (Common RB 0). Its lowest subcarrier is also known as Point A (see TS 38.211 [16], clause 4.4.4.2). Note that the lower edge of the actual carrier is not defined by this field but rather in the <i>scs-SpecificCarrierList</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>additionalSpectrumEmission</i></b>  | The additional spectrum emission requirements to be applied by the UE on this uplink. If both <i>additionalSpectrumEmission</i> (without suffix) and <i>additionalSpectrumEmission-v1760</i> are absent, the UE uses value 0 for the <i>additionalSpectrumEmission</i> (see TS 38.101-1 [15], tables 6.2.3.1-1A, 6.2A.3.1.1-2 and 6.2A.3.1.2-2, TS 38.101-2 [39], tables 6.2.3.1-2 and 6.2A.3.1-2, and TS 38.101-5 [75], table 6.2.3.1-1A). Network configures the same value in <i>additionalSpectrumEmission</i> for all uplink carrier(s) of the same band with UL configured and if signalled, the same value in <i>additionalSpectrumEmission-v1760</i> for all uplink carrier(s) of the same band with UL configured, except for <i>additionalSpectrumEmission</i> value corresponding to NS_55/NS_57. If NS_55/NS_57 (see TS 38.101-1 [15], table 6.2.3.1-1) is applicable for at least one uplink carrier, the network may configure either NS_55/NS_57 or NS_01 for these uplink carriers, and NS_01 for the remaining uplink carrier(s) of band n77. The <i>additionalSpectrumEmission</i> is applicable for all uplink carriers of the same band with UL configured. |
| <b><i>frequencyBandList</i></b>           | List containing only one frequency band to which this carrier(s) belongs. Multiple values are not supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>frequencyShift7p5khz</i></b>        | Enable the NR UL transmission with a 7.5 kHz shift to the LTE raster. If the field is absent, the frequency shift is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>p-Max</i></b>                       | Maximum transmit power allowed in this serving cell. The maximum transmit power that the UE may use on this serving cell may be additionally limited by <i>p-NR-FR1</i> (configured for the cell group) and by <i>p-UE-FR1</i> (configured total for all serving cells operating on FR1). If absent, the UE applies the maximum power according to TS 38.101-1 [15] in case of an FR1 cell, TS 38.101-2 [39] in case of an FR2 cell or TS 38.101-5 [75] in case of an NTN cell. In this release of the specification, if <i>p-Max</i> is present on a carrier frequency in FR2, the UE shall ignore the field and applies the maximum power according to TS 38.101-2 [39]. Value in dBm. This field is ignored by IAB-MT, the IAB-MT applies output power and emissions requirements, as specified in TS 38.174 [63].                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>scs-SpecificCarrierList</i></b>     | A set of carriers for different subcarrier spacings (numerologies). Defined in relation to Point A. The network configures a <i>scs-SpecificCarrier</i> at least for each numerology (SCS) that is used e.g. in a BWP (see TS 38.211 [16], clause 5.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Conditional Presence</b>   | <b>Explanation</b>                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>FDD-OrSUL</i>              | The field is mandatory present if this <i>FrequencyInfoUL</i> is for the paired UL for a DL (defined in a <i>FrequencyInfoDL</i> ) or if this <i>FrequencyInfoUL</i> is for a supplementary uplink (SUL). It is absent, Need R, otherwise (if this <i>FrequencyInfoUL</i> is for an unpaired UL (TDD)).                                                                                                                     |
| <i>FDD-TDD-OrSUL-Optional</i> | The field is optionally present, Need R, if this <i>FrequencyInfoUL</i> is for the paired UL for a DL (defined in a <i>FrequencyInfoDL</i> ), or if this <i>FrequencyInfoUL</i> is for an unpaired UL (TDD) in certain bands (as defined in clause 5.4.2.1 of TS 38.101-1 and in clause 5.4.2.1 of TS 38.104 [12]), or if this <i>FrequencyInfoUL</i> is for a supplementary uplink (SUL). It is absent, Need R, otherwise. |

## – *FrequencyInfoUL-SIB*

The IE *FrequencyInfoUL-SIB* provides basic parameters of an uplink carrier and transmission thereon.

|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>absoluteFrequencyPointA</i></b>         | Absolute frequency of the reference resource block (Common RB 0). Its lowest subcarrier is also known as Point A (see TS 38.211 [16], clause 4.4.4.2). Note that the lower edge of the actual carrier is not defined by this field but rather in the <i>scs-SpecificCarrierList</i> .                                                                                                                                                                                                                                                       |
| <b><i>frequencyBandList</i></b>               | Provides the frequency band indicator and a list of <i>additionalPmax</i> and <i>additionalSpectrumEmission</i> values as defined in TS 38.101-1 [15], table 6.2.3.1-1, TS 38.101-2 [39], table 6.2.3.1-2, and TS 38.101-5 [75], table 6.2.3.1-1. The UE shall apply the first listed band which it supports in the <i>frequencyBandList</i> field. If <i>frequencyBandList-v1760</i> is present, it shall contain the same number of entries, listed in the same order as in <i>frequencyBandList</i> (without suffix).                    |
| <b><i>frequencyShift7p5khz</i></b>            | Enable the NR UL transmission with a 7.5 kHz shift to the LTE raster. If the field is absent, the frequency shift is disabled.                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>p-Max</i></b>                           | Value in dBm applicable for the cell. If absent the UE applies the maximum power according to TS 38.101-1 [15] in case of an FR1 cell, TS 38.101-2 [39] in case of an FR2 cell or TS 38.101-5 [75] in case of an NTN cell. In this release of the specification, if p-Max is present on a carrier frequency in FR2, the UE shall ignore the field and applies the maximum power according to TS 38.101-2 [39]. This field is ignored by IAB-MT, the IAB-MT applies output power and emissions requirements, as specified in TS 38.174 [63]. |
| <b><i>scs-SpecificCarrierList</i></b>         | A set of carriers for different subcarrier spacings (numerologies). Defined in relation to Point A (see TS 38.211 [16], clause 5.3). The network configures this for all SCSs that are used in UL BWPs configured in this serving cell.                                                                                                                                                                                                                                                                                                     |

| Conditional Presence          | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>FDD-OrSUL</i>              | The field is mandatory present if this <i>FrequencyInfoUL-SIB</i> is for the paired UL for a DL (defined in a <i>FrequencyInfoDL-SIB</i> ) or if this <i>FrequencyInfoUL-SIB</i> is for a supplementary uplink (SUL). It is absent otherwise (if this <i>FrequencyInfoUL-SIB</i> is for an unpaired UL (TDD)).                                                                                                                     |
| <i>FDD-TDD-OrSUL-Optional</i> | The field is optionally present, Need R, if this <i>FrequencyInfoUL-SIB</i> is for the paired UL for a DL (defined in a <i>FrequencyInfoDL-SIB</i> ), or if this <i>FrequencyInfoUL-SIB</i> is for an unpaired UL (TDD) in certain bands (as defined in clause 5.4.2.1 of TS 38.101-1 and in clause 5.4.2.1 of TS 38.104 [12]), or if this <i>FrequencyInfoUL-SIB</i> is for a supplementary uplink (SUL). It is absent otherwise. |

| <p><b>periodicityAndPattern</b><br/>A time domain repetition pattern at which the pattern defined by <i>symbols</i> recurs. This slot pattern repeats itself continuously. When the field is not configured, the UE uses the value n1 (see TS 38.214 [19], clause 6.1).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <p><b>symbols</b><br/>A symbol level bitmap in time domain (see TS 38.214[19], clause 6.1).<br/>For <i>oneSlot</i>, if ECP is configured, the first 12 bits represent the symbols within the slot and the last two bits within the bitstring are ignored by the UE; Otherwise, the 14 bits represent the symbols within the slot.<br/>For <i>twoSlots</i>, if ECP is configured, the first 12 bits represent the symbols within the first slot and the next 12 bits represent the symbols in the second slot and the last four bits within the bit string are ignored by the UE; Otherwise, the first 14 bits represent the symbols within the first slot and the next 14 bits represent the symbols in the second slot.<br/>For the bits representing symbols in a slot, the most significant bit of the bit string represents the first symbol in the slot and the second most significant bit represents the second symbol in the slot and so on.<br/>This pattern recurs (in time domain) with the configured <i>periodicityAndPattern</i>.</p> |

– *I-RNTI-Value*

The IE *I-RNTI-Value* is used to identify the suspended UE context of a UE in RRC\_INACTIVE.

*I-RNTI-Value* information element

```
-- ASN1START
-- TAG-I-RNTI-VALUE-START

I-RNTI-Value ::=          BIT STRING (SIZE(40))

-- TAG-I-RNTI-VALUE-STOP
-- ASN1STOP
```

– *LBT-FailureRecoveryConfig*

The IE *LBT-FailureRecoveryConfig-r16* is used to configure the parameters used for detection of consistent uplink LBT failures for operation with shared spectrum channel access, as specified in TS 38.321 [3].

*LBT-FailureRecoveryConfig* information element

```
-- ASN1START
-- TAG-LBT-FAILURERECOVERYCONFIG-START

LBT-FailureRecoveryConfig-r16 ::= SEQUENCE {
```

```
lbt-FailureInstanceMaxCount-r16    ENUMERATED {n4, n8, n16, n32, n64, n128},
lbt-FailureDetectionTimer-r16      ENUMERATED {ms10, ms20, ms40, ms80, ms160, ms320},
...
}

-- TAG-LBT-FAILURERECOVERYCONFIG-STOP
-- ASN1STOP
```

| LBT-FailureRecoveryConfig field descriptions                                                                                                                                                                                                                                        |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>lbt-FailureDetectionTimer</b><br>Timer for consistent uplink LBT failure detection (see TS 38.321 [3]). Value <i>ms10</i> corresponds to 10 ms, value <i>ms20</i> corresponds to 20 ms, and so on.                                                                               |
| <b>lbt-FailureInstanceMaxCount</b><br>This field determines after how many LBT failure indications received from the physical layer the UE triggers uplink LBT failure recovery (see TS 38.321 [3]). Value <i>n4</i> corresponds to 4, value <i>n8</i> corresponds to 8, and so on. |

– *LocationInfo*

The IE *LocationInfo* is used to transfer available detailed location information, Bluetooth, WLAN and sensor available measurement results at the UE.

*LocationInfo* information element

```
-- ASN1START
-- TAG-LOCATIONINFO-START

LocationInfo-r16 ::= SEQUENCE {
    commonLocationInfo-r16    CommonLocationInfo-r16    OPTIONAL,
    bt-LocationInfo-r16      LogMeasResultListBT-r16    OPTIONAL,
    wlan-LocationInfo-r16    LogMeasResultListWLAN-r16  OPTIONAL,
    sensor-LocationInfo-r16  Sensor-LocationInfo-r16    OPTIONAL,
    ...
}

-- TAG-LOCATIONINFO-STOP
-- ASN1STOP
```

– *LocationMeasurementInfo*

The IE *LocationMeasurementInfo* defines the information sent by the UE to the network to assist with the configuration of measurement gaps for location related measurements.

*LocationMeasurementInfo* information element

```
-- ASN1START
-- TAG-LOCATIONMEASUREMENTINFO-START

LocationMeasurementInfo ::= CHOICE {
```

| <b>carrierFreq</b><br>The EARFCN value of the carrier received from upper layers for which the UE needs to perform the inter-RAT RSTD measurements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>measPRS-Offset</b><br>Indicates the requested gap offset for performing RSTD measurements towards E-UTRA. It is the smallest subframe offset from the beginning of subframe 0 of SFN=0 of the serving cell of the requested gap for measuring PRS positioning occasions in the carrier frequency <i>carrierFreq</i> for which the UE needs to perform the inter-RAT RSTD measurements. The PRS positioning occasion information is received from upper layers. The value of <i>measPRS-Offset</i> is obtained by mapping the starting subframe of the PRS positioning occasion in the measured cell onto the corresponding subframe in the serving cell and is calculated as the serving cell's number of subframes from SFN=0 mod 40.<br>The UE shall take into account any additional time required by the UE to start PRS measurements on the other carrier when it does this mapping for determining the <i>measPRS-Offset</i> .<br>NOTE: Figure 6.2.2-1 in TS 36.331[10] illustrates the <i>measPRS-Offset</i> field. |
| <b>dl-PRS-PointA</b><br>The ARFCN value of the carrier received from upper layers for which the UE needs to perform the NR DL-PRS measurements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>nr-MeasPRS-RepetitionAndOffset</b><br>Indicates the gap periodicity in ms and offset in number of subframes of the requested measurement gap for performing NR DL-PRS measurements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>nr-MeasPRS-length</b><br>Indicates measurement gap length in ms of the requested measurement gap for performing NR DL-PRS measurements. The measurement gap length is according to in Table 9.1.2-1 in TS 38.133 [14].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## – *LogicalChannelConfig*

The IE *LogicalChannelConfig* is used to configure the logical channel parameters.

| <i>LogicalChannelConfig</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b><i>allowedCG-List</i></b><br/>This restriction applies only when the UL grant is a configured grant. If present, UL MAC SDUs from this logical channel can only be mapped to the indicated configured grant configuration. If the size of the sequence is zero, then UL MAC SDUs from this logical channel cannot be mapped to any configured grant configurations. If the field is not present, UL MAC SDUs from this logical channel can be mapped to any configured grant configurations. If the field <i>configuredGrantType1Allowed</i> is present, only those configured grant type 1 configuration indicated in this sequence are allowed for use by this logical channel; otherwise, this sequence shall not include any configured grant type 1 configuration. Corresponds to "allowedCG-List" as specified in TS 38.321 [3]. This field is ignored when SDT procedure is ongoing.</p> |
| <p><b><i>allowedHARQ-mode</i></b><br/>Indicates the allowed HARQ mode of a HARQ process mapped to this logical channel. If the parameter is absent, there is no restriction for HARQ mode for the mapping. This field applies to SRB1, SRB2, SRB4 and DRBs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <p><b><i>allowedPHY-PriorityIndex</i></b><br/>This restriction applies only when the UL grant is a dynamic grant. If the field is present and the dynamic grant has a PHY-priority index, UL MAC SDUs from this logical channel can only be mapped to the dynamic grants indicating PHY-priority index equal to the values configured by this field. If the field is present and the dynamic grant does not have a PHY-priority index, UL MAC SDUs from this logical channel can only be mapped to this dynamic grant if the value of the field is <i>p0</i>, see TS 38.213 [13], clause 9. If the field is not present, UL MAC SDUs from this logical channel can be mapped to any dynamic grants. Corresponds to "allowedPHY-PriorityIndex" as specified in TS 38.321 [3].</p>                                                                                                                      |
| <p><b><i>allowedSCS-List</i></b><br/>If present, UL MAC SDUs from this logical channel can only be mapped to the indicated numerology. Otherwise, UL MAC SDUs from this logical channel can be mapped to any configured numerology. Corresponds to '<i>allowedSCS-List</i>' as specified in TS 38.321 [3].<br/>Only the following values are applicable depending on the used frequency:<br/>FR1: 15, 30, or 60 kHz<br/>FR2-1: 60 or 120 kHz<br/>FR2-2: 120, 480, or 960 kHz</p>                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <p><b><i>allowedServingCells</i></b><br/>If present, UL MAC SDUs from this logical channel can only be mapped to the serving cells indicated in this list. Otherwise, UL MAC SDUs from this logical channel can be mapped to any configured serving cell of this cell group. Corresponds to '<i>allowedServingCells</i>' in TS 38.321 [3].</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <p><b><i>bitRateMultiplier</i></b><br/>Bit rate multiplier for recommended bit rate MAC CE as specified in TS 38.321 [3]. Value <i>x40</i> indicates bit rate multiplier 40, value <i>x70</i> indicates bit rate multiplier 70 and so on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <p><b><i>bitRateQueryProhibitTimer</i></b><br/>The timer is used for bit rate recommendation query in TS 38.321 [3], in seconds. Value <i>s0</i> means 0 s, <i>s0dot4</i> means 0.4 s and so on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

#### ***LTE-NeighCellsCRS-AssistInfo* field descriptions**

##### ***neighCarrierBandwidthDL***

Indicates the channel bandwidth of the neighbour LTE cell in number of PRBs. If the field is absent, the UE applies the value of *carrierBandwidthDL* indicated in *RateMatchPatternLTE-CRS* for this serving cell, if configured.

##### ***neighCarrierFreqDL***

Indicates the downlink centre frequency of the neighbour LTE cell. If the field is absent, the UE applies the value of *carrierFreqDL* indicated in *RateMatchPatternLTE-CRS* for this serving cell, if configured.

##### ***neighCellId***

Indicates the physical cell ID of the neighbour LTE cell for which the other fields within the same *LTE-NeighCellsCRS-AssistInfo* apply.  
 If the IE *LTE-NeighCellsCRS-AssistInfoList* contains multiple list entries, either this field or *neighV-Shift* is included in each instance.  
 If the IE *LTE-NeighCellsCRS-AssistInfoList* contains multiple list entries, the entry with *neighV-Shift* is only used for neighbour LTE cells for which *neighCellId* is not provided (i.e. the entry with *neighCellId* takes precedence over the entry with *neighV-Shift*, if provided).  
 If the IE *LTE-NeighCellsCRS-AssistInfoList* contains one list entry with neither this field nor *neighV-Shift*, the information within the entry applies to all neighbour LTE cells.

##### ***neighCRS-muting***

Indicates whether the CRS interference mitigation is enabled in the neighbour LTE cell, as specified in TS 36.133 [40], clause 3.6.1.1.

##### ***neighMBSFN-SubframeConfigList***

Indicates the MBSFN subframe configuration of the neighbour LTE cell. If *RateMatchPatternLTE-CRS* is configured for this serving cell and the field is absent, the UE applies the value of *mbsfn-SubframeConfigList* indicated in *RateMatchPatternLTE-CRS* for this serving cell if configured; otherwise, if the field is absent, the UE assumes MBSFN is not configured in the neighbour LTE cell.

##### ***neighNrofCRS-Ports***

Indicates the CRS antenna ports number of the neighbour LTE cell. If the field is absent, the UE applies the value of *nrofCRS-Ports* indicated in *RateMatchPatternLTE-CRS* for this serving cell, if configured. If *RateMatchPatternLTE-CRS* is not configured for this serving cell and the field is absent, the UE applies the default value *n4*.

##### ***neighV-Shift***

Indicates the shifting value *v-shift* of neighbour LTE cells for which the other fields within the same *LTE-NeighCellsCRS-AssistInfo* apply.

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b><i>g-CS-RNTI-ConfigToAddModList</i></b><br>List of G-CS-RNTI configurations to add or modify. Up to 8 G-CS-RNTIs can be configured in total in this release based on the UE capability.                                                                                                                                                                                                                                                                                                |
| <b><i>g-CS-RNTI-ConfigToReleaseList</i></b><br>List of G-CS-RNTI configurations to release.                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>intraCG-Prioritization</i></b><br>Used to enable HARQ process ID selection based on LCH-priority for one CG as specified in TS 38.321 [3].                                                                                                                                                                                                                                                                                                                                          |
| <b><i>lch-BasedPrioritization</i></b><br>If this field is present, the corresponding MAC entity of the UE is configured with prioritization between overlapping grants and between scheduling request and overlapping grants based on LCH priority, see TS 38.321 [3]. The network does not configure <i>lch-BasedPrioritization</i> with <i>enhancedSkipUplinkTxDynamic</i> simultaneously nor <i>lch-BasedPrioritization</i> with <i>enhancedSkipUplinkTxConfigured</i> simultaneously. |
| <b><i>posMG-Request</i></b><br>Indicates whether UE is configured to send UL MAC CE for Positioning Measurement Gap Activation/Deactivation Request, as specified in TS 38.321 [3].                                                                                                                                                                                                                                                                                                       |
| <b><i>schedulingRequestID-BFR-SCell</i></b><br>Indicates the scheduling request configuration applicable for BFR on SCell, as specified in TS 38.321 [3].                                                                                                                                                                                                                                                                                                                                 |
| <b><i>schedulingRequestID-BFR</i></b><br>Indicates the scheduling request configuration (SchedulingRequestConfig) that the UE shall use upon detecting a beam failure on the detection resources configured in <i>failureDetectionSet1</i> of a serving cell while beam failure is not detected on resources configured in <i>failureDetectionSet2</i> of the same serving cell.                                                                                                          |
| <b><i>schedulingRequestID-BFR2</i></b><br>Indicates the scheduling request configuration (SchedulingRequestConfig) that the UE shall use upon detecting a beam failure on the detection resources configured in <i>failureDetectionSet2</i> of a serving cell while beam failure is not detected on resources configured in <i>failureDetectionSet1</i> of the same serving cell.                                                                                                         |
| <b><i>schedulingRequestID-LBT-SCell</i></b><br>Indicates the scheduling request configuration applicable for consistent uplink LBT recovery on SCell, as specified in TS 38.321 [3].                                                                                                                                                                                                                                                                                                      |
| <b><i>schedulingRequestID-PosMG-Request</i></b><br>Indicates the scheduling request configuration applicable for Positioning Measurement Gap Activation/Deactivation Request, as specified in TS 38.321 [3].                                                                                                                                                                                                                                                                              |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>skipUplinkTxDynamic, enhancedSkipUplinkTxDynamic, enhancedSkipUplinkTxConfigured</i></b><br>If set to <i>true</i> , the UE skips UL transmissions as described in TS 38.321 [3]. If the UE is configured with <i>enhancedSkipUplinkTxDynamic</i> or <i>enhancedSkipUplinkTxConfigured</i> with value <i>true</i> , REPETITION_NUMBER (as specified in TS 38.321 [3], clause 5.4.2.1) of the corresponding PUSCH transmission of the uplink grant shall be equal to 1. The network does not configure <i>enhancedSkipUplinkTxDynamic</i> or <i>enhancedSkipUplinkTxConfigured</i> with value <i>true</i> together with <i>numberOfSlotsTBoMS-r17</i> . |
| <b><i>tag-Config</i></b><br>The field is used to configure parameters for a time-alignment group. The field is not present if any DAPS bearer is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>usePreBSR</i></b><br>If set to <i>true</i> , the MAC entity of the IAB-MT may use the Pre-emptive BSR, see TS 38.321 [3].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b><i>MBS-RNTI-SpecificConfig</i></b> field descriptions                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>drx-ConfigPTM</i></b><br>Used to configure DRX for PTM transmission as specified in TS 38.321 [3].                                                                                                                                                                                                                                                                                                                                      |
| <b><i>g-CS-RNTI</i></b><br>Used to scramble the SPS group-common PDSCH and activation/deactivation of SPS group-common PDSCH for one or more MBS multicast services.                                                                                                                                                                                                                                                                          |
| <b><i>g-RNTI</i></b><br>Used to scramble the scheduling and transmission of PTM for one or more MBS multicast services.                                                                                                                                                                                                                                                                                                                       |
| <b><i>groupCommon-RNTI</i></b><br>Used to configure <i>g-RNTI</i> or <i>g-CS-RNTI</i> .                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>harq-FeedbackEnablerMulticast</i></b><br>Indicates whether the UE shall provide HARQ feedback for MBS multicast. Value <i>dci-enabler</i> means that whether the UE shall provide HARQ feedback for MBS multicast is indicated by DCI as specified in TS 38.213 [13]. Value <i>enabled</i> means the UE shall always provide HARQ feedback for MBS multicast. When the field is absent, the UE behavior is specified in TS 38.213 [13]. |
| <b><i>harq-FeedbackOptionMulticast</i></b><br>Indicates the feedback mode for MBS multicast dynamically scheduled PDSCH or SPS PDSCH.                                                                                                                                                                                                                                                                                                         |
| <b><i>mbs-RNTI-SpecificConfigId</i></b><br>An identifier of the RNTI specific configuration for MBS multicast.                                                                                                                                                                                                                                                                                                                                |
| <b><i>pdsch-AggregationFactor</i></b><br>Number of repetitions for dynamically scheduled MBS multicast data (see TS 38.214 [19], clause 5.1.2.1). When the field is absent and <i>groupCommon-RNTI</i> is set to <i>g-RNTI</i> , the UE applies the value 1.                                                                                                                                                                                  |

| <b>Conditional Presence</b>  | <b>Explanation</b>                                                                                                                                                                                                                                                           |

|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>gapAssociationPRS</b><br/>Indicates that PRS measurement is associated with this measurement gap. The network only includes this field for one per-UE gap or for one per-FR gap. If concurrent gap (i.e. one of the gap combination as defined in Table 9.1.8-1 in TS 38.133 [14]) is configured and no gap is configured with this field, the PRS measurement is associated with the gap configured via <i>GapConfig</i> (without suffix), if available. If both per-UE gap and per-FR gap are configured via <i>GapConfig</i> and/or <i>GapConfig-r17</i>, the PRS measurement is always associated with the per-UE gap.</p>                                                                                                                                                                                                                                                                                                                                                                                                  |
| <p><b>gapFR1</b><br/>Indicates measurement gap configuration that applies to FR1 only. In (NG)EN-DC, <i>gapFR1</i> cannot be set up by NR RRC (i.e. only LTE RRC can configure FR1 measurement gap). In NE-DC, <i>gapFR1</i> can only be set up by NR RRC (i.e. LTE RRC cannot configure FR1 gap). In NR-DC, <i>gapFR1</i> can only be set up in the <i>measConfig</i> associated with MCG. <i>gapFR1</i> can not be configured together with <i>gapUE</i>. The applicability of the FR1 measurement gap is according to Table 9.1.2-2 and Table 9.1.2-3 in TS 38.133 [14].</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <p><b>gapFR2</b><br/>Indicates measurement gap configuration applies to FR2 only. In (NG)EN-DC or NE-DC, <i>gapFR2</i> can only be set up by NR RRC (i.e. LTE RRC cannot configure FR2 gap). In NR-DC, <i>gapFR2</i> can only be set up in the <i>measConfig</i> associated with MCG. <i>gapFR2</i> cannot be configured together with <i>gapUE</i>. The applicability of the FR2 measurement gap is according to Table 9.1.2-2 and Table 9.1.2-3 in TS 38.133 [14].</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <p><b>gapOffset</b><br/>Value <i>gapOffset</i> is the gap offset of the gap pattern with MGRP indicated in the field <i>mgrp</i>. The value range is from 0 to <i>mgrp</i>-1. If <i>ncsgInd-r17</i> is present, this offset value refers to the starting point of VIL1 (the visible interruption length before the ML).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <p><b>gapPriority</b><br/>Indicates the priority of this measurement gap (see TS 38.133 [14]). Value 1 indicates highest priority, value 2 indicates second level priority, and so on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <p><b>gapSharing</b><br/>Indicates the measurement gap sharing scheme that applies to this <i>GapConfig</i>. For applicability of the different gap sharing schemes, see TS 38.133 [14]. Value <i>scheme00</i> corresponds to scheme "00", value <i>scheme01</i> corresponds to scheme "01", and so on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <p><b>gapToAddModList</b><br/>A list of measurement gap configuration to be added or modified. If more than one measurement gap is configured (i.e. concurrent measurement gap as specified in TS 38.133[14], clause 9.1.8 for TN or clause 9.1C.8 for NTN), the maximum number of configured measurement gap is limited by the gap combinations defined in Table 9.1.8-1 in TS 38.133 [14] for TN. For NTN the maximum number of configured measurement gap is limited by UE capability indicated in <i>parallelMeasurementGap</i>. The network configures at most one NCSG or pre-configured measurement gap for a given gap type. In this version of the specification, the network configures this field only in NR standalone. This field is used only for a UE that supports pre-configured measurement gap, concurrent measurement gap, or NCSG. In this version of the specification, the network does not configure concurrent measurement gap together with MUSIM gap or preconfigured measurement gap for positioning.</p> |
| <p><b>gapToReleaseList</b><br/>A list of measurement gap configuration to be released.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <p><b>gapType</b><br/>Indicates the type of this measurement gap. Value <i>perUE</i> indicates that it is a per UE measurement gap, value <i>perFR1</i> indicates that it is an FR1 measurement gap, and value <i>perFR2</i> indicates that it is an FR2 measurement gap.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <p><b>gapUE</b><br/>Indicates measurement gap configuration that applies to all frequencies (FR1 and FR2). In (NG)EN-DC, <i>gapUE</i> cannot be set up by NR RRC (i.e. only LTE RRC can configure per UE measurement gap). In NE-DC, <i>gapUE</i> can only be set up by NR RRC (i.e. LTE RRC cannot configure per UE gap). In NR-DC, <i>gapUE</i> can only be set up in the <i>measConfig</i> associated with MCG. If <i>gapUE</i> is configured, then neither <i>gapFR1</i> nor <i>gapFR2</i> can be configured. For TN, the applicability of the per UE measurement gap is according to Table 9.1.2-2 and Table 9.1.2-3 for non-RedCap UEs, and Table 9.1A.2-2 for RedCap UEs in TS 38.133 [14]. For NTN, the applicability of per UE measurement gap is according to subclause 9.1C.2 in TS 38.133 [14].</p>                                                                                                                                                                                                                       |
| <p><b>measGapId</b><br/>The ID of this measurement gap configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <p><b>mgl</b><br/>Value <i>mgl</i> is the measurement gap length in ms of the measurement gap. If <i>ncsgInd-r17</i> is not present, the measurement gap length is according to Table 9.1.2-1 for non-RedCap UEs in TN, Table 9.1A.2-1 for RedCap UEs in TN, and Table 9.1C.2-1 for NTN in TS 38.133 [14]. If <i>ncsgInd-r17</i> is present, this field indicates the measurement length (ML) in NCSG pattern and is configured according to Table 9.1.9.3-1 in TS 38.133 [14]. Value <i>ms1dot5</i> corresponds to 1.5 ms, <i>ms3</i> corresponds to 3 ms and so on. If <i>mgl-r16</i> is present, UE shall ignore the <i>mgl</i> (without suffix). Value <i>ms1</i>, <i>ms2</i>, and <i>ms5</i> can only be configured if <i>ncsgInd</i> is present.</p>                                                                                                                                                                                                                                                                            |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>mgrp</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| If <i>ncsglnd-r17</i> is not present, the <i>mgrp</i> field indicates the measurement gap repetition period in (ms) of the measurement gap according to Table 9.1.2-1 for non-RedCap UEs in TN, Table 9.1A.2-1 for RedCap UEs in TN, and Table 9.1C.2-1 for NTN in TS 38.133 [14]. If <i>ncsglnd-r17</i> is present, the <i>mgrp</i> field indicates the Visible Interruption Repetition Period (VIRP) of NCSG pattern and is configured according to Table 9.1.9.3-1 in TS 38.133 [14].                                                                                                                                                                                                                                                                                                                                 |
| <b><i>mgta</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Value <i>mgta</i> is the measurement gap timing advance in ms. The applicability of the measurement gap timing advance is according to clause 9.1.2 for non-RedCap UEs in TN, clause 9.1A.2 for RedCap UEs in TN, and clause 9.1C.2 for NTN of TS 38.133 [14], or according to clause 9.1.9 of TS 38.133 [14] if <i>ncsglnd</i> is present. Value <i>ms0</i> corresponds to 0 ms, <i>ms0dot25</i> corresponds to 0.25 ms, <i>ms0dot5</i> corresponds to 0.5 ms and <i>ms0dot75</i> corresponds to 0.75 ms. For FR2, the network only configures 0 ms and 0.25 ms if <i>ncsglnd</i> is not present. If <i>ncsglnd</i> is present, the network only configures 0ms for per-UE NCSG and FR1 NCSG and only configures 0ms or 0.75ms for FR2 NCSG. Value <i>ms0dot75</i> can only be configured if <i>ncsglnd</i> is present. |
| <b><i>ncsglnd</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Indicates that the measurement gap is a NCSG as specified in 38.133 [14].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| List of preconfigured measurement gap for positioning to add and/or modify. All the gaps configured are associated with the measurement of PRS for RSTD, UE-RxTx Time Difference, PRS-RSRP and PRS-RSRPP as defined in TS 38.215 [9]. In this version of the specification, the network does not configure preconfigured measurement gap for positioning together with concurrent measurement gap or MUSIM gap.                                                                                                                                                                                                                                                                                                                                                                                                          |

|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>gapSharingFR1</b><br>Indicates the measurement gap sharing scheme that applies to the gap set via <i>gapFR1</i> . In (NG)EN-DC, <i>gapSharingFR1</i> cannot be set up by NR RRC (i.e. only LTE RRC can configure FR1 gap sharing). In NE-DC, <i>gapSharingFR1</i> can only be set up by NR RRC (i.e. LTE RRC cannot configure FR1 gap sharing). In NR-DC, <i>gapSharingFR1</i> can only be set up in the <i>measConfig</i> associated with MCG. <i>gapSharingFR1</i> can not be configured together with <i>gapSharingUE</i> . For the applicability of the different gap sharing schemes, see TS 38.133 [14]. Value <i>scheme00</i> corresponds to scheme "00", value <i>scheme01</i> corresponds to scheme "01", and so on.                                       |
| <b>gapSharingFR2</b><br>Indicates the measurement gap sharing scheme that applies to the gap set via <i>gapFR2</i> . In (NG)EN-DC or NE-DC, <i>gapSharingFR2</i> can only be set up by NR RRC (i.e. LTE RRC cannot configure FR2 gap sharing). In NR-DC, <i>gapSharingFR2</i> can only be set up by MCG in the <i>measConfig</i> associated with MCG. <i>gapSharingFR2</i> cannot be configured together with <i>gapSharingUE</i> . For applicability of the different gap sharing schemes, see TS 38.133 [14]. Value <i>scheme00</i> corresponds to scheme "00", value <i>scheme01</i> corresponds to scheme "01", and so on.                                                                                                                                         |
| <b>gapSharingUE</b><br>Indicates the measurement gap sharing scheme that applies to the gap set via <i>gapUE</i> . In (NG)EN-DC, <i>gapSharingUE</i> cannot be set up by NR RRC (i.e. only LTE RRC can configure per UE gap sharing). In NE-DC, <i>gapSharingUE</i> can only be set up by NR RRC (i.e. LTE RRC cannot configure per UE gap sharing). In NR-DC, <i>gapSharingUE</i> can only be set up in the <i>measConfig</i> associated with MCG. If <i>gapSharingUE</i> is configured, then neither <i>gapSharingFR1</i> nor <i>gapSharingFR2</i> can be configured. For the applicability of the different gap sharing schemes, see TS 38.133 [14]. Value <i>scheme00</i> corresponds to scheme "00", value <i>scheme01</i> corresponds to scheme "01", and so on. |

## — *MeasId*

The IE *MeasId* is used to identify a measurement configuration, i.e., linking of a measurement object and a reporting configuration.

### *MeasId* information element

```
-- ASN1START
-- TAG-MEASID-START

MeasId ::=                               INTEGER (1..maxNrofMeasId)

-- TAG-MEASID-STOP
-- ASN1STOP
```

## — *MeasIdleConfig*

The IE *MeasIdleConfig* is used to convey information to UE about measurements requested to be done while in RRC\_IDLE or RRC\_INACTIVE.

### *MeasIdleConfig* information element

| <b><i>deriveSSB-IndexFromCell</i></b><br>This field indicates whether the UE may use the timing of any detected cell on that frequency to derive the SSB index of all neighbour cells on that frequency. If this field is set to true, the UE assumes SFN and frame boundary alignment across cells on the neighbor frequency as specified in TS 38.133 [14]. |
| <b><i>frequencyBandList</i></b><br>Indicates the list of frequency bands for which the NR idle/inactive measurement parameters apply. The UE shall select the first listed band which it supports in the frequencyBandList field to represent the NR neighbour carrier frequency.                                                                             |
| <b><i>includeBeamMeasurements</i></b><br>Indicates whether or not the UE shall include beam measurements in the NR idle/inactive measurement results.                                                                                                                                                                                                         |
| <b><i>maxNrofRS-IndexesToReport</i></b><br>Max number of beam indices to include in the idle/inactive measurement result.                                                                                                                                                                                                                                     |
| <b><i>measCellListEUTRA</i></b><br>Indicates the list of E-UTRA cells which the UE is requested to measure and report for idle/inactive measurements.                                                                                                                                                                                                         |
| <b><i>measCellListNR</i></b><br>Indicates the list of NR cells which the UE is requested to measure and report for idle/inactive measurements.                                                                                                                                                                                                                |
| <b><i>measIdleCarrierListEUTRA</i></b><br>Indicates the E-UTRA carriers to be measured during RRC_IDLE or RRC_INACTIVE.                                                                                                                                                                                                                                       |
| <b><i>measIdleCarrierListNR</i></b><br>Indicates the NR carriers to be measured during RRC_IDLE or RRC_INACTIVE.                                                                                                                                                                                                                                              |
| <b><i>measIdleDuration</i></b><br>Indicates the duration for performing idle/inactive measurements while in RRC_IDLE or RRC_INACTIVE. Value sec10 correspond to 10 seconds, value sec30 to 30 seconds and so on.                                                                                                                                              |
| <b><i>nrofSS-BlocksToAverage</i></b><br>Number of SS blocks to average for cell measurement derivation.                                                                                                                                                                                                                                                       |
| <b><i>qualityThreshold</i></b><br>Indicates the quality thresholds for reporting the measured cells for idle/inactive NR measurements.                                                                                                                                                                                                                        |
| <b><i>qualityThresholdEUTRA</i></b><br>Indicates the quality thresholds for reporting the measured cells for idle/inactive E-UTRA measurements.                                                                                                                                                                                                               |
| <b><i>reportQuantities</i></b><br>Indicates which measurement quantities UE is requested to report in the idle/inactive measurement report.                                                                                                                                                                                                                   |
| <b><i>reportQuantitiesEUTRA</i></b><br>Indicates which E-UTRA measurement quantities the UE is requested to report in the idle/inactive measurement report.                                                                                                                                                                                                   |
| <b><i>reportQuantityRS-Indexes</i></b><br>Indicates which measurement information per beam index the UE shall include in the NR idle/inactive measurement results.                                                                                                                                                                                            |
| <b><i>smtc</i></b><br>Indicates the measurement timing configuration for inter-frequency measurement. If this field is absent in <i>VarMeasIdleConfig</i> , the UE assumes that SSB periodicity is 5 ms in this frequency.                                                                                                                                    |

|                                                                                                                                                                                                                               |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ssbSubcarrierSpacing</b><br>Indicates subcarrier spacing of SSB.<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15 or 30 kHz<br>FR2-1: 120 or 240 kHz<br>FR2-2: 120, 480, or 960 kHz |
| <b>ssb-ToMeasure</b><br>The set of SS blocks to be measured within the SMTC measurement duration (see TS 38.215 [9]). When the field is absent in <i>VarMeasIdleConfig</i> , the UE measures on all SS-blocks.                |
| <b>ss-RSSI-Measurement</b><br>Indicates the SSB-based RSSI measurement configuration. If the field is absent in <i>VarMeasIdleConfig</i> , the UE behaviour is defined in TS 38.215 [89], clause 5.1.3.                       |
| <b>validityAreaList</b><br>Indicates the list of frequencies and optionally, for each frequency, a list of cells within which the UE is required to perform measurements while in RRC_IDLE and RRC_INACTIVE.                  |

— *MeasIdToAddModList*

The IE *MeasIdToAddModList* concerns a list of measurement identities to add or modify, with for each entry the measId, the associated *measObjectId* and the associated *reportConfigId*.

**MeasIdToAddModList information element**

```
-- ASN1START
-- TAG-MEASIDTOADDMODLIST-START

MeasIdToAddModList ::=
    SEQUENCE (SIZE (1..maxNrofMeasId)) OF MeasIdToAddMod

MeasIdToAddMod ::=
    SEQUENCE {
        measId
        measObjectId
        reportConfigId
    }

-- TAG-MEASIDTOADDMODLIST-STOP
-- ASN1STOP
```

— *MeasObjectCLI*

The IE *MeasObjectCLI* specifies information applicable for SRS-RSRP measurements and/or CLI-RSSI measurements.

**MeasObjectCLI information element**

```
-- ASN1START
-- TAG-MEASOBJECTCLI-START
```

```

MeasObjectCLI-r16 ::=
    cli-ResourceConfig-r16
    ...
}

CLI-ResourceConfig-r16 ::=
    srs-ResourceConfig-r16
    rssi-ResourceConfig-r16
}

SRS-ResourceListConfigCLI-r16 ::= SEQUENCE (SIZE (1.. maxNrofCLI-SRS-Resources-r16)) OF SRS-ResourceConfigCLI-r16

RSSI-ResourceListConfigCLI-r16 ::= SEQUENCE (SIZE (1.. maxNrofCLI-RSSI-Resources-r16)) OF RSSI-ResourceConfigCLI-r16

SRS-ResourceConfigCLI-r16 ::= SEQUENCE {
    srs-Resource-r16
    srs-SCS-r16
    refServCellIndex-r16
    refBWP-r16
    ...
}

RSSI-ResourceConfigCLI-r16 ::= SEQUENCE {
    rssi-ResourceId-r16
    rssi-SCS-r16
    startPRB-r16

|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>nrofPRBs</b><br>Allowed size of the measurement BW. Only multiples of 4 are allowed. The smallest configurable number is the minimum of 4 and the width of the active DL BWP. If the configured value is larger than the width of the active DL BWP, the UE shall assume that the actual CLI-RSSI resource bandwidth is within the active DL BWP.                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>nrofSymbols</b><br>Within a slot that is configured for CLI-RSSI measurement (see slotConfiguration), the UE measures the RSSI from <i>startPosition</i> to <i>startPosition</i> + <i>nrofSymbols</i> - 1. The configured CLI-RSSI resource does not exceed the slot boundary of the reference SCS. If the SCS of configured DL BWP(s) is larger than the reference SCS, network configures <i>startPosition</i> and <i>nrofSymbols</i> such that the configured CLI-RSSI resource not to exceed the slot boundary corresponding to the configured BWP SCS. If the reference SCS is larger than SCS of configured DL BWP(s), network ensures <i>startPosition</i> and <i>nrofSymbols</i> are integer multiple of reference SCS divided by configured BWP SCS. |
| <b>refServCellIndex</b><br>The index of the reference serving cell. Frequency reference point of the RSSI resource is subcarrier 0 of CRB0 of the reference serving cell. If this field is absent, the reference serving cell is PCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>rssi-PeriodicityAndOffset</b><br>Periodicity and slot offset for this CLI-RSSI resource. All values are in "number of slots". Value <i>s1</i> corresponds to a periodicity of 1 slot, value <i>s2</i> corresponds to a periodicity of 2 slots, and so on. For each periodicity the corresponding offset is given in number of slots.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>rssi-SCS</b><br>Reference subcarrier spacing for CLI-RSSI measurement.<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15, 30, or 60 kHz<br>FR2-1: 60 or 120 kHz<br>FR2-2: 120, 480, or 960 kHz<br>UE performs CLI-RSSI measurement with the SCS of the active bandwidth part within the configured CLI-RSSI resource in the active BWP regardless of the reference SCS of the measurement resource.                                                                                                                                                                                                                                                                                                                     |
| <b>startPosition</b><br>OFDM symbol location of the CLI-RSSI resource within a slot.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>startPRB</b><br>Starting PRB index of the measurement bandwidth. For the case where the reference subcarrier spacing is smaller than subcarrier spacing of active DL BWP(s), network configures startPRB and nrofPRBs are as a multiple of active BW SCS divided by reference SCS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b><i>excludedCellsToAddModList</i></b><br>List of cells to add/modify in the exclude-list of cells. It applies only to SSB resources.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>excludedCellsToRemoveList</i></b><br>List of cells to remove from the exclude-list of cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>freqBandIndicatorNR</i></b><br>The frequency band in which the SSB and/or CSI-RS indicated in this <i>MeasObjectNR</i> are located and according to which the UE shall perform the RRM measurements. This field is always provided when the network configures measurements with this <i>MeasObjectNR</i> .                                                                                                                                                                                                                                                       |
| <b><i>measCyclePSCell</i></b><br>The parameter is used only when the PSCell is configured on the frequency indicated by the <i>measObjectNR</i> and the SCG is deactivated, see TS 38.133 [14]. The field may also be configured when the PSCell is not configured on that frequency. The network always configures <i>measCyclePSCell</i> for the <i>measObjectNR</i> associated with the PSCell if <i>bfd-and-RLM</i> is set to <i>true</i> and the SCG is deactivated. Value <i>ms160</i> corresponds to 160 ms, value <i>ms256</i> corresponds to 256 ms and so on. |
| <b><i>measCycleSCell</i></b><br>The parameter is used only when an SCell is configured on the frequency indicated by the <i>measObjectNR</i> and is in deactivated state, see TS 38.133 [14]. gNB configures the parameter whenever an SCell is configured on the frequency indicated by the <i>measObjectNR</i> , but the field may also be signalled when an SCell is not configured. Value <i>sf160</i> corresponds to 160 sub-frames, value <i>sf256</i> corresponds to 256 sub-frames and so on.                                                                   |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Secondary measurement timing configuration for SS corresponding to this <i>MeasObjectNR</i> with PCI listed in <i>pci-List</i> . For these SS, the periodicity is indicated by <i>periodicity</i> in <i>smtc2</i> and the timing offset is equal to the offset indicated in <i>periodicityAndOffset</i> modulo <i>periodicity</i> . <i>periodicity</i> in <i>smtc2</i> can only be set to a value strictly shorter than the periodicity indicated by <i>periodicityAndOffset</i> in <i>smtc1</i> (e.g. if <i>periodicityAndOffset</i> indicates <i>sf10</i> , <i>periodicity</i> can only be set of <i>sf5</i> , if <i>periodicityAndOffset</i> indicates <i>sf5</i> , <i>smtc2</i> cannot be configured). This field is not configured together with <i>smtc4list</i> . |

| Indicates the frequency of the SS associated to this <i>MeasObjectNR</i> . For operation with shared spectrum channel access, this field is a <i>k</i> *30 kHz shift from the sync raster where <i>k</i> = 0,1,2, and so on if the <i>reportType</i> within the corresponding <i>ReportConfigNR</i> is set to <i>reportCGI</i> (see TS 38.211 [16], clause 7.4.3.1). Frequencies are considered to be on the sync raster if they are also identifiable with a GSCN value (see TS 38.101-1 [15], or TS 38.101-5 [75]).                                                                                                                                                                                                                                                    |

| <b>RMTC-Config field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>measDurationSymbols</b><br>Number of consecutive symbols for which the Physical Layer reports samples of RSSI (see TS 38.215 [9], clause 5.1.21). Value <i>sym1</i> corresponds to one symbol, <i>sym14or12</i> corresponds to 14 symbols of the reference numerology for NCP and 12 symbols for ECP, and so on.<br>If <i>measDurationSymbols-v1700</i> is signalled, the UE ignores <i>measDurationSymbols-r16</i> .                                            |
| <b>ref-BWPId</b><br>Indicates the reference BWP for the TCI state indicated in <i>tc-StateInfo</i> . Network includes this field if <i>tc-StateInfo</i> is present. This field is only applicable for operation with shared spectrum channel access in FR2-2 and network does not configure this if the UE does not have any serving cells in FR2-2.                                                                                                                |
| <b>ref-SCS-CP</b><br>Indicates a reference subcarrier spacing and cyclic prefix to be used for RSSI measurements (see TS 38.215 [9]). Value kHz15 corresponds to 15kHz, kHz30 corresponds to 30 kHz, value kHz60-NCP corresponds to 60 kHz using normal cyclic prefix (NCP), and kHz60-ECP corresponds to 60 kHz using extended cyclic prefix (ECP).<br>If <i>ref-SCS-CP-v1700</i> is signalled, the UE ignores <i>ref-SCS-CP-r16</i> .                             |
| <b>ref-ServCellId</b><br>Indicates the FR2-2 reference serving cell index for the TCI state. Network includes this field if <i>tc-StateInfo</i> is present. This field is only applicable for operation with shared spectrum channel access in FR2-2 and network does not configure this if the UE does not have any serving cells in FR2-2.                                                                                                                        |
| <b>rmtc-Bandwidth</b><br>Indicates the bandwidth for the RSSI measurement (see TS 38. 215 [9], clause 5.1.21).                                                                                                                                                                                                                                                                                                                                                      |
| <b>rmtc-Frequency</b><br>Indicates the center frequency of the measured bandwidth for a frequency which operates with shared spectrum channel access (see TS 38. 215 [9], clause 5.1.21).                                                                                                                                                                                                                                                                           |
| <b>rmtc-Periodicity</b><br>Indicates the RSSI measurement timing configuration (RMTC) periodicity (see TS 38.215 [9], clause 5.1.21).                                                                                                                                                                                                                                                                                                                               |
| <b>rmtc-SubframeOffset</b><br>Indicates the RSSI measurement timing configuration (RMTC) subframe offset for this frequency (see TS 38.215 [9], clause 5.1.21). For inter-frequency measurements, this field is optional present and if it is not configured, the UE chooses a random value as <i>rmtc-SubframeOffset</i> for <i>measDurationSymbols</i> which shall be selected to be between 0 and the configured <i>rmtc-Periodicity</i> with equal probability. |
| <b>tc-StateId</b><br>Indicates the TCI state to be used for RSSI measurements. This field is only applicable for shared spectrum channel access in FR2-2. Network does not configure this if the UE does not have any serving cells in FR2-2 and in such a case, it is up to UE implementation how to determine the spatial domain filter for the inter-frequency RSSI measurement in FR2-2.                                                                        |

| <b>SSB-ConfigMobility field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cca-CellsToAddModList, cca-CellsToRemoveList</b><br>Lists of cells to be added or removed from the list of neighbor cells that apply channel access mode procedures for operation with shared spectrum channel access in accordance with TS 37.213 [48], clause 4.4 for FR2-2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>deriveSSB-IndexFromCell</b><br>If this field is set to <i>true</i> , UE assumes SFN and frame boundary alignment across cells on the same frequency carrier as specified in TS 38.133 [14]. Hence, if the UE is configured with a serving cell for which ( <i>absoluteFrequencySSB</i> , <i>subcarrierSpacing</i> ) in <i>ServingCellConfigCommon</i> is equal to ( <i>ssbFrequency</i> , <i>ssbSubcarrierSpacing</i> ) in this <i>MeasObjectNR</i> , this field indicates whether the UE can utilize the timing of this serving cell to derive the index of SS block transmitted by neighbour cell. Otherwise, this field indicates whether the UE may use the timing of any detected cell on that target frequency to derive the SSB index of all neighbour cells on that frequency. |
| <b>deriveSSB-IndexFromCellInter</b><br>If this field is present, UE assumes SFN and frame boundary alignment between the reference serving cell indicated by <i>ServCellIndex</i> and all neighbour cells in this <i>MeasObjectNR</i> as specified in TS 38.133 [14]. This field also indicates that the UE can utilize the timing of the reference serving cell indicated by <i>ServCellIndex</i> to derive the index of SS block transmitted by all inter-frequency neighbour cells on the frequency indicated by the <i>MeasObjectNR</i> . When this field is included, the network should set <i>deriveSSB-IndexFromCell</i> to <i>true</i> .                                                                                                                                         |
| <b>ssb-ToMeasure</b><br>The set of SS blocks to be measured within the SMTC measurement duration. The first/leftmost bit corresponds to SS/PBCH block index 0, the second bit corresponds to SS/PBCH block index 1, and so on. Value 0 in the bitmap indicates that the corresponding SS/PBCH block is not to be measured while value 1 indicates that the corresponding SS/PBCH block is to be measured (see TS 38.215 [9]). When the field is not configured the UE measures on all SS blocks. Regardless of the value of this field, SS/PBCH blocks outside of the applicable <i>smtc</i> are not to be measured. See TS 38.215 [9] clause 5.1.1.                                                                                                                                      |

| <b>SSB-PositionQCL-CellsToAddMod field descriptions</b>                                                                                                                                                                                            |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>physCellId</b><br>Physical cell identity of a cell in the cell list.                                                                                                                                                                            |
| <b>ssb-PositionQCL</b><br>Indicates the QCL relation between SS/PBCH blocks for a specific cell as specified in TS 38.213 [13], clause 4.1. If provided, the cell specific value overwrites the value signalled by <i>ssb-PositionQCL-Common</i> . |

| <b>Conditional Presence</b> | <b>Explanation</b>                                                                                                                                                                                                                                                                                                   |

## — *MeasObjectNR-SL*

The IE *MeasObjectNR-SL* concerns a measurement object including a list of transmission resource pool(s) for which CBR measurement is performed for NR sidelink communication/discovery.

### *MeasObjectNR-SL* information element

