| <b><i>ehc-Uplink</i></b><br>Indicates the configurations that apply for only uplink. If the field is configured, then Ethernet header compression is configured for uplink. Otherwise, it is not configured for uplink.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>maxCID-EHC-UL</i></b><br>Indicates the value of the MAX_CID_EHC_UL parameter as specified in TS 38.323 [5]. The total value of MAX_CID_EHC_UL across all bearers for the UE should be less than or equal to the value of <i>maxNumberEHC-Contexts</i> parameter as indicated by the UE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <i>UplinkDataCompression field descriptions</i> |                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bufferSize</b>                               | This field indicates the buffer size applied for UDC as specified in TS 38.323 [5]. Value <i>kbyte2</i> means 2048 bytes, <i>kbyte4</i> means 4096 bytes and so on.                                                                                                                                                                        |
| <b>dictionary</b>                               | This field indicates which pre-defined dictionary is used for UDC as specified in TS 38.323 [5]. The value <i>sip-SDP</i> means that UE shall prefill the buffer with standard dictionary for SIP and SDP defined in TS 38.323 [5], and the value <i>operator</i> means that UE shall prefill the buffer with operator-defined dictionary. |

| Conditional presence      | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>DRB</i>                | This field is mandatory present when the corresponding DRB/multicast MRB is being set up, absent for SRBs. Otherwise this field is optionally present, need M.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <i>DRB2</i>               | This field is optionally present in case of DRB, need M. Otherwise, it is absent for SRBs and MRBs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <i>Drb-Duplication</i>    | For SRBs, this field is absent. For DRBs, this field is absent if duplication is not configured. Otherwise, this field is optional, need R.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <i>MoreThanOneRLC</i>     | This field is mandatory present upon RRC reconfiguration with setup of a PDCP entity for a radio bearer (except for multicast MRB) with more than one associated logical channel and upon RRC reconfiguration with the association of additional logical channels to the PDCP entity.<br>The field is also mandatory present in case the field <i>moreThanTwoRLC-DRB</i> is included in <i>PDCP-Config</i> .<br>Upon RRC reconfiguration when a PDCP entity is associated with multiple logical channels, this field is optionally present need M. Otherwise, this field is absent. Need R. |
| <i>MoreThanTwoRLC-DRB</i> | For SRBs, this field is absent.<br>For DRBs, this field is mandatory present upon RRC reconfiguration with setup of a PDCP entity for a radio bearer with more than two associated logical channels and upon RRC reconfiguration with the association of one or more additional logical channel(s) to the PDCP entity so that the PDCP entity has more than two associated logical channels.<br>Upon RRC reconfiguration when a PDCP entity is associated with more than two logical channels, this field is optionally present, Need M. Otherwise, the field is absent, Need R.            |
| <i>Rlc-AM</i>             | For RLC AM, the field is optionally present, need M. Otherwise, the field is absent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <i>Rlc-AM-UM</i>          | In case of DRB, for RLC UM (if the UE supports DAPS handover) or RLC AM, the field is optionally present, need R. In case of multicast MRB, if multicast MRB is associated with at least one RLC AM entity, the field is optionally present, need R. Otherwise, the field is absent.                                                                                                                                                                                                                                                                                                        |
| <i>Setup</i>              | The field is mandatory present in case of DRB setup. Otherwise the field is optionally present, need M.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <i>SplitBearer</i>        | The field is absent for SRBs. Otherwise, the field is optional present, need M, in case of radio bearer with more than one associated RLC mapped to different cell groups.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <i>SplitBearer2</i>       | The field is mandatory present, in case of a split bearer except MP split bearer with primary path on direct path. Otherwise the field is absent.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <i>SplitBearerMP</i>      | The field is absent for SRBs. Otherwise, the field is optionally present, need R, when MP is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <i>ConnectedTo5GC</i>     | The field is optionally present, need R, if the UE is connected to 5GC. Otherwise the field is absent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <i>ConnectedTo5GC1</i>    | The field is optionally present, need R, if the UE is connected to NR/5GC or if the UE supports user plane integrity protection when connected to E-UTRA/EPC (as specified in TS 33.401 [30]). | <b>antennaPortsFieldPresenceDCI-1-2</b><br>Configure the presence of "Antenna ports" field in DCI format 1_2. When the field is configured, then the "Antenna ports" field is present in DCI format 1_2. Otherwise, the field size is set to 0 for DCI format 1_2 (See TS 38.212 [17], clause 7.3.1.1.3). If neither <i>dmrs-DownlinkForPDSCH-MappingTypeA-DCI-1-2</i> nor <i>dmrs-DownlinkForPDSCH-MappingTypeB-DCI-1-2</i> is configured, this field is absent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>aperiodic-ZP-CSI-RS-ResourceSetsToAddModList, aperiodic-ZP-CSI-RS-ResourceSetsToAddModListDCI-1-2</b><br>AddMod/Release lists for configuring aperiodically triggered zero-power CSI-RS resource sets. Each set contains a <i>ZP-CSI-RS-ResourceSetId</i> and the IDs of one or more <i>ZP-CSI-RS-Resources</i> (the actual resources are defined in the <i>zp-CSI-RS-ResourceToAddModList</i> ). The network configures the UE with at most 3 aperiodic <i>ZP-CSI-RS-ResourceSets</i> and it uses only the <i>ZP-CSI-RS-ResourceSetId</i> 1 to 3. The network triggers a set by indicating its <i>ZP-CSI-RS-ResourceSetId</i> in the DCI payload. The DCI codepoint '01' triggers the resource set with <i>ZP-CSI-RS-ResourceSetId</i> 1, the DCI codepoint '10' triggers the resource set with <i>ZP-CSI-RS-ResourceSetId</i> 2, and the DCI codepoint '11' triggers the resource set with <i>ZP-CSI-RS-ResourceSetId</i> 3 (see TS 38.214 [19], clause 5.1.4.2). The field <i>aperiodic-ZP-CSI-RS-ResourceSetsToAddModList</i> applies to DCI format 1_1 and the field <i>aperiodic-ZP-CSI-RS-ResourceSetsToAddModListDCI-1-2</i> applies to DCI format 1_2 (see TS 38.214 [19], clause 5.1.4.2 and TS 38.212 [17] clause 7.3.1). |
| <b>beamAppTime</b><br>Indicates the first slot to apply the unified TCI indicated by DCI as specified in TS 38.214 Clause 5.1.5. The value n1 means 1 symbol, n2 two symbols and so on. The first slot is at least Y symbols indicated by beamAppTime parameter after the last symbol of the acknowledgment of the joint or separate DL/UL beam indication. The same value shall be configured for all serving cells in any one of the <i>simultaneousU-TCI-UpdateListN</i> configured in IE <i>CellGroupConfig</i> based on the smallest SCS of the active BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>dataScramblingIdentityPDSCH, dataScramblingIdentityPDSCH2</b><br>Identifier(s) used to initialize data scrambling (c_init) for PDSCH as specified in TS 38.211 [16], clause 7.3.1.1. The <i>dataScramblingIdentityPDSCH2</i> is configured if <i>coresetPoolIndex</i> is configured with 1 for at least one CORESET in the same BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <p><b>maxMIMO-Layers</b><br/>Indicates the maximum number of MIMO layers to be used for PDSCH in this DL BWP. If not configured, the UE uses the <i>maxMIMO-Layers</i> configuration in IE <i>PDSCH-ServingCellConfig</i> of the serving cell to which this BWP belongs, when the UE operates in this BWP. The value of <i>maxMIMO-Layers</i> for a DL BWP shall be smaller than or equal to the value of <i>maxMIMO-Layers</i> configured in IE <i>PDSCH-ServingCellConfig</i> of the serving cell to which this BWP belongs.<br/>For MBS multicast, indicates the maximum number of MIMO layers to be used for group-common PDSCH of MBS multicast in this CFR. If not configured for CFR, the UE applies value 1. The value of <i>maxMIMO-Layers</i> for a CFR shall be smaller than or equal to the value of <i>maxMIMO-Layers</i> configured in <i>PDSCH-ServingCellConfig</i> IE of the serving cell to which this CFR belongs.</p>           |
| <p><b>maxNrofCodeWordsScheduledByDCI</b><br/>Maximum number of code words that a single DCI may schedule. This changes the number of MCS/RV/NDI bits in the DCI message from 1 to 2.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <p><b>mcs-Table</b><br/>Indicates which MCS table the UE shall use for PDSCH for DCI formats 1_0, 1_1 and 1_3 (see TS 38.214 [19], clause 5.1.3.1). If all fields are absent the UE applies the value 64QAM. If the field <i>mcs-Table-r17</i> is present for DCI formats 1_1 and 1_3, the network does not configure the field <i>mcs-Table</i> (without suffix). For an (e)RedCap UE, the 256QAM MCS table for PDSCH is only supported if the UE indicates support of 256QAM for PDSCH.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <p><b>mcs-TableDCI-1-2</b><br/>Indicates which MCS table the UE shall use for PDSCH for DCI format 1_2 (see TS 38.214 [19], clause 5.1.3.1). If all fields are absent the UE applies the value 64QAM. If the field <i>mcs-TableDCI-1-2-r17</i> is present, the network does not configure the field <i>mcs-TableDCI-1-2-r16</i>. For an (e)RedCap UE, the 256QAM MCS table for PDSCH is only supported if the UE indicates support of 256QAM for PDSCH.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <p><b>minimumSchedulingOffsetK0</b><br/>List of minimum K0 values. Minimum K0 parameter denotes minimum applicable value(s) for the TDRA table for PDSCH and for A-CSI RS triggering Offset(s) (see TS 38.214 [19], clause 5.3.1).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <p><b>numberOfBitsForRV-DCI-1-2</b><br/>Configures the number of bits for "Redundancy version" in the DCI format 1_2 (see TS 38.212 [17], clause 7.3.1 and TS 38.214 [19], clause 5.1.2.1).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <p><b>pdsch-AggregationFactor</b><br/>Number of repetitions for data (see TS 38.214 [19], clause 5.1.2.1). When the field is absent in <i>PDSCH-Config</i> which is not used for MBS CFR, the UE applies the value 1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

These patterns can be activated dynamically by DCI (see TS 38.214 [19], clause 5.1.4.1). The field <i>rateMatchPatternGroup1</i> applies to DCI formats 1_1 and 1_3, and the field <i>rateMatchPatternGroup1DCI-1-2</i> applies to DCI format 1_2 (see TS 38.214 [19], clause 5.1.4.1).</p>                                                                                                                                                           |
| <p><b>rateMatchPatternGroup2, rateMatchPatternGroup2DCI-1-2</b><br/>The IDs of a second group of <i>RateMatchPatterns</i> defined in <i>PDSCH-Config-&gt;rateMatchPatternToAddModList</i> (BWP level) or in <i>ServingCellConfig-&gt;rateMatchPatternToAddModList</i> (cell level). These patterns can be activated dynamically by DCI (see TS 38.214 [19], clause 5.1.4.1). The field <i>rateMatchPatternGroup2</i> applies to DCI formats 1_1 and 1_3, and the field <i>rateMatchPatternGroup2DCI-1-2</i> applies to DCI format 1_2 (see TS 38.214 [19], clause 5.1.4.1).</p>                                                                                                                                                          |
| <p><b>rateMatchPatternToAddModList</b><br/>Resources patterns which the UE should rate match PDSCH around. The UE rate matches around the union of all resources indicated in the rate match patterns (see TS 38.214 [19], clause 5.1.4.1). If a <i>RateMatchPattern</i> with the same <i>RateMatchPatternId</i> is configured in both MBS CFR and its associated BWP, the entire <i>RateMatchPattern</i> configuration, including the set of RBs/REs indicated by the patterns for the rate matching around, shall be the same and they are counted as a single rate match pattern in the total configured rate match patterns as defined in TS 38.214 [19].</p>                                                                        |
| <p><b>rbg-Size</b><br/>Selection between config 1 and config 2 for RBG size for PDSCH except PDSCH scheduled by DCI format 1_3. The UE ignores this field if <i>resourceAllocation</i> is set to <i>resourceAllocationType1</i> (see TS 38.214 [19], clause 5.1.2.2.1).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <p><b>referenceOfSLIVDCI-1-2</b><br/>Enable using the starting symbol of the PDCCH monitoring occasion in which the DL assignment is detected as the reference of the SLIV for DCI format 1_2. When the RRC parameter enables the utilization of the new reference, the new reference is applied for TDRA entries with K0=0. For other entries (if any) in the same TDRA table, the reference is slot boundary as in Rel-15. PDSCH mapping type A is not supported with the new reference. The new reference of SLIV is not configured for a serving cell configured to be scheduled by cross-carrier scheduling on a scheduling cell with different numerology (see TS 38.212 [17] clause 7.3.1 and TS 38.214 [19] clause 5.1.2.1).</p> |
| <p><b>repetitionSchemeConfig</b><br/>Configure the UE with repetition schemes. The network does not configure <i>repetitionSchemeConfig-r16</i> and <i>repetitionSchemeConfig-v1630</i> simultaneously to <i>setup</i> in the same <i>PDSCH-Config</i>. The network does not configure this parameter and <i>sfnSchemePDSCH</i> in <i>MIMOParam-r17</i> simultaneously in the same serving cell.</p>                                                                                                                                                                                                                                                                                                                                     |
| <p><b>resourceAllocation, resourceAllocationDCI-1-2</b><br/>Configuration of resource allocation type 0 and resource allocation type 1 for non-fallback DCI (see TS 38.214 [19], clause 5.1.2.2). The field <i>resourceAllocation</i> applies to DCI format 1_1, and the field <i>resourceAllocationDCI-1-2</i> applies to DCI format 1_2 (see TS 38.214 [19], clause 5.1.2.2).</p>                                                                                                                                                                                                                                                                                                                                                      |
| <p><b>resourceAllocationType1GranularityDCI-1-2</b><br/>Configure the scheduling granularity applicable for both the starting point and length indication for resource allocation type 1 in DCI format 1_2. If this field is absent, the granularity is 1 PRB (see TS 38.214 [19], clause 5.1.2.2.2).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <p><b>sizeDCI-4-2</b><br/>Indicates the size of DCI format 4-2 (see TS 38.213 [13], clause 10.1).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <p><b>sp-ZP-CSI-RS-ResourceSetsToAddModList</b><br/>AddMod/Release lists for configuring semi-persistent zero-power CSI-RS resource sets. Each set contains a <i>ZP-CSI-RS-ResourceSetId</i> and the IDs of one or more <i>ZP-CSI-RS-Resources</i> (the actual resources are defined in the <i>zp-CSI-RS-ResourceToAddModList</i>) (see TS 38.214 [19], clause 5.1.4.2).</p>                                                                                                                                                                                                                                                                                                                                                             |

|                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>tcI-StatesToAddModList</i></b>                                                                                                                                                                                                                                                                                                                                                             |
| A list of Transmission Configuration Indicator (TCI) states indicating a transmission configuration which includes QCL-relationships between the DL RSs in one RS set and the PDSCH DMRS ports (see TS 38.214 [19], clause 5.1.5). If <i>unifiedTCI-StateType</i> is configured for the serving cell, no element in this list is configured.                                                     |
| <b><i>unifiedTCI-StateRef</i></b>                                                                                                                                                                                                                                                                                                                                                                |
| Provides the serving cell and BWP where the configuration for <i>dl-OrJointTCI-StateToAddModList-r17</i> are defined. When this field is present, <i>dl-OrJointTCI-StateToAddModList</i> and <i>dl-OrJointTCI-StateToReleaseList</i> are not present. The value of <i>unifiedTCI-StateType</i> of current serving cell is the same in the serving cell indicated by <i>unifiedTCI-StateRef</i> . |
| <b><i>vrB-ToPRB-Interleaver, vrB-ToPRB-InterleaverDCI-1-2</i></b>                                                                                                                                                                                                                                                                                                                                |
| Interleaving unit configurable between 2 and 4 PRBs (see TS 38.211 [16], clause 7.3.1.6). When the field is absent, the UE performs non-interleaved VRB-to-PRB mapping.                                                                                                                                                                                                                          |
| <b><i>xOverheadMulticast</i></b>                                                                                                                                                                                                                                                                                                                                                                 |
| Accounts for an overhead from CSI-RS, CORESET etc. If the field is absent, the UE applies value xOh0 (see TS 38.214 [19]).                                                                                                                                                                                                                                                                       |
| <b><i>zp-CSI-RS-ResourceToAddModList</i></b>                                                                                                                                                                                                                                                                                                                                                     |
| A list of Zero-Power (ZP) CSI-RS resources used for PDSCH rate-matching. Each resource in this list may be referred to from only one type of resource set, i.e., aperiodic, semi-persistent or periodic (see TS 38.214 [19]).                                                                                                                                                                    |

|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>codeBlockGroupTransmission</i></b><br>Enables and configures code-block-group (CBG) based transmission (see TS 38.213 [13], clause 9.1.1). Network does not configure for a UE both spatial bundling of HARQ ACKs and <i>codeBlockGroupTransmission</i> within the same cell group.<br>The network does not configure this field if<br>- the SCS of at least one DL BWP configured in the cell is 480 or 960 kHz<br>- Type-1 HARQ-ACK codebook is configured and <i>pdsch-TimeDomainAllocationListForMultiPDSCH-r17</i> for this serving cell contains pdsch-AllocationList with multiple entries (multiple PDSCH)<br>- Type-2 HARQ-ACK codebook is configured and <i>pdsch-TimeDomainAllocationListForMultiPDSCH-r17</i> for any cell in the same PUCCH cell group associated with this serving cell contains pdsch-AllocationList with multiple entries (multiple PDSCH) |
| <b><i>downlinkHARQ-FeedbackDisabled</i></b><br>Used to disable the DL HARQ feedback, sent in the uplink, per HARQ process ID. The first/leftmost bit corresponds to HARQ process ID 0, the next bit to HARQ process ID 1 and so on. Bits corresponding to HARQ process IDs that are not configured shall be ignored. The bit(s) set to one identify HARQ processes with disabled DL HARQ feedback and the bit(s) set to zero identify HARQ processes with enabled DL HARQ feedback.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>maxMIMO-Layers</i></b><br>Indicates the maximum number of MIMO layers to be used for PDSCH in all BWPs of this serving cell. (see TS 38.212 [17], clause 5.4.2.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>nrofHARQ-ProcessesForPDSCH</i></b><br>The number of HARQ processes to be used on the PDSCH of a serving cell. Value <i>n2</i> corresponds to 2 HARQ processes, value <i>n4</i> to 4 HARQ processes, and so on. If both <i>nrofHARQ-ProcessesForPDSCH</i> and <i>nrofHARQ-ProcessesForPDSCH-v1700</i> are absent, the UE uses 8 HARQ processes (see TS 38.214 [19], clause 5.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>pdsch-CodeBlockGroupTransmissionList</i></b><br>A list of configurations for up to two simultaneously constructed HARQ-ACK codebooks (see TS 38.213 [13], clause 9.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>processingType2Enabled</i></b><br>Enables configuration of advanced processing time capability 2 for PDSCH (see 38.214 [19], clause 5.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>pucch-Cell</i></b><br>The ID of the serving cell (of the same cell group) to use for PUCCH. If the field is absent, the UE sends the HARQ feedback on the PUCCH of the SpCell of this cell group, or on this serving cell if it is a PUCCH SCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>xOverhead</i></b><br>Accounts for overhead from CSI-RS, CORESET, etc. If the field is absent, the UE applies value xOh0 (see TS 38.214 [19], clause 5.1.3.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Conditional Presence</b> | <b>Explanation</b>                                                                                                                                                                                               |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>SCellAddOnly</i>         | It is optionally present, Need S, for (non-PUCCH) SCells when adding a new SCell. The field is absent, Need M, when reconfiguring SCells. The field is also absent for the SpCells as well as for a PUCCH SCell. |

## – *PDSCH-TimeDomainResourceAllocationList*

The IE *PDSCH-TimeDomainResourceAllocation* is used to configure a time domain relation between PDCCH and PDSCH. The *PDSCH-TimeDomainResourceAllocationList* contains one or more of such *PDSCH-TimeDomainResourceAllocations*. The network indicates in the DL assignment which of the configured time domain allocations the UE shall apply for that DL assignment. The UE determines the bit width of the DCI field based on the number of entries in the *PDSCH-TimeDomainResourceAllocationList*. Value 0 in the DCI field refers to the first element in this list, value 1 in the DCI field refers to the second element in this list, and so on.

| <b><i>ackNackFeedbackMode</i></b><br>Indicates which among the joint and separate ACK/NACK feedback modes to use within a slot as specified in TS 38.213 [13] (clause 9).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>bdFactorR</i></b><br>Parameter for determining and distributing the maximum numbers of BD/CCE for mPDCCH based mPDSCH transmission as specified in TS 38.213 [13] Clause 10.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>cs-RNTI</i></b><br>RNTI value for downlink SPS (see <i>SPS-Config</i> ) and uplink configured grant (see <i>ConfiguredGrantConfig</i> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>downlinkAssignmentIndexDCI-0-2</i></b><br>Indicates if "Downlink assignment index" is present or absent in DCI format 0_2. If the field " <i>downlinkAssignmentIndexDCI-0-2</i> " is absent, then 0 bit for "Downlink assignment index" in DCI format 0_2. If the field " <i>downlinkAssignmentIndexDCI-0-2</i> " is present, then the bitwidth of "Downlink assignment index" in DCI format 0_2 is defined in the same way as that in DCI format 0_1 (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 9.1).                                                                                                                                                                                                        |
| <b><i>downlinkAssignmentIndexDCI-1-2</i></b><br>Configures the number of bits for "Downlink assignment index" in DCI format 1_2. If the field is absent, then 0 bit is applied for "Downlink assignment index" in DCI format 1_2. Note that 1 bit and 2 bits are applied if only one serving cell is configured in the DL and <i>pdsch-HARQ-ACK-Codebook</i> is set to <i>dynamic</i> . 4 bits is applied if more than one serving cell are configured in the DL and <i>pdsch-HARQ-ACK-Codebook</i> is set to <i>dynamic</i> (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 9.1).                                                                                                                                       |
| <b><i>enableDiffCB-Size</i></b><br>This field indicates whether a different codebook size from the size determined based on HARQ-ACK information associated with PDSCH reception(s) scheduled before a UL grant, is determined or not to include HARQ-ACK information associated with PDSCH reception(s) scheduled after a UL grant scheduling a PUSCH transmission with repetitions and the HARQ-ACK information are multiplexed on a repetition of the PUSCH transmission other than a first repetition. If enabled, a different HARQ codebook size might be determined. See clause 9 in TS 38.213 [13].                                                                                                                            |
| <b><i>enableDiffPUCCH-Resource</i></b><br>This field indicates whether a different PUCCH resource in time domain in a slot from the PUCCH resource indicated by the last DCI format before a UL grant in the slot, is determined or not to include HARQ-ACK information associated with PDSCH reception(s) scheduled after a UL grant scheduling a PUSCH transmission with repetitions and the HARQ-ACK information are multiplexed on a repetition of the PUSCH transmission other than a first repetition in the same slot. If enabled, a different PUCCH resource in time domain might be determined. See clause 9 in TS 38.213 [13].                                                                                              |
| <b><i>enableType1HARQ-ACK-MuxForDL-AssignmentAfterUL-Grant</i></b><br>If enabled, UE multiplexes Type-1 HARQ-ACK codebook on a repetition of a PUSCH transmission other than a first repetition, where the HARQ-ACK codebook includes HARQ-ACK information associated with PDSCH reception(s) scheduled after the UL grant scheduling the PUSCH transmission. See clause 9 in TS 38.213 [13]. This feature is not simultaneously enabled with PUCCH cell switching.                                                                                                                                                                                                                                                                   |
| <b><i>enableType2HARQ-ACK-MuxForDL-AssignmentAfterUL-Grant</i></b><br>If enabled, UE multiplexes Type-2 HARQ-ACK codebook on a repetition of a PUSCH transmission other than a first repetition, where the HARQ-ACK codebook includes HARQ-ACK information associated with PDSCH reception(s) scheduled after the UL grant scheduling the PUSCH transmission. See clause 9 in TS 38.213 [13]. This feature is not simultaneously enabled with PUCCH cell switching.                                                                                                                                                                                                                                                                   |
| <b><i>enableType3HARQ-ACK-MuxForDL-AssignmentAfterUL-Grant</i></b><br>If enabled, UE multiplexes Type-3 HARQ-ACK codebook on a repetition of a PUSCH transmission other than a first repetition, where the HARQ-ACK codebook includes HARQ-ACK information associated with PDSCH reception(s) scheduled after the UL grant scheduling the PUSCH transmission. See clause 9 in TS 38.213 [13]. This feature is not simultaneously enabled with PUCCH cell switching.                                                                                                                                                                                                                                                                   |
| <b><i>harq-ACK-SpatialBundlingPUCCH</i></b><br>Enables spatial bundling of HARQ ACKs. It is configured per cell group (i.e. for all the cells within the cell group) for PUCCH reporting of HARQ-ACK. It is only applicable when more than 4 layers are possible to schedule. When the field is absent, the spatial bundling of PUCCH HARQ ACKs for the primary PUCCH group is disabled (see TS 38.213 [13], clause 9.1.2.1). If the field <i>harq-ACK-SpatialBundlingPUCCH-secondaryPUCCHgroup</i> is present, <i>harq-ACK-SpatialBundlingPUCCH</i> is only applied to primary PUCCH group. Network does not configure for a UE both spatial bundling of HARQ ACKs and <i>codeBlockGroupTransmission</i> within the same cell group. |
| <b><i>harq-ACK-SpatialBundlingPUCCH-secondaryPUCCHgroup</i></b><br>Indicates whether spatial bundling of PUCCH HARQ ACKs for the secondary PUCCH group is enabled or disabled. The field is only applicable when more than 4 layers are possible to schedule (see TS 38.213 [13], clause 9.1.2.1). When the field is absent, the use of spatial bundling of PUCCH HARQ ACKs for the secondary PUCCH group is indicated by <i>harq-ACK-SpatialBundlingPUCCH</i> . See TS 38.213 [13], clause 9.1.2.1. Network does not configure for a UE both spatial bundling of HARQ ACKs and <i>codeBlockGroupTransmission</i> within the same cell group.                                                                                         |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>harq-ACK-SpatialBundlingPUSCH</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Enables spatial bundling of HARQ ACKs. It is configured per cell group (i.e. for all the cells within the cell group) for PUSCH reporting of HARQ-ACK. It is only applicable when more than 4 layers are possible to schedule. When the field is absent, the spatial bundling of PUSCH HARQ ACKs for the primary PUCCH group is disabled (see TS 38.213 [13], clauses 9.1.2.2 and 9.1.3.2). If the field <i>harq-ACK SpatialBundlingPUSCH-secondaryPUCCHgroup</i> is present, <i>harq-ACK-SpatialBundlingPUSCH</i> is only applied to primary PUCCH group. Network does not configure for a UE both spatial bundling of HARQ ACKs and <i>codeBlockGroupTransmission</i> within the same cell group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>harq-ACK-SpatialBundlingPUSCH-secondaryPUCCHgroup</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Indicates whether spatial bundling of PUSCH HARQ ACKs for the secondary PUCCH group is enabled or disabled. The field is only applicable when more than 4 layers are possible to schedule (see TS 38.213 [13], clauses 9.1.2.2 and 9.1.3.2). When the field is absent, the use of spatial bundling of PUSCH HARQ ACKs for the secondary PUCCH group is indicated by <i>harq-ACK-SpatialBundlingPUSCH</i> . See TS 38.213 [13], clauses 9.1.2.2 and 9.1.3.2. Network does not configure for a UE both spatial bundling of HARQ ACKs and <i>codeBlockGroupTransmission</i> within the same cell group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| RNTI to indicate use of <i>qam64LowSE</i> for grant-based transmissions. When the <i>mcs-C-RNTI</i> is configured, RNTI scrambling of DCI CRC is used to choose the corresponding MCS table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Indicates the reference number of cells for PDCCH blind detection for the CG. Network configures the field for each CG when the UE is in NR DC and sets the value in accordance with the constraints specified in TS 38.213 [13]. The network configures <i>pdccch-BlindDetection</i> only if the UE is in NR-DC. The network configures <i>pdccch-BlindDetection2</i> only if the UE is in NR-DC with at least one downlink cell using Rel-16 PDCCH monitoring capability. The network configures <i>pdccch-BlindDetection3</i> only if the UE is in NR-DC with at least one downlink cell using Rel-15 PDCCH monitoring capability. The network configures <i>pdccch-BlindDetection4</i> only if the UE is in NR-DC with at least one downlink cell using Rel-17 PDCCH monitoring capability.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>pdccch-BlindDetectionCA-CombIndicator</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Configure one combination of <i>pdccch-BlindDetectionCA1</i> (for R15) and <i>pdccch-BlindDetectionCA2</i> (for R16) for UE to use for scaling PDCCH monitoring capability if the number of serving cells configured to a UE is larger than the reported capability, and if UE reports more than one combination of <i>pdccch-BlindDetectionCA1</i> and <i>pdccch-BlindDetectionCA2</i> as UE capability. The combination of <i>pdccch-BlindDetectionCA1</i> and <i>pdccch-BlindDetectionCA2</i> configured by <i>pdccch-BlindDetectionCA-CombIndicator</i> is from the more than one combination of <i>pdccch-BlindDetectionCA1</i> and <i>pdccch-BlindDetectionCA2</i> reported by UE (see TS 38.213 [13], clause 10).<br><i>pdccch-BlindDetectionCA-CombIndicator-r17</i> is used to configure one combination of <i>pdccch-BlindDetectionCA1</i> (for R15), <i>pdccch-BlindDetectionCA2</i> (for R16) and <i>pdccch-BlindDetectionCA3</i> (for R17) for UE to use for scaling PDCCH monitoring capability if the number of serving cells configured to a UE is larger than the reported capability, and if UE reports more than one combination of <i>pdccch-BlindDetectionCA1</i> , <i>pdccch-BlindDetectionCA2</i> and <i>pdccch-BlindDetectionCA3</i> as UE capability. The combination of <i>pdccch-BlindDetectionCA1</i> , <i>pdccch-BlindDetectionCA2</i> and <i>pdccch-BlindDetectionCA3</i> configured by <i>pdccch-BlindDetectionCA-CombIndicator-r17</i> is from the more than one combination of <i>pdccch-BlindDetectionCA1</i> , <i>pdccch-BlindDetectionCA2</i> and <i>pdccch-BlindDetectionCA3</i> reported by UE (see TS 38.213 [13], clause 10).<br><i>pdccch-BlindDetectionCA-CombIndicator-r16</i> and <i>pdccch-BlindDetectionCA-CombIndicator-r17</i> are not configured simultaneously. |

***pdsch-HARQ-ACK-Codebook***

The PDSCH HARQ-ACK codebook is either semi-static or dynamic. This is applicable to both CA and non-CA operation (see TS 38.213 [13], clauses 9.1.2 and 9.1.3). If *pdsch-HARQ-ACK-Codebook-r16* is signalled, UE shall ignore the *pdsch-HARQ-ACK-Codebook* (without suffix). For the HARQ-ACK for sidelink, if *pdsch-HARQ-ACK-Codebook-r16* is signalled, the UE uses *pdsch-HARQ-ACK-Codebook* (without suffix) and ignores *pdsch-HARQ-ACK-Codebook-r16*. If the field *pdsch-HARQ-ACK-Codebook-secondaryPUCCHgroup* is present, *pdsch-HARQ-ACK-Codebook* is applied to primary PUCCH group. Otherwise, this field is applied to the cell group (i.e. for all the cells within the cell group). For the HARQ-ACK for sidelink, if the field *pdsch-HARQ-ACK-Codebook-secondaryPUCCHgroup* is present, *pdsch-HARQ-ACK-Codebook* is applied to primary and secondary PUCCH group and the UE ignores *pdsch-HARQ-ACK-Codebook-secondaryPUCCHgroup*.

***pdsch-HARQ-ACK-CodebookList***

A list of configurations for one or two HARQ-ACK codebooks. Each configuration in the list is defined in the same way as *pdsch-HARQ-ACK-Codebook* (see TS 38.212 [17], clause 7.3.1.2.2 and TS 38.213 [13], clauses 7.2.1, 9.1.2, 9.1.3 and 9.2.1). If this field is present, the field *pdsch-HARQ-ACK-Codebook* is ignored. If this field is present, the value of this field is applied for primary PUCCH group and for secondary PUCCH group (if configured). For the HARQ-ACK for sidelink, the UE uses *pdsch-HARQ-ACK-Codebook* and ignores *pdsch-HARQ-ACK-CodebookList* if this field is present.

***pdsch-HARQ-ACK-Codebook-secondaryPUCCHgroup***

The PDSCH HARQ-ACK codebook is either semi-static or dynamic. This is applicable to CA operation (see TS 38.213 [13], clauses 9.1.2 and 9.1.3). It is configured for secondary PUCCH group.

***pdsch-HARQ-ACK-EnhType3DCI-Field, pdsch-HARQ-ACK-EnhType3DCI-FieldSecondaryPUCCHgroup***

Indicates the enhanced Type 3 codebook through a new DCI field to indicate the enhanced Type 3 HARQ-ACK codebook in the primary PUCCH group if the more than one enhanced Type 3 HARQ-ACK codebook is configured for the primary PUCCH group, or in the secondary PUCCH group if the more than one enhanced Type 3 HARQ-ACK code is configured for the secondary PUCCH group, respectively.

***pdsch-HARQ-ACK-EnhType3ToAddModList, pdsch-HARQ-ACK-EnhType3SecondaryToAddModList***

Configure the list of enhanced Type 3 HARQ-ACK codebooks for the primary PUCCH group and the secondary PUCCH group, respectively. When configured, DCI format 1\_1 can request the UE to report A/N for one of the configured enhanced Type 3 HARQ-ACK codebooks in the corresponding PUCCH group (see TS 38.213 [13], clause 9.1.4). The network can configure *pdsch-HARQ-ACK-EnhType3SecondaryToAddModList* only if secondary PUCCH group is configured.

***pdsch-HARQ-ACK-OneShotFeedback***

When configured, the DCI format 1\_1 can request the UE to report A/N for all HARQ processes and all CCs configured in the PUCCH group (see TS 38.212 [17], clause 7.3.1).

***pdsch-HARQ-ACK-OneShotFeedbackCBG***

When configured, the DCI format 1\_1 can request the UE to include CBG level A/N for each CC with CBG level transmission configured. When not configured, the UE will report TB level A/N even if CBG level transmission is configured for a CC. The network configures this only when *pdsch-HARQ-ACK-OneShotFeedback* is configured.

***pdsch-HARQ-ACK-OneShotFeedbackNDI***

When configured, the DCI format 1\_1 can request the UE to include NDI for each A/N reported. The network configures this only when *pdsch-HARQ-ACK-OneShotFeedback* is configured.

***pdsch-HARQ-ACK-Retx, pdsch-HARQ-ACK-RetxSecondaryPUCCHgroup***

When configured, the DCI format 1\_1 can request the UE to perform a HARQ-ACK re-transmission on a PUCCH resource in the primary PUCCH group and the secondary PUCCH group, respectively (see TS 38.213 [13], clause 9.1.5).

***prioLowDG-HighCG***

Enable PHY prioritization for the case where low-priority dynamic grant-PUSCH collides with high-priority configured grant-PUSCH on a BWP of a serving cell (see TS 38.213 [13], clause 9), when the UE has generated transport blocks for both DG-PUSCH and CG-PUSCH as described in TS 38.321 [3].

***prioHighDG-LowCG***

Enable PHY prioritization for the case where high-priority dynamic grant PUSCH collides with low-priority configured grant PUSCH on a BWP of a serving cell (see TS 38.213 [13], clause 9), when the UE has generated transport blocks for both DG-PUSCH and CG-PUSCH as described in TS 38.321 [3].

***ps-RNTI***

RNTI value for scrambling CRC of DCI format 2\_6 used for power saving (see TS 38.213 [13], clause 10.1).

***ps-Offset***

The start of the search-time of DCI format 2\_6 with CRC scrambled by PS-RNTI relative to the start of the *drx-onDurationTimer* of Long DRX (see TS 38.213 [13], clause 10.3). Value in multiples of 0.125ms (milliseconds). 1 corresponds to 0.125 ms, 2 corresponds to 0.25 ms, 3 corresponds to 0.375 ms and so on.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b><i>tpc-PUSCH-RNTI</i></b><br>RNTI used for PUSCH TPC commands on DCI (see TS 38.213 [13], clause 10.1).                                                                                                                                                                                                                                                   |
| <b><i>tpc-SRS-RNTI</i></b><br>RNTI used for SRS TPC commands on DCI (see TS 38.213 [13], clause 10.1).                                                                                                                                                                                                                                                       |
| <b><i>twoQCL-TypeD-ForMultiDCI</i></b><br>Indicates whether a UE is expected to identify and monitor two QCL-TypeD properties for multiple overlapping CORESETs, where the first QCL-TypeD is associated with <i>coresetPoolIndex</i> value 0, and the second QCL-TypeD is associated with <i>coresetPoolIndex</i> value 1. (See TS 38.213 [13], clause 10). |
| <b><i>twoQCLTypeDforPDCCHRepetition</i></b><br>Indicates whether a UE is expected UE to identify and monitor two QCL-TypeD properties for multiple overlapping CORESETs in the case of PDCCH repetition.                                                                                                                                                     |
| <b><i>uci-MuxWithDiffPrio, uci-MuxWithDiffPrio-secondaryPUCCHgroup</i></b><br>When configured, enables multiplexing a high-priority (HP) HARQ-ACK UCI and a low-priority (LP) HARQ-ACK UCI into a PUCCH or PUSCH for the primary PUCCH group and the secondary PUCCH group, respectively.                                                                    |
| <b><i>ul-TotalDAI-Included</i></b><br>Indicates whether the total DAI fields of the additional PDSCH group is included in the non-fallback UL grant DCI (see TS 38.212 [17], clause 7.3.1). The network configures this only when enhanced dynamic codebook is configured ( <i>pdsch-HARQ-ACK-Codebook</i> is set to <i>enhancedDynamic</i> ).               |
| <b><i>xScale</i></b><br>The UE is allowed to drop NR only if the power scaling applied to NR results in a difference between scaled and unscaled NR UL of more than <i>xScale</i> dB (see TS 38.213 [13]). If the value is not configured for dynamic power sharing, the UE assumes default value of 6 dB.                                                   |

| <b><i>MulticastConfig</i> field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>pdsch-HARQ-ACK-CodebookListMulticast</i></b><br>A list of configurations for one or two HARQ-ACK codebooks for MBS multicast. Each configuration in the list is defined in the same way as <i>pdsch-HARQ-ACK-Codebook</i> (see TS 38.212 [17], clause 7.3.1.2.2 and TS 38.213 [13], clauses 7.2.1, 9.1.2, 9.1.3 and 9.2.1). If this field is present, the field <i>pdsch-HARQ-ACK-Codebook</i> is ignored. If this field is present, the value of this field is applied for primary PUCCH group and for secondary PUCCH group (if configured). |
| <b><i>type1CodebookGenerationMode</i></b><br>Indicates the mode of Type-1 HARQ-ACK codebook generation, as specified in TS 38.213 [13]. Mode 1 is based on the k1 values that are in the intersection of K1 set for unicast and K1 set for multicast. Mode 2 is based on the k1 values that are in the union of K1 set for unicast and K1 set for multicast.                                                                                                                                                                                         |

| <b><i>PDSCH-HARQ-ACK-EnhType3</i> field descriptions</b>                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>pdsch-HARQ-ACK-EnhType3CBG</i></b><br>When configured, the DCI format 1_1 or DCI format 1_2 can request the UE to include CBG level A/N for each CC with CBG level transmission configured of the enhanced Type 3 HARQ-ACK codebook. When not configured, the UE will report TB level A/N even if CBG level transmission is configured for a CC.                          |
| <b><i>pdsch-HARQ-ACK-EnhType3NDI</i></b><br>When configured, the DCI format 1_1 or DCI format 1_2 can request the UE to include NDI for each A/N reported of the enhanced Type 3 HARQ-ACK codebook.                                                                                                                                                                             |
| <b><i>perCC</i></b><br>Configures enhanced Type 3 HARQ-ACK codebook using per CC configuration.                                                                                                                                                                                                                                                                                 |
| <b><i>perHARQ, perHARQ-Ext</i></b><br>Configures enhanced Type 3 HARQ-ACK codebook using per HARQ process and CC configuration. <i>perHARQ-Ext</i> is present only when <i>nrofHARQ-ProcessesForPDSCH-v1700</i> is present in <i>pdsch-ServingCellConfig</i> of at least one serving cell in the PUCCH group. If <i>perHARQ-Ext</i> is present, the UE ignores <i>perHARQ</i> . |

| PLMN-IdentityInfo field descriptions |                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>cellReservedForOperatorUse</b>    | Indicates whether the cell is reserved for operator use (per PLMN), as defined in TS 38.304 [20]. This field is ignored by IAB-MT and NCR-MT.                                                                                                                                                                                                                                       |
| <b>gNB-ID-Length</b>                 | Indicates the length of the gNB ID out of the 36-bit long <i>cellIdentity</i> . This field is always present if the <i>mobileIAB-Support</i> is broadcasted.                                                                                                                                                                                                                        |
| <b>iab-Support</b>                   | This field combines both the support of IAB and the cell status for IAB. If the field is present, the cell supports IAB and the cell is also considered as a candidate for cell (re)selection for IAB-node; if the field is absent, the cell does not support IAB and/or the cell is barred for IAB-node. This field is absent if <i>mobileIAB-Cell</i> is broadcasted in the cell. |
| <b>mobileIAB-Support</b>             | This field indicates the support of mobile IAB and whether the cell can be considered as a candidate for cell (re)selection for mobile IAB-node. This field is absent if <i>mobileIAB-Cell</i> is broadcasted in the cell. If the field is absent, the cell is barred for mobile IAB-node.                                                                                          |
| <b>trackingAreaCode</b>              | Indicates Tracking Area Code to which the cell indicated by <i>cellIdentity</i> field belongs. The absence of the field indicates that the cell only supports PSCell/SCell functionality (per PLMN) or is an NTN cell.                                                                                                                                                              |
| <b>trackingAreaList</b>              | List of Tracking Areas to which the cell indicated by <i>cellIdentity</i> field belongs. If this field is present, network does not configure <i>trackingAreaCode</i> . Total number of different TACs across different <i>PLMN-IdentityInfos</i> shall not exceed <i>maxTAC</i> . This field is only present in an NTN cell.                                                       |

| Conditional Presence | Explanation                                                                                                                                                                                                       |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>eventID-TSS</i>   | If <i>eventID-TSS</i> is present in SIB9, this field is mandatory present in the <i>PLMN-IdentityInfo</i> IE of <i>PLMN-IdentityInfoList</i> in <i>SIB1</i> . Otherwise, the field is optionally present, Need R. |

— *PLMN-IdentityList2*

Includes a list of PLMN identities.