```
-- ASN1START
-- TAG-MEASOBJECTNR-SL-START

MeasObjectNR-SL-r16 ::= SEQUENCE {
    tx-PoolMeasToRemoveList-r16  Tx-PoolMeasList-r16          OPTIONAL,    -- Need N
    tx-PoolMeasToAddModList-r16  Tx-PoolMeasList-r16          OPTIONAL,    -- Need N
}

Tx-PoolMeasList-r16 ::= SEQUENCE (SIZE (1..maxNrofSL-PoolToMeasureNR-r16)) OF SL-ResourcePoolID-r16

-- TAG-MEASOBJECTNR-SL-STOP
-- ASN1STOP
```

## — *MeasObjectRxTxDiff*

The IE *MeasObjectRxTxDiff* is used to configure the measurement object for UE Rx-Tx time difference measurement.

### *MeasObjectRxTxDiff* information element

```
-- ASN1START
-- TAG-MEASOBJECTRXTXDIFF-START

MeasObjectRxTxDiff-r17 ::= SEQUENCE {
    dl-Ref-r17 CHOICE {
        prs-Ref-r17 NULL,
        csi-RS-Ref-r17 NULL,
        ...
    } OPTIONAL,    -- Need R
    ...
}

-- TAG-MEASOBJECTRXTXDIFF-STOP
-- ASN1STOP
```

**MeasObjectRxTxDiff field descriptions****dl-Ref**

configures the DL references signals to measure Rx-Tx time difference. *prs-Ref-r17* indicates PRS is chosen, and *csi-RS-Ref-r17* indicates that CSI-RS for tracking is chosen. Only one PRS resource set is configured by the network. Only one *NZP-CSI-RS-ResourceSet* can be configured with *pdcc-Info-r17* set to *true* and it is used for UE Rx-Tx time difference measurement. Only reference signals from the PCell of the MCG can be configured by the network.

## – **MeasObjectToAddModList**

The IE *MeasObjectToAddModList* concerns a list of measurement objects to add or modify.

**MeasObjectToAddModList information element**

```
-- ASN1START
-- TAG-MEASOBJECTTOADDMODLIST-START

MeasObjectToAddModList ::=
    SEQUENCE (SIZE (1..maxNrofObjectId)) OF MeasObjectToAddMod

MeasObjectToAddMod ::=
    SEQUENCE {
        measObjectId,
        measObject
        CHOICE {
            measObjectNR
            MeasObjectEUTRA,
            measObjectUTRA-FDD-r16,
            measObjectNR-SL-r16,
            measObjectCLI-r16,
            measObjectRxTxDiff-r17,
            SL-MeasObject-r16
        }
    }

-- TAG-MEASOBJECTTOADDMODLIST-STOP
-- ASN1STOP
```

## – **MeasObjectUTRA-FDD**

The IE *MeasObjectUTRA-FDD* specifies information applicable for inter-RAT UTRA-FDD neighbouring cells.

**MeasObjectUTRA-FDD information element**

```
-- ASN1START
-- TAG-MEASOBJECTUTRA-FDD-START

MeasObjectUTRA-FDD-r16 ::=
    SEQUENCE {
        carrierFreq-r16,
        utra-FDD-Q-OffsetRange-r16,
        cellsToRemoveList-r16
        ARFCN-ValueUTRA-FDD-r16,
        UTRA-FDD-Q-OffsetRange-r16,
        UTRA-FDD-CellIndexList-r16
        OPTIONAL,
        OPTIONAL,
        -- Need R
        -- Need N
    }
```

```

        cellsToAddModList-r16
        ...
    }

CellsToAddModListUTRA-FDD-r16 ::=
    SEQUENCE (SIZE (1..maxCellMeasUTRA-FDD-r16)) OF CellsToAddModUTRA-FDD-r16

CellsToAddModUTRA-FDD-r16 ::=
    SEQUENCE {
        cellIndexUTRA-FDD-r16
        physCellId-r16
    }

UTRA-FDD-CellIndexList-r16 ::=
    SEQUENCE (SIZE (1..maxCellMeasUTRA-FDD-r16)) OF UTRA-FDD-CellIndex-r16

UTRA-FDD-CellIndex-r16 ::=
    INTEGER (1..maxCellMeasUTRA-FDD-r16)

-- TAG-MEASOBJECTUTRA-FDD-STOP
-- ASN1STOP

```

| MeasObjectUTRA-FDD field descriptions                                                                                                                                                                                                    |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>carrierFreq</b><br>Identifies UTRA-FDD carrier frequency for which this configuration is valid. NR does not configure more than one measurement object for the same physical frequency regardless of the ARFCN used to indicate this. |
| <b>cellIndexUTRA-FDD</b><br>Entry index in the neighbouring cell list.                                                                                                                                                                   |
| <b>cellsToAddModList</b><br>List of UTRA-FDD cells to add/modify in the neighbouring cell list.                                                                                                                                          |
| <b>cellsToRemoveList</b><br>List of cells to remove from the neighbouring cell list.                                                                                                                                                     |
| <b>utra-FDD-Q-OffsetRange</b><br>Used to indicate a frequency specific offset to be applied when evaluating triggering conditions for measurement reporting. The value is in dB.                                                         |

–
 **MeasResultCellListSFTD-NR**

The IE *MeasResultCellListSFTD-NR* consists of SFN and radio frame boundary difference between the PCell and an NR cell as specified in TS 38.215 [9] and TS 38.133 [14].

**MeasResultCellListSFTD-NR information element**

```

-- ASN1START
-- TAG-MEASRESULTCELLLISTSFTD-NR-START

MeasResultCellListSFTD-NR ::=
    SEQUENCE (SIZE (1..maxCellSFTD)) OF MeasResultCellSFTD-NR

MeasResultCellSFTD-NR ::=
    SEQUENCE {
        physCellId
        sfn-OffsetResult
        frameBoundaryOffsetResult
        rsrp-Result
    }
    OPTIONAL

```

-- TAG-MEASRESULTCELLLISTSFTD-NR-STOP  
-- ASN1STOP

| MeasResultCellSFTD-NR field descriptions                                                                                                                      |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>sfn-OffsetResult</b><br>Indicates the SFN difference between the PCell and the NR cell as an integer value according to TS 38.215 [9].                     |
| <b>frameBoundaryOffsetResult</b><br>Indicates the frame boundary difference between the PCell and the NR cell as an integer value according to TS 38.215 [9]. |

MeasResultCellListSFTD-EUTRA

The IE *MeasResultCellListSFTD-EUTRA* consists of SFN and radio frame boundary difference between the PCell and an E-UTRA PSCell.

MeasResultCellListSFTD-EUTRA information element

-- ASN1START  
-- TAG-MEASRESULTCELLLISTSFTD-EUTRA-START

```

MeasResultCellListSFTD-EUTRA ::= SEQUENCE (SIZE (1..maxCellsFTD)) OF MeasResultSFTD-EUTRA

MeasResultSFTD-EUTRA ::= SEQUENCE {
    eutra-PhysCellId          EUTRA-PhysCellId,
    sfn-OffsetResult          INTEGER (0..1023),
    frameBoundaryOffsetResult INTEGER (-30720..30719),
    rsrp-Result               RSRP-Range,
}

```

-- TAG-MEASRESULTCELLLISTSFTD-EUTRA-STOP  
-- ASN1STOP

| MeasResultSFTD-EUTRA field descriptions                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>eutra-PhysCellId</b><br>Identifies the physical cell identity of the E-UTRA cell for which the reporting is being performed.                                   |
| <b>sfn-OffsetResult</b><br>Indicates the SFN difference between the PCell and the E-UTRA cell as an integer value according to TS 38.215 [9].                     |
| <b>frameBoundaryOffsetResult</b><br>Indicates the frame boundary difference between the PCell and the E-UTRA cell as an integer value according to TS 38.215 [9]. |

MeasResults

The IE *MeasResults* covers measured results for intra-frequency, inter-frequency, inter-RAT mobility and measured results for NR sidelink communication/discovery.

**MeasResults** information element

```
-- ASN1START
-- TAG-MEASRESULTS-START
```

    MsgA-PUSCH-Config-r16
}

OPTIONAL --Cond InitialBWPConfig

-- TAG-MSGACONFIGCOMMON-STOP
-- ASN1STOP

```

#### ***MsgA-ConfigCommon* field descriptions**

##### ***msgA-PUSCH-Config***

Configuration of cell-specific MsgA PUSCH parameters which the UE uses for contention-based MsgA PUSCH transmission of this BWP. If the field is not configured for the selected UL BWP, the UE shall use the MsgA PUSCH configuration of initial UL BWP.

##### ***rach-ConfigCommonTwoStepRA***

Configuration of cell specific random access parameters which the UE uses for contention based and contention free 2-step random access type procedure as well as for 2-step RA type contention based beam failure recovery in this BWP.

| Conditional Presence    | Explanation                                                                                                                                                                                                                                                                                                      |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>InitialBWPConfig</i> | The field is mandatory present when <i>MsgA-ConfigCommon</i> is configured for the initial uplink BWP, or when <i>MsgA-ConfigCommon</i> is configured for a non-initial uplink BWP and <i>MsgA-ConfigCommon</i> is not configured for the initial uplink BWP, otherwise the field is optionally present, Need S. |

## – ***MsgA-PUSCH-Config***

The IE *MsgA-PUSCH-Config* is used to specify the PUSCH allocation for MsgA in 2-step random access type procedure.

| <b><i>msgA-Alpha</i></b><br>Dedicated alpha value for MsgA PUSCH. If the field is absent, the UE shall use the value of <i>msg3-Alpha</i> if configured, else UE applies value 1 (see TS 38.213 [13], clause 7.1.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>msgA-DMRS-Config</i></b><br>DMRS configuration for msgA PUSCH (see TS 38.213 [13], clause 8.1A and TS 38.214 [19] clause 6.2.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>msgA-HoppingBits</i></b><br>Value of hopping bits to indicate which frequency offset to be used for second hop. See Table 8.3-1 in TS 38.213 [13].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>msgA-IntraSlotFrequencyHopping</i></b><br>Intra-slot frequency hopping per PUSCH occasion (see TS 38.213 [13], clause 8.1A).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>msgA-MCS</i></b><br>Indicates the MCS index for msgA PUSCH from the Table 6.1.4.1-1 for DFT-s-OFDM and Table 5.1.3.1-1 for CP-OFDM in TS 38.214 [19].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>msgA-PUSCH-TimeDomainAllocation</i></b><br>Indicates a combination of start symbol and length and PUSCH mapping type from the TDRA table ( <i>PUSCH-TimeDomainResourceAllocationList</i> if provided in <i>PUSCH-ConfigCommon</i> , or else the default Table 6.1.2.1.1-2 in 38.214 [19] is used if <i>pusch-TimeDomainAllocationList</i> is not provided in <i>PUSCH-ConfigCommon</i> ). The parameter K2 in the table is not used for msgA PUSCH. The network configures one of <i>msgA-PUSCH-TimeDomainAllocation</i> and <i>startSymbolAndLengthMsgA-PO</i> , but not both. If the field is absent, the UE shall use the value of <i>startSymbolAndLengthMsgA-PO</i> . |
| <b><i>msgA-PUSCH-TimeDomainOffset</i></b><br>A single time offset with respect to the start of each PRACH slot (with at least one valid RO), counted as the number of slots (based on the numerology of active UL BWP). See TS 38.213 [13], clause 8.1A.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>nrofDMRS-Sequences</i></b><br>Number of DMRS sequences for MsgA PUSCH for CP-OFDM. In case of single PUSCH configuration or if the DMRS symbols of multiple configurations are not overlapped, if the DMRS resources configured in one PUSCH occasion is no larger than 8 (for <i>len2</i> ) or 4 (for <i>len1</i> ), then only DMRS port is configured.                                                                                                                                                                                                                                                                                                                   |
| <b><i>nrofInterlacesPerMsgA-PO</i></b><br>Number of consecutive interlaces per PUSCH occasion if interlaced PUSCH is configured. For 30kHz SCS only the integers 1, 2, 3, 4, 5 are applicable (see TS 38.213 [13], clause 8.1A).                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>nrofMsgA-PO-FDM</i></b><br>The number of msgA PUSCH occasions FDMed in one time instance (see TS 38.213 [13], clause 8.1A).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>nrofMsgA-PO-PerSlot</i></b><br>Number of time domain PUSCH occasions in each slot. PUSCH occasions including guard period are contiguous in time domain within a slot (see TS 38.213 [13], clause 8.1A).                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>nrofPRBs-PerMsgA-PO</i></b><br>Number of PRBs per PUSCH occasion (see TS 38.213 [13], clause 8.1A).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>nrofSlotsMsgA-PUSCH</i></b><br>Number of slots (in active UL BWP numerology) containing one or multiple PUSCH occasions, each slot has the same time domain resource allocation (see TS 38.213 [13], clause 8.1A).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>startSymbolAndLengthMsgA-PO</i></b><br>An index giving valid combinations of start symbol, length and mapping type as start and length indicator (SLIV) for the first msgA PUSCH occasion, for RRC_CONNECTED UEs in non-initial BWP as described in TS 38.214 [19] clause 6.1.2. The network configures the field so that the allocation does not cross the slot boundary. The number of occupied symbols excludes the guard period. If the field is absent, the UE shall use the value in <i>msgA-PUSCH-TimeDomainAllocation</i> (see TS 38.213 [13], clause 8.1A). The network configures one of <i>msgA-PUSCH-TimeDomainAllocation</i> and <i>startSymbolAndLengthMsgA-PO</i> , but not both. If the field is absent, the UE shall use the value of <i>msgA-PUSCH-TimeDomainAllocation</i> . |

| <b><i>MsgA-DMRS-Config</i> field descriptions</b>                                                                                                                                                        |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>msgA-DMRS-AdditionalPosition</i></b><br>Indicates the position for additional DM-RS. If the field is absent, the UE applies value <i>pos2</i> .                                                    |
| <b><i>msgA-MaxLength</i></b><br>indicates single-symbol or double-symbol DMRS. If the field is absent, the UE applies value <i>len1</i> .                                                                |
| <b><i>msgA-PUSCH-DMRS-CDM-Group</i></b><br>1-bit indication of indices of CDM group(s). If the field is absent, then both CDM groups are used.                                                           |

}

-- TAG-MULTIFREQUENCYBANDLISTNR-SIB-STOP
-- ASN1STOP
```

| NR-MultiBandInfo field descriptions |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>freqBandIndicatorNR</b>          | Provides an NR frequency band number as defined in TS 38.101-1 [15], TS 38.101-2 [39], table 5.2-1, and TS 38.101-5 [75], table 5.2.2-1.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>nr-NS-PmaxList</b>               | Provides a list of <i>additionalPmax</i> and <i>additionalSpectrumEmission</i> values. If the field is absent the UE uses value 0 for the <i>additionalSpectrumEmission</i> (see TS 38.101-1 [15] table 6.2.3.1-1A, TS 38.101-2 [39], table 6.2.3.1-2, and TS 38.101-5 [75], table 6.2.3.1-1A). This field is ignored by IAB-MT, the IAB-MT applies output power and emissions requirements, as specified in TS 38.174 [63]. If <i>nr-NS-PmaxList-v1760</i> is present, it shall contain the same number of entries, listed in the same order as in <i>nr-NS-PmaxList</i> (without suffix). |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                   |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>OptULNotSIB2</i>  | The field is absent for <i>SIB2</i> and is mandatory present in <i>SIB4</i> and <i>frequencyInfoDL-SIB</i> . Otherwise, if the field is absent in <i>frequencyInfoUL-SIB</i> in <i>UplinkConfigCommonSIB</i> , the UE will use the frequency band indicated in <i>frequencyInfoDL-SIB</i> in <i>DownlinkConfigCommonSIB</i> . |

— *MUSIM-GapConfig*

The IE *MUSIM-GapConfig* specifies the MUSIM gap configuration and controls setup/release of MUSIM gaps.

| <p><b>requestedTargetBandFilterNR</b><br/>Indicates the target NR bands that the UE is requested to report the gap requirement information.</p> |

—                   *NeedForGapsInfoNR*

The IE *NeedForGapsInfoNR* indicates whether measurement gap is required for the UE to perform SSB based measurements on an NR target band while NR-DC or NE-DC is not configured.

| <b>servCellId</b><br>Indicates the serving cell which contains the target SSB (associated with the initial DL BWP) to be measured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>gapIndicationIntra</b><br>Indicates whether measurement gap or NCSG is required for the UE to perform intra-frequency SSB based measurements on the concerned serving cell. Value <i>gap</i> indicates that a measurement gap is needed if any of the UE configured BWPs (except the BWP(s) configured with <i>servingCellMO</i> associated with NCD-SSB) do not contain the frequency domain resources of the SSB associated to the initial DL BWP (CD-SSB). Value <i>ncsg</i> indicates that a NCSG is needed if any of the UE configured BWPs do not contain the frequency domain resources of the SSB associated to the initial DL BWP. Value <i>nogap-noncsG</i> indicates that neither a measurement gap nor a NCSG is needed to measure the SSB associated to the initial DL BWP (CD-SSB) for all configured BWPs (except the BWP(s) configured with <i>servingCellMO</i> associated with NCD-SSB), no matter the SSB is within the configured BWP or not. Value <i>nogap-noncsG</i> also indicates interruption is not needed. |

| NeedForNCSG-NR field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bandNR</b><br>Indicates the NR target band to be measured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>gapIndication</b><br>Indicates whether measurement gap or NCSG is required for the UE to perform SSB based measurements on the concerned NR target band while NR-DC or NE-DC is not configured. The UE determines this information based on the resultant configuration of the <i>RRCReconfiguration</i> or <i>RRCResume</i> message that triggers this response. Value <i>gap</i> indicates that a measurement gap is needed, value <i>ncsg</i> indicates that a NCSG is needed, and value <i>nogap-noncsG</i> indicates neither a measurement gap nor a NCSG is needed. Value <i>nogap-noncsG</i> also indicates interruption is not needed. |

— *NextHopChainingCount*

The IE *NextHopChainingCount* is used to update the  $K_{gNB}$  key and corresponds to parameter NCC: See TS 33.501 [11].

*NextHopChainingCount* information element

```
-- ASN1START
-- TAG-NEXTHOPCHAININGCOUNT-START

NextHopChainingCount ::=
    INTEGER (0..7)

-- TAG-NEXTHOPCHAININGCOUNT-STOP
-- ASN1STOP
```

— *NG-5G-S-TMSI*

The IE *NG-5G-S-TMSI* contains a 5G S-Temporary Mobile Subscription Identifier (5G-S-TMSI), a temporary UE identity provided by the 5GC which uniquely identifies the UE within the tracking area, see TS 23.003 [21].

*NG-5G-S-TMSI* information element

```
-- ASN1START
-- TAG-NG-5G-S-TMSI-START
```

```
NG-5G-S-TMSI ::=
-- TAG-NG-5G-S-TMSI-STOP
-- ASN1STOP
```

– *NonCellDefiningSSB*

The IE *NonCellDefiningSSB* is used to configure a NCD-SSB to be used while the UE operates in a RedCap-specific initial BWP or dedicated BWP.

*NonCellDefiningSSB* information element

```
-- ASN1START
-- TAG-NONCELLDEFININGSSB-START

NonCellDefiningSSB-r17 ::= SEQUENCE {
    absoluteFrequencySSB-r17 ARFCN-ValueNR,

```

| NonCellDefiningSSB field descriptions |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>absoluteFrequencySSB</b>           | Frequency of the NCD-SSB. The network configures this field so that the SSB is within the bandwidth of the BWP configured in <i>BWP-DownlinkCommon</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>ssb-Periodicity</b>                | The periodicity of this NCD-SSB. The network configures only periodicities that are larger than the periodicity of serving cell's CD-SSB. If the field is absent, the UE applies the SSB periodicity of the CD-SSB ( <i>ssb-periodicityServingCell</i> configured in <i>ServingCellConfigCommon</i> or <i>ServingCellConfigCommonSIB</i> ).                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>ssb-TimeOffset</b>                 | The time offset between CD-SSB of the serving cell and this NCD-SSB. Value <i>ms5</i> means the first burst of NCD-SSB is transmitted 5ms later than the first burst of CD-SSB transmitted after the first symbol of SFN=0 of the serving cell, value <i>ms10</i> means the first burst of NCD-SSB is transmitted 10ms later than the first burst of CD-SSB transmitted after the first symbol in SFN=0 of the serving cell, and so on. If the field is absent, RedCap UE considers that the time offset between the first burst of CD-SSB transmitted in the serving cell and the first burst of this NCD-SSB transmitted is zero. For RedCap UEs in TDD cells, the network configures this time offset to be an integer multiple of the periodicity of the serving cell's CD-SSB. |

– *NPN-Identity*

The IE *NPN-Identity* includes either a list of CAG-IDs or a list of NIDs per PLMN Identity. Further information regarding how to set the IE is specified in TS 23.003 [21].

NPN-Identity information element

```
-- ASN1START
-- TAG-NPN-IDENTITY-START

NPN-Identity-r16 ::=
    pn1-npn-r16
    plmn-Identity-r16
    cag-IdentityList-r16
    },
    snpn-r16
    plmn-Identity-r16
    nid-List-r16
    }

CAG-IdentityInfo-r16 ::=
    cag-Identity-r16
    manualCAGselectionAllowed-r16

NID-r16 ::=

-- TAG-NPN-IDENTITY-STOP
-- ASN1STOP
```

| NPN-Identity field descriptions                                                                                                                                                       |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cag-Identity</b><br>A CAG-ID as specified in TS 23.003 [21]. The PLMN ID and a CAG ID in the <i>NPN-Identity</i> identifies a PNI-NPN.                                             |
| <b>cag-IdentityList</b><br>The <i>cag-IdentityList</i> contains one or more CAG IDs. All CAG IDs associated to the same PLMN ID are listed in the same <i>cag-IdentityList</i> entry. |
| <b>manualCAGselectionAllowed</b><br>The <i>manualCAGselectionAllowed</i> indicates that the CAG ID can be selected manually even if it is outside the UE's allowed CAG list.          |
| <b>NID</b><br>A NID as specified in TS 23.003 [21]. The PLMN ID and a NID in the <i>NPN-Identity</i> identifies a SNPN.                                                               |
| <b>nid-List</b><br>The <i>nid-List</i> contains one or more <i>NID</i> .                                                                                                              |

– NPN-IdentityInfoList

The IE *NPN-IdentityInfoList* includes a list of NPN identity information.

NPN-IdentityInfoList information element

```
-- ASN1START

```

| NPN-IdentityInfoList field descriptions |                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>iab-Support</b>                      | This field combines both the support of IAB and the cell status for IAB. If the field is present, the cell supports IAB and the cell is also considered as a candidate for cell (re)selection for IAB-nodes; if the field is absent, the cell does not support IAB and/or the cell is barred for IAB-node. |
| <b>gNB-ID-Length</b>                    | Indicates the length of the gNB ID out of the 36-bit long <i>cellIdentity</i> .                                                                                                                                                                                                                            |
| <b>NPN-IdentityInfo</b>                 | The <i>NPN-IdentityInfo</i> contains one or more NPN identities and additional information associated with those NPNs. Only the same type of NPNs (either SNPNs or PNI-NPNs) can be listed in a <i>NPN-IdentityInfo</i> element.                                                                           |
| <b>npn-IdentityList</b>                 | The <i>npn-IdentityList</i> contains one or more NPN Identity elements.                                                                                                                                                                                                                                    |
| <b>trackingAreaCode</b>                 | Indicates the Tracking Area Code to which the cell indicated by <i>cellIdentity</i> field belongs.                                                                                                                                                                                                         |
| <b>ranac</b>                            | Indicates the RAN Area Code to which the cell indicated by <i>cellIdentity</i> field belongs.                                                                                                                                                                                                              |
| <b>cellReservedForOperatorUse</b>       | Indicates whether the cell is reserved for operator use (for the NPN(s) identified in the <i>npn-IdentityList</i> ) as defined in TS 38.304 [20]. This field is ignored by NPN capable IAB-MT.                                                                                                             |

– NR-DL-PRS-PDC-Info

The IE *NR-DL-PRS-PDC-Info* defines downlink PRS configuration for PDC.

|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dl-PRS-ResourceBandwidth</b><br>This field specifies the number of PRBs allocated for all the DL-PRS Resource (allocated DL-PRS bandwidth) in multiples of 4 PRBs in this resource set. All DL-PRS Resources of the DL-PRS-PDC Resource Set have the same bandwidth. Integer value 1 corresponds to 24 PRBs, value 2 corresponds to 28 PRBs, value 3 corresponds to 32 PRBs and so on. |
| <b>dl-PRS-StartPRB</b><br>This field specifies the start PRB index defined as offset with respect to subcarrier 0 in common resource block 0 for the DL-PRS Resource. All DL-PRS Resources of the DL-PRS-PDC Resource Set have the same value of dl-PRS-StartPRB.                                                                                                                         |
| <b>numSymbols</b><br>This field specifies the number of symbols per DL-PRS Resource within a slot.                                                                                                                                                                                                                                                                                        |
| <b>periodicityAndOffset</b><br>This field specifies the periodicity of DL-PRS allocation in slots and the slot offset with respect to SFN #0 slot #0 in the PCell where the DL-PRS-PDC Resource Set is configured (i.e., slot where the first DL-PRS Resource of DL-PRS-PDC Resource Set occurs).                                                                                         |
| <b>repFactorAndTimeGap</b><br>If this field is absent, the value for <i>repetitionFactor</i> is 1 (i.e., no resource repetition).                                                                                                                                                                                                                                                         |

| RepFactorAndTimeGap field descriptions                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>repetitionFactor</b><br>This field specifies how many times each DL-PRS Resource is repeated for a single instance of the DL-PRS Resource Set. It is applied to all resources of the DL-PRS Resource Set. Enumerated values n2, n4, n6, n8, n16, n32 correspond to 2, 4, 6, 8, 16, 32 resource repetitions, respectively.                                                                      |
| <b>timeGap</b><br>This field specifies the offset in units of slots between two repeated instances of a DL-PRS Resource corresponding to the same DL-PRS Resource ID within a single instance of the DL-PRS Resource Set. The time duration spanned by one DL-PRS Resource Set containing repeated DL-PRS Resources should not exceed the periodicity configured by <i>periodicityAndOffset</i> . |

— NR-NS-PmaxList

The IE *NR-NS-PmaxList* is used to configure a list of *additionalPmax* and *additionalSpectrumEmission*, as defined in TS 38.101-1 [15], table 6.2.3.1-1A, TS 38.101-2 [39], table 6.2.3.1-2, and TS 38.101-5 [75], table 6.2.3.1-1A for a given frequency band.

NR-NS-PmaxList information element

```
-- ASN1START
-- TAG-NR-NS-PMAXLIST-START

NR-NS-PmaxList ::=
    SEQUENCE (SIZE (1..maxNR-NS-Pmax)) OF NR-NS-PmaxValue

NR-NS-PmaxValue ::=
    SEQUENCE {
        additionalPmax P-Max OPTIONAL, -- Need N
        additionalSpectrumEmission
    }

NR-NS-PmaxList-v1760 ::=
    SEQUENCE (SIZE (1.. maxNR-NS-Pmax)) OF NR-NS-PmaxValue-v1760

NR-NS-PmaxValue-v1760 ::=

| <p><b><i>ephemerisInfo</i></b><br/>This field provides satellite ephemeris either in format of position and velocity state vector or in format of orbital parameters. This field is excluded when determining changes in system information, i.e. changes to <i>ephemerisInfo</i> should neither result in system information change notifications nor in a modification of <i>valueTag</i> in <i>SIB1</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <p><b><i>epochTime</i></b><br/>Indicate the epoch time for the NTN assistance information. When explicitly provided through SIB, or through dedicated signaling, the <i>EpochTime</i> is the starting time of a DL sub-frame, indicated by a SFN and a sub-frame number signaled together with the assistance information. For serving cell, the field <i>sfn</i> indicates the current SFN or the next upcoming SFN after the frame where the message indicating the <i>epochTime</i> is received. For neighbour cell when explicit epoch time is present, the <i>sfn</i> indicates the SFN nearest to the frame where the message indicating the <i>epochTime</i> is received. The reference point for epoch time of the serving or neighbour NTN payload ephemeris and Common TA parameters is the uplink time synchronization reference point of the serving cell. In case of handover or conditional handover, the reference point for epoch time of the target NTN payload ephemeris and Common TA parameters is the uplink time synchronization reference point of the target cell. If this field is absent for the serving cell, the epoch time is the end of SI window where this SIB19 is scheduled. This field is mandatory present when <i>ntn-Config</i> is provided in dedicated configuration. If this field is absent in <i>ntn-Config</i> provided via <i>NTN-NeighCellConfig</i> the UE uses epoch time of the serving cell, otherwise the field is based on the timing of the serving cell, i.e. the SFN and sub-frame number indicated in this field refers to the SFN and sub-frame of the serving cell. In case of handover or conditional handover, this field is based on the timing of the target cell, i.e. the SFN and sub-frame number indicated in this field refers to the SFN and sub-frame of the target cell. For the target cell the UE considers epoch time, indicated by the SFN and sub-frame number in this field, to be the frame nearest to the frame in which the message indicating the epoch time is received. This field is excluded when determining changes in system information, i.e. changes to <i>epochTime</i> should neither result in system information change notifications nor in a modification of <i>valueTag</i> in <i>SIB1</i>.</p> |
| <p><b><i>cellSpecificKoffset</i></b><br/>Scheduling offset used for the timing relationships that are modified for NTN (see TS 38.213 [13]). The unit of the field <i>K_offset</i> is number of slots for a given subcarrier spacing of 15 kHz. If the field is absent UE assumes value 0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <p><b><i>kmac</i></b><br/>Scheduling offset provided by network if downlink and uplink frame timing are not aligned at gNB. If the field is absent UE assumes value 0. If both <i>ntn-PolarizationUL</i> and <i>ntn-PolarizationDL</i> are not present, the UE releases any stored value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <p><b><i>ntn-UISyncValidityDuration</i></b><br/>A validity duration configured by the network for assistance information (i.e. Serving and/or neighbour satellite ephemeris and Common TA parameters) which indicates the maximum time duration (from <i>epochTime</i>) during which the UE can apply assistance information without having acquired new assistance information.<br/>The unit of <i>ntn-UISyncValidityDuration</i> is second. Value <i>s5</i> corresponds to 5 s, value <i>s10</i> indicate 10 s and so on. If this field is absent in <i>ntn-Config</i> provided via <i>NTN-NeighCellConfig</i>, the UE uses validity duration from the serving cell assistance information. This field is excluded when determining changes in system information, i.e. changes of <i>ntn-UISyncValidityDuration</i> should neither result in system information change notifications nor in a modification of <i>valueTag</i> in <i>SIB1</i>. <i>ntn-UISyncValidityDuration</i> is only updated when at least one of <i>epochTime</i>, <i>ta-Info</i>, <i>ephemerisInfo</i> is updated.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <p><b><i>ta-Common</i></b><br/>Network-controlled common timing advance value and it may include any timing offset considered necessary by the network. <i>ta-Common</i> with value of 0 is supported. | <b>ta-CommonDriftVariant</b><br>Indicate drift rate variation of the common TA. The granularity of <i>ta-CommonDriftVariant</i> is 0.2×10 <sup>^</sup> (-4) μs/s <sup>^</sup> 2. Values are given in unit of corresponding granularity. This field is excluded when determining changes in system information, i.e. changes of <i>ta-CommonDriftVariant</i> should neither result in system information change notifications nor in a modification of <i>valueTag</i> in SIB1.                                                                          |
| <b>ta-Report</b><br>When this field is included in SIB19, it indicates reporting of timing advance is enabled during Random Access due to RRC connection establishment or RRC connection resume, and during RRC connection reestablishment. When configured, the UE may include TA report during the SDT procedure for CG-SDT. When this field is included in <i>ServingCellConfigCommon</i> within dedicated signalling, it indicates TA reporting is enabled during Random Access due to reconfiguration with sync (see TS 38.321 [3], clause 5.4.8). |

| Conditional Presence | Explanation                                                                                                       |
|----------------------|-------------------------------------------------------------------------------------------------------------------|
| <i>SIB19</i>         | The field is mandatory present for the serving cell in SIB19. The field is optionally present, Need R, otherwise. |

– *NZP-CSI-RS-Resource*

The IE *NZP-CSI-RS-Resource* is used to configure Non-Zero-Power (NZP) CSI-RS transmitted in the cell where the IE is included, which the UE may be configured to measure on (see TS 38.214 [19], clause 5.2.2.3.1). A change of configuration between periodic, semi-persistent or aperiodic for an *NZP-CSI-RS-Resource* is not supported without a release and add.

| <b><i>periodicityAndOffset</i></b><br>Periodicity and slot offset <i>s1</i> corresponds to a periodicity of 1 slot, <i>s2</i> to a periodicity of two slots, and so on. The corresponding offset is also given in number of slots (see TS 38.214 [19], clause 5.2.2.3.1). Network always configures the UE with a value for this field for periodic and semi-persistent NZP-CSI-RS-Resource (as indicated in <i>CSI-ResourceConfig</i> ).                                                                                                                                                                                                              |
| <b><i>powerControlOffset</i></b><br>Power offset of PDSCH RE to NZP CSI-RS RE. Value in dB (see TS 38.214 [19], clauses 5.2.2.3.1 and 4.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <i>Periodic</i>                 | The field is optionally present, Need M, for periodic <i>NZP-CSI-RS-Resources</i> (as indicated in <i>CSI-ResourceConfig</i> ). The field is absent otherwise.                     |
| <i>PeriodicOrSemiPersistent</i> | The field is optionally present, Need M, for periodic and semi-persistent <i>NZP-CSI-RS-Resources</i> (as indicated in <i>CSI-ResourceConfig</i> ). The field is absent otherwise. |

## – *NZP-CSI-RS-ResourceId*

The IE *NZP-CSI-RS-ResourceId* is used to identify one NZP-CSI-RS-Resource.

### *NZP-CSI-RS-ResourceId* information element

```
-- ASN1START
-- TAG-NZP-CSI-RS-RESOURCEID-START

NZP-CSI-RS-ResourceId ::= INTEGER (0..maxNrofNZP-CSI-RS-Resources-1)

-- TAG-NZP-CSI-RS-RESOURCEID-STOP
-- ASN1STOP
```

## – *NZP-CSI-RS-ResourceSet*

The IE *NZP-CSI-RS-ResourceSet* is a set of Non-Zero-Power (NZP) CSI-RS resources (their IDs) and set-specific parameters.

**NZP-CSI-RS-ResourceSet** information element

```

| <b>NZP-CSI-RS-ResourceSet field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>aperiodicTriggeringOffset, aperiodicTriggeringOffset-r16, aperiodicTriggeringOffset-r17</i></b><br>Offset X between the slot containing the DCI that triggers a set of aperiodic NZP CSI-RS resources and the slot in which the CSI-RS resource set is transmitted. For <i>aperiodicTriggeringOffset</i> , the value 0 corresponds to 0 slots, value 1 corresponds to 1 slot, value 2 corresponds to 2 slots, value 3 corresponds to 3 slots, value 4 corresponds to 4 slots, value 5 corresponds to 16 slots, value 6 corresponds to 24 slots. For <i>aperiodicTriggeringOffset-r16</i> and <i>aperiodicTriggeringOffset-r17</i> , the value indicates the number of slots. <i>aperiodicTriggeringOffset-r17</i> is applicable to SCS 480 kHz and 960 kHz, and only the values of integer multiples of 4 are valid, i.e. 0, 4, 8, and so on. The network configures only one of the fields. When neither field is included, the UE applies the value 0. |
| <b><i>aperiodicTriggeringOffsetL2</i></b><br>Indicates triggering offset of aperiodic NZP CSI-RS resources used for fast activation of the SCell (see clause 5.2.1.5.3 of TS 38.214 [19]), when the NZP CSI-RS resources are activated by the MAC CE (see clause 5.9 of TS 38.321 [3]). The value indicates the number of slots.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>cmrGroupingAndPairing</i></b><br>Configures CMR groups and pairs. The first <i>nrofResourcesGroup1</i> resources in the NZP-CSI-RS resource set belong to Group 1 and the remaining resources in the NZP-CSI-RS resource set belong to Group 2. <i>nrofResourcesGroup1</i> is $K_1$ and the number of remaining resources in the NZP-CSI-RS resource set belonging to Group 2 is $K_2$ as specified in TS 38.214 clause 5.2.1.4.1. Maximum total number in Group 1 and Group 2 is 8 (see TS 38.214 [19], clauses 5.2.1.4.1 and 5.2.1.4.2).                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>pair1OfNZP-CSI-RS, pair2OfNZP-CSI-RS</i></b><br>A pair of NZP CSI-RS resources. In one pair, one resource shall belong to group 1 and the other resource shall belong to group 2 (see TS 38.214 [19], clause 5.2.1.4.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>nzp-CSI-RS-Resources</i></b><br>NZP-CSI-RS-Resources associated with this NZP-CSI-RS resource set (see TS 38.214 [19], clause 5.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>nzp-CSI-RS-ResourceId1, nzp-CSI-RS-ResourceId2</i></b><br>The <i>nzp-CSI-RS-ResourceId1-r17</i> represents the index of the NZP CSI-RS resource in Resource Group 1, and <i>nzp-CSI-RS-ResourceId2-r17</i> represents the index of the NZP CSI-RS resource in Resource Group 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>pdcc-Info</i></b><br>Indicates that this NZP-CSI-RS-ResourceSet, if configured also with <i>trs-Info</i> , is used for propagation delay compensation. The field can be present only if <i>trs-info</i> is present. The field can be present in only one <i>NZP-CSI-RS-ResourceSet</i> . If network configures this field for an <i>NZP-CSI-RS-ResourceSet</i> , the UE measures the UE Rx-Tx time difference based on resources configured in this resource set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>repetition</i></b><br>Indicates whether repetition is on/off. If the field is set to <i>off</i> or if the field is absent, the UE may not assume that the NZP-CSI-RS resources within the resource set are transmitted with the same downlink spatial domain transmission filter (see TS 38.214 [19], clauses 5.2.2.3.1 and 5.1.6.1.2). It can only be configured for CSI-RS resource sets which are associated with <i>CSI-ReportConfig</i> with report of L1 RSRP, L1 SINR or "no report".                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>trs-Info</i></b><br>Indicates that the antenna port for all NZP-CSI-RS resources in the CSI-RS resource set is same. If the field is absent or released the UE applies the value <i>false</i> (see TS 38.214 [19], clause 5.2.2.3.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

– ***NZP-CSI-RS-ResourceSetId***

The IE *NZP-CSI-RS-ResourceSetId* is used to identify one *NZP-CSI-RS-ResourceSet*.

#### ***NZP-CSI-RS-ResourceSetId* information element**

```
-- ASN1START
-- TAG-NZP-CSI-RS-RESOURCESETID-START
```

```
NZP-CSI-RS-ResourceSetId ::= INTEGER (0..maxNrofNZP-CSI-RS-ResourceSets-1)
```

```
-- TAG-NZP-CSI-RS-RESOURCESETID-STOP
-- ASN1STOP
```

— *P-Max*

The IE *P-Max* is used to limit the UE's uplink transmission power on a carrier frequency, in TS 38.101-1 [15] and in TS 38.101-5 [75], and is used to calculate the parameter *Pcompensation* defined in TS 38.304 [20].

***P-Max* information element**

```
-- ASN1START
-- TAG-P-MAX-START

P-Max ::=
    INTEGER ( -30..33)

-- TAG-P-MAX-STOP
-- ASN1STOP
```

— *PathlossReferenceRS*

The IE *PathlossReferenceRS* is used to configure a Reference Signal (e.g. a CSI-RS config or a SS block) to be used for path loss estimation for PUSCH, PUCCH and SRS for unified TCI state operation.

***PathlossReferenceRS* information element**

```
-- ASN1START
-- TAG-PATHLOSSREFERENCERS-START

PathlossReferenceRS-r17 ::= SEQUENCE {
    pathlossReferenceRS-Id-r17 PathlossReferenceRS-Id-r17,
    referenceSignal-r17 CHOICE {
        ssb-Index SSB-Index,
        csi-RS-Index NZP-CSI-RS-ResourceId
    },
    additionalPCI-r17 AdditionalPCIIndex-r17
}

-- TAG-PATHLOSSREFERENCERS-STOP
-- ASN1STOP
```

| <i>PathlossReferenceRS</i> field descriptions                                                           |
|---------------------------------------------------------------------------------------------------------|
| <b><i>additionalPCI</i></b><br>Indicates the physical cell ID (PCI) of the SSB for the referenceSignal. |

| Conditional Presence | Explanation                                                                                                                             |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <i>RS-SSB</i>        | The field is optionally present, Need R, if <i>ssb-Index</i> is configured for <i>referenceSignal</i> . Otherwise it is absent, Need R. |

### – *PathlossReferenceRS-Id*

The IE *PathlossReferenceRS-Id* is an ID for a reference signal (RS) configured as PUSCH, PUCCH and SRS pathloss reference RS for unified TCI state operation.

#### *PathlossReferenceRS-Id* information element

```
-- ASN1START
-- TAG-PATHLOSSREFERENCERS-ID-START

PathlossReferenceRS-Id-r17 ::= INTEGER (0..maxNrofPathlossReferenceRSs-1-r17)

-- TAG-PATHLOSSREFERENCERS-ID-STOP
-- ASN1STOP
```

### – *PCI-ARFCN-EUTRA*

The IE *PCI-ARFCN-EUTRA* is used to encode EUTRA PCI and ARFCN.

#### *PCI-ARFCN-EUTRA* information element

```
-- ASN1START
-- TAG-PCIARFCNEUTRA-START

PCI-ARFCN-EUTRA-r16 ::= SEQUENCE {
    physCellId-r16      EUTRA-PhysCellId,
    carrierFreq-r16     ARFCN-ValueEUTRA
}

-- TAG-PCIARFCNEUTRA-STOP
-- ASN1STOP
```

### – *PCI-ARFCN-NR*

The IE *PCI-ARFCN-NR* is used to encode NR PCI and ARFCN.

#### *PCI-ARFCN-NR* information element

```
-- ASN1START
-- TAG-PCIARFCNNR-START

PCI-ARFCN-NR-r16 ::= SEQUENCE {
```

```

    physCellId-r16
    carrierFreq-r16
}

-- TAG-PCIARFCNNR-STOP
-- ASN1STOP

```

### — *PCI-List*

The IE *PCI-List* concerns a list of physical cell identities, which may be used for different purposes.

#### *PCI-List* information element

```

-- ASN1START
-- TAG-PCI-LIST-START

PCI-List ::=
    SEQUENCE (SIZE (1..maxNrofCellMeas)) OF PhysCellId

-- TAG-PCI-LIST-STOP
-- ASN1STOP

```

### — *PCI-Range*

The IE *PCI-Range* is used to encode either a single or a range of physical cell identities. The range is encoded by using a *start* value and by indicating the number of consecutive physical cell identities (including *start*) in the range. For fields comprising multiple occurrences of *PCI-Range*, the Network may configure overlapping ranges of physical cell identities.

#### *PCI-Range* information element

```

-- ASN1START
-- TAG-PCI-RANGE-START

PCI-Range ::=
    SEQUENCE {
        start
        range
    }
    ENUMERATED {n4, n8, n12, n16, n24, n32, n48, n64, n84,
                n96, n128, n168, n252, n504, n1008, spare1}
    OPTIONAL -- Need S

-- TAG-PCI-RANGE-STOP
-- ASN1STOP

```

| PCI-Range field descriptions                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>range</b><br>Indicates the number of physical cell identities in the range (including <i>start</i> ). Value <i>n4</i> corresponds with 4, value <i>n8</i> corresponds with 8 and so on. The UE shall apply value 1 in case the field is absent, in which case only the physical cell identity value indicated by <i>start</i> applies. |
| <b>start</b><br>Indicates the lowest physical cell identity in the range.                                                                                                                                                                                                                                                                 |

– PCI-RangeElement

The IE *PCI-RangeElement* is used to define a PCI-Range as part of a list (e.g. AddMod list).

PCI-RangeElement information element

```
-- ASN1START
-- TAG-PCI-RANGEELEMENT-START

PCI-RangeElement ::=
    pci-RangeIndex
    pci-Range
}

-- TAG-PCI-RANGEELEMENT-STOP
-- ASN1STOP
```

| PCI-RangeElement field descriptions                                                |
|------------------------------------------------------------------------------------|
| <b>pci-Range</b><br>Physical cell identity or a range of physical cell identities. |

– PCI-RangeIndex

The IE *PCI-RangeIndex* identifies a physical cell id range, which may be used for different purposes.

PCI-RangeIndex information element

```
-- ASN1START
-- TAG-PCI-RANGEINDEX-START

PCI-RangeIndex ::=
    INTEGER (1..maxNrofPCI-Ranges)

-- TAG-PCI-RANGEINDEX-STOP
-- ASN1STOP
```

## – *PCI-RangeIndexList*

The IE *PCI-RangeIndexList* concerns a list of indexes of physical cell id ranges, which may be used for different purposes.

### *PCI-RangeIndexList* information element

```
-- ASN1START
-- TAG-PCI-RANGEINDEXLIST-START

PCI-RangeIndexList ::=
    SEQUENCE (SIZE (1..maxNrofPCI-Ranges)) OF PCI-RangeIndex

-- TAG-PCI-RANGEINDEXLIST-STOP
-- ASN1STOP
```

## – *PDCCH-Config*

The IE *PDCCH-Config* is used to configure UE specific PDCCH parameters or MBS multicast PDCCH parameters such as control resource sets (CORESET), search spaces and additional parameters for acquiring the PDCCH. If this IE is used for the scheduled SCell in case of cross carrier scheduling, the fields other than *searchSpacesToAddModList* and *searchSpacesToReleaseList* are absent. If the IE is used for a dormant BWP, the fields other than *controlResourceSetToAddModList* and *controlResourceSetToReleaseList* are absent. If this IE is used for MBS CFR, the field *downlinkPreemption*, *tpc-PUSCH*, *tpc-SRS*, *uplinkCancellation*, *monitoringCapabilityConfig*, and *searchSpaceSwitchConfig* are absent.

### *PDCCH-Config* information element

```
-- ASN1START
-- TAG-PDCCH-CONFIG-START

PDCCH-Config ::=
    SEQUENCE {
        controlResourceSetToAddModList SEQUENCE(SIZE (1..3)) OF ControlResourceSet OPTIONAL, -- Need N
        controlResourceSetToReleaseList SEQUENCE(SIZE (1..3)) OF ControlResourceSetId OPTIONAL, -- Need N

| <b>PDCCH-Config field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b><i>controlResourceSetToAddModList, controlResourceSetToAddModListSizeExt</i></b><br/> List of UE specifically configured Control Resource Sets (CORESETs) to be used by the UE. The network restrictions on configuration of CORESETs per DL BWP are specified in TS 38.213 [13], clause 10.1 and TS 38.306 [26]. The UE shall consider entries in <i>controlResourceSetToAddModList</i> and in <i>controlResourceSetToAddModListSizeExt</i> as a single list, i.e. an entry created using <i>controlResourceSetToAddModList</i> can be modified using <i>controlResourceSetToAddModListSizeExt</i> (or deleted using <i>controlResourceSetToReleaseListSizeExt</i>) and vice-versa. In case network reconfigures control resource set with the same <i>ControlResourceSetId</i> as used for <i>commonControlResourceSet</i> or <i>commonControlResourceSetExt</i> configured via <i>PDCCH-ConfigCommon</i> or via <i>SIB20</i>, the configuration from <i>PDCCH-Config</i> always takes precedence and should not be updated by the UE based on <i>servingCellConfigCommon</i> or based on <i>SIB20</i>.</p> |
| <p><b><i>controlResourceSetToReleaseList, controlResourceSetToReleaseListSizeExt</i></b><br/> List of UE specifically configured Control Resource Sets (CORESETs) to be released by the UE. This field only applies to CORESETs configured by <i>controlResourceSetToAddModList</i> or <i>controlResourceSetToAddModListSizeExt</i> and does not release the field <i>commonControlResourceSet</i> configured by <i>PDCCH-ConfigCommon</i> and <i>commonControlResourceSetExt</i> configured by <i>SIB20</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <p><b><i>downlinkPreemption</i></b><br/> Configuration of downlink preemption indications to be monitored in this cell (see TS 38.213 [13], clause 11.2).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <p><b><i>monitoringCapabilityConfig</i></b><br/> Configures either Rel-15 PDCCH monitoring capability, Rel-16 PDCCH monitoring capability or Rel-17 PDCCH monitoring capability for PDCCH monitoring on a serving cell (see TS 38.213 [13], clause 10.1). Value <i>r15monitoringcapability</i> enables the Rel-15 monitoring capability, and value <i>r16monitoringcapability</i> enables the Rel-16 PDCCH monitoring capability. <i>r17monitoringcapability</i> enables the Rel-17 PDCCH multi-slot monitoring capability. For 480 and 960 kHz SCS, only value <i>r17monitoringcapability</i> is applicable.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <p><b><i>pdccch-SkippingDurationList</i></b><br/> Provides one or more values to derive the skipping duration in unit of slots, as specified in TS 38.213 [13], clause 10.4. The DCI which schedules data indicates which of the values is to be applied (see TS 38.213 [13], clause 10.4). For the 15kHz SCS, for each entry, only the first 26 values are valid and correspond to {1, 2, 3, ..., 20, 30, 40, 50, 60, 80, 100}. For the 30kHz SCS, for each entry, only the first 46 values are valid and correspond to {1, 2, 3, ..., 40, 60, 80, 100, 120, 160, 200}. For the 60kHz SCS, for each entry, only the first 86 values are valid and correspond to {1, 2, 3, ..., 80, 120, 160, 200, 240, 320, 400}. For the 120kHz SCS, for each entry, the 166 values correspond to {1, 2, 3, ..., 160, 240, 320, 400, 480, 640, 800}. For the 480kHz SCS, for each entry, the 166 values correspond to {4, 8, 12, ..., 640, 960, 1280, 1600, 1920, 2560, 3200}. For the 960kHz SCS, for each entry, the 166 values correspond to {8, 16, 24, ..., 1280, 1920, 2560, 3200, 3840, 5120, 6400}.</p>                   |
| <p><b><i>searchSpacesToAddModList, searchSpacesToAddModListExt</i></b><br/> List of UE specifically configured Search Spaces or MBS multicast Search Spaces. The network configures at most 10 Search Spaces per BWP per cell (including UE-specific and common Search Spaces). If the network includes <i>searchSpacesToAddModListExt</i>, it includes the same number of entries, and listed in the same order, as in <i>searchSpacesToAddModList</i> in each of them.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <p><b><i>searchSpaceSwitchConfig</i></b><br/> Configuration to control the UE behavior to switch from search space group X back to search space group 0, as specified in clause 10 of TS 38.213 [13]. The network only configures either <i>searchSpaceSwitchConfig-r16</i> or <i>searchSpaceSwitchConfig-r17</i> for a UE.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <p><b><i>tpc-PUCCH</i></b><br/> Enable and configure reception of group TPC commands for PUCCH.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b><i>cellGroupsForSwitchList</i></b><br>The list of serving cells which are bundled for the search space group switching purpose (see TS 38.213 [13], clause 10.4). A serving cell can belong to only one <i>CellGroupForSwitch</i> . The network configures the same list for all BWPs of serving cells in the same <i>CellGroupForSwitch</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>searchSpaceSwitchDelay</i></b><br>Indicates the value to be applied by a UE for Search Space Set Group switching; corresponds to the P value in TS 38.213 [13], clause 10.4. The network configures the same value for all BWPs of serving cells in the same <i>CellGroupForSwitch</i> . For 120/480/960 kHz SCS, only values 40,41, ... 52 are valid and the actual value = field value * SCS/120 kHz i.e. field value 40 corresponds to 40 with 120 kHz SCS, 160 with 480 kHz SCS and 320 with 960 kHz SCS, and so on.                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>searchSpaceSwitchTimer</i></b><br>Timer (in unit of slots) to control the UE behavior to switch from search space group X back to search space group 0, as specified in clause 10 of TS 38.213 [13]. For the 15kHz SCS, only the first 26 values are valid and correspond to {1, 2, 3, ..., 20, 30, 40, 50, 60, 80, 100}. For the 30kHz SCS, only the first 46 values are valid and correspond to {1, 2, 3, ..., 40, 60, 80, 100, 120, 160, 200}. For the 60kHz SCS, only the first 86 values are valid and correspond to {1, 2, 3, ..., 80, 120, 160, 200, 240, 320, 400}. For the 120kHz SCS, the 166 values correspond to {1, 2, 3, ..., 160, 240, 320, 400, 480, 640, 800}. For the 480kHz SCS, the 166 values correspond to {4, 8, 12, ..., 640, 960, 1280, 1600, 1920, 2560, 3200}. For the 960kHz SCS, the 166 values correspond to {8, 16, 24, ..., 1280, 1920, 2560, 3200, 3840, 5120, 6400}. |

## – *PDCCH-ConfigCommon*

The IE *PDCCH-ConfigCommon* is used to configure cell specific PDCCH parameters provided in SIB as well as in dedicated signalling.

| <b>PDCCH-ConfigCommon field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>commonControlResourceSet</b><br/>An additional common control resource set which may be configured and used for any common or UE-specific search space. If the network configures this field, it uses a <i>ControlResourceSetId</i> other than 0 for this <i>ControlResourceSet</i>. The network configures the <i>commonControlResourceSet</i> in <i>SIB1</i> so that it is contained in the bandwidth of CORESET#0. If the RedCap-specific initial downlink BWP does not contain the entire CORESET#0, the network configures the <i>commonControlResourceSet</i> in the RedCap-specific initial downlink BWP in <i>SIB1</i> for RedCap such that it does not have to be contained in the bandwidth of CORESET#0.</p> |
| <p><b>commonSearchSpaceList, commonSearchSpaceListExt, commonSearchSpaceListExt2</b><br/>A list of additional common search spaces. If the network configures this field, it uses the <i>SearchSpaceIds</i> other than 0. If the field is included, it replaces any previous list, i.e. all the entries of the list are replaced and each of the <i>SearchSpace</i> entries is considered to be newly created and the conditions and Need codes for setup of the entry apply. If the network includes <i>commonSearchSpaceListExt/commonSearchSpaceListExt2</i>, it includes the same number of entries, and listed in the same order, as in <i>commonSearchSpaceList</i>.</p>                                                |
| <p><b>controlResourceSetZero</b><br/>Parameters of the common CORESET#0 which can be used in any common or UE-specific search spaces. The values are interpreted like the corresponding bits in <i>MIB pdccch-ConfigSIB1</i>. Even though this field is only configured in the initial BWP (BWP#0) <i>controlResourceSetZero</i> can be used in search spaces configured in other DL BWP(s) than the initial DL BWP if the conditions defined in TS 38.213 [13], clause 10 are satisfied.</p>                                                                                                                                                                                                                                 |
| <p><b>firstPDCCH-MonitoringOccasionOfPEI-O</b><br/>Offset, in number of symbols, from the start of the reference frame for PEI-O to the start of the first PDCCH monitoring occasion of PEI-O on this BWP, see TS 38.213 [13], clause 10.4A. For the case <i>po-NumPerPEI</i> is smaller than <i>Ns</i>, UE applies the <math>(\text{floor}(i\_s/\text{po-NumPerPEI})+1)</math>-th value out of <math>(N\_s/\text{po-NumPerPEI})</math> configured values in <i>firstPDCCH-MonitoringOccasionOfPEI-O</i> for the symbol-level offset. When <i>po-NumPerPEI</i> is one or multiple of <i>Ns</i>, UE applies the first configured value in <i>firstPDCCH-MonitoringOccasionOfPEI-O</i> for the symbol-level offset.</p>         |
| <p><b>firstPDCCH-MonitoringOccasionOfPO</b><br/>Indicates the first PDCCH monitoring occasion of each PO of the PF on this BWP, see TS 38.304 [20]. The field <i>sCS120KHZquarterT-SCS60KHZZoneEighthT-SCS30KHZZoneSixteenthT</i>, <i>sCS120KHZZoneEighthT-SCS60KHZZoneSixteenthT</i> and <i>sCS120KHZZoneSixteenthT</i> can be applied for SCS 480kHz, corresponding to <i>sCS480KHZZoneT-SCS120KHZquarterT-SCS60KHZZoneEighthT-SCS30KHZZoneSixteenthT</i>, <i>sCS480KHZhalfT-SCS120KHZZoneEighthT-SCS60KHZZoneSixteenthT</i> and <i>sCS480KHZquarterT-SCS120KHZZoneSixteenthT</i> in IE <i>DownlinkConfigCommonSIB</i> respectively.</p>                                                                                    |
| <p><b>followUnifiedTCI-State</b><br/>When set to enabled, for PDCCH reception in CORESET #0, the UE applies the "indicated" DL only TCI or joint TCI as specified in TS 38.214 [19], clause 5.1.5.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <p><b>pagingSearchSpace</b><br/>ID of the search space for paging (see TS 38.213 [13], clause 10.1). If the field is absent, the UE does not receive paging in this BWP (see TS 38.213 [13], clause 10). This field is absent for the RedCap-specific initial downlink BWP, if it does not include CD-SSB and the entire CORESET#0. In that case, a RedCap UE in RRC_IDLE or RRC_INACTIVE while SDT procedure is not ongoing, shall monitor paging in the initial DL BWP that includes CORESET#0.</p>                                                                                                                                                                                                                         |
| <p><b>pei-ConfigBWP</b><br/>Provides the configuration for PEI reception in this BWP. If the field is absent, the UE does not receive PEI in this BWP. For the <i>initialDownlinkBWP-RedCap</i> not including CD-SSB and the entire CORESET#0, a RedCap UE in RRC_IDLE or RRC_INACTIVE while SDT procedure is not ongoing monitors PEI in the <i>initialDownlinkBWP</i> that includes CORESET#0, if the <i>initialDownlinkBWP</i> is configured with <i>pei-ConfigBWP</i>.</p>                                                                                                                                                                                                                                                |
| <p><b>pei-SearchSpace</b><br/>ID of dedicated search space for PEI. It can be configured to one of up to 4 common SS sets configured by <i>commonSearchSpaceList</i> with <i>SearchSpaceId</i> &gt; 0. The CCE aggregation levels and maximum number of PDCCH candidates per CCE aggregation level follows Table 10.1-1 of TS38.213 [13]. <i>SearchSpaceId</i> = 0 can be configured for the case of SS/PBCH block and CORESET multiplexing pattern 2 or 3.</p>                                                                                                                                                                                                                                                               |
| <p><b>ra-SearchSpace</b><br/>ID of the Search space for random access procedure (see TS 38.213 [13], clause 10.1). If the field is absent, the UE does not receive RAR in this BWP. This field is mandatory present in the DL BWP(s) if the conditions described in TS 38.321 [3], clause 5.15 are met.</p>                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <p><b>sdt-SearchSpace</b><br/>Common search space for CG-SDT and RA-SDT (see TS 38.213 [13]). If an <i>existingSearchSpace</i> is used, the network only signals the search space ID of the <i>ra-SearchSpace</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b><i>searchSpaceMCCH</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ID of the search space for MCCH. If the field is absent, the UE does not receive MCCH in this BWP (see TS 38.213 [13], clause 10). This field is absent for the RedCap-specific initial downlink BWP, if it does not include CD-SSB and the entire CORESET#0.                                                                                                                                                                                                                                                                                                     |
| <b><i>searchSpaceMTCH</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ID of the search space for MTCH of MBS broadcast. If the field is absent, the UE applies <i>searchSpaceMCCH</i> also for MTCH, (see TS 38.213 [13], clause 10). This field is absent for the RedCap-specific initial downlink BWP, if it does not include CD-SSB and the entire CORESET#0.                                                                                                                                                                                                                                                                        |
| <b><i>searchSpaceOtherSystemInformation</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| ID of the Search space for other system information, i.e., <i>SIB2</i> and beyond (see TS 38.213 [13], clause 10.1). If the field is absent, the UE does not receive other system information in this BWP. This field is absent for the RedCap-specific initial DL BWP, if it does not include CD-SSB and the entire CORESET#0. In that case, a RedCap UE in RRC_IDLE or RRC_INACTIVE shall monitor PDCCH to receive other system information using <i>searchSpaceOtherSystemInformation</i> in the initial DL BWP that includes CD-SSB and the entire CORESET#0. |
| <b><i>searchSpaceSIB1</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ID of the search space for <i>SIB1</i> message. In the initial DL BWP of the UE's PCell, the network sets this field to 0. If the field is absent, the UE does not receive <i>SIB1</i> in this BWP. (see TS 38.213 [13], clause 10). This field is absent for the RedCap-specific initial DL BWP, if it does not include CD-SSB and the entire CORESET#0. In that case, a RedCap UE in RRC_IDLE or RRC_INACTIVE shall monitor PDCCH to receive <i>SIB1</i> using <i>searchSpaceSIB1</i> in the initial DL BWP that includes CD-SSB and the entire CORESET#0.      |
| <b><i>searchSpaceZero</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Parameters of the common SearchSpace#0. The values are interpreted like the corresponding bits in <i>MIB pdcch-ConfigSIB1</i> . Even though this field is only configured in the initial BWP (BWP#0), <i>searchSpaceZero</i> can be used in search spaces configured in other DL BWP(s) than the initial DL BWP if the conditions described in TS 38.213 [13], clause 10, are satisfied.                                                                                                                                                                          |

| Conditional Presence     | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>InitialBWP-Only</i>   | If <i>SIB1</i> is broadcast the field is mandatory present in the <i>PDCCH-ConfigCommon</i> of the initial BWP (BWP#0) in <i>ServingCellConfigCommon</i> except it is the RedCap-specific initial BWP not including CD-SSB and the entire CORESET#0 in which case the field is absent, Need R; it is absent in other BWPs and when sent in system information. If <i>SIB1</i> is not broadcast and there is an SSB associated to the cell, the field is optionally present, Need M, in the <i>PDCCH-ConfigCommon</i> of the initial BWP (BWP#0) in <i>ServingCellConfigCommon</i> (still with the same setting for all UEs). In other cases, the field is absent. |
| <i>OtherBWP</i>          | This field is optionally present, Need R, if this BWP is not the <i>initialDownlinkBWP</i> and <i>pagingSearchSpace</i> is configured in this BWP. Otherwise this field is absent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <i>InitialBWP-Paging</i> | This field is optionally present, Need R, if this BWP is the <i>initialDownlinkBWP</i> or <i>initialDownlinkBWP-RedCap</i> including CD-SSB and the entire CORESET#0, and <i>pei-Config</i> is configured in <i>DownlinkConfigCommonSIB</i> . Otherwise, this field is absent.                                                                                                                                                                                                                                                                                                                                                                                    |

## – *PDCCH-ConfigSIB1*

The IE *PDCCH-ConfigSIB1* is used to configure CORESET#0 and search space#0.

If this field is present, the field <i>discardTimer</i> is ignored and <i>discardTimerExt</i> is used instead.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>discardTimerExt2</i></b><br>Value in ms of <i>discardTimerExt</i> specified in TS 38.323 [5]. Value <i>ms2000</i> corresponds to 2000 ms. If this field is present, the field <i>discardTimer</i> and <i>discardTimerExt</i> are ignored and <i>discardTimerExt2</i> is used instead.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>drb-ContinueROHC</i></b><br>Indicates whether the PDCP entity continues or resets the ROHC header compression protocol during PDCP re-establishment, as specified in TS 38.323 [5]. This field is configured only in case of resuming an RRC connection or reconfiguration with sync, where the PDCP termination point is not changed and the <i>fullConfig</i> is not indicated. The network does not include the field if the bearer is configured as DAPS bearer. This field can be configured for both DRB and multicast MRB.                                                                                                                                                                                                                                                                                                                 |
| <b><i>duplicationState</i></b><br>This field indicates the uplink PDCP duplication state for the associated RLC entities at the time of receiving this IE. If set to <i>true</i> , the PDCP duplication state is activated for the associated RLC entity. The index for the indication is determined by ascending order of logical channel ID of all RLC entities other than the primary RLC entity indicated by <i>primaryPath</i> in the order of MCG and SCG, as in clause 6.1.3.32 of TS 38.321 [3]. If the number of associated RLC entities other than the primary RLC entity is two, UE ignores the value in the largest index of this field. If the field is absent, the PDCP duplication states are deactivated for all associated RLC entities.                                                                                               |
| <b><i>ethernetHeaderCompression</i></b><br>This fields configures Ethernet Header Compression. This field can only be configured for a bi-directional DRB or a bi-directional multicast MRB. The network reconfigures <i>ethernetHeaderCompression</i> only upon reconfiguration involving PDCP re-establishment and with neither <i>drb-ContinueEHC-DL</i> nor <i>drb-ContinueEHC-UL</i> configured. Network only configures this field when <i>uplinkDataCompression</i> is not configured.                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>headerCompression</i></b><br>If rohc is configured, the UE shall apply the configured ROHC profile(s) in both uplink and downlink. If <i>uplinkOnlyROHC</i> is configured, the UE shall apply the configured ROHC profile(s) in uplink (there is no header compression in downlink). ROHC can be configured for any bearer type. ROHC and EHC can be both configured simultaneously for a DRB or a multicast MRB. The network reconfigures <i>headerCompression</i> only upon reconfiguration involving PDCP re-establishment or involving PDCP entity reconfiguration to configure DAPS bearer(s), and without any <i>drb-ContinueROHC</i> . Network configures <i>headerCompression</i> to <i>notUsed</i> when <i>outOfOrderDelivery</i> is configured. Network only configures this field when <i>uplinkDataCompression</i> is not configured. |
| <b><i>initialRX-DELIV</i></b><br>Indicates the initial value of RX_DELIV during PDCP window initialization for multicast MRB as specified in TS 38.323 [5]. The first/leftmost bit of the bit string contains the most significant bit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>integrityProtection</i></b><br>Indicates whether or not integrity protection is configured for this radio bearer. The network configures all DRBs with the same PDU-session ID with same value for this field. The value for this field cannot be changed after the DRB is set up.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>maxCID</i></b><br>Indicates the value of the MAX_CID parameter as specified in TS 38.323 [5].<br>The total value of MAX_CIDs across all bearers for the UE should be less than or equal to the value of <i>maxNumberROHC-ContextSessions</i> parameter as indicated by the UE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>moreThanOneRLC</i></b><br>This field configures UL data transmission when more than one RLC entity is associated with the PDCP entity. This field is not present if the bearer is configured as DAPS bearer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b><i>moreThanTwoRLC-DRB</i></b><br>This field configures UL data transmission when more than two RLC entities are associated with the PDCP entity for DRBs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>outOfOrderDelivery</i></b><br>Indicates whether or not <i>outOfOrderDelivery</i> specified in TS 38.323 [5] is configured. This field should be either always present or always absent, after the radio bearer is established.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>pdcp-Duplication</i></b><br>Indicates whether or not uplink duplication status at the time of receiving this IE is configured and activated as specified in TS 38.323 [5]. The presence of this field indicates that duplication is configured. PDCP duplication is not configured for CA packet duplication of LTE RLC bearer. The value of this field, when the field is present, indicates the state of the duplication at the time of receiving this IE. If set to <i>true</i> , duplication is activated. The value of this field is always <i>true</i> , when configured for a SRB. For PDCP entity with more than two associated RLC entities for UL transmission, this field is always present. If the field <i>moreThanTwoRLC-DRB</i> is present, the value of this field is ignored and the state of the duplication is indicated by <i>duplicationState</i> . For PDCP entity with more than two associated RLC entities, only NR RLC bearer is supported.                                                                                                                                                                                                                              |
| <b><i>pdcp-SN-SizeDL</i></b><br>PDCP sequence number size for downlink, 12 or 18 bits, as specified in TS 38.323 [5]. For SRBs only the value <i>len12bits</i> is applicable. The value for this field cannot be changed in case of reconfiguration with sync, if the bearer is configured as DAPS bearer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>pdcp-SN-SizeUL</i></b><br>PDCP sequence number size for uplink, 12 or 18 bits, as specified in TS 38.323 [5]. For SRBs only the value <i>len12bits</i> is applicable. The value for this field cannot be changed in case of reconfiguration with sync, if the bearer is configured as DAPS bearer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>primaryPath</i></b><br>Indicates the cell group ID and LCID of the primary RLC entity as specified in TS 38.323 [5], clause 5.2.1 for UL data transmission when more than one RLC entity is associated with the PDCP entity. In this version of the specification, only cell group ID corresponding to MCG is supported for SRBs, except for the split SRB2 of the IAB-MT, and except when the UE is required to set the <i>primaryPath</i> to refer to the SCG as specified in clause 5.7.3b.4. In this last case, if the network sends an <i>RRCReconfiguration</i> message (in NR-DC) or an EUTRA <i>RRCConnectionReconfiguration</i> message (in (NG)EN-DC) keeping SRB1 as split SRB, the network explicitly configures the <i>primaryPath</i> for the PDCP entity of SRB1 to refer to the MCG. In this version of the specification, only cell group ID corresponding to MCG is supported for DRBs when the SCG is deactivated. The NW indicates <i>cellGroup</i> for split bearers using logical channels in different cell groups. The NW always indicates <i>logicalChannel</i> if CA based PDCP duplication is configured in the cell group indicated by <i>cellGroup</i> of this field. |
| <b><i>splitSecondaryPath</i></b><br>Indicates the LCID of the split secondary RLC entity as specified in TS 38.323 [5] for fallback to split bearer operation when UL data transmission with more than two RLC entities is associated with the PDCP entity. This RLC entity belongs to a cell group that is different from the cell group indicated by <i>cellGroup</i> in the field <i>primaryPath</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>statusReportRequired</i></b><br>For AM DRBs, AM MRBs and DAPS UM DRBs, indicates whether the DRB or the multicast MRB is configured to send a PDCP status report in the uplink, as specified in TS 38.323 [5]. For DAPS AM DRBs, it also indicates whether the DRB is configured to send a second PDCP status report in the uplink, as specified in TS 38.323 [5].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>survivalTimeStateSupport</i></b><br>Indicates whether the DRB associated with this PDCP entity has survival time state support. If this field is configured to be true, all associated RLC entities are activated for PDCP duplication upon reception of a retransmission grant addressed to CS-RNTI, as specified in TS 38.321 [3].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>t-Reordering</i></b><br>Value in ms of t-Reordering specified in TS 38.323 [5]. Value <i>ms0</i> corresponds to 0 ms, value <i>ms20</i> corresponds to 20 ms, value <i>ms40</i> corresponds to 40 ms, and so on. When the field is absent the UE applies the value <i>infinity</i> . The value for this field cannot be changed in case of reconfiguration with sync, if the bearer is configured as DAPS bearer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>ul-DataSplitThreshold</i></b><br>Parameter specified in TS 38.323 [5]. Value <i>b0</i> corresponds to 0 bytes, value <i>b100</i> corresponds to 100 bytes, value <i>b200</i> corresponds to 200 bytes, and so on. The network sets this field to <i>infinity</i> for UEs not supporting <i>splitDRB-withUL-Both-MCG-SCG</i> and when the SCG is deactivated. If the field is absent when the split bearer is configured for the radio bearer first time, then the default value <i>infinity</i> is applied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b><i>PDCP-Config field descriptions</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b><i>uplinkDataCompression</i></b><br/>Indicates the UDC configuration that the UE shall apply. Network does not configure <i>uplinkDataCompression</i> for a DRB, if <i>headerCompression</i> or <i>ethernetHeaderCompression</i> is already configured or <i>outOfOrderDelivery</i> or DAPS is configured for the DRB. The maximum number of DRBs where <i>uplinkDataCompression</i> can be applied is two. The network reconfigures <i>uplinkDataCompression</i> only upon reconfiguration involving PDCP re-establishment. If the field is set to <i>drb-ContinueUDC</i>, the PDCP entity continues the uplink data compression protocol during PDCP re-establishment, as specified in TS 38.323 [5]. The field is set to <i>drb-ContinueUDC</i> only in case of resuming an RRC connection or reconfiguration with sync, where the PDCP termination point is not changed and the <i>fullConfig</i> is not indicated.</p> |
| <b><i>EthernetHeaderCompression field descriptions</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <p><b><i>drb-ContinueEHC-DL</i></b><br/>Indicates whether the PDCP entity continues or resets the downlink EHC header compression protocol during PDCP re-establishment, as specified in TS 38.323 [5]. The field is configured only in case of resuming an RRC connection or reconfiguration with sync, where the PDCP termination point is not changed and the <i>fullConfig</i> is not indicated.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <p><b><i>drb-ContinueEHC-UL</i></b><br/>Indicates whether the PDCP entity continues or resets the uplink EHC header compression protocol during PDCP re-establishment, as specified in TS 38.323 [5]. The field is configured only in case of resuming an RRC connection or reconfiguration with sync, where the PDCP termination point is not changed and the <i>fullConfig</i> is not indicated.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <p><b><i>ehc-CID-Length</i></b><br/>Indicates the length of the CID field for EHC packet. The value <i>bits7</i> indicates the length is 7 bits, and the value <i>bits15</i> indicates the length is 15 bits. Once the field <i>ethernetHeaderCompression-r16</i> is configured for a DRB or a multicast MRB, the value of the field <i>ehc-CID-Length</i> for this DRB or multicast MRB is not reconfigured to a different value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <p><b><i>ehc-Common</i></b><br/>Indicates the configurations that apply for both downlink and uplink.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <p><b>antennaPortsFieldPresenceDCI-1-2</b><br/>Configure the presence of "Antenna ports" field in DCI format 1_2. When the field is configured, then the "Antenna ports" field is present in DCI format 1_2. Otherwise, the field size is set to 0 for DCI format 1_2 (See TS 38.212 [17], clause 7.3.1.1.3). If neither <i>dmrs-DownlinkForPDSCH-MappingTypeA-DCI-1-2</i> nor <i>dmrs-DownlinkForPDSCH-MappingTypeB-DCI-1-2</i> is configured, this field is absent.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <p><b>aperiodic-ZP-CSI-RS-ResourceSetsToAddModList, aperiodic-ZP-CSI-RS-ResourceSetsToAddModListDCI-1-2</b><br/>AddMod/Release lists for configuring aperiodically triggered zero-power CSI-RS resource sets. Each set contains a <i>ZP-CSI-RS-ResourceSetId</i> and the IDs of one or more <i>ZP-CSI-RS-Resources</i> (the actual resources are defined in the <i>zp-CSI-RS-ResourceToAddModList</i>). The network configures the UE with at most 3 aperiodic <i>ZP-CSI-RS-ResourceSets</i> and it uses only the <i>ZP-CSI-RS-ResourceSetId</i> 1 to 3. The network triggers a set by indicating its <i>ZP-CSI-RS-ResourceSetId</i> in the DCI payload. The DCI codepoint '01' triggers the resource set with <i>ZP-CSI-RS-ResourceSetId</i> 1, the DCI codepoint '10' triggers the resource set with <i>ZP-CSI-RS-ResourceSetId</i> 2, and the DCI codepoint '11' triggers the resource set with <i>ZP-CSI-RS-ResourceSetId</i> 3 (see TS 38.214 [19], clause 5.1.4.2). The field <i>aperiodic-ZP-CSI-RS-ResourceSetsToAddModList</i> applies to DCI format 1_1 and the field <i>aperiodic-ZP-CSI-RS-ResourceSetsToAddModListDCI-1-2</i> applies to DCI format 1_2 (see TS 38.214 [19], clause 5.1.4.2 and TS 38.212 [17] clause 7.3.1).</p> |
| <p><b>beamAppTime</b><br/>Indicates the first slot to apply the unified TCI indicated by DCI as specified in TS 38.214 Clause 5.1.5. The value n1 means 1 symbol, n2 two symbols and so on. The first slot is at least Y symbols indicated by beamAppTime parameter after the last symbol of the acknowledgment of the joint or separate DL/UL beam indication. The same value shall be configured for all serving cells in any one of the <i>simultaneousU-TCI-UpdateListN</i> configured in IE <i>CellGroupConfig</i> based on the smallest SCS of the active BWP.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <p><b>dataScramblingIdentityPDSCH, dataScramblingIdentityPDSCH2</b><br/>Identifier(s) used to initialize data scrambling (<i>c_init</i>) for PDSCH as specified in TS 38.211 [16], clause 7.3.1.1. The <i>dataScramblingIdentityPDSCH2</i> is configured if <i>coresetPoolIndex</i> is configured with 1 for at least one CORESET in the same BWP.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <p><b>dl-OrJointTCI-StateToAddModList</b><br/>A list of Transmission Configuration Indicator (TCI) states indicating a transmission configuration which includes QCL-relationships between the DL RSs in one RS set and the PDSCH DMRS ports, PDCCH DMRS ports, and CSI-RS, and in case of join mode, also the PUSCH, PUCCH and SRS (see TS 38.214 [19], clause 5.1.5).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <p><b>dmrs-DownlinkForPDSCH-MappingTypeA, dmrs-DownlinkForPDSCH-MappingTypeA-DCI-1-2</b><br/>DMRS configuration for PDSCH transmissions using PDSCH mapping type A (chosen dynamically via <i>PDSCH-TimeDomainResourceAllocation</i>). Only the fields <i>dmrs-Type</i>, <i>dmrs-AdditionalPosition</i> and <i>maxLength</i> may be set differently for mapping type A and B. The field <i>dmrs-DownlinkForPDSCH-MappingTypeA</i> applies to DCI format 1_1 and the field <i>dmrs-DownlinkForPDSCH-MappingTypeA-DCI-1-2</i> applies to DCI format 1_2 (see TS 38.212 [17], clause 7.3.1).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <p><b>rateMatchPatternGroup2, rateMatchPatternGroup2DCI-1-2</b><br/> The IDs of a second group of <i>RateMatchPatterns</i> defined in <i>PDSCH-Config-&gt;rateMatchPatternToAddModList</i> (BWP level) or in <i>ServingCellConfig-&gt;rateMatchPatternToAddModList</i> (cell level). These patterns can be activated dynamically by DCI (see TS 38.214 [19], clause 5.1.4.1). The field <i>rateMatchPatternGroup2</i> applies to DCI format 1_1, and the field <i>rateMatchPatternGroup2DCI-1-2</i> applies to DCI format 1_2 (see TS 38.214 [19], clause 5.1.4.1).</p>                                                                                                                                                                   |
| <p><b>rateMatchPatternToAddModList</b><br/> Resources patterns which the UE should rate match PDSCH around. The UE rate matches around the union of all resources indicated in the rate match patterns (see TS 38.214 [19], clause 5.1.4.1). If a <i>RateMatchPattern</i> with the same <i>RateMatchPatternId</i> is configured in both MBS CFR and its associated BWP, the entire <i>RateMatchPattern</i> configuration, including the set of RBs/REs indicated by the patterns for the rate matching around, shall be the same and they are counted as a single rate match pattern in the total configured rate match patterns as defined in TS 38.214 [19].</p>                                                                        |
| <p><b>rbg-Size</b><br/> Selection between config 1 and config 2 for RBG size for PDSCH. The UE ignores this field if <i>resourceAllocation</i> is set to <i>resourceAllocationType1</i> (see TS 38.214 [19], clause 5.1.2.2.1).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <p><b>referenceOfSLIVDCI-1-2</b><br/> Enable using the starting symbol of the PDCCH monitoring occasion in which the DL assignment is detected as the reference of the SLIV for DCI format 1_2. When the RRC parameter enables the utilization of the new reference, the new reference is applied for TDRA entries with K0=0. For other entries (if any) in the same TDRA table, the reference is slot boundary as in Rel-15. PDSCH mapping type A is not supported with the new reference. The new reference of SLIV is not configured for a serving cell configured to be scheduled by cross-carrier scheduling on a scheduling cell with different numerology (see TS 38.212 [17] clause 7.3.1 and TS 38.214 [19] clause 5.1.2.1).</p> |
| <p><b>repetitionSchemeConfig</b><br/> Configure the UE with repetition schemes. The network does not configure <i>repetitionSchemeConfig-r16</i> and <i>repetitionSchemeConfig-v1630</i> simultaneously to <i>setup</i> in the same <i>PDSCH-Config</i>. The network does not configure this parameter and <i>sfnSchemePDSCH</i> in <i>MIMOParam-r17</i> simultaneously in the same serving cell.</p>                                                                                                                                                                                                                                                                                                                                     |
| <p><b>resourceAllocation, resourceAllocationDCI-1-2</b><br/> Configuration of resource allocation type 0 and resource allocation type 1 for non-fallback DCI (see TS 38.214 [19], clause 5.1.2.2). The field <i>resourceAllocation</i> applies to DCI format 1_1, and the field <i>resourceAllocationDCI-1-2</i> applies to DCI format 1_2 (see TS 38.214 [19], clause 5.1.2.2).</p>                                                                                                                                                                                                                                                                                                                                                      |
| <p><b>resourceAllocationType1GranularityDCI-1-2</b><br/> Configure the scheduling granularity applicable for both the starting point and length indication for resource allocation type 1 in DCI format 1_2. If this field is absent, the granularity is 1 PRB (see TS 38.214 [19], clause 5.1.2.2.2).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <p><b>sizeDCI-4-2</b><br/> Indicates the size of DCI format 4-2 (see TS 38.213 [13], clause 10.1).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <p><b>sp-ZP-CSI-RS-ResourceSetsToAddModList</b><br/> AddMod/Release lists for configuring semi-persistent zero-power CSI-RS resource sets. Each set contains a <i>ZP-CSI-RS-ResourceSetId</i> and the IDs of one or more <i>ZP-CSI-RS-Resources</i> (the actual resources are defined in the <i>zp-CSI-RS-ResourceToAddModList</i>) (see TS 38.214 [19], clause 5.1.4.2).</p>                                                                                                                                                                                                                                                                                                                                                             |

|                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>tcI-StatesToAddModList</b><br>A list of Transmission Configuration Indicator (TCI) states indicating a transmission configuration which includes QCL-relationships between the DL RSs in one RS set and the PDSCH DMRS ports (see TS 38.214 [19], clause 5.1.5). If <i>unifiedTCI-StateType</i> is configured for the serving cell, no element in this list is configured.                                                  |
| <b>unifiedTCI-StateRef</b><br>Provides the serving cell and BWP where the configuration for <i>dl-OrJointTCI-StateToAddModList-r17</i> are defined. When this field is present, <i>dl-OrJointTCI-StateToAddModList</i> and <i>dl-OrJointTCI-StateToReleaseList</i> are not present. The value of <i>unifiedTCI-StateType</i> of current serving cell is the same in the serving cell indicated by <i>unifiedTCI-StateRef</i> . |
| <b>vrB-ToPRB-Interleaver, vrB-ToPRB-InterleaverDCI-1-2</b><br>Interleaving unit configurable between 2 and 4 PRBs (see TS 38.211 [16], clause 7.3.1.6). When the field is absent, the UE performs non-interleaved VRB-to-PRB mapping.                                                                                                                                                                                          |
| <b>xOverheadMulticast</b><br>Accounts for an overhead from CSI-RS, CORESET etc. If the field is absent, the UE applies value xOh0 (see TS 38.214 [19]).                                                                                                                                                                                                                                                                        |
| <b>zp-CSI-RS-ResourceToAddModList</b><br>A list of Zero-Power (ZP) CSI-RS resources used for PDSCH rate-matching. Each resource in this list may be referred to from only one type of resource set, i.e., aperiodic, semi-persistent or periodic (see TS 38.214 [19]).                                                                                                                                                         |

– PDSCH-ConfigCommon

The IE *PDSCH-ConfigCommon* is used to configure cell specific PDSCH parameters.

PDSCH-ConfigCommon information element

```
-- ASN1START
-- TAG-PDSCH-CONFIGCOMMON-START

PDSCH-ConfigCommon ::=
    pdsch-TimeDomainAllocationList SEQUENCE {
        ... PDSCH-TimeDomainResourceAllocationList OPTIONAL, -- Need R
    }

-- TAG-PDSCH-CONFIGCOMMON-STOP
-- ASN1STOP
```

|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>codeBlockGroupFlushIndicator</b><br>Indicates whether CBGFI for CBG based (re)transmission in DL is enabled (true). (see TS 38.212 [17], clause 7.3.1.2.2).                    |
| <b>maxCodeBlockGroupsPerTransportBlock</b><br>Maximum number of code-block-groups (CBGs) per TB. In case of multiple CW, the maximum CBG is 4 (see TS 38.213 [13], clause 9.1.1). |

| <b><i>PDSCH-ServingCellConfig</i> field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>codeBlockGroupTransmission</i></b><br>Enables and configures code-block-group (CBG) based transmission (see TS 38.213 [13], clause 9.1.1). Network does not configure for a UE both spatial bundling of HARQ ACKs and <i>codeBlockGroupTransmission</i> within the same cell group.<br>The network does not configure this field if <ul style="list-style-type: none"> <li>- the SCS of at least one DL BWP configured in the cell is 480 or 960 kHz</li> <li>- Type-1 HARQ-ACK codebook is configured and <i>pdsch-TimeDomainAllocationListForMultiPDSCH-r17</i> for this serving cell contains pdsch-AllocationList with multiple entries (multiple PDSCH)</li> <li>- Type-2 HARQ-ACK codebook is configured and <i>pdsch-TimeDomainAllocationListForMultiPDSCH-r17</i> for any cell in the same PUCCH cell group associated with this serving cell contains pdsch-AllocationList with multiple entries (multiple PDSCH)</li> </ul> |
| <b><i>downlinkHARQ-FeedbackDisabled</i></b><br>Used to disable the DL HARQ feedback, sent in the uplink, per HARQ process ID. The first/leftmost bit corresponds to HARQ process ID 0, the next bit to HARQ process ID 1 and so on. Bits corresponding to HARQ process IDs that are not configured shall be ignored. The bit(s) set to one identify HARQ processes with disabled DL HARQ feedback and the bit(s) set to zero identify HARQ processes with enabled DL HARQ feedback.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>maxMIMO-Layers</i></b><br>Indicates the maximum number of MIMO layers to be used for PDSCH in all BWPs of this serving cell. (see TS 38.212 [17], clause 5.4.2.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>nrofHARQ-ProcessesForPDSCH</i></b><br>The number of HARQ processes to be used on the PDSCH of a serving cell. Value <i>n2</i> corresponds to 2 HARQ processes, value <i>n4</i> to 4 HARQ processes, and so on. If both <i>nrofHARQ-ProcessesForPDSCH</i> and <i>nrofHARQ-ProcessesForPDSCH-v1700</i> are absent, the UE uses 8 HARQ processes (see TS 38.214 [19], clause 5.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>pdsch-CodeBlockGroupTransmissionList</i></b><br>A list of configurations for up to two simultaneously constructed HARQ-ACK codebooks (see TS 38.213 [13], clause 9.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>processingType2Enabled</i></b><br>Enables configuration of advanced processing time capability 2 for PDSCH (see 38.214 [19], clause 5.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>pucch-Cell</i></b><br>The ID of the serving cell (of the same cell group) to use for PUCCH. If the field is absent, the UE sends the HARQ feedback on the PUCCH of the SpCell of this cell group, or on this serving cell if it is a PUCCH SCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>xOverhead</i></b><br>Accounts for overhead from CSI-RS, CORESET, etc. If the field is absent, the UE applies value xOh0 (see TS 38.214 [19], clause 5.1.3.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Conditional Presence</b> | <b>Explanation</b>                                                                                                                                                                                               |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>SCellAddOnly</i>         | It is optionally present, Need S, for (non-PUCCH) SCells when adding a new SCell. The field is absent, Need M, when reconfiguring SCells. The field is also absent for the SpCells as well as for a PUCCH SCell. |

## – *PDSCH-TimeDomainResourceAllocationList*

The IE *PDSCH-TimeDomainResourceAllocation* is used to configure a time domain relation between PDCCH and PDSCH. The *PDSCH-TimeDomainResourceAllocationList* contains one or more of such *PDSCH-TimeDomainResourceAllocations*. The network indicates in the DL assignment which of the configured time domain allocations the UE shall apply for that DL assignment. The UE determines the bit width of the DCI field based on the number of entries in the *PDSCH-TimeDomainResourceAllocationList*. Value 0 in the DCI field refers to the first element in this list, value 1 in the DCI field refers to the second element in this list, and so on.

| <i><b>PDSCH-TimeDomainResourceAllocation</b></i> field descriptions |                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>k0</i></b>                                                    | Slot offset between DCI and its scheduled PDSCH (see TS 38.214 [19], clause 5.1.2.1). <i>k0-v1710</i> is only applicable for PDSCH SCS of 480 kHz and 960 kHz. If multiple PDSCHs are configured per PDCCH, the network always configures this field. Otherwise, when the field is absent and only one PDSCH is configured per PDCCH, the UE applies the value 0. |
| <b><i>mappingType</i></b>                                           | PDSCH mapping type (see TS 38.214 [19], clause 5.3).                                                                                                                                                                                                                                                                                                              |
| <b><i>repetitionNumber</i></b>                                      | Indicates the number of PDSCH transmission occasions for slot-based repetition scheme in IE <i>RepetitionSchemeConfig</i> . The parameter is used as specified in 38.214 [19].                                                                                                                                                                                    |
| <b><i>startSymbolAndLength</i></b>                                  | An index giving valid combinations of start symbol and length (jointly encoded) as start and length indicator (SLIV). The network configures the field so that the allocation does not cross the slot boundary (see TS 38.214 [19], clause 5.1.2.1).                                                                                                              |

| <i>MultiPDSCH-TimeDomainResourceAllocation</i> field descriptions                                                 |  |
|-------------------------------------------------------------------------------------------------------------------|--|
| <b><i>pdsch-TDRA-List</i></b>                                                                                     |  |
| One or multiple PDSCHs which can be in consecutive or non-consecutive slots (see TS 38.214 [19], clause 5.1.2.1). |  |

| <b>downlinkAssignmentIndexDCI-0-2</b><br>Indicates if "Downlink assignment index" is present or absent in DCI format 0_2. If the field " <i>downlinkAssignmentIndexDCI-0-2</i> " is absent, then 0 bit for "Downlink assignment index" in DCI format 0_2. If the field " <i>downlinkAssignmentIndexDCI-0-2</i> " is present, then the bitwidth of "Downlink assignment index" in DCI format 0_2 is defined in the same was as that in DCI format 0_1 (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 9.1).                                                                                                                                                                                                                     |
| <b>downlinkAssignmentIndexDCI-1-2</b><br>Configures the number of bits for "Downlink assignment index" in DCI format 1_2. If the field is absent, then 0 bit is applied for "Downlink assignment index" in DCI format 1_2. Note that 1 bit and 2 bits are applied if only one serving cell is configured in the DL and <i>pdsch-HARQ-ACK-Codebook</i> is set to <i>dynamic</i> . 4 bits is applied if more than one serving cell are configured in the DL and <i>pdsch-HARQ-ACK-Codebook</i> is set to <i>dynamic</i> (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 9.1).                                                                                                                                                    |
| <b>harq-ACK-SpatialBundlingPUCCH</b><br>Enables spatial bundling of HARQ ACKs. It is configured per cell group (i.e. for all the cells within the cell group) for PUCCH reporting of HARQ-ACK. It is only applicable when more than 4 layers are possible to schedule. When the field is absent, the spatial bundling of PUCCH HARQ ACKs for the primary PUCCH group is disabled (see TS 38.213 [13], clause 9.1.2.1). If the field <i>harq-ACK SpatialBundlingPUCCH-secondaryPUCCHgroup</i> is present, <i>harq-ACK-SpatialBundlingPUCCH</i> is only applied to primary PUCCH group. Network does not configure for a UE both spatial bundling of HARQ ACKs and <i>codeBlockGroupTransmission</i> within the same cell group.              |
| <b>harq-ACK-SpatialBundlingPUCCH-secondaryPUCCHgroup</b><br>Indicates whether spatial bundling of PUCCH HARQ ACKs for the secondary PUCCH group is enabled or disabled. The field is only applicable when more than 4 layers are possible to schedule (see TS 38.213 [13], clause 9.1.2.1). When the field is absent, the use of spatial bundling of PUCCH HARQ ACKs for the secondary PUCCH group is indicated by <i>harq-ACK-SpatialBundlingPUCCH</i> . See TS 38.213 [13], clause 9.1.2.1. Network does not configure for a UE both spatial bundling of HARQ ACKs and <i>codeBlockGroupTransmission</i> within the same cell group.                                                                                                      |
| <b>harq-ACK-SpatialBundlingPUSCH</b><br>Enables spatial bundling of HARQ ACKs. It is configured per cell group (i.e. for all the cells within the cell group) for PUSCH reporting of HARQ-ACK. It is only applicable when more than 4 layers are possible to schedule. When the field is absent, the spatial bundling of PUSCH HARQ ACKs for the primary PUCCH group is disabled (see TS 38.213 [13], clauses 9.1.2.2 and 9.1.3.2). If the field <i>harq-ACK SpatialBundlingPUSCH-secondaryPUCCHgroup</i> is present, <i>harq-ACK-SpatialBundlingPUSCH</i> is only applied to primary PUCCH group. Network does not configure for a UE both spatial bundling of HARQ ACKs and <i>codeBlockGroupTransmission</i> within the same cell group. |
| <b>harq-ACK-SpatialBundlingPUSCH-secondaryPUCCHgroup</b><br>Indicates whether spatial bundling of PUSCH HARQ ACKs for the secondary PUCCH group is enabled or disabled. The field is only applicable when more than 4 layers are possible to schedule (see TS 38.213 [13], clauses 9.1.2.2 and 9.1.3.2). When the field is absent, the use of spatial bundling of PUSCH HARQ ACKs for the secondary PUCCH group is indicated by <i>harq-ACK-SpatialBundlingPUSCH</i> . See TS 38.213 [13], clauses 9.1.2.2 and 9.1.3.2. Network does not configure for a UE both spatial bundling of HARQ ACKs and <i>codeBlockGroupTransmission</i> within the same cell group.                                                                            |
| <b>intraBandNC-PRACH-simultX</b><br>Enables parallel PRACH and SRS/PUCCH/PUSCH transmissions across CCs in intra-band non-contiguous CA (see TS 38.213 [13], clause 8.1 and TS 38.214 [19], clause 6.2.1). This field is absent in the IE <i>CellGroupConfig</i> when provided as part of <i>RRCSetup</i> message.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>mcs-C-RNTI</b><br>RNTI to indicate use of <i>qam64LowSE</i> for grant-based transmissions. When the <i>mcs-C-RNTI</i> is configured, RNTI scrambling of DCI CRC is used to choose the corresponding MCS table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>nfi-TotalDAI-Included</b><br>Indicates whether the NFI and total DAI fields of the non-scheduled PDSCH group is included in the non-fallback DL grant DCI (see TS 38.212 [17], clause 7.3.1). The network configures this only when enhanced dynamic codebook is configured ( <i>pdsch-HARQ-ACK-Codebook</i> is set to <i>enhancedDynamic</i> ).                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>nr-dc-PCmode-FR1</b><br>Indicates the uplink power sharing mode that the UE uses in NR-DC in frequency range 1 (FR1) (see TS 38.213 [13], clause 7.6).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Indicates the uplink power sharing mode that the UE uses in NR-DC in frequency range 2 (FR2) (see TS 38.213 [13], clause 7.6).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>pdccch-BlindDetection, pdccch-BlindDetection2, pdccch-BlindDetection3, pdccch-BlindDetection4</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Indicates the reference number of cells for PDCCH blind detection for the CG. Network configures the field for each CG when the UE is in NR DC and sets the value in accordance with the constraints specified in TS 38.213 [13]. The network configures <i>pdccch-BlindDetection</i> only if the UE is in NR-DC. The network configures <i>pdccch-BlindDetection2</i> only if the UE is in NR-DC with at least one downlink cell using Rel-16 PDCCH monitoring capability. The network configures <i>pdccch-BlindDetection3</i> only if the UE is in NR-DC with at least one downlink cell using Rel-15 PDCCH monitoring capability. The network configures <i>pdccch-BlindDetection4</i> only if the UE is in NR-DC with at least one downlink cell using Rel-17 PDCCH monitoring capability.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>pdccch-BlindDetectionCA-CombIndicator</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Configure one combination of <i>pdccch-BlindDetectionCA1</i> (for R15) and <i>pdccch-BlindDetectionCA2</i> (for R16) for UE to use for scaling PDCCH monitoring capability if the number of serving cells configured to a UE is larger than the reported capability, and if UE reports more than one combination of <i>pdccch-BlindDetectionCA1</i> and <i>pdccch-BlindDetectionCA2</i> as UE capability. The combination of <i>pdccch-BlindDetectionCA1</i> and <i>pdccch-BlindDetectionCA2</i> configured by <i>pdccch-BlindDetectionCA-CombIndicator</i> is from the more than one combination of <i>pdccch-BlindDetectionCA1</i> and <i>pdccch-BlindDetectionCA2</i> reported by UE (see TS 38.213 [13], clause 10).<br><i>pdccch-BlindDetectionCA-CombIndicator-r17</i> is used to configure one combination of <i>pdccch-BlindDetectionCA1</i> (for R15), <i>pdccch-BlindDetectionCA2</i> (for R16) and <i>pdccch-BlindDetectionCA3</i> (for R17) for UE to use for scaling PDCCH monitoring capability if the number of serving cells configured to a UE is larger than the reported capability, and if UE reports more than one combination of <i>pdccch-BlindDetectionCA1</i> , <i>pdccch-BlindDetectionCA2</i> and <i>pdccch-BlindDetectionCA3</i> as UE capability. The combination of <i>pdccch-BlindDetectionCA1</i> , <i>pdccch-BlindDetectionCA2</i> and <i>pdccch-BlindDetectionCA3</i> configured by <i>pdccch-BlindDetectionCA-CombIndicator-r17</i> is from the more than one combination of <i>pdccch-BlindDetectionCA1</i> , <i>pdccch-BlindDetectionCA2</i> and <i>pdccch-BlindDetectionCA3</i> reported by UE (see TS 38.213 [13], clause 10).<br><i>pdccch-BlindDetectionCA-CombIndicator-r16</i> and <i>pdccch-BlindDetectionCA-CombIndicator-r17</i> are not configured simultaneously. |