*PLMN-IdentityList2* information element

```
-- ASN1START
-- TAG-PLMNIDENTITYLIST2-START

PLMN-IdentityList2-r16 ::= SEQUENCE (SIZE (1..16)) OF PLMN-Identity

-- TAG-PLMNIDENTITYLIST2-STOP
-- ASN1STOP
```

— *PRB-Id*

The IE *PRB-Id* identifies a Physical Resource Block (PRB) position within a carrier.

***PRB-Id* information element**

```

-- ASN1START
-- TAG-PRB-ID-START

PRB-Id ::=
    INTEGER (0..maxNrofPhysicalResourceBlocks-1)

-- TAG-PRB-ID-STOP
-- ASN1STOP

```

— ***PTRS-DownlinkConfig***

The IE *PTRS-DownlinkConfig* is used to configure downlink phase tracking reference signals (PTRS) (see TS 38.214 [19] clause 5.1.6.3)

***PTRS-DownlinkConfig* information element**

```

-- ASN1START
-- TAG-PTRS-DOWNLINKCONFIG-START

PTRS-DownlinkConfig ::=
    SEQUENCE {
        frequencyDensity
            SEQUENCE (SIZE (2)) OF INTEGER (1..276)

        ...,
        [[
            maxNrofPorts-r16
            ENUMERATED {n1, n2}
            OPTIONAL -- Need R
        ]]
    }

-- TAG-PTRS-DOWNLINKCONFIG-STOP
-- ASN1STOP

```

| <i><b>PTRS-DownlinkConfig</b></i> field descriptions                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>epre-Ratio</i></b><br>EPRE ratio between PTRS and PDSCH. Value 0 corresponds to the codepoint "00" in tables 4.1-2 and 4.1-2A. Value 1 corresponds to codepoint "01", and so on. If the field is not provided, the UE applies value 0 (see TS 38.214 [19], clause 4.1).                                                                                             |
| <b><i>frequencyDensity</i></b><br>Presence and frequency density of DL PT-RS as a function of Scheduled BW. If the field is absent, the UE uses $K_{\text{PT-RS}} = 2$ (see TS 38.214 [19], clause 5.1.6.3, table 5.1.6.3-2).                                                                                                                                             |
| <b><i>maxNrofPorts</i></b><br>The maximum number of DL PTRS ports specified in TS 38.214 [19] (clause 5.1.6.3). 2 PT-RS ports can only be configured for a DL BWP that is configured, as specified in TS 38.214 [19] clause 5.1, with a mode where a single PDSCH has association between the DM-RS ports and the TCI states as defined in TS 38.214 [19] clause 5.1.6.2. |
| <b><i>resourceElementOffset</i></b><br>Indicates the subcarrier offset for DL PTRS. If the field is absent, the UE applies the value offset00 (see TS 38.211 [16], clause 7.4.1.2.2).                                                                                                                                                                                     |
| <b><i>timeDensity</i></b><br>Presence and time density of DL PT-RS as a function of MCS. The value 29 is only applicable for MCS Table 5.1.3.1-1 (TS 38.214 [19]). If the field is absent, the UE uses $L_{\text{PT-RS}} = 1$ (see TS 38.214 [19], clause 5.1.6.3, table 5.1.6.3-1).                                                                                      |

## – ***PTRS-UplinkConfig***

The IE *PTRS-UplinkConfig* is used to configure uplink Phase-Tracking-Reference-Signals (PTRS).

### ***PTRS-UplinkConfig*** information element

```

-- ASN1START

| <b>PUCCH-Config field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b><i>dl-DataToUL-ACK, dl-DataToUL-ACK-DCI-1-2</i></b><br/> List of timing for given PDSCH to the DL ACK (see TS 38.213 [13], clause 9.1.2). The field <i>dl-DataToUL-ACK</i> applies to DCI format 1_1 and the field <i>dl-DataToUL-ACK-DCI-1-2</i> applies to DCI format 1_2 (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 9.2.3). The <i>dl-DataToUL-ACK-v1700</i> is applicable for NTN and <i>dl-DataToUL-ACK-r17</i> is applicable for FR2-2. The <i>dl-DataToUL-ACK-r18</i> is applicable for ATG. If <i>dl-DataToUL-ACK-r16</i> or <i>dl-DataToUL-ACK-r17</i> or <i>dl-DataToUL-ACK-v1700</i> or <i>dl-DataToUL-ACK-r18</i> is signalled, UE shall ignore the <i>dl-DataToUL-ACK</i> (without suffix). The value -1 corresponds to "inapplicable value" for the case where the A/N feedback timing is not explicitly included at the time of scheduling PDSCH. The fields <i>dl-DataToUL-ACK-r17</i> and <i>dl-DataToUL-ACK-DCI-1-2-r17</i> are only applicable for SCS of 480 kHz or 960 kHz. The field <i>dl-DataToUL-ACK-r18</i> applies to DCI format 1_1 and the field <i>dl-DataToUL-ACK-DCI-1-2-r18</i> applies to DCI format 1_2 (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 9.2.3).</p> |
| <p><b><i>dl-DataToUL-ACK-MulticastDCI-Format4-1</i></b><br/> List of timing for given group-common PDSCH to the DL ACK (see TS 38.213 [13], clause 9.1.2). The field <i>dl-DataToUL-ACK-MulticastDciFormat4-1</i> applies to DCI format 4_1 for MBS multicast (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 9.2.3).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <p><b><i>dmrs-BundlingPUCCH-Config</i></b><br/> Configuration of the parameters for DMRS bundling for PUCCH (see TS 38.214 [19], clause 6.1.7). DMRS bundling for PUCCH is not supported for PUCCH format 0/2. In this release, this is not applicable to FR2-2.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <p><b><i>dmrs-UplinkTransformPrecodingPUCCH</i></b><br/> This field is used for PUCCH formats 3 and 4 according to TS 38.211, Clause 6.4.1.3.3.1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <p><b><i>format0</i></b><br/> Parameters that are common for all PUCCH resources of format 0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <p><b><i>format1</i></b><br/> Parameters that are common for all PUCCH resources of format 1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| A second TPC field can be configured via RRC for DCI-1-1 and DCI-1-2. Each TPC field is for each closed-loop index value respectively (i.e., 1st /2nd TPC fields correspond to "closedLoopIndex" value = 0 and 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>spatialRelationInfoToAddModList, spatialRelationInfoToAddModListSizeExt, spatialRelationInfoToAddModListExt</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Configuration of the spatial relation between a reference RS and PUCCH. Reference RS can be SSB/CSI-RS/SRS. If the list has more than one element, MAC-CE selects a single element (see TS 38.321 [3], clause 5.18.8 and TS 38.213 [13], clause 9.2.2). The UE shall consider entries in <i>spatialRelationInfoToAddModList</i> and in <i>spatialRelationInfoToAddModListSizeExt</i> as a single list, i.e. an entry created using <i>spatialRelationInfoToAddModList</i> can be modified using <i>spatialRelationInfoToAddModListSizeExt</i> (or deleted using <i>spatialRelationInfoToReleaseListSizeExt</i> ) and vice-versa. If the network includes <i>spatialRelationInfoToAddModListExt</i> , it includes the same number of entries, and listed in the same order, as in the concatenation of <i>spatialRelationInfoToAddModList</i> and of <i>spatialRelationInfoToAddModListSizeExt</i> . If <i>unifiedTCI-StateType</i> is configured for the serving cell, no element in this list is configured. |
| <b>spatialRelationInfoToReleaseList, spatialRelationInfoToReleaseListSizeExt, spatialRelationInfoToReleaseListExt</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Lists of spatial relation configurations between a reference RS and PUCCH to be released by the UE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <p><b><i>rb-SetIndex</i></b><br/>Indicates the RB set where PUCCH resource is allocated.</p>                                                                                                                                                                                                                                                                                                                                                                                                    |
| <p><b><i>simultaneousHARQ-ACK-CSI</i></b><br/>If the field is present, the UE uses simultaneous transmission of CSI and HARQ-ACK feedback with or without SR with PUCCH Format 2, 3 or 4. See TS 38.213 [13], clause 9.2.5. When the field is absent the UE applies the value <i>off</i>. The field is not applicable for format 0 and 1.</p>                                                                                                                                                   |

| <i><b>PUCCH-Resource, PUCCH-ResourceExt</b></i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>applyIndicatedTCI-State</i></b><br>This field indicates, for PUCCH transmission(s) corresponding to this PUCCH resource, if UE applies the first, the second or both "indicated" UL only TCI or joint TCI as specified in TS 38.213 9.2.2. For PUCCH resources belonging to a PUCCH group, network configures same value.                                                                                                                                                                                                                                                                 |
| <b><i>format</i></b><br>Selection of the PUCCH format (format 0 – 4) and format-specific parameters, see TS 38.213 [13], clause 9.2. <i>format0</i> and <i>format1</i> are only allowed for a resource in a first PUCCH resource set. <i>format2</i> , <i>format3</i> and <i>format4</i> are only allowed for a resource in non-first PUCCH resource set. The network can only configure <i>format-v1610</i> when format is set to <i>format2</i> or <i>format3</i> . The network only configures <i>format-v1700</i> when format is set to <i>format0</i> , <i>format1</i> or <i>format4</i> . |
| <b><i>interlace0</i></b><br>This is the only interlace of interlaced PUCCH Format 0 and 1 and the first interlace for interlaced PUCCH Format 2 and 3.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>interlace1</i></b><br>A second interlace, in addition to interlace 0, as specified in TS 38.213 [13], clause 9.2.1. For 15kHz SCS, values {0..9} are applicable; for 30kHz SCS, values {0..4} are applicable. For 15kHz SCS, the values of <i>interlace1</i> shall satisfy $interlace1 = \text{mod}(interlace0 + X, 10)$ where $X=1, -1$ , or 5.                                                                                                                                                                                                                                          |
| <b><i>intraSlotFrequencyHopping</i></b><br>Enabling intra-slot frequency hopping, applicable for all types of PUCCH formats. For long PUCCH over multiple slots, the intra and inter slot frequency hopping cannot be enabled at the same time for a UE. See TS 38.213 [13], clause 9.2.1.                                                                                                                                                                                                                                                                                                      |
| <b><i>nrofPRBs</i></b><br>Indicates the number of PRBs used per PUCCH resource for the PUCCH format, see TS 38.213 [13], clause 9.2.1. This field is applicable for PUCCH <i>format0</i> , <i>format1</i> , and <i>format4</i> in FR2-2. The supported values for <i>format4</i> are 1,2,3,4,5,6,8,9,10,12,15 and 16.                                                                                                                                                                                                                                                                           |
| <b><i>multipanelSFN-Scheme</i></b><br>Parameter to configure multiple panel simultaneous uplink transmission SFN scheme for PUCCH resources, see TS 38.214 [19] clause 6.1.1.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>occ-Index</i></b><br>Indicates the orthogonal cover code index (see TS 38.213 [13], clause 9.2.1). This field is applicable when <i>useInterlacePUCCH-PUSCH-16</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>occ-Length</i></b><br>Indicates the orthogonal cover code length (see TS 38.213 [13], clause 9.2.1). This field is applicable when <i>useInterlacePUCCH-PUSCH-16</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>pucch-RepetitionNrofSlots</i></b><br>Configuration of PUCCH repetition factor per PUCCH resource with associated scheduling DCI corresponding to Rel-17 dynamic PUCCH repetition. For a PUCCH resource, if both the field <i>pucch-RepetitionNrofSlots</i> and the field <i>nrofSlots</i> are present, the field <i>nrofSlots</i> is ignored and apply the value of <i>pucch-RepetitionNrofSlots</i> corresponding to Rel-17 dynamic PUCCH repetition. If this field is absent in a PUCCH resource with associated scheduling DCI, the UE applies the value of field <i>nrofSlots</i> .   |
| <b><i>pucch-ResourceId</i></b><br>Identifier of the PUCCH resource.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>secondHopPRB</i></b><br>Index of first PRB after frequency hopping of PUCCH. This value is applicable for intra-slot frequency hopping (see TS 38.213 [13], clause 9.2.1) or inter-slot frequency hopping (see TS 38.213 [13], clause 9.2.6).                                                                                                                                                                                                                                                                                                                                             |

| <i>PUCCH-ResourceSet</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>maxPayloadSize</b><br/>Maximum number of UCI information bits that the UE may transmit using this PUCCH resource set (see TS 38.213 [13], clause 9.2.1). In a PUCCH occurrence, the UE chooses the first of its <i>PUCCH-ResourceSet</i> which supports the number of bits that the UE wants to transmit. The field is absent in the first set (Set0) and in the last configured set since the UE derives the maximum number of UCI information bits as specified in TS 38.213 [13], clause 9.2.1. This field can take integer values that are multiples of 4.</p>                                                                                                                                             |
| <p><b>resourceList</b><br/>PUCCH resources of <i>format0</i> and <i>format1</i> are only allowed in the first PUCCH resource set, i.e., in a <i>PUCCH-ResourceSet</i> with <i>pucch-ResourceSetId</i> = 0. This set may contain between 1 and 32 resources. PUCCH resources of <i>format2</i>, <i>format3</i> and <i>format4</i> are only allowed in a <i>PUCCH-ResourceSet</i> with <i>pucch-ResourceSetId</i> &gt; 0. If present, these sets contain between 1 and 8 resources each. The UE chooses a <i>PUCCH-Resource</i> from this list as specified in TS 38.213 [13], clause 9.2.3. Note that this list contains only a list of resource IDs. The actual resources are configured in <i>PUCCH-Config</i>.</p> |

| Conditional Presence | Explanation                                                                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>PI2-BPSK</i>      | The field is optionally present, Need R, if <i>format3</i> and/or <i>format4</i> are configured and <i>pi2BPSK</i> is configured in each of them. It is absent, Need R otherwise. |

## – *PUCCH-ConfigCommon*

The IE *PUCCH-ConfigCommon* is used to configure the cell specific PUCCH parameters.

|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>InitialBWP-Only</i>       | The field is mandatory present in the <i>PUCCH-ConfigCommon</i> of the initial BWP (BWP#0) in SIB1. It is absent in other BWPs including the RedCap-specific initial uplink BWP, if configured.                                                             |
| <i>InitialBWP-RedCap</i>     | The field is mandatory present in the <i>PUCCH-ConfigCommon</i> of the RedCap-specific initial BWP. It is optional present, Need R, in the <i>PUCCH-ConfigCommon</i> of the initial BWP configured by <i>initialUplinkBWP</i> . It is absent in other BWPs. |
| <i>InitialBWP-RedCapOnly</i> | The field is optional present, Need S, in the <i>PUCCH-ConfigCommon</i> of the RedCap-specific initial BWP. It is absent in other BWPs.                                                                                                                     |

## – *PUCCH-ConfigurationList*

The IE *PUCCH-ConfigurationList* is used to configure UE specific PUCCH parameters (per BWP) for two simultaneously constructed HARQ-ACK codebooks. See TS 38.213 [13], clause 9.1.

PUCCH-ConfigurationList information element

```
-- ASN1START
-- TAG-PUCCH-CONFIGURATIONLIST-START

PUCCH-ConfigurationList-r16 ::= SEQUENCE (SIZE (1..2)) OF PUCCH-Config

-- TAG-PUCCH-CONFIGURATIONLIST-STOP
-- ASN1STOP
```

– PUCCH-CSI-Resource

The IE *PUCCH-CSI-Resource* is used to indicate a PUCCH resource to use for reporting on PUCCH.

PUCCH-CSI-Resource information element

```
-- ASN1START
-- TAG-PUCCH-CSI-RESOURCE-START

PUCCH-CSI-Resource ::= SEQUENCE {
    uplinkBandwidthPartId BWP-Id,
    pucch-Resource PUCCH-ResourceId
}

-- TAG-PUCCH-CSI-RESOURCE-STOP
-- ASN1STOP
```

| PUCCH-CSI-Resource field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>pucch-Resource</b><br/>PUCCH resource for the associated uplink BWP. Only PUCCH-Resource of format 2, 3 and 4 is supported. The actual PUCCH-Resource is configured in <i>PUCCH-Config</i> and referred to by its ID. When two <i>PUCCH-Config</i> are configured within <i>PUCCH-ConfigurationList</i>, <i>PUCCH-ResourceId</i> in a <i>PUCCH-CSI-Resource</i> refers to a PUCCH-Resource in the <i>PUCCH-Config</i> used for HARQ-ACK with low priority.</p> |

– PUCCH-PathlossReferenceRS-Id

The IE *PUCCH-PathlossReferenceRS-Id* is an ID for a reference signal (RS) configured as PUCCH pathloss reference (see TS 38.213 [13], clause 7.2).

PUCCH-PathlossReferenceRS-Id information element

```
-- ASN1START
-- TAG-PUCCH-PATHLOSSREFERENCERS-ID-START

PUCCH-PathlossReferenceRS-Id ::= INTEGER (0..maxNrofPUCCH-PathlossReferenceRSs-1)

PUCCH-PathlossReferenceRS-Id-v1610 ::= INTEGER (maxNrofPUCCH-PathlossReferenceRSs..maxNrofPUCCH-PathlossReferenceRSs-1-r16)
```

PUCCH-PathlossReferenceRS-Id-r17 ::= INTEGER (0..maxNrofPUCCH-PathlossReferenceRSs-1-r17)

-- TAG-PUCCH-PATHLOSSREFERENCERS-ID-STOP  
-- ASN1STOP

## – PUCCH-PowerControl

The IE *PUCCH-PowerControl* is used to configure UE-specific parameters for the power control of PUCCH.

### *PUCCH-PowerControl* information element

```
-- ASN1START
-- TAG-PUCCH-POWERCONTROL-START
PUCCH-PowerControl ::=
    deltaF-PUCCH-f0          INTEGER (-16..15)          OPTIONAL, -- Need R

#### P0-PUCCH field descriptions

##### p0-PUCCH-Value

P0 value for PUCCH with 1dB step size.

#### PUCCH-PowerControl field descriptions

##### deltaF-PUCCH-f0

deltaF for PUCCH format 0 with 1dB step size (see TS 38.213 [13], clause 7.2).

##### deltaF-PUCCH-f1

deltaF for PUCCH format 1 with 1dB step size (see TS 38.213 [13], clause 7.2).

##### deltaF-PUCCH-f2

deltaF for PUCCH format 2 with 1dB step size (see TS 38.213 [13], clause 7.2).

##### deltaF-PUCCH-f3

deltaF for PUCCH format 3 with 1dB step size (see TS 38.213 [13], clause 7.2).

##### deltaF-PUCCH-f4

deltaF for PUCCH format 4 with 1dB step size (see TS 38.213 [13], clause 7.2).

##### p0-Set

A set with dedicated P0 values for PUCCH, i.e., {P01, P02,...} (see TS 38.213 [13], clause 7.2). This field is not configured if *unifiedTCI-StateType* is configured for the serving cell.

##### pathlossReferenceRSs, pathlossReferenceRSs-v1610

A set of Reference Signals (e.g. a CSI-RS config or a SS block) to be used for PUCCH pathloss estimation. Up to *maxNrofPUCCH-PathlossReference-RSs* may be configured. If the field is not configured, the UE uses the SSB as reference signal (see TS 38.213 [13], clause 7.2). The set includes Reference Signals indicated in *pathlossReferenceRSs* (without suffix) and in *pathlossReferenceRSs-v1610*. The UE maintains *pathlossReferenceRSs* and *pathlossReferenceRSs-v1610* separately: Receiving *pathlossReferenceRSs-v1610* set to *release* releases only the entries that were configured by *pathlossReferenceRSs-v1610*, and receiving *pathlossReferenceRSs-v1610* set to *setup* replaces only the entries that were configured by *pathlossReferenceRSs-v1610* with the newly signalled entries. Neither the field *pathlossReferenceRSs* (without suffix) nor *pathlossReferenceRSs-v1610* are configured if *unifiedTCI-StateType* is configured for the serving cell.

##### twoPUCCH-PC-AdjustmentStates

Number of PUCCH power control adjustment states maintained by the UE (i.e., *g(i)*). If the field is present (*n2*) the UE maintains two power control states (i.e., *g(i,0)* and *g(i,1)*). If the field is absent, it maintains one power control state (i.e., *g(i,0)*) (see TS 38.213 [13], clause 7.2).

– *PUCCH-SpatialRelationInfo*

The IE *PUCCH-SpatialRelationInfo* is used to configure the spatial setting for PUCCH transmission and the parameters for PUCCH power control, see TS 38.213, [13], clause 9.2.2.

| <b>deltaMCS</b><br>Indicates whether to apply delta MCS. When the field is absent, the UE applies $K_s = 0$ in delta_TFC formula for PUSCH (see TS 38.213 [13], clause 7.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>dummy</b><br>This field is not used in the specification. If received it shall be ignored by the UE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>msg3-Alpha</b><br>Dedicated alpha value for msg3 PUSCH (see TS 38.213 [13], clause 7.1). When the field is absent the UE applies the value 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>olpc-ParameterSetDCI-0-1, olpc-ParameterSetDCI-0-2</b><br>Configures the number of bits for Open-loop power control parameter set indication for DCI format 0_1/0_2 in case SRI is not configured in the DCI. 2 bits is applicable only if SRI is not present in the DCI format 0_1. The field <i>olpc-ParameterSetDCI-0-1</i> applies to DCI format 0_1 and the field <i>olpc-ParameterSetDCI-0-2</i> applies to DCI format 0_2 (see TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 11).                                                                                                                                                                                   |
| <b>p0-AlphaSets</b><br>Configuration {p0-pusch, alpha} sets for PUSCH (except msg3 and msgA PUSCH), i.e., { {p0,alpha,index1}, {p0,alpha,index2},...} (see TS 38.213 [13], clause 7.1). When no set is configured, the UE uses the P0-nominal for msg3/msgA PUSCH, P0-UE is set to 0 and alpha is set according to either msg3-Alpha or msgA-Alpha (see TS 38.213 [13], clause 7.1). This field is not configured if <i>unifiedTCI-StateType</i> is configured for the serving cell.                                                                                                                                                                                                    |
| <b>p0-NominalWithoutGrant</b><br>P0 value for UL grant-free/SPS based PUSCH. Value in dBm. Only even values (step size 2) allowed (see TS 38.213 [13], clause 7.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>p0-PUSCH-SetList</b><br>Configure one additional <i>P0-PUSCH-Set</i> per SRI. If present, the one bit or 2 bits in the DCI is used to dynamically indicate among the P0 value from the existing <i>P0-PUSCH-AlphaSet</i> and the P0 value(s) from the <i>P0-PUSCH-Set</i> (See TS 38.212 [17], clause 7.3.1 and TS 38.213 [13], clause 17).                                                                                                                                                                                                                                                                                                                                          |
| <b>p0-PUSCH-SetList2</b><br>For indicating per-TRP OLPC set in DCI format 0_1/0_2 with the open-loop power control parameter set indication field, a second <i>p0-PUSCH-SetList-r16</i> is used. When this field is present the <i>p0-PUSCH-SetList-r16</i> corresponds to the first SRS resource set (see TS 38.213 [13]).                                                                                                                                                                                                                                                                                                                                                             |
| <b>pathlossReferenceRSToAddModList, pathlossReferenceRSToAddModListSizeExt</b><br>A set of Reference Signals (e.g. a CSI-RS config or a SS block) to be used for PUSCH path loss estimation. The set consists of Reference Signals configured using <i>pathLossReferenceRSToAddModList</i> and Reference Signals configured using <i>pathlossReferenceRSToAddModListSizeExt</i> . Up to <i>maxNrofPUSCH-PathlossReferenceRSs</i> may be configured (see TS 38.213 [13], clause 7.1). No elements in the list <i>pathLossReferenceRSToAddModList</i> nor <i>pathlossReferenceRSToAddModListSizeExt</i> are configured if <i>unifiedTCI-StateType</i> is configured for the serving cell. |
| <b>pathlossReferenceRSToReleaseList, pathlossReferenceRSToReleaseListSizeExt</b><br>Lists of reference signals for PUSCH path loss estimation to be released by the UE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>sri-PUSCH-MappingToAddModList</b><br>A list of <i>SRI-PUSCH-PowerControl</i> elements among which one is selected (see TS 38.213 [13], clause 7.1). No elements in this list are configured if <i>unifiedTCI-StateType</i> is configured for the serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>sri-PUSCH-MappingToAddModList2</b><br>A list of <i>SRI-PUSCH-PowerControl</i> elements for second SRS-resource set, among which one is selected by the SRI field in DCI (see TS 38.213 [13], clause 7.1). When this field is present the <i>sri-PUSCH-MappingToAddModList</i> corresponds to the first SRS resource set for PUSCH. No elements in this list are configured if <i>unifiedTCI-StateType</i> is configured for the serving cell.                                                                                                                                                                                                                                        |
| <b>tpc-Accumulation</b><br>If enabled, UE applies TPC commands via accumulation. If not enabled, UE applies the TPC command without accumulation. If the field is absent, TPC accumulation is enabled (see TS 38.213 [13], clause 7.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>twoPUSCH-PC-AdjustmentStates</b><br>Number of PUSCH power control adjustment states maintained by the UE (i.e., $fc(i)$ ). If the field is present ( $n_2$ ) the UE maintains two power control states (i.e., $fc(i,0)$ and $fc(i,1)$ ). If the field is absent, it maintains one power control state (i.e., $fc(i,0)$ ) (see TS 38.213 [13], clause 7.1).                                                                                                                                                                                                                                                                                                                           |

## – *PUSCH-ServingCellConfig*

The IE *PUSCH-ServingCellConfig* is used to configure UE specific PUSCH parameters that are common across the UE's BWPs of one serving cell.

### *PUSCH-ServingCellConfig* information element

```
-- ASN1START
-- TAG-PUSCH-SERVINGCELLCONFIG-START

PUSCH-ServingCellConfig ::=
    codeBlockGroupTransmission      SEQUENCE {
        SetupRelease { PUSCH-CodeBlockGroupTransmission }    OPTIONAL, -- Need M
        rateMatching              ENUMERATED {limitedBufferRM}  OPTIONAL, -- Need S
        xOverhead                 ENUMERATED {xoh6, xoh12, xoh18}  OPTIONAL, -- Need S
        ...,
        [[
            maxMIMO-Layers          INTEGER (1..4)              OPTIONAL, -- Need M
            processingType2Enabled   BOOLEAN                     OPTIONAL, -- Need M
        ]],
        [[

            maxMIMO-LayersforSFN-DCI-0-2-r18 INTEGER (1..2)      OPTIONAL, -- Need R
        ]],
    ]
}

PUSCH-CodeBlockGroupTransmission ::=
    maxCodeBlockGroupsPerTransportBlock SEQUENCE {
        ...,
    }
}
```

MaxMIMO-LayersDCI-0-2-r16 ::= INTEGER (1..4)

UplinkHARQ-mode-r17 ::= BIT STRING (SIZE (32))

-- TAG-PUSCH-SERVINGCELLCONFIG-STOP

-- ASN1STOP

#### ***PUSCH-CodeBlockGroupTransmission* field descriptions**

##### ***maxCodeBlockGroupsPerTransportBlock***

Maximum number of code-block-groups (CBGs) per TB (see TS 38.213 [13], clause 9.1).

#### ***PUSCH-ServingCellConfig* field descriptions**

##### ***codeBlockGroupTransmission***

Enables and configures code-block-group (CBG) based transmission (see TS 38.214 [19], clause 6.1.5).  
The network does not configure this field if the SCS of at least one UL BWP configured in the cell is 480 or 960 kHz.

##### ***maxMIMO-Layers***

Indicates the maximum MIMO layer to be used for PUSCH in all BWPs of the corresponding UL of this serving cell (see TS 38.212 [17], clause 5.4.2.1). If present, the network sets *maxRank* to the same value. The field *maxMIMO-Layers* refers to DCI format 0\_1. If network configures *maxMIMO-Layers-v1810* the UE ignores *maxMIMO-Layers* (without suffix).

##### ***maxMIMO-LayersforSDM***

Parameter to indicate maximal number of MIMO layers of each panel for PUSCH with SDM scheme for NCB PUSCH

##### ***maxMIMO-LayersforSDM-DCI-0-2***

Parameter to indicate maximal number of MIMO layers of each panel for PUSCH with SDM scheme for DCI format 0\_2 for NCB PUSCH

##### ***maxMIMO-LayersforSFN***

Parameter to indicate maximal number of MIMO layers of each panel for PUSCH with SFN scheme for NCB PUSCH

##### ***maxMIMO-LayersforSFN-DCI-0-2***

Parameter to indicate maximal number of MIMO layers of each panel for PUSCH with SFN scheme for DCI format 0\_2 for NCB PUSCH

##### ***nrofHARQ-ProcessesForPUSCH***

The number of HARQ processes to be used on the PUSCH of a serving cell. Value *n*32 corresponds to 32 HARQ processes. If the field is absent, the UE uses 16 HARQ processes (see TS 38.214 [19], clause 6.1).

##### ***processingType2Enabled***

Enables configuration of advanced processing time capability 2 for PUSCH (see 38.214 [19], clause 6.4).

##### ***rateMatching***

Enables LBRM (Limited buffer rate-matching). When the field is absent the UE applies FBRM (Full buffer rate-matchingLBRM) (see TS 38.212 [17], clause 5.4.2).

##### ***xOverhead***

If the field is absent, the UE applies the value 0 (see TS 38.214 [19], clause 6.1.4.2).

##### ***maxMIMO-LayersDCI-0-2***

Indicates the maximum MIMO layer to be used for PUSCH for DCI format 0\_2 in all BWPs of the corresponding UL of this serving cell (see TS 38.212 [17], clause 5.4.2.1). If present, the network sets *maxRankDCI-0-2* to the same value.

##### ***uplinkHARQ-mode***

Used to set the HARQ mode per HARQ process ID, see TS 38.321 [3]. The first/leftmost bit corresponds to HARQ process ID 0, the next bit to HARQ process ID 1 and so on. Bits corresponding to HARQ process IDs that are not configured shall be ignored. A bit set to one identifies a HARQ process with *HARQmodeA* and a bit set to zero identifies a HARQ process with *HARQ modeB*. This field applies for SRBs and DRBs.

## – *PUSCH-TimeDomainResourceAllocationList*

The IE *PUSCH-TimeDomainResourceAllocation* is used to configure a time domain relation between PDCCH and PUSCH. *PUSCH-TimeDomainResourceAllocationList* contains one or more of such *PUSCH-TimeDomainResourceAllocations*. The network indicates in the UL grant which of the configured time domain allocations the UE shall apply for that UL grant. The UE determines the bit width of the DCI field based on the number of entries in the *PUSCH-TimeDomainResourceAllocationList*. Value 0 in the DCI field refers to the first element in this list, value 1 in the DCI field refers to the second element in this list, and so on.

### *PUSCH-TimeDomainResourceAllocation* information element

```

|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| targetCell                                 | The serving cell to which the acquired power control commands are applicable. If the value is absent, the UE applies the TPC commands to the serving cell on which the command has been received. |
| tpc-Index                                  | An index determining the position of the first bit of TPC command inside the DCI format 2-2 payload.                                                                                              |
| tpc-IndexSUL                               | An index determining the position of the first bit of TPC command inside the DCI format 2-2 payload.                                                                                              |

| Conditional Presence | Explanation                                                                                                                                |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| SUL-Only             | The field is optionally present, Need R, if supplementaryUplink is configured within ServingCellConfig. It is absent otherwise.            |
| SUL                  | The field is optionally present, Need R, if supplementaryUplink is configured within ServingCellConfig. It is mandatory present otherwise. |

— QFI

The IE QFI is used to indicate the QoS Flow Identifier.

QFI information element

-- ASN1START  
-- TAG-QFI-START

QFI ::= INTEGER (0..maxQFI)

-- TAG-QFI-STOP  
-- ASN1STOP

— Q-OffsetRange

The IE Q-OffsetRange is used to indicate a cell, beam or measurement object specific offset to be applied when evaluating candidates for cell re-selection or when evaluating triggering conditions for measurement reporting. The value is in dB. Value dB-24 corresponds to -24 dB, dB-22 corresponds to -22 dB and so on.

Q-OffsetRange information element

-- ASN1START  
-- TAG-Q-OFFSETRANGE-START

Q-OffsetRange ::= ENUMERATED {  
dB-24, dB-22, dB-20, dB-18, dB-16, dB-14,  
dB-12, dB-10, dB-8, dB-6, dB-5, dB-4, dB-3,  
dB-2, dB-1, dB0, dB1, dB2, dB3, dB4, dB5,  
dB6, dB8, dB10, dB12, dB14, dB16, dB18,  
dB20, dB22, dB24}

```
-- TAG-Q-OFFSETRANGE-STOP
-- ASN1STOP
```

### — *Q-QualMin*

The IE *Q-QualMin* is used to indicate for cell selection/ re-selection the required minimum received RSRQ level in the (NR) cell. Corresponds to parameter  $Q_{\text{qualmin}}$  in TS 38.304 [20]. Actual value  $Q_{\text{qualmin}}$  = field value [dB].

#### *Q-QualMin* information element

```
-- ASN1START
-- TAG-Q-QUALMIN-START

Q-QualMin ::=                               INTEGER ( -43..-12)

-- TAG-Q-QUALMIN-STOP
-- ASN1STOP
```

### — *Q-RxLevMin*

The IE *Q-RxLevMin* is used to indicate for cell selection/ re-selection the required minimum received RSRP level in the (NR) cell. Corresponds to parameter  $Q_{\text{rxlevmin}}$  in TS 38.304 [20]. Actual value  $Q_{\text{rxlevmin}}$  = field value \* 2 [dBm].

#### *Q-RxLevMin* information element

```
-- ASN1START
-- TAG-Q-RXLEVMIN-START

Q-RxLevMin ::=                             INTEGER ( -70..-22)

-- TAG-Q-RXLEVMIN-STOP
-- ASN1STOP
```

### — *QuantityConfig*

The IE *QuantityConfig* specifies the measurement quantities and layer 3 filtering coefficients for NR and inter-RAT measurements.

#### *QuantityConfig* information element

#### QuantityConfigNR field descriptions

##### quantityConfigCell

Specifies L3 filter configurations for cell measurement results for the configurable RS Types (e.g. SS/PBCH block and CSI-RS) and the configurable measurement quantities (e.g. RSRP, RSRQ and SINR).

##### quantityConfigRS-Index

Specifies L3 filter configurations for measurement results per RS index for the configurable RS Types (e.g. SS/PBCH block and CSI-RS) and the configurable measurement quantities (e.g. RSRP, RSRQ and SINR).

| <b><i>messagePowerOffsetGroupB</i></b><br>Threshold for preamble selection. Value is in dB. Value <i>minusinfinity</i> corresponds to –infinity. Value <i>dB0</i> corresponds to 0 dB, <i>dB5</i> corresponds to 5 dB and so on (see TS 38.321 [3], clause 5.1.2). This field is set to the same value for different repetition numbers associated with a specific <i>FeatureCombination</i> .                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>msg1-SubcarrierSpacing</i></b><br>Subcarrier spacing of PRACH (see TS 38.211 [16], clause 5.3.2).<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15 or 30 kHz<br>FR2-1/FR2-NTN: 60 or 120 kHz<br>FR2-2: 120, 480, or 960 kHz<br>If absent, the UE applies the SCS as derived from the <i>prach-ConfigurationIndex</i> in <i>RACH-ConfigGeneric</i> (see tables Table 6.3.3.1-1, Table 6.3.3.1-2, Table 6.3.3.2-2 and Table 6.3.3.2-3, TS 38.211 [16]). The value also applies to contention free random access ( <i>RACH-ConfigDedicated</i> ), to SI-request and to contention-based beam failure recovery (CB-BFR). But it does not apply for contention free beam failure recovery (CF-BFR) (see <i>BeamFailureRecoveryConfig</i> ). |
| <b><i>msg3-transformPrecoder</i></b><br>Enables the transform precoder for Msg3 transmission according to clause 6.1.3 of TS 38.214 [19]. If the field is absent, the UE disables the transformer precoder (see TS 38.213 [13], clause 8.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>numberOfRA-PreamblesGroupA</i></b><br>The number of CB preambles per SSB in group A. This determines implicitly the number of CB preambles per SSB available in group B. (see TS 38.321 [3], clause 5.1.1). The setting should be consistent with the setting of <i>ssb-perRACH-OccasionAndCB-PreamblesPerSSB</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>prach-RootSequenceIndex</i></b><br>PRACH root sequence index (see TS 38.211 [16], clause 6.3.3.1). The value range depends on whether L=839 or L=139 or L=571 or L=1151. The length of the root sequence corresponding with the index indicated in this IE should be consistent with the one indicated in <i>prach-ConfigurationIndex</i> in the <i>RACH-ConfigDedicated</i> (if configured). If <i>prach-RootSequenceIndex-r16</i> is signalled, UE shall ignore the <i>prach-RootSequenceIndex</i> (without suffix).<br>For FR2-2, only the following values are applicable depending on the used subcarrier spacing:<br>120 kHz: L=139, L=571, and L=1151<br>480 kHz: L=139, and L=571<br>960 kHz: L=139                                                                   |
| <b><i>ra-ContentionResolutionTimer</i></b><br>The initial value for the contention resolution timer (see TS 38.321 [3], clause 5.1.5). Value <i>sf8</i> corresponds to 8 subframes, value <i>sf16</i> corresponds to 16 subframes, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>ra-Msg3SizeGroupA</i></b><br>Transport Blocks size threshold in bits below which the UE shall use a contention-based RA preamble of group A (see TS 38.321 [3], clause 5.1.2). This field is set to the same value for different repetition numbers associated with a specific <i>FeatureCombination</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>ra-Prioritization</i></b><br>Parameters which apply for prioritized random access procedure on any UL BWP of SpCell for specific Access Identities (see TS 38.321 [3], clause 5.1.1a).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>ra-PrioritizationForAI</i></b><br>Indicates whether the field <i>ra-Prioritization-r16</i> applies for Access Identities. The first/leftmost bit corresponds to Access Identity 1, the next bit corresponds to Access Identity 2. Value 1 indicates that the field <i>ra-Prioritization-r16</i> applies otherwise the field does not apply (see TS 23.501 [32]).                                                                                                                                                                                                                                                                                                                                                                                                              |

| UE may select the SS block and corresponding PRACH resource for path-loss estimation and (re)transmission based on SS blocks that satisfy the threshold (see TS 38.213 [13]).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>rsrp-ThresholdSSB-SUL</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| The UE selects SUL carrier to perform random access based on this threshold (see TS 38.321 [3], clause 5.1.1). The value applies to all the BWPs and all RACH configurations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>ssb-perRACH-OccasionAndCB-PreamblesPerSSB</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| The meaning of this field is twofold: the CHOICE conveys the information about the number of SSBs per RACH occasion. Value <i>oneEighth</i> corresponds to one SSB associated with 8 RACH occasions, value <i>oneFourth</i> corresponds to one SSB associated with 4 RACH occasions, and so on. The ENUMERATED part indicates the number of Contention Based preambles per SSB. Value <i>n4</i> corresponds to 4 Contention Based preambles per SSB, value <i>n8</i> corresponds to 8 Contention Based preambles per SSB, and so on. The total number of CB preambles in a RACH occasion is given by <i>CB-preambles-per-SSB * max(1, SSB-per-rach-occasion)</i> . See TS 38.213 [13]. |
| <b>totalNumberOfRA-Preambles</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Total number of preambles used for contention based and contention free 4-step or 2-step random access in the RACH resources defined in <i>RACH-ConfigCommon</i> , excluding preambles used for other purposes (e.g. for SI request). If the field is absent, all 64 preambles are available for RA. The setting should be consistent with the setting of <i>ssb-perRACH-OccasionAndCB-PreamblesPerSSB</i> , i.e. it should be a multiple of the number of SSBs per RACH occasion.                                                                                                                                                                                                     |

| Conditional Presence   | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

When both 2-step and 4-step type random access is configured, this field is only configured for the case of separate ROs between 2-step and 4-step type random access.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>msgA-RSRP-Threshold</i></b><br>The UE selects 2-step random access type to perform random access based on this threshold (see TS 38.321 [3], clause 5.1.1). This field is only present if both 2-step and 4-step RA type are configured for the BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>msgA-RSRP-ThresholdSSB</i></b><br>UE may select the SS block and corresponding PRACH resource for path-loss estimation and (re)transmission based on SS blocks that satisfy the threshold (see TS 38.213 [13]).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>msgA-SSB-PerRACH-OccasionAndCB-PreamblesPerSSB</i></b><br>The meaning of this field is twofold: the CHOICE conveys the information about the number of SSBs per RACH occasion. Value <i>oneEight</i> corresponds to one SSB associated with 8 RACH occasions, value <i>oneFourth</i> corresponds to one SSB associated with 4 RACH occasions, and so on. The ENUMERATED part indicates the number of Contention Based preambles per SSB. Value <i>n4</i> corresponds to 4 Contention Based preambles per SSB, value <i>n8</i> corresponds to 8 Contention Based preambles per SSB, and so on. The total number of CB preambles in a RACH occasion is given by <i>CB-preambles-per-SSB</i> * max(1, <i>SSB-per-rach-occasion</i> ). If the field is not configured in <i>RACH-ConfigCommonTwoStepRA</i> which is configured directly within a BWP (i.e. not within <i>AdditionalRACH-Config</i> ) and both 2-step and 4-step are configured for the BWP, the UE applies the value in the field <i>ssb-perRACH-OccasionAndCB-PreamblesPerSSB</i> in <i>RACH-ConfigCommon</i> . If the field is not configured in <i>AdditionalRACH-Config</i> and both 2-step and 4-step are configured in <i>AdditionalRACH-Config</i> , the UE applies the value in the field <i>ssb-perRACH-OccasionAndCB-PreamblesPerSSB</i> in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i> . The field is not present when RACH occasions are shared between 2-step and 4-step type random access in the BWP. |
| <b><i>msgA-SSB-SharedRO-MaskIndex</i></b><br>Indicates the subset of 4-step type ROs shared with 2-step random access type for each SSB. This field is configured when there is more than one RO per SSB. If the field is absent, and 4-step and 2-step has shared ROs, then all ROs are shared.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b><i>msgA-SubcarrierSpacing</i></b><br/> Subcarrier spacing of PRACH (see TS 38.211 [16], clause 5.3.2).<br/> Only the following values are applicable depending on the used frequency:<br/> FR1: 15 or 30 kHz<br/> FR2-1/FR2-NTN: 60 or 120 kHz<br/> FR2-2: 120, 480, or 960 kHz.<br/> If the field is absent, the UE applies the SCS as derived from the <i>msgA-PRACH-ConfigurationIndex</i> in <i>RACH-ConfigGenericTwoStepRA</i> (see tables Table 6.3.3.1-1, Table 6.3.3.1-2, Table 6.3.3.2-2 and Table 6.3.3.2-3, TS 38.211 [16]) in case of 2-step only BWP, otherwise the UE applies the same SCS as <i>Msg1</i> derived from <i>RACH-ConfigCommon</i>. The value also applies to contention free 2-step random access type (<i>RACH-ConfigDedicated</i>).</p> |
| <p><b><i>msgA-TotalNumberOfRA-Preambles</i></b><br/> Indicates the total number of preambles used for contention-based and contention-free 2-step random access type when ROs for 2-step are not shared with 4-step. If the field is absent, and 2-step and 4-step does not have shared ROs, all 64 preambles are available for 2-step random access type.</p>                                                                                                                                                                                                                                                                                                                                                                                                              |
| <p><b><i>msgA-TransMax</i></b><br/> Max number of <i>MsgA</i> preamble transmissions performed before switching to 4-step random access (see TS 38.321 [3], clauses 5.1.1). This field is only applicable when 2-step and 4-step RA type are configured and switching to 4-step type RA is supported. If the field is absent, switching from 2-step RA type to 4-step RA type is not allowed.</p>                                                                                                                                                                                                                                                                                                                                                                           |
| <p><b><i>ra-ContentionResolutionTimer</i></b><br/> The initial value for the contention resolution timer for fallback RAR in case no 4-step random access type is configured (see TS 38.321 [3], clause 5.1.5). Value <i>sf8</i> corresponds to 8 subframes, value <i>sf16</i> corresponds to 16 subframes, and so on. If both 2-step and 4-step random access type resources are configured on the BWP, then this field is absent. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i>, the UE shall apply the corresponding value in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i>.</p>                                                                                                                       |
| <p><b><i>ra-Prioritization</i></b><br/> Parameters which apply for prioritized random access procedure on any UL BWP of SpCell for specific Access Identities (see TS 38.321 [3], clause 5.1.1a).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <p><b><i>ra-PrioritizationForAI</i></b><br/> Indicates whether the field <i>ra-Prioritization-r16</i> applies for Access Identities. The first/leftmost bit corresponds to Access Identity 1, the next bit corresponds to Access Identity 2. Value <i>1</i> for an Access Identity indicates that the field <i>ra-Prioritization-r16</i> applies, otherwise the field does not apply.</p>                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>csi-RS</b>                                 | The ID of a CSI-RS resource defined in the measurement object associated with this serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>ra-OccasionList</b>                        | RA occasions that the UE shall use when performing CF-RA upon selecting the candidate beam identified by this CSI-RS. The network ensures that the RA occasion indexes provided herein are also configured by prach-ConfigurationIndex and msg1-FDM. Each RACH occasion is sequentially numbered, first, in increasing order of frequency resource indexes for frequency multiplexed PRACH occasions; second, in increasing order of time resource indexes for time multiplexed PRACH occasions within a PRACH slot and Third, in increasing order of indexes for PRACH slots.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>ra-PreambleIndex</b>                       | The RA preamble index to use in the RA occasions associated with this CSI-RS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>CFRA field descriptions</b>                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>msg1-RepetitionNum</b>                     | Indicates the MSG1 repetition number used for contention free 4-step random access type in TS 38.321 [3]. If this field is absent, the UE performs contention free 4-step random access without MSG1-Repetitions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>occasions</b>                              | RA occasions for contention free random access. If the field is absent, the UE uses the RA occasions configured in <i>RACH-ConfigCommon</i> in the first active UL BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>ra-ssb-OccasionMaskIndex</b>               | Explicitly signalled PRACH Mask Index for RA Resource selection in TS 38.321 [3]. The mask is valid for all SSB resources signalled in <i>ssb-ResourceList</i> . The UE shall ignore this field if the field <i>msg1-RepetitionNum</i> included in <i>CFRA</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>rach-ConfigGeneric</b>                     | Configuration of contention free random access occasions for CFRA. The UE shall ignore <i>preambleReceivedTargetPower</i> , <i>preambleTransMax</i> , <i>powerRampingStep</i> , <i>ra-ResponseWindow</i> signaled within this field and use the corresponding values provided in <i>RACH-ConfigCommon</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>ssb-perRACH-Occasion</b>                   | Number of SSBs per RACH occasion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>totalNumberOfRA-Preambles</b>              | Total number of preambles used for contention free random access in the RACH resources defined in CFRA, excluding preambles used for other purposes (e.g. for SI request). If the field is absent but the field <i>occasions</i> is present, the UE may assume all the 64 preambles are for RA. The setting should be consistent with the setting of <i>ssb-perRACH-Occasion</i> , if present, i.e. it should be a multiple of the number of SSBs per RACH occasion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>CFRA-SSB-Resource field descriptions</b>   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>msgA-PUSCH-Resource-Index</b>              | Identifies the index of the PUSCH resource used for MSGA CFRA. The PUSCH resource index indicates a valid PUSCH occasion (as specified in TS 38.213 [13], clause 8.1A) and the associated DMRS resources corresponding to a PRACH slot. The PUSCH resource indexes are sequentially numbered and are mapped to valid PUSCH occasions corresponding to a PRACH slot which are ordered, first, in increasing order of frequency resource indexes for frequency multiplexed PUSCH occasions; second, in increasing order of DMRS resource indexes within a PUSCH occasion, where a $DMRS_{id}$ resource index is determined first in an ascending order of a DMRS port index and then in an ascending order of a DMRS sequence index, third in increasing order of time resource indexes for time multiplexed PUSCH occasions within a PUSCH slot and fourth, in increasing order of indexes for PUSCH slots. For the case of contention free 2-step random access type, if this field is absent, the UE shall use the value 0. |
| <b>ra-PreambleIndex</b>                       | The preamble index that the UE shall use when performing CF-RA upon selecting the candidate beams identified by this SSB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>ssb</b>                                    | The ID of an SSB transmitted by this serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>CFRA-<i>TwoStep</i> field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>msgA-CFRA-PUSCH</i></b><br>PUSCH resource configuration(s) for msgA CFRA.                                                                                                                                                                                                                                                                                                                                |
| <b><i>msgA-TransMax</i></b><br>Max number of MsgA preamble transmissions performed before switching to 4-step type random access (see TS 38.321 [3], clauses 5.1.1). This field is only applicable when 2-step and 4-step RA type are configured and switching to 4-step type RA is supported. If the field is absent in <i>cfra-TwoStep</i> , switching from 2-step RA type to 4-step RA type is not allowed. |
| <b><i>occasionsTwoStepRA</i></b><br>RA occasions for contention free random access. If the field is absent, the UE uses the RA occasions configured in <i>RACH-ConfigCommonTwoStepRA</i> in the first active UL BWP.                                                                                                                                                                                           |
| <b><i>ra-SSB-OccasionMaskIndex</i></b><br>Explicitly signalled PRACH Mask Index for RA Resource selection in TS 38.321 [3]. The mask is valid for all SSB resources signalled in <i>ssb-ResourceList</i> .                                                                                                                                                                                                     |

(see TS 38.211 [16], clause 6.3.3.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>powerRampingStep</i></b><br>Power ramping steps for PRACH (see TS 38.321 [3], 5.1.3). This field is set to the same value for different repetition numbers associated with a specific <i>FeatureCombination</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>prach-ConfigurationFrameOffset-IAB</i></b><br>Frame offset for ROs defined in the baseline configuration indicated by <i>prach-ConfigurationIndex</i> and is used only by the IAB-MT. (see TS 38.211 [16], clause 6.3.3.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>prach-ConfigurationIndex</i></b><br>PRACH configuration index. For <i>prach-ConfigurationIndex</i> configured under <i>beamFailureRecoveryConfig</i> , the <i>prach-ConfigurationIndex</i> can only correspond to the short preamble format, (see TS 38.211 [16], clause 6.3.3.2). If the field <i>prach-ConfigurationIndex-v1610</i> is present, the UE shall ignore the value provided in <i>prach-ConfigurationIndex</i> (without suffix).                                                                                                                                                                                                                                                                                                      |
| <b><i>prach-ConfigurationPeriodScaling-IAB</i></b><br>Scaling factor to extend the periodicity of the baseline configuration indicated by <i>prach-ConfigurationIndex</i> and is used only by the IAB-MT. Value <i>scf1</i> corresponds to scaling factor of 1 and so on. (see TS 38.211 [16], clause 6.3.3.2).                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>prach-ConfigurationSOffset-IAB</i></b><br>Subframe/Slot offset for ROs defined in the baseline configuration indicated by <i>prach-ConfigurationIndex</i> and is used only by the IAB-MT. (see TS 38.211 [16], clause 6.3.3.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>preambleReceivedTargetPower</i></b><br>The target power level at the network receiver side (see TS 38.213 [13], clause 7.4, TS 38.321 [3], clauses 5.1.2, 5.1.3). Only multiples of 2 dBm may be chosen (e.g. -202, -200, -198, ...). This field is set to the same value for different repetition numbers associated with a specific <i>FeatureCombination</i> .                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>preambleTransMax</i></b><br>Max number of RA preamble transmission performed before declaring a failure (see TS 38.321 [3], clauses 5.1.4, 5.1.5). The UE shall ignore this field in case <i>rach-ConfigGeneric</i> is included within an <i>EarlyUL-SyncConfig</i> IE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>ra-ResponseWindow</i></b><br>Msg2 (RAR) window length in number of slots. The network configures a value lower than or equal to 10 ms when Msg2 is transmitted in licensed spectrum and a value lower than or equal to 40 ms when Msg2 is transmitted with shared spectrum channel access (see TS 38.321 [3], clause 5.1.4). UE ignores the field if included in <i>SCellConfig</i> . If <i>ra-ResponseWindow-v1610</i> or <i>ra-ResponseWindow-v1700</i> is signalled, UE shall ignore the <i>ra-ResponseWindow</i> (without suffix). The field <i>ra-ResponseWindow-v1700</i> is applicable to SCS 480 kHz and SCS 960 kHz. The UE shall ignore this field in case <i>rach-ConfigGeneric</i> is included within an <i>EarlyUL-SyncConfig</i> IE. |
| <b><i>zeroCorrelationZoneConfig</i></b><br>N-CS configuration, see Table 6.3.3.1-5 in TS 38.211 [16].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## – *RACH-ConfigGenericTwoStepRA*

The IE *RACH-ConfigGenericTwoStepRA* is used to specify the 2-step random access type parameters.

| <p><b><i>msgA-PreamblePowerRampingStep</i></b><br/>Power ramping steps for msgA PRACH. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i>, the UE shall apply the corresponding value in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i>. If the field is absent in other cases, UE shall use the value of <i>powerRampingStep</i> in <i>RACH-ConfigGeneric</i> in the configured BWP (see TS 38.321 [3], 5.1.3). This field may only be present if no 4-step type RA is configured in the BWP or in the case of separate ROs with 4-step type RA. The field is absent if <i>RACH-ConfigGenericTwoStepRA</i> is included in <i>CFRA-TwoStep</i> in <i>RACH-ConfigDedicated</i> and then the UE uses the value of <i>msgA-PreamblePowerRampingStep</i> in <i>RACH-ConfigGenericTwoStepRA</i> configured for CBRA.</p>             |
| <p><b><i>msgA-PreambleReceivedTargetPower</i></b><br/>The target power level at the network receiver side (see TS 38.213 [13], clause 7.1.1 and TS 38.321 [3], clause 5.1.1). Only multiples of 2 dBm may be chosen (e.g -202, -200, -198, ...). If the field is absent, UE shall use the value of <i>preambleReceivedTargetPower</i> in <i>RACH-ConfigGeneric</i> in the configured BWP. This field may only be present if no 4-step type RA is configured in the BWP. The field is absent if <i>RACH-ConfigGenericTwoStepRA</i> is included in <i>CFRA-TwoStep</i> in <i>RACH-ConfigDedicated</i> and then the UE uses the value of <i>msgA-PreambleReceivedTargetPower</i> in <i>RACH-ConfigGenericTwoStepRA</i> configured for CBRA.</p>                                                                                                                                                |
| <p><b><i>msgA-PRACH-ConfigurationIndex</i></b><br/>Cell-specific PRACH configuration index for 2-step RA type. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> which is configured directly within a BWP (i.e. not within <i>AdditionalRACH-Config</i>), the UE shall use the value of corresponding 4-step random access parameter in the configured BWP. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i>, the UE shall apply the corresponding value in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i>. If the value is in the range of 256 to 262, the field <i>prach-ConfigurationIndex-v1610</i> should be considered configured (see TS 38.211 [16], clause 6.3.3.2). This field may only be present if no 4-step type RA is configured in the BWP or in the case of separate ROs with 4-step type RA.</p> |
| <p><b><i>msgA-RO-FDM</i></b><br/>The number of msgA PRACH transmission occasions Frequency-Division Multiplexed in one time instance. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> which is configured directly within a BWP (i.e. not within <i>AdditionalRACH-Config</i>), UE shall use value of <i>msg1-FDM</i> in <i>RACH-ConfigGeneric</i> in the configured BWP. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i>, the UE shall apply the value of <i>msg1-FDM</i> in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i> (see TS 38.211 [16], clause 6.3.3.2). This field may only be present if no 4-step type RA is configured in the BWP or in the case of separate ROs with 4-step type RA.</p>                                                                                                          |
| <p><b><i>msgA-RO-FrequencyStart</i></b><br/>Offset of lowest PRACH transmissions occasion in frequency domain with respect to PRB 0. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> which is configured directly within a BWP (i.e. not within <i>AdditionalRACH-Config</i>), UE shall use value of <i>msg1-FrequencyStart</i> in <i>RACH-ConfigGeneric</i> in the configured BWP. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i>, the UE shall apply the value of <i>msg1-FrequencyStart</i> in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i> (see TS 38.211 [16], clauses 5.3.2 and 6.3.3.2). This field may only be present if no 4-step type RA is configured in the BWP or in the case of separate ROs with 4-step type RA.</p>                                                                          |
| <p><b><i>msgA-ZeroCorrelationZoneConfig</i></b><br/>N-CS configuration for msgA preamble, see Table 6.3.3.1-5 in TS 38.211 [16]. If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i>, the UE shall apply the corresponding value in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i>. If the field is absent in other cases, UE shall use value <i>zeroCorrelationZoneConfig</i> in <i>RACH-ConfigGeneric</i> in the configured BWP. This field may only be present if no 4-step type RA is configured in the BWP or in the case of separate ROs with 4-step type RA.</p>                                                                                                                                                                                                                                                          |
| <p><b><i>msgB-ResponseWindow</i></b><br/>MsgB monitoring window length in number of slots. The network configures a value lower than or equal to 40ms (see TS 38.321 [3], clause 5.1.1). The network does not configure <i>msgB-ResponseWindow-r16</i> simultaneously with <i>msgB-ResponseWindow-v1700</i>, and if both fields are absent, the UE uses the value of <i>msgB-ResponseWindow</i> in <i>RACH-ConfigGenericTwoStepRA</i> configured for CBRA.</p>                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <p><b><i>preambleTransMax</i></b><br/>Max number of RA preamble transmission performed before declaring a failure (see TS 38.321 [3], clauses 5.1.4, 5.1.5). If the field is absent in <i>RACH-ConfigCommonTwoStepRA</i> in <i>AdditionalRACH-Config</i>, the UE shall apply the corresponding value in <i>RACH-ConfigCommon</i> in the same <i>AdditionalRACH-Config</i>. If the field is absent in other cases, UE shall use the value of <i>preambleTransMax</i> in <i>RACH-ConfigGeneric</i> in the configured BWP. The field is absent if <i>RACH-ConfigGenericTwoStepRA</i> is included in <i>CFRA-TwoStep</i> in <i>RACH-ConfigDedicated</i> and then the UE uses the value of <i>preambleTransMax</i> in <i>RACH-ConfigGenericTwoStepRA</i> configured for CBRA.</p>                                                                                                                |

| Conditional Presence   | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

RA-PrioritizationForSlicing

The IE RA-PrioritizationForSlicing is used to configure prioritized random access for slicing.

RA-PrioritizationForSlicing information element

```

-- ASN1START
-- TAG-RA-PRIORITIZATIONFORSLICING-START

RA-PrioritizationForSlicing-r17 ::= SEQUENCE {
    ra-PrioritizationSliceInfoList-r17 RA-PrioritizationSliceInfoList-r17,
    ...
}

RA-PrioritizationSliceInfoList-r17 ::= SEQUENCE (SIZE (1..maxSliceInfo-r17)) OF RA-PrioritizationSliceInfo-r17

RA-PrioritizationSliceInfo-r17 ::= SEQUENCE {
    nsag-ID-List-r17 SEQUENCE (SIZE (1..maxSliceInfo-r17)) OF NSAG-ID-r17,
    ra-Prioritization-r17 RA-Prioritization,
    ...
}

-- TAG-RA-PRIORITIZATIONFORSLICING-STOP
-- ASN1STOP

```

RadioBearerConfig

The IE RadioBearerConfig is used to add, modify and release signalling, multicast MRBs and/or data radio bearers. Specifically, this IE carries the parameters for PDCP and, if applicable, SDAP entities for the radio bearers.

RadioBearerConfig information element

```

-- ASN1START
-- TAG-RADIOBEARERCONFIG-START

RadioBearerConfig ::= SEQUENCE {
    srb-ToAddModList SRB-ToAddModList OPTIONAL, -- Cond HO-Conn
    srb3-ToRelease ENUMERATED{true} OPTIONAL, -- Need N
    drb-ToAddModList DRB-ToAddModList OPTIONAL, -- Cond HO-toNR

```

|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>securityConfig</i></b><br>Indicates the security algorithm and key to use for the signalling and data radio bearers configured with the list in this IE <i>RadioBearerConfig</i> . When the field is not included after AS security has been activated, the UE shall continue to use the currently configured <i>keyToUse</i> and security algorithm for the radio bearers reconfigured with the lists in this IE <i>RadioBearerConfig</i> . The field is not included when configuring SRB1 before AS security is activated. |
| <b><i>srb3-ToRelease</i></b><br>Release SRB3. SRB3 release can only be done over SRB1 and only at SCG release and reconfiguration with sync.                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>SecurityConfig field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>keyToUse</b><br>Indicates if the bearers configured with the list in this IE <i>RadioBearerConfig</i> are using the master key or the secondary key for deriving ciphering and/or integrity protection keys. For MR-DC, network should not configure SRB1 and SRB2 with secondary key and SRB3 with the master key. When the field is not included, the UE shall continue to use the currently configured <i>keyToUse</i> for the radio bearers reconfigured with the lists in this IE <i>RadioBearerConfig</i> . |
| <b>securityAlgorithmConfig</b><br>Indicates the security algorithm for the signalling and data radio bearers configured with the list in this IE <i>RadioBearerConfig</i> . When the field is not included, the UE shall continue to use the currently configured security algorithm for the radio bearers reconfigured with the lists in this IE <i>RadioBearerConfig</i> .                                                                                                                                         |

| <b>SRB-ToAddMod field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>discardOnPDCP</b><br>Indicates that PDCP should discard stored SDU and PDU according to TS 38.323 [5]. Network doesn't include this field if the <i>RadioBearerConfig</i> IE is part of an <i>RRCReconfiguration</i> message associated with subsequent CPAC within the <i>ConditionalReconfiguration</i> IE which is received within a MCG <i>RRCReconfiguration</i> message via SRB1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>reestablishPDCP</b><br>Indicates that PDCP should be re-established. Network sets this to <i>true</i> whenever the security key used for this radio bearer changes. Key change could for example be due to reconfiguration with sync, for SRB2 when resuming an RRC connection, or at the first reconfiguration after RRC connection reestablishment in NR. For SRB1, when resuming an RRC connection, or at the first reconfiguration after RRC connection reestablishment in NR, the network does not set this field to <i>true</i> . For LTE SRBs using NR PDCP, it could be for handover, RRC connection reestablishment or resume. Network doesn't include this field if any DAPS bearer is configured or if the <i>RadioBearerConfig</i> IE is part of an <i>RRCReconfiguration</i> message within the <i>LTM-Config</i> IE. For SRB3, network doesn't include this field if the <i>RadioBearerConfig</i> IE is part of an <i>RRCReconfiguration</i> message associated with subsequent CPAC within the <i>ConditionalReconfiguration</i> IE. |
| <b>srb-Identity, srb-Identity-v1700, srb-Identity-v1800</b><br>Value 1 is applicable for SRB1 only. Value 2 is applicable for SRB2 only. Value 3 is applicable for SRB3 only. Value 4 is applicable for SRB4 only. Value 5 is applicable for SRB5 only. If <i>srb-Identity-v1700</i> or <i>srb-Identity-v1800</i> is received for an SRB, the UE shall ignore <i>srb-Identity</i> (i.e. without suffix) for this SRB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>additionalPCI</b><br>Indicates the physical cell IDs (PCI) of the SSBs in the <i>failureDetectionSet2</i> . If <i>candidateBeamRS-List2</i> is configured in IE <i>BeamFailureRecoveryRSConfig</i> the field indicates the physical cell IDs (PCI) of the SSBs in the <i>candidateBeamRS-List2</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>beamFailureDetectionTimer</b><br>Timer for beam failure detection (see TS 38.321 [3], clause 5.17). See also the <i>BeamFailureRecoveryConfig</i> IE. Value in number of "Q <sub>out,LR</sub> reporting periods of Beam Failure Detection" Reference Signal (see TS 38.213 [13], clause 6). Value <i>pbfd1</i> corresponds to 1 Q <sub>out,LR</sub> reporting period of Beam Failure Detection Reference Signal, value <i>pbfd2</i> corresponds to 2 Q <sub>out,LR</sub> reporting periods of Beam Failure Detection Reference Signal and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>beamFailureInstanceMaxCount</b><br>This field determines after how many beam failure events the UE triggers beam failure recovery (see TS 38.321 [3], clause 5.17). Value n1 corresponds to 1 beam failure instance, value n2 corresponds to 2 beam failure instances and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>failureDetectionResourcesToAddModList</b><br>A list of reference signals for detecting beam failure and/or cell level radio link failure (RLF). The limits of the reference signals that the network can configure are specified in TS 38.213 [13], table 5-1. The network configures at most two detectionResources per BWP for the purpose <i>beamFailure</i> or <i>both</i> . If no RSs are provided for the purpose of beam failure detection, the UE performs beam monitoring based on the activated <i>TCI-State</i> for PDCCH as described in TS 38.213 [13], clause 6. If no RSs are provided in this list for the purpose of RLF detection, the UE performs Cell-RLM based on the activated <i>TCI-State</i> of PDCCH as described in TS 38.213 [13], clause 5. The network ensures that the UE has a suitable set of reference signals for performing cell-RLM. If <i>failureDetectionSet1-r17</i> and <i>failureDetectionSet2-r17</i> are present, the <i>purpose</i> of <i>RadioLinkMonitoringRS</i> in <i>failureDetectionResourcesToAddModList</i> only can be set to <i>rlf</i> .                                          |
| <b>failureDetectionSet1, failureDetectionSet2</b><br>Configures parameters for beamfailure detection towards beam failure detection resources configured in the set. If additional PCIs are configured using <i>additionalPCI-ToAddModList</i> for the serving cell, each RS in one set can be associated only with one PCI. Network always configures the <i>failureDetectionSet1</i> and <i>failureDetectionSet2</i> together. <i>failureDetectionSetN</i> is present if and only if <i>candidateBeamRS-List2-r17</i> is configured. When a <i>failureDetectionSetN</i> is present, after the reconfiguration, the UE shall consider all the reference signals for this failure detection set as activated if at most <i>maxBFD-RS-resourcesPerSetPerBWP-r17</i> reference signals are configured for each failure detection set, otherwise the UE shall consider all the reference signals in this failure detection set as deactivated. If <i>bfdResourcesToAddModList-r17</i> in <i>failureDetectionSetN</i> is not present, the UE determines the RS(es) in each <i>failureDetectionSetN</i> as described in TS 38.213 [13], clause 6. |

| RadioLinkMonitoringRS field descriptions                                                                                                                                                                                                                          |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>detectionResource</b><br>A reference signal that the UE shall use for radio link monitoring or beam failure detection (depending on the indicated <i>purpose</i> ). Only periodic 1-port CSI-RS can be configured on SCell for beam failure detection purpose. |
| <b>purpose</b><br>Determines whether the UE shall monitor the associated reference signal for the purpose of cell- and/or beam failure detection. For SCell, network only configures the value to beamFailure.                                                    |

— RadioLinkMonitoringRS-Id

The IE *RadioLinkMonitoringRS-Id* is used to identify one *RadioLinkMonitoringRS*.

RadioLinkMonitoringRS-Id information element

```
-- ASN1START
-- TAG-RADIOLINKMONITORINGRS-ID-START

RadioLinkMonitoringRS-Id ::= INTEGER (0..maxNrofFailureDetectionResources-1)
```

```
-- TAG-RADIOLINKMONITORINGRS-ID-STOP
-- ASN1STOP
```

## — *RAN-AreaCode*

The IE *RAN-AreaCode* is used to identify a RAN area within the scope of a tracking area.

### *RAN-AreaCode* information element

```
-- ASN1START
-- TAG-RAN-AREACODE-START
```

```
RAN-AreaCode ::= INTEGER (0..255)
```

```
-- TAG-RAN-AREACODE-STOP
-- ASN1STOP
```

## — *RateMatchPattern*

The IE *RateMatchPattern* is used to configure one rate matching pattern for PDSCH, see TS 38.214 [19], clause 5.1.4.1.

|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>bitmaps</b><br>Indicates rate matching pattern by a pair of bitmaps <i>resourceBlocks</i> and <i>symbolsInResourceBlock</i> to define the rate match pattern within one or two slots, and a third bitmap <i>periodicityAndPattern</i> to define the repetition pattern with which the pattern defined by the above bitmap pair occurs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>controlResourceSet</b><br>This ControlResourceSet is used as a PDSCH rate matching pattern, i.e., PDSCH reception rate matches around it. In frequency domain, the resource is determined by the frequency domain resource of the CORESET with the corresponding CORESET ID. Time domain resource is determined by the parameters of the associated search space of the CORESET.<br>If the field <i>controlResourceSetId-r16</i> is present, UE shall ignore the <i>controlResourceSetId</i> (without suffix).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>periodicityAndPattern</b><br>A time domain repetition pattern at which the pattern defined by <i>symbolsInResourceBlock</i> and <i>resourceBlocks</i> recurs. This slot pattern repeats itself continuously. Absence of this field indicates the value <i>n1</i> (see TS 38.214 [19], clause 5.1.4.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>resourceBlocks</b><br>A resource block level bitmap in the frequency domain. A bit in the bitmap set to 1 indicates that the UE shall apply rate matching in the corresponding resource block in accordance with the <i>symbolsInResourceBlock</i> bitmap. If used as cell-level rate matching pattern, the bitmap identifies "common resource blocks (CRB)". If used for MBS broadcast CFR, the bitmap identifies "physical resource blocks" inside the MBS broadcast CFR. If used as BWP-level rate matching pattern, the bitmap identifies "physical resource blocks" inside the BWP or MBS multicast CFR. The first/ leftmost bit corresponds to resource block 0, and so on (see TS 38.214 [19], clause 5.1.4.1).                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>subcarrierSpacing</b><br>The SubcarrierSpacing for this resource pattern. If the field is absent, the UE applies the SCS of the associated BWP. The value <i>kHz15</i> corresponds to $\mu=0$ , the value <i>kHz30</i> corresponds to $\mu=1$ , and so on.<br>Only the following values are applicable depending on the used frequency (see TS 38.214 [19], clause 5.1.4.1):<br>FR1: 15, 30 or 60 kHz<br>FR2-1/FR2-NTN: 60 or 120 kHz<br>FR2-2: 120, 480, or 960 kHz                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>symbolsInResourceBlock</b><br>A symbol level bitmap in time domain. It indicates with a bit set to true that the UE shall rate match around the corresponding symbol. This pattern recurs (in time domain) with the configured <i>periodicityAndPattern</i> (see TS 38.214 [19], clause 5.1.4.1).<br>For <i>oneSlot</i> , if ECP is configured, the first 12 bits represent the symbols within the slot and the last two bits within the bitstring are ignored by the UE; Otherwise, the 14 bits represent the symbols within the slot.<br>For <i>twoSlots</i> , if ECP is configured, the first 12 bits represent the symbols within the first slot and the next 12 bits represent the symbols in the second slot and the last four bits within the bit string are ignored by the UE; Otherwise, the first 14 bits represent the symbols within the first slot and the next 14 bits represent the symbols in the second slot.<br>For the bits representing symbols in a slot, the most significant bit of the bit string represents the first symbol in the slot and the second most significant bit represents the second symbol in the slot and so on. |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>CellLevel</i>     | The field is mandatory present if the <i>RateMatchPattern</i> is defined on cell level. The field is absent when the <i>RateMatchPattern</i> is defined on BWP level or defined for MBS broadcast CFR. If the <i>RateMatchPattern</i> is defined on BWP level, the UE applies the SCS of the BWP and if <i>RateMatchPattern</i> is defined for MBS broadcast CFR, the UE applies the SCS of the initial BWP or RedCap-specific initial BWP (if configured) for (e)RedCap UEs. |

## – *RateMatchPatternId*

The IE *RateMatchPatternId* identifies one *RateMatchPattern* (see TS 38.214 [19], clause 5.1.4.1).

### *RateMatchPatternId* information element

```
-- ASN1START
-- TAG-RATEMATCHPATTERNID-START

RateMatchPatternId ::=                INTEGER (0..maxNrofRateMatchPatterns-1)

-- TAG-RATEMATCHPATTERNID-STOP
-- ASN1STOP
```

## – *RateMatchPatternLTE-CRS*

The IE *RateMatchPatternLTE-CRS* is used to configure a pattern to rate match around LTE CRS. See TS 38.214 [19], clause 5.1.4.2.

### *RateMatchPatternLTE-CRS* information element

```
-- ASN1START
-- TAG-RATEMATCHPATTERNLTE-CRS-START

RateMatchPatternLTE-CRS ::=          SEQUENCE {
    carrierFreqDL                      INTEGER (0..16383),
    carrierBandwidthDL                 ENUMERATED {n6, n15, n25, n50, n75, n100, spare2, spare1},
    mbsfn-SubframeConfigList           EUTRA-MBSFN-SubframeConfigList
    nrofCRS-Ports                      ENUMERATED {n1, n2, n4},
    v-Shift                           ENUMERATED {n0, n1, n2, n3, n4, n5}
}

LTE-CRS-PatternList-r16 ::=          SEQUENCE (SIZE (1..maxLTE-CRS-Patterns-r16)) OF RateMatchPatternLTE-CRS

-- TAG-RATEMATCHPATTERNLTE-CRS-STOP
-- ASN1STOP
```

OPTIONAL,    -- Need M

| RateMatchPatternLTE-CRS field descriptions                                                                         |
|--------------------------------------------------------------------------------------------------------------------|
| <b>carrierBandwidthDL</b><br>BW of the LTE carrier in number of PRBs (see TS 38.214 [19], clause 5.1.4.2).         |
| <b>carrierFreqDL</b><br>Center of the LTE carrier (see TS 38.214 [19], clause 5.1.4.2).                            |
| <b>mbsfn-SubframeConfigList</b><br>LTE MBSFN subframe configuration (see TS 38.214 [19], clause 5.1.4.2).          |
| <b>nrofCRS-Ports</b><br>Number of LTE CRS antenna port to rate-match around (see TS 38.214 [19], clause 5.1.4.2).  |
| <b>v-Shift</b><br>Shifting value v-shift in LTE to rate match around LTE CRS (see TS 38.214 [19], clause 5.1.4.2). |

— *ReferenceConfiguration*

The IE *ReferenceConfiguration* is used provide a configuration that is common, within the same cell group, to all configured non-complete candidate configurations.

*ReferenceConfiguration* information element

```
-- ASN1START
-- TAG-REFERENCECONFIGURATION-START

ReferenceConfiguration-r18 ::= OCTET STRING (CONTAINING RRCReconfiguration)

-- TAG-REFERENCECONFIGURATION-STOP
-- ASN1STOP
```

— *ReferenceLocation*

The IE *ReferenceLocation* contains location information used as a reference location. The value of the field is same as *Ellipsoid-Point* defined in TS37.355 [49]. The first/leftmost bit of the first octet contains the most significant bit.

*ReferenceLocation* information element

```
-- ASN1START
-- TAG-REFERENCELOCATION-START

ReferenceLocation-r17 ::= OCTET STRING

-- TAG-REFERENCELOCATION-STOP
-- ASN1STOP
```

— *ReferenceTimeInfo*

The IE *ReferenceTimeInfo* contains timing information for 5G internal system clock used for, e.g., time stamping, see TS 23.501 [32], clause 5.27.1.2.

***ReferenceTimeInfo* information element**

```
-- ASN1START
-- TAG-REFERENCETIMEINFO-START

ReferenceTimeInfo-r16 ::= SEQUENCE {
    time-r16                ReferenceTime-r16,
    uncertainty-r16          INTEGER (0..32767)          OPTIONAL, -- Need S
    timeInfoType-r16         ENUMERATED {localClock}     OPTIONAL, -- Need S
    referenceSFN-r16          INTEGER (0..1023)           OPTIONAL, -- Cond RefTime
}

ReferenceTime-r16 ::= SEQUENCE {
    refDays-r16              INTEGER (0..72999),
    refSeconds-r16           INTEGER (0..86399),
    refMilliseconds-r16      INTEGER (0..999),
    refTenNanoSeconds-r16    INTEGER (0..99999)
}

-- TAG-REFERENCETIMEINFO-STOP

| <b>referenceSFN</b><br>This field indicates the reference SFN corresponding to the reference time information. If <i>referenceTimeInfo</i> field is received in <i>DLInformationTransfer</i> message, this field indicates the SFN of PCell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>time</b><br>This field indicates time reference with 10ns granularity. If included in <i>DLInformationTransfer</i> and if UE-side TA PDC is de-activated, the indicated time may not be referenced at the network, i.e., gNB may pre-compensate for RF propagation delay. If included in <i>DLInformationTransfer</i> and if UE is requested to transmit UE Rx-Tx time difference measurement, the indicated time may not be referenced at the network, i.e., gNB may pre-compensate for RF propagation delay. Otherwise, the indicated time is referenced at the network, i.e., without compensating for RF propagation delay. In an NTN cell, the indicated time is referenced at the uplink time synchronization reference point (RP), i.e., UE should take into account the propagation delay between UE and RP when determining the UTC time at the UE.<br>The indicated time in 10ns unit from the origin is $refDays*86400*1000*100000 + refSeconds*1000*100000 + refMilliSeconds*100000 + refTenNanoSeconds$ . The <i>refDays</i> field specifies the sequential number of days (with day count starting at 0) from the origin of the <i>time</i> field.<br>If the <i>referenceTimeInfo</i> field is received in <i>DLInformationTransfer</i> message, the time field indicates the <i>time</i> at the ending boundary of the system frame indicated by <i>referenceSFN</i> . The UE considers this frame (indicated by <i>referenceSFN</i> ) to be the frame which is nearest to the frame where the message is received (which can be either in the past or in the future).<br>If the <i>referenceTimeInfo</i> field is received in <i>SIB9</i> , the <i>time</i> field indicates the time at the SFN boundary at or immediately after the ending boundary of the SI-window in which <i>SIB9</i> is transmitted.<br>If <i>referenceTimeInfo</i> field is received in <i>SIB9</i> , this field is excluded when determining changes in system information, i.e. changes of time should neither result in system information change notifications nor in a modification of <i>valueTag</i> in <i>SIB1</i> .<br><br>NOTE: The estimated time in an NTN-cell may be less accurate than the estimated time in a TN-cell. |
| <b>timeInfoType</b><br>If <i>timeInfoType</i> is not included, the <i>time</i> indicates the GPS time and the origin of the <i>time</i> field is 00:00:00 on Gregorian calendar date 6 January, 1980 (start of GPS time). If <i>timeInfoType</i> is set to <i>localClock</i> , the origin of the <i>time</i> is unspecified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>uncertainty</b><br>This field indicates the uncertainty of the reference time information provided by the time field. The uncertainty is 25ns multiplied by this field. If this field is absent, the uncertainty is unspecified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

ReportConfigId

The IE *ReportConfigId* is used to identify a measurement reporting configuration.