| The maximum total transmit power to be used by the UE in this NR cell group across all serving cells in frequency range 2 (FR2). The maximum transmit power that the UE may use may be additionally limited by <i>p-Max</i> (configured in <i>FrequencyInfoUL</i> ) and by <i>p-UE-FR2</i> (configured total for all serving cells operating on FR2). This field is only used in NR-DC. A UE does not expect to be configured with this parameter in this release of the specification.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <p><b>ps-TransmitOtherPeriodicCSI</b><br/>Indicates the UE to transmit periodic CSI report(s) other than L1-RSRP reports when the <i>drx-onDurationTimer</i> does not start (see TS 38.321 [3], clause 5.7). If the field is absent, the UE does not transmit periodic CSI report(s) other than L1-RSRP reports when the <i>drx-onDurationTimer</i> does not start.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <p><b>p-UE-FR1</b><br/>The maximum total transmit power to be used by the UE across all serving cells in frequency range 1 (FR1) across all cell groups. The maximum transmit power that the UE may use may be additionally limited by <i>p-Max</i> (configured in <i>FrequencyInfoUL</i>) and by <i>p-NR-FR1</i> (configured for the cell group).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <p><b>p-UE-FR2</b><br/>The maximum total transmit power to be used by the UE across all serving cells in frequency range 2 (FR2) across all cell groups. The maximum transmit power that the UE may use may be additionally limited by <i>p-Max</i> (configured in <i>FrequencyInfoUL</i>) and by <i>p-NR-FR2</i> (configured for the cell group). A UE does not expect to be configured with this parameter in this release of the specification.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <p><b>pdsch-HARQ-ACK-Codebook</b><br/>The PDSCH HARQ-ACK codebook is either semi-static or dynamic. This is applicable to both CA and non-CA operation (see TS 38.213 [13], clauses 9.1.2 and 9.1.3). If <i>pdsch-HARQ-ACK-Codebook-r16</i> is signalled, UE shall ignore the <i>pdsch-HARQ-ACK-Codebook</i> (without suffix). For the HARQ-ACK for sidelink, if <i>pdsch-HARQ-ACK-Codebook-r16</i> is signalled, the UE uses <i>pdsch-HARQ-ACK-Codebook</i> (without suffix) and ignores <i>pdsch-HARQ-ACK-Codebook-r16</i>. If the field <i>pdsch-HARQ-ACK-Codebook-secondaryPUCCHgroup</i> is present, <i>pdsch-HARQ-ACK-Codebook</i> is applied to primary PUCCH group. Otherwise, this field is applied to the cell group (i.e. for all the cells within the cell group). For the HARQ-ACK for sidelink, if the field <i>pdsch-HARQ-ACK-Codebook-secondaryPUCCHgroup</i> is present, <i>pdsch-HARQ-ACK-Codebook</i> is applied to primary and secondary PUCCH group and the UE ignores <i>pdsch-HARQ-ACK-Codebook-secondaryPUCCHgroup</i>.</p> |
| <p><b>pdsch-HARQ-ACK-CodebookList</b><br/>A list of configurations for one or two HARQ-ACK codebooks. Each configuration in the list is defined in the same way as <i>pdsch-HARQ-ACK-Codebook</i> (see TS 38.212 [17], clause 7.3.1.2.2 and TS 38.213 [13], clauses 7.2.1, 9.1.2, 9.1.3 and 9.2.1). If this field is present, the field <i>pdsch-HARQ-ACK-Codebook</i> is ignored. If this field is present, the value of this field is applied for primary PUCCH group and for secondary PUCCH group (if configured). For the HARQ-ACK for sidelink, the UE uses <i>pdsch-HARQ-ACK-Codebook</i> and ignores <i>pdsch-HARQ-ACK-CodebookList</i> if this field is present.</p>                                                                                                                                                                                                                                                                                                                                                                       |
| <p><b>pdsch-HARQ-ACK-Codebook-secondaryPUCCHgroup</b><br/>The PDSCH HARQ-ACK codebook is either semi-static or dynamic. This is applicable to CA operation (see TS 38.213 [13], clauses 9.1.2 and 9.1.3). It is configured for secondary PUCCH group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <p><b>pdsch-HARQ-ACK-EnhType3DCI-Field, pdsch-HARQ-ACK-EnhType3DCI-FieldSecondaryPUCCHgroup</b><br/>Indicates the enhanced Type 3 codebook through a new DCI field to indicate the enhanced Type 3 HARQ-ACK codebook in the primary PUCCH group if the more than one enhanced Type 3 HARQ-ACK codebook is configured for the primary PUCCH group, or in the secondary PUCCH group if the more than one enhanced Type 3 HARQ-ACK code is configured for the secondary PUCCH group, respectively.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <p><b>pdsch-HARQ-ACK-EnhType3ToAddModList, pdsch-HARQ-ACK-EnhType3SecondaryToAddModList</b><br/>Configure the list of enhanced Type 3 HARQ-ACK codebooks for the primary PUCCH group and the secondary PUCCH group, respectively. When configured, DCI format 1_1 can request the UE to report A/N for one of the configured enhanced Type 3 HARQ-ACK codebooks in the corresponding PUCCH group (see TS 38.213 [13], clause 9.1.4). The network can configure <i>pdsch-HARQ-ACK-EnhType3SecondaryToAddModList</i> only if secondary PUCCH group is configured.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <p><b>pdsch-HARQ-ACK-OneShotFeedback</b><br/>When configured, the DCI format 1_1 can request the UE to report A/N for all HARQ processes and all CCs configured in the PUCCH group (see TS 38.212 [17], clause 7.3.1).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <p><b>pdsch-HARQ-ACK-OneShotFeedbackCBG</b><br/>When configured, the DCI format 1_1 can request the UE to include CBG level A/N for each CC with CBG level transmission configured. When not configured, the UE will report TB level A/N even if CBG level transmission is configured for a CC. The network configures this only when <i>pdsch-HARQ-ACK-OneShotFeedback</i> is configured.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <p><b>pdsch-HARQ-ACK-OneShotFeedbackNDI</b><br/>When configured, the DCI format 1_1 can request the UE to include NDI for each A/N reported. | Indicates whether a UE is expected UE to identify and monitor two QCL-TypeD properties for multiple overlapping CORESETs in the case of PDCCH repetition.                                                                                                                                                     |
| <b><i>uci-MuxWithDiffPrio, uci-MuxWithDiffPrio-secondaryPUCCHgroup</i></b>                                                                                                                                                                                                                                    |
| When configured, enables multiplexing a high-priority (HP) HARQ-ACK UCI and a low-priority (LP) HARQ-ACK UCI into a PUCCH or PUSCH for the primary PUCCH group and the secondary PUCCH group, respectively.                                                                                                   |
| <b><i>ul-TotalDAI-Included</i></b>                                                                                                                                                                                                                                                                            |
| Indicates whether the total DAI fields of the additional PDSCH group is included in the non-fallback UL grant DCI (see TS 38.212 [17], clause 7.3.1). The network configures this only when enhanced dynamic codebook is configured ( <i>pdsch-HARQ-ACK-Codebook</i> is set to <i>enhancedDynamic</i> ).      |
| <b><i>xScale</i></b>                                                                                                                                                                                                                                                                                          |
| The UE is allowed to drop NR only if the power scaling applied to NR results in a difference between scaled and unscaled NR UL of more than <i>xScale</i> dB (see TS 38.213 [13]). If the value is not configured for dynamic power sharing, the UE assumes default value of 6 dB.                            |

| MulticastConfig field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>pdsch-HARQ-ACK-CodebookListMulticast</b><br/> A list of configurations for one or two HARQ-ACK codebooks for MBS multicast. Each configuration in the list is defined in the same way as <i>pdsch-HARQ-ACK-Codebook</i> (see TS 38.212 [17], clause 7.3.1.2.2 and TS 38.213 [13], clauses 7.2.1, 9.1.2, 9.1.3 and 9.2.1). If this field is present, the field <i>pdsch-HARQ-ACK-Codebook</i> is ignored. If this field is present, the value of this field is applied for primary PUCCH group and for secondary PUCCH group (if configured).</p> <p><b>type1CodebookGenerationMode</b><br/> Indicates the mode of Type-1 HARQ-ACK codebook generation, as specified in TS 38.213 [13]. Mode 1 is based on the k1 values that are in the intersection of K1 set for unicast and K1 set for multicast. Mode 2 is based on the k1 values that are in the union of K1 set for unicast and K1 set for multicast.</p> |

| PDSCH-HARQ-ACK-EnhType3 field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>pdsch-HARQ-ACK-EnhType3CBG</b><br/> When configured, the DCI format 1_1 or DCI format 1_2 can request the UE to include CBG level A/N for each CC with CBG level transmission configured of the enhanced Type 3 HARQ-ACK codebook. When not configured, the UE will report TB level A/N even if CBG level transmission is configured for a CC.</p> <p><b>pdsch-HARQ-ACK-EnhType3NDI</b><br/> When configured, the DCI format 1_1 or DCI format 1_2 can request the UE to include NDI for each A/N reported of the enhanced Type 3 HARQ-ACK codebook.</p> <p><b>perCC</b><br/> Configures enhanced Type 3 HARQ-ACK codebook using per CC configuration.</p> <p><b>perHARQ, perHARQ-Ext</b><br/> Configures enhanced Type 3 HARQ-ACK codebook using per HARQ process and CC configuration. <i>perHARQ-Ext</i> is present only when <i>nrofHARQ-ProcessesForPDSCH-v1700</i> is present in <i>pdsch-ServingCellConfig</i> of at least one serving cell in the PUCCH group. If <i>perHARQ-Ext</i> is present, the UE ignores <i>perHARQ</i>.</p> |

| Conditional Presence | Explanation                                                                                                                                                   |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MCG-Only             | This field is optionally present, Need R, in the <i>PhysicalCellGroupConfig</i> of the MCG. It is absent otherwise.                                           |

| PLMN-Identity field descriptions |                                                                                                                                                                                                                                         |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mcc                              | The first element contains the first MCC digit, the second element the second MCC digit and so on. If the field is absent, it takes the same value as the <i>mcc</i> of the immediately preceding IE PLMN-Identity. See TS 23.003 [21]. |
| mnc                              | The first element contains the first MNC digit, the second element the second MNC digit and so on. See TS 23.003 [21].                                                                                                                  |

| Conditional Presence | Explanation                                                                                                                                                                  |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MCC                  | This field is mandatory present when PLMN-Identity is not used in a list or if it is the first entry of PLMN-Identity in a list. Otherwise it is optionally present, Need S. |

– PLMN-IdentityInfoList

The IE *PLMN-IdentityInfoList* includes a list of PLMN identity information.

PLMN-IdentityInfoList information element

```
-- ASN1START
-- TAG-PLMN-IDENTITYINFOLIST-START

PLMN-IdentityInfoList ::= SEQUENCE (SIZE (1..maxPLMN)) OF PLMN-IdentityInfo

PLMN-IdentityInfo ::= SEQUENCE {
  plmn-IdentityList      SEQUENCE (SIZE (1..maxPLMN)) OF PLMN-Identity,
  trackingAreaCode       TrackingAreaCode                      OPTIONAL, -- Need R
  ranac                  RAN-AreaCode                          OPTIONAL, -- Need R
  cellIdentity           CellIdentity,
  cellReservedForOperatorUse ENUMERATED {reserved, notReserved},
  ...,
  [[
    iab-Support-r16      ENUMERATED {true}                      OPTIONAL -- Need S
  ]],
  [[

  ]]
}
```

-- TAG-PLMN-IDENTITYINFOLIST-STOP

-- ASN1STOP

| <i>PLMN-IdentityInfo</i> field descriptions                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>cellReservedForOperatorUse</i></b><br>Indicates whether the cell is reserved for operator use (per PLMN), as defined in TS 38.304 [20]. This field is ignored by IAB-MT.                                                                                                                                                                                  |
| <b><i>gNB-ID-Length</i></b><br>Indicates the length of the gNB ID out of the 36-bit long <i>cellIdentity</i> .                                                                                                                                                                                                                                                  |
| <b><i>iab-Support</i></b><br>This field combines both the support of IAB and the cell status for IAB. If the field is present, the cell supports IAB and the cell is also considered as a candidate for cell (re)selection for IAB-node; if the field is absent, the cell does not support IAB and/or the cell is barred for IAB-node.                          |
| <b><i>trackingAreaCode</i></b><br>Indicates Tracking Area Code to which the cell indicated by <i>cellIdentity</i> field belongs. The absence of the field indicates that the cell only supports PSCell/SCell functionality (per PLMN) or is an NTN cell.                                                                                                        |
| <b><i>trackingAreaList</i></b><br>List of Tracking Areas to which the cell indicated by <i>cellIdentity</i> field belongs. If this field is present, network does not configure <i>trackingAreaCode</i> . Total number of different TACs across different <i>PLMN-IdentityInfos</i> shall not exceed <i>maxTAC</i> . This field is only present in an NTN cell. |

— *PLMN-IdentityList2*

Includes a list of PLMN identities.

*PLMN-IdentityList2* information element

```
-- ASN1START
-- TAG-PLMNIDENTITYLIST2-START

PLMN-IdentityList2-r16 ::= SEQUENCE (SIZE (1..16)) OF PLMN-Identity

-- TAG-PLMNIDENTITYLIST2-STOP
-- ASN1STOP
```

— *PRB-Id*

The IE *PRB-Id* identifies a Physical Resource Block (PRB) position within a carrier.

*PRB-Id* information element

```
-- ASN1START
-- TAG-PRB-ID-START

PRB-Id ::= INTEGER (0..maxNrofPhysicalResourceBlocks-1)

-- TAG-PRB-ID-STOP
-- ASN1STOP
```

–
 *PTRS-DownlinkConfig*

The IE *PTRS-DownlinkConfig* is used to configure downlink phase tracking reference signals (PTRS) (see TS 38.214 [19] clause 5.1.6.3)

*PTRS-DownlinkConfig* information element

```

-- ASN1START
-- TAG-PTRS-DOWNLINKCONFIG-START

PTRS-DownlinkConfig ::=
    frequencyDensity          SEQUENCE {
        frequencyDensity      SEQUENCE (SIZE (2)) OF INTEGER (1..276)          OPTIONAL, -- Need S
        timeDensity           SEQUENCE (SIZE (3)) OF INTEGER (0..29)          OPTIONAL, -- Need S
        epre-Ratio            INTEGER (0..3)                                OPTIONAL, -- Need S
        resourceElementOffset ENUMERATED { offset01, offset10, offset11 }      OPTIONAL, -- Need S
        ...,
        [[
            maxNrofPorts-r16    ENUMERATED {n1, n2}                          OPTIONAL  -- Need R
        ]]
    }

-- TAG-PTRS-DOWNLINKCONFIG-STOP

| <i>PTRS-DownlinkConfig</i> field descriptions |                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>epre-Ratio</i></b>                      | EPRE ratio between PTRS and PDSCH. Value 0 corresponds to the codepoint "00" in table 4.1-2. Value 1 corresponds to codepoint "01", and so on. If the field is not provided, the UE applies value 0 (see TS 38.214 [19], clause 4.1).                                                                                                       |
| <b><i>frequencyDensity</i></b>                | Presence and frequency density of DL PT-RS as a function of Scheduled BW. If the field is absent, the UE uses K_PT-RS = 2 (see TS 38.214 [19], clause 5.1.6.3, table 5.1.6.3-2).                                                                                                                                                            |
| <b><i>maxNrofPorts</i></b>                    | The maximum number of DL PTRS ports specified in TS 38.214 [19] (clause 5.1.6.3). 2 PT-RS ports can only be configured for a DL BWP that is configured, as specified in TS 38.214 [19] clause 5.1, with a mode where a single PDSCH has association between the DM-RS ports and the TCI states as defined in TS 38.214 [19] clause 5.1.6.2. |
| <b><i>resourceElementOffset</i></b>           | Indicates the subcarrier offset for DL PTRS. If the field is absent, the UE applies the value offset00 (see TS 38.211 [16], clause 7.4.1.2.2).                                                                                                                                                                                              |
| <b><i>timeDensity</i></b>                     | Presence and time density of DL PT-RS as a function of MCS. The value 29 is only applicable for MCS Table 5.1.3.1-1 (TS 38.214 [19]). If the field is absent, the UE uses L_PT-RS = 1 (see TS 38.214 [19], clause 5.1.6.3, table 5.1.6.3-1).                                                                                                |

–
 *PTRS-UplinkConfig*

The IE *PTRS-UplinkConfig* is used to configure uplink Phase-Tracking-Reference-Signals (PTRS).

| <b>PTRS-UplinkConfig</b> field descriptions |                                                                                                                                                                                                                                                                                                              |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>frequencyDensity</b>                     | Presence and frequency density of UL PT-RS for CP-OFDM waveform as a function of scheduled BW If the field is absent, the UE uses $K_{PT-RS} = 2$ (see TS 38.214 [19], clause 6.1).                                                                                                                          |
| <b>maxNrofPorts</b>                         | The maximum number of UL PTRS ports for CP-OFDM (see TS 38.214 [19], clause 6.2.3.1).                                                                                                                                                                                                                        |
| <b>ptrs-Power</b>                           | UL PTRS power boosting factor per PTRS port (see TS 38.214 [19], clause 6.1, table 6.2.3.1.3).                                                                                                                                                                                                               |
| <b>resourceElementOffset</b>                | Indicates the subcarrier offset for UL PTRS for CP-OFDM. If the field is absent, the UE applies the value offset00 (see TS 38.211 [16], clause 6.4.1.2.2).                                                                                                                                                   |
| <b>sampleDensity</b>                        | Sample density of PT-RS for DFT-s-OFDM, pre-DFT, indicating a set of thresholds $T=\{NRBn, n=0,1,2,3,4\}$ , that indicates dependency between presence of PT-RS and scheduled BW and the values of X and K the UE should use depending on the scheduled BW, see TS 38.214 [19], clause 6.1, table 6.2.3.2-1. |
| <b>timeDensity</b>                          | Presence and time density of UL PT-RS for CP-OFDM waveform as a function of MCS If the field is absent, the UE uses $L_{PT-RS} = 1$ (see TS 38.214 [19], clause 6.1).                                                                                                                                        |
| <b>timeDensityTransformPrecoding</b>        | Time density (OFDM symbol level) of PT-RS for DFT-s-OFDM. If the field is absent, the UE applies value d1 (see TS 38.214 [19], clause 6.1).                                                                                                                                                                  |
| <b>transformPrecoderDisabled</b>            | Configuration of UL PTRS without transform precoder (with CP-OFDM).                                                                                                                                                                                                                                          |
| <b>transformPrecoderEnabled</b>             | Configuration of UL PTRS with transform precoder (DFT-S-OFDM).                                                                                                                                                                                                                                               |

## – PUCCH-Config

The IE *PUCCH-Config* is used to configure UE specific PUCCH parameters (per BWP).

| <b><i>dl-DataToUL-ACK, dl-DataToUL-ACK-DCI-1-2</i></b><br>List of timing for given PDSCH to the DL ACK (see TS 38.213 [13], clause 9.1.2). The field <i>dl-DataToUL-ACK</i> applies to DCI format 1_1 and the field <i>dl-DataToUL-ACK-DCI-1-2</i> applies to DCI format 1_2 (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 9.2.3). The <i>dl-DataToUL-ACK-v1700</i> is applicable for NTN and <i>dl-DataToUL-ACK-r17</i> is applicable for FR2-2. If <i>dl-DataToUL-ACK-r16</i> or <i>dl-DataToUL-ACK-r17</i> or <i>dl-DataToUL-ACK-v1700</i> is signalled, UE shall ignore the <i>dl-DataToUL-ACK</i> (without suffix). The value -1 corresponds to "inapplicable value" for the case where the A/N feedback timing is not explicitly included at the time of scheduling PDSCH. The fields <i>dl-DataToUL-ACK-r17</i> and <i>dl-DataToUL-ACK-DCI-1-2-r17</i> are only applicable for SCS of 480 kHz or 960 kHz. |
| <b><i>dl-DataToUL-ACK-MulticastDCI-Format4-1</i></b><br>List of timing for given group-common PDSCH to the DL ACK (see TS 38.213 [13], clause 9.1.2). The field <i>dl-DataToUL-ACK-MulticastDciFormat4-1</i> applies to DCI format 4_1 for MBS multicast (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 9.2.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>dmrs-BundlingPUCCH-Config</i></b><br>Configuration of the parameters for DMRS bundling for PUCCH (see TS 38.214 [19], clause 6.1.7). DMRS bundling for PUCCH is not supported for PUCCH format 0/2. In this release, this is not applicable to FR2-2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b><i>spatialRelationInfoToAddModList</i>, <i>spatialRelationInfoToAddModListSizeExt</i>, <i>spatialRelationInfoToAddModListExt</i></b><br/> Configuration of the spatial relation between a reference RS and PUCCH. Reference RS can be SSB/CSI-RS/SRS. If the list has more than one element, MAC-CE selects a single element (see TS 38.321 [3], clause 5.18.8 and TS 38.213 [13], clause 9.2.2). The UE shall consider entries in <i>spatialRelationInfoToAddModList</i> and in <i>spatialRelationInfoToAddModListSizeExt</i> as a single list, i.e. an entry created using <i>spatialRelationInfoToAddModList</i> can be modified using <i>spatialRelationInfoToAddModListSizeExt</i> (or deleted using <i>spatialRelationInfoToReleaseListSizeExt</i>) and vice-versa. If the network includes <i>spatialRelationInfoToAddModListExt</i>, it includes the same number of entries, and listed in the same order, as in the concatenation of <i>spatialRelationInfoToAddModList</i> and of <i>spatialRelationInfoToAddModListSizeExt</i>. If <i>unifiedTCI-StateType</i> is configured for the serving cell, no element in this list is configured.</p> |
| <p><b><i>spatialRelationInfoToReleaseList</i>, <i>spatialRelationInfoToReleaseListSizeExt</i>, <i>spatialRelationInfoToReleaseListExt</i></b><br/> Lists of spatial relation configurations between a reference RS and PUCCH to be released by the UE.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <p><b><i>sps-PUCCH-AN-List</i></b><br/> Indicates a list of PUCCH resources for DL SPS HARQ ACK. The field <i>maxPayloadSize</i> is absent for the first and the last <i>SPS-PUCCH-AN</i> in the list. If configured, this overrides <i>n1PUCCH-AN</i> in <i>SPS-config</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <p><b><i>sps-PUCCH-AN-ListMulticast</i></b><br/> The field is used to configure the list of PUCCH resources per HARQ ACK codebook for MBS multicast.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <p><b><i>subslotLengthForPUCCH</i></b><br/> Indicates the sub-slot length for sub-slot based PUCCH feedback in number of symbols (see TS 38.213 [13], clause 9). Value <i>n2</i> corresponds to 2 symbols, value <i>n6</i> corresponds to 6 symbols, value <i>n7</i> corresponds to 7 symbols. For normal CP, the value is either <i>n2</i> or <i>n7</i>. For extended CP, the value is either <i>n2</i> or <i>n6</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <p><b><i>ul-AccessConfigListDCI-1-1</i>, <i>ul-AccessConfigListDCI-1-2</i></b><br/> List of the combinations of cyclic prefix extension and UL channel access type (see TS 38.212 [17], clause 7.3.1) applicable, respectively, to DCI format 1_1 and DCI format 1_2. The fields <i>ul-AccessConfigListDCI-1-1-r16</i> and <i>ul-AccessConfigListDCI-1-2-r17</i> are only applicable for FR1 (see TS 38.212 [17], Table 7.3.1.2.2-6). The field <i>ul-AccessConfigListDCI-1-1-r17</i> indicates a list which only contains UL channel access types and is only applicable for FR2-2 (see TS 38.212 [17], Table 7.3.1.2.2-6A).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b><i>PUCCH-format3</i> field descriptions</b>                                                                                                                      |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b><i>nrofPRBs</i></b><br/> The supported values are 1,2,3,4,5,6,8,9,10,12,15 and 16. The UE shall ignore this field when <i>format-v1610</i> is configured.</p> |

| <i><b>PUCCH-FormatConfig, PUCCH-FormatConfigExt field descriptions</b></i>                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b><i>additionalDMRS</i></b><br/>If the field is present, the UE enables 2 DMRS symbols per hop of a PUCCH Format 3 or 4 if both hops are more than X symbols when FH is enabled (X=4). And it enables 4 DMRS symbols for a PUCCH Format 3 or 4 with more than 2X+1 symbols when FH is disabled (X=4). The field is not applicable for format 0, 1 and 2. See TS 38.213 [13], clause 9.2.2.</p>                                                                                              |
| <p><b><i>interslotFrequencyHopping</i></b><br/>If the field is present, the UE enables inter-slot frequency hopping when PUCCH Format 0, 1, 2, 3 or 4 is repeated over multiple slots. For a PUCCH over multiple slots, the intra and inter slot frequency hopping cannot be enabled at the same time for a UE. See TS 38.213 [13], clause 9.2.6.</p>                                                                                                                                           |
| <p><b><i>maxCodeRate</i></b><br/>Max coding rate to determine how to feedback UCI on PUCCH for format 2, 3 or 4. The field is not applicable for format 0 and 1. See TS 38.213 [13], clause 9.2.5.</p>                                                                                                                                                                                                                                                                                          |
| <p><b><i>maxCodeRateLP</i></b><br/>Max coding rate to determine how to feedback UCI on PUCCH for format 2, 3 or 4. The field is not applicable for format 0 and 1. This field configures additional max code rate in the second entry of <i>PUCCH-ConfigurationList-r16</i> for multiplexing low-priority (LP) HARQ-ACK and high-priority (HP) UCI in a PUCCH as described Clause 9.2.5.3 of TS 38.213 [13]. The field is absent for the first entry of <i>PUCCH-ConfigurationList-r16</i>.</p> |
| <p><b><i>nrofSlots</i></b><br/>Number of slots with the same PUCCH. When the field is absent the UE applies the value <i>n1</i>. See TS 38.213 [13], clause 9.2.6.</p>                                                                                                                                                                                                                                                                                                                          |
| <p><b><i>pi2BPSK</i></b><br/>If the field is present, the UE uses pi/2 BPSK for UCI symbols instead of QPSK for PUCCH. The field is not applicable for format 0, 1 and 2. See TS 38.213 [13], clause 9.2.5.</p>                                                                                                                                                                                                                                                                                 |
| <p><b><i>rb-SetIndex</i></b><br/>Indicates the RB set where PUCCH resource is allocated.</p>                                                                                                                                                                                                                                                                                                                                                                                                    |
| <p><b><i>simultaneousHARQ-ACK-CSI</i></b><br/>If the field is present, the UE uses simultaneous transmission of CSI and HARQ-ACK feedback with or without SR with PUCCH Format 2, 3 or 4. See TS 38.213 [13], clause 9.2.5. When the field is absent the UE applies the value <i>off</i>. The field is not applicable for format 0 and 1.</p>                                                                                                                                                   |

| <i>PUCCH-Resource, PUCCH-ResourceExt</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>format</b><br/>Selection of the PUCCH format (format 0 – 4) and format-specific parameters, see TS 38.213 [13], clause 9.2. <i>format0</i> and <i>format1</i> are only allowed for a resource in a first PUCCH resource set. <i>format2</i>, <i>format3</i> and <i>format4</i> are only allowed for a resource in non-first PUCCH resource set. The network can only configure <i>format-v1610</i> when format is set to <i>format2</i> or <i>format3</i>. The network only configures <i>format-v1700</i> when format is set to <i>format0</i>, <i>format1</i> or <i>format4</i>.</p>  |
| <p><b>interlace0</b><br/>This is the only interlace of interlaced PUCCH Format 0 and 1 and the first interlace for interlaced PUCCH Format 2 and 3.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <p><b>interlace1</b><br/>A second interlace, in addition to interlace 0, as specified in TS 38.213 [13], clause 9.2.1. For 15kHz SCS, values {0..9} are applicable; for 30kHz SCS, values {0..4} are applicable. For 15kHz SCS, the values of <i>interlace1</i> shall satisfy <math>interlace1 = \text{mod}(interlace0 + X, 10)</math> where <math>X=1, -1, \text{ or } 5</math>.</p>                                                                                                                                                                                                         |
| <p><b>intraSlotFrequencyHopping</b><br/>Enabling intra-slot frequency hopping, applicable for all types of PUCCH formats. For long PUCCH over multiple slots, the intra and inter slot frequency hopping cannot be enabled at the same time for a UE. See TS 38.213 [13], clause 9.2.1.</p>                                                                                                                                                                                                                                                                                                   |
| <p><b>nrofPRBs</b><br/>Indicates the number of PRBs used per PUCCH resource for the PUCCH format, see TS 38.213 [13], clause 9.2.1. This field is applicable for PUCCH <i>format0</i>, <i>format1</i>, and <i>format4</i> in FR2-2. The supported values for <i>format4</i> are 1,2,3,4,5,6,8,9,10,12,15 and 16.</p>                                                                                                                                                                                                                                                                          |
| <p><b>occ-Index</b><br/>Indicates the orthogonal cover code index (see TS 38.213 [13], clause 9.2.1). This field is applicable when <i>useInterlacePUCCH-PUSCH-16</i> is configured.</p>                                                                                                                                                                                                                                                                                                                                                                                                      |
| <p><b>occ-Length</b><br/>Indicates the orthogonal cover code length (see TS 38.213 [13], clause 9.2.1). This field is applicable when <i>useInterlacePUCCH-PUSCH-16</i> is configured.</p>                                                                                                                                                                                                                                                                                                                                                                                                    |
| <p><b>pucch-RepetitionNrofSlots</b><br/>Configuration of PUCCH repetition factor per PUCCH resource with associated scheduling DCI corresponding to Rel-17 dynamic PUCCH repetition. For a PUCCH resource, if both the field <i>pucch-RepetitionNrofSlots</i> and the field <i>nrofSlots</i> are present, the field <i>nrofSlots</i> is ignored and apply the value of <i>pucch-RepetitionNrofSlots</i> corresponding to Rel-17 dynamic PUCCH repetition. If this field is absent in a PUCCH resource with associated scheduling DCI, the UE applies the value of field <i>nrofSlots</i>.</p> |
| <p><b>pucch-ResourceId</b><br/>Identifier of the PUCCH resource.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <p><b>secondHopPRB</b><br/>Index of first PRB after frequency hopping of PUCCH. This value is applicable for intra-slot frequency hopping (see TS 38.213 [13], clause 9.2.1) or inter-slot frequency hopping (see TS 38.213 [13], clause 9.2.6).</p>                                                                                                                                                                                                                                                                                                                                          |

| <i>PUCCH-ResourceSet</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>maxPayloadSize</b><br/>Maximum number of UCI information bits that the UE may transmit using this PUCCH resource set (see TS 38.213 [13], clause 9.2.1). In a PUCCH occurrence, the UE chooses the first of its <i>PUCCH-ResourceSet</i> which supports the number of bits that the UE wants to transmit. The field is absent in the first set (Set0) and in the last configured set since the UE derives the maximum number of UCI information bits as specified in TS 38.213 [13], clause 9.2.1. This field can take integer values that are multiples of 4.</p>                                                                                                                                             |
| <p><b>resourceList</b><br/>PUCCH resources of <i>format0</i> and <i>format1</i> are only allowed in the first PUCCH resource set, i.e., in a <i>PUCCH-ResourceSet</i> with <i>pucch-ResourceSetId</i> = 0. This set may contain between 1 and 32 resources. PUCCH resources of <i>format2</i>, <i>format3</i> and <i>format4</i> are only allowed in a <i>PUCCH-ResourceSet</i> with <i>pucch-ResourceSetId</i> &gt; 0. If present, these sets contain between 1 and 8 resources each. The UE chooses a <i>PUCCH-Resource</i> from this list as specified in TS 38.213 [13], clause 9.2.3. Note that this list contains only a list of resource IDs. The actual resources are configured in <i>PUCCH-Config</i>.</p> |

| Conditional Presence | Explanation                                                                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>PI2-BPSK</i>      | The field is optionally present, Need R, if <i>format3</i> and/or <i>format4</i> are configured and <i>pi2BPSK</i> is configured in each of them. It is absent, Need R otherwise. |

– *PUCCH-ConfigCommon*

The IE *PUCCH-ConfigCommon* is used to configure the cell specific PUCCH parameters.

| <b><i>additionalPRBOffset</i></b><br>When intra-slot PUCCH frequency hopping within RedCap-specific initial UL BWP is disabled, each common PUCCH resource is mapped to a single PRB on one side of the UL BWP. This parameter determines an additional PRB offset in the PRB mapping for the PUCCH resource. If the field is not configured, the UE shall assume an additional PRB offset of zero.                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>hoppingId</i></b><br>Cell-specific scrambling ID for group hopping and sequence hopping if enabled, see TS 38.211 [16], clause 6.3.2.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>intra-SlotFH-r17</i></b><br>In case a separate initial UL BWP is configured for RedCap UEs, the presence of this parameter indicates whether intra-slot PUCCH frequency hopping within the separate initial UL BWP in the common PUCCH resource is enabled for RedCap UEs. If this field is absent, intra-slot PUCCH frequency hopping within RedCap-specific initial UL BWP is enabled. If this field is present, intra-slot PUCCH frequency hopping within RedCap-specific initial UL BWP is disabled and each PUCCH resource is mapped to a single PRB on one side of the UL BWP and this parameter determines whether the PRB index in the PRB mapping is counted in increasing order from the lower edge or in decreasing order from the upper edge of the UL BWP. |
| <b><i>nrofPRBs</i></b><br>Indicates the number of PRBs used per PUCCH resource for PUCCH format 0 and format 1 in FR2-2, see TS 38.213 [13], clause 9.2.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>p0-nominal</i></b><br>Power control parameter P0 for PUCCH transmissions. Value in dBm. Only even values (step size 2) allowed (see TS 38.213 [13], clause 7.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>pucch-GroupHopping</i></b><br>Configuration of group- and sequence hopping for all the PUCCH formats 0, 1, 3 and 4. Value <i>neither</i> implies neither group or sequence hopping is enabled. Value <i>enable</i> enables group hopping and disables sequence hopping. Value <i>disable</i> disables group hopping and enables sequence hopping (see TS 38.211 [16], clause 6.3.2.2).                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>pucch-ResourceCommon</i></b><br>An entry into a 16-row table where each row configures a set of cell-specific PUCCH resources/parameters. The UE uses those PUCCH resources until it is provided with a dedicated <i>PUCCH-Config</i> (e.g. during initial access) on the initial uplink BWP. Once the network provides a dedicated <i>PUCCH-Config</i> for that bandwidth part the UE applies that one instead of the one provided in this field (see TS 38.213 [13], clause 9.2).                                                                                                                                                                                                                                                                                     |
| <b><i>pucch-ResourceCommonRedCap</i></b><br>An entry into a 16-row table where each row configures a set of cell-specific PUCCH resources/parameters for RedCap UEs. The UE uses those PUCCH resources until it is provided with a dedicated <i>PUCCH-Config</i> (e.g. during initial access) on the initial uplink BWP. Once the network provides a dedicated <i>PUCCH-Config</i> for that bandwidth part the UE applies that one instead of the one provided in this field (see TS 38.213 [13], clause 9.2).                                                                                                                                                                                                                                                                |

| Conditional Presence         | Explanation                                                                                                                                                                                                                                                 |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>InitialBWP-Only</i>       | The field is mandatory present in the <i>PUCCH-ConfigCommon</i> of the initial BWP (BWP#0) in SIB1. It is absent in other BWPs including the RedCap-specific initial uplink BWP, if configured.                                                             |
| <i>InitialBWP-RedCap</i>     | The field is mandatory present in the <i>PUCCH-ConfigCommon</i> of the RedCap-specific initial BWP. It is optional present, Need R, in the <i>PUCCH-ConfigCommon</i> of the initial BWP configured by <i>initialUplinkBWP</i> . It is absent in other BWPs. |
| <i>InitialBWP-RedCapOnly</i> | The field is optional present, Need S, in the <i>PUCCH-ConfigCommon</i> of the RedCap-specific initial BWP. It is absent in other BWPs.                                                                                                                     |

– *PUCCH-ConfigurationList*

The IE *PUCCH-ConfigurationList* is used to configure UE specific PUCCH parameters (per BWP) for two simultaneously constructed HARQ-ACK codebooks. See TS 38.213 [13], clause 9.1.

**PUCCH-ConfigurationList information element**

```

-- ASN1START
-- TAG-PUCCH-CONFIGURATIONLIST-START

PUCCH-ConfigurationList-r16 ::=      SEQUENCE (SIZE (1..2)) OF PUCCH-Config

-- TAG-PUCCH-CONFIGURATIONLIST-STOP
-- ASN1STOP

```

— ***PUCCH-PathlossReferenceRS-Id***

The IE *PUCCH-PathlossReferenceRS-Id* is an ID for a reference signal (RS) configured as PUCCH pathloss reference (see TS 38.213 [13], clause 7.2).

***PUCCH-PathlossReferenceRS-Id* information element**

```

-- ASN1START
-- TAG-PUCCH-PATHLOSSREFERENCERS-ID-START

PUCCH-PathlossReferenceRS-Id ::=      INTEGER (0..maxNrofPUCCH-PathlossReferenceRSs-1)

PUCCH-PathlossReferenceRS-Id-v1610 ::=      INTEGER (maxNrofPUCCH-PathlossReferenceRSs..maxNrofPUCCH-PathlossReferenceRSs-1-r16)

PUCCH-PathlossReferenceRS-Id-r17 ::=      INTEGER (0..maxNrofPUCCH-PathlossReferenceRSs-1-r17)

-- TAG-PUCCH-PATHLOSSREFERENCERS-ID-STOP
-- ASN1STOP

```

— ***PUCCH-PowerControl***

The IE *PUCCH-PowerControl* is used to configure UE-specific parameters for the power control of PUCCH.

***PUCCH-PowerControl* information element**

```

-- ASN1START
-- TAG-PUCCH-POWERCONTROL-START
PUCCH-PowerControl ::=      SEQUENCE {
    deltaF-PUCCH-f0          INTEGER (-16..15)                OPTIONAL, -- Need R
    deltaF-PUCCH-f1          INTEGER (-16..15)                OPTIONAL, -- Need R
    deltaF-PUCCH-f2          INTEGER (-16..15)                OPTIONAL, -- Need R
    deltaF-PUCCH-f3          INTEGER (-16..15)                OPTIONAL, -- Need R

| <b><i>p0-Set</i></b><br>A set with dedicated P0 values for PUCCH, i.e., {P01, P02,... } (see TS 38.213 [13], clause 7.2). This field is not configured if <i>unifiedTCI-StateType</i> is configured for the serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>pathlossReferenceRSs, pathlossReferenceRSs-v1610</i></b><br>A set of Reference Signals (e.g. a CSI-RS config or a SS block) to be used for PUCCH pathloss estimation. Up to <i>maxNrofPUCCH-PathlossReference-RSs</i> may be configured. If the field is not configured, the UE uses the SSB as reference signal (see TS 38.213 [13], clause 7.2). The set includes Reference Signals indicated in <i>pathlossReferenceRSs</i> (without suffix) and in <i>pathlossReferenceRSs-v1610</i> . The UE maintains <i>pathlossReferenceRSs</i> and <i>pathlossReferenceRSs-v1610</i> separately: Receiving <i>pathlossReferenceRSs-v1610</i> set to <i>release</i> releases only the entries that were configured by <i>pathlossReferenceRSs-v1610</i> , and receiving <i>pathlossReferenceRSs-v1610</i> set to <i>setup</i> replaces only the entries that were configured by <i>pathlossReferenceRSs-v1610</i> with the newly signalled entries. Neither the field <i>pathlossReferenceRSs</i> (without suffix) nor <i>pathlossReferenceRSs-v1610</i> are configured if <i>unifiedTCI-StateType</i> is configured for the serving cell. |
| <b><i>twoPUCCH-PC-AdjustmentStates</i></b><br>Number of PUCCH power control adjustment states maintained by the UE (i.e., <i>g(i)</i> ). If the field is present ( <i>n2</i> ) the UE maintains two power control states (i.e., <i>g(i,0)</i> and <i>g(i,1)</i> ). If the field is absent, it maintains one power control state (i.e., <i>g(i,0)</i> ) (see TS 38.213 [13], clause 7.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## – *PUCCH-SpatialRelationInfo*

The IE *PUCCH-SpatialRelationInfo* is used to configure the spatial setting for PUCCH transmission and the parameters for PUCCH power control, see TS 38.213, [13], clause 9.2.2.

| <b>pucch-PathLossReferenceRS-Id</b><br>When <i>pucch-PathLossReferenceRS-Id-v1610</i> is configured, the UE shall ignore <i>pucch-PathLossReferenceRS-Id</i> (without suffix).                                                                                                                               |
| <b>pucch-SpatialRelationInfoId</b><br>When <i>pucch-SpatialRelationInfoId-v1610</i> is configured, the UE shall ignore <i>pucch-SpatialRelationInfoId</i> (without suffix). If <i>pucch-SpatialRelationInfoId-v1610</i> is absent, the UE shall use the <i>pucch-SpatialRelationInfoId</i> (without suffix). |
| <b>servingCellId</b><br>If the field is absent, the UE applies the <i>ServCellId</i> of the serving cell in which this <i>PUCCH-SpatialRelationInfo</i> is configured                                                                                                                                        |

– PUCCH-SpatialRelationInfo-Id

The IE *PUCCH-SpatialRelationInfo-Id* is used to identify a *PUCCH-SpatialRelationInfo*

PUCCH-SpatialRelationInfo-Id information element

```
-- ASN1START
-- TAG-PUCCH-SPATIALRELATIONINFO-START

PUCCH-SpatialRelationInfoId ::=
  INTEGER (1..maxNrofSpatialRelationInfos)

PUCCH-SpatialRelationInfoId-r16 ::=
  INTEGER (1..maxNrofSpatialRelationInfos-r16)

PUCCH-SpatialRelationInfoId-v1610 ::=
  INTEGER (maxNrofSpatialRelationInfos-plus-1..maxNrofSpatialRelationInfos-r16)

-- TAG-PUCCH-SPATIALRELATIONINFO-STOP
-- ASN1STOP
```

– PUCCH-TPC-CommandConfig

The IE *PUCCH-TPC-CommandConfig* is used to configure the UE for extracting TPC commands for PUCCH from a group-TPC messages on DCI.

**PUCCH-TPC-CommandConfig** information element

```

-- ASN1START
-- TAG-PUCCH-TPC-COMMANDCONFIG-START

PUCCH-TPC-CommandConfig ::=
    tpc-IndexPCell                INTEGER (1..15)                OPTIONAL, -- Cond PDCCH-OfSpCell
    tpc-IndexPUCCH-SCell          INTEGER (1..15)                OPTIONAL, -- Cond PDCCH-ofSpCellOrPUCCH-SCell
    ...,
    [[
        tpc-IndexPUCCH-sSCell-r17    INTEGER (1..15)            OPTIONAL, -- Need R
        tpc-IndexPUCCH-sSCellSecondaryPUCCHgroup-r17    INTEGER (1..15)            OPTIONAL -- Cond twoPUCCHgroup
    ]]
}

-- TAG-PUCCH-TPC-COMMANDCONFIG-STOP
-- ASN1STOP

```

**PUCCH-TPC-CommandConfig** field descriptions***tpc-IndexPCell***

An index determining the position of the first bit of TPC command (applicable to the SpCell) inside the DCI format 2-2 payload.

***tpc-IndexPUCCH-SCell***

An index determining the position of the first bit of TPC command (applicable to the PUCCH SCell) inside the DCI format 2-2 payload.