ReportConfigId information element

```

-- ASN1START
-- TAG-REPORTCONFIGID-START

ReportConfigId ::=
    INTEGER (1..maxReportConfigId)

-- TAG-REPORTCONFIGID-STOP
-- ASN1STOP

```

—
ReportConfigInterRAT

The IE *ReportConfigInterRAT* specifies criteria for triggering of an inter-RAT measurement reporting event, or an L2 U2N relay measurement reporting event. The inter-RAT measurement reporting events for E-UTRA and UTRA-FDD are labelled BN with *N* equal to 1, 2 and so on. The measurement reporting events for L2 U2N relay UE are labelled YN with *N* equal to 1, 2 and so on, and Z1.

- Event B1: Neighbour becomes better than absolute threshold;
- Event B2: PCell becomes worse than absolute threshold1 AND Neighbour becomes better than another absolute threshold2;
- Event Y1: PCell becomes worse than absolute threshold1 AND candidate L2 U2N Relay UE becomes better than another absolute threshold2;

Event Y2: Candidate L2 U2N Relay UE becomes better than absolute threshold;

Event Z1: Serving L2 U2N Relay UE becomes worse than absolute threshold1 AND candidate L2 U2N Relay UE becomes better than another absolute threshold2;

| <b><i>reportQuantity</i>, <i>reportQuantityUTRA-FDD</i></b><br>The cell measurement quantities to be included in the measurement report. If the field <i>reportQuantityUTRA-FDD</i> is present, the UE shall ignore the value(s) provided in <i>reportQuantity</i> . |

| <i>CellIndividualOffsetList-EUTRA</i> field descriptions                                                                                                                                                                                                                                                                    |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>carrierFreq</i></b><br>Indicates the EUTRA frequency for which <i>cellIndividualOffset</i> is applicable. If the field is not configured, the EUTRA frequency indicated by <i>carrierFreq</i> within the <i>MeasObjectEUTRA</i> of the <i>measID</i> associated with this <i>ReportConfigInterRAT</i> applies.        |
| <b><i>cellIndividualOffset</i></b><br>Cell individual offsets applicable to a specific measurement event. If this field is present, the UE, for the same cell, shall ignore the cell individual offset configured within the <i>MeasObjectEUTRA</i> of the <i>measID</i> associated with this <i>ReportConfigInterRAT</i> . |
| <b><i>physCellId</i></b><br>Physical cell identity of a E-UTRAN cell in the cell list.                                                                                                                                                                                                                                      |

## – *ReportConfigNR*

The IE *ReportConfigNR* specifies criteria for triggering of an NR measurement reporting event or of a CHO, CPA or CPC event or of an L2 U2N relay measurement reporting event. For events labelled AN with N equal to 1, 2 and so on, measurement reporting events and CHO, CPA or CPC events are based on cell measurement results, which can either be derived based on SS/PBCH block or CSI-RS.

Event A1: Serving becomes better than absolute threshold;

Event A2: Serving becomes worse than absolute threshold;

Event A3: Neighbour becomes amount of offset better than PCell/PSCell;

Event A4: Neighbour becomes better than absolute threshold;

Event A5: PCell/PSCell becomes worse than absolute threshold1 AND Neighbour/SCell becomes better than another absolute threshold2;

Event A6: Neighbour becomes amount of offset better than SCell;

Event D1: Distance between UE and a reference location *referenceLocation1* becomes larger than configured threshold *distanceThreshFromReference1* and distance between UE and a reference location *referenceLocation2* becomes shorter than configured threshold *distanceThreshFromReference2*;

Event D2: Distance between UE and the serving cell moving reference location determined based on *movingReferenceLocation* and its corresponding satellite ephemeris and epoch time broadcast in *SIB19* becomes larger than configured threshold *distanceThreshFromReference1* and distance between UE and a moving reference location determined based on *referenceLocation* and its corresponding satellite ephemeris and epoch time for the neighbor cell provided in the associated *MeasObjectNR* becomes shorter than configured threshold *distanceThreshFromReference2*;

CondEvent A3: Conditional reconfiguration candidate becomes amount of offset better than PCell/PSCell;

CondEvent A4: Conditional reconfiguration candidate becomes better than absolute threshold where *condEventA4* can also be used for current PSCell (i.e., in case it is configured as candidate PSCell for CondEvent A4 evaluation) for CHO with candidate SCG(s) case;

CondEvent A5: PCell/PSCell becomes worse than absolute threshold1 AND Conditional reconfiguration candidate becomes better than another absolute threshold2;

CondEvent D1: Distance between UE and a reference location *referenceLocation1* becomes larger than configured threshold *distanceThreshFromReference1* and distance between UE and a reference location *referenceLocation2* of conditional reconfiguration candidate becomes shorter than configured threshold *distanceThreshFromReference2*;

CondEvent D2: Distance between UE and the serving cell moving reference location determined based on *movingReferenceLocation* and its corresponding satellite ephemeris and epoch time broadcast in *SIB19* becomes larger than configured threshold *distanceThreshFromReference1* and distance between UE and a moving reference location determined based on *referenceLocation* and its corresponding satellite ephemeris and epoch time for the conditional reconfiguration candidate provided in the associated *MeasObjectNR* becomes shorter than configured threshold *distanceThreshFromReference2*;

CondEvent T1: Time measured at UE becomes more than configured threshold *t1-Threshold* but is less than *t1-Threshold + duration*;

Event X1: Serving L2 U2N Relay UE becomes worse than absolute threshold1 AND NR Cell becomes better than another absolute threshold2;

Event X2: Serving L2 U2N Relay UE becomes worse than absolute threshold;

For event I1, measurement reporting event is based on CLI measurement results, which can either be derived based on SRS-RSRP or CLI-RSSI.

Event I1: Interference becomes higher than absolute threshold;

The reporting events concerning Aerial UE altitude are labelled HN with *N* equal to 1 and 2. Additionally, the reporting events concerning Aerial UE altitude and the neighboring cell measurements simultaneously are labelled AMHN with *M* equal to 3, 4, 5 and *N* equal to 1, 2.

Event H1: Aerial UE altitude becomes higher than a threshold;

Event H2: Aerial UE altitude becomes lower than a threshold;

Event A3H1: Neighbour becomes offset better than SpCell and the Aerial UE altitude becomes higher than a threshold;

Event A3H2: Neighbour becomes offset better than SpCell and the Aerial UE altitude becomes lower than a threshold;

Event A4H1: Neighbour becomes better than threshold1 and the Aerial UE altitude becomes higher than a threshold2;

Event A4H2: Neighbour becomes better than threshold1 and the Aerial UE altitude becomes lower than a threshold2;

Event A5H1: SpCell becomes worse than threshold1 and neighbour becomes better than threshold2 and the Aerial UE altitude becomes higher than a threshold3;

Event A5H2: SpCell becomes worse than threshold1 and neighbour becomes better than threshold2 and the Aerial UE altitude becomes lower than a threshold3.

| <b>distanceThreshFromReference1, distanceThreshFromReference2</b><br>Distance from a fixed reference location configured with <i>referenceLocation1</i> or <i>referenceLocation2</i> for <i>condEventD1</i> . Distance from a moving reference location determined by the UE based on the serving cell <i>movingReferenceLocation</i> broadcast in <i>SIB19</i> or <i>referenceLocation</i> and the corresponding epoch time and satellite ephemeris configured within the <i>MeasObjectNR</i> associated to the event for <i>condEventD2</i> . Each step represents 50m. |
| <b>duration</b><br>This field is used for defining the leaving condition T1-2 for conditional HO event <i>condEventT1</i> . Each step represents 100ms.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>nesEvent</b><br>Indicates the event is a NES-specific CHO event and the event is only considered to be satisfied if indication from lower layers is received indicating the applicability of NES-specific CHO event and the related entry condition(s) is fulfilled. This field can only be configured for <i>condEventA3</i> , <i>condEventA4</i> or <i>condEventA5</i> . This field cannot be configured for CPAC.                                                                                                                                                   |
| <b>referenceLocation1, referenceLocation2</b><br>The <i>referenceLocation1</i> is associated to serving cell and <i>referenceLocation2</i> is associated to candidate target cell.                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>t1-Threshold</b><br>The field counts the number of UTC seconds in 10 ms units since 00:00:00 on Gregorian calendar date 1 January, 1900 (midnight between Sunday, December 31, 1899 and Monday, January 1, 1900).                                                                                                                                                                                                                                                                                                                                                      |
| <b>timeToTrigger</b><br>Time during which specific criteria for the event needs to be met in order to execute the conditional reconfiguration evaluation.                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <i>ReportConfigNR</i> field descriptions                                                                                                                                                                                                  |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>reportType</b><br>Type of the configured measurement report. In MR-DC, network does not configure report of type <i>reportCGI</i> using SRB3. The <i>condTriggerConfig</i> is used for CHO, CPA, CPC or subsequent CPAC configuration. |

| <i>ReportCGI</i> field descriptions                                                                                                                                                                                                                   |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b><i>useAutonomousGaps</i></b><br/>Indicates whether or not the UE is allowed to use autonomous gaps in acquiring system information from the NR neighbour cell. When the field is included, the UE applies the corresponding value for T321.</p> |

| <i>EventTriggerConfig</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>a3-Offset/a6-Offset</b><br>Offset value(s) to be used in NR measurement report triggering condition for event a3/a6. The actual value is field value * 0.5 dB.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>aN-ThresholdM</b><br>Threshold value associated to the selected trigger quantity (e.g. RSRP, RSRQ, SINR) per RS Type (e.g. SS/PBCH block, CSI-RS) to be used in NR measurement report triggering condition for event number aN. If multiple thresholds are defined for event number aN, the thresholds are differentiated by M. In the same <i>eventA5</i> , <i>eventA5H1</i> , <i>eventA5H2</i> , the network configures the same quantity for the <i>MeasTriggerQuantity</i> of the <i>a5-Threshold1</i> and for the <i>MeasTriggerQuantity</i> of the <i>a5-Threshold2</i> . |
| <b>channelOccupancyThreshold</b><br>RSSI threshold which is used for channel occupancy evaluation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>coarseLocationRequest</b><br>This field is used to request UE to report coarse location information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>distanceThreshFromReference1, distanceThreshFromReference2</b><br>Distance from a fixed reference location configured with <i>referenceLocation1</i> or <i>referenceLocation2</i> for <i>eventD1</i> . Distance from a moving reference location determined by the UE based on the serving cell <i>movingReferenceLocation</i> broadcast in <i>SIB19</i> or <i>referenceLocation</i> and the corresponding epoch time and satellite ephemeris configured within the <i>MeasObjectNR</i> associated to the event for <i>eventD2</i> . Each step represents 50m.                  |
| <b>eventId</b><br>Choice of NR event triggered reporting criteria.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>eventXN-SD-Threshold</b><br>Indicates the SD-RSRP threshold value for the serving L2 U2N Relay UE in event <i>XN</i> ( <i>N</i> equals 1 or 2). If this field is not included, the UE considers the SD-RSRP threshold value equals to the one indicated by <i>x1-Threshold1-Relay</i> / <i>x2-Threshold-Relay</i> .                                                                                                                                                                                                                                                             |
| <b>includeAltitudeUE</b><br>This field is used to request UE to report altitude information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>maxNrofRS-IndexesToReport</b><br>Max number of RS indexes to include in the measurement report for A1-A6 events.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>maxReportCells</b><br>Max number of non-serving cells to include in the measurement report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>numberOfTriggeringCells</b><br>Indicates the number of cells detected that are required to fulfill an event for a measurement report to be triggered. This field is applicable only for the events concerning neighbor cells, i.e. <i>eventA3</i> , <i>eventA4</i> , <i>eventA5</i> , <i>eventA3H1</i> , <i>eventA3H2</i> , <i>eventA4H1</i> , <i>eventA4H2</i> , <i>eventA5H1</i> , <i>eventA5H2</i> .                                                                                                                                                                         |
| <b>referenceLocation1, referenceLocation2</b><br>The <i>referenceLocation1</i> is associated to serving cell and <i>referenceLocation2</i> is associated to neighbour cell.                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>reportAddNeighMeas</b><br>Indicates that the UE shall include the best neighbour cells per serving frequency.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>cellForWhichToReportSFTD</i></b><br>Indicates the target NR neighbour cells for SFTD measurement between PCell and NR neighbour cells.                                                                                                                                                                                       |
| <b><i>drx-SFTD-NeighMeas</i></b><br>Indicates that the UE shall use available idle periods (i.e. DRX off periods) for the SFTD measurement in NR standalone. The network only includes <i>drx-SFTD-NeighMeas</i> field when <i>reprtSFTD-NeighMeas</i> is set to true.                                                             |
| <b><i>reportSFTD-Meas</i></b><br>Indicates whether UE is required to perform SFTD measurement between PCell and NR PSCell in NR-DC.                                                                                                                                                                                                |
| <b><i>reportSFTD-NeighMeas</i></b><br>Indicates whether UE is required to perform SFTD measurement between PCell and NR neighbour cells in NR standalone. The network does not include this field if <i>reportSFTD-Meas</i> is set to true.                                                                                        |
| <b><i>reportRSRP</i></b><br>Indicates whether UE is required to include RSRP result of NR PSCell or NR neighbour cells in SFTD measurement result, derived based on SSB. If it is set to true, the network should ensure that <i>ssb-ConfigMobility</i> is included in the measurement object for NR PSCell or NR neighbour cells. |

**RxTxPeriodical field descriptions****reportAmount**

This field indicates the number of UE Rx-Tx time difference measurement reports. If configured to *r1*, the network does not configure *rxTxReportInterval* and only one measurement is reported. If configured to *infinity*, UE periodically reports measurements according to the periodicity configured by *rxTxReportInterval*.

**rxTxReportInterval**

This field indicates the measurement reporting periodicity of UE Rx-Tx time difference.

**other field descriptions****MeasTriggerQuantity**

SINR is applicable only for CONNECTED mode events.

**ReportOnScellActivation field descriptions****rsType**

Indicates which RS is used to provide the measurement result. Only value *ssb* can be set in this release.

**reportQuantityRS-Indexes**

Indicates which measurement information per RS index is used to sort the reported measurement results and is included in the measurement report.

**maxNrofRS-IndexesToReport**

Max number of RS indexes to include in the measurement report.

**includeBeamMeasurements**

Indicates whether to include the measurement result per RS index in the measurement report.

**CellIndividualOffsetList field descriptions****cellIndividualOffset**

Cell individual offsets applicable to a specific measurement event. If this field is present, the UE, for the same cell, shall ignore the cell individual offset configured within the *MeasObjectNR* of the *measID* associated with this *ReportConfigNR*.

**physCellId**

Physical cell identity of a cell in the cell list.

**ssbFrequency**

Indicates the NR frequency of SS for which *cellIndividualOffset* is applicable. If the field is not configured, the NR frequency of SS indicated by *ssbFrequency* indicated within the *MeasObjectNR* of the *measID* associated with this *ReportConfigNR* applies.

– **ReportConfigNR-SL**

The IE *ReportConfigNR-SL* specifies criteria for triggering of a CBR measurement reporting event for NR sidelink communication/discovery. Measurement reporting events are based on CBR measurement results on the corresponding transmission resource pools. These events are labelled CN with N equal to 1 and 2.

Event C1: CBR of NR sidelink communication/discovery is above a threshold;

Event C2: CBR of NR sidelink communication/discovery is below a threshold;

— *ReportConfigToAddModList*

The IE *ReportConfigToAddModList* concerns a list of reporting configurations to add or modify.

**ReportConfigToAddModList information element**

```
-- ASN1START
-- TAG-REPORTCONFIGTOADDMODLIST-START

ReportConfigToAddModList ::=          SEQUENCE (SIZE (1..maxReportConfigId)) OF ReportConfigToAddMod

ReportConfigToAddMod ::=              SEQUENCE {
    reportConfigId                      ReportConfigId,
    reportConfig                        CHOICE {
        reportConfigNR                  ReportConfigNR,
        ...,
        reportConfigInterRAT            ReportConfigInterRAT,
        reportConfigNR-SL-r16           ReportConfigNR-SL-r16
    }
}

-- TAG-REPORTCONFIGTOADDMODLIST-STOP
-- ASN1STOP
```

## — *ReportInterval*

The IE *ReportInterval* indicates the interval between periodical reports. The *ReportInterval* is applicable if the UE performs periodical reporting (i.e. when *reportAmount* exceeds 1) when *reportType* is set to either *eventTriggered*, *periodical*, *cli-EventTriggered* or *cli-Periodical*. Value *ms120* corresponds to 120 ms, value *ms240* corresponds to 240 ms and so on, while value *min1* corresponds to 1 min, *min6* corresponds to 6 min and so on.

### *ReportInterval* information element

```
-- ASN1START
-- TAG-REPORTINTERVAL-START

ReportInterval ::=
    ENUMERATED {ms120, ms240, ms480, ms640, ms1024, ms2048, ms5120, ms10240, ms20480, ms40960,
                min1,min6, min12, min30 }

-- TAG-REPORTINTERVAL-STOP
-- ASN1STOP
```

## — *ReselectionThreshold*

The IE *ReselectionThreshold* is used to indicate an Rx level threshold for cell reselection. Actual value of threshold = field value \* 2 [dB].

### *ReselectionThreshold* information element

```
-- ASN1START
-- TAG-RESELECTIONTHRESHOLD-START

ReselectionThreshold ::=
    INTEGER (0..31)

-- TAG-RESELECTIONTHRESHOLD-STOP
-- ASN1STOP
```

## — *ReselectionThresholdQ*

The IE *ReselectionThresholdQ* is used to indicate a quality level threshold for cell reselection. Actual value of threshold = field value [dB].

### *ReselectionThresholdQ* information element

```
-- ASN1START
-- TAG-RESELECTIONTHRESHOLDQ-START

ReselectionThresholdQ ::=
    INTEGER (0..31)

-- TAG-RESELECTIONTHRESHOLDQ-STOP
-- ASN1STOP
```

## — *ResumeCause*

The IE *ResumeCause* is used to indicate the resume cause in *RRCResumeRequest*, *RRCResumeRequest1* and *UEAssistanceInformation*.

### *ResumeCause* information element

```
-- ASN1START
-- TAG-RESUMECAUSE-START

ResumeCause ::=
    ENUMERATED {emergency, highPriorityAccess, mt-Access, mo-Signalling,
                mo-Data, mo-VoiceCall, mo-VideoCall, mo-SMS, rna-Update, mps-PriorityAccess,
                mcs-PriorityAccess, mt-SDT-v1810, srs-PosConfigOrActivationReq-v1800, spare3, spare2, spare1 }

-- TAG-RESUMECAUSE-STOP
-- ASN1STOP
```

## — *RLC-BearerConfig*

The IE *RLC-BearerConfig* is used to configure an RLC entity, a corresponding logical channel in MAC and the linking to a PDCP entity (served radio bearer).

### *RLC-BearerConfig* information element

```
-- ASN1START
-- TAG-RLC-BEARERCONFIG-START

| <b>logicalChannelIdentity</b><br>ID used commonly for the MAC logical channel and for the RLC bearer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>logicalChannelIdentityExt</b><br>Extended logical channel ID used commonly for the MAC logical channel and for the RLC bearer for PTM reception. If this field is configured, the UE shall ignore <i>logicalChannelIdentity</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>reestablishRLC</b><br>Indicates that RLC should be re-established. Network sets this to <i>true</i> at least whenever the security key used for the radio bearer associated with this RLC entity changes. For SRB2, multicast MRBs and DRBs, unless full configuration is used, it is also set to <i>true</i> during the resumption of the RRC connection or the first reconfiguration after reestablishment. For SRB1, when resuming an RRC connection, or at the first reconfiguration after RRC connection reestablishment, the network does not set this field to <i>true</i> . The network does not include this field if <i>servedRadioBearer</i> is set to <i>drb-Identity</i> and the <i>RLC-BearerConfig</i> IE is part of an <i>RRCReconfiguration</i> message within the <i>LTM-Config</i> IE. For DRBs, network doesn't include this field if the <i>RLC-BearerConfig</i> IE is part of an <i>RRCReconfiguration</i> message associated with subsequent CPAC within the <i>ConditionalReconfiguration</i> IE. Network doesn't include this field if the <i>RadioBearerConfig</i> IE is part of an <i>RRCReconfiguration</i> message associated with subsequent CPAC within the <i>ConditionalReconfiguration</i> IE which is received within a MCG <i>RRCReconfiguration</i> message via SRB1. |
| <b>rlc-Config</b><br>Determines the RLC mode (UM, AM) and provides corresponding parameters. RLC mode reconfiguration can only be performed by DRB/multicast MRB release/addition or full configuration. The network may configure <i>rlc-Config-v1610</i> only when <i>rlc-Config</i> (without suffix) is set to <i>am</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>servedMBS-RadioBearer</b><br>Associates the RLC Bearer with a multicast MRB. The UE shall deliver DL RLC SDUs received via the RLC entity of this RLC bearer to the PDCP entity of the <i>servedMBS-RadioBearer</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>servedRadioBearer, servedRadioBearerSRB4, servedRadioBearerSRB5</b><br>Associates the RLC Bearer with an SRB or a DRB. The UE shall deliver DL RLC SDUs received via the RLC entity of this RLC bearer to the PDCP entity of the <i>servedRadioBearer</i> . Furthermore, the UE shall advertise and deliver uplink PDCP PDUs of the uplink PDCP entity of the <i>servedRadioBearer</i> to the uplink RLC entity of this RLC bearer unless the uplink scheduling restrictions ( <i>moreThanOneRLC</i> in <i>PDCP-Config</i> and the restrictions in <i>LogicalChannelConfig</i> ) forbid it to do so.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Conditional Presence     | Explanation                                                                                                                                                                                                                                                                                                                                               |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>LCH-Setup</i>         | This field is mandatory present upon creation of a new logical channel for a DRB or a multicast MRB or SRB4 or SRB5. This field is optionally present, Need S, upon creation of a new logical channel for an SRB except SRB4 and SRB5. It is optionally present, Need M, otherwise.                                                                       |
| <i>LCH-SetupModMRB</i>   | This field is optionally present upon creation of a new logical channel for PTM reception for a multicast MRB. If this field is included upon creation of a new logical channel for PTM reception for a multicast MRB, it shall be present when modifying this logical channel. The field is absent for logical channels configured for an SRB and a DRB. |
| <i>LCH-SetupOnly</i>     | This field is mandatory present upon creation of a new logical channel for a DRB or an SRB ( <i>servedRadioBearer</i> ). It is absent, Need M otherwise.                                                                                                                                                                                                  |
| <i>LCH-SetupOnlyMRB</i>  | This field is mandatory present upon creation of a new logical channel for a multicast MRB and upon modification of <i>MRB-Identity</i> of the served MRB. It is absent, Need M otherwise.                                                                                                                                                                |
| <i>LCH-SetupOnlySRB4</i> | This field is mandatory present upon creation of a new logical channel for SRB4 ( <i>servedRadioBearerSRB4</i> ). It is absent, Need M otherwise.                                                                                                                                                                                                         |
| <i>LCH-SetupOnlySRB5</i> | This field is mandatory present upon creation of a new logical channel for SRB5 ( <i>servedRadioBearerSRB5</i> ). It is absent, Need M otherwise.                                                                                                                                                                                                         |

## – *RLC-Config*

The IE *RLC-Config* is used to specify the RLC configuration of SRBs, multicast MRBs and DRBs.

### *RLC-Config* information element

```
-- ASN1START
-- TAG-RLC-CONFIG-START

RLC-Config ::=
    am

| <i>t3xy</i><br>Timers are described in clause 7.1. Value <i>ms0</i> corresponds to 0 ms, value <i>ms50</i> corresponds to 50 ms and so on. |

— *RNTI-Value*

The IE *RNTI-Value* represents a Radio Network Temporary Identity.

*RNTI-Value* information element

```
-- ASN1START
-- TAG-RNTI-VALUE-START

RNTI-Value ::=
    INTEGER (0..65535)

-- TAG-RNTI-VALUE-STOP
-- ASN1STOP
```

— *RSRP-Range*

The IE *RSRP-Range* specifies the value range used in RSRP measurements and thresholds. For measurements, integer value for RSRP measurements is according to Table 10.1.6.1-1 in TS 38.133 [14]. For thresholds, the actual value is (IE value – 156) dBm, except for the IE value 127, in which case the actual value is infinity.

*RSRP-Range* information element

```
-- ASN1START
-- TAG-RSRP-RANGE-START

RSRP-Range ::=
    INTEGER(0..127)

-- TAG-RSRP-RANGE-STOP
-- ASN1STOP
```

— *RSRQ-Range*

The IE *RSRQ-Range* specifies the value range used in RSRQ measurements and thresholds. For measurements, integer value for RSRQ measurements is according to Table 10.1.11.1-1 in TS 38.133 [14]. For thresholds, the actual value is (IE value – 87) / 2 dB.

*RSRQ-Range* information element

```
-- ASN1START
```

```
-- TAG-RSRQ-RANGE-START
RSRQ-Range ::= INTEGER(0..127)
-- TAG-RSRQ-RANGE-STOP
-- ASN1STOP
```

## — *RSSI-Range*

The IE *RSSI-Range* specifies the value range used in RSSI measurements and thresholds for NR operation with shared spectrum channel access. The integer value for RSSI measurements is according to Table 10.1.34.3-1 in TS 38.133 [14].

### *RSSI-Range* information element

```
-- ASN1START
-- TAG-RSSI-RANGE-START
RSSI-Range-r16 ::= INTEGER(0..76)
-- TAG-RSSI-RANGE-STOP
-- ASN1STOP
```

## — *RxTxTimeDiff*

The IE *RxTxTimeDiff* contains the Rx-Tx time difference measurement at either the UE or the gNB.

### *RxTxTimeDiff* information element

```
-- ASN1START
-- TAG-RXTXTIMEDIFF-START
RxTxTimeDiff-r17 ::= SEQUENCE {
    result-k5-r17 INTEGER (0..61565) OPTIONAL, -- Need N
    ...
}
-- TAG-RXTXTIMEDIFF-STOP
-- ASN1STOP
```

### *RxTxTimeDiff* field descriptions

#### *result-k5*

This field indicates the Rx-Tx time difference measurement, see TS 38.215 [9], clause 10.1.25.3.1 of TS 38.133 [14] for UE Rx-Tx time difference and clause 13.2.1 of TS 38.133 [14] for gNB Rx-Tx time difference.

— *SCellActivationRS-Config*

The IE *SCellActivationRS-Config* is used to configure a Reference Signal for fast activation of the SCell where the IE is included (see TS 38.214 [19], clause 5.2.1.5.3. Usage of an *SCellActivationRS-Config* is indicated by including its *scellActivationRS-Id* in the Enhanced SCell activation MAC CE (see TS 38.321 [3] clause 6.1.3.55).

***SCellActivationRS-Config* information element**

```

| <b>schedulingRequestId</b><br>Used to modify a SR configuration and to indicate, in <i>LogicalChannelConfig</i> , the SR configuration to which a logical channel is mapped and to indicate, in <i>SchedulingRequestResourceConfig</i> , the SR configuration for which a scheduling request resource is used.                                                                                                            |
| <b>sr-ProhibitTimer</b><br>Timer for SR transmission on PUCCH in TS 38.321 [3]. Value is in ms. Value <i>ms1</i> corresponds to 1ms, value <i>ms2</i> corresponds to 2ms, and so on. If <i>sr-ProhibitTimer-v1700</i> is configured, UE shall ignore <i>sr-ProhibitTimer</i> (without suffix). If both <i>sr-ProhibitTimer</i> (without suffix) and <i>sr-ProhibitTimer-v1700</i> are absent, the UE applies the value 0. |
| <b>sr-TransMax</b><br>Maximum number of SR transmissions as described in TS 38.321 [3]. Value <i>n4</i> corresponds to 4, value <i>n8</i> corresponds to 8, and so on.                                                                                                                                                                                                                                                    |

– SchedulingRequestId

The IE *SchedulingRequestId* is used to identify a Scheduling Request instance in the MAC layer.

SchedulingRequestId information element

The actual <i>PUCCH-Resource</i> is configured in <i>PUCCH-Config</i> of the same UL BWP and serving cell as this <i>SchedulingRequestResourceConfig</i>. The network configures a <i>PUCCH-Resource</i> of <i>PUCCH-format0</i> or <i>PUCCH-format1</i> (other formats not supported) (see TS 38.213 [13], clause 9.2.4)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <p><b>schedulingRequestID</b></p> <p>The ID of the <i>SchedulingRequestConfig</i> that uses this scheduling request resource.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

– SchedulingRequestResourceId

The IE *SchedulingRequestResourceId* is used to identify scheduling request resources on PUCCH.

SchedulingRequestResourceId information element

```
-- ASN1START
-- TAG-SCHEDULINGREQUESTRESOURCEID-START

SchedulingRequestResourceId ::=    INTEGER (1..maxNrofSR-Resources)

-- TAG-SCHEDULINGREQUESTRESOURCEID-STOP
-- ASN1STOP
```

– ScramblingId

The IE *ScramblingID* is used for scrambling channels and reference signals.

***ScramblingId*** information element

```
-- ASN1START
-- TAG-SCRAMBLINGID-START
```

```
ScramblingId ::= INTEGER(0..1023)
```

```
-- TAG-SCRAMBLINGID-STOP
-- ASN1STOP
```

— ***SCS-SpecificCarrier***

The IE *SCS-SpecificCarrier* provides parameters determining the location and width of the actual carrier or the carrier bandwidth. It is defined specifically for a numerology (subcarrier spacing (SCS)) and in relation (frequency offset) to Point A.

***SCS-SpecificCarrier*** information element

```
-- ASN1START
-- TAG-SCS-SPECIFICCARRIER-START
```

```
SCS-SpecificCarrier ::= SEQUENCE {
    offsetToCarrier          INTEGER (0..2199),
    subcarrierSpacing        SubcarrierSpacing,
    carrierBandwidth         INTEGER (1..maxNrofPhysicalResourceBlocks),
    ...,
    [[
        txDirectCurrentLocation    INTEGER (0..4095)          OPTIONAL    -- Need S
    ]]
}
```

```
-- TAG-SCS-SPECIFICCARRIER-STOP
-- ASN1STOP
```

| SCS-SpecificCarrier field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>carrierBandwidth</b><br>Width of this carrier in number of PRBs (using the <i>subcarrierSpacing</i> defined for this carrier) (see TS 38.211 [16], clause 4.4.2). For the case that 12PRB/20 PRB transmission bandwidth is used as specified in TS 38.101-1 [15], TS 38.211[16] and TS 38.213[13], the network shall configure the <i>carrierBandwidth</i> to 15 PRB (for the 12 PRB case) and 25 PRB (for the 20 PRB case) respectively and the UE shall use 12PRB/20 PRB as the transmission bandwidth respectively.                                                                  |
| <b>offsetToCarrier</b><br>Offset in frequency domain between Point A (lowest subcarrier of common RB 0) and the lowest usable subcarrier on this carrier in number of PRBs (using the <i>subcarrierSpacing</i> defined for this carrier). The maximum value corresponds to 275*8-1. See TS 38.211 [16], clause 4.4.2.                                                                                                                                                                                                                                                                      |
| <b>txDirectCurrentLocation</b><br>Indicates the downlink Tx Direct Current location for the carrier. A value in the range 0..3299 indicates the subcarrier index within the carrier. The values in the value range 3301..4095 are reserved and ignored by the UE. If this field is absent for downlink within <i>ServingCellConfigCommon</i> and <i>ServingCellConfigCommonSIB</i> , the UE assumes the default value of 3300 (i.e. "Outside the carrier"). (see TS 38.211 [16], clause 4.4.2). Network does not configure this field via <i>ServingCellConfig</i> or for uplink carriers. |
| <b>subcarrierSpacing</b><br>Subcarrier spacing of this carrier. It is used to convert the <i>offsetToCarrier</i> into an actual frequency.<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15, 30 or 60 kHz<br>FR2-1/FR2-NTN: 60 or 120 kHz<br>FR2-2: 120, 480, or 960 kHz                                                                                                                                                                                                                                                                            |

– SDAP-Config

The IE *SDAP-Config* is used to set the configurable SDAP parameters for a data radio bearer. All configured instances of *SDAP-Config* with the same value of *pdu-Session* correspond to the same SDAP entity as specified in TS 37.324 [24].

SDAP-Config information element

```
-- ASN1START
-- TAG-SDAP-CONFIG-START

SDAP-Config ::=
    pdu-Session
    sdap-HeaderDL
    sdap-HeaderUL
    defaultDRB
    mappedQoS-FlowsToAdd
    mappedQoS-FlowsToRelease
    ...
}

    SEQUENCE (SIZE (1..maxNrofQFIs)) OF QFI OPTIONAL, -- Need N
}

-- TAG-SDAP-CONFIG-STOP
-- ASN1STOP
```

| SDAP-Config field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>defaultDRB</b><br>Indicates whether or not this is the default DRB for this PDU session. Among all configured instances of <i>SDAP-Config</i> with the same value of <i>pdu-Session</i> , this field shall be set to <i>true</i> in at most one instance of <i>SDAP-Config</i> and to <i>false</i> in all other instances.                                                                                                                                                                                                                        |
| <b>mappedQoS-FlowsToAdd</b><br>Indicates the list of QFIs of UL QoS flows of the PDU session to be additionally mapped to this DRB. A QFI value can be included at most once in all configured instances of <i>SDAP-Config</i> with the same value of <i>pdu-Session</i> . For QoS flow remapping, the QFI value of the remapped QoS flow is only included in <i>mappedQoS-FlowsToAdd</i> in <i>sdap-Config</i> corresponding to the new DRB and not included in <i>mappedQoS-FlowsToRelease</i> in <i>sdap-Config</i> corresponding to the old DRB. |
| <b>mappedQoS-FlowsToRelease</b><br>Indicates the list of QFIs of QoS flows of the PDU session to be released from existing QoS flow to DRB mapping of this DRB.                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>pdu-Session</b><br>Identity of the PDU session whose QoS flows are mapped to the DRB.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>sdap-HeaderUL</b><br>Indicates whether or not a SDAP header is present for UL data on this DRB. The field cannot be changed after a DRB is established. The network sets this field to <i>present</i> if the field <i>defaultDRB</i> is set to <i>true</i> .                                                                                                                                                                                                                                                                                      |
| <b>sdap-HeaderDL</b><br>Indicates whether or not a SDAP header is present for DL data on this DRB. The field cannot be changed after a DRB is established.                                                                                                                                                                                                                                                                                                                                                                                           |

– SearchSpace

The IE *SearchSpace* defines how/where to search for PDCCH candidates. Each search space is associated with one *ControlResourceSet*. For a scheduled SCell in the case of cross carrier scheduling, except for *nrofCandidates*, all the optional fields are absent (regardless of their presence conditions). For a scheduled SpCell in the case of the cross carrier scheduling, if the search space is linked to another search space in the scheduling SCell, all the optional fields of this search space in the scheduled SpCell are absent (regardless of their presence conditions) except for *nrofCandidates*.

| <p><b><i>dcf-FormatsSL-PRS</i></b><br/>Indicates whether the UE monitors in this USS for DCI formats 3-2 or for formats 3-0 and 3-2 or for formats 3-0 and 3-1 and 3-2 or for formats 3-1 and 3-2. If this field is present, the field <i>dcf-Formats</i> is ignored and <i>dcf-FormatsSL-PRS</i> is used.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <p><b><i>duration</i></b><br/>Number of consecutive slots that a SearchSpace lasts in every occasion, i.e., upon every period as given in the <i>periodicityAndOffset</i>. If the field is absent, the UE applies the value 1 slot, except for DCI format 2_0. The UE ignores this field for DCI format 2_0. The maximum valid duration is periodicity-1 (periodicity as given in the <i>monitoringSlotPeriodicityAndOffset</i>).<br/>For SCS 480 kHz and SCS 960 kHz, <i>duration-r17</i> is used, and the configured duration is restricted to be an integer multiple of L slots and smaller than periodicity, where L is the configured length of the bitmap <i>monitoringSlotsWithinSlotGroup-r17</i>. If <i>duration-r17</i> is absent, the UE assumes the duration in slots is equal to L. The maximum valid duration is periodicity-L.<br/><br/>For IAB-MT, duration indicates number of consecutive slots that a SearchSpace lasts in every occasion, i.e., upon every period as given in the <i>periodicityAndOffset</i>. If the field is absent, the IAB-MT applies the value 1 slot, except for DCI format 2_0 and DCI format 2_5. The IAB-MT ignores this field for DCI format 2_0 and DCI format 2_5. The maximum valid duration is periodicity-1 (periodicity as given in the <i>monitoringSlotPeriodicityAndOffset</i>).</p> |
| <p><b><i>freqMonitorLocations</i></b><br/>Defines an association of the search space to multiple monitoring locations in the frequency domain and indicates whether the pattern configured in the associated CORESET is replicated to a specific RB set, see TS 38.213, clause 10.1. Each bit in the bitmap corresponds to one RB set, and the leftmost (most significant) bit corresponds to RB set 0 in the BWP. A bit set to 1 indicates that a frequency domain resource allocation replicated from the pattern configured in the associated CORESET is mapped to the RB set.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**monitoringSlotPeriodicityAndOffset**

Slots for PDCCH Monitoring configured as periodicity and offset.

For SCS 15, 30, 60, and 120 kHz and if the UE is configured to monitor:

- DCI format 2\_1, only the values 'sl1', 'sl2' or 'sl4' are applicable.
- DCI format 2\_0, only the values 'sl1', 'sl2', 'sl4', 'sl5', 'sl8', 'sl10', 'sl16', and 'sl20' are applicable (see TS 38.213 [13], clause 10).
- DCI format 2\_4, only the values 'sl1', 'sl2', 'sl4', 'sl5', 'sl8' and 'sl10' are applicable.

For SCS 480 kHz and if the UE is configured to monitor:

- DCI format 2\_0, only the values 'sl4', 'sl8', 'sl16', 'sl20', 'sl32', 'sl40', 'sl64', and 'sl80' are applicable.
- DCI format 2\_1, only the values 'sl4', 'sl8', and 'sl16' are applicable.
- DCI format 2\_4, only the values 'sl4', 'sl8', 'sl16', 'sl20', 'sl32', 'sl40' are applicable.

For SCS 960 kHz and if the UE is configured to monitor:

- DCI format 2\_0, only the values 'sl8', 'sl16', 'sl32', 'sl40', 'sl64', 'sl80', 'sl128', and 'sl160' are applicable.
- DCI format 2\_1, only the values 'sl8', 'sl16', and 'sl32' are applicable.
- DCI format 2\_4, only the values 'sl8', 'sl16', 'sl32', 'sl40', 'sl64', 'sl80' are applicable.

For SCS 480 kHz and SCS 960 kHz, and the configured periodicity and offset are restricted to be an integer multiple of L slots, where L is the configured length of the bitmap provided by *monitoringSlotsWithinSlotGroup-r17*, i.e. for a given periodicity, the offset has a range of {0, L, 2\*L, ..., L\*FLOOR(1/L\*(periodicity-1))}.

For IAB-MT, If the IAB-MT is configured to monitor DCI format 2\_1, only the values 'sl1', 'sl2' or 'sl4' are applicable. If the IAB-MT is configured to monitor DCI format 2\_0 or DCI format 2\_5, only the values 'sl1', 'sl2', 'sl4', 'sl5', 'sl8', 'sl10', 'sl16', and 'sl20' are applicable (see TS 38.213, clause 10).

If *monitoringSlotPeriodicityAndOffset-v1710* is present, any previously configured *monitoringSlotPeriodicityAndOffset* is released, and if *monitoringSlotPeriodicityAndOffset* is present, any previously configured *monitoringSlotPeriodicityAndOffset-v1710* is released.

**monitoringSlotsWithinSlotGroup**

Indicates which slot(s) within a slot group are configured for multi-slot PDCCH monitoring. The first (leftmost, most significant) bit represents the first slot in the slot group, the second bit represents the second slot in the slot group, and so on. A bit set to '1' indicates that the corresponding slot is configured for multi-slot PDCCH monitoring (see TS 38.213 [13], clause 10). The number of slots for multi-slot PDCCH monitoring is configured according to clause 10 in TS 38.213 [13].

**monitoringSymbolsWithinSlot**

The first symbol(s) for PDCCH monitoring in the slots configured for (multi-slot) PDCCH monitoring (see *monitoringSlotPeriodicityAndOffset* and *duration*). The most significant (left) bit represents the first OFDM in a slot, and the second most significant (left) bit represents the second OFDM symbol in a slot and so on. The bit(s) set to one identify the first OFDM symbol(s) of the control resource set within a slot. If the cyclic prefix of the BWP is set to extended CP, the last two bits within the bit string shall be ignored by the UE or IAB-MT.

For DCI format 2\_0, the first one symbol applies if the *duration* of CORESET (in the IE *ControlResourceSet*) identified by *controlResourceSetId* indicates 3 symbols, the first two symbols apply if the *duration* of CORESET identified by *controlResourceSetId* indicates 2 symbols, and the first three symbols apply if the *duration* of CORESET identified by *controlResourceSetId* indicates 1 symbol.

See TS 38.213 [13], clause 10.

For IAB-MT: For DCI format 2\_0 or DCI format 2\_5, the first one symbol applies if the *duration* of CORESET (in the IE *ControlResourceSet*) identified by *controlResourceSetId* indicates 3 symbols, the first two symbols apply if the *duration* of CORESET identified by *controlResourceSetId* indicates 2 symbols, and the first three symbols apply if the *duration* of CORESET identified by *controlResourceSetId* indicates 1 symbol.

See TS 38.213 [13], clause 10.

**nrofCandidates-CI**

The number of PDCCH candidates specifically for format 2-4 for the configured aggregation level. If an aggregation level is absent, the UE does not search for any candidates with that aggregation level. The network configures only one aggregationLevel and the corresponding number of candidates (see TS 38.213 [13], clause 10.1). In this release of the specification, only value *n1* is valid.

**nrofCandidates-PEI**

The number of PDCCH candidates specifically for format 2-7 for the configured aggregation level.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <p><b><i>nrofCandidates-SFI</i></b><br/>The number of PDCCH candidates specifically for format 2-0 for the configured aggregation level. If an aggregation level is absent, the UE does not search for any candidates with that aggregation level. The network configures only one aggregationLevel and the corresponding number of candidates (see TS 38.213 [13], clause 11.1.1). For a search space configured with <i>freqMonitorLocations-r16</i>, only value 'n1' is valid.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <p><b><i>nrofCandidates</i></b><br/>Number of PDCCH candidates per aggregation level. The number of candidates and aggregation levels configured here applies to all formats unless a particular value is specified or a format-specific value is provided (see inside <i>searchSpaceType</i>). If configured in the <i>SearchSpace</i> of a cross carrier scheduled cell, this field determines the number of candidates and aggregation levels to be used on the linked scheduling cell (see TS 38.213 [13], clause 10).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <p><b><i>searchSpaceGroupIDList-r16, searchSpaceGroupIDList-r17</i></b><br/>List of search space group IDs which the search space is associated with. The network configures at most 2 search space groups per BWP where the group ID is either 0 or 1 if <i>searchSpaceGroupIDList-r16</i> is included. The network configures at most 3 search space groups per BWP where the group ID is either 0, 1 or 2 if <i>searchSpaceGroupIDList-r17</i> is included. And if <i>searchSpaceGroupIDList-r17</i> is included, <i>searchSpaceGroupIDList-r16</i> is ignored.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <p><b><i>searchSpaceId</i></b><br/>Identity of the search space. SearchSpaceId = 0 identifies the <i>searchSpaceZero</i> configured via PBCH (MIB) or <i>ServingCellConfigCommon</i> and may hence not be used in the <i>SearchSpace</i> IE. The <i>searchSpaceId</i> is unique among the BWPs of a Serving Cell. In case of cross carrier scheduling, search spaces with the same <i>searchSpaceId</i> in scheduled cell and scheduling cell are linked to each other. The UE applies the search space for the scheduled cell only if the DL BWPs in which the linked search spaces are configured in scheduling cell and scheduled cell are both active.<br/>For an IAB-MT, the search space defines how/where to search for PDCCH candidates for an IAB-MT where each search space is associated with one ControlResearchSet and for a scheduled cell in the case of cross carrier scheduling, except for <i>nrofCandidates</i>, all the optional fields are absent.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <p><b><i>SearchSpaceLinkingId</i></b><br/>This parameter is used to link two search spaces of same type in the same BWP. If two search spaces have the same SearchSpaceLinkingId UE assumes these search spaces are linked to PDCCH repetition REF. When PDCCH repetition is monitored in two linked search space (SS) sets, the UE does not expect a third monitored SS set to be linked with any of the two linked SS sets. The two linked SS sets have the same SS set type (USS/CSS). The two linked SS sets have the same DCI formats to monitor. For intra-slot PDCCH repetition: The two SS sets should have the same periodicity and offset (monitoringSlotPeriodicityAndOffset), and the same duration. For linking monitoring occasions across the two SS sets that exist in the same slot: The two SS sets have the same number of monitoring occasions within a slot and n-th monitoring occasion of one SS set is linked to n-th monitoring occasion of the other SS set. The following SS sets cannot be linked with another SS set for PDCCH repetition: SS set 0, <i>searchSpaceSIB1</i>, <i>searchSpaceOtherSystemInformation</i>, <i>pagingSearchSpace</i>, <i>ra-SearchSpace</i>, <i>searchSpaceMCCH</i>, <i>searchSpaceMTCH</i>, <i>peiSearchSpace</i>, and <i>sdt-SearchSpace</i>. SS set configured by <i>recoverySearchSpaceId</i> cannot be linked to another SS set for PDCCH repetition. When a scheduled serving cell is configured to be cross-carrier scheduled by a scheduling serving cell, two PDCCH candidates (with the same AL and candidate index associated with the scheduled serving cell) are linked only if the corresponding two SS sets in the scheduling serving cell are linked and two SS sets in the scheduled serving cell with the same SS set IDs are also linked.<br/>This parameter is not applicable to search space configured with <i>dci-FormatsSL</i> for monitoring format 3-0 or format 3-1 or for monitoring formats 3-0 and format 3-1.<br/>This parameter is not applicable to search space configured with <i>dci-FormatsSL-PRS</i> for monitoring format 3-2 or for monitoring formats 3-0 and 3-2 or for monitoring formats 3-1 and 3-2.</p> |
| <p><b><i>searchSpaceType</i></b><br/>Indicates whether this is a common search space (present) or a UE specific search space as well as DCI formats to monitor for.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <p><b><i>ue-Specific</i></b><br/>Configures this search space as UE specific search space (USS). The UE monitors the DCI format with CRC scrambled by C-RNTI, CS-RNTI (if configured), and SP-CSI-RNTI (if configured)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## — *SearchSpaceId*

The IE *SearchSpaceId* is used to identify Search Spaces. The ID space is used across the BWPs of a Serving Cell. The search space with the *SearchSpaceId* = 0 identifies the search space configured via PBCH (MIB) and in *ServingCellConfigCommon* (*searchSpaceZero*). The number of Search Spaces per BWP is limited to 10 including the common and UE specific Search Spaces.

### ***SearchSpaceId* information element**

```
-- ASN1START
-- TAG-SEARCHSPACEID-START
```

```
SearchSpaceId ::= INTEGER (0..maxNrofSearchSpaces-1)
```

```
-- TAG-SEARCHSPACEID-STOP
-- ASN1STOP
```

## — *SearchSpaceZero*

The IE *SearchSpaceZero* is used to configure SearchSpace#0 of the initial BWP (see TS 38.213 [13], clause 13).

### ***SearchSpaceZero* information element**

```
-- ASN1START
-- TAG-SEARCHSPACEZERO-START
```

```
SearchSpaceZero ::=                INTEGER (0..15)

-- TAG-SEARCHSPACEZERO-STOP
-- ASN1STOP
```

– *SecurityAlgorithmConfig*

The IE *SecurityAlgorithmConfig* is used to configure AS integrity protection algorithm and AS ciphering algorithm for SRBs and DRBs.

***SecurityAlgorithmConfig* information element**

```
-- ASN1START
-- TAG-SECURITYALGORITHMCONFIG-START

SecurityAlgorithmConfig ::=        SEQUENCE {
    cipheringAlgorithm              CipheringAlgorithm,
    integrityProtAlgorithm          IntegrityProtAlgorithm    OPTIONAL, -- Need R
    ...
}

IntegrityProtAlgorithm ::=        ENUMERATED {
    nia0, nia1, nia2, nia3, spare4, spare3,
    spare2, spare1, ...}

CipheringAlgorithm ::=            ENUMERATED {
    nea0, nea1, nea2, nea3, spare4, spare3,
    spare2, spare1, ...}

-- TAG-SECURITYALGORITHMCONFIG-STOP
-- ASN1STOP
```

| SecurityAlgorithmConfig field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b><i>cipheringAlgorithm</i></b></p> <p>Indicates the ciphering algorithm to be used for SRBs and DRBs, as specified in TS 33.501 [11]. The algorithms <i>nea0-nea3</i> are identical to the LTE algorithms <i>eea0-3</i>. The algorithms configured for all bearers using master key shall be the same, and the algorithms configured for all bearers using secondary key, if any, shall be the same. If UE is connected to E-UTRA/EPC, this field indicates the ciphering algorithm to be used for RBs configured with NR PDCP, as specified in TS 33.501 [11].</p>                                                                                                                                                                                                                                                                                                                |
| <p><b><i>integrityProtAlgorithm</i></b></p> <p>Indicates the integrity protection algorithm to be used for SRBs and DRBs, as specified in TS 33.501 [11]. The algorithms <i>nia0-nia3</i> are identical to the E-UTRA algorithms <i>eia0-3</i>. The algorithms configured for all bearers using master key shall be the same and the algorithms configured for all bearers using secondary key, if any, shall be the same. The network does not configure <i>nia0</i> except for unauthenticated emergency sessions for unauthenticated UEs in LSM (limited service mode). If UE is connected to E-UTRA/EPC, this field indicates the integrity protection algorithm to be used for SRBs configured with NR PDCP as specified in TS 33.501 [11], and DRBs configured with integrity protection as specified in TS 33.401 [30]. The network does not configure <i>nia0</i> for SRB3.</p> |

– *SelectedPSCellForCHO-WithSCG*

The IE *SelectedPSCellForCHO-WithSCG* is used to indicate the information of the selected target PSCell to target MN at execution of a conditional reconfiguration for CHO with candidate SCG(s).

***SelectedPSCellForCHO-WithSCG* information element**

```
-- ASN1START
-- TAG-SELECTEDPSCELLFORCHO-WITHSCG-START

SelectedPSCellForCHO-WithSCG-r18 ::= SEQUENCE {
    ssbFrequency-r18          ARFCN-ValueNR,
    physCellId-r18            PhysCellId
}

-- TAG-SELECTEDPSCELLFORCHO-WITHSCG-STOP
-- ASN1STOP
```

– *SemiStaticChannelAccessConfig*

The IE *SemiStaticChannelAccessConfig* is used to configure channel access parameters when the network is operating in semi-static channel access mode (see clause 4.3 in TS 37.213 [48]).

***SemiStaticChannelAccessConfig* information element**

```
-- ASN1START
-- TAG-SEMISTATICCHANNELACCESSCONFIG-START

SemiStaticChannelAccessConfig-r16 ::= SEQUENCE {
    period-r16          ENUMERATED {ms1, ms2, ms2dot5, ms4, ms5, ms10}
}

-- TAG-SEMISTATICCHANNELACCESSCONFIG-STOP
-- ASN1STOP
```

| <i>SemiStaticChannelAccessConfig</i> field descriptions                                                                                                                                                                                  |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>period</i></b><br>Indicates the periodicity of the semi-static channel access mode (see TS 37.213 [48], clause 4.3). Value ms1 corresponds to 1 ms, value ms2 corresponds to 2 ms, value ms2dot5 corresponds to 2.5 ms, and so on. |

– *SemiStaticChannelAccessConfigUE*

The IE *SemiStaticChannelAccessConfigUE* is used to configure channel access parameters for UE initiated semi-static channel access.

*SemiStaticChannelAccessConfigUE* information element

```
-- ASN1START
-- TAG-SEMISTATICCHANNELACCESSCONFIGUE-START

SemiStaticChannelAccessConfigUE-r17 ::= SEQUENCE {
    periodUE-r17          ENUMERATED {ms1, ms2, ms2dot5, ms4, ms5, ms10, spare2, spare1},
    offsetUE-r17          INTEGER (0..559)
}

-- TAG-SEMISTATICCHANNELACCESSCONFIGUE-STOP
-- ASN1STOP
```

| <i>SemiStaticChannelAccessConfigUE</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>periodUE</i></b><br>Indicates the period of a channel occupancy that the UE can initiate as described in TS 37.213 [48], clause 4.3. Value ms1 corresponds to 1 ms, value ms2 corresponds to 2 ms, value ms2dot5 corresponds to 2.5 ms, and so on.                                                                                                                                                                                                                                                                                |
| <b><i>offsetUE</i></b><br>Indicates the number of symbols from the beginning of the even indexed radio frame to the start of the first period within that radio frame that the UE can initiate a channel occupancy (see TS 37.213 [48], clause 4.3), based on the smallest SCS among the configured SCSs in the serving cell. The offset duration indicated by this field is less than the period duration indicated by <i>periodUE</i> . The maximum value is 139, 279 and 559 for 15, 30 and 60 kHz subcarrier spacing, respectively. |

— *Sensor-LocationInfo*

The IE *Sensor-LocationInfo* is used by the UE to provide sensor information.

*Sensor-LocationInfo* information element

```
-- ASN1START
-- TAG-SENSORLOCATIONINFO-START

Sensor-LocationInfo-r16 ::= SEQUENCE {
    sensor-MeasurementInformation-r16 OCTET STRING OPTIONAL,
    sensor-MotionInformation-r16     OCTET STRING OPTIONAL,
    ...
}

-- TAG-SENSORLOCATIONINFO-STOP
-- ASN1STOP
```

| Sensor-LocationInfo field descriptions                                                                                                                                                                                                       |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>sensor-MeasurementInformation</b><br>This field provides barometric pressure measurements as <i>Sensor-MeasurementInformation</i> defined in TS 37.355 [49]. The first/leftmost bit of the first octet contains the most significant bit. |
| <b>sensor-MotionInformation</b><br>This field provides motion sensor measurements as <i>Sensor-MotionInformation</i> defined in TS 37.355 [49]. The first/leftmost bit of the first octet contains the most significant bit.                 |

– *ServingCellAndBWP-Id*

The IE *ServingCellAndBWP-Id* is used to indicate a serving cell and an uplink or a downlink BWP.

***ServingCellAndBWP-Id* information element**

```
-- ASN1START
-- TAG-SERVINGCELLANDBWP-ID-START

ServingCellAndBWP-Id-r17 ::= SEQUENCE {
    servingcell-r17      ServCellIndex,
    bwp-r17              BWP-Id
}

-- TAG-SERVINGCELLANDBWP-ID-STOP
-- ASN1STOP
```

– *ServCellIndex*

The IE *ServCellIndex* concerns a short identity, used to uniquely identify a serving cell (i.e. the PCell, the PSCell or an SCell) across the cell groups. Value 0 applies for the PCell, while the *SCellIndex* that has previously been assigned applies for SCells.

***ServCellIndex* information element**

```
-- ASN1START
-- TAG-SERVCELLINDEX-START

ServCellIndex ::=
    INTEGER (0..maxNrofServingCells-1)

-- TAG-SERVCELLINDEX-STOP
-- ASN1STOP
```

## – *ServingCellConfig*

The IE *ServingCellConfig* is used to configure (add or modify) the UE with a serving cell, which may be the SpCell or an SCell of an MCG or SCG. The parameters herein are mostly UE specific but partly also cell specific (e.g. in additionally configured bandwidth parts). Reconfiguration between a PUCCH and PUCCHless SCell is only supported using an SCell release and add.

### *ServingCellConfig* information element

```
-- ASN1START
-- TAG-SERVINGCELLCONFIG-START

ServingCellConfig ::=

| <b><i>additionalTDDConfig-perPCI-ToAddModList</i></b><br>List of TDD-UL-DL configurations for the additional PCIs. When the network releases an additional PCI of a serving cell, the network also explicitly releases the associated TDD-UL-DL configuration for the additional PCI.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>bwp-InactivityTimer</i></b><br>The duration in ms after which the UE falls back to the default Bandwidth Part (see TS 38.321 [3], clause 5.15). When the network releases the timer configuration, the UE stops the timer without switching to the default BWP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>ca-SlotOffset</i></b><br>Slot offset between the primary cell (PCell/PSCell) and the SCell in unaligned frame boundary with slot alignment and partial SFN alignment inter-band CA. Based on this field, the UE determines the time offset of the SCell as specified in clause 4.5 of TS 38.211 [16]. The granularity of this field is determined by the reference SCS for the slot offset (i.e. the maximum of PCell/PSCell lowest SCS among all the configured SCSs in DL/UL <i>SCS-SpecificCarrierList</i> in <i>ServingCellConfigCommon</i> or <i>ServingCellConfigCommonSIB</i> and this serving cell's lowest SCS among all the configured SCSs in DL/UL <i>SCS-SpecificCarrierList</i> in <i>ServingCellConfigCommon</i> or <i>ServingCellConfigCommonSIB</i> ).<br>The Network configures at most single non-zero offset duration in ms (independent on SCS) among CCs in the unaligned CA configuration. If the field is absent, the UE applies the value of 0. The slot offset value can only be changed with SCell release and add. |
| <b><i>cbg-TxDiffTbsProcessingType1, cbg-TxDiffTbsProcessingType2</i></b><br>Indicates whether processing types 1 and 2 based CBG based operation is enabled according to Rel-16 UE capabilities.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>cellDTX-DRX-Config</i></b><br>Used to configure cell DTX/DRX for the serving cell, as specified in TS 38.321 [3]. A maximum of two cell DTX/DRX patterns can be configured per MAC entity for different serving cells. The two configured patterns are aligned, that the start and slot offset are common and the periodicity of one pattern is an integer multiple of the other. Cell DTX is configured only when connected mode DRX is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>cellDTX-DRX-L1activation</i></b><br>Indicates whether this serving cell has enabled L1 signaling based on DCI 2_9 for dynamic activation/deactivation of cell DTX/DRX configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b><i>cjt-Scheme-PDSCH</i></b><br>This field is used to configure CJT Tx scheme <i>cjtSchemeA</i> or <i>cjtSchemeB</i> for PDSCH reception, see TS 38.214 [19] clause 5.1.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Indicates that this serving cell is using directional collision handling between a reference and other cell(s) for half-duplex operation in TDD CA with same SCS as specified in TS 38.213 [13], clause 11.1. The half-duplex operation only applies within the same frequency range and cell group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| The network only configures this field for TDD serving cells that are using the same SCS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>directionalCollisionHandling-DC</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| For the IAB-MT, it indicates that this serving cell is using directional collision handling between a reference and other cell(s) for half-duplex operation in TDD NR-DC with same SCS within same cell group or cross different cell groups.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>downlinkChannelBW-PerSCS-List</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| A set of UE specific channel bandwidth and location configurations for different subcarrier spacings (numerologies). Defined in relation to Point A. The UE uses the configuration provided in this field only for the purpose of channel bandwidth and location determination. If absent, UE uses the configuration indicated in <i>scs-SpecificCarrierList</i> in <i>DownlinkConfigCommon</i> / <i>DownlinkConfigCommonSIB</i> . Network only configures channel bandwidth that corresponds to the channel bandwidth values defined in TS 38.101-1 [15], TS 38.101-2 [39], and TS 38.101-5 [75]. If the UE is an (e)RedCap UE and needs to autonomously switch to its initial downlink bandwidth part to perform a random access procedure but its current UE specific channel bandwidth does not cover the initial downlink bandwidth part, the UE autonomously changes its UE specific channel bandwidth to cover the initial downlink bandwidth part. In that case, after completion of the random access procedure, the network ensures that the UE specific channel bandwidth fully covers the UE's active downlink bandwidth part in subsequent bandwidth part switch operations. |

| Indicates the Type-1 HARQ codebook generation as specified in TS 38.213 [13], clause 9.1.2.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>firstActiveDownlinkBWP-Id</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| If configured for an SpCell, this field contains the ID of the DL BWP to be activated or to be used for RLM, BFD and measurements if included in an <i>RRCReconfiguration</i> message contained in an NR or E-UTRA RRC message indicating that the SCG is deactivated, upon performing the RRC (re-)configuration. If the field is absent, the RRC (re-)configuration does not impose a BWP switch. If the field is absent for the PSCell at SCG deactivation, the UE considers the previously activated DL BWP as the BWP to be used for RLM, BFD and measurements. If the field is absent for the PSCell at SCG activation, the DL BWP to be activated is the DL BWP previously to be used for RLM, BFD and measurements.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| If configured for an SCell, this field contains the ID of the downlink bandwidth part to be used upon activation of an SCell. The initial bandwidth part is referred to by BWP-Id = 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Upon reconfiguration with <i>reconfigurationWithSync</i> , the network sets the <i>firstActiveDownlinkBWP-Id</i> and <i>firstActiveUplinkBWP-Id</i> to the same value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| The dedicated (UE-specific) configuration for the initial downlink bandwidth-part (i.e., DL BWP#0). If any of the optional IEs are configured within this IE, the UE considers the BWP#0 to be an RRC configured BWP (from UE capability viewpoint). Otherwise, the UE does not consider the BWP#0 as an RRC configured BWP (from UE capability viewpoint). Network always configures the UE with a value for this field if no other BWPs are configured. NOTE1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| List of intra-cell guard bands in a serving cell for operation with shared spectrum channel access in FR1. If not configured, the guard bands are defined according to 38.101-1 [15], see TS 38.214 [19], clause 7. For operation in licensed spectrum, this field is absent, and no UE action is required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| A list of LTE CRS patterns around which the UE shall do rate matching for PDSCH. The LTE CRS patterns in this list shall be non-overlapping in frequency. The network does not configure this field and <i>lte-CRS-ToMatchAround</i> simultaneously.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>lte-CRS-PatternList2</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| A list of LTE CRS patterns around which the UE shall do rate matching for PDSCH scheduled with a DCI detected on a CORESET with CORESETPoolIndex configured with 1. This list is configured only if CORESETPoolIndex configured with 1. The first LTE CRS pattern in this list shall be fully overlapping in frequency with the first LTE CRS pattern in <i>lte-CRS-PatternList1</i> . The second LTE CRS pattern in this list shall be fully overlapping in frequency with the second LTE CRS pattern in <i>lte-CRS-PatternList1</i> , and so on. Network configures this field only if the field <i>lte-CRS-ToMatchAround</i> is not configured and there is at least one ControlResourceSet in one DL BWP of this serving cell with <i>coresetPoolIndex</i> set to 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>lte-CRS-PatternList3</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| A list of LTE CRS patterns around which the UE shall do rate matching for PDSCH. The LTE CRS patterns in this list shall be non-overlapping in frequency. The network does not configure this field and <i>lte-CRS-ToMatchAround</i> , or this field and <i>lte-CRS-PatternList1</i> , or this field and <i>lte-CRS-PatternList2</i> simultaneously.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>lte-CRS-PatternList4</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| A list of LTE CRS patterns around which the UE shall do rate matching for PDSCH. The LTE CRS patterns in this list shall be non-overlapping in frequency. The first LTE CRS pattern in this list shall be fully overlapping in frequency with the first LTE CRS pattern in <i>lte-CRS-PatternList3</i> . The second LTE CRS pattern in this list shall be fully overlapping in frequency with the second LTE CRS pattern in <i>lte-CRS-PatternList3</i> , and so on. Network configures this field only if the field <i>lte-CRS-ToMatchAround</i> is not configured and the field <i>lte-CRS-PatternList3</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>lte-CRS-ToMatchAround</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Parameters to determine an LTE CRS pattern that the UE shall rate match around.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Configures the UE behaviour for Type1 codebook HARQ ACK generation regarding the number of PDSCHs per slot on a serving cell as specified in TS 38.213 [13], clause 9.1.2.1.<br>When this parameter is configured and set to <i>disabled</i> for a serving cell, the network does not schedule UE with more than one PDSCH in a slot on the serving cell if HARQ-ACKs of any two PDSCHs in the slot on the serving cell are supposed to be reported on one PUCCH resource in the same PUCCH slot. If two <i>coresetPoolIndex</i> values are configured, the number of received PDSCHs is per <i>coresetPoolIndex</i> value per slot for a serving cell. If the UE generates two HARQ-ACK codebooks for two priorities, the number of received PDSCHs is per priority per slot for a serving cell. If <i>fdmed-ReceptionMulticast</i> is configured, the number of received PDSCHs is per traffic type (unicast / multicast) per slot for a serving cell. |

| Resources patterns which the UE should rate match PDSCH around. The UE rate matches around the union of all resources indicated in the rate match patterns. Rate match patterns defined here on cell level apply only to PDSCH of the same numerology. See TS 38.214 [19], clause 5.1.4.1. If a <i>RateMatchPattern</i> with the same <i>RateMatchPatternId</i> is configured in both <i>ServingCellConfig/ServingCellConfigCommon</i> and in SIB20/MCCH, the entire <i>RateMatchPattern</i> configuration shall be the same, including the set of RBs/REs indicated by the patterns for the rate matching around, and they are counted as a single rate match pattern in the total configured rate match patterns as defined in TS 38.214 [19].                                                                                                                                                                                                         |

| <b>sfnSchemePDCCH</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| This parameter is used to configure single frequency network scheme for PDCCH: <i>sfnSchemeA</i> or <i>sfnSchemeB</i> as specified (see TS 38.214 [19], clause 5.1). If network includes both <i>sfnSchemePDCCH</i> and <i>sfnSchemePDSCH</i> , same value shall be configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>sfnSchemePDSCH</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| This parameter is used to configure single frequency network scheme for PDSCH: <i>sfnSchemeA</i> or <i>sfnSchemeB</i> as specified (see TS 38.214 [19], clause 5.1). If network includes both <i>sfnSchemePDCCH</i> and <i>sfnSchemePDSCH</i> , same value shall be configured. The network does not configure this parameter and <i>repetitionSchemeConfig</i> in <i>PDSCH-Config</i> simultaneously in the same serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>semiStaticChannelAccessConfigUE</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| When this field is configured and when <i>channelAccessMode-r16</i> (see IE <i>ServingCellConfigCommon</i> and IE <i>ServingCellConfigCommonSIB</i> ) is configured to <i>semiStatic</i> , the UE operates in semi-static channel access mode and can initiate a channel occupancy periodically (see TS 37.213 [48], Clause 4.3).<br>The period can be configured independently from period configured in <i>SemiStaticChannelAccessConfig-r16</i> if the UE indicates the corresponding capability. Otherwise, the periodicity configured by <i>periodUE-r17</i> is an integer multiple of or an integer factor of the periodicity indicated by <i>period</i> in <i>SemiStaticChannelAccessConfig-r16</i> .                                                                                                                                                                                                                                             |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>servingCellMO</b><br/> <i>measObjectld</i> of the <i>MeasObjectNR</i> in <i>MeasConfig</i> which is associated to the serving cell. If the serving cell is associated with SSB, the following relationship applies between the corresponding <i>MeasObjectNR</i> and <i>frequencyInfoDL</i> in <i>ServingCellConfigCommon/ServingCellConfigCommonSIB</i> of the serving cell: if <i>ssbFrequency</i> is configured, its value is the same as the <i>absoluteFrequencySSB</i> and if <i>csi-rs-ResourceConfigMobility</i> is configured, the value of its <i>subcarrierSpacing</i> is present in one entry of the <i>scs-SpecificCarrierList</i>, <i>csi-RS-CellListMobility</i> includes an entry corresponding to the serving cell (with <i>cellld</i> equal to <i>physCellld</i> in <i>ServingCellConfigCommon</i>) and the frequency range indicated by the <i>csi-rs-MeasurementBW</i> of the entry in <i>csi-RS-CellListMobility</i> is included in the frequency range indicated by in the entry of the <i>scs-SpecificCarrierList</i>. If the serving cell is not associated with SSB (i.e. SSB-less SCell), the carrier frequency indicated by <i>ssbFrequency</i> of the corresponding <i>MeasObjectNR</i>, if configured, is within the frequency range indicated by any entry of the <i>scs-SpecificCarrierList</i>.</p>                                                                            |

|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>carrierSwitching</b><br>Includes parameters for configuration of carrier based SRS switching (see TS 38.214 [19], clause 6.2.1.3.                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>enableDefaultBeamPL-ForPUSCH0-0, enableDefaultBeamPL-ForPUCCH, enableDefaultBeamPL-ForSRS</b><br>When the parameter is present, UE derives the spatial relation and the corresponding pathloss reference Rs as specified in 38.213, clauses 7.1.1, 7.2.1, 7.3.1 and 9.2.2. The network only configures these parameters for FR2.                                                                                                                                                                                            |
| <b>enablePL-RS-UpdateForPUSCH-SRS</b><br>When this parameter is present, the Rel-16 feature of MAC CE based pathloss RS updates for PUSCH/SRS is enabled. Network only configures this parameter when the UE is configured with <i>sri-PUSCH-PowerControl</i> . If this field is not configured, network configures at most 4 pathloss RS resources for PUSCH/PUCCH/SRS transmissions per BWP, not including pathloss RS resources for SRS transmissions for positioning. (See TS 38.213 [13], clause 7).                      |
| <b>enablePL-RS-UpdateForType1CG-PUSCH</b><br>When this parameter is present, the Rel-18 feature of MAC CE based pathloss RS updates for Type 1 CG-PUSCH is enabled. The network only configures this parameter, when the parameter <i>enablePL-RS-UpdateForPUSCH-SRS</i> is configured. (See TS 38.213 [13], clause 7).                                                                                                                                                                                                        |
| <b>firstActiveUplinkBWP-Id</b><br>If configured for an SpCell, this field contains the ID of the UL BWP to be activated upon performing the RRC (re-)configuration. If the field is absent, the RRC (re-)configuration does not impose a BWP switch.<br>If configured for an SCell, this field contains the ID of the uplink bandwidth part to be used upon activation of an SCell. The initial bandwidth part is referred to by <i>BandwidthPartId</i> = 0.                                                                   |
| <b>initialUplinkBWP</b><br>The dedicated (UE-specific) configuration for the initial uplink bandwidth-part (i.e. UL BWP#0). If any of the optional IEs are configured within this IE as part of the IE <i>uplinkConfig</i> , the UE considers the BWP#0 to be an RRC configured BWP (from UE capability viewpoint). Otherwise, the UE does not consider the BWP#0 as an RRC configured BWP (from UE capability viewpoint). Network always configures the UE with a value for this field if no other BWPs are configured. NOTE1 |
| <b>moreThanOneNackOnlyMode</b><br>Indicates the mode of NACK-only feedback in the PUCCH transmission, as specified in TS 38.213 [13], clause 18. If multicast CFR is not configured, this field is not included. Otherwise, if the field is absent, UE uses mode 1 for multicast CFR.                                                                                                                                                                                                                                          |
| <b>mpr-PowerBoost-FR2</b><br>Indicates whether UE is allowed to boost uplink transmission power by suspending in-band emission (IBE) requirements as specified in TS 38.101-2 [39]. Network only configures this field for FR2 serving cells.                                                                                                                                                                                                                                                                                  |
| <b>powerBoostPi2BPSK</b><br>If this field is set to <i>true</i> , the UE determines the maximum output power for PUCCH/PUSCH transmissions that use pi/2 BPSK modulation according to TS 38.101-1 [15] /TS 38.101-5 [75], clause 6.2.4. The network ensures that <i>powerBoostPi2BPSK</i> and <i>powerBoostPi2BPSK-r18</i> are not configured at the same time for a UE.                                                                                                                                                       |
| <b>powerBoostQPSK</b><br>If this field is set to <i>true</i> , the UE determines the maximum output power for PUSCH transmissions that use QPSK modulation according to TS 38.101-1 [15], clause 6.2.4.                                                                                                                                                                                                                                                                                                                        |
| <b>pusch-ServingCellConfig</b><br>PUSCH related parameters that are not BWP-specific.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>srs-PosTx-Hopping</b><br>Contains configuration related to the SRS for Positioning with frequency hopping for RRC_CONNECTED state. When this field is present for a certain uplink carrier, and SP positioning SRS is configured, other positioning SRS resource sets configured in the uplink BWP configurations (i.e., <i>BWP-UplinkDedicated</i> ) on this uplink carrier cannot be configured as <i>semi-persistent</i> .                                                                                               |
| <b>uplinkBWP-ToAddModList</b><br>The additional bandwidth parts for uplink to be added or modified. In case of TDD uplink- and downlink BWP with the same <i>bandwidthPartId</i> are considered as a BWP pair and must have the same center frequency.                                                                                                                                                                                                                                                                         |
| <b>uplinkBWP-ToReleaseList</b><br>The additional bandwidth parts for uplink to be released.                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b><i>uplinkChannelBW-PerSCS-List</i></b><br/> A set of UE specific channel bandwidth and location configurations for different subcarrier spacings (numerologies). Defined in relation to Point A. The UE uses the configuration provided in this field only for the purpose of channel bandwidth and location determination. If absent, UE uses the configuration indicated in <i>scs-SpecificCarrierList</i> in <i>UplinkConfigCommon</i> / <i>UplinkConfigCommonSIB</i>. Network only configures channel bandwidth that corresponds to the channel bandwidth values defined in TS 38.101-1 [15], TS 38.101-2 [39], and TS 38.101-5 [75]. If the UE is an (e)RedCap UE and needs to autonomously switch to its initial uplink bandwidth part to perform a random access procedure but its current UE specific channel bandwidth does not cover the initial uplink bandwidth part, the UE autonomously changes its UE specific channel bandwidth to cover the initial uplink bandwidth part. In that case, after completion of the random access procedure, the network ensures that the UE specific channel bandwidth fully covers the UE's active uplink bandwidth part in subsequent bandwidth part switch operations.</p> |
| <p><b><i>uplinkTxSwitchingPeriodLocation</i></b><br/> Indicates whether the location of UL Tx switching period is configured in this uplink carrier in case of inter-band UL CA, SUL, or (NG)EN-DC, as specified in TS 38.101-1 [15] and TS 38.101-3 [34].<br/> In case of (NG)EN-DC, network always configures this field to TRUE for NR carrier (i.e. with (NG)EN-DC, the UL switching period always occurs on the NR carrier).<br/> In case of inter-band UL CA or SUL, for dynamic uplink Tx switching between 2 bands with 2 uplink carriers or 3 uplink carriers as defined in TS 38.101-1 [15], network configures this field to TRUE for the uplink carrier(s) on one band and configures this field to FALSE for the uplink carrier(s) on the other band. This field is set to the same value for the carriers on the same band.</p>                                                                                                                                                                                                                                                                                                                                                                                      |
| <p><b><i>uplinkTxSwitchingCarrier</i></b><br/> Indicates that the configured carrier is carrier1 or carrier2 for dynamic uplink Tx switching, as defined in TS 38.101-1 [15] and TS 38.101-3 [34]. In case of (NG)EN-DC, network always configures the NR carrier as carrier 2.<br/> In case of inter-band UL CA or SUL, for dynamic uplink Tx switching between 2 bands with 2 uplink carriers or 3 uplink carriers as defined in TS 38.101-1 [15], network configures the uplink carrier(s) on one band as carrier1 and the uplink carrier(s) on the other band as carrier2. This field is set to the same value for the carriers on the same band.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b><i>DormantBWP-Config</i></b> field descriptions                                                                                                                                                                                                                                                                                 |

| <b><i>ZP-CSI-DCI-1-3</i></b><br>Configure each row of the joint ZP-CSI-RS trigger table for DL scheduling via DCI format 1_3, where index for a cell points to a corresponding ZP-CSI-RS trigger applicable for DCI format 1_1, and the order of ZP-CSI-RS trigger index in each row refers the order of cells in <i>scheduledCellListDCI-1-3</i> (i.e., first index is for the first cell in <i>scheduledCellListDCI-1-3</i> , that are configured with <i>aperiodic-ZP-CSI-RS-ResourceSetsToAddModList</i> on at least one DL BWP and so on), the number of entries in a row of <i>ZP-CSI-DCI-1-3</i> should be the same as the number of cells, that are configured with <i>aperiodic-ZP-CSI-RS-ResourceSetsToAddModList</i> on at least one DL BWP, included in <i>scheduledCellListDCI-1-3</i> , and entries for co-scheduled cells in a row of <i>ZP-CSI-DCI-1-3</i> are interpreted based on the BWPs of co-scheduled cells on which the UE operates based on the BWP indicator field of DCI format 1_3 (see TS 38.212 [17], clause 7.3.1.2.4 and TS 38.213 [13], clause 12). |
| <b><i>zp-CSI-RSListDCI-1-3</i></b><br>Configure joint ZP-CSI-RS trigger table for DL scheduling via DCI format 1_3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

NOTE 1: If the dedicated part of initial UL/DL BWP configuration is absent, the initial BWP can be used but with some limitations. For example, changing to another BWP requires *RRCReconfiguration* since DCI format 1\_0 doesn't support DCI-based switching.

| Conditional Presence           | Explanation                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>2TA-TDD-Only</i>            | The field is optionally present, Need N, for a TDD cell, in the <i>mimoParam-v1850</i> if <i>additionalPCI-ToAddModList</i> is present in <i>ServingCellConfig</i> and if <i>tag2</i> is present in <i>ServingCellConfig</i> . It is absent otherwise.                                                                                                                          |
| <i>AsyncCA</i>                 | This field is mandatory present for SCells whose slot offset between the SpCell is not 0. Otherwise it is absent, Need S.                                                                                                                                                                                                                                                       |
| <i>MeasObject</i>              | This field is mandatory present for the SpCell if the UE has a <i>measConfig</i> , and it is optionally present, Need M, for SCells. For (e)RedCap UEs, this field is optionally present, Need M. For SSB-less SCell(s), this field is not present if <i>intraF-NeighMeasForSCellWithoutSSB</i> is not supported by the UE, otherwise this field is optionally present, Need M. |
| <i>SCellOnly</i>               | This field is optionally present, Need R, for SCells. It is absent otherwise.                                                                                                                                                                                                                                                                                                   |
| <i>ServingCellWithoutPUCCH</i> | This field is optionally present, Need S, for SCells except PUCCH SCells. It is absent otherwise.                                                                                                                                                                                                                                                                               |
| <i>SyncAndCellAdd</i>          | This field is mandatory present for a SpCell upon reconfiguration with <i>reconfigurationWithSync</i> and upon <i>RRCSetup/RRCResume</i> . The field is optionally present for an SpCell, Need N, upon reconfiguration without <i>reconfigurationWithSync</i> . The field is mandatory present for an SCell upon addition, and absent for SCell in other cases, Need M.         |
| <i>TCI_ActivatedConfig</i>     | This field is optional Need N for SCells if <i>sCellState</i> is configured, otherwise it is absent. This field is optional Need S for the PSCell when the SCG is indicated as deactivated or is being activated, otherwise it is absent. This field is absent for the PCell.                                                                                                   |

| <i>TypeDCI1-3</i>              | This field is mandatory present if <i>ScheduledCellListDCI-1-3</i> is configured, otherwise it is absent, Need R.                                                                                                                                                                                                                                                               |

## – *ServingCellConfigCommon*

The IE *ServingCellConfigCommon* is used to configure cell specific parameters of a UE's serving cell. The IE contains parameters which a UE would typically acquire from SSB, MIB or SIBs when accessing the cell from IDLE. With this IE, the network provides this information in dedicated signalling when configuring a UE with a SCells or with an additional cell group (SCG). It also provides it for SpCells (MCG and SCG) upon reconfiguration with sync.