***tpc-IndexPUCCH-sSCell, tpc-IndexPUCCH-sSCellSecondaryPUCCHgroup***

An index determining the position of the first bit of TPC command (applicable to the alternative PUCCH cell for PUCCH cell switching) inside the DCI format 2-2 payload, for the primary PUCCH group and the secondary PUCCH group respectively.

| Conditional Presence               | Explanation                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>PDCCH-OfSpCell</i>              | The field is mandatory present if the <i>PUCCH-TPC-CommandConfig</i> is provided in the <i>PDCCH-Config</i> for the SpCell. Otherwise, the field is absent, Need R.                                                                                                                                                                                                              |
| <i>PDCCH-ofSpCellOrPUCCH-SCell</i> | The field is mandatory present if the <i>PUCCH-TPC-CommandConfig</i> is provided in the <i>PDCCH-Config</i> for the PUCCH-SCell. The field is optionally present, need R, if the UE is configured with a PUCCH SCell in this cell group and if the <i>PUCCH-TPC-CommandConfig</i> is provided in the <i>PDCCH-Config</i> for the SpCell. Otherwise, the field is absent, Need R. |
| <i>twoPUCCHgroup</i>               | This field is optionally present, Need R, if secondary PUCCH group is configured. It is absent otherwise.                                                                                                                                                                                                                                                                        |

– **PUSCH-Config**

The IE *PUSCH-Config* is used to configure the UE specific PUSCH parameters applicable to a particular BWP.

|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>antennaPortsFieldPresenceDCI-0-2</b><br/>Configure the presence of "Antenna ports" field in DCI format 0_2. When the field is configured, then the "Antenna ports" field is present in DCI format 0_2. Otherwise, the field size is set to 0 for DCI format 0_2 (See TS 38.212 [17], clause 7.3.1.1.3). If neither <i>dmrs-UplinkForPUSCH-MappingTypeA-DCI-0-2</i> nor <i>dmrs-UplinkForPUSCH-MappingTypeB-DCI-0-2</i> is configured, this field is absent.</p>                                                                                                                                                                                                                                                                                                                                                                                                         |
| <p><b>availableSlotCounting</b><br/>Indicate whether PUSCH repetitions counted on the basis of available slots is enabled. If the field is absent, PUSCH repetitions counted on the basis of available slots is disabled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <p><b>betaOffsetsCrossPrio, betaOffsetsCrossPrio1, betaOffsetsCrossPrio0DCI-0-2, betaOffsetsCrossPrio1DCI-0-2</b><br/>Selection between and configuration of dynamic and semi-static beta-offset for multiplexing HARQ-ACK on dynamically scheduled PUSCH with different priorities, see TS 38.213 [13], clause 9.3.<br/>The field <i>betaOffsetsCrossPrio0</i> indicates multiplexing low priority (LP) HARQ-ACK on dynamically scheduled high priority (HP) PUSCH.<br/>The field <i>betaOffsetsCrossPrio1</i> indicates multiplexing HP HARQ-ACK on dynamically scheduled LP PUSCH.<br/>The field <i>betaOffsetsCrossPrio0DCI-0-2</i> indicates multiplexing LP HARQ-ACK on dynamically scheduled HP PUSCH by DCI format 0_2.<br/>The field <i>betaOffsetsCrossPrio1DCI-0-2</i> indicates multiplexing HP HARQ-ACK on dynamically scheduled LP PUSCH by DCI format 0_2.</p> |
| <p><b>codebookSubset, codebookSubsetDCI-0-2</b><br/>Subset of PMIs addressed by TPMI, where PMIs are those supported by UEs with maximum coherence capabilities (see TS 38.214 [19], clause 6.1.1.1). The field <i>codebookSubset</i> applies to DCI format 0_1 and the field <i>codebookSubsetDCI-0-2</i> applies to DCI format 0_2 (see TS 38.214 [19], clause 6.1.1.1).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <p><b>dataScramblingIdentityPUSCH</b><br/>Identifier used to initialise data scrambling (<i>c<sub>init</sub></i>) for PUSCH. If the field is absent, the UE applies the physical cell ID. (see TS 38.211 [16], clause 6.3.1.1).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <p><b>dmrs-BundlingPUSCH-Config</b><br/>Configure the parameters for DMRS bundling for PUSCH (see TS 38.214 [19], clause 6.1.7). In this release, this is not applicable to FR2-2.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <p><b>dmrs-SequenceInitializationDCI-0-2</b><br/>Configure whether the field "DMRS Sequence Initialization" is present or not in DCI format 0_2. If the field is absent, then 0 bit for the field "DMRS Sequence Initialization" in DCI format 0_2. If the field is present, then the number of bits is determined in the same way as DCI format 0_1 (see TS 38.212 [17], clause 7.3.1).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <p><b>dmrs-UplinkForPUSCH-MappingTypeA, dmrs-UplinkForPUSCH-MappingTypeA-DCI-0-2</b><br/>DMRS configuration for PUSCH transmissions using PUSCH mapping type A (chosen dynamically via <i>PUSCH-TimeDomainResourceAllocation</i>). Only the fields <i>dmrs-Type</i>, <i>dmrs-AdditionalPosition</i> and <i>maxLength</i> may be set differently for mapping type A and B. The field <i>dmrs-UplinkForPUSCH-MappingTypeA</i> applies to DCI format 0_1 and the field <i>dmrs-UplinkForPUSCH-MappingTypeA-DCI-0-2</i> applies to DCI format 0_2 (see TS 38.212 [17], clause 7.3.1).</p>                                                                                                                                                                                                                                                                                         |
| <p><b>dmrs-UplinkForPUSCH-MappingTypeB, dmrs-UplinkForPUSCH-MappingTypeB-DCI-0-2</b><br/>DMRS configuration for PUSCH transmissions using PUSCH mapping type B (chosen dynamically via <i>PUSCH-TimeDomainResourceAllocation</i>). Only the fields <i>dmrs-Type</i>, <i>dmrs-AdditionalPosition</i> and <i>maxLength</i> may be set differently for mapping type A and B. The field <i>dmrs-UplinkForPUSCH-MappingTypeB</i> applies to DCI format 0_1 and the field <i>dmrs-UplinkForPUSCH-MappingTypeB-DCI-0-2</i> applies to DCI format 0_2 (see TS 38.212 [17], clause 7.3.1).</p>                                                                                                                                                                                                                                                                                         |
| <p><b>frequencyHopping</b><br/>The value <i>intraSlot</i> enables 'Intra-slot frequency hopping' and the value <i>interSlot</i> enables 'Inter-slot frequency hopping'. If the field is absent, frequency hopping is not configured for 'pusch-RepTypeA' (see TS 38.214 [19], clause 6.3). The field <i>frequencyHopping</i> applies to DCI format 0_0 and 0_1 for 'pusch-RepTypeA'.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <p><b>frequencyHoppingDCI-0-1</b><br/>Indicates the frequency hopping scheme for DCI format 0_1 when <i>pusch-RepTypeIndicatorDCI-0-1</i> is set to 'pusch-RepTypeB'. The value <i>interRepetition</i> enables 'Inter-repetition frequency hopping', and the value <i>interSlot</i> enables 'Inter-slot frequency hopping'. If the field is absent, frequency hopping is not configured for DCI format 0_1 for 'pusch-RepTypeB' (see TS 38.214 [19], clause 6.1).</p>                                                                                                                                                                                                                                                                                                                                                                                                         |
| <p><b>frequencyHoppingDCI-0-2</b><br/>Indicate the frequency hopping scheme for DCI format 0_2. The value <i>intraSlot</i> enables 'intra-slot frequency hopping', and the value <i>interRepetition</i> enables 'Inter-repetition frequency hopping', and the value <i>interSlot</i> enables 'Inter-slot frequency hopping'. When <i>pusch-RepTypeIndicatorDCI-0-2</i> is not set to 'pusch-RepTypeB', the frequency hopping scheme can be chosen between 'intra-slot frequency hopping' and 'inter-slot frequency hopping' if enabled. When <i>pusch-RepTypeIndicatorDCI-0-2</i> is set to 'pusch-RepTypeB', the frequency hopping scheme can be chosen between 'inter-repetition frequency hopping' and 'inter-slot frequency hopping' if enabled. If the field is absent, frequency hopping is not configured for DCI format 0_2 (see TS 38.214 [19], clause 6.3).</p>     |

| <p><b><i>frequencyHoppingOffsetLists, frequencyHoppingOffsetListsDCI-0-2</i></b><br/>Set of frequency hopping offsets used when frequency hopping is enabled for granted transmission (not msg3) and type 2 configured grant activation (see TS 38.214 [19], clause 6.3). The field <i>frequencyHoppingOffsetLists</i> applies to DCI format 0_0 and DCI format 0_1 and the field <i>frequencyHoppingOffsetListsDCI-0-2</i> applies to DCI format 0_2 (see TS 38.214 [19], clause 6.3).</p>                                                                                                                                              |
| <p><b><i>harq-ProcessNumberSizeDCI-0-2</i></b><br/>Configure the number of bits for the field "HARQ process number" in DCI format 0_2 (see TS 38.212 [17], clause 7.3.1).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <p><b><i>invalidSymbolPattern</i></b><br/>Indicates one pattern for invalid symbols for PUSCH transmission repetition type B applicable to both DCI format 0_1 and 0_2. If <i>InvalidSymbolPattern</i> is not configured, semi-static flexible symbols are used for PUSCH. Segmentation occurs only around semi-static DL symbols (see TS 38.214 [19] clause 6.1).</p>                                                                                                                                                                                                                                                                   |
| <p><b><i>invalidSymbolPatternIndicatorDCI-0-1, invalidSymbolPatternIndicatorDCI-0-2</i></b><br/>Indicates the presence of an additional bit in the DCI format 0_1/0_2. If <i>invalidSymbolPattern</i> is absent, then both <i>invalidSymbolPatternIndicatorDCI-0-1</i> and <i>invalidSymbolPatternIndicatorDCI-0-2</i> are absent. The field <i>invalidSymbolPatternIndicatorDCI-0-1</i> applies to the DCI format 0_1 and the field <i>invalidSymbolPatternIndicatorDCI-0-2</i> applies to DCI format 0_2 (see TS 38.214 [19] clause 6.1). If the field is absent, the UE behaviour is specified in TS 38.214 [19], clause 6.1.2.1.</p> |
| <p><b><i>mappingPattern</i></b><br/>Indicates whether the UE should follow Cyclical mapping pattern or Sequential mapping pattern for when two SRS resource sets are configured in <i>srs-ResourceSetToAddModList</i> or <i>srs-ResourceSetToAddModListDCI-0-2</i> with usage 'codebook' or 'noncodebook' for PUSCH transmission and the PUSCH transmission occasions are associated with both SRS resource sets.</p>                                                                                                                                                                                                                    |
| <p><b><i>maxRank, maxRankDCI-0-2</i></b><br/>Subset of PMIs addressed by TRIs from 1 to ULmaxRank (see TS 38.214 [19], clause 6.1.1.1). The field <i>maxRank</i> applies to DCI format 0_1 and the field <i>maxRankDCI-0-2</i> applies to DCI format 0_2 (see TS 38.214 [19], clause 6.1.1.1).</p>                                                                                                                                                                                                                                                                                                                                       |
| <p><b><i>mcs-Table, mcs-TableFormat0-2</i></b><br/>Indicates which MCS table the UE shall use for PUSCH without transform precoder (see TS 38.214 [19], clause 6.1.4.1). If the field is absent the UE applies the value 64QAM. The field <i>mcs-Table</i> applies to DCI format 0_0 and DCI format 0_1 and the field <i>mcs-TableDCI-0-2</i> applies to DCI format 0_2 (see TS 38.214 [19], clause 6.1.4.1).</p>                                                                                                                                                                                                                        |
| <p><b><i>mcs-TableTransformPrecoder, mcs-TableTransformPrecoderDCI-0-2</i></b><br/>Indicates which MCS table the UE shall use for PUSCH with transform precoding (see TS 38.214 [19], clause 6.1.4.1). If the field is absent the UE applies the value 64QAM. The field <i>mcs-TableTransformPrecoder</i> applies to DCI format 0_0 and DCI format 0_1 and the field <i>mcs-TableTransformPrecoderDCI-0-2</i> applies to DCI format 0_2 (see TS 38.214 [19], clause 6.1.4.1).</p>                                                                                                                                                        |
| <p><b><i>minimumSchedulingOffsetK2</i></b><br/>List of minimum K2 values. Minimum K2 parameter denotes minimum applicable value(s) for the <i>Time domain resource assignment</i> table for PUSCH (see TS 38.214 [19], clause 6.1.2.1).</p>                                                                                                                                                                                                                                                                                                                                                                                              |
| <p><b><i>mpe-ResourcePoolToAddModList</i></b><br/>List of SSB/CSI-RS resources for P-MPR reporting. Each resource is configured with serving cell index where the resource is configured for the UE. The <i>additionalPCI</i> is configured only if the resource is SSB. For each resource, if neither <i>cell</i> nor <i>additionalPCI</i> is present, the SSB/CSI-RS resource is from the serving cell where the <i>PUSCH-Config</i> is configured.</p>                                                                                                                                                                                |
| <p><b><i>numberOfBitsForRV-DCI-0-2</i></b><br/>Configures the number of bits for "Redundancy version" in the DCI format 0_2 (see TS 38.212 [17], clause 7.3.1 and TS 38.214 [19], clause 6.1.2.1).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <p><b><i>numberOfInvalidSymbolsForDL-UL-Switching</i></b><br/>Indicates the number of symbols after the last semi-static DL symbol that are invalid symbols for PUSCH repetition Type B. If it is absent, no symbol is explicitly defined for DL-to-UL switching (see TS 38.214 [19], clause 6.1).</p>                                                                                                                                                                                                                                                                                                                                   |
| <p><b><i>priorityIndicatorDCI-0-1, priorityIndicatorDCI-0-2</i></b><br/>Configures the presence of "priority indicator" in DCI format 0_1/0_2. When the field is absent in the IE, then the UE shall apply 0 bit for "Priority indicator" in DCI format 0_1/0_2. The field <i>priorityIndicatorDCI-0-1</i> applies to DCI format 0_1 and the field <i>priorityIndicatorDCI-0-2</i> applies to DCI format 0_2 (see TS 38.212 [17] clause 7.3.1 and TS 38.213 [13] clause 9).</p>                                                                                                                                                          |
| <p><b><i>pusch-AggregationFactor</i></b><br/>Number of repetitions for data (see TS 38.214 [19], clause 6.1.2.1). If the field is absent the UE applies the value 1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>pusch-PowerControl</i></b><br>Configures power control parameters PUSCH transmission.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>pusch-RepTypeIndicatorDCI-0-1, pusch-RepTypeIndicatorDCI-0-2</i></b><br>Indicates whether UE follows the behavior for "PUSCH repetition type A" or the behavior for "PUSCH repetition type B" for the PUSCH scheduled by DCI format 0_1/0_2 and for Type 2 CG associated with the activating DCI format 0_1/0_2. The value <i>pusch-RepTypeA</i> enables the 'PUSCH repetition type A' and the value <i>pusch-RepTypeB</i> enables the 'PUSCH repetition type B'. The field <i>pusch-RepTypeIndicatorDCI-0-1</i> applies to DCI format 0_1 and the field <i>pusch-RepTypeIndicatorDCI-0-2</i> applies to DCI format 0_2 (see TS 38.214 [19], clause 6.1.2.1).                                                                                                           |
| <b><i>pusch-TimeDomainAllocationList</i></b><br>List of time domain allocations for timing of UL assignment to UL data (see TS 38.214 [19], table 6.1.2.1.1-1). The field <i>pusch-TimeDomainAllocationList</i> applies to DCI formats 0_0 or DCI format 0_1 when the field <i>pusch-TimeDomainAllocationListDCI-0-1</i> is not configured (see TS 38.214 [19], table 6.1.2.1.1-1 and table 6.1.2.1.1-1A). The network does not configure the <i>pusch-TimeDomainAllocationList</i> (without suffix) simultaneously with the <i>pusch-TimeDomainAllocationListDCI-0-2-r16</i> or <i>pusch-TimeDomainAllocationListDCI-0-1-r16</i> or <i>pusch-TimeDomainAllocationListForMultiPUSCH-r16</i> .                                                                                 |
| <b><i>pusch-TimeDomainAllocationListDCI-0-1</i></b><br>Configuration of the time domain resource allocation (TDRA) table for DCI format 0_1 (see TS 38.214 [19], clause 6.1, table 6.1.2.1.1-1A).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>pusch-TimeDomainAllocationListDCI-0-2</i></b><br>Configuration of the time domain resource allocation (TDRA) table for DCI format 0_2 (see TS 38.214 [19], clause 6.1.2, table 6.1.2.1.1-1B).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>pusch-TimeDomainAllocationListForMultiPUSCH</i></b><br>Configuration of the time domain resource allocation (TDRA) table for multiple PUSCH (see TS 38.214 [19], clause 6.1.2). The network configures at most 64 rows in this TDRA table in <i>PUSCH-TimeDomainResourceAllocationList-r16</i> configured by this field. This field is not configured simultaneously with <i>pusch-AggregationFactor</i> if <i>extendedK2</i> is not configured. The network does not configure the <i>pusch-TimeDomainAllocationListForMultiPUSCH-r16</i> simultaneously with the <i>pusch-TimeDomainAllocationListDCI-0-1-r16</i> . The network does not configure the <i>pusch-TimeDomainAllocationListForMultiPUSCH-r16</i> simultaneously with the <i>numberOfSlotsTBOMS-r17</i> . |
| <b><i>rbg-Size</i></b><br>Selection between configuration 1 and configuration 2 for RBG size for PUSCH. The UE does not apply this field if <i>resourceAllocation</i> is set to <i>resourceAllocationType1</i> . Otherwise, the UE applies the value <i>config1</i> when the field is absent (see TS 38.214 [19], clause 6.1.2.2.1).                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>resourceAllocation, resourceAllocationDCI-0-2</i></b><br>Configuration of resource allocation type 0 and resource allocation type 1 for non-fallback DCI (see TS 38.214 [19], clause 6.1.2). The field <i>resourceAllocation</i> applies to DCI format 0_1 and the field <i>resourceAllocationDCI-0-2</i> applies to DCI format 0_2 (see TS 38.214 [19], clause 6.1.2).                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>resourceAllocationType1GranularityDCI-0-2</i></b><br>Configures the scheduling granularity applicable for both the starting point and length indication for resource allocation type 1 in DCI format 0_2. If this field is absent, the granularity is 1 PRB (see TS 38.214 [19], clause 6.1.2.2.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>secondTPCFieldDCI-0-1, secondTPCFieldDCI-0-2</i></b><br>A second TPC field can be configured via RRC for DCI-0-1 and DCI-0-2. Each TPC field is for each closed-loop index value respectively (i.e., 1st /2nd TPC fields correspond to "closedLoopIndex" value = 0 and 1,                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b><i>tp-pi2BPSK</i></b><br>Enables pi/2-BPSK modulation with transform precoding if the field is present and disables it otherwise.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>transformPrecoder</i></b><br>The UE specific selection of transformer precoder for PUSCH (see TS 38.214 [19], clause 6.1.3). When the field is absent the UE applies the value of the field <i>msg3-transformPrecoder</i> from <i>rach-ConfigCommon</i> included directly within BWP configuration (i.e., not included in <i>additionalRACH-ConfigList</i> ).                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>txConfig</i></b><br>Whether UE uses codebook based or non-codebook based transmission (see TS 38.214 [19], clause 6.1.1). If the field is absent, the UE transmits PUSCH on one antenna port, see TS 38.214 [19], clause 6.1.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>uci-OnPUSCH-ListDCI-0-1, uci-OnPUSCH-ListDCI-0-2</i></b><br>Configuration for up to 2 HARQ-ACK codebooks specific to DCI format 0_1/0_2. The field <i>uci-OnPUSCH-ListDCI-0-1</i> applies to DCI format 0_1 and the field <i>uci-OnPUSCH-ListDCI-0-2</i> applies to DCI format 0_2 (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13] clause 9.3).                                                                                                                                                                                                                                                                                                                                                                                                                    |

***ul-AccessConfigListDCI-0-1, ul-AccessConfigListDCI-0-2***

List of the combinations of cyclic prefix extension, channel access priority class (CAPC), and UL channel access type (see TS 38.212 [17], clause 7.3.1) applicable for DCI format 0\_1 and DCI format 0\_2, respectively. The fields *ul-AccessConfigListDCI-0-1-r16* and *ul-AccessConfigListDCI-0-2-r17* are only applicable for FR1 (see TS 38.212 [17], Table 7.3.1.1.2-35). The field *ul-AccessConfigListDCI-0-1-r17* only contains a list of UL channel access types and is only applicable for FR2-2 (see TS 38.212 [17], Table 7.3.1.1.2-35A).

***ul-FullPowerTransmission***

Configures the UE with UL full power transmission mode as specified in TS 38.213 [13]. This field is not configured if *ul-powerControl* is configured in the *BWP-UplinkDedicated* in which the *PUCCH-Config* is included.

**UCI-OnPUSCH field descriptions*****betaOffsets***

Selection between and configuration of dynamic and semi-static beta-offset for DCI formats other than DCI format 0\_2. If the field is not configured, the UE applies the value 'semiStatic' (see TS 38.213 [13], clause 9.3).

***scaling***

Indicates a scaling factor to limit the number of resource elements assigned to UCI on PUSCH for DCI formats other than DCI format 0\_2. Value *f0p5* corresponds to 0.5, value *f0p65* corresponds to 0.65, and so on. The value configured herein is applicable for PUSCH with configured grant (see TS 38.212 [17], clause 6.3).

**UCI-OnPUSCH-DCI-0-2 field descriptions*****betaOffsetsDCI-0-2***

Configuration of beta-offset for DCI format 0\_2. If *semiStaticDCI-0-2* is chosen, the UE shall apply the value of 0 bit for the field of beta offset indicator in DCI format 0\_2. If *dynamicDCI-0-2* is chosen, the UE shall apply the value of 1 bit or 2 bits for the field of beta offset indicator in DCI format 0\_2 (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13] clause 9.3).

***dynamicDCI-0-2***

Indicates the UE applies the value 'dynamic' for DCI format 0\_2 (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 9.3).

***semiStaticDCI-0-2***

Indicates the UE applies the value 'semiStatic' for DCI format 0\_2. (see TS 38.212 [17], clause 7.3.1 and see TS 38.213 [13], clause 9.3).

***scalingDCI-0-2***

Indicates a scaling factor to limit the number of resource elements assigned to UCI on PUSCH for DCI format 0\_2. Value *f0p5* corresponds to 0.5, value *f0p65* corresponds to 0.65, and so on (see TS 38.212 [17], clause 6.3).

| Conditional Presence | Explanation                                                                                                                                                                                            |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>codebookBased</i> | The field is mandatory present if <i>txConfig</i> is set to codebook and absent otherwise.                                                                                                             |
| <i>RepTypeB</i>      | The field is optionally present, Need S, if <i>pusch-RepTypeIndicatorDCI-0-1</i> is set to <i>pusch-RepTypeB</i> . It is absent otherwise.                                                             |
| <i>RepTypeB2</i>     | The field is optionally present, Need S, if <i>pusch-RepTypeIndicatorDCI-0-1</i> or <i>pusch-RepTypeIndicatorDCI-0-2</i> is set to <i>pusch-RepTypeB</i> . It is absent otherwise.                     |
| <i>SRSsets</i>       | This field is mandatory present when UE is configured with two SRS sets in either <i>srs-ResourceSetToAddModList</i> or <i>srs-ResourceSetToAddModListDCI-0-2</i> with usage codebook or non-codebook. |

– ***PUSCH-ConfigCommon***

The IE *PUSCH-ConfigCommon* is used to configure the cell specific PUSCH parameters.

**PUSCH-ConfigCommon** information element

```

-- ASN1START
-- TAG-PUSCH-CONFIGCOMMON-START

PUSCH-ConfigCommon ::=
    groupHoppingEnabledTransformPrecoding  ENUMERATED {enabled}          OPTIONAL, -- Need R
    pusch-TimeDomainAllocationList          PUSCH-TimeDomainResourceAllocationList OPTIONAL, -- Need R
    msg3-DeltaPreamble                      INTEGER (-1..6)              OPTIONAL, -- Need R
    p0-NominalWithGrant                    INTEGER (-202..24)            OPTIONAL, -- Need R
    ...
}

```

**PUSCH-ConfigCommon** field descriptions**groupHoppingEnabledTransformPrecoding**

For DMRS transmission with transform precoder, the NW may configure group hopping by this cell-specific parameter, see TS 38.211 [16], clause 6.4.1.1.1.2.

**msg3-DeltaPreamble**

Power offset between msg3 and RACH preamble transmission. Actual value = field value \* 2 [dB] (see TS 38.213 [13], clause 7.1)

**p0-NominalWithGrant**

P0 value for PUSCH with grant (except msg3). Value in dBm. Only even values (step size 2) allowed (see TS 38.213 [13], clause 7.1) This field is cell specific

**pusch-TimeDomainAllocationList**

List of time domain allocations for timing of UL assignment to UL data (see TS 38.214 [19], table 6.1.2.1.1-1).

**PUSCH-PowerControl**

The IE *PUSCH-PowerControl* is used to configure UE specific power control parameter for PUSCH.

**PUSCH-PowerControl** information element

#### ***P0-PUSCH-AlphaSet* field descriptions**

##### ***alpha***

alpha value for PUSCH with grant (except msg3) (see TS 38.213 [13], clause 7.1). When the field is absent the UE applies the value 1.

##### ***p0***

P0 value for PUSCH with grant (except msg3) in steps of 1dB (see TS 38.213 [13], clause 7.1). When the field is absent the UE applies the value 0.

#### ***P0-PUSCH-Set* field descriptions**

##### ***p0-List***

Configuration of {p0-PUSCH, p0-PUSCH} sets for PUSCH. If SRI is present in the DCI, then one p0-PUSCH can be configured in P0-PUSCH-Set. If SRI is not present in the DCI, and both *olpc-ParameterSetDCI-0-1* and *olpc-ParameterSetDCI-0-2* are configured to be 1 bit, then one p0-PUSCH can be configured in P0-PUSCH-Set. If SRI is not present in the DCI, and if any of *olpc-ParameterSetDCI-0-1* and *olpc-ParameterSetDCI-0-2* is configured to be 2 bits, then two p0-PUSCH values can be configured in P0-PUSCH-Set (see TS 38.213 [13] clause 7 and TS 38.212 [17] clause 7.3.1).

##### ***p0-PUSCH-SetId***

Configure the index of a p0-PUSCH-Set (see TS 38.213 [13] clause 7 and TS 38.212 [17] clause 7.3.1).

| <b>PUSCH-PowerControl field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

When the field is absent, the UE applies $K_s = 0$ in delta_TFC formula for PUSCH (see TS 38.213 [13], clause 7.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>dummy</b><br>This field is not used in the specification. If received it shall be ignored by the UE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>msg3-Alpha</b><br>Dedicated alpha value for msg3 PUSCH (see TS 38.213 [13], clause 7.1). When the field is absent the UE applies the value 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>olpc-ParameterSetDCI-0-1, olpc-ParameterSetDCI-0-2</b><br>Configures the number of bits for Open-loop power control parameter set indication for DCI format 0_1/0_2 in case SRI is not configured in the DCI. 2 bits is applicable only if SRI is not present in the DCI format 0_1. The field <i>olpc-ParameterSetDCI-0-1</i> applies to DCI format 0_1 and the field <i>olpc-ParameterSetDCI-0-2</i> applies to DCI format 0_2 (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 11).                                                                                                                                                                                   |
| <b>p0-AlphaSets</b><br>Configuration {p0-pusch, alpha} sets for PUSCH (except msg3 and msgA PUSCH), i.e., { {p0,alpha,index1}, {p0,alpha,index2},...} (see TS 38.213 [13], clause 7.1). When no set is configured, the UE uses the P0-nominal for msg3/msgA PUSCH, P0-UE is set to 0 and alpha is set according to either msg3-Alpha or msgA-Alpha (see TS 38.213 [13], clause 7.1). This field is not configured if <i>unifiedTCI-StateType</i> is configured for the serving cell.                                                                                                                                                                                                    |
| <b>p0-NominalWithoutGrant</b><br>P0 value for UL grant-free/SPS based PUSCH. Value in dBm. Only even values (step size 2) allowed (see TS 38.213 [13], clause 7.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>p0-PUSCH-SetList</b><br>Configure one additional <i>P0-PUSCH-Set</i> per SRI. If present, the one bit or 2 bits in the DCI is used to dynamically indicate among the P0 value from the existing <i>P0-PUSCH-AlphaSet</i> and the P0 value(s) from the <i>P0-PUSCH-Set</i> (See TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 17).                                                                                                                                                                                                                                                                                                                                          |
| <b>p0-PUSCH-SetList2</b><br>For indicating per-TRP OLPC set in DCI format 0_1/0_2 with the open-loop power control parameter set indication field, a second <i>p0-PUSCH-SetList-r16</i> is used. When this field is present the <i>p0-PUSCH-SetList-r16</i> corresponds to the first SRS resource set (see TS 38.213 [13]).                                                                                                                                                                                                                                                                                                                                                             |
| <b>pathlossReferenceRSToAddModList, pathlossReferenceRSToAddModListSizeExt</b><br>A set of Reference Signals (e.g. a CSI-RS config or a SS block) to be used for PUSCH path loss estimation. The set consists of Reference Signals configured using <i>pathLossReferenceRSToAddModList</i> and Reference Signals configured using <i>pathlossReferenceRSToAddModListSizeExt</i> . Up to <i>maxNrofPUSCH-PathlossReferenceRSs</i> may be configured (see TS 38.213 [13], clause 7.1). No elements in the list <i>pathLossReferenceRSToAddModList</i> nor <i>pathlossReferenceRSToAddModListSizeExt</i> are configured if <i>unifiedTCI-StateType</i> is configured for the serving cell. |
| <b>pathlossReferenceRSToReleaseList, pathlossReferenceRSToReleaseListSizeExt</b><br>Lists of reference signals for PUSCH path loss estimation to be released by the UE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>sri-PUSCH-MappingToAddModList</b><br>A list of <i>SRI-PUSCH-PowerControl</i> elements among which one is selected by the SRI field in DCI (see TS 38.213 [13], clause 7.1). No elements in this list are configured if <i>unifiedTCI-StateType</i> is configured for the serving cell.                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>sri-PUSCH-MappingToAddModList2</b><br>A list of <i>SRI-PUSCH-PowerControl</i> elements for second SRS-resource set, among which one is selected by the SRI field in DCI (see TS 38.213 [13], clause 7.1). When this field is present the <i>sri-PUSCH-MappingToAddModList</i> corresponds to the first SRS resource set for PUSCH. No elements in this list are configured if <i>unifiedTCI-StateType</i> is configured for the serving cell.                                                                                                                                                                                                                                        |
| <b>tpc-Accumulation</b><br>If enabled, UE applies TPC commands via accumulation. If not enabled, UE applies the TPC command without accumulation. If the field is absent, TPC accumulation is enabled (see TS 38.213 [13], clause 7.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>twoPUSCH-PC-AdjustmentStates</b><br>Number of PUSCH power control adjustment states maintained by the UE (i.e., $fc(i)$ ). If the field is present ( $n_2$ ) the UE maintains two power control states (i.e., $fc(i,0)$ and $fc(i,1)$ ). If the field is absent, it maintains one power control state (i.e., $fc(i,0)$ ) (see TS 38.213 [13], clause 7.1).                                                                                                                                                                                                                                                                                                                           |

| <b><i>SRI-PUSCH-PowerControl</i> field descriptions</b>                                                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>sri-P0-PUSCH-AlphaSetId</i></b><br>The ID of a <i>P0-PUSCH-AlphaSet</i> as configured in <i>p0-AlphaSets</i> in <i>PUSCH-PowerControl</i> .                                       |
| <b><i>sri-PUSCH-ClosedLoopIndex</i></b><br>The index of the closed power control loop associated with this <i>SRI-PUSCH-PowerControl</i> .                                              |
| <b><i>sri-PUSCH-PathlossReferenceRS-Id</i></b><br>The ID of <i>PUSCH-PathlossReferenceRS</i> as configured in the <i>pathlossReferenceRSToAddModList</i> in <i>PUSCH-PowerControl</i> . |
| <b><i>sri-PUSCH-PowerControlId</i></b><br>The ID of this <i>SRI-PUSCH-PowerControl</i> configuration. It is used as the codepoint (payload) in the SRI DCI field.                       |

## – *PUSCH-ServingCellConfig*

The IE *PUSCH-ServingCellConfig* is used to configure UE specific PUSCH parameters that are common across the UE's BWPs of one serving cell.

### *PUSCH-ServingCellConfig* information element

```
-- ASN1START
-- TAG-PUSCH-SERVINGCELLCONFIG-START

PUSCH-ServingCellConfig ::=

| <i>PUSCH-CodeBlockGroupTransmission</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>maxCodeBlockGroupsPerTransportBlock</i></b><br>Maximum number of code-block-groups (CBGs) per TB (see TS 38.213 [13], clause 9.1).                                                                                                                                                                                                                                                                                                                                  |
| <i>PUSCH-ServingCellConfig</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>codeBlockGroupTransmission</i></b><br>Enables and configures code-block-group (CBG) based transmission (see TS 38.214 [19], clause 6.1.5).<br>The network does not configure this field if the SCS of at least one UL BWP configured in the cell is 480 or 960 kHz.                                                                                                                                                                                                 |
| <b><i>maxMIMO-Layers</i></b><br>Indicates the maximum MIMO layer to be used for PUSCH in all BWPs of the corresponding UL of this serving cell (see TS 38.212 [17], clause 5.4.2.1). If present, the network sets <i>maxRank</i> to the same value. The field <i>maxMIMO-Layers</i> refers to DCI format 0_1.                                                                                                                                                             |
| <b><i>nrofHARQ-ProcessesForPUSCH</i></b><br>The number of HARQ processes to be used on the PUSCH of a serving cell. Value <i>n</i> 32 corresponds to 32 HARQ processes. If the field is absent, the UE uses 16 HARQ processes (see TS 38.214 [19], clause 6.1).                                                                                                                                                                                                           |
| <b><i>processingType2Enabled</i></b><br>Enables configuration of advanced processing time capability 2 for PUSCH (see TS 38.214 [19], clause 6.4).                                                                                                                                                                                                                                                                                                                        |
| <b><i>rateMatching</i></b><br>Enables LBRM (Limited buffer rate-matching). When the field is absent the UE applies FBRM (Full buffer rate-matching LBRM) (see TS 38.212 [17], clause 5.4.2).                                                                                                                                                                                                                                                                              |
| <b><i>xOverhead</i></b><br>If the field is absent, the UE applies the value 0 (see TS 38.214 [19], clause 6.1.4.2).                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>maxMIMO-LayersDCI-0-2</i></b><br>Indicates the maximum MIMO layer to be used for PUSCH for DCI format 0_2 in all BWPs of the corresponding UL of this serving cell (see TS 38.212 [17], clause 5.4.2.1). If present, the network sets <i>maxRankDCI-0-2</i> to the same value.                                                                                                                                                                                      |
| <b><i>uplinkHARQ-mode</i></b><br>Used to set the HARQ mode per HARQ process ID, see TS 38.321 [3]. The first/leftmost bit corresponds to HARQ process ID 0, the next bit to HARQ process ID 1 and so on. Bits corresponding to HARQ process IDs that are not configured shall be ignored. A bit set to one identifies a HARQ process with <i>HARQmodeA</i> and a bit set to zero identifies a HARQ process with <i>HARQ modeB</i> . This field applies for SRBs and DRBs. |

## – *PUSCH-TimeDomainResourceAllocationList*

The IE *PUSCH-TimeDomainResourceAllocation* is used to configure a time domain relation between PDCCH and PUSCH. *PUSCH-TimeDomainResourceAllocationList* contains one or more of such *PUSCH-TimeDomainResourceAllocations*. The network indicates in the UL grant which of the configured time domain allocations the UE shall apply for that UL grant. The UE determines the bit width of the DCI field based on the number of entries in the *PUSCH-TimeDomainResourceAllocationList*. Value 0 in the DCI field refers to the first element in this list, value 1 in the DCI field refers to the second element in this list, and so on.

|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b><i>extendedK2</i></b><br/>Corresponds to L1 parameter 'K2' (see TS 38.214 [19], clause 6.1.2.1) configurable per PUSCH allocation. Only values {0..32} are applicable for PUSCH SCS of 120 kHz. When the field is absent for the first PUSCH if multiple PUSCH are configured per PDCCH and <i>k2-r16</i> is absent, or when the field is absent and only one PUSCH is configured per PDCCH and <i>k2-r16</i> is absent, the UE applies the value 1 when PUSCH SCS is 15/30 kHz; the value 2 when PUSCH SCS is 60 kHz, the value 3 when PUSCH SCS is 120 kHz, the value 11 when PUSCH SCS is 480 kHz, and the value 21 when PUSCH SCS is 960 kHz. If multiple contiguous PUSCHs are configured per PDCCH, when the field <i>extendedK2(n)</i> corresponding to <i>k2</i> of the PUSCH(s) in the <i>n</i>-th slot (<i>n</i>&gt;1), or of the PUSCH(s) except the first PUSCH in the first slot (<i>n</i>=1), is absent, the UE applies <i>k2</i> of the first PUSCH plus <i>n</i>-1.</p> |
| <p><b><i>k2</i></b><br/>Corresponds to L1 parameter 'K2' (see TS 38.214 [19], clause 6.1.2.1). When the field is absent the UE applies the value 1 when PUSCH SCS is 15/30 kHz; the value 2 when PUSCH SCS is 60 kHz, and the value 3 when PUSCH SCS is 120 kHz. <i>k2</i> is absent/ignored if <i>extendedK2</i> is present.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <p><b><i>length</i></b><br/>Indicates the length allocated for PUSCH for DCI format 0_1/0_2 (see TS 38.214 [19], clause 6.1.2.1).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <p><b><i>mappingType</i></b><br/>Mapping type (see TS 38.214 [19], clause 6.1.2.1).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <p><b><i>numberOfRepetitions</i></b><br/>Number of repetitions for DCI format 0_1/0_2 (see TS 38.214 [19], clause 6.1.2.1). When <i>numberOfSlotsTBoMS-r17</i> is set to 2, 4 or 8 (i.e. TB processing over multi-slot (TBoMS) PUSCH is enabled), it indicates the number of repetitions of a single TBoMS.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <p><b><i>numberOfRepetitionsExt</i></b><br/>Number of repetitions for DCI format 0_1/0_2 if <i>pusch-RepTypeIndicatorDCI-0-1/pusch-RepTypeIndicatorDCI-0-2</i> is not set to <i>pusch-RepTypeB</i> (see TS 38.214 [19], clause 6.1.2.1). If this field is present, the field <i>numberOfRepetitions-r16</i> is ignored for PUSCH repetition Type A.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <p><b><i>numberOfSlotsTBoMS</i></b><br/>Number of slots allocated for TB processing over multi-slot PUSCH for DCI format 0_1/0_2. If a number of repetitions <i>K</i> is configured by <i>numberOfRepetitions</i> or <i>numberOfRepetitionsExt</i>, the network configures <i>numberOfSlotsTBoMS</i> (<i>N</i>) and <i>K</i> such that <math>N \cdot K \leq 32</math> (see TS 38.214 [19], clause 6.1.2.1). The network does not configure the <i>numberOfSlotsTBoMS-r17</i> simultaneously with the <i>pusch-TimeDomainAllocationListForMultiPUSCH-r16</i>. The network does not configure the <i>numberOfSlotsTBoMS-r17</i> together with <i>enhancedSkipUplinkTxDynamic</i> or <i>enhancedSkipUplinkTxConfigured</i> with value <i>true</i>.</p>                                                                                                                                                                                                                                           |
| <p><b><i>puschAllocationList</i></b><br/>The field <i>puschAllocationList-r16</i> indicates one or multiple PUSCH continuous in time domain which share a common <i>k2</i> (see TS 38.214 [19], clause 6.1.2.1). In this release, this field configures one or multiple PUSCH that may be in consecutive or non-consecutive slots (see TS 38.214 [19], clause 6.1.2.1). The <i>puschAllocationList-r16</i> only has one element in <i>pusch-TimeDomainAllocationListDCI-0-1-r16</i> and in <i>pusch-TimeDomainAllocationListDCI-0-2-r16</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <p><b><i>startSymbol</i></b><br/>Indicates the index of start symbol for PUSCH for DCI format 0_1/0_2 (see TS 38.214 [19], clause 6.1.2.1).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <p><b><i>startSymbolAndLength</i></b><br/>An index giving valid combinations of start symbol and length (jointly encoded) as start and length indicator (SLIV). The network configures the field so that the allocation does not cross the slot boundary. (see TS 38.214 [19], clause 6.1.2.1).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Otherwise, it is optionally present, Need S.                                                                                                                                                                                                                 |

## – *PUSCH-TPC-CommandConfig*

The IE *PUSCH-TPC-CommandConfig* is used to configure the UE for extracting TPC commands for PUSCH from a group-TPC messages on DCI.

### *PUSCH-TPC-CommandConfig* information element

```
-- ASN1START
-- TAG-PUSCH-TPC-COMMANDCONFIG-START

PUSCH-TPC-CommandConfig ::= SEQUENCE {
    tpc-Index          INTEGER (1..15)          OPTIONAL, -- Cond SUL
    tpc-IndexSUL       INTEGER (1..15)          OPTIONAL, -- Cond SUL-Only
    targetCell         ServCellIndex            OPTIONAL, -- Need S
    ...
}

-- TAG-PUSCH-TPC-COMMANDCONFIG-STOP
-- ASN1STOP
```

| PUSCH-TPC-CommandConfig field descriptions |                                                                                                                                                                                                   |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| targetCell                                 | The serving cell to which the acquired power control commands are applicable. If the value is absent, the UE applies the TPC commands to the serving cell on which the command has been received. |
| tpc-Index                                  | An index determining the position of the first bit of TPC command inside the DCI format 2-2 payload.                                                                                              |
| tpc-IndexSUL                               | An index determining the position of the first bit of TPC command inside the DCI format 2-2 payload.                                                                                              |

| Conditional Presence | Explanation                                                                                                                                |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| SUL-Only             | The field is optionally present, Need R, if supplementaryUplink is configured within ServingCellConfig. It is absent otherwise.            |
| SUL                  | The field is optionally present, Need R, if supplementaryUplink is configured within ServingCellConfig. It is mandatory present otherwise. |

— Q-OffsetRange

The IE *Q-OffsetRange* is used to indicate a cell, beam or measurement object specific offset to be applied when evaluating candidates for cell re-selection or when evaluating triggering conditions for measurement reporting. The value is in dB. Value *dB-24* corresponds to -24 dB, *dB-22* corresponds to -22 dB and so on.

Q-OffsetRange information element

```
-- ASN1START
-- TAG-Q-OFFSETRANGE-START

Q-OffsetRange ::=
    ENUMERATED {
        dB-24, dB-22, dB-20, dB-18, dB-16, dB-14,
        dB-12, dB-10, dB-8, dB-6, dB-5, dB-4, dB-3,
        dB-2, dB-1, dB0, dB1, dB2, dB3, dB4, dB5,
        dB6, dB8, dB10, dB12, dB14, dB16, dB18,
        dB20, dB22, dB24}

-- TAG-Q-OFFSETRANGE-STOP
-- ASN1STOP
```

— Q-QualMin

The IE *Q-QualMin* is used to indicate for cell selection/ re-selection the required minimum received RSRQ level in the (NR) cell. Corresponds to parameter *Q<sub>qualmin</sub>* in TS 38.304 [20]. Actual value *Q<sub>qualmin</sub>* = field value [dB].

Q-QualMin information element