### *ServingCellConfigCommon* information element

| <b><i>channelAccessMode</i></b><br>If present, this field indicates which channel access procedures to apply for operation with shared spectrum channel access as defined in TS 37.213 [48]. If the field is configured as "semiStatic", the UE shall apply the channel access procedures for semi-static channel occupancy as described in clause 4.3 in TS 37.213. If the field is configured as "dynamic", the UE shall apply the channel access procedures as defined in TS 37.213, clause 4.1 and 4.2.                                                                                                                                                                                                                                                                                     |
| <b><i>channelAccessMode2</i></b><br>If present, the UE shall apply channel access procedures for operation with shared spectrum channel access in accordance with TS 37.213 [48], clause 4.4 for FR2-2. If absent, the UE shall not apply any channel access procedure. The network always configures this field if channel access procedures are required for the serving cell within this region by regulations.                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>dmrs-TypeA-Position</i></b><br>Position of (first) DM-RS for downlink (see TS 38.211 [16], clause 7.4.1.1.1) and uplink (TS 38.211 [16], clause 6.4.1.1.3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>downlinkConfigCommon</i></b><br>The common downlink configuration of the serving cell, including the frequency information configuration and the initial downlink BWP common configuration. The parameters provided herein should match the parameters configured by MIB and SIB1 (if provided) of the serving cell, with the exception of <i>controlResourceSetZero</i> and <i>searchSpaceZero</i> which can be configured in <i>ServingCellConfigCommon</i> even if MIB indicates that they are absent.                                                                                                                                                                                                                                                                                 |
| <b><i>discoveryBurstWindowLength</i></b><br>Indicates the window length of the discovery burst in ms (see TS 37.213 [48]). The field <i>discoveryBurstWindowLength-r17</i> is applicable to SCS 480 kHz and SCS 960 kHz.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>featurePriorities</i></b><br>Indicates priorities for features, such as (e)RedCap, Slicing, SDT, MSG1-Repetitions, and MSG3-Repetitions for Coverage Enhancements. These priorities are used to determine which <i>FeatureCombinationPreambles</i> the UE shall use when a feature maps to more than one <i>FeatureCombinationPreambles</i> , as specified in TS 38.321 [3]. A lower value means a higher priority. The network does not signal the same priority for more than one feature. The network signals a priority for all feature that map to at least one <i>FeatureCombinationPreambles</i> .                                                                                                                                                                                 |
| <b><i>longBitmap</i></b><br>Bitmap when maximum number of SS/PBCH blocks per half frame equals to 64 as defined in TS 38.213 [13], clause 4.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>lte-CRS-ToMatchAround</i></b><br>Parameters to determine an LTE CRS pattern that the UE shall rate match around.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>mediumBitmap</i></b><br>Bitmap when maximum number of SS/PBCH blocks per half frame equals to 8 as defined in TS 38.213 [13], clause 4.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>n-TimingAdvanceOffset</i></b><br>The N_TA-Offset to be applied for all uplink transmissions on this serving cell if <i>n-TimingAdvanceOffset2</i> is not configured. If <i>tag2</i> is configured for this serving cell, this field is to be applied to all uplink transmissions associated to <i>tag-id</i> configured for this serving cell. If the field is absent, the UE applies the value defined for the duplex mode and frequency range of this serving cell. See TS 38.133 [14], table 7.1.2-2/table 7.1C.2-4.                                                                                                                                                                                                                                                                   |
| <b><i>ra-ChannelAccess</i></b><br>If present, this field indicates that the UE shall apply channel access procedures before msg1/msgA transmission for operation with shared spectrum channel access in accordance with TS 37.213 [48], clause 4.4.5 for FR2-2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>rateMatchPatternToAddModList</i></b><br>Resources patterns which the UE should rate match PDSCH around. The UE rate matches around the union of all resources indicated in the rate match patterns. Rate match patterns defined here on cell level apply only to PDSCH of the same numerology (see TS 38.214 [19], clause 5.1.4.1). If a <i>RateMatchPattern</i> with the same <i>RateMatchPatternId</i> is configured in both <i>ServingCellConfig/ServingCellConfigCommon</i> and in SIB20/MCCH, the entire <i>RateMatchPattern</i> configuration, including the set of RBs/REs indicated by the patterns for the rate matching around, shall be the same and they are counted as a single rate match pattern in the total configured rate match patterns as defined in TS 38.214 [19]. |
| <b><i>shortBitmap</i></b><br>Bitmap when maximum number of SS/PBCH blocks per half frame equals to 4 as defined in TS 38.213 [13], clause 4.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>ss-PBCH-BlockPower</i></b><br>Average EPRE of the resources elements that carry secondary synchronization signals in dBm that the NW used for SSB transmission, see TS 38.213 [13], clause 7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>ssb-periodicityServingCell</i></b><br>The SSB periodicity in ms for the rate matching purpose. If the field is absent, the UE applies the value ms5. (see TS 38.213 [13], clause 4.1)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Indicates the QCL relation between SSB positions for this serving cell as specified in TS 38.213 [13], clause 4.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>ssb-PositionsInBurst</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| For operation in licensed spectrum, indicates the time domain positions of the transmitted SS-blocks in a half frame with SS/PBCH blocks as defined in TS 38.213 [13], clause 4.1. The first/leftmost bit corresponds to SS/PBCH block index 0, the second bit corresponds to SS/PBCH block index 1, and so on. Value 0 in the bitmap indicates that the corresponding SS/PBCH block is not transmitted while value 1 indicates that the corresponding SS/PBCH block is transmitted. The network configures the same pattern in this field as in the corresponding field in <i>ServingCellConfigCommonSIB</i> .<br>For operation with shared spectrum channel access, the UE assumes that one or more SS/PBCH blocks indicated by <i>ssb-PositionsInBurst</i> may be transmitted within the discovery burst transmission window and have candidate SS/PBCH blocks indexes corresponding to SS/PBCH block indexes provided by <i>ssb-PositionsInBurst</i> (see TS 38.213 [13], clause 4.1). If the k-th bit of <i>ssb-PositionsInBurst</i> is set to 1, the UE assumes that one or more SS/PBCH blocks within the discovery burst transmission window with candidate SS/PBCH block indexes corresponding to SS/PBCH block index equal to k – 1 may be transmitted; if the kt-th bit is set to 0, the UE assumes that the corresponding SS/PBCH block(s) are not transmitted. The k-th bit is set to 0, where k > <i>ssb-PositionQCL</i> and the number of actually transmitted SS/PBCH blocks is not larger than the number of 1's in the bitmap. The network configures the same pattern in this field as in the corresponding field in <i>ServingCellConfigCommonSIB</i> . For operation with shared spectrum channel access in FR1, only <i>mediumBitmap</i> is used, and for FR2-2, <i>longBitmap</i> is used. |
| <b><i>ssbSubcarrierSpacing</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Subcarrier spacing of SSB.<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15 or 30 kHz<br>FR2-1/FR2-NTN: 120 or 240 kHz<br>FR2-2: 120, 480, or 960 kHz                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <i>AbsFreqSSB</i>           | The field is absent when <i>absoluteFrequencySSB</i> in <i>frequencyInfoDL</i> is absent, otherwise the field is mandatory present.                                                                    |
| <i>HOAndServCellAdd</i>     | This field is mandatory present upon SpCell change (including path switch between a serving cell and a L2 U2N Relay UE) and upon serving cell (PSCell/SCell) addition. Otherwise, the field is absent. |
| <i>HOAndServCellWithSSB</i> | This field is mandatory present upon SpCell change and upon serving cell (SCell with SSB or PSCell) addition. Otherwise, the field is absent.                                                          |
| <i>SharedSpectrum</i>       | This field is mandatory present if this cell operates with shared spectrum channel access in FR1. Otherwise, it is absent, Need R.                                                                     |
| <i>SharedSpectrum2</i>      | This field is optionally present if this cell operates with shared spectrum channel access in FR2-2, Need R. Otherwise, it is absent, Need R.                                                          |
| <i>TDD</i>                  | The field is optionally present, Need R, for TDD cells; otherwise it is absent.                                                                                                                        |

## – *ServingCellConfigCommonSIB*

The IE *ServingCellConfigCommonSIB* is used to configure cell specific parameters of a UE's serving cell in SIB1.

***ServingCellConfigCommonSIB*** information element

| <b>channelAccessMode</b>                             | If present, this field indicates which channel access procedures to apply for operation with shared spectrum channel access as defined in TS 37.213 [48]. If the field is configured as "semiStatic", the UE shall apply the channel access procedures for semi-static channel occupancy as described in clause 4.3 in TS 37.213. If the field is configured as "dynamic", the UE shall apply the channel access procedures as defined in TS 37.213, clause 4.1 and 4.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>channelAccessMode2</b>                            | If present, this field indicates that the UE shall apply channel access procedures for operation with shared spectrum channel access in accordance with TS 37.213 [48], clause 4.4 for FR2-2. If absent, the UE shall not apply any channel access procedure. The network always configures this field if channel access procedures are required for the serving cell within this region by regulations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>discoveryBurstWindowLength</b>                    | Indicates the window length of the discovery burst in ms (see TS 37.213 [48]). The field <i>discoveryBurstWindowLength-v1700</i> is applicable to SCS 480 kHz and SCS 960 kHz.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>enhancedMeasurementNGSO</b>                       | If the field is present and UE supports the enhanced cell reselection requirements for NTN NGSO in RRC_IDLE/RRC_INACTIVE, the UE shall apply the enhanced cell reselection requirements for NTN NGSO as specified in TS 38.133 [14], clauses 4.2C.2.3 and 4.2C.2.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>groupPresence</b>                                 | This field is present when maximum number of SS/PBCH blocks per half frame equals to 64 as defined in TS 38.213 [13], clause 4.1. The first/leftmost bit corresponds to the SS/PBCH index 0-7, the second bit corresponds to SS/PBCH block 8-15, and so on. Value 0 in the bitmap indicates that the SSBs according to <i>inOneGroup</i> are absent. Value 1 indicates that the SS/PBCH blocks are transmitted in accordance with <i>inOneGroup</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>inOneGroup</b>                                    | When maximum number of SS/PBCH blocks per half frame equals to 4 as defined in TS 38.213 [13], clause 4.1, only the 4 leftmost bits are valid; the UE ignores the 4 rightmost bits. When maximum number of SS/PBCH blocks per half frame equals to 8 as defined in TS 38.213 [13], clause 4.1, all 8 bits are valid. The first/ leftmost bit corresponds to SS/PBCH block index 0, the second bit corresponds to SS/PBCH block index 1, and so on. When maximum number of SS/PBCH blocks per half frame equals to 64 as defined in TS 38.213 [13], clause 4.1, all 8 bit are valid; The first/ leftmost bit corresponds to the first SS/PBCH block index in the group (i.e., to SSB index 0, 8, and so on); the second bit corresponds to the second SS/PBCH block index in the group (i.e., to SSB index 1, 9, and so on), and so on. Value 0 in the bitmap indicates that the corresponding SS/PBCH block is not transmitted while value 1 indicates that the corresponding SS/PBCH block is transmitted. |
| <b>n-TimingAdvanceOffset</b>                         | The N_TA-Offset to be applied for random access on this serving cell. If the field is absent, the UE applies the value defined for the duplex mode and frequency range of this serving cell. See TS 38.133 [14], table 7.1.2-2/table 7.1C.2-4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>ra-ChannelAccess</b>                              | If present, this field indicates that the UE shall apply channel access procedures before msg1/msgA transmission for operation with shared spectrum channel access in accordance with TS 37.213 [48], clause 4.4.5 for FR2-2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>ssb-PositionsInBurst</b>                          | Time domain positions of the transmitted SS-blocks in an SS-burst as defined in TS 38.213 [13], clause 4.1.<br>For operation with shared spectrum channel access in FR1, only <i>inOneGroup</i> is used and the UE interprets this field same as <i>mediumBitmap</i> in <i>ServingCellConfigCommon</i> .<br>The UE assumes that a bit in <i>inOneGroup</i> at position $k > N_{SSB}^{QCL}$ is 0, where $N_{SSB}^{QCL}$ is obtained from <i>MIB</i> as specified in TS 38.213 [13], clause 4.1. For operation with shared spectrum channel access in FR2-2, the m-th bit in <i>groupPresence</i> is set to 0 for $m > N_{SSB}^{QCL}/8$ , where $N_{SSB}^{QCL}$ is obtained from <i>MIB</i> as specified in TS 38.213 [13], clause 4.1.                                                                                                                                                                                                                                                                       |
| <b>ss-PBCH-BlockPower</b>                            | Average EPRE of the resources elements that carry secondary synchronization signals in dBm that the NW used for SSB transmission, see TS 38.213 [13], clause 7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Conditional Presence   | Explanation                                                                                                                                   |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <i>FR2-Only</i>        | This field is mandatory present for an FR2 carrier frequency. It is absent otherwise and UE releases any configured value.                    |
| <i>SharedSpectrum</i>  | This field is mandatory present if this cell operates with shared spectrum channel access in FR1. Otherwise, it is absent, Need R.            |
| <i>SharedSpectrum2</i> | This field is optionally present if this cell operates with shared spectrum channel access in FR2-2, Need R. Otherwise, it is absent, Need R. |
| <i>TDD</i>             | The field is optionally present, Need R, for TDD cells; otherwise it is absent.                                                               |

### — *ShortI-RNTI-Value*

The IE *ShortI-RNTI-Value* is used to identify the suspended UE context of a UE in RRC\_INACTIVE using fewer bits compared to I-RNTI-Value.

#### ***ShortI-RNTI-Value* information element**

```
-- ASN1START
-- TAG-SHORTI-RNTI-VALUE-START
```

```
ShortI-RNTI-Value ::= BIT STRING (SIZE(24))
```

```
-- TAG-SHORTI-RNTI-VALUE-STOP
-- ASN1STOP
```

### — *ShortMAC-I*

The IE *ShortMAC-I* is used to identify and verify the UE at RRC connection re-establishment. The 16 least significant bits of the MAC-I calculated using the AS security configuration of the source PCell, as specified in 5.3.7.4.

#### ***ShortMAC-I* information element**

```
-- ASN1START
-- TAG-SHORTMAC-I-START
```

```
ShortMAC-I ::= BIT STRING (SIZE (16))
```

```
-- TAG-SHORTMAC-I-STOP
-- ASN1STOP
```

### — *SINR-Range*

The IE *SINR-Range* specifies the value range used in SINR measurements and thresholds. For measurements, integer value for SINR measurements is according to Table 10.1.16.1-1 in TS 38.133 [14]. For thresholds, the actual value is (IE value – 46) / 2 dB.

#### ***SINR-Range* information element**

```
-- ASN1START
-- TAG-SINR-RANGE-START
```

```
SINR-Range ::= INTEGER(0..127)

## – *SI-RequestConfig*

The IE *SI-RequestConfig* contains configuration for Msg1 based SI request without Msg1 repetition. For the random access parameters (e.g. *prach-RootSequenceIndex*, *msg1-SubcarrierSpacing*, etc.) not configured in *SI-RequestConfig*, the UE applies the parameters configured in *rach-ConfigCommon* corresponding to the RACH resource set selected upon RACH initialization (as specified in TS 38.321 [3]), of the initial uplink BWP unless otherwise specified.

| <b><i>ra-PreambleStartIndex</i></b><br>If N SSBs are associated with a RACH occasion, where N >= 1, for the i-th SSB (i=0, ..., N-1) the preamble with preamble index = <i>ra-PreambleStartIndex</i> + i is used for SI request; For N < 1, the preamble with preamble index = <i>ra-PreambleStartIndex</i> is used for SI request.                    |

## – *SI-RequestConfigRepetition*

The IE *SI-RequestConfigRepetition* contains configuration for Msg1 based SI request with Msg1 repetition. For the random access parameters (e.g. *prach-RootSequenceIndex*, *msg1-SubcarrierSpacing* and *msg1-RepetitionTimeOffsetROGroup*, etc.) not configured in *SI-RequestConfigRepetition*, the UE applies the parameters configured in *rach-ConfigCommon* corresponding to the RACH resource set selected upon RACH initialization (as specified in TS 38.321 [3]), of the initial uplink BWP unless otherwise specified.

#### SI-RequestConfigRepetition field descriptions

##### ***rach-OccasionsSI***

Configuration of dedicated RACH Occasions for SI. If the field is absent, the UE uses the corresponding parameters configured in *rach-ConfigCommon* corresponding to the RACH resource set selected upon RACH initialization (as specified in TS 38.321 [3]), of the initial uplink BWP.

##### ***si-RequestResourcesRepetitionNum2, si-RequestResourcesRepetitionNum4, si-RequestResourcesRepetitionNum8***

Indicates the configurations for Msg1-based SI request with Msg1 repetition for repetition number 2, 4 and 8, respectively.

If there is only one entry in the list, the configuration is used for all SI messages for which *si-BroadcastStatus* or *posSI-BroadcastStatus* is set to *notBroadcasting*. Otherwise:

- If *si-SchedulingInfo-v1700* is not present and the *si-RequestResourcesRepetitionNum2/si-RequestResourcesRepetitionNum4/si-RequestResourcesRepetitionNum8* is used for on-demand SI request in *SI-SchedulingInfo* or *PosSI-SchedulingInfo*, the 1<sup>st</sup> entry in the list corresponds to the first SI message in *schedulingInfoList* or *posSchedulingInfoList* for which *si-BroadcastStatus* or *posSI-BroadcastStatus* is set to *notBroadcasting*, 2<sup>nd</sup> entry in the list corresponds to the second SI message in *schedulingInfoList* or *posSchedulingInfoList* for which *si-BroadcastStatus* or *posSI-BroadcastStatus* is set to *notBroadcasting* and so on.
- If *si-SchedulingInfo-v1700* is present and *si-RequestResourcesRepetitionNum2/si-RequestResourcesRepetitionNum4/si-RequestResourcesRepetitionNum8* is configured in *SI-SchedulingInfo* for on-demand SI request, the UE generates a list of concatenated SI messages by appending the SI messages containing type1 SIB configured by *schedulingInfoList2* in *si-SchedulingInfo-v1700* to the SI messages configured by *schedulingInfoList* in *si-SchedulingInfo*. The 1<sup>st</sup> entry in the list corresponds to the first SI message for which *si-BroadcastStatus* is set to *notBroadcasting*, 2<sup>nd</sup> entry in the list corresponds to the second SI message for which *si-BroadcastStatus* is set to *notBroadcasting* and so on.
- If *si-SchedulingInfo-v1700* is present and *si-RequestResourcesRepetitionNum2/si-RequestResourcesRepetitionNum4/si-RequestResourcesRepetitionNum8* is configured in *PosSI-SchedulingInfo* for on-demand SI request, the UE generates a list of concatenated SI messages by appending the SI messages containing type2 SIB configured by *schedulingInfoList2* in *si-SchedulingInfo-v1700* to the SI messages configured by *posSchedulingInfoList* in *posSI-SchedulingInfo*. The 1<sup>st</sup> entry in the list corresponds to the first SI message for which *posSI-BroadcastStatus* or *si-BroadcastStatus* is set to *notBroadcasting*, 2<sup>nd</sup> entry in the list corresponds to the second SI message for which *posSI-BroadcastStatus* or *si-BroadcastStatus* is set to *notBroadcasting* and so on.

Change of *si-RequestResourcesRepetitionNum2/si-RequestResourcesRepetitionNum4/si-RequestResourcesRepetitionNum8* should not result in system information change notification.

***SI-RequestResourcesRepetition* field descriptions*****ra-PreambleStartIndex***

If N SSBs are associated with a RACH occasion, where  $N \geq 1$ , for the  $i$ -th SSB ( $i=0, \dots, N-1$ ) the preamble with preamble index = *ra-PreambleStartIndex* +  $i$  is used for SI request with Msg1 repetition; For  $N < 1$ , the preamble with preamble index = *ra-PreambleStartIndex* is used for SI request with Msg1 repetition.

— ***SI-SchedulingInfo***

The IE *SI-SchedulingInfo* contains information needed for acquisition of SI messages.

| SchedulingInfo field descriptions |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>areaScope</b>                  | Indicates that a SIB is area specific. If the field is absent, the SIB is cell specific.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>si-BroadcastStatus</b>         | Indicates if the SI message is being broadcasted or not. Change of <i>si-BroadcastStatus</i> should not result in system information change notifications in Short Message transmitted with P-RNTI over DCI (see clause 6.5). The value of the indication is valid until the end of the BCCH modification period when set to <i>broadcasting</i> . When <i>SIB19</i> is scheduled in an NTN cell, the <i>si-BroadcastStatus</i> for the mapped <i>SIB19</i> is set to <i>broadcasting</i> . When <i>SIB22</i> is scheduled in an ATG cell, the <i>si-broadcastStatus</i> for the mapped <i>SIB22</i> is set to <i>broadcasting</i> . |
| <b>si-Periodicity</b>             | Periodicity of the SI-message in radio frames. Value <i>rf8</i> corresponds to 8 radio frames, value <i>rf16</i> corresponds to 16 radio frames, and so on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>encrypted</b>                          | The presence of this field indicates that the pos-sib-type is encrypted as specified in TS 37.355 [49].                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>gnss-id</b>                            | The presence of this field indicates that the positioning SIB type is for a specific GNSS. Indicates a specific GNSS (see also TS 37.355 [49]).                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>posSibType</b>                         | The posSIBs as defined in TS 37.355 [49] mapped to SI for scheduling using <i>schedulingInfoList2</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>sbas-id</b>                            | The presence of this field indicates that the positioning SIB type is for a specific SBAS. Indicates a specific SBAS (see also TS 37.355 [49]).                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>si-WindowPosition</b>                  | This field indicates the SI window position of the associated SI-message. The network provides <i>si-WindowPosition</i> in an ascending order, i.e. <i>si-WindowPosition</i> in the subsequent entry in <i>schedulingInfoList2</i> has always value higher than in the previous entry of <i>schedulingInfoList2</i> . The network configures this field in a way that ensures that SI messages scheduled by <i>schedulingInfoList</i> and/or <i>posSchedulingInfoList</i> do not overlap with SI messages scheduled by <i>schedulingInfoList2</i> . |
| <b>sib-MappingInfo</b>                    | Indicates which SIBs or posSIBs are contained in the SI message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>sibType</b>                            | The type of SIB(s) mapped to SI for scheduling using <i>schedulingInfoList2</i> . Value <i>type1</i> indicates SIBs and value <i>type2</i> indicates posSIBs.                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Conditional presence</b> | <b>Explanation</b>                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>GNSS-ID-SBAS</i>         | The field is mandatory present if <i>gnss-id</i> is set to <i>sbas</i> . It is absent otherwise.                                                                                                                                                                                                                                                             |
| <i>MSG-1</i>                | The field is optionally present, Need R, if <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> for any SI-message included in <i>schedulingInfoList</i> or any SI-message containing type1 SIB included in <i>schedulingInfoList2</i> . It is absent otherwise.                                                                                      |
| <i>SIB-TYPE</i>             | The field is mandatory present if the SIB type is different from <i>SIB6</i> , <i>SIB7</i> or <i>SIB8</i> . For <i>SIB6</i> , <i>SIB7</i> and <i>SIB8</i> it is absent.                                                                                                                                                                                      |
| <i>NonPosSIB</i>            | The field is mandatory present if the SIB type is <i>type1</i> . For <i>type2</i> it is absent.                                                                                                                                                                                                                                                              |
| <i>SUL-MSG-1</i>            | The field is optionally present, Need R, if <i>supplementaryUplink</i> is configured in <i>ServingCellConfigCommonSIB</i> and if <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> for any SI-message included in <i>schedulingInfoList</i> or any SI-message containing type1 SIB included in <i>schedulingInfoList2</i> . It is absent otherwise. |
| <i>REDCAP-MSG-1</i>         | The field is optionally present, Need R, if <i>initialUplinkBWP-RedCap</i> is configured in <i>UplinkConfigCommonSIB</i> and if <i>si-BroadcastStatus</i> is set to <i>notBroadcasting</i> for any SI-message included in <i>schedulingInfoList</i> or any SI-message containing type1 SIB included in <i>schedulingInfoList2</i> . It is absent otherwise.  |

## – SK-Counter

The IE *SK-Counter* is a counter used upon initial configuration of SN security for NR-DC and NE-DC, as well as upon refresh of  $S\text{-}K_{\text{gNB}}$  or  $S\text{-}K_{\text{eNB}}$  based on the current or newly derived  $K_{\text{gNB}}$  during RRC Resume or RRC Reconfiguration, as defined in TS 33.501 [11].

```
-- ASN1START
-- TAG-SKCOUNTER-START
```

```
SK-Counter ::= INTEGER (0..65535)
```

```
-- TAG-SKCOUNTER-STOP
-- ASN1STOP
```

– SlotFormatCombinationsPerCell

The IE *SlotFormatCombinationsPerCell* is used to configure the *SlotFormatCombinations* applicable for one serving cell (see TS 38.213 [13], clause 11.1.1).

**SlotFormatCombinationsPerCell information element**

```
-- ASN1START
-- TAG-SLOTFORMATCOMBINATIONSPERCELL-START

SlotFormatCombinationsPerCell ::= SEQUENCE {
    servingCellId          ServCellIndex,
    subcarrierSpacing      SubcarrierSpacing,
    subcarrierSpacing2     SubcarrierSpacing OPTIONAL, -- Need R
    slotFormatCombinations SEQUENCE (SIZE (1..maxNrofSlotFormatCombinationsPerSet)) OF SlotFormatCombination OPTIONAL, -- Need M
    positionInDCI          INTEGER(0..maxSFI-DCI-PayloadSize-1) OPTIONAL, -- Need M
    ...
    [[

|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>enableConfiguredUL</i></b><br>If configured, the UE is allowed to transmit uplink signals/channels (SRS, PUCCH, CG-PUSCH) in the set of symbols of the slot when the UE does not detect a DCI format 2_0 providing a slot format for the set of symbols (see TS 38.213 [13], 11.1.1). This field is applicable only if <i>cg-RetransmissionTimer-r16</i> is configured.                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>positionInDCI</i></b><br>The (starting) position (bit) of the slotFormatCombinationId (SFI-Index) for this serving cell (servingCellId) within the DCI payload (see TS 38.213 [13], clause 11.1.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b><i>servingCellId</i></b><br>The ID of the serving cell for which the slotFormatCombinations are applicable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>slotFormatCombinations</i></b><br>A list with <i>SlotFormatCombinations</i> . Each <i>SlotFormatCombination</i> comprises of one or more <i>SlotFormats</i> (see TS 38.211 [16], clause 4.3.2). The total number of <i>slotFormats</i> in the <i>slotFormatCombinations</i> list does not exceed 512.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>subcarrierSpacing2</i></b><br>Reference subcarrier spacing for a Slot Format Combination on an FDD or SUL cell (see TS 38.213 [13], clause 11.1.1). For FDD, subcarrierSpacing (SFI-scs) is the reference SCS for DL BWP and subcarrierSpacing2 (SFI-scs2) is the reference SCS for UL BWP. For SUL, <i>subcarrierSpacing</i> (SFI-scs) is the reference SCS for non-SUL carrier and <i>subcarrierSpacing2</i> (SFI-scs2) is the reference SCS for SUL carrier. The network configures a value that is smaller than or equal to any SCS of configured BWPs of the serving cell that the command applies to. And the network configures a value that is smaller than or equal to the SCS of the serving cell which the UE monitors for SFI indications. |

The network configures a value that is smaller than or equal to any SCS of configured BWPs of the serving cell that the command applies to. And the network configures a value that is smaller than or equal to the SCS of the serving cell which the UE monitors for SFI indications (see TS 38.213 [13], clause 11.1.1).                                                                                                                                                                                                                                                                                                                                 |

## – *SlotFormatIndicator*

The IE *SlotFormatIndicator* is used to configure monitoring a Group-Common-PDCCH for Slot-Format-Indicators (SFI).

| <b>dci-PayloadSize</b><br>Total length of the DCI payload scrambled with SFI-RNTI (see TS 38.213 [13], clause 11.1.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>sfi-RNTI</b><br>RNTI used for SFI on the given cell (see TS 38.213 [13], clause 11.1.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>slotFormatCombToAddModList</b><br>A list of <i>SlotFormatCombinations</i> for the UE's serving cells (see TS 38.213 [13], clause 11.1.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>switchTriggerToAddModList, switchTriggerToAddModListSizeExt</b><br>A list of <i>SearchSpaceSwitchTrigger</i> objects. Each <i>SearchSpaceSwitchTrigger</i> object provides position in DCI of the bit field indicating search space switching flag for a serving cell or, if <i>cellGroupsForSwitchList</i> is configured, group of serving cells (see TS 38.213 [13], clause 10.4). If <i>cellGroupsForSwitchList</i> is configured, only one of the cells belonging to the same cell group is added/modified, and the configuration applies to all cells belonging to the <i>cellGroupsForSwitchList</i> (see TS 38.213 [13], clause 10.4). The network configures more than 4 <i>SearchSpaceSwitchTrigger</i> objects only if <i>cellGroupsForSwitchList</i> is not configured. The UE shall consider entries in <i>switchTriggerToAddModList</i> and in <i>switchTriggerToAddModListSizeExt</i> as a single list, i.e. an entry created using <i>switchTriggerToAddModList</i> can be modified using <i>switchTriggerToAddModListSizeExt</i> and vice-versa. |
| <b>switchTriggerToReleaseModList, switchTriggerToReleaseListSizeExt</b><br>A list of <i>SearchSpaceSwitchTriggers</i> to be released. If <i>cellGroupsForSwitchList</i> is configured, the <i>SearchSpaceSwitchTrigger</i> is released for all serving cells belonging to the same <i>CellGroupForSwitch</i> . The UE shall consider entries in <i>switchTriggerToReleaseList</i> and in <i>switchTriggerToReleaseListSizeExt</i> as a single list, i.e. an entry created using <i>switchTriggerToAddModList</i> or <i>switchTriggerToAddModListSizeExt</i> can be deleted using <i>switchTriggerToReleaseList</i> or <i>switchTriggerToReleaseListSizeExt</i> .                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>AvailableRB-SetsPerCell field descriptions</b>                                                                                                                                |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>positionInDCI</b><br>The (starting) position of the bits within DCI payload indicating the availability of the RB sets of a serving cell (see TS 38.213 [13], clause 11.1.1). |
| <b>servingCellId</b><br>The ID of the serving cell for which the configuration is applicable.                                                                                    |

| CO-DurationsPerCell field descriptions                                                                                                                                                                                                                                                                                                   |

| <b>positionInDCI</b><br>The position of the bit within DCI payload containing a search space switching flag (see TS 38.213 [13], clause 11.1.1).                                                                 |
| <b>servingCellId</b><br>The ID of the serving cell for which the configuration is applicable or the group of serving cells as indicated by <i>CellGroupsForSwitch-r16</i> containing this <i>servingCellId</i> . |

— S-NSSAI

The IE *S-NSSAI* (*Single Network Slice Selection Assistance Information*) identifies a Network Slice end to end and comprises a slice/service type and a slice differentiator, see TS 23.003 [21].

S-NSSAI information element

```
-- ASN1START
-- TAG-S-NSSAI-START

S-NSSAI ::=
    CHOICE{
        sst          BIT STRING (SIZE (8)),
        sst-SD       BIT STRING (SIZE (32))
    }

-- TAG-S-NSSAI-STOP
-- ASN1STOP
```

| S-NSSAI field descriptions                                                                                            |
|-----------------------------------------------------------------------------------------------------------------------|
| <b>sst</b><br>Indicates the S-NSSAI consisting of Slice/Service Type, see TS 23.003 [21].                             |
| <b>sst-SD</b><br>Indicates the S-NSSAI consisting of Slice/Service Type and Slice Differentiator, see TS 23.003 [21]. |

– *SpeedStateScaleFactors*

The IE *SpeedStateScaleFactors* concerns factors, to be applied when the UE is in medium or high speed state, used for scaling a mobility control related parameter.

*SpeedStateScaleFactors* information element

```
-- ASN1START
-- TAG-SPEEDSTATESCALEFACTORS-START

SpeedStateScaleFactors ::=
    sf-Medium
    sf-High
}
-- TAG-SPEEDSTATESCALEFACTORS-STOP
-- ASN1STOP
```

| <i>SpeedStateScaleFactors</i> field descriptions                                                                                                                                                                                                                                                            |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>sf-High</b><br>The concerned mobility control related parameter is multiplied with this factor if the UE is in High Mobility state as defined in TS 38.304 [20]. Value <i>oDot25</i> corresponds to 0.25, value <i>oDot5</i> corresponds to 0.5, <i>oDot75</i> corresponds to 0.75 and so on.            |
| <b>sf-Medium</b><br>The concerned mobility control related parameter is multiplied with this factor if the UE is in Medium Mobility state as defined in TS 38.304 [20]. Value <i>oDot25</i> corresponds to 0.25, value <i>oDot5</i> corresponds to 0.5, value <i>oDot75</i> corresponds to 0.75, and so on. |

– *SPS-Config*

The IE *SPS-Config* is used to configure downlink semi-persistent transmission. Multiple Downlink SPS configurations may be configured in one BWP of a serving cell.

*SPS-Config* information element

```
-- ASN1START
-- TAG-SPS-CONFIG-START

SPS-Config ::=
    periodicity
    nrofHARQ-Processes
    n1PUCCH-AN
    SEQUENCE {
        ENUMERATED {ms10, ms20, ms32, ms40, ms64, ms80, ms128, ms160, ms320, ms640,

| <b>harq-CodebookID</b>               | Indicates the HARQ-ACK codebook index for the corresponding HARQ-ACK codebook for SPS PDSCH and ACK for SPS PDSCH release.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>harq-ProcID-Offset</b>            | Indicates the offset used in deriving the HARQ process IDs, see TS 38.321 [3], clause 5.3.1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>mcs-Table</b>                     | Indicates the MCS table the UE shall use for DL SPS (see TS 38.214 [19], clause 5.1.3.1. If present, the UE shall use the MCS table of low-SE 64QAM table indicated in Table 5.1.3.1-3 of TS 38.214 [19]. If this field is absent and field mcs-table in PDSCH-Config is set to 'qam256' and the activating DCI is of format 1_1, the UE applies the 256QAM table indicated in Table 5.1.3.1-2 of TS 38.214 [19]. If this field is absent and the field <i>mcs-Table-r17</i> in <i>PDSCH-Config</i> is set to 'qam1024' and the activating DCI is format 1_1, the UE applies the 1024QAM table indicated in Table 5.1.3.1-4 of TS 38.214 [19]. Otherwise, the UE applies the non-low-SE 64QAM table indicated in Table 5.1.3.1-1 of TS 38.214 [19].                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>n1PUCCH-AN</b>                    | HARQ resource for PUCCH for DL SPS. The network configures the resource either as format0 or format1. The actual <i>PUCCH-Resource</i> is configured in <i>PUCCH-Config</i> and referred to by its ID. See TS 38.213 [13], clause 9.2.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>n1PUCCH-AN-PUCCHsSCell</b>        | HARQ resource for PUCCH on PUCCH switching SCell (sSCell) for DL SPS. The network configures the resource either as format 0 or format 1. The actual <i>PUCCH-Resource</i> is configured in <i>PUCCH-Config</i> of the <i>PUCCH sSCell</i> and referred to by its ID. See TS 38.213 [13], clause 9.2.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>nrofHARQ-Processes</b>            | Number of configured HARQ processes for SPS DL (see TS 38.321 [3], clause 5.8.1). If UE is configured with <i>nrofHARQ-Processes-v1710</i> UE shall ignore <i>nrofHARQ-Processes</i> (without suffix).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>pdsch-AggregationFactor</b>       | Number of repetitions for SPS PDSCH (see TS 38.214 [19], clause 5.1.2.1). When the field is absent, the UE applies the value 1 for MBS multicast data and the <i>pdsch-AggregationFactor</i> in <i>pdsch-Config</i> for other data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>periodicity</b>                   | Periodicity for DL SPS (see TS 38.214 [19] and TS 38.321 [3], clause 5.8.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>periodicityExt</b>                | This field is used to calculate the periodicity for DL SPS (see TS 38.214 [19] and see TS 38.321 [3], clause 5.8.1). If this field is present, the field <i>periodicity</i> is ignored.<br>The following periodicities are supported depending on the configured subcarrier spacing [ms]:<br>15 kHz: $periodicityExt$ , where <i>periodicityExt</i> has a value between 1 and 640.<br>30 kHz: $0.5 \times periodicityExt$ , where <i>periodicityExt</i> has a value between 1 and 1280.<br>60 kHz with normal CP: $0.25 \times periodicityExt$ , where <i>periodicityExt</i> has a value between 1 and 2560.<br>60 kHz with ECP: $0.25 \times periodicityExt$ , where <i>periodicityExt</i> has a value between 1 and 2560.<br>120 kHz: $0.125 \times periodicityExt$ , where <i>periodicityExt</i> has a value between 1 and 5120.<br>480 kHz: $0.03125 \times periodicityExt$ , where <i>periodicityExt</i> has a value between 1 and 20480.<br>960 kHz: $0.015625 \times periodicityExt$ , where <i>periodicityExt</i> has a value between 1 and 40960.<br><i>periodicityExt-r17</i> is only applicable for SCS 480 kHz and 960 kHz. |
| <b>sps-ConfigIndex</b>               | Indicates the index of one of multiple SPS configurations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>sps-HARQ-Deferral</b>             | Indicates the maximum number of slots or subslots the transmission of DL SPS HARQ-ACK in a slot or subslot can be deferred (see TS 38.213 [13], clause 9.2.5.4).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Conditional Presence | Explanation                                                                                                                                                      |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SPS-List             | The field is mandatory present when included in <i>sps-ConfigToAddModList-r16</i> or <i>sps-ConfigMulticastToAddModList-r17</i> , otherwise the field is absent. |

— *SPS-ConfigIndex*

The IE *SPS-ConfigIndex* is used to indicate the index of one of multiple DL SPS configurations in one BWP.

***SPS-ConfigIndex* information element**

```
-- ASN1START
-- TAG-SPS-CONFIGINDEX-START

SPS-ConfigIndex-r16          ::= INTEGER (0.. maxNrofSPS-Config-1-r16)

-- TAG-SPS-CONFIGINDEX-STOP
-- ASN1STOP
```

— *SPS-PUCCH-AN*

The IE *SPS-PUCCH-AN* is used to indicate a PUCCH resource for HARQ ACK and configure the corresponding maximum payload size for the PUCCH resource.

***SPS-PUCCH-AN* information element**

```
-- ASN1START
-- TAG-SPS-PUCCH-AN-START

SPS-PUCCH-AN-r16 ::= SEQUENCE {
    sps-PUCCH-AN-ResourceID-r16 PUCCH-ResourceId,
    maxPayloadSize-r16          INTEGER (4..256) OPTIONAL -- Need R
}

-- TAG-SPS-PUCCH-AN-STOP
-- ASN1STOP
```

| <i>SPS-PUCCH-AN field descriptions</i>                                                                      |
|-------------------------------------------------------------------------------------------------------------|
| <b><i>maxPayloadSize</i></b><br>Indicates the maximum payload size for the corresponding PUCCH resource ID. |
| <b><i>sps-PUCCH-AN-ResourceID</i></b><br>Indicates the PUCCH resource ID                                    |

— *SPS-PUCCH-AN-List*

The IE *SPS-PUCCH-AN-List* is used to configure the list of PUCCH resources per HARQ ACK codebook

***SPS-PUCCH-AN-List* information element**

```
-- ASN1START
```

```
-- TAG-SPS-PUCCH-AN-LIST-START
SPS-PUCCH-AN-List-r16 ::= SEQUENCE (SIZE(1..4)) OF SPS-PUCCH-AN-r16
-- TAG-SPS-PUCCH-AN-LIST-STOP
-- ASN1STOP
```

## — *SRB-Identity*

The IE *SRB-Identity* is used to identify a Signalling Radio Bearer (SRB) used by a UE.

### *SRB-Identity* information element

```
-- ASN1START
-- TAG-SRB-IDENTITY-START
SRB-Identity ::= INTEGER (1..3)
SRB-Identity-v1700 ::= INTEGER (4)
SRB-Identity-v1800 ::= INTEGER (5)
-- TAG-SRB-IDENTITY-STOP
-- ASN1STOP
```

## — *SRS-CarrierSwitching*

The IE *SRS-CarrierSwitching* is used to configure SRS carrier switching when PUSCH is not configured or to configure independent SRS power control from that of PUSCH.

### *SRS-CarrierSwitching* information element

```
-- ASN1START
-- TAG-SRS-CARRIERSWITCHING-START
SRS-CarrierSwitching ::= SEQUENCE {
    srs-SwitchFromServCellIndex INTEGER (0..31) OPTIONAL, -- Need M
    srs-SwitchFromCarrier ENUMERATED {sUL, nUL},
    srs-TPC-PDCCH-Group CHOICE {
        typeA SEQUENCE (SIZE (1..32)) OF SRS-TPC-PDCCH-Config,
        typeB SRS-TPC-PDCCH-Config
    } OPTIONAL, -- Need M
    monitoringCells SEQUENCE (SIZE (1..maxNrofServingCells)) OF ServCellIndex OPTIONAL, -- Need M
    ...
}
SRS-TPC-PDCCH-Config ::= SEQUENCE {
    srs-CC-SetIndexList SEQUENCE (SIZE(1..4)) OF SRS-CC-SetIndex OPTIONAL -- Need M
```

```

}

SRS-CC-SetIndex ::=
    cc-SetIndex          SEQUENCE {
                           INTEGER (0..3)
                           INTEGER (0..7)
    }
    OPTIONAL, -- Need M
    OPTIONAL  -- Need M