```
-- ASN1START
-- TAG-Q-QUALMIN-START
```

Q-QualMin ::= INTEGER (-43..-12)

-- TAG-Q-QUALMIN-STOP  
-- ASN1STOP

## — *Q-RxLevMin*

The IE *Q-RxLevMin* is used to indicate for cell selection/ re-selection the required minimum received RSRP level in the (NR) cell. Corresponds to parameter  $Q_{rxlevmin}$  in TS 38.304 [20]. Actual value  $Q_{rxlevmin} = \text{field value} * 2$  [dBm].

### *Q-RxLevMin* information element

-- ASN1START  
-- TAG-Q-RXLEVMIN-START

Q-RxLevMin ::= INTEGER (-70..-22)

-- TAG-Q-RXLEVMIN-STOP  
-- ASN1STOP

## — *QuantityConfig*

The IE *QuantityConfig* specifies the measurement quantities and layer 3 filtering coefficients for NR and inter-RAT measurements.

### *QuantityConfig* information element

#### ***QuantityConfigNR field descriptions***

##### ***quantityConfigCell***

Specifies L3 filter configurations for cell measurement results for the configurable RS Types (e.g. SS/PBCH block and CSI-RS) and the configurable measurement quantities (e.g. RSRP, RSRQ and SINR).

##### ***quantityConfigRS-Index***

Specifies L3 filter configurations for measurement results per RS index for the configurable RS Types (e.g. SS/PBCH block and CSI-RS) and the configurable measurement quantities (e.g. RSRP, RSRQ and SINR).

#### ***QuantityConfigRS field descriptions***

##### ***csi-RS-FilterConfig***

CSI-RS based L3 filter configurations:

Specifies L3 filter configurations for CSI-RSRP, CSI-RSRQ and CSI-SINR measurement results from the L1 filter(s), as defined in TS 38.215 [9].

##### ***ssb-FilterConfig***

SS Block based L3 filter configurations:

Specifies L3 filter configurations for SS-RSRP, SS-RSRQ and SS-SINR measurement results from the L1 filter(s), as defined in TS 38.215 [9].

#### ***QuantityConfigUTRA-FDD field descriptions***

##### ***filterCoefficientRSCP***

Specifies L3 filter coefficient for FDD UTRAN CPICH\_RSCP measurement results from L1 filter.

##### ***filterCoefficientEcN0***

Specifies L3 filter coefficient for FDD UTRAN CPICH\_EcN0 measurement results from L1 filter.

## – RACH-ConfigCommon

The IE *RACH-ConfigCommon* is used to specify the cell specific random-access parameters.

### *RACH-ConfigCommon* information element

| <b><i>featureCombinationPreamblesList</i></b><br>Specifies a series of preamble partitions each associated to a combination of features and 4-step RA. The network does not configure this list to have more than 16 entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>messagePowerOffsetGroupB</i></b><br>Threshold for preamble selection. Value is in dB. Value <i>minusinfinity</i> corresponds to –infinity. Value <i>dB0</i> corresponds to 0 dB, <i>dB5</i> corresponds to 5 dB and so on. (see TS 38.321 [3], clause 5.1.2)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>msg1-SubcarrierSpacing</i></b><br>Subcarrier spacing of PRACH (see TS 38.211 [16], clause 5.3.2).<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15 or 30 kHz<br>FR2-1: 60 or 120 kHz<br>FR2-2: 120, 480, or 960 kHz<br>If absent, the UE applies the SCS as derived from the <i>prach-ConfigurationIndex</i> in <i>RACH-ConfigGeneric</i> (see tables Table 6.3.3.1-1, Table 6.3.3.1-2, Table 6.3.3.2-2 and Table 6.3.3.2-3, TS 38.211 [16]). The value also applies to contention free random access ( <i>RACH-ConfigDedicated</i> ), to SI-request and to contention-based beam failure recovery (CB-BFR). But it does not apply for contention free beam failure recovery (CF-BFR) (see <i>BeamFailureRecoveryConfig</i> ). |
| <b><i>msg3-transformPrecoder</i></b><br>Enables the transform precoder for Msg3 transmission according to clause 6.1.3 of TS 38.214 [19]. If the field is absent, the UE disables the transformer precoder (see TS 38.213 [13], clause 8.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>numberOfRA-PreamblesGroupA</i></b><br>The number of CB preambles per SSB in group A. This determines implicitly the number of CB preambles per SSB available in group B. (see TS 38.321 [3], clause 5.1.1). The setting should be consistent with the setting of <i>ssb-perRACH-OccasionAndCB-PreamblesPerSSB</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>prach-RootSequenceIndex</i></b><br>PRACH root sequence index (see TS 38.211 [16], clause 6.3.3.1). The value range depends on whether L=839 or L=139 or L=571 or L=1151. The length of the root sequence corresponding with the index indicated in this IE should be consistent with the one indicated in <i>prach-ConfigurationIndex</i> in the <i>RACH-ConfigDedicated</i> (if configured). If <i>prach-RootSequenceIndex-r16</i> is signalled, UE shall ignore the <i>prach-RootSequenceIndex</i> (without suffix).<br>For FR2-2, only the following values are applicable depending on the used subcarrier spacing:<br>120 kHz: L=139, L=571, and L=1151<br>480 kHz: L=139, and L=571<br>960 kHz: L=139                                                           |
| <b><i>ra-ContentionResolutionTimer</i></b><br>The initial value for the contention resolution timer (see TS 38.321 [3], clause 5.1.5). Value <i>sf8</i> corresponds to 8 subframes, value <i>sf16</i> corresponds to 16 subframes, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>ra-Msg3SizeGroupA</i></b><br>Transport Blocks size threshold in bits below which the UE shall use a contention-based RA preamble of group A. (see TS 38.321 [3], clause 5.1.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>ra-Prioritization</i></b><br>Parameters which apply for prioritized random access procedure on any UL BWP of SpCell for specific Access Identities (see TS 38.321 [3], clause 5.1.1a).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>ra-PrioritizationForAI</i></b><br>Indicates whether the field <i>ra-Prioritization-r16</i> applies for Access Identities. The first/leftmost bit corresponds to Access Identity 1, the next bit corresponds to Access Identity 2. Value 1 indicates that the field <i>ra-Prioritization-r16</i> applies otherwise the field does not apply (see TS 23.501 [32]).                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>ra-PrioritizationForSlicing</i></b><br>Parameters which apply to configure prioritized CBRA 4-step random access type for slicing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| UE may select the SS block and corresponding PRACH resource for path-loss estimation and (re)transmission based on SS blocks that satisfy the threshold (see TS 38.213 [13]).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>rsrp-ThresholdSSB-SUL</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| The UE selects SUL carrier to perform random access based on this threshold (see TS 38.321 [3], clause 5.1.1). The value applies to all the BWPs and all RACH configurations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>ssb-perRACH-OccasionAndCB-PreamblesPerSSB</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| The meaning of this field is twofold: the CHOICE conveys the information about the number of SSBs per RACH occasion. Value <i>oneEighth</i> corresponds to one SSB associated with 8 RACH occasions, value <i>oneFourth</i> corresponds to one SSB associated with 4 RACH occasions, and so on. The ENUMERATED part indicates the number of Contention Based preambles per SSB. Value <i>n4</i> corresponds to 4 Contention Based preambles per SSB, value <i>n8</i> corresponds to 8 Contention Based preambles per SSB, and so on. The total number of CB preambles in a RACH occasion is given by <i>CB-preambles-per-SSB</i> * max(1, <i>SSB-per-rach-occasion</i> ). See TS 38.213 [13]. |
| <b><i>totalNumberOfRA-Preambles</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Total number of preambles used for contention based and contention free 4-step or 2-step random access in the RACH resources defined in <i>RACH-ConfigCommon</i> , excluding preambles used for other purposes (e.g. for SI request). If the field is absent, all 64 preambles are available for RA. The setting should be consistent with the setting of <i>ssb-perRACH-OccasionAndCB-PreamblesPerSSB</i> , i.e. it should be a multiple of the number of SSBs per RACH occasion.                                                                                                                                                                                                            |

| Conditional Presence   | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b><i>featureCombinationPreamblesList</i></b><br>Specifies a series of preamble partitions each associated to a combination of features and 2-step RA. The network does not configure this list to have more than 16 entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>groupB-ConfiguredTwoStepRA</i></b><br>Preamble grouping for 2-step random access type. If the field is absent then there is only one preamble group configured and only one msgA PUSCH configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>msgA-CB-PreamblesPerSSB-PerSharedRO</i></b><br>Number of contention-based preambles used for 2-step RA type from the non-CBRA 4-step type preambles associated with each SSB for RO shared with 4-step type RA. The number of preambles for 2-step RA type shall not exceed the number of preambles per SSB minus the number of contention-based preambles per SSB for 4-step type RA. The possible value range for this parameter needs to be aligned with value range for the configured SSBs per RACH occasion in <i>ssb-perRACH-OccasionAndCB-PreamblesPerSSB</i> in <i>RACH-ConfigCommon</i> . The field is only applicable for the case of shared ROs with 4-step type random access.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>msgA-PRACH-RootSequenceIndex</i></b><br>PRACH root sequence index. If the field is not configured in <i>RACH-ConfigCommonTwoStepRA</i> which is configured directly within a BWP (i.e., not within <i>AdditionalRACH-Config</i> ), the UE applies the value in field <i>prach-RootSequenceIndex</i> in <i>RACH-ConfigCommon</i> in the configured BWP. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i> , the UE applies the corresponding value of <i>prach-RootSequenceIndex</i> in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i> . When both 2-step and 4-step type random access is configured, this field is only configured for the case of separate ROs between 2-step and 4-step type random access.<br>For FR2-2, only the following values are applicable depending on the used subcarrier spacing:<br>120 kHz: L=139, L=571, and L=1151<br>480 kHz: L=139, and L=571<br>960 kHz: L=139                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>msgA-RestrictedSetConfig</i></b><br>Configuration of an unrestricted set or one of two types of restricted sets for 2-step random access type preamble. If the field is not configured in <i>RACH-ConfigCommonTwoStepRA</i> which is configured directly within a BWP (i.e. not within <i>AdditionalRACH-Config</i> ), the UE applies the value in field <i>restrictedSetConfig</i> in <i>RACH-ConfigCommon</i> in the configured BWP. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i> , the UE applies the value of <i>restrictedSetConfig</i> in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i> . When both 2-step and 4-step type random access is configured, this field is only configured for the case of separate ROs between 2-step and 4-step type random access.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>msgA-RSRP-Threshold</i></b><br>The UE selects 2-step random access type to perform random access based on this threshold (see TS 38.321 [3], clause 5.1.1). This field is only present if both 2-step and 4-step RA type are configured for the BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>msgA-RSRP-ThresholdSSB</i></b><br>UE may select the SS block and corresponding PRACH resource for path-loss estimation and (re)transmission based on SS blocks that satisfy the threshold (see TS 38.213 [13]).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>msgA-SSB-PerRACH-OccasionAndCB-PreamblesPerSSB</i></b><br>The meaning of this field is twofold: the CHOICE conveys the information about the number of SSBs per RACH occasion. Value <i>oneEight</i> corresponds to one SSB associated with 8 RACH occasions, value <i>oneFourth</i> corresponds to one SSB associated with 4 RACH occasions, and so on. The ENUMERATED part indicates the number of Contention Based preambles per SSB. Value <i>n4</i> corresponds to 4 Contention Based preambles per SSB, value <i>n8</i> corresponds to 8 Contention Based preambles per SSB, and so on. The total number of CB preambles in a RACH occasion is given by <i>CB-preambles-per-SSB</i> * max(1, <i>SSB-per-rach-occasion</i> ). If the field is not configured in <i>RACH-ConfigCommonTwoStepRA</i> which is configured directly within a BWP (i.e. not within <i>AdditionalRACH-Config</i> ) and both 2-step and 4-step are configured for the BWP, the UE applies the value in the field <i>ssb-perRACH-OccasionAndCB-PreamblesPerSSB</i> in <i>RACH-ConfigCommon</i> . If the field is not configured in <i>AdditionalRACH-Config</i> and both 2-step and 4-step are configured in <i>AdditionalRACH-Config</i> , the UE applies the value in the field <i>ssb-perRACH-OccasionAndCB-PreamblesPerSSB</i> in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i> . The field is not present when RACH occasions are shared between 2-step and 4-step type random access in the BWP. |
| <b><i>msgA-SSB-SharedRO-MaskIndex</i></b><br>Indicates the subset of 4-step type ROs shared with 2-step random access type for each SSB. This field is configured when there is more than one RO per SSB. If the field is absent, and 4-step and 2-step has shared ROs, then all ROs are shared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b><i>msgA-SubcarrierSpacing</i></b><br/> Subcarrier spacing of PRACH (see TS 38.211 [16], clause 5.3.2).<br/> Only the following values are applicable depending on the used frequency:<br/> FR1: 15 or 30 kHz<br/> FR2-1: 60 or 120 kHz<br/> FR2-2: 120, 480, or 960 kHz.<br/> If the field is absent, the UE applies the SCS as derived from the <i>msgA-PRACH-ConfigurationIndex</i> in <i>RACH-ConfigGenericTwoStepRA</i> (see tables Table 6.3.3.1-1, Table 6.3.3.1-2, Table 6.3.3.2-2 and Table 6.3.3.2-3, TS 38.211 [16]) in case of 2-step only BWP, otherwise the UE applies the same SCS as <i>Msg1</i> derived from <i>RACH-ConfigCommon</i>. The value also applies to contention free 2-step random access type (<i>RACH-ConfigDedicated</i>).</p> |
| <p><b><i>msgA-TotalNumberOfRA-Preambles</i></b><br/> Indicates the total number of preambles used for contention-based and contention-free 2-step random access type when ROs for 2-step are not shared with 4-step. If the field is absent, and 2-step and 4-step does not have shared ROs, all 64 preambles are available for 2-step random access type.</p>                                                                                                                                                                                                                                                                                                                                                                                                      |
| <p><b><i>msgA-TransMax</i></b><br/> Max number of <i>MsgA</i> preamble transmissions performed before switching to 4-step random access (see TS 38.321 [3], clauses 5.1.1). This field is only applicable when 2-step and 4-step RA type are configured and switching to 4-step type RA is supported. If the field is absent, switching from 2-step RA type to 4-step RA type is not allowed.</p>                                                                                                                                                                                                                                                                                                                                                                   |
| <p><b><i>ra-ContentionResolutionTimer</i></b><br/> The initial value for the contention resolution timer for fallback RAR in case no 4-step random access type is configured (see TS 38.321 [3], clause 5.1.5). Value <i>sf8</i> corresponds to 8 subframes, value <i>sf16</i> corresponds to 16 subframes, and so on. If both 2-step and 4-step random access type resources are configured on the BWP, then this field is absent. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i>, the UE shall apply the corresponding value in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i>.</p>                                                                                                               |
| <p><b><i>ra-Prioritization</i></b><br/> Parameters which apply for prioritized random access procedure on any UL BWP of SpCell for specific Access Identities (see TS 38.321 [3], clause 5.1.1a).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <p><b><i>ra-PrioritizationForAI</i></b><br/> Indicates whether the field <i>ra-Prioritization-r16</i> applies for Access Identities. | <b>csi-RS</b>                                 | The ID of a CSI-RS resource defined in the measurement object associated with this serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>ra-OccasionList</b>                        | RA occasions that the UE shall use when performing CF-RA upon selecting the candidate beam identified by this CSI-RS. The network ensures that the RA occasion indexes provided herein are also configured by prach-ConfigurationIndex and msg1-FDM. Each RACH occasion is sequentially numbered, first, in increasing order of frequency resource indexes for frequency multiplexed PRACH occasions; second, in increasing order of time resource indexes for time multiplexed PRACH occasions within a PRACH slot and Third, in increasing order of indexes for PRACH slots.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>ra-PreambleIndex</b>                       | The RA preamble index to use in the RA occasions associated with this CSI-RS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>CFRA field descriptions</b>                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>occasions</b>                              | RA occasions for contention free random access. If the field is absent, the UE uses the RA occasions configured in <i>RACH-ConfigCommon</i> in the first active UL BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>ra-ssb-OccasionMaskIndex</b>               | Explicitly signalled PRACH Mask Index for RA Resource selection in TS 38.321 [3]. The mask is valid for all SSB resources signalled in <i>ssb-ResourceList</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>rach-ConfigGeneric</b>                     | Configuration of contention free random access occasions for CFRA. The UE shall ignore <i>preambleReceivedTargetPower</i> , <i>preambleTransMax</i> , <i>powerRampingStep</i> , <i>ra-ResponseWindow</i> signaled within this field and use the corresponding values provided in <i>RACH-ConfigCommon</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>ssb-perRACH-Occasion</b>                   | Number of SSBs per RACH occasion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>totalNumberOfRA-Preambles</b>              | Total number of preambles used for contention free random access in the RACH resources defined in CFRA, excluding preambles used for other purposes (e.g. for SI request). If the field is absent but the field <i>occasions</i> is present, the UE may assume all the 64 preambles are for RA. The setting should be consistent with the setting of <i>ssb-perRACH-Occasion</i> , if present, i.e. it should be a multiple of the number of SSBs per RACH occasion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>CFRA-SSB-Resource field descriptions</b>   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>msgA-PUSCH-Resource-Index</b>              | Identifies the index of the PUSCH resource used for MSGA CFRA. The PUSCH resource index indicates a valid PUSCH occasion (as specified in TS 38.213 [13], clause 8.1A) and the associated DMRS resources corresponding to a PRACH slot. The PUSCH resource indexes are sequentially numbered and are mapped to valid PUSCH occasions corresponding to a PRACH slot which are ordered, first, in increasing order of frequency resource indexes for frequency multiplexed PUSCH occasions; second, in increasing order of DMRS resource indexes within a PUSCH occasion, where a DMRS resource index <i>DMRS<sub>id</sub></i> is determined first in an ascending order of a DMRS port index and then in an ascending order of a DMRS sequence index, third in increasing order of time resource indexes for time multiplexed PUSCH occasions within a PUSCH slot and fourth, in increasing order of indexes for PUSCH slots. For the case of contention free 2-step random access type, if this field is absent, the UE shall use the value 0. |
| <b>ra-PreambleIndex</b>                       | The preamble index that the UE shall use when performing CF-RA upon selecting the candidate beams identified by this SSB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>ssb</b>                                    | The ID of an SSB transmitted by this serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| CFRA- <i>TwoStep</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                 |

| <b><i>RACH-ConfigGenericTwoStepRA</i> field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b><i>msgA-PreamblePowerRampingStep</i></b><br/> Power ramping steps for msgA PRACH. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i>, the UE shall apply the corresponding value in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i>. If the field is absent in other cases, UE shall use the value of <i>powerRampingStep</i> in <i>RACH-ConfigGeneric</i> in the configured BWP (see TS 38.321 [3], 5.1.3). This field may only be present if no 4-step type RA is configured in the BWP or in the case of separate ROs with 4-step type RA. The field is absent if <i>RACH-ConfigGenericTwoStepRA</i> is included in <i>CFRA-TwoStep</i> in <i>RACH-ConfigDedicated</i> and then the UE uses the value of <i>msgA-PreamblePowerRampingStep</i> in <i>RACH-ConfigGenericTwoStepRA</i> configured for CBRA.</p>             |
| <p><b><i>msgA-PreambleReceivedTargetPower</i></b><br/> The target power level at the network receiver side (see TS 38.213 [13], clause 7.1.1 and TS 38.321 [3], clause 5.1.1). Only multiples of 2 dBm may be chosen (e.g -202, -200, -198, ...). If the field is absent, UE shall use the value of <i>preambleReceivedTargetPower</i> in <i>RACH-ConfigGeneric</i> in the configured BWP. This field may only be present if no 4-step type RA is configured in the BWP. The field is absent if <i>RACH-ConfigGenericTwoStepRA</i> is included in <i>CFRA-TwoStep</i> in <i>RACH-ConfigDedicated</i> and then the UE uses the value of <i>msgA-PreambleReceivedTargetPower</i> in <i>RACH-ConfigGenericTwoStepRA</i> configured for CBRA.</p>                                                                                                                                                |
| <p><b><i>msgA-PRACH-ConfigurationIndex</i></b><br/> Cell-specific PRACH configuration index for 2-step RA type. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> which is configured directly within a BWP (i.e. not within <i>AdditionalRACH-Config</i>), the UE shall use the value of corresponding 4-step random access parameter in the configured BWP. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i>, the UE shall apply the corresponding value in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i>. If the value is in the range of 256 to 262, the field <i>prach-ConfigurationIndex-v1610</i> should be considered configured (see TS 38.211 [16], clause 6.3.3.2). This field may only be present if no 4-step type RA is configured in the BWP or in the case of separate ROs with 4-step type RA.</p> |
| <p><b><i>msgA-RO-FDM</i></b><br/> The number of msgA PRACH transmission occasions Frequency-Division Multiplexed in one time instance. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> which is configured directly within a BWP (i.e. not within <i>AdditionalRACH-Config</i>), UE shall use value of <i>msg1-FDM</i> in <i>RACH-ConfigGeneric</i> in the configured BWP. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i>, the UE shall apply the value of <i>msg1-FDM</i> in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i> (see TS 38.211 [16], clause 6.3.3.2). This field may only be present if no 4-step type RA is configured in the BWP or in the case of separate ROs with 4-step type RA.</p>                                                                                                          |
| <p><b><i>msgA-RO-FrequencyStart</i></b><br/> Offset of lowest PRACH transmissions occasion in frequency domain with respect to PRB 0. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> which is configured directly within a BWP (i.e. not within <i>AdditionalRACH-Config</i>), UE shall use value of <i>msg1-FrequencyStart</i> in <i>RACH-ConfigGeneric</i> in the configured BWP. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i>, the UE shall apply the value of <i>msg1-FrequencyStart</i> in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i> (see TS 38.211 [16], clauses 5.3.2 and 6.3.3.2). This field may only be present if no 4-step type RA is configured in the BWP or in the case of separate ROs with 4-step type RA.</p>                                                                          |
| <p><b><i>msgA-ZeroCorrelationZoneConfig</i></b><br/> N-CS configuration for msgA preamble, see Table 6.3.3.1-5 in TS 38.211 [16]. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i>, the UE shall apply the corresponding value in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i>. If the field is absent in other cases, UE shall use value <i>zeroCorrelationZoneConfig</i> in <i>RACH-ConfigGeneric</i> in the configured BWP. This field may only be present if no 4-step type RA is configured in the BWP or in the case of separate ROs with 4-step type RA.</p>                                                                                                                                                                                                                                                          |
| <p><b><i>msgB-ResponseWindow</i></b><br/> MsgB monitoring window length in number of slots. The network configures a value lower than or equal to 40ms (see TS 38.321 [3], clause 5.1.1). The network does not configure <i>msgB-ResponseWindow-r16</i> simultaneously with <i>msgB-ResponseWindow-v1700</i>, and if both fields are absent, the UE uses the value of <i>msgB-ResponseWindow</i> in <i>RACH-ConfigGenericTwoStepRA</i> configured for CBRA.</p>                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <p><b><i>preambleTransMax</i></b><br/> Max number of RA preamble transmission performed before declaring a failure (see TS 38.321 [3], clauses 5.1.4, 5.1.5). If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i>, the UE shall apply the corresponding value in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i>. If the field is absent in other cases, UE shall use the value of <i>preambleTransMax</i> in <i>RACH-ConfigGeneric</i> in the configured BWP. The field is absent if <i>RACH-ConfigGenericTwoStepRA</i> is included in <i>CFRA-TwoStep</i> in <i>RACH-ConfigDedicated</i> and then the UE uses the value of <i>preambleTransMax</i> in <i>RACH-ConfigGenericTwoStepRA</i> configured for CBRA.</p>                                                                                                                |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2StepOnly            | <p>The field is mandatory present in <i>msgA-ConfigCommon</i> field in <i>BWP-UplinkCommon</i> if <i>rach-ConfigCommon</i> field is absent in this <i>BWP-UplinkCommon</i>, otherwise the field is optionally present in <i>msgA-ConfigCommon</i> field in <i>BWP-UplinkCommon</i>, Need S.</p> <p>The field is mandatory present in <i>msgA-ConfigCommon</i> in <i>AdditionalRACH-Config</i> if <i>rach-ConfigCommon</i> field is absent in this <i>AdditionalRACH-Config</i>, otherwise the field is optionally present in <i>msgA-ConfigCommon</i> field in <i>AdditionalRACH-Config</i>, Need S.</p> |
| 2StepOnlyNoCFRA      | The field is mandatory present if <i>RACH-ConfigGenericTwoStepRA</i> is included in the <i>RACH-ConfigCommonTwoStepRA</i> and there are no 4-step random access configurations configured in the BWP (i.e only 2-step random access type configured in the BWP), otherwise (i.e. 4-step random access configuration also exists in the BWP) the field is optionally present, Need S. When <i>RACH-ConfigGenericTwoStepRA</i> is included in the <i>RACH-ConfigDedicated</i> , this field is absent.                                                                                                      |
| NoCFRA               | The field is mandatory present if <i>msgB-ResponseWindow-r17</i> is absent and <i>RACH-ConfigGenericTwoStepRA</i> is not included in <i>CFRA-TwoStep</i> in <i>RACH-ConfigDedicated</i> , otherwise the field is absent, Need S.                                                                                                                                                                                                                                                                                                                                                                         |
| NoCFRA2              | The field is mandatory present if <i>msgB-ResponseWindow-r16</i> is absent and <i>RACH-ConfigGenericTwoStepRA</i> is not included in <i>CFRA-TwoStep</i> in <i>RACH-ConfigDedicated</i> , otherwise the field is absent, Need S.                                                                                                                                                                                                                                                                                                                                                                         |

RA-Prioritization

The IE *RA-Prioritization* is used to configure prioritized random access.

RA-Prioritization information element

```

-- ASN1START
-- TAG-RA-PRIORITIZATION-START

RA-Prioritization ::=
    SEQUENCE {
        powerRampingStepHighPriority    ENUMERATED {dB0, dB2, dB4, dB6},
        scalingFactorBI                ENUMERATED {zero, dot25, dot5, dot75}
        ...
    }
-- TAG-RA-PRIORITIZATION-STOP
-- ASN1STOP
OPTIONAL, -- Need R

```

| RA-Prioritization field descriptions                                                                                                                                                                                                                   |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>powerRampingStepHighPriority</b><br/> Power ramping step applied for prioritized random access procedure.</p>                                                                                                                                    |
| <p><b>scalingFactorBI</b><br/> Scaling factor for the backoff indicator (BI) for the prioritized random access procedure. (see TS 38.321 [3], clause 5.1.4). Value <i>zero</i> corresponds to 0, value <i>dot25</i> corresponds to 0.25 and so on.</p> |

## — *RA-PrioritizationForSlicing*

The IE *RA-PrioritizationForSlicing* is used to configure prioritized random access for slicing.

### *RA-PrioritizationForSlicing* information element

```
-- ASN1START
-- TAG-RA-PRIORITIZATIONFORSLICING-START

RA-PrioritizationForSlicing-r17 ::= SEQUENCE {
    ra-PrioritizationSliceInfoList-r17 RA-PrioritizationSliceInfoList-r17,
    ...
}

RA-PrioritizationSliceInfoList-r17 ::= SEQUENCE (SIZE (1..maxSliceInfo-r17)) OF RA-PrioritizationSliceInfo-r17

RA-PrioritizationSliceInfo-r17 ::= SEQUENCE {
    nsag-ID-List-r17 SEQUENCE (SIZE (1..maxSliceInfo-r17)) OF NSAG-ID-r17,
    ra-Prioritization-r17 RA-Prioritization,
    ...
}

-- TAG-RA-PRIORITIZATIONFORSLICING-STOP
-- ASN1STOP
```

## — *RadioBearerConfig*

The IE *RadioBearerConfig* is used to add, modify and release signalling, multicast MRBs and/or data radio bearers. Specifically, this IE carries the parameters for PDCP and, if applicable, SDAP entities for the radio bearers.

### *RadioBearerConfig* information element

```
-- ASN1START
-- TAG-RADIOBEARERCONFIG-START

RadioBearerConfig ::=

| <b>DRB-ToAddMod and MRB-ToAddMod field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cnAssociation</b><br>Indicates if the bearer is associated with the <i>eps-bearerIdentity</i> (when connected to EPC) or <i>sdap-Config</i> (when connected to 5GC).                                                                                                                                                                                                                                                                                                                                                       |
| <b>daps-Config</b><br>Indicates that the bearer is configured as DAPS bearer.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>drb-Identity</b><br>In case of DC, the DRB identity is unique within the scope of the UE, i.e. an MCG DRB cannot use the same value as a split DRB. For a split DRB the same identity is used for the MCG and SCG parts of the configuration.                                                                                                                                                                                                                                                                              |
| <b>eps-BearerIdentity</b><br>The EPS bearer ID determines the EPS bearer.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>mbs-SessionId</b><br>Indicates which multicast MBS session the bearer is associated with.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>mrbi-Identity</b><br>Identification of the multicast MRB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>mrbi-IdentityNew</b><br>New identity of the multicast MRB when <i>mrbi-Identity</i> needs to be changed, e.g. as a result of a handover.                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>reestablishPDCP</b><br>Indicates that PDCP should be re-established. Network sets this to <i>true</i> whenever the security key used for this radio bearer changes. Key change could for example be due to termination point change for the bearer, reconfiguration with sync, resuming an RRC connection, or the first reconfiguration after reestablishment. It is also applicable for LTE procedures when NR PDCP is configured. Network doesn't include this field for DRB if the bearer is configured as DAPS bearer. |
| <b>recoverPDCP</b><br>Indicates that PDCP should perform recovery according to TS 38.323 [5]. Network doesn't include this field if the bearer is configured as DAPS bearer.                                                                                                                                                                                                                                                                                                                                                  |
| <b>sdap-Config</b><br>The SDAP configuration determines how to map QoS flows to DRBs when NR or E-UTRA connects to the 5GC and presence/absence of UL/DL SDAP headers.                                                                                                                                                                                                                                                                                                                                                        |

| <b>RadioBearerConfig field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>securityConfig</b><br>Indicates the security algorithm and key to use for the signalling and data radio bearers configured with the list in this IE <i>RadioBearerConfig</i> . When the field is not included after AS security has been activated, the UE shall continue to use the currently configured <i>keyToUse</i> and security algorithm for the radio bearers reconfigured with the lists in this IE <i>RadioBearerConfig</i> . The field is not included when configuring SRB1 before AS security is activated. |
| <b>srb3-ToRelease</b><br>Release SRB3. SRB3 release can only be done over SRB1 and only at SCG release and reconfiguration with sync.                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>SecurityConfig field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>keyToUse</b><br>Indicates if the bearers configured with the list in this IE <i>RadioBearerConfig</i> are using the master key or the secondary key for deriving ciphering and/or integrity protection keys. For MR-DC, network should not configure SRB1 and SRB2 with secondary key and SRB3 with the master key. When the field is not included, the UE shall continue to use the currently configured <i>keyToUse</i> for the radio bearers reconfigured with the lists in this IE <i>RadioBearerConfig</i> . |
| <b>securityAlgorithmConfig</b><br>Indicates the security algorithm for the signalling and data radio bearers configured with the list in this IE <i>RadioBearerConfig</i> . When the field is not included, the UE shall continue to use the currently configured security algorithm for the radio bearers reconfigured with the lists in this IE <i>RadioBearerConfig</i> .                                                                                                                                         |

| SRB-ToAddMod field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>discardOnPDCP</b><br>Indicates that PDCP should discard stored SDU and PDU according to TS 38.323 [5].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>reestablishPDCP</b><br>Indicates that PDCP should be re-established. Network sets this to <i>true</i> whenever the security key used for this radio bearer changes. Key change could for example be due to reconfiguration with sync, for SRB2 when resuming an RRC connection, or at the first reconfiguration after RRC connection reestablishment in NR. For SRB1, when resuming an RRC connection, or at the first reconfiguration after RRC connection reestablishment in NR, the network does not set this field to <i>true</i> . For LTE SRBs using NR PDCP, it could be for handover, RRC connection reestablishment or resume. Network doesn't include this field if any DAPS bearer is configured. |
| <b>srb-Identity, srb-Identity-v1700</b><br>Value 1 is applicable for SRB1 only. Value 2 is applicable for SRB2 only. Value 3 is applicable for SRB3 only. Value 4 is applicable for SRB4 only. If <i>srb-Identity-v1700</i> is received for an SRB, the UE shall ignore <i>srb-Identity</i> (i.e. without suffix) for this SRB.                                                                                                                                                                                                                                                                                                                                                                                 |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

If <i>candidateBeamRS-List2</i> is configured in IE <i>BeamFailureRecoveryRSConfig</i> the field indicates the physical cell IDs (PCI) of the SSBs in the <i>candidateBeamRS-List2</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <p><b>beamFailureDetectionTimer</b><br/>Timer for beam failure detection (see TS 38.321 [3], clause 5.17). See also the <i>BeamFailureRecoveryConfig</i> IE. Value in number of "Q<sub>out,LR</sub> reporting periods of Beam Failure Detection" Reference Signal (see TS 38.213 [13], clause 6). Value <i>pbfd1</i> corresponds to 1 Q<sub>out,LR</sub> reporting period of Beam Failure Detection Reference Signal, value <i>pbfd2</i> corresponds to 2 Q<sub>out,LR</sub> reporting periods of Beam Failure Detection Reference Signal and so on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <p><b>beamFailureInstanceMaxCount</b><br/>This field determines after how many beam failure events the UE triggers beam failure recovery (see TS 38.321 [3], clause 5.17). Value n1 corresponds to 1 beam failure instance, value n2 corresponds to 2 beam failure instances and so on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <p><b>failureDetectionResourcesToAddModList</b><br/>A list of reference signals for detecting beam failure and/or cell level radio link failure (RLF). The limits of the reference signals that the network can configure are specified in TS 38.213 [13], table 5-1. The network configures at most two detectionResources per BWP for the purpose <i>beamFailure</i> or <i>both</i>. If no RSs are provided for the purpose of beam failure detection, the UE performs beam monitoring based on the activated <i>TCI-State</i> for PDCCH as described in TS 38.213 [13], clause 6. If no RSs are provided in this list for the purpose of RLF detection, the UE performs Cell-RLM based on the activated <i>TCI-State</i> of PDCCH as described in TS 38.213 [13], clause 5. The network ensures that the UE has a suitable set of reference signals for performing cell-RLM. If <i>failureDetectionSet1-r17</i> and <i>failureDetectionSet2-r17</i> are present, the <i>purpose</i> of <i>RadioLinkMonitoringRS</i> in <i>failureDetectionResourcesToAddModList</i> only can be set to <i>rlf</i>.</p>                                            |
| <p><b>failureDetectionSet1, failureDetectionSet2</b><br/>Configures parameters for beamfailure detection towards beam failure detection resources configured in the set. If additional PCIs are configured using <i>additionalPCI-ToAddModList</i> for the serving cell, each RS in one set can be associated only with one PCI. Network always configures the <i>failureDetectionSet1</i> and <i>failureDetectionSet2</i> together. <i>failureDetectionSetN</i> is present if and only if <i>candidateBeamRS-List2-r17</i> is configured. When a <i>failureDetectionSetN</i> is present, after the reconfiguration, the UE shall consider all the reference signals for this failure detection set as activated if at most <i>maxBFD-RS-resourcesPerSetPerBWP-r17</i> reference signals are configured for each failure detection set, otherwise the UE shall consider all the reference signals in this failure detection set as deactivated. If <i>bfdResourcesToAddModList-r17</i> in <i>failureDetectionSetN</i> is not present, the UE determines the RS(es) in each <i>failureDetectionSetN</i> as described in TS 38.213 [13], clause 6.</p> |

| <b>RadioLinkMonitoringRS field descriptions</b>                                                                                                                                                                                                                          |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>detectionResource</b><br/>A reference signal that the UE shall use for radio link monitoring or beam failure detection (depending on the indicated <i>purpose</i>). Only periodic 1-port CSI-RS can be configured on SCell for beam failure detection purpose.</p> |
| <p><b>purpose</b><br/>Determines whether the UE shall monitor the associated reference signal for the purpose of cell- and/or beam failure detection. For SCell, network only configures the value to <i>beamFailure</i>.</p>                                            |

— **RadioLinkMonitoringRS-Id**

The IE *RadioLinkMonitoringRS-Id* is used to identify one *RadioLinkMonitoringRS*.

#### **RadioLinkMonitoringRS-Id information element**

```
-- ASN1START
-- TAG-RADIOLINKMONITORINGRS-ID-START
```

```
RadioLinkMonitoringRS-Id ::= INTEGER (0..maxNrofFailureDetectionResources-1)
```

```
-- TAG-RADIOLINKMONITORINGRS-ID-STOP
-- ASN1STOP
```

## — *RAN-AreaCode*

The IE *RAN-AreaCode* is used to identify a RAN area within the scope of a tracking area.

### *RAN-AreaCode* information element

```
-- ASN1START
-- TAG-RAN-AREACODE-START
```

```
RAN-AreaCode ::= INTEGER (0..255)
```

```
-- TAG-RAN-AREACODE-STOP
-- ASN1STOP
```

## — *RateMatchPattern*

The IE *RateMatchPattern* is used to configure one rate matching pattern for PDSCH, see TS 38.214 [19], clause 5.1.4.1.

### *RateMatchPattern* information element

```

| <b>bitmaps</b><br>Indicates rate matching pattern by a pair of bitmaps <i>resourceBlocks</i> and <i>symbolsInResourceBlock</i> to define the rate match pattern within one or two slots, and a third bitmap <i>periodicityAndPattern</i> to define the repetition pattern with which the pattern defined by the above bitmap pair occurs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>controlResourceSet</b><br>This ControlResourceSet is used as a PDSCH rate matching pattern, i.e., PDSCH reception rate matches around it. In frequency domain, the resource is determined by the frequency domain resource of the CORESET with the corresponding CORESET ID. Time domain resource is determined by the parameters of the associated search space of the CORESET.<br>If the field <i>controlResourceSetId-r16</i> is present, UE shall ignore the <i>controlResourceSetId</i> (without suffix).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>periodicityAndPattern</b><br>A time domain repetition pattern at which the pattern defined by <i>symbolsInResourceBlock</i> and <i>resourceBlocks</i> recurs. This slot pattern repeats itself continuously. Absence of this field indicates the value <i>n1</i> (see TS 38.214 [19], clause 5.1.4.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>resourceBlocks</b><br>A resource block level bitmap in the frequency domain. A bit in the bitmap set to 1 indicates that the UE shall apply rate matching in the corresponding resource block in accordance with the <i>symbolsInResourceBlock</i> bitmap. If used as cell-level rate matching pattern, the bitmap identifies "common resource blocks (CRB)". If used for MBS broadcast CFR, the bitmap identifies "physical resource blocks" inside the MBS broadcast CFR. If used as BWP-level rate matching pattern, the bitmap identifies "physical resource blocks" inside the BWP or MBS multicast CFR. The first/ leftmost bit corresponds to resource block 0, and so on (see TS 38.214 [19], clause 5.1.4.1).                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>subcarrierSpacing</b><br>The SubcarrierSpacing for this resource pattern. If the field is absent, the UE applies the SCS of the associated BWP. The value <i>kHz15</i> corresponds to $\mu=0$ , the value <i>kHz30</i> corresponds to $\mu=1$ , and so on.<br>Only the following values are applicable depending on the used frequency (see TS 38.214 [19], clause 5.1.4.1):<br>FR1: 15, 30 or 60 kHz<br>FR2-1: 60 or 120 kHz<br>FR2-2: 120, 480, or 960 kHz                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>symbolsInResourceBlock</b><br>A symbol level bitmap in time domain. It indicates with a bit set to true that the UE shall rate match around the corresponding symbol. This pattern recurs (in time domain) with the configured <i>periodicityAndPattern</i> (see TS 38.214 [19], clause 5.1.4.1).<br>For <i>oneSlot</i> , if ECP is configured, the first 12 bits represent the symbols within the slot and the last two bits within the bitstring are ignored by the UE; Otherwise, the 14 bits represent the symbols within the slot.<br>For <i>twoSlots</i> , if ECP is configured, the first 12 bits represent the symbols within the first slot and the next 12 bits represent the symbols in the second slot and the last four bits within the bit string are ignored by the UE; Otherwise, the first 14 bits represent the symbols within the first slot and the next 14 bits represent the symbols in the second slot.<br>For the bits representing symbols in a slot, the most significant bit of the bit string represents the first symbol in the slot and the second most significant bit represents the second symbol in the slot and so on. |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>CellLevel</i>     | The field is mandatory present if the <i>RateMatchPattern</i> is defined on cell level. The field is absent when the <i>RateMatchPattern</i> is defined on BWP level or defined for MBS broadcast CFR. If the <i>RateMatchPattern</i> is defined on BWP level, the UE applies the SCS of the BWP and if <i>RateMatchPattern</i> is defined for MBS broadcast CFR, the UE applies the SCS of the initial BWP or RedCap-specific initial BWP (if configured) for RedCap UEs. |

## – *RateMatchPatternId*

The IE *RateMatchPatternId* identifies one *RateMatchPattern* (see TS 38.214 [19], clause 5.1.4.1).

### *RateMatchPatternId* information element

```
-- ASN1START
-- TAG-RATEMATCHPATTERNID-START

–
 **ReferenceLocation**

The IE *ReferenceLocation* contains location information used as a reference location. The value of the field is same as *Ellipsoid-Point* defined in TS37.355 [49]. The first/leftmost bit of the first octet contains the most significant bit.

**ReferenceLocation** information element

```

-- ASN1START
-- TAG-REFERENCELOCATION-START

ReferenceLocation-r17 ::= OCTET STRING

-- TAG-REFERENCELOCATION-STOP
-- ASN1STOP

```

–
 **ReferenceTimeInfo**

The IE *ReferenceTimeInfo* contains timing information for 5G internal system clock used for, e.g., time stamping, see TS 23.501 [32], clause 5.27.1.2.

**ReferenceTimeInfo** information element

```

-- ASN1START
-- TAG-REFERENCETIMEINFO-START

ReferenceTimeInfo-r16 ::= SEQUENCE {
    time-r16                ReferenceTime-r16,
    uncertainty-r16          INTEGER (0..32767)          OPTIONAL,  -- Need S
    timeInfoType-r16         ENUMERATED {localClock}     OPTIONAL,  -- Need S
    referenceSFN-r16         INTEGER (0..1023)           OPTIONAL  -- Cond RefTime
}

ReferenceTime-r16 ::= SEQUENCE {
    refDays-r16              INTEGER (0..72999),

```

```

    refSeconds-r16          INTEGER (0..86399),
    refMilliSeconds-r16     INTEGER (0..999),
    refTenNanoSeconds-r16  INTEGER (0..99999)
}

-- TAG-REFERENCETIMEINFO-STOP
-- ASN1STOP

```

#### ReferenceTimeInfo field descriptions

##### referenceSFN

This field indicates the reference SFN corresponding to the reference time information. If *referenceTimeInfo* field is received in *DLInformationTransfer* message, this field indicates the SFN of PCell.

##### time

This field indicates time reference with 10ns granularity. If included in *DLInformationTransfer* and if UE-side TA PDC is de-activated, the indicated time may not be referenced at the network, i.e., gNB may pre-compensate for RF propagation delay. If included in *DLInformationTransfer* and if UE is requested to transmit UE Rx-Tx time difference measurement, the indicated time may not be referenced at the network, i.e., gNB may pre-compensate for RF propagation delay. Otherwise, the indicated time is referenced at the network, i.e., without compensating for RF propagation delay. In an NTN cell, the indicated time is referenced at the uplink time synchronization reference point (RP), i.e., UE should take into account the propagation delay between UE and RP when determining the UTC time at the UE.

The indicated time in 10ns unit from the origin is  $refDays * 86400 * 1000 * 100000 + refSeconds * 1000 * 100000 + refMilliSeconds * 100000 + refTenNanoSeconds$ . The *refDays* field specifies the sequential number of days (with day count starting at 0) from the origin of the *time* field.

If the *referenceTimeInfo* field is received in *DLInformationTransfer* message, the *time* field indicates the *time* at the ending boundary of the system frame indicated by *referenceSFN*. The UE considers this frame (indicated by *referenceSFN*) to be the frame which is nearest to the frame where the message is received (which can be either in the past or in the future).

If the *referenceTimeInfo* field is received in *SIB9*, the *time* field indicates the time at the SFN boundary at or immediately after the ending boundary of the SI-window in which *SIB9* is transmitted.

If *referenceTimeInfo* field is received in *SIB9*, this field is excluded when determining changes in system information, i.e. changes of time should neither result in system information change notifications nor in a modification of *valueTag* in *SIB1*.

NOTE: The estimated time in an NTN-cell may be less accurate than the estimated time in a TN-cell.

##### timeInfoType

If *timeInfoType* is not included, the *time* indicates the GPS time and the origin of the *time* field is 00:00:00 on Gregorian calendar date 6 January, 1980 (start of GPS time). If *timeInfoType* is set to *localClock*, the origin of the *time* is unspecified.

##### uncertainty

This field indicates the uncertainty of the reference time information provided by the time field. The uncertainty is 25ns multiplied by this field. If this field is absent, the uncertainty is unspecified.

| Conditional Presence | Explanation                                                                                                                                    |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>RefTime</i>       | The field is mandatory present if <i>referenceTimeInfo</i> is included in <i>DLInformationTransfer</i> message; otherwise the field is absent. |

## – RejectWaitTime

The IE *RejectWaitTime* is used to provide the value in seconds for timer T302.

***RejectWaitTime*** information element

```

-- ASN1START
-- TAG-REJECTWAITTIME-START

RejectWaitTime ::=                INTEGER (1..16)

-- TAG-REJECTWAITTIME-STOP

|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>fdm-TDM</i></b><br>Configures UE with a repetition scheme among <i>fdmSchemeA</i> , <i>fdmSchemeB</i> and <i>tdmSchemeA</i> as specified in clause 5.1 of TS 38.214 [19]. The network does not set this field to <i>release</i> . Upon reception of this field in <i>RepetitionSchemeConfig-r16</i> , the UE shall release <i>slotBased</i> if previously configured in the same instance of <i>RepetitionSchemeConfig-r16</i> .                                            |
| <b><i>sequenceOffsetForRV</i></b><br>For slot-based repetition scheme, selected RV sequence is applied to transmission occasions associated to the first TCI state. The RV sequence associated to the second TCI state is determined by a RV offset from that selected RV sequence.                                                                                                                                                                                               |
| <b><i>slotBased</i></b><br>Configures UE with slot-based repetition scheme. Network always configures this field when the parameter <i>repetitionNumber</i> is present in IE <i>PDSCH-TimeDomainResourceAllocationList</i> . The network does not set this field to <i>release</i> . Upon reception of this field in <i>RepetitionSchemeConfig-r16</i> , the UE shall release <i>fdm-TDM</i> if previously configured in the same instance of <i>RepetitionSchemeConfig-r16</i> . |
| <b><i>startingSymbolOffsetK</i></b><br>The starting symbol of the second transmission occasion has K symbol offset relative to the last symbol of the first transmission occasion. When UE is configured with <i>tdmSchemeA</i> , the parameter <i>startingSymbolOffsetK</i> is present, otherwise absent.                                                                                                                                                                        |
| <b><i>tcMapping</i></b><br>Enables TCI state mapping method to PDSCH transmission occasions.                                                                                                                                                                                                                                                                                                                                                                                      |

— *ReportConfigId*

The IE *ReportConfigId* is used to identify a measurement reporting configuration.

*ReportConfigId* information element

```
-- ASN1START
-- TAG-REPORTCONFIGID-START

ReportConfigId ::=
    INTEGER (1..maxReportConfigId)

-- TAG-REPORTCONFIGID-STOP
-- ASN1STOP
```

— *ReportConfigInterRAT*

The IE *ReportConfigInterRAT* specifies criteria for triggering of an inter-RAT measurement reporting event, or an L2 U2N relay measurement reporting event. The inter-RAT measurement reporting events for E-UTRA and UTRA-FDD are labelled BN with N equal to 1, 2 and so on. The measurement reporting events for L2 U2N relay UE are labelled YN with N equal to 1, 2 and so on.

- Event B1: Neighbour becomes better than absolute threshold;
- Event B2: PCell becomes worse than absolute threshold1 AND Neighbour becomes better than another absolute threshold2;
- Event Y1: PCell becomes worse than absolute threshold1 AND candidate L2 U2N Relay UE becomes better than another absolute threshold2;

Event Y2: Candidate L2 U2N Relay UE becomes better than absolute threshold;

| <b>reportAmount</b><br>Number of measurement reports applicable for <i>eventTriggered</i> as well as for <i>periodical</i> report types                                                                                                                |
| <b>reportQuantity, reportQuantityUTRA-FDD</b><br>The cell measurement quantities to be included in the measurement report. If the field <i>reportQuantityUTRA-FDD</i> is present, the UE shall ignore the value(s) provided in <i>reportQuantity</i> . |

## – *ReportConfigNR*

The IE *ReportConfigNR* specifies criteria for triggering of an NR measurement reporting event or of a CHO, CPA or CPC event or of an L2 U2N relay measurement reporting event. For events labelled AN with N equal to 1, 2 and so on, measurement reporting events and CHO, CPA or CPC events are based on cell measurement results, which can either be derived based on SS/PBCH block or CSI-RS.

Event A1: Serving becomes better than absolute threshold;

Event A2: Serving becomes worse than absolute threshold;

Event A3: Neighbour becomes amount of offset better than PCell/PSCell;

Event A4: Neighbour becomes better than absolute threshold;

Event A5: PCell/PSCell becomes worse than absolute threshold1 AND Neighbour/SCell becomes better than another absolute threshold2;

Event A6: Neighbour becomes amount of offset better than SCell;

Event D1: Distance between UE and a reference location *referenceLocation1* becomes larger than configured threshold *distanceThreshFromReference1* and distance between UE and a reference location *referenceLocation2* becomes shorter than configured threshold *distanceThreshFromReference2*;

CondEvent A3: Conditional reconfiguration candidate becomes amount of offset better than PCell/PSCell;

CondEvent A4: Conditional reconfiguration candidate becomes better than absolute threshold;

CondEvent A5: PCell/PSCell becomes worse than absolute threshold1 AND Conditional reconfiguration candidate becomes better than another absolute threshold2;

CondEvent D1: Distance between UE and a reference location *referenceLocation1* becomes larger than configured threshold *distanceThreshFromReference1* and distance between UE and a reference location *referenceLocation2* of conditional reconfiguration candidate becomes shorter than configured threshold *distanceThreshFromReference2*;

CondEvent T1: Time measured at UE becomes more than configured threshold *t1-Threshold* but is less than *t1-Threshold + duration*;

Event X1: Serving L2 U2N Relay UE becomes worse than absolute threshold1 AND NR Cell becomes better than another absolute threshold2;

Event X2: Serving L2 U2N Relay UE becomes worse than absolute threshold;

For event I1, measurement reporting event is based on CLI measurement results, which can either be derived based on SRS-RSRP or CLI-RSSI.

Event I1: Interference becomes higher than absolute threshold.

|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>a3-Offset</b><br>Offset value(s) to be used in NR conditional reconfiguration triggering condition for cond event a3. The actual value is field value * 0.5 dB.                                                                                                                                                                                                                                                                                                     |
| <b>a4-Threshold</b><br>Threshold value associated to the selected trigger quantity (e.g. RSRP, RSRQ, SINR) per RS Type (e.g. SS/PBCH block, CSI-RS) to be used in NR conditional reconfiguration triggering condition for cond event a4.                                                                                                                                                                                                                               |
| <b>a5-Threshold1/ a5-Threshold2</b><br>Threshold value associated to the selected trigger quantity (e.g. RSRP, RSRQ, SINR) per RS Type (e.g. SS/PBCH block, CSI-RS) to be used in NR conditional reconfiguration triggering condition for cond event a5. In the same <i>condEventA5</i> , the network configures the same quantity for the <i>MeasTriggerQuantity</i> of the <i>a5-Threshold1</i> and for the <i>MeasTriggerQuantity</i> of the <i>a5-Threshold2</i> . |
| <b>condEventId</b><br>Choice of NR conditional reconfiguration event triggered criteria.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>distanceThreshFromReference1, distanceThreshFromReference2</b><br>Distance from a reference location configured with <i>referenceLocation1</i> or <i>referenceLocation2</i> . Each step represents 50m.                                                                                                                                                                                                                                                             |
| <b>duration</b><br>This field is used for defining the leaving condition T1-2 for conditional HO event <i>condEventT1</i> . Each step represents 100ms.                                                                                                                                                                                                                                                                                                                |
| <b>referenceLocation1, referenceLocation2</b><br>Reference locations used for <i>condEventD1</i> . The <i>referenceLocation1</i> is associated to serving cell and <i>referenceLocation2</i> is associated to candidate target cell.                                                                                                                                                                                                                                   |
| <b>t1-Threshold</b><br>The field counts the number of UTC seconds in 10 ms units since 00:00:00 on Gregorian calendar date 1 January, 1900 (midnight between Sunday, December 31, 1899 and Monday, January 1, 1900).                                                                                                                                                                                                                                                   |
| <b>timeToTrigger</b><br>Time during which specific criteria for the event needs to be met in order to execute the conditional reconfiguration evaluation.                                                                                                                                                                                                                                                                                                              |

| <b>ReportConfigNR field descriptions</b>                                                                                                                                                                                 |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>reportType</b><br>Type of the configured measurement report. In MR-DC, network does not configure report of type <i>reportCGI</i> using SRB3. The <i>condTriggerConfig</i> is used for CHO, CPA or CPC configuration. |

| <b>ReportCGI field descriptions</b>                                                                                                                                                                                                    |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>useAutonomousGaps</b><br>Indicates whether or not the UE is allowed to use autonomous gaps in acquiring system information from the NR neighbour cell. When the field is included, the UE applies the corresponding value for T321. |

| <i>EventTriggerConfig</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>a3-Offset/a6-Offset</b><br>Offset value(s) to be used in NR measurement report triggering condition for event a3/a6. The actual value is field value * 0.5 dB.                                                                                                                                                                                                                                                                                                                                                                            |
| <b>aN-ThresholdM</b><br>Threshold value associated to the selected trigger quantity (e.g. RSRP, RSRQ, SINR) per RS Type (e.g. SS/PBCH block, CSI-RS) to be used in NR measurement report triggering condition for event number aN. If multiple thresholds are defined for event number aN, the thresholds are differentiated by M. In the same <i>eventA5</i> , the network configures the same quantity for the <i>MeasTriggerQuantity</i> of the <i>a5-Threshold1</i> and for the <i>MeasTriggerQuantity</i> of the <i>a5-Threshold2</i> . |
| <b>channelOccupancyThreshold</b><br>RSSI threshold which is used for channel occupancy evaluation.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>coarseLocationRequest</b><br>This field is used to request UE to report coarse location information.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>distanceThreshFromReference1, distanceThreshFromReference2</b><br>Threshold value associated to the distance from a reference location configured with <i>referenceLocation1</i> or <i>referenceLocation2</i> . Each step represents 50m.                                                                                                                                                                                                                                                                                                 |
| <b>eventId</b><br>Choice of NR event triggered reporting criteria.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>maxNrofRS-IndexesToReport</b><br>Max number of RS indexes to include in the measurement report for A1-A6 events.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>maxReportCells</b><br>Max number of non-serving cells to include in the measurement report.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>referenceLocation1, referenceLocation2</b><br>Reference locations used for <i>eventD1</i> . The <i>referenceLocation1</i> is associated to serving cell and <i>referenceLocation2</i> is associated to neighbour cell.                                                                                                                                                                                                                                                                                                                    |
| <b>reportAddNeighMeas</b><br>Indicates that the UE shall include the best neighbour cells per serving frequency.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>reportAmount</b><br>Number of measurement reports applicable for <i>eventTriggered</i> as well as for <i>periodical</i> report types.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>reportOnLeave</b><br>Indicates whether or not the UE shall initiate the measurement reporting procedure when the leaving condition is met for a cell in <i>cellsTriggeredList</i> or for a L2 U2N Relay UE in <i>relaysTriggeredList</i> , as specified in 5.5.4.1.<br>Indicates whether or not the UE shall initiate the measurement reporting procedure when the leaving condition is met if configured in <i>eventD1</i> , as specified in 5.5.4.1.                                                                                    |
| <b>reportQuantityCell</b><br>The cell measurement quantities to be included in the measurement report.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>reportQuantityRS-Indexes</b><br>Indicates which measurement information per RS index the UE shall include in the measurement report.                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>timeToTrigger</b><br>Time during which specific criteria for the event needs to be met in order to trigger a measurement report.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>useAllowedCellList</b><br>Indicates whether only the cells included in the allow-list of the associated <i>measObject</i> are applicable as specified in 5.5.4.1.                                                                                                                                                                                                                                                                                                                                                                         |
| <b>useT312</b><br>If value <i>TRUE</i> is configured, the UE shall use the timer T312 with the value <i>t312</i> as specified in the corresponding <i>measObjectNR</i> . If value <i>FALSE</i> is configured, the timer T312 is considered as disabled. Network configures value <i>TRUE</i> only if <i>reportType</i> is set to <i>eventTriggered</i> .                                                                                                                                                                                     |
| <b>xN-ThresholdM</b><br>Threshold value associated to the selected trigger quantity (e.g. RSRP, RSRQ, SINR) per RS Type (e.g. SS/PBCH block, CSI-RS) to be used in NR measurement report triggering condition for event xN. If multiple thresholds are defined for event number xN, the thresholds are differentiated by M. <i>x1-Threshold1</i> and <i>x2-Threshold</i> indicates the threshold value for the serving L2 U2N Relay UE, <i>x1-Threshold2</i> indicates the threshold value for the NR Cells.                                 |

| <b><i>CLI-EventTriggerConfig</i> field descriptions</b>                                                                                                                                                                                                              |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>i1-Threshold</i></b><br>Threshold value associated to the selected trigger quantity (e.g. SRS-RSRP, CLI-RSSI) to be used in CLI measurement report triggering condition for event i1.                                                                          |
| <b><i>eventId</i></b><br>Choice of CLI event triggered reporting criteria.                                                                                                                                                                                           |
| <b><i>maxReportCLI</i></b><br>Max number of CLI measurement resource to include in the measurement report.                                                                                                                                                           |
| <b><i>reportAmount</i></b><br>Number of measurement reports.                                                                                                                                                                                                         |
| <b><i>reportOnLeave</i></b><br>Indicates whether or not the UE shall initiate the measurement reporting procedure when the leaving condition is met for a CLI measurement resource in <i>srsTriggeredList</i> or <i>rssiTriggeredList</i> , as specified in 5.5.4.1. |
| <b><i>timeToTrigger</i></b><br>Time during which specific criteria for the event needs to be met in order to trigger a measurement report.                                                                                                                           |

| <b><i>CLI-PeriodicalReportConfig</i> field descriptions</b>                                                 |
|-------------------------------------------------------------------------------------------------------------|
| <b><i>maxReportCLI</i></b><br>Max number of CLI measurement resource to include in the measurement report.  |

## – *ReportConfigNR-SL*

The IE *ReportConfigNR-SL* specifies criteria for triggering of a CBR measurement reporting event for NR sidelink communication/discovery. Measurement reporting events are based on CBR measurement results on the corresponding transmission resource pools. These events are labelled CN with N equal to 1 and 2.

Event C1: CBR of NR sidelink communication/discovery is above a threshold;

Event C2: CBR of NR sidelink communication/discovery is below a threshold;

-- ASN1STOP
```

**ReportConfigNR-SL field descriptions****reportType**

Type of the configured CBR measurement report for NR sidelink communication/discovery.

**EventTriggerConfigNR-SL field descriptions****cN-Threshold**

Threshold used for events C1 and C2 specified in clauses 5.5.4.11 and 5.5.4.12, respectively.

**eventId**

Choice of NR event triggered reporting criteria.

**reportAmount**

Number of measurement reports applicable for *eventTriggered* as well as for *periodical* report types.

**reportQuantity**

The sidelink measurement quantities to be included in the measurement report. In this release, this is set as the CBR measurement result.

**timeToTrigger**

Time during which specific criteria for the event needs to be met in order to trigger a measurement report.

**PeriodicalReportConfigNR-SL field descriptions****reportAmount**

Number of measurement reports applicable for *eventTriggered* as well as for *periodical* report types.

**reportQuantity**

The sidelink measurement quantities to be included in the measurement report. In this release, this is set as the CBR measurement result.

## — *ReportConfigToAddModList*

The IE *ReportConfigToAddModList* concerns a list of reporting configurations to add or modify.

### **ReportConfigToAddModList information element**

```
-- ASN1START
-- TAG-REPORTCONFIGTOADDMODLIST-START

ReportConfigToAddModList ::= SEQUENCE (SIZE (1..maxReportConfigId)) OF ReportConfigToAddMod

ReportConfigToAddMod ::= SEQUENCE {
    reportConfigId      ReportConfigId,
    reportConfig        CHOICE {
        reportConfigNR      ReportConfigNR,
        ...,
        reportConfigInterRAT ReportConfigInterRAT,
        reportConfigNR-SL-r16 ReportConfigNR-SL-r16
    }
}

-- TAG-REPORTCONFIGTOADDMODLIST-STOP
-- ASN1STOP
```

## — *ReportInterval*

The IE *ReportInterval* indicates the interval between periodical reports. The *ReportInterval* is applicable if the UE performs periodical reporting (i.e. when *reportAmount* exceeds 1) when *reportType* is set to either *eventTriggered*, *periodical*, *cli-EventTriggered* or *cli-Periodical*. Value *ms120* corresponds to 120 ms, value *ms240* corresponds to 240 ms and so on, while value *min1* corresponds to 1 min, *min6* corresponds to 6 min and so on.

### **ReportInterval information element**

```
-- ASN1START
-- TAG-REPORTINTERVAL-START

ReportInterval ::= ENUMERATED {ms120, ms240, ms480, ms640, ms1024, ms2048, ms5120, ms10240, ms20480, ms40960,
                                min1,min6, min12, min30 }

-- TAG-REPORTINTERVAL-STOP
-- ASN1STOP
```

## — *ReselectionThreshold*

The IE *ReselectionThreshold* is used to indicate an Rx level threshold for cell reselection. Actual value of threshold = field value \* 2 [dB].

***ReselectionThreshold* information element**

```
-- ASN1START
-- TAG-RESELECTIONTHRESHOLD-START
```

```
ReselectionThreshold ::= INTEGER (0..31)
```

```
-- TAG-RESELECTIONTHRESHOLD-STOP
-- ASN1STOP
```

**— *ReselectionThresholdQ***

The IE *ReselectionThresholdQ* is used to indicate a quality level threshold for cell reselection. Actual value of threshold = field value [dB].

***ReselectionThresholdQ* information element**

```
-- ASN1START
-- TAG-RESELECTIONTHRESHOLDQ-START
```

```
ReselectionThresholdQ ::= INTEGER (0..31)
```

```
-- TAG-RESELECTIONTHRESHOLDQ-STOP
-- ASN1STOP
```

**— *ResumeCause***

The IE *ResumeCause* is used to indicate the resume cause in *RRCResumeRequest*, *RRCResumeRequest1* and *UEAssistanceInformation*.

***ResumeCause* information element**

```
-- ASN1START
-- TAG-RESUMECAUSE-START
```

```
ResumeCause ::= ENUMERATED {emergency, highPriorityAccess, mt-Access, mo-Signalling,
                             mo-Data, mo-VoiceCall, mo-VideoCall, mo-SMS, rna-Update, mps-PriorityAccess,
                             mcs-PriorityAccess, spare5, spare4, spare3, spare2, spare1 }
```

```
-- TAG-RESUMECAUSE-STOP
-- ASN1STOP
```

**— *RLC-BearerConfig***

The IE *RLC-BearerConfig* is used to configure an RLC entity, a corresponding logical channel in MAC and the linking to a PDCP entity (served radio bearer).

**RLC-BearerConfig** information element

```
-- ASN1START
-- TAG-RLC-BEARERCONFIG-START

| <b>RLC-BearerConfig field descriptions</b>      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>isPTM-Entity</b>                             | If configured, indicates that the RLC entity is used for PTM reception. When the field is absent the RLC entity is used for PTP transmission/reception.                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>logicalChannelIdentity</b>                   | ID used commonly for the MAC logical channel and for the RLC bearer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>logicalChannelIdentityExt</b>                | Extended logical channel ID used commonly for the MAC logical channel and for the RLC bearer for PTM reception. If this field is configured, the UE shall ignore <i>logicalChannelIdentity</i> .                                                                                                                                                                                                                                                                                                                                                              |
| <b>reestablishRLC</b>                           | Indicates that RLC should be re-established. Network sets this to <i>true</i> at least whenever the security key used for the radio bearer associated with this RLC entity changes. For SRB2, multicast MRBs and DRBs, unless full configuration is used, it is also set to <i>true</i> during the resumption of the RRC connection or the first reconfiguration after reestablishment. For SRB1, when resuming an RRC connection, or at the first reconfiguration after RRC connection reestablishment, the network does not set this field to <i>true</i> . |
| <b>rlc-Config</b>                               | Determines the RLC mode (UM, AM) and provides corresponding parameters. RLC mode reconfiguration can only be performed by DRB/multicast MRB release/addition or full configuration. The network may configure <i>rlc-Config-v1610</i> only when <i>rlc-Config</i> (without suffix) is set to <i>am</i> .                                                                                                                                                                                                                                                      |
| <b>servedMBS-RadioBearer</b>                    | Associates the RLC Bearer with a multicast MRB. The UE shall deliver DL RLC SDUs received via the RLC entity of this RLC bearer to the PDCP entity of the <i>servedMBS-RadioBearer</i> .                                                                                                                                                                                                                                                                                                                                                                      |
| <b>servedRadioBearer, servedRadioBearerSRB4</b> | Associates the RLC Bearer with an SRB or a DRB. The UE shall deliver DL RLC SDUs received via the RLC entity of this RLC bearer to the PDCP entity of the <i>servedRadioBearer</i> . Furthermore, the UE shall advertise and deliver uplink PDCP PDUs of the uplink PDCP entity of the <i>servedRadioBearer</i> to the uplink RLC entity of this RLC bearer unless the uplink scheduling restrictions ( <i>moreThanOneRLC</i> in <i>PDCP-Config</i> and the restrictions in <i>LogicalChannelConfig</i> ) forbid it to do so.                                 |

| <b>Conditional Presence</b> | <b>Explanation</b>                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>LCH-Setup</i>            | This field is mandatory present upon creation of a new logical channel for a DRB or a multicast MRB or SRB4. This field is optionally present, Need S, upon creation of a new logical channel for an SRB except SRB4. It is optionally present, Need M, otherwise.                                                                                        |
| <i>LCH-SetupModMRB</i>      | This field is optionally present upon creation of a new logical channel for PTM reception for a multicast MRB. If this field is included upon creation of a new logical channel for PTM reception for a multicast MRB, it shall be present when modifying this logical channel. The field is absent for logical channels configured for an SRB and a DRB. |
| <i>LCH-SetupOnly</i>        | This field is mandatory present upon creation of a new logical channel for a DRB or an SRB ( <i>servedRadioBearer</i> ). It is absent, Need M otherwise.                                                                                                                                                                                                  |
| <i>LCH-SetupOnlyMRB</i>     | This field is mandatory present upon creation of a new logical channel for a multicast MRB and upon modification of <i>MRB-Identity</i> of the served MRB. It is absent, Need M otherwise.                                                                                                                                                                |
| <i>LCH-SetupOnlySRB4</i>    | This field is mandatory present upon creation of a new logical channel for SRB4 ( <i>servedRadioBearerSRB4</i> ). It is absent, Need M otherwise.                                                                                                                                                                                                         |

## – RLC-Config

The IE *RLC-Config* is used to specify the RLC configuration of SRBs, multicast MRBs and DRBs.

|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>maxRetxThreshold</b>              | Parameter for RLC AM in TS 38.322 [4]. Value <i>t1</i> corresponds to 1 retransmission, value <i>t2</i> corresponds to 2 retransmissions and so on.                                                                                                                                                                                                                                          |
| <b>pollByte</b>                      | Parameter for RLC AM in TS 38.322 [4]. Value <i>kB25</i> corresponds to 25 kBytes, value <i>kB50</i> corresponds to 50 kBytes and so on. <i>infinity</i> corresponds to an infinite amount of kBytes.                                                                                                                                                                                        |
| <b>pollPDU</b>                       | Parameter for RLC AM in TS 38.322 [4]. Value <i>p4</i> corresponds to 4 PDUs, value <i>p8</i> corresponds to 8 PDUs and so on. <i>infinity</i> corresponds to an infinite number of PDUs.                                                                                                                                                                                                    |
| <b>sn-FieldLength</b>                | Indicates the RLC SN field size, see TS 38.322 [4], in bits. Value <i>size6</i> means 6 bits, value <i>size12</i> means 12 bits, value <i>size18</i> means 18 bits. The value of <i>sn-FieldLength</i> of an RLC entity for the DRB/multicast MRB shall be changed only using reconfiguration with sync. The network configures only value <i>size12</i> in <i>SN-FieldLengthAM</i> for SRB. |
| <b>t-PollRetransmit</b>              | Timer for RLC AM in TS 38.322 [4], in milliseconds. Value <i>ms5</i> means 5 ms, value <i>ms10</i> means 10 ms and so on.                                                                                                                                                                                                                                                                    |
| <b>t-Reassembly, t-ReassemblyExt</b> | Timer for reassembly in TS 38.322 [4], in milliseconds. Value <i>ms0</i> means 0 ms, value <i>ms5</i> means 5 ms and so on. If <i>t-ReassemblyExt-r17</i> is configured, the UE shall ignore <i>t-Reassembly</i> (without suffix).                                                                                                                                                           |
| <b>t-StatusProhibit</b>              | Timer for status reporting in TS 38.322 [4], in milliseconds. Value <i>ms0</i> means 0 ms, value <i>ms5</i> means 5 ms and so on. If <i>t-StatusProhibit-v1610</i> is present, the UE shall ignore <i>t-StatusProhibit</i> (without suffix).                                                                                                                                                 |

| Conditional Presence | Explanation                                                                                                                                    |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Reestab</i>       | The field is mandatory present at RLC bearer setup. It is optionally present, need M, at RLC re-establishment. Otherwise it is absent. Need M. |

## — RLF-TimersAndConstants

The IE *RLF-TimersAndConstants* is used to configure UE specific timers and constants.

RLF-TimersAndConstants information element

```
-- ASN1START
-- TAG-RLF-TIMERSANDCONSTANTS-START

RLF-TimersAndConstants ::=
    SEQUENCE {
        t310      ENUMERATED {ms0, ms50, ms100, ms200, ms500, ms1000, ms2000, ms4000, ms6000},
        n310      ENUMERATED {n1, n2, n3, n4, n6, n8, n10, n20},
        n311      ENUMERATED {n1, n2, n3, n4, n5, n6, n8, n10},
        ...
        [[
            t311      ENUMERATED {ms1000, ms3000, ms5000, ms10000, ms15000, ms20000, ms30000}
        ]]
    }

|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>n3xy</b><br>Constants are described in clause 7.3. Value <i>n1</i> corresponds to 1, value <i>n2</i> corresponds to 2 and so on.        |
| <b>t3xy</b><br>Timers are described in clause 7.1. Value <i>ms0</i> corresponds to 0 ms, value <i>ms50</i> corresponds to 50 ms and so on. |

— RNTI-Value

The IE *RNTI-Value* represents a Radio Network Temporary Identity.

RNTI-Value information element

```
-- ASN1START
-- TAG-RNTI-VALUE-START

RNTI-Value ::=
    INTEGER (0..65535)

-- TAG-RNTI-VALUE-STOP
-- ASN1STOP
```

— RSRP-Range

The IE *RSRP-Range* specifies the value range used in RSRP measurements and thresholds. For measurements, integer value for RSRP measurements is according to Table 10.1.6.1-1 in TS 38.133 [14]. For thresholds, the actual value is (IE value – 156) dBm, except for the IE value 127, in which case the actual value is infinity.

***RSRP-Range* information element**

```
-- ASN1START
-- TAG-RSRP-RANGE-START
```

```
RSRP-Range ::= INTEGER(0..127)
```

```
-- TAG-RSRP-RANGE-STOP
-- ASN1STOP
```

**— *RSRQ-Range***

The IE *RSRQ-Range* specifies the value range used in RSRQ measurements and thresholds. For measurements, integer value for RSRQ measurements is according to Table 10.1.11.1-1 in TS 38.133 [14]. For thresholds, the actual value is (IE value – 87) / 2 dB.

***RSRQ-Range* information element**

```
-- ASN1START
-- TAG-RSRQ-RANGE-START
```

```
RSRQ-Range ::= INTEGER(0..127)
```

```
-- TAG-RSRQ-RANGE-STOP
-- ASN1STOP
```

**— *RSSI-Range***

The IE *RSSI-Range* specifies the value range used in RSSI measurements and thresholds for NR operation with shared spectrum channel access. The integer value for RSSI measurements is according to Table 10.1.34.3-1 in TS 38.133 [14].

***RSSI-Range* information element**

```
-- ASN1START
-- TAG-RSSI-RANGE-START
```

```
RSSI-Range-r16 ::= INTEGER(0..76)
```

```
-- TAG-RSSI-RANGE-STOP
-- ASN1STOP
```

**— *RxTxTimeDiff***

The IE *RxTxTimeDiff* contains the Rx-Tx time difference measurement at either the UE or the gNB.

*RxTxTimeDiff* information element

```
-- ASN1START
-- TAG-RXTXTIMEDIFF-START

RxTxTimeDiff-r17 ::= SEQUENCE {
    result-k5-r17      INTEGER (0..61565)          OPTIONAL, -- Need N
    ...
}

-- TAG-RXTXTIMEDIFF-STOP
-- ASN1STOP
```

| RxTxTimeDiff field descriptions                                                                                                                                                                                                         |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>result-k5</b><br>This field indicates the Rx-Tx time difference measurement, see TS 38.215 [9], clause 10.1.25.3.1 of TS 38.133 [14] for UE Rx-Tx time difference and clause 13.2.1 of TS 38.133 [14] for gNB Rx-Tx time difference. |

– *SCellActivationRS-Config*

The IE *SCellActivationRS-Config* is used to configure a Reference Signal for fast activation of the SCell where the IE is included (see TS 38.214 [19], clause 5.2.1.5.3. Usage of an *SCellActivationRS-Config* is indicated by including its *scellActivationRS-Id* in the Enhanced SCell activation MAC CE (see TS 38.321 [3] clause 6.1.3.55).

*SCellActivationRS-Config* information element

```
-- ASN1START
-- TAG-SCELLACTIONNRS-CONFIG-START

SCellActivationRS-Config-r17 ::= SEQUENCE {
    scellActivationRS-Id-r17      SCellActivationRS-ConfigId-r17,
    resourceSet-r17              NZP-CSI-RS-ResourceSetId,
    gapBetweenBursts-r17         INTEGER (2..31)          OPTIONAL, -- Need R
    qcl-Info-r17                 TCI-StateId,
    ...
}

-- TAG-SCELLACTIONNRS-CONFIG-STOP
-- ASN1STOP
```

| <i>SCellActivationRS-Config</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>gapBetweenBursts</b><br>When this field is present, there are two bursts and it indicates the gap between the two bursts in number of slots. When this field is absent, there is a single burst.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>qcl-Info</b><br>Reference to TCI-State for providing the QCL source and QCL type for each <i>NZP-CSI-RS-Resource</i> listed in <i>nzp-CSI-RS-Resources</i> of the <i>NZP-CSI-RS-ResourceSet</i> indicated by <i>resourceSet</i> (see TS 38.214 [19], clause 5.1.6.1.1.1). <i>TCI-StateId</i> refers to the <i>TCI-State</i> which has this value for <i>tcI-StateId</i> and is defined in <i>tcI-StatesToAddModList</i> or <i>dl-Or-JointTCI-StateList</i> in the <i>PD-SCH-Config</i> included in the <i>BWP-Downlink</i> of this serving cell indicated by <i>firstActiveDownlinkBWP-Id</i> in the <i>ServingCellConfig</i> in which this IE is included. |
| <b>resourceSet</b><br><i>nzp-CSI-ResourceSetId</i> of the <i>NZP-CSI-RS-ResourceSet</i> of this serving cell used as resource configuration for one or two bursts for SCell activation. This NZP-CSI-RS-ResourceSet consists of four NZP CSI-RS resources in two consecutive slots with two NZP CSI-RS resources in each slot (see TS 38.214 [19], clause 5.1.6.1.1.1). The CSI-RS associated with this NZP-CSI-RS-ResourceSet are located in the BWP addressed by <i>firstActiveDownlinkBWP-Id</i> .                                                                                                                                                          |

— *SCellActivationRS-ConfigId*

The IE *SCellActivationRS-ConfigId* is used to identify one *SCellActivationRS-Config*.

*SCellActivationRS-ConfigId* information element

```
-- ASN1START
-- TAG-SCellACTIVATIONRS-CONFIGID-START

SCellActivationRS-ConfigId-r17 ::=          INTEGER (1.. maxNrofSCellActRS-r17)

-- TAG-SCellACTIVATIONRS-CONFIGID-STOP
-- ASN1STOP
```

— *SCellIndex*

The IE *SCellIndex* concerns a short identity, used to identify an SCell. The value range is shared across the Cell Groups.

*SCellIndex* information element

```
-- ASN1START
-- TAG-SCellINDEX-START

SCellIndex ::=          INTEGER (1..31)

-- TAG-SCellINDEX-STOP
-- ASN1STOP
```

—                    *SchedulingRequestConfig*

The IE *SchedulingRequestConfig* is used to configure the parameters, for the dedicated scheduling request (SR) resources.

***SchedulingRequestConfig* information element**

```
-- ASN1START
-- TAG-SCHEDULINGREQUESTCONFIG-START

SchedulingRequestConfig ::=          SEQUENCE {
    schedulingRequestToAddModList      SEQUENCE (SIZE (1..maxNrofSR-ConfigPerCellGroup)) OF SchedulingRequestToAddMod
                                     OPTIONAL, -- Need N
    schedulingRequestToReleaseList     SEQUENCE (SIZE (1..maxNrofSR-ConfigPerCellGroup)) OF SchedulingRequestId
                                     OPTIONAL    -- Need N
}

– SchedulingRequestResourceId

The IE *SchedulingRequestResourceId* is used to identify scheduling request resources on PUCCH.

SchedulingRequestResourceId information element

```
-- ASN1START
-- TAG-SCHEDULINGREQUESTRESOURCEID-START

SchedulingRequestResourceId ::=      INTEGER (1..maxNrofSR-Resources)

-- TAG-SCHEDULINGREQUESTRESOURCEID-STOP
-- ASN1STOP
```

– ScramblingId

The IE *ScramblingID* is used for scrambling channels and reference signals.

***ScramblingId*** information element

```
-- ASN1START
-- TAG-SCRAMBLINGID-START
```

```
ScramblingId ::= INTEGER(0..1023)
```

```
-- TAG-SCRAMBLINGID-STOP
-- ASN1STOP
```

— ***SCS-SpecificCarrier***

The IE *SCS-SpecificCarrier* provides parameters determining the location and width of the actual carrier or the carrier bandwidth. It is defined specifically for a numerology (subcarrier spacing (SCS)) and in relation (frequency offset) to Point A.

***SCS-SpecificCarrier*** information element

```
-- ASN1START
-- TAG-SCS-SPECIFICCARRIER-START
```

```
SCS-SpecificCarrier ::= SEQUENCE {
    offsetToCarrier          INTEGER (0..2199),
    subcarrierSpacing        SubcarrierSpacing,
    carrierBandwidth         INTEGER (1..maxNrofPhysicalResourceBlocks),
    ...,
    [[
        txDirectCurrentLocation  INTEGER (0..4095)          OPTIONAL    -- Need S
    ]]
}
```

```
-- TAG-SCS-SPECIFICCARRIER-STOP

|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>carrierBandwidth</b><br>Width of this carrier in number of PRBs (using the <i>subcarrierSpacing</i> defined for this carrier) (see TS 38.211 [16], clause 4.4.2).                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>offsetToCarrier</b><br>Offset in frequency domain between Point A (lowest subcarrier of common RB 0) and the lowest usable subcarrier on this carrier in number of PRBs (using the <i>subcarrierSpacing</i> defined for this carrier). The maximum value corresponds to 275*8-1. See TS 38.211 [16], clause 4.4.2.                                                                                                                                                                                                                                                                      |
| <b>txDirectCurrentLocation</b><br>Indicates the downlink Tx Direct Current location for the carrier. A value in the range 0..3299 indicates the subcarrier index within the carrier. The values in the value range 3301..4095 are reserved and ignored by the UE. If this field is absent for downlink within <i>ServingCellConfigCommon</i> and <i>ServingCellConfigCommonSIB</i> , the UE assumes the default value of 3300 (i.e. "Outside the carrier"). (see TS 38.211 [16], clause 4.4.2). Network does not configure this field via <i>ServingCellConfig</i> or for uplink carriers. |
| <b>subcarrierSpacing</b><br>Subcarrier spacing of this carrier. It is used to convert the <i>offsetToCarrier</i> into an actual frequency.<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15, 30 or 60 kHz<br>FR2-1: 60 or 120 kHz<br>FR2-2: 120, 480, or 960 kHz                                                                                                                                                                                                                                                                                    |

– SDAP-Config

The IE *SDAP-Config* is used to set the configurable SDAP parameters for a data radio bearer. All configured instances of SDAP-Config with the same value of pdu-Session correspond to the same SDAP entity as specified in TS 37.324 [24].

SDAP-Config information element

```

| SDAP-Config field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>defaultDRB</b><br>Indicates whether or not this is the default DRB for this PDU session. Among all configured instances of <i>SDAP-Config</i> with the same value of <i>pdu-Session</i> , this field shall be set to <i>true</i> in at most one instance of <i>SDAP-Config</i> and to <i>false</i> in all other instances.                                                                                                                                                                                                                        |
| <b>mappedQoS-FlowsToAdd</b><br>Indicates the list of QFIs of UL QoS flows of the PDU session to be additionally mapped to this DRB. A QFI value can be included at most once in all configured instances of <i>SDAP-Config</i> with the same value of <i>pdu-Session</i> . For QoS flow remapping, the QFI value of the remapped QoS flow is only included in <i>mappedQoS-FlowsToAdd</i> in <i>sdap-Config</i> corresponding to the new DRB and not included in <i>mappedQoS-FlowsToRelease</i> in <i>sdap-Config</i> corresponding to the old DRB. |
| <b>mappedQoS-FlowsToRelease</b><br>Indicates the list of QFIs of QoS flows of the PDU session to be released from existing QoS flow to DRB mapping of this DRB.                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>pdu-Session</b><br>Identity of the PDU session whose QoS flows are mapped to the DRB.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>sdap-HeaderUL</b><br>Indicates whether or not a SDAP header is present for UL data on this DRB. The field cannot be changed after a DRB is established. The network sets this field to <i>present</i> if the field <i>defaultDRB</i> is set to <i>true</i> .                                                                                                                                                                                                                                                                                      |
| <b>sdap-HeaderDL</b><br>Indicates whether or not a SDAP header is present for DL data on this DRB. The field cannot be changed after a DRB is established.                                                                                                                                                                                                                                                                                                                                                                                           |

—                    *SearchSpace*

The IE *SearchSpace* defines how/where to search for PDCCH candidates. Each search space is associated with one *ControlResourceSet*. For a scheduled SCell in the case of cross carrier scheduling, except for *nrofCandidates*, all the optional fields are absent (regardless of their presence conditions). For a scheduled SpCell in the case of the cross carrier scheduling, if the search space is linked to another search space in the scheduling SCell, all the optional fields of this search space in the scheduled SpCell are absent (regardless of their presence conditions) except for *nrofCandidates*.

| <b>dci-Format4-2</b><br>If configured, the UE monitors the DCI format 4_2 with CRC scrambled by G-RNTI/G-CS-RNTI according to TS 38.213 [13], clause [10.1].                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>dci-Formats</b><br>Indicates whether the UE monitors in this USS for DCI formats 0-0 and 1-0 or for formats 0-1 and 1-1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>dci-FormatsExt</b><br>If this field is present, the field <i>dci-Formats</i> is ignored and <i>dci-FormatsExt</i> is used instead to indicate whether the UE monitors in this USS for DCI format 0_2 and 1_2 or formats 0_1 and 1_1 and 0_2 and 1_2 (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 10.1). This field is not configured for operation with shared spectrum channel access in this release.                                                                                                                                                                                                       |
| <b>dci-Formats-MT</b><br>Indicates whether the IAB-MT monitors the DCI formats 2-5 according to TS 38.213 [13], clause 14.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

***dci-FormatsSL***

Indicates whether the UE monitors in this USS for DCI formats 0-0 and 1-0 or for formats 0-1 and 1-1 or for format 3-0 or for format 3-1 or for formats 3-0 and 3-1. If this field is present, the field *dci-Formats* is ignored and *dci-FormatsSL* is used.

***duration***

Number of consecutive slots that a SearchSpace lasts in every occasion, i.e., upon every period as given in the *periodicityAndOffset*. If the field is absent, the UE applies the value 1 slot, except for DCI format 2\_0. The UE ignores this field for DCI format 2\_0. The maximum valid duration is *periodicity-1* (periodicity as given in the *monitoringSlotPeriodicityAndOffset*).

For SCS 480 kHz and SCS 960 kHz, *duration-r17* is used, and the configured duration is restricted to be an integer multiple of L slots and smaller than periodicity, where L is the configured length of the bitmap *monitoringSlotsWithinSlotGroup-r17*. If *duration-r17* is absent, the UE assumes the duration in slots is equal to L. The maximum valid duration is *periodicity-L*.

For IAB-MT, duration indicates number of consecutive slots that a SearchSpace lasts in every occasion, i.e., upon every period as given in the *periodicityAndOffset*. If the field is absent, the IAB-MT applies the value 1 slot, except for DCI format 2\_0 and DCI format 2\_5. The IAB-MT ignores this field for DCI format 2\_0 and DCI format 2\_5. The maximum valid duration is *periodicity-1* (periodicity as given in the *monitoringSlotPeriodicityAndOffset*).

***freqMonitorLocations***

Defines an association of the search space to multiple monitoring locations in the frequency domain and indicates whether the pattern configured in the associated CORESET is replicated to a specific RB set, see TS 38.213, clause 10.1. Each bit in the bitmap corresponds to one RB set, and the leftmost (most significant) bit corresponds to RB set 0 in the BWP. A bit set to 1 indicates that a frequency domain resource allocation replicated from the pattern configured in the associated CORESET is mapped to the RB set.

***monitoringSlotPeriodicityAndOffset***

Slots for PDCCH Monitoring configured as periodicity and offset.

For SCS 15, 30, 60, and 120 kHz and if the UE is configured to monitor:

- DCI format 2\_1, only the values 'sl1', 'sl2' or 'sl4' are applicable.
- DCI format 2\_0, only the values 'sl1', 'sl2', 'sl4', 'sl5', 'sl8', 'sl10', 'sl16', and 'sl20' are applicable (see TS 38.213 [13], clause 10).
- DCI format 2\_4, only the values 'sl1', 'sl2', 'sl4', 'sl5', 'sl8' and 'sl10' are applicable.

For SCS 480 kHz and if the UE is configured to monitor:

- DCI format 2\_0, only the values 'sl4', 'sl8', 'sl16', 'sl20', 'sl32', 'sl40', 'sl64', and 'sl80' are applicable.
- DCI format 2\_1, only the values 'sl4', 'sl8', and 'sl16' are applicable.
- DCI format 2\_4, only the values 'sl4', 'sl8', 'sl16', 'sl20', 'sl32', 'sl40' are applicable.

For SCS 960 kHz and if the UE is configured to monitor:

- DCI format 2\_0, only the values 'sl8', 'sl16', 'sl32', 'sl40', 'sl64', 'sl80', 'sl128', and 'sl160' are applicable.
- DCI format 2\_1, only the values 'sl8', 'sl16', and 'sl32' are applicable.
- DCI format 2\_4, only the values 'sl8', 'sl16', 'sl32', 'sl40', 'sl64', 'sl80' are applicable.

For SCS 480 kHz and SCS 960 kHz, and the configured periodicity and offset are restricted to be an integer multiple of L slots, where L is the configured length of the bitmap provided by *monitoringSlotsWithinSlotGroup-r17*, i.e. for a given periodicity, the offset has a range of {0, L, 2\*L, ..., L\*FLOOR(1/L\*(periodicity-1))}.

For IAB-MT, If the IAB-MT is configured to monitor DCI format 2\_1, only the values 'sl1', 'sl2' or 'sl4' are applicable. If the IAB-MT is configured to monitor DCI format 2\_0 or DCI format 2\_5, only the values 'sl1', 'sl2', 'sl4', 'sl5', 'sl8', 'sl10', 'sl16', and 'sl20' are applicable (see TS 38.213, clause 10).

If *monitoringSlotPeriodicityAndOffset-v1710* is present, any previously configured *monitoringSlotPeriodicityAndOffset* is released, and if *monitoringSlotPeriodicityAndOffset* is present, any previously configured *monitoringSlotPeriodicityAndOffset-v1710* is released.

***monitoringSlotsWithinSlotGroup***

Indicates which slot(s) within a slot group are configured for multi-slot PDCCH monitoring. The first (leftmost, most significant) bit represents the first slot in the slot group, the second bit represents the second slot in the slot group, and so on. A bit set to '1' indicates that the corresponding slot is configured for multi-slot PDCCH monitoring (see TS 38.213 [13], clause 10). The number of slots for multi-slot PDCCH monitoring is configured according to clause 10 in TS 38.213 [13].

**monitoringSymbolsWithinSlot**

The first symbol(s) for PDCCH monitoring in the slots configured for (multi-slot) PDCCH monitoring (see *monitoringSlotPeriodicityAndOffset* and *duration*). The most significant (left) bit represents the first OFDM in a slot, and the second most significant (left) bit represents the second OFDM symbol in a slot and so on. The bit(s) set to one identify the first OFDM symbol(s) of the control resource set within a slot. If the cyclic prefix of the BWP is set to extended CP, the last two bits within the bit string shall be ignored by the UE or IAB-MT.

For DCI format 2\_0, the first one symbol applies if the *duration* of CORESET (in the IE *ControlResourceSet*) identified by *controlResourceSetId* indicates 3 symbols, the first two symbols apply if the *duration* of CORESET identified by *controlResourceSetId* indicates 2 symbols, and the first three symbols apply if the *duration* of CORESET identified by *controlResourceSetId* indicates 1 symbol.

See TS 38.213 [13], clause 10.

For IAB-MT: For DCI format 2\_0 or DCI format 2\_5, the first one symbol applies if the duration of CORESET (in the IE *ControlResourceSet*) identified by *controlResourceSetId* indicates 3 symbols, the first two symbols apply if the *duration* of CORESET identified by *controlResourceSetId* indicates 2 symbols, and the first three symbols apply if the *duration* of CORESET identified by *controlResourceSetId* indicates 1 symbol.

See TS 38.213 [13], clause 10.

**nrofCandidates-CI**

The number of PDCCH candidates specifically for format 2-4 for the configured aggregation level. If an aggregation level is absent, the UE does not search for any candidates with that aggregation level. The network configures only one aggregationLevel and the corresponding number of candidates (see TS 38.213 [13], clause 10.1). In this release of the specification, only value *n1* is valid.

**nrofCandidates-PEI**

The number of PDCCH candidates specifically for format 2-7 for the configured aggregation level.

**nrofCandidates-SFI**

The number of PDCCH candidates specifically for format 2-0 for the configured aggregation level. If an aggregation level is absent, the UE does not search for any candidates with that aggregation level. The network configures only one aggregationLevel and the corresponding number of candidates (see TS 38.213 [13], clause 11.1.1). For a search space configured with *freqMonitorLocations-r16*, only value 'n1' is valid.

**nrofCandidates**

Number of PDCCH candidates per aggregation level. The number of candidates and aggregation levels configured here applies to all formats unless a particular value is specified or a format-specific value is provided (see inside *searchSpaceType*). If configured in the *SearchSpace* of a cross carrier scheduled cell, this field determines the number of candidates and aggregation levels to be used on the linked scheduling cell (see TS 38.213 [13], clause 10).

**searchSpaceGroupIdList-r16, searchSpaceGroupIdList-r17**

List of search space group IDs which the search space is associated with. The network configures at most 2 search space groups per BWP where the group ID is either 0 or 1 if *searchSpaceGroupIdList-r16* is included. The network configures at most 3 search space groups per BWP where the group ID is either 0, 1 or 2 if *searchSpaceGroupIdList-r17* is included. And if *searchSpaceGroupIdList-r17* is included, *searchSpaceGroupIdList-r16* is ignored.

**searchSpaceId**

Identity of the search space. SearchSpaceId = 0 identifies the *searchSpaceZero* configured via PBCH (MIB) or *ServingCellConfigCommon* and may hence not be used in the *SearchSpace* IE. The *searchSpaceId* is unique among the BWPs of a Serving Cell. In case of cross carrier scheduling, search spaces with the same *searchSpaceId* in scheduled cell and scheduling cell are linked to each other. The UE applies the search space for the scheduled cell only if the DL BWPs in which the linked search spaces are configured in scheduling cell and scheduled cell are both active.

For an IAB-MT, the search space defines how/where to search for PDCCH candidates for an IAB-MT where each search space is associated with one ControlResourceSet and for a scheduled cell in the case of cross carrier scheduling, except for nrofCandidates, all the optional fields are absent.

**SearchSpaceLinkingId**

This parameter is used to link two search spaces of same type in the same BWP. If two search spaces have the same SearchSpaceLinkingId UE assumes these search spaces are linked to PDCCH repetition REF. When PDCCH repetition is monitored in two linked search space (SS) sets, the UE does not expect a third monitored SS set to be linked with any of the two linked SS sets. The two linked SS sets have the same SS set type (USS/CSS). The two linked SS sets have the same DCI formats to monitor. For intra-slot PDCCH repetition: The two SS sets should have the same periodicity and offset (monitoringSlotPeriodicityAndOffset), and the same duration. For linking monitoring occasions across the two SS sets that exist in the same slot: The two SS sets have the same number of monitoring occasions within a slot and n-th monitoring occasion of one SS set is linked to n-th monitoring occasion of the other SS set. The following SS sets cannot be linked with another SS set for PDCCH repetition: SS set 0, *searchSpaceSIB1*, *searchSpaceOtherSystemInformation*, *pagingSearchSpace*, *ra-SearchSpace*, *searchSpaceMCCH*, *searchSpaceMTCH*, *peiSearchSpace*, and *sdt-SearchSpace*. SS set configured by *recoverySearchSpaceId* cannot be linked to another SS set for PDCCH repetition. When a scheduled serving cell is configured to be cross-carrier scheduled by a scheduling serving cell, two PDCCH candidates (with the same AL and candidate index associated with the scheduled serving cell) are linked only if the corresponding two SS sets in the scheduling serving cell are linked and two SS sets in the scheduled serving cell with the same SS set IDs are also linked.

This parameter is not applicable to search space configured with *dc FormatsSL* for monitoring format 3-0 or format 3-1 or for monitoring formats 3-0 and format 3-1.

**searchSpaceType**

Indicates whether this is a common search space (present) or a UE specific search space as well as DCI formats to monitor for.

**ue-Specific**

Configures this search space as UE specific search space (USS). The UE monitors the DCI format with CRC scrambled by C-RNTI, CS-RNTI (if configured), and SP-CSI-RNTI (if configured)

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                           |

– **SearchSpaceId**

The IE *SearchSpaceId* is used to identify Search Spaces. The ID space is used across the BWPs of a Serving Cell. The search space with the *SearchSpaceId* = 0 identifies the search space configured via PBCH (MIB) and in *ServingCellConfigCommon* (*searchSpaceZero*). The number of Search Spaces per BWP is limited to 10 including the common and UE specific Search Spaces.

***SearchSpaceId* information element**

```
-- ASN1START
-- TAG-SEARCHSPACEID-START
```

```
SearchSpaceId ::= INTEGER (0..maxNrofSearchSpaces-1)
```

```
-- TAG-SEARCHSPACEID-STOP
-- ASN1STOP
```

— ***SearchSpaceZero***

The IE *SearchSpaceZero* is used to configure SearchSpace#0 of the initial BWP (see TS 38.213 [13], clause 13).

***SearchSpaceZero* information element**

```
-- ASN1START
-- TAG-SEARCHSPACEZERO-START
```

```
SearchSpaceZero ::= INTEGER (0..15)
```

```
-- TAG-SEARCHSPACEZERO-STOP
-- ASN1STOP
```

— ***SecurityAlgorithmConfig***

The IE *SecurityAlgorithmConfig* is used to configure AS integrity protection algorithm and AS ciphering algorithm for SRBs and DRBs.

***SecurityAlgorithmConfig* information element**

```
-- ASN1START
-- TAG-SECURITYALGORITHMCONFIG-START
```

```
SecurityAlgorithmConfig ::= SEQUENCE {
    cipheringAlgorithm      CipheringAlgorithm,
    integrityProtAlgorithm  IntegrityProtAlgorithm OPTIONAL, -- Need R
    ...
}
```

```
IntegrityProtAlgorithm ::= ENUMERATED {
    nia0, nia1, nia2, nia3, spare4, spare3,
    spare2, spare1, ...}
```

```
CipheringAlgorithm ::= ENUMERATED {
    nea0, nea1, nea2, nea3, spare4, spare3,
    spare2, spare1, ...}
```

-- TAG-SECURITYALGORITHMCONFIG-STOP  
-- ASN1STOP

| SecurityAlgorithmConfig field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>cipheringAlgorithm</b><br/> Indicates the ciphering algorithm to be used for SRBs and DRBs, as specified in TS 33.501 [11]. The algorithms <i>nea0-nea3</i> are identical to the LTE algorithms <i>eea0-3</i>. The algorithms configured for all bearers using master key shall be the same, and the algorithms configured for all bearers using secondary key, if any, shall be the same. If UE is connected to E-UTRA/EPC, this field indicates the ciphering algorithm to be used for RBs configured with NR PDCP, as specified in TS 33.501 [11].</p>                                                                                                                                                                                                                                                                                                                     |
| <p><b>integrityProtAlgorithm</b><br/> Indicates the integrity protection algorithm to be used for SRBs and DRBs, as specified in TS 33.501 [11]. The algorithms <i>nia0-nia3</i> are identical to the E-UTRA algorithms <i>eia0-3</i>. The algorithms configured for all bearers using master key shall be the same and the algorithms configured for all bearers using secondary key, if any, shall be the same. The network does not configure <i>nia0</i> except for unauthenticated emergency sessions for unauthenticated UEs in LSM (limited service mode).<br/> If UE is connected to E-UTRA/EPC, this field indicates the integrity protection algorithm to be used for SRBs configured with NR PDCP as specified in TS 33.501 [11], and DRBs configured with integrity protection as specified in TS 33.401 [30]. The network does not configure <i>nia0</i> for SRB3.</p> |

### SemiStaticChannelAccessConfig

The IE *SemiStaticChannelAccessConfig* is used to configure channel access parameters when the network is operating in semi-static channel access mode (see clause 4.3 in TS 37.213 [48]).

**SemiStaticChannelAccessConfig information element**

```

-- ASN1START
-- TAG-SEMISTATICCHANNELACCESSCONFIG-START

SemiStaticChannelAccessConfig-r16 ::= SEQUENCE {
    period-r16 ENUMERATED {ms1, ms2, ms2dot5, ms4, ms5, ms10}
}

-- TAG-SEMISTATICCHANNELACCESSCONFIG-STOP
-- ASN1STOP

```

| SemiStaticChannelAccessConfig field descriptions                                                                                                                                                                                                                |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>period</b><br/> Indicates the periodicity of the semi-static channel access mode (see TS 37.213 [48], clause 4.3). Value <i>ms1</i> corresponds to 1 ms, value <i>ms2</i> corresponds to 2 ms, value <i>ms2dot5</i> corresponds to 2.5 ms, and so on.</p> |

–

### SemiStaticChannelAccessConfigUE

The IE *SemiStaticChannelAccessConfigUE* is used to configure channel access parameters for UE initiated semi-static channel access.

*SemiStaticChannelAccessConfigUE* information element

```
-- ASN1START
-- TAG-SEMISTATICCHANNELACCESSCONFIGUE-START

SemiStaticChannelAccessConfigUE-r17 ::= SEQUENCE {
    periodUE-r17      ENUMERATED {ms1, ms2, ms2dot5, ms4, ms5, ms10, spare2, spare1},
    offsetUE-r17      INTEGER (0..559)
}

-- TAG-SEMISTATICCHANNELACCESSCONFIGUE-STOP
-- ASN1STOP
```

| <i>SemiStaticChannelAccessConfigUE</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>periodUE</i></b><br>Indicates the period of a channel occupancy that the UE can initiate as described in TS 37.213 [48], clause 4.3. Value ms1 corresponds to 1 ms, value ms2 corresponds to 2 ms, value ms2dot5 corresponds to 2.5 ms, and so on.                                                                                                                                                                                                                                                                                |
| <b><i>offsetUE</i></b><br>Indicates the number of symbols from the beginning of the even indexed radio frame to the start of the first period within that radio frame that the UE can initiate a channel occupancy (see TS 37.213 [48], clause 4.3), based on the smallest SCS among the configured SCSs in the serving cell. The offset duration indicated by this field is less than the period duration indicated by <i>periodUE</i> . The maximum value is 139, 279 and 559 for 15, 30 and 60 kHz subcarrier spacing, respectively. |

– *Sensor-LocationInfo*

The IE *Sensor-LocationInfo* is used by the UE to provide sensor information.

*Sensor-LocationInfo* information element

```
-- ASN1START
-- TAG-SENSORLOCATIONINFO-START

Sensor-LocationInfo-r16 ::= SEQUENCE {
    sensor-MeasurementInformation-r16 OCTET STRING OPTIONAL,
    sensor-MotionInformation-r16     OCTET STRING OPTIONAL,
    ...
}

-- TAG-SENSORLOCATIONINFO-STOP
-- ASN1STOP
```

| Sensor-LocationInfo field descriptions                                                                                                                                                                                                       |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>sensor-MeasurementInformation</b><br>This field provides barometric pressure measurements as <i>Sensor-MeasurementInformation</i> defined in TS 37.355 [49]. The first/leftmost bit of the first octet contains the most significant bit. |
| <b>sensor-MotionInformation</b><br>This field provides motion sensor measurements as <i>Sensor-MotionInformation</i> defined in TS 37.355 [49]. The first/leftmost bit of the first octet contains the most significant bit.                 |

—                    *ServingCellAndBWP-Id*

The IE *ServingCellAndBWP-Id* is used to indicate a serving cell and an uplink or a downlink BWP.

***ServingCellAndBWP-Id* information element**

```
-- ASN1START
-- TAG-SERVINGCELLANDBWP-ID-START

ServingCellAndBWP-Id-r17 ::= SEQUENCE {
    servingcell-r17      ServCellIndex,
    bwp-r17              BWP-Id
}

-- TAG-SERVINGCELLANDBWP-ID-STOP
-- ASN1STOP
```

—                    *ServCellIndex*

The IE *ServCellIndex* concerns a short identity, used to uniquely identify a serving cell (i.e. the PCell, the PSCell or an SCell) across the cell groups. Value 0 applies for the PCell, while the *SCellIndex* that has previously been assigned applies for SCells.

***ServCellIndex* information element**

```
-- ASN1START
-- TAG-SERVCELLINDEX-START

ServCellIndex ::=
    INTEGER (0..maxNrofServingCells-1)