-- TAG-SRS-CARRIERSWITCHING-STOP
-- ASN1STOP

```

#### SRS-CC-SetIndex field descriptions

##### **cc-IndexInOneCC-Set**

Indicates the CC index in one CC set for Type A (see TS 38.212 [17], TS 38.213 [13], clause 7.3.1, 11.4). The network always includes this field when the *srs-TPC-PDCCH-Group* is set to *typeA*.

##### **cc-SetIndex**

Indicates the CC set index for Type A associated (see TS 38.212 [17], TS 38.213 [13], clause 7.3.1, 11.4). The network always includes this field when the *srs-TPC-PDCCH-Group* is set to *typeA*. The network does not configure this field to 3 in this release of specification.

#### SRS-CarrierSwitching field descriptions

##### **monitoringCells**

A set of serving cells for monitoring PDCCH conveying SRS DCI format with CRC scrambled by TPC-SRS-RNTI (see TS 38.212 [17], TS 38.213 [13], clause 7.3.1, 11.4).

##### **srs-SwitchFromCarrier**

The UE ignores this field in case of independent SRS power control from that of PUSCH.

##### **srs-SwitchFromServCellIndex**

Indicates the serving cell whose UL transmission may be interrupted during SRS transmission on a PUSCH-less SCell. During SRS transmission on a PUSCH-less SCell, the UE may temporarily suspend the UL transmission on a serving cell with PUSCH in the same CG to allow the PUSCH-less SCell to transmit SRS. (see TS 38.214 [19], clause 6.2.1.3).

##### **srs-TPC-PDCCH-Group**

Network configures the UE with either *typeA-SRS-TPC-PDCCH-Group* or *typeB-SRS-TPC-PDCCH-Group*, if any.

##### **typeA**

Type A trigger configuration for SRS transmission on a PUSCH-less SCell, or for SRS transmission on a serving cell with independent SRS power control from that of PUSCH (see TS 38.213 [13], clause 11.4). In this release, the network configures at most one entry (the first entry) of *typeA*, and the first entry corresponds to the serving cell in which the *SRS-CarrierSwitching* field is configured. SRS carrier switching to SUL carrier is not supported in this version of the specification.

##### **typeB**

Type B trigger configuration for SRS transmission on a PUSCH-less SCell, or for SRS transmission on a serving cell with independent SRS power control from that of PUSCH (see TS 38.213 [13], clause 11.4).

#### SRS-TPC-PDCCH-Config field descriptions

##### **srs-CC-SetIndexlist**

A list of pairs of [cc-SetIndex; cc-IndexInOneCC-Set] (see TS 38.212 [17], TS 38.213 [13], clause 7.3.1, 11.4). The network does not configure this field for *typeB*.

## – SRS-Config

The IE *SRS-Config* is used to configure sounding reference signal transmissions. The configuration defines a list of SRS-Resources, a list of SRS-PosResources, a list of SRS-PosResourceSets and a list of SRS-ResourceSets. Each resource set defines a set of SRS-Resources or SRS-PosResources. The network triggers the transmission of the set of SRS-Resources or SRS-PosResources using a configured aperiodicSRS-ResourceTrigger (L1 DCI). The network does not configure SRS specific power control parameters *alpha* (without suffix) or *pathlossReferenceRS* if *unifiedTCI-StateType* is configured for the serving cell.

### SRS-Config information element

```

| <b>cyclicShift-n2</b><br>Cyclic shift configuration (see TS 38.214 [19], clause 6.2.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>cyclicShift-n4</b><br>Cyclic shift configuration (see TS 38.214 [19], clause 6.2.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>cyclicShift-n8</b><br>Cyclic shift configuration (see TS 38.214 [19], clause 6.2.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>combOffsetHopping</b><br>Configures UE with comb offset hopping. The <i>hoppingId</i> is used to initialize pseudo random comb offset hopping. If UE is configured with both comb offset and cyclic shift hopping, only one <i>hoppingId</i> is configured. The <i>hoppingWithRepetition</i> configures time-domain hopping behavior for repetition factor $R > 1$ . The <i>hoppingSubset</i> indicates a set of comb offset by a bit string (see clause 6.4.1.4.3 of TS 38.211 [16]). The $i$ -th bit in the bit string is set to 1 to indicate the $s_{coh}^{SRS}(t) = i - 1$ , where $t$ is determined by its ordinary position among the positive bits in bit string, i.e., if the $i$ -th bit is a first positive bit, $t=0$ ; if the $i$ -th bit is a second positive bit, $t=1$ , and so on.                                                                                                                                                                |
| <b>cyclicShiftHopping</b><br>Configures UE with cyclic shift hopping. The <i>hoppingId</i> is used to initialize pseudo random cyclic shift hopping. If UE is configured with both comb offset and cyclic shift hopping, only one <i>hoppingId</i> is configured. The <i>hoppingFinerGranularity</i> enables finer granular hopping, see TS 38.211 [16], clause 6.4.1.4.2. If <i>hoppingSubset</i> is configured, <i>hoppingFinerGranularity</i> is not configured. The <i>hoppingSubset</i> indicates a set of cyclic shift by a bit string (see clause 6.4.1.4.2 of TS 38.211 [16]). The $i$ -th bit in the bit string is set to 1 to indicate the $s_{ch}^{SRS}(t) = i - 1$ , where $t$ is determined by its ordinary position among the positive bits in bit string, i.e., if the $i$ -th bit is a first positive bit, $t=0$ ; if the $i$ -th bit is a second positive bit, $t=1$ , and so on.                                                                    |
| <b>enableStartRBHopping</b><br>When this RRC parameter is configured, start RB location hopping is enabled for partial frequency sounding in different SRS frequency hopping periods for periodic/semi-persistent/aperiodic SRS as described in clause 6.4.1.4 in TS 38.211.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>freqHopping</b><br>Includes parameters capturing SRS frequency hopping (see TS 38.214 [19], clause 6.2.1). For CLI SRS-RSRP measurement, the network always configures this field such that $b\text{-hop} > b\text{-SRS}$ . For SRS for positioning configuration in multiple cells, the value of this field applies to all cells in the validity area. <i>c-SRS</i> Indicates the maximum bandwidth per hop. When <i>TxHoppingConfig</i> is configured the valid values for <i>c-SRS</i> are such that the maximum bandwidth is: 104 PRBs, 48 PRBs, 132 PRBs, 64 PRBs, for 15,30,60,120 KHz respectively. The same value for <i>c-SRS</i> is configured for all the hops when <i>TxHoppingConfig</i> is configured.                                                                                                                                                                                                                                               |
| <b>groupOrSequenceHopping</b><br>Parameter(s) for configuring group or sequence hopping (see TS 38.211 [16], clause 6.4.1.4.2). For CLI SRS-RSRP measurement, the network always configures this parameter to 'neither'. For SRS for positioning configuration in multiple cells, the value of this field applies to all cells in the validity area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>nrofSRS-Ports</b><br>Number of ports. For CLI SRS-RSRP measurement, the network always configures this parameter to 'port1'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>nrofSRS-Ports-n8</b><br>Number of ports if the number of antenna ports is 8. The value 'ports8' configures UE with 8 antenna ports and the value 'ports8tdm' configures the UE with 8 antenna ports which are partitioned into 2 subsets with each subset having 4 different ports, and the subsets are mapped to different OFDM symbols, see TS 38.211 [16], clause 6.4.1.4.2. If <i>combOffsetHopping-r18</i> or <i>cyclicShiftHopping-r18</i> is configured, this field is not set to <i>ports8tdm</i> . If this field is present UE ignores the field <i>nrofSRS-Ports</i> .                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>periodicityAndOffset-p, periodicityAndOffset-p-Ext</b><br>Periodicity and slot offset for this SRS resource. All values are in "number of slots". Value <i>s1</i> corresponds to a periodicity of 1 slot, value <i>s2</i> corresponds to a periodicity of 2 slots, and so on. For each periodicity the corresponding offset is given in number of slots. For periodicity <i>s1</i> the offset is 0 slots (see TS 38.214 [19], clause 6.2.1). For CLI SRS-RSRP measurement, <i>s1280</i> and <i>s12560</i> cannot be configured. For <i>SRS-PosResource</i> , values <i>s120480</i> , <i>s140960</i> and <i>s181920</i> cannot be configured for SCS=15kHz, values <i>s140960</i> and <i>s181920</i> cannot be configured for SCS=30kHz, and value <i>s181920</i> cannot be configured for SCS=60kHz except when periodicity of 20480ms is configured. When <i>periodicityAndOffset-p-Ext</i> is present, <i>periodicityAndOffset-p</i> shall be ignored by the UE. |

| <b><i>ptrs-PortIndex</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| The PTRS port index for this SRS resource for non-codebook based UL MIMO. This is only applicable when the corresponding <i>PTRS-UplinkConfig</i> is set to CP-OFDM. The <i>ptrs-PortIndex</i> configured here must be smaller than the <i>maxNrofPorts</i> configured in the <i>PTRS-UplinkConfig</i> (see TS 38.214 [19], clause 6.2.3.1). This parameter is not applicable to CLI SRS-RSRP measurement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>resourceMapping</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| OFDM symbol location of the SRS resource within a slot including <i>nrofSymbols</i> (number of OFDM symbols), <i>startPosition</i> (value 0 refers to the last symbol, value 1 refers to the second last symbol, and so on) and <i>repetitionFactor</i> (see TS 38.214 [19], clause 6.2.1 and TS 38.211 [16], clause 6.4.1.4). The configured SRS resource does not exceed the slot boundary. If <i>resourceMapping-r16</i> is signalled, UE shall ignore the <i>resourceMapping</i> (without suffix). If <i>resourceMapping-r17</i> is signalled, <i>resourceMapping-r16</i> is not signalled and the UE shall ignore the <i>resourceMapping</i> (without suffix) and only the values of <i>nrofSymbols</i> which are integer multiples of the configured <i>repetitionFactor</i> can be configured. The network can only signal <i>repetitionFactor-v1730</i> if <i>resourceMapping-r17</i> is signalled. When <i>repetitionFactor-v1730</i> is signalled, the UE shall ignore <i>repetitionFactor-r17</i> . For CLI SRS-RSRP measurement, the network always configures <i>nrofSymbols</i> and <i>repetitionFactor</i> to 'n1'. If <i>srs-PosRRC-InactiveValidityAreaPreConfigList</i> or <i>srs-PosRRC-InactiveValidityAreaNonPreConfig</i> is configured, the value of this field applies to all cells in the validity area. <i>nrofSymbols</i> is same for all the hops when <i>TxHoppingConfig</i> is configured. |
| <b><i>resourceType</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Periodicity and offset for semi-persistent and periodic SRS resource, or slot offset for aperiodic SRS resource for positioning (see TS 38.214 [19], clause 6.2.1). For CLI SRS-RSRP measurement, only 'periodic' is applicable for <i>resourceType</i> . If <i>srs-PosRRC-InactiveValidityAreaPreConfigList</i> or <i>srs-PosRRC-InactiveValidityAreaNonPreConfig</i> is configured, the value of this field applies to all cells in the validity area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>sequenceId</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Sequence ID used to initialize pseudo random group and sequence hopping (see TS 38.214 [19], clause 6.2.1). If <i>srs-PosRRC-InactiveValidityAreaPreConfigList</i> or <i>srs-PosRRC-InactiveValidityAreaNonPreConfig</i> is configured, the value of this field applies to all cells in the validity area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>slotOffset</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| An offset in number of slots between the triggering DCI and the actual transmission of this <i>SRS-PosResource</i> . If the field is absent the UE applies no offset (value 0).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Configuration of the spatial relation between a reference RS and the target SRS. Reference RS can be SSB/CSI-RS/SRS (see TS 38.214 [19], clause 6.2.1). This parameter is not applicable to CLI SRS-RSRP measurement. This field is not configured if <i>unifiedTCI-StateType</i> is configured for the serving cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Configuration of the spatial relation between a reference RS and the target SRS. Reference RS can be SSB/CSI-RS/SRS/DL-PRS-PDC (see TS 38.214 [19], clause 6.2.1). The field is present in case of <i>resourceType=periodic</i> and <i>usagePDC-r17=true</i> in the <i>SRS-ResourceSet</i> , otherwise the field is absent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>spatialRelationInfoPos</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Configuration of the spatial relation between a reference RS and the target SRS. Reference RS can be SSB/CSI-RS/SRS/DL-PRS (see TS 38.214 [19], clause 6.2.1). If the IE <i>srs-ResourceId-Ext</i> is present, the IE <i>srs-ResourceId</i> in <i>spatialRelationInfoPos</i> represents the index from 0 to 63. Otherwise the IE <i>srs-ResourceId</i> in <i>spatialRelationInfoPos</i> represents the index from 0 to 31. If the SRS for positioning is configured for RRC_INACTIVE state, the <i>srs-ResourceId</i> and <i>csi-RS-IndexServing</i> are not included in this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>srs-PosPeriodicConfigHyperSFN-Index</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Indicates even or odd hyper SFN in which the SRS for positioning is transmitted for the periodicity value of 20480m. If this field is not configured, the UE assumes that SRS for positioning periodicity longer than one Hyper SFN is not configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Indicate the number of bits for "SRS request" in DCI format 0_2. When the field is absent, then the value of 0 bit for "SRS request" in DCI format 0_2 is applied. If the parameter <i>srs-RequestDCI-0-2</i> is configured to value 1, 1 bit is used to indicate one of the first two rows of Table 7.3.1.1.2-24 in TS 38.212 [17] for triggered aperiodic SRS resource set. If the value 2 is configured, 2 bits are used to indicate one of the rows of Table 7.3.1.1.2-24 in TS 38.212 [17]. When UE is configured with <i>supplementaryUplink</i> , an extra bit (the first bit of the SRS request field) is used for the non-SUL/SUL indication.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Indicate the number of bits for "SRS request" in DCI format 1_2. When the field is absent, then the value of 0 bit for "SRS request" in DCI format 1_2 is applied. When the UE is configured with <i>supplementaryUplink</i> , an extra bit (the first bit of the SRS request field) is used for the non-SUL/SUL indication (see TS 38.214 [19], clause 6.1.1.2).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b><i>srs-ResourceSetToAddModListDCI-0-2</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| List of SRS resource set to be added or modified for DCI format 0_2 (see TS 38.212 [17], clause 7.3.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>srs-ResourceSetToReleaseListDCI-0-2</b><br>List of SRS resource set to be released for DCI format 0_2 (see TS 38.212 [17], clause 7.3.1).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>srs-TCI-State</b><br>Configuration of either a UL TCI state or a joint TCI state for the SRS resource. In case of <i>UL TCI-State</i> , refers to the TCI state defined in <i>ul-TCI-StateList</i> in the <i>BWP-UplinkDedicated</i> where the <i>SRS-Config</i> is configured. In case of joint TCI state, refers to a TCI state defined in <i>dl-OrJointTCI-StateList</i> in <i>pdsch-Config</i> of the <i>BWP-DownlinkDedicated</i> and serving cell indicated by <i>cellAndBWP</i> . This field is absent when the SRS resource is in an <i>SRS-ResourceSet</i> configured with <i>followUnifiedTCI-StateSRS-r17</i> or <i>applyIndicatedTCI-State</i> , or when the field <i>unifiedTCI-StateType</i> is not configured to the serving cell which the SRS resource is located in. |
| <b>startRBIndexAndFreqScalingFactor</b><br>Configures the UE with the <i>startRBIndex</i> and <i>freqScalingFactor</i> for partial frequency sounding as described in Clause 6.4.1.4 in TS 38.211. The <i>startRBIndexForFScaling2</i> gives the <i>startRBIndex</i> when <i>freqScalingFactor</i> is 2 and the <i>startRBIndexForFScaling4</i> gives the <i>startRBIndex</i> when <i>FreqScalingFactor</i> is 4                                                                                                                                                                                                                                                                                                                                                                          |
| <b>transmissionComb, transmissionComb-n2, transmissionComb-n4, transmissionComb-n8</b><br>Comb value (2 or 4 or 8) and comb offset (0..combValue-1) (see TS 38.214 [19], clause 6.2.1). If network configures field <i>transmissionComb-n8</i> , the UE ignores <i>transmissionComb</i> . If <i>srs-PosRRC-InactiveValidityAreaPreConfig</i> or <i>srs-PosRRC-InactiveValidityAreaNonPreConfig</i> is configured, the value of this field applies to all cells in the validity area.                                                                                                                                                                                                                                                                                                      |

| <b><i>SRS-ResourceSet, SRS-PosResourceSet</i></b> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>alpha</i></b><br>alpha value for SRS power control (see TS 38.213 [13], clause 7.3). When the field is absent the UE applies the value 1. If <i>srs-PosRRC-InactiveValidityAreaPreConfigList</i> or <i>srs-PosRRC-InactiveValidityAreaNonPreConfig</i> is configured, the value of this field applies to all cells in the validity area.                                                                                                                                                                                                                          |
| <b><i>aperiodicSRS-ResourceTriggerList</i></b><br>An additional list of DCI "code points" upon which the UE shall transmit SRS according to this SRS resource set configuration (see TS 38.214 [19], clause 6). When the field is not included during a reconfiguration of <i>SRS-ResourceSet</i> of <i>resourceType</i> set to <i>aperiodic</i> , UE maintains this value based on the Need M; that is, this list is not considered as an extension of <i>aperiodicSRS-ResourceTrigger</i> for purpose of applying the general rule for extended list in clause 6.1.3. |
| <b><i>aperiodicSRS-ResourceTrigger</i></b><br>The DCI "code point" upon which the UE shall transmit SRS according to this SRS resource set configuration (see TS 38.214 [19], clause 6).                                                                                                                                                                                                                                                                                                                                                                                |
| <b><i>applyIndicatedTCI-State</i></b><br>This field indicates, for an SRS-ResourceSet, if UE applies the first or the second "indicated" UL only TCI or joint TCI as specified in TS 38.214 [19], clause 6.2.1.                                                                                                                                                                                                                                                                                                                                                         |
| <b><i>associatedCSI-RS</i></b><br>ID of CSI-RS resource associated with this SRS resource set in non-codebook based operation (see TS 38.214 [19], clause 6.1.1.2).                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b><i>availableSlotOffsetList</i></b><br>Indicates a list of up to four different available slot offset values from slot $n+k$ to the slot where the aperiodic SRS resource set is transmitted, where slot $n$ is the slot with the triggering DCI, and $k$ is the <i>slotOffset</i> (without suffix) as described in clause 6.2.1 of TS 38.214 [19].                                                                                                                                                                                                                   |
| <b><i>csi-RS</i></b><br>ID of CSI-RS resource associated with this SRS resource set (see TS 38.214 [19], clause 6.1.1.2).                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b><i>dl-PRS</i></b><br>This field indicates a PRS configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b><i>followUnifiedTCI-StateSRS</i></b><br>When set to enabled, for SRS resource Set, the UE applies the "indicated" UL only TCI or joint TCI as specified in TS 38.214 [19], clause 5.1.5. This parameter may be configured for aperiodic SRS for BM or SRS of any time-domain behavior for codebook, non-codebook, and antenna switching.                                                                                                                                                                                                                             |
| <b><i>p0</i></b><br>P0 value for SRS power control. The value is in dBm. Only even values (step size 2) are allowed (see TS 38.213 [13], clause 7.3). If <i>srs-PosRRC-InactiveValidityAreaPreConfigList</i> or <i>srs-PosRRC-InactiveValidityAreaNonPreConfig</i> is configured, the value of this field applies to all cells in the validity area.                                                                                                                                                                                                                    |
| <b><i>pathlossReferenceRS</i></b><br>A reference signal (e.g. a CSI-RS config or a SS block) to be used for SRS path loss estimation (see TS 38.213 [13], clause 7.3).                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b><i>pathlossReferenceRS-Pos</i></b><br>A reference signal (e.g. a SS block or a DL-PRS config) to be used for SRS path loss estimation (see TS 38.213 [13], clause 7.3).                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>pathlossReferenceRSList</i></b><br>Multiple candidate pathloss reference RS(s) for SRS power control, where one candidate RS can be mapped to SRS Resource Set via MAC CE (clause 6.1.3.27 in TS 38.321 [3]). The network can only configure this field if <i>pathlossReferenceRS</i> is not configured in the same <i>SRS-ResourceSet</i> .                                                                                                                                                                                                                      |
| <b><i>resourceType</i></b><br>Time domain behavior of SRS resource configuration, see TS 38.214 [19], clause 6.2.1. The network configures SRS resources in the same resource set with the same time domain behavior on periodic, aperiodic and semi-persistent SRS. The aperiodic SRS is not applicable for the UE in RRC_INACTIVE. If <i>srs-PosRRC-InactiveValidityAreaPreConfigList</i> or <i>srs-PosRRC-InactiveValidityAreaNonPreConfig</i> is configured, the value of this field applies to all cells in the validity area.                                     |
| <b><i>slotOffset</i></b><br>An offset in number of slots between the triggering DCI and the actual transmission of this <i>SRS-ResourceSet</i> . If the field is absent the UE applies no offset (value 0).                                                                                                                                                                                                                                                                                                                                                             |
| <b><i>srs-PowerControlAdjustmentStates</i></b><br>Indicates whether $h_{srs,c(i)} = f_c(i,1)$ or $h_{srs,c(i)} = f_c(i,2)$ (if twoPUSCH-PC-AdjustmentStates are configured) or separate close loop is configured for SRS. This parameter is applicable only for Uls on which UE also transmits PUSCH. If absent or release, the UE applies the value sameAs-Fci1 (see TS 38.213 [13], clause 7.3).                                                                                                                                                                      |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>srs-ResourceIdList, srs-PosResourceIdList</i></b><br>The IDs of the SRS-Resources/SRS-PosResource used in this <i>SRS-ResourceSet</i> / <i>SRS-PosResourceSet</i> . If this <i>SRS-ResourceSet</i> is configured with <i>usage</i> set to <i>codebook</i> , the <i>srs-ResourceIdList</i> contains at most 2 entries. If this <i>SRS-ResourceSet</i> is configured with <i>usage</i> set to <i>nonCodebook</i> , the <i>srs-ResourceIdList</i> contains at most 4 entries. If <i>srs-PosRRC-InactiveValidityAreaPreConfigList</i> or <i>srs-PosRRC-InactiveValidityAreaNonPreConfig</i> is configured, <i>srs-PosResourceIdList</i> is commonly configured across cells within the validity area. |
| <b><i>srs-ResourceSetId, srs-PosResourceSetId</i></b><br>The ID of this resource set. It is unique in the context of the BWP in which the parent <i>SRS-Config</i> is defined. If <i>srs-PosRRC-InactiveValidityAreaPreConfigList</i> or <i>srs-PosRRC-InactiveValidityAreaNonPreConfig</i> is configured, <i>srs-PosResourceSetId</i> is commonly configured across cells within the validity area.                                                                                                                                                                                                                                                                                                    |
| <b><i>ssb-IndexServing</i></b><br>Indicates SSB index belonging to a serving cell where the SRS is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b><i>ssb-Ncell</i></b><br>This field indicates a SSB configuration from neighboring cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b><i>usage</i></b><br>Indicates if the SRS resource set is used for beam management, codebook based or non-codebook based transmission or antenna switching. See TS 38.214 [19], clause 6.2.1. Reconfiguration between codebook based and non-codebook based transmission is not supported.                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b><i>usagePDC</i></b><br>If configured, it indicates that this SRS resource set is used for propagation delay compensation. The field can be present in only one <i>SRS-ResourceSet</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b><i>SRS-SpatialRelationInfoPos</i> field descriptions</b>                                                                                                                                                                                                  |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>csi-RS-IndexServing</i></b><br>Indicates CSI-RS index belonging to a serving cell.                                                                                                                                                                     |
| <b><i>dl-PRS</i></b><br>This field indicates a PRS configuration.                                                                                                                                                                                            |
| <b><i>resourceSelection</i></b><br>Indicates whether the configured SRS spatial relation resource is a <i>SRS-Resource</i> or <i>SRS-PosResource</i> .                                                                                                       |
| <b><i>servingCellId</i></b><br>The serving Cell ID of the source SSB, CSI-RS, or SRS for the spatial relation of the target SRS resource. If this field is absent the SSB, the CSI-RS, or the SRS is from the same serving cell where the SRS is configured. |
| <b><i>ssb-IndexServing</i></b><br>Indicates SSB index belonging to a serving cell.                                                                                                                                                                           |
| <b><i>ssb-Ncell</i></b><br>This field indicates a SSB configuration from neighboring cell.                                                                                                                                                                   |

| <b><i>SSB-InfoNCell</i> field descriptions</b>                                                                                                                                                                                                                                                                                                              |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>physicalCellId</i></b><br>This field specifies the physical cell ID of the neighbour cell or NCD-SSB of the serving cell for which SSB configuration is provided.                                                                                                                                                                                     |
| <b><i>ssb-IndexNcell</i></b><br>This field specifies the index of the SSB for a neighbour cell or NCD-SSB of the serving cell. See TS 38.213 [13]. If this field is absent, the UE determines the <i>ssb-IndexNcell</i> of the <i>physicalCellId</i> based on its SSB measurement from the cell.                                                            |
| <b><i>ssb-Configuration</i></b><br>This field specifies the full configuration of the SSB. If this field is absent, the UE obtains the configuration for the SSB from <i>nr-SSB-Config</i> received as part of DL-PRS assistance data in LPP, see TS 37.355 [49], by looking up the corresponding SSB configuration using the field <i>physicalCellId</i> . |

| <b>DL-PRS-Info field descriptions</b>                                                                                                                                                                                                                   |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dl-PRS-ID</b><br>This field specifies the UE specific TRP ID (see TS 37.355 [49]) for which PRS configuration is provided.                                                                                                                           |
| <b>dl-PRS-ResourceSetId</b><br>This field specifies the PRS-ResourceSet ID of a PRS resourceSet.                                                                                                                                                        |
| <b>dl-PRS-ResourceId</b><br>This field specifies the PRS-Resource ID of a PRS resource. If this field is absent, the UE determines the <i>dl-PRS-ResourceID</i> based on its PRS measurement from the TRP (see TS 37.355 [49]) and DL-PRS Resource Set. |

| <b>SSB-Configuration field descriptions</b>                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>halfFrameIndex</b><br>Indicates whether SSB is in the first half or the second half of the frame. Value zero indicates the first half and value 1 indicates the second half.                                                                                                                                                                                                                                                                 |
| <b>integerSubframeOffset</b><br>Indicates the subframe boundary offset of the cell in which SSB is transmitted.                                                                                                                                                                                                                                                                                                                                 |
| <b>sfn0-Offset</b><br>Indicates the time offset of the SFN0 slot 0 for the cell with respect to SFN0 slot 0 of serving cell.                                                                                                                                                                                                                                                                                                                    |
| <b>sfn-Offset</b><br>Specifies the SFN offset between the cell in which SSB is transmitted and serving cell. The offset corresponds to the number of full radio frames counted from the beginning of a radio frame #0 of serving cell to the beginning of the closest subsequent radio frame #0 of the cell in which SSB is transmitted.                                                                                                        |
| <b>sfn-SSB-Offset</b><br>Indicates the SFN offset of the transmitted SSB relative to the start of the SSB period. Value 0 indicates that the SSB is transmitted in the first system frame, value 1 indicates that SSB is transmitted in the second system frame and so on. The network configures this field according to the field <i>ssb-Periodicity</i> such that the indicated system frame does not exceed the configured SSB periodicity. |
| <b>ssb-Freq</b><br>Indicates the frequency of the SSB.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>ss-PBCH-BlockPower</b><br>Average EPRE of the resources elements that carry secondary synchronization signals in dBm that the NW used for SSB transmission, see TS 38.213 [13], clause 7.                                                                                                                                                                                                                                                    |
| <b>ssb-Periodicity</b><br>Indicates the periodicity of the SSB. If the field is absent, the UE applies the value ms5. (see TS 38.213 [13], clause 4.1)                                                                                                                                                                                                                                                                                          |
| <b>ssbSubcarrierSpacing</b><br>Subcarrier spacing of SSB.<br>Only the following values are applicable depending on the used frequency:<br>FR1: 15 or 30 kHz<br>FR2-1/FR2-NTN: 120 or 240 kHz<br>FR2-2: 120, 480, or 960 kHz                                                                                                                                                                                                                     |

| <i><b>TxHoppingConfig</b></i> field descriptions                                                                                                                                                                                                                                                                                             |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>numberOfHops</i></b><br>This field specifies the number of hops. Value 1 indicates one hop, value 2 indicates two hops and so on.                                                                                                                                                                                                      |
| <b><i>overlapValue</i></b><br>This field specifies the overlap during SRS transmission in terms of number of <i>resource blocks</i> . Value <i>zeroRB</i> implies 0 RB, value <i>oneRB</i> corresponds to 1 RB, value <i>twoRB</i> corresponds to 2 RBs and so on. The same value for the <i>overlapValue</i> is configured to all the hops. |
| <b><i>slotOffsetForRemainingHopsList</i></b><br>This field specifies the starting slot offset and starting symbol for the SRS resource with tx hopping for different resource types (aperiodic, semi-persistent or periodic SRS transmission). Each hop is configured with the same periodicity.                                             |

| Conditional Presence    | Explanation                                                                                                                                              |

— SRS-RSRP-Range

The IE *SRS-RSRP-Range* specifies the value range used in SRS-RSRP measurements and thresholds. The integer value for SRS-RSRP measurements is according to Table 10.1.22.1.2-1 in TS 38.133 [14]. For thresholds, the actual value is (IE value –140) dBm, except for the IE value 98, in which case the actual value is infinity.

SRS-RSRP-Range information element

```

-- ASN1START
-- TAG-SRS-RSRP-RANGE-START

SRS-RSRP-Range-r16 ::=
    INTEGER(0..98)

-- TAG-SRS-RSRP-RANGE-STOP
-- ASN1STOP
```

— *SRS-TPC-CommandConfig*

The IE *SRS-TPC-CommandConfig* is used to configure the UE for extracting TPC commands for SRS from a group-TPC messages on DCI.

***SRS-TPC-CommandConfig* information element**

```
-- ASN1START
-- TAG-SRS-TPC-COMMANDCONFIG-START

SRS-TPC-CommandConfig ::=

| <b>additionalPCI</b><br>PCI of the additional SSB different from serving cell PCI.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>periodicity</b><br>Periodicity of the SS/PBCH blocks, see 5.5.2.10. Periodicity is given in number of subframes.                                                                                                                                                                                                                                                                                                                                                             |
| <b>ssb-PositionsInBurst</b><br>Indicates the time domain positions of the transmitted SS-blocks in a half frame with SS/PBCH blocks as defined in TS 38.213 [13], clause 4.1. The first/leftmost bit corresponds to SS/PBCH block index 0, the second bit corresponds to SS/PBCH block index 1, and so on. Value 0 in the bitmap indicates that the corresponding SS/PBCH block is not transmitted while value 1 indicates that the corresponding SS/PBCH block is transmitted. |
| <b>ss-PBCH-BlockPower</b><br>Average EPRE of the resources elements that carry secondary synchronization signals in dBm that the NW used for SSB transmission, see TS 38.213 [13], clause 7.                                                                                                                                                                                                                                                                                    |

– SSB-PositionQCL-Relation

The IE *SSB-PositionQCL-Relation* is used to indicate the QCL relationship between SSB positions on the frequency indicated by *ssbFrequency* (see TS 38.213 [13], clause 4.1) for operation with shared spectrum channel access. Value n1 corresponds to 1, value n2 corresponds to 2 and so on.

SSB-PositionQCL-Relation information element

```
-- ASN1START
-- TAG-SSB-POSITIONQCL-RELATION-START

SSB-PositionQCL-Relation-r16 ::= ENUMERATED {n1,n2,n4,n8}

SSB-PositionQCL-Relation-r17 ::= ENUMERATED {n32, n64}

-- TAG-SSB-POSITIONQCL-RELATION-STOP
-- ASN1STOP
```

– SSB-ToMeasure

The IE *SSB-ToMeasure* is used to configure a pattern of SSBs. For operation with shared spectrum channel access in FR1, only *mediumBitmap* is used, and for FR2-2, *longBitmap* is used.

SSB-ToMeasure information element

```
-- ASN1START
```

-- TAG-SSB-TOMEASURE-START

```
SSB-ToMeasure ::=
    shortBitmap          CHOICE {
    mediumBitmap          BIT STRING (SIZE (4)),
    longBitmap           BIT STRING (SIZE (8)),
    }                   BIT STRING (SIZE (64))
```

-- TAG-SSB-TOMEASURE-STOP  
-- ASN1STOP

| SSB-ToMeasure field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>longBitmap</b><br/>Bitmap when maximum number of SS/PBCH blocks per half frame equals to 64 as defined in TS 38.213 [13], clause 4.1. For operation with shared spectrum channel access in FR2-2, if the k-th bit is set to 1, the UE assumes that one or more SS/PBCH blocks within the SMTC measurement duration with candidate SS/PBCH block indexes corresponding to SS/PBCH block index equal to (k-1) may be transmitted; if the k-th bit is set to 0, the UE assumes that the corresponding SS/PBCH block(s) are not transmitted.</p>                                                                                                                                                                                                                                                                                                                                                                                                  |
| <p><b>mediumBitmap</b><br/>Bitmap when maximum number of SS/PBCH blocks per half frame equals to 8 as defined in TS 38.213 [13], clause 4.1. For operation with shared spectrum channel access, if the k-th bit is set to 1, the UE assumes that one or more SS/PBCH blocks within the SMTC measurement duration with candidate SS/PBCH block indexes corresponding to SS/PBCH block index equal to k-1 may be transmitted; if the k-th bit is set to 0, the UE assumes that the corresponding SS/PBCH block(s) are not transmitted. The k-th bit is set to 0, where <math>k &gt; \text{ssb-PositionQCL-Common}</math> and the number of actually transmitted SS/PBCH blocks is not larger than the number of 1's in the bitmap. If <i>ssb-PositionQCL</i> is configured with a value smaller than <i>ssb-PositionQCL-Common</i>, only the leftmost K bits (<math>K = \text{ssb-PositionQCL}</math>) are applicable for the corresponding cell.</p> |
| <p><b>shortBitmap</b><br/>Bitmap when maximum number of SS/PBCH blocks per half frame equals to 4 as defined in TS 38.213 [13], clause 4.1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## – SS-RSSI-Measurement

The IE *SS-RSSI-Measurement* is used to configure RSSI measurements based on synchronization reference signals.

### SS-RSSI-Measurement information element

-- ASN1START  
-- TAG-SS-RSSI-MEASUREMENT-START

```
SS-RSSI-Measurement ::=
    measurementsSlots    SEQUENCE {
    endSymbol            BIT STRING (SIZE (1..80)),
    }                   INTEGER(0..3)
```

-- TAG-SS-RSSI-MEASUREMENT-STOP  
-- ASN1STOP

| SS-RSSI-Measurement field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <div> <div><b>endSymbol</b></div> <div> Within a slot that is configured for RSSI measurements (see <i>measurementSlots</i>) the UE measures the RSSI from symbol 0 to symbol <i>endSymbol</i>. This field identifies the entry in Table 5.1.3-1 in TS 38.215 [9], which determines the actual end symbol. </div> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <div> <div><b>measurementSlots</b></div> <div> Indicates the slots in which the UE can perform RSSI measurements. The length of the BIT STRING is equal to the number of slots in the configured SMTC window (determined by the duration and by the subcarrierSpacing). The first (left-most / most significant) bit in the bitmap corresponds to the first slot in the SMTC window, the second bit in the bitmap corresponds to the second slot in the SMTC window, and so on. The UE measures in slots for which the corresponding bit in the bitmap is set to 1. In case this field is configured for a SCell with <i>ca-SlotOffset-r16</i>, the bits in the bitmap corresponds to the slots that are fully contained in the SMTC window. </div> </div> |

– SubcarrierSpacing

The IE *SubcarrierSpacing* determines the subcarrier spacing. Restrictions applicable for certain frequencies, channels or signals are clarified in the fields that use this IE.

SubcarrierSpacing information element

```

-- ASN1START
-- TAG-SUBCARRIERSPACING-START

SubcarrierSpacing ::=
    ENUMERATED {kHz15, kHz30, kHz60, kHz120, kHz240, kHz480-v1700, kHz960-v1700, spare1}

-- TAG-SUBCARRIERSPACING-STOP
-- ASN1STOP

```

– TAG-Config

The IE *TAG-Config* is used to configure parameters for a time-alignment group.

TAG-Config information element

```

-- ASN1START
-- TAG-TAG-CONFIG-START

TAG-Config ::=
    tag-ToReleaseList
    tag-ToAddModList
}

TAG ::=
    tag-Id
    timeAlignmentTimer
    ...
}

TAG-Id ::=
    INTEGER (0..maxNrofTAGs-1)

```

|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>offsetThresholdTA</b><br>Offset for TA reporting as specified in TS 38.321 [3]. Network only configures this parameter for MCG. For <i>offsetThresholdTA-r17</i> , value <i>ms0dot5</i> corresponds to 0.5 ms, value <i>ms1</i> corresponds to 1 ms, and so on.<br>Network only configures <i>offsetThresholdTA-r18</i> for ATG, which is in unit of symbols based on the subcarrier spacing of the BWP indicated by <i>firstActiveDownlinkBWP-Id</i> if received in the same RRC message, otherwise, it is based on the subcarrier spacing of the active DL BWP of the PCell when <i>offsetThresholdTA-r18</i> is received. Once configured, the value of TA offset threshold does not change autonomously by the UE with BWP switching. |
| <b>timingAdvanceSR</b><br>Used to configure whether a Timing Advance report may trigger a Scheduling Request as specified in TS 38.321 [3].                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

– *TCI-ActivatedConfig*

The IE *TCI-ActivatedConfig* is used to provide activated TCI states for PDSCH and/or PDCCH of the PSCell or of an SCell.

*TCI-ActivatedConfig* information element

```

-- ASN1START
-- TAG-TCI-ACTIVATEDCONFIG-START

TCI-ActivatedConfig-r17 ::= SEQUENCE {
    pdcch-TCI-r17          SEQUENCE (SIZE (1..5)) OF TCI-StateId,
    pdsch-TCI-r17          BIT STRING (SIZE (1..maxNrofTCI-States))
}

-- TAG-TCI-ACTIVATEDCONFIG-STOP
-- ASN1STOP

```

| <i>TCI-ActivatedConfig</i> field descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b><i>pdcch-TCI</i></b><br/>                     Indicates the TCI state for PDCCH for each configured CORESET of the DL BWP to be activated at SCell activation, to be activated for the PSCell at SCG activation and/or to be used for BFD, RLM and measurements while the SCG is deactivated. The list includes exactly as many entries as CORESETs configured in this BWP, ordered by increasing values of <i>ControlResourceSet-Id</i>, i.e. the first entry indicates the TCI state for the configured CORESET with the lowest <i>ControlResourceSet-Id</i> value, the second value indicates the TCI states for the configured CORESET with the second lowest <i>ControlResourceSet-Id</i> value, and so on.</p> |
| <p><b><i>pdsch-TCI</i></b><br/>                     Indicates TCI states for PDSCH reception at SCell addition/activation or of the PSCell at SCG activation. This field indicates activated TCI state(s) for this BWP ordered by increasing values of <i>TCI-StateId</i>, i.e. the first bit indicates the activation state of the TCI state with the lowest <i>TCI-StateId</i> value, the second value indicates the activation status of the TCI state with the second lowest <i>TCI-StateId</i> value, and so on. A bit set to 0 indicates that the corresponding TCI state is deactivated, a bit set to 1 indicates that the TCI state is activated.</p>                                                              |

– *TCI-State*

The IE *TCI-State* associates one or two DL reference signals with a corresponding quasi-colocation (QCL) type.

*TCI-State* information element

```

| <b>referenceSignal</b><br>Reference signal with which quasi-collocation information is provided as specified in TS 38.214 [19] clause 5.1.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>qcl-Type</b><br>QCL type as specified in TS 38.214 [19] clause 5.1.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>TCI-State field descriptions</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>additionalPCI</b>                | Indicates the physical cell IDs (PCI) of the SSBs when <i>referenceSignal</i> is configured as SSB for both QCL-Type1 and QCL-Type2. In case the <i>cell</i> is present, the <i>additionalPCI</i> refers to a PCI value configured in the list configured using <i>additionalPCI-ToAddModList</i> in the serving cell indicated by the field <i>cell</i> . Otherwise, it refers to a PCI value configured in a list <i>additionalPCI-ToAddModList</i> configured in the serving cell where the <i>TCI-State</i> is applied by the UE. When this field is present the <i>cell</i> for <i>qcl-Type1</i> and <i>qcl-Type2</i> is configured with same value, if present.                                           |
| <b>pathlossReferenceRS-Id</b>       | The ID of the reference signal (e.g. a CSI-RS or an SS block) used for PUSCH, PUCCH and SRS path loss estimation. This field refers to an element in the list configured using <i>pathlossReferenceRSToAddModList</i> in the serving cell and UL BWP where the TCI State is applied by the UE.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>qcl-Type1, qcl-Type2</b>         | QCL information for the TCI state as specified in TS 38.214 [19] clause 5.1.5.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>tag-Id-ptr</b>                   | It indicates the TAG that is associated with this TCI state, value n0 means the TCI state associate with the TAG indicated by <i>tag-Id</i> , value n1 means this TCI state associated with the TAG indicated by <i>tag2-Id</i> . The <i>tag-Id-ptr</i> refers to the TAG of the serving cell where the TCI state is applied.                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>tci-StateId</b>                  | ID number of the TCI state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>ul-PowerControl</b>              | Configures power control parameters for PUCCH, PUSCH and SRS for this TCI state. The field is present here only if <i>ul-powerControl</i> is not configured in any <i>BWP-Uplink-Dedicated</i> of this serving cell. This field refers to an element in the list configured using <i>uplink-PowerControlToAddModList</i> in the serving cell where the <i>dl-OrJointTCI-StateToAddModList</i> is configured. For each serving cell, <i>ul-powerControl</i> is either configured in each <i>TCI-State</i> configured or referred to in <i>dl-OrJointTCI-StateList</i> in each DL BWP, or it is not configured in any <i>TCI-State</i> configured or referred to in <i>dl-OrJointTCI-StateList</i> in any DL BWP. |

| Conditional Presence | Explanation                                                                                                                                                                                                                                                            |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2TA                  | This field is mandatory present if <i>tag2</i> is present for the serving cell and the serving cell is configured with <i>unifiedTCI-StateType</i> set to <i>joint</i> . It is absent, Need R, otherwise.                                                              |
| CSI-RS-Indicated     | This field is mandatory present if <i>csi-rs</i> is included and <i>unifiedTCI-StateType</i> is not configured. This field is optionally present, Need R, if <i>csi-rs</i> is included and <i>unifiedTCI-StateType</i> is configured. Otherwise, it is absent, Need R. |
| JointTCI             | This field is optionally present, Need R, if this serving cell is configured with <i>unifiedTCI-StateType</i> set to <i>'joint'</i> . It is absent, Need R, otherwise.                                                                                                 |
| JointTCI1            | This field is mandatory present, if this serving cell is configured with <i>unifiedTCI-StateType</i> set to <i>'joint'</i> . It is absent, Need R, otherwise.                                                                                                          |

– **TCI-StateId**

The IE *TCI-StateId* is used to identify one *TCI-State* configuration.

#### **TCI-StateId information element**

```
-- ASN1START
-- TAG-TCI-STATEID-START
```

```
TCI-StateId ::= INTEGER (0..maxNrofTCI-States-1)

— TrackingAreaCode

The IE *TrackingAreaCode* is used to identify a tracking area within the scope of a PLMN/SNPN, see TS 24.501 [23].

TrackingAreaCode information element

```
-- ASN1START
-- TAG-TRACKINGAREACODE-START

TrackingAreaCode ::= BIT STRING (SIZE (24))

-- TAG-TRACKINGAREACODE-STOP
-- ASN1STOP
```

— T-Reselection

The IE *T-Reselection* concerns the cell reselection timer  $T_{reselction_{RAT}}$  for NR and E-UTRA. Value in seconds. For value 0, behaviour as specified in 7.1.2 applies.

T-Reselection information element

```
-- ASN1START
-- TAG-TRESELECTION-START
```

T-Reselection ::= INTEGER (0..7)

-- TAG-TRESELECTION-STOP  
-- ASN1STOP

## — *TimeAlignmentTimer*

The IE *TimeAlignmentTimer* is used to configure the time alignment timer as specified in TS 38.321 [3]. The values are in ms.

### *TimeAlignmentTimer* information element

-- ASN1START  
-- TAG-TIMEALIGNMENTTIMER-START

TimeAlignmentTimer ::= ENUMERATED {ms500, ms750, ms1280, ms1920, ms2560, ms5120, ms10240, infinity}

-- TAG-TIMEALIGNMENTTIMER-STOP  
-- ASN1STOP

## — *TimeToTrigger*

The IE *TimeToTrigger* specifies the value range used for time to trigger parameter, which concerns the time during which specific criteria for the event needs to be met in order to trigger a measurement report. Value *ms0* corresponds to 0 ms and behaviour as specified in 7.1.2 applies, value *ms40* corresponds to 40 ms, and so on.

### *TimeToTrigger* information element

-- ASN1START  
-- TAG-TIMETOTRIGGER-START

TimeToTrigger ::= ENUMERATED {  
ms0, ms40, ms64, ms80, ms100, ms128, ms160, ms256,  
ms320, ms480, ms512, ms640, ms1024, ms1280, ms2560,  
ms5120}

-- TAG-TIMETOTRIGGER-STOP  
-- ASN1STOP

## — *TN-AreaId*

The IE *TN-AreaId* is used to identify a TN coverage area in an NTN system.

***TN-AreaId* information element**

```

-- ASN1START
-- TAG-TN-AREAID-START

TN-AreaId-r18 ::=
    INTEGER (1..maxTN-AreaInfo-r18)

-- TAG-TN-AREAID-STOP
-- ASN1STOP

```

— ***UAC-BarringInfoSetIndex***

The IE *UAC-BarringInfoSetIndex* provides the index of the entry in *uac-BarringInfoSetList*. Value 1 corresponds to the first entry in *uac-BarringInfoSetList*, value 2 corresponds to the second entry in this list and so on. An index value referring to an entry not included in *uac-BarringInfoSetList* indicates no barring.

***UAC-BarringInfoSetIndex* information element**

```

-- ASN1START
-- TAG-UAC-BARRINGINFOSETINDEX-START

UAC-BarringInfoSetIndex ::=
    INTEGER (1..maxBarringInfoSet)

-- TAG-UAC-BARRINGINFOSETINDEX-STOP
-- ASN1STOP

```

— ***UAC-BarringInfoSetList***

The IE *UAC-BarringInfoSetList* provides a list of access control parameter sets. An access category can be configured with access parameters according to one of the sets.

***UAC-BarringInfoSetList* information element**

```

-- ASN1START
-- TAG-UAC-BARRINGINFOSETLIST-START

UAC-BarringInfoSetList ::=
    SEQUENCE (SIZE(1..maxBarringInfoSet)) OF UAC-BarringInfoSet

UAC-BarringInfoSetList-v1700 ::= SEQUENCE (SIZE(1..maxBarringInfoSet)) OF UAC-BarringInfoSet-v1700

UAC-BarringInfoSet ::=
    SEQUENCE {
        uac-BarringFactor      ENUMERATED {p00, p05, p10, p15, p20, p25, p30, p40,
                                           p50, p60, p70, p75, p80, p85, p90, p95},
        uac-BarringTime        ENUMERATED {s4, s8, s16, s32, s64, s128, s256, s512},

| <b>delay-DRBlist</b><br>Indicates the DRB IDs used by UE to provide results of UL PDCP Packet Delay value per DRB measurement as specified in TS 38.314 [53]. |

– *UL-ExcessDelayConfig*

The IE *UL-ExcessDelayConfig* IE specifies the configuration of the UL PDCP Excess Packet Delay per DRB measurement specified in TS 38.314 [53].

*UL-ExcessDelayConfig* information element

```
-- ASN1START
-- TAG-ULEXCESSDELAYCONFIG-START

UL-ExcessDelayConfig-r17 ::= SEQUENCE {
    excessDelay-DRBlist-r17      SEQUENCE (SIZE(1..maxDRB)) OF ExcessDelay-DRB-IdentityInfo-r17
}

ExcessDelay-DRB-IdentityInfo-r17 ::= SEQUENCE {
    drb-IdentityList             SEQUENCE (SIZE (1..maxDRB)) OF DRB-Identity,
    delayThreshold               ENUMERATED {ms0dot25, ms0dot5, ms1, ms2, ms4, ms5, ms10, ms20, ms30, ms40, ms50, ms60, ms70,
                                           ms80, ms90, ms100, ms150, ms300, ms500}
}

-- TAG-ULEXCESSDELAYCONFIG-STOP
-- ASN1STOP
```

| UL-ExcessDelayConfig field descriptions                                                                                                                                                                     |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>drb-IdentityList</b><br>Indicates the DRB IDs used by UE to provide results of UL PDCP Excess Packet Delay per DRB measurement as specified in TS 38.314 [53].                                           |
| <b>delayThreshold</b><br>Indicates the delay threshold for the DRB IDs indicated in DRB-IdentityList. Value ms0dot25 corresponds to 0.25ms, ms0dot5 corresponds to 0.5ms, ms1 corresponds to 1ms and so on. |

– *UL-GapFR2-Config*

The IE *UL-GapFR2-Config* specifies the FR2 uplink gap configuration.

UL-GapFR2-Config information element

```
-- ASN1START
-- TAG-UL-GAPFR2-CONFIG-START

UL-GapFR2-Config-r17 ::= SEQUENCE {
    gapOffset-r17          INTEGER (0..159),
    ugl-r17                ENUMERATED {ms0dot125, ms0dot25, ms0dot5, ms1},
    ugrp-r17               ENUMERATED {ms5, ms20, ms40, ms160},
    refFR2-ServCellAsyncCA-r17 ServCellIndex
}

-- TAG-UL-GAPFR2-CONFIG-STOP
-- ASN1STOP
```

| UL-GapFR2-Config field descriptions |                                                                                                                                                                                                                  |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| gapOffset                           | Value gapOffset is the gap offset of the FR2 UL gap pattern with UGRP indicated in the field ugrp. The value range is from 0 to ugrp-1.                                                                          |
| refFR2-ServCellAsyncCA              | Indicates the FR2 serving cell identifier whose SFN and subframe is used for FR2 UL gap calculation for this gap pattern with asynchronous CA involving FR2 carrier(s).                                          |
| ugl                                 | Value ugl is the gap length in ms of the FR2 UL gap. The FR2 UL gap length is according to Table 9.1.11-1 in TS 38.133 [14]. Value ms0dot125 corresponds to 0.125 ms, ms0dot25 corresponds to 0.25 ms and so on. |
| ugrp                                | Value ugrp is the gap repetition period in (ms) of the FR2 UL gap. The FR2 UL gap repetition period is according to Table 9.1.11-1 in TS 38.133 [14].                                                            |

| Conditional Presence | Explanation                                                                                                                                                                                                                    |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AsyncCA              | This field is mandatory present when configuring FR2 UL gap pattern to UE in:<br>- (NG)EN-DC, NR SA, NE-DC or NR-DC without FR2-FR2 band combination, with asynchronous CA involving FR2 carriers.<br>Otherwise, it is absent. |

UplinkCancellation

The IE UplinkCancellation is used to configure the UE to monitor PDCCH for the CI-RNTI.

UplinkCancellation information element

```
-- ASN1START
-- TAG-ULINKCANCELLATION-START

UplinkCancellation-r16 ::= SEQUENCE {
    ci-RNTI-r16          RNTI-Value,

| UplinkCancellation field descriptions |                                                                                                                                                 |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ci-ConfigurationPerServingCell</b> | Indicates (per serving cell) the position of the <i>ci-PaylaodSize</i> bit CI values inside the DCI payload (see TS 38.213 [13], clause 11.2A). |
| <b>ci-RNTI</b>                        | RNTI used for indication cancellation in UL (see TS 38.212 [17] clause 7.3.1 and TS 38.213 [13], clause 11.2A).                                 |
| <b>dci-PayloadSizeForCI</b>           | Total length of the DCI payload scrambled with CI-RNTI (see TS 38.213 [13], clause 11.2A).                                                      |

| <i>CI-ConfigurationPerServingCell</i> field descriptions |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>ci-PayloadSize</i></b>                             | Configures the field size for each UL cancelation indicator of this serving cell ( <i>servingCellId</i> ) (see TS 38.213 [13], clause 11.2A).                                                                                                                                                                                                                                                                                                                                          |
| <b><i>deltaOffset</i></b>                                | Configures the additional offset from the end of a PDCCH reception where the UE detects the DCI format 2_4 and the first symbol of the T_ "CI" symbols, in the unit of OFDM symbols (see TS 38.213 [13], clause 11.2A).                                                                                                                                                                                                                                                                |
| <b><i>frequencyRegionForCI</i></b>                       | Configures the reference frequency region where a detected UL CI is applicable (see TS 38.213 [13], clause 11.2A). It is defined in the same way as <i>locationAndBandwidth</i> .                                                                                                                                                                                                                                                                                                      |
| <b><i>positionInDCI</i></b>                              | Starting position (in number of bit) of the <i>ci-PayloadSize</i> bit CI value applicable for this serving cell ( <i>servingCellId</i> ) within the DCI payload (see TS 38.213 [13], clause 11.2A).                                                                                                                                                                                                                                                                                    |
| <b><i>positionInDCI-ForSUL</i></b>                       | Starting position (in number of bit) of the <i>ci-PayloadSize</i> bit CI value applicable for SUL of this serving cell ( <i>servingCellId</i> ) within the DCI payload (see TS 38.213 [13], clause 11.2A).                                                                                                                                                                                                                                                                             |
| <b><i>timeDurationForCI</i></b>                          | Configures the duration of the reference time region in symbols where a detected UL CI is applicable of this serving cell ( <i>servingCellId</i> ) (see TS 38.213 [13], clause 11.2A). If the field is absent, i.e., the configured UL CI monitoring periodicity indicated by <i>monitoringSlotPeriodicityAndOffset</i> for DCI format 2_4 is larger than 1 slot or 1 slot with only one monitoring occasion, the UE applies the value of the configured UL CI monitoring periodicity, |
| <b><i>timeFrequencyRegion</i></b>                        | Configures the reference time and frequency region where a detected UL CI is applicable of this serving cell ( <i>servingCellId</i> ) (see TS 38.213 [13], clause 11.2A).                                                                                                                                                                                                                                                                                                              |
| <b><i>timeGranularityForCI</i></b>                       | Configures the number of partitions within the time region of this serving cell ( <i>servingCellId</i> ) (see TS 38.213 [13], clause 11.2A).                                                                                                                                                                                                                                                                                                                                           |
| <b><i>uplinkCancellationPriority</i></b>                 | Configures uplink cancellation behavior if both UL CI and intra-UE priority indicator are configured for a given UE. If the field is present, then UL CI is only applicable to the UL transmissions indicated/configured as low priority level. If the field is absent, UL CI is applicable to UL transmission irrespective of its priority level (see TS 38.213 [13], clause 11.2A).                                                                                                  |

| Conditional Presence     | Explanation                                                                                                                                                                                                                  |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>SUL-Only</i>          | The field is optionally present, Need R, if <i>supplementaryUplink</i> is configured in <i>ServingCellConfig</i> . It is absent otherwise.                                                                                   |
| <i>SymbolPeriodicity</i> | This field is mandatory present if the configured UL CI monitoring periodicity indicated by <i>monitoringSlotPeriodicityAndOffset</i> for DCI format 2_4 is 1 slot with more than one monitoring occasion, otherwise absent. |

## – *UplinkConfigCommon*

The IE *UplinkConfigCommon* provides common uplink parameters of a cell.

| <b><i>CC-Group</i></b><br>The contiguous carriers sharing the same PA in an intra-band UL CA configuration. The UE shall report only one DC location for an intra-band CC combination with one active uplink carrier in case <i>DefaultDC-Location</i> is set to <i>activeCarrier</i> or <i>activeBWP</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b><i>defaultDC-Location</i></b><br>Indicates the default DC location derivation option. The default Tx Direct Current is located at the mathematical center of the UE bandwidth, i.e. between the lower edge of the lowest subcarrier of the lowest frequency component and the upper edge of the highest subcarrier of the highest frequency component, rounded to the subcarrier grid of the lowest SCS defined for the component carrier on which the default Direct Current is located. The lowest and highest frequency components used for derivation of mathematical center are indicated by <i>FrequencyComponent</i> in the associated <i>CC-Group</i> , where the lowest frequency component and the highest frequency component may be the same. If the mathematical center of the UE bandwidth lands on frequencies where there is no subcarrier grid defined, the subcarrier grid of the lowest SCS of the nearest lower frequency component carrier shall be extended to cover the frequency of the mathematical default Direct Current location. |
| <b><i>offsetToDefault</i></b><br>Indicates the DC location offset to the default DC location derived from <i>defaultDC-Location</i> . The lowest SCS in the CC group is used as the offset granularity. Value 0 represents no offset.<br>offsetValue is used in case <i>DefaultDC-Location</i> is set to <i>configuredCarrier</i> or <i>configuredBWP</i> . <i>offsetlist</i> is used in case <i>DefaultDC-Location</i> is set to <i>activeCarrier</i> or <i>activeBWP</i> . Each entity in this list corresponds to the entry in carriers combination in <i>IntraBandCC-CombinationReqList</i> of the intra-band CA component. For each CC group, the UE shall include the same number of entries, and listed in the same order as in <i>CC-CombinationList</i> . If <i>DefaultDC-Location</i> is set the <i>activeCarrier</i> , same offsetValue is signalled for all requested carriers combinations with same active carriers states (regardless of the active BWP index).                                                                                   |
| <b><i>servCellIndexHigher</i></b><br>Indicates the serving cell index of the highest edge of the <i>CC-Group</i> . If absent, there is only one carrier in this group indicated by <i>servCellIndexLower</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b><i>servCellIndexLower</i></b><br>Indicates the serving cell index of the lowest edge of the <i>CC-Group</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b><i>shift7dot5kHz</i></b><br>Indicates whether there is 7.5 kHz shift or not. 7.5 kHz shift is applied if the field is set to true, otherwise 7.5 kHz shift is not applied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b><i>DefaultDC-Location</i> field descriptions</b>                                                                                                     |
|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>dl</i></b><br>Indicates that the default DC location is derived based on the DL frequencies of the frequency component.                           |
| <b><i>ul</i></b><br>Indicates that the default DC location is derived based on the UL frequencies of the frequency component.                           |
| <b><i>ulAndDL</i></b><br>Indicates that the default DC location is derived based on the edge most frequencies among any DL and UL frequency components. |

## – *UplinkTxDirectCurrentTwoCarrierList*

The IE *UplinkTxDirectCurrentTwoCarrierList* indicates the Tx Direct Current locations when uplink intra-band CA with two carriers is configured, based on the configured carriers and BWP numerology and the associated carrier bandwidth of the carriers. The UE does not report the uplink Direct Current location information for SUL carrier(s).

|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>carrierOneInfo</b><br>The serving cell ID and BWP ID of the first carrier of the uplink carrier aggregation for which the uplink Tx Direct Current location(s) are being reported.                                                                                                                                                                                               |
| <b>carrierTwoInfo</b><br>The serving cell ID and BWP ID of the second carrier of the uplink carrier aggregation for which the uplink Tx Direct Current location(s) are being reported.                                                                                                                                                                                              |
| <b>singlePA-TxDirectCurrent</b><br>The uplink Tx Direct Current location for the UE which support single PA for this uplink carrier aggregation. For the UEs which support dual PA for this uplink carrier aggregation, this field is for reporting the uplink Tx Direct Current location of the first PA.                                                                          |
| <b>secondPA-TxDirectCurrent</b><br>The uplink Tx Direct Current location used by the UE with the second PA for the UEs which support dual PA for this uplink carrier aggregation. This field shall be absent for the <i>UplinkTxDirectCurrentTwoCarrier</i> entity where <i>deactivatedCarrier</i> of <i>carrierOneInfo</i> or <i>carrierTwoInfo</i> is set to <i>deactivated</i> . |

– ZP-CSI-RS-Resource

The IE *ZP-CSI-RS-Resource* is used to configure a Zero-Power (ZP) CSI-RS resource (see TS 38.214 [19], clause 5.1.4.2). Reconfiguration of a *ZP-CSI-RS-Resource* between periodic or semi-persistent and aperiodic is not supported.

ZP-CSI-RS-Resource information element

```

-- ASN1START
-- TAG-ZP-CSI-RS-RESOURCE-START

ZP-CSI-RS-Resource ::=
    zp-CSI-RS-ResourceId
    resourceMapping
    periodicityAndOffset
    ...
}

ZP-CSI-RS-ResourceId ::=
    INTEGER (0..maxNrofZP-CSI-RS-Resources-1)

-- TAG-ZP-CSI-RS-RESOURCE-STOP
-- ASN1STOP

```

**BandParametersSidelinkEUTRA-NR field descriptions****bandParametersSidelinkEUTRA1, bandParametersSidelinkEUTRA2**

This field includes the V2X-BandParameters-r14 and V2X-BandParameters-v1530 IE as specified in 36.331 [10]. It is used for reporting the per-band capability for V2X sidelink communication.

## – **BandCombinationListSL-Discovery**

The IE *BandCombinationListSL-Discovery* contains a list of NR Sidelink discovery band combinations.

**BandCombinationListSidelinkSL-Discovery information element**

```
-- ASN1START
-- TAG-BANDCOMBINATIONLISTSLDISCOVERY-START

BandCombinationListSL-Discovery-r17 ::= SEQUENCE (SIZE (1..maxSimultaneousBands)) OF BandParametersSidelinkDiscovery-r17

```

## – **CA-BandwidthClassEUTRA**

The IE *CA-BandwidthClassEUTRA* indicates the E-UTRA CA bandwidth class as defined in TS 36.101 [22], table 5.6A-1.

**CA-BandwidthClassEUTRA** information element

```
-- ASN1START
-- TAG-CA-BANDWIDTHCLASSEUTRA-START
```

```
CA-BandwidthClassEUTRA ::= ENUMERATED {a, b, c, d, e, f, ...}
```

```
-- TAG-CA-BANDWIDTHCLASSEUTRA-STOP
-- ASN1STOP
```

— **CA-BandwidthClassNR**

The IE *CA-BandwidthClassNR* indicates the NR CA bandwidth class as defined in TS 38.101-1 [15], table 5.3A.5-1 and TS 38.101-2 [39], table 5.3A.4-1.

**CA-BandwidthClassNR** information element

```
-- ASN1START
-- TAG-CA-BANDWIDTHCLASSNR-START
```

```
-- R4 17-6: new CA BW Classes R2-R12
-- R4 17-7: new CA BW Classes V, W
```

```
CA-BandwidthClassNR ::= ENUMERATED {a, b, c, d, e, f, g, h, i, j, k, l, m, n, o, p, q, ..., r2-v1730, r3-v1730, r4-v1730, r5-v1730, r6-v1730, r7-v1730, r8-v1730, r9-v1730, r10-v1730, r11-v1730, r12-v1730, v-v1770, w-v1770 }

| <b>supportedCSI-RS-ResourceListAlt</b><br>This field indicates the alternative list of <i>SupportedCSI-RS-Resource</i> supported for each codebook type. The supported CSI-RS resource is indicated by an integer value which pinpoints <i>SupportedCSI-RS-Resource</i> defined in <i>CodebookVariantsList</i> . The value 0 corresponds to the first entry of <i>CodebookVariantsList</i> . The value 1 corresponds to the second entry of <i>CodebookVariantsList</i> , and so on. For each codebook type, the field shall be included in both <i>codebookParametersPerBC</i> (but optional for single CC) and <i>codebookParametersPerBand</i> . |

— *DL-PRS-MeasurementWithRxFH-RRC-Connected*

The IE *DL-PRS-MeasurementWithRxFH-RRC-Connected* is used to convey the capabilities supported by the UE for PRS measurement with Rx frequency hopping within a measurement gap and measurement reporting in RRC\_CONNECTED for RedCap UEs.

*DL-PRS-MeasurementWithRxFH-RRC-Connected information element*

}

-- TAG-EREDCAPPARAMETERS-STOP
-- ASN1STOP

```

## — *FeatureSetCombination*

The IE *FeatureSetCombination* is a two-dimensional matrix of *FeatureSet* entries.

Each *FeatureSetsPerBand* contains a list of feature sets applicable to the carrier(s) of one band entry of the associated band combination. Across the associated bands, the UE shall support the combination of *FeatureSets* at the same position in the *FeatureSetsPerBand*. All *FeatureSetsPerBand* in one *FeatureSetCombination* must have the same number of entries.

The number of *FeatureSetsPerBand* in the *FeatureSetCombination* must be equal to the number of band entries in an associated band combination. The first *FeatureSetPerBand* applies to the first band entry of the band combination, and so on.

Each *FeatureSet* contains either a pair of NR or E-UTRA feature set IDs for UL and DL.

In case of NR, the actual feature sets for UL and DL are defined in the *FeatureSets* IE and referred to from here by their ID, i.e., their position in the *featureSetsUplink* / *featureSetsDownlink* list in the *FeatureSet* IE.

In case of E-UTRA, the feature sets referred to from this list are defined in TS 36.331 [10] and conveyed as part of the *UE-EUTRA-Capability* container.

The *FeatureSetUplink* and *FeatureSetDownlink* referred to from the *FeatureSet* comprise, among other information, a set of *FeatureSetUplinkPerCC-Ids* and *FeatureSetDownlinkPerCC-Ids*. The number of these per-CC IDs determines the number of carriers that the UE is able to aggregate contiguously in frequency domain in the corresponding band. The number of carriers supported by the UE is also restricted by the bandwidth class indicated in the associated *BandCombination*, if present.

In feature set combinations the UE shall exclude entries with same or lower capabilities, since the network may anyway assume that the UE supports those.

NOTE 1: The UE may advertise fallback band-combinations in which it supports additional functionality explicitly in two ways: Either by setting *FeatureSet* IDs to zero (inter-band and intra-band non-contiguous fallback) and by reducing the number of *FeatureSet-PerCC* IDs in a *Feature Set* (intra-band contiguous fallback). Or by separate *BandCombination* entries with associated *FeatureSetCombinations*.

NOTE 2: The UE may advertise a *FeatureSetCombination* containing only fallback band combinations. That means, in a *FeatureSetCombination*, each group of *FeatureSets* across the bands may contain at least one pair of *FeatureSetUplinkId* and *FeatureSetDownlinkId* which is set to 0/0.

NOTE 3: The Network configures serving cell(s) and BWP(s) configuration to comply with capabilities derived from the combination of *FeatureSets* at the same position in the *FeatureSetsPerBand*, regardless of activated/deactivated serving cell(s) and BWP(s).

### ***FeatureSetCombination* information element**

```
-- ASN1START
-- TAG-FEATURESETCOMBINATION-START

FeatureSetCombination ::=
    SEQUENCE (SIZE (1..maxSimultaneousBands)) OF FeatureSetsPerBand

FeatureSetsPerBand ::=
    SEQUENCE (SIZE (1..maxFeatureSetsPerBand)) OF FeatureSet

FeatureSet ::=
    CHOICE {
        eutra
            SEQUENCE {
                downlinkSetEUTRA
                uplinkSetEUTRA
            },
        nr
            SEQUENCE {
                downlinkSetNR
                uplinkSetNR
            }
    }

-- TAG-FEATURESETCOMBINATION-STOP
-- ASN1STOP
```

## – *FeatureSetCombinationId*

The IE *FeatureSetCombinationId* identifies a *FeatureSetCombination*. The *FeatureSetCombinationId* of a *FeatureSetCombination* is the position of the *FeatureSetCombination* in the *featureSetCombinations* list (in *UE-NR-Capability* or *UE-MRDC-Capability*). The *FeatureSetCombinationId* = 0 refers to the first entry in the *featureSetCombinations* list (in *UE-NR-Capability* or *UE-MRDC-Capability*).

NOTE: The *FeatureSetCombinationId* = 1024 is not used due to the maximum entry number of *featureSetCombinations*.

### ***FeatureSetCombinationId* information element**

```
-- ASN1START
-- TAG-FEATURESETCOMBINATIONID-START

FeatureSetCombinationId ::=          INTEGER (0.. maxFeatureSetCombinations)

-- TAG-FEATURESETCOMBINATIONID-STOP
-- ASN1STOP
```

## – *FeatureSetDownlink*

The IE *FeatureSetDownlink* indicates a set of features that the UE supports on the carriers corresponding to one band entry in a band combination.

### ***FeatureSetDownlink* information element**

```
-- ASN1START
-- TAG-FEATURESETDOWNLINK-START

FeatureSetDownlink ::=

|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>featureSetListPerDownlinkCC</b><br>Indicates which features the UE supports on the individual DL carriers of the feature set (and hence of a band entry that refer to the feature set). The UE shall hence include at least as many <i>FeatureSetDownlinkPerCC-Id</i> in this list as the number of carriers it supports according to the <i>ca-BandwidthClassDL</i> , except if indicating additional functionality by reducing the number of <i>FeatureSetDownlinkPerCC-Id</i> in the feature set (see NOTE 1 in <i>FeatureSetCombination</i> IE description). The order of the elements in this list is not relevant, i.e., the network may configure any of the carriers in accordance with any of the <i>FeatureSetDownlinkPerCC-Id</i> in this list. |
| <b>supportedSRS-Resources</b><br>Indicates supported SRS resources for SRS carrier switching to the band associated with this <i>FeatureSetDownlink</i> . The UE is only allowed to set this field for a band with associated <i>FeatureSetUplinkId</i> set to 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

— FeatureSetDownlinkId

The IE *FeatureSetDownlinkId* identifies a downlink feature set. The *FeatureSetDownlinkId* of a *FeatureSetDownlink* is the index position of the *FeatureSetDownlink* in the *featureSetsDownlink* list in the *FeatureSets* IE. The first element in that list is referred to by *FeatureSetDownlinkId* = 1. The *FeatureSetDownlinkId*=0 is not used by an actual *FeatureSetDownlink* but means that the UE does not support a carrier in this band of a band combination.

FeatureSetDownlinkId information element

```
-- ASN1START
-- TAG-FEATURESETDOWNLINKID-START

FeatureSetDownlinkId ::=          INTEGER (0..maxDownlinkFeatureSets)

-- TAG-FEATURESETDOWNLINKID-STOP
-- ASN1STOP
```

— FeatureSetDownlinkPerCC

The IE *FeatureSetDownlinkPerCC* indicates a set of features that the UE supports on the corresponding carrier of one band entry of a band combination.

FeatureSetDownlinkPerCC information element

```
-- ASN1START
-- TAG-FEATURESETDOWNLINKPERCC-START

-- TAG-FEATURESETDOWNLINKPERCC-STOP
-- ASN1STOP

```

## – *FeatureSetDownlinkPerCC-Id*

The IE *FeatureSetDownlinkPerCC-Id* identifies a set of features applicable to one carrier of a feature set. The *FeatureSetDownlinkPerCC-Id* of a *FeatureSetDownlinkPerCC* is the index position of the *FeatureSetDownlinkPerCC* in the *featureSetsDownlinkPerCC*. The first element in the list is referred to by *FeatureSetDownlinkPerCC-Id* = 1, and so on.

### ***FeatureSetDownlinkPerCC-Id* information element**

```

-- ASN1START
-- TAG-FEATURESETDOWNLINKPERCC-ID-START

FeatureSetDownlinkPerCC-Id ::=
    INTEGER (1..maxPerCC-FeatureSets)

-- TAG-FEATURESETDOWNLINKPERCC-ID-STOP
-- ASN1STOP

```

## — *FeatureSetEUTRA-DownlinkId*

The IE *FeatureSetEUTRA-DownlinkId* identifies a downlink feature set in E-UTRA list (see TS 36.331 [10]). The first element in that list is referred to by *FeatureSetEUTRA-DownlinkId* = 1. The *FeatureSetEUTRA-DownlinkId*=0 is used when the UE does not support a carrier in this band of a band combination.

### ***FeatureSetEUTRA-DownlinkId* information element**

```
-- ASN1START
-- TAG-FEATURESETEUTRADOWNLINKID-START

FeatureSetEUTRA-DownlinkId ::=      INTEGER (0..maxEUTRA-DL-FeatureSets)

-- TAG-FEATURESETEUTRADOWNLINKID-STOP
-- ASN1STOP
```

## — *FeatureSetEUTRA-UplinkId*

The IE *FeatureSetEUTRA-UplinkId* identifies an uplink feature set in E-UTRA list (see TS 36.331 [10]). The first element in that list is referred to by *FeatureSetEUTRA-UplinkId* = 1. The *FeatureSetEUTRA-UplinkId* =0 is used when the UE does not support a carrier in this band of a band combination.

### ***FeatureSetEUTRA-UplinkId* information element**

```
-- ASN1START
-- TAG-FEATURESETEUTRAUPLINKID-START

FeatureSetEUTRA-UplinkId ::=      INTEGER (0..maxEUTRA-UL-FeatureSets)

-- TAG-FEATURESETEUTRAUPLINKID-STOP
-- ASN1STOP
```

## — *FeatureSets*

The IE *FeatureSets* is used to provide pools of downlink and uplink features sets. A *FeatureSetCombination* refers to the IDs of the feature set(s) that the UE supports in that *FeatureSetCombination*. The *BandCombination* entries in the *BandCombinationList* then indicate the ID of the *FeatureSetCombination* that the UE supports for that band combination.

The entries in the lists in this IE are identified by their index position. For example, the *FeatureSetUplinkPerCC-Id* = 4 identifies the 4<sup>th</sup> element in the *featureSetsUplinkPerCC* list.

NOTE: When feature sets (per CC) IEs require extension in future versions of the specification, new versions of the *FeatureSetDownlink*, *FeatureSetUplink*, *FeatureSets*, *FeatureSetDownlinkPerCC* and/or *FeatureSetUplinkPerCC* will be created and instantiated in corresponding new lists in the *FeatureSets* IE. For example, if new capability bits are to be added to the *FeatureSetDownlink*, they will instead be defined in a new *FeatureSetDownlink-rxy* which will be instantiated in a new *featureSetDownlinkList-rxy* list. If a UE indicates in a *FeatureSetCombination* that it supports the *FeatureSetDownlink* with ID #5, it implies that it supports both the features in *FeatureSetDownlink* #5 and *FeatureSetDownlink-rxy* #5 (if present). The number of entries in the new list(s) shall be the same as in the original list(s).

**FeatureSetUplink field descriptions****featureSetListPerUplinkCC**

Indicates which features the UE supports on the individual UL carriers of the feature set (and hence of a band entry that refers to the feature set). The UE shall hence include at least as many *FeatureSetUplinkPerCC-Id* in this list as the number of carriers it supports according to the *ca-BandwidthClassUL*, except if indicating additional functionality by reducing the number of *FeatureSetUplinkPerCC-Id* in the feature set (see NOTE 1 in *FeatureSetCombination* IE description). The order of the elements in this list is not relevant, i.e., the network may configure any of the carriers in accordance with any of the *FeatureSetUplinkPerCC-Id* in this list.

– **FeatureSetUplinkId**

The IE *FeatureSetUplinkId* identifies an uplink feature set. The *FeatureSetUplinkId* of a *FeatureSetUplink* is the index position of the *FeatureSetUplink* in the *featureSetsUplink* list in the *FeatureSets* IE. The first element in the list is referred to by *FeatureSetUplinkId* = 1, and so on. The *FeatureSetUplinkId* = 0 is not used by an actual *FeatureSetUplink* but means that the UE does not support a carrier in this band of a band combination.

**FeatureSetUplinkId information element**

```
-- ASN1START
-- TAG-FEATURESETUPLINKID-START

FeatureSetUplinkId ::=
    INTEGER (0..maxUplinkFeatureSets)

-- TAG-FEATURESETUPLINKID-STOP
-- ASN1STOP
```

– **FeatureSetUplinkPerCC**

The IE *FeatureSetUplinkPerCC* indicates a set of features that the UE supports on the corresponding carrier of one band entry of a band combination.

**FeatureSetUplinkPerCC information element**

-- TAG-FEATURESETUPLINKPERCC-STOP
-- ASN1STOP

```

### — *FeatureSetUplinkPerCC-Id*

The IE *FeatureSetUplinkPerCC-Id* identifies a set of features applicable to one carrier of a feature set. The *FeatureSetUplinkPerCC-Id* of a *FeatureSetUplinkPerCC* is the index position of the *FeatureSetUplinkPerCC* in the *featureSetsUplinkPerCC*. The first element in the list is referred to by *FeatureSetUplinkPerCC-Id* = 1, and so on.

### *FeatureSetUplinkPerCC-Id* information element

```

-- ASN1START
-- TAG-FEATURESETUPLINKPERCC-ID-START

FeatureSetUplinkPerCC-Id ::=          INTEGER (1..maxPerCC-FeatureSets)

-- TAG-FEATURESETUPLINKPERCC-ID-STOP
-- ASN1STOP

```

## — *FreqBandIndicatorEUTRA*

```
-- ASN1START
-- TAG-FREQBANDINDICATOREUTRA-START

FreqBandIndicatorEUTRA ::= INTEGER (1..maxBandsEUTRA)

-- TAG-FREQBANDINDICATOREUTRA-STOP
-- ASN1STOP
```

## — *FreqBandList*

The IE *FreqBandList* is used by the network to request NR CA, NR non-CA and/or MR-DC band combinations for specific NR and/or E-UTRA frequency bands and/or up to a specific number of carriers and/or up to specific aggregated bandwidth. This is also used to request feature sets (for NR) and feature set combinations (for NR and MR-DC). For NR sidelink communication, this is used by the initiating UE to request sidelink UE radio access capabilities from the peer UE. This is also used to request lower MSD capability for specific NR frequency bands for the UE supporting lower MSD.

### *FreqBandList* information element

```
-- ASN1START
-- TAG-FREQBANDLIST-START

FreqBandList ::= SEQUENCE (SIZE (1..maxBandsMRDC)) OF FreqBandInformation

#### ***Phy-ParametersFRX-Diff* field descriptions**

##### ***csi-RS-IM-ReceptionForFeedback/ csi-RS-ProcFrameworkForSRS/ csi-ReportFramework***

These fields are optionally present in *fr1-fr2-Add-UE-NR-Capabilities* in *UE-NR-Capability*. They shall not be set in any other instance of the IE *Phy-ParametersFRX-Diff*. If the network configures the UE with serving cells on both FR1 and FR2 bands, these parameters, if present, limit the corresponding parameters in *MIMO-ParametersPerBand*.

## – ***Phy-ParametersMRDC***

The IE *Phy-ParametersMRDC* is used to convey physical layer capabilities for MR-DC.

#### ***Phy-ParametersMRDC* information element**

```

The encoding is defined in PC5 <i>BandCombinationListSidelinkNR-r16</i> .                                                                                                                                                                                                                                                                      |
| <b><i>supportedBandCombinationList-UplinkTxSwitch</i></b><br>A list of band combinations that the UE supports dynamic uplink Tx switching for NR UL CA and SUL. The <i>FeatureSetCombinationId</i> :s in this list refer to the <i>FeatureSetCombination</i> entries in the <i>featureSetCombinations</i> list in the <i>UE-NR-Capability</i> IE. The UE does not include this field if the UE capability is requested by E-UTRAN and the network request includes the field <i>eutra-nr-only</i> [10]. |
| <b><i>supportedBandListNR</i></b><br>A list of NR bands supported by the UE. If <i>supportedBandListNR-v16c0</i> is included, the UE shall include the same number of entries, and listed in the same order, as in <i>supportedBandListNR</i> (without suffix).                                                                                                                                                                                                                                         |

## – *RF-ParametersMRDC*

The IE *RF-ParametersMRDC* is used to convey RF related capabilities for MR-DC.

|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>appliedFreqBandListFilter</b><br>In this field the UE mirrors the <i>FreqBandList</i> that the NW provided in the capability enquiry, if any. The UE filtered the band combinations in the <i>supportedBandCombinationList</i> in accordance with this <i>appliedFreqBandListFilter</i> .                                                                                                   |
| <b>dummy1, dummy2</b><br>The fields are not used in the specification and the network ignores the received values.                                                                                                                                                                                                                                                                             |
| <b>supportedBandCombinationList</b><br>A list of band combinations that the UE supports for (NG)EN-DC, or both (NG)EN-DC and NE-DC. The <i>FeatureSetCombinationId</i> :s in this list refer to the <i>FeatureSetCombination</i> entries in the <i>featureSetCombinations</i> list in the <i>UE-MRDC-Capability</i> IE.                                                                        |
| <b>supportedBandCombinationListNEDC-Only, supportedBandCombinationListNEDC-Only-v1610, supportedBandCombinationListNEDC-Only-v1780</b><br>A list of band combinations that the UE supports only for NE-DC. The <i>FeatureSetCombinationId</i> :s in this list refer to the <i>FeatureSetCombination</i> entries in the <i>featureSetCombinations</i> list in the <i>UE-MRDC-Capability</i> IE. |
| <b>supportedBandCombinationList-UplinkTxSwitch</b><br>A list of band combinations that the UE supports dynamic UL Tx switching for (NG)EN-DC. The <i>FeatureSetCombinationId</i> :s in this list refer to the <i>FeatureSetCombination</i> entries in the <i>featureSetCombinations</i> list in the <i>UE-MRDC-Capability</i> IE.                                                              |

— RLC-Parameters

The IE *RLC-Parameters* is used to convey capabilities related to RLC.

RLC-Parameters information element

```
-- ASN1START
-- TAG-RLC-PARAMETERS-START

RLC-Parameters ::= SEQUENCE {
  am-WithShortSN      ENUMERATED {supported} OPTIONAL,