-- TAG-SERVCELLINDEX-STOP
-- ASN1STOP
```

## – *ServingCellConfig*

The IE *ServingCellConfig* is used to configure (add or modify) the UE with a serving cell, which may be the SpCell or an SCell of an MCG or SCG. The parameters herein are mostly UE specific but partly also cell specific (e.g. in additionally configured bandwidth parts). Reconfiguration between a PUCCH and PUCCHless SCell is only supported using an SCell release and add.

### *ServingCellConfig* information element

|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>absenceOfAnyOtherTechnology</b><br>Presence of this field indicates absence on a long term basis (e.g. by level of regulation) of any other technology sharing the carrier; absence of this field indicates the potential presence of any other technology sharing the carrier, as specified in TS 37.213 [48] clauses 4.2.1 and 4.2.3.        |
| <b>energyDetectionConfig</b><br>Indicates whether to use the <i>maxEnergyDetectionThreshold</i> or the <i>energyDetectionThresholdOffset</i> (see TS 37.213 [48], clause 4.2.3).                                                                                                                                                                  |
| <b>energyDetectionThresholdOffset</b><br>Indicates the offset to the default maximum energy detection threshold value. Unit in dB. Value -13 corresponds to -13dB, value -12 corresponds to -12dB, and so on (i.e. in steps of 1dB) as specified in TS 37.213 [48], clause 4.2.3.                                                                 |
| <b>maxEnergyDetectionThreshold</b><br>Indicates the absolute maximum energy detection threshold value. Unit in dBm. Value -85 corresponds to -85 dBm, value -84 corresponds to -84 dBm, and so on (i.e. in steps of 1dBm) as specified in TS 37.213 [48], clause 4.2.3.                                                                           |
| <b>ul-toDL-COT-SharingED-Threshold</b><br>Maximum energy detection threshold that the UE should use to share channel occupancy with gNB for DL transmission as specified in TS 37.213 [48], clause 4.1.3 for downlink channel access and clause 4.2.3 for uplink channel access. This field is not applicable in semi-static channel access mode. |

| <i>ServingCellConfig</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b><i>additionalPCI-ToAddModList</i></b><br>List of information for the additional SSB with different PCI than the serving cell PCI. The additional SSBs with different PCIs are not used for serving cell quality derivation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>bwp-InactivityTimer</i></b><br>The duration in ms after which the UE falls back to the default Bandwidth Part (see TS 38.321 [3], clause 5.15). When the network releases the timer configuration, the UE stops the timer without switching to the default BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>ca-SlotOffset</i></b><br>Slot offset between the primary cell (PCell/PSCell) and the SCell in unaligned frame boundary with slot alignment and partial SFN alignment inter-band CA. Based on this field, the UE determines the time offset of the SCell as specified in clause 4.5 of TS 38.211 [16]. The granularity of this field is determined by the reference SCS for the slot offset (i.e. the maximum of PCell/PSCell lowest SCS among all the configured SCSs in DL/UL <i>SCS-SpecificCarrierList</i> in <i>ServingCellConfigCommon</i> or <i>ServingCellConfigCommonSIB</i> and this serving cell's lowest SCS among all the configured SCSs in DL/UL <i>SCS-SpecificCarrierList</i> in <i>ServingCellConfigCommon</i> or <i>ServingCellConfigCommonSIB</i> ).<br>The Network configures at most single non-zero offset duration in ms (independent on SCS) among CCs in the unaligned CA configuration. If the field is absent, the UE applies the value of 0. The slot offset value can only be changed with SCell release and add. |
| <b><i>cbg-TxDiffTbsProcessingType1, cbg-TxDiffTbsProcessingType2</i></b><br>Indicates whether processing types 1 and 2 based CBG based operation is enabled according to Rel-16 UE capabilities.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>channelAccessConfig</i></b><br>List of parameters used for access procedures of operation with shared spectrum channel access (see TS 37.213 [48]).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>channelAccessMode2</i></b><br>If present, this field indicates that the UE shall apply channel access procedures for operation with shared spectrum channel access in accordance with TS 37.213 [48], clause 4.4 for FR2-2. If absent, the UE does not apply these channel access procedures. The network always configures this field if channel access procedures are required for the serving cell within this region by regulations.<br>Overwrites the corresponding field in <i>ServingCellConfigCommon</i> or <i>ServingCellConfigCommonSIB</i> for this serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>crossCarrierSchedulingConfig</i></b><br>Indicates whether this serving cell is cross-carrier scheduled by another serving cell or whether it cross-carrier schedules another serving cell. If the field <i>other</i> is configured for an SpCell (i.e., the SpCell is cross-carrier scheduled by another serving cell), the SpCell can be additionally scheduled by the PDCCH on the SpCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>crossCarrierSchedulingConfigRelease</i></b><br>If this field is included, the UE shall release the cross carrier scheduling configuration configured by <i>crossCarrierSchedulingConfig</i> . The network may only include either <i>crossCarrierSchedulingConfigRelease</i> or <i>crossCarrierSchedulingConfig</i> at a time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>crs-RateMatch-PerCORESETPoolIndex</i></b><br>Indicates how UE performs rate matching when both lte-CRS-PatternList1-r16 and lte-CRS-PatternList2-r16 are configured as specified in TS 38.214 [19], clause 5.1.4.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>csi-RS-ValidationWithDCI</i></b><br>Indicates how the UE performs periodic and semi-persistent CSI-RS reception in a slot. The presence of this field indicates that the UE uses DCI detection to validate whether to receive CSI-RS (see TS 38.213 [13], clause 11.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>defaultDownlinkBWP-Id</i></b><br>The initial bandwidth part is referred to by BWP-Id = 0. ID of the downlink bandwidth part to be used upon expiry of the BWP inactivity timer. This field is UE specific. When the field is absent the UE uses the initial BWP as default BWP. (see TS 38.213 [13], clause 12 and TS 38.321 [3], clause 5.15).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>directionalCollisionHandling</i></b><br>Indicates that this serving cell is using directional collision handling between a reference and other cell(s) for half-duplex operation in TDD CA with same SCS as specified in TS 38.213 [13], clause 11.1. The half-duplex operation only applies within the same frequency range and cell group.<br><br>The network only configures this field for TDD serving cells that are using the same SCS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>directionalCollisionHandling-DC</i></b><br>For the IAB-MT, it indicates that this serving cell is using directional collision handling between a reference and other cell(s) for half-duplex operation in TDD NR-DC with same SCS within same cell group or cross different cell groups.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>dormantBWP-Config</i></b><br>The dormant BWP configuration for an SCell. This field can be configured only for a (non-PUCCH) SCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| A set of UE specific channel bandwidth and location configurations for different subcarrier spacings (numerologies). Defined in relation to Point A. The UE uses the configuration provided in this field only for the purpose of channel bandwidth and location determination. If absent, UE uses the configuration indicated in <i>scs-SpecificCarrierList</i> in <i>DownlinkConfigCommon</i> / <i>DownlinkConfigCommonSIB</i> . Network only configures channel bandwidth that corresponds to the channel bandwidth values defined in TS 38.101-1 [15], TS 38.101-2 [39], and TS 38.101-5 [75]. If the UE is a RedCap UE and needs to autonomously switch to its initial downlink bandwidth part to perform a random access procedure but its current UE specific channel bandwidth does not cover the initial downlink bandwidth part, the UE autonomously changes its UE specific channel bandwidth to cover the initial downlink bandwidth part. In that case, after completion of the random access procedure, the network ensures that the UE specific channel bandwidth fully covers the UE's active downlink bandwidth part in subsequent bandwidth part switch operations. |

| Presence of this field indicates the UE shall follow the release 16 behavior of two default TCI states for PDSCH when at least one TCI codepoint is mapped to two TCI states is enabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>fdmed-ReceptionMulticast</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Indicates the Type-1 HARQ codebook generation as specified in TS 38.213 [13], clause 9.1.2.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>firstActiveDownlinkBWP-Id</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| If configured for an SpCell, this field contains the ID of the DL BWP to be activated or to be used for RLM, BFD and measurements if included in an <i>RRCReconfiguration</i> message contained in an NR or E-UTRA RRC message indicating that the SCG is deactivated, upon performing the RRC (re-)configuration. If the field is absent, the RRC (re-)configuration does not impose a BWP switch. If the field is absent for the PSCell at SCG deactivation, the UE considers the previously activated DL BWP as the BWP to be used for RLM, BFD and measurements. If the field is absent for the PSCell at SCG activation, the DL BWP to be activated is the DL BWP previously to be used for RLM, BFD and measurements.<br>If configured for an SCell, this field contains the ID of the downlink bandwidth part to be used upon activation of an SCell. The initial bandwidth part is referred to by BWP-Id = 0.<br>Upon reconfiguration with <i>reconfigurationWithSync</i> , the network sets the <i>firstActiveDownlinkBWP-Id</i> and <i>firstActiveUplinkBWP-Id</i> to the same value.                                                                                       |
| <b><i>initialDownlinkBWP</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| The dedicated (UE-specific) configuration for the initial downlink bandwidth-part (i.e., DL BWP#0). If any of the optional IEs are configured within this IE, the UE considers the BWP#0 to be an RRC configured BWP (from UE capability viewpoint). Otherwise, the UE does not consider the BWP#0 as an RRC configured BWP (from UE capability viewpoint). Network always configures the UE with a value for this field if no other BWPs are configured. NOTE1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>intraCellGuardBandsDL-List, intraCellGuardBandsUL-List</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| List of intra-cell guard bands in a serving cell for operation with shared spectrum channel access in FR1. If not configured, the guard bands are defined according to 38.101-1 [15], see TS 38.214 [19], clause 7. For operation in licensed spectrum, this field is absent, and no UE action is required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>lte-CRS-PatternList1</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| A list of LTE CRS patterns around which the UE shall do rate matching for PDSCH. The LTE CRS patterns in this list shall be non-overlapping in frequency. The network does not configure this field and <i>lte-CRS-ToMatchAround</i> simultaneously.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

***lte-CRS-PatternList2***

A list of LTE CRS patterns around which the UE shall do rate matching for PDSCH scheduled with a DCI detected on a CORESET with CORESETPoolIndex configured with 1. This list is configured only if CORESETPoolIndex configured with 1. The first LTE CRS pattern in this list shall be fully overlapping in frequency with the first LTE CRS pattern in lte-CRS-PatternList1, The second LTE CRS pattern in this list shall be fully overlapping in frequency with the second LTE CRS pattern in lte-CRS-PatternList1, and so on. Network configures this field only if the field *lte-CRS-ToMatchAround* is not configured and there is at least one ControlResourceSet in one DL BWP of this serving cell with *coresetPoolIndex* set to 1.

***lte-CRS-ToMatchAround***

Parameters to determine an LTE CRS pattern that the UE shall rate match around.

***lte-NeighCellsCRS-AssistInfoList***

A list of LTE neighbour cells configuration information which is used to assist the UE to perform CRS interference mitigation (CRS-IM) in scenarios with overlapping spectrum for LTE and NR (see TS 38.101-4 [59]). If the field is included, it replaces any previous list, i.e. all the entries of the list are replaced and each of the *LTE-NeighCellsCRS-AssistInfo* entries is considered to be newly created and the conditions and Need codes for setup of the entry apply.

***lte-NeighCellsCRS-Assumptions***

If the field is not configured, the following default network configuration assumptions are valid for all LTE neighbour cells for the purpose of CRS interference mitigation (CRS-IM) in scenarios with overlapping spectrum for LTE and NR (see TS 38.101-4 [59]).

- The CRS port number is the same as the one indicated in *RateMatchPatternLTE-CRS* if configured for the serving cell.
- The CRS port number is 4 if *RateMatchPatternLTE-CRS* is not configured for the serving cell.
- The channel bandwidth and centre frequency are the same as the ones indicated in *RateMatchPatternLTE-CRS* if configured for the serving cell.
- The MBSFN configuration is the same as the one indicated in *RateMatchPatternLTE-CRS* if configured for the serving cell. If *RateMatchPatternLTE-CRS* is not configured for the serving cell, MBSFN subframe is not configured.
- Network-based CRS interference mitigation (i.e., CRS muting), as in *crs-IntfMitigConfig* specified in TS 36.331 [10], is not enabled.

If the field is configured (i.e. false) and *LTE-NeighCellsCRS-AssistInfoList* is configured, the configuration provided in *LTE-NeighCellsCRS-AssistInfoList* overrides the default network configuration assumptions.

If the field is configured (i.e. false) and *LTE-NeighCellsCRS-AssistInfoList* is not configured, it is up to the UE implementation whether to apply CRS-IM operation.

***multiPDSCH-PerSlotType1-CB***

Configures the UE behaviour for Type1 codebook HARQ ACK generation regarding the number of PDSCHs per slot on a serving cell as specified in TS 38.213 [13], clause 9.1.2.1.

When this parameter is configured and set to disabled for a serving cell, the network does not schedule UE with more than one PDSCH in a slot on the serving cell if HARQ-ACKs of any two PDSCHs in the slot on the serving cell are supposed to be reported on one PUCCH resource in the same PUCCH slot. If two *coresetPoolIndex* values are configured, the number of received PDSCHs is per *coresetPoolIndex* value per slot for a serving cell. If the UE generates two HARQ-ACK codebooks for two priorities, the number of received PDSCHs is per priority per slot for a serving cell. If *fdmed-ReceptionMulticast* is configured, the number of received PDSCHs is per traffic type (unicast / multicast) per slot for a serving cell.

***nr-dl-PRS-PDC-Info***

Configures the DL PRS for propagation delay compensation. When configured, the UE measures the UE Rx-Tx time difference based on the reference signals configured in this field.

***nrofHARQ-BundlingGroups***

Indicates the number of HARQ bundling groups for type2 HARQ-ACK codebook.

***pathlossReferenceLinking***

Indicates whether UE shall apply as pathloss reference either the downlink of SpCell (PCell for MCG or PSCell for SCG) or of SCell that corresponds with this uplink (see TS 38.213 [13], clause 7).

***pdsch-ServingCellConfig***

PDSCH related parameters that are not BWP-specific.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Resources patterns which the UE should rate match PDSCH around. The UE rate matches around the union of all resources indicated in the rate match patterns. Rate match patterns defined here on cell level apply only to PDSCH of the same numerology. See TS 38.214 [19], clause 5.1.4.1. If a <i>RateMatchPattern</i> with the same <i>RateMatchPatternId</i> is configured in both <i>ServingCellConfig/ServingCellConfigCommon</i> and in SIB20/MCCH, the entire <i>RateMatchPattern</i> configuration shall be the same, including the set of RBs/REs indicated by the patterns for the rate matching around, and they are counted as a single rate match pattern in the total configured rate match patterns as defined in TS 38.214 [19].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>sCellDeactivationTimer</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SCell deactivation timer in TS 38.321 [3]. If the field is absent, the UE applies the value infinity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>sfnSchemePDCCH</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| This parameter is used to configure single frequency network scheme for PDCCH: <i>sfnSchemeA</i> or <i>sfnSchemeB</i> as specified (see TS 38.214 [19], clause 5.1). If network includes both <i>sfnSchemePDCCH</i> and <i>sfnSchemePDSCH</i> , same value shall be configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>sfnSchemePDSCH</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| This parameter is used to configure single frequency network scheme for PDSCH: <i>sfnSchemeA</i> or <i>sfnSchemeB</i> as specified (see TS 38.214 [19], clause 5.1). If network includes both <i>sfnSchemePDCCH</i> and <i>sfnSchemePDSCH</i> , same value shall be configured. The network does not configure this parameter and <i>repetitionSchemeConfig</i> in <i>PDSCH-Config</i> simultaneously in the same serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>semiStaticChannelAccessConfigUE</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| When this field is configured and when <i>channelAccessMode-r16</i> (see IE <i>ServingCellConfigCommon</i> and IE <i>ServingCellConfigCommonSIB</i> ) is configured to <i>semiStatic</i> , the UE operates in semi-static channel access mode and can initiate a channel occupancy periodically (see TS 37.213 [48], Clause 4.3). The period can be configured independently from period configured in <i>SemiStaticChannelAccessConfig-r16</i> if the UE indicates the corresponding capability. Otherwise, the periodicity configured by <i>periodUE-r17</i> is an integer multiple of or an integer factor of the periodicity indicated by <i>period</i> in <i>SemiStaticChannelAccessConfig-r16</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>servingCellMO</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <i>measObjectId</i> of the <i>MeasObjectNR</i> in <i>MeasConfig</i> which is associated to the serving cell. If the serving cell is associated with SSB, the following relationship applies between the corresponding <i>MeasObjectNR</i> and <i>frequencyInfoDL</i> in <i>ServingCellConfigCommon/ServingCellConfigCommonSIB</i> of the serving cell: if <i>ssbFrequency</i> is configured, its value is the same as the <i>absoluteFrequencySSB</i> and if <i>csi-rs-ResourceConfigMobility</i> is configured, the value of its <i>subcarrierSpacing</i> is present in one entry of the <i>scs-SpecificCarrierList</i> , <i>csi-RS-CellListMobility</i> includes an entry corresponding to the serving cell (with <i>cellId</i> equal to <i>physCellId</i> in <i>ServingCellConfigCommon</i> ) and the frequency range indicated by the <i>csi-rs-MeasurementBW</i> of the entry in <i>csi-RS-CellListMobility</i> is included in the frequency range indicated by in the entry of the <i>scs-SpecificCarrierList</i> . If the serving cell is not associated with SSB (i.e. SSB-less SCell), the carrier frequency indicated by <i>ssbFrequency</i> of the corresponding <i>MeasObjectNR</i> , if configured, is within the frequency range indicated by any entry of the <i>scs-SpecificCarrierList</i> . |
| <b><i>supplementaryUplink</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Network may configure this field only when <i>supplementaryUplinkConfig</i> is configured in <i>ServingCellConfigCommon</i> or <i>supplementaryUplink</i> is configured in <i>ServingCellConfigCommonSIB</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>supplementaryUplinkRelease</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| If this field is included, the UE shall release the uplink configuration configured by <i>supplementaryUplink</i> . The network only includes either <i>supplementaryUplinkRelease</i> or <i>supplementaryUplink</i> at a time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>tag-Id</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Timing Advance Group ID, as specified in TS 38.321 [3], which this cell belongs to.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

***tcj-ActivatedConfig***

If configured for an SCell, or if configured for the PSCell when the SCG is being activated upon the reception of the containing message, the UE shall consider the TCI states provided in this field as the activated TCI states for PDCCH/PDSCH reception on this serving cell.

If configured for the PSCell when the SCG is indicated as deactivated in the containing message:

- the UE shall consider the TCI states provided in this field as the TCI states to be activated for PDCCH/PDSCH reception upon a later SCG activation in which *tcj-ActivatedConfig* is absent

- if *bfd-and-RLM* is configured and no RS is configured in *RadioLinkMonitoringConfig* for RLM, respectively for BFD, the UE shall use the TCI states provided in this field for PDCCH as RS for RLM, respectively for BFD.

When this field is absent for the PSCell and the SCG is being deactivated:

- the UE shall consider the previously activated TCI states as the TCI states to be activated for PDCCH/PDSCH reception upon a later SCG activation in which *tcj-ActivatedConfig* is absent

- if *bfd-and-RLM* is configured and no RS is configured in *RadioLinkMonitoringConfig* for RLM, respectively for BFD, the UE shall use the previously activated TCI states for PDCCH as RS for RLM, respectively for BFD.

***tdd-UL-DL-ConfigurationDedicated-IAB-MT***

Resource configuration per IAB-MT D/U/F overrides all symbols (with a limitation that effectively only flexible symbols can be overwritten in Rel-16) per slot over the number of slots as provided by *TDD-UL-DL ConfigurationCommon*.

***unifiedTCI-StateType***

Indicates the unified TCI state type the UE is configured for this serving cell. The value *separate* means this serving cell is configured with *dl-OrJointTCI-StateList* for DL TCI state and *ul-TCI-StateList* for UL TCI state. The value *joint* means this serving cell is configured with *dl-OrJointTCI-StateList* for joint TCI state for UL and DL operation. The network does not configure the field in a serving cell that is configured with more than one value for the *coresetPoolIndex*.

***uplinkConfig***

Network may configure this field only when *uplinkConfigCommon* is configured in *ServingCellConfigCommon* or *ServingCellConfigCommonSIB*. Addition or release of this field can only be done upon SCell addition or release (respectively).

***uplink-PowerControlToAddModList***

Configures UL power control parameters for PUSCH, PUCCH and SRS when field *unifiedTCI-StateType* is configured for this serving cell.

| <b><i>UplinkConfig</i></b> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b><i>carrierSwitching</i></b><br>Includes parameters for configuration of carrier based SRS switching (see TS 38.214 [19], clause 6.2.1.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>enableDefaultBeamPL-ForPUSCH0-0, enableDefaultBeamPL-ForPUCCH, enableDefaultBeamPL-ForSRS</i></b><br>When the parameter is present, UE derives the spatial relation and the corresponding pathloss reference Rs as specified in 38.213, clauses 7.1.1, 7.2.1, 7.3.1 and 9.2.2. The network only configures these parameters for FR2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>enablePL-RS-UpdateForPUSCH-SRS</i></b><br>When this parameter is present, the Rel-16 feature of MAC CE based pathloss RS updates for PUSCH/SRS is enabled. Network only configures this parameter when the UE is configured with <i>sri-PUSCH-PowerControl</i> . If this field is not configured, network configures at most 4 pathloss RS resources for PUSCH/PUCCH/SRS transmissions per BWP, not including pathloss RS resources for SRS transmissions for positioning. (See TS 38.213 [13], clause 7).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>firstActiveUplinkBWP-Id</i></b><br>If configured for an SpCell, this field contains the ID of the UL BWP to be activated upon performing the RRC (re-)configuration. If the field is absent, the RRC (re-)configuration does not impose a BWP switch.<br>If configured for an SCell, this field contains the ID of the uplink bandwidth part to be used upon activation of an SCell. The initial bandwidth part is referred to by <i>BandwidthPartId</i> = 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>initialUplinkBWP</i></b><br>The dedicated (UE-specific) configuration for the initial uplink bandwidth-part (i.e. UL BWP#0). If any of the optional IEs are configured within this IE as part of the IE <i>uplinkConfig</i> , the UE considers the BWP#0 to be an RRC configured BWP (from UE capability viewpoint). Otherwise, the UE does not consider the BWP#0 as an RRC configured BWP (from UE capability viewpoint). Network always configures the UE with a value for this field if no other BWPs are configured. NOTE1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>moreThanOneNackOnlyMode</i></b><br>Indicates the mode of NACK-only feedback in the PUCCH transmission, as specified in TS 38.213 [13], clause 18. If multicast CFR is not configured, this field is not included. Otherwise, if the field is absent, UE uses mode 1 for multicast CFR.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>mpr-PowerBoost-FR2</i></b><br>Indicates whether UE is allowed to boost uplink transmission power by suspending in-band emission (IBE) requirements as specified in TS 38.101-2 [39]. Network only configures this field for FR2 serving cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>powerBoostPi2BPSK</i></b><br>If this field is set to <i>true</i> , the UE determines the maximum output power for PUCCH/PUSCH transmissions that use pi/2 BPSK modulation according to TS 38.101-1 [15] / TS 38.101-5 [75], clause 6.2.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b><i>uplinkChannelBW-PerSCS-List</i></b><br>A set of UE specific channel bandwidth and location configurations for different subcarrier spacings (numerologies). Defined in relation to Point A. The UE uses the configuration provided in this field only for the purpose of channel bandwidth and location determination. If absent, UE uses the configuration indicated in <i>scs-SpecificCarrierList</i> in <i>UplinkConfigCommon</i> / <i>UplinkConfigCommonSIB</i> . Network only configures channel bandwidth that corresponds to the channel bandwidth values defined in TS 38.101-1 [15], TS 38.101-2 [39], and TS 38.101-5 [75]. If the UE is a RedCap UE and needs to autonomously switch to its initial uplink bandwidth part to perform a random access procedure but its current UE specific channel bandwidth does not cover the initial uplink bandwidth part, the UE autonomously changes its UE specific channel bandwidth to cover the initial uplink bandwidth part. In that case, after completion of the random access procedure, the network ensures that the UE specific channel bandwidth fully covers the UE's active uplink bandwidth part in subsequent bandwidth part switch operations. |

|------------------------------------------------------------------------------------------------------------------------------|
| <p><b><i>startCRB</i></b><br/>Indicates the starting RB of the guard band.</p>                                               |
| <p><b><i>nrofCRB</i></b><br/>Indicates the length of the guard band in RBs. When set to 0, zero-size guard band is used.</p> |

NOTE 1: If the dedicated part of initial UL/DL BWP configuration is absent, the initial BWP can be used but with some limitations. For example, changing to another BWP requires *RRCReconfiguration* since DCI format 1\_0 doesn't support DCI-based switching.

| Conditional Presence           | Explanation                                                                                                                                                                                                                                                                                                                                                                     |

## – *ServingCellConfigCommon*

The IE *ServingCellConfigCommon* is used to configure cell specific parameters of a UE's serving cell. The IE contains parameters which a UE would typically acquire from SSB, MIB or SIBs when accessing the cell from IDLE. With this IE, the network provides this information in dedicated signalling when configuring a UE with a SCells or with an additional cell group (SCG). It also provides it for SpCells (MCG and SCG) upon reconfiguration with sync.

### *ServingCellConfigCommon* information element

| <b><i>ServingCellConfigCommon</i> field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>channelAccessMode</i></b><br>If present, this field indicates which channel access procedures to apply for operation with shared spectrum channel access as defined in TS 37.213 [48]. If the field is configured as "semiStatic", the UE shall apply the channel access procedures for semi-static channel occupancy as described in clause 4.3 in TS 37.213. If the field is configured as "dynamic", the UE shall apply the channel access procedures as defined in TS 37.213, clause 4.1 and 4.2.                                                                                                                                                                                                                                                                                     |
| <b><i>channelAccessMode2</i></b><br>If present, the UE shall apply channel access procedures for operation with shared spectrum channel access in accordance with TS 37.213 [48], clause 4.4 for FR2-2. If absent, the UE shall not apply any channel access procedure. The network always configures this field if channel access procedures are required for the serving cell within this region by regulations.                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>dmrs-TypeA-Position</i></b><br>Position of (first) DM-RS for downlink (see TS 38.211 [16], clause 7.4.1.1.1) and uplink (TS 38.211 [16], clause 6.4.1.1.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>downlinkConfigCommon</i></b><br>The common downlink configuration of the serving cell, including the frequency information configuration and the initial downlink BWP common configuration. The parameters provided herein should match the parameters configured by MIB and SIB1 (if provided) of the serving cell, with the exception of <i>controlResourceSetZero</i> and <i>searchSpaceZero</i> which can be configured in <i>ServingCellConfigCommon</i> even if MIB indicates that they are absent.                                                                                                                                                                                                                                                                                 |
| <b><i>discoveryBurstWindowLength</i></b><br>Indicates the window length of the discovery burst in ms (see TS 37.213 [48]). The field <i>discoveryBurstWindowLength-r17</i> is applicable to SCS 480 kHz and SCS 960 kHz.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>featurePriorities</i></b><br>Indicates priorities for features, such as RedCap, Slicing, SDT and MSG3-Repetitions for Coverage Enhancements. These priorities are used to determine which <i>FeatureCombinationPreambles</i> the UE shall use when a feature maps to more than one <i>FeatureCombinationPreambles</i> , as specified in TS 38.321 [3]. A lower value means a higher priority. The network does not signal the same priority for more than one feature. The network signals a priority for all feature that map to at least one <i>FeatureCombinationPreambles</i> .                                                                                                                                                                                                       |
| <b><i>longBitmap</i></b><br>Bitmap when maximum number of SS/PBCH blocks per half frame equals to 64 as defined in TS 38.213 [13], clause 4.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>lte-CRS-ToMatchAround</i></b><br>Parameters to determine an LTE CRS pattern that the UE shall rate match around.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>mediumBitmap</i></b><br>Bitmap when maximum number of SS/PBCH blocks per half frame equals to 8 as defined in TS 38.213 [13], clause 4.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>n-TimingAdvanceOffset</i></b><br>The N_TA-Offset to be applied for all uplink transmissions on this serving cell. If the field is absent, the UE applies the value defined for the duplex mode and frequency range of this serving cell. See TS 38.133 [14], table 7.1.2-2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>ra-ChannelAccess</i></b><br>If present, this field indicates that the UE shall apply channel access procedures before msg1/msgA transmission for operation with shared spectrum channel access in accordance with TS 37.213 [48], clause 4.4.5 for FR2-2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>rateMatchPatternToAddModList</i></b><br>Resources patterns which the UE should rate match PDSCH around. The UE rate matches around the union of all resources indicated in the rate match patterns. Rate match patterns defined here on cell level apply only to PDSCH of the same numerology (see TS 38.214 [19], clause 5.1.4.1). If a <i>RateMatchPattern</i> with the same <i>RateMatchPatternId</i> is configured in both <i>ServingCellConfig/ServingCellConfigCommon</i> and in SIB20/MCCH, the entire <i>RateMatchPattern</i> configuration, including the set of RBs/REs indicated by the patterns for the rate matching around, shall be the same and they are counted as a single rate match pattern in the total configured rate match patterns as defined in TS 38.214 [19]. |
| <b><i>shortBitmap</i></b><br>Bitmap when maximum number of SS/PBCH blocks per half frame equals to 4 as defined in TS 38.213 [13], clause 4.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Indicates the QCL relation between SSB positions for this serving cell as specified in TS 38.213 [13], clause 4.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>ssb-PositionsInBurst</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| For operation in licensed spectrum, indicates the time domain positions of the transmitted SS-blocks in a half frame with SS/PBCH blocks as defined in TS 38.213 [13], clause 4.1. The first/leftmost bit corresponds to SS/PBCH block index 0, the second bit corresponds to SS/PBCH block index 1, and so on. Value 0 in the bitmap indicates that the corresponding SS/PBCH block is not transmitted while value 1 indicates that the corresponding SS/PBCH block is transmitted. The network configures the same pattern in this field as in the corresponding field in <i>ServingCellConfigCommonSIB</i> .<br>For operation with shared spectrum channel access, the UE assumes that one or more SS/PBCH blocks indicated by <i>ssb-PositionsInBurst</i> may be transmitted within the discovery burst transmission window and have candidate SS/PBCH blocks indexes corresponding to SS/PBCH block indexes provided by <i>ssb-PositionsInBurst</i> (see TS 38.213 [13], clause 4.1). If the k-th bit of <i>ssb-PositionsInBurst</i> is set to 1, the UE assumes that one or more SS/PBCH blocks within the discovery burst transmission window with candidate SS/PBCH block indexes corresponding to SS/PBCH block index equal to k – 1 may be transmitted; if the kt-th bit is set to 0, the UE assumes that the corresponding SS/PBCH block(s) are not transmitted. The k-th bit is set to 0, where k > <i>ssb-PositionQCL</i> and the number of actually transmitted SS/PBCH blocks is not larger than the number of 1's in the bitmap. The network configures the same pattern in this field as in the corresponding field in <i>ServingCellConfigCommonSIB</i> . For operation with shared spectrum channel access in FR1, only <i>mediumBitmap</i> is used, and for FR2-2, <i>longBitmap</i> is used. |
| <b><i>ssbSubcarrierSpacing</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Subcarrier spacing of SSB.<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15 or 30 kHz<br>FR2-1: 120 or 240 kHz<br>FR2-2: 120, 480, or 960 kHz                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <i>AbsFreqSSB</i>           | The field is absent when <i>absoluteFrequencySSB</i> in <i>frequencyInfoDL</i> is absent, otherwise the field is mandatory present.                                                                    |
| <i>HOAndServCellAdd</i>     | This field is mandatory present upon SpCell change (including path switch between a serving cell and a L2 U2N Relay UE) and upon serving cell (PSCell/SCell) addition. Otherwise, the field is absent. |
| <i>HOAndServCellWithSSB</i> | This field is mandatory present upon SpCell change and upon serving cell (SCell with SSB or PSCell) addition. Otherwise, the field is absent.                                                          |
| <i>SharedSpectrum</i>       | This field is mandatory present if this cell operates with shared spectrum channel access in FR1. Otherwise, it is absent, Need R.                                                                     |
| <i>SharedSpectrum2</i>      | This field is optionally present if this cell operates with shared spectrum channel access in FR2-2, Need R. Otherwise, it is absent, Need R.                                                          |
| <i>TDD</i>                  | The field is optionally present, Need R, for TDD cells; otherwise it is absent.                                                                                                                        |

## – *ServingCellConfigCommonSIB*

The IE *ServingCellConfigCommonSIB* is used to configure cell specific parameters of a UE's serving cell in SIB1.

***ServingCellConfigCommonSIB*** information element

| <b>channelAccessMode</b>                             | If present, this field indicates which channel access procedures to apply for operation with shared spectrum channel access as defined in TS 37.213 [48]. If the field is configured as "semiStatic", the UE shall apply the channel access procedures for semi-static channel occupancy as described in clause 4.3 in TS 37.213. If the field is configured as "dynamic", the UE shall apply the channel access procedures as defined in TS 37.213, clause 4.1 and 4.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>channelAccessMode2</b>                            | If present, this field indicates that the UE shall apply channel access procedures for operation with shared spectrum channel access in accordance with TS 37.213 [48], clause 4.4 for FR2-2. If absent, the UE shall not apply any channel access procedure. The network always configures this field if channel access procedures are required for the serving cell within this region by regulations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>discoveryBurstWindowLength</b>                    | Indicates the window length of the discovery burst in ms (see TS 37.213 [48]). The field <i>discoveryBurstWindowLength-v1700</i> is applicable to SCS 480 kHz and SCS 960 kHz.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>enhancedMeasurementNGSO</b>                       | If the field is present and UE supports the enhanced cell reselection requirements for NTN NGSO in RRC_IDLE/RRC_INACTIVE, the UE shall apply the enhanced cell reselection requirements for NTN NGSO as specified in TS 38.133 [14], clauses 4.2C.2.3 and 4.2C.2.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>groupPresence</b>                                 | This field is present when maximum number of SS/PBCH blocks per half frame equals to 64 as defined in TS 38.213 [13], clause 4.1. The first/leftmost bit corresponds to the SS/PBCH index 0-7, the second bit corresponds to SS/PBCH block 8-15, and so on. Value 0 in the bitmap indicates that the SSBs according to <i>inOneGroup</i> are absent. Value 1 indicates that the SS/PBCH blocks are transmitted in accordance with <i>inOneGroup</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>inOneGroup</b>                                    | When maximum number of SS/PBCH blocks per half frame equals to 4 as defined in TS 38.213 [13], clause 4.1, only the 4 leftmost bits are valid; the UE ignores the 4 rightmost bits. When maximum number of SS/PBCH blocks per half frame equals to 8 as defined in TS 38.213 [13], clause 4.1, all 8 bits are valid. The first/ leftmost bit corresponds to SS/PBCH block index 0, the second bit corresponds to SS/PBCH block index 1, and so on. When maximum number of SS/PBCH blocks per half frame equals to 64 as defined in TS 38.213 [13], clause 4.1, all 8 bit are valid; The first/ leftmost bit corresponds to the first SS/PBCH block index in the group (i.e., to SSB index 0, 8, and so on); the second bit corresponds to the second SS/PBCH block index in the group (i.e., to SSB index 1, 9, and so on), and so on. Value 0 in the bitmap indicates that the corresponding SS/PBCH block is not transmitted while value 1 indicates that the corresponding SS/PBCH block is transmitted. |
| <b>n-TimingAdvanceOffset</b>                         | The N_TA-Offset to be applied for random access on this serving cell. If the field is absent, the UE applies the value defined for the duplex mode and frequency range of this serving cell. See TS 38.133 [14], table 7.1.2-2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>ra-ChannelAccess</b>                              | If present, this field indicates that the UE shall apply channel access procedures before msg1/msgA transmission for operation with shared spectrum channel access in accordance with TS 37.213 [48], clause 4.4.5 for FR2-2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>ssb-PositionsInBurst</b>                          | Time domain positions of the transmitted SS-blocks in an SS-burst as defined in TS 38.213 [13], clause 4.1.<br>For operation with shared spectrum channel access in FR1, only <i>inOneGroup</i> is used and the UE interprets this field same as <i>mediumBitmap</i> in <i>ServingCellConfigCommon</i> .<br>The UE assumes that a bit in <i>inOneGroup</i> at position $k > N_{SSB}^{QCL}$ is 0, where $N_{SSB}^{QCL}$ is obtained from <i>MIB</i> as specified in TS 38.213 [13], clause 4.1. For operation with shared spectrum channel access in FR2-2, the m-th bit in <i>groupPresence</i> is set to 0 for $m > N_{SSB}^{QCL}/8$ , where $N_{SSB}^{QCL}$ is obtained from <i>MIB</i> as specified in TS 38.213 [13], clause 4.1.                                                                                                                                                                                                                                                                       |
| <b>ss-PBCH-BlockPower</b>                            | Average EPRE of the resources elements that carry secondary synchronization signals in dBm that the NW used for SSB transmission, see TS 38.213 [13], clause 7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Conditional Presence   | Explanation                                                                                                                                   |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <i>FR2-Only</i>        | This field is mandatory present for an FR2 carrier frequency. It is absent otherwise and UE releases any configured value.                    |
| <i>SharedSpectrum</i>  | This field is mandatory present if this cell operates with shared spectrum channel access in FR1. Otherwise, it is absent, Need R.            |
| <i>SharedSpectrum2</i> | This field is optionally present if this cell operates with shared spectrum channel access in FR2-2, Need R. Otherwise, it is absent, Need R. |
| <i>TDD</i>             | The field is optionally present, Need R, for TDD cells; otherwise it is absent.                                                               |

### — *ShortI-RNTI-Value*

The IE *ShortI-RNTI-Value* is used to identify the suspended UE context of a UE in RRC\_INACTIVE using fewer bits compared to I-RNTI-Value.

#### ***ShortI-RNTI-Value* information element**

```
-- ASN1START
-- TAG-SHORTI-RNTI-VALUE-START
```

```
ShortI-RNTI-Value ::= BIT STRING (SIZE(24))
```

```
-- TAG-SHORTI-RNTI-VALUE-STOP
-- ASN1STOP
```

### — *ShortMAC-I*

The IE *ShortMAC-I* is used to identify and verify the UE at RRC connection re-establishment. The 16 least significant bits of the MAC-I calculated using the AS security configuration of the source PCell, as specified in 5.3.7.4.

#### ***ShortMAC-I* information element**

```
-- ASN1START
-- TAG-SHORTMAC-I-START
```

```
ShortMAC-I ::= BIT STRING (SIZE (16))
```

```
-- TAG-SHORTMAC-I-STOP
-- ASN1STOP
```

### — *SINR-Range*

The IE *SINR-Range* specifies the value range used in SINR measurements and thresholds. For measurements, integer value for SINR measurements is according to Table 10.1.16.1-1 in TS 38.133 [14]. For thresholds, the actual value is (IE value – 46) / 2 dB.

#### ***SINR-Range* information element**

```
-- ASN1START
-- TAG-SINR-RANGE-START

## – *SI-RequestConfig*

The IE *SI-RequestConfig* contains configuration for Msg1 based SI request. For the random access parameters (e.g. *prach-RootSequenceIndex*, *msg1-SubcarrierSpacing*, etc.) not configured in *SI-RequestConfig*, the UE applies the parameters configured in *rach-ConfigCommon* corresponding to the RACH resource set selected upon RACH initialization (as specified in TS 38.321 [3]), of the initial uplink BWP unless otherwise specified.

| <b>dummy</b><br>This field is not used in this specification. If received, it is ignored by the UE.                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>schedulingInfoList, schedulingInfoList2</b><br>List of scheduling information for SI messages. If <i>si-SchedulingInfo-v1700</i> is present, the network ensures that the total number of SI messages in the list of concatenated SI messages configured by <i>schedulingInfoList</i> in <i>si-SchedulingInfo</i> and SI messages containing type1 SIB configured by <i>schedulingInfoList2</i> in <i>si-SchedulingInfo-v1700</i> does not exceed the limit of <i>maxSI-Message</i> . |
| <b>si-RequestConfig</b><br>Configuration of Msg1 resources that the UE uses for requesting SI-messages for which <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> .                                                                                                                                                                                                                                                                                                            |
| <b>si-RequestConfigRedCap</b><br>Configuration of Msg1 resources for <i>initialUplinkBWP-RedCap</i> that the RedCap UE uses for requesting SI-messages for which <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> .                                                                                                                                                                                                                                                            |
| <b>si-RequestConfigSUL</b><br>Configuration of Msg1 resources that the UE uses for requesting SI-messages for which <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> .                                                                                                                                                                                                                                                                                                         |
| <b>si-WindowLength</b><br>The length of the SI scheduling window. Value <i>s5</i> corresponds to 5 slots, value <i>s10</i> corresponds to 10 slots and so on. The network always configures <i>si-WindowLength</i> to be shorter than or equal to the <i>si-Periodicity</i> . The values <i>s2560-v1710</i> and <i>s5120-v1710</i> are only applicable for SCS 480 kHz.                                                                                                                  |
| <b>systemInformationAreaID</b><br>Indicates the system information area that the cell belongs to, if any. Any SIB with <i>areaScope</i> within the SI is considered to belong to this <i>systemInformationAreaID</i> . The <i>systemInformationAreaID</i> is unique within a PLMN/SNPN.                                                                                                                                                                                                  |

| <b>SchedulingInfo2 field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>encrypted</b>                          | The presence of this field indicates that the pos-sib-type is encrypted as specified in TS 37.355 [49].                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>gnss-id</b>                            | The presence of this field indicates that the positioning SIB type is for a specific GNSS. Indicates a specific GNSS (see also TS 37.355 [49]).                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>posSibType</b>                         | The posSIBs as defined in TS 37.355 [49] mapped to SI for scheduling using <i>schedulingInfoList2</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>sbas-id</b>                            | The presence of this field indicates that the positioning SIB type is for a specific SBAS. Indicates a specific SBAS (see also TS 37.355 [49]).                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>si-WindowPosition</b>                  | This field indicates the SI window position of the associated SI-message. The network provides <i>si-WindowPosition</i> in an ascending order, i.e. <i>si-WindowPosition</i> in the subsequent entry in <i>schedulingInfoList2</i> has always value higher than in the previous entry of <i>schedulingInfoList2</i> . The network configures this field in a way that ensures that SI messages scheduled by <i>schedulingInfoList</i> and/or <i>posSchedulingInfoList</i> do not overlap with SI messages scheduled by <i>schedulingInfoList2</i> . |
| <b>sib-MappingInfo</b>                    | Indicates which SIBs or posSIBs are contained in the SI message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>sibType</b>                            | The type of SIB(s) mapped to SI for scheduling using <i>schedulingInfoList2</i> . Value <i>type1</i> indicates SIBs and value <i>type2</i> indicates posSIBs.                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Conditional presence</b> | <b>Explanation</b>                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>GNSS-ID-SBAS</i>         | The field is mandatory present if <i>gnss-id</i> is set to <i>sbas</i> . It is absent otherwise.                                                                                                                                                                                                                                                             |
| <i>MSG-1</i>                | The field is optionally present, Need R, if <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> for any SI-message included in <i>schedulingInfoList</i> or any SI-message containing type1 SIB included in <i>schedulingInfoList2</i> . It is absent otherwise.                                                                                      |
| <i>SIB-TYPE</i>             | The field is mandatory present if the SIB type is different from <i>SIB6</i> , <i>SIB7</i> or <i>SIB8</i> . For <i>SIB6</i> , <i>SIB7</i> and <i>SIB8</i> it is absent.                                                                                                                                                                                      |
| <i>NonPosSIB</i>            | The field is mandatory present if the SIB type is <i>type1</i> . For <i>type2</i> it is absent.                                                                                                                                                                                                                                                              |
| <i>SUL-MSG-1</i>            | The field is optionally present, Need R, if <i>supplementaryUplink</i> is configured in <i>ServingCellConfigCommonSIB</i> and if <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> for any SI-message included in <i>schedulingInfoList</i> or any SI-message containing type1 SIB included in <i>schedulingInfoList2</i> . It is absent otherwise. |
| <i>REDCAP-MSG-1</i>         | The field is optionally present, Need R, if <i>initialUplinkBWP-RedCap</i> is configured in <i>UplinkConfigCommonSIB</i> and if <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> for any SI-message included in <i>schedulingInfoList</i> or any SI-message containing type1 SIB included in <i>schedulingInfoList2</i> . It is absent otherwise.  |

## – SK-Counter

The IE *SK-Counter* is a counter used upon initial configuration of SN security for NR-DC and NE-DC, as well as upon refresh of  $S\text{-}K_{\text{gNB}}$  or  $S\text{-}K_{\text{eNB}}$  based on the current or newly derived  $K_{\text{gNB}}$  during RRC Resume or RRC Reconfiguration, as defined in TS 33.501 [11].

```
-- ASN1START
-- TAG-SKCOUNTER-START
```

```
SK-Counter ::= INTEGER (0..65535)
```

```
-- TAG-SKCOUNTER-STOP
-- ASN1STOP
```

– SlotFormatCombinationsPerCell

The IE *SlotFormatCombinationsPerCell* is used to configure the *SlotFormatCombinations* applicable for one serving cell (see TS 38.213 [13], clause 11.1.1).

**SlotFormatCombinationsPerCell information element**

```
-- ASN1START
-- TAG-SLOTFORMATCOMBINATIONSPERCELL-START

SlotFormatCombinationsPerCell ::= SEQUENCE {
    servingCellId          ServCellIndex,
    subcarrierSpacing      SubcarrierSpacing,
    subcarrierSpacing2     SubcarrierSpacing OPTIONAL, -- Need R
    slotFormatCombinations SEQUENCE (SIZE (1..maxNrofSlotFormatCombinationsPerSet)) OF SlotFormatCombination OPTIONAL, -- Need M
    positionInDCI          INTEGER(0..maxSFI-DCI-PayloadSize-1) OPTIONAL, -- Need M
    ...
    [[
    enableConfiguredUL-r16 ENUMERATED {enabled} OPTIONAL -- Need R
    ]]
}

SlotFormatCombination ::= SEQUENCE {
    slotFormatCombinationId SlotFormatCombinationId,
    slotFormats              SEQUENCE (SIZE (1..maxNrofSlotFormatsPerCombination)) OF INTEGER (0..255)
}

SlotFormatCombinationId ::= INTEGER (0..maxNrofSlotFormatCombinationsPerSet-1)

-- TAG-SLOTFORMATCOMBINATIONSPERCELL-STOP
-- ASN1STOP
```

| SlotFormatCombination field descriptions                                                                                                                                             |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>slotFormatCombinationId</b><br>This ID is used in the DCI payload to dynamically select this <i>SlotFormatCombination</i> (see TS 38.213 [13], clause 11.1.1).                    |
| <b>slotFormats</b><br>Slot formats that occur in consecutive slots in time domain order as listed here (see TS 38.213 [13], clause 11.1.1 and TS 38.213 [13], clause 14 for IAB-MT). |

| <i>SlotFormatCombinationsPerCell</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>enableConfiguredUL</i></b><br>If configured, the UE is allowed to transmit uplink signals/channels (SRS, PUCCH, CG-PUSCH) in the set of symbols of the slot when the UE does not detect a DCI format 2_0 providing a slot format for the set of symbols (see TS 38.213 [13], 11.1.1). This field is applicable only if <i>cg-RetransmissionTimer-r16</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>positionInDCI</i></b><br>The (starting) position (bit) of the slotFormatCombinationId (SFI-Index) for this serving cell (servingCellId) within the DCI payload (see TS 38.213 [13], clause 11.1.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>servingCellId</i></b><br>The ID of the serving cell for which the slotFormatCombinations are applicable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>slotFormatCombinations</i></b><br>A list with <i>SlotFormatCombinations</i> . Each <i>SlotFormatCombination</i> comprises of one or more <i>SlotFormats</i> (see TS 38.211 [16], clause 4.3.2). The total number of <i>slotFormats</i> in the <i>slotFormatCombinations</i> list does not exceed 512.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>subcarrierSpacing2</i></b><br>Reference subcarrier spacing for a Slot Format Combination on an FDD or SUL cell (see TS 38.213 [13], clause 11.1.1). For FDD, subcarrierSpacing (SFI-scs) is the reference SCS for DL BWP and subcarrierSpacing2 (SFI-scs2) is the reference SCS for UL BWP. For SUL, <i>subcarrierSpacing</i> (SFI-scs) is the reference SCS for non-SUL carrier and <i>subcarrierSpacing2</i> (SFI-scs2) is the reference SCS for SUL carrier. The network configures a value that is smaller than or equal to any SCS of configured BWPs of the serving cell that the command applies to. And the network configures a value that is smaller than or equal to the SCS of the serving cell which the UE monitors for SFI indications. |
| <b><i>subcarrierSpacing</i></b><br>Reference subcarrier spacing for this Slot Format Combination. The network configures a value that is smaller than or equal to any SCS of configured BWPs of the serving cell that the command applies to. And the network configures a value that is smaller than or equal to the SCS of the serving cell which the UE monitors for SFI indications (see TS 38.213 [13], clause 11.1.1).                                                                                                                                                                                                                                                                                                                                 |

## – *SlotFormatIndicator*

The IE *SlotFormatIndicator* is used to configure monitoring a Group-Common-PDCCH for Slot-Format-Indicators (SFI).

If not configured, the UE uses the slot format indicator (SFI), if available, to determine the channel occupancy duration (see TS 38.213 [13], clause 11.1.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>co-DurationsPerCellToReleaseList</b><br>A list of <i>CO-DurationsPerCell</i> objects to be released. An entry created using <i>co-DurationsPerCellToAddModList-r16</i> or <i>co-DurationsPerCellToAddModList-r17</i> can be deleted using <i>co-DurationsPerCellToReleaseList</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>dci-PayloadSize</b><br>Total length of the DCI payload scrambled with SFI-RNTI (see TS 38.213 [13], clause 11.1.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>sfi-RNTI</b><br>RNTI used for SFI on the given cell (see TS 38.213 [13], clause 11.1.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>slotFormatCombToAddModList</b><br>A list of <i>SlotFormatCombinations</i> for the UE's serving cells (see TS 38.213 [13], clause 11.1.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>switchTriggerToAddModList, switchTriggerToAddModListSizeExt</b><br>A list of <i>SearchSpaceSwitchTrigger</i> objects. Each <i>SearchSpaceSwitchTrigger</i> object provides position in DCI of the bit field indicating search space switching flag for a serving cell or, if <i>cellGroupsForSwitchList</i> is configured, group of serving cells (see TS 38.213 [13], clause 10.4). If <i>cellGroupsForSwitchList</i> is configured, only one of the cells belonging to the same cell group is added/modified, and the configuration applies to all cells belonging to the <i>cellGroupsForSwitchList</i> (see TS 38.213 [13], clause 10.4). The network configures more than 4 <i>SearchSpaceSwitchTrigger</i> objects only if <i>cellGroupsForSwitchList</i> is not configured. The UE shall consider entries in <i>switchTriggerToAddModList</i> and in <i>switchTriggerToAddModListSizeExt</i> as a single list, i.e. an entry created using <i>switchTriggerToAddModList</i> can be modified using <i>switchTriggerToAddModListSizeExt</i> and vice-versa. |
| <b>switchTriggerToReleaseModList, switchTriggerToReleaseListSizeExt</b><br>A list of <i>SearchSpaceSwitchTriggers</i> to be released. If <i>cellGroupsForSwitchList</i> is configured, the <i>SearchSpaceSwitchTrigger</i> is released for all serving cells belonging to the same <i>CellGroupForSwitch</i> . The UE shall consider entries in <i>switchTriggerToReleaseList</i> and in <i>switchTriggerToReleaseListSizeExt</i> as a single list, i.e. an entry created using <i>switchTriggerToAddModList</i> or <i>switchTriggerToAddModListSizeExt</i> can be deleted using <i>switchTriggerToReleaseList</i> or <i>switchTriggerToReleaseListSizeExt</i> .                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>AvailableRB-SetsPerCell</b> field descriptions                                                                                                                                |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>positionInDCI</b><br>The (starting) position of the bits within DCI payload indicating the availability of the RB sets of a serving cell (see TS 38.213 [13], clause 11.1.1). |
| <b>servingCellId</b><br>The ID of the serving cell for which the configuration is applicable.                                                                                    |

| CO-DurationsPerCell field descriptions                                                                                                                                                                                                                                                                                                   |

| <b>positionInDCI</b><br>Position in DCI of the bit field indicating Channel Occupancy duration for UE's serving cells (see TS 38.213 [13], clause 11.1.1).                                                                                                                                                                               |
| <b>servingCellId</b><br>The ID of the serving cell for which the configuration is applicable.                                                                                                                                                                                                                                            |
| <b>subcarrierSpacing</b><br>Reference subcarrier spacing for the list of Channel Occupancy durations (see TS 38.213 [13], clause 11.1.1).<br>Only the following values are applicable depending on the used frequency range:<br>FR1: 15, 30, or 60 kHz<br>FR2-2: 120, 480, or 960 kHz                                                    |

| SearchSpaceSwitchTrigger field descriptions                                                                                                                                                                      |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>positionInDCI</b><br>The position of the bit within DCI payload containing a search space switching flag (see TS 38.213 [13], clause 11.1.1).                                                                 |
| <b>servingCellId</b><br>The ID of the serving cell for which the configuration is applicable or the group of serving cells as indicated by <i>CellGroupsForSwitch-r16</i> containing this <i>servingCellId</i> . |

— S-NSSAI

The IE *S-NSSAI* (*Single Network Slice Selection Assistance Information*) identifies a Network Slice end to end and comprises a slice/service type and a slice differentiator, see TS 23.003 [21].

S-NSSAI information element

```
-- ASN1START
-- TAG-S-NSSAI-START

S-NSSAI ::=
    CHOICE{
        sst          BIT STRING (SIZE (8)),
        sst-SD       BIT STRING (SIZE (32))
    }

-- TAG-S-NSSAI-STOP
-- ASN1STOP
```

| S-NSSAI field descriptions                                                                                            |
|-----------------------------------------------------------------------------------------------------------------------|
| <b>sst</b><br>Indicates the S-NSSAI consisting of Slice/Service Type, see TS 23.003 [21].                             |
| <b>sst-SD</b><br>Indicates the S-NSSAI consisting of Slice/Service Type and Slice Differentiator, see TS 23.003 [21]. |

– *SpeedStateScaleFactors*

The IE *SpeedStateScaleFactors* concerns factors, to be applied when the UE is in medium or high speed state, used for scaling a mobility control related parameter.

*SpeedStateScaleFactors* information element

```
-- ASN1START
-- TAG-SPEEDSTATESCALEFACTORS-START

SpeedStateScaleFactors ::=
    sf-Medium
    sf-High
}
-- TAG-SPEEDSTATESCALEFACTORS-STOP
-- ASN1STOP
```

| <b>harq-CodebookID</b>               | Indicates the HARQ-ACK codebook index for the corresponding HARQ-ACK codebook for SPS PDSCH and ACK for SPS PDSCH release.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>harq-ProcID-Offset</b>            | Indicates the offset used in deriving the HARQ process IDs, see TS 38.321 [3], clause 5.3.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>mcs-Table</b>                     | Indicates the MCS table the UE shall use for DL SPS (see TS 38.214 [19], clause 5.1.3.1. If present, the UE shall use the MCS table of low-SE 64QAM table indicated in Table 5.1.3.1-3 of TS 38.214 [19]. If this field is absent and field mcs-table in PDSCH-Config is set to 'qam256' and the activating DCI is of format 1_1, the UE applies the 256QAM table indicated in Table 5.1.3.1-2 of TS 38.214 [19]. If this field is absent and the field <i>mcs-Table-r17</i> in <i>PDSCH-Config</i> is set to 'qam1024' and the activating DCI is format 1_1, the UE applies the 1024QAM table indicated in Table 5.1.3.1-4 of TS 38.214 [19]. Otherwise, the UE applies the non-low-SE 64QAM table indicated in Table 5.1.3.1-1 of TS 38.214 [19].                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>n1PUCCH-AN</b>                    | HARQ resource for PUCCH for DL SPS. The network configures the resource either as format0 or format1. The actual <i>PUCCH-Resource</i> is configured in <i>PUCCH-Config</i> and referred to by its ID. See TS 38.213 [13], clause 9.2.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>n1PUCCH-AN-PUCCHsSCell</b>        | HARQ resource for PUCCH on PUCCH switching SCell (sSCell) for DL SPS. The network configures the resource either as format 0 or format 1. The actual PUCCH-Resource is configured in PUCCH-Config of the PUCCH sSCell and referred to by its ID. See TS 38.213 [13], clause 9.2.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>nrofHARQ-Processes</b>            | Number of configured HARQ processes for SPS DL (see TS 38.321 [3], clause 5.8.1). If UE is configured with <i>nrofHARQ-Processes-v1710</i> UE shall ignore <i>nrofHARQ-Processes</i> (without suffix).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>pdsch-AggregationFactor</b>       | Number of repetitions for SPS PDSCH (see TS 38.214 [19], clause 5.1.2.1). When the field is absent, the UE applies the value 1 for MBS multicast data and the <i>pdsch-AggregationFactor</i> in <i>pdsch-Config</i> for other data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>periodicity</b>                   | Periodicity for DL SPS (see TS 38.214 [19] and TS 38.321 [3], clause 5.8.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>periodicityExt</b>                | This field is used to calculate the periodicity for DL SPS (see TS 38.214 [19] and see TS 38.321 [3], clause 5.8.1). If this field is present, the field <i>periodicity</i> is ignored. The following periodicities are supported depending on the configured subcarrier spacing [ms]:<br>15 kHz: $periodicityExt$ , where <i>periodicityExt</i> has a value between 1 and 640.<br>30 kHz: $0.5 \times periodicityExt$ , where <i>periodicityExt</i> has a value between 1 and 1280.<br>60 kHz with normal CP: $0.25 \times periodicityExt$ , where <i>periodicityExt</i> has a value between 1 and 2560.<br>60 kHz with ECP: $0.25 \times periodicityExt$ , where <i>periodicityExt</i> has a value between 1 and 2560.<br>120 kHz: $0.125 \times periodicityExt$ , where <i>periodicityExt</i> has a value between 1 and 5120.<br>480 kHz: $0.03125 \times periodicityExt$ , where <i>periodicityExt</i> has a value between 1 and 20480.<br>960 kHz: $0.015625 \times periodicityExt$ , where <i>periodicityExt</i> has a value between 1 and 40960.<br><i>periodicityExt-r17</i> is only applicable for SCS 480 kHz and 960 kHz. |
